Past energy developments give rise to interesting speculation about the future world requirements for coal and petroleum, and how they will be supplied. On the one side, the steady increase in energy needs that has taken place will apparently continue. On the other side, the tendency for the greater portion of coal and petroleum supply to rest more and more on the output of a few countries will have the result that satisfying requirements will become increasingly complicated with each succeeding year.[5] Possibly within this decade, conditions may force considerable changes among the uses of fuel. Certainly within the next twenty-five years, the world fuel structure will have quite a different appearance from what it has today.

What may the world fuel situation be in twenty-five years? By then, population will have increased; technology, industrialization, and other components of the world economy will have advanced, providing global conditions are no worse than they have been. This economic growth may come about at a rate that corresponds to a past period.

Based upon 1937 to 1950, world requirements during the next twenty-five years will increase 27.5 per cent for coal and 170 per cent for petroleum. Coal projects to 2.1 billion tons and petroleum to 10.8 billion barrels. The two projections combined represent a growth of 74 per cent in British thermal units (Btu's). Natural gas may be excluded in the world calculations, since

[5] World coal reserves are rated by Paul Averitt and Louise R. Berryhill in *Coal Resources of The United States*, Circular 94, p. 26 (U. S. Geological Survey, Nov. 1950). Distribution of the major reserves is: United States 40 per cent, Russia 21 per cent, China 18 per cent. Germany and the United Kingdom have 6 per cent and 3 per cent respectively. Location of the major petroleum proved reserves is: 50 per cent in Middle East, 25 per cent in the United States, 10 per cent in Venezuela. *Petroleum Facts and Figures*, 9th Ed., 1951 (New York: American Petroleum Institute), p. 443. Also estimates of D. M. Duff, "Middle East Accounts for More Than Half of Global Petroleum Reserves," *Oil and Gas Journal*, Vol. 50, No. 33 (Dec. 20, 1951), pp. 224 and 227.

Water power[d]	3,483	5.8	4,836	5.8	38.8
Total	60,277	100.0	83,292	100.0	38.2

[a] Metric ton = 28.9 million British thermal units.
[b] 1 barrel = 5.8 million Btu's.
[c] 1 cubic foot = 1,075 Btu's.
[d] In 1937, 1 pound of coal was equal to 1.44 kilowatt-hours; in 1950 it was equal to 1.19.
Sources: U. S. Bureau of Mines; United Nations; *Energy Resources of the World*, U. S. State Department, Washington, 1937.

its use is confined primarily to the United States. Water power—a comparatively small energy source—also may be excluded on the basis that it will expand in proportion to total energy requirements.

In the United States, requirements for total energy—as derived from the combination of coal, petroleum, natural gas, and water power—will double in twenty-five years according to the 1937–50 experience. This will amount to 70.4 quadrillion Btu's. Petroleum and natural gas taken alone, because of their steady increase in the base period and subsequent greater volume in the years that follow, will account for 65.2 quadrillion Btu's, or most of the requirements. Allowing water power to double in output, practically nothing will be left for coal on the basis of 70.4 quadrillion Btu's. But because there are certain uses that cannot be satisfied by petroleum, gas, or water power, for instance in steelmaking, coal probably will retain at least half of its volume, making the requirements for the other energy sources somewhat less than their particular projections indicate. This is the sort of situation that may result if petroleum and natural gas are as readily available as they were during 1937–50.

TABLE 4—PROJECTED WORLD REQUIREMENTS OF COAL AND PETROLEUM
(Quadrillion Btu's)

	Actual 1950	Projected 1975	Per cent increase
Coal	47.5	60.6	27.5
Petroleum	23.2	62.6	170.0
Total	70.7	123.2	74.0

Conditions in the rest of North America will relate to those in the United States. Europe, on the 1937–50 experience, will have a 50 per cent growth (about 450 million tons) in coal consumption—most of the world increase for this solid fuel. South America and Asia will expand coal demand by 50 per cent, and Africa and Oceania together will require 70 per cent more tonnage.

The advance in petroleum demand of 170 per cent for the world will be represented by a 190 per cent increase for the United States and a 160 per cent increase for the rest of the world. In Europe it will double, the increase in western Europe being 130 per cent and that in eastern Europe being 50 per cent. Other increases of smaller volume are 150 per cent in Asia, and 400 per cent in South America and Africa-Oceania.

Few countries can look to anything but coal and petroleum to supply their increased fuel requirements. Natural gas will be a major fuel in the United States, but it offers no significant prospects elsewhere except in Venezuela and Canada, and to a less extent in a few other countries. This is exclusive of what may be done with the supposedly large gas reserves of Russia.

SUPPLY PROBLEMS

Prospective supply difficulties center around two situations. First is the likelihood that western Europe will be unable to acquire the increased amounts of coal to meet its greater energy requirements. Figured on a straight projection of 1937 to 1950, it will need 20 per cent more coal in 1975; but if allowance is made for its supply scarcity since World War II, it will probably need 50 per cent additional tonnage, or 250 million tons. Western Europe, confronted with poor mining conditions and high costs, does not demonstrate that it can better its present production 10 per cent, much less 50 per cent.[6]

The United States could enlarge its mining facilities to produce the extra coal that western Europe may need. Unfortunately, the tonnage might have to be delivered at comparatively high cost to the consumer because of transportation and handling charges. United States coal delivered to overseas buyers at costs ranging from $20 to $25 per ton, as prevailed during 1951, three-fourths represented in shipping charges largely because of vessel rates, would push European fuel budgets beyond economic reason.[7]

A reduction in these shipping charges is probable, but whether they can be lowered to the point to permit the general flow of coal to Europe economically over the long run raises a doubt.[8] The reduction may permit the movement of by-product and other special-quality coals which may be as much as 50 million tons yearly, although hardly a tonnage several times larger which Europe may be required to import to satisfy total coal needs. Little help can be expected from the Soviet Union, which must expand its mining to supply its growing coal requirements. Hence, if western Europe is to have adequate energy in the years ahead, it will look for a source other than coal. Petroleum is the only source left that has potentialities.[9]

The second major supply difficulty concerns petroleum in the United States.

[6] Coal production in western Europe has relatively high costs because of physical mining conditions and the inability to utilize mechanization in the same degree as in the United States. In October and November 1950, output per man-shift was 1.2 tons in Great Britain, 1.1 tons in Western Germany, and 0.8 ton in France. It was 6.1 tons for bituminous coal in the United States in 1950. *International Coal Trade* (U. S. Bureau of Mines), Vol. 20, No. 2, Feb. 1951.

[7] *Saward's Journal*, Vol. 34, No. 42 (Jan. 1952), p. 585, quotes ocean single-trip rates per gross ton on coal from the eastern United States as follows: United Kingdom about $12.00; Antwerp $10.50 to $11.25; Italy $11.70 to $14.00. Western Europe imported over 25 million tons of coal from the United States in 1951.

[8] During the early part of 1952, a joint UMWA-coal operators shipping pool was under consideration for the purpose of leasing and operating government surplus ships. The proposal was to operate ships at cost in order to reduce delivered coal costs at foreign ports. See *United Mine Journal*, Vol. LXIII, No. 1 (Jan. 1, 1952), p. 10.

[9] Petroleum also has lower transportation costs than coal. The maximum price on heavy fuel oil in New York Harbor was $2.45 per barrel, equivalent to coal at $10 per ton, during much of 1951. Oil from Venezuela and the Middle East was delivered at this price, or about half what it cost to deliver the equivalent of American coal in Europe.

It has been estimated, with certain qualifying conditions, that peak petroleum production in the United States may be reached by 1960 and possibly before.[10] Much oil will be produced from the country's reserves following the peak performance, but eventually at a declining rate. Estimators of the peak outlook further hold that indigenous petroleum may supply only 10 per cent of the country's total oil requirements at the end of the present century.

The world peak in petroleum production may appear in 1985[11] as figured with regard to various considerations, one of which is that the world reserves ultimately producible total one trillion barrels, larger than sometimes cited. Furthermore, it is held that world production may have a peak no larger than 7 billion barrels per annum. If the latter proves to be the case and the demand for oil approximates the increase projected—that is, a growth from 4 to 10.8 billion barrels in twenty-five years—a shortage in petroleum may develop within the next dozen years.

BALANCING OUT

Interrelating requirement and supply prospects, what may be the consumption of coal and of petroleum twenty-five years hence?

In the United States, a number of changes will take place. Where the requirement trends show coal as a solid fuel losing half of its volume, while petroleum and natural gas are advancing 190 per cent and 200 per cent respectively, the addition of supply factors present a different outlook. This is true even if it is liberally assumed that natural gas will have the production volume to take care of its demand growth.

PETROLEUM IN 1975

Petroleum production in the United States, should it reach a peak by 1960, would be at a comparatively low level by 1975. One forecast indicates that it may be no larger than 1 billion barrels annually by the early seventies.[12] Still, if it were as high as 2 billion barrels in 1975, then against a projected oil demand of 6.9 billion barrels there would be a difference of 4.9 billion barrels to be supplied from other sources.

Petroleum imports will be one way to supplement domestic supply, but in a limited manner. They amounted to 309 million barrels last year and in 1950. Canada will be the origin for part of the imports, but Venezuela and the Middle East will be the source for most of them. To have imports furnish the greater part of future domestic needs would depend upon a gigantic fleet of tankers besides the availability of foreign petroleum. The latter apparently will be wishful thinking, since the rest of the world likewise will be bidding for petroleum and will attempt to take all that is produced. An allowance of 1 billion barrels for imports in 1975 may be too large, but such a volume would still leave a deficit of 3.9 billion barrels in oil supply.

Prices will keep oil to its more essential uses and will encourage technological advancement in the development of new supply to offset petroleum scarcity. Oil for motor vehicles, aircraft, and other motive equipment will be a principal requirement. Its uses for space heating and under boilers for raising industrial steam will diminish in volume by necessity. In 1950, about 800 million barrels, one-third of the total domestic oil demand, was consumed for heat and boiler-plant steam. At the same time, 1.1 billion barrels of gasoline, diesel oil, and other light oils was required for motor fuel—41 per cent of total demand. Assuming that in 1975 gasoline and other motor oils would have a demand of 3 billion barrels, approximately the proportion of total oil demand they presently have, and that oils for other uses would be restricted, petroleum requirements could be substantially lowered. Instead of needing 6.9 billion barrels, probably 3.5 billion barrels of petroleum would yield the needed motor and other essential oils. This would leave a deficit of 500 million barrels after domestic petroleum and imports accounted for 3 billion barrels.

Shale oil would supplement supply, probably to the amount of 300 million barrels.[13] The great deposits of shale vary widely as to minability and oil content, and those that could be processed within a reasonable cost range apparently would not support a production beyond this figure.

SYNTHETIC OIL

Supplying the remaining 200 million barrels of oil would fall upon coal. Oil can be made from coal by various processes, any one of which is now in a preliminary stage and will probably be improved a great deal with further investigation.[14] Thermal inefficiency in conversion is a major problem; about half of the heat value of the coal used is lost in processes like hydrogenation and Fischer-Tropsch. A ton of coal instead of making four-plus barrels of oil makes only two.

An initial approach to synthetic oil output may be through the recovery of tar from coal through low-temperature carbonization and use of the principal resulting product—char or semicoke—for a solid fuel and additional synthetic output. The 40 gallons of tar taken from a metric ton of coal can be converted into oils with a high degree of efficiency.[15] This process may well take care of the 200 million barrels of oil needed to balance supply in 1975, and has potentialities for supplying much more. Five hundred million tons of coal used in this process would be the basis for about 450 million barrels of motor fuel and related products, and 350 million tons of char.

A char market will have limitations if confined to solid fuel, but may be unlimited if extended to the raw material needed by other synthetic oil processes. These other processes where the entire ton of coal or char is used for oil making will have to be employed as the spread enlarges between what oil is needed and what can be supplied through domestic petroleum, imports, and shale. Their potentialities from a cost standpoint still need a great deal more exploration before satisfactory determinations can be made as to what process is to offer the greatest advantages.[16]

[15] See *Petroleum Processing*, Vol. 7, No. 1 (Jan. 1952), p. 45, for an interesting account of the possibilities in low-temperature carbonization.

[16] It has been estimated that the large-scale conversion of the better-quality shale into motor fuel can be made presently at a cost of 14.7 cents per gallon—slightly more than 3 cents above the average refinery price. Coal hydrogenation is figured to cost 41 cents per gallon. See *Report of The National Petroleum Council's Committee on Synthetic Liquid Fuels Production Costs*, Washington, Oct. 31, 1951. The U. S. Bureau of Mines estimates that the hydrogenation process is less costly than the Petroleum Council's figure. Current figures on the Fischer-Tropsch process are not available, but some contend they will give a lower cost than estimates for hydrogenation.

HEATING AND STEAM FUELS

What about the requirements for heating and steam fuels that were to be but could not be supplied by oil? This may be harder to answer satisfactorily than the question of meeting demands for motor and other essential oils. Substitute energy to displace 3.4 billion barrels of oil is not readily available if it is to be consumed without economic hardship.

It takes about 700 million tons of coal to furnish the Btu's in 3.4 billion barrels of petroleum. Presently, coal can displace oil for some uses with little if any additional cost and without any loss in thermal efficiency. These uses consist of fuel for large boiler operations such as at electric utility plants and even at oil refinery plants located in certain areas. They will be fueled more with coal as oil tends to become scarce and its price rises. In less than twenty-five years, most of the boiler fuel that had been oil will consist of coal. Probably as much as 1 billion of the projected 3.4 billion barrels can be displaced directly by coal.

The amount of oil used for heating residential and commercial buildings totaled 400 million barrels in 1950.[17] It projects to 1.3 billion barrels, or 260 million tons of coal in heat equivalent, in 1975. Here the question of convenience to the user often is the controlling factor in selecting fuels, and it will be more so. Part of the heating requirements can be supplied by the use of central coal plants. These plants now operate satisfactorily in a number of places, especially in concentrated city areas. They are economical and provide a convenient heat. Electrical heating, now installed on a modest scale, features convenience and potential economies. It fits into the scheme of building equipment and furnishing which is tending towards electrification. Probably it will eventually become a major supplier of space heat on its own merits. Coal-generated electricity will likely furnish heat at a cost comparable to the current cost of oil heat. If this develops, then central plants and electrical units with coal as the energy source can displace 1.3 billion barrels of oil heat with thermal equivalent and, moreover, with added convenience.

While 2.3 billion barrels of oil can be displaced through the substitution of coal in boiler plants and as an energy source for space heating, there remains to be supplied 1.1 billion of the projected 3.4 billion barrels. This consists of fuel for ship bunkers, railroads, processing in manufacturing plants, and a variety of additional requirements. Much will depend upon technological advance if coal is to displace oil for these particular uses and higher relative fuel costs are to be avoided. The coal gas turbine, now under development, may provide the way for decreasing oil for bunker and railroad needs as well as for other purposes. Electric power may be used more extensively for railroad transportation. It also may serve in place of oil for many processing needs. Furthermore, oil made from coal may be utilized if synthetic production is advanced as some think it will be. A great deal has to be done in the efficient substitution of coal for oil, but there is evidence that it can be done for numerous uses within a twenty-five-year period.

SITUATION IN NORTH AMERICA

Under this sequence of fuel developments, adequate energy would be available to the United States in 1975. One billion metric tons of coal would supply solid fuel needs and be the source for 200 million barrels of motor fuel and for energy for space heating and other purposes now serviced by petroleum products. Shale oil would contribute 300 million gallons of motor fuel. Three billion barrels of petroleum would be the source for motor and other essential oils.[18]

Outside the United States, the fuel outlooks vary widely depending upon the country or continent considered. Canada has a promising oil and natural gas production, but, taking into account a rising energy demand, it still will need a larger coal tonnage. It is estimated that Canadian coal requirements will double in twenty-five years to an approximate 80 million tons, with no allowance for synthetic oil output or any special displacement of oil.[19] Half would be supplied by the United States. Like the United States, the other countries of North America will require continually greater volumes of oil.

SITUATION IN EUROPE

There is no indication that western Europe will be able to expand its coal supply through production and imports to anything like 250 million tons in the future years. Most of this additional fuel will have to be secured from a source other than coal. In the circumstances, a billion barrels of fuel oil may go a long way towards making fuel supply adequate in 1975.

Western Europe likewise is going to require sizable additions to motor and related oils. Projections, even though reflecting austere living since World War II, point to a twenty-five-year increase in motor fuels of 100 per cent, or to 1 billion barrels. The increase may be twice as great. Thus in 1975 western Europe may be taking 3 billion barrels of petroleum from the Middle East and from where else it can be had. A six-fold growth in oil consumption like this may appear to be fanciful at first glance, but it is similar to what happened in the United States between World War I and 1950. It is probable if world production and transportation of petroleum develop as assumed. Moreover, the per capita consumption in western Europe in 1975 would be only 8 barrels, compared to the present 16 barrels in the United States.

Eastern Europe apparently will be better situated to enlarge its production of coal and petroleum, and probably natural gas. It already has made good strides in coal mining and should be able to reach the 650 million tons projected. Russia may develop crude oil output in view of its supposedly large petroleum reserves. Eastern Europe's twenty-five-year projected oil consumption amounts to only 500 million barrels. An increase to 1.5 billion barrels is not too much to expect, especially if eastern Europe attempts to maintain an energy position comparable to the one assumed for western Europe.

SITUATION OUTSIDE NORTH AMERICA AND EUROPE

North America and Europe account for most of the energy to be consumed. The remainder of the world, however, will plan to use more coal and petro-

[17] *Bituminous Coal Annual* (Washington: Bituminous Coal Institute, 1951), p. 135.

[18] "A Billion-Ton Year For Coal?" *Mechanization*, Vol. XV, No. 11 (Nov. 1951), pp. 89–100, makes an estimate of future energy requirements on a different basis. It assumes that the energy load of the country may double in twenty-five years under certain conditions. It arrives at a different fuel setup, since, for one thing, it is figured that the United States will have 6 billion barrels of petroleum available in 1975. This article is further analyzed by George A. Lamb, D. L. McElroy, and Joseph Pursglove, Jr., in "There's Coal in Your Future," *Utilization*, Vol. 5, No. 12 (Dec. 1951), pp. 29–38. Eugene Ayres, "Synthetic Liquid Fuels," cited note 11 *supra*, p. 44, believes that a demand of 3.5 billion barrels of motor fuel by 1980 is a plausible figure. This compares to the 3 billion barrels in 1975 used in the assumptions.

[19] Estimate furnished by letter from C. L. O'Brian, Assistant to Chairman, Dominion Coal Board, Ottawa, Canada.

TABLE 5—USE OF COAL AND CRUDE PETROLEUM IN 1975, COMPILED WITH REFERENCE TO CERTAIN ASSUMPTIONS

	Coal		Petroleum		Total Quadrillion Btu's
	Million metric tons	Quadrillion Btu's	Million barrels	Quadrillion Btu's	
North America	*1,100*	*31.8*	*3,500*	*20.3*	*52.1*
United States[a]	1,000	28.9	3,000	17.4	46.3

World, totals	2,600	75.1	10,300	59.7	134.8

[a] In addition, oil shale would supply 300 million barrels of oil.

leum—a prospect that may be underestimated. It used 180 million tons of coal in 1950, and it is conservative to say it will use 250 million tons in 1975. It will have the greater part of the petroleum reserves and two-thirds of the population, or 2 billion persons. Its 1975 oil consumption would be 600 million barrels projected from 1937–50 trends, but it could easily soar to at least 2 billion barrels—1 barrel per capita. If countries on continents like South America and Asia advance their economies as they plan to do, there will be a great demand for fuel energy, and petroleum will be the attractive source.[20]

In the circumstances outlined, world energy requirements for coal and petroleum in 1975 amount to 135 quadrillion Btu's, 10 per cent higher than projected upon the 1937–50 basis. This comes about mainly because of allowances for certain additional energy growth outside of North America.

[20] Arthur D. Stewart, "World Demand to Continue Upward Trend," *Oil and Gas Journal*, Dec. 20, 1951, p. 270, estimates that the world outside of the Soviet Union and its satellites will require one-third more oil in the next ten years. Increases are general.

DEVELOPMENTS IN SUPPLY

Supply has some interesting developments under the conditions set forth. In North America, coal once more regains the prominent position as an energy source. This occurs while Europe, which has been principally a coal consumer, turns to petroleum for a good part of its energy supply. Western Europe, with petroleum reserves of no consequence and the world crude production on the decline during the late part of the century, with coal reserves that offer limited production, has dim prospects for energy supply in the distant future.

Events do not have to be greatly unlike those assumed to bring about a different fuel situation in 1975. Peak petroleum production in the United States may come in 1970 or later, rather than in 1960. It may not be reached in the world until 2000. Similarly, fuel needs may not be so large as expected. World progress may be at a slow pace if at all. The fuel setup suggested for 1975 may not be approximated for decades after that time.

Similarly, it may be argued that the decline in petroleum output will start sooner than expected. Fuel requirements ahead may be underestimated, as is often the case, instead of overestimated. A new era of world advancement is about to start. Hence, a transition in fuel supply may be well underway in another ten years.

Serious thinking about the undertakings that may be necessary to assure adequate supply in the future should not be discouraged by various opinions on details of fuel outlook. That substantial fuel changes may not have to be effected until ten or twenty years later than some predict offers no respite in light of what may have to be done.

Shifting energy sources to supply increasing energy needs will be a venture of staggering proportions. Should coal and petroleum be utilized to provide energy in 1975, as assumed, it could only be the result of foresight, careful planning, and wise execution by the fuel industries. Consumers, likewise, would have to have been understanding and co-operative.

TRANSITION IN UNITED STATES

An annual coal production in the United States of a billion metric tons, twice the present rate, does not seem to present difficulties at first glance. And it would not if the increased capacity could be added gradually in accordance with its long-term as well as immediate needs. Investment could be attracted, mines developed, manpower trained, and transportation supplemented. But if past events are a yardstick, there is the danger that expansion will not come about so smoothly. A billion tons of coal may be urgently needed in 1975; half that volume will be plenty this year and likely during the years ahead while oil and natural gas remain in apparent abundance. Necessity for coal expansion may not be fully realized until there is actually a fuel shortage. Then development of additional mining will be rushed to completion with all the disadvantages of emergency application. Consumers will pay more for their energy as a consequence.

Coal mining development is but one phase of the complex transition in prospect for the American energy structure. Facilities for generating greater volumes of electricity, producing synthetic oil, and processing other energy products, will take new technology, and also an investment, along with steel and other materials, of a magnitude that might be needed to support another world war. Changes in equipment to permit utilization of the new energy supply will entail vast expansions in manufacturing and in consumer expenditures.

Only part of the great money and materials outlay applied to the transition may be in addition to what the outlay would have been had petroleum been plentiful and supplied to satisfy increasing energy needs. But the transition will be a departure from conventional practice. The change-over will have to be started well ahead of its need, or later fuel requirements will not be met. This is not the sort of undertaking that gets enthusiastic backing. It may not appear possible to formulate a sound fuel program, generally acceptable, which will move the country towards preparation that will assure adequate energy supply twenty-five years from now. This is but to admit that the country can afford to take a chance on an energy shortage, on the costly rehabilitation of energy supply on an emergency basis, and suffer no loss in the end. And such shortage and attendant cost will happen unless serious thinking and effective action are given to the future fuel situation.

TRANSITION OUTSIDE OF UNITED STATES

Fuel developments will be even more complex outside of North America. In supplying the major part of the increased energy load, the utilization of petroleum needs to be broadly established and its production greatly expanded. Plant and equipment using oil, like oil refining and transportation capacities, will take a tremendous outlay of capital if energy requirements are to be supplied in 1975. In many countries, the undertaking will be of proportions never before considered.

If it is imperative that countries of western Europe and the other Allies strengthen their economies, it is likewise imperative that they have access to more energy, with petroleum the likely source. Ways and means will have to be devised so that the necessary petroleum can be acquired and used, or the Allies will get nowhere in their quest for economic strength. Countries opposing the Allies, too, will look towards petroleum for additional energy in the attempt to maintain their position. Conditions like these may soon force the demand for petroleum upward at an accelerated rate.

Petroleum requirements outside of North America in 1975 may be quite different from those assumed, without changing the energy position of the United States very much. They may total 5 billion or even 10 billion barrels instead of the 7 billion barrels projected, and the outlook is about the same. Five billion barrels would make it easier to acquire imports which may be limited in volume regardless. Ten billion barrels would reduce imports substantially, which would advance the production of synthetic oils and other energy products to offset the foreign oil deficiency. Thus, as projections extend further into the future, the United States must become more self-sufficient in fuel supply if its energy requirements are to be satisfied.

George A. Lamb, Pittsburgh, Pennsylvania, is manager of business surveys for the Pittsburgh Consolidation Coal Company. He has served as assistant director of the United States Bureau of Mines and as economist with the Department of the Interior and the Interstate Commerce Commission. He is author of a number of technical articles dealing with fuel matters.

Adequacy of Our Mineral Fuels

By ROBERT E. HARDWICKE

IT is impossible to isolate or value the most important influences in the United States that have brought about our well-being, especially our physical comfort, but surely the extensive use of inanimate energy resources is one of them.[1]

Blessed with enormous supplies of coal, petroleum, and falling water, we have been ingenious in their employment. Although our population has doubled since 1900, each of us on the average has today four times as much inanimate or mechanical energy working for him as each individual had in 1900. Americans, per capita, use ten times as much inanimate energy as do the people of the rest of the world.[2] Fortunately, this energy has been employed in such a manner and under such conditions as to make a major contribution to causes leading to our high standard of living.[3]

Perhaps more than any other country, we are committed to an economy that is based heavily on the use of gaseous and liquid fuels. In 1945, about 56 per cent of the energy of oil was used in transportation. Apparently the percentage has not since materially changed.[4] About 25 per cent of all energy used in the United States at the present time serves to run mobile equipment.[5] A lack of adequate supply of fuels might be disastrous.

The following questions are therefore pertinent: (1) How large are the known and prospective reserves of mineral fuels in the United States? (2) What is the likelihood that an adequate supply, particularly of gaseous and liquid fuels, will be available for a long time at reasonable prices? (3) What is being done and what should be done to minimize the waste of our supplies in producing operations? (4) What other sources of

[1] "The extent to which a nation employs [inanimate] energy resources is a definite indication of the level of living which its people enjoy." Arthur A. Sandusky, *et al., Basic Data Relating to Energy Resources* (1951), p. xv. The reference is to the report of a study made for the Committee on Interior and Insular Affairs pursuant to S. Res. 239, 81st Congress, authorizing the Committee to investigate available fuel reserves and formulate a national fuel policy for the United States. The study was made under the supervision of Arthur A. Sandusky, a member of the professional staff of the Committee, with the assistance of specialists from the Department of the Interior and the Legislative Reference Service of the Library of Congress. The 226-page report contains an enormous amount of valuable data. Since it will be referred to frequently, a short title, *Basic Data*, will be used.

energy are available if present sources of mineral fuels become inadequate? (5) What is the existing national policy with respect to mineral fuels? (6) Should a different policy be adopted?

A short answer to the second question may now be given: A continuation of our present policy of competition and freedom of individual initiative will ensure for a long period adequate supplies of mineral fuels, including liquid and gaseous, at reasonable prices.

Unquestionably, an adequate supply of liquid and gaseous fuels is of tremendous importance to this country. Ease of mobility and a lessening of man's physical burdens have consistently accelerated the progress of civilization.[6] The wheel, the sail, the steam engine, the internal-combustion and electric motors are points on the lines that mark the upward trend of ease of mobility, and the substitution of inanimate for animate work. Those lines closely parallel the lines of advancing culture.

In the United States in 1850 man did 15 per cent of the physical work, animals 79 per cent, and machines 6 per cent to produce in one man-hour goods worth 27 cents; in 1930 man did 4 per cent of the work, animals 12 per cent, and machines 84 per cent to produce in one man-hour goods worth 82 cents; and it is estimated that in 1960 the percentage will be man 3 per cent, animals 1 per cent, and machines 96 per cent to produce in one man-hour goods worth $1.61.[7] The figures indicate that a high level of living is now enjoyed in the United States.[8]

The existence of great supplies of energy resources, raw materials, manpower, and capital was an important factor in our progress, but perhaps the greatest factors of all were intangibles: social and political philosophies that encouraged individual initiative and competition. These philosophies offered to an unusual degree an equality of opportunity, and fostered conditions that challenged the individual to realize his capabilities, with consequent benefit to the country.[9]

At this very moment, as an outgrowth of our social and political philosophies, we are witnessing a dynamic of great forces: the competition of exhaustible mineral fuels (oil, natural gas, and coal) among themselves and with hydroelectricity. The severity of the conflict is indicated by the following figures given in round numbers: in 1900, on a Btu (British thermal unit) basis of comparison, the output of mineral fuels and water power was as follows: coal 88 per cent, oil and gas 8 per cent, and water power 4 per cent. In 1925 the percentages were: coal 70 per cent, oil and gas 27 per cent, and water power 3 per cent; while in 1949 the figures were: coal 40 per cent, oil and gas 55 per cent, and water power 5 per cent.[10]

The participants were outstanding executives, educators, authors, and editors. The condensed record also appears in the *Harvard Business Review*, Part I in the issue of November 1951, and Part II in the issue of January–February 1952.

[10] *Basic Data*, pp. 7–8; Zimmermann, *op. cit.* note 3, pp. 483–85. Zimmermann emphasizes that the figures deal with output, not percentages of energy realized, inasmuch as the amount of energy obtained depends on the efficiency of utilization.

Tomorrow the figures may indicate a different trend, for no fuel has suffered a hopeless defeat. New techniques are being employed, and, to add to the problems of competition, new combatants, such as solar heat, wind and tides, and even atomic energy, may soon participate with vigor in the battle royal. Experience gives us the right to believe that the public will be the benefactor.

RESERVES OF MINERAL FUELS

Although enormous supplies of mineral fuels exist within the United States, these supplies are unfortunately nonreplenishing. They can be exhausted. Prudence suggests, then, that we take stock of known recoverable reserves, and consider the probability of increasing them materially.

Coal

The total of the reserves of commercially recoverable coal of all classes, assuming 50 per cent recovery of the basic reserves, was recently estimated to be about 1,213 billion (1⅕ trillion) short tons as of January 1, 1950,[11] while the total production for 1949 was about 480,600,000 net tons, or only a small fraction of the reserve.[12] A more accurate survey of the coal reserves would doubtless result in changing the basic reserve figures, either up or down, and many factors, such as prices, technology, and availability, would influence the percentage recovery to be used in any new estimate; but it is not likely that there will be any shortage of reserves of coal for a long time.

Petroleum (oil and natural gas)

Few have been willing to estimate potential reserves or the total quantity of petroleum that will eventually be produced in the United States. A true saying in the petroleum industry is: oil and gas are where you find them, they are looked for in many places where they ain't, and they are found in large quantities where they ain't supposed to be. So far, each estimate of reserves given for a date or period in the future not close to the date of the estimate has been grossly erroneous. One reason is the impossibility of estimating the effect of technology in finding and recovery, or the effect of changes in economic conditions or governmental policy and action.

In order to avoid speculation as to the quantities of commercially recoverable petroleum that will eventually be found in the United States or will be available at some future date, the petroleum industry deals with "known" or "proved" reserves, taking into account only the supply proved to exist by wells already drilled. Moreover, the estimates are based on the quantity considered to be recoverable under economic and operating conditions existing at the time the estimate is made, with not a barrel added to represent an increase that would certainly take place as the result of higher prices or improved technology in finding and producing. For many years, the estimates

[11] *Basic Data*, pp. 153, 156; *Fuel Reserves of the United States* (1951), p. 9. The latter is a statement prepared by the United States Geological Survey for the Committee on Interior and Insular Affairs (United States Senate) in connection with S. Res. 239 (81st Cong.). It was printed by the government in booklet form for the Committee, and contains valuable information concerning fuel reserves and the methods of calculation. See discussion by Dr. Eugene Ayres and Charles A. Scarlott, *Energy Sources—The Wealth of the World* (New York, 1952), Chap. 4, and Zimmermann, *op. cit.* note 3, p. 461.

[12] *Basic Data*, p. 76.

of proved reserves of petroleum have been conservative.[13]

Proved reserves of natural gas have been steadily going up. On January 1, 1951, the figure was 186 trillion cubic feet. The net production of natural gas for 1950 was about 7 trillion cubic feet, being approximately 1/26 of the proved reserves.[14] The American Petroleum Institute and the American Gas Association released about March 10, 1952 the reserves of gas and liquid hydrocarbons as of January 1, 1952. The gas reserves were almost 194 trillion cubic feet, an increase of about 8 trillion cubic feet over the figure for December 31, 1950, though the net production in 1951 was about 8 trillion cubic feet.

Proved reserves of oil (including liquid hydrocarbons extractable from natural gas) on January 1, 1951 were approximately 30 billion barrels (barrels of 42 U. S. gallons), while the production for 1950 was about 2,170,000,000 barrels, or about one-fifteenth of the proved reserves. At the same time, reserves of all liquid hydrocarbons at the end of the year exceeded by about 1,160,000,000 barrels the figure for the beginning of 1950.[15]

The estimate of reserves as of January 1, 1952, released by the American Petroleum Institute and the American Gas Association, is approximately 32,200,000,000 barrels, an increase of more than 2,600,000,000 over the reserves of about 29,600,000,000 on January 1, 1951, though the production for 1951 was about 2,500,000,000 barrels. If there had not been a shortage of pipe and other steel items, caused by the defense program, the reserve figure might have been higher.

While production of oil (including liquid hydrocarbons from natural gas) has shown an upward trend, so have the figures of proved reserves. For a long period the reserves have been maintained at a level approximating fourteen times the annual production. For the period 1938–51, for every barrel of oil produced, about 1½ barrels of new reserves were established.[16]

There appears to be no clear indication that a shortage of oil will occur in the near future; however, although the total amount of new oil or reserves has continued to increase, little comfort is found in knowing that for the last ten years the proportion of large new discoveries has declined, or in knowing that informed persons can assign plausible grounds for predicting that domestic production by 1960 may not be large enough to supply the domestic demand unless the trend of large discoveries moves upward or something else happens to add materially to productive capacity.[17]

We do know that more than a billion acres of sedimentary deposits in the United States, including large areas of the continental shelf off our shores, are suitable for the accumulation of oil that could be produced at reasonable cost.[18]

Enormous areas remain to be tested. The search for, and the finding of, new reserves continue. Experience indicates that the relation of production to reserves will not soon materially worsen if the economic incentive justifies the risks involved.[19]

Hydroelectricity

Hydroelectricity, though not a mineral fuel, is an important energy resource that competes with mineral fuels, and may therefore be considered in this discussion.

Electric plants contributing to the public supply in 1950 produced over 329 billion kilowatt-hours, compared with 40 billion in 1920, 91 billion in 1930, and 142 billion in 1940.[20] One estimate for 1951 is 372 billion kilowatt-hours, or more than twice that of 1941 or 1942.[21] Production by industrial producers, not contributing to the public supply, is much smaller and has not materially increased for some years.

Our present reserve of electricity may be considered as being composed of (*a*) the excess of generating capacity and (*b*) potential hydroelectric power. A witness at a recent hearing before a committee of the United States Senate testified that hydroelectric power could be increased about four times that now developed, or to 390 billion kilowatt-hours, and about 75 per cent of such potential power could be considered as economically feasible, and therefore a reserve.[22]

The supply of electric energy can be increased to almost any desired figure by additional plants, if all sources of power are used. Moreover, news items indicate the likelihood that atomic energy may soon furnish heat in connection with the generation of electricity. Such a development might have tremendous influence upon the supply and price of electric energy, with far-reaching effect upon the use and reserves of mineral fuels.

MEANING OF CONSERVATION

Because of space limitations, this paper has been restricted to a discussion of conservation with respect to production of mineral fuels, treating only incidentally, if at all, conservation applicable to transportation, processing, or consumption.[23]

Conservation is here used, as in many oil and gas conservation statutes, to mean the prevention of waste; and waste means reasonably avoidable loss, primarily in the production process, of a commodity that has economic value. Conservation as here used does not include hoarding. Waste with respect to mineral fuels may take place aboveground, as by permitting a gas well to blow into the air, or underground, as by failing to use economically justifiable practices that would increase the ultimate recovery of the fuel.

In determining whether waste exists, or whether additional conservation measures should be employed, prices and other economic considerations are important factors. Waste does not take place merely because a mineral fuel is lost or is not made available for use, or because maximum ultimate recovery will not be obtained by the production methods that are employed. For instance, on the average only about 50 per cent of the coal that is mined is re-

[23] For a discussion of such subjects, see Ayres and Scarlott, *op. cit.* note 17, c. 10, p. 128; Zimmermann, *op. cit.* note 3, c. 49, p. 799.

covered in a form suitable for marketing. The other 50 per cent is usually left in the mine, partly because the cost of preparing it for market would be greater than its value. The term "waste" should not necessarily apply to that loss.

Although modern practices in oil production are considered to be efficient, a large fraction, averaging at least 30 per cent, of the oil in place is not recovered, and cannot be recovered economically by any known method. The oil-bearing rocks (often called sands) are not commonly found at shallow depths. The producing formations in a great many fields are more than 5,000 feet below the surface. Many are more than 10,000 feet deep. Considerable recovery of the oil left in the rocks could be had if the overburden were removed, say to the average depth of one mile, and the rocks were crushed, heated, and subjected to various processes to extract the oil contained in the pores of the rocks. Obviously, the cost of recovering a barrel of oil by such a method would be an incredibly large figure when compared with the value of the oil obtained. Increased recovery is physically possible but not economically feasible.

Clearly, conservation does not require that the maximum quantity of mineral fuels must be produced or recovered regardless of costs or economic values, or that production should be deferred because it may be possible far in the future to recover a greater portion of the fuel in place. Though private owners of mineral fuels, or at least petroleum, may properly be required by governmental regulation to operate so as to prevent reasonably avoidable loss of the fuel, they should not be expected, much less required, to operate without profit to produce or recover the maximum amount, regardless of expense. As well say that conservation requires that the waters of the Mississippi, instead of being permitted to flow into the Gulf of Mexico, should be transported to irrigate some of the arid or semiarid regions of the country, or should be stored for use in future years, whatever the cost may be when compared with the benefits.

CONSERVATION OF COAL

Conservation in the production of coal has made great progress. The continuous improvement in mechanization and mining technique has not only resulted in better products, but has reduced costs, permitting a higher recovery at a cost commensurate with the economic value of the coal recovered. These benefits have been offset in part by the practice of by-passing areas where the recovery does not justify the use of expensive machines.[24] Of more significance may be a process of production already developed that probably will be employed when economic conditions justify its commercial use. It is called underground gasification of coal, and will permit a recovery or use of more than 50 per cent of the coal employed in the process. There is clearly a trend toward a further decrease in the loss of coal, whether or not the term "waste" may fairly be used to describe the loss.

CONSERVATION OF NATURAL GAS

For many years, great quantities of natural gas were vented or lost, especially gas unavoidably produced with oil, called casing-head gas or oil-well gas to distinguish it from gas from wells producing gas only. "Natural gas" is a term that embraces oil-well gas and also gas from wells that produce no oil.

Part or all of the oil-well gas may be dissolved in the oil in the reservoir. Such gas reduces viscosity so that the oil will move more easily to the producing well. Furthermore, the expansion of gas dissolved in oil, and of any gas associated with oil but not in solution, serves in many fields to move the oil. Frequently, some of it is used as fuel for operations or is sold for local use. It follows that gas unavoidably produced with oil, if not at an excessive ratio, performs a valuable function in the production of oil, and for carrying on operations, though most of the gas is dissipated at the surface. Gas produced in excess of a reasonable ratio does not perform its maximum function in aiding production.

For a long time there was no market or use, or any reasonable prospect of a market or use, for much of the oil-well gas after it had been produced, especially in the Southwest; consequently, operators often faced the choice either (*a*) of producing the oil with the aid of solution and associated gas, though most of the gas produced was lost, or (*b*) of shutting in the oil wells to avoid the loss of the gas that would be produced but could not be used or marketed.[25] It is reasonable to say that in most instances the operators were not acting arbitrarily and imprudently by failing to shut down their oil wells, though most or all of the oil-well gas escaped into the air.

At the present, the loss of gas from gas pools is virtually unknown. While a considerable quantity of oil-well gas is lost, the quantity that could with prudence be saved or used is relatively small. Most of the gas that is now lost has no market value at the well. It would not be saved or utilized even if it were given away to anyone who would take it. The gas may contain large quantities of deleterious substances like hydrogen sulphide, or the quantity may be small, or the cost of transporting it to available market may be prohibitive. Many of the new oil fields are far from gas pipelines or markets, and, until a reasonable amount of development has taken place so that the quantity of gas available can be estimated with fair accuracy, sound plans for constructing pipelines and marketing the gas cannot be made. Moreover, it takes time to obtain materials and construct lines. In the meantime, at least part of the oil-well gas is lost. These are some of the many factors that must be considered in determining whether the loss of oil-well gas may fairly be called a waste of such gas.[26]

Operators and officials of state regulatory agencies are fully cognizant of the evil of wasting natural gas, and its loss has already been reduced to a figure that ten or even five years ago would have been regarded as a fanciful one. More remains to be done, and is being done, but the facts do not warrant the statement that tremendous quantities of natural gas are now being dissipated that could be utilized without imposing an unreasonable burden on the operators—a burden not justified by law.

CONSERVATION OF OIL

The history of the conservation of oil need only be briefly sketched here, for

[24] Ayres and Scarlott, *op. cit.* note 17, p. 60.

[25] Stuart E. Buckley (Ed.), *op. cit.* note 13, p. 32.

[26] *Ibid.*, p. 33; Robert E. Hardwicke, "Texas, 1938–1948," in *Conservation of Oil and Gas, A Legal History—1948* (Chicago, 1948), p. 482. The conservation agency in Texas several years ago ordered that the oil wells in a number of fields be shut down until measures were taken to prevent the loss of gas. The orders were based on the finding that waste was occurring because it was economically feasible to prevent the loss of the gas. Robert E. Hardwicke, "Unitization Statutes: Voluntary Action or Compulsion," 24 *Rocky Mt. L. Rev.* (Boulder, Dec. 1951), p. 39. Orders of the Texas agency made in March 1952 will further reduce the loss of oil-well gas produced in a number of West Texas fields. The agency has announced that it will use all its power to minimize the waste of gas.

it has been told in detail in many books and articles.[27]

Serious attention to waste in the production of oil and gas did not become general until about 1930, when the domestic production of oil, plus imports, brought the stocks in storage of oil and products to an all-time peak, wholly out of line with needs. Tested by our knowledge of today, which should not however be imputed generally to members of the industry in 1930, the production practices then in use caused great waste of oil and gas, aboveground and underground.

The overproduction was largely caused by the nature of petroleum and by the manner in which it was produced under laws applicable to the rights of the landowner, usually called lessor, and the duty of the operator, usually called lessee. Oil and gas in the underground reservoir are under pressure, sometimes very great. When a well is producing, there is a reduction of pressure in the reservoir around the bottom of the well. This creates a pressure differential, causing oil and gas in the reservoir to move toward the bottom of the well, being the point of lower pressure, paying no attention to boundary lines in the migration. Oil and gas are then brought to the surface, either by the pressure available in the reservoir or by energy supplied by artificial means, as by pumps.

Prior to regulation under conservation statutes, the influence of the law of oil and gas on waste and overproduction was far-reaching. Under the typical document or lease executed by the landowner to authorize drilling and producing operations, the lessee was obligated to drill wells and operate them in a manner to produce as much oil as possible from the leased tract, draining oil from neighboring tracts if he could, and protecting against drainage of oil from the leased tract to wells on neighboring tracts. It was inevitable that as a rule each lessee-operator drilled wells as fast as he could, and produced them to capacity. Failure of a lessee to drill and produce wells with reasonable diligence, or to act prudently in preventing reasonably avoidable adverse drainage, made the lessee liable to his lessor for the resulting damages, and in some instances caused a termination of the lessee's rights. Such a situation necessarily resulted in a maximum rate of production from all wells, with no regard for dissipation of gas, the pulling in of water, or the needs of the market. Indeed, until the early 1930's, most oilmen thought that they were conducting operations in accordance with sound engineering principles. We now know that this was not true.

The situation became so serious in the late 1920's that state and federal officials, as well as members of the petroleum industry, sought adequate remedies. For various reasons not necessary to relate, agreements among operators offered no solution; and governmental regulation therefore appeared to be necessary. Lawyers expressed

[27] These books contain much information, and nearly all of them are replete with citations and references to other material: *Legal History of Conservation of Oil and Gas, A Symposium* (Chicago, 1939); Blakely M. Murphy (Ed.), *Conservation of Oil and Gas, A Legal History—1948* (Chicago, 1948); Robert E. Hardwicke, *Antitrust Laws, et al. v. Unit Operation of Oil or Gas Pools* (New York, 1948); Engineering Committee of Interstate Oil Compact Commission, *Oil and Gas Production* (Oklahoma City, 1951); Stuart E. Buckley (Ed.), *Petroleum Conservation* (Dallas, 1951). The Compact Commission book is "an introductory guide to production techniques and conservation methods." *Petroleum Conservation* is a definitive exposition of the science of conservation of petroleum. Each is a valuable contribution to the literature of petroleum production and conservation.

doubt as to the legality of federal regulation, but generally agreed that state statutes providing for prevention of waste would be upheld; consequently, the oilmen who talked about great waste being caused by unrestrained production were listened to more attentively. Leaders of the industry turned to the states for help in 1930, encouraging the enforcement of conservation statutes already in the books in several states, and recommending the passage and enforcement of statutes in other states.

Intensive study of the behavior of reservoir fluids was stimulated, and in many forums the subject of waste prevention in oil production was discussed. It soon appeared that sound engineering principles required practices quite different from those prevailing (drill and produce as you please).

State regulation

Regulation that began on a state-wide scale in several states in 1930 was necessarily comprehensive, for the practices of one operator affected another, and when self-help was denied as a method of protecting property rights, law imposed on the regulatory agency an obligation to protect those rights, subject to the reasonable necessities of waste prevention. The oilman was regulated as to the number of wells that he might drill on his property and where they might be located, as to the kind of pipe to use in the well and where he might place it, and as to the amount of oil that he might produce each day and how it should be produced to avoid waste. In many other ways his activities were directed and controlled to prevent waste. Almost never was a well permitted to flow to capacity, and rarely even to pump continuously to capacity unless capacity was very small.

By 1935 a comprehensive program of regulation was reasonably well established, and was generally accepted as being a necessary restriction on the use of private property; but it must not be supposed that in the period 1930–35 vigorous debates and bitter contests as to the legality and necessity of the program did not take place in legislative halls, in the court houses, in the hearing rooms of administrative agencies, and in other forums. It is submitted that no other owners of private property, except perhaps some public carriers, have been subjected to such far-reaching restrictions and control on the use of their property.

It was, of course, inevitable that mistakes were made, especially in the first few years of regulation, but in retrospect it is almost unbelievable that so much progress in waste prevention and in technology of production was accomplished in so short a time. It is also almost incredible that oilmen, long accustomed to drill and produce as they pleased, and to follow practices designed to recover petroleum drained from beneath their neighbors' lands, would seriously urge regulation to prevent waste and to afford each an equal opportunity to produce only the petroleum in his own land or an equal quantity. Even in states where no comprehensive laws have been passed, most of the operators have followed efficient practices that have been developed, but often they were unable to do so because of practices of other operators. Experience has proved that the aid of state regulation is almost always necessary.

It is believed that regulation under state conservation statutes during the last twenty years has resulted in a recovery of perhaps 50 per cent more oil than would have been recovered in the absence of regulation, and has also offered a workable method of protecting property rights. Few realize how neces-

ment at Gorgas, Alabama, under the joint auspices of the United States Bureau of Mines and the Alabama Power Company. By this process, a large part of the coal in place can be gasified, furnishing a gas suitable for power and with an efficiency greater than that obtainable from present mining methods and the use of coal in steam power plants. The gas may also be used to make oil and gasoline. Moreover, deposits heretofore considered to be of little value can be gasified.[29]

A process is also known, called hydrogenation of coal. It was developed some years ago in Germany, but has been greatly improved by American technologists. The process is used to change coal molecules so that a liquid is formed similar to oil. By distillation of the liquid, gasoline of high octane value, as well as other products, can be produced.[30]

This is not all. The Fischer-Tropsch process can be used to convert coal gas to liquid fuels, from which may be made diesel fuel, gasoline, and other products to compete with products from petroleum.[31]

The Standard Oil Company (New Jersey) and the Pittsburgh Consolidation Coal Company have jointly carried on at great cost extensive research with respect to various methods for the conversion of coal to liquid and gaseous fuels.[32] Similar research has been carried on by other members of the coal and petroleum industries, and by the United States Bureau of Mines. The cost of making liquid fuels from coal is still considerably higher than the cost of making similar products from petroleum, but some progress has been made in narrowing the gap.[33]

One more interesting development should be mentioned. Experiments on a coal-burning gas turbine, sponsored by the Locomotive Development Company at Dunkirk, New York, are far advanced, and may result in a power plant for locomotives that will replace diesel engines and other current types of power.[34]

Enough has been said to make clear that raw coal is now offering vigorous competition to other fuels, with technology playing an important part.

Natural gas

The tremendous increase in transportation and marketing facilities for natural gas in the last ten years has made possible the utilization of much natural gas that previously had been vented and was lost, and has made available to consumers in the northern and eastern portions of the country at relatively low prices a clean fuel that is convenient to use. Natural gas, like coal gas, may be converted by the Fischer-Tropsch gas-synthesis process into hydrocarbon liquids from which can be obtained gasoline and other materials similar to those obtained from oil. A group of oil companies recently completed a gas-synthesis plant at Brownsville, Texas, costing about forty million dollars, having an initial daily capacity of about 7,000 barrels of liquid fuels.[35]

Natural gas is a vigorous competitor for the markets where gas can be used, but the cost of converting natural gas into liquid fuel is still too great to compete very well with liquid fuels from oil.

Oil

It may be no easy task for the petroleum industry to maintain adequate reserves of oil in this country so that a supply of liquid fuels from oil will be available at reasonable prices; however, the indications are that the task will be accomplished, and there will be no shortage for many years. Imports, especially of fuel oils to the east coast, may be relied upon to supplement domestic production, as they have done for years, regardless of any actual shortage in domestic capacity to meet the demand. Time after time, the cry of an imminent prospect of exhaustion or serious shortage of our domestic oil reserves has been heard, but always new reserves have been established, and a reasonable level of prices competitive with those of other fuels has been maintained. It is significant that in 1925 the retail price of gasoline, exclusive of tax averaging 2 cents, in fifty representative cities was 20 cents a gallon, which was also the price in 1950, exclusive of state and federal taxes of about 6½ cents.[36] Moreover, a gallon of gasoline today does 50 per cent more work than it did twenty-five years ago, thus in effect decreasing the price and increasing the reserves.

The petroleum industry is now spending more than one hundred million dollars a year on research. Who knows what tomorrow will bring in the science of finding new reserves? Perhaps something more spectacular than the geophysical methods which were developed only a few years ago.

Max Ball has told in a few words what could be stretched into a long story: "The more [oil] we find, the less there is remaining to be found; but the more we find, the more we learn to find more." [37]

In the early days of the petroleum industry, surface indications, such as oil seeps or gas bubbles, influenced the drilling of wells in search for oil. About 1900, the theory was advanced that anticlines or domal-shaped formations were ideal for the accumulation of petroleum. The theory was sound, being proved in many instances, and in a spectacular manner in 1901 when the Lucas Well at Spindletop Hill, near Beaumont, Texas, came in with a roar heard for a mile, gushing great quantities of oil all over the countryside. Spindletop Hill got its name because the area was a low hill in the coastal plane.

We now know that the hill or slight elevation resulted from great forces causing the movement far underground of a large salt mass existing in a plastic form or a fluid. The salt mass exerted terrific pressure, causing fractures in a part of the overlying formation. The salt flowed into one of the larger fractures or weak places, becoming what is known as a salt plug. This plug, like a gigantic bullet, was forced upward

[33] Ayres and Scarlott, *op. cit.* note 17, pp. 104 *et seq.* Eugene Ayres, "Synthetic Liquid Fuels—When and How?" *Petroleum Processing*, Jan. 1952, p. 42, says that to earn even nominal interest on investment, the wholesale price of gasoline would have to be at least 18 cents a gallon; and to attract capital, the price would have to be 44 cents higher. Dr. Ayres does not give similar figures for liquids formed by the Fischer-Tropsch process, but does say that the price of products from oil must go considerably higher before the Fischer-Tropsch process will likely be used. George A. Lamb, of the Pittsburgh Consolidation Coal Company, testified that the cost of gasoline made from coal by the hydrogenation process was only 20 per cent higher than the cost of gasoline made from oil. It is not clear whether such things as fair return on investment, taxes, etc. were taken into account. Hearings June 13, 1950, before the Committee on Interior and Insular Affairs (Senate) pursuant to S. Res. 239, S. J. Res. 157, *et al.*, p. 62. A report of a discussion by Paul R. Schultz of the costs of making liquid fuels from oil and from coal appears in *Petroleum Technology* (Feb. 1952) at p. 17.

sary is the program to adjust and protect property rights.

Percentage depletion

In determining taxable income, the Internal Revenue Code purports to allow reasonable depreciation or depletion in order to avoid taxation of capital values. With respect to petroleum and other minerals, each barrel or other unit that is recovered is in a very real sense a reduction of capital assets or depletion of the corpus of the property. The amount of depletion cannot be measured on the ordinary basis of capital invested in the property, because such measurement would fail to take into account the large sums risked and lost on nonproductive ventures.

In the early income tax laws, Congress provided for depletion to be measured on the basis of the value of a property after discovery of oil. That method involved many difficult fact questions; consequently, in 1926 the Congress met this situation by adopting a simplified method known as percentage depletion. Section 114(b)(3) of the Internal Revenue Code authorizes a depletion allowance for an oil and gas producing property of 27.5 per cent of the gross income, excluding an amount equal to any rents or royalties paid or incurred in respect of the property, but not to exceed 50 per cent of the net income of the taxpayer (computed without allowance for depletion) from the property; however, in no event may the allowance be less than it would be if computed on the cost and unit-of-production basis.

The provision of the Code, passed in 1926, was designed to provide a reasonable method for determining taxable income and to give an opportunity to replace the capital asset in somewhat similar manner as depreciation does with respect to an ordinary capital asset. The need for, and the reasonableness of, these depletion provisions have been the subject of inquiry many times by committees of the Congress. Each time the Congress has concluded that these provisions are proper and should be continued in effect.

If the depletion allowance were reduced materially, the income taxes on the owners of oil properties would be higher, and their net incomes would be lower; funds previously available for replacing production by further exploration, drilling, and secondary recovery operations would be reduced; there would be less incentive to risk capital in the further search for oil; and the result would be smaller supplies at higher prices. In a tight supply situation, there would be pressure on operators and state agencies to permit production at excessive rates that would cause physical waste. Inefficient practices would reduce ultimate recovery, and conditions would grow progressively worse. The situation briefly outlined is further evidence that economic factors, including taxes, have a direct bearing on conservation.

Saving of manpower and materials

Unquestionably, state conservation statutes and regulations not only prevent or minimize waste of oil and gas, but also the waste of manpower and materials.

Prior to extensive regulation under conservation statutes, operators drilled a large number of wells that would now be called unnecessary wells. Close spacing was ordinarily the rule, for competition required each operator to drill many wells in order to get quickly whatever amount could be produced on his land from wells producing to capacity or virtually so. The advent of regulation under conservation statutes brought control of spacing, wider spacing, and allocation of pool allowables. The incentive, as well as the right, to drill wells that were not reasonably needed to drain each tract was taken away or substantially lessened, and this caused a material reduction in the number of wells that were drilled compared with the number that would have been drilled in the absence of regulation. Doubtless the reduction was more than 50 per cent. Now it is common to drill only one well on each ten, twenty, or forty acres (depending on many factors, such as depth of the producing formation, the porosity and permeability of the rock, the thickness of the productive zone, and the energy available), while prior to regulation one well to each acre or five acres was quite usual. With a decrease in the number of unnecessary wells, there was a corresponding reduction in the use of fittings, equipment, connections, and the like. The saving of manpower and materials has been tremendous.

Although great progress has been made in reducing the number of unnecessary wells, there is still room for improvement. Better information as to reservoir conditions and effective drainage areas, revision of conservation acts in several states, and better administration will accelerate the rate of improvement.

EFFECT OF TECHNOLOGY AND COMPETITION AMONG MINERAL FUELS UPON FUTURE SUPPLIES

It should not be assumed that members of the mineral fuel industries are content with the progress made in preventing waste and in furnishing supplies of fuels at reasonable prices, and are willing to let the future take care of itself. Competition is too keen for the enjoyment of complacency.

Coal

The statistics indicate that coal is losing in its competition with other fuels. Various reasons other than normal competition have been suggested, including the following: (1) most coal is sold in the raw; (2) it is transported by rail, and high freight rates make it difficult for coal to compete with fuels transported by cheaper methods; (3) too often a shortage of cars; (4) transportation of raw coal is the least effective method of transporting energy fuels, transportation of oil by tanker being the most efficient and by pipeline the next; (5) in spite of relatively low mine costs, consumer prices are high because of expensive hauls from mine to market and to ultimate consumer; (6) coal is not as clean or convenient to use as other fuels; and (7) labor troubles are frequent, causing uncertainty or shortage of supply at times when serious consequences may follow.[28]

From a competitive standpoint these handicaps are burdensome, but most of them are not insurmountable. A dynamic policy for the coal industry is now under way. It may shortly reverse the trend in the use of coal.

Consumers of fuels are being wooed to the use of coal by attractive advertising on a national scale, stressing the cheapness and stability of price, the enormous reserves available, the safety in storage and use, and the continuous effort of the coal industry to provide a better product at the lowest possible price.

Better mining equipment is being employed by the coal industry to reduce production costs, and continuous improvement in consuming equipment is giving greater efficiency and convenience, and also reducing costs. Gasification of coal underground has been accomplished in a major-scale develop-

[28] Zimmermann, *op. cit.* note 3, pp. 486 and 490, discusses some of the causes of decline in the use of coal. Spot shortages of oil and gas in some areas, and for varying reasons, have also taken place from time to time, so the coal industry is not the only one that can be accused of having spot shortages.

ment at Gorgas, Alabama, under the joint auspices of the United States Bureau of Mines and the Alabama Power Company. By this process, a large part of the coal in place can be gasified, furnishing a gas suitable for power and with an efficiency greater than that obtainable from present mining methods and the use of coal in steam power plants. The gas may also be used to make oil and gasoline. Moreover, deposits heretofore considered to be of little value can be gasified.[29]

A process is also known, called hydrogenation of coal. It was developed some years ago in Germany, but has been greatly improved by American technologists. The process is used to change coal molecules so that a liquid is formed similar to oil. By distillation of the liquid, gasoline of high octane value, as well as other products, can be produced.[30]

This is not all. The Fischer-Tropsch process can be used to convert coal gas to liquid fuels, from which may be made diesel fuel, gasoline, and other products to compete with products from petroleum.[31]

The Standard Oil Company (New Jersey) and the Pittsburgh Consolidation Coal Company have jointly carried on at great cost extensive research with respect to various methods for the conversion of coal to liquid and gaseous fuels.[32] Similar research has been carried on by other members of the coal and petroleum industries, and by the United States Bureau of Mines. The cost of making liquid fuels from coal is still considerably higher than the cost of making similar products from petroleum, but some progress has been made in narrowing the gap.[33]

One more interesting development should be mentioned. Experiments on a coal-burning gas turbine, sponsored by the Locomotive Development Company at Dunkirk, New York, are far advanced, and may result in a power plant for locomotives that will replace diesel engines and other current types of power.[34]

Enough has been said to make clear that raw coal is now offering vigorous competition to other fuels, with technology playing an important part.

Natural gas

The tremendous increase in transportation and marketing facilities for natural gas in the last ten years has made possible the utilization of much natural gas that previously had been vented and was lost, and has made available to consumers in the northern and eastern portions of the country at relatively low prices a clean fuel that is convenient to use. Natural gas, like coal gas, may be converted by the Fischer-Tropsch gas-synthesis process into hydrocarbon liquids from which can be obtained gasoline and other materials similar to those obtained from oil. A group of oil companies recently completed a gas-synthesis plant at Brownsville, Texas, costing about forty million dollars, having an initial daily capacity of about 7,000 barrels of liquid fuels.[35]

Natural gas is a vigorous competitor for the markets where gas can be used, but the cost of converting natural gas into liquid fuel is still too great to compete very well with liquid fuels from oil.

Oil

It may be no easy task for the petroleum industry to maintain adequate reserves of oil in this country so that a supply of liquid fuels from oil will be available at reasonable prices; however, the indications are that the task will be accomplished, and there will be no shortage for many years. Imports, especially of fuel oils to the east coast, may be relied upon to supplement domestic production, as they have done for years, regardless of any actual shortage in domestic capacity to meet the demand. Time after time, the cry of an imminent prospect of exhaustion or serious shortage of our domestic oil reserves has been heard, but always new reserves have been established, and a reasonable level of prices competitive with those of other fuels has been maintained. It is significant that in 1925 the retail price of gasoline, exclusive of tax averaging 2 cents, in fifty representative cities was 20 cents a gallon, which was also the price in 1950, exclusive of state and federal taxes of about 6½ cents.[36] Moreover, a gallon of gasoline today does 50 per cent more work than it did twenty-five years ago, thus in effect decreasing the price and increasing the reserves.

The petroleum industry is now spending more than one hundred million dollars a year on research. Who knows what tomorrow will bring in the science of finding new reserves? Perhaps something more spectacular than the geophysical methods which were developed only a few years ago.

Max Ball has told in a few words what could be stretched into a long story: "The more [oil] we find, the less there is remaining to be found; but the more we find, the more we learn to find more."[37]

In the early days of the petroleum industry, surface indications, such as oil seeps or gas bubbles, influenced the drilling of wells in search for oil. About 1900, the theory was advanced that anticlines or domal-shaped formations were ideal for the accumulation of petroleum. The theory was sound, being proved in many instances, and in a spectacular manner in 1901 when the Lucas Well at Spindletop Hill, near Beaumont, Texas, came in with a roar heard for a mile, gushing great quantities of oil all over the countryside. Spindletop Hill got its name because the area was a low hill in the coastal plane.

We now know that the hill or slight elevation resulted from great forces causing the movement far underground of a large salt mass existing in a plastic form or a fluid. The salt mass exerted terrific pressure, causing fractures in a part of the overlying formation. The salt flowed into one of the larger fractures or weak places, becoming what is known as a salt plug. This plug, like a gigantic bullet, was forced upward

by what might be called hydraulic pressure, moving a considerable distance. This force bent upward formations nearer the surface; and a dome was created, easily recognized in the coastal plane. The search for other salt domes became the aim of the oilman in the Gulf coast, and many fields were found; but before long few visible domes were left to drill, and prophecies were freely made as late as 1920 that no more oil fields would be found in the Gulf coast. These were reasonable prophecies if the dome-shaped formations could not be located without surface indications. The prophets failed to reckon, however, with technology.

The arts of the geologist and the geophysicist make possible the location in the Gulf coast of many domes and other traps or conditions suitable for the accumulation of oil and gas, without the aid of surface indications. The proof is this: 33 billion barrels of oil have been discovered in the Gulf coast since 1920, and, of this amount, geology and geophysics were responsible for about 75 per cent of the discoveries. More than 8 billion barrels have been discovered in the coastal area in the last decade, of which 99.5 per cent is attributable to geology and geophysics.[38]

A show of oil was found in West Texas in 1944 and again in 1947, in a formation that is now commonly called the Spraberry formation, or trend. Several pools were indicated by wells completed in 1949, especially in the Midland area where the sand series had vertical fractures that provided the main drainage channels. However, the likelihood of producing from the low-quality Spraberry formation at a profit was so slight that few were willing to take the risk until the latter part of 1950. A higher price level for oil, relatively wide spacing, faster and cheaper drilling, good reservoir engineering, plus the use of the "hydrafrac" method, were some of the factors that stimulated operations and the hope of profit. Now the Spraberry trend involves some two million acres extending through ten counties, with a proved reserve of one billion or more barrels of oil, and great quantities of gas. The "hydrafrac" method, as improved by one of the oil companies, not only employs "hydraulic" pressure to cause fracturing, to increase the size of old fractures, and to effect communication between fractures, but it also forces into the fractures sand grains, called propping agents, to keep the openings from closing. It is plain that technology was largely responsible for establishing a great reserve of oil and gas.[39]

In recent months, the Richey area in Montana and the Williston Basin in North Dakota, far from any oil fields, have been proved to be productive. Extensive drilling has not yet taken place, so the probable sizes of the reserves have not been indicated; but the prospects must be favorable, for millions of acres are being leased, and an active drilling campaign is under way.

These typical incidents of additions

[38] Carl E. Reistle, Jr., "The Importance of Technology in Oil Production," *Petroleum Engineer*, Drilling and Producing ed., Dec. 1951, p. A-40.

[39] Two companies are now experimenting with unorthodox drilling procedures to increase production. One company, by directional drilling or slanting the hole at a considerable angle, anticipates that a larger number of the vertical fractures will be connected than would be by drilling a vertical hole. Another company drills several short, almost lateral, holes off the main well bore in the pay zone, in order to increase the drainage area by cutting into more fractures. *Oil and Gas Journal*, Feb. 4, 1952, p. 37. A recent newspaper dispatch says that research is now going on at the University of Texas to increase ultimate recovery of oil, especially from depleted pools, by the use of soap or detergents. The results may be gratifying to the company advertising that "Duz does everything."

to reserves illustrate the truth of the statement by Max Ball; they show why there is hesitancy among informed oilmen, even after test wells are drilled, to condemn an area as being nonproductive or to make positive estimates as to potential reserves.

The effect of developments in exploration, drilling, and production technology leading to finding more oil and increasing recovery at lower cost has been told by Carl E. Reistle, Jr. in the interesting paper, "The Importance of Technology in Developing Oil Production." Reistle's sketch of the amazing technological progress warrants the belief that for a long time the domestic reserves of petroleum will be adequate.[40]

Enormous quantities of petroleum oil, conservatively estimated to be from 7 to 10 billion barrels, remain to be produced by secondary recovery methods from depleted and semidepleted pools [41] when it is economically feasible to undertake the operations. The astounding growth in the number of projects and in technology in eight years is evidenced by the two editions of the book, *Secondary Recovery of Oil in the United States*, the first in 1942 (259 pages), the second in 1950 (838 pages).

[40] Reistle, Jr., *op. cit.* note 38. A new record for fast drilling was recently set in Louisiana, when the crew in eight hours drilled 2,575 feet, or one-half mile. Such efficiency of tools and men illustrates the astounding accomplishments of the industry in doing a better job and reducing costs. Research with the aim of developing better methods of finding and producing oil and gas has been continuous for years.

[41] Committee of American Petroleum Institute, *Secondary Recovery of Oil in the United States* (New York, 2d ed., 1950), p. 31, and many papers cited therein; Ayres and Scarlott, *op. cit.* note 17, p. 44. Lt. Gen. Ernest O. Thompson, member of the Railroad Commission of Texas, the agency administering conservation statutes, in an address before the American Petroleum Institute in Nov. 1951, said that the possible recovery might be as high as 75 billion barrels.

Many additional prolific deposits of petroleum are almost certain to be found in the continental shelf, often called tidelands. Already a number of fields have been discovered off the shores of California, Louisiana, and Texas. In spite of wind, wave, and hurricane, wells have been drilled and produced in the Gulf of Mexico some twenty-five miles from land in water nearly fifty feet deep.[42] The ingenuity of the oilman in conducting successful offshore operations at expense that seems to be justified approaches the incredible. It is certain that further drilling in the offshore areas will result in finding new pools.

This is what the United States Geological Survey said in 1951 about the ability of the industry to maintain adequate petroleum reserves:

> No precise statement as to the amount of potential reserves of oil and gas in the United States can yet be made. If the future can be judged by the past, oil and gas will be found in sufficient quantities for many years to come. In the United States adequate production has been a direct function of economic incentive. Until the unpredictable date at which that incentive fails to provide the needed supplies, there will be no convincing evidence that we have reached the limits of our ability to expand the potential ultimately recoverable reserves of petroleum.[43]

Leaders in the petroleum industry agree with that statement; [44] however, they have no intention whatever of being un-

[42] Robert E. Hardwicke, "The Tidelands and Oil," *Atlantic Monthly*, June 1949, p. 21; "Offshore Drilling Symposium," *Oil and Gas Journal*, Feb. 23, 1950, pp. 135–54.

[43] *Fuel Reserves of the United States*, p. 35.

[44] Repeated statements of such import appear in Hearings on S. Res. 239 (1951), in the Proceedings of the 28th and 31st Annual Meetings of the American Petroleum Institute, and elsewhere. Especially interesting is *Petroleum Productive Capacity*, *op. cit.* note 5. It is a valuable contribution to the literature of petroleum.

prepared if a shortage of petroleum is indicated. They observe that the essential business of the industry is that of supplying liquid and gaseous fuels to the public, and the industry will turn to an alternate source of raw materials, if that be necessary to stay in business.[45] To a great extent, the time and direction of the shift will be controlled by economic factors. The raw material may be coal or natural gas, but more likely it will first be oil shale.

Oil shale and bitumens

The known supply of oil shale in the United States is enormous. Especially large and rich deposits exist in Colorado, Utah, and Wyoming. Oil shale contains solid organic matter, part of which can be converted by distillation into oil and combustible gas. Conservative estimates place the recoverable oil content at 500 billion barrels from known deposits. The problem has been to make the recovery economically feasible. The United States Bureau of Mines and units in the petroleum industry, separately and co-operatively, have for a number of years carried on research and operated pilot plants in an effort to obtain oil, gas, and products from oil shale that could be marketed in competition with petroleum and its products. A large-scale operation is now being conducted near Rifle, Colorado, with considerable improvement in the efficiency of operations. The indications are that in time oil from shale will enter into the vigorous competitive contest now going on among mineral fuels.[46]

[45] Hearings on S. Res. 239 (1951), pp. 96–99. Even if liquid and gaseous fuels are made synthetically, the petroleum industry can use much of its present facilities and organization.

[46] *Fuel Reserves of the United States,* pp. 35–38; *Basic Data,* pp. 169–71; Hearings on S. Res. 239 (1951), pp. 96–99; Clyde Berg, "Oil Shale as a Fuel Reserve," *Petroleum Engineer,* Drilling and Producing ed., Jan. 1952, p. A-37.

Many factors will bear upon the time when and the extent to which oil shale will supply liquid and gaseous fuels.

Scattered throughout the United States are bituminous rocks and asphaltic deposits from which liquid fuel may be obtained, though at much higher cost than from petroleum. A recovery of more than a billion barrels of oil is esimated as being possible from known deposits in Utah, Texas, and California.[47]

IMPORTANCE OF TECHNOLOGY AND FREEDOM OF INITIATIVE

Whatever may be the facts with respect to reserves in the United States of raw materials suitable for mineral fuels, there are physical limits imposed by nature. The total numbers of tons of coal and barrels of oil in place are fixed, but the total numbers of available tons and barrels can be greatly increased, being stretched or multiplied by factors that virtually have no limits, such as technology and freedom of initiative.

Substantially the same idea was expressed by the United States Geological Survey in concluding its statement as to the fuel resources in the United States as follows:

> Only in appraisal of the basic geologic data and in the conception and application of new modes of discovery thinking and new techniques of discovery does the geologist have a large share of responsibility. For the fuels as for many other minerals, the other technologic and economic factors have at least an equally significant part in determining our Nation's future ability to supply itself and its citizens with the heat, light, and power requirements needful for our defense and continued progress to higher levels of civilization.[48]

[47] *Fuel Reserves of the United States,* p. 38.

[48] *Fuel Reserves of the United States,* p. 40. To the same effect, J. Frederic Dewhurst (Ed.), *op. cit.* note 7, p. 577.

Our energy-resource industries have performed near miracles under a social and political system that encouraged individual initiative and competition, subject to state conservation laws and to antitrust and similar laws. The wording of S. Res. 239 (81st Cong., 1950) may carry the implication that a new system or national policy should be adopted. Surely the need to discard the existing system or policy for a new one has not been proved. During the hearings held in March 1951, pursuant to the Senate Resolution, members of the competitive energy-resource industries who participated in the discussions expressed satisfaction with the existing system, and they opposed any change that contemplated comprehensive federal regulation, or even payment of subsidies, or allocation of markets for fuels, or control of end use, as a means of assisting any fuel in competing with other fuels.

In the round-table discussion reported in *Basic Elements of a Free, Dynamic Society,* Dr. Frank Tannenbaum, professor of Latin American history at Columbia University, and Peter F. Drucker, author and consultant on management organization, went further. They even opposed pretentious planning by government. Dr. Tannenbaum said:

> Now, second, the things that have happened in America unexpectedly, unplanned, have happened, I think, partly because we don't make great plans. We make little plans. We make no plans at all. That is, we are inclined to cross the bridge when we get to it. We don't attempt to harness the future. And I should be very sorry to see any such attempt projected.[49]

Mr. Drucker put it this way:

> My second point is, we made very clear that we are not a planned society. . . . Planning presupposes infallibility, and we don't believe in that. Yet we certainly do not want to create the impression that what has happened in the United States "just happened." Somebody made it happen. We are all agreed that what has happened came about because of the existence of conflict—because we accepted conflict and tried to utilize it, to turn it to account rather than to suppress it into the harmony of the graveyard, which is the social scientist's paradise, called "adjustment."[50]

[49] *Basic Elements of a Free, Dynamic Society, op. cit.* note 9, p. 18.

No one participating in the round-table discussion disagreed with the ideas expressed in the quotations.

Competition, individual initiative, technology, and ingenuity may be compressed into the words "man's resourcefulness." If a national policy for the mineral fuels and hydroelectric power, or for all energy resources, does not exist and must be made, and be in the interest of the whole people rather than the interest of any fuel, then the following quotation contains observations that should control:

> Our greatest resource is man's resourcefulness, encouraged by appropriate incentives and expressed in the progressive march of technology. It is the fundamental resource, and it is unmeasurable for the future. We only know that it can be encouraged or discouraged. Competition and freedom of individual initiative, together with rewards that are comparable with the risks assumed, are the driving forces behind such technological progress. Subsidies of one form or another, efforts to direct the use of particular forms of energy into specified channels, and other such devices have always had disappointing results in the long run. If used in the future, they will again fan the hot dry winds of discouragement to aggressive and competitive progress.
>
> Technology has grown and flourished in comparatively free and unencumbered climates. *Any discouragement of the progress of technology, the real resource for the*

[50] *Ibid.,* pp. 73–74.

future, might make a forecast of future availability prove to be more accurate, but this surely is a poor substitute for the abundance of all energy resources which the national interest requires. Artificial interference with the normal development of the energy resources of the future could only assure the realization of the lower limits of availabilities that are predictable on the basis of known technology.

In the free society, man will never be short of the energy he needs, for he will never be short of ingenuity.[51]

Indeed, we already have a national policy that conforms to the recommendations inherent in the language just quoted. That policy has been extraordinarily successful. To make any material change, for example by introducing federal control, certainly appears unwarranted under present conditions, and federal control might even be disastrous.

[51] The quotation is from an unpublished draft of a report of a subcommittee of the National Petroleum Council. An elaboration of the viewpoint appears in the report, *Petroleum Productive Capacity, op. cit.* note 5.

He has specialized in the law of oil and gas, has served as chairman of the Section of Mineral Law of the American Bar Association and the similar section of the State Bar of Texas, and was associate and chief counsel of the Petroleum Administration for War during World War II. He is author of Petroleum and Natural Gas Bibliography (1937) and Antitrust Laws, et al. v. Unit Operation of Oil or Gas Pools (1948), and of many articles on the law of oil and gas and on conservation published in legal periodicals or as chapters in books.

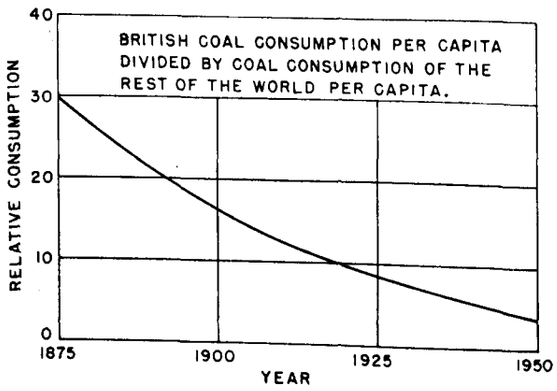
International Fuel Economy

By EUGENE AYRES

TODAY the majority of the earth's population is living in much the same fashion as our primitive ancestors, while the way of life of a minority is beyond comparison. This is not a historical innovation; it has always been so. Each superior people has been justly proud. Each has thrived only a little while. Islands of culture have been submerged by tidal waves of more primitive humanity. But each superior people has made some lasting contribution to progress of mankind, and as the centuries have rolled by, the ratio of highly privileged to underprivileged may have become larger.

The highly privileged are still a minority. Sixty per cent of the earth's population is underfed, and this unhappy majority has a common vital goal in demand for bread. The 40 per cent, of which the United States is a part, is divided by competition for cake.

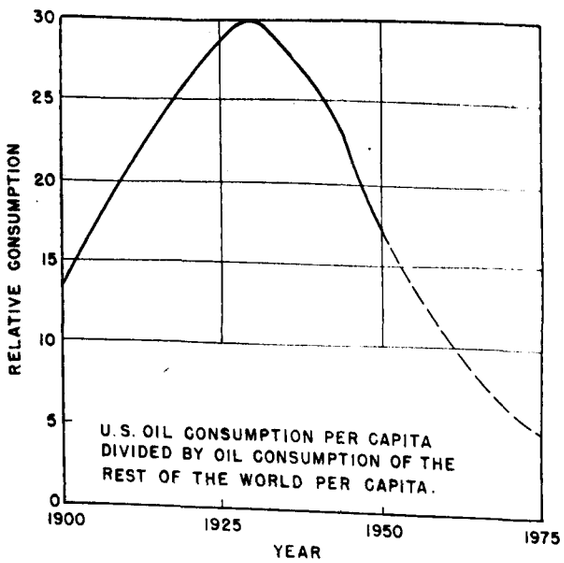
An important focus of competition today is liquid fuel. We are inclined to boast about our prodigious use of petroleum, but statistics on world versus United States consumption have a familiar ring. They remind us of the seventeenth century when England conceived of "bringing coals to Newcastle" as a description of ultimate futility. Today, as coal is indeed being brought to Newcastle in ever increasing quantities from the shores of America, it is timely to appraise our own circumstances in the light of British economic history. Let us take a brief look at some of the factors of analogy and distinction.



A PATTERN OF ECONOMIC CHANGE

Among the many useful indexes of economic health, one is generally overlooked. This is the trend with time of the ratio of per capita consumption of one country to per capita consumption of the rest of the world. This trend is remarkable because it is almost insensitive to wars, social legislation, business levels, and monetary policies.

In 1875 Britain consumed 30 times as much coal per capita as the rest of the world. The factor has declined smoothly and steadily from that date. In 1900 it was 16; in 1925 it was 8; now it is 4. Most of Britain's production has been for home consumption and for export for use in British ships. Maximum British use in comparison with the rest of the world was probably not much earlier than 1875. This is when British ships were renowned the world over, and Queen Victoria was proclaimed Empress of India; when interest rates were abnormally low, and ratio of exports to imports had begun to fall.



The situation for the United States with regard to oil is similar. In 1910 we consumed 21 times as much oil per capita as the rest of the world. The factor rose until the maximum distortion was reached in 1930 when we consumed 30 times as much as the rest of the world. Since 1930 the factor has become smaller each year. In 1940 it was 26; in 1945 it was 22; now it is 17. No physical or economic factors appear to exist to halt the downward sweep. A good guess for 1975 is that we shall then be consuming per capita about 5 times as much as the rest of the world. It is too early to know whether our peak of relative consumption has been coincident with any other economic trend.

It is obvious that downward trends for Britain and for the United States

mean an upward sweep somewhere else in the world. A trend toward equalization of consumption might represent a trend toward economic world stability. Such a trend would be good for the world and consequently good for the United States—provided we could contrive to make the transition more gracefully than Britain. But it happens that while the most highly industrialized countries are now showing a downward trend, the same-thing is also true of areas having the *least* consumption (Middle East, India, Pakistan, and China).

Curves of relative per capita consumption are not concerned with capacity to produce, with absolute per capita consumption, with needs for energy, or with extravagance in use. They are concerned only with relative *capacity for use*. That is why they are so smooth and why they have such fundamental significance. Capacity for use is determined by degree of industrialization, national income, and distribution

of purchasing power; but the trend with time of relative capacity for use is determined by such intangibles as virility, optimism, ingenuity, confidence, and imagination—qualities that are not exclusive to any people, and qualities that are likely to change in degree with the march of time.

NATURE OF RESERVES

The present difficulty with British economy was predicted in 1865 by Stanley Jevons; but no one in Britain then paid much attention to Jevons' warning, for it was clouded by a popular misconception of the nature of reserves —a misconception that is common in the United States today. The most important factor is not the *size* of a reserve but rather the *rate* at which it may be procured. Jevons' idea of the probable optimum rate of procurement seemed unrealistic in the light of the great amounts of minable coal that were presumed to exist under British soil. Today it is believed that during the next century Britain will be able to produce not more than 25 billion tons, and will need twice this amount. Another 25 billion tons may be gradually produced in later centuries. Regardless of technical, social, political, or fiscal events, Britain is confronted with a permanent and growing shortage of domestic energy. For she has almost no petroleum or gas.

Estimates of petroleum reserves in the United States are more realistic. We are producing around two billion barrels a year, and we are virtually sure that 30 billion barrels more are producible. Plausible geologic estimates of 110 billion barrels have been made. But it has been shown that even a reserve of this magnitude does not mean that our domestic production can keep pace with domestic demand. We are already importing substantial amounts, and after 1970 we shall probably have to step up our imports drastically. We are confronted with a permanent and growing shortage of domestic petroleum, but not of energy; for our coal reserves are very large.

Britain's economy has been somewhat dependent upon exports of coal. Our economy is not at all dependent upon exports of petroleum. Britain's coal consumption is still well above world coal consumption—even a little above that of the United States, because so much of our energy comes from oil and gas. But the world is catching up. The economic consequences to Britain are painful because of two independent factors: (1) shrinking relative capacity for use of coal, and (2) insufficiency of production to meet her needs. Of the two, the former has been by far the more important. The second is a recent malady that will soon accentuate her difficulties, because her economy has been inflexibly geared to domestic coal. She has not yet found an economically suitable way of making up thermal deficiencies with imported coal or by substitution of oil from British-owned concessions abroad. One is tempted to believe that national revenues should come from anything other than imports of fuel.

Our economy is tightly geared, in part, to liquid fuel but not to domestic petroleum. We have the fortunate alternatives of importation of petroleum as long as this is possible, and conversion of our abundant coal when imports become inadequate or undependable.

Existence of such alternatives should not make us complacent. Imports of petroleum will be impeded more and more by international competition. For as the world tends to catch up with us in consumption, the rate of world production will begin eventually to decline. We shall then be compelled to use rela-

tively expensive liquid fuel from coal (and oil shale) while some other nations are still using relatively cheap petroleum. It is of the utmost importance to us (1) to import as abundantly as we can while it is still possible, and (2) to avoid unnecessary waste of petroleum. Only thus can we postpone the time when we shall be at a fundamental competitive disadvantage.

MIDDLE EAST

The long-term disadvantage to the United States of incidents like the cessation of Iranian production is not that we must export to make up world deficiency, but rather that we can import less than we need. The fabulous Middle East, of which Iran is a part, has an area nearly as large as the United States and with about one-third our population. Climatic variations are similar to those in the United States, although more of the Middle East is desert, and portions of the country are normally colder. Portions are extremely fertile, but much is arid. The Middle East is believed to be the birthplace of civilization, and has suffered the senseless ravages of civilization for a longer time than any other part of the earth. For example, deforestation has been almost complete, and erosion is widespread. The consumption of wood per capita in Iran is now little more than one-thousandth that in Finland (the most prolific wood user). But the petroleum reserves of the Middle East are believed to be larger than those in the United States—larger, in fact, than in any other known area of the earth. For its petroleum, the world is destined to be dependent upon the Middle East for several decades to come.

Iran is only one of the countries that make up the Middle East. Iran looks unimpressive on a map of Asia, but it is as large as the sum of Texas, Oklahoma, Kansas, Nebraska, South Dakota, and North Dakota—a neat slice out of the center of the United States. The population of Iran is 30 per cent larger than the sum of the population of the above states. Iran has been blessed with petroleum production since 1913, and while most of this production has been for export, Iran has had the opportunity to retain up to her capacity for use. Early statistics are inadequate to determine just when her relative per capita consumption reached its peak, but since 1938 it has been on the way down. In 1938 Iran used (per capita) only about as much petroleum as the rest of the world. In 1947 (before the termination of production) the proportion was about seven-tenths. This makes a curious parallel between Iranian and United States economy. While one is a little below world consumption and the other well above, both are on the way down in a relative sense. This is all the more remarkable in that the *production* of Iran in 1947 was 2.5 times the production in 1938, and royalties to the Iranian government have been proportionate.

Iran cannot be regarded as altogether typical of Middle East countries. Iraq, Saudi Arabia, and Kuwait are all different in various respects. Much favorable comment has been made regarding the special wisdom with which Saudi Arabia has been investing its oil revenues. Kuwait is remarkable because, while it is only about as large as Rhode Island, its oil reserves probably exceed those of Iran. But in spite of differences between component parts, the Middle East as a whole has not yet developed to the point of even average per capita consumption of oil. There may not be time enough. The peak of Middle East production is likely to come only about twenty-five years after the peak of production in the United States. The Middle East countries will continue to export oil until they have no more to export, and the vast royalties they will receive may not be invested in sufficiently productive enterprises to provide adequate future income. Let us hope that the governments and peoples of these countries will be able to take advantage of their significant opportunities.

DISTRIBUTION OF OIL

The Middle East and Russia are believed to divide about equally one-half of the petroleum yet to be produced in the world. Forty per cent is divided about equally between the United States and the rest of the Western Hemisphere. The other 10 per cent is widely scattered. This distribution is based upon somewhat academic estimates of ultimate production—estimates that are related in no way to "proved reserves." They are related even less to production; for about 63 per cent of the world's total oil production so far has come from the United States. Fifteen per cent has come from the rest of the Western Hemisphere. This leaves only 22 per cent for the rest of the world, and only a quarter of this has been produced by the Middle East.

From these figures it is apparent that the Middle East still has a long way to go. Russia has "proved" less than 4 per cent of her presumed ultimate reserves. For this reason, Russian production is likely to come late upon the world stage. Because of vigorous exploration by western nations, the Middle East has about the same proportion of "proved reserves" as the United States (about a fifth of presumed ultimate reserves). The Middle East, therefore, is in a position to contribute promptly to world demands.

Figures of interest are obtained by expressing cumulative production as a percentage of the sum of cumulative production and proved reserves. Such "relative depletion" is 61 per cent for the United States and only 8 per cent for the Middle East. If relative depletion is based on estimated ultimate production instead of proved reserves, it appears that we have produced about a quarter of the oil originally present under United States soil, while the Middle East has produced only 2.5 per cent of its original reserve.

SOME OTHER COUNTRIES

India and Pakistan are examples of countries with substantially no petroleum and very low per capita energy consumption. In 1938 they used 0.05 as much oil as the rest of the world. By 1947 this had fallen to 0.036.

China has always been low in per capita use of fuel, and because of continuous internal strife, her relative coal consumption today is only about a quarter of what it was ten years ago.

Russia is on the way up. She has not yet reached the peak of relative consumption of total energy (coal plus gas plus oil). The curve is still rising rapidly—about 25 per cent per decade—but her relative per capita consumption is not yet above 10 per cent of that of the United States. The United States reached a peak of relative per capita consumption of total energy about 1910, since when we have been slowly receding. We now use (per capita) about 17 times as much coal, oil, and gas as the rest of the world. If present trends continue, Russia's per capita consumption of coal may equal ours in 1960, but she will not then equal us in *total* fuel use.

Canadian consumption of oil (production plus net imports) shows a rising curve. She now uses four times as much per capita as the rest of the world. This is interesting in view of Canada's excellent fiscal position. Yugoslavia is another country on the way up. In 1942 she used per capita only a tenth as much coal as the rest of the world.

Today she is a little above par. Her curve shows a more sensational recent rise than any other.

THE FUTURE

If Middle East oil should not be freely available to us after the peak of oil production has been passed in the United States, we may be at a temporary disadvantage in energy costs; but eventually we shall be in a very fortunate position, for it seems that we have more than half the world's oil shale and about half the coal. The latter is of special importance because energy from oil shale is likely to be only about 3 per cent of energy from coal. We passed one peak of relative coal consumption before 1920. The factor has been going down since then because of our abundant use of oil and gas, but it will rise again to a new peak by the end of this century because of our prospective use of coal not only for liquid fuel but also for the generation of electric power. Our economy is geared even more tightly to electric power than to liquid fuel.

There is every reason to expect our second (and last) peak to be higher than the first. For some decades we shall have an enviable *opportunity* in the possession of ample competitive energy reserves. This does not mean, of course, that we shall take proper advantage of this opportunity. Britain's economy subsided from 1875 in spite of ample energy reserves. The economy of the Middle East is not in a position to take advantage of her present unexampled opportunity in oil reserves. Whether we prosper depends upon the economic ingenuity with which we may compensate for the subsidence of our relative capacity for use.

Back in 1768, Horace Walpole (who made many whimsical mistakes) was strangely impelled to exclaim—"The best sun we have is made of Newcastle coal, and I am determined never to reckon upon any other." Unknowingly, this statement was a counsel of despair; for the Newcastle "sun" is fading, and England has less natural sunlight than most geographical areas. The wealth of the more distant future—beginning, perhaps, a little more than a century hence —will be derived from the sun. When that time comes, the Middle East, which is generously drenched with sunlight, may again become the fountainhead of civilization.

CONCLUSION

The pattern of economic change discussed in this brief article is not easy to interpret. Statistics on world consumption of fuels are spotty and sometimes unreliable. But it is clear that a falling trend of relative per capita consumption in highly industrialized countries cannot be dismissed as a natural consequence of development of "backward" peoples. Unfortunately, peoples who are lowest in use of energy are moving still lower (in a relative sense). In general, improvement is shown in nations that have been partially industrialized and that have rapidly developing capacity for use. The trends will bear watching in the future.

Eugene Ayres, Pittsburgh, Pennsylvania, is technical assistant to the executive vice president of the Gulf Research & Development Company. During the past twenty-five years he has been engaged in the organization and management of petroleum research. He is a member of many petroleum committees, has taken out more than fifty patents, and has written many technical articles. He is co-author of Energy Sources—The Wealth of the World (1952) and has contributed chapters in other books.

Conservation of Hydroelectric Power

By PAUL J. RAVER

THE development, use, and conservation of energy resources are indispensable to the physical progress of mankind. The high degree of correlation between the per capita use of energy and per capita production of the nations of the world is ample proof of this statement. No country, state, or region in the world today can prosper unless it assures itself of an energy supply which is adequate for current uses, can be expanded for future needs, and is low in cost and will continue to be low in cost in future years.

If men continue to increase their physical standards of living, they must increase their consumption of energy. They require energy for the transportation of people and things, for the modification of the temperatures of their dwellings and other buildings, and to change the form of materials so as to make them more useful. Continued progress in the satisfaction of physical wants means continually greater drafts on the energy sources of the world.

ENERGY SOURCES

Eugene Ayres has divided the energy sources of the world into two major categories which he calls "continuous" and "unrenewable."[1] He includes in his "continuous" sources vegetation, solar heat, water power, wind power, tropical waters, earth heat, tides, and atmospheric electricity. In the "unrenewable" sources of energy he includes the fossil and atomic fuels. Most of our energy sources can be traced to the heat and light given off by the sun at present and in past years.

There is in view today for the United States an adequate supply of energy to meet our foreseeable requirements for many generations. We have learned not only how to recover the energy from our coal and oils, but also how to convert solid into liquid fuels, and how to convert all fuels except atomic energy into electricity. And electric generators powered by atomic energy may be operating soon.

Our principal energy problem for the next few decades will be to keep the cost of energy low enough so that increasing demands will not be frustrated by increases in cost. The easily accessible supplies of energy are the first exploited, and hence the first exhausted. As less accessible supplies are tapped, the cost per unit tends to rise. Offsetting this trend to higher costs have been the continuing improvements in technology. Scientific and mechanical developments have kept the costs of coal, natural gas, petroleum, and electricity relatively low in spite of deeper mines, deeper wells, and more remote hydroelectric sites.

Conservation of hydroelectric power of the United States means the development of all feasible water power sites for maximum power and energy production. Such development should, of course, be consistent with other uses of our resources. The opposite of conservation in this respect is failure to develop and use our water power resources, or development of only part of the potential of our power sites.

The flow of water in our streams is constantly being renewed by the processes of evaporation and condensation

[1] Eugene Ayres, "Major Sources of Energy," a paper presented before the 28th Annual Meeting of the American Petroleum Institute, Chicago, November 9, 1948.

and the phenomena of snow and rain. The power of the falling water in our streams is thus considered to be "continuous." If it is not used for power generation, however, it is wasted beyond recovery. Like time, it flows on forever; but once the flow has passed, it is lost forever.

COMPARATIVE DEVELOPMENT OF WATER POWER

Although water power was the preferred source of industrial energy when manufacturing began in the United States, it has lagged far behind. Out of 432 billion kilowatt-hours generated in 1951 by industrial and utility plants, only 102 billion were generated by water power. Of the 330 billion kw.-hrs. generated by thermal plants, steam turbines produced all but about 7 billion, which were produced by internal combustion engines, mostly diesel engines.

If all of the undeveloped hydroelectric sites in the United States had been developed and in use, total generation by water power alone could have exceeded the total 1951 electric output in the United States. In terms of capacity, about 18 per cent of the total United States water power potential had been developed by January 1, 1952. It is estimated that this capacity was capable of producing approximately 20 per cent of the total United States hydroelectric energy potential.

By January 1, 1952 there were under construction or authorized for construction projects with a potential capacity of 18 million kilowatts capable of producing 85 billion kw.-hrs. in an average water year. Of this, 7.7 million kw. were located in the Pacific Northwest, where projects with a potential capacity of 34 million kw. still awaited development in 1950.

For a variety of reasons, it will not be possible to develop *all* of America's water power potential in the foreseeable future. Cost of construction and land at some sites will be too expensive for the power output to compete with other methods of generating electricity. Development of other sites is likely to be prevented by pressure groups, representing vested interests such as railroads, fisheries, privately owned utilities, national park enthusiasts, miners, port commissions, and landowners. Some potential water power sites may never be developed because of these factors.

On the other hand, if the people of the United States were convinced of the importance of conserving our water power, the development of 65 to 75 per cent of our total water power resources could be completed in the *next* twenty-five to fifty years.

ADVANTAGES OF PUBLIC DEVELOPMENT

If America's hydroelectric resources are to be conserved by developing her river basins, the government will have to assume the major responsibility. By and large, the feasible single-purpose hydroelectric sites, suitable for development by private investors, have already been pre-empted and developed. By 1930, privately owned electric utilities had installed about 8 million kilowatts of hydroelectric capacity. By 1950 this had increased only to 9 million kw., and in 1951 only 140,000 kw. was added. Private investment in hydroelectric sites is currently increasing because of the ability of private companies to obtain rapid amortization under the defense laws, which in effect have reduced the investment required for hydroelectric development; but even with this advantage, the number of feasible single-purpose sites is too limited to sustain a permanently higher level of private investment.

Public development of river basins for all their values, including—in addition to power—flood control, irrigation, soil conservation, navigation, recreation, maintenance of fish and wildlife, pollution abatement, and municipal and industrial water supply, makes possible the proration of the cost of facilities common to power and other functions, thus reducing the cost to be borne by power.

On the other hand, by paying its share of the cost of such joint facilities, hydroelectric power may bring down the cost of navigation or irrigation or any other river function, and thus make it possible for the public to enjoy the benefits of such developments. These are public functions, and can be achieved only by public development of river basins on a comprehensive basis.

The key to these aspects of water conservation is the storage reservoir which holds back floodwaters for release during periods of low river flows for the generation of power, the irrigation of land, the maintenance of adequate river depths for navigation, the abatement of pollution, the restoration of oxygen to the streams to permit fish to live, and the provision of municipal and industrial water supplies. But such reservoirs will seldom be constructed unless hydroelectric power shares the cost.

Public development of hydroelectric sites is more feasible also because of the lower interest rates enjoyed by public agencies, and because public agencies can finance entirely with borrowed money and do not have to induce investors to put equity money into their ventures. These factors are extremely important when considering the feasibility of hydroelectric sites, since a preponderance of the cost of hydroelectric power relates directly to investment.

The sooner we develop our hydroelectric sites, the lower the cost of such development is likely to be. Most river basin plans include storage reservoirs to hold back flood waters for later release. Such reservoirs are feasible, however, only if land is relatively cheap and unimproved. The settlement of reservoir sites with communities or towns or cities may make the cost prohibitive.

SAVING OF FUELS AND RELATED FACTORS

If the United States in 1951 could have generated all its electric power supply from its hydroelectric resources, it would have saved more than 120 million tons of coal, 65 million barrels of liquid fuels, and 800 billion cubic feet of natural and by-product gas consumed last year in thermal electric generating plants. On the other hand, if none of its water power had been in operation in 1951, it would have required the burning of 50 million tons of coal *or* 1,400 billion cubic feet of gas, *or* 230 million barrels of residual fuel oil to replace the electric energy generated in our hydroelectric plants.

This considerable saving of fossil fuels which cannot be renewed is, of course, accompanied by important savings in transportation of fuels by railroads, pipelines, tankers, and barges. Also, manpower for mining coal, drilling oil and gas wells, and operating railroads and pipelines will probably be more expensive in future years. Production of hydroelectric power requires none of this labor, once the plant is built.

SAVING OF ORES

When power is low in cost, it can be used to smelt and refine the important metals contained in low-grade or complex mineral ores. It so happens that while nonelectric processes may be preferred, or are at least acceptable, for high-grade ores, in many cases only electric processes can be used for the lower-grade minerals.

For example, the taconite ores of the Mesabi Range in Minnesota will require 75 kw.-hrs per ton for magnetic separation in order to upgrade the ores prior to their shipment to steel mills. This compares with only 2 to 3 kw.-hrs. to prepare high-grade ores for shipment. The only commercially feasible nickel operation in the United States will use electric furnaces to recover approximately 60 pounds of nickel per ton of ore. The greatest bulk of the western phosphate deposits is low-grade rock. Only the high-grade rock, 30 per cent or more P_2O_5 content, can be used for the production of triple superphosphate fertilizer by the wet or sulphuric acid process. Electric furnaces can smelt lower-grade rock with a P_2O_5 content as low as 25 per cent. By using higher grades of rock to mix with rock of less than 25 per cent P_2O_5 content, the total tonnage of usable rock can be greatly increased. All these are examples of the use of electric energy to develop and conserve our supplies of materials. By making feasible or economical the recovery of metals and chemicals from low-grade sources, electric energy performs an important conservation function.

CO-ORDINATION OF PLANTS

Conservation of hydroelectric power, we noted, means not only the development of our water power sites but also the development of the full potential of each site. Actually, it means also development of an entire river system to maximize the energy production of all sites on the system by co-ordinated and integrated planning and operation.

A good example is the integrated operation of Hungry Horse Dam, now under construction by the Bureau of Reclamation on the south fork of the Flathead River in Montana, with downstream plants in Canada and the United States. Co-ordination of operation in this case means storing water for four months each year for release during the eight months when flows of other streams are at a minimum. Hungry Horse and downstream power plants will produce 402,000 kw. more prime power by this method of operation than if Hungry Horse Dam were to be operated on an isolated basis and its storage were to be released uniformly throughout the year. An almost identical type of operation will produce 1,124,000 kilowatts of prime power at Hells Canyon Dam and downstream plants, in comparison with only 532,000 kw. if Hells Canyon Dam and power plant were operated on an isolated basis.[2]

Such co-ordination of operation of plants is possible only if high-capacity transmission systems interconnect the plants on a river system so that large blocks of power can be shifted from plants with surplus power production during parts of the year to areas which would otherwise be served by plants like Hungry Horse and Hells Canyon operating on an isolated basis.

IMPORTANCE TO THE ECONOMY

In a paper I presented at the 1950 meetings of the American Economic Association, I stated:

> The capitalistic system flourishes under an expanding and dynamic economy. It dies under a contracting or static economy. Our system has made its greatest strides by increasing productivity per manhour. This increase has been accomplished by mass production and the machine technique. The expansion of machine production has been built on an expandable and cheap supply of energy in the form of coal, oil, gas, or falling water.[3]

If we are to continue to increase production, we must have larger supplies of low-cost energy. The use of electric energy in industrial plants has increased from 2.61 kilowatt-hours per man-hour in 1929 to 4.60 in 1939, 5.71 in 1947, and an estimated 6.29 in 1950. This ratio must keep rising if productivity is to continue to increase. The conservation of water power will contribute to the energy supplies required to increase the productivity of labor. It will help this country to maintain a dynamic economy, the backbone of the capitalistic system.

These larger supplies of low-cost electric energy can be obtained if the program of the Federal Government to develop the economical hydroelectric sites in this country is achieved. Included in this program are: the development of the St. Lawrence Seaway and Power Project, the redevelopment of Niagara Falls, and the major projects on the Columbia River and its tributaries in the Pacific Northwest. The construction of these projects represents the next important step in the conservation of hydroelectric power in the United States.

[2] In addition, Hells Canyon storage along with other Columbia River storage results in greater prime power at all system plants, through co-ordination of operation. Hells Canyon's share of this greater prime power amounts to 306,000 kw. Thus total power attributable to Hells Canyon is 1,430,000 kw.

Private Forestry in Transition

By Samuel T. Dana

FROM colonial days to the present, the forests of the United States have played a major role in its development. They have built its homes, supplied the raw material for many of its manufactured products, provided containers for their shipment, and helped to prevent erosion and floods. These products and services have come, and must continue to come, mainly from the three-fourths of our forest area that is in private ownership. What are the prospects that this area of 345 million acres will be so managed as to guarantee adequate future supplies and services?

Until recently most students of the situation have viewed it with uneasy concern or even genuine alarm. For more than half a century they have emphasized the key position in the national economy occupied by forest lands in private ownership, and have successively proposed public co-operation, public regulation, public ownership, and private initiative as means of assuring their effective management.

Public Co-operation and Regulation Proposed

In 1899 in his first report as Chief of the Division of Forestry, Gifford Pinchot commented optimistically on the program which he had initiated to further the practice of forestry on private lands by public co-operation in the preparation of forest working plans. The response was encouraging; but the resulting plans so commonly gathered dust in a convenient pigeonhole that some ten years later a wag summed up progress with the remark that "forestry is now being practiced everywhere except in the woods." The co-operative approach was renewed in different form in the Weeks Act of 1911, the Clarke-McNary Act of 1924, the Norris-Doxey Act of 1937, and the Cooperative Forest Management Act of 1950. Results have been more substantial, but have fallen far short of bringing private forest lands in general under even fairly satisfactory management.

In 1919 the Forest Service, under the leadership of Henry S. Graves, and the Society of American Foresters, under the leadership of Frederic E. Olmsted and Gifford Pinchot, started a campaign to solve the problem by public regulation of cutting on private lands. Mr. Pinchot summarized his views with characteristic vigor:

> Forest devastation will not be stopped through persuasion, a method which has been thoroughly tried out for the past twenty years and has failed utterly. Since otherwise they will not do so, private owners of forest land must now be compelled to manage their properties in harmony with the public good. Pressure from without, in the form of public sentiment, crystallized in compulsory nation-wide legislation, is the only method that promises adequate results. To apply this method successfully means to fight.

Legislatively, the only immediate result of this campagin was the strengthening of the federal program in the fields of public co-operation and public ownership by the passage of the Clarke-McNary Act. Today federal regulation, in spite of sporadic attempts by the Forest Service to obtain its adoption, seems more remote than ever. State regulation has made some progress, but is neither sufficiently widespread nor effective enough to offer any real promise of providing a panacea.

Public Ownership Proposed

In 1933 the Forest Service, in the Copeland Report ("A National Plan for American Forestry"), subordinated public co-operation and public regulation to public ownership as the most effective means of solving the forest problem. This report prepared under the supervision of E. H. Clapp during the incumbency of R. Y. Stuart as Chief of the Forest Service, expressed the view "that practically all of the major problems of American forestry center in, or have grown out of, private ownership." To meet the situation, it recommended the acquisition of 134 million acres of forest land by the Federal Government and of 90 million acres by state governments. This proposal, which would have more than trebled the area of commercial forest land at that time in public ownership, was made during the depth of the depression when some private owners, particularly in the West, were inclined to regard their forest lands as a liability rather than an asset, and to regret that the government had ever allowed them to assume the "burden" of ownership. It was endorsed by Secretary of Agriculture Henry A. Wallace, who strongly recommended the earliest possible action on the federal part of the plan.

Although the area of forest land in public ownership has increased substantially in the last twenty years, this increase has been meager indeed in comparison with the goal set by the Copeland Report. Today the Federal Government owns 19 per cent of the commercial forest area, and state and smaller units of government 6 per cent, with no apparent likelihood of any marked increase in either category. That we shall now attempt to solve the problems created by private ownership by largely abolishing such ownership seems most improbable.

Self-regulation

The year of the Copeland Report (1933) may also be regarded as the year of the first attempt to put private forestry on the map by mobilizing private initiative on a nation-wide scale. Article X of the Code of Fair Competition for the Lumber and Timber Products Industries provided that:

> the applicant industries undertake, in co-operation with public and other agencies, to carry out such practicable measures as may be necessary for the declared purposes of this code in respect of conservation and sustained production of forest resources.

Wilson Compton, general manager of the National Lumber Manufacturers Association, promptly announced that "this is an industry undertaking. It will be so administered."

Two large conferences of representatives of industry and of the general public led to agreement on the principles to be followed in the drafting for each forest region of the country of codes of forest practice which would have the force of law. This procedure, known as "self-regulation," was lauded as a desirable and effective alternative to public regulation.

Considerable progress in the preparation and adoption of regional rules of forest practice had been made by the spring of 1935, when the National Industrial Recovery Act was declared unconstitutional by the Supreme Court. Thereupon the interest of most forest owners and operators in the entire enterprise suddenly waned, although in some regions consideration was given to the desirability of going ahead with the program in spite of the invalidation of the act. This loss of interest may have been due to economic conditions (the depression was still with us), to lack of

faith in the virtues of forestry as a voluntary undertaking, or to preoccupation with other matters. Whatever the cause, it strengthened the skepticism of those who believed that self-regulation would materialize only under the spur of legal compulsion; and it led F. A. Silcox, currently head of the Forest Service, to renew the campaign for public regulation.

One region where organized effort by industry to push private forestry did crystallize into definite action was the Pacific Northwest. Here the timber associations took seriously the excellent rules of forest practice which they had developed. Sustained timber production, in their judgment, was highly desirable from both the public and the private point of view, Article X or no Article X. Two developments of major consequence soon followed, both in 1941: (1) the passage by Oregon, with the support of the timber interests, of legislation requiring private owners to adopt minimum standards of forest practice; and (2) the inauguration of the tree-farm movement by the establishment of the Clemons Tree Farm in Washington by the Weyerhaeuser Timber Company.

The same year saw the organization of American Forest Products Industries, Inc. (AFPI)—the educational arm of the forest industries. Under its aegis the keep-green and the tree-farm programs have gone steadily forward, accompanied by a vigorous campaign for the education both of the general public and of forest owners. Regional associations and individual owners, and of course the federal and state governments, have also played an important part in the general advance.

STATUS OF PRIVATE MANAGEMENT

Where, then, does private forestry stand today, and what are its prospects for the future? Is the perennial problem of American forestry—management of private lands—actually on its way to a satisfactory solution? Is the outlook as rosy as the optimists in industry believe, or as dark as the pessimists in government fear?

The answer to these questions, in the judgment of a middle-of-the-roader like the present writer, is that private forestry is in a state of transition from a position of minor importance in the national economy to one of major importance. It has come a long way in recent years; it still has a long way to go; and liberal public participation in the forestry enterprise will continue to be necessary for satisfactory progress.

Private forestry has gone farther in the last decade than in all the previous years of our history put together. The number of well-managed properties has jumped suddenly from the hundreds into the thousands. The rapidity of the change is dramatized by the growth in the number of tree farms from one in 1941 to more than thirty-five hundred today. Their number and distribution as of March 1, 1952, were as shown in Table 1.

TABLE 1—TREE FARMS AS OF March 1, 1951

Region	Number	Per Cent	Acres	Per Cent
West	492	14	8,649,830	35
South	1,899	53	14,204,200	57
Lake	497	14	1,503,662	6
Central and Plains	346	10	150,629	1
Eastern	307	9	354,917	1
United States	3,541	100	24,863,238	100

According to AFPI, the sponsor of the tree farm movement,

> A tree farm is an area of privately owned forest land devoted primarily to the continuous growth of merchantable forest products under good forest practices. . . . Tree farming, like the raising of any crop, is a practical business venture.

Both the idea and the name have proved so popular that thirty-three states now have formal tree-farm programs. Each of these states has a responsible agency to establish and enforce standards of practice, compliance with which entitles an owner, whether of a small farm woodlot or a large industrial holding, to be officially certified as a tree farmer.

In interpreting tree-farm figures such as those given above, two offsetting facts must be kept in mind. In the first place, many of the properties included in them were being well managed in pre-tree-farm days. Secondly, they do not include well-managed properties that have not yet been registered or that are in non-tree-farm states. Statistical accuracy, however, is not necessary to prove to the careful observer that there has been an unforeseen and highly gratifying upsurge in the practice of private forestry. This is most evident on the lands of pulp and paper companies, which have been leaders both in the area placed under management and in the quality of that management. Their interest is due to the phenomenal growth of the industry, which increased its production even during the depression; to its heavy capital investment, which makes an assured supply of raw material indispensable; and to technological advances, which have made possible the utilization of species and grades of material that were formerly unavailable.

ACTIVITIES OF THE INDUSTRY

The new attitude is well stated on the letterhead of the country's largest private timberland owner: "Timber is a crop." It finds expression in the woods, both on tree farms and elsewhere, in more effective control of fire, insects, and disease; in thinnings, cleanings, and other silvicultural treatments in immature stands to improve the quality of the final crop; in the conduct of harvesting operations so as to obtain natural reproduction of desirable species in adequate amount; in the artificial reforestation of denuded areas; in the development of permanent systems of transportation; and in the practice of sustained-yield management, through which the balancing of growth and drain assures continued forest production for an indefinite future. It also finds expression in the general acquisition by larger owners (especially in the paper industry) of small holdings which for economic reasons cannot be handled satisfactorily by their present owners and are likely to be much better managed as integral parts of an extensive timber-growing enterprise.

In some instances private management is even more intensive than that on national forests, where standards have long been high. Moreover, the Southern Pulpwood Conservation Association and several individual owners assist smaller owners without charge in the management of their land. Such assistance may include the marking of the trees to be cut in a logging operation and the furnishing of planting stock for reforestation purposes. This is not entirely an altruistic gesture, but rather an intelligent approach to the problem of assuring an adequate supply of wood to meet the manufacturer's needs for raw material.

All these activities are normally conducted under the professional direction of a trained forester, who may be on the staff of the owner, employed by him on a consulting basis, or made temporarily available in an advisory capacity by a public agency. Some 5,100 foresters are now estimated to be employed by industry. Several of the larger companies have a score or more of foresters

on their payrolls, many in positions of responsibility for the determination of policy as well as of technical practice. A few concerns go so far as to employ specialists for research in such fields as forest pathology, forest entomology, and forest soils. Experimental forests, sometimes aggregating many thousand acres, are not uncommon. One of the most encouraging features of the situation is that current openings for foresters in private employ considerably exceed those in public employ.

PUBLICITY WORK

Prominent in the efforts being made in many quarters to put private forestry on the map is American Forest Products Industries, to which reference has already been made. This organization has been largely responsible for putting across the keep-green program in 31 states, the tree-farm program in 33 states, and the more-trees program in 6 states. It issues a large volume of attractive literature designed to get more forestry practiced on private lands; to inform the general public, and especially school children, as to the importance of forests, forest products, and forest industries in the life of the nation; and to make known what industry is doing to assure adequate future supplies. In 1951, for example, educational material was sent to 89,000 schools in all parts of the country.

Naturally, activity of this sort has led to the charge that industry is indulging in propaganda to lull the American people into a false feeling of security. Careful study of the literature issued both by AFPI and by individual companies fails to substantiate the charge. While the general presentation is usually optimistic, sometimes perhaps too optimistic, reference is nearly always made to the fact that the forest situation as a whole is not satisfactory, and that all of us must put our shoulders to the wheel to make it more so. If this constitutes advertising and window dressing, it must be remembered that advertising and window dressing are part and parcel of the entire system of private enterprise. From radio and newspaper to the department store's window display, they are characteristic of American business. And is it any wonder that timberland owners should emphasize the bright spots in the present picture after the names they have been called and the unfavorable publicity they have previously received?

MOTIVATION OF ADVANCE

The important question is: How permanent and how effective is the recent upsurge in private forestry? In an economic world, it is encouraging that the primary cause of the new interest is an economic one. Owners have not suddenly "got religion" or become panicky because of fear of federal regulation; nor are they unduly influenced by the opportunity to invest in their own business funds that would otherwise go to the government as income taxes. They have decided to go into the business of growing timber because it pays. High stumpage prices, the closer utilization of inferior material made possible by advances in wood technology, and the necessity of protecting heavy investments in land and mills now justify practices which most owners, rightly or wrongly, formerly regarded as uneconomical. Added to the economic motive, on the part of some at least of the larger manufacturers, is a sense of responsibility for the maintenance of the communities supported by their plants.

Enlightened self-interest thus provides a solid foundation which offers real promise of permanence. Another depression would undoubtedly lead to some decrease in expenditures for forestry by private owners, just as it would lead to economies in other directions. That it would result in the virtual abandonment of any considerable part of the present program is most unlikely, particularly in the case of manufacturers with heavy capital investments. The stakes are too high.

GOOD BUT NOT GOOD ENOUGH

On the other hand, accomplishments to date in relation to needs give no cause for complacency. Forest Service estimates showing the status of forest management in 1945 are given in Table 2. Additional areas have come under management since that date, and the intensity of management on other areas has no doubt increased. Even so, the level of management of the private forests is clearly low, both intrinsically and in comparison with that of the public forests. This is notably true of the small holdings (less than 5,000 acres) and the medium-sized holdings (5,000 to 50,000 acres), with only 4 and 8 per cent respectively under good or better management. The large owners, particularly the pulp and paper companies, are doing much better, with 29 per cent of the area involved under good or excellent management; but this group includes only 15 per cent of the total forest area in private ownership.

TABLE 2—CHARACTER OF CUTTING IN 1945
(Per cent)

	Good and Better	Fair	Poor and Worse
Private ownership	8	28	64
Small	4	25	71
Medium	8	31	61
Large	29	39	32
Public ownership	67	19	14
National forests	80	19	1
Other federal	43	32	25
State and local	47	10	43
All lands	23	25	52

A closer look at the situation in one of the most productive forest areas in the country, the southern pine region, is revealing. Here the pulp and paper industry has increased its output nearly ten times in the last twenty years, with another marked expansion scheduled for the immediate future. Although pulp and paper manufacturers are almost uniformly practicing good forestry on their own lands, these are far from adequate to meet their requirements. They must therefore obtain about half of their wood supply, in competition with the lumber industry and other wood-using industries, from other lands. Of these, the most important are the small ownerships, which greatly predominate in the region, and only 2 per cent of which are being well handled. Clearly, the progress which has so far been made, spectacular as it is on some individual properties, is far from enough.

Forest Service estimates also show that the total growth of the forests (in cubic feet) approximately equals the total drain resulting from cutting and from losses by fire, insects, and disease, and that the growth of sawtimber (in board feet) is about two-thirds of the drain. Do these figures mean that more widespread and more intensive forest management, whether on public or private lands, is not really an urgent necessity? They mean no such thing, unless we are to be satisfied with a static supply of wood in an expanding economy; and unless we are willing to reduce drastically our consumption of saw timber, on which we now depend for many important uses.

Wood, in spite of the much-advertised increase in the use of substitutes, continues to be the "universal raw material." Far from being "obsolete," it is constantly finding new uses and being improved for old uses. From lumber, plywood, and the myriad articles manufactured from them, to turpentine and

rosin, paper and its products, lignin, sugar, alcohol, vanillin, and other chemical derivatives, forest products enter into our daily life not only in many obvious but also in many unrecognized ways. Our whole economy will be richer or poorer as they are abundant or scarce.

Liberal use of forest products is desirable because of their renewability as well as because of their utility. It is reassuring to know that about a fourth of our total land area is best suited to the production of forest crops, and that these 461 million acres, *if properly managed,* would permanently provide a much larger yield than we are now harvesting.

THE SOCIAL REQUIREMENT

Is any such addition to the national wealth in the form of increased forest production likely to result from private enterprise alone? In spite of the recent highly encouraging developments in private forestry, the answer is almost certainly No. The job is of a nature and a size to require public participation. There is nothing inconsistent with the "American way of life" in this conclusion.

The institutions of private property and private profit are based on the theory that they best serve the interests of society as a whole. Here in the United States we are convinced that this is the case; but when unrestricted freedom of enterprise fails to render optimum service or results in actual disservice, the community does not hesitate to intervene. Public schools, agricultural experiment stations, blue-sky laws, pure food and drug acts, regulation of public utility rates and service, incentive payments, zoning ordinances, control of stream pollution, and national parks, to pick just a few examples, all bear witness to this fact.

Experience both here and abroad shows that forestry is a field in which such intervention is often desirable. Many owners are either unable or unwilling to handle their lands in such a way as to assure their continued productivity. When forest supplies are abundant in relation to the demand, this fact may have little social significance. When the situation becomes reversed, it may be of outstanding importance. Indeed, as population expands and natural resources shrink, the point may well be reached where the way in which they are managed is of more concern to the community at large than to their individual owners.

The United States cannot raise the standard of living for its own rapidly mounting population, nor can it exercise effective leadership in a bankrupt world, without wise use of its natural resources, among which forests are of major importance. The goal must be reached chiefly through action of private owners, but with a reasonable measure of the three forms of public participation with which we are already familiar.

FORMS OF PUBLIC PARTICIPATION

Public co-operation is exemplified in such fields as protection of forests from fire, insects, and disease; research; education; provision of planting stock; and on-the-ground aid in the management of specific properties. These activities are almost universally approved, including the liberal use of federal grants-in-aid administered by state agencies. They have demonstrated the ability of private owners and of federal and state officials to work together in the formulation and execution of constructive programs in which the participation of all concerned is on a wholly voluntary basis.

Public regulation commands less favor, even at the state level; but it is likely to prove necessary, particularly in connection with "protection forests," unless forest owners as a whole prove more amenable to educational influences here than they have proved in even such forest-minded countries as Norway and Sweden. It is significant that in Oregon and Washington, which now have the most drastic laws of any of the states, the legislation had the backing of the very owners who were to be regulated; and that in Washington these owners helped to get a decision from the state Supreme Court upholding the constitutionality of the act. In the words of L. F. Watts, chief of the Forest Service, regulatory measures constitute the "rules of the game" and "are as necessary in resource management as they are to transportation, communication, and other enterprises that affect the public welfare." Although mandatory in form, the fact that they automatically force an owner to consider the basic problem of sustained forest production gives them great potential educational value, which is magnified if private owners themselves participate in the regulatory process.

Public ownership to the extent of 25 per cent of the commercial forest area has resulted from the reservation of lands originally in federal or state ownership (chiefly the public domain), from the acquisition of additional lands by purchase or exchange, and by the retention of tax-delinquent lands. They include largely lands that are (or have been) submarginal for private ownership, and that are needed for purposes such as watershed protection and recreation, which are generally recognized as a public responsibility. The character of their management is less subject to the ups and downs of the business cycle than is the management of private lands, and they can be used for the production of timber of larger size and higher quality than most private owners can afford to grow. This latter function will continue to be an important one until the highly uncertain arrival of the day when technology makes it possible to substitute built-up and synthetic products for high-grade lumber and plywood with equal satisfaction from the standpoint of cost, utility, and beauty. That the present pattern of ownership is the best that could be devised is unlikely; but that a considerable backlog of public forests is highly desirable as a means of promoting stability and of providing intangible but essential services can hardly be doubted.

SUMMARY

To sum up, private forestry is in a state of transition. Timber mining is at last being replaced by timber cropping on a substantial scale. Great credit is due to the individuals, companies, and organizations whose leadership has been responsible for the change. The evidence is convincing that the new attitude is here to stay, and that the movement which they have started will continue to spread.

Enthusiasm over recent progress should not, however, blind us to the fact that it is only a good beginning. Evolution, not revolution, is the order of the day. Neither the area of private forest land now under management nor the average quality of that management gives any assurance of a continuing supply of forest products adequate to meet the needs of a nation with a rapidly expanding population, a desire for ever higher standards of living, and a responsibility for world leadership. Current efforts by private owners must be intensified, extended, and supplemented (not supplanted) by appropriate activities on the part of public agencies.

Private forestry in the United States has come far in the last ten years. It has still farther to go. With full cooperation on the part of all concerned, there is reasonable hope of success in attaining the common objective of en-

abling our forest resources to play the part they can and should in promoting and maintaining the prosperity of the nation. Industry's present attitude arouses hope and confidence that the transition from negligible planned production, through substantial production, to full production on the 75 per cent of our forest area in private hands will be faster than we had dared to hope. The prospect is one to encourage optimism but not complacency.

Samuel T. Dana, Sc.D., Ann Arbor, Michigan, is Filibert Roth University Professor of Forestry at the University of Michigan. He previously served in various capacities with the United States Forest Service for some twenty years, and has represented the United States Department of Agriculture, the Society of American Foresters, and Yale University at international conferences. He is author of many bulletins and reports in his field, and is a contributor to the Journal of Forestry, of which he was editor in chief for six years.

"Big" Versus "Little" Lumber Operators in the Pacific Northwest

By DANIEL L. GOLDY

A STRUGGLE is going on in the lumber industry of the Pacific Northwest, the outcome of which will have important consequences for the future economic health and strength of the United States. It is popularly referred to as the battle between the "big" and the "little" lumber operators. But this is to some extent an oversimplification. Measured exclusively by size of mill, volume of raw material consumed, or value of output, one might be confused in finding some large operators on the side of the little fellows and some relatively small operators on the side of the big fellows. A more accurate delineation distinguishes between those operators who wish to stifle competition, particularly by controlling the basic raw material of the industry, and those who feel that they are dependent upon free competition and an open timber market for survival. Of course, those who are in a position to monopolize a significant portion of the timber supply in an area do not define "free enterprise" in the same way as those who must find their logs wherever they can compete for them.

NORTHWEST TIMBER RESOURCES

To appreciate the issues involved, one must understand something of the nature of the Pacific Northwest lumber industry and its importance to the economy of the United States. The Pacific Northwest contains over 40 per cent of the remaining saw timber in the United States. A substantial portion of this timber is in the Douglas fir belt of western Oregon and western Washington, which currently produces about one-third of the nation's timber requirements. Inasmuch as the predominant species in this area—Douglas fir—provides excellent structural lumber for housing and other types of construction, the area's resources have been under increasing pressure during the war and postwar construction and housing booms.

With better housing as one of the primary items in the aspirations of Americans for a higher standard of living, there is little likelihood that the pressure on the Northwest timber resources will diminish in the future. As was true in the New England and Middle Western timbered areas of the United States, the lumber operators of the Pacific Northwest have been cutting the timber resources for some time at a rate substantially in excess of a sustained-yield capacity. Citizens of communities which are dependent upon the forest resource for their principal means of livelihood, and operators who must maintain a flow of logs to their mills in order to continue operating, are becoming increasingly concerned about the imbalance in the forestry budget.

One of the clues to the problem, however, is in the definition of what constitutes sustained-yield capacity. At the present level of utilization—which involves on the average about 50 per cent waste—estimates of sustained-yield capacity in the Douglas fir belt range between 3.8 and 5 billion board feet a year. In 1951 the mills of western Oregon and Washington produced over 11 billion board feet of Douglas fir lumber. It is estimated, however, that with reasonably full and proper utilization of the timber resources—based on proc-

esses which have been tried and proved and for which a market is believed to exist—the sustained-yield capacity would be in excess of 14 billion board feet, rather than the 3.8 to 5 billion board feet. To achieve this goal would require extensive investment in secondary and diversified forms of forest products manufacture.

The overcutting that has taken place in the Pacific Northwest has been largely on privately owned timber lands. This has resulted in a major shift in the proportions of private and government timber ownership during the last decade. In 1940 it was estimated that approximately 50 per cent of the merchantable timber in the states of Washington and Oregon was owned by the Federal Government and 50 per cent by private operators. By 1950 the proportion had changed to approximately 70 per cent in government ownership and 30 per cent in private ownership.

MONOPOLY TACTICS

With timber becoming increasingly scarce, its availability is the primary determinant of whether any given operation can continue in business or will be forced to close down. Those operators with substantial or strategic holdings of private timber—whether considered big or little by other standards—tend to form a block dedicated to shutting off access to timber for other operators not so fortunately situated. There is a variety of techniques by which this is done, but the objectives are: (1) to acquire the exclusive opportunity to purchase and cut the tracts of timber held in scattered private ownerships in the drainage in which they operate, enabling them pretty much to set the price; (2) to obtain exclusive control over the federal timber in the drainage, which in many instances represents the principal raw material supply of the future; and (3) to freeze out present competitors by denying them access to the raw material needed to keep them going.

Control of access

Of the various techniques employed to accomplish these objectives, the most effective and most widely practiced relates to control of the means of access to the privately or publicly owned timber involved. In the early days of lumber operations in the Pacific Northwest, the large operators would locate their mills at tidewater or other strategic locations and would build logging railroads into the virgin forest areas. These private railroads would furnish the exclusive means of access, enabling the lumber company concerned to dictate what timber would be cut and removed, when it would be purchased, and the price which would be paid, regardless of who actually owned the timber.

With the advent of the logging truck and portable yarding and bucking equipment, it became more difficult for a few large operators to maintain such exclusive control. Hundreds of small operators came into the business. Access to the timber was obtained by extending logging roads into the drainages from state and county roads. The large companies soon recognized the potentialities of competition from this source, and considerable investments were made in acquiring strategic parcels of land located at the neck of the drainage bottle, in acquiring rights of way for the construction of roads, or in actually constructing the first segments of roads that would ultimately tap all the timber in a given drainage. Among the rights of way obtained were those over government-owned lands, generally granted in the early days without any thought to the question of preserving the public's interest in access to its own timber.

Those companies which stood to gain by exclusive control of logging roads vigorously opposed requests for governmental appropriations for the construction of access roads to overmature and decaying stands of federal timber, despite the obvious need for such roads in the interests of lumber production and conservation. Among their principal arguments before congressional committees were their willingness to build the roads themselves and their belief that they could do it better and more cheaply.

These operators did not explain to the Congress that a substantial part of the cost of constructing these "private" access roads was borne by the government timber. It has been the practice of the Forest Service and the Bureau of Land Management—the two federal agencies primarily involved—to make generous allowances in timber appraisals for the cost of road construction. Thus, if a tract of timber were valued at $100,000, it might be offered for sale at $70,000, the difference being an allowance to defray the cost of private road construction. By this method the federal agencies have in some instances repaid to private operators the entire amount invested by them in road systems, but have left the roads in their complete, undisputed, and exclusive control. The private operators continue to enjoy the right of exclusive access to the federal timber in the drainage, as well as to such privately owned timber as they themselves do not own.

Preference in sales

Another technique by which certain operators are able to control the federal timber being offered for sale is to obtain preference from the government foresters in the planning of the sales, so that only the preferred operator is able to purchase the timber offered. This preference can be accorded in several ways: by offering blocks of timber adjacent to the preferred operator's present area of cutting or in accordance with his cutting plan so that the time and place of the sale favor him; by laying out the "settings" in such a way that they do not constitute an economic "show" for anyone but the owner of the adjacent land, whose timber must be logged with the offered federal timber to make it economically feasible; or to offer the timber in such large blocks that only the operator for whom it is intended will have sufficient financial resources to be able to bid on it.

These informal understandings by which federal timber is disposed of to preferred operators without open competition are clear violations of the spirit, if not the letter, of the applicable federal laws. These statutes require that federal timber be disposed of by open competition—except only where a cooperative sustained-yield agreement has been concluded in the manner prescribed by law. In the instances referred to above, such agreements were not in effect.

While discrimination in the disposal of government timber worth millions of dollars is inconsistent with law, it is not inconsistent with the philosophy which governs the actions of many of the federal foresters. That philosophy holds that only the big operators can practice good forestry, so in the interests of conservation and good forestry one should co-operate with the big operators to ensure that only they are purchasers of the government's timber. Those who subscribe to this point of view have concluded that what is essentially needed is monopoly in the private forestry field—where a few large companies control as much as possible of

the private timber, and they (the federal foresters) control the companies through regulations prescribed by law.

Sustained-yield agreements

One of the favorite approaches to this type of utopia is the co-operative sustained-yield agreement mentioned above. In return for obtaining the exclusive option to purchase government timber at an appraised price, the private operator must subject the time, rate, and manner of cutting on his own forest lands to regulation by the government. Through the pooling of the federal and privately owned timber lands in a co-operative agreement, the federal statutes contemplated that sustained-yield forestry operations could be achieved, thereby guaranteeing the permanence of those lumber operations which constituted the principal employment source for dependent communities.

Only one co-operative sustained-yield agreement has been entered into thus far. It was concluded between the Forest Service and the Simpson Logging Company in Shelton, Washington. Since that time the storm of opposition from those lumber operators—as well as other interested groups—who would be excluded from the opportunity to bid for government timber by the granting to one operator of an exclusive sales option for time periods ranging up to one hundred years has been sufficient to shelve the proposals. But the battle is about to break out into the open again, as the time nears for a public hearing on a proposed co-operative sustained-yield agreement between the Forest Service and the Pope & Talbot Company in a forest area not far from Eugene, Oregon.

In January 1948 the Department of the Interior conducted a public hearing on a co-operative sustained-yield agreement which had been proposed by the Bureau of Land Management and the Fischer Lumber Company near Eugene, Oregon. At the hearing, representatives of the small and independent lumber operators, and of labor, farm, and conservation groups, expressed their accumulated bitterness at the "discriminatory" policies practiced by the federal agencies in the disposal of timber. Their charges were carefully examined by the Interior Department and in the main were found to be justified. As a consequence, a new policy and program was adopted by the Interior Department in June 1948 and the BLM was directed to take vigorous steps to carry it out.

THE NEW PROGRAM

The program can be summarized as follows: first, exclusive control of roads tapping the BLM timber was eliminated, and the roads were made available to whoever purchased the government timber. This was accomplished on an interim basis by withholding from sale those tracts of timber which were tapped by a privately owned road, unless the road owner would agree to make the road available to the purchaser of the government timber upon payment to the road owner of a fair price for using the road. On a long-term basis, the problem was attacked through the promulgation of new right of way regulations. Under these regulations the government receives rights to use access roads for the removal of its timber in return for granting private operators rights of way to build roads across government lands. In effect, such agreements for reciprocal road use are nothing more than agreements between the government and private operators each to permit the other to use those segments of roads which are located on each other's lands. The investment of the private operator is recognized, and fair compensation must be paid to him under the regulations when the road is used by another party for the removal of government timber.

Although such an approach to the granting of rights of way seems eminently reasonable, it touched off a bitter fight by the "big" operators. The regulations had been carefully worked out over a period of fifteen months in consultation with an advisory board appointed by the Secretary and representative of all points of view. After considerable pressure had been applied by their industry colleagues, the representatives of the "big" operators on the board repudiated their concurrence in the unanimous recommendation that the regulations be promulgated. A war chest was begun to fight the regulations in the courts, but thus far they have not been successfully challenged. They have proved practical in operation and have stood the test of public criticism.

Second, to eliminate discrimination an advance timber sale program was instituted and administered in consultation with public advisory boards established in each of the Forest Districts. Under this program, suggestions for tracts of land to be offered by the BLM are received by the operators, screened in accordance with clearly defined and previously announced standards, and a timber sale program for the following calendar year is formulated. District Foresters of the BLM who prepare the plan must explain to their district advisory boards why suggestions are accepted or rejected, and the principles of sound forestry that were followed in making their decisions. In December the plan for the following calendar year is advertised, so that all operators who are interested in the timber offerings know well in advance where and when the timber will come up for sale. In addition, timber is offered in small blocks so that even those operators with limited financial resources can afford to purchase one or more of the blocks as needed.

The district advisory boards referred to above are composed of representatives of the various segments of the lumber industry, both large and small, and representatives of farm, labor, grazing, recreation, mining, and other groups concerned with the administration of the program. Their participation in the program is an additional safeguard against the re-emergence in the BLM of the professional forester attitude which looks kindly on discrimination in favor of the "big" operator.

COMPETITION AND ITS EFFECTS

The elimination of discrimination in timber sales and the assurance of access to the timber for all who wished to bid resulted in greatly increased competition for the BLM timber. Whereas before there was an absence of competition in over 80 per cent of the timber sales made by the Bureau, under the new policies the figures in many sales were just the reverse. On the average there was more than a 100 per cent increase in competitive sales over the previous high period in the Bureau's history.

Competitive sales taught the Bureau something about the true value of its timber. It found that on the average it received about 55 per cent more than the appraised price whenever there was competition for the timber. Or stated in another way, when the Forest Service and BLM dispose of timber without competition, the operators receive a substantial windfall, and the United States Treasury and the counties—which share in the revenues from federal timber sales—are shortchanged.

In an area where 70 per cent of the merchantable timber is owned by the

Federal Government, the value of federal stumpage largely determines the value of private stumpage. Under the impact of competition, BLM stumpage has more than doubled in value during the past few years. This has in turn resulted in increasing the economic margins on all of the private timber in the area, so that the practice of good private forestry is increasingly feasible from an economic standpoint. This is reflected in the high values now placed on cutover lands which in past years had gone to the counties for taxes, and in the rapid growth of tree farms and other indexes of conservation in private forest management.

But the most important function of competition is to furnish the incentive for investment in new plants and equipment, particularly in secondary manufacturing which utilizes raw materials which were previously regarded as waste. In an industry where it is regarded as normal to waste 50 per cent of a dwindling and valuable raw material resource, incentives for increased utilization are urgently needed. Such an incentive exists when scarce federal timber goes to the operator who can make the best economic use of it as evidenced by his ability to pay.

Forest conservation will not be achieved in the United States by having government foresters decide who are the good and who are the bad operators; nor by setting up monopolies—regulated or unregulated; nor by stabilizing the lumber industry at the present levels of waste. Some regulation of private forestry practices is undoubtedly needed, and to a limited extent is being undertaken by some of the states. But the basic problem of forest conservation will not be solved until we have made economic the practice of full utilization. And the substantial investments in plants and facilities required to make full use of the large proportion of the timber resource which is now left in the woods or burned as waste, are most likely to be forthcoming if the normal economic incentives of free enterprise and competition are maintained.

Daniel L. Goldy, at present in France serving on the staff of the Director of the European Office of the Mutual Security Agency, was recently Pacific Northwest Regional Administrator, Bureau of Land Management, Department of the Interior. He was previously special assistant to the Assistant Secretary of the Interior, Washington, D. C. He has also served in several other government agencies, and was a lieutenant in the United States Navy during World War II.

Tree Farms Versus Regulation

By T. D. STEVENS

THE early forest history of the United States is one of devastation and desolation. The pictures of destructively cut forests and fire-blackened previously forested areas are all too fresh in the minds of many, for these conditions were prevalent even past the turn of the century.

Several great fires burned hundreds of thousands of acres; yes, even millions of acres. The great Wisconsin fire of 1871 which started near Green Bay burned over one and a quarter million acres, destroyed several towns, and left six hundred dead in its wake. Even as late as 1918 the town of Cloquet, Minnesota was virtually destroyed by a fire which burned over 250,000 acres and destroyed over four hundred people. Other conflagrations just as destructive as those at Green Bay and Cloquet have occurred in other forested areas from Maine to Oregon.

Spectacular as these fires were, they accounted for only a very small part of the total destruction wrought by fire. Of far greater importance was the cumulative destruction of thousands of small fires year after year. Resulting from carelessness or deliberate sets, frequently as an aftermath of logging, fire has taken a terrible toll of American forest resources. All too often, the lumberman has been accused of being responsible for this blackened page of forest history. True, the lumberman may have been partially at fault, but the blame must be placed largely on the shoulders of an apathetic public.

HISTORY OF LUMBERING

The history of lumbering in this country is one of exploitation and migration. Early cutting started in New England shortly after settlement. For many years, Maine was the leading timber producing state. As Maine's virgin forests were depleted, New York became the leading producer, only to be superseded by Pennsylvania. About the time of the War between the States, the lumber industry began to migrate to the Lake States. Some of the finest forests ever seen by man grew in Michigan, Wisconsin, and Minnesota. In the minds of many, the forests were inexhaustible. The sawdust flew from one end of the Lake States to the other. Ruthless cutting was the order of the day, without provision or thought for regeneration and continuous forest production.

By 1880 it became apparent to many operators that the forests were not inexhaustible. They began to look elsewhere for new areas of virgin timber, and their gaze rested on the magnificent pine forests of the South. Before the Lake States were even close to being cut out, the lumber industry began to migrate southward. Southern mills were better capitalized and more efficient than their predecessors in the Lake States. Exploitation of the southern pineries took place at a very rapid pace.

During the last decade of the past century, with the end of the Lake States' timber in view and the end of the southern pineries easily calculable, the lumber industry began a planned movement to the colossal fir and pine forests of the Pacific Northwest. The center of the industry has remained in the Northwest since the turn of the century, although the end of the readily

accessible virgin timber is clearly discernible today.

Fire and the "cut out and get out" policy of the lumbermen brought about the rapid depletion, often referred to as devastation, of a large portion of the nation's forest resource. To complicate the situation further, the migratory character of the lumber industry left economic chaos in its wake as it moved from one region to another. Vast tracts of land were left in a denuded condition, since the lumbermen had little or no interest in the inherent productive capacity of the land. There was always plenty of virgin timber over the next hill, virtually free for the taking. The idea of free timber coincided with our national policy of free land. We gave the land away almost for the asking, and the timber went with it. Originally, there were over five hundred million acres of forest land within the continental boundaries of the United States. It is not surprising that the early lumbermen considered the forests inexhaustible and free for the taking. In their time, they saw little need for permanency in a particular forest region. Ghost towns and all the other evils usually accompanying the exhaustion and depletion of a natural resource were commonplace in the cutover regions.

The lumbermen were no more to blame for this depletion than they were for the fires that raged across the lands. Furthermore, the rapid liquidation of our timber resources during a critical developmental period in our history helped to create a high degree of prosperity which ultimately brought the nation to world leadership. Without readily exploitable natural resources, this almost miraculous achievement would never have been possible.

Thus, by way of recapitulation, the early forest history of the United States was characterized by exploitation, fire, and devastation. The exploitation was justified, but it is indeed unfortunate that an enlightened public was not available to insist that the exploitation be carried out in conformity with good forest conservation practices.

BEGINNING OF CONSERVATION

Toward the end of the last century, a few voices bewailed the "wanton destruction" of the forest resource and began to call for forest conservation. The conservation movement first became effective in 1891 when the Federal Government enacted the Forest Reserve Act under which forest reserves were set aside from forested areas within the public domain. These forest reserves became national forests in 1905 when they were placed under the administration of the Forest Service within the United States Department of Agriculture. While the establishment of these federal forests was an important forward step in forest conservation, it represented only a mild improvement in the over-all picture, since exploitation and devastation continued on a majority of privately held timberlands.

The forest conservation movement continued largely under the crusading leadership of Gifford Pinchot, who became the first Chief Forester of the United States Forest Service in 1905. The conservationists clamored for federal regulation of cutting on privately owned timberlands. The lumber industry, on the other hand, reacted in a typical laissez faire manner by scathingly denouncing federal regulation as unneeded and undemocratic. If needed, said industry, regulation should be at the state level and not at the national level; federal participation should be limited to co-operation with the state and local agencies.

PROTECTIVE LEGISLATION

Most controversial questions are solved, for a time at least, by effecting a compromise. The first federal act influencing the management of privately owned forest land was the Weeks law of 1911, which was definitely a compromise from the regulation viewpoint. The Weeks law provided federal co-operation with the states in controlling fire on forested watersheds of navigable rivers.

Thirteen years later Congress passed the Clarke-McNary Act, which provided three-way co-operation in the control of forest fires. Under the act, the private owner participated in the program along with state and federal governments. The act has for its goal the protection of every forested acre in the United States. As a result of this pertinent piece of legislation, more than 80 per cent of all state and private forest lands receive organized fire protection. In many states, fire protection is compulsory. Today, fire, the Number One enemy of the forest, is definitely on the wane. Despite the progress made in fire protection and the beneficial effects it had on forest management, many continued to believe public regulation of cutting on private forest lands was needed.

The depression of the thirties brought the National Recovery Administration lumber code. The code was written largely by lumbermen at the request of the national administration. In the writing of the code William B. Greeley had no small part, for he was in effect, if not in fact, the spokesman for the lumber industry. At the time the code was formulated, Greeley was executive secretary of the West Coast Lumbermen's Association. Previously he had been with the United States Forest Service, where he became chief forester in 1920. His philosophy seemed to be one of co-operation by all people and agencies interested in the forests and their management, as opposed to strict federal regulation.

Article X of the lumber code required the industry to leave "its cutover lands in good condition for reforestation." When the Supreme Court sounded the death knell for the NRA, the lumber industry voluntarily agreed to continue complying with Article X. This was the first concerted act on the part of the lumber industry indicating an interest in forestry. This belated interest was not surprising, for there were many factors working to make lumbermen forestry minded. One was the continual threat of federal regulation. Another was the influence of the ever increasing number of technically trained foresters in the employ of lumber companies. But most important of all was the frightening realization that the end of the virgin forests was in view. No longer could cheap stumpage be obtained close by or by moving the mill to a new area. Lumbermen finally realized that they had to practice forestry if they were to stay in business.

POOR PRACTICES ON SMALL TRACTS

But this realization and voluntary compliance with Article X was not enough for the proponents of regulation. They knew that 76 per cent of all private commercial forest land was in small tracts. In many instances these holdings were not well suited to good forest management, because of their smallness and lack of affiliation with a permanent forest operation. Many owners of small forest tracts felt they could not afford to practice forestry. Furthermore, many tracts were in the hands of absentee owners who had little interest in the productive capacity of the land for growing timber.

A recent United States Forest Serv-

ice survey[1] clearly showed cutting on 71 per cent of small commercial forest holdings to be poor and destructive. The regulationists had been very much aware of this fact for some time, and used it as verbal and written ammunition in their battle for regulation. In general, cutting on the larger forest holdings was shown by the aforementioned survey to be reasonably satisfactory; but industry knew something would have to be done to improve cutting practices on small private holdings if regulation was to be prevented.

THE TREE FARM MOVEMENT

Industry had consistently held that widespread improvement in private forest management practices could be obtained through education rather than by government decree. The most effective way to prevent regulation was to convince the public that it was unnecessary. To accomplish this, an improvement had to be obtained in private forest practices. About 1940 the Weyerhaeuser Timber Company decided to apply intensive forestry on a 120,000-acre logged-out tract near Montesano, Washington. To protect the area against carelessness with fire, and to teach the public that the company intended to grow a second crop of trees, the area was advertised as a tree farm. The term implied forest management for the continuous production of forest crops.

Public reaction was so favorable that the National Lumber Manufacturing Association initiated the tree farm movement on a national scale in 1941. The goal of the movement was to encourage the protection and permanent productive use of private forest lands. Co-ordination of the movement is now carried out by the American Forest Products Industries, Inc., which has as its aim "the promotion and development of sound economic forest practices and the development of a better public understanding of and co-operation with private forest enterprises." This organization encourages and assists in the initiation of the tree farm programs, keeps national records, and publicizes the movement.

Each state embracing the tree farm movement has a local sponsor, which may be the state forestry department, a state forestry association, a combination of two local organizations, or a regional wood-using industry group or association. Among the regional sponsors are Forest Conservation Committee of the Pacific Northwest industries, Western Pine Association, California Redwood Association, Southern Pine Association, Appalachian Hardwood Manufacturers' Association, and Southern Hardwood Producers, Inc.

There is more to tree farming than merely posting a tree farm sign on a piece of forest property. To qualify as a tree farm, a tract of forest or woodland must be located in a state where the American Tree Farm System operates. Size of the tract is unimportant. Tree farms vary from three acres to vast commercial holdings running to hundreds of thousands of acres. Of course, the woodland must be privately owned and maintained for the purpose of growing and harvesting commercial timber crops. Cutting practices must be of a character to ensure continuous crops of merchantable forest products. The woodland must also be adequately protected against fire, insects, disease, and destructive grazing. Any woodland owner meeting these qualifications may become a tree farmer by applying to the State Tree Farm Committee through the local sponsor. If the inspecting forester's report is satisfactory, and upon recommendation of the Tree Farm Committee, a Tree Farm Certificate is issued to the owner. Tree farm certification will be withdrawn should the land change ownership or should the owner fail to maintain high management standards.

[1] U. S. Forest Service, *Forests and National Prosperity*, U.S.D.A. Miscellaneous Publication No. 668, 1948, p. 48.

Slightly over ten years has passed since the first tree farm was established in Washington. Today, the American Tree Farm System has spread over thirty-three states. The number of tree farms is approximately 3,400, and the total acreage is in excess of 24 million. In the Douglas fir region of western Oregon and Washington, 37 per cent of all privately owned forests has been certified as tree farms. Great progress has been made in ten years. Significant as this progress has been, there is yet a long way to go. Actually, only about 7 per cent of the privately owned commercial forest land is in tree farms. Nevertheless, the movement is expanding steadily, and within the next decade or two it should be responsible for a marked improvement in forest conservation on privately owned forest lands.

A PROFITABLE BUSINESS

Tree farming, like any other business venture, must be profitable before it can be successfully sold to the public. The rapidity with which the tree farm movement has spread from coast to coast is eloquent testimony that it pays to be a tree farmer. Under normal conditions and under good forest management, most forest land will grow trees at a profit. We are truly just entering the "cellulose age," and as demands for wood and wood products increase, as they most surely will, tree farming will become more and more profitable. The American Forest Products Industries, Inc. cites the following typical examples of profitable tree farming on small private holdings.

A tree farmer in central Pennsylvania for the past twenty years has harvested an annual crop of 5,000 board feet of saw logs from his 130-acre wood lot. With the lumber he has built a modern eight-room house, a garage, an ice house, a chicken house, and an implement shed, besides keeping fences and other buildings in repair. In addition, he sells $300 worth of pulpwood and $50 worth of posts a year.

An Alabama tree farmer grossed $6,375, enough to send a son through college and law school, from timber harvests on a 286-acre wood lot. Today the wood lot is still producing regular cash crops and is in better condition than when the management program began.

An Ohio tree farmer with a 283-acre farm, of which 92 acres are in trees, averages a gross income of $2,000 per year from timber harvests off his land. His sales include selectively cut hardwood saw logs, Christmas trees thinned from hand planted stands, and veneer bolts.

A Washington tree farmer with a 50-acre stand of second-growth timber in eight years sold one million board feet of railroad ties, eight hundred cords of fuel wood, one million board feet of saw logs, and five hundred cords of pulpwood. Today his wood lot supports a thick stand of healthy, fast growing trees that will yield successive cash crops of wood.

An Oregon tree farmer owns 640 acres of land, all but 30 acres of it wooded. Since establishing a forest management program, the farmer has harvested 13,500 cords of firewood and several hundred dollars worth of pulpwood. In addition, he has cut enough saw logs to provide lumber for a new house and other farm buildings.

AN ANSWER TO REGULATION

The tree farm movement is an admission by the wood-using industry that more forestry is needed in the manage-

ment of private forest lands, and the industry proposes to obtain it by education and self-discipline—regulation, if you like, by and within the industry. Tree farming is industry's answer to state or federal regulation. It is a democratic answer, an American answer. Let us hope it will prove to be the correct answer for the furtherance of good forest management on private forest lands without government regulation.

T. D. Stevens, Ph.D., East Lansing, Michigan, is head of the Forestry Department at Michigan State College. He has also served as head of the Forestry Department at Alabama Polytechnic Institute and as assistant professor of range management at Colorado Agricultural and Mechanical College, and spent several years with the United States Forest Service. He is author of several technical articles and bulletins.

A Program for the Redwoods

By DEWEY ANDERSON

THE redwood forest of California stretches for 250 miles from the Oregon border southward to Sebastopol. Some of the oldest trees in the country grow there. Out of two million acres some 700,000 are in virgin growth. A large amount of Douglas fir and other white woods add to the value of this California resource.

This resource is being used up rapidly. Far more than half the cutting practices were described by the United States Forest Service as poor or destructive. Within our time, large parts of the forest will probably become ghost areas, offering neither work nor recreation for the increasing population of the state. The high prices of recent years have speeded up the cutting process.

Private conservation groups have been able to set aside a few small areas of the finest and oldest trees, and to save them from destruction. However, there will never be enough private money to save the whole area. It can and should be lumbered so that the useful trees are taken before they deteriorate, and so that replanting becomes an essential part of the process. By 1946 some 30 per cent of the redwood forest had been so badly wrecked that restoration to a highly productive forest would take 120 years.

What the Forest Service said in its 1946 survey was:

> Of all the redwood lands cut over to date, 56 per cent are growing little or no timber. The attempts made by the private owners to reforest a portion of these lands were unsuccessful and were abandoned. Restocking of these lands which have a tremendous growth potential should be a major objective for the area. . . . Ninety-five per cent of the timbered area within the proposed forest is privately owned. These lands are being cut over in such a manner that 80 per cent are left in a condition below acceptable standards of productivity.

THE PROPOSAL

Three years ago I worked out, together with Mr. Earle H. Clapp, the former associate chief forester of the United States, a program for the redwood forests.[1] The objectives of that program were to prolong and continue indefinitely the growth and value of the forest, to preserve the work opportunities of the people, to stabilize their community life, and to provide 124,000 acres of new state parks for recreational purposes. The method suggested was the establishment of a National Redwood Forest Corporation—financed by $125 million through loans from the Reconstruction Finance Corporation—which would purchase the forest lands and turn them over to the United States Forest Service for operation. The state would be asked to finance the new parks to the extent of $25 million, and would then own them and operate them. The forest debt could be paid off within sixty years at 2½ per cent interest, and the revenue from the forests would go on forever. The lumber companies and their workers would be continuously instead of temporarily employed.

The proposed National Redwood Forest area would cover about 2,100,000 acres. Of this, 708,000 acres are in old-growth redwoods and 220,000 are in old-growth Douglas fir. The

[1] *An Action Program for the Redwood Forests*, Washington: Public Affairs Institute, 1949.

four state recreation areas proposed would be made up of some of the best stands of the old-growth redwood. These areas would be owned and managed by the state of California, and would not be logged commercially.

It is very important for the successful functioning of our democracy to bring local people into the affairs that touch their lives. In setting up a National Redwood Forest Corporation I suggested that one of the three members be nominated by the Governor of California. The chairman would be the Chief Forester of the United States. The third member would not necessarily be from California. But in addition, there would be a Redwood Advisory Committee, chosen by the Governor of California from representatives of agriculture, labor, industry, and the local communities in the forest area. This body could represent all the interests of the state very effectively.

This proposal is to keep the present logging companies in operation. It is *not* a proposal to put them out of business. It is simply to provide a mechanism by which they will be prevented from carrying on destructive cutting, and by which reforestation and cultivation can be given a chance to rebuild the forests. Private initiative is desirable, but where its chief result is the destruction of a valuable renewable resource, it should be prevented, for its own sake, from doing that harm to society. I tried to state my interest in maintaining a regular logging industry as follows:

> It might be possible in negotiating some purchases to use a repurchase-right plan to the advantage of both the Government and the present owners. Such an arrangement would be particularly applicable to large operating ownerships with heavy and unliquidated investments in manufacturing plants and logging equipment and facilities . . . the advantage to present owners would include relief from taxation on timberlands, interest on indebtedness and from carrying costs in general over an extended period. They would shift to the Government whatever risk there might be in carrying stumpage over many years. They would also be relieved of the high cost of road construction, and also of the cost of maintaining all but minor roads . . . the stumpage for repurchase would be appraised by the Forest Service at frequent intervals on the basis of current operating costs and lumber prices with a reasonable margin for operating risks and profit—usually about 12½ per cent. Since it would be paid for only when and as cut, a relatively quick turn-over would be possible. . . . Repurchase might be either with the privilege of meeting the highest responsible bid, or without competition at the appraised value of the timber.[2]

THE SOCIAL ASPECT

The forest conservation dispute is basically one between present interest and future interests. It may well be more profitable for present owners to clear-cut now, and let the future go unconsidered. It may, at the same time, be of more value to society to forgo a few of the present benefits for the sake of maintaining a permanent resource.

In preparing this program for the redwoods I was struck with the way in which these differences spelled themselves out in terms of forest growth. In 1946 the Forest Service made a survey of the area. Under the cutting practices then prevalent, the annual growth rate was less than 200 board feet per acre per year. Good cutting standards would have produced something over 400 board feet of growth per acre per year. "Intensive management" would, after a period of time, have produced over 1,000 board feet of growth each year. Perhaps cutting practices have improved a little since then, but this

[2] *An Action Program for the Redwood Forests*, pp. 16–17.

discrepancy between the actual and the potential is too wide to be made up easily. The difference in the future, when even larger numbers of people will be demanding more lumber at reasonable prices, will obviously be large.

It would seem possible to make an estimate of the social cost of allowing a growth of only 200 board feet a year when five times as much could be obtained in the future by some present decrease in cutting, and by very active reforestation. Our schools of forestry ought to have done this for us long ago. Present profits are presumably reinvested in other properties and so aid our economic progress in other ways, but they are not invested in tree-growing, which is a long process. There will always be substitutes for lumber, and demand at future high prices will, by definition, never be greater than the supply at those prices. But effective demand at much lower prices might be much larger. The difference to the future home buyers and other consumers between probable high prices and possible lower prices may well exceed any advantages to society from the present prices and profits of the lumber companies. The magnitude of the difference needs to be worked out in detail, but I believe that it will be an impressive amount. The advantages to the wood workers of having a steady occupation instead of a migratory one, and the advantages to the communities in the areas from a continuing resource, are much clearer, and quite large.

What good forest practices can mean to the wood workers and to the communities in the forest area can readily be seen through a few figures. Each 12,000 board feet of lumber supports one person for a year. With a present average growth of only 150 board feet an acre, it will take about 80 acres to keep one person at work. Under the "good forest practices" of the Forest Service, it would take only 27 acres. Under the "intensive management practices" which involve cultivation and reforestation, it would take only 12 acres to keep each man employed a full year. To put it another way, present growth rates on one acre will support one worker for a little over half a day. Under intensive management that acre will give him eight times as much work—four days. I am particularly interested in trying to prevent any new migratory labor problems in the California forests because California already has enough of them in its food crops.

What California is apparently going to experience is what the East and Southeast have already experienced in regard to overcutting and lack of reforestation. In periods of very high prices the temptation to overcut seems irresistible, and in periods of low prices there are no funds for reforestation, and many lessees feel that they must cut more ruthlessly than before in order to maximize their income. I have a great deal of sympathy for their problems, but it does seem that the social costs of their operations should not be borne by the innocent bystanders in the form of the wood workers, the communities and the younger generation of the area, and the general taxpayers. A regular, steady lumber industry, cutting in accordance with good practices and with a reasonable share of its revenue devoted regularly to reforestation, would render more of a service to the state and the nation than one which, for presumably good and generally sufficient reasons, lets the future take care of itself. That simply means shifting a whole series of burdens to the community.

The lumbering companies of California, I am certain, would make more money over a sixty-year period by welcoming and accepting the intensive forest management which has been pro-

posed than they will by objecting to it and going on as they are at present. And if the stockholders of those companies want funds to pass on to their children, they would probably get more after taxes for that purpose under my proposal than they will get under the present practices.

THE ECONOMIC ASPECT

The proposal for operation of the redwoods by the United States Forest Service under the auspices of a National Redwood Forest Corporation was based on fairly low stumpage values, increasing annually at the rate of 1½ per cent. The starting figures were $6.35 per thousand board feet for redwood and $4.52 for white wood. On that basis the whole job of replanting, cultivating, and protecting would have been undertaken, with revenues sufficient to pay off the $125 million loan from the RFC and the compounded interest within sixty years. An annual cut of no more than 470 million board feet of redwood and 33 million board feet of white wood was assumed, in order to allow for re-establishing the forest. At the end of a sixty-year period the cut could be much larger, and at the end of 120 years it could be almost doubled.

In the three years since that proposal was made, lumber values have increased so much (about 17 per cent at the mills) that the cultivation and reforestation work could have been stepped up and the whole loan could have been repaid in a much shorter time, or a somewhat higher price could have been paid for the timber and a larger loan could have been repaid within sixty years.

A few figures from the pay-out estimate may be of interest. The accompanying table shows for a few selected years the total revenues from lumber sales, the salvage of minor species, and grazing rights, in Column 2. The total costs include administration, road construction, maintenance, planting and cultural costs, interest charges, and the sum of one million dollars annually paid in lieu of taxes to the state for the benefit of the forest counties. They are grouped in Column 3. The net revenue available for amortization is given in Column 4. (In this model, interest payments were postponable for the first ten years.) The last column on the right shows the unretired portion of the forest loan, originally $125 million, at the end of each of the years given.

TABLE 1—ESTIMATES OF OPERATION

1 Year of Operation	2 Total Revenues	3 Total Costs	4 Net for Amortization	5 Unretired Forest Investment
1	$4,596,430	$3,250,000	$1,346,430	$123,653,570
20	6,294,350	6,201,980	92,370	111,907,050
40	8,266,060	4,833,670	3,432,390	74,419,710
60	11,121,120	3,082,000	8,039,120	0

By the time the loan was repaid, the state and the nation would have had an investment worth over $320 million (including the improvements) at no cost to the two governments, and with a net annual revenue of $8 million to be divided equally between them, together with a far larger supply of reasonably priced lumber for the consumers, steady incomes for the wood workers, and a sound and continuous financial stability for the communities in the area.

THE NEGATIVE SIDE

It is important to attempt to understand why this proposal was not accepted when it was made. First, there was no national conservation or other group to press it on the attention of Congress. The country's policies seem to be affected more by contending producer groups than by consumer groups, and Congress does not yet see its own function as that of protector of the general welfare of the otherwise unrepresented consumers. Second, there

was no fiscal mechanism for the loan that had ever been used in quite this way before. The RFC has frequently loaned sums to mines and factories, but the practice of loaning to a national agency for conservation purposes was less common. Third, and most important, the lumber interests of the area were unwilling to forgo their opportunities for maximum short-term profits and to take their chances on contracts for regular cutting over a long period. The opposition was pronounced in spite of the provision that present timberland owners could be given the right to repurchase specified amounts of timber over the years, and stay in business. Perhaps a final explanation is that conservation has been mixed up in the public mind—and perhaps not by accident—with too much government.

One other argument was offered by some, namely, the fact that California now has a state forest law which presumes to regulate forest practices on private land. But nothing done under that law offers any hope that the redwood forest of California will be managed on a sustained-yield basis. Nor will the rapidly increasing population be provided with sufficient recreational areas that way. Simply to preserve some "forest museums" of these remarkable trees is a poor legacy to hand to the generations which follow us.

The government's expenditures for resources are on a year-by-year basis, with a host of claimant agencies contesting for the sums that are available. Actually, it is quite absurd for the United States to act as if public investment in resources were only a maintenance charge, to come out of the current annual appropriations. No business concern would put an acquisition of major assets under the head of operating expenses, to be paid for out of the year's current revenues. The odd part of this practice is that the United States treats its investments in foreign resources quite differently. It authorizes the Export-Import Bank to lend sums abroad up to a certain amount. The Bank then makes a series of loans. But none of these loans shows up in the annual budget, because they will be repaid. Wherever necessary public loans in soil or forest conservation in our own country can be repaid, it would seem reasonable to put them in the same class as our investments in foreign resources. If that were done as a matter of common practice, Congress might have been more ready to authorize this proposal.

But even more important than this revision of our accounting and budgeting system is the need for some more thorough national questioning about the whole idea of letting the forest resource owners carry on as if they had a responsibility only to their stockholders, and none to the communities where they operate. Practically all the American petroleum companies operating abroad have accepted a certain degree of responsibility to the nations whose resources they are extracting. They are helping them to build up the living standards of the people, to industrialize, to get better housing, to learn new farming and health techniques. Is it asking too much for our logging companies to accept some degree of responsibility for the future of the American communities whose resources they are extracting, and whose future they are unmaking?

Dewey Anderson, Ph.D., Washington, D. C., is executive director of Public Affairs Institute, and former codirector (with Percey E. Davidson) of the Institute of Occupational Research, Stanford University. He has engaged in numerous activities in the field of economics in connection with governmental agencies, and is author or co-author of many books, of which the latest is An Action Program for the Redwood Forests (1949).

Forest Policy for the Years Ahead

By Hardy L. Shirley

THE observant traveler journeying across our eastern and southern states is impressed with the large amount of potentially productive land that is little used or completely idle. Fallow fields, brushy pastures, abandoned farms, and some heavily eroded lands meet the eye. Much land that has never been cleared for farming likewise lies virtually idle in terms of potential productivity. Pine lands cut and burned in the Lake States furnish one example. Cutover woodlands in which decadent and cull trees occupy 80 per cent of the growing space provide another. Idle land best suited to forests is estimated to total 60 million acres.

Neglected land has its counterpart in neglected farm homes, shabby villages, idle factories, and the unsightly no man's land that surrounds our cities, producing only signboards, dumps, and huts of the scavengers.

To the European, accustomed to well-kept farms, forests, and villages, these neglected acres suggest crass waste. He might with clear conscience say, Open the gates of your idle acres to the homeless of other lands that they may use the good soil to stay hunger and want.

Yes, idle land is a symbol of waste. It is a symbol of overoptimism, of hasty development and slow disillusionment. Yet what measures can we use to control it?

Remedial Measures

Some would impose drastic regulations to prevent exhaustion of our basic resources of soil, forests, and water. Others just as earnestly would invoke drastic restrictions on government expansion lest precious individual rights be irretrievably lost.

Can we find a middle way? We can; in fact, we have found it. Case histories of trends in agriculture show the way. In New York State careful records kept over the years by farmers on both good and poor land have been intensively studied by experts in farm management. Farmers on good land were found to become progressively more prosperous; those on poor land, progressively more poverty ridden. Every improvement in genetic strain of crop or livestock, every refinement in soil management, but magnified the advantage of farming good land rather than poor land.

The over-all result of applied agricultural science, therefore, was to favor enormously the farmer on good land and to discourage his neighbor on the hill farm. Abandonment resulted. This encouraged land speculators, who sold land acquired at little cost to inexperienced farmers. Average tenure on such lands dropped to five years or less. Meanwhile, the savings of a lifetime might be dissipated.

To stop this evil, land classification based on the capacity of the land to support a family practicing good farming was begun. This was supplemented by state purchase of submarginal farms and returning them to forests. County agricultural agents and local bankers advised prospective farmers against purchasing poor land. Attractive wages in nearby factories drew others out of farming. Wise management of these land resources was attained without drastic regulation, loss of owners' rights, or granting undue power to governmnet.

World Outlook

In a world where half the people are poorly fed and housed, needless waste of resources is viewed as a sin against mankind. Superabundance for a few, alongside want for the many, creates vast human unrest. Years of international tension seem to lie ahead. To ignore the consequences of such a state on domestic forest policy today is as unrealistic as to ignore atomic weapons. Leaders in other lands are demanding much in addition to food—shelter, fuel, books, education, and industries. Forest products are next to food in importance.

World forests are vast. They cover 9.5 billion acres, of which only one-half have been tapped for commercial use. However, unexploited forests are remote, contain trees of many species and unknown properties, and are mostly hardwoods. Available chiefly only from North America, Europe, and Siberia, softwoods today make up 85 per cent of total lumber demand. The densely populated Mediterranean and Far Eastern countries are mostly without adequate wood supplies. Consumption of wood in these countries is as low as 2 cubic feet per capita yearly, as contrasted with 28 in Europe and 75 in the United States. Since little prospect exists for quickly developing the untouched forest, and requirements of local populations expand about as rapidly as transportation opens these lands, the United States can expect to obtain little wood to augment our own supply or to fill needs of deficit countries.

The United States has a twofold obligation in world forestry. We should manage our own forests well to set an example before other nations. This would mean growing timber to meet our own needs, with some surplus for export.

We should assist others to develop the full potentialities of their forest land. Aid to others can be most effective and cheap if it is concentrated on efforts to spread technical information and the desire to use it. Suggested methods of accomplishing this are graduate instruction and study tours in the United States, help to establish technical schools, research centers, and extension services in other lands, and promotion of international trade. To default on these obligations is to invite rival nations to provide the service and to reap the good will that results from such co-operation.

Need of Forests at Home

Our country by 1960 assuredly will contain 170 million souls and by the year 2000 in excess of 250 millions. Such a population is vastly in excess of the 180 million forecast used in the United States Forest Service wood requirements studies. Another article in this series will deal in greater detail with domestic requirements. Suffice it to say here that little prospect exists of substantial and long-continued decline in requirements, in view of population growth, mobility of workers, high defense requirements, and the needs of other countries.

Wood has always occupied an important place in the national economy. As of 1947 the lumber and lumber products industries ranked tenth in national employment, with 636,000 workers. These created values of 2.5 billion dollars. The paper industry ranked eleventh in the values added by manufacture. Wood as a basic raw material for other fiber-producing industries and plastics industries seems destined to grow in importance in the years ahead.

Our country greatly needs the many additional services of forest land. Water becomes more precious year by year, floods more disastrous. Increasing dependence on an industrial economy multiplies the need for outdoor recrea-

tion in natural settings. Forests protect watersheds, afford recreation for man, and provide homes for useful wildlife. Forests represent the best commercial use of over 25 per cent of the land area of the United States. On an additional 8 per cent of our land area, forests serve as the most useful vegetation even though no timber is harvested.

PRESENT PROGRAMS IN FORESTRY

Our country has impressive forestry programs currently in operation. They include some 115 million acres in federal, state, county, and community forests, managed with timber production as a major objective. To this should be added nontimber-producing lands in national, state, and local parks, and noncommercial forest land included within the boundaries of national and state forests. Pulp and paper, lumber, and other forest products industries have industrial forestry programs some of which match those of public agencies in intensity. Public effort through the Cooperative Forest Management Act, and private effort through the tree farm and other movements, are carrying the management of forests to small holdings. Co-operative control of fires and disease and insect outbreaks is being rapidly expanded. Research in forestry has moved at a rapid pace.

Equally significant have been advances in logging equipment, and in milling, processing, and wood fabrication.

Progress in forest management during the past decade has been little short of phenomenal, especially in industrial forestry. Foresters employed by private business have increased from about 700 to some 4,400. Changes in attitudes and policies match the growth in industrial foresters. Still we are barely started on the huge tasks that lie ahead.

Present forestry programs fall short in the following specific instances:

Large areas of forest land are still unprotected against fire.

Losses from destructive insects and tree diseases substantially exceed those caused annually by fire.

Saw-timber growing stock still appears to be declining at the rate of 1⅓ per cent annually.

Clear-cutting immature timber, wasteful of both wood and growing space, still exists in most states.

The timber-growing potentials of the national forests are only partially realized through timber harvest.

Some 60 million acres of land best suited to forests remain today understocked or denuded. Planting programs are decades behind need.

The economic problems involved in small land ownerships have still to be clearly defined and solved.

Logging and lumber manufacture lag behind other industries in increasing output of labor and in reducing accident rates.

Lumber prices in recent years have increased at a far more rapid rate than prices of other manufactured commodities.

Floods and periods of low water supply plague many areas of our country.

RECENT PROPOSALS

Following exhaustive studies of forest resources and national requirements by both the United States Forest Service and the American Forestry Association, a Forestry Congress met in Washington in 1946. The *Proceedings* of the congress contains the best modern résumé of thinking on the question.[1] Other significant writings are those of

[1] American Forestry Association, *Proceedings of American Forestry Congress*, Washington, D. C., 1946.

Graves,[2] Pinchot,[3] Winters,[4] Greeley,[5] Raushenbush,[6] Gulick,[7] and members of the United States Forest Service.[8]

An analysis of these various proposals would be out of place in this article. Much ground in common exists, and some sharp differences.

Proposals generally supported

Agreement is general that more adequate protection should be provided forests against fire, insects, and diseases.

Those lands that are needed for public recreation or for critical watershed protection, and lands that are so poor in quality that they cannot yield sufficient forest products to justify private ownership, should be largely in public ownership.

Taxes on forest land should be neither confiscatory nor so low that the forest fails to contribute its fair share toward support of government.

States having forests should support a competent organization to protect lands from fire and manage state forests.

Research programs should be carried forward vigorously on all major forestry fronts.

Insurance to protect forest landowners against crippling losses from fire, insects, and diseases should be provided.

Barren lands unsuited to other uses but capable of supporting commercial forest crops should be planted to trees.

The national forests should be managed so as to produce to their full capacity timber to support the national economy. Other public forests should be managed likewise. Industry, landowners, government, and labor should co-operate in managing all forest land so that the social benefits to mankind are maximized. This includes use of forests for recreation, wildlife, and water and soil protection. It also implies management to stabilize employment, and forest communities dependent thereon.

Controversial issues

Sharp differences in opinion exist among representatives of government, industry, and labor over the extent and types of aids to private owners, the extent of public ownership of forests, and public regulation of private forest practice. The forest industries are opposed to the generous extension of public credit, believing that this will lead to supporting uneconomic holdings and inefficient management. Credit, they feel, should be handled through private channels. Government as represented by the United States Forest Service has favored public credit on a fiscally sound basis and has favored distribution of planting stock to farmers at nominal cost, but has not advocated direct benefit payments for forest improvement practices. Organized labor has advocated extensive benefit payments to landowners and timber operators for forest improvements, safety measures, and practice of good forestry.

The United States Forest Service wishes public ownership extended to block up holdings within existing national forests. It also advocates ac-

quiring lands of low productivity by the public. The forest industries are willing to exchange land within national forests to block up federal holdings, but ask also that some federal lands be relinquished to block up private holdings.

The Forest Service advocates public regulation of private forest practice by states. In states that fail to act within reasonable time, the Forest Service favors direct federal action. The forest industries favor regulation at the state level only where this is demonstrated to be needed. Organized labor has favored regulation strictly at the federal level, which would provide that no timber be cut unless designated for cutting by an officer of the United States Forest Service or a forester licensed by this Service.

NEW APPROACH NEEDED

The writer feels that the proposals discussed fall short of future needs in several respects:

1. Future United States and world populations have been underestimated.
2. Obligations of the United States as a leader in world political and economic affairs have been minimized or ignored.
3. No nation-wide classification of forest land based on uses and productivity has been proposed carrying a program for each land class.
4. No proposal deals effectively with the complex problems confronting the holders of small forest properties.
5. Proposals for regulating private forestry practice provide inadequate landowner representation, and are restrictive rather than constructive in nature.

In the following sections the writer sketches his own thoughts on forest policy. They are based on his conviction that United States industries in the years ahead will provide a good market for all the timber we can grow economically.

CLASSIFICATION OF FOREST LANDS

Forest policy can best be formulated and administered by relating it to the following classes of forests: (1) protection forests; (2) recreation forests; (3) commercial forests: (*a*) suited for intensive private management, (*b*) suited for extensive private management, (*c*) uneconomic for private management.

1. *Protection forests*

Steep slopes, municipal watersheds, and flood-producing areas are classes of lands that require the protective effect of forests to retard erosion, to hasten infiltration of water into the soil, and to impede surface runoff. Protection forests should be given the most careful handling. This will require public ownership of the most critical, and for other lands, restrictions on cutting. Because abuse of protection forests may cause disastrous public losses, these should be the first to be placed under a form of public regulation.

2. *Recreation forests*

Second only in priority to soil and water protection are forests for recreation. Lands needed for public parks, parkways, and scenic monuments should be set aside in generous amounts. Most should be in public ownership with timber use excluded or restricted so as not to interfere with recreational use. Timber harvesting on many lands can be conducted so as to enhance recreational values by opening vistas, improving food and cover for wildlife, increasing accessibility, and creating variety in otherwise unbroken forests. Private forest lands having high value for public recreation may in some cases require special treatment. The public might very well consider offering the owners inducements to open such lands to public use.

3. *Commercial forest lands*

Commercial forest lands are those capable of producing harvestable crops of timber and not required for higher uses conflicting with timber cutting.

(*a*) *Lands suited to intensive private management*

Lands supplied with a good transportation network, near timber markets, and capable of producing attractive financial returns from forestry, justify intensive management. Potential growth is such that merchantable harvests may be expected at intervals of thirty years or less. Few such lands support today timber stands of high value. In fact, it is these very lands that have been cut most frequently and heavily in the past. On many accessible forests, timber growing stock has been so badly depleted that intensive management will be unprofitable for decades. These fall in Class 3(c) below. Lands classified as suitable for intensive forestry should receive special consideration by government. It is from such lands that the bulk of the future wood supply for the nation must come. Forest practice on these well-located, high-producing lands should be in keeping with the potentialities of the land.

(*b*) *Lands suited to extensive private forestry*

Land remote from transportation, rugged in topography, with rock or poor soil, or otherwise difficult to operate, is suited only for extensive management. Merchantable cuts of timber can be had only at intervals of thirty years or more. Such land if taxed at a reasonable rate, as in the unorganized towns of Maine, may be a good investment for the private timberland owner. It can, however, support only limited expenses for forestry. Public regulation of practices should be mild. The land should be protected against fire. Public policy should encourage efforts on the part of the owners gradually to convert these lands, by means of roads and other practical measures, into land that can be handled intensively.

(*c*) *Forests uneconomic for private management*

Timber may be profitably harvested from many lands on which the stumpage value is below the cost of producing it. Lands may fall in this classification because they are remote, steep, rocky, arid, or swampy. They may also be uneconomic if overtaxed or if undersized. Lacking prospect for financial return, the bulk of such land should be managed by the public. However, small scattered holdings may prove unduly expensive to manage by government. Carefully administered public aids to private owners offer an alternative. Aids would be justified in the long run only if they enabled owners within a few decades to transform these lands from Class 3(c) to Class 3(a) or 3(b). Little can be done by the public to regulate forest practices on such lands without such requirements being tantamount to confiscation.

SPECIAL PROBLEMS ON SMALL FOREST PROPERTIES

Small forest properties owned by 3.1 million farmers and 1 million others in aggregate total 261 million acres. Practices on such lands as revealed by the Forest Service reappraisal study of 1945 are poorest of all. Present public measures grouped together are still insufficient to make timber growing economic on properties averaging only 63 acres in size unless these are an adjunct to some other use. Cull trees, low-value

species, and small trees are common. Understocking is characteristic. Timber operators usually want to cut everything useful on such a property because of the high cost to them of purchasing and harvesting timber in small quantities. Co-operative marketing has occasionally helped such owners.

The best results on small ownerships have been attained in New Jersey, where it is stated that 50 per cent of the timber is cut under state supervision.

High productivity can be assured only by consolidating such land into economically sized management units. Public policy should encourage this. Neither state nor federal government can be expected to act as agent for over four million private owners.

A PATTERN FOR IMPROVING FOREST PRACTICE

Argument during the past eight years has centered not so much on the desirability of public regulation of forest practice as on what form regulation should take, and what agency should administer it. What really concerns owners is the fear that regulations will be imposed by men lacking firsthand experience in the economic difficulties of managing timberlands.

The proposal made here is similar to patterns that have worked successfully in Sweden, Finland, and Norway. It involves organizing each forested state into appropriate-sized forest districts. A forestry board made up of representatives selected by forest landowners and appointees of the state should serve each district. Their functions would include establishing forest practice standards, supervising the administration of public aids to forest owners, and reviewing the program and activities of district foresters.

Boards should emphasize positive measures to improve forest productivity, rather than punitive measures against delinquent owners. Such positive measures might include improved protection against fire, insects, and diseases, aid in access road construction where this would benefit several owners, improvement of marketing information and services, measures to stabilize local industry and employment, and perhaps licensing or listing of forest operators who can be relied upon to do a satisfactory job of timber appraisal, logging, custom sawing, tree planting, and access road building.

Such boards should be given wide authority to promote activities that offer substantial promise of increasing the usefulness of forests. Integrated wood-using industries that encompass pulp, lumber, veneer, and small dimension manufacture are examples of opportunities to reduce waste and thereby improve potential returns to landowners.

Work of district boards should be subject to review by state forestry boards and a national forestry board. Review should be in the nature of establishing national and state goals in timber production and distributing these to districts, rather than restricting imaginative attack on local problems by individual district boards.

In addition, these citizens' boards would be useful as advisory bodies to the federal and state forestry services. Forest landowners should make up the majority representation on state and federal boards, with additional representation from forest labor, wood-using industries, recreationists, and range and water users. Constant liaison between federal and state forest officers would enable forestry boards to adjust their programs to meet national needs.

SUMMARY

It has been possible herein only to sketch in bare outline some of the major issues involved in managing our country's forest resources, and measures deemed helpful in meeting these.

Our forest policy should provide for a population far in excess of 180 millions. This level may be approached within a decade. Foreign obligations should be recognized and provided for, including assistance to other countries in developing their own forests. Generous reservations of park and other recreation lands should be made with appropriate restrictions on forest practice. Public concern should be especially directed to protecting soil and watersheds. Classification based on economic productivity should be recognized as essential for guiding practice on both public and private lands.

Public control over private forest practice should be democratically administered, with forest landowners themselves having majority representation on policy boards. Government control over forestry should be directed toward meeting positive goals rather than setting minimum standards.

Hardy L. Shirley, Ph.D., Syracuse, New York, is acting dean of the State University of New York, College of Forestry at Syracuse. Prior to coming to Syracuse in 1945, he served sixteen years in the United States Forest Service at the Lake States and Northeastern Forest Experiment Stations, and was director of the latter station from 1939 to 1945. He has published widely in the fields of silviculture, forest economics, and forest policy, and is author of a forthcoming book entitled Forestry and Its Career Opportunities.

Soil Conservation and the Maintenance of Soil Productivity

By Richard Bradfield

According to the basic laws of conservation, matter and energy can neither be created nor destroyed. These principles apply to the material of which soils are made, as well as to the rest of the earth. The soil, as an individual entity, can be destroyed partly or completely. The matter in it can be transformed into a myriad different compounds and dispersed throughout the globe, but it cannot be destroyed. It will still exist somewhere and be available at some time for use in another soil building cycle.

The general public has been greatly confused by the widespread difference in views which have been appearing in the public press and in popular books and magazines in the last decade, regarding the status of the productivity of the soils of the United States and of the rest of the world. This is a very vital matter, and the thinking person should be concerned. What is the truth? Which of these conflicting views is correct—the pessimistic view expressed so eloquently by Bennett, Vogt, Osborn, and others, or the more optimistic view frequently expounded by Salter, Kellogg, Sir John Russell, and others?

As is the case in most controversies between optimists and pessimists, there is a considerable body of basic truth available to support either point of view. This is certainly true with respect to the highly divergent views regarding soil conservation. People tend to see what they want to see. They see not only with their eyes but through their specialized training and past experiences as well. Soils men are becoming more and more highly specialized. The vast accumulation of data of all sorts dealing with soils makes this necessary. We have soil physicists, soil chemists, soil microbiologists, soil fertility specialists, soil morphologists, soil conservationists, et cetera.

It is just as natural for soil scientists in these various specialized fields to reach different conclusions as to the status of our soils as it is for independent medical specialists to differ in their diagnosis of a patient's illness. No one man has at his disposal all the basic information necessary for an accurate judgment of the potentialities of the soils of the United States. The answer that one gets when one speculates on this question depends on the assumptions he makes with respect to a whole host of contributing factors.

Agricultural Experiments

From the dawn of soil science, all specialists in these fields have been more or less interested in maintaining and increasing the productivity of the soil. The first agricultural experiment station at Rothamsted in England set up experiments in 1843 to measure the effect of the soil treatments which were known and feasible at that time upon the long-time productivity of the soil. At that time, chemical fertilizers were just being introduced, and the founder of this station, Sir John Lawes, was interested in finding out whether these new chemical fertilizers would maintain the productivity of the soil over a long period of time as effectively as the well-known barnyard manure. These experiments have been continued ever since that time. The answer which

they have given is quite clear cut. Crop yields have been maintained for over a century, even with continuous culture of wheat, with both chemical fertilizers and farm manure.

When the state experiment stations were set up in this country, most of them shortly after the close of the Civil War, similar experiments designed to measure the effects of different cropping systems and different soil treatments upon the long-time productivity of the soil were started, and in a few cases these original experiments are still being continued.

The oldest of these, the Morrow plots at the University of Illinois, are now over seventy years old and show quite conclusively that systems of management known at the time these experiments were started and now widely practiced throughout the corn belt are not only maintaining but even increasing the productivity of that originally exceedingly fertile Illinois land. As a matter of fact, the plots which have been growing a rotation of corn, oats, and clover for this entire period, with modest applications of farmyard manure, lime, and superphosphate, have in recent years been producing yields of crops which are about 32 per cent larger than the yields obtained when these experiments were started. Similar experiments are located on Sanborn field in Columbia, Missouri, and the Jordan plots at State College, Pennsylvania.

Early in this century, Cyril G. Hopkins, of the University of Illinois, published a book entitled *Soil Fertility and Permanent Agriculture*. Director C. E. Thorne of the Ohio Agricultural Experiment Station published a series of bulletins about the same time on the maintenance of the productivity of soils, with special emphasis on Ohio conditions. All this early work was based on field experiments, and the criterion used for determining what was happening to the soils was the yield of crops obtained each year over a long period of time. These early leaders were working in a general farming area, in which considerable livestock was raised, in which good crop rotations were widely followed, and in which the soil, in general, was protected physically and rendered inactive biologically by long, cold winters. It is clear, then, that soil scientists have from the beginning been concerned with the problem of maintaining the productivity of soils.

Emphasis on Erosion

In the South, the situation was different. Farmers were following a one-crop system, with a high percentage of their land in row crops such as corn and cotton. The rainfall was heavier than in the North. Because of the more open winters, the soil was not so well protected against erosion nor so inactive biologically as in the North. Hugh Bennett, founder of the Soil Conservation Service, was a native of North Carolina and spent much of his professional career in the South. This was the type of agriculture with which he was most familiar and in which he was most interested. To his practiced eye, the effects of erosion were obvious and devastating. He succeeded in persuading President Roosevelt to establish a special Soil Erosion Service in the Department of the Interior in 1933. This later developed into the Soil Conservation Service of the Department of Agriculture. It was given the mandate to stop soil erosion.

Bennett was a crusader. Every type of evidence that he or his employees could find of soil moving off a field or from one part of a field to another was measured, photographed, and dramatized. By comparing the depth of certain characteristic layers or features in the cross section or profile of virgin

soils in woods or fence rows with the depth of these same features in fields which had been cultivated for a long time, it was possible to estimate roughly the amount of topsoil which had been lost by sheet erosion. By the use of such criteria, land under cultivation in most of the United States was quickly surveyed and mapped and estimates were made of the amount of topsoil lost from the arable land in the United States by erosion.

DIVERGENT VIEWS

As an outgrowth of these developments, the men working on soils in the United States have, in the last twenty years, tended to be divided into two groups. First are those interested primarily in the physical losses of topsoil by erosion and in means of preventing further losses. This group is largely affiliated either officially or ideologically with the Soil Conservation Service. Second are those interested primarily in developing the best possible methods for managing the soils which we have left, their potentialities under good management, and so forth. This group is made up largely of the soil scientists in the state agricultural colleges and experiment stations and in the Bureau of Plant Industry, Soils, and Agricultural Engineering (until recently Robert M. Salter was chief of this Bureau) of the United States Department of Agriculture. We have, then, two fairly large groups of soil specialists, supported largely with public funds, either state or federal, and both interested in better soil management.

It soon became evident that while the innovations emphasized by the Soil Conservation Service for preventing erosion (terracing, strip cropping, diversion ditches) were very helpful, they needed to be combined with the best of the conventional agronomic practices. But this area of activity had already been pre-empted by the older Bureau of Plant Industry, Soils, and Agricultural Engineering in the Department of Agricultural and the state agricultural experiment stations and colleges. Any effort made to apply such a well-balanced system of soil management obviously led to overlapping activities, controversies, and competition for funds between the various agencies, and aggravated the need of each for data for dramatizing the situation. The net result is that many thinking people on the side lines have been confused. This is all a part, possibly an essential part, of the democratic process.

Erosion control is a very important phase of soil conservation in most areas; in certain areas, unquestionably the most important phase. There is no question that, in the broadest sense, it was being neglected and is still being neglected in many areas. In a period of about two decades, largely as a result of the energetic leadership and evangelistic fervor of H. H. Bennett, the country has been made erosion and soil conservation conscious. The colleges of agriculture in many states have added specialists in soil conservation to their staffs and are offering courses in soil conservation to their students.

When he asked me to prepare this paper, the editor wished "a disinterested judgment on the merits of the controversy between the Soil Conservation Service which argues that we must restore vast areas, and the Salter-Kellogg group which seems to argue that increasing productivity will see us through fairly well." In the meantime, Hugh Bennett, chief of the Soil Conservation Service, has reached retirement age, and Robert M. Salter, then chief of the Bureau of Plant Industry, has been named as his successor.

This point is significant. It does not detract one iota from the epoch-making services of H. H. Bennett. It indicates merely that his most important job, making the United States and the world more conscious of the evils of soil erosion, has been superbly done, but that it is now time for all concerned to bury their hatchets and devote all their energies to the development of carefully integrated, well-balanced systems of soil management in which erosion control receives its due share of attention.

SOIL BUILDING AND DEPLETION

All the above is cited to give the general reader some background which I think is factual for understanding some of the confusing and at times apparently conflicting statements made in the public press and in popular magazines and books. Let us now approach our subject from the standpoint of the best basic scientific evidence available to us. Let us consider first the nature of soils, how they are formed, how and why they deteriorate under cultivation, and how this deterioration can be prevented.

The soil is not a dead, static storehouse with a few inches of topsoil built up before agriculture started and incapable of being renewed. It is a living, dynamic system, in which constructive and destructive processes are constantly proceeding side by side. If all the vegetation produced is allowed to fall back on the soil, as it does under natural conditions, organic matter accumulates and fertility increases. As organic matter accumulates, the rate of its decomposition increases until a dynamic equilibrium is reached between soil building and soil depleting processes. When the soil is put under cultivation, the destructive processes are accelerated and the constructive processes retarded.

If a soil depleting cultivated crop like corn or wheat is grown continuously for long periods, without fertilization, yields will not drop to zero but will tend to reach a new equilibrium value which can be maintained for very long periods—for practical purposes, almost indefinitely. The yields of corn or wheat produced under such circumstances usually range from ten to twelve bushels per acre. This is what has happened in many old countries with dense population and an underdeveloped agriculture.

That course is, however, not the only one open to us. We can, in many cases at least, step up the soil building processes until they equal or even exceed the soil depleting processes. Proof that it can be done on a national scale is found in the history of agriculture of western Europe. The average yields of wheat in western Europe 150 years ago were close to this limiting value of 8 to 12 bushels per acre mentioned above. At the present time, they average from 30 to 40 bushels. Many regions in eastern United States which have been farmed for over 150 years supply equally convincing evidence that practical and economical ways have been found for building up the productivity of the soil far above the natural virgin levels existing when the white man came to America. It is worth noting, too, that this has been done by farmers without subsidies. In the early years it was done without the aid of the very great advances made in the agricultural sciences in the last quarter of a century.

PLANT NUTRIENTS

All the energy stored in our crop plants comes from the sun, and usually about 95 per cent of the dry matter in them is derived from air and water, leaving only about 5 per cent coming from the soil. This 5 per cent is made up of the elements contained in the ash of the crops, plus the nitrogen which is volatilized when crops are burned. The major ash constituents are calcium, mag-

nesium, potassium, sulphur, and phosphorus. Several other elements are required by plants in very small quantities, usually only a few pounds per acre. These elements are copper, manganese, zinc, iron, boron, and molybdenum. They are usually referred to as the micronutrients because they are needed by crops in such small quantities. They are just as essential for the growth of the plant as the macronutrients. Practically all the water used by plants is absorbed by the soil through the plant roots. With most crops, between 300 and 800 pounds of water is required for every pound of dry matter produced. This calls for enormous quantities of water; and since our rains are often poorly distributed, it is important that the soil have sufficient storage capacity for water to meet the needs of the growing crop during the periods between rains.

The soil is, of course, also a storehouse for plant nutrients. An acre of soil one foot in depth usually weighs about four million pounds. Plant roots are usually able to exploit the nutrients in a soil to a depth of from two to five feet. Usually there is enough nitrogen and phosphorus in the top three feet of average soil of the humid region to meet the needs of from fifty to one hundred average crops, and enough potash for one thousand average crops. The size of the reserve in tropical soils or in very coarse sandy soils is of course not so large. Chemical analyses give us an accurate picture of the size of this stored reserve of plant nutrients. It was found quite early, however, that while chemical analyses gave a very useful picture of the magnitude of these stored reserves of plant nutrients, they often failed to give an accurate picture of the capacity of the soil to release these nutrients to the crop in a usable form. It was found, for example, that many very unproductive soils could not be distinguished from very productive ones by their chemical composition.

AVAILABILITY OF NUTRIENTS

We now know that this lack of agreement was due to the fact that these soils differed greatly in their ability to release their stored reserve of nutrients in a form which could be utilized by the growing crop. The rate of growth of the crop is not influenced by the magnitude of the stored reserves, but only by the amount of the various nutrients available for meeting the day-by-day needs of the crop. These needs, even in the case of the elements needed in largest amounts, seldom exceed two or three pounds per acre per day at the time the crop is growing most rapidly. It is very difficult and would be very expensive in most cases to make any great change in the magnitude of the reserves of fertility stored in the soil in a short period of time. On the other hand, it is very easy and often exceedingly profitable for the farmer to increase the supply of nutrients available for meeting the day-by-day needs of his crops. In the case of nitrogen, for example, he can do this by growing leguminous crops like clover which have the capacity to take nitrogen from the air and fix it in forms which can be made available to the succeeding crop by the action of soil micro-organisms. A crop of alfalfa can fix as much as 250 pounds of nitrogen per acre in one year—an amount that is more than sufficient to meet the needs of most nonleguminous crops for one year. As a matter of fact, when a crop like alfalfa is grown and the top used for hay, enough nitrogen is left in the ground in the form of roots to meet the requirements for many nonleguminous crops for one year. The farmer can also increase the supply of available nutrients for his crops by the addition of crop residues, farm manures, and commercial fertilizers.

The extent to which each of the above techniques is used for maintaining the productivity of soil varies widely in different sections of the country, on different soil types, and with different types of farming. Livestock farming is ideal from the standpoint of soil maintenance, and as long as we are able to afford a livestock economy in this country, the maintenance of the productivity of our soils will not be a very difficult problem in most areas. To produce most types of livestock economically, large areas of leguminous forage crops are needed as a cheap source of high protein feed. Crop residues not fit for feed may be used for bedding the livestock and returned to the soil with the manure. Long-time experiments at Illinois and Ohio indicate that with a three-year rotation of corn, oats, and clover handled in this way and supplemented with very modest and inexpensive applications of ground limestone and superphosphate, yields of all crops involved can easily be maintained indefinitely at levels 30 to 40 per cent above the yields obtained on these soils seventy years ago. With more liberal fertilization, yields 50 per cent above those obtained seventy years ago can be consistently obtained with techniques now available.

In the potato and truck crop areas of eastern United States, applications of commercial fertilizer are used instead of farm manures. The soils in these areas are increasing in their content of phosphorus (see Table 1) and potassium, and are holding their own fairly well in nitrogen. The yields of practically all these crops in all these areas have been larger in the last ten years than ever before in history. There is little reason for feeling that their productivity is declining.

The citrus and vegetable production of Florida is based almost exclusively upon hand-to-mouth feeding of the crops with commercial fertilizers. Many of the soils used for producing these crops contain 95 per cent or more of sand. Farmers find it highly profitable to buy practically all the plant nutrients they need in the form of commercial fertilizer. As a matter of fact, they have been buying from five to ten times as much phosphorus as their crops have removed.

INCREASES IN YIELDS

For many years, the South has been referred to as Economic Problem No. 1. This is due in part to the one-crop cotton system of farming which has predominated the agriculture of much of the area. This era is rapidly drawing to a close as improved techniques for producing cotton are adopted. Several states have reported that they are now producing as much cotton as they ever did, on half of the land that they used twenty-five years ago. This frees half of the former cotton acreage in these areas for the production of forage crops and the development of a livestock industry. Dairying and other forms of livestock production are expanding rapidly. With this change in type of farming, there is little question that the agriculture of the South will soon be on a much more profitable and permanent basis. It would be hard to find a pessimist on the future of agriculture in the South among the agronomists of that region.

A careful study of crop yields for sixteen of our principal seed crops by Pearson, Myers, and Doak [1] indicates that the yields increased an average of 27 per cent during the period 1937–48. This was an unparalleled increase. During the same period, yields of vegetables increased on the average 2,100 pounds

per acre, a greater increase than had taken place in the preceding half-century. Heavy fertilization undoubtedly played an important role in both cases. During this period the use of commercial fertilizers more than doubled.

EFFECTS OF HIGHER YIELDS

This raises a question which is often asked. Do not higher yields per acre deplete soils more rapidly? In one sense, the answer is Yes. A 100-bushel crop of corn, for example, will take more from the soil than a 25-bushel crop. But it will not take four times as much, and *therefore not as much per bushel*. In another sense and from a long-time point of view, a much more important sense, the answer is emphatically No. The reason is that when we raise 100 bushels of corn instead of 25 on one acre, we free three acres for growing other crops; and if soil-building leguminous sod crops are grown on one or preferably two of the remaining three acres, the soil will be in better condition for future crop production.

Heavier fertilization results not only in larger crops but also in larger residues of fertilizer in the soil. If we calculate the amount of phosphoric acid removed in harvested crops in the states east of the Mississippi River, we find that the amount is often much less than is returned to the soil in the form of commercial fertilizer. Table 1 gives a summary of such data prepared by Cummings.[2] One needs to bear in mind when examining this table that it does not include the 500,000 tons of phosphorus returned to the soil in the form of barnyard manure each year. Since this table was prepared, the consumption of phosphate fertilizers in the United States has increased to over two million tons.

While the reserves of organic matter and of the nitrogen in it have undoubtedly been depleted in many sections of the United States, the fact that yields are increasing indicates that farmers are finding ways of meeting the day-by-day requirements of their crops for nitrogen by other techniques. With the increased production of improved leguminous forage crops already under way

[2] Soil Science Society of America *Proceedings*, 10: 241, 1945.

in many sections of the country and with the increase in the livestock industry in the South, the rate of loss of soil organic matter should be easily reduced. Our synthetic nitrogen fertilizer production has increased from practically zero at the close of World War I to almost 2,000,000 tons. Plants now being planned will increase our total capacity to about 2,300,000 tons per year by 1955. There is every reason for thinking, then, that the supply of nitrogen available to our growing crops will be greater in a few years than it ever was before, and fortunately the supply of free nitrogen in the air is inexhaustible.

In my opinion, we need not be very greatly alarmed about these losses in organic matter and nitrogen as long as crop yields are increasing. Higher yields per acre usually result in more efficient production, and more efficient production means cheaper food for the consumer, more profit for the producer, and, in general, larger residues of fertility left in the soil. The real time for alarm is when crop yields begin to decline consistently. No highly developed country has yet reached this stage, nor, in my opinion, is it likely to. The cost would be too great.

FUTURE PRODUCTION

Many have expressed concern in recent years about our future food production capacity. I feel confident that if our descendants a hundred years from now fail to produce enough food for themselves, it will be because they fail to make full use of the knowledge and materials which modern science has placed at their disposal. It will not be because of mistakes made prior to 1950 in managing our soils. There should be no problem in producing all the fruit, vegetables, potatoes, and cereals needed for our population a century hence, if it continues to grow at about 1 per cent a year. There should be but little difficulty in producing all the dairy and poultry products that we are likely to need under these same conditions. The most difficult problem will be to produce enough T-bone steaks to meet demands in times of great prosperity. While more difficult, when we consider the great potentialities for improving our vast areas of grasslands, even this goal seems attainable!

Richard Bradfield, Ph.D., D.Sc., Ithaca, New York, is professor of soil science and head of the Department of Agronomy at Cornell University. He was formerly associate professor of soil science at the University of Missouri and professor of soil science at Ohio State University. He is a member of the National Soil and Fertilizer Research Committee of the United States Department of Agriculture; of the Committee on Plant and Crop Ecology of the National Research Council; of the Agricultural Advisory Committee of the Rockefeller Foundation; of the Food and Agriculture Organization Committee on Agricultural Production; and of the Editorial Advisory Boards of the Journal of the American Society of Agronomy and of Soil Science. He is a past president of the Soil Science Society of America and of the American Society of Agronomy.

Comparative Costs of Restoration and Reclamation of Land

By Paul B. Sears *

ANY thorough analysis of land use and management is likely to reveal the existence of conflicting interests, as well as of purely technical problems. Nor is the situation simplified when such conflict involves, as it often does, more than bare economic advantage. In spite of the present rationalization of much farm practice, the typical operator lives with his land, and his feelings are correspondingly involved in anything that concerns it.

Land subject to restoration, or old land, has been under operation, usually tillage, is relatively near to long-established markets, represents a past investment of capital and labor, and frequently reflects the presence of traditional values. As part of an older political entity it is likely to be thoroughly taxed, but in return it usually has at hand an adequate system of public facilities to serve its occupants. Any expenditure of public funds represents a charge against these occupants.

The owner of old land may question the fairness of being obliged to pay for enterprises that create competition for him. On the question of broader benefits, such as power and flood control, he may wonder whether the benefit to him is in any proportion to his contribution. But while this objection may be tenable for special assessments, it is stilled—technically, at least—in the case of expenditures from blanket taxation, such as the federal income tax. It may be noted that while the seventeen irrigation states gain practically all the direct benefits from federal reclamation spending, in 1950 they paid only 17 per cent of income tax revenues.

Any clear analysis of the pattern of equities involved would have to go far beyond the limits of the present paper. To what extent is the need of reclaimed new lands a bona fide economic and social pressure? To what extent a manufactured one? To what extent do such reclaimed lands actually compete with old lands? To what extent do they represent a rational enrichment of important production? Assuming the need for greater national production requiring the investment of more capital, should this capital come from private savings or from (increased) taxation? These are some of the very important elements in the problem that we must leave untouched.

Depletion of Old Land

The productive capacity of much old land has suffered considerably. Dr. Robert Salter stated in 1938 that in spite of enormous progress in many fields of agricultural science, the per acre yield of Ohio farms was being maintained with difficulty.[1] And the same scientist reported in 1948 that the greatly increased yields due to hybrid corn had not been obtained without a corresponding demand upon soil nutrients.[2]

* With the invaluable help of Robert D. Teeters and Susannah Coolidge.

[2] R. M. Salter, "New Horizons for Agriculture," address given at the Annual Convention of the American Farm Bureau Federation, Atlantic City, N. J., 1948.

While much of this old land can most profitably be retired to uses other than farming,[3] the bulk of it can be restored to a good level of sustained production by suitable technical measures. As will be shown in the following discussion, the expense involved in this restoration can be met out of the resulting increased earnings. The experience of certain bankers shows that such rehabilitation can be satisfactorily handled through the ordinary channels of private credit.[4]

Besides this old land, there is in the United States an extensive area, estimated by the Soil Conservation Service in 1945 to be about 85 million acres, of now unoccupied land or land subject to extensive, low-grade use, some of which has proved very productive for fishing or trapping. To date these lands represent little if any investment, settlement, or improvement, although they can be made suitable for farming through clearing or drainage. Both operational and social facilities must be developed in the process of reclamation.

Government Investment

Unlike the earlier irrigation projects, a majority of which were privately financed, those now remaining must be underwritten by government funds. This money is contributed in part by all operators of old land, through taxation. Before 1940 the contribution of the Federal Government in this direction was deemed to be about one-quarter of the total output; but in the last decade the government proportion has greatly increased, and it will no doubt continue to do so. The remaining lands are naturally the more difficult and inaccessible ones; therefore ever larger investments will be required to build roads and bridges as well as the drainage and irrigation facilities. Then, too, this large investment will require provision for markets and other social institutions. In principle, all such expense is returnable to the Treasury from those who will own and operate the reclaimed land. However, their liability is minimized by the fact that cost of power, flood control, navigation, and other benefits is deducted from the cost of bringing new land into operation.

Reclamation of New Land

Estimates of the Twentieth Century Fund and the Army Engineers, representing both private and public sources, show that as much as 100 billion dollars would be required in the next generation to conserve and develop the country's renewable resources adequately. It is perhaps ironical for those interested in conservation to question the wisdom of measures designed to improve land use.

In a 1945 survey, the Soil Conservation Service estimated that there were 25 million acres which, when cleared

The amount of deterioration is difficult to determine, although Bennett's estimate of 50 million acres of cropland ruined for further practical cultivation, 50 million nearly so, and another 100 million acres with over half its soil gone deserves consideration. (Hugh H. Bennett, *Soil Conservation*, 1939, p. 7.) A fair criterion for the ordinary observer is the extent to which mixed legume-grass meadows are developed. Where the proportion on unspecialized farms falls below one field in four, efficiency of land use may be questioned. In 1950 the writer traveled over a thousand miles in Maine, where hay is a staple crop, and observed only four farms making effective use of lime and legumes. During the same season traverses of Ohio, Indiana, Illinois, and Iowa revealed fewer than one grass-legume field in twelve.

and drained, would be suitable for regular cultivation, and over 15 million more acres that could be irrigated. In the decade from 1950 to 1960 it is probable that about 12.5 million acres actually will be developed as farmland —more than half to be expansion of existing farms and the rest to be created into new farms.[5]

The cost of such development is conjectural, and there is no clear basis for determining what the returns from this new land will be. Study of Bureau of Reclamation figures reveals little, because the projects involve much more than the development of land for cultivation, and it is difficult to separate the costs. At the end of the fiscal year 1950 the Bureau had spent $2,196,000,000 to render 5,657,037 acres irrigable, which amounts to $388 an acre including money spent on uncompleted projects and on power facilities. In 1947 it was estimated that those whose lands were being irrigated by the projects would pay back 33 cents on the dollar, the rest of the revenues being derived from power and miscellaneous sources; while nonreimbursible items would amount to approximately 5 cents on the dollar.[6]

Clearly, the power facilities are more than paying for themselves—in fact, are paying for some of the irrigation facilities. Therefore, while we have figures for the estimated improvement in dollars per irrigable acre, the judgment is not an intrinsic one. Rather it is an evaluation of how much the farmer is equipped to contribute to the expense of construction of the project. Economists have suggested that repayment schedules might be improved and that methods for determining the economic value of irrigation and drainage need revision; but even if this were done, costs would have to be separated to provide the people of this country with a clear picture.

Except for sporadic studies made in limited areas, no substantial data are available as to what the returns are from reclaimed lands and whether the costs are justified. While no insurmountable physical obstacles stand in the way of development of vast new acreages, the economic feasibility of such undertakings is uncertain.

Determining economic feasibility

Experience can be resorted to in some degree, however. In examining irrigation prospects, a distinction must be made between supplementary irrigation and irrigation of arid lands. In many areas rainfall is adequate but poorly distributed throughout the year, in which case irrigation provides some degree of insurance against drought hazards. Or where rainfall is low, yields may be increased by supplementary watering from irrigation facilities. These objectives can be differentiated from those which are concerned with making arid lands cultivable.

One method that has been used to determine whether or not an irrigation enterprise will be economically feasible is to classify the land to be irrigated by type and then to figure how many acres of each type a farmer would need to own in order to pay for irrigation facilities and meet the other expenses of his farm. In the Columbia Basin, a Joint Investigation Committee estimated that 33 per cent of the lands to be irrigated could be classified as the highest type, that 40 per cent was suitable for most crops, and that 27 per cent could be used for pasture. At prewar prices and excluding the cost of irrigation construction, a farmer could expect to make $60 per acre per year from Class I land, $35–$50 from Class II land, and $20–$30 from Class III land. To meet operating expenses, the committee concluded that a farmer in the Columbia Basin would need to own altogether at least 50 acres of Class I land, 55–80 acres of Class II land, and 160 acres of Class III land, a total of 265–290 acres.[7] Naturally, if he owned Class I and II land only, his acreage would be less; but if his land were Class III exclusively, his unit would have to be considerably greater. While the formation of such a scale is based on judgment, it can be of value, and illustrates the kind of planning and forethought which can facilitate decisions about irrigation undertakings.

Present work and plans

In 1948 it was estimated that 22 million acres of idle, fallow, and pasture land as well as cropland was being irrigated, which is over half of the acreage that it is believed would lend itself to this development. In 1947 a tentative plan of the Bureau of Reclamation envisaged increased irrigation of more than 10.5 million acres by 1957 at a cost of $560 an acre, or a total of $5,976,000,000.[8] The Bureau further expressed its goal of eventually irrigating almost 19 million acres for less than $500 an acre; but from the present trend in prices, there is no likelihood that costs will decrease as was seemingly expected.

This ambitious program is contemplated despite certain difficulties in the past. Five projects have been abandoned and written off at a total loss of over three million dollars, and seven others have presented serious difficulties. In one of its own publications the Bureau states that "the project never became fully settled and the landowners were not particularly interested in irrigation after it became available."[9] In the Missouri Basin, surveys have shown that the unevenness of the terrain, low ridges and mounds, and small depressions present problems in planning ditches, leveling the land, and spreading the water.

The vast majority of the great irrigation schemes are in the West. Land sales records in the late 1940's show that in that part of the country land that is in or near an area of projected irrigation has sold for $50–$100 an acre. When all the improvements of clearing, leveling, and ditching are completed, the investment may be $200–$300 per acre.

Returns from improved lands

In the Pacific States the high prices that have prevailed during and since World War II for fruit and other crops have justified the costs of irrigation. Profit on some of the new-land farms of the Southwest has been derived from cotton, for which there has been a high demand, although over the long run the cotton market is known to be very uneven. Irrigation is possible only when water supplies are available. In the past few years, favorable weather conditions have been a factor in the success of a number of projects. Moreover, commitments abroad and demands of the armed forces have made the last decade a period of unprecedented returns from high prices and expanded markets.

When new irrigation projects are contemplated, the long-time lag between appropriation of funds and actual yields from the improved land must be taken into account. Payment is not com-

plete on any of the seventy-three projects undertaken by the Bureau of Reclamation in the western half of the United States since 1902, and has not started on some thirty projects.[10] Prevailing markets and prices are a questionable basis for evolving land development plans. Some estimate of probable future trends is essential in making a decision about present construction.

Drainage

Drainage has been used in the past as a technique by which extensive lands have been developed into cultivable areas, and it presents some promise for the future. But drainage of lowlands is expensive. The Soil Conservation Service found that whereas farm drains which emptied into natural streams could be built at a cost of about $5 to $30 per acre, drainage on land which required an outlet averaged from $15 to $40 per acre.[11] Some of the most far-reaching drainage projects are for lowlands of the Gulf coast and in the deltas of the Red River and the lower Mississippi. In the last seventy years, 8 million acres of agricultural land have been developed for farming in the lower Mississippi Delta, and since the war considerable other work has been done, especially north of the Red River. It is expected that 4,000 to 5,000 new farms may be under operation in this area by 1954.[12] Existing values such as the annual multimillion-dollar muskrat trapping industry of Louisiana cannot be overlooked when further drainage is contemplated. Moreover, flood protection will have to become more effective as these lowlands are developed. In the past, maintenance of drainage facilities in the valleys of the Mississippi and associated rivers has proved more expensive than in surrounding uplands—another factor worthy of consideration. This high maintenance cost has been caused in part by the filling in of channels with eroding soils from hillsides. Much redredging has been necessary.

In recent years the drained lands have done well as a result of high farm incomes in the postwar period. Districts where drainage is common have been able to pay off indebtedness, partly as a result of the favorable adjustments made possible by the Reconstruction Finance Corporation in the late 1930's.

A study of drainage in Sussex County, Delaware showed that the benefits derived would meet the costs and eventually provide the basis for gains. A drainage project in Rhode Island costing from $30 to $125 per acre, where the improved land was to be used for pasture and hay, was also considered worth while.

Possibilities and costs

In the Southeast, where the natural increase of the population is at a high rate in comparison to that in other parts of the country and where extensive acreage has been rendered unfertile by erosion, the pressure to develop new lands is great. A local survey made by the Soil Conservation Service showed that in Jasper County, South Carolina, 150,000 acres of land when cleared and drained would be suitable for farming. These findings were deemed applicable to similar areas of the Lower Coastal Plain of Georgia, North Carolina, and South Carolina, and the estimated costs in 1948 averaged $105 per acre: $55 for clearing after deduction of salable timber, $40 for drainage, and $10 for other costs.

Costs in other parts of the Southeast may vary above or below those in the Lower Coastal Plain, but studies of the Virginia Piedmont show that opportunity for the development of new farm units is slight. A considerable amount of land in Virginia and North Carolina is held for investment and is tenant farmed. Some of the owners who have considered clearing and drainage of their undeveloped lands have found that the advantages to be derived did not warrant the costs, and that it was more profitable as an investment to grow timber than to reclaim the land for cultivable crops. As long as enough farm crops to meet demands are produced on lands that are already improved or maintained at a productive level, new development of lands is not economically remunerative, and it is unfortunate that land advertisements have been persuasively designed to give a different impression.

RESTORATION OF OLD LAND

In the Southeast, the Corn Belt, the Lake States, and the Northeast, improvement of existing land suitable for cultivation presents an important challenge. Whether the development of new lands in these areas by clearing, drainage, or irrigation is justifiable is not so certain. The character and the amount of work required for restoration vary greatly. The extreme would be represented by farms on which boulders would need to be removed, stone fences buried in deep trenches, brush cleared, wet spots drained, field layouts and fencing changed, and strip cropping, liming, fertilizing, and seeding carried out. A more general situation, represented by the typical Soil Conservation District farm plans, would simply involve improved layouts, liming, fertilizing, and establishment of sound rotations based on increased use of grass-legume meadows. Where this latter is possible, an investment of perhaps $30 an acre is probably sufficient, and experience indicates that a three-year credit period is ample to repay the cost from increased earnings.

In New England, where farming is not a lucrative profession in comparison to other occupations, clearing brush for seeded pasture was estimated to run as high as $50 to $110 per acre in 1949.[13] Woodland clearing for orchards, vegetables, and other crops ranges from $95 to $160 per acre. The removal of light brush in recently abandoned fields would cost much less. Clearing in the Southeast could perhaps be kept as low as $25 per acre without stumping in areas where some returns could be derived from the timber.

Cultivated land

There is evidence that improvement and renovation of lands which are now cultivated is the most advantageous form of restoration. Estimates in a study of *The Rural Economy of New England*[14] showed that net income per acre increased in proportion to the amount invested for stepped-up productivity, although the smaller investments paid off more quickly. Another estimate[15] indicates that the costs would be about $30 per acre for "a good but fairly simple protective job, including expert help, fertilizer, seed, and use of machinery."

A study of farms in seven counties in Illinois[16] revealed that the county average of cost of conservation needs ran from $14.50 to $22.63 an acre. The farms were divided into two matched groups—"high" and "low" conservation farms—and it was found that the "high" farmers spent about 66 cents per acre

[j] $2,200 if new acreage actually benefited is considered.

per year more than the "lows." But the crop yields for the "highs" were 9 per cent to 21 per cent higher and their net returns $7.22 more per acre. Therefore, the 66-cent investment returned them $7.22—a rate of return of $10.94 on the dollar. The farms had been matched at the beginning of the study so as to make their net income and crop yield index similar.

A seven-year program worked out for a Missouri farm of 267 acres [17] showed that an investment of $9,700 ($36.30 per acre) including interest and hired labor would increase net income by $2,000 a year.

A case history of a 160-acre farm in Iowa [18] indicated that an $18 an acre investment (actually $23 if the farmer borrowed in order not to reduce his level of living) would result in decreased returns for the first three years. But even with the minimum returns that could be expected, the investment would pay off in nine years.

Other case studies have shown that the investments pay back with interest. Yields usually double, and the net income is tripled or quadrupled. Often a program covering several years is necessary to make the investment pay, but this time lag is favorable in comparison to the construction period needed to build irrigation and drainage facilities.

THE QUESTION

There can be no doubt that the continued development of land is necessary to meet the needs of an increasing population as well as expanding commitments. Moreover, some of our land is still being depleted and will have to be retired from cultivation before long. Other areas of cultivable land will be needed for road building and urban and industrial development. Certainly the yearly acquisitions of new land by drainage or irrigation operations and conservation practices have never been sheer gain, nor are they expected to be. But with newly perfected developments in farm technology, the trend will be towards producing a greater amount of crops on the same amount of land.

For the most efficient use of land, consolidation of farms and fewer of them may be the direction in which we should move. Yet human desires cannot be ignored, and at the present time the demand of citizens seems to be for more farms. Prices are high, and good farming land is difficult to obtain at the present time. The number of those who are lured by marginal or poor lands is not inconsiderable.

Whether it be in the best interests of the country for the government to create new lands for the cultivation of crops when the productive capacity of the lands now being worked could be increased with greater efficiency and economy is a subtle question. The role of a democracy may encompass the obligation to provide citizens with reasonable opportunity to choose a profession and way of life that they feel strongly about, especially when deriving a livelihood from the land has played such a significant part in the historical heritage of the country. Furthermore, it may be argued that the farm areas have replenished the populations of our cities in the past, and, with the curtailment of immigration, will be more important in this respect in the future.

On the other hand, at a time when every exertion is being made to preserve some vestige of security in the world, it may be regarded as something of a luxury for the government to develop new lands at great cost if more practical

[18] William G. Murray, Earl L. Heady, and John F. Timmons, "Economic Aspects of Soil Conservation Problems," *Journal of Soil and Water Conservation*, Vol. 5, Jan. 1949.

solutions to expanding needs are apparent. The justification of developing new lands on the basis that the drainage and irrigation facilities envisaged would also serve to improve existing lands is an argument without end. If a line is ever drawn, the competition for obtaining a good farm will be heightened; but this in itself might be a factor favoring better land use in the long run.

Economic Analysis of Land Use on the Western Ranges

By M. M. KELSO

THE THEORETICAL FRAMEWORK

INVESTMENT, for conservation or development, in any resource that yields a recurrent product is a problem in maximization over time of the social net product derived from use of the resource and its associated productive resources (1) with only so much investment as is needed to maintain unchanged the level of physical productivity of the resource in question, and (2) with investment of capital funds or labor to enhance the physical productivity of the source. The two are separable in theory but not in practice.[1]

Maximization of social net product from these resources with or without investment to enhance productivity is attained through control over production and investment inputs through which effect is given to decisions as to the kind and proportionality of inputs to commit to production systems based upon the utilization of these resources. Such decisions are made by entrepreneurs acting through firms, the requisite control over conjoint resource inputs being provided by the institution of property. Such firms may be privately managed or publicly managed, and the property may be private property or public property. Under capitalism, it is presumed that maximization over time of private profit to the firm is synonymous with maximization over time of social net product unless there is clear evidence to the contrary.

Maximization over time of *private firm profit,* with or without investment to enhance productivity, refers to maximization of the discounted stream of net profits anticipated by the firm resulting from the resource commitments decided upon by it. The discount factor will be larger (smaller) as the risks and uncertainties of the future seem to the firm to be greater (less).

Maximization over time of *social net product,* with or without investment to enhance productivity, refers to maximization of the discounted stream of "social benefits" over "social sacrifices" anticipated by the "public firm" resulting from resource commitments decided upon or permitted by it. Many of the benefits and sacrifices are not measurable in monetary terms; even for those that are, their over-all effect within the total economy is not empirically, though it is theoretically, measurable. The discount factor used by public firms (except under stresses brought about by need for short-run survival of the society) will normally be smaller than for private firms.

When resource use is under the joint control of two (or more) public and/or private firms, maximum net social product will result from its use only when the goals and expectations of the firms are alike, only when the time pattern of their inputs (costs) are comparable, and only when they share in returns comparable to their shares in costs. Otherwise, inputs and returns will be dis-

[1] To be theoretically complete, a third aspect of the problem should be stated, namely, disinvestment (deterioration) over time of the resource to maximize social net product. But to keep the argument within limits that can be treated in this paper, the third problem will be ignored by the assumption that deterioration of the recurrently productive resource—range land—is never socially justified.

torted away from a maximum either towards a shorter or a longer time span pattern or towards a different combination of product outputs, or both.

BASIC ASSUMPTION

The function of theory is to guide the search for facts, determine their meanings (definitions), provide for their classification, and subsequently to lead to testable, predictive hypotheses as to what *will* happen over time within the situation, or what *can be made to happen* better to attain specified human ends. Within the theoretical context described, we will now turn to a description of the situation within which our problem lies. We begin with the presumption that the conservation and development of the western public range land resources are important to the nation, that these resources are neither developed to the point of economy nor used at the point of maximized long-run social income, and that this state of affairs is largely due to the institutional setting within which the use and development of these resources occur.

THE NATURAL ENVIRONMENT

A full description of the facts of the natural environment within which our problem lies is necessary to a complete understanding of the argument. But in order to confine our analysis to the space limitations of this article, we must be satisfied with a categorical listing of the more important features.

1. The low inherent productivity per acre of these range lands (largely due to relative aridity or rough and barren mountain slopes) requires many acres for even minimum "family-sized" livestock farms.

2. The plains sod grasses, the shrubs and bunch grasses of mountains and semideserts, the annual weeds, react differently to use and abuse. Misuse will do less long-run harm, and damage will be more narrowly confined to him who causes it, in the plains sod grasses than in the bunch grasses and rough mountain ranges.

3. Hay and feed crop production is a necessary supplement to range use throughout the West except in parts of the far Southwest.

4. Except in the year-long range use areas (plains and far Southwest), range lands of proper seasonality together with necessary hay and feed crop lands do not lie interspersed so as to permit ranch units organized in self-contained blocks behind their own "line fences."

5. Water and water development are factors of crucial importance in western range land use. Hay and pasture irrigation and stock water supplies are essential to full use of associated ranges. Two-thirds to three-fourths of the water for irrigation, power, and urban use in the West originates on public land in high mountains. A significant portion of the negative value flood and silt flows originate on lower-lying semiarid range lands, both publicly and privately owned.

6. A significant portion of these western range areas are producers of other values besides range forage—water, recreation, lumber, and, negatively speaking, floods and silt.

7. Much of the western range can be materially increased in productivity by capital investments for revegetation, water development, fencing, and other purposes.

THE FIRMS

In any economy, the use and development of its resources are organized through "firms"—the units through which management decisions are channeled into action. In our economy, the conservation, development, and use of our western range resources are carried out by both public and private firms.

Western range resources are utilized through private entrepreneurial units usually called ranches. These firms are private businesses run to serve private ends, one of the more important of which is profit. These firms assemble the resources needed for a livestock business—labor, livestock, other capital items, and land—manage their use, and determine how and for what the resources owned by them shall be used. As with private firms everywhere, given the conditions imposed upon them by the property institutions and given the technical knowledge of the manager, the firm tries to maximize the flow of satisfactions coming to its owners.

Unlike any other type of agriculture in the United States, public firms play an important role in the western range livestock industry. Here, a large part of the basic land resources are owned by government and managed by government agencies. But these agencies do not carry out all entrepreneurial functions—they do not harvest, they do not invest operating capital. They look after the government-owned resources, assign their use to private users, and make capital investments for conservation and development. They perform a landlord function.

These firms are agencies of government, which means that they serve as trust agents for the citizenry to manage the public's land. Presumably, the management goal of these firms is to maximize over time the sociocultural returns to the public from use of the public's land. Objective measurement of returns to alternative uses of public lands is a much less definitive thing than is objective measurement of profits from alternative uses of private resources.

Except for the Bureau of Land Management, whose advisory boards of users have some say in management, only employees of these public firms have direct say on matters of allocation, use, development, and management of these public resources. However, these employees are aware of and often influenced by what they think or know the vocal and influential part of the public may tell or be telling Congress about them. They are rarely domineering or dictatorial in their relations with private users of the lands in their charge. They are usually helpful to and sympathetic with the private firm's problems that grow out of its relations to public lands.

The public firms decide what investments for conservation and development are economically and socially justified on these lands. But except for the BLM "improvement funds" derived from grazing fees, they must ask Congress for the money to carry out these improvements. These public firms find it difficult (in fact, in the light of fifty years of experience they have found it impossible) to secure adequate funds from Congress for the needed investment in conservation and development of these public grazing lands.

THE PROPERTY ENVIRONMENT

Private property

Slightly more than 50 per cent [2] of the western range lands are privately owned. But private ownership controls the more productive ranges, so about two-thirds [3] of the range feed is produced on private lands.[4] The proportion of private ownership is greatest in

[2] *The Western Range*, Senate Document No. 199, 74th Cong., 2d sess., 1936, Table 2, p. 7 and estimated from Table 2 and Table 82, p. 508.

[3] *Ibid.*

[4] When it is considered that virtually all feed production from improved pasture, hay and crop land in the region comes from privately owned land, it will be realized that much more than two-thirds of all western livestock feed is produced on private land, possibly as much as 80 to 90 per cent.

the plains and least in the semideserts and mountains.

Not all privately owned range lands are used by the firms who own them. Several railroad corporations own extensive areas; nonresident individuals are an important class of owners, especially in the plains. Thus, it is evident that there is considerable private leasing of range lands by livestock firms.

Relatively few livestock firms in the West operate wholly on privately owned land, and fewer still own, themselves, all the land on which they operate. Such as do are almost wholly in the eastern edges of the plains. The property status of ranch firms varies from those with wholly privately owned lands to those who own only spring-fall range and/or hay and crop land or those who own only hay land and water controlling tracts. Though as recently as fifteen years ago ranch firms existed that owned (or legally controlled) no land at all, such firms no longer exist—all today have a base of controlled land of some sort. But in many areas, the privately owned ranges and feed crop lands cannot be used economically without the conjoint use of adjacent public land—and vice versa.

Public property

Publicly owned range lands furnish feed resources less than in proportion to their acreage. However, in many areas they furnish an indispensable part of the annual feed supply.

Public ownership is in the hands of county, state, and federal governments. We will consider only the last-named, for lack of space to treat them all. Of the many classes of federally owned range lands, we will consider only two —those administered by the United States Forest Service and the United States Bureau of Land Management, which control between them about three-fourths of the publicly owned range.

THE FOREST SERVICE

The Forest Service was set up early in this century to administer the lands withdrawn from the public domain for purposes of forestry and watershed protection and such other uses as are not inconsistent with the two specifically named. Under the latter clause, grazing and recreational use of the Forests has developed. The Forest Service has, over forty-five years of experience, formulated policies and procedures for the orderly supervision of grazing use of Forest lands by private firms.

It is most important to note that private use of public land under positive federal landlordship had not previously existed in the United States; therefore the Forest Service had to build its own policies and methods without guidance from any previous experience.

It is next important to note that grazing was a subordinate use, permitted only as long and as far as it did not interfere unduly with timber and watersheds.

Out of these circumstances developed the system under which grazing use by private firms is a privilege and not a right. This privilege is granted by a "permit" which is not a contract, but can be (legally though not politically) revoked or changed at the will of the Forest Service. The permit gives no contractual assurance as to the number of head or the season of use that will be permitted in any subsequent season. However, when it is a "ten-year permit," it does assure its holder that he will have the right for ten years to graze whatever numbers for whatever seasons are authorized under it each year. The permit is not directly salable or otherwise transferable, even through inheritance. If a ranchman holding a

Forest grazing permit dies or transfers or sells his ranch, whether or not a permit will be issued to the new owner, for how many head, and for how long a season, are determinable solely by the Forest Service. It is a policy of the Service (infrequently exercised, but available) to reduce permits of firms larger than some established maximum whenever transfer takes place.

All decisions at all times as to who shall graze on the Forest, with what kinds and numbers of livestock, for how long a season, and under what management rules, are the legal responsibility of the Forest Service, which it has not delegated either to individual users through contracts or to advisory boards among its users.

In addition to permit cuts for conservation and protection of the range, the Forest Service has an adopted policy of cuts and transfers of grazing privileges designed to encourage sound family-sized livestock firms. The policy works by cutting down on permits held by firms above certain maxima in size to add to permits held by firms below certain minima in size when such small firms have the necessary supplemental feed resources and are situated so that they can use the added Forest range economically. This policy has been infrequently used, but is always available. Permit cuts for range protection have been much more prevalent than have cuts for redistribution.

National forest range is predominantly mountain range, largely furnishing summer grazing to private firms who must own or control other feed resources to maintain their livestock while not on the Forest. Sometimes only one private firm can efficiently use adjacent forest range, in which case its permit for Forest grazing is relatively secure, though a sense of insecurity may arise because it may be cut in numbers and season at any time. More commonly the alternative users available to the Forest Service are more numerous; then the user may feel an additional insecurity, especially if his firm is above the established local maximum for size.

Fees and investments

The fee charged for grazing use on Forest lands is not a significant source of uncertainty to the operator. A base fee per animal unit month was set Forest by Forest by the Service many years ago; the annual fee is set by a formula based on changes in the market price of cattle and sheep relative to similar prices in the base period. The base fee was set at a comparatively low level, so the fee for Forest grazing is usually cheap, relative to private land costs, and the firm is assured that the fee will fall with falling livestock prices.

Investments to protect or enhance the productivity of the grazing resource in National Forests are solely the responsibility of the Forest Service and the Federal Government. The private firm that uses Forest range could, until recently, make such investments on its allotted range, but under restrictions so severe and under uncertainties for the future so disturbing that little use was made of the privilege. Recently, even the limited privileges heretofore available have been withdrawn. Thus, essentially all investments in Forest range are dependent on appropriations made by the federal Congress.

BUREAU OF LAND MANAGEMENT

Largest in area among the many kinds of range land administered by the Bureau of Land Management (the BLM) are the remnants of the public domain—that part of our vast federal landholdings that, after 140 years of picking over, no one has wanted in 640-acre parcels even as a free gift (home-

stead). Provision for their positive protection, development, and management was made by Congress only eighteen years ago (1934). They are, in the main, the poorest of all our grazing lands; in their native state their productivity was in many cases low, and after seventy years of use under no positive landlord control whatever, many of them are badly depleted. The BLM estimates that 50 per cent of the grazing land under its control is severely depleted and that another 32 per cent is moderately damaged.

The BLM grants grazing use of these lands to private firms usually under ten-year permits. The BLM permits, like the Forest permits, are not contractual obligations. Numbers of stock, lengths of season, and management practices on the ranges may legally be changed at any time by the Bureau. But partly because the other possible uses of the grazing resources managed by BLM are of limited importance, partly because the basic law under which BLM operates gives a positive and superior place to grazing and to the stability of the user's privileges, and partly because of policies adopted by BLM, permits issued by it are less subject to change during their ten-year life, they are transferable with the base property to which they "attach," and they are not subject to reductions for redistribution or at transfer.

BLM grazing land is predominantly winter range—even usually semidesert range. As with Forest lands, these BLM lands generally do not make self-contained ranch units but must be used in conjunction with lands of other types and ownerships.

Fees charged by the BLM are fixed in amount, do not fluctuate with livestock prices, and are very low, particularly at this time of high livestock prices, as compared with Forest grazing fees or private land costs.

BLM grazing lands, naturally low in productivity and often badly depleted, need much investment for conservation and development. Permittees can make investments for improvement of these lands—with approval of BLM—with greater freedom and with somewhat greater certainty that they will derive future benefits from them than is the case with permittees on Forest lands. On BLM lands, furthermore, private firms contribute through the fees they pay to the funds needed for improvement of the lands. By law, a stipulated portion of the grazing fees collected must be used for development of the resource. But because fees are at such a low level, the portion stipulated for development accrues in very small amounts each year—much less than required for full economic development of the lands.

As with Forest lands, except for the small amount secured through fees collected, investment funds for conservation and development of BLM lands depend upon congressional appropriations.

Some BLM grazing lands, different from any Forest lands, may be sold or leased to private firms. These are those small and isolated remnant tracts of the public domain that do not lend themselves to efficient administration by the Bureau.

THE PROBLEM TO BE SOLVED

The foregoing is merely a description of the situation within which use, conservation, and development of our western public range resources take place. The problem that it raises contains at least two elements, each equally important: (1) Much of the public grazing land has other actual or potential usefulness than grazing. How shall it be determined what use or combination of uses is best? (2) Under what form of tenure should public land committed to grazing be put in the hands of the private grazing firm?

Theory with which to solve the first aspect of the problem is not well enough developed to provide a definitive analytical base, so we will confine ourselves to the second aspect.

Not all public grazing lands are alike. For some, private ownership may be preferable; for others, public ownership. In the latter case, the situation is that of a landlord-tenant institution in which the tenant is a private firm, *but the landlord is an administrative unit of government.*

Private firms (and private livestock producing firms are no exception) find an atmosphere of bargaining transactions most congenial to the rationale of their behavior—a willing buyer and a willing seller, each with an accessible alternative of nearly equal value, bargaining out mutually acceptable contracts with performance enforceable in the courts. Public firms (and public land managers are no exception) find an atmosphere of rationing transactions most congenial to the rationale of their behavior—a superior authority distributing privileges among subordinate firms under rules or policies laid down by the superior to guide its distributions. The private firm tenant contends for arrangements formulated within the context of bargaining transactions; the public firm landlord contends for arrangements formulated within the context of rationing transactions. The two do not mix; the contending parties are striving for incompatible things.

So we find two roots to our problem: (1) Under what circumstances should public grazing lands be transferred to private ownership, and (2) what institutional arrangement reasonably congenial both to private tenant and public landlord should attach to those grazing lands that must remain in public ownership?

Measures of efficiency

A solution to these root problems will rest on a determination as to which arrangement in each case will function most efficiently for society. What constitutes a measure of efficient functioning in this context that may serve as a basis for evaluating alternative arrangements on public grazing land?

Within the context of economics there seem to be two closely related measures: (1) maximum economic productivity from whatever grazing resources are rationed to use by private firms, and (2) an optimum degree of progress as reflected in an optimum level of capital investment in the grazing resource to enhance its productivity and ensure its conservation.

A further measure, found within the context of social theory, seems necessary, namely, that in those circumstances where alternative tenure arrangements seem to function with about equal economic efficiency, that alternative be chosen which is most in harmony with the cultural habits, ideals, and goals of the society.[5]

HYPOTHESES TO SOLVE THE PROBLEM

We turn now to the last step, that of outlining through theoretical analysis the hypotheses of problem solution. We can best approach the task in two parts. First, under what circumstances is public ownership of grazing land not essential to attainment of maximum economic efficiency and progress? Second, where it is essential, under what land-

[5] This formulation of the criterion begs a basic but so far unsolvable question, namely, how much sacrifice in economic efficiency is warranted in the interest of cultural harmony, and vice versa. In the absence of definitive, quantifiable theory to treat this problem, I propose to ignore it by positing that where economic efficiency is approximately equal, cultural harmony as a criterion of choice shall enter into judgment.

lord-tenant arrangements can we attain maximum economic efficiency and progress?

Private versus public ownership

Private property in agricultural land is presumed in all capitalistic societies to give the firm that degree of security of expectations necessary for it to plan in a time dimension such as to maximize economic productivity over time, including an optimum degree of conservation in the present and an optimum degree of investment for increased productivity in the future. Private property in agricultural land fails to attain these ends perfectly—especially for society—as we in the United States know from experience. But it is significant that practically no voices are raised urging public ownership of pasture and crop lands to protect them from abuses by private firms or to enhance investment in their increased productivity. But many voices are so raised relative to western grazing land. It would seem that, except where there are clear reasons to the contrary, western grazing lands—which are a form of agricultural pasture land—should be privately owned in harmony with our cultural ideals.

What clear reasons are there to the contrary? By far the most important is multiple use. Certain of the uses practiced on public range lands are necessarily public in character (recreation, and water production for power and irrigation), and certain of the uses are not generally practiced jointly within single private firms (stock raising and lumbering). For combinations of such uses, private ownership does not serve the end of maximized economic productivity. Certain of the uses will be slighted or completely ignored if the lands are privately owned. Where multiple use of grazing lands is an important factor, private ownership will not be suitable.

Some western public grazing lands, though used for grazing only, are so low in productivity that it does not pay private firms to own them. Such lands produce no net economic return with which to pay interest on investment and real estate taxes. If such lands are to be used by private firms and are to be properly managed, they must be owned and their use supervised by a public landlord.

The social costs of resource deterioration are not so acute on western privately owned grazing lands as they are on the far more productive, more valuable, privately owned pasture and crop lands in the humid areas to the east.

It is paradoxical that the grazing lands east of the 100th meridian are in a relatively poorer condition than those in other parts of the region (the Great Plains). Of the 15 million acres in poor condition (in the Great Plains), 9½ million acres are located in this area (east of the 100th meridian). The native grazing lands remaining in this area have lost so much of their original grasses from hard use that it generally requires complete new seedings of the native bluestems or other adapted grasses before the potential production can be restored. It is in this area that reseeding and careful management will net the greatest returns for time and money expended.[6]

Yet it is for grazing lands west, not east, of the 100th meridian that public ownership is urged to prevent their private owners from "shoveling them into the Gulf of Mexico."

So we conclude that any western public grazing land that has no use of significance other than for grazing and that is productive enough to support

[6] *Post-war Programs of Conservation and Improvement of Range and Native Pasture Lands in the Northern Great Plains*, Section II of Report of Subcommittee on Soil, Range and Forest Development, and Conservation, Northern Great Plains Agricultural Advisory Council, June 1, 1944, p. 13.

the costs of private ownership can, in keeping with our cultural ideals, be transferred to private ownership. By so doing, these lands will be in a setting where long-run security of property and contract on the part of the user will lead to that degree of maximized economic productivity and optimized investment for conservation and development that private firms in agriculture generally attain.

Public landlord-private tenant relations

Much of the public grazing resource will remain public property for the reasons described above. But if it is to be used for grazing, such use will be carried out by private, not public, firms. Consequently, on such publicly owned grazing resources we have a problem of tenure relations between public managers and private firms. This is a problem in public landlord-private tenant relations.

Relative to the solution of this problem, the only experience to guide us is that of the Forest Service and the Bureau of Land Management.

Here our hypotheses for problem solution will be theoretical; their validity will be indeterminate (except as far as analogy to private landlord-private tenant relations can be considered pertinent) until such time as they may be put to the test of trial and experience. Here we will be "speculating"—inventing—to find new institutional forms better to meet a social problem.

Our reasoning here is within and derived from the propositions with which this paper opened. We will apply them to the peculiar conditions of western public grazing land management and use.

1. The public grazing land manager will be concerned, normally, with long-run rather than short-run returns and with investments for conservation first and for long-run development second; he will be little or not at all concerned with costs and returns relative to current productive use of the resource; he will thus distort inputs in the direction of long-run future returns. And because his time discount factor is smaller (normally) than that of the private firm, he will direct investment inputs towards even more distant returns than will the private firm. When the time patterns of costs and returns are not comparable as between public and private firms, maximization of net product is jeopardized.

2. As long as the public land manager insists on absolute liberty to alter the use to which the grazing land is committed or to change the user to which it is rationed, the private firm user has limited security of expectations relative to long-run returns from such investments in the land as he may wish to make, and will distort his inputs toward short-run returns, including deterioration of the land resource. Furthermore, because of the peculiarly close relations between publicly and privately owned range resources in the western grazing industry, the private firm will feel insecure regarding the investments it has or may wish to make in its privately owned land resources.

3. Control over or access to adequate capital funds to finance investments in public grazing land (together with capital to finance other resources in the grazing firm) to the level of maximum economic productivity may be unequal as between the private firm and the public land managing firm. Under current economic conditions, the private firms are, in general, well supplied with capital for adequate long-run investments and, given security of expectations, are anxious to make such investments because of low interest rates, high income taxes, and the high level of prospective marginal returns to meat and wool production. The public land managing

firms, on the other hand, find it difficult (in the light of fifty years of experience it can be said they have found it impossible) to secure adequate funds from Congress for the needed investment in conservation and development of these public grazing lands. Such chronic inadequacy of public funds seems to derive from public apathy towards the need for such investments and from competition for public funds from other claimants with more appeal. Furthermore, given security of expectations, those private firms not possessing capital adequate in amount for economic long-run investments can and will obtain it in the private capital market. It seems evident that greatly expanded investments in conservation and development of public grazing resources would result from a greater degree of security of expectations granted to private firms.

4. Given security of expectations, the private grazing firm will be able to allocate inputs as between short-run and long-run returns to maximize returns from the resources comparable to those of the firm that owns its resources outright.

5. Security of expectations, in the above sense, implies a tenure arrangement comparable to contract, for reasonably long terms, enforceable in the courts, and transferable.

Principles of action

Propositions 1 through 4 above are empirical generalizations; proposition 5 is a definition. Test of the validity of propositions 1 through 4 awaits empirical research. If, however, they are accepted as true and valid, it follows that the problem will be solved (under circumstances where the public grazing land cannot be transferred outright to private ownership) by the following principles of action (which are simply hypotheses until tested by empirical evidence and experience):

1. The public land manager must decide (within the context of theory and relative to ends not herein discussed) to what uses the public land shall be put and in what proportion of intensities as between such uses.

2. The public land manager must decide upon and carry out a rationing plan by which it will be decided to whom grazing uses to be permitted on the public land will be allocated. (The goals to be attained by such rationing and the theory within which their realization must be analyzed have not been discussed in this paper.)

3. But once it has been decided what intensity of grazing use will be permitted on the public land and to whom it will be rationed, such uses must be assigned to the grazing firms with a reasonable degree of security of expectations on the part of the private firm so that it will be able to realize gains and losses from investments and decisions made by it relative to such resources.

4. Reasonable security of expectations requires that the grazing resource be made available by a long-run (even perpetual) contract that is renewable (if not perpetual), enforceable in the courts and transferable. If the contract is not perpetual, it should be for a sufficient number of years to permit the private firm fully to depreciate such investments as it may make for conservation or enhanced productivity.

5. Not all investments for conservation and development will or should be made by the private firm in the first few years of such a contract. It would be desirable that such investments be made by the firm continuously throughout its tenure. Consequently, no economically valid date for contract termination will ever occur. Two alternatives are possible: (*a*) perpetual contracts freely transferable by the private firm, purchasable by the public firm at a negotiated (or condemnation) price should the public firm wish to change the grazing allocation; or (*b*) term-of-year contracts which provide that unexhausted investments at the time of contract termination shall be appraised by a specified means, and the new allottee (or the government) must pay such appraised price for the unexhausted investments if the contract is not reexecuted with the same grazing firm.

6. Rental fees for the use of grazing privileges by private firms should be set at their full economic value (*a*) so as not to distort allocations of capital resources by making such publicly furnished grazing unduly cheap, and (*b*) so as not to provide windfall gains to first allottees of public grazing. (The context of theory within which such values would be determined has not been discussed in this paper.)

M. M. Kelso, Ph.D., Bozeman, Montana, is head of the Department of Agricultural Economics and Rural Sociology and the Department of Economics and Sociology at Montana State College. He operated a cattle ranch in eastern Montana from 1942 to 1946. He was employed in the Submarginal Land Purchase Program, Resettlement Administration, 1933–37; was head of the Division of Land Economics, Bureau of Agricultural Economics, 1937–41; and was regional representative of the Bureau of Agricultural Economics at Albuquerque, New Mexico, 1941–42.

A Rounded Land Conservation Program

By Charles M. Hardin

THIS article deals primarily with a federal program for farm and ranch lands in private ownership in the United States, proposing a reorientation of present efforts toward the objective of "improved farm family living on a conservation base." Conservation is taken to mean development and use as much as protection against aggravated erosion and soil depletion. A "rounded" program is not one which presents no "angles" for exploitation by organized interests; rather it is one designed in recognition of the relationship of land use to other resources and to the relevant pattern of human activities.

Present Programs

The 1945 census reports 5,860,000 farms and ranches which include 1,142,000,000 acres or 60 per cent of the area of continental United States. What are the present land conservation programs in this area? How may they be redirected? [1]

The Soil Conservation Service (SCS) is a bureau of the United States Department of Agriculture (USDA) which assists farmers to develop and apply complete farm plans in accordance with the principle that "each acre of agricultural land" shall be used "within its capabilities" and treated "in accordance with its needs for protection and improvement." This has now become the "basic physical objective of soil-conservation activities" of the USDA.[2] The SCS co-operates with farmers through memoranda of understanding with soil conservation districts which are established under state enabling acts and now number approximately 2,400. Annual SCS appropriations are about $55 million double the amount available in 1940; some 94 per cent goes for "assistance to soil conservation districts and other co-operators." [3]

The SCS makes a conservation survey, similar to a soil survey, of co-operators' farms, helps to develop farm plans, and assists in applying the plans. In February 1951, SCS reported that some 900,000 farm plans had been made. But application proceeds slowly. After eighteen years, less than 10 per cent of the farm land in twenty-seven states had been "treated" in accordance with the SCS plans.[4]

The Department's other major "action" program of soil conservation is administered by the Production and Marketing Administration (PMA). It dates from the Soil Conservation and Domestic Allotment Act of 1936 which Congress passed to replace the original Agricultural Adjustment Act that the Supreme Court had invalidated. The 1936 act authorized annual appropriations of $500 million for conservation payments to farmers; but the object was to increase farm incomes and to attain by financial rewards what the Court had just declared could not be accomplished by regulation, namely, the control of production. Appropriations approximated the authorization in early years, fell below $400 million for the first time in fiscal 1945, reached a low of $150 million in fiscal 1949, and currently amount to $256 million, which is near the average for the past eight years.[5]

The PMA conservation program is extensive, while that of SCS is intensive. In the early years, payments were earned chiefly by staying within the "soil depleting base" allotted to farms. When acreage allotments and production quotas were generally removed early in the war, the conservation program was shifted; payments could be earned only by specific performance as approved by the local committees (then of the Agricultural Adjustment Administration; since 1945, of the PMA); and participation declined somewhat, although the program continues to reach some three million farms annually. Considerable friction has existed between PMA and SCS; numerous efforts to combine the two programs culminated in Memorandum 1278 of February 1951, which aims at co-ordination at all levels. But friction and dissatisfaction continue, and the organization of the USDA is not necessarily settled.[6]

Criticisms of PMA Program

Meanwhile, the conservation program of PMA continues to be criticized as stressing annual practices rather than long-run conservation farm plans,[7] as reimbursing farmers for what they would do anyway, as distributing the bulk of payments to farmers who need them least,[8] as representing undue expenditures in view of the federal budgetary situation, as providing an unhappy example of duplication of activities, and as maintaining an unhealthy dependence of farmers on payments from the Federal Government. Behind these criticisms are the fears, especially of the Farm Bureau and the colleges of agriculture, of the political power inherent in the PMA committee system.[9]

In addition, the co-operative agricultural Extension Service of the USDA and the land-grant colleges is involved. Its current budget of approximately $76 million (of which the Federal Government currently supplies about 43 per cent) enables a considerable range of educational, informational, and other kinds of services to farmers. A large, although undetermined, proportion of Extension's activities are closely related to improvement of land use. Relevant also are the co-operative researches of the USDA and the experiment stations of the colleges of agriculture. Thus, the Bureau of Plant Industry, Soils, and Agricultural Engineering currently spends some $2,750,000 on "soils, fertilizers, and irrigation investigations." The state experiment stations have a total budget of some $60 million (one-fifth from federal grants) of which a considerable though unknown amount is spent on

[1] For an elaboration of many points made here, see the writer's book, *The Politics of Agriculture: Soil Conservation and the Struggle for Power in Rural America*, Glencoe, Ill.: Free Press, 1952; and articles, "The Politics of Conservation," *Journal of Politics*, Vol. XIII, No. 3, Aug. 1951; "Land or People," *Land Economics*, Vol. XVII, No. 2, May 1951; and (for the group planning approach of the Soil Conservation Service) "Natural Leaders and the Administration of Soil Conservation Programs," *Rural Sociology*, Vol. 16, No. 3, Sept. 1951.

[6] Cf. the Aiken Bill, S. 1149, 82d Cong., 1st sess., *op. cit.* note 2 *supra*.

[7] *Hearings*, Agric. Approp., fiscal 1952, H. of R., Part 1, p. 618.

[8] *Ibid.*, fiscal 1948, Part 1, p. 1251. Twenty per cent of the co-operating farmers get 60 per cent of the payments.

[9] In general, midwestern and northern Farm Bureaus would eliminate PMA conservation payments, but southern Farm Bureaus want to keep them. The American Farm Bureau Federation unsuccessfully attempted to lower them to $150 million in 1951; the National Grange resolved in 1951 that they should be eliminated.

investigations directly relevant to the present inquiry.[10]

SIGNIFICANCE OF OBJECTIVES

In light of present efforts, what can be said respecting a "rounded land conservation program" for farms and ranches? The assumed need is to accommodate private interests and public purposes. Any conservation program for farm land is inevitably related to efforts to support agricultural prices and adjust agricultural production; as indicated, the conservation program of PMA originated as part of the government's major economic program for agriculture. In this program, parity has become a goal which in the thought of many farmers is to be achieved by government guarantees of specific prices for different crops and products. The public interest in economic stability in agriculture has been forcefully argued.[11] At the same time, the elevation of parity prices into *ends* of policy is strongly criticized as preventing prices and the market from performing the function of allocating resources, both within agriculture and between agriculture and other sectors of society.[12] But the vesting of emotional loyalties in parity has made it a symbol of simple economic justice for farmers, and the problem becomes one of preventing particular price levels from becoming equally sacrosanct. Thus the obligation to examine the objectives of programs becomes clear. How can such programs be restated to serve the purposes not only of improving land use but also of achieving effective agricultural adjustment in the public interest?

A somewhat similar question arises respecting soil conservation as an end in itself—as the "basic physical objective" of USDA conservation activities. The concept is appealing to those who wish to identify with some high moral purposes which cannot be called "radical" by the most unhinged imagination. Erosion is like sin; everyone is against it. But where is the cause of erosion to be found? The Chief of the Division of Soil Survey, USDA, has declared that erosion is generally a symptom. "Frequently, we find weak plant cover and declining soil fertility resulting from unstable economic conditions, bad tenure relationships, overcrowded land, poverty, disease, and wars. . . ."[13] Neither the present concept of objectives in soil conservation programs nor their current organization facilitates an attack upon the fundamental causes which Kellogg has delineated.

A PROPOSED OBJECTIVE

It is here proposed to set as a goal the improvement of farm family living on a conservation base. In stating this objective, the writer has in mind a program of research, demonstration, and extension which would take over the present SCS and become an effective guide to adjustment policy. Research should establish for typical farms the most favorable combinations of enterprises and of technologies under different assumptions about trends in the market. Imaginative and vigorous extension programs should help farmers to adopt—and adapt—the research findings. Thus what is needed is not only pilot (research) farms and demonstration farms, but also workable programs which will make the alternatives developed really available to farmers. Again Charles E. Kellogg has stated the program succinctly, and his educational objectives bear quoting: not simply for farmers "to introduce new practices rapidly and successfully," but for them to learn "*how to* use technology resulting from science in making their decisions."[14]

This restatement of objectives is advanced on grounds of judgment rather than scientific demonstration. The writer strongly believes in the importance of ideal objectives to policies and programs, and, in the present discussion, in the need for offering an ideal objective which can hope to contend successfully with the powerful appeals represented by parity prices and soil conservation as goals. It is further believed that the emphasis on farm family living stresses human beings essentially as ends rather than as means (for example, to improvement in soil conservation); second, that the new objective invites planning *farms* to make them economically more rewarding within the anticipated framework of prices in a relatively free market, instead of planning *prices* to make farming more profitable; and, third, that the shift in emphasis will invite consideration of the underlying causes of soil erosion and depletion, which tend to be overlooked in programs aimed directly at erosion control.

Arguments are at hand to sustain all these points, but no guarantee exists that the shift in objectives will fulfill the promises stated or implied above. Many agricultural economists advocated production payments as a means of supporting agricultural prices but vigorously protested the Brannan plan (which proposed such payments) because of the income support levels which it included. Likewise, improved farm family living is clearly an objective of the Family Farm Policy Review of the USDA in 1951; yet the strategy, timing, and approach of this review resulted in an aggravation of most of the differences now existing in agriculture and turned the analysis of public problems into a heated debate over political symbols. In the process, the family farm tended to become a shibboleth to the friends of the review and an anathema to its enemies.

The experience of the Family Farm Policy Review in 1951 augurs ill for the present proposal, but invalidates none of the arguments advanced in its support. Whoever wins in November 1952, some major aspects of the political situation for the next four years will be laid down. Perhaps a new approach in land conservation and related programs

[10] In addition, the agricultural program cooperatively developed by the Tennessee Valley Authority and the colleges of agriculture (especially but not exclusively in the Tennessee Valley states) should be mentioned. This program will not be discussed here. Some of the literature indicates that the TVA program can be accommodated to the suggestions made below. Cf. Norman Wengert, "TVA and Agriculture: A Study in Regional Administration," unpublished Ph.D. thesis, University of Wisconsin, 1947; but contrast Philip M. Selznick, *TVA and the Grass Roots*, University of California Press, 1949. The writer prefers Wengert's analysis.

[14] "The Natural Sciences and Farm Planning," *Journal of Farm Economics*, Vol. XXIX, No. 1 (Proceedings Number, Feb. 1947), pp. 193 ff. Space is not available to provide details of the present proposal. That a new orientation is needed is suggested by the difficulty in estimating the effects of the SCS program; cf. *Hearings*, Agric. Approp., fiscal 1952, H. of R., Part 2, pp. 792–93, 802–3; note the importance of economic planning in all the examples presented in "Conservation Problems and Achievements on Selected Midwestern Farms," Special Circular 86, July 1951, Ohio Agricultural Experiment Station (North Central Regional Publication No. 23). Note the inclusion of the pilot farms and demonstration farms in the "Family Farm Policy Review: Provisional Report . . ." USDA, June 1951, pp. 3–4, 15, 25. See John D. Black, "Federal-State-Local Relations in Agriculture," National Planning Ass'n, Feb. 1950, pp. 40 ff., and also *The Rural Economy of New England*, Cambridge, Mass.: Harvard University Press, 1950.

will then be possible. How may this approach be achieved? What may be its chief organizational characteristics?

THE VIRTUES OF NEGOTIATION

Recent history suggests that negotiation is the most promising means of getting a new approach in this area. None of the interests in agriculture have been able to succeed in unilateral action. So far, at least, Secretary Brannan's plan of 1949 has failed; and so has his Family Farm Policy Review of 1951. But the Hoover Commission's Task Force for Agriculture, in which land-grant college interests were heavily represented, also fell short of reorganizing the USDA in the interests of the colleges and their allies. The powerful American Farm Bureau has been least successful in its efforts in the land conservation area. This experience suggests a return to the approaches of the 1930's (until 1938, at least), when negotiation among the agricultural interests played an important part in formulating agricultural policy. Negotiation, however, needs to be informed by a conception of the public interest—a conception which goes beyond simple identification with the various group interests involved.

SUGGESTED REORGANIZATION

The problem is by no means merely the achievement of administrative efficiency. Also involved are the organization and control of political power, and the relationships of research and educational institutions to "action" agencies. Many highly organized group interests are concerned, and a stalemate may develop which will prevent the rather drastic realignment suggested. A further complication arises because on some of the proposals new legislation would be required.

Since space is not available to present various alternatives, only one line of action will be set forth. The initial step would be to transfer the functions of SCS, assigning the conservation survey to the Soil Survey of the Bureau of Plant Industry, Soils, and Agricultural Engineering and the experiment stations; the research and flood control investigations to the same Bureau, the Bureau of Agricultural Economics, and the experiment stations; and the activities in co-operation with farmers through soil conservation districts to the co-operative Extension Service.[15]

SCS functions at the farm level would be carried on by Extension, but a shift in emphasis would take place, so that the program would become one of farm and home planning. Presumably, many of the present SCS employees would transfer to the Extension farm and home planning program; however, as replacements in their ranks appeared, the policy would be to hire men trained especially in the economics of farm management so that the professional staff would reflect the changed direction of the program.[16]

The aim of the program should be to assist every farm in the country to develop a sound economic base; this is of the essence of agricultural adjustment. As pilot and demonstration farms were developed and means devised to facilitate the spread of the techniques and combinations widely among farmers—including that mastery of technology already mentioned—the need for close relationship to the PMA program would appear very clearly.

The assumption is that a major part of public policy for agriculture will continue to be price- or income-supporting measures, together with programs to assist agricultural adjustment toward a sounder economic footing. It is argued that the public interest will be served best if the aspect of *adjustment* in such programs is favored over the aspects of price support and production control. If so, the proposed heavy investment in *farm and home planning* should show the way and provide the means for agricultural adjustment. This statement does not imply that all agricultural adjustment has to be or ought to be made within agriculture. It is assumed that much adjustment will continue to be made by the movement of people off farms into industry and trade; nevertheless, an adjustment problem *within* agriculture remains.

ADMINISTRATION OF PAYMENTS

The chief point for relating the farm and home planning program to the adjustment program is in the administration of conservation payments. It is assumed that annual appropriations for such payments will continue. But several changes appear advisable. The initial step would be to divide the fund. One part would be available to reimburse farmers for specific performance of conservation practices listed in the current bulletins; this is the "open offer" to all qualifying farmers as the program now operates. The other part would be used to help defray whatever expenditures were needed to put a farm and home plan into effect. The object would be to shift the entire fund, over a period of years, to the second category, and it may well be that Congress should designate a time for this shift to be accomplished—say in seven years. Payments would then be made only to those farmers with farm and home plans showing a schedule of inputs—whether for conservation materials, land rehabilitation, provision of permanent improvements, acquisition of livestock, or machinery purchases. After payments had been shifted to carry out farm plans, individual farmers should be eligible for no more than five years of grants from the fund.

In addition, the writer would prefer that the fund be allocated to states and counties and eventually to farmers on some formula which would be in inverse proportion to per capita farm income. Such a shift might tend to encourage persons to remain in farming without adequate resources; but this would not need to occur if some criteria of reasonable economic size of farms could be agreed upon, with regional and local adaptations. It seems to the writer that the present allocation of funds to those who need the money least is unconscionable. To be sure, these farmers are, in a sense, custodians of an important social resource; but there are countless social resources which are not subsidized in this fashion. Should we, for example, subsidize the men of military age for maintaining physical fitness?

A delicate problem arises in administrative relationships for these proposals. On the one hand, it seems clear that the technical responsibility for farm and home planning should be vested in the research and educational agencies, as noted. On the other hand, these agencies are loath to administer, and stand accountable for, subsidy programs. At the same time, it seems vital to bring about an intimate relationship between

[15] No recommendation is offered here for the land utilization program. A problem is recognized respecting that part of flood control work which has to do with *applications* rather than surveys. To date, eleven watersheds are involved; the SCS expenditures approximate $6,000,000 annually. If SCS functions were transferred as indicated, the flood control watershed improvement program would be shifted to the research and educational agencies indicated; co-ordination would remain in the office of the Secretary. Cf. *Hearings*, Agric. Approp., fiscal 1952, H. of R., Part 2, pp. 749 ff.

[16] Present SCS personnel are chiefly engineers by training. *Hearings*, Agric. Approp., fiscal 1952, H. of R., Part 2, p. 793.

the programs for farm and home planning and for agricultural adjustment. Perhaps a solution could be found in the establishment of a joint committee of the Extension Service and the local PMA organization. This committee would agree on the farmers who, having qualified with farm and home plans, would receive grants; it would also set the amounts of the grants.

How is political favoritism to be kept out of this kind of allocation? The answer may be found in creating a widely shared understanding of the objectives of the program, in developing accepted standards for the farm and home planning program, and in establishing effective co-operation between the Extension Service and the local PMA committees in allocating the funds.

THE COSTS

The program described could probably be put into effect for less than the present outlays. Presumably some administrative savings would be realized in consolidating the major part of SCS activities with the Extension Service. The opportunity for largest savings would appear in the PMA conservation program. In 1936–50, appropriations for this program totaled $5,342,800,000. In the proposed program an annual appropriation of $150,000,000 for adjustment payments might be planned for fifteen years. After a few years, Congress might well write a schedule of future appropriations which would taper off and culminate, say, in 1967. While no Congress can bind its successor, the provision of such a schedule would be advantageous. If a situation arose in which additional direct income aids for agriculture appeared advisable, they should not be confused with conservation or (preferably) adjustment payments. It would, in any event, be extremely interesting to see whether a democracy can plan a development of this sort, carry it through, and, after a period of years, end it.[17]

WHAT OF A ROUNDED PROGRAM FOR OTHER LAND?

The foregoing suggestions assume that land programs need to be designed in relationship to other relevant public activities and to the patterns of human purpose directly involved. What emerges is not one but many programs —as many as there are bona fide farms and ranches. Public programs should promote private efforts to improve farm family living on a conservation base—and thereby help stabilize an economically sound agriculture. There is also a tacit assumption that the program suggested would help to strengthen a pattern of family farming which contributes to democratic constitutionalism.

The preceding analysis for private agricultural lands is by no means all-inclusive. Some 250,000,000 acres, or 55 per cent of the potential timberland in continental United States, is in small holdings; it should produce 30 to 40 per cent of our future timber supply. Nearly half of this is in some 3,200,000 farm wood lots. It is assumed that the program advanced earlier would have the economic use of farm wood lots as an objective and thus would contribute to forestry policy.[18] It is also assumed that the program would have beneficial effects on flood control, especially in eastern watersheds, although conflict is

[17] This suggestion is to be distinguished from the "timetable" of soil conservation, criticized in *The Politics of Agriculture* (*op. cit.* note 1 *supra*), Chap. vi, Section 4. There is no timetable for agricultural adjustment; but there could well be a time *limit* on the specific means of adjustment employed in the agricultural conservation program of PMA.

[18] Cf. Luther H. Gulick, *American Forest Policy* (New York: Duell, Sloan, and Pearce, 1952), index under "small forest owner."

possible between agriculture and hydroelectric power respecting water conservation policy. Similar assumptions may be made for the conservation of wildlife, although conflicts of interest among sportsmen, recreationists, and farmers will certainly continue to be matters of local vexation.

The largest block of other lands is in federal ownership or administration—457,600,000 acres in continental United States, or 24 per cent of the area. Four hundred and seven million acres of this is in the eleven western states, where the United States controls land that comprises 35 per cent of the acreage in Washington up to 85 per cent in Nevada. While several agencies share in the administration of western public land, the Forest Service of the United States Department of Agriculture is responsible for perhaps 35 per cent of it and the Bureau of Land Management (BLM) in the Department of the Interior, for some 40 per cent.[19]

Program development for western lands poses many problems, two of which may be briefly mentioned. First, the relationship between land and water is especially important. The President's Water Resources Policy Commission has proposed a *Water Policy for the American People*[20] which embraces multiple planning and development of resources on a grand scale. The commission emphasizes sedimentation control particularly in the West[21]—an emphasis which implies a strong case for co-ordinated planning, management, and development of land and water resources. Without attempting a systematic treatment of the numerous problems raised by such co-ordination, the writer would merely point up the following. Land management may easily be exaggerated as a means of controlling sedimentation,[22] and scientific standards for the extensive management of range lands are hard to formulate.[23] The easy assumption of the interrelatedness of land and water may prompt an uncritical acceptance of the need for consolidating the management of these different resources in one agency.[24] At the same time, the complete rejection of the idea of one agency to plan and administer the land and water resources of a region may sacrifice significant symbolic values. The tension between accepted obligations and actual accomplishments has been stimulated by the regional agency approach.[25]

[25] Norman Wengert, "TVA—Symbol and Reality," *Journal of Politics,* Vol. XIII, No. 3, Aug. 1951.

Second, what of the proposal to transfer the Bureau of Land Management from the Department of the Interior to the Department of Agriculture?[26] Proponents argue that the public domain would be managed better in Agriculture. The BLM has been strapped for funds and has allegedly "virtually lost control of the range."[27] Many will agree that the activities concerned are now underfinanced and that the historical record of the Forest Service is better than land-management agencies of Interior can offer. Before the transfer is approved, however, two arguments should be carefully weighed. First, the vigorous leadership enjoyed by the BLM since 1948 might be given a few more years to demonstrate what it can do.[28] Second, the proposed consolidation would create an agency of considerable power. A careful study should be made of the amount of authority thus to be concentrated before this step is taken.[29]

[26] Proposed by the Hoover Commission's Task Force for Agriculture (see "Agriculture Activities," Appendix M, Jan. 1949), as well as by the Hoover Commission itself in its report "The Department of Agriculture," Feb. 1949. The proposal has been incorporated in S. 1149; see *Hearings*, S. 1149, 82d Cong., 1st sess., p. 15. Most of the organizations appearing favored the transfer, with the exception of the livestock groups. Cf. *ibid.*, pp. 535 ff.

[27] "Management of Public Land Resources," *Yale Law Journal*, March 1951; reprinted in *Hearings*, S. 1149 (previous note); but cf. Clawson, *op. cit.* note 19 *supra*, pp. 282–96. The Bureau of the Budget is currently studying the matter; *Hearings*, S. 1149, pp. 209 ff.

[28] The BLM has moved to meet some objections. Regarding BLM's failure to "adopt a long-range program of retention-dam construction, terracing, and stream-bank protection" (*Hearings*, S. 1149, p. 65), see BLM, "Rebuilding the Federal Range" (1951).

[29] The considerable power which becomes concentrated—or spearheaded—in public agencies is shown for the United States Engineering Department by Arthur Maass, *Muddy Waters*, Cambridge, Mass.: Harvard University Press, 1951, and for relevant agricultural agencies in the writer's *Politics of Agriculture*, *op. cit.* note 1 *supra*.

Charles M. Hardin, Ph.D., Chicago, Illinois, is associate professor of political science at the University of Chicago. He has taught at Harvard University and has lectured in a number of colleges of agriculture. He has been a consultant to the Tennessee Valley Authority (1948) and to the Secretary of Agriculture (1949). He is author of The Politics of Agriculture: Soil Conservation and the Struggle for Power in Rural America (1952) and of articles in professional journals.

The Work of the President's Water Resources Policy Commission

By ROBERT G. SNIDER

ON December 11, 1950, slightly more than eleven months after its establishment, the President's Water Resources Policy Commission presented *the first of its three volumes.* This document[1] was the product of the efforts of a Commission of seven members, working with a professional staff of seventeen, twenty-two consultants, and the periodic assistance of almost two hundred federal agency personnel.

Within approximately eight months this group had drawn and analyzed information from each federal agency involved with water in any way, from numerous agencies in each state and territory, from sixty colleges and universities, and from 196 private organizations and agencies. Eight meetings in various parts of the country elicited comment on water problems from about one-quarter of the two thousand people who attended. With this mass of information, the Commission proceeded to study, and make recommendations to the President with respect to, *Federal* responsibility for and participation in the development, utilization, and conservation of water resources, including related land uses and other public purposes to the extent that they are directly concerned with water resources. . . . give consideration in particular to (a) the extent and character of *Federal Government participation* in major water-resources programs, (b) an appraisal of the priority of water-resources programs from the standpoint of economic and social need, (c) criteria and standards for evaluating the feasibility of water-resources projects, and (d) desirable legislation or changes in existing legislation relating to the development, utilization and conservation of water resources.[2]

The Commission members were: Paul S. Burgess, dean, College of Agriculture, University of Arizona; Lewis Webster Jones, president, University of Arkansas; Samuel B. Morris, general manager, Metropolitan Water District, Los Angeles; Leland Olds, former chairman, Federal Power Commission; Roland R. Renne, president, Montana State College; Gilbert F. White, president, Haverford College; and Morris L. Cooke, consulting engineer, Philadelphia *(chairman)*.

GROWTH OF WATER POLICY

Water, as a basic resource, has suffered from lack of man's understanding. Our easy acceptance of its availability in humid areas and our uncoordinated policies for its development in the arid regions suggest the casual treatment we have given it. Fragmentary federal water policy began as early as 1879 with the recognition of the relationship between navigation and flood control. In 1891, by authorizing the establishment of National Forests, the Congress recognized the connections between forest cover and flood prevention and stream flow control. Federal development of the waters of the West was authorized by the Reclamation Act of 1902, amplified in 1906. By 1907 congressional attention was being focused on the need for co-ordinating ex-

[1] President's Water Resources Policy Commission, *A Water Policy for the American People*, Vol. I, Washington: Government Printing Office, 1950.

[2] *Ibid.*, p. 309. Italics ours. It should be noted that primary emphasis is directed toward federal policy and participation.

isting water agencies.[3] In appointing an Inland Waterways Commission that year to "evolve a comprehensive plan designed for benefit of the entire country," Theodore Roosevelt said:

> Every stream should be used to its utmost. No stream can be so used unless such use is planned for in advance. When such plans are made, we shall find that, instead of interfering, one use can often be made to assist another. Each river system, from its headwaters in the forest to its mouth on the coast, is a single unit and should be treated as such.[4]

It is this thesis that serves as one of the main points of the Commission's program.

In the last half-century there has been a growing awareness of the desirability of multipurpose development, and of treating entire river systems as wholes. But haphazard legal and administrative growth has left us without a comprehensive national water policy or a co-ordinated group of responsible agencies.

INCREASED USE CONTEMPLATED

The Commission based its report on the assumption of an expanding economy. The implications of this assumption are broad. In addition to our currently increasing rate of population growth, which may give us a national total of as much as 200–300 million by the year 2000, according to Joseph S. Davis,[5] our rate of water use has shown even more rapid growth. Between 1939 and 1949, according to a recent study, 2,252 industrial plants increased their water intake by an average of 36 per cent.[6] A national survey of groundwater problems, sponsored by the Conservation Foundation, points out that current use of water may be doubled within a few decades.[7]

This growth may call for extensive legal and administrative adjustments, but from the point of view of the water supply itself, there is ample room for such increased use. By way of illustration, it is interesting to note that of the total rainfall in the United States, approximately 30 per cent is runoff, available for man's use. But of that runoff, only 4 per cent is now "used" by man—a mere 14 per cent of that available to him.[8] Much of this is susceptible of reuse, often many times.

Thus, except in the arid West, water resources are, as far as gross quantities go, available for greatly expanded use, if the facilities and administrative machinery can be established to realize the potential in an equitable manner. To define what the role of the Federal Government should be in future development was the task of the Commission.

PRINCIPLES OF PLANNING

Federal water policy must be the result of creative joint effort by individuals as well as government at all levels. Early in its report, the Commission outlines the requirements of democratic planning:

> The American system succeeds only as it encourages initiative, enterprise, and a sense of responsibility for the common good. No "plan" can be acceptable which weakens or fails to use these qualities. The recommendations of this report do indeed envisage long-range plans for each river basin, and an over-all water resources plan for the Nation as a whole. But both in the detailed formulation of these plans and in their operation, individual farmers, workers, and businessmen, as well as agencies of local, State, and Federal Government, will play an indispensable and fully responsible part.

The Federal Government is clearly charged with responsibility for safeguarding and developing our resources, but it is only one of the agencies involved. Its specific role is one of leadership—the provision of relevant scientific and economic information and co-ordination, as well as a public investment function on behalf of the entire Nation. These functions aid and supplement, but can never supplant, the work of local individuals and groups directly concerned.[9]

Further planning principles are set forth. Each regional plan should be comprehensive and co-ordinated, based on the concept of multiple use. Plans should arise from present or prospective requirements, and be designed to meet them on a regional, state, or local basis. In all, there is a body of recommendations on which general agreement exists—as the Water Policy Panel of the Engineers Joint Council notes.[10] Plans should be based on adequate data. Congress should create an independent board of review. The investment appraisal statement should be complete. Uniform procedures should be used by all agencies in estimating costs and benefits. Congress should provide a uniform national reimbursement policy and specify the principles to be applied. Reimbursement should be secured for direct benefits and for local secondary benefits. All levels of government—federal, state, and local—should participate in planning.

The Engineers Joint Council points out that "despite some references to local and state participation, *the emphasis in the report is almost universally on federal direction and control.*"[11] And this is the general tenor of much of the criticism directed at the Commission's argument. But it should be noted that "the Commission favors full participation by the states to the extent that they accept the broad responsibility which goes with such participation,"[12] indicating, however, the problems of limited funds and inadequately trained personnel in state planning groups. That much remains to be done by the states themselves has been brought out during a study now being sponsored by the Conservation Foundation, conducted by the University of Pittsburgh Law School. Here, in a state generally acknowledged as "advanced" in conservation, some twenty state agencies, controlled and affected by 663 state and federal laws and regulations dealing with water in Pennsylvania, have never had the benefit of a compendium of these interrelated laws.

FINANCIAL FEASIBILITY

Another basic point which several critics question is the Commission's emphasis on financial feasibility as distinguished from economic feasibility. In developing recommendations for evaluation of projects, the Water Resources Policy Commission deals with the various effects of water resources programs on the economy, pointing out the significance of intangible as well as tangible benefits, and emphasizing social benefits of regional and national scope.

The relationship between total costs and total returns would indicate the extent to which the program or project would be financially feasible.

Financial feasibility has been urged by some as the determining factor in evaluation, that is, they believe that all water re-

[11] *Ibid.*, p. 3.
[12] President's Water Resources Policy Commission, *op. cit.* note 1, p. 49.

sources projects should be self-liquidating. This view implies that Federal agencies should seek out sound business opportunities wherever they may be found in the water resources field.

The basic fallacy in such reasoning is that it seeks to transfer to public investments the limitations common to private investments. The Federal Government seeks to conserve and develop the Nation's natural resources for the general welfare and not for profit. Hence, financial feasibility is not the same as economic feasibility. Financial costs and returns should be considered in analysis, but financial feasibility alone should not determine the desirability of a program or project. For this reason the Commission is recommending that Congress eliminate the requirement that irrigation projects show financial feasibility.[18]

On the general principle evoked here, the Water Policy Panel of the Engineers Joint Council *"must record distinct disagreement."* Collective action for water conservation and control should be accomplished at the lowest governmental level practical. When collective action is taken through the Federal Government, the Council recommends as policy:

> First, to do those things which are essential to the national defense or otherwise of substantial benefit to all of the people throughout the nation; and
>
> Second, to aid in the financing of the cost of construction of works for the benefit of a limited number of people on terms equitable to all other citizens of the nation.

In the discharge of the first function the Federal Government is acting as a trustee in the disbursement of tax revenues on a non-reimbursable basis for the general benefit. It follows that such expenditures should be made for those purposes which will produce the greatest benefits to the nation as a whole. This responsibility goes far beyond any determination of feasibility; it requires a determination of what is best, not merely what is good.

[18] *Op. cit.* note 1, p. 59.

In its performance of the second function the Federal Government is basically acting as a banker responsible for the soundness of his loans. It is fundamental to this function that such loans should be repaid with interest so long as there is a national debt and that the period of amortization should not exceed the useful life of the works. It is also fundamental to this function that those who benefit directly from the construction of such works for the conservation and control of water should repay all costs properly allocable to the production of such benefits; furthermore, where indirect benefits will accrue to a region in greater degree than to the nation as a whole, the people in that region should repay a like proportion of all costs not allocable to production of direct benefits.[14]

Question of Federal Control

Reporting to the Water Problems Section of the Commonwealth Club of California, Sinclair O. Harper, section chairman and former chief engineer of the United States Bureau of Reclamation, points out that the greatest justification for the trend toward federal control of water resources development lies in

> projects too large for state or local development; projects whose benefits are largely interstate or national, such as navigation and flood control; projects serving a number of purposes—irrigation, flood control, navigation, power, recreation, etc.—but unlikely to be developed by local or state agencies without federal subsidies.[15]

He further notes that under a 1940 Supreme Court ruling, federal authority may control virtually all major streams.[16] He also suggests the desirability for local agencies to obtain operative authority over their water projects, even to the extent of returning to the Federal Treasury all reimbursable project costs.

[14] *Principles of a Sound National Water Policy* (New York: Engineers Joint Council, July 1951), pp. 20–21.

[15] Sinclair O. Harper, "Water Development —Federal, State, Local Fields?" *The Commonwealth*, Vol. XXVI, Part Two (Sept. 24, 1951), p. 5.

[16] *Ibid.*, p. 6.

However, a poll of the members of the Commonwealth Club's Water Problems Section shows 43 per cent voting in favor of continuing the policy of federal *financing* of major water resource developments, although more than 95 per cent favor giving the Federal Government less responsibility in such developments.[17] This is indicative of the continued conflict which has hampered our water development to date—the attitude expressed as "Give us the federal funds, but let us spend them ourselves."

Much of the controversial nature of the Water Policy Commission's recommendations centers around the character and the extent of local and state participation in water resources development. The National Association of Manufacturers, for example, while commending the Commission for its thorough compilation of material for study of the problem, takes issue with any type of river basin development plan similar to the Tennessee Valley Authority.

> The Association again states its firm conviction that the American people have progressed, and will continue to progress and prosper better under the present system that depends to a maximum degree on individual initiative, resourcefulness, and responsibility, and self and local control, than they would under a socialistic government, the seeds of which are inherent in the Commission's proposals for basin-wide developments.[18]

To avoid such a situation, the NAM committee favors interstate compacts or intrastate conservancy or development boards. It may be pointed out here that some of the more noteworthy of these have in fact, despite their widely acclaimed grass-roots character, received most of their funds from federal sources.

[17] *Ibid.*, p. 15.

[18] Recommendations of the Committee on Conservation of Renewable Natural Resources to the September 1951 NAM Board of Directors Meeting (mimeo.).

Responsibility and Control

David M. Guy, then manager of the Natural Resources Department of the Chamber of Commerce of the United States, dealing with the general water development problem, recognizes the connection between financial responsibility and control:

> In all development of water resources, it must be borne in mind that responsibility and control are inseparable. And to the extent that federal responsibility, financial or otherwise, is accepted, it goes without saying that there will be, and must be, a commensurate share of control. Financial responsibility without control is not tenable in private enterprise. It cannot be expected in government. Conversely the more financial responsibility the states and communities assume in river development, the less they will be troubled with federal intervention.[19]

This is perhaps the crux of the matter. Federal control should be kept at a minimum not only because of American tradition (a strong point in the NAM and the Edison Electric Institute arguments against the Commission's recommendations) but also because local participation, particularly financial, is likely to make the direct beneficiaries insist on the most efficient utilization of their funds.

A Complex Situation

But individual developments locally planned are unlikely to provide the de-

[19] "Background for Development of Water Problems and Policy" (Washington: Chamber of Commerce of the U. S., Oct. 23, 1951, mimeo.), p. 11.

gree of co-ordination necessary to develop the integrated system required for wise use of the renewable resources in areas linked by a common water course. Treatment of these broad areas is complex and difficult. It is relatively easy to propose a particular dam. It is definite as to location and objectives and cost. And on this information the Congress acts. However, a dam is only a part of the whole development. Without upstream treatment, silt deposition may destroy the investment; or a dam allowing for stream flow peaks, which might be susceptible of reduction by land treatment, may require unreasonable expenditures. Without integration of various developments, the river is a collection of unconnected fragments. Over-all planning for its use, taking into account local needs, is imperative.

The widely varying laws dealing with federal (and state) water development help to complicate an already complex problem. Arthur Maass, a careful student of federal water administration, points out the need for a basic law setting forth detailed standards and criteria for determining priorities among proposed water development projects.[20] Uniform standards would go a long way toward overcoming the inequities which now permit competition between federal agencies in water development. This competition does much to bring about the conflict which arises when local groups on the one hand urge local development of water resources, and on the other hand turn to the Federal Government—and nonbeneficiary taxpayers —to foot the bill.

PROPOSED FEDERAL ORGANIZATION

To put its recommendations into action, the Commission has presented a proposed bill[21] to the President. At this writing, no action has been taken, nor has it, or any like bill, been presented to the Congress, although various agencies and the Bureau of the Budget have been studying the proposal.

The legislation outlines in general terms the character of federal organization for water resources development and sets up commissions in river basins in composition suggestive of the informal Inter-Agency River Basin Committees. These commissions are to consist of nine members, representing the Corps of Engineers, the Departments of Interior, Agriculture, and Commerce, the United States Public Health Service, and the Federal Power Commission, two nongovernmental representatives elected by a local advisory committee, and a presidentially appointed chairman. The last three must be residents of the region. These commissions are required to prepare a long-range program for *federal* participation in the region's resource development, co-ordinate and require co-operative *federal* resource development functions, and recommend specific legislative changes to achieve the objectives of the act.

To advise and serve as liaison with the public, the bill provides that the governors of states within an established river basin shall each appoint a personal representative and elect three representatives for the basin from agriculture, from business, from labor, and from fish, wildlife, and recreational interests, and a sufficient number from local governments to complete the committee's membership of twenty-five. These representatives are responsible to consult with their commission in the long-range program planning, to assist in co-ordination of commission and state and local resource developments, and to help in negotiation of repayment agreements from state and local indirect beneficiaries.

In addition, a five-man Federal Board of Review is to co-ordinate the operations of the various basin commissions, examine the relation of commission proposals to costs, benefits, and long-range programs, and, after consideration of the various factors involved, make recommendations through the President to the Congress. These recommendations, under the proposed bill, would serve as a guide to congressional action.

OUTWORKINGS OF PROPOSALS

In this Board of Review one finds for the first time in federal organization an agency which could, for example, weigh in national terms the merits of expensive water developments in the arid West against those in longer-established agricultural regions. Such a board could be responsive to local claims for well-planned, locally financed developments as part of integrated programs. But most important, this board has the opportunity of recommending federal expenditure on a rational basis and opposing pork-barrel efforts. With wisdom and objectivity, it should be a major force in long-range resource conservation. Its membership and the precepts under which it operates are of vital importance to the nation's welfare.

In the proposed legislation the possibilty for local developments (private or public) to arise independent of a basin-wide plan is not dealt with specifically, but there appears to be no major barrier to private and local initiative. Local participation is provided for by advisory committees and by the system of negotiated repayment agreements with state and local beneficiaries, including conservancy districts. The legislation recommended by the Water Resources Policy Commission offers a brake on unconsidered or ill-conceived programs of individual pressure groups. It provides a basis for uniform standards for each agency's projects, and a review of interrelated problems.

The submission through the Commission and the Board of Review of the various agency budgets for their resource development activities would favor a co-ordination of effort which has been grievously lacking. Instead of the artificial device of budgeting in terms of a given agency's program throughout the country, priorities for balanced development in specific areas by all agencies could be established. The needs of one agency would be functionally linked to those of others.

The device of reimbursement, by others as well as by direct beneficiaries, recognizes the merit of local participation. Since agreements must be negotiated, rather than taxes levied on the entire body politic, there is additional control over ill-conceived projects, and promise of a more equitable basis for local assumption of financial responsibility.

Uniform accounting systems, including a weighing of nondollar advantages and disadvantages, would make it possible to consider in comparable terms the economic feasibility of various projects in a development program. In all, the draft bill meets a number of important requirements for effective operation.

As the Commission says, "There is a sobering finality in the construction of a river basin development. . . ." A Board of Review, a group of river basin commissions, and local advisory groups can lay plans with well-rounded objectives for the consideration of the people involved, local residents and distant taxpayers. Informed, deliberate action by individuals immediately concerned with the development

and use of resources is necessary in an expanding economy. Full utilization of resources must take into account their interdependence; some body must be charged with the responsibility of interrelating their development on a scale commensurate with the complex values of these interrelated resources.

Robert G. Snider, New York City, is director of research and vice president of the Conservation Foundation.

Water: West

By MORRIS E. GARNSEY [1]

Conservation is one of the least popular words in any lexicon in this country. I regret that we didn't name it development. Since it is a land-use problem, development would be a more accurate label, because conservation suggests to the fisherman that we don't want him to catch any fish, to the hunter that we don't want him to hunt, and to the axman that we don't want him to cut. All of this is wrong. If you say development you've got everybody on your side even if development is the most destructive thing in the world.[2]

THESE words offered sound advice when they were written fourteen years ago by Tom Wallace, one of the great champions of conservation in America. Today they have an added ring of prophecy about them—at least as far as the great American West is concerned; for the idea of development appeals to the westerner, not only because of its affinity with the traditional expansionist views of the frontiersman, but also because of an increasing realization among westerners that the new wave of population growth in the United States is certain to result in a relatively large acceleration of economic activity throughout the western United States during the years ahead.

WESTERN POPULATION INCREASE

It now seems reasonable to estimate that the population of continental United States will reach 200 million by 1975—an increase of approximately one-third in twenty-five years. Should this be the case, the rate of increase of the population of the seventeen western states is certain to exceed the national increase by a substantial margin. Indeed, it is not inconceivable that this group of states, which accounted for 22.6 per cent of total United States population in 1950, should provide residence for as much as 30 to 33⅓ per cent of the population in 1975. This would mean a rise in western population from 34 million in 1950 to approximately 60 to 65 million in 1975. Thus, when national population grows by 33⅓ per cent, the population of the West is likely to rise by 75 to 95 per cent!

Obviously, such a large growth of western population would require a heavy migration to the region from the rest of the United States. However, there is good reason to expect that such a migration will take place. The westward movement has accelerated when total population has been rising rapidly, and decelerated when population increase has been more moderate. It is relevant to note that the center of population moved farther west between 1941 and 1950 than in any previous decade since 1881–90.

Historic parallel is in itself not a conclusive basis for forecasting. Much

[1] I wish to acknowledge with thanks the contribution to this article of the students in my Graduate Seminar in Regional Economics, both in the preparation of the following research papers and in general discussion of water resources development in the West: H. L. Bacon, "The Central Valley of California"; R. L. Bingham, "Water: Key to the Future in the Colorado River Basin"; R. L. Hasse, "The Missouri Valley"; W. G. Neahr, "The Upper Arkansas River Basin"; J. V. Walther, "The Rio Grande River Basin"; and J. E. Wood, "Conservation of Water in the Columbia River Basin."

[2] Tom Wallace, "Getting Publicity for Conservation," condensed from *Forestry News Digest* and appearing in *Conservation*, Vol. 5 (Jan.–Feb. 1939), pp. 30–31.

more significant is the fact that the westward movement is now, as in the past, closely related to the need for bringing new land under cultivation in order to feed a growing number if persons. By 1975 the United States should have added at least 100 million acres of cropland to the approximately 400 million acres in use in 1950 in order to serve the extra 50 million persons then at the nation's dinner table. Much of this land must come from the West, and nearly all of the western share must be irrigated land. According to Wesley R. Nelson, assistant commissioner of reclamation, there are nearly 50 million acres of potentially irrigable land in the seventeen western states which under cultivation would yield crops equivalent to the produce of 100–150 million acres of average nonirrigated cropland.[3] Thus, the West could, in a pinch, supply nearly all the additional cropland needed by this country in 1975.

In addition, the West could supply most of the other resources required by a larger population, particularly mineral fuels and fertilizers, forest products, and hydroelectric power. In short, most of the unutilized natural resources of the United States are to be found in the West, and it is in the West that many of our new citizens may be expected to locate.

Technological Possibilities

Of course, it should be recognized that the precise extent and character of western development will not be determined simply by the direct pressure of population, but will be significantly affected also by the nature of the technological and social innovations which may be expected to accompany our imminent population upsurge. In the area of technology, three possibilities may be mentioned.

First, if Krilium turns out to be as effective for soil-rebuilding as its discoverers promise, much of the new acreage to be brought under cultivation may be found in the submarginal lands of the United States east of the 20-inch rainfall line.

On the other hand, if the technique of controlled precipitation through cloud-seeding develops rapidly, western expansion will be greatly facilitated. At the moment, the potentialities of cloud-seeding are being debated vigorously, with the skeptics having a bit the best of it. Nevertheless, the continued improvement of new techniques is a commonplace of our civilization. It seems a fair judgment to say that in 1952 the technique of cloud-seeding is about as far advanced as was that of the airplane when the Wright brothers flew at Kitty Hawk. If the analogy holds, the controlled increase of the snow pack in the high mountains as a means of regulating the supply of irrigation water throughout the West ought to be commonplace by 1975; while in certain areas the control of precipitation for direct application to crops and pasture would be regularly practiced.

The third technological factor of significance for the future of land and water development in the West does not involve substantial innovation, but does require an immense extension of existing techniques, together with their refinement and adaptation to diverse circumstances. This is the diversion of water from where it happens to flow by virtue of natural forces to wherever it can be used most efficiently. Such transfers of water involve the construction of dams, reservoirs, canals, and hydroelectric pumping plants on a very large scale. Certainly the Bureau of Reclamation could not speak of "50 million potentially irrigable" acres of western land if it did not assume the fullest use of facilities for the storage and transfer of water on every natural stream of any consequence throughout the West. Indeed, it is well known that a water utilization program of great magnitude is already under construction or survey in each of the major drainage basins of the West. It is from this technique of storage and transfer that we may expect most of the more immediate expansion of land and water resource utilization throughout the seventeen western states.

[3] Wesley R. Nelson, *Water and Our Future* (U. S. Dept. of Interior, Bureau of Reclamation), p. 7. An extension and revision of remarks made at a symposium on "Hydrodynamics in Modern Technology" at the Massachusetts Institute of Technology, June 4–6, 1951.

Hindering Factors

However, the rate of economic expansion in the West will depend not only upon technology but also upon the ease of adaptation of social institutions to changes in the economic and technological environment. It is here that we may introduce into our discussion a consideration of the problem of water (and land) conservation in the West. For while it seems inevitable that there will be a large degree of resources development in the West for the reasons just given, it is by no means certain that this development will be accompanied by the employment of practices and techniques of conservation on an equally large scale.

Not all the people of the West regard conservation and development as integral parts of the same process, as Tom Wallace would have us do. There is a sizable minority of standpat western "conservationists" who apparently would prefer to preserve much of the region in a primitive state, unpolluted by settlers and tourists. There is an even stronger minority who, as Wallace indicated, favor development as long as they can equate it with the unregulated private destruction of the resource base.

The western conservationist's first task, therefore, is to persuade these two aggressive minorities of the cogency of the majority view—that conservation and development must go hand in hand, and that a sound program for the utilization of resources over time is most easily conceived and implemented in a period, such as that just ahead, when new resources are being brought into employment and old ones are being utilized more intensively than before. Nevertheless, it is not likely that the mere use of exhortation would result in the conversion of the minorities to a sound conservationist point of view. Persuasiveness should rather take the form of the creation of a well-conceived policy and a carefully thought-out program for the future development and conservation of the West's water resources—a policy and program which could not ignore the values of recreation and open space, nor deny to the individual the opportunity to develop resources for private profit.

Policy and Practice

Fortunately, there has been rapid progress in the formulation of water policy in the recent past. The sixty-eight-point declaration of policy published by the President's Water Resources Policy Commission in December 1950 gives us for the first time a broad, clear-cut concept of the specific policies which must be implemented by the American people if we are to develop our resources successfully and arrest their all too rapid destruction. The emphasis on basin-wide, multiple-purpose resource planning by the Commission is particularly helpful, while its recommendations concerning the

evaluation, financing, and reimbursement features of development programs go far toward achieving the ultimate solutions to these knotty problems. It is true that some of the Commission's recommendations are controversial, and are not acceptable to many who are seriously concerned with conservation and development. Nevertheless, the major recommendations deserve universal approbation, and, for the West, the Report of the Commission is not only valuable but also exceedingly well timed.

Nevertheless, declarations of policy cannot in themselves stop erosion, control floods, or generate hydroelectric power. Our policies now must be implemented by the formulation of effective programs and the drafting of adequate plans—particularly in the field of conservation. For at the present time conservation planning in the West is lagging behind development projects, and conservation practice is lagging even further behind current development. Both planning and action are severely handicapped by inadequate local participation and by jurisdictional disputes among federal agencies and state governments—in short, by the failure of social institutions to keep pace with technological change or with the growing national demand for food and fibers.

The Rio Grande Basin

Perhaps the most appalling conservation situation is in the Rio Grande Basin, an area of severe water shortage, already suffering from advanced and serious erosion damage. This past and present destruction of the soil-water resource base has resulted from the short-run exploitation of range lands and the misuse of surface and ground-water supplies. The situation is further complicated by a heterogeneous cultural background, and the restricted economic opportunities available to most of the Spanish-American population. In many areas farms have been so divided and redivided that a surplus agricultural population is crowded on acreages too small even to support their operators, let alone finance the expensive measures necessary for the recovery of the basin. In addition, high-value irrigation farming cannot be expanded because there is no additional water available. In fact, 20 per cent of the presently irrigated two million acres should be retired.[4] Here in the agricultural sector of the Rio Grande economy, Malthus' dire predictions of population pressure on a limited resource base seem nearer realization than anywhere else in this country.

The major conservation problem of this basin is the rehabilitation of deteriorating water and soil resources. As in most of the western river basins, the soil-water relationship of the Rio Grande Basin is extremely precarious even under natural conditions. Man has accelerated the destructive forces of nature, which now produce barren lands and rivers clogged with silt. As a consequence, even the rehabilitation outlook is discouraging, because effective conservation is difficult and expensive after so long a period of misuse.

Yet something must be done. The Rio Grande Basin can make an important contribution to the national economy both culturally and materially if its water and soil resources are well managed. A balanced program which includes provision for dams, watershed rehabilitation, and an appeal to the grass-roots farmer is a must for this basin.

[4] Report of the President's Water Resources Policy Commission, Vol. II, *Ten Rivers in America's Future* (Washington: Government Printing Office, 1950), pp. 306–307.

The Colorado River Basin

The Colorado River Basin also faces problems of water scarcity, but in a different context. Water is scarce, but this scarcity is potential rather than existing. All possible uses of the water of the Colorado River would require 25 per cent more water than is available; yet present depletion is only approximately 44 per cent of the water supply.[5] Thus, the future holds relatively bright prospects for the Colorado River Basin *if* an adequate program of conservation and development is put into effect.

Here again it must be recognized that soil and water are interdependent. If conservation is to be emphasized, resource development must be of a long-run and sustained-yield nature. It cannot be too heavily underscored that, for a sustained-yield type of water resources development, adequate attention must be given to range management and erosion control. Indeed, aside from the damaging effects of severe erosion on land, irrigation enterprises, and hydroelectric facilities, erosion also damages the most efficient natural reservoir—storage as ground water. The universal importance of ground water for irrigation is strongly emphasized in the Colorado River Basin, particularly in Arizona, where 90 per cent of the irrigated land receives all or most of its water supply from ground water pumped from wells.[6]

The Colorado River Basin also has industrial possibilities which should be encouraged by further development of hydroelectric power capacity. This source of energy production can be increased at least three times, from a present installed capacity of approximately 3 million kilowatts to an ultimate capacity of about 9 million kilowatts.

However, before substantial progress can be realized within this basin, serious administrative problems must be solved. We will find again and again throughout most of the West that although the physical techniques for water development and conservation are available, the social and administrative techniques for applying scientific knowledge to the achievement of maximum welfare are in dispute. In the Colorado River Basin this dispute takes the form of interstate conflict. In the upper basin, administrative progress has been accomplished through the creation of the Upper Colorado River Commission, an interstate compact to co-ordinate state water resource development. But in the lower basin, conflict between Arizona and California over water apportionment continues, and consequently development is retarded.

[5] U. S. Congress, *The Colorado River*, H. Doc. 419, 80th Cong., 1st sess. (Washington: Government Printing Office, 1947), p. 14. These estimates include allowances for export of as much as three million acre-feet to other basins, although export on this scale would necessarily eliminate some of the potential uses within the basin.

[6] Department of Commerce, Bureau of the Census, "Preliminary 1950 Census of Agriculture," series IR 50–1, Jan. 14, 1952.

The Missouri River Basin

The Missouri River Basin offers another example of administrative conflict which has slowed development and retarded efforts to solve conservation problems similar to those of the Colorado River Basin. Here too there exists a relative water shortage—not enough water for all projects possible. In addition to being limited in quantity, water in the Missouri Basin is variable in quality and poorly distributed. These facts, together with the large size of the area and limited mineral resources, have been largely responsible for a scattered population and lack of industrialization.

On the Missouri, as on most western rivers of uneven regime, man must control the flow of rivers by storing excess water for later use. With a complete water control and development program for the basin, hydroelectric power capacity can be increased approximately nine times, to over 9 million kilowatts; and the present irrigation of 5 million acres of land can be doubled. However, no complete water control and development program exists at the present time, largely because of the conflict of aims and interests which exists between the Bureau of Reclamation and the Army Engineers. Neither the Pick-Sloan Plan nor the Inter-Agency Basin Committee has succeeded in developing a basin-wide, multiple-purpose program for the Missouri. If it proves impossible to create a Missouri Valley Authority, the recent proposal of the Council of State Governments should be seriously considered.[7] Against the dominance of federal authority, this proposal would encourage more state and local participation by setting up a policy board and an operating agency deriving their powers from an interstate compact.

The Missouri Basin also offers a most promising field for the extension of the rapidly growing watershed association movement. Because of the basin's size and diversity, the attack on conservation and development problems should be broken down into sub-basin units. The dominance of agriculture in this region and the prevalence of habits of co-operation among the farmers of the Missouri Valley also point to the success of a conservation program administered on the basis of local participation.

[7] According to the *Denver Post*, Section E, p. 1, Feb. 24, 1952. A rough draft of this proposal for an administrative board has been developed by Elton McQuery, assistant director of the Council of State Governments. Under his plan each state would have one representative and one vote. Also, the Federal Government would have one representative possessing one vote for each state.

THE CENTRAL VALLEY

The interagency conflict between the Bureau of Reclamation and the Army Engineers has not stopped at the boundaries of the Missouri Basin. The conflict has been even more severe in the Central Valley of California, where competition between these two federal agencies for support both in the valley and in Congress has resulted in development by political pressure. In the meantime, the Central Valley has suffered prolonged delay in securing an integrated program of development which will meet its conservation needs.

These needs are somewhat different from those in river basins where extreme water shortage prevails. There is plenty of water for all areas of the Central Valley, provided it is properly distributed. More water than can be utilized originates in the northern sector of the valley, while there is not enough water in the southern portion. To alleviate this particular shortage, the Bureau of Reclamation has proposed an elaborate network of pumps and canals to make surplus waters of the north "run uphill" to the irrigable acres of the southern basin. This water development program would cut water losses in the Central Valley from over 9 million to 1.5 million acre-feet per year, and at the same time increase the hydroelectric power output by four times and raise the irrigable acreage by 50 per cent.[8] The economy of the region must expand in order to provide adequate economic opportunity for its present and growing population. Much of this expansion depends on the utilization of water which now flows unchecked into the Pacific.

[8] Report of the President's Water Resources Policy Commission, *op. cit.*, pp. 81–161.

In the Central Valley, as in the other basins, the conservation aspect of development has been neglected for short-run gain. The exploitive use of ground water has seriously damaged and reduced the flow of this valuable resource. The implementation of land treatment programs and ground-water conservation measures has proceeded at a very slow pace, with only about 10 per cent of the valley's farms and ranches included in Soil Conservation Districts.[9] Once more we find that control of water resources has begun only after the water has reached the river with consequent use of expensive and elaborate control structures. Dams and reservoirs are necessary and useful instruments of water resource development, but their full effectiveness will not be realized in the Central Valley as long as the region's water program lacks a proper balance between conservation and development.

THE ARKANSAS-WHITE-RED BASIN

Now for a brief look at the Arkansas-White-Red River Basin. It has been said that if this river system could be made to flow in a circle, the prospects of water supply would be infinitely more hopeful. The situation again is a maldistribution of water. The lower basin, situated in a more humid climate, has more water than can be profitably put to use. Additional irrigation demands are not important in the agricultural economy, because of adequate rainfall; and hydroelectric power, supplying less than 10 per cent of the power demand, is also relatively unimportant.

However, in the upper basin the water supply is chronically inadequate. The problem cannot be solved simply by the better use of existing water supplies, important as better use may be. The paramount need is to secure more water by transmontane diversions from the Colorado River Basin. Yet even with this possibility the water supply problems of the Upper Arkansas will not be solved. The possibilities of diversion from the Upper Colorado River Basin are limited, and most of the water which could be diverted into the Arkansas Valley will be needed for municipal water supplies there. In addition, the present provisions of the Colorado River Compact restrict the use of the diverted water to the boundaries of the state of Colorado. Therefore, although irrigation is very important in the upper basin, little expansion in this field is anticipated. On the other hand, hydroelectric power could be increased by approximately eight times, to a capacity of almost 5 million kilowatts.

Yet, despite these handicaps, the Arkansas-White-Red Basin does offer us the one contemporary example of an outstanding social and administrative attempt to solve the common problem. The principles of multiple-purpose, integrated, basin-wide development are the foundation of development here largely because the AWRB Inter-Agency Committee has been set up *in advance* of the formulation of unilateral plans by separate agencies or by the construction of major works.

[9] *Ibid.*

THE COLUMBIA RIVER BASIN

Last to be discussed in this survey of river basin water needs, shortages, and potentialities is the mighty Columbia River and its surrounding basin. Here no water shortage is faced. Only a relatively small part of the total discharge can be expected to be utilized for irrigation. The water supply is so large in the Columbia River Basin that more than half of the total water discharged from western streams flows to the sea

from the Columbia River and from the Washington and Oregon coast and Puget Sound tributaries. Water is the basin's most valuable resource, and the irrigated crops and electric power which can be produced from it affect the relative values of every other resource in the region.

Water development potentialities of the basin include the doubling of the irrigated acreage and a tenfold increase in the production of hydroelectric power. Electricity is the only energy resource of importance in the region; and with complete development, the Columbia River Basin would possess 40 per cent of the hydroelectric capacity of the entire United States.[10]

Also because of the existence of so much surplus water, unconsumed by the generation of hydroelectric energy, tremendous possibilities exist for the alleviation of deficiencies elsewhere. Transmontane diversions to Nevada and Southern California are technologically possible, and if carried out would substantially reduce the demand of the Los Angeles area for Colorado River water. In a very real sense, the Columbia Basin is the outstanding example of an interbasin maldistribution of water. If social and political developments can keep pace with technological improvements, some 50 million acre-feet of water can be made available for export to croplands in other basins. Conservationists should be the first to recognize the desirability of creating a social framework within which to apply our technology for the purpose of improving human welfare.

In terms of land management, the Columbia Basin is not superior to other western basins, in spite of its relatively greater development of water resources. The conservation deficiencies present in other basins are also present in various degrees in the Columbia Basin. Watershed management is inadequate, and irrigated lands are not always efficiently operated. Forest conservation also needs extension, not only to provide a continuous flow of forest products, but also to protect vulunerable watersheds.

AN URGENT SITUATION

What may we conclude from this brief survey of the water resources of the West? Basin by basin and in the aggregate, the practice of conservation is not sufficient to prevent the continued destruction of the land and water resources of the West. Nor do present plans for future development include a sufficient emphasis on the integration of conservation techniques with development projects. At the same time, both development and conservation programs are seriously handicapped by administrative deficiencies arising out of jurisdictional rivalries and inadequate local participation.

This situation exists, moreover, at the very moment when the West is facing an increased demand for land and water unparalleled since the original settlement of the region. If this demand is to be met without a repetition of the ruthless exploitation of the last century, new concepts must be popularized and new procedures adopted without delay. Valley authorities modeled upon, if not duplicating, the Tennessee Valley Authority should be created at once in each of the six great basins of the West. Soil Conservation Districts should be multiplied and watershed associations created as rapidly as possible. From these authorities and associations should come project studies and priority lists, plans for local and national financing of conservation projects, and a barrage of education for conservation worthy of a Wallace or a Pinchot. Without such action, the desert lands of the West will encroach upon a million more acres of useful land, and flooding streams will flow muddy to the sea. With such action, our children will arise up and call us blessed.

He is author of America's New Frontier and various articles on regional economics.

Water Supply—The Industrial East

By Stephen Bergen

To illustrate the importance of water supply to human communities I should be obliged to have recourse to commonplaces, or else to the lays of the poets, who from earliest antiquity have glorified water. Water is necessary, paramount, vital. . . . No one will deny this, and yet. . . . One is really astounded to see what still remains to be done in every country in the world, even in the most advanced, in the matter of water supply as well as in the no less important matter of sanitary arrangements.[1]

IF one of the jobs of an economist is to promote the most desirable allocation of limited resources, he will find much to interest him in questions of water supply and in the natural and man-made conditions affecting its availability. For with growing national needs, the supply of good water is becoming limited in various respects in a number of places. Abundant natural water sources have made possible the development of industrialized and heavily populated areas east of the Mississippi. There is no doubt that these sources are generally so ample that they will support much further growth. But in highly developed areas of the East problems of providing enough water are demanding the attention of many communities and industries.

The challenge to communities, whether large industrial and commercial centers or agricultural areas making increasing use of supplemental irrigation, is not only one of engineering. Water in the East is becoming politics and also is entering the courts,[2] thus assuming a role long familiar in semiarid regions of the West. Along with more exacting regulation of water use and disposal by established governmental units, increasing and often conflicting water uses are begetting new forms of political association, such as interstate agencies and watershed organizations. For the use of a water source will involve the interests of all who depend on it. When a number of communities take water from and put wastes into the same river, clearly some sort of joint regulation of use will be necessary as the need for water increases.

The Watershed Is the Basic Unit

This community of interest is related to the fact that the natural land unit which continuously delivers and disposes of our water supplies is the watershed (or drainage basin). Large or small, it is the natural basis for many of the measuring and analytical operations—for example, stream gauging and sediment sampling—which aid in determining the quantity and quality of water available for use in a particular locality.

Because it is a naturally bounded unit, a watershed is the logical basis for scientific and engineering study and for harmonizing the activities of interdependent water users. This is well illustrated by a stream-analysis research project under way at the University of Michigan.[3] This project includes studies to determine the self-purifying capacities of individual streams on which pulp and paper mills are or may be located. The capacity of individual streams to purify themselves of pollution loads by natural processes varies partly with their flow. In general, the greater the stream flow, the greater the pollution load that may be safely introduced into and diluted by the stream. The flow of the stream depends, in turn, upon rainfall in the basin, which may be abnormally low in certain years.

> Dry-weather flow varies radically from river to river and year to year and each drainage has its own peculiar pattern. The prediction of drought severity for a particular river can, however, be accomplished by modern statistical analysis. As this project's researches continue, the hydrologic studies consistently emphasize the dominant role exercised by drought probabilities and the necessity for giving that factor major consideration in the establishment of stream [quality] standards and programs of stream improvement.

In other words, rainfall over its entire watershed will govern in part the use of a stream by a particular plant for waste disposal.

The Natural Water Supply

The natural water supply in the eastern part of the country is generous. East of the Mississippi the climate is humid. Precipitation (rain and snow), the ultimate source of all our water, ranges from an annual minimum of about 30 inches in the Great Lakes region to as high as 60 inches in parts of the Gulf coast and the tip of Florida. (There is an "island" of very heavy precipitation—up to 80 inches—roughly at the junction of Georgia with North and South Carolina.)[4] Precipitation is the gross supply, and only part of it is available for our use. The water that drains from the land into creeks and rivers during and after precipitation is called runoff. It has been defined as "a residual of rainfall after Nature's take—that is, after the persistent demands of evaporation from land and transpiration from vegetation have been supplied."[5] This remainder represents the total quantity of water available for development in streams and ground-water basins.

The amount of runoff in the East varies of course from place to place and from year to year, and reflects the amount of precipitation, the effect of temperature upon rates of evaporation and of transpiration by vegetation, and effects of geology and topography. Measured in inches depth over drainage areas, the average annual runoff ranges from 10 to 15 inches in the Great Lakes region, 20 to 40 inches along the Appalachians and in the Northeast, and 10 to 15 inches along the eastern Coastal Plain south of Maryland.[6] These bare figures take on more meaning in relation to estimates of the comparatively small quantity of water used by man. For the country as a whole, the average annual precipitation is about 30 inches, about 21.5 inches of which returns to the atmosphere, leav-

[6] *Ibid.*, Plate 1.

ing an average runoff of about 8.5 inches.[7] It has been estimated that less than 1 inch of this water is intercepted and used in passage.

THE LOCAL CONDITIONS

These broad average relationships are cited merely to illustrate that we use a very small part of the water running off to the ocean. They are suggestive, but need certain qualifications. Water is really not permanently available until developed by means of dams or wells, pumping facilities, and a distribution system. While the total quantity of water available, measured on an over-all basis for a large watershed, may be ample in relation to total demand, local conditions are extremely pertinent, and often limiting, in developing a supply for a particular community at reasonable cost. It is the relation of local demand to local sources that governs, granted that the amount of good water available to a downstream user will often be affected by use and waste-disposal practices upstream. The practical question is one of determining the dependable supply offered by perhaps several local sources,[8] and of designing facilities on a scale with local water needs.

Thus, many "shortages" of water widely reported in the last few years are not due primarily to drought or to shrinking of natural supplies. They are often due rather to present inadequate knowledge or exploitation of sources locally available, or to rapid increases or concentration of demand that strains existing water supply facilities. The case of New York City has become famous.

Careful reviews of the New York City water supply situation disclose without question that the shortage of water was due entirely to the delay in providing the physical facilities essential for delivering increased quantities, and not to the unavailability of water. This delay was manmade and was the result of a major economic depression, a serious world war and local municipal fiscal stresses. None of these causes were even remotely related to the absence of abundant water resources. These resources are abundant in the New York area and are economically available for uses far in excess of those now anticipated for the long distant future.[9]

WATER USES

How much water is used east of the Mississippi for various purposes? Uses are usually classified as municipal, industrial, rural domestic and stock use, irrigational, and water power. These may be called *withdrawal uses*,[10] requiring the water to be removed from the ground, stream, lake, or pond, as distinguished from *nonwithdrawal uses* for waste disposal, navigation, recreation, and the support of fish and wildlife. Most of the second group, unlike the first, do not lend themselves to evaluation in terms of quantity; but they are clearly of great economic and social importance.

It should be noted that when used, water is often only partly consumed, if at all, though its quality may be impaired. Obviously, the same water may be used again and again to generate

[7] Harold E. Thomas, *The Conservation of Ground Water* (New York: McGraw-Hill Book Co., 1951), pp. 20–21.

[8] Where demand is concentrated and great, local sources within the watershed are often not sufficient. New York reaches out 120 miles for water; Los Angeles, 350 miles.

[10] Kenneth M. MacKichan, "Estimated Use of Water in the U.S.—1950," U. S. Geological Survey Circular 115, 13 pp.

power in a series of plants. In irrigation, from 20 to 60 per cent may seep into a stream as return flow.[11] A recent survey of water use in about three thousand manufacturing plants revealed that about 65 per cent of the plants discharged from 90 to 100 per cent of their intake.[12] A great part of the public water supply used in communities returns to the streams as sewage effluent.[13]

Table 1 shows rough estimates of the quantities of water withdrawn for various uses in the twenty-six states east of the Mississippi (including District of Columbia), and, for comparison, the national totals for these uses.

TABLE 1—ESTIMATED WITHDRAWAL USE OF WATER, 1950[a]

Uses	States East of Mississippi			United States		
	Ground Water	Surface Water	Total	Ground Water	Surface Water	Total
Municipal	1,817	7,580	9,397	3,549	10,048	13,597
Industrial	3,590	65,295[b]	68,885	5,495	71,682[b]	77,177[c]
Rural (domestic and stock)	1,431	347	1,778	2,803	696	3,499
Irrigational	252	286	538[d]	19,654	67,776	87,430
Water power		858,140	858,140		1,246,660	1,246,660

[a] MacKichan, *op. cit.* note 10, pp. 6–7. All figures in million gallons per day (mgd) except those for irrigational use, which are in 1,000 acre-feet per year. An acre-foot is the quantity of water required to cover an acre one foot deep; 1,000 acre-feet per year equals 0.89 million gallons per day.

[b] 11,720 mgd was brackish (from tidal streams).

[c] This does not include water for industrial use from public supply systems, which is included under municipal.

[d] This does not include irrigational use described as negligible in sixteen states.

These data reveal that, apart from water power, the largest use of water in the East is industrial. West of the Mississippi the largest use is for irrigation. On a national basis these two uses are roughly equal in total (70–80 billion gallons per day), and far exceed the total United States municipal use. Municipal systems served about 93.5 million people in 1950, an average of 145 gallons per day per person.[14] For the entire country, far more surface water is used than ground water; the proportion is about 5 to 1. But about three times as much ground water is used west of the Mississippi as in the East, and chiefly for irrigation.

These are rough estimates, indicating gross withdrawals at sources with some water unavoidably counted perhaps several times; net consumptive use is much less.[15] The estimate of gross industrial use made by the United States Geological Survey includes water for cooling purposes; other estimates, made by industry itself and others, are far lower (10–25 billion gallons per day), depending on the basis of calculation.[16] It is clear in any case that the water needs of industry in general are considerable. The economic sig-

[16] See Abel Wolman, *op. cit.* note 9, pp. 1–2.

nificance of industries which are large water users is indicated by the fact that they account for almost one-third of the total "dollar value added by manufacture" by all industries.[17]

In recent years federal and state agencies and industries themselves have been gathering more detailed information on industrial water use. A study made in 1950 by the National Association of Manufacturers and the Conservation Foundation developed data on some three thousand industrial plants, widely diversified as to location and type of industry. It was found that there was an average increase of 30–40 per cent in water intake, for the plants and industries covered, over the decade 1939–49.[18] The most spectacular increases in water use due to industrial expansion have been occurring in Texas. Yet in the East, Baltimore increased its water use almost 70 per cent from 1938 to 1948, while population grew only about 6 per cent; in Detroit use increased 47 per cent from 1932 to 1945, while population increased about 4.3 per cent.[19]

The range in the quantities of water used by industrial plants is rather striking. For the three thousand plants surveyed, between 5 and 6 per cent of them accounted for almost 80 per cent of the total water intake reported, while about 65 per cent took in less than 2 per cent of the total. This suggests that in many respects the problem of industrial water supply is that of the larger user. This must have considerable significance in planning the use of water resources. However, where water economy is necessary, the opportunities for conservation measures within the large water-using plants may be great. Thus, the Kaiser Steel plant in Fontana, California, uses far less water per ton of steel than the average for the industry.[20] Among large water users, the greatest part of the water intake is usually for cooling purposes; for plants in general, water is used for process purposes, cooling, sanitation, and service.

LACK OF FACILITIES

If the water resources of the East are generally ample, though varying considerably from place to place, why are supplies often insufficient in local areas to meet industrial needs? In the opinion of one authority,[21] the difficulties arise partly because of delay by communities in executing water development projects; the lag between planning and construction often amounts to ten to fifteen years. This delay reflects the fact that "municipal bodies move slowly, not only because bond issues always must carry conviction to the electorate, but because legal and fiscal restraints are many and time consuming for compliance."

The difficulties also arise because of outgrown distribution facilities. Installing and expanding such facilities require large amounts of money, "yet their significance in relation to industrial demand is most difficult to make clear to the average citizen and sometimes to the average industrialist."

Related to this is a general lack of administrative and fiscal organization on the part of existing political units for developing water for industry. (Where industry is large it often undertakes its own water development on a strictly private basis.) What could be done in this direction is illustrated by "water district" agencies, such as the Washington Suburban Sanitary District and the Boston Metropolitan District, which have power to issue bonds and to construct and to operate water systems. The Charleston Development Board (South Carolina), for example, has been successful in attracting industries recently by taking the initiative in developing a large water supply (up to 10 billion gallons a day) at tidewater.[22]

POLLUTION TREATMENT

Severe and widespread pollution of surface waters in the East by physical, chemical, and biological wastes also limits the amount of water available to industry. The Delaware River, for example, each day receives about 500 million gallons of domestic sewage and hundreds of millions more of industrial wastes.[23] According to information gathered by the United States Public Health Service, about 24 million people of the 90 million living east of the Mississippi (excluding the population of the eastern part of the Upper and Lower Mississippi drainage basins) live in municipalities lacking sewage treatment of any kind.[24] Put another way, about 3,800 of a total 6,800 muncipalities in the East lack treatment facilities. In the same area there are about 6,400 industrial sources of pollution discharging wastes directly into watercourses. Of these, 1,760 treat their wastes, 2,859 do not, and 1,817 have undetermined facilities.

One measure of the seriousness of the problem is a Public Health Service estimate that for this area about 2,900 new plants are required for treatment of municipal wastes (with 1,300 cases as yet undetermined). Similarly, about 2,400 new plants are needed to take care of industrial pollution sources (with 2,480 cases undetermined).

A brief look at the record of the last fifty years gives some perspective to the pollution problem confronting the country. In the last half-century the total population of the United States, now 150 million, has doubled. In 1900 the *urban* population was about 30 million; in 1950 it was about 90 million; it has doubled in the last 35 years, and is now increasing at a rate of about 1,500,000 a year. Not only have new waste-treatment facilities been needed for this growth; the degree of treatment also must be greater to deal with a greater density of population. About 60 million people (1950) in the United States are tributary to some 6,700 sewage treatment plants; that is, about two-thirds of the urban population has some form of waste treatment, though only about 40 million may be said to receive complete treatment. The rate of growth of sewage treatment facilities over the last fifty years is shown in Table 2.[25] It seems fair to assume

[17] Engineers Joint Council, *A Statement of Desirable Policy with Respect to the Conservation, Development and Use of the National Water Resources,* 1950, Statement of Task Committee No. I, pp. 6–7. The data given are for 1947. The industries cited are: chemicals, textiles, steel, petroleum refining, rubber, pulp, paper and board, meat packing, canning, preserving and freezing, brewing, dairy products, whiskey, soap and glycerin, rayon, tanning, and manufactured ice.

TABLE 2—GROWTH OF SEWAGE TREATMENT

Decade	Additional Population Having Sewage Treatment
1900–1910	3,000,000
1910–1920	5,500,000
1920–1930	8,500,000
1930–1940	19,000,000
1940–1950	23,000,000

that, should this accelerating rate continue, most of the sewage from urban sources would be treated by, say, 1970. It certainly seems reasonable to say also that the country could afford it.

By and large practically any community in the U.S. that wants sewage treatment can finance it at a cost of approximately 1 cent per capita per day which will produce a sum sufficient to provide for the interest and amortization of the cost and the expense of operating the treatment plant. If waste treatment cannot be sold at so low a cost people have not been sufficiently educated as to the requirements or the cost.[26]

Estimates have been made of the total cost of reducing stream pollution in the United States to a reasonable level. Allowing for normal population increase, plant obsolescence, and so forth over the next decade, the cost for municipalities would be about 4.5 billion dollars (1950 prices). Since the industrial pollution load is somewhat larger than the municipal (while treatment methods, with known exceptions, follow the same pattern), the cost of abating it would be greater. Costs will be related also to the quality standards set for a particular stream. With a greater degree of waste treatment the stream will be suitable for more uses, but cost of treatment will be higher. Depending on the water uses finally chosen, the total cost for a pollution abatement program for the United States will range roughly from 9 to 12 billion dollars.[27] A more recent estimate (early 1952) is 20 billion dollars.[28]

MEASURES TO COMBAT POLLUTION

If the pollution situation is serious in many areas of the East, it is also true that much is under way to relieve it. A public more and more hemmed in by industrial and residential development is pressing its demand for clean water for recreation. Industry is becoming more sensitive to being called a bad neighbor, and it also has its own stake in water of good quality. The United States Supreme Court in a decision concerning the Delaware River stated some years ago: "A river is a treasure which offers a necessity of life that must be rationed among those who have the power of it."[29] Over the last decade this sentiment has been embodied in legislation by many states to control water use and waste disposal.

As of June 1951 only one state in the East had no law or program regulating stream pollution, though it had a study in progress to draft legislation. Of the 26 states east of the Mississippi, 8 require primary treatment of all wastes; 6 have laws covering a specific industry; 23 control established sources of pollution; 24 provide penalties; 16 have provision for classification of streams; 14 classify or are now in process of classifying streams; 26 require approval of new treatment plants; 13 help or advise in design of plant.[30]

[30] "Industrial Waste Treatment," *Industry and Power*, June 1951. See also M. D. Weiss, *Industrial Water Pollution, A Survey of Legislation and Regulations*, New York: Chemonomics, 1951.

With the passage of the Water Pollution Control Act in 1948 the Federal Government has taken a leading role in working toward uniform and effective legislation by the states, while recognizing their primary rights and responsibilities in this field. Financial aid is also given. For the period 1948–52, the sum of 22.5 million dollars annually was appropriated for loans to states, municipalities, or interstate agencies for sewage works construction. A million dollars is given the states annually for research and surveys; another million is granted for preliminary investigation of specific approved projects. Research in waste utilization is also promoted. The United States Public Health Service, co-operating with the states, is surveying pollution conditions throughout the country, river basin by river basin.[31]

Interstate agencies

The work of interstate agencies concerned with water pollution in the East also ought to be noted. There are commissions or informal agreements covering the Delaware Basin ("Incodel"), the Potomac Basin, the New York Harbor and adjacent tidal waters and estuaries, the interstate waters of New England, the Ohio River Valley, the Great Lakes Drainage, and the Upper Mississippi Drainage.

The Ohio River Valley Water Sanitation Commission formed in 1948, for example, is actively pressing a pollution abatement campaign among the communities and industries of the valley in the belief that "persuasion with facts rather than compulsion by law [is] a speedier way to gain its objectives."[32] It has the active co-operation of five industry groups studying methods of dealing with specific wastes; the commission also makes technical studies as a basis for policy decisions. The commission has legal powers as yet unused for securing compliance with its orders. The chairman of the commission recently stated:

I consider it the responsibility of a control agency to make the necessary surveys to define the industrial problem in terms of volume, strength of wastes, their effect on the outlet stream, and the degree of treatment required. However, the solution of an industrial waste problem is the responsibility of the industry, and the fact that no practical solution to a particular waste problem has yet been effected merely indicates that insufficient time and study have been given to it by that industry. The cost of industrial waste treatment, I feel, is rightfully charged to production costs.

INDUSTRIAL RESPONSIBILITY

The conviction is spreading that the only reasonable and equitable public policy is that each industrial establishment must be responsible for the proper control of its wastes. Therefore, the costs of waste control facilities automatically becomes a part of plant installation costs and the costs of waste control operations becomes an integral part of the operating costs of the plant. Waste control becomes a utility requirement the same as water, steam, power and drainage. It becomes one additional cost to operation that must be borne to assure the opportunity and privilege of operating in an advantageous industrial economy.[33]

Of course the cost of equipment for the treatment of waste represents a capital investment which, along with the cost of operating such equipment, becomes a part of the cost of producing

[31] Reports have already been published for eleven drainage basins over the country. U. S. Public Health Service, *Summary Reports on Water Pollution*, Water Pollution Series, Nos. 2–7, 9–12, Washington, 1951.

goods and is therefore reflected in the selling price.[34]

The losses caused by water pollution cannot be computed easily; many are intangible. But it may be said that they represent social costs [35] which are gradually being recognized. Most of those discussing the subject agree that educating the public regarding the nature and extent of the problem, and their responsibilities in it, will hasten this more realistic "cost accounting."

RESEARCH NEEDED

There is broad agreement, too, about what generally would help to improve the water situation in the East. There is great need to proceed as rapidly as possible with comprehensive investigations of water sources, especially in the field of ground water. Only with greater knowledge than we have now regarding most areas will further development be soundly based. The relation of the use of land to the availability of water is also still imperfectly understood. Technical governmental agencies, such as the United States Geological Survey, the United States Forest Service, and comparable state organizations, play a leading role in this indispensable research activity; it should be expanded.

As important as knowing how much is naturally available from area to area is knowing the effects of water uses with respect to quality as well as quantity. Much remains to be done along this line; a great deal of water is or could be reused in certain areas. Reclamation of sewage effluent and reuse of water within industrial plants are increasing but could be employed more than at present.

Soil Conservation and Floods

By HUGH H. BENNETT

THE 1951 flood catastrophe in Kansas and neighboring states once more has focused attention on the urgent need for more effectively curbing the floods that somewhere every year sweep destructively across productive farmlands and through prosperous towns and cities.

What can be done to prevent the staggering losses in crops, soil, property, even human life, will depend to a very considerable degree on the wisdom and timely efforts of the people and their leaders.

In any clear presentation of the problem several points should be emphasized at the outset:

1. We can be certain that costly floods will strike again next year, or the next, somewhere in the country.

2. Our experience shows that it is possible to control or greatly reduce floods. It shows that the smaller, more localized floods along the upper tributaries or "little waters" can be eliminated almost completely; and indicate that substantial reduction of flood flows along the major streams is also practicable.

3. Soil erosion is part of the flood problem—the result of the rains that produce floods and the source of the silt that reduces the carrying capacity of streams and the water-retention capacity of reservoirs.

4. Soil conservation is an indispensable and co-ordinate part of flood control and silt control.

No single method of flood control can do an adequate job. We have seen in the recent Midwestern flood, for example, that levees high enough to withstand the largest previous floods on record were overtopped. We have also seen that the soils of fields and pastures became so nearly saturated after weeks of heavy rains that they could absorb but little more from the final big rains. To meet all kinds of flood conditions and prevent or minimize flood damages wherever they are a hazard, we must use every available method of control we know about.

Every additional gallon of water that can be stored in the soil through the use of conservation measures means one gallon less contributed to flood flows.

A first step, then, in flood prevention is to put the soil in optimum condition for maximum water intake. This will require the maintenance of good soil structure, a good cover of vegetation wherever practicable, and efficient engineering structures wherever required. What excess water runs off fields into drainageways must be slowed down with small retarding structures along the headwater drainages, and what flows out of these lesser drainages will have to be handled in the main river valleys by more imposing measures—large engineering installations, such as reservoirs, levees, floodways.

The job of flood control, then, begins where the rains fall and does not end until the runoff reaches the ocean.

CO-ORDINATION OF FLOOD CONTROL EFFORTS

It is important to determine what kind and combinations of measures are needed, where to use them, and how best to dovetail their use, watershed by watershed, in order to accomplish the best possible job of flood control. In doing this we must, of course, bear in

mind the continuing need for water storage for irrigation, power, municipal water supply, pollution abatement, and preservation of fish and wildlife, and maintenance of maximum ground and underground storage. It must be borne in mind that the use of the limited number of suitable sites for large reservoirs should be considered in relation to the multiple needs for land and water before they are dedicated solely to flood control.

Distribution of flood damage

Another feature necessitating co-ordinated effort is the distribution of flood damages. The crops of upland fields that are washed out or covered with eroded soil resulting from flood-producing rains are just as truly lost as the crops on overflowed land in the valleys below. Soil washed out of upland fields reduces the productivity of that land just as much as, or more than, deposition of soil carried by waters flooding agricultural bottomlands along the rivers. Floodwater damages to agricultural lands in the hundreds of thousands of miles of small, upstream creek bottoms represent just as much loss per acre as the flooding of the wide Missouri River bottoms between Kansas City and St. Louis.

The Soil Conservation Service, in its preliminary survey of the storm and flood damages in Kansas and Nebraska during July 1951, found that losses of crops on upland farms amounted to approximately $110 million. Losses of rich topsoil were estimated at $200 million. Losses from floodwater and sediment in the small creek bottoms above the points where anyone has yet proposed specific flood protection measures were estimated at $102 million. The total of these estimated damages amounted to $412 million. Probably at least 90 per cent of these losses could be prevented through the soil and water conservation and flood control programs being carried on by the Department of Agriculture. And the benefits would largely exceed the cost.

Without in any way minimizing the staggering downstream losses, like those at Kansas City last year, the even greater damages along the tributary streams are convincing evidence that a flood control program aimed only at protection of downstream cities and river bottoms is only partially effective and will certainly not benefit all the people who suffer flood losses.

Superfloods like this last Midwestern flood are comparatively rare events. I understand that the flood discharge at Kansas City last year far exceeded the highest ever previously experienced. Such an occurrence not only makes banner headlines, but it becomes a historic event to be retold down through the decades. It stays in our memories and gets into textbooks. People come to look on such a catastrophe as characteristic rather than something rare—or unique. Actually, if the enormous damage caused by such a superflood is spread over all the years between such rare events, the average annual loss is considerably less that that from all the smaller local floods that occur year after year in the smaller watersheds.

Surveys thus far made indicate that around three-fourths of our average annual flood loss has occurred above the main river valleys and large cities. This, of course, is partially due to the fact that some of the major river floodplains and many cities have already been protected by levees, floodways, and combinations of reservoirs—for which credit is due to the effective work of the Army's Corps of Engineers.

Erosion

There are still other reasons why a co-ordinated approach to flood control is essential. As already pointed out, erosion must be controlled upstream in order to protect flood control reservoirs downstream from rapid silting and consequent loss of effectiveness. And to re-emphasize, erosion must be controlled to prevent the silting of stream channels, which further reduces their flood-containing capacity, and to prevent overwash of infertile sand and poor subsoil material on productive bottom lands. But even more important than these, erosion must be controlled if we are to maintain the base for agriculture, on which depends national strength and defense and, conceivably, the prevention of civilization from going the disastrous way of many great nations of the past which failed to take care of their agricultural land.

One of the most important responsibilities shared by all the people of any state, county, community, or neighborhood is to safeguard and prudently use the land and the water that makes land productive. Such conservation, to be fully effective, must be applied to every acre of land needing it, and this according to the kind of land a farmer has and its need for protection and improvement. This basic concept of effective soil and water conservation is taken from nature's handbook for creating soil in the first place and then safeguarding it for perpetual productiveness.

SOIL CONSERVATION IS PART OF FLOOD PREVENTION

The flood problem was not tied in with the erosion problem in any effectively working relationship until the advent of modern soil conservation.

Look at some of the measured effects of land use on erosion and runoff: At the Northwest Appalachian Conservation Experiment Station near Zanesville, Ohio, the losses from bare ground (hard fallow) on a 12 per cent slope amounted to an annual average, over nine years, of 96.58 tons of soil per acre and 44.8 per cent of the rainfall, including snow. But from bluegrass the soil loss was only 0.028 ton per acre and the water loss 5.42 per cent of the rainfall. The corresponding losses from continuous corn on the same kind of land having the same slope were 99.3 tons of soil per acre and 40.32 per cent of the rainfall.

Comparative soil and water losses from small watersheds over a nine-year period recorded on this experiment station included only .01 ton of soil per acre and 3.2 per cent of the precipitation for woodland, and 17.18 tons of soil and 20.6 per cent of the precipitation for a cultivated watershed. During January 1937, when a huge flood swept down the Ohio River, the rainfall on these watersheds totaled 10.48 inches. The wooded watershed lost as runoff 36 per cent of the precipitation; a pasture watershed lost 75 per cent; and the cultivated watershed lost 95 per cent.

Such precise measurements made in great numbers throughout the country cannot be discarded as representing what happens on just mere bits of land, for the reason that the country is a mosaic of bits of land differing from one another in many ways. To be sure, the runoff will be much more per acre from some areas, but it will also be much less from others. Quantitative measurements have been made on so many different kinds and patterns of land that I believe these measurements represent a fair average of what happens to the rainfall of countless watersheds throughout the country. There will be wide differences, of course, but significant meaning undoubtedly can be found in the results as estimated by those acquainted with local details of climate, land, agriculture, and the land's retentiveness of rainfall. Such experienced specialists will be able to weigh

with considerable accuracy the effects of rainstorms on local flood flows.

The technicians of the Soil Conservation Service carefully weigh all these physical facts in all their work having to do with the control of floods and soil erosion. The Service has been the leader in technical investigations relating to the character of the land, the pattern of rainstorms,[1] the amount of water contained in mountain snows (as shown by snow surveys), the effect of soil and soil condition on water-absorption capacity, and similar matters. Moreover, the Soil Conservation Service has made, and continues to make, a great many detailed studies of the effects of cover, cultivation, land use, and soil conservation on runoff and erosion from both large and small watersheds in many parts of the country.

One of the first watershed erosion control undertakings ever completed in this country was that at Honey Creek in Bucks County, Pennsylvania. Prior to conservation work on the upper slopes of the watershed, the land in the lower part of the little valley was too wet for cultivation because of excessive overflow, and had little value except for poor pasture. But I saw that land producing good crops as a result of conservation measures applied to the entire valley. Not only the erosion problem but also the flood problem was largely overcome.

AN EXAMPLE OF FLOOD CONTROL CO-OPERATION AT THE GRASS ROOTS

The work in the Salt-Wahoo watershed, near Lincoln, Nebraska, is a good illustration of the co-ordinated watershed approach to flood control. Here also is a striking illustration of effective community co-operation, including the Salt-Wahoo Watershed Association, which is made up of city people and farmers in Soil Conservation Districts, with representatives of the Soil Conservation Service, the Army Engineers, and other local, state, and federal agencies.

Joint studies of this watershed are being made by the Soil Conservation Service and the Army Engineers under authority of the Flood Control Act of 1936. It is hoped that this study will lead to authorization of a co-ordinated program for flood control in this area similar to that already authorized in eleven other watersheds of the country. I think the soundness of this co-operative approach was well stated in the progress report on the joint watershed survey made by the Army Engineers and Soil Conservation Service. The report pointed out that the two agencies had one objective in this study—that is, to prepare an over-all plan for the entire watershed which, quoting from the report, "will represent from the standpoint of both agencies the best plan for the basin as a whole which is practicable within the limits of economic feasibility, and one which both agencies can recommend and support without reservation."

"Both agencies feel," the report added, "that this objective can best be realized by a joint study which will produce a single plan mutually developed by both agencies rather than a compromise between two individual plans developed by the two agencies acting independently."

The Salt-Wahoo undertaking also illustrates the importance and effectiveness of local group action in watershed planning and development. Here, as elsewhere, the local soil conservation districts are taking an important part in the permanent watershed program. As the principal organization through which soil and water conservation measures are being applied to the land by individual farmers the country over, it is only logical that these districts also should be called on to serve directly in such flood control activities in the public interest.

By the same token, the Salt-Wahoo situation shows why there is a place for an advisory group like the Salt-Wahoo Watershed Association to bring together the interests of farmers and city people. For any watershed development program to operate successfully, the basic responsibility for that program must involve the people residing in the watershed. That means there should be a local responsible organization which is representative of all the interests in the watershed and which can act promptly to co-ordinate the activities and services of all agencies and interests to formulate the necessary broad, flexible program for watershed development and protection.

TECHNICAL SKILL AND DETAILED TREATMENT NEEDED

It should not be overlooked that planning and application of watershed programs require special technical skills. Downstream, the highest order of engineering skill is necessary for building dams, main-channel stabilization works, and so on. Likewise, in the uplands technical know-how is required to plan and install sound land-use and land-protection treatment and upstream engineering measures. Such work must be based on painstaking research and practical experience. It must take into account the principles of hydrology, engineering, agronomy, land and conservation science, forestry, biology, and other related fields.

In no event can the watershed planning and treatment be accomplished overnight with some magic formula, although it takes heavy rains and excessive runoff only a few days, or even hours, to do irreparable damage to land and property.

We cannot depend on windshield surveys and office planning to carry out a job of the complexity and magnitude of safeguarding our farmlands and controlling floods. Nor can we have a ready-made plan including a fixed set of practices to slap on any farm or watershed. Land and the behavior of water falling on land differ from watershed to watershed, from farm to farm, sometimes from field to field. Accordingly, every watershed and each parcel of land in every watershed must be dealt with individually. And, moreover, every distinctive parcel of land within every watershed must be dealt with according to its complementary relationship to every other parcel of land—wherever there is any significant relationship.

That, briefly, is how, in this era of soil and water conservation, we are going about the treatment of agricultural land for effective soil conservation and flood prevention and control. We have developed a unique combination of soil-conservation, engineering, and vegetative practices designed to dispose of surplus water safely while making the best practical use of the water that otherwise would also be wasted. Thus, for the first time in history, we are going into the small watersheds to do *everything possible to provide relief* from recurring flood damages. Splendid examples of the effectiveness of tributary stream flood control can be cited from the experiences of the Soil Conservation Service and the soil conservation districts.

TAKING THE TEETH OUT OF FLOODS

Not long ago, while looking over the flood control work being carried on under the Little Sioux River Watershed Authorization, in Iowa, I came to the

[1] See Hugh H. Bennett, *Soil Conservation*, pp. 179–97.

definite understanding that finally we are doing the upstream phase of the flood control job properly. I had understood all along that we were not likely to have fully effective, nationwide flood control until both the upstream and downstream phases of the job were carried out properly and in co-ordination.

Here on the Little Sioux the Soil Conservation Service is co-operating with the local Soil Conservation Districts in carrying out the upstream part of the flood control job on this typical floodstream. The job is being done, subwatershed by subwatershed, beginning at the upper end of these tributary streams and working on down along each to the main chanel. The general procedure is exactly the same in principle as that being followed in other watersheds of the country where the Department of Agriculture is going extensively into flood control work on watersheds authorized by Congress.

The flood control part of the Department's contribution, over and above the normal soil conservation work on farms and ranches, covers such items as the construction of water-detention reservoirs, gully plugs, diversions, and roadside work. Farmers ordinarily cannot carry out such operations because of their size and technical requirements. Moreover, they should not be expected to do so, because these works have a public benefit, affecting many people downstream from the points of installation—even more so, frequently, than the farmer on whose land the work is done. But farmers are helping, county highway authorities are helping, Soil Conservation Districts are assuming responsibility for general maintenance operations and farmer co-operation, and, in the instance of the Little Sioux, a committee composed of representatives from the various Soil Conservation Districts covering portions of the watershed is furnishing very helpful assistance in setting up priority work jobs, assignment and routing of machinery, developing arrangements for farmer and soil conservation district co-operation and assistance in connection with the cost and execution of maintenance operations, and so on.

Such a highly co-operative arrangement with the farmers is perhaps the backbone of the matter of getting the flood control job done expeditiously and effectively, and of maintaining the installations.

The effective performance of conservation measures under flood conditions may be observed on watersheds in various parts of the country where flood control work has been done. You may see it, for example, on the Theobold Creek subwatershed of the Little Sioux River in Iowa. There, three detention reservoirs and ten small structures on the main creek channel have reduced the fall and velocity enough to eliminate much of the formerly serious channel cutting. There are also six structures in lateral drainage, and other conservation measures, along with proper land use. The effect of these developments has been to eliminate virtually the entire erosion and flood problems in the subwatershed.

Dollar benefits

Dollar benefits accruing from such effective measures are likewise beginning to pile up over the country. For example, improvements completed in 1950 in the small Masters subwatershed of the Little Sioux prevented measurable damages of $3,600 in one rainstorm in June 1951, plus possible livestock, traffic, siltation, and other damages not evaluated.

A survey of damages from the January 1952 flood in the San Fernando Valley of the Los Angeles River watershed in California showed the effectiveness of the far from complete conservation flood control work. Damage was negligible in the areas protected by this work. Conservation-treated cropland suffered little erosion; whereas up to 100 tons of soil per acre were washed off some of the adjacent, unprotected cropland. And while a total of some $730,000 damage was done on the unprotected subwatersheds, flood control works prevented $300,000 of damage to land and property in the treated subwatersheds.

The Washita River watershed in Oklahoma is another of the eleven authorized flood control projects. Its Sandstone Creek subwatershed has suffered annual flood damage of about $60,000. The nearly completed program on this creek includes land treatment measures and floodwater retarding structures. It is estimated that future flooding will not exceed an average of 110 acres annually, out of the total floodplain of 4,700 acres, with an estimated annual damage of only $1,236. That is an estimated 90 per cent reduction in annual flood damages, or $57,461 a year. At the same time, the estimated annual net benefit from more intensive land use by farmers will be more than $11,000. All together, the measures installed on Sandstone Creek will produce approximately three dollars of benefit for each dollar of cost.

When the structural and land treatment measures have been completed on the entire Washita watershed—now one-third planned—at a cost of about $74,000,000, the total floodwater and sediment damages will be reduced by an estimated 73 per cent, or more than $4,000,000 annually. Confirmation of these anticipated benefits may be found, for example, on the approximately 6,000-acre Cloud Creek subwatershed, where the watershed treatment work was completed in 1948 at a total cost of $97,366. Annual operation and maintenance costs have amounted to about $2,900, including interest on installation costs; whereas total annual benefits have averaged about $5,700. So, for each dollar of cost this work is returning $1.96 in benefits.

Conservation and flood control benefits on an 18,432-acre subwatershed of the Little Tallahatchie River in Mississippi for the year ending June 30, 1951 were calculated at $25,000. The year's apportioned cost of the watershed improvement work responsible for that calculated return was only $13,334, or a little less than 2 to 1 benefit ratio. The annual cost was arrived at by including 2½ per cent of the federal and 4 per cent of private cost of installation, plus operation and maintenance costs for the year.

Similar benefits and dollar returns are mounting throughout the country, as in the Trinity River watershed in Texas, to cite one more. There, benefits of $2.20 for each dollar of cost are being returned on the 15,570-acre Howard Creek subwatershed, although the treatment has been only partially completed. On Honey Creek, the subwatershed program is estimated to bring benefits of $7.12 for each dollar of cost; and the East Fork program, above Lavon Reservoir, $10.12 in benefits for one dollar of cost.

In the big river basins

On the basis of such measured benefits, surveys, and other sound information available, we may estimate with reasonable accuracy the far wider resource conservation and economic returns that will come from the extension of co-ordinated watershed flood control programs to the nation's big river basins like the Missouri Basin. The whole program of the Department of Agriculture in the Missouri Basin would cost, as estimated, a total of about $8.5 billion, including cost to farmers, the Fed-

eral Government, and state and local interests.

At the same time, the program would protect an extensive but undetermined acreage, prevent annual flood and sediment damages of an estimated $25.25 million, provide three-quarters of a billion dollars in associated benefits annually, and return other, unevaluated benefits to the nation's agricultural plant, to our local and national economy, and to national security and defense. Figuring the total annual cost at something over $500 million—including interest on the investment and operating and maintenance costs—the net benefits would be expected to be about $250 million annually, or a net return of about 3 per cent on the original investment.

Although it is not claimed that such watershed programs will by themselves control superfloods like the 1951 Kansas-Missouri flood, they can be counted on to curb the flood flow in some degree. The real problem is where the people of a major river basin and of the nation as a whole may want to draw a line of compromise between the fullest utilization of protected tributary valley lands and the fullest protection of downstream urban areas and mainstem floodplains.

Soil conservationists do not hold that they can "dry up the rivers" by spending the amount of money on watershed programs that is spent on flood control reservoirs. Additional controls such as reservoirs, levees, and other main-channel protective works will always be needed for complete safeguarding of the floodplains against disastrous major floods.

PRINCIPLES OF EFFECTIVE TREATMENT

The basic principles of effective watershed or river basin treatment are clear: conservation land treatment for soil erosion prevention and orderly disposal of runoff water, upstream engineering for waterflow retardation and channel stabilization, and downstream engineering for control along the mainstems.

There we have, as soil conservationists understand it, a co-ordinated approach to flood prevention and control —a program that protects the farmer of the uplands as well as of the lowlands, while protecting the cities, too.

Hugh H. Bennett, D.Sc., LL.D., Washington, D. C., is special assistant to the Secretary of Agriculture. He entered the employ of the Department of Agriculture as a soil scientist in the old Bureau of Soils in 1903. From 1933 to 1935 he was director of the Soil Erosion Service in the Department of the Interior. In March 1935, when that agency was transferred to the Department of Agriculture as the Soil Conservation Service, he was named chief of the new Service and served in that capacity until November 1951.

Labor Looks at Conservation and Development

BY ANTHONY WAYNE SMITH

EARLY theories of industrial unionism prophesied that a broad interest in general social problems would appear within the labor movement as plant-wide organization replaced the traditional craft-union structure. The comprehensive programs of the Congress of Industrial Organizations bear considerable witness to the soundness of these expectations.[1] Some of them, for example, deal with the conservation of natural resources and related issues of regional development, matters which might be supposed at first glance to be distant enough from labor's preoccupations.[2]

The Re-employment Plan presented by Mr. Philip Murray, president of the CIO, to the CIO Convention in 1944, is an early landmark.[3] Anticipating the possibility of a severe industrial recession after the war, this statement called for expanded government investment in peacetime projects, and recommended, among other things, the application of the principles of the Tennessee Valley Authority in the other major watersheds of the country.

The TVA idea was endorsed, first of all, as a full-employment measure: construction; manufacture of turbines, generators; production of steel, copper, and the like. It symbolized industrialization, new plants, more jobs, reduced electric power rates, and higher living standards. The CIO understood quite well that the great upsurge of prosperity in the Tennessee Valley, after TVA, was attributable in large measure to the low-cost public generation and transmission of hydroelectric power. But the related aspects of TVA policy were not overlooked: flood control, navigation, soil conservation, fertilizers, reforestation, and, above all, the integrated valley-wide plan.

At the same convention, by separate resolution, on the initiative of the late Worth Lowry, then president of the International Woodworkers of America (the CIO union in the logging and sawmill industries), a comprehensive statement on forest conservation was adopted.[4]

With these declarations as a starting point, the interest and activities of the CIO have expanded until they now touch to some extent on almost all aspects of regional development and conservation.

PROPOSED MISSOURI VALLEY AUTHORITY

When President Roosevelt recommended a Missouri Valley Authority, modeled on TVA, and Senator James E. Murray of Montana introduced the legislation, the CIO endorsed it.[5] In association with the National Farmers Union, numerous Rural Electrification Administration co-operatives, public

power groups, and a few organizations of the American Federation of Labor, it worked vigorously for the MVA bill for several years.

As is well known, at the time the MVA proposal was advanced, the Bureau of Reclamation and the Army Corps of Engineers had separate plans already prepared for the region; unfortunately, they were in fundamental conflict.[6] Nonetheless, when the MVA movement began to gain momentum, they were combined into the so-called Pick-Sloan program, which was offered as a substitute for an MVA, and congressional authorizations were obtained.

Appropriations proved slow in arriving; when they were sought, it was the residents of the valley themselves, and particularly the people who would be flooded out by the dams, that objected to construction.[7] The refusal of Congress to provide for comprehensive planning was accompanied by negative opposition to the Pick-Sloan proposals and a stalemate in the valley.

It could easily be foreseen, of course, that the first serious floods might result in an indiscriminate demand for action, of which the Pick-Sloan projects, others being unavailable, would be the beneficiaries; the Pick-Sloan forces could afford to bide their time. The disaster in the Kaw River Basin in the summer of 1951 provided the long-awaited opportunity, and the Corps of Engineers began blowing the bugles for its levees and big downstream dams.

It might have been understandable had labor joined in the uproar; the packing houses and assembly plants of downtown Kansas City which were wrecked by the flood had employed thousands of men who were members of CIO unions; the companies threatened not to rebuild, and the workers were faced with permanent loss of employment; in many cases their homes and possessions had been swept away.

At this juncture, however, Mr. Murray wrote publicly to President Truman and warned against the danger of falling back on Pick-Sloan. He recommended the appointment of a Presidential Commission to replan the basin, urged immediate attention to the watershed management program of the Department of Agriculture,[8] called again for an MVA, and went on to recommend a national Watershed Review Board, with authority over Engineers, Reclamation, and the Federal Power Commission.[9]

From the beginning, the CIO had pointed out that one of the great needs in the Missouri Valley was for substantial blocks of hydroelectric power to lighten labor on farms and bring industrialization; Pick-Sloan would not produce the power. Great waste would be involved in the flowing-channel navigation scheme and in the high-cost irrigation. Flood control should begin at the divide, and not with levees and main-stem dams. The unnecessary destruction of priceless farmland and waterfowl and game-animal habitat was inexcusable. The prospect was for the spread of man-made deserts along the margins of the enormous reservoirs during the dry cycle and for the appearance of artificial swamps and quicksands behind the huge concrete emplacements, as the silt-laden Missouri River, in the course of two or three generations, filled the reservoirs and rendered them useless. As usual, the Indian tribes were being expelled from their fertile river-bottom lands and driven into the hills, their traditional way of life destroyed; money damages, slow in arriving, could never compensate for the loss. Tens of thousands of other residents of the valley were also being uprooted. Much heavier emphasis needed to be placed on the programs of soil conservation, reforestation, and watershed management which had ostensibly (and to some extent actually) been part of the TVA approach.[10]

The President, in reply to Mr. Murray, conceded the need for an MVA, but pointed to the problem of electing a favorable Congress; in January he announced the appointment of a Presidential Commission to restudy the basin.

Proposed Columbia Valley Authority

Meanwhile, bureaucratic rivalry and conflict, contractor pressure, and local "boom" psychology had led to the presentation of another hybrid program to Congress (the Pick-Straus plan), covering the Columbia River Basin. In this case power development was not neglected, but there was the usual inattention to soil and forests, the customary callous invasion of Indian rights, a squandering of funds on fantastically expensive irrigation programs, a serious overemphasis on navigation, and a wanton disregard of the migratory fish runs as an essential resource of the Pacific Northwest. President Truman proposed a Columbia Valley Authority; the CIO endorsed the CVA legislation in the hope that better planning might result.[11] When the possibility of immediate passage faded, it opposed authorizations and appropriations for the more objectionable portions of the Pick-Straus plan (while urging the immediate construction of specific hydroelectric power projects), pending a genuine effort to solve the fisheries problem. The issue still hangs in the balance.

Power Development Versus Other Values

The controversy focuses attention on the need to reconcile the protection and conservation of living resources with the development of hydroelectric power. The CIO has always favored a generous development of power. Uniformly, the legislation it has endorsed (TVA, MVA, CVA, St. Lawrence project) has provided for public development and transmission, distribution with a priority to publicly and co-operatively owned agencies, and public aid to such agencies in acquiring existing systems.[12]

On the other hand, the CIO has urged that power development take place within the framework of complete valley-wide plans in which due attention is paid to soil, forests, wildlife, recreation, scenery, and minority rights.

[6] They had many other serious faults. See *The Big Missouri*, Public Affairs Institute, 1948; also the Hoover Commission Task Force Report (*Commission on Organization of the Executive Branch, Task Force Report on Natural Resources*, 1949, p. 107, *et seq.*).

[7] For example, opposition of the Fort Berthold Indians to the Garrison Dam; of the Blue Valley farmers to the Tuttle Creek Dam; see *Flood Control . . . in reverse*, Blue River Study Association, Bigelow, Kansas, 1947.

[8] *Missouri River Basin Agricultural Program*, H. Doc. 373, 81st Cong., 1st sess., 1949.

[9] The establishment of such a board had been suggested by the Cooke Commission (Water Resources Policy Commission: *A Water Policy for the American People*, 1950, Vol. 1, p. 49), though with some vagueness in respect to the power of the board over the licensing function of the Federal Power Commission; but the board would be impotent without authority over the Power Commission; private power development would race ahead without plan, while public development would be frustrated. The Hoover Commission had also recommended the establishment of a Board of Impartial Analysis of Engineering and Architectural Projects (Commission on Organization of the Executive Branch, Report on Department of Interior, 1949, p. 2).

[10] Frank, Bernard, and Anthony Netboy, *Water, Land, and People* (New York: Alfred A. Knopf, 1950), pp. 209 *et seq.* As to the above paragraph in general, see notes 5, 6, and 7, *supra*.

[11] *The Magnificent Columbia*, CIO Committee on Regional Development and Conservation, CIO Pamphlet No. 178, 1949.

[12] Bills dealing with the St. Lawrence Seaway and Power Project differ; testimony on behalf of the CIO, favoring the project, has always supported the policies indicated.

It has pointed out that the damage above the dam (including intangibles and long-range factors)[13] must be balanced against all benefits.

This is a difficult position to maintain. Programs which are bad from a conservation point of view (for instance, Pick-Straus) may have merit as power producers. To oppose them in the absence of ready alternatives may seem to jeopardize industrial expansion (a serious matter in wartime), or may lead to the issuance of certificates by the Federal Power Commission for private development.[14] Proponents of public power need all the support they can muster against the attacks of the electric utility industry, but unfortunately they have too often been heedless of the well-founded objections of conservationists in particular cases.

LABOR'S RIGHTS AND DISPERSION OF INDUSTRY

At all times, the CIO has insisted that an indispensable element of the TVA idea is fair treatment for labor, including payment of not less than prevailing wages and recognition of the right of employees to organize and bargain collectively and take concerted action for mutual aid and protection. Obviously, the acceptance of collective bargaining by public agencies engaged mainly in economic enterprise is a prerequisite to union support for such public operations.[15]

Another problem which the CIO has recognized in its development programs is the dispersion of industry. Clearly, power dams and transmission lines must be so located, within broad limits, as to supply existing load centers. But at the same time the choice of sites for dams and lines influences the location and density of industrial, hence residential, concentrations. The CIO has been insisting that our great cities have become impossibly congested, and that dispersion is essential for both peacetime and wartime purposes. Such dispersion cannot be accomplished without industrial decentralization; the latter can be helped or hindered by public policy in power development and transmission. Countless lives may depend upon dispersion in the age of the atomic bomb; peacetime health and happiness will depend upon it increasingly in the future. Since it is humanly desirable, it should be planned for, and the transition should be accomplished with guarantees of job security and union stability, and without undue hardship and dislocation; such an outcome is by no means impossible if we set our minds to it.

FORESTS, SOIL, AND RANGES

The forestry program of the CIO and the International Woodworkers of America has been a distinguished one, comprising some of the most comprehensive proposals since the days of Gifford Pinchot. It calls for direct regulation of timber harvesting on all private timberlands on principles of sustained yield, selective cutting, and individual tree marking; [16] for the development of a comprehensive system of access roads open to the public; for the protection and extension of the National Forest System; [17] for adequate appropriations and abundant federal credit for timber management; [18] for the extension of many of the agricultural aids to forestry; for experimentation in the public purchase of managerial rights in privately owned timber lands; and for a number of specific projects, such as a national forest with park units comprising the entire coast redwood belt in California.[19] While the employment interests of loggers and sawmill workers provide a solid foundation for this program, it is a real expression of the citizenship interests of the union membership.

Closely related have been efforts in soil and range conservation. So heavily dependent are the operations of the Soil Conservation Service on annual congressional appropriations that it has seemed best for labor to concentrate on the appropriations problem.[20] Help has also been given in fighting off special-interest legislation which would have led to serious overgrazing or even to the surrender of the ranges. Is not the interest of union members in abundant food and high nutritive content (not to mention their concern with the public welfare) sufficiently clear? Meanwhile, more and more attention has been paid to comprehensive watershed management plans as the key to both nutrition and river control.

OUTDOOR LIFE

Outdoor recreation is more and more important to union members. They have obtained greatly increased leisure through their organizations during the last fifteen years: shorter hours, longer week ends, longer paid vacations. New state and national parks and expanded camping facilities in our state and national forests are greatly needed. In consequence the CIO has lent vigorous support to such projects as the Quetico-Superior wilderness program. Again, it has urged that the Reclamation Bureau relocate the dams proposed for Dinosaur National Monument, placing them outside the boundaries, and has urged that the monument be developed promptly as a national park.[21] Considerable doubt has been expressed as to the recreational values created around the margins of fluctuating flood-control and hydroelectric power reservoirs, as distinguished from the possibilities of natural recreation in the normal river basin, if properly developed for picnic grounds and camp sites. Because union members are often sportsmen, or just plain conservationists, interest has been taken in the protection of waterfowl, game animals, and the like, where their survival is threatened by ill-advised

[13] It opposed approval of the Report of the Subcommittee on *Benefits and Costs* of the Federal Inter-Agency River Basin Committee (1950) on the ground of inadequate attention to intangibles and long-range factors.

[14] The point about the Commission is widely overlooked; though not, of course, by the utilities; see note 9 *supra*.

[15] As to the efforts of federal agencies to solve this problem constructively, see *Labor-Management Relations in TVA*, S. Rept. 372, 81st Cong., 1st sess. (1949); *Labor-Management Relations in the Bonneville Power Administration*, S. Rept. 192, 82d Cong., 1st sess. (1951). The law in regard to municipalities is embryonic; there is no reason why it cannot develop favorably. As to differences of opinion between CIO and AFL groups organized in the industry, with the AFL organization supporting public power, see *AFL News-Reporter*, Jan. 16, 1952, reporting statement of Mr. Charles MacGowan, president of the International Brotherhood of Boilermakers, AFL.

[16] For example, the CIO supported the Hook Bill, H. R. 6221 (1946).

[17] For example, see the full text of my statement before the American Forest Congress, mimeographed, 1946.

[18] An excellent statement on the credit problem is contained in Stephen Raushenbush, *Our Conservation Job*, Public Affairs Institute, 1949.

[19] Embodied in the Douglas Bill (Roosevelt Redwood Forest Bill), H. R. 6201 (1946), H. R. 2876 (1947), H. R. 2394 (1949); see Helen Gahagan Douglas, "The Proposed Redwood Forest," *National Parks Magazine*, April–June 1947; Dewey Anderson, *An Action Program for the Redwood Forests*, Public Affairs Institute, 1949; *An Appraisal of the Economic and Social Effect of the . . . Proposed Roosevelt Redwood Forest*, U. S. Forest Service, typewritten, with maps, 1946.

[20] *Healthy Soil, Healthy People*, CIO Pamphlet No. 162; see my testimony before the Senate Sub-Committee on Agriculture Appropriations, mimeographed, 1949.

[21] I took a group of state CIO officers on an expedition into the monument in May 1951, as a result of which a consensus was reached as indicated.

drainage or construction. And the national disgrace of stream pollution has not gone unnoticed.

VARIOUS ELEMENTS OF POLICY

Many other activities could be mentioned: the organization has fought for the retention of the off-shore petroleum resources in federal hands, development to be by the Federal Government itself or by a sound system of leasing. In respect to atomic energy, the CIO has advocated not only federal ownership but actual federal operation, as distinguished from the present system of contracting operations to monopolistic corporations.

The true synthesis of policy in conservation and development in America has not yet been fully formulated. The germ of the idea was present in the TVA, but its growth, while good, was not entire; criticism by sportsmen, recreationists, soil and forest conservationists, and watershed management experts reveals the deficiencies.[22]

The ultimate solution must place heavier emphasis on upstream watershed management (ponds, terraces, check-dams, contour plowing, strip cropping, afforestation, and so forth) as distinguished from downstream river engineering for purposes of flood control. Such a shift of attention from construction to cultivation may provide a new meeting ground for farm and labor groups. Moderation and deliberation in the pace of hydroelectric development, coupled with the necessary reasonable limitation on total construction which is inherent in balanced planning, should help to bridge the gap between proponents of public power and conservationists.

Vigorous restraints should be imposed on future reclamation and navigation schemes (one good test would be ability to repay in full); the subsidies, open and hidden, which are now being squandered on them should go to watershed management. Indeed, all river engineering (for purposes of navigation, reclamation, or power whether *private* or public) should contribute to watershed maintenance by setting up suitable reserves and making proper contributions to the maintenance of that portion of the capital plant which the watershed itself represents.[23]

Recognition of the rights of collective bargaining and concerted action for employees of publicly owned economic enterprises is essential, and should moderate potential opposition to public power by minority union groups. The assignments given by Congress to federal agencies (for example, to the Army Engineers, flood control and navigation; to the Bureau of Reclamation, "irrigate everything") must be changed so that all decisions are based on balanced plans; and some central review or planning commission, with full veto powers, must be created. The administrative policies of all agencies must be based on specified *policies*, and not on naked grants of *power*.

There are some fundamental problems of *evaluation* to be solved (all politics goes back to evaluation): Do we really want to destroy our high wildernesses by "scenic" drives, timber cutting, useless transmountain diversions? Is the "drain everything" policy of Reclamation and Agriculture to proceed without hindrance to destroy our marshlands, hence our migratory waterfowl? Is idolatry of "free" enterprise going to block yardstick hydro-

[22] For example, Frank and Netboy, *loc. cit.* note 10 *supra;* cf. *Policies and Objectives of Regional Development,* statement by the author before National Emergency Conference on Resources, mimeographed, 1949.

[23] Cf. Frank and Netboy, cited note 10 *supra,* pp. 236–37, where the suggestion is advanced that the TVA "divert all its net revenues" to watershed management.

electric power? On the other hand, is human welfare measurable in kilowatt-hours, but not in the quietudes and scenic grandeurs (and the rapids and waterfalls) which are so often destroyed by the big dams? Are the big-city values, the speed values, the gadget values, the important ones, or should we try to recapture the old-time natural outdoor American life in some degree? Are we capable, as a nation, as a world, of facing the population problems involved in all of this?

QUESTION OF POLITICAL ACTION

No effective action, whether in appropriations, in regulation, or in planning, seems probable without an improvement, as the President said, in the congressional situation. Such improvement, in turn, awaits concerted political action. A coalition of creative forces throughout America is essential to such political action. Among such forces are the soil and forest conservation societies, the park and wilderness organizations, the wildlife and ecological societies, the sportsmen's organizations, the public power associations, the regional planning societies, the farm organizations, and the labor unions. Because the industrial union movement contains within itself so many of the interests and groups which appear to be in conflict in these matters throughout the nation, it may well contribute greatly, granted friendly co-operation from others, both to a workable policy synthesis and to the necessary working coalition.

Anthony Wayne Smith, LL.B., Washington, D. C., is assistant general counsel to the Congress of Industrial Organizations; assistant director of Industrial Union Councils, the state and city central organizations of the CIO; and executive secretary of the National CIO Committee on Regional Development and Conservation. He has served on the staff of the CIO in many capacities since 1937 and is the author of numerous pamphlets, articles, and speeches on labor and conservation matters. He was secretary to Gifford Pinchot during the latter's second term as Governor of Pennsylvania, and practiced law thereafter in New York City. He is a member of the bars of New York State, the District of Columbia, and Appellate Courts.

Conservation and Wise Utilization of Natural Resources in Canada

By H. A. Young

A COUNTRY'S approach to the conservation and wise utilization of its natural resources may in large part be determined by the character and extent of these resources. Canada is well blessed. In the field of minerals she leads the world in the output of nickel, asbestos, and platinum, producing 80 per cent, 65 per cent, and about 50 per cent respectively of the total. She stands second in the output of zinc and gold, third in the production of silver, and fourth in copper. She also ranks high in pitchblende, although comparative figures for the world's leading producers are not available. The bulk of this production goes abroad; 97 per cent of our production of nickel, 95 per cent of asbestos, 90 per cent of zinc, and 70 per cent of copper are all exported. Almost all of Canada's production of gold is exported for monetary purposes.

Recent developments in iron ore and in petroleum, while not placing Canada among the world's leading producers, are rapidly bringing her to a position of importance in those fields. Canada's production of iron ore has grown from an almost negligible quantity before the war to a current annual figure of 4,700,000 tons, and it has been estimated that it may be as much as 33,000,000 tons annually within the next decade. Known reserves of petroleum are now 1,700,000,000 barrels, 34 times as great as they were five years ago, and active exploration continues. In the past five years Canada's annual production has risen from 7,600,000 barrels to 48,000,000 barrels. Further, the famous Athabaska tar sands, 250 miles north of Edmonton, should not be overlooked. At present an economic method of extracting the petroleum from these sands has not been developed, but extensive research is being undertaken, and should it be successful, Canada will have petroleum reserves greater than all the present proved commercial reserves of the rest of the world combined.

Land and Water Resources

In forestry, Canada's position again is important. In 1949 she produced about 6 per cent of the world's fuel wood, 11 per cent of the saw logs, and almost 28 per cent of the pulpwood. Canadian mills accounted for 27 per cent of the total production of woodpulp and for 63 per cent of newsprint. In exports, Canada led the world (excluding the Soviet Union) in newsprint, with 83 per cent of the total, and in lumber, with 29 per cent of the total, and ranked second in woodpulp, with 29 per cent of the total.

In food products, Canada's contribution is well known. She ranks second as an exporter of wheat and of live cattle, and is an important exporter of other cereal and animal products. The coastal and inland fishing industries make her the free world's fifth largest producer of fish and the leading exporter.

In addition to all this, Canada is extremely well blessed with water-power resources. Fortunately, moreover, these are abundant in what are termed the "acute fuel zones" of Ontario and Quebec, where native coal is not economically situated but which in other respects are well suited to industrial development. In the last half-century installed hydroelectric capacity has risen from 275,000 horsepower to 13,300,000 hp.—48 times the original figure. Between 1939 and 1951 the capacity was enlarged by no less than 60 per cent. With a population of less than 1 per cent of the world total, Canada has over 10 per cent of the world's developed hydroelectric power, but even so, has developed only one-quarter of her water-power potential.

Extensive Exports

One of the most significant factors about our natural resources is that the bulk of our mineral, agricultural, fish, and forest output is sold abroad. The same may be said, to a considerable degree, of our hydroelectric output; for while it is consumed in Canada, a substantial part of it goes to the manufacture of goods for export. Two large consumers of electric energy, for example, are aluminum and newsprint. The development of an aluminum industry in Canada is due entirely to the availability of large amounts of low-cost power in the vicinity of tidewater, for the raw materials are imported. The Canadian aluminum industry now accounts for about 28 per cent of world production, and nine out of every ten tons are shipped abroad. Newsprint is now Canada's largest single export; its importance in world trade has been mentioned.

The foreign demand for Canada's natural resources has been, of course, the key factor in building our economy to a point where a country of only fourteen million people—twenty-fifth among the countries of the world in terms of population—has achieved fourth place among the trading nations of the world and second in terms of high standards of living. Our pre-eminence as a foreign trader, however, is important not only to Canadians but to all the world. Under present conditions, when preparedness to resist aggression is of paramount importance, Canada's resources are once again vital to the defense effort of the free nations of the world, just as they were during the six long years of the Second World War. Furthermore, in addition to their contribution to defense, these resources can still mean better living to countries which obtain them, and it is our earnest hope that improving living conditions may create a climate more favorable to the achievement of a full and lasting peace. For these reasons the conservation and efficient development of her resources becomes not only a national but an international responsibility.

Problems of Conservation

There was a time, not very long ago, when the abundance and variety of Canada's resources seemed to convince her people that there was little need to conserve them. Forests were cut with no heed to reforestation or the encouragement of natural growth. Crops were grown with no thought to the replenishment of the life-giving contents of the soil. Drought and dust storms, lowered water tables in the prairies and in other parts of the country, flash floods followed by dried-up river beds, the disappearance of many valuable forests, and mines abandoned too early because they had been high-graded, all served to bring home the folly of profligate exploitation of resources. It is well appreciated, too, in Canada that the rapidly increasing world population, the rising living standards in underdeveloped countries, and technical developments increasing the utility of many metals and other products, are all combining to increase at a startling rate the demand for raw materials.

Nevertheless, however fully the need for conservation is recognized, it is no simple matter to put it into practice. The fact is that, over the short run, it is more costly to exploit resources with an eye to the future than with both eyes solely on the present. It is more expensive, for example, to cut a forest on a sustained-yield basis than to adopt the wasteful method of "cut out and get out." Less accessible areas may have to be cut, and a good deal of research is necessary to obtain the requisite data on rates and conditions of growth and many other matters. Then, if conservation is to be thorough, it must not be limited to the growing forest; it must cover such fields as making the fullest use of all parts of the tree, including the sawdust, and the preservation of wood and wood products, the substitution as far as possible of more common woods for those less common, and so on. All this calls for research—much research—and research is costly.

The same thing applies to minerals. More immediate profit comes from high-grading than from mixing the rich ore with that of lower grade and thus prolonging the life of the mine. Then, here again, much research is necessary to find the best methods of discovering the minerals in the ground, of extracting them from the rock, of utilizing them and protecting the finished product against stress, strain, and erosion. And in agriculture and fisheries it is also true that the wasteful method promises the largest *immediate* profit.

WHOSE RESPONSIBILITY?

Conservation is, and always must be, a responsibility of all groups in the community, including national governments and local governments; universities, private research organizations, and service clubs; large and small corporations; individual farmers, miners, fishermen, and lumber operators; prospectors, hunters, and tourists. The role of government, however, is a special one, for to a large extent it may stimulate better conservation by other groups.

The importance of government's role in conservation derives from the fact that the development of resources on sound conservation standards is not compatible with the immediate maximization of profit. It is probable that conservation will *over the long run* produce the maximum profit from resources; but as J. M. Keynes said, "In the long run we are all dead." It may be difficult, therefore, for even the most public spirited board of directors to adopt, beyond a point, more costly measures of development than appear to be necessary, merely to preserve our natural resources for the use of future generations fifty or a hundred years hence. They are inclined to argue that the very fact that it will be future generations that will benefit from conservation is a sound economic reason for *part at least* of the costs of conservation being borne by the people of the country as a whole, as taxpayers, rather than by the consumers of the raw material through higher prices, by the laborers that produce it through lower wages, or by the owners of the resource through lower profits. There is wide public acceptance of this general principle; the only dispute concerns the extent to which it should be applied—the degree to which the taxpayer by one method or another should carry the burden of conservation.

INTERGOVERNMENTAL RELATIONS

Basic to any examination of how the problem is dealt with in Canada is a knowledge of the manner in which responsibility for resource development is divided between the federal and the provincial governments. Under the British North America Act—Canada's constitution—the ownership and administration of land, forest, mineral, and water-power resources is given solely to the provincial governments, the exceptions being in the Northwest Territories and the Yukon, which have not yet achieved provincial status and where the natural resources are owned and administered by the Federal Government, and certain relatively small areas of federal land in the provinces. Concerning agriculture, the B.N.A. Act states that the provincial and federal governments shall have concurrent rights, but that provincial laws shall be valid only to the extent that they are not repugnant to federal legislation.

In practice, the provincial governments limit their agricultural legislation to problems affecting their own province, while the Federal Government concerns itself with national or broad regional problems. Both coastal and inland fisheries are a federal responsibility under the B.N.A. Act, but in regard to the inland fisheries the practice has developed whereby the Federal Government legislates in accordance with provincial desires and leaves the administration of this legislation to provincial authorities.

However, although the provincial governments have complete jurisdiction over certain resources, the Federal Government has also a valid interest in conserving and developing these resources and can properly give assistance in doing so, provided that such assistance is given in agreement with the provincial governments concerned. The Minister of Resources and Development has pointed out that in cases where natural-resource problems spread beyond provincial or national boundaries, or where the resource is of such a type and is available in such quantities that its development requires a truly national effort, joint federal and provincial action may be desirable.

CARE OF FORESTS

Government policy relating to the conservation of a particular resource is determined in part by whether the resource is renewable or nonrenewable. For example, in the case of a renewable resource such as forests it is generally recognized that the goal must be to achieve sustained yield; that is, the rate of depletion—by cutting and by loss through fire and disease—must not exceed the rate of replacement by natural growth and reforestation. Both the provincial governments and the industry recognize this, and important steps have been taken to frame provincial legislation and industrial practice so as to achieve this end.

To facilitate co-operative efforts by the provincial and federal governments to improve the care and management of Canada's forests, Parliament in 1949 passed the Canada Forestry Act, which provides, among other things, for the Federal Government to enter into agreements with any province for the protection, development, or utilization of forest resources. Unfortunately, the need for increased defense activities coming shortly after the passage of this act has up to the present restricted the extent of federal activities. Nevertheless, in the summer of 1951 the Minister of Resources and Development announced that the Federal Government was entering into an agreement with the provincial governments to give financial assistance in the taking of a reliable and complete forest inventory, and in encouraging reforestation. He pointed out that a forest inventory is essential before a policy to achieve sustained yeld can be successfully planned, and that reforestation is badly needed

in certain cut-out areas which will not regenerate themselves naturally and where forest cover is necessary not only for the development of forest projects but also in the interest of soil conservation, flood control, cover for wildlife, and other uses.

For many years past, the Federal Government has assisted in forest conservation by extensive research. Forestry research is carried on in Ottawa and through five district offices and five forest experiment stations situated in different regions throughout the country. It covers silviculture and forest management, forest inventories, and fire protection research. It is designed to provide solutions to many technical problems encountered in improving forest management. Forest products research is undertaken in two forest products laboratories, one in Ottawa and one in Vancouver. It covers such fields as wood utilization, wood preservation, timber mechanics, and wood chemistry. There is in addition an experimental sawmill in Ottawa.

AGRICULTURAL IMPROVEMENT

In agriculture much has been done by precept to teach better methods of farming, and research is carried on by almost forty agricultural experimental stations throughout the country. A particularly interesting project is that undertaken by the Federal Government under the Prairie Farm Rehabilitation Act. This act was passed in 1935 to provide for the restoration of substantial areas in Manitoba, Saskatchewan, and Alberta. Federal funds on a large scale were made available for assistance to these provinces. The federal Department of Agriculture directed the work, but joint federal-provincial committees co-ordinated the work of all agricultural bodies, including that of some private commercial and financial organizations.

This act is still in effect. Its work is divided into three main divisions: (*a*) land culture practices, (*b*) land utilization, and (*c*) water development. The Federal Government provides funds and direction for the construction of water reservoirs, for economic and soil surveys, for land classification and determination of use, for the study of cultural practices, and for the provision of illustration stations to demonstrate the proper use of land for the regrassing of devastated lands and for the establishment of community pastures. Combined with these undertakings there has been an extension of federal research in a broad range of subjects such as soils, forestry, entomology, crop production, and agricultural engineering. This work, started in 1935, is continuing and has expanded into other provinces as agreements between the federal and provincial authorities have been concluded.

FISH CONSERVATION

The responsibility for fish conservation, except in certain of the inland fisheries, is exercised by the Federal Government. The general policy is to manage the resources in such a manner as to allow maximum production for use, yet guarantee the supply in perpetuity. Effort toward this end is directed along two lines: (*a*) protection of the existing stock to allow sufficient individuals to spawn, and (*b*) improvement of environmental conditions to permit more efficient use of the spawning areas.

To provide basic information on which to design proper procedures for the protection of the existing stock, the Fisheries Research Board of Canada is constantly investigating the life histories of the various species and estimating population abundance. For those species where it is indicated that exploitation may be reaching dangerous levels (for example, Pacfic salmon, Pacific herring, Pacific halibut, lobsters, Atlantic salmon, Atlantic smelts, clams, and in some instances whitefish), pertinent restrictions are applied in the form of minimum lengths, closed seasons, closed areas, catch quotas, and so forth. Improvement of environmental conditions to encourage more efficient spawning and incubation is restricted almost wholly to anadromous and fresh-water fishes, such as salmon, smelt, and trout. This work may be expected to develop greatly in a country such as Canada, where increasing industrialization will more and more tend to put water to various uses and increase the discharge of wastes. At the present time, the main problems are created by water-power developments, and pulp and lumber mills.

MINERAL CONSERVATION

Since minerals fall in the class of nonrenewable resources, their conservation, from the theoretical point of view, presents a problem different from those we have so far discussed. There is no simple criterion by which to determine the rate of exploitation that should be permitted, such as is provided in the case of forest, soil, and fish resources by the goal of sustained yield, because by definition there is no such thing as sustained yield in a nonrenewable resource. The question as to the extent to which the taxpayer should bear the burden of increased production costs necessary to prolong the life of a mineral deposit can be answered only on an empirical basis.

In Canada both federal and provincial governments follow the general practice of encouraging mineral conservation by the indirect method of reducing costs so as to encourage the production of lower grades, rather than by direct controls. Mineral rights, once they are relinquished to private enterprise, generally become the property of the company or individual concerned, and no conservation policies are enforced. An important exception, however, is found in the case of natural gas and petroleum resources in the province of Alberta, where the Petroleum and Natural Gas Conservation Board exercises strict control over the number of wells and the volume of production.

Financial encouragement to the mining industry is given by favorable income tax provisions during the development and early production stages of a mine and by government assistance in the construction of transportation facilities—railroads, roads, landing fields, docks, and so forth—in remote areas. The government furthermore undertakes geological, topographical, and other surveys which are basic to the discovery and development of mineral resources, and, through the Mines Branch of the Department of Mines and Technical Surveys, carries out extensive research in a very wide range of problems concerning the discovery, extraction, processing, utilization, and preservation of minerals.

THE OVER-ALL PICTURE

To sum up, the policy of the Federal Government in Canada is to create an economic climate favorable to the exploitation of natural resources by private industry to the maximum degree compatible with principles of sound conservation. Within provincial jurisdictions the specific policies vary somewhat in detail, depending on the historical background, local conditions, and the ideology of the current provincial governments. Putting all these government policies together with the

activities of corporations, institutions, and individuals concerned, it is not boasting to maintain that Canada realizes her responsibility as one of the world's greatest natural resource storehouses and that she is striving to ensure that these resources are exploited prudently and used wisely.

Major-General Hugh Andrew Young, C.B., C.B.E., D.S.O., Ottawa, Canada, is Deputy Minister of Resources and Development and Commissioner of the Northwest Territories. He is a director of the Central Mortgage and Housing Corporation; chairman of the Arctic Research Advisory Committee (Defence Research Board); member of the Board of Governors of the Arctic Institute of North America; member of the Board of Directors of the Canadian Geographical Society; and member of the Board of Directors of the Pulp and Paper Research Institute of Canada.

INTERNATIONAL RELATIONS AND WORLD GOVERNMENT

KIEFFER, JOHN E. *Realities of World Power.* Pp. xiii, 326. New York: David McKay Company, 1952. $4.00.

Proudly publicized as a geopolitical blueprint for the layman, with particular reference to the American strategic position, John Kieffer's recent work sets out to combine ambitiously the main principles of geopolitical doctrine with a current appraisal of the world political scene. Although he signally fails in his first objective, his challenging and belligerent observations often hit the mark on the practical side of the picture. The reviewer's principal impression is that the book is extremely uneven, hastily written, and filled with emotional outbursts which not only astound the academician, but which will cause most readers to lose the thread of the author's discussion. The weakest part of the book is the introductory section, the chapters dealing with the historical background and fundamental factors of the pseudo science of geopolitics. The author gingerly sidesteps any attempt to offer a clear-cut and intelligible definition of geopolitics which is mysteriously labelled as an "almost diabolical plot to forestall our efforts" (p. 5). A few pages later a larger and more confused definition is given, broad in its outlines to the point of meaninglessness.

The first hundred pages display a tendency to underestimate the significant theoretical aspects of twentieth-century geopolitics. The reviewer would strongly dispute the statements that "the principles of geopolitics are simple," and that "the global concept is only the application of common-sense thinking to world areas" (p. 6). Based on these oversimplified assumptions, the discussion of the fundamental factors of geopolitics and of geostrategy assumes the form of a superficial primer. Particularly disturbing is the complete absence of documentation which is essential to the interpretation of background-theory. Important works are briefly mentioned by reference to volume, without giving precise quotations or a more exact indication of the source itself. The book, incidentally, has no index, no appendixes; and its entire bibliography consists of eleven generally known textbook titles.

The major part of Kieffer's work is based on a detailed survey of the world's "strategic power areas." This is by far the most useful section of *Realities of World Power*, and the reader will find valuable information in the well-written chapters on the United States, Great Brit-

ain, France, Spain, and Italy. However, the author's analysis of the explosive Spanish situation is lopsided and misleading. The condemnation of Spain in the United States is not the result of pro-Communist propaganda; the *rapport* between the democracies and Franco is indeed a dangerous experiment, even if the author explicitly disregards the moral aspects of an exuberant friendship with the Spanish dictator. Similar political misjudgments mar the chapter on Germany and the geopolitical review of Tito's Yugoslavia. It is probably justifiable to characterize Tito as "a political opportunist whose primary interest is power for Tito" (p. 229). At the same time, much more emphasis should be placed on Tito's determined challenge of the imperialistic structure of Stalinism, and on the strategic value of a Western alliance with the Yugoslav outpost.

On the whole, the author is at his best in the survey of the United States and of Western and Central Europe. The farther he drifts from these well-charted regions, the more lightly does he tread on the dangerous ground of political problem-areas. The Near Eastern and Far Eastern sections are particularly confusing and hesitant. They detract considerably from the over-all value of preceding chapters, which are lively and often informative. The final chapter on "The Common Problem and the Future" reasserts the primacy of power politics and hotly denies the role of moral considerations in the author's own perspective of "geopolitics." He reveals the characteristic theme of this emotionally inclined and controversial work in a closing comment: "We have said much about idealism, and all of it has been in a contemptuous vein."

ANDREW GYORGY

Yale University

KORNER, EMIL. *The Law of Freedom as the Remedy for War and Poverty.* Translated from the German by H. Leigh Farnell. 2 vols. Pp. xxiii, 562; vi, 668. London: Williams & Norgate (distributed in U. S. by the British Book Center), 1951. $9.50.

This scholarly and closely-reasoned work defends the thesis that poverty and war are to be overcome, not by democratic or autocratic socialism, but by capitalism operating under conditions of genuine freedom. Perhaps its chief attraction consists not so much in its positive program as in its illuminating attack on both the untruthful foes and the misguided friends of liberalism.

The first volume considers economics in its setting of psychology, philosophy, politics, and history. Besides dealing with popular fallacies, it presents two basic principles in the social economy of "means," or valuable goods. The final *use* of means should be governed by the ethical principle: "Develop your own self as you would that your nearest and dearest should develop his." And the *acquisition* of means should be governed by the economic principle of freedom of choice, but on the understanding that the "law of freedom" is always subject to this limitation: "What you would not have done to you, never to another do, and do not allow it to be done to anyone else." Thus the basic functions of the political state are two: to protect freedom, and to exercise for individuals the precautions which they would exercise for themselves if they could.

The second volume is devoted to a number of problems in economic theory and political practice. Outstanding are the problems of "unemployment" (interpreted as the total unemployment of some workers) and "full employment." The first of these problems can be solved by fixing a minimum wage rate and so varying the maximum hours of work that the total volume of labor demanded at any time is distributed automatically among the total number of willing workers. The second problem, although no satisfactory solution of it is known, may be made less serious by relaxing the existing limits on both consumption and production. Here it is important, not merely to maintain equality, in terms of exchange value, between total productive services and total product, but to do so by means of a monetary standard whose real buying power is stable. For this purpose only one kind of productive service needs to have a stable price, and the most suitable kind is unskilled labor. What we should do, then, is link a fixed minimum money wage with a variable maximum working week. To illustrate, dollars might be issued subject to the condition that not less than forty dollars shall be paid for a working week of, say, forty hours.

It is only within a "world state," Korner holds, that freedom can be realized and war abolished, since any national state can be prevented by another from carrying the law of freedom into effect. If we do not voluntarily construct a free world state, we may have a totalitarian world state imposed on us. Depending on one's concern for freedom in its present struggle with state control, one may or may not approve the vigor with which Korner assails Marx, sometimes Keynes, and occasionally such writers as Drucker and Vaihinger; but in any case the quality of the assault is likely to be respected.

BRUCE KNIGHT

Dartmouth College

MIKESELL, RAYMOND F. *United States Economic Policy and International Relations.* Pp. xii, 341. New York: McGraw-Hill Book Company, 1952. $4.75.

With this broad-gauged and scholarly treatise, Professor Mikesell has signally contributed to a major field of study which, despite the appearance of numerous technical and theoretical discussions, has long suffered from the lack of a comprehensive survey of our foreign economic policy. Indeed, the prevalence of the piecemeal approach to isolated aspects of this multifaceted subject has tempted occasional observers to doubt the existence of any such policy. Without denying or belittling the significance of numerous inconsistencies and paradoxes, Mikesell shows how historical and analytical techniques can be made to yield a definite rationale which reflects both the fluctuating aims of our foreign policy and our basic traditions of economic liberalism. Addressing himself to the dominant problems and policies of World War II and its aftermath by way of a succinct historic review of interwar developments, the author skillfully highlights the change in the country's international accounts after World War I, its attitudes toward war debts and foreign lending, and the protectionist refusal to adjust to the new realities before and during the great depression. His discussion of international monetary policies during this period compares central bank co-operation in the 1920's with the Treasury's efforts toward stabilization in the 1930's and leads him to the conclusion that the earlier Federal Reserve activities represent "a more substantial contribution" than the actions of the Treasury; this judgment might be somewhat qualified by reference to the depression-born pressures which had made the failure of the 1933 London Conference very nearly inevitable once the proclamation of Empire preferences at Ottawa in 1932 had virtually invited competitive exchange-rate depreciation.

The main part of the book offers a systematic exposition of the principal postwar aspects of international monetary and investment policy. The presentation is marked by commendable restraint and a fitting sense of proportion in assessing the many crosscurrents which left their mark on the emerging institutional and policy pattern of the recent past. This reviewer happens to share the author's view that "the most essential key to the elimination of discriminatory trade and exchange controls lies in the restoration of Sterling-Dollar convertibility"; however, he may perhaps be permitted to ask whether this view would not call for some comment on the failure to deal more realistically with the war-generated sterling balances than was done in the 1945 Anglo-American Financial Agreement. The discussion of exchange rate and gold policy is thorough and lucid, but might usefully have included a reference to the misguided wartime attempts to "aid" occupied areas by fixing exchange rates there according to purist concepts. The treatment of such organizations as World Bank and Fund, Economic Cooperation Administration (ECA), and European Payments Union (EPU), and of the Point IV and International Trade Organization's General Agreement on Tariffs and Trade (ITO/GATT) programs is competent and to the point. The struggle over postwar commercial policy forms the subject of a vivid chapter which

illustrates the political shortcomings of our agricultural policies. The book closes with an outline of the new directions which the defense effort has imparted to our foreign economic policy; regrettably, the last two chapters do not mention the East-West trade problem despite its relevance to their subjects. This may, however, not have been possible within the necessarily restricted scope of the "Economic Handbook Series" of which this volume is one. In fact, it is this degree of condensation which makes the book valuable as collateral reading for advanced courses, although its main appeal should be directed to the wide audience of informed general readers.

ADOLPHE J. WARNER
New York City

WARBURG, JAMES P. *How to Co-exist Without Playing the Kremlin's Game.* Pp. viii, 228. Boston: The Beacon Press, 1952. $2.75 cloth; $1.00 paper.

James P. Warburg is a critic, although a restrained and moderate critic, of the present trend of American foreign policy. He finds it too "tough" with the Soviet Union, too negative and lacking in broad constructive blueprints for promoting peace and disarmament and for promoting a crusade against poverty and distress all over the world.

As a means of "co-existing" with the Soviet Union "without playing the Kremlin's game" he offers "six imperatives" for a new policy, which may be briefly summarized as follows:

Help develop a plan for peace through which universal enforceable disarmament under law would become a practical possibility.

Help develop a worldwide co-operative program of economic development and social reform, aimed at liberating all mankind from hunger, poverty, disease, and oppression.

Do not betray the basic principles of a free society in the name of cold war expediency.

Build up the military power of the free world, but in such a way as to "combine the maximum deterrent with the minimum of provocation" and not to undermine the economic strength and political stability of the nations which are resisting aggression.

However attractive these proposals may sound, the obstacles to their realization are a good deal more formidable than Mr. Warburg seems to recognize. To find a common denominator of "law" which would satisfy both the Communist states and the free states is not difficult; it is starkly, flatly impossible. Given the Communist philosophy of implacable hostility to the "capitalist" world and the Soviet record of international bad faith, it is certainly difficult to conceive any formula that would insure "enforceable disarmament."

The United States is carrying such a heavy load of rearmament expenditure (and there is as yet no assurance that we are ahead of the Soviet Union) that a large-scale plunge into an international giveaway program would be much more likely to bankrupt the United States than to end poverty in "underprivileged" areas of the world.

The author is no doubt sincere in his professed abhorrence of communism. Yet most of his concrete proposals, notably the abandonment of German rearmament and a hands-off attitude toward Formosa, would almost certainly pave the way for big new Communist advances, both in Europe and in Asia.

His suggestions for a united Germany and a united Korea, based on free elections, seem to skip very lightly over the obstacle presented by the frozen indoctrination in Communist mental molds imposed upon East Germans and North Koreans. A general criticism of the book is that the author does not take adequate account of such aspects of the Soviet Communist problem as the inflexibility of the Soviet rulers in pursuing their aims and the range of political and psychological instrumentalities by which they hold in subjection the peoples within their orbit and wage unceasing warfare against the nations outside that orbit.

The force of the book's argument is weakened by a rambling, discursive style, although the author tells one good story on himself. It seems that his career as a publicity man for the Baltimore and Ohio Railroad came to a swift end when he came up with the slogan: "Take the B. and O. Between New York and Washington—and Avoid the Crowds."

WILLIAM HENRY CHAMBERLIN
Cambridge, Massachusetts

HARRISON, JOHN B. *This Age of Global Strife.* Pp. ix, 470. Philadelphia: J. B. Lippincott Company, 1952. $5.50.

Professing to eschew a "heavy, technical, fact-crammed" text and "the kind of cynical detachment and moral relativism" that precludes firm conclusions or moral judgments, Professor Harrison has attempted in this book for the college undergraduate and for the general reader "a sound historical account of the major world events of the immediate past which give meaning to most of today's world problems" (p. vii). Such an ambitious and commendable undertaking requires thoroughness and objectivity in studying the data, perspective and good judgment in choosing the themes to be stressed, and nicety of diction in order that the generalities and conclusions reflect, with the least possible distortion, the minutiae omitted. These requirements the author has not sufficiently appreciated, or at least has not always well fulfilled.

He is most open to criticism for Part I, "The Coming of World War II," especially its first three chapters which start with "The Rise of Germany to Dominance in Europe" and carry the story through the settlement of 1919. He exaggerates the iniquity of Germany, betrays a startling ignorance of the outcome of the Balkan crises preceding 1914, and misrepresents the character of the Triple Entente, particularly Great Britain's role in it. Little slips in this section, such as a "wizened" Lloyd George in 1919 and "the international Curzon Commission" (which never existed), suggest imperfect mastery of details. Moreover, the choice of material in this part provides an inadequate basis for understanding the denouement discussed in the last section, half of which is devoted to Soviet-American rivalry, unless we assume that the technology, politics, economy, and ideology of today are mainly the direct result of two world wars.

On the other hand, Professor Harrison has written well, indeed admirably, about World War II and the "Cold War" since 1945. These sections, which constitute four-fifths of the book, reflect a firmer grasp of primary sources, a more satisfactory, though a still too narrow, selection of material, and a more felicitous exposition. Most praiseworthy is his treatment of Soviet-American relations, whose discords he dates from April 1945. Here he is courageously free from the partisan and semihysterical interpretations that recent rivalry has fostered. For this his book deserves high praise and a wide audience.

DWIGHT E. LEE
Clark University

AMERICAN GOVERNMENT, HISTORY, LAW, AND POLITICAL THEORY

GRASSMUCK, GEORGE L. *Sectional Biases in Congress on Foreign Policy.* Pp. 181, xv. Baltimore, Md.: Johns Hopkins Press, 1951. $2.00.

In the attempt to develop a more precise political science the techniques of statistical analysis are being applied to many new fields. Studies of voting behavior have contributed new insights and supplied useful correctives to conceptual assumptions of an earlier period. The present volume represents the application of the same techniques to the behavior of Congress in the field of foreign policy.

By measuring roll call votes for and against selected categories of foreign policy legislation during two periods: 1921–1932 and 1933–1941, the author is able to report on the attitudes reflected by party and section on certain foreign policy issues.

Party and section may vie with one another for preponderant weight in any given legislative situation. Party emerges as the single most influential factor although this influence is not expressed as a continuous or consistent adherence to a particular substantive policy. Quite the opposite. For example, during the twenties Republican congressmen tended to support the foreign policy of the Republican presidents,

and this policy favored a strong international position. Throughout this same period Democratic congressmen tended to oppose this position.

In the thirties, however, Democratic congressmen gave generally firm support to the increasingly forceful international policies of the Democratic administration while Republican congressmen shifted to a position of opposition. Party asserted itself in organizational rather than doctrinal terms.

Comparatively, sectional influence seems to be linked more closely to policy predispositions. Dr. Grassmuck discovers a high degree of continuity in the voting behavior of the successive representatives from a particular district or state. He reasons that this tendency toward consistency reflects the fact that the congressman is a constituent of, as well as the representative of, his district. The geographic, demographic, economic, and social factors that condition voting attitudes remain relatively constant. These influences impart a strong local orientation to the congressman's voting behavior on any specific issue.

When this predisposition toward localism is countered by strong administration support of a contrary position, congressmen of the party in power must resolve this conflict. When this occurs such considerations as the differing party mechanisms of the two houses, the strategic power of the executive, and the relation between the foreign policy issue and domestic economic factors will determine the congressman's decision.

These complex interactions receive discerning treatment in this carefully reasoned and well written book. One may disagree with some points of emphasis, but the author has presented a useful analysis that contributes needed refinement to our understanding of congressional voting behavior. More such studies are needed.

LAWRENCE H. CHAMBERLAIN
Columbia University

HALLENBECK, WILBUR C. *American Urban Communities.* Pp. xi, 617. New York: Harper & Brothers, 1951. $6.00.

Professor Hallenback has attempted, within the compass of a single book, to present a detailed study of the whole, many-sided problem of the urban community. This is an interesting and provocative account of urban social life (in the United States only) in which hardly a single aspect of this complicated problem is omitted.

In his introductory chapter, "The Study of Cities," Professor Hallenbeck carefully sets down a series of hypotheses and assumptions which serve as guideposts for his presentation of materials throughout the study. Here, too, he lays out the general outline of the work.

It must be admitted that the author has essayed a difficult task, merging, as he must, the findings from a number of fields —history, government, economics, sociology, social work—as they bear upon investigation of the urban community. Considering the breadth and scope of the problems covered, the author has done a very creditable job of research, generalization, and integration of the data used in the study.

The work embraces thirty chapters arranged in seven parts, though limitations of space preclude specific comment on any part except the last. Among the subjects treated are: the historical development of cities, regionalism, the form and structure of cities, municipal government and politics, major social problems (poverty, disease, delinquency, crime), major areas of organized social life (health, education, recreation, religion), changes in structure and function of urban families, city planning, and suggestions for the development of a more ideal community now and in the future.

Throughout the work the author utilizes a vast array of statistics derived from many sources, including the United States Census Reports, and from a myriad of spadework studies carried on by students of urban life in widely distributed cities throughout the United States. Whenever possible statistical correlations are employed in an effort to establish standards of "goodness" for measuring urban communities as well as for many other purposes. Graphs and charts are freely employed to show all manner of measurable changes in urban life, but more particularly to present census data. The student is introduced to and made aware of the vast and growing importance of census tracts as devices for understanding neighborhoods and communities. A wealth of demographic data is presented although a few of these pictorial and graphic accounts suffer somewhat from lack of size and color. The methodology used throughout the work is predominately inductive.

Part Seven, containing three chapters, is devoted to "Cities and the Future." Chapter 28 contains a thorough summary of the history, philosophy, principles, and operation of city planning in United States, with incidental reference to the London County Plan. The author manages to convey a broad picture of the growing impact of such planning, with the principles involved spelled out step by step beginning with community commitment to the planning process and ending with a program of priorities for the execution of the plan.

Chapter 29 is devoted to a review of the almost boundless opportunities for the good life available to people living in urban communities. However, it was deemed necessary to recognize the grievous lack of widespread citizen participation in community affairs and to explain the reasons for this baffling social phenomenon.

Possibly the most interesting and, in a sense, the most controversial part of the work is reserved until last (chapter 30) where Professor Hallenbeck, relying heavily upon the method of statistical calculation for setting urban standards, maintains that within broad limits, the ideal urban community of tomorrow can be created if men but have the will to attempt it. Underlying the whole approach is the assumption that there is urgent need for decentralization of urban areas based upon constellations of smaller cities planned and built around large central cities. Ideally, then, the large central cities and the smaller units would act together functionally to create a more perfect urban community.

The work is thoroughly documented and contains suggestions for supplementary readings at the end of each chapter.

GEORGE S. HART
California State Teachers College
California, Pennsylvania

STEPHENSON, GEORGE M. *The Puritan Heritage.* Pp. 282. New York: The Macmillan Company, 1952. $3.50.

The author of this vigorously written book has been for many years a professor of American History at the University of Minnesota, and presumably the materials in this volume have, through the years, constituted a distinctive emphasis in the author's presentation of his subject. What he has done here is to put the influence of Christianity where it belongs in the stream of American history, quite in contrast to most American historians who have almost completely left it out. It is indeed a strange presumption, in the light of what this book reveals, that American civilization can be understood without taking into enlightened consideration the things of the mind and spirit. Yet, strange to say, that is just what the mine-run of American historians are attempting to do. Professor Stephenson is well qualified to place stress upon this influence. Twenty or more years ago he made a painstaking study of the religious aspects of Swedish immigration, publishing the results of his researches, after spending a year in Sweden on a Guggenheim scholarship. The study is a model of its kind and throws a flood of light upon one great stream of immigration which has enriched American life both in its spiritual and material aspects.

In this compact volume Professor Stephenson follows all the main currents which have gone into the making of our distinctive American heritage. The New England Puritans, the Quakers, the Unitarians, the Methodists, the great colonial awakenings, the part revivalism played in taming the west, the many benevolent agencies which arose to keep the things of the spirit alive on the frontier—the home missionary societies, the tract and Bible societies, temperance societies, all of which are given cogent treatment in several short but adequate chapters. The author does not bemoan the fact, as many less understanding writers have done, that America, by the end of the colonial period, was dotted with numerous "religious experiment stations." It was religious diversity which made these experiment stations possible and put into the Constitution of the

United States one of its finest, if not *the* finest, provision, the guarantee of religious freedom—and "not religious toleration, which assumes a privileged church." Unlike other colonizing nations, the English colonies were open to all, and thus there developed a wide toleration of religious differences.

The book ends with three chapters dealing with two of the most exciting episodes in American history—first, the swarming of the Catholic Irish to these shores and the natural resistance to them and their old world religious pattern, and, second, of slavery and the resistance to it, which created the most tragic era in American history.

WILLIAM W. SWEET
Southern Methodist University

JOHNSON, GERALD W. *This American People.* Pp. xii, 205. New York: Harper & Brothers, 1951. $2.75.

Mr. Gerald Johnson in this suggestive little book takes the ideas about human nature and human society with which the founders of the United States worked and asks how true, how valid, how workable they are today. This is not a new enterprise. Almost all who are concerned with political ideas today have had a try at this problem. Mr. Johnson's originality lies in his deliberately unacademic, man-to-man style. He is writing not for the scholars but for the people. Yet he keeps the discussion at a high level; this intimate colloquy with puzzled Americans just escapes the folksy, the deliberate writing-down, the patronizing. It is a balanced, temperate discussion of our current political problems, seen in the light of our habits, feelings, traditions, dispositions.

The central point Mr. Johnson makes is that government as our eighteenth-century forefathers established it in this country exacts much from many—just possibly too much. Our difficulties spring not from the wrongness of the moral and political basis of the republic, nor even from the alterations time has made in the conditions of life on this earth—though Mr. Johnson admits these conditions have changed greatly—but from the seriousness of the strain our democracy puts upon ordinary human nature. Indeed, the more than half our people who do not even vote in national elections have already given up under the strain. Mr. Johnson refuses to count them as Americans.

He is not, however, basically pessimistic. He thinks the other half, if it will take seriously the duties of government by discussion, if it will live up to the challenge of greatness, can still keep within hailing distance of the ideals of the Founding Fathers. He does not, as do men like Reinhold Niebuhr and the more pessimistic social psychologists, seriously question the fitness of these eighteenth-century ideals to a twentieth-century society.

CRANE BRINTON
Harvard University

DANGERFIELD, GEORGE. *The Era of Good Feelings.* Pp. xiv, 525. New York: Harcourt, Brace and Company, 1952. $6.00.

Traditionally the term, "Era of Good Feelings," has been used to designate the eight years of Monroe's presidency. Mr. Dangerfield thinks there was little good feeling after the first two years when the Panic of 1819 initiated a bitter depression with consequent social and political repercussions. Here indeed was the seedbed of Jacksonian democracy.

However, this study begins its investigation with the Twelfth (or "War Hawk") Congress which was set ablaze with the news of the Battle of Tippecanoe. With the exception of the battle of New Orleans little attention is paid to the War of 1812, but the negotiations leading to the Treaty of Ghent are detailed. This event is illuminated with the current background of British politics, and one could scarcely find a better account of how the American commissioners—Adams, Clay, Gallatin, and Bayard—wore down the British commissioners and ended an inglorious war without budging on the points their opponents insisted upon and without loss of a foot of American territory. The English recognition of the value of American trade and the imminent decline of mercantilism had been solvents of the impasse.

Also contributing to the termination of good feelings was the "firebell in the night," the bitter sectional controversy over slavery uneasily resolved by the Missouri Compromise. Here the real grievance of the North was not the sin of slavery but the advantage held by the South in Congress and Electoral College due to the three-fifths rule in counting slaves. The twenty-four years of the Virginia dynasty were largely due to this advantage.

Nearly a hundred pages are devoted to the "diplomacy of coal and iron" in explaining the British maneuvering that unintentionally culminated in the breath-taking Monroe Doctrine. This reviewer knows no finer treatment than this up-to-date exposition of that landmark in our foreign policy. The British shift away from mercantilism is again given weight in explaining the event.

This study closes with a hundred pages on Adam's nightmarish administration. Dangerfield seems to accept the "bargain and corruption" charge against Clay and Adams as if proved. The Adams-Clay program was a Neo-Federalism designed to recover the lost dominance by business. Monroe's administration had attempted a definition of agrarian rights which soon found their symbolism in Jackson who as President established these rights by defying the emerging industrialism.

A more comprehensive exploitation of the pertinent sources can scarcely be imagined. The final hundred pages consist of bibliography, citations, and notes. But the enormous mass of material has been sifted with a keen intelligence, and thoroughly digested and assimilated with a resulting admirably integrated treatment of the subject. The author, a naturalized American citizen, may puzzle American readers with such Anglicisms as Louisiana Purchase "stock" instead of the American term "securities" or "bonds." "Gouts of water" is delicious dialectical English. So well is this book written that the reviewer suspects an inherent acumen has here been whetted to rapier keenness by the Oxford tutorial.

WILFRED E. BINKLEY

SHULIM, JOSEPH I. *The Old Dominion and Napoleon Bonaparte: a Study in American Opinion.* Pp. 332. New York: Columbia University Press, 1952. $4.50.

This is apparently a doctoral dissertation. The subject is Virginian opinion—Republican, Federalist, and Tertium Quid—about Napoleon down to 1809, by which time, according to the author, that opinion in its different forms had become fixed. He says he has tried to make an exhaustive study of it. What he has produced is an exhausting piece of reportorial work supported by 835 footnotes and a 25-page bibliography. The text is dreary reading, for it is full of repetitious quotations that add nothing to our knowledge, and it is almost empty of criticism or interpretation. For all the show of finished scholarship, this is a job of scissors and paste. A doctoral candidate who turns out a thesis of this kind deserves pity rather than blame. The blame should fall heavily on his mentors, who are responsible for seeing that he has a task worth doing and that he does it well.

A. L. BURT
University of Minnesota

LEONARD, V. A. *Police Organization and Management.* Pp. xviii, 507. Brooklyn: The Foundation Press, 1951. $5.00.

This book deals almost exclusively with the problems of American municipal police. Forms, procedures, and similar illustrative materials are freely employed and occupy well over one-half of the total bulk. Such materials are largely drawn from Pacific Coast jurisdictions, especially Seattle and Berkeley.

Four pages are devoted to a record of earthquake shocks in western Washington since 1930. Sixty pages, which appear to have been taken in their entirety from an academic catalogue, list the various curricula offered by the Department of Police Science and Administration at the State College of Washington. One-third of the chapter on the police executive is concerned with the announcement circular and application form used in an examination for police chief in Seattle.

Some of the illustrative materials already are outdated. The range of salaries

paid to chiefs of police is for 1946, despite the inflationary changes of the past five years and the ready availability of current data. Swiftly changing practices concerning one-man patrol cars are not well represented by a tabulation for January 1, 1944, when manpower shortages controlled police deployment. *Other examples abound* on every hand.

Editorial and manufacturing standards are low. No uniformity is observed in the length of type pages. If tabular matter requires an entire page, the preceding page breaks off at the point where the table originally was inserted in the text. What appear to be the identifying slugs used by the compositors in each galley of proof have been carried over onto many of the printed pages. The subject index is wholly inadequate and quite useless.

Such strictures should not obscure the fact that Professor Leonard has substantial qualifications for police authorship. He has wide and varied experience with police problems and he has some illuminating and helpful things to say about them.

Ten chapters, six appendixes and a bibliography are concerned with the police executive, organization, selection and training, records administration, patrol and other line units, strategy and tactics, and measurements of police efficiency. We like best his Chapter 7: "Patrol—Major Component of Manpower." It is so clear, coherent, and penetrating in its analysis as to constitute the best treatment of the subject that we have seen.

PHARR, CLYDE, in collaboration with THERESA SHERRER DAVIDSON and MARY BROWN PHARR (Translators and *eds.*). ***The Theodosian Code and Novels and the Sirmondian Constitutions***. Pp. xxvi, 643. Princeton, N. J.: Princeton University Press, 1952. $20.00.

This stupendous, complete, scholarly translation, the combined prolonged effort of over twenty specialists, is one of the most important books published in our generation and should be on the shelves of every college library and every public library.

The *Theodosian Code*, drawn up by a nine-man commission working from 429 A.D. to 438 and unanimously approved by the Roman Senate in the year 438, codifies the legislation of the Roman Empire from the time of Constantine in 313 to the reign of Theodosius II in 438. The *Novels* contain the decrees in both eastern and western empires from 438 to 468. Professor Pharr and his associates, working since 1932 with assistance and subsidies from numerous foundations, universities, and private individuals, and with the generous co-operation of the Princeton University Press, have produced the only English translation of the richest single source and the only official collection of contemporary information on the political, social, religious, and economic conditions of the later Roman Empire.

This book's great importance arises from the fact that the period from 313 to 468 A.D. has taken on high significance among modern social scientists. It was more like our own times in its problems and developments than perhaps any other era in history. This is well pointed out by C. Dickerman Williams of the New York Bar in a brilliant but brief introduction. Sections of the code deal with such modern topics as price fixing, inflation, currency control, black markets, and conscription and regulation of labor. Scores of laws regulate a complicated bureaucracy, so overweening as to be virtually out of control. Page after page of laws and regulations strike desperately at corruption in government bureaus and set up an intricate system of secret service and confidential agents to report upon government officials, upon tax evaders, and upon each other.

This Code presents perhaps the best, certainly the most realistic, picture in all literature of a full-blown socialized state. Henry Charles Lea once wisely said that "the surest basis of investigation for a given period lay in an examination of its jurisprudence, which presents without disguise its aspirations and the means regarded as best adapted for their realization." Modern social, political, and especially economic theorists should keep copies of this great code upon their dasks as an antidote to much loose and wishful thinking, for the Roman State owned and operated both heavy and light industries such as mines, quarries, munition factories, textile mills, the building trade, glass and iron works, shipping, and the public post, and had a passion for regulating everything. Many industries not directly owned by the state were organized into associations controlled by the state. Socialized medicine is clearly outlined.

Imperial interest in education and in freeing liberal arts professors from public obligations will surprise even some members of the American Association of University Professors. The Code reveals a literate society keeping quantities of records, receipts, written contracts, producing a "boundless multitude of books" (p. 487). Today when a college diploma is becoming the *sine qua non* for many occupations and business executives are rediscovering the advantages of a liberal education, it is significant to read in the Code that even a lowly copyist and a fiscal clerk, to hold his job from the year 357 on, must "excel in the practice and training of the liberal studies" and be "so polished in the use of letters that words proceed from him without the offense of imperfections, and it is Our will that all men shall be so informed" (p. 405).

Book VII covers Military Affairs from induction through military clothing, subsistence allowances, the preparing and transportation of food and supplies, quartering, bathing facilities, leaves of absence, deserters, and concludes with elaborate specifications concerning veterans and the Roman equivalents of the G.I. Bill.

No brief review can do more than suggest the vast mine of information and Roman experience that awaits the economist; the sociologist with his interest in marriage, crime, divorce, population, urban and racial problems, all clearly thought out and provided for by the Roman mind; the lawyer; the political scientist; the historian. The *Theodosian Code* and *Novels* reveal a teeming, complex, mature society, a vast "welfare state," and probe unself-consciously into every cranny of it.

Modern Roman and medieval historians have of course for a long time known the importance of this code. They also knew that it was locked away in obscure and difficult Latin. More than one bright scholar has thought of translating it until he looked into it carefully, and only those who have used portions of the code in the original can fully appreciate the gigantic labors which have kept Professor Pharr and his distinguished associates busy almost to despair for the past twenty years. The present excellent and readable translation fully justifies their efforts and unlocks the huge storehouse of Roman experience and legal wisdom for the benefit of all social scientists.

It is ungracious to criticize such a monumental work, but several weaknesses became apparent as I read through the mass of laws. The notes are too brief and their intricate numberings become confusing. Many laws need more historical explanations to make them fully intelligible. The valuable glossary at the end contains pertinent definitions and a mass of information, but a more extensive use could have been made of the great "paratitla" of Jacobus Gothofredus, the first modern editor of the Code and founder of modern Theodosian scholarship, who labored thirty years upon his six-volume edition in the early seventeenth century, upon whose commentary Gibbon, Mommsen, and Dill leaned so heavily with profit. The present volume is dedicated to Gothofredus, but I wish it had drawn further upon his wisdom. The uninformed reader of this book will wonder how the laws worked. No mention is made of the use of the Code by the barbarians in forming their *Leges Barbarorum* and in applying it to Roman citizens, nor of its use during the middle ages.

These shortcomings, however, are trivial in light of the sound, exact, scholarly translation of this great legal code. The book, even though it costs a good deal, is worth any other ten volumes a social scientist could possibly have on his shelves. He should have it where, when any contemporary problem or condition confronts him, he can look quickly by means of the excellent index into the *Theodosian Code* and see what sensible, judicious light the Ro-

mans of the late empire throw upon it. He will find it always vigorous, stimulating, even with touches of humor as in the case of laws which attempt to stop property owners from surreptitiously tapping public aqueducts with six-inch pipes. It is a great aid to perspective; and this last is what most of us need badly. Not the least, he will own a beautiful book, the product of the highest standards of modern workmanship.

ECONOMICS AND INDUSTRY

CANOYER, HELEN G., and ROLAND S. VAILE. *Economics of Income and Consumption.* Pp. xvii, 355. New York: The Ronald Press Company, 1951. $4.50.

Although not a revision of *Income and Consumption,* portions of this book are based on the authors' earlier book. It was written for two quite different groups of students—those who have had a course in principles of economics, and those who "shy away from the conventional and formal course in principles. . . ." These two groups would seem to include all students. As a consequence the text is not a principles book, in the usual sense, nor is it consumer economics, in the usual sense. The first seven chapters are introductory: a thumbnail sketch of political economy (5 pages); how the economy works (12 pages); definitions (8 pages); standards and planes of consumption (6 pages); specialization (15 pages); exchange, including index numbers, banking, and consumer credit (26 pages); and marketing (16 pages).

"The text then proceeds to its major task of relating economic principles to the many aspects of consumption." Chapters 8–14 include general problems (12 pages); national consumption of food, housing, clothing, recreation (20 pages); personal consumption (18 pages); factors which affect our capacity to consume (14 pages); money income effect on consumption, including causes of inequality (14 pages); effects of habit, health, custom, abilities, attitudes (14 pages); such economic and institutional factors affecting consumption as sales promotion, prices (including 3 pages on the law of demand and elasticity), propensity to save, and leisure (19 pages).

The authors express the hope that chapters 15–20 "will . . . show students how they may govern their *productive* lives more wisely." The contents of this section range from scientific management to comments on the welfare state. Eight pages are alloted to budgeting, six to "wise use of insurance," two and a half to investment, ten to co-operatives, four and a half to labeling, three to advertising, two to testing services, two and a half to Food and Drug Administration, and two and a half to Federal Trade Commission. An average student could complete the text in 10 to 12 assignments.

One must wonder what students who have had principles would find new in these pages, and how much students who "shy away" from principles would learn about governing "their productive lives more wisely."

LELAND J. GORDON
Denison University

NATIONAL BUREAU OF ECONOMIC RESEARCH. *Conference on Business Cycles.* Pp. xii, 433. New York, 1951. $6.00.

This volume contains papers presented at the November 1949 Conference on Business Cycles and some of the comments thereon made by participants.

It is clearly a sign of our times that about half the volume deals with econometric approaches to business cycles. In "A Test of an Econometric Model for the United States, 1921–1947," Christ of the Cowles Commission presents a revision of those parts of Klein's sixteen-equation model III that fit postwar experience least well. When the revised model is used to predict an additional year and the results are compared with what actually happened, Klein's experiment does not turn out to be very successful. Klein's criticisms of the paper and Christ's rejoinder make one tend to agree with Friedman's prediction that the National Bureau and the Cowles Commission approaches to investigating business cycles "will become more and more alike." Of particular interest is David McCord Wright's comment that no set of econometric models will ever suffice for reliable long-run economic forecasting: "the element of novel social conception is always *breaking in.*"

In "Studies in Investment Behavior," Klein analyzes patterns of investment (chiefly in the railway industry) during the interwar period. His principal conclusions—that investment during any year was heavily influenced by gross operating profits of the preceding year, that the rate of interest played a smaller role, and that one or more powerful trend variables (perhaps the stock of capital) depressed railroad investment—are critically examined by Angell and Leontief, with a reply by Klein.

C. A. Wright, in "Business Cycle Research and Business Policy," outlines some of the fields of business policy in which business cycle research might help to reduce costs, discusses various forecasting techniques, and presents his own interesting method of forecasting business cycle turning points. Miss Mack's comment, that correct anticipation of turns in business might lead to a new type of technological unemployment, deals with a very remote danger, indeed, though her advice not only to improve techniques of forecasting but also to examine how forecasts are used by businessmen is sound.

A very interesting paper is Haberler's "Business Cycles in a Planned Economy." He argues that, while in a planned economy there would be no business cycles as we know them, planning would not avoid the maladjustments and misdirections of resources which produce depressions in a capitalist economy. The discussion by Bergson, Lowe, Wright, and others is most stimulating.

It is an unfortunate duplication that a relatively large part of the papers have been or will also be printed elsewhere. These include Burns's "Mitchell on What Happens During Business Cycles," Christ's article mentioned above, Hultgren's "Cyclical Diversities in the Fortunes of Industrial Corporations," Abramovitz's "Influence of Inventory on Business Cycles," and presumably Gordon's "Cyclical Experience in the Interwar Period: the Investment Boom of the Twenties." The latter paper examines some of the main factors influencing various components of total investment and lends some tentative and qualified support to the "secular stagnation" thesis.

HANS A. ADLER
Bureau of the Budget
Washington, D. C.

DAVIS, RALPH CURRIER. *The Fundamentals of Top Management.* Pp. xx, 825. New York: Harper & Brothers, 1951. $6.00.

The purpose of this book is to present a fundamental statement of business objectives, policies, and general methods that govern the solution of basic business problems. The author develops and presents a philosophy of management for the purpose of giving maximum assistance to business executives and management educators. It is the author's contention that a sound philosophy of management is necessary for the continuance of the free enterprise system.

Management is treated as the function of executive leadership and an interesting distinction is made between the professional executive and a business mechanic. Functions of the professional executive are discussed as those of planning, organizing, and controlling. Both the management functions and principles are applied to the organic work areas of producing utilities, distributing utilities, and financing the production and distribution processes. The author's treatment of morale and the integration of interests in relation to the line functions of business are important contributions to our concepts in human relations. All this is presented within the framework of line and staff as the two basic forms of organization structure.

In formulating and developing the fundamentals of top management, the author seeks principles and a system of logical thought that can be applied to all executive problems of organization and operation. Within twenty-one tightly packed and closely related chapters the following topics unfold: Basic Management Prob-

lems; Standards and Standardization; Business Plans and Planning; Business Objectives and Ethical Standards; Executive Leadership and Management.

In discussing the problems which a professional executive must recognize, analyze, and resolve in operating a successful business, the author establishes as essential the necessities of earning a profit, rendering an economic service, and discharging public responsibility. Attention there is given to: business policy; business functions and functionalization; responsibility, authority, decentralization, and accountability; the line organization; staff organization; the attributes of good organization; organizational morale and the integration of interests; operations and the basis of control; preliminary and concurrent control of operations; and business procedure.

In the final chapter on summary and conclusions concerning management, the author recapitulates his philosophy of management. The lazy reader, however, cannot substitute this summary for painstakingly reading the preceding chapters. The book will be widely accepted as a reference book for executives, educators, and students. It may be used as either a reference manual or textbook for advanced management study.

Within the past quarter of a century, there has developed a literature in the field of management and management thought. Collectively this literature has contained the material presented in *The Fundamentals of Top Management*. Professor Davis in this book, his third major contribution, has given to the management field the best and most comprehensive treatment of management philosophy and fundamentals to date.

JOHN F. MEE
University of Indiana

STERN, SIEGFRIED. *The United States in International Banking*. Pp. xiii, 447. New York: Columbia University Press, 1951. $5.25.

The author has performed a distinct service in writing this book. Only a few people will find it of practical use inasmuch as foreign banking is highly concentrated in only a few large institutions; but it contains information which will be found helpful by many others working in the general area of money and banking. Little attempt has been made to analyze monetary theories or to discuss broad economic developments; this is a "factual compendium of notes and sketches on certain interesting phases of American international banking."

The material is based on the author's experience over more than thirty years as head of the foreign departments of various New York banks. It is divided into five parts: a fairly brief historical survey of the development of international banking from 1914 to 1945; a discussion of wartime problems, government corporations, and the role of silver; a detailed account of international banking in different foreign countries; a description of the organization of foreign departments of banks; and a short section on the outlook for international banking after World War II.

This organization occasionally leads to repetition, since material covered in the historical review or in the analysis of specific problems is apt to crop up later in the discussion of individual countries.

This description by countries takes up more than half the volume and is packed with facts—so much so as to make for tedious reading. While it is a good thing, perhaps, to have these facts recorded, the reader will find himself wishing the author had been more discriminating. For example, it is interesting to learn that in Chinese branches of United States banks a native comprador is given such great responsibility that he actually becomes a sort of banker within the bank. On the other hand, the following passage, while suffering from being taken out of context, may nevertheless give an idea of the degree of detail covered:

"Import credits were opened by United States banks to pay for various Mexican crops, such as hennequen, which was grown in Yucatan. Earlier experiences with the financing of sisal hemp back in 1921 had been deeply disappointing for the New York banks involved, but with the Defense Supply Corporation as the buyer the establishment of credits for hennequen and chick peas were transactions devoid of any risk. The hennequen was sold for distribution to United States consumers and fabricators; the peas were payable after inspection on their arrival in freight cars at the American side of the border. Like the Mexican sugar union, the Henequeneros de Yucatan concentrated the sale of their produce in their own hands, using acceptance credits of American banks, secured by the receipts of warehouses in Merida and Progreso in the state of Yucatan."

This is a book for reference, not casual reading.

SAGE, GEORGE H. *Basing-Point Pricing Systems Under the Federal Antitrust Laws*. Pp. xvii, 381. St. Louis, Mo.: Thomas Law Book Company, 1951. $10.00.

This is an objective, interesting, and useful analysis of basing-point pricing. Its emphasis is legal, and the volume will be of value to practicing attorneys, business managers, and especially to users of industrial products who find themselves disadvantaged and injured by pricing systems.

The study presents fresh, concrete material on the many industries which have used, or are now using, various forms of pricing formulas. Purchasers of a wide range of industrial products are shown to be affected by such systems. Even ultimate consumers have been, or now are, affected in the purchase of such products as corn syrups, corn oils, refined sugar, beer, salt, tire chains, kitchen utensils, galvanized ware, water-mixed paints, crepe paper, paper drinking cups, and cornstarch.

Mr. Sage finds the main explanation for the adoption and use of basing-point systems in the profit-maximizing activities of geographically separate enterprises. A locally separate concern could quote a relatively low mill price and exclude distant rivals from its own "natural-freight rate territory." In competing on price, the locally separate mill could also reduce its mill price to expand its sales area. A distant rival may likewise compete on price to expand its sales area. Thus, Mr. Sage observes, the several geographically separate mills find a common interest in avoiding this marginal price competition by adopting a pricing formula.

From the standpoint of industrial users and final consumers, Mr. Sage states that basing-point pricing means "noncompetitive prices," "arbitrarily high prices," and "identical prices." It deprives purchasers of any choice between sellers on the basis of price. In establishing high local prices, a mill also discriminates against purchasers in its own "pricing territory."

Following each analysis of the various kinds of basing-point pricing, Mr. Sage gives a summary statement of the legal status of the particular pricing formula. Federal legislation which may be applied to basing-point practices consists of: (1) the Sherman Act, (2) the Federal Trade Commission Act, (3) the Wilson Tariff Act, and (4) the Robinson-Patman Act.

In reading Mr. Sage's analysis one is impressed with the clarity and certainty of the law *against* basing-point pricing. Basing-point practitioners urging that new legislation be enacted *to clarify* the law should read this book. The fact is that basing-point industries do not like the existing law and its interpretation. They want it changed so that they can continue their monopolistic ways.

Mr. Sage presents no special remedy for the basing-point practice, except the implied one of an enforcement of the law. Section 4 of the Clayton Act provides that any person injured in his business or property by a violation of the federal antitrust laws may sue for treble damages. Since winning its land-mark decisions against basing-point pricing (1945–1948), the Federal Trade Commission has done little more than to call upon other industries to comply. Perhaps persons injured by basing-point pricing can make a contribution to law enforcement by bringing actions for treble damages. The immediate problem of enforcement, however, waits upon action by Congress. If proposed legislation to amend the Robinson-Patman Act is adopted, it is probable that industrial users and consumers will be largely helpless

against the stone wall of identical delivered prices. VERNON A. MUND

SOCIOLOGY AND EDUCATION

PARSONS, TALCOTT, and EDWARD A. SHILS (Eds.). *Toward a General Theory of Action.* Pp. xi, 506. Cambridge, Mass.: Harvard University Press, 1951. $7.50.

Despite the authors' masterly analytical skills and despite their heroic pertinacity, this collaborative treatise by sociologists and psychologists, entering boldly upon a terrain where philosophers have made some magnificent but forgotten explorations, has deeply stirred but not persuaded this reader. Students of Freud, Durkheim, and Weber in general behavior psychology will easily verify the editors' modest assertion that any originality in their theory must be found solely in their formal conceptualization of certain presumed "outcomes" of "twentieth century" social science. In any appreciation of the proposed theory given this presumption, everything must depend upon the characteristics of the formalization and upon the fruitfulness of this formalization for inquiry.

A steady stream of overly-general and too unqualifiedly logical-positivist comment on the relation of theory to experience does indeed run through the volume. None of the comments, however, evinces any awareness of the differences which Windleband, Rickert, and Weber carefully pointed out between their type of "model" and that of the mathematical-natural sciences, or, for that matter, of the lacunae in logical-positivist theory concerning the ideal basis of decisions connecting logical calculi with nature and society. Not one step is taken in the entire volume toward the design of confirming experiments or answering inquiries concerning the general theory of Parsons and Shils, with the exception of Stouffer's paper, a paper of marked intrinsic statistical interest but quite obviously separable in technique from the general theory of Parsons and Shils.

There are, nevertheless, excellent things in the papers surrounding, if not exemplifying, the basic theory. Murray's paper is sweetened with classic humanistic wisdom: a breath of Emerson in a sociological desert. Kluckhohn dissects Lundberg neatly, and opens a definite, if somewhat hesitant, attack upon the excesses of cultural relativism. Tolman carefully and honestly maps the terra incognita between animal and human psychology. Allport shows a sensitivity to the dimensions of prejudice not often found in the optimistic literature. Much more could be added in acknowledgment of the merit of the papers surrounding the basic theory, if space allowed.

Waiving all questions of applicability and illustration, we now ask, is there anything dubious or incomplete at the logical heart of the basic theory as such? The root-idea of Parsons and Shils is the thesis that there are precisely five inevitable dilemmas or five kinds of selective choice in all action (pp. 80 ff.). Every selective choice, it is maintained, is necessarily involved in "costs," for costs must be assessed whenever any possible goals, gratifications, or objects are excluded from a selective choice as "physically" or "logically" incompatible with those that are actually chosen. Only praise can be offered to the editors for the brilliant virtuosity with which they trace the impact of their five dilemmas through the dimensions and types of personality, society, and culture. The sobriety and integrity of Parsons' and Shils's exposition of the inevitable costs under any circumstances of maintaining the mutually irreducible systems of personality, society, and culture in required interaction will serve well in counteracting the naïve optimism of "social engineers," utopian Marxists, anthropologizing romantics, and others. But it is all rather grim, too grim to be a pure logical deduction. The editor's assertion that their dilemmas are by *definition* (p. 91) exhaustive and inevitable is simply powerless to legislate for the facts. This reviewer believes, on the contrary, that every achievement of mature culture could be shown to be a transcendence of their dilemmas; for example, "asceticism" can invigorate "immediate satisfaction"; granting universal rights can increase the supply of friends; equity can be incorporated into law; what people could do is by reasonable love known to be part of their character, and so forth.

So far as this reader can discern, the authors' confidence concerning the messy costs of all possible action is really sustained, not by logic, but by three enormous presumptions concerning matters of fact and experiment. Briefly stated these presumptions appear to be the following: (1) contradictions cannot be removed in time and duration by a respecification and reconstruction of what they "inhere" in (a good antidote to this presumption can be found in Bradley's essay on contradiction and contrary in his "Essays on Truth and Reality"); (2) the scientific control of materials and events cannot diminish "scarcity" to that range within which human choice would no longer be essentially economic; and (3) maximized moral value is some basically additive summed aggregate of primitive need-dispositions. These are not analytical truths, but positivist and psychoanalytical superstitions wedded to a derivative Kantianism which has lost contact with experimental science.

We should, if this were the occasion, propose to the authors of the present theory of action an alternative leading idea in proper postulational form that conflict between "alternatives" can be diminished without limit. The postulates of such a view might enable one really to find a difference between spurious and genuine culture. Such at least, we believe, was the impression of Leibniz as he surveyed the pluralities of action systems; it is not likely that the authors or any critics of this essay could rival him either in analytical or combinatorial power or in serenity. Man and his works are, it is a comforting thought, perhaps better than we pretend.

Pennsylvania State College

FESTINGER, LEON, and HAROLD H. KELLEY. *Changing Attitudes Through Social Contract: An Experimental Study of a Housing Project.* Pp. 83. Ann Arbor: Research Center for Group Dynamics, University of Michigan, 1951. $1.50.

While the Center for Group Dynamics was still at M.I.T., this research was undertaken to contribute to our knowledge of attitudinal change. The subjects of the project were a sample of the adult inhabitants of a hundred-dwelling federal housing project, erected in 1942 to provide houses for shipyard workers adjoining "Baytown," which had a population of 30,000 and was one of the oldest towns in the country. The study was made in 1947, when only 40 per cent of the original project dwellers were still in residence and when only 12 per cent of the project members still were employed in the shipyards. The inhabitants saw their neighbors not only as low-status people but also thought the townspeople looked down on their project neighbors as inferior. The resulting hostility expressed itself not only in poor project-community morale, but also in poor intergroup relations between the project and the surrounding town. To change this situation of hostility, the study was projected. "The persistence of these attitudes in the face of evidence to the contrary seemed to be explained by the scarcity of social contacts occurring within the project and between the project and the surrounding community." To test the hypothesis implicit in this observation a research team, consisting not only of researchers, but also of community workers, came to Baytown and for a period of nine months carried on the action research described in the report.

After making an initial survey of the status-related attitudes of a sampling of project and town inhabitants, the action wing of the research team went to work and helped organize several community programs in the housing project: a nursery school, a program for school-age children (9 to 12), a teen-age project, some adult group activities (men's softball teams and adult evening craft sessions), and finally during the last period of the research program an advisory committee for community problems.

The research findings were based on data collected during the action program, from records kept by the community workers which described the day to day developments of the program and data on contacts, friendships, and attitudes observed by these workers, and from four surveys

which marked the more formal program of evaluation to determine the kind and amount of change occurring during the development of the program. These surveys were taken at intervals of two or three months and covered not only the people in the project but also a random sample of town residents.

Interpreting their findings, the authors offer for further consideration the following communication theory of attitudinal change:

1. "Contacts are effective in producing attitude change only if they entail the transmission of social attitudes, i.e., evaluative statements by other persons about the objects of the attitude." These "evaluative statements" need not be verbal, but may be evidenced in other modes of behavior.

2. "The effectiveness of a communicated attitude in producing change is a function of various aspects of the relationships between the communicator and recipient, e.g., their interpersonal attractions, power relationships, etc." That is to say, if people engage in a project of common concern and in the course of their contacts carry on communication about attitudes and opinions on which they differ, the conditions for attitude change are present.

3. "Contacts will not be effective in producing attitude change if they merely contain information about the objects of the attitude."

MARTIN P. CHWOROWSKY
University of Pennsylvania

SOROKIN, PITIRIM A. *S.O.S. The Meaning of Our Crisis.* Pp. xi, 177. Boston: The Beacon Press, 1951. $2.50.

This is one more book in the succession of publications in which Sorokin endeavors to popularize the findings of his "Social and Cultural Dynamics." Here he deals with three phases of the crisis of the last decade: the "murderous trend" it exhibits, and polarization and totalitarianism which accompany this trend.

Evidence of the "murderous trend" is presented in the first three chapters. According to Sorokin, "the Great Destroyer" is at large and He is incarnated in the ruling groups and in their scientific and legal advisers, for these groups have "the highest rate of the most brutal, greedy, selfish, sensual and cynical individuals" (p. 13). In presenting the case against these individuals Sorokin adopts a novel style. He makes a devastating indictment of *everything that* is being done today in *all* fields of endeavor, from politics to science and art, in the form of a supplication from "the Little Mortals to the Big Immortals." It contains the fanciest appellations ever to appear on a printed page. Social scientists will be interested to know that they are, among other things, "Learned Weavers of Words into Meaningless Carpets," "Testophrenics," and "Psychosocial Technomaniacs," and that they study the basic problems of the social and humanistic sciences "with the marvelous techniques of anti-mathematical statistics, anti-logical semantics, anti-observational psychoanalysis, anti-rational operationalism, and by the techniques of the thoughtlessly nondirective interviewing, of the open-and-closed interrogation, of the guided-in-unguided questionnaires of the clinical psychologists, sociologists and anthropologists" (p. 45). In sum, ye "Scholarly Vibrators of Air Waves and Processers of Paper" serve the Great Destroyer "as the ideological parasites of the bloodsucking parasites of humanity" by "confusing our minds and consciences" (p. 49). However, the presently rampant Rule of Perversity is not going to last. Eventually the "re-enthronement of the soul" will shatter the hypnotic power of our present lords and their scientific experts.

The vituperative effusions and exaggerations are not carried into the other chapters of the book. In these Sorokin, with relative calm and in his familiar eclectic manner, discusses polarization and totalitarianism. He sets forth two "laws." The first is "that a crisis, calamity, or frustration tends to make explicit and open the implicit and hidden contradictions, whether in one's mind and conduct, or in a social group and institution, or in a given culture" (p. 100). This he calls the law of polarization. To contradict the effect of this law a reintegration of our culture "along integralist lines" should be instituted.

The second law asserts that "as soon as any important emergency or calamity occurs in a given society, the control and regimentation of its government begins to expand and grow; as soon as the emergency subsides, the government control declines" (p. 144). After a somewhat sketchy inductive verification of this proposition, Sorokin draws the general conclusion that "the medicine against Communism and totalitarianism is neither war, nor rearmament, nor threats, nor propaganda of hate, but peace, and lack of emergency" (p. 169).

The least that can be said by way of criticism of this book is that it shares the fundamental weakness of most other books that deal with the present crisis. It stresses what *should* be, but fails to indicate *how* this can be accomplished.

THEODORE ABEL
Hunter College

HEBERLE, RUDOLF. *Social Movements: An Introduction to Political Sociology.* Pp. xiii, 478. New York: Appleton-Century-Crofts, 1951. $4.00.

Political sociology, the subject of this book, is, it appears, the study of how men act to accomplish political or social ends whether those ends are reconcilable with prevailing community values or not. As it happens, in the disturbed world we inhabit, as much of the material presented and analyzed in this book deals with movements whose ends are realizable only outside the established community—with fascism and communism—as with "normal" political affairs.

Professor Heberle's techniques of analysis represent chiefly a synthesis of pre-Hitler German and American approaches, with side glances at French and British ideas. As he employs them, they produce results which are, generally speaking, illuminating; and they are so clearly explained that they can readily be taken over and applied by others. In this sense the volume is a most successful textbook.

There is, of course, no requirement on textbooks that they be novel in the ideas they convey. This reviewer is far from being a specialist in political sociology, or politics, or sociology. Nevertheless he was forcibly struck that most of the ideas and interpretations offered by Professor Heberle have somehow gained a wide circulation. They seem to have reached numerous persons who, for one reason or another, have had to concern themselves with the whys and hows of politics today. This, then, is not a book to search for unusual insights but rather should be viewed as a valuable epitome of current thought, systematically organized for pedagogical purposes.

However the field is sliced, American politics still comes out *sui generis*. On Professor Heberle's showing we can contract most of the political and social diseases going at any time and yet somehow throw them off before they do irreparable damage. Other nations are not so fortunate. Is this attributable to the formal organization of American politics, which is loose and often pleasantly illogical, or is it attributable to the fact that, all pessimism to the contrary, we possess one of the most soundly viable societies in the world today, so that our community values still outweigh any alternatives thus far propagated? Or are both factors operative? And which is the more important? An essay by Professor Heberle along these lines would make very interesting reading.

C. HARTLEY GRATTAN
Katonah, New York

HANDLIN, OSCAR. *The Uprooted: The Epic Story of the Great Migrations That Made the American People.* Pp. 310. Boston: Little, Brown and Company, 1951. $4.00.

Since all Americans are immigrants or the descendants of immigrants, it is not strange that the vast influx of new peoples into the United States in the nineteenth century has been the focus of much attention. Marcus Hansen and Carl Wittke have enriched our understanding of the role of immigration in American life and culture. The present book, different in content as well as in style, seems worthy of rank beside the works of those two scholars.

Others have written of "the impact of

the immigrant upon the society which received him, of the effect upon political, social and economic institutions" of the more than thirty millions of newcomers in the century after 1820. Dr. Handlin, taking an opposite point of view, is concerned with what immigration did to the immigrants and with the extent to which "their reactions . . . may throw light on the problems of all those whom the modern world somehow uproots."

In his opening chapter, Professor Handlin goes back to the European roots of the great migrations—to the European village with its age-old customs and security, to the peasant family, a tightly-knit social, economic, and cultural unit. In dramatic, moving prose he discusses the changes and problems that beset the peasant villagers. Finally, after the land enclosures, they began to seek, in ever increasing numbers, the New World of Promise.

Seldom in our historical literature have we been offered such detailed, realistic pictures of what it meant to come to the New World. The crossing itself, the struggle to make a living in the New World, the problems of housing, social fellowship, religion, adjustment to democracy—a chapter is devoted to each of these. The social and political pressures, the friction and misunderstanding between generations, the awful realization that the adjustment was too great—this reviewer knows of no book that captures these moods and situations with such sympathy and understanding. In an epilogue titled "Promise," an imaginary and unspoken conversation between an immigrant father and his son, the author probes for the spiritual and moral meanings of the great epic movement.

This is not, in either style or format, conventional or scholarly history. There is no bibliography, index, or footnotes; quotations are paraphrased. The style is not pedantic or heavy. The author is imaginative, sensitive, understanding. A tremendous amount of research and real depth of understanding lies behind the book. Laymen will enjoy this book; specialists will find it provocative and will admire the style and synthesis. This is literary history in the tradition of Parkman, Prescott, and Motley. It should be widely read.

RALPH ADAMS BROWN
State University of New York
at Cortland

BUELL, BRADLEY, and associates. *Community Planning for Human Services.* Pp. xiv, 464. New York: Columbia University Press, 1952. $5.50.

This book resulted from a joint undertaking by Community Research Associates, consultants from the principal fields covered, and many others who contributed particular knowledge. The purpose, as explained in the preface, was to create the framework of a coherent program of community well-being.

Much of it is based upon the St. Paul, Minnesota, project which revealed clear and precise data on a family-to-family basis as well as a community-wide picture of the incidence and interrelationships of basic human problems. This study showed that serious problems of dependency, ill health, and maladjustment tend to cluster in the same family groups, with 6 per cent of the community's families receiving over 50 per cent of the health and welfare services in the city.

The framework of the book consists of separate sections, the four human problems of dependency, ill health, maladjustment, and recreational needs. In each, the problems, service functions, and systems are discussed. Not surprisingly these are uneven in treatment. In spite of the provocative nature of the book as a whole, there are certain inaccuracies, conclusions that seem unwarranted by the findings, and points of view that may be questioned.

In the section on dependency, the statements regarding social insurance are misleading. Much is said about conflicting objectives and the cost of insurance. No clear picture is presented of social insurance as a protection against the common hazards of life such as old age, death of the bread winner, unemployment, sickness, and disability, nor of insurance as a way of preventing dependency.

The section on ill health seems to reflect the thinking of the American Medical Association with no recognition of the views of the Physicians Forum. Fear is expressed that health insurance would give the consumer an official voice in respect to problems governing the practice of medicine! The conclusion is reached (p. 234) that we must choose between "community-wide organization of a purposeful program to prevent, control and reduce disease" and "the expansion of medical services to assure their distribution to individuals who have hitherto been unable to avail themselves of these services." Why?

In the section on "Maladjustment," the term is used to cover a composite of behavior disorders and socially unacceptable conduct. The discussion on community acceptance of responsibility, particularly pages 246–251, seems to be unusually good. The lack of federal leadership in the maladjustment agencies for corrections, mental health, and case work may be significant. Comparison may well be made with the areas previously discussed where major gains have been made in the reduction of need and in lower death rates.

The "Recreation" section points up the need to develop criteria "by which to judge quality of performance in the recreational field or to allocate labor and responsibility among the community agencies." The need for more facts and for a survey of the current use of recreational agencies is restressed. Good suggestions for further research and planning are included. There seems to be some lack of information about the current developments of social group work and the functions of the social group worker.

The authors conclude that a new functional design for the total community would help to prevent and reduce the consequences of these many interrelated problems. The team approach by the different professional groups is required for this.

The book is interesting, stimulating, and thought-provoking largely because it approaches these complex problems of human trouble from the perspective of the local community. The final chapter in the book on the significance of the findings for community-wide planning is an excellent statement.

MARIETTA STEVENSON
University of Illinois

SMITH, T. LYNN, and C. A. MCMAHAN. *The Sociology of Urban Life.* A textbook with readings. Pp. xiii, 831. New York: The Dryden Press, 1951. $5.50.

Systematic treatises on urban sociology like those written during the twenties and thirties seem to be in process of disappearing in favor of collections of papers on special topics, for which the semidemographic term, "urban sociology," may serve as an organizing principle. This shift in emphasis may reflect the shift from an older macrocosmic to a newer microcosmic sociology of interpersonal relations.

The authors of this volume have prepared a pedagogically sound textbook, inasmuch as the divisions into eight parts and 25 chapters are preceded by brief and often perceptive introductions serving to orient beginning students not only to urban sociology but to sociology in general to the extent the readings which have been selected permit this to be done. Selected problems and projects and lists of suggested and of supplementary readings follow each chapter. Many will feel that a content and an organization of this kind are preferable to the treatises by a single author and specialist in his particular field of sociology.

The book must be critized on at least two counts. There are some 68 readings or essays in the volume. Of these 32 could be identified as having been published before 1940. These include 5 selections from *Our Cities,* issued in 1937 by the now defunct National Resources Committee. Included also are 5 selections from the pre-1930 works of Sorokin and Zimmerman. The sociologists Burgess, MacKenzie, Park, Albion, Small, Cooley, Mowrer, and Ogburn are represented by one paper each (two for R. E. Park), and none of these essays are dated later than 1933. Of the total of 68 readings it is possible to identify at least 27 written by nonsociologists or prepared by government agencies. Eleven of the readings were either prepared especially for this volume or were taken from previously unpublished manuscripts. These 11 were written by four authors, all teaching in southern land-grant colleges, of whom at least two have earned distinguished records as rural soci-

ologists. Indeed, at least 4 of these readings in urban sociology are condensed versions of bulletins of Agricultural Experiment Stations, and as such may not provide meaningful insights into the nature of modern American urban culture. Finally, at least 10 of the readings reprinted in this book are excerpts from five readily available sociology textbooks, all published in new or revised editions since 1947.

A more serious objection to *The Sociology of Urban Life* is the exceptionally strong emphasis upon an older formalistic sociology in which institutions and demographic aggregates are the chief objects of study, rather than the social dynamics of interpersonal relationishps. Largely missing are references to the anthropologists' studies of the urban culture of contemporary America, to the structure and function of ethnic groups, and to collective behavior and its phenomena. The readings on ecology do not adequately represent either the past or the current research in this field. Social structure becomes social morphology; the scientific method is the traditionalist "science" of mechanistic positivism, and the social processes are the orthodox assimilation, accommodation, acculturation, conflict, co-operation, competition. Of social process, forerunner of interactionist and situational sociology, the authors say (p. 587): "Social processes are much more difficult to analyze than the morphological and institutional aspects of society. For this reason, no doubt, this part of sociology is not very highly developed." It certainly is not very highly developed in this book.

MYRON F. LEWIS

Washington, D. C.

DUBLIN, LOUIS I., in collaboration with MORTIMER SPIEGELMAN. *The Facts of Life—From Birth to Death*. Pp. x, 461. New York: The Macmillan Company, 1951. $4.95.

In his preface, Dr. Dublin writes that this book has been suggested by a great number of inquiries from all sorts of people, which inquiries have poured into the Metropolitan Life Insurance Company as a result of the company's wide circulation of pamphlets and of the *Statistical Bulletin*. In spite of this explanation, one wonders what the purpose of the book really is. It is not an encyclopedia in the usual sense. It is a set of twenty-five chapters beginning with "Who We Are—The Population" and ending with "The Effects of War." The chapters consist exclusively of questions and answers, totaling about 1,100, with some cross-referenced duplications. The questions range in number per chapter from 38 ("The Conquest of Tuberculosis," VIII, and "Suicide and Homicide," XVII) to 56 ("The Accident Toll," XVI).

Without question, the book is informative, but in an irritating way. The book is written almost completely in a dogmatic style as one would write for children. For example, on page 243: "Are more males than females killed in accidents? . . . The adventuresome male has more than twice the chances of the female of being killed by accident . . ." is followed by a discussion of data for 1946 and a sex-ratio chart. Where was this information obtained? Presumably the reader should be satisfied that Dr. Dublin has put down the right figures, that he knew that the use of 1946 data could be taken as typical with respect to relative frequency among types of accidents and distribution by sex within types of accidents. If one wanted to look further, he could turn to the bibliography on Chapter XVI on p. 431, but he would find there no reference to Vital Statistics in the United States, which this reviewer assumes to be the source of the data. Only the informed could find that reference on page 426 under "General Reports." Most people would not be able to track these things down, and they would therefore have to cite Dr. Dublin as the original source. Worse still, in many instances, the answers come from "one survey," and the only way to find out what that was would be to send further inquiries to Dr. Dublin.

There is an extensive index, and the questions are well set off. It would take a battery of experts to determine whether the answers represent the best current knowledge. In those few fields where this reviewer has had some experience, no major exceptions could be taken, and most of the important points were covered. It is almost impossible to criticize omissions because one does not know how to begin. It may be unfair, for example, to suggest something on the recent important work on ovulation time in a book that claims to start its facts from birth. I would like to have seen some reference to the extensive current data being collected by the Health Insurance Plan of Greater New York; and the use of Selective Service data seemed skimpy. These, however, are random thoughts. The main point is that an alternative procedure of issuing something more like an annotated *World Almanac*, where one does find sources cited, would be much more useful to people with real intellectual curiosity in this general field.

E. DOUGLASS BURDICK

The University of Pennsylvania

ERNST, MORRIS L., and DAVID LOTH. *For Better or Worse: A New Approach to Marriage and Divorce*. Pp. 245. New York: Harper & Brothers, 1951. $3.00.

"In the last ten years eight million Americans have walked out of court with a divorce decree, to face . . . what?" is the opening sentence of this popular book for the man on the street and his unhappy wife or ex-wife. The authors proceed to outline the various problems that divorced people face in a series of chapters entitled: Loneliness; Frustration; Sex; Money; Children; Jealousy.

Much of the content of the book is in the form of verbatim excerpts taken apparently from personal responses to questions sent by the authors to men and women divorced at some time previously. There is no statement of the number of respondents, or the length of time since their divorces. As the authors put it, ". . . the men and women who collaborated with us do not constitute a survey. This is not a poll. There is a wide variety of representation, geographical, economic, occupational, age and so on. But these cases are not a sample that can be said to give an accurate or complete cross section of our divorced population. They are simply people who have been divorced" (p. 21).

The treatment of other's work in the field is quite as casual, "Aside from a few magazine articles, a few sociological studies, a novel or two, there is no literature to tell them what the world of divorce has in store for them" (p. 1). Although the subtitle announces this as "A New Approach to Marriage and Divorce," there is no reference to the relevant work of the Interprofessional Commission on Marriage and Divorce Laws; the American Bar Association; the report and recommendations of the Legal Section of the National Conference on Family Life; Divorcees Anonymous; the American Association of Marriage Counselors; the National Committee on Marriage Counseling and the National Committee on Marriage and Family Law, both of the National Council on Family Relations; the marriage counseling that is an inherent part of such courts as those of Judge Alexander of Toledo or of Judge Anna Kross of New York; nor is there mention of the recent studies of William Goode (popularly presented in a series of articles in *The Saturday Evening Post*), or Harvey Locke's *Predicting Adjustment in Marriage: A Comparison of a Divorced and a Happily Married Group* (Henry Holt, 1951).

Chapter X, "Remedies," recommends five points for state concern in the childless divorce:

"1. That the action is not hasty or hysterical.

"2. That the couple have had help in trying to make their marriage work.

"3. That the marriage has every chance to heal itself while divorce is under consideration.

"4. That the wife has not accepted a monetary settlement under duress or through ignorance of her rights, especially if she is untrained for self-support.

"5. That the wife is not pregnant" (pp. 216–217).

For the couple with children, the authors recommend a period of delay and study under the guidance of a competent counselor to protect fully the interests of the children as well as to safeguard the values of the family.

As is usual with books of this kind, there is no index, no list of parallel readings, no documentation, and no listing of sources

of further help. Within these limits, the book is a contribution to the field and to the men and women for whom it is intended.

EVELYN MILLIS DUVALL
Chicago, Illinois

LUZBETAK, LOUIS J. *Marriage and the Family in Caucasia: A Contribution to the Study of North Caucasian Ethnology and Customary Law.* Vol. 3 in "Studia Instituti Anthropos." Pp. xvi, 272. Vienna-Mödling: St. Gabriel's Mission Press, 1951. No price.

This is an ethnographic study based largely on written sources, most of it from rare periodicals and adat collections, and belongs to the so-called Jesuit school of diffusion associated with the name of Wilhelm Schmidt of the Universities of Fribourg and Vienna. The author does not use Soviet sources and is critical of czarist studies but finds them nevertheless often the best available. A bibliography of 635 pre-Soviet items in Czech, Arabic, Russian, Caucasian, and other inaccessible languages, as well as in English, is appended in addition to an ethnographic and linguistic map of the Caucasus.

The emphasis is juridical, the aim being "to trace the history of North Caucasian marriage and family law from the present to prehistorical times." Russian (Soviet and pre-Soviet), Islamic, Christian, Avesta, Armenian, Byzantine, and Roman unifying influences are illustrated concretely and located geographically, and then, figuratively speaking, peeled off. The residual core of marriage and family customary law is taken to constitute "a more or less pure adat-law." Despite the fact that there are no pastoral nomads in the Caucasus the type of marriage and family embodied in the adat law as revealed under the layers of later influence is typically pastoral nomadic, although in varying degrees among the different tribes. The author explains this pastoral nomadic character of the adat law in terms of prehistoric finds which show that this area was the home of a highly developed pastoral nomadic civilization and that it continued to feel the impact of other cultures of this type. "This constant contact with nomadic societies perhaps from the very beginning of pastoral nomadism—certainly since the Scythian period almost 3,000 years ago—throws light upon the intricate problem: Why, how and when did the North Caucasian marriage and family customary laws become so pastoral nomadic?" (196). The author concludes that "a connection between the North Caucasian society and that of Inner Asia is beyond question" (199). Future research will have to determine the nature of marriage and family law before the impact of pastoral nomadism.

This is doubtless an excellent study of the old-fashioned type; it is interesting, but it does not, as more modern studies do, attempt to get at the meaning of social forms to the people who practice them. A good many recent American studies go to the opposite extreme. Is there not a happy medium?

JESSIE BERNARD
The Pennsylvania State College

DONAHUE, WILMA, and CLARK TIBBITTS (Eds.). *Growing in the Older Years.* With a foreword by Everett J. Soop. Pp. 204. Ann Arbor: University of Michigan Press, 1951. $2.50.

Growing in the Older Years is the last of a trilogy about the problems of our aging population. Like its predecessors, *Living Through the Older Years* and *Planning the Older Years,* it is a collection of intelligent and thought-provoking essays providing up-to-date information for the practitioner and student of gerontology as well as for those concerned with their own aging processes. This book is planned around three subjects: (1) medical health; (2) mental hygiene; and (3) education. It is pleasant to find that all the contributors have the knack of talking intelligibly and interestingly about their special topics.

The four doctors (J. W. Mountin, W. B. Kountz, N. D. Leyda, and M. M. Dacso) who discuss problems of medical services do a comprehensive job in limited space. They consider the kind of community health organization needed to make the best use of existing knowledge; methods of controlling degenerative diseases; the role of the industrial physician; and the techniques of physical restoration. They display a hopeful and constructive approach to the prevention of physical disability in old age and to the restoration of those already disabled.

A similar positive note is struck in the three chapters on mental health. Robert Felix classifies the processes of aging as physical, mental, social, and economic, then proceeds to analyze the supportive factors in personal and community life that contribute to the maintenance of mental health in old age. Moses Frohlich provocatively concerns himself with the changes in emotional needs with aging, specifically with changes in the need for power, changes in the body concept, in aggressive behavior, in social needs, and in erotic strivings. Jack Weinberg discusses recent trends in psychiatric treatment for older people, again emphasizing the new appreciation of the possibilities of psychological rehabilitation.

In all seven chapters we see again and again the recognition of the interrelationship between environmental and personal factors as we age.

The section on education (by Thomas Van Sant, Everett Soop, Ollie Randall, and Roger Heyns) highlights four important topics. Van Sant points to the need for education of the total community about aging and underscores areas of ignorance as well as indicating desirable development of goals and programming. Soop elaborates this theme in reviewing current and proposed educational efforts. In a slightly different vein, Ollie Randall contributes a well-rounded essay on the training of volunteers for older people's programs, and Heyns supplies a basic discussion of the use of groups.

Two more general papers that begin and end this book are written by Clark Tibbitts and Wilma Donahue, the two people who were primarily responsible for all three volumes. They are to be congratulated upon the substantial educational task so successfully undertaken in this trilogy.

ELIZABETH BRECKINRIDGE
Illinois Department of Public Welfare
Chicago, Illinois

REDL, FRITZ, and DAVID WINEMAN. *Children Who Hate: The Disorganization and Breakdown of Behavior Controls.* Pp. 253. Glencoe, Ill.: The Free Press, 1951. $3.50.

A bold attempt was made by the authors to experiment with a number of children who exhibited the most serious characteristics of aggressiveness and misbehavior, and to learn what actually produced delinquents. The investigation was distinctly a research project, but the writers preferred the use of the word "exploration."

The appeal of the book is largely to the professional worker or student and makes difficult reading for the ordinary layman. However, from the stratosphere of psychiatric terminology, it comes to earth with such words as "leery," "hog-wild," and extracts from case histories that accurately reveal the boys' delinquent egos but induce painful hysteria in the ostrich-minded book censor.

The project consisted of the establishment and operation over a period of nineteen months of a "group therapy home" known as "Pioneer House." Of the ten children admitted only five constituted the stable population that remained until the close of the study. In order that the control system of a child might be better understood, the factors involved in the causes of his psychological trauma were studied before each boy's admission.

The observation in the "Home" revealed more than twenty types of breakdown of control some of which are described under such terms as: "situational lure," "gadgetorial seduction," "newness panic," and "exposure to competitive challenges." The traditional descriptions of ego functions in terms of basic attitudes toward reality are recognized as inadequate.. Furthermore professional psychiatry provides no satisfactory remedy since the ego must be followed into the scene of daily behavior control. The authors recognize delinquency in terms of its legal and cultural connotation but contend that the clinical concept of delinquency has great relevancy. For example, it can well differentiate between the personality disturbances in the case of two boys who might have committed exactly the same type of offense.

In Chapter IV the numerous techniques of the delinquent ego are enumerated and described. The tyranny of the "group code" is very important and also of great interest to the sociologist. The purpose in presenting various defenses is to show how the aggressive ego tries to excuse itself both in respect to the world and to the individual conscience.

The writers note that the well-known defense mechanisms of current usage are inadequate, and therefore they present techniques that aim to deal with the aggressive ego so as to provide a gradual reduction of ego tensions as well as the elimination of various aspects of impulsivity.

The book closes with the statement that the "details of a total strategy for ego support will be offered by the authors in their forthcoming publication." This leaves the reader at the cross roads not knowing which way to go. Nevertheless the book will be most useful for professional workers with children, and the supplementary volume should be awaited with eager anticipation.

GEORGE B. MANGOLD
University of Southern California

PIERSON, DONALD, with the assistance of LÉVI CRUZ, MIRTES BRANDÃO LOPES, HELEN BATCHELOR PIERSON, CARLOS BORGES TEIXEIRA, and others. *Cruz das Almas: A Brazilian Village*. Pp. viii, 226, 20 plates. Washington: Smithsonian Institution (Institute of Social Anthropology Publication No. 12), 1951. $1.50.

Cruz das Almas, in the state of São Paulo, includes some 2,700 village dwellers and inhabitants of the surrounding area. This population is composed of relatively isolated, nonliterate (or only partially literate) descendants of assimilated Indians. Miscegenation, which began with the arrival of the Portuguese, continued until the indigenous peoples, as a distinct physical type, disappeared. Since amalgamation continued when Africans were brought in, there are few places in the world where the fusion of racial groups has been as continuous and on as extensive a scale. The society is characterized by a high degree of social solidarity, primary relations, and a minimum of social change and social disorganization. The culture is largely a folk culture; personalities are relatively well integrated.

Racial categories have no place in the vital statistics of the community; instead, the color categories of white, black, and intermediate are found. These sociological categories reflect what the local residents consider the terms to mean. A registrar lists a person as white if he looks more like a white than a black, but his reaction varies with degree of friendship and with his current mood. An expected pattern of behavior throughout the community is that of "grading-up." It is bad form not to refer to a black, especially in his presence, as if he were an intermediate and to an intermediate as if he were white. According to the village registrar, no black was born in the district in the period 1931–47, but the authors state that at least twenty-seven persons in this age group appear to be of relatively unmixed African origin. The authors are somewhat inconsistent in their appraisal of color as a prestige factor. On page 190 they state that "prestige definitely attaches to white color," but on page 200 they say that ". . . status is little, if at all, determined by race or color." In any event, in daily association little attention is given to either racial or color variations. Persons of color eat at the white's table, and there is no discrimination in voting, in employment, or at Sunday Masses. People of all colors drink together, play cards together, dance together, hunt together. There are a considerable number of intermarriages, although those involving the opposite ends of the color scale are less common, and there is a tendency to marry a person who is as light as possible.

The family type is patriarchal and the family groups are closely knit. Woman's place is very much in the home, and her inferior status is seen in the authority her husband exercises over her, her lack of participation in politics except to vote as instructed by her husband, and her limited mobility and recreations. Nevertheless, as in many peasant societies, a wife may exert effective control over her husband.

Catholic Masses and prayer services are well attended in Cruz das Almas, but the number who confess and receive Communion is relatively small. Vows to saints at times of personal crisis and pilgrimages to a shrine some distance away are parts of the Catholicism complex in this area. Although their followings are small, a number of recently formed Protestant sects have occasioned some conflict.

Interesting examples of sympathetic magic include subjecting the image of a saint to such indignities as hanging it by the neck in a well, holding it over a fire, or putting it into a mortar and smashing it.

The term "acculturation" does not appear in this volume. Of the five references to "vestiges" of African culture, two are brief and general, two pertain to language, and one concerns the possibility that the present attitude toward illegitimacy "reflects imported Portuguese *mores*, re-enforced by African and Indian cultural heritages, together with the circumstances of colonial settlement in Brazil." In addition to two general *references to* "vestiges" of Indian culture, the following specific items are touched upon: Indian words which have become a part of the country man's speech, the *restlessness* of landless individuals as a possible survival of earlier seminomadicism, the continued importance of the hunt despite the fact that today the basic means of subsistence in this country is agriculture, and the care given to keeping the *terreiro* (space around the house) cleared of vegetation. According to the authors, the assimilation of Indians and Africans has been so effective that "until today the most diligent and persistent research is able to turn up only a few vestiges of either group of cultures." The reviewer suggests that such beliefs as those concerning (a) the crossroads as an evil place (page 169) and (b) the ability of the souls of the dead to return and harm the living (page 168) may be African retentions. One wonders whether an Africanist would discover other Africanisms in Cruz das Almas.

This is a competently executed and interesting community study in which the emphasis is put on empirical data rather than on theoretical problems in sociology and cultural anthropology.

TERRIS, MILTON, and NATHAN A. KRAMER. *General Medical Care Programs in Local Health Departments: A Report to the Subcommittee on Medical Care, Committee on Administrative Practice, American Public Health Association*. Pp. vi, 129. New York: American Public Health Association, 1951. 50 cents.

Methods for the provision of medical care services are subjects for widespread discussion at the present time. The suggestion that many such services may be effectively administered at the local level in health departments has often been made. This suggestion, as with many other matters involving medical care, has both its advocates and opponents. In order to obtain information to determine its validity, a study of existing medical care programs now operating in health departments was undertaken by the staff of the Subcommittee on Medical Care of the American Public Health Association.

In this small volume the authors report and make some analysis of the findings of the study. Programs for medical care were found to be operating in 62 full-time health departments, 23 of which were in the State of Maryland. The scope of services varied greatly—from those in which the health officer also acted as county physician to complex programs aiming at integration of therapeutic and preventive medical services to individuals.

Details for the various plans studied are presented in both tabular and narrative form. The presentation provides to the reader a ready reference source on this type of administration of medical care. The authors conclude from their interpretation of the statistics that they support the contention that the administration of new medical care programs as they are developed can logically be entrusted to the health department.

Because 90 per cent of the plans de-

scribed in the report provide services for the dependent group of the population, some readers may question how much support the survey data give to such a generalized proposition. It is clear, however, that the report amply demonstrates the fact that it is possible to administer medical care programs in health departments and that such arrangements provide interesting opportunities for increased integration of therapeutic and preventive medical practices. The account of these relationships should be of interest to the administrator, student, and observer of health and medical care programs.

JAMES P. DIXON
Department of Public Health
Philadelphia, Pennsylvania

MOLONEY, JAMES CLARK. *The Battle for Mental Health*. Pp. x, 105. New York: Philosophical Library, 1952. $3.50.

Dr. Moloney is already well known in psychiatric circles for many articles in professional journals on the subject of infant training on the island of Okinawa and in this country and for his book "The Magic Cloak." In the present little book, he writes in a vivid and provocative style in favor of the principles of the Cornelian Corner. This is an organization of psychiatrists, psychologists, and social workers in Detroit dedicated to the better emotional care of infants. Its principles are quoted thus:

"To promote healthy parent-child relationships . . .

"1. Through research in the fields of child development and family life,

"2. Through the education of parents, especially expectant mothers and fathers, as to the basic needs of the developing child, and

"3. Through the wide promulgation to professional groups as well as parents of all pertinent information regarding the developing child and his environmental needs,

(a) To strongly advocate the abandonment of the artificial practice of separating the newborn child from his parents, and

(b) With the conviction that it is advantageous to both mother and child, . . . [to] encourage breast feeding of the infants with opportunity to nurse whenever the infant is hungry or anxious."

Few child psychiatrists and psychoanalysts would disagree with these aims and means, but some question might be raised about Dr. Moloney's way of advocating them. He implies that by these methods all mental disorders and criminality can be eliminated or markedly reduced. It seems to this reviewer he claims too much. A warmer and more relaxed relation between mothers and infants should make for much better adjusted children and help to reduce the frequency and severity of many of the problems of normal childhood and make behavior problems and neuroses less prevalent. To demonstrate that these simple measures would have much effect on more deeply-seated psychic and social difficulties would require the comparison between a group of children raised by these methods over a period of ten or twenty years and a group raised by more rigid methods.

An obstetrician who reads page 65 and finds himself characterized as having "misanthropic attitudes toward the newborn," as feeling "most liked and most financially secure if they fawn before the mother," and as being in "unconscious conspiracy" and "collusion," will probably never get beyond that page. Less tactless language would gain more readers and adherents.

The adoption of aims and methods which the Cornelian Corner advocates should also help to alleviate those rigidities in our culture which the author describes so well. The help of well-trained members of other professional disciplines is also needed, including sociologists and cultural anthropologists. Our personal and social abnormalities will succumb only to planned and co-ordinated attack from many directions.

ROBERT A. CLARK, M.D.
University of Pittsburgh

ULICH, ROBERT. *Crisis and Hope in American Education*. Pp. xiv, 235. Boston: The Beacon Press, 1951. $3.75.

The author of this volume presents a thoughtful and thought-provoking appraisal of the American educational system. He finds in it much to be approved and much that is in need of fundamental change. Where adversely critical he feels the moral obligation to propose, in rather concrete terms, the needed reconstructions.

The central educational problem in America—and indeed in all democracies—is "to find a principle of conciliation between the seemingly contradictory trends of equality and individuality." Stated in other terms, how does a democracy devise an educational structure and program that meets its ideals of *equality* and *quality?* An educational structure that avoids division and differentiation, that does not adequately recognize and provide for differences in human capacities, may achieve the ideal of equality but at the price of sacrificing the ideal of quality. "The tension and friction of these contrasts is the essential challenge in the educational situation of democracy."

A very large part of the book is devoted to showing how, in the author's opinion, American education has failed to meet this challenge and how the challenge may be met more effectively. The prolongation of school age with the kind of educational structure and program now provided is indefensible; worse than that it may be a curse unless there goes with it a "revolutionary rethinking of the total program and a restructuring of the total educational system from the secondary school upwards." It is with this "rethinking" and "restructuring" that the author concerns himself.

No brief review can do justice to the author's position. It may be pointed out, however, that in his proposed plan for the reorganization of secondary education he would make intellect the sphere of differentiation and the culture of the emotions the uniting core of the program. The secondary school plant would consist of a group of buildings. The Community House would be a place where all pupils would assemble for their common activities, where the cultivation of the emotions would take place through music, poetry, art, and drama. Here, too, would be housed the general library. Other buildings would take care of the needs of various groups of pupils classified on the basis of intellectual abilities and interests. The proposed classification includes the small number who have true intellectual interests, (1) the humanists and (2) the scientists; other classifications include (3) the executive group, (4) the artisans, and (5) the workers.

Higher education is in no less need of rethinking and restructuring. The necessary directives in the philosophy of higher education may be found in the impregnating with meaning for our time of the traditional ideals of the gentleman and the scholar. The challenge of scholarship is to profit from the work of the specialist but somehow to see universal meaning behind the details of life. The traditions of the gentleman ideal (*humanitas*) and of scholarship (*veritas*) complement each other like two sides of a trangle which has as its base devotion to a universal order (*religio*).

Many readers will challenge what appears to be the author's social philosophy and his theory of knowledge. Even so, this is a book that should be read.

NEWTON EDWARDS

University of Texas

WILSON, HOWARD E. *Universities and World Affairs*. Pp. 88. New York: The Carnegie Endowment for International Peace, 1951. $1.00.

What is the responsibility of the free university in world affairs? How well are American universities fulfilling their obligations in this area? How can colleges and universities more effectively discharge their responsibilities not alone through the programs of a department or two, or the individual efforts of a few faculty members, but more broadly through a general university approach? How can the university, as a university, make the contributions required of it to promote better understanding of international affairs? In an endeavor to supply general answers to these sweeping questions, an exploratory inquiry was undertaken by committees from eight American colleges and universities in cooperation with committees from the American Council on Education and the Car-

negie Endowment for International Peace. This small volume summarizes their findings.

The inquiry began with the formulation of a working paper embodying a systematic statement of ideas, assumptions, and questions regarding the universities and world affairs. This served as a basis for discussion by the survey groups and provided them a conceptual framework for the specific studies of individual college situations. Part I of this small volume presents the major points of the working paper in a concise form. Each college survey committee undertook to evaluate the hypotheses of the working paper by study of its own campus situation. In the process they not only arrived at an appraisal of the soundness of the working paper's assumptions, but brought forth additional ideas and problems as well. Part II of the book summarizes the experience of the eight university groups in their respective campus explorations.

The campus surveys provided both a validation of the tentative conclusions of the working paper and a demonstration of the value of such an inquiry to the universities. As a consequence the first recommendation of the general report is that each institution of higher learning take inventory of its programs, facilities, and plans in the area of world affairs. Part III of the book offers a systematic check list of items which should be covered in any such survey.

The author acted as a rapporteur for the undertaking and has produced a cogent and easy-reading book. Its clear and concise statement of the issues and problems should commend it to university administrators and to those teaching in the field. The book can well serve as a starting point for the kind of audit the author suggests each university might conduct.

The findings and conclusions of the report will probably come as no great surprise to persons in the field. That five "legitimate" areas for university action in world affairs are: instruction, research, encouragement of extracurricular activities, facilitation of student and faculty exchange with institutions abroad, and adult education, few will disagree. Nor will many take issue that education about world affairs is not the sole responsibility of specialists in the field. As universities are generally not too well "co-ordinated," it is also not surprising that co-ordination is inadequate in this particular field and that there are failures in the utilization of readily available university resources.

To this reviewer, the report marks a beginning. The questions which remain are more challenging than those answered. What is the most fruitful way to organize an interdisciplinary program for international studies within a university? Is it really worth the effort to try giving a general orientation on world affairs in a professional curriculum like engineering? Isn't it equally important that the engineer be given orientation in public administration, "human relations," and the like. Where do we draw the line? What is the proper role of the universities vis-à-vis the developing staff colleges like the Foreign Service Institute? Does a mere interchange of students and faculty with institutions abroad actually promote understanding, or is special orientation necessary? And finally, what do the committees and the author mean when they speak of a "world outlook"?

HOLLIS, ERNEST V., and ALICE L. TAYLOR. *Social Work Education in the United States*. Pp. xix, 422. New York: Columbia University Press, 1951. $5.50.

Three years of inquiry and study by an educator, Ernest V. Hollis, Chief of College Education in the United States Office of Education, and by a social worker, Alice L. Taylor, Training Consultant in the Federal Bureau of Public Assistance, are expressed in this report on Education for Social Work in the United States. The authors did their work at the invitation and under the auspices of the National Council on Social Work Education with the understanding that their findings and recommendations would be their own. The study was made possible by a grant from the Carnegie Corporation.

The book starts with a competent review of the half century of education in this field, analyzes the present scope and status of social work, and estimates a considerable future growth. It then explores the undergraduate college in social work education, graduate professional education, the organization and administration of schools of social work, the responsibilities of the professional organizations in social work, and accreditation.

"Both social work and social workers," the authors say, "should be looked upon as evolving concepts that are as yet too fluid for precise definition." They take a practical way of delimiting the field, listing the titles of 155 positions which in 1950 served as the basis of the national survey of salaries and working conditions in social work made by the United States Bureau of Labor Statistics. Against a BLS estimate of a total of 75,000 positions they find only 18,000 members of professional social work organizations. Moreover, "between three fifths and three quarters of public assistance and related social workers" have not had any professional education and nearly half have less than college education.

As a means of enlarging the substantive content of social work education and offering it to a larger number of students they recommend "three separate but articulated functions for the undergraduate college": first, a broad program of general education for prospective social workers which would also serve "for identifying and teaching the basic concepts of social welfare that belong in the common cultural heritage of all college students." With this recommendation there will be agreement throughout the field of social work education and practice.

The second recommendation is offered guardedly and tentatively, namely, that the undergraduate college with proper safeguards offer semiprofessional preparation for social work technicians "if job analyses make it feasible." In this suggestion the authors are influenced largely by developments in medicine and related fields. It is a question, however, whether the analogy applies in social work where the problem is not so much a reallocation of duties within the area of professional practice as a distribution of tasks between social work and clerical activities, accounting, and other nonsocial-work specializations. Where social work itself is concerned the most successful experiments indicate the possibility, within large organizations, of specialization in practice rather than differentiation between professional and semiprofessional functions.

The third recommendation proposes a concentration, equivalent to a broad major, in the arts and sciences that would serve both as a foundation for graduate professional education and as a preparation for persons entering social agencies directly from the undergraduate college. In this connection the report advocates a four-year integrated program, two years undergraduate and two years graduate. The emphasis which the authors place, not only upon the social sciences but also upon the humanities and the biological and physical sciences would probably reduce the danger of an early technicalization of education for social work. It would be important, however, that admissions to the professional school should not be restricted to persons who at the beginning of their junior undergraduate year had decided upon social work as a career. It would be unfortunate to lose to social work the many people who do not make their vocational choices until later. Social work needs the infusion of rich personalities such as in the past it has welcomed from a wide variety of educational backgrounds and life experience.

The recommendation at the graduate professional level is for a generic curriculum, immediately for the first year, with an ultimate postponement of specialization beyond the second year. This plan, with very little modification, is feasible and, in some schools, is close to being in force.

The authors consider social casework, group work, and community organization to be major curricular areas rather than specializations. They would constitute administration, supervision, teaching, and research as fields for special education. Presumably advanced practice would also fall into this category. At this point it is important to recognize the double role of social casework, group work, and research.

All three make their specific contribution to a generic education but are, at the same time, special disciplines which for adequate practice need more than a generic education.

The report expresses concern about the "dichotomy that continues to exist between the classroom and the field work," and seems to be inclined to put the burden of proof on field work. This dichotomy need not exist and, where education for social work achieves its purposes, does not exist. The work in the field provides the specific for the generalizations in class, and the discussions in class bring perspective to the practice in the field. In this process, and in the close working relationship between the field supervisors and the teachers of the seminars in practice, social work is perhaps making its greatest contribution to education. Where professional education is at its best, this integration extends to the teachers in the substantive areas. That the authors of the report have seen field work which is little more than apprenticeship and a dissociation of substantive and methodological teaching does not mean that there are not schools where an across-the-board integration has been and is being attained. Therein lies the essence of education for social work.

The teacher who has the privilege of working in a school in a university where there is a real interplay among the various faculties will endorse the emphasis of the authors upon the importance of the school of social work being a member of the university family. That, however, demands strong leadership in the school and a faculty willing to accept the intellectual challenge of association with its colleagues in other disciplines.

The authors of the report had a most difficult assignment in surveying a field which is still in process of definition and where the profession has yet to clarify its purposes and to agree upon its content. If, in places, the report is difficult to read and understand, in that respect it is a true reflection of the situation of a profession in course of evolution. The authors have struck at the main problems in the field. They have produced a document that is now, and will long be, a taking-off point for discussion in faculties and professional organizations. They have left a substantial and stimulating agenda for the National Council on Social Work Education.

KARL DE SCHWEINITZ
University of California
Los Angeles

WIETING, C. MAURICE. *The Progress of Cooperatives; With Aids for Teachers.* Pp. xiv, 210. New York: Harper & Brothers, 1952. $3.00.

This book is an expansion of earlier writings of the same author which treated education concerning the co-operative movement. Despite the expansion, it is all too brief. It is possible however that a longer volume would not prove so attractive to the audience for which it was intended. *The Progress of Cooperatives* does not pose as a scholarly study. It was written as a manual for teachers, and it will serve this purpose admirably.

The book consists of three parts, the first of which gives information concerning co-operatives. Here are discussed the principles of co-operation and the history of the co-operative movement. Separate chapters deal with various types of co-operatives. Emphasis is given to the United States, but there is a brief treatment of the co-operative movement in other parts of the world. Part I closes with an "appraisal of cooperatives." Needless to say, the conclusions are favorable to the movement. Part II is devoted to the educational activities of co-operatives in the United States. Part III, which takes up more than half the book, has to do with teaching about co-operatives. Here the author describes the status of education concerning co-operatives in the schools and makes suggestions for fitting the study of co-operatives into several kinds of curricula.

In his suggestions for teachers who plan their own units the author makes an important contribution to educational literature and to school programs. He presents an outline of content for the study of co-operatives; a list of eighty-seven suggested activities; a twelve-page annotated bibliography, much of it referring to free or inexpensive materials; a nine-page list of teaching films; and a three-page list of organizations and agencies from which teachers may obtain further information. Numerous specific examples of real co-operative activities carried on in particular school systems are discussed.

Mr. Wieting has provided a valuable classroom aid to teachers. The book is an example of the kind of help which should exist in many fields. The treatment of some phases of the co-operative movement is brief and inadequate. But the class which begins with *The Progress of Cooperatives* and goes on, as its author intended, to exploit the sources of information and the kinds of learning activities suggested will find the path to understanding the value and potential of co-operatives for society an easier one.

PHILOSOPHY AND RELIGION

WACH, JOACHIM. *Types of Religious Experience, Christian and Non-Christian.* Pp. xvi, 275. Chicago: University of Chicago Press, 1951. $3.50.

In this collection of ten scholarly essays, five of which have been previously published in English and one in German, the Professor of the History of Religions in the University of Chicago explores the nature of religious experience and offers criteria for distinguishing it from other types of experience.

The essays fall into three groups. The first group deals with questions of methodology and contains the author's conclusions drawn from analyses of the religious phenomenon in its great variety. The second and third groups contain specimens of the detailed studies of particular types of religious experience and thought on which the general conclusions rest. The second group deals with non-Christian religions. It contains three essays, one on the idea of man in the Near Eastern religions, one on the Sufi movement in Islam, and one on Mahayana Buddhism. The third group is concerned with Christianity. One of the essays analyzes the religious thought of Kaspar Schwenkfeld, a sixteenth-century Protestant spiritualist and a leader of the "Left-wing Reformation," another deals with the role of religion in the social philosophy of Alexis de Tocqueville, a Catholic historian and statesman of the nineteenth century who sought to reconcile religious principles with progressive thought. The third paper in this group, on *Church, Denomination and Sect,* is a study of how religion expresses itself in social organization. The fourth is an appreciative analysis of Rudolph Otto's *Idea of the Holy.*

These studies in the history of religion are all interesting and valuable in themselves but their chief importance for their author is for their bearing on the general interpretation of religion given in the essays of Part I. In the first of these, on the place of the history of religions in the study of theology, he argues for "an inclusive concept of revelation according to which the whole history of religion should be viewed as divine self-disclosure" (p. 25). In the second, on universals in religion, he proposes four criteria which together distinguish an experience as religious. It is (a) a total response of the total being; (b) a response to what is regarded as ultimate reality; (c) the experience is "existential," the most intense of which man is capable; (d) it involves an imperative, a commitment which impels man to act. In the expressions of such experience the world over, he shows, there is an amazing similarity of structure.

The general tenor of these essays supports Rudolph Otto's interpretation of religion as rooted in the mystical sense of the "numinous," but they do not illuminate the crucial question which Otto left unsolved—that of the fundamental connection of the mystical and moral elements in religious experience.

A. CAMPBELL GARNETT
University of Wisconsin

HEDLEY, GEORGE. *The Superstitions of the Irreligious.* Pp. xii, 140. New York: The Macmillan Company, 1951. $2.50.

Hedley has written a book worth reading because it is full of interesting infor-

mation. Few will not find in it much that to them is novel, tellingly presented. The thesis of the author is well expressed in his title: that the so-called, or self-called, irreligious people oppose traditional religion because they think it impracticable, unrealistic, unprogressive, an opiate, but do not themselves feel any responsibility for informing themselves about what they are denouncing. Such people "discount religion because they suppose it uninformed and irrational. . . . They themselves are uninformed and irrational, and therefore utterly superstitious, until they seek authentic information on the subject and until they do some sober reasoning about it." To combat such ignorant condemnation Hedley marshals a most unusual apologetic, in which he points out the use of the best scholarly methods by biblical critics (one reads with particular sympathy his disparagement of courses in the Bible as literature given by people from departments of literature, who are utterly ignorant of that scholarship), the social activity of the churches in the last sixty or more years, and the basic fact that to try to live a life without ideals is the most idealistic of all approaches to life.

Still, if Hedley has written an interesting book, it is not a profound one. He is seen to be most at a loss in his concluding chapter. He has presented his mass of evidence for the value of religion, while steadily admitting that the churches and churchmen have not always lived up to the ideal of their faith. But his presentation has been as much a special pleading for traditional religion as those of his "opponents" have tended to special pleadings against it. He quotes at the end a "distinguished friend" who disliked religion. Hedley forced the friend to admit that he called anything he did not like "religion." Hedley is doing exactly the same on the other side. The matter is not to be helped by presenting a list only of the virtues of traditional religion to those who can see only its defects. Hedley admits at the end that probably few of those for whom the book was designed will read it, and that the great majority of his readers will be those who needed no convincing. If he really hoped to accomplish his purpose of reaching the "irreligious," one would have thought he would have begun again on a different sort of book.

A still deeper defect in Hedley's thinking is that he calls "the irreligious" those who reject traditional Judeo-Christianity, and says that they should investigate "religion" before they decide against it. But he admits that the people he is talking about "are religious men and women," are indeed "very religious." Where are we, then, and where is Hedley? If "the irreligious" are actually "very religious" there must be other bases and formulations of religion, even in our civilization, than the acceptance of Judeo-Christian creeds and forms of worship. If Hedley wants to meet his audience, he must find these bases and accept them. That is a large task, but someone must do it if the spiritual forces of our age are not to go on calling themselves "irreligious," and so lose much of their power to lead and inspire.

ERWIN R. GOODENOUGH
Yale University

MILLER, EDWARD. *The Abbey & Bishopric of Ely: The Social History of an Ecclesiastical Estate from the Tenth Century to the Early Fourteenth Century*. Pp. xiii, 313. New York: Cambridge University Press, 1951. $5.00.

It has been said that feudalism is extremely complex and fundamentally simple. The simplicities of the feudal age, however, can be discovered only through a multiplicity of particulars. The value of Edward Miller's book is in the abundance of pertinent and interesting facts he uses to establish his general conclusions. This is an important contribution to medieval studies and a most welcome addition to the limited number of works available for an understanding of the medieval social pattern. Social history is, perhaps, the most difficult of all forms of history to define and equally hard to delimit. The truth of this generalization is obvious even for a study of the restricted areas of Ely lands. Since social relationships were political, administrative, and economic, medieval men like the abbots and bishops of Ely were often perplexed when forced to define precisely the nature of specific social types. This admirable study demonstrates this difficulty explicitly on almost every page.

Although he is forced often by lack of adequate sources to present tentative conclusions, the author has faced squarely the challenge of origins and has not turned with fright from "that obscurity which covers all the peoples of the Middle Ages." He shows at least the achievement of the abbots of Ely in acquiring lands between 970 and 1020, which "in virtue both of its magnitude and its rapidity, must have had major social consequences. . . . The work which was done in a brief half-century endured for near six hundred years." A chapter on "The Old English Estate and the Norman Conquest" gives vividly an indication of what the change to a new order could bring. Naturally the survey of 1086 must be relied upon, and we know more than we otherwise could without it "if the words of *Domesday Book* mean what they say. . . ." We are, however, not always sure they do. A chapter on "The Medieval Estates of the Bishops of Ely" will attract the specialist, but one devoted to "The Peasantry" deserves a wide circle of readers. After reading this essay few could retain faith in oversimplified clichés of text-books, for Miller demonstrates incontestably how lines of social status were vague, indeterminate, overlapping, and confused, rather than the clearly marked delimitations that are the lawyers' delight. "'Omnes homines aut liberi sunt aut servi,' Bracton would say; and that would be true enough in the eyes of the law. But the law, and especially a law so Roman as this, was no very good guide to social relationships."

"The Honour of St. Etheldreda" and "The Liberty of St. Etheldreda" are each examined in separated chapters which can only be noted here. These are important and worthy of careful attention, but they are of less general interest than the concluding section describing "Administration." If the problems and requirements of the earlier days seem relatively simple, the administrative demands of the thirteenth century were great. By then the Bishops of Ely had a kind of permanent civil service. Professionals in administration and the technically trained were available to assume the burdensome functions essential to maintain the integrity of extensive lands.

GRAY C. BOYCE
Northwestern University

BARON, SALO WITTMAYER. *A Social and Religious History of the Jews*. "Ancient Times." Two volumes. Pp. xiii, 415; 493. 2nd ed., rev. and enlarged. New York: Columbia University Press, 1952. $12.50.

These two impressively documented and indexed volumes, which survey the cultural history of the ancient Jews through the Talmudic Age, are to be followed by possibly five more. Professor Baron has kept alert to historians' and classical archeologists' advances in research; these motivated an enlargement of his earlier three-volume study of 1937. The more than two hundred pages of notes are rich in bibliographic citations and critical comment. Baron's work, which is leveled at scholars, is based upon an almost encyclopedic accumulation of information and on an examination of all relevant secondary sources.

It is a pity that this massive work, the fullest and most up-to-date general study in English on the cultural history of the ancient Jews, has not ventured beyond the outdated canons of interpretation of exotic cultures still found among otherwise excellent historians. The central criticism is that, like so much of contemporary historiography, Baron's phrasings regarding cultures and culture change are of the vintage of the 1920's or earlier in historiography. Baron has remained handicapped by the current academic ailment of specialist self-segregation. Except for classical archeology, he is largely unfamiliar with contiguous social sciences.

An anthropological reviewer notes with horror Baron's speaking (1: 49) of Semitic and other races in the Near East. He says (1: 172) that one cause of Jewish numerical expansion by the time of Christ was partly due to proselytism and partly to

"the natural increase of a highly prolific race," that is, the Jews. He writes repeatedly of a medley of races in the Near East. Even the Phoenicians become a race (1: 176), and finally we read (2: 23) of "racially pure Jews." If we can ignore the ridiculous implication that the Jews were once especially fecund because of their race, the confusion appears to be terminological: by race Baron really means tribal or cultural group.

One of the weak portions of his study is in the discussions of feminine social status (1: 58; 2: 235–241). His criteria of such status are unclear. But he assures us, in an almost Nazi passage, that the "concentration of women's activities upon her home . . . while perhaps prejudicial to her general economic and social standing, had nevertheless great value for the preservation of the [Jewish] nation's physical and moral strength."

He writes confusingly of an ancient precapitalistic system and of precapitalistic forms of exploitation (1: 68–69); of ancient industrialists, proletariat and bourgeois (1: 73–74), when such terms might best be reserved for analyses of social phenomena of modern centuries. He asserts (1: 51) that in early preagricultural seminomadic times, the Jews owned herds communally. This deduction needs documentation in order to controvert the weight of anthropological evidence that herds of domesticated animals are almost always privately owned by individuals or lineages. Time and again he uses the term "nation" for what is much more fittingly called a tribe or federation of tribes. There is still less aptness in his use of "nation" for widely scattered Diaspora groups of most diverse linguistic and cultural features, although such groups shared a religio-cultural heritage and similar historical experiences.

Baron's interpretations of cultural phenomena improve, and his extrapolations of inappropriate concepts and terms that are suitable for modern times lessen, as he moves into the Roman Empire. His comprehension of that culture is better not because the sources for it are fuller but because it is easier to comprehend a culture that is closer to our own. Although he has served specialist scholarship admirably in his monumental assembling of studies of ancient times, his interpretive discussions of ancient cultural phenomena outside of Rome and Greece are largely old hat or do not stand up in the light of cultural anthropology. But the compilation that he has achieved will make interpretations of Jewish culture history easier for historical scholars who are also oriented in disciplines such as cultural anthropology and social psychology.

COMMONWEALTH OF NATIONS

CARR, EDWARD HALLETT. *The New Society*. Pp. vii, 119. London: Macmillan & Co. (distributed in the U. S. by The Macmillan Company), 1951. $1.60.

We have moved far away from the conceptions and from the conditions out of which the democratic tradition was born. This is the theme for six radio lectures by Mr. Carr for British audiences in mid-1951, the series being reproduced here without substantial change.

While the process of increasing government services is not new, their increasing scope, changing nature, and handling at national levels are remaking contemporary society. The present need for state economic planning arose from (1) the great depression and (2) preparedness programs for war.

The approach to an understanding of problems of our "new society" should be historical. Mr. Carr emphasizes the continuity of history, which "moves constantly and never returns to the same place" (p. 5). There are fashions in writing history; the historian moves with the times (p. 14). Today's looking back, at least to the American, French, and industrial revolutions, should be not for solutions but for critical insights.

In sequence there appeared unrestrained private enterprise, competition, monopoly, and governmental regulation. We are now in the period of the "welfare state," the transition to which the author considers inevitable, if for nothing else than to care for unemployment. The laissez-faire economic whips to force people to make their own way were unemployment and hunger. We now have governmental relief of "the poor and the wretched," health services, and food subsidies. Will guaranteed full employment and other social services weaken the initiative and independence of the worker? The author does not think so. After discarding the former whips what is needed, he suggests, is "the creation of a new philosophy which will furnish an incentive and a reinforcement for the new social habit of work" (p. 53). The inducement of higher living standards might be substituted for economic penalties. He would also nationalize the major part of industry.

The lectures stress British movements but for illustration draw also on many changes in American economic life. The author concludes, "This is an American century in the same sense and with the same right as the last century was a British century" (p. 84).

If sometimes pessimistic in conviction, the always forthright author balances that attitude with a measure of reasonable optimism for the future. Some will dispute the generalization that private laissez-faire capitalism has been dead everywhere outside the United States for twenty years (p. 31). In the lecture contrasting "individualism" with "mass democracy," it might have been shown that individual rights and the "general will" have quite different ends in view. When speaking of individual rights we mean, more often than not, those rights sheltered against governmental encroachment. The general will simply contrasts with an individual will, say that of a sovereign. Majority rule applies within a legislature, moreover, not only for the general electorate. Nowhere do democratic processes require the mass of voters to determine policy that sets technical details. Lincoln probably meant government of the sovereign people, for the people, by the representatives of the people.

ROWNTREE, B. SEEBOHM, and G. R. LAVERS. *English Life and Leisure*. Pp. xvi, 482. New York: Longmans, Green and Co., 1951. $4.00.

This volume is an interesting contribution to sociological literature for three reasons: it combines the case-study technique with data derived from statistical reports and interviews; it includes selected cultural aspects of life in England, Wales, and the Scandinavian countries; and it is written with a view to influencing behavior patterns.

The basic data of the analysis are 975 case studies, the facts and judgments in each case procured after sufficient acquaintance to make them a matter of informal conversations. A total of 220 cases are presented in the first chapter. Other data were obtained from reports and from interviews with police officers, social workers, and others.

The areas of cultural life selected for study are: commercialized gambling, drinking, smoking, sexual promiscuity, honesty, the cinema, the stage, broadcasting, dancing, reading habits, adult education, and religion. The last two chapters do not follow this specific approach. One is a community survey of leisure-time activities in an English town; the other is a superficial survey of leisure activities in each of the Scandinavian countries.

The authors are convinced that vigorous steps need to be taken to reverse the current trend, for each analysis leads them to conclude that behavior patterns are below the standards "of higher qualities that distinguish great nations and great individuals within a nation." They concede that the English people have a high respect for law and an enviable tradition of voluntary work with such organizations as youth clubs and the Red Cross but consider these the "unsensational blessings, won by sacrifice and effort in the past and maintained by good sense, and as a consequence of our reasonably civilized outlook."

In spite of the authors' seemingly pessimistic conclusions, they come to a positive proposal in relation to each area discussed. Some would criticize the fact that, while the report is factual, the conclusions

are based upon value judgments. These are primarily drawn from Christian ethics but are justified by the authors not only on moral and spiritual grounds, but, even more, on the grounds of national interest.

WEDGWOOD, C. V. *The Last of the Radicals: Josiah Wedgwood, M. P.* Pp. 252. London: Jonathan Cape (distributed in the U. S. by The Macmillan Company), 1951. $3.00.

It is good to know that the life of the last radical has been written. This seems unbelievable. The way in which the author follows her uncle's request to give this title to his biography is indicative of her devotion throughout the work. She goes so far as to put herself into the story to a minor degree toward the close of the book, giving indications of her uncle's attitude toward her. And yet, she does not violate the canons of good biographical writing too openly.

Josiah Wedgwood, M. P., had the advantages of family and fortune, and the disadvantages. The biographer reveals a man whose life was too easy. Being from the Wedgwood family, he could afford to be outspokenly liberal and increasingly eccentric. He loved a contest with forces of darkness, monopoly, conservatism, or tyranny—so long as the contest needed him. When success approached, he would drop out and take up another cause. He was a leader of lost causes and happy as a warrior in naval, political, or social battles. His daring was his pride and may have inspired others many times; but his liberalism made him see the other side of each cause as well as his own side so that if the opposition became an underdog he might turn to help it. He fought for Zionism, for instance, but while so doing he helped the non-Zionists if they called upon him.

The one passion of his life and the one solution for all of the troubles of our civilization was the single tax reform. Henry George gave him a lifelong cause and gave him an all-inclusive answer. His solution to the vast array of public issues was a bit too simple for lasting results.

The student of history and politics will find in this enthusiastic review of a liberal and a labor leader in Parliament a number of ideas worth getting. "Josh" Wedgwood was a member of Parliament from 1906 to 1942 when he was raised to the peerage and entered the House of Lords, which he had earlier scorned. The reviewer found the struggle for civil liberties in England of value; he enjoyed the story of a life so buoyant that its subject could stand for independence of thought in his own family to the extent that it worried even himself when his two daughters became pacifists; it is good to have the intimate view of the battle at Gallipoli in 1915 and the accounts of Wedgwood's trips to America to talk with Colonel House about peace terms and to Vladivostok to try to hold the Russians in their Allied war efforts after the March revolution of 1917. The part played in the Zionist movement is worth reading, and there are some good sidelights on the colonial reform movements in Nigeria and South Africa. In the main it is just a good story of a dynamic, humanity-loving Englishman who revelled in lost causes and came to think by the time he died in 1943 that he, himself, was a lost cause.

One wonders whether he was ever an asset to the Liberal party or to the Independent Labor party, or later to the Labor party to which he belonged; but he was a colorful figure, a voluminous writer, a champion of civil liberties and of freedom for all men and women of all races and creeds. It must have been exasperating to work with "Josh" Wedgwood, but a continuing inspiration to have felt his daring and reckless optimism. English and American liberalism owes much to such men as Josiah Wedgwood. We trust that he is not the last of the radicals.

W. HENRY COOKE
Claremont Graduate School

RUSSELL, BERTRAND. *New Hopes for a Changing World.* Pp. 213. New York: Simon and Schuster, 1952. $3.00.

Gilbert Murray once entitled a chapter on the Hellenistic period "The Failure of Nerve." By that phrase he meant the mood of despair which led people to abandon any real hope for a rational solution

of their problems. It may be that future historians—if there should be any—will characterize our age in the same way. We are the creatures of chance and fate, which in the end are the same, blind and inscrutable forces, to which we must reconcile ourselves. In Hellenistic times these post-rational systems grounded on a despair of reason were philosophies such as Stoicism and Epicureanism, or religious cults like those of Mithraism and Christianity. Today, for many people, Existentialism, Thomism, and Marxism perform a similar function. Ours is an age of retreat, one in which nihilism and dogmatism seem the only alternatives. A tragic example is that of H. G. Wells. This heroic and lifelong prophet of the Western philosophy of enlightenment and progress at the last concluded: "A frightful queerness has come into life. . . . The writer is convinced that there is no way out, or around, or through the impasse. It is the end."

This is the problem to which we expect Bertrand Russell, from the title of his book, to address himself, and it is disappointing to find that if the world has changed, he has not. One hoped Russell would apply his trenchant intellect to the causes of our despair, that he would give us some real grounds for hope. Instead, he remains where he was all of fifty years ago. When he wrote the melodramatically eloquent essay, "A Free Man's Worship," he admonished us, like true Stoics, to wrap ourselves in the impregnable mantle of our ideals. Thus do we become immune to the assaults of chance and fate.

Russell's stoical temperament thus makes him incapable of coming to grips with the problem. In a revealing passage near the end of the present work he remarks:

"I have not, however, in this book dwelt much upon the reasons for fear, since I do not think that it is through fear that we shall avoid the dangers that threaten us. Our world has too much of fear, and emphasis upon dangers is apt to lead to apathetic despair. What our world needs is the opposite; it needs rational creative hope; it needs something positive to live for. It needs 'yes' feelings rather than 'no' feelings. If the 'yes' feelings are as strong as a purely rational consideration allows them to be, the 'no' feelings will melt away and become unnecessary. But if we dwell upon 'no' feelings too much, we shall never emerge from despair" (pp. 206–207).

And so the whole book is a series of "if-then" propositions: *If* we were more rational in dealing with population problems, with conflicts of class and nation, of creed and race, *if* we could rid ourselves of obsolete ideas, of groundless anxieties and of irrational fears by instituting a juster society and a more sensible kind of education, *then* we should have peace with happiness and progress unlimited. On this the only proper comment is, "O brave new world, that has such people in't."

Thus Bertrand Russell vacillates between hoping that on an *off chance* events may take this fortunate turn and the compensatory mood of stoic resignation. When he is thinking of these wholly rational creatures, his optimism is unbounded. He says, for instance—and I have no doubt of it either—that "it would be completely possible to make the whole world within fifty years as prosperous as the United States is now." But then he reflects that there is only too much reason to fear that Western civilization as we have known it is poised on the verge of the *fatal* abyss. Resuming the Stoic's mantle, he assures us, "And so long as man continues to exist, we may be pretty sure that, whatever he may suffer for a time, and whatever brightness may be eclipsed, he will emerge sooner or later, perhaps strengthened and reinvigorated by a period of mental sleep" (p. 186). Such is Bertrand Russell's unchanging advice to this changing world. Can a world that is plunging headlong in its furious course be expected to heed it?

GAIL KENNEDY

DUE, JOHN F. *The General Manufacturers Sales Tax in Canada.* Canadian Tax Papers No. 3. Pp. xi, 202. Toronto: Canadian Tax Foundation, 1951. $2.00.

The present volume is to be welcomed on this side of the border as well as in its home country. There has been intermittent agitation for a federal sales tax in this country for some years. This clear

orderly history and description of the Canadian tax will be of particular value if a manufacturers' levy is again seriously considered. The usefulness of the book is much broader than this, however. Much of the discussion is pertinent to other forms of sales taxes and to other levels of government.

Canada imposed a 1 per cent turnover tax in 1920 in an attempt to meet heavy postwar expenses. It was changed to a manufacturers' levy in 1924. For the sixteen years from 1936 to 1951, the tax was imposed at the rate of 8 per cent, but was increased to 10 per cent in 1951.

Small manufacturers are exempt, and goods used in production are generally excluded from the tax. Most foods, certain articles for medical use, several major categories of building materials, electric power and fuel, and goods for educational and religious purposes are also exempt. Due to the various exclusions and exemptions the sales tax yield in 1950 with an 8 per cent rate was 3.6 per cent of total consumer expenditures. With a 10 per cent rate it is estimated that the consumer tax burden will be about 4.5 per cent.

The tax has been a productive one. It yielded 31 per cent of federal tax revenues in 1938. Due to heavy increases in other taxes, however, it dropped in relative importance during the war and was down to 10 per cent of tax revenues in 1945 and 1946. The current yield is around 17 per cent. From 1932 to 1943 the sales tax was far more productive than the personal income tax. It has been outstripped by the income tax since then.

Summarizing briefly, the principal findings of the study are that the tax is highly productive and well administered. Collection costs are low. There is evidence of pyramiding since markup percentages are applied to new purchase prices. In general the tax appears to be shifted to consumers. Due mainly to exemption of food, there appears to be only slight, if any, regression below the $4,000 income level. Above that point the burden of the tax becomes less as incomes increase.

Arguments for the tax, in addition to its productivity and administrative feasibility, are that it is less harmful incentivewise than the income tax and that it tends to hold inflation in check. The author feels that a personal income tax falling with the same weight as the sales tax does upon various income groups would be no more injurious to incentives. He does not compare the effect of the sales tax with the corporate income tax in this connection, nor does he compare these two taxes with respect to their influence upon management decisions.

The argument against the tax rests mainly on grounds of equity, since it constitutes a substantial burden upon low income groups. The author does not favor retention of the tax as a permanent feature of the revenue system.

MABEL L. WALKER
Tax Institute
Princeton, New Jersey

PERRY, J. HARVEY. *Taxation in Canada.* Pp. xiii, 409. Toronto: University of Toronto Press, 1951. $6.00.

The author is an officer of the Department of Finance with more than fifteen years experience in practical tax matters. *Taxation in Canada* is a description of the current Canadian tax structure—Dominion, provincial, and municipal—and also in part of the Canadian governmental organization and of the nature of the Canadian economy. The fiscal, the political, and the economic are effectively interwoven in nontechnical yet authoritative exposition designed to appeal both to the layman and the tax expert.

Essentially the author's concern is with the provisions of the statutes and with their elucidation. Mr. Perry does not pretend to deal exhaustively with such matters as the shifting and incidence of taxation nor with the broad problem of fiscal policy.

Many chapters conclude with a short separately spaced summary of their content together with a tabular statement of the percentage of tax revenue and total revenue provided by a given tax. An adequate bibliography, chapter by chapter, appears at the end of the book. Various tables throughout and in the appendix enlighten and supplement the text. Frequent and at times extensive reference is made to court decisions. The specific and important problem of tax administration is discussed in concluding chapters.

Mr. Perry makes his work interesting and instructive to the American reader by comparisons or contrasts often made between Canadian and American facts and procedures as for instance the contrast between the concepts of income or between the positions of local assessors in the two countries.

Certain chapters are worthy of especial mention. They deal with the historical development of the Canadian tax system, with certain constitutional aspects of taxation, with budgetary procedures, and, as has been said, with administration.

Some of the material presented is transient in nature as are the facts as to current tax rates, but most of the substance is of fundamental and permanent nature, dealing as it does with the taxes which must support government and with their legal and constitutional foundations.

Mr. Perry has drawn in clear lines an informative over-all picture of the Canadian tax structure. One might wish for a brief concluding chapter to focus the scene, but, although this does not appear, the reader feels that competent workmanship and a sense of symmetry and artistry simply expressed have produced a certain feeling of warmth which works on taxation do not always engender in him.

MARVEL STOCKWELL
University of California
Los Angeles

KOTHARI, SHANTILAL. *India's Emerging Foreign Policies.* Pp. viii, 220. Bombay: Vora & Co., 1951. $2.00.

It is obviously valuable to know what Indians are thinking about their policies and ours. Mr. Kothari's small volume, done as a project at the University of California, will be useful in this respect. He has undertaken an exposition and defense of India's major present positions and has suggested what he regards as an imperative next step.

In his view the present world scene represents a struggle between two power blocs led respectively by the Soviet Union and the United States. The struggle, he says, is essentially economic in its origin since it is the clash between communism, represented by Russia, and monopoly capitalism, represented by the United States.

India, in this analysis, faces two dangers, two putative antagonists. The first is Soviet communism, the second is "Anglo-American imperialism." The danger from the first is more acute, he believes, but the second is also a potential threat. India must be on guard against both.

In the event of a shooting war, he holds, India could not be neutral and would inevitably line up with the Western world. In a "cold war," on the other hand, it is his judgment that India should and must remain neutral, the better to serve the cause of peace. This is the explanation of India's policy toward Communist China. It is Mr. Kothari's thesis that it has not yet been determined that Communist China is a Soviet satellite and that, if it is eventually so determined, India's policy will have to be modified.

Meanwhile India will continue to work for better international understanding, independence for all subject peoples, an end to all racial discrimination, and a co-operative opposition to all forms of "imperialism."

The imperative next step, he declares, is the formation of a working South Asian alliance to resist aggression from any quarter. He is opposed to co-operation in any similar Pacific pact since the latter would involve some non-Asian states. He does not believe in nonviolent methods and is critical of Gandhi on this score. He is, himself, a partisan of Subhas Chandra Bose, the Indian nationalist who went over to the Japanese. His argument for the cultural values of such an alliance, which it stresses, is persuasive. His picture of it as a strong physically defensive position falls flat when he states clearly that the security of the area is dependent upon the sea power of the United Kingdom and the United States. He is, nevertheless, opposed to any ties to the West and suggests that India's withdrawal from the Commonwealth is probably imminent.

The Western reader will be informed, but slightly bewildered, by the acute hypersensitivity that is revealed. At times it

amounts almost to a persecution complex. How else could one explain a statement such as this: "European diplomacy, nearly [neatly?] aligned under American leadership in international politics, is active in preventing India from becoming a strong nation." This is in the class with the almost pathological fear of "imperialism" that pervades the book and which, coupled with the total myopia in respect to Soviet imperialism, gives it an air of unreality.

ROBERT AURA SMITH
The New York Times

VAKIL, C. N., and P. R. BRAHMANANDA. *Planning for a Shortage Economy: The Indian Experiment.* Pp. 320. Bombay, India: Vora and Co., 1952. Price Rs 5/8. paper; Rs 7.– cloth.

The old story that India is a land of fabulous wealth is decently buried. The magnificence and grandeur of the Indian princes has also disappeared with the withdrawal of British administration from the country. One hears nowadays nothing but reports of direct poverty of the Indian masses. In Brahmanic philosophy this poverty was once lauded highly. But it is no longer accepted as a source of greatness or spirituality, but rather is condemned as a menace to the physical, intellectual, and moral stamina of the Indian nation and as a threat to the expansion of the democratic ideal in the land. The amelioration of mass poverty is believed to be the greatest problem India has to face now.

To remove the specter of poverty that stalks in India, a group of merchants brought out a plan, known as the Bombay Plan, in 1944. Other people also came out with other plans such as the People's Plan, the Gandhian Plan, the Visvesarya Plan and so on. In fact, so many plans were hatched in so short a time that even the stolid Government of India was accelerated into action and appointed an Advisory Planning Board to look into the matter in 1946. But the partition which took place in the next year set at naught most of the calculations of the Board. The regions which produced a surplus of wheat and most of the cotton and jute fell to the share of Pakistan. A large number of displaced persons who needed immediate rehabilitation further complicated the problem. The new government that came into the saddle appointed a National Planning Commission in 1948. Two years later, it submitted a six-year plan to the Commonwealth Consultative Committee which held its session in Colombo. The desire was to enlist the sympathy of the Commonwealth countries in a large co-operative scheme to rebuild the economy of the war-torn regions of southern Asia. But unfortunately the countries to which the appeal was made were not in a sufficiently financially solvent condition to take up the steps suggested. So the Government of India modified the plan and brought out a new version of it, to reconstruct the economy of the country. Vakil and Brahmananda's book discusses the new Five-Year Plan (1952 to 1957) propounded by the Indian administration.

The plan has many objectives: to solve the problem caused by the shortage of raw materials, essential consumer goods, and housing; to fight the high and rising prices and the growing cost of living; to rehabilitate the persons displaced by partition; to utilize social resources to suppress black-marketing and profiteering; to readjust the economy; and to develop the country. Thus, the problems it sets out to tackle are immediate. It does not consider the nationalization of industries, nor does it suggest any structural change in community life to provide for social justice.

The government sets out with 17,930 million rupees to carry out the scheme, from which it anticipates raising 11,210 million by internal loan, 3,950 million by utilization of the money earmarked in the budget for social services; 2,000 million from various surplus balances; 2,500 from small savings and unfunded debts; and 1,140 million from the organized capital market. When put into effect, agriculture will absorb 13 per cent of the investment, irrigation and power plants 30 per cent, transport and communications 26, industry and minerals 7, social services 17, rehabilitation 5, and miscellaneous items 2 per cent.

The objectives of the plan are limited. The authors believe that if they can be realized within the five years of the program, and the damage done to the economy by the war and partition repaired, the country will have a substantial basis for planning another advance with greater success and less friction. We agree.

It is unfortunate that many of the figures supplied by the Planning Commission have to be modified and changed from year to year. The reason is that the Indian government does not yet have exact statistical data on which sound planning can be based. The authors are aware of the fact and plead for economic research. We again support the plea.

The book is well written and, compared with other Indian publications, well printed. As an exposition of the present five-year plan, it serves a useful purpose.

N. G. D. JOARDAR
Washington, D. C.

FUCHS, STEPHEN. *The Children of Hari: A Study of the Nimar Balahis in the Central Provinces of India.* Pp. xviii, 463, XXII plates. New York: Frederick A. Praeger, 1951. $7.50.

This work is an anthropological-sociological description of an "untouchable" agricultural group known as *Balahis*, especially those who live in the Nimar district in the southwest corner of the Central Provinces (now known as Madhya Pradesh) of India. These are one of the economically and educationally backward peoples of India. The author, as a missionary work ing among this people and at the same time a trained anthropologist, utilized his opportunity for a long-onctinued field study. The book is one of the most complete accounts we have of any Indian group.

After a brief, too brief, introduction of 16 pages on the geographical, historical, and racial background of the Balahis, Father Fuchs treats their culture in over 400 more pages under the four heads of sociology, the life history of an individual, religion and magic, and material culture. There are 79 illustrations (line drawings and photographs), a glossary (which like the text never gives a transliteration of Indian words that would indicate pronunciation), and an index.

The Balahis appear to have been Hinduized in relatively recent times, and their Hinduization is very imperfect; that is to say, their social customs do not correspond with any exactitude to the ideal demands of the orothodox texts. But since few, if any, low-caste Hindu groups do have institutions that would satisfy the religious and legalistic purists, the Balahis may be viewed as a typical group living by a variety of what is often for convenience called the lower Hinduism. They have "Brahmans," to be sure, but these appear to be by origin Balahis who have taken over priestly functions and not historical Aryan Brahmans, and they are reputed among the Balahis to eat meat as does the community generally. The Balahis' religion is directed toward propitiation of clan gods, of the mother goddesses, and of various demons with the use of special festivals, ceremonies, and cult practices, in all of which the major Hindu deities and epic and puranic mythology have only a vague and fugitive part.

In a final brief chapter the author writes of the future of the Balahis, holding out little hope for them unless the Hindu community as a whole changes its basic attitude toward untouchability. His remarks may be considered applicable to all Untouchables. Mere good will on the part of socially minded reformers like Gandhi or a mere constitutional provision as in the Constitution of 1950, which claims that it "abolishes untouchability," does not appear to him adequate. Presumably Dr. B. R. Ambedkar, himself an Untouchable, chief leader of the Untouchables and principal architect of the 1950 Constitution, had the same opinion last autumn when he resigned from the dominant Congress Party on the ground that it was unwilling to enact enforcing legislation for its social provisions.

W. NORMAN BROWN
University of Pennsylvania

NANAVATI, MANILAL B., and C. N. VAKIL (Eds.). *Group Prejudices in India: A Symposium.* Pp. 223. Bombay: Vora & Co., 1951. $3.00.

Indian society is one of the most complex in the world with its Hindu caste groups and its many other divisions along religious, regional, and linguistic lines. Latent hostilities between many of these

groups have been brought out by self-government. The twenty-nine essays in this volume represent a pioneer attempt to describe the serious consequences to an independent India of these tensions.

The authors of the various articles represent a wide variety of university professors and government officials. They write out of a deep concern for the success of India's new government. A tone of urgency and a desire for immediate reform run through their writing. The editors reflect this spirit in their preface. "All thinking people would agree that the early removal of the prevailing group prejudices in the country is an essential preliminary for moulding free India into a united, strong and democratic nation."

The Indian Constitution contains detailed prohibitions against discrimination on grounds of "religion, race, caste, sex, place of birth." Discrimination is forbidden in public places such as shops, restaurants, places of entertainment, wells, bathing ghats, and temples. These constitutional provisions, though not universally enforced, are outlined by Professor Venkatarangaiya in his article, "The New Constitution and the Removal of Group Prejudices." This essay, however, is brief and general in character, which is true also of the other articles in the book.

This volume is significant in showing the increasing awareness in India of the social and political consequences of group antagonisms. But the authors in their desire for rapid solutions limit themselves to rather elementary and superficial programs, such as the creation of a central university, a national language, higher standards of living, educational reforms, and moral appeals. There is little realization of the extreme complexity and durability of group attitudes. The authors are not familiar with American research in the field of minority groups and culture prejudices. The essays were written before the United Nations Educational, Scientific, and Cultural Organization (UNESCO) studies of group tensions were initiated in India.

The book has no index.

SLAVIC COUNTRIES

ZAVALANI, T. *How Strong Is Russia?* Pp. 244. New York: Frederick A. Praeger, 1952. $4.00.

This book is an attempt by an Albanian former Communist to assess the successes and failures of the Soviet Five Year Plans. His verdict is almost wholly negative. "The main lesson of Soviet economic planning," he believes, "is to teach us how it should not be done." The Five Year Plans, as he demonstrates, have been pushed home to the accompaniment of mass murder, starvation, forced labor camps, inflation, shortages of consumer goods, and the strictest kind of labor discipline. Given the shortage of skilled labor, they have also been marked by appalling waste and inefficiency.

All this is true, as any serious student of the Soviet Union knows, but it would probably be a mistake to conclude that the Soviet economy is as weak as Mr. Zavalani seems to think. The severest test of the Soviet economy to date was of course the war against Germany. Confronted with the indubitable fact of Soviet victory in this war, Mr. Zavalani attributes it to Hitler's mistakes, to Lend Lease, and to the poorly developed state of Soviet communications (which according to him hampered the Germans more than it did the Russians). He pays tribute to the fighting qualities of the Russian soldier, but this concession is hardly an adequate corrective to his mistakes. His view coincides almost exactly with that of a group of former German generals, led by Halder, who are busily explaining to anyone who will listen that the war was lost through no fault of the German General Staff.

Actually, the Five Year Plans provided the Soviet Union, however brutally and wastefully, with the industrial basis for fighting a major war, something Imperial Russia did not have in 1914–17. The best explanation of the Soviet victory, and the best corrective to the optimism which Mr. Zavalani's excessively negative analysis of Soviet economic planning may inspire in the unwary, is to be found in *Soviet Arms and Soviet Power* by General Augustin Guillaume, a distinguished French officer who served as French Military Attache in Moscow after the war:

"Unity of doctrine, whether realized in enthusiasm or imposed by power from above—unity of direction in the political, economic and military domains insured by the strong personality of Stalin, chief of the Party, chief of government, chief of the armies—with the absolute authority and stability of power insured by dictatorship—amplitude of preparation, industrial and military—application without reservation, once the time had come, of the total human and material resources of the immense country—furious work by a great people under an inflexible discipline—the quality of military cadres insured by rigorous selection—the quality of military units based on strength of manpower and on a carefully sustained morale—and a material strength that was constantly increased and improved—these were the sources of the Soviet victory."

Mr. Zavalani has failed to make use of a number of good postwar works on Soviet economic development, such as the writings of Naum Jasny and Harry Schwartz. These, as well as others dealing with important noneconomic aspects of the Soviet state, ought to be consulted by anyone attempting the difficult task of answering the question posed by the title of this book. A full answer to this question, I fear, would give the Soviet rulers and their economic planners, however regretfully, higher marks than Mr. Zavalani has been willing to allow them.

SCOTT, ANDREW MACKAY. *The Anatomy of Communism.* Pp. xiii, 197. New York: Philosophical Library, 1951. $3.00.

Dr. Scott has here performed a valuable service to all students of international affairs by the preparation of this objective, accurate, and critical study of the theory and practice of Russian communism.

The Anatomy of Communism begins with a critical analysis of the Marxian background of contemporary communism, and an appraisal of the Marx and Engels theory of the materialistic conception of history and the class struggle. This section is followed by a careful documentary study of Bolshevik tactics from the beginning of the twentieth century to the present time, as developed by Lenin and Stalin, and as carried out by the Soviet dictatorship.

During the last decade or so, there have been many students of communism who have been bitterly critical of Stalin and his rigid, dictatorial regime, and yet who have had many words of praise for Lenin. If only Lenin were alive today, they have declared, the Russian dictatorship would by now have taken long strides toward a democratic form of government.

Dr. Scott, in quotation after quotation, shows that it was Lenin who laid the foundation for the Bolshevik *coup d'état,* the Stalin dictatorship, and the Machiavellian tactics to which the communist movement has adhered since its beginning.

The author calls attention to Lenin's advocacy not only of dictatorship in general, but to his justification of *one man* dictatorship during a transitional period. Thus, in answering the question as to whether the will of a single individual, a dictator, may fulfill the will of the working class, Lenin is quoted as saying [Lenin, *Selected Works,* Vol. VII, pp. 341–2]:

"The question [of one-man dictatorship] has become one of really enormous significance. First, the question of principle, *viz.,* is the appointment of individual persons, dictators with unlimited powers, in general compatible with the fundamental principles of Soviet government? . . .

"The irrefutable experience of history has shown that in the history of revolutionary movements the dictatorship of individual persons was very often the vehicle, the channel of the dictatorship of the revolutionary classes. . . . Hence there is absolutely no contradiction in principle between the Soviet democracy and the exercise of dictatorial powers by individual persons."

The author likewise shows how Lenin evolved the concept of Russia as the "Socialist fatherland," to which Communists not only of Russia but of all lands should give chief allegiance in time of conflict.

Dr. Scott ends with a suggestive chapter on "The Great Illusion." Russian communism, he concludes, is "a whole fabric of illusions. . . . The responsibility for the fabrication of the majority of these illusions belongs to Lenin, and the ease with which they won wide acceptance is explained, in part, by an illusion having to do with Lenin himself—the idea that he was devoted to freedom and welfare for the working people of the world."

The reviewer, while finding Part I on early Marxian theories suggestive, feels that the author's treatment of the class struggle and economic interpretation of history in this section is too brief to permit of an adequate and well-balanced presentation. Those portions of Part I which are essential to the discussion of communism this reviewer feels could better have been woven into various chapters in Part II on communism proper. On the whole, however, the reading public should be grateful to the author for this clear and thoughtful contribution to the real nature of the contemporary communist movement.

HARE, RICHARD. *Pioneers of Russian Social Thought: Studies of Non-Marxian Formation in Nineteenth Century Russia and of Its Partial Revival in the Soviet Union.* Pp. viii, 307. New York: Oxford University Press, 1951. $4.50.

The revolutionary history of Russia is as full of paradoxes as it is full of interest. The central paradox is brought to light by the interesting study of Mr. Richard Hare. The West hardly knows that the radical idealistic movements of Western Europe and America about the middle of the nineteenth century had a parallel in a similar trend in Russia, one equally imbued with social humanism and equally fertile in ideas for reform. At the same time, as Mr. Hare's individual studies show, the Russian reformers were driven more and more upon themselves. While the Western trend was internationalist and, whether liberal or socialist, was concerned wholly with the urban class, the Russian trend developed a strong Slavophile outlook and a social philosophy, which came to be known as populism, centering on the peasant. That distinction became sharper with the rise of Marxian "scientific" socialism. The Russian reformers called themselves socialists, but most of them rejected the doctrine and implications of Marxism, which in the East was at best an alien importation.

Altogether the rigidity of the Marxist dogma was distasteful to the way of thinking of the bulk of the Russian revolutionaries. Chernyshevsky, for instance, wrote that to talk about natural economic laws made very little sense, nor need what is natural be any recommendation (p. 187). And Herzen, who met Marx in London and came to dislike him heartily, and in a way the ablest of them all, is quoted by Mr. Hare as follows: "I am not a bit frightened of the word 'gradualness,' wretchedly debased though it has been by the unsteady shaky steps of various reforming governments. . . . One learns mathematics gradually, so why should final conclusions and thoughts about sociology be spread like an epidemic of smallpox, or abruptly injected into the brain like medicine forcibly poured down a horse's throat?"; and he added that "to tell all that to the people we live among, demands if not more, at least as much courage and independence as it does to pursue extremes in everything" (pp. 267–68).

The Russian revolutionaries certainly did not lack courage or the spirit of sacrifice. There was always among them however this division between Easterners and Westerners, with the small Marxist group leading the latter. Since the late twenties especially, Soviet policy has completed the circle of paradox. The Communists had taken over a Western theoretical product which proved so arbitrary that, to apply it effectively, they have had to cut themselves off from the West and to act in the way which the Easterners claimed to be inevitable. Whether Soviet communism is truly Marxist or not is for Marxists to decide; but it is patently a highly nationalistic and isolationist policy in the extreme Slavophile tradition. Mr. Hare adds the point that the new Soviet state links up with the despotic czarism of Peter the Great and Ivan the Terrible, not with the semiliberal reformist czarism of Alexander II (p. 302).

Mr. Hare has given us a highly interesting study of social thinkers whose lives and works are hardly known in the West. The writing is not always in the same class as the scholarship; and for a volume of disconnected studies an index of names is woefully inadequate.

DAVID MITRANY
Oxford, England

Soviet Legal Philosophy. Papers by V. I. LENIN, P. I. STUCHKA, M. A. REISNER, E. B. PASHUKANIS, J. V. STALIN, A. Y. VYSHINSKY, P. YUDIN, S. A. GOLUNSKII, M. S. STROGOVICH, and I. P. TRAININ. Translated by HUGH W. BABB, with an introduction by JOHN N. HAZARD. Vol. V in "20th Century Legal Philosophy Series." Pp. xxvii, 465. Cambridge, Mass.: Harvard University Press, 1951. $7.50.

This volume is "a chronicle of the steps taken in the formulation of a Soviet legal philosophy" (p. xvii). It contains a short lecture delivered by Lenin in 1918 entitled "The State," excerpts from the writings of two legal theorists of the twenties (Stuchka and Reisner), the famous book of Pashukanis on "The General Theory of Law and Marxism" (3rd edition, 1927), two short selections from Stalin indicating the crisis in Soviet political theory in 1929–1930, the 1930 speech of Pashukanis in which he succeeded in bringing his theories through the crisis almost intact, the denunciation of Pashukanis and others by Yudin in 1937 and the more extensive refutation by Vyshinsky in 1938, a short excerpt on the theory of the state from Stalin's 1939 report to the Eighteenth Party Congress, and about 100 pages from Soviet writings of 1940 and 1945 on the theories of the state and of law.

As a supplement to the literature in English on Soviet law (some half-dozen books), this anthology is most useful. However, the reader who is not familiar with the concrete legal developments in the Soviet Union over the past 35 years will be misled if he takes the present volume as a guide to what Soviet jurists have really thought about law. This is not to say that the writers here represented are attempting to deceive anyone, but only that their theories are constructed primarily for the sake of meeting certain practical problems faced by the Soviet state and not primarily for the sake of the truth. Soviet legal theories may be analogized to legal fictions, which are not meant to be believed or disbelieved but which are designed as a means of developing the law. The practical implications must be read—where Soviet eyes are accustomed to read—between the lines.

Taken simply as a series of essays in legal and political philosophy, the present volume has considerable interest. Perhaps its chief merit is that it presents Pashukanis for the first time in English. Pashukanis was a profound legal philosopher, who dominated Soviet jurisprudence (and in some respects Soviet legal development) for some 20 years. His theories were, however, disastrous for the actual development of Soviet law, since he believed that law was based essentially on the market and on the principle of reciprocity or exchange, and that hence in a socialist planned economy law represented a bourgeois survival which should be used, if at all, simply for political purposes. Vyshinsky, with less profundity, but with more common sense, opposes the reduction of law to either politics or economics.

Hoover Institute Studies, Series B: "Elite Studies," Nos. 1, 2, and 3. Stanford Calif.: Stanford University Press. No price.

No. 1. LASSWELL, HAROLD D., DANIEL LERNER, and C. EASTON ROTHWELL. *The Comparative Study of Elites: An Introduction and Bibliography.* Pp. iii, 72. 1952.

No. 2. SCHUELLER, GEORGE K. *The Politburo.* Pp. vi, 79. 1951.

No. 3. LERNER, DANIEL, with ITHIEL DE SOLA POOL and GEORGE K. SCHUELLER. *The Nazi Elite.* Pp. x, 112. 1951.

These booklets open a series devoted to the study of leadership groups as part of a wider exploration of the "world revolution of our time." Whether or not God deigns to chuckle over so full a phrase, its use could hardly detract from the value of scientific inquiry into what is here called "elites." Lasswell recommends the concept as covering "both the leadership and the strata from which leaders usually come." Elites, it is asserted, exist in democratic as well as nondemocratic societies. The leadership groups are thus an inviting object of political analysis.

This idea itself is not unfamiliar. But it cannot be said that much capital has been made of it up to now. The significance of the new series lies in the systematic presentation of basic biographical data about the body of individuals who form or have formed particular elites. The results are a welcome enrichment of political science, both in broadening the empirical base of knowledge and in elaborating a useful methodological approach. The planners of the series and the individual authors deserve the gratitude of all those who seek to come to grips with the elusive essence of the political process.

This is where a brief review might end, ignoring the temptation to show the able authors less than right on particular points. But perhaps they will not mind if some words are added about the limitations that inhere in studying elites on the basis of a *Who's Who*. One thing such study leaves in the dark is the vital matter of internal relationships, above all the lines of effective communication within the elite as a general chart of power and status. Another thing that remains obscure is the relationship between different elite formations in one and the same society. This interplay of different elite formations can be observed even in societies where the supremacy of a particular elite formation is formally acknowledged.

More than ten years ago I suggested the possibilities of getting at the operating realities of totalitarian systems by examination of the "interaction of different hierarchies" within each system. Perhaps it is the focus on membership characteristics that carries into Scheuller's sketch of the Politburo and Lerner's sifting of the Nazi leadership an excessive implication of structural unity, despite the cautions sounded in the introductory discussion of the elite concept.

The set of mirrors so shrewdly employed in this series to look over forbidding walls provides us with intriguing perspectives, but leaves us still guessing at the whole story. One would hope for equally careful experimentation with additional approaches to increase the yield in a field of study that holds great promise.

FRITZ MORSTEIN MARX
American University

FEHLING, HELMUT M. *One Great Prison: The Story Behind Russia's Unreleased POW's.* With a foreword by KONRAD ADENAUER and JOSEF CARDINAL FRINGS. Translated from the German by CHARLES R. JOY. Pp. xvi, 175. Boston: The Beacon Press, 1951. $2.50.

The sordid story of the mistreatment of war prisoners, the infliction of penal servitude upon the soldiers of vanquished powers, keeping them from the home circle years after the end of hostilities, needs to be told as often and as fully as possible. Nowhere have reparations in human chattels attained such proportions or continued so long as in the Soviet Union, although France strove mightily, within the limits of her reduced capacity, to compile a record of shame, and the United States emerges with anything but clean hands.

Unfortunately, this little book by a German war captive is not an effective indictment of the Soviet record. It is in no sense a study of the problem, but merely a sketch of personal experiences, a relation of horrors in which incidents crowd upon each other with so little explanation as to leave the reader with a confused impression of everything except the nature of the Soviet regime. Less striving for literary effect and more down-to-earth reporting would have strengthened the author's message without detracting unduly from the interest of his narrative.

Embitterment over treatment that will shorten his life and has already claimed that of many of his fellows naturally disposes him to lump people and regime together in one sweeping condemnation—a common failing of our day, and one to which the author's own countrymen have fallen victim. Yet on occasion he succeeds in being fair to the Russian people. The story of the elderly woman physician (p. 54), whom "the hard soil of her homeland will soon cover" because of her devotion to the consumptive prisoners confided to her care, is deeply moving, and more than once an acid comment is made about the German character and a grudging tribute paid the Russian. There is unhappily little reason to think that Fehling has exaggerated conditions; as in the case of other accounts of life in the Soviet Union, the reader will not be able to decide whether cruelty or callousness is the more terrible aspect of Soviet rule, and whether prisoners of war fare any worse than native Russians who have somehow run afoul of this all-embracing system.

The second half of the book presents a useful compilation of documents, notes, and pronouncements regarding the war prisoners issue; when one emerges from the maze of conflicting statements, one is left with the feeling that nothing is certain except that large numbers of prisoners have perished in the Soviet Union and many are still detained despite official assertions to the contrary. Some day a definitive indictment may be drawn; this book does not do it, and it is obvious that it cannot be done at the present time.

OLIVER H. RADKEY
University of Cincinnati

KRYLOV, IVAN. *Soviet Staff Officer.* Translated by EDWARD FITZGERALD. Pp. vi, 298. New York: Philosophical Library, 1951. $3.75.

Some of the most pertinent questions of the day regarding the Soviet Union find elucidation in the conversations and experiences recorded by Captain Krylov. Are there real differences of opinion in the Politburo? What are Stalin's relations with the Politburo, with the Army? How far is Soviet policy determined by Communist dialectic, and how far by Russian historical aspirations? What is the nature of dissidence in the Party and among the people?

The author begins his story in the spring of 1940. Germany and the Soviet Union had partitioned Poland, and all the Powers except the United States were sparring for the most advantageous positions in the imminent great war. Krylov, as a staff officer with experience as military attaché abroad, a knowledge of French, German, and English, and membership in the Party, enjoyed the sharing of information and misinformation which took place at embassy functions and within the Party elite. Voroshilov invited him to a conference. Marshal Shaposhnikov was his sponsor and hero. As aide to the latter he attended a Kremlin top-level meeting of Politburo and General Staff members, with Stalin presiding, to decide between Shaposhnikov and Budenny on battle strategy. Because of an indiscretion, he was reduced to the ranks. He fought at Poltava, was wounded, decorated with the Order of Lenin, and regained his commission and place in military and political planning. He participated in a "circle" of army officers working for a palace revolution which would substitute the army for Party dictatorship. As a result of wartime acquaintance with peasants, the Cossacks, the Ukrainians, and the Soviet intelligentsia, but particularly in consequence of his study of Russian history, Krylov's convictions led him to shift to another dissident group, which dreamed of a Russian republic with free elections and justice for all.

Stalin appears as a shrewd manipulator rather than as a personal dictator. He draws out the members of the Politburo, seeming to enjoy their personal antagonisms; then, with his secretary, he works out a resolution which constitutes a synthesis for general acceptance. More than once have we learned from "inside" stories that Stalin turns to religion at critical moments. Krylov reports that at the signing of the treaty with Yugoslavia on April 6, 1941, Stalin said to Gavrilović, "We are brothers by blood and religion." As the party was breaking up, "Stalin went up to Gavrilović, shook him by the hand and then, before turning to go, made the sign

of the cross in the Orthodox manner . . . as though he were blessing the Yugoslav Minister."

When the war was at its height, the Soviet people became vocal in their hope that "everything will be different" with peace. They "expected political changes, the dissolution of the NKVD, free elections for the Supreme Council without intimidation by the local authorities, and the institution of a second party side by side with the Communist Party to get rid of the dictatorship. . . . Pamphlets were printed for civilian consumption explaining that 'the normal regime will consist of two parties: the Communist Party for the workers in the town, and a Peasant Party for the workers of the countryside.'" But, as victory drew near, the Communist Party resumed its grip, stifled free expression, astutely and mercilessly combined Communist dialectic method with Russian historical aspirations to set the stage for the greater conflict yet to come.

Most of the book is written in the form of conversation. This is a good style for enlivening, sharpening up, and personalizing the record, but it is of doubtful advantage in a field where accuracy is essential. Yet there is a ring of sincerity and authenticity throughout. Krylov's first hand reports on high level conversations are revealing, but his book is more valuable as the autobiography of a reasoning person in an unreasonable society. How many Krylovs are there in the Soviet Union today?

WESTERN CONTINENTAL EUROPE

ZURCHER, ARNOLD J. (Ed.). ***Constitutions and Constitutional Trends Since World War II: An Examination of Significant Aspects of Postwar Public Law with Particular Reference to the New Constitutions of Western Europe.*** Pp. viii, 351. New York: New York University Press, 1951. $5.00.

This work is a symposium of timely contributions by specialists in their respective fields: Carl J. Friedrich, "The Political Theory of the New Democratic Constitutions"; Edward G. Lewis, "Electoral Changes after World War II" and "The Position of the Representative Legislature in the Postwar Constitutions"; Joseph Dunner, "Stabilization of the Cabinet System in Western Europe"; Ferdinand A. Hermens, "Local Autonomy in France and Italy" and "Functional Autonomy after World War II"; John Brown Mason, "Federalism—The Bonn Model"; Adam B. Ulam, "The British Commonwealth as an Example of a Multinational State System"; and Robert G. Neumann, "Constitutional Documents of East-Central Europe."

These contributions are treated by Karl Loewenstein to an engagingly piquant rationalization under the all-too-modest title, "Reflections on the Value of Constitutions in Our Revolutionary Age." Editor Zurcher's introduction constitutes an able survey of the contributors' special studies, including Professor Loewenstein's Reflections. The book concludes with the texts of the constitutions subject to study; the Statute of Westminster, 1931; Communiqué and Declaration of the Commonwealth Prime Ministers' Conference; the Statute of the Council of Europe; and a useful index.

Within the space allotted, only a few over-all observations are feasible. The conception that constitutions, particularly democratic versions, would prove to be the simple and infallible cure-all for the ills of nineteenth- and twentieth-century politically organized society has received a rude shock. The hope that progressive modifications of such constitutions, dictated by changing internal and international exigencies, would eventually produce a workable functional mechanism suitable for the realization of basic moral, social, and political principles, has not fared better. Such hope has given way to the disturbing discovery that the more one changes, the more one is forced to change—an inevitable price to pay for the unpredictability of men, democratic or otherwise.

Some of the contributors see the shortcomings of democratic constitutions and functional processes in the failure to meet

the problem of the modern democratic party state, the absence of agreement on party values, and the lack of social and moral unity in the community. The reviewer suggests that tackling the problems cited by the contributors requires in the last analysis a coming to grips with the lack of moral, social, and political values among the citizenry at large, from which individual membership in parties, parliaments, and public administration issues.

The terms "moral" and "values" are used, without definition, as applied by the contributors, presumably in the meaning of the golden rule.

JOHANNES MATTERN
The Johns Hopkins University

DUVERGER, MAURICE. *Les Partis Politiques.* Pp. x, 476. Paris: Librairie Armand Colin, 1951. 100 fr.

In view of the importance of political parties in the contemporary world, astonishingly little is known about their internal structure, their comparative anatomy and the general principles that condition their development and influence. M. Duverger's book is an important pioneer work in this field. After a brief account of the historical origins of parties, he turns to the heart of the matter. His examination of structural problems, perhaps his most original contribution, includes the originating impulse, whether within or outside of the parliaments, the role of the inscribed members, militants, sympathizers, and voters, the ways of selecting the leaders, their power and relationship to the parties' parliamentary representatives. The second half of the volume deals with party systems, single, biparty, multiple-party, party alliances, and relationships with public opinion and governments. Numerous charts illustrate the text, and the conclusions are presented in a final chapter.

M. Duverger has an extraordinary knowledge of the political scene in many countries, overseas as well as in Europe. Examples shift with dizzy speed from one country or continent to another. Only the Far East and Spain are missing, while French experience is perhaps cited most frequently. Familiar with the technical literature in the important western languages, the author seems to have studied many problems at first hand and to have consulted the appropriate experts. Aware of the many gaps in his information, he repeatedly identifies his conclusions as tentative in character, and speaks of the development of a science of political parties in perhaps fifty years. That future researchers should ask the right questions is the most urgent need, and the author believes that he has formulated them.

These warnings notwithstanding, this book presents a remarkably integrated theory of parties, only one phase of which can be mentioned here. To say that M. Duverger regards the internal structure of parties as the key to all other problems would be unfair, for he attributes much influence to methods of voting (majority or proportional representation) and to party programs. But the trend of his thought lies definitely in that direction. In his opinion, the mass party, founded at the turn of the century by the Socialists, is here to stay with permanent local organizations of various types (including Communist cells and Fascist action squads) integrated vertically under powerful leadership. The United States is about the only exception. While all parties are oligarchical in character, they are becoming increasingly authoritarian under the influence of the mass parties. They form more than they reflect public opinion. M. Duverger nevertheless accepts the party system as indispensable and as justifiable. On the basis of the Turkish experience, he even sees the one-party system as an instrument of progress toward democracy in Asia but not in the Soviet Union where it has become a permanent organ of the state. In general, he values parties, not as an assurance of government "by the people and for the people" which he regards as impossible, but as a means of drawing leaders from the people.

E. MALCOLM CARROLL
Duke University

SCOTT, JOHN A. *Republican Ideas and the Liberal Tradition in France, 1870–1914.* Pp. 209. New York: Columbia University Press, 1951. $3.00.

According to Dr. Scott, French republicanism has been characterized by its opposition to the monarchical principle as "irrational and archaic," by the secular spirit which pervades it, by political democracy in a national state, and finally by a "deep concern for the social question." "From the beginning," says Scott, "the word republic has represented to millions of Frenchmen a social as much as a political ideal" (p. 18).

Contrary to James Bryce, the author does not believe French Republican democracy sprang suddenly into being in the eighteenth century. It, he thinks, dates back as far as the Reformation, if not farther, and was the result of generations of struggle against absolutism. Except for some very brief mention of Fénelon, Pierre Bayle, and Jurieu, he makes no attempt to illustrate or prove this important point. Instead the major part of his 44-page introduction is taken up with an interesting discussion of the ideas of the French philosophers of the Enlightenment and of the Girondists and Jacobins so far as these apply to his theme.

The main part of the volume deals first with the republican theories of a nineteenth century Gironde, in two chapters dealing with Charles Renouvier and the philosophic liberals and with Émile Littré and republican sociology, and second with what are termed the Neo-Jacobins, this section likewise subdivided into two chapters—on Clemenceau and the Radical party and on Solidarité, an official philosophy.

Renouvier, says Dr. Scott, took the Girondist tradition of the eighteenth century, too narrowly political to suit the advancing times, and "developed it to meet the special problems raised by the coming of the industrial age" and early socialism.

Littré, while advancing liberal republicanism still farther by his philosophical writings and his membership in parliament, gave a practical bent to its existence. To him, it must rely on the liberal bourgeosie and the peasantry as against the extremes of the Right and the Left. To accomplish its purposes it must advance a policy of national education, social conciliation, and protection of peasant rights.

Perhaps Clemenceau, whose family was thoroughly Jacobin in background, with the family residence "cluttered with pictures of Robespierre, Saint-Just, and other great Jacobin heroes," is most interesting of all both in the vicissitudes of his career and in his personality. He was present in America at the end of the Civil War and in Paris during its siege and the Days of the Commune; he became the champion of popular rights and of the Republic in parliament, the leader of the radical group which held the parliamentary balance of power, first as the workers' spokesman in parliament, and then in fierce opposition to the workers' contention that war in 1914 would be a crime which they must unite to oppose, he strongly advocated *revanche* towards Germany and *rapprochement* with England; and finally he is distinguished by his role as indomitable war dictator in 1917.

In his ideals Clemenceau especially advanced the "concept of the Republic as a lay state." It never could be secure as long as state and church were officially combined. The church must be driven out of politics since in the past the state had been "submerged by successive waves of royalist and clerical reaction." Purged of the influence of royalists and of the church, France should enjoy a stable, democratic regime, while the carrying out of peaceful social reform should satisfy the proletariat and make future revolutions unnecessary.

This latter idea was in accord with Solidarité, the official philosophy founded by Alfred Fouillée and further developed by Léon Bourgeois. "The aim of Solidarité was not social equality, the abolition of capitalism, and the inauguration of socialism. Solidarité stressed the necessity of maintaining the existing bases of society, of making only those social concessions that would avert the danger of revolution" (p. 176). Neither, as Bourgeois saw it, was it state socialism as in Germany. "The state should not interfere in economic life to the extent of challenging or regulating the productive process or the employer-labor relationship" (p. 177). While avoiding both laissez-faire liberalism and revolutionary socialism" it provided a formula for the amelioration of glaring social abuses, while maintaining untouched the existing bases of capitalist society in private property and freedom of business enterprises" (p. 178). It became a philosophical guide for the leading republican intellectuals. It was taught in the schools, became the topic of many articles and speeches, and Solidarité was accepted in the assembly as the promoter of public assistance and social hygiene laws. It became by 1914 "the dominant philosophy of the Third Republic" (p. 179).

It may be said in conclusion that this volume of the Columbia Studies in History, Economics, and Public Law is well organized, well written, and thought provoking.

JAMES E. GILLESPIE
Pennsylvania State College

WIESE UND KAISERWALDAU, LEOPOLD MAX WALTER VON. *Gesellschaftliche Stände und Klassen.* Pp. 85. Bern, Switzerland: A. Francke, 1950. No price.

Dr. Leopold von Wiese of the University of Cologne, Germany, whose seventy-fifth birthday is being celebrated by his admirers in the field of social philosophy, gives in his recent study of functional and social classes an interesting insight into German scientific thought. In his brilliantly written book the problem of what determines class membership is historically developed.

Professor von Wiese begins with the "karnine" social system of Blut, where the functioning group is based upon blood ties —the period of Nomadism. Then he describes the "domine" social system of Boden (settlement on land) with its natural consequences of war and conquest, warrior and leader, slavery and serfdom—the period of feudalism. *Reiten und Rauben ist keine Schande; das tun die Besten im Lande.* To ride and to rob is no disgrace; it's done by the best in the land. This system of feudalism is followed by the institution of craft and merchant guilds, patriciate, and township in the "merzine" period of commerce. The ensuing Industrial Revolution produced the "artine" type through technology. The social hierarchy, based upon a differentiating system of values, especially of "individuation"—evaluation of the individual according to his qualifications, social heredity, and economic income, leading to *Klasse*—is historically preceded by the functional class of occupation and profession—*Stand*. The principal of individuation has been replaced in the European sphere of culture by the class struggle in Marxian sense between proletariat and proprietor, which, according to the author, eventually created a system of five classes: the impoverished; the labor class; the small capitalists; the well-to-do; and the plutocrats. Today, after the collapse of National-Socialism, Professor von Wiese sees six classes in Germany: the uprooted (some 15 million expellees, who cannot find a niche in *Klasse* or *Stand*); the old and disabled; the intellectuals; the laborers and employees; the small entrepreneurs and farmers; and the monopolists of coal, iron, textile, and chemical industry, who, however, do not represent the capitalists of the old style, but rather a kind of black or gray marketeers of scarce goods—a moral result of the national disaster.

His book ends with an interesting outlook into the future stratification of society. This last chapter must be especially provoking to a man who spent the first half of his life in German intellectual climate and thereafter has studied American social philosophy for more than a decade in this country.

Von Wiese's rejection of communism as a farce of classlessness and socialization of thought will be generally shared here. However it seems to this writer that the author's blueprint of an ideal society of the future is already reality in the United States today, even in view of much criticized exceptions. Von Wiese's general premise of social stratification is the assumption of hereditary inequality, biologically as well as socially, which consequently and inevitably leads to the hierarchy in social structure. In this connection he thinks of natural inequalities of talent, genes, of mental, emotional, and physical potentialities. As a distant goal, the author visualizes social freedom from limitations, selfishness, and enmities—equality on a higher level. The near goal should be a social

structure in which the different social levels come closer to each other through higher general culture and higher standard of living.

In order to understand von Wiese's argumentation, it should be remembered that deeply anchored in the German mind, historically conditioned in a feudal social order, along with heel clicking in the presence of a member of a "higher" class, is the conscious or subconscious thought that the "higher" class is the socially more valuable one. It is somewhat difficult to disregard the impression that the author is more a student of the French and the Bolshevist Revolutions than of the American Revolution of 1776. Because what are sketched by von Wiese as distant and near goals for an ideal society of the future have become or are in the process of being definite reality in this country. While even Great Britain had legal class privileges until 1945, privileged classes are legally unknown in the United States. The privileged class of nobility and aristocracy has been abolished in this country since 1776. The social distance between individuals here is recognizably smaller. The greater accessibility of the American of even highest functional class stems from the democratic attitude of equality. Even if it must be admitted that there exists a certain rigidity of spatial boundaries within the more intimate central regions of personality, exemplified in exclusive clubs, this could probably be explained as a form of feudalistic atavism.

Lloyd Warner's economic class structure is not identical with European class consciousness, an attitude which separates the proletarian from the capitalist, the poor from the rich. We do not have here class hatred of Marxian vintage between the representatives of the lower economic classes, who do not think of themselves as proletarians, and the lower upper and upper upper classes. There is no deep enmity between capital and labor in the United States, because the well-to-do do not represent a "ruling" class of capitalism in the sense of Marx. American capitalism is not scheming to "exploit" labor, because labor is its best customer in a predominantly domestic market. In Europe political power always has been and still is caste or class power. American government is not partisan. The Democratic party is not the party of the poor, and the Republicans are not the rich—the coal miners' boss Lewis is a Republican. American government has to defend the rights of labor as well as those of capital in order to remain in office. In spite of numerous exceptions, it is American tradition to chose the white man according to his ability rather than according to his pedigree.

Von Wiese's immediate goal of social structure, in which the different social levels would come closer to each other through higher general culture and standard of living, seems to have been achieved here through our high income and inheritance taxes which are closing more and more the gap between rich and poor, and through our vastly improving general educational system which lifts the individual to a higher cultural *niveau*. All the rich, according to the author's dream of a future society, should feel themselves as trustees of funds used in general and public interest. The numerous private foundations for research in our country are ample proof that these dreams are reality in the United States. Classlessness in von Wiese's opinion (page 82) is equivalent to communism. However our own tax and educational system seems to lead to a somewhat real classless society on that higher level von Wiese speaks of. But it certainly will not be communism.

Only once, in the last sentence of his book, is American culture mentioned—in a negative sense. It confirmed for this writer how little understood our social philosophy is in Germany.

ROBERT SCHARF
Georgia Institute of Technology

EINAUDI, MARIO, JEAN-MARIE DOMENACH, and ALDO GAROSCI. *Communism in Western Europe*. Pp. ix, 239. Ithaca, N. Y.: Cornell University Press, 1951. $3.00.

This is a most useful piece of research on the political strategy and tactics, on the organization and strength, on the historical evolution, and on the present prospects of communism in what the authors insist on calling Western Europe, but which is actually only a part, though an important part of it—France and Italy. Neither the Low Countries, Western Germany, Switzerland, nor Austria is examined, not to speak of Great Britain and Scandinavia. This equation of France and Italy with Western Europe is not only a bit parochial but in the present context actually misleading, because it suggests that the conditions discussed in the book are typical of all of Western Europe, whereas in fact in other sections west of the Iron Curtain conditions are extremely different, and the reasons why this is so would merit careful comparison.

On the other hand, the authors are justified in lumping France and Italy together for the purpose of their present study, more so than was Einaudi in describing their constitutional systems together in the collective text on *Foreign Governments* edited by F. Morstein Marx, a feature wisely abandoned in its second edition. For, while the constitutional systems of the two countries are very different, their situation with regard to communism is indeed strikingly alike.

In the full and accurate analysis of this situation the book represents good workmanship of able political scientists, intent on facts first and interpretation next. Jean-Marie Domenach, member of the French Resistance and editor of a periodical dedicated to Catholic thought, presents the French Communist party in some 90 pages; Aldo Garosci, of the Italian "Justice and Freedom" movement, its Italian counterpart in about an equal space; while Mario Einaudi draws general conclusions in a fine 60-page introductory chapter.

Most illuminating are the precise details given on organization and tactics, especially on the cells and their efficient control from above through the inhibition of cross contacts among them; the flexible use of expansive and contractive methods; the simple devices applied in winning domination over other groups that have been allured into some joint front organization or bloc; and above all the analysis of the reasons why people of obviously non-Communist convictions have so generously given their votes to the Communist party in both countries, which they failed to do, for example, in Western Germany or Norway. The role played by trusted, and in the general sense of the term integer, personalities in Communist activities is well illustrated by sketches part caricature and part idealization, which are offered of the leading Communists.

Unfortunately, nonprofessional readers will not readily turn to a book like this which is both difficult to read and bare of sensational coloring. If they did, they would better understand what is going on this side of the Iron Curtain, what the dangers are of ignorance in dealing with an adversary like Communism, and the overpowering importance of positive rather than negative measures in the cold war.

ARNOLD BRECHT
New School for Social Research

GALENSON, WALTER. *The Danish System of Labor Relations*. Pp. xiii, 321. Cambridge, Mass.: Harvard University Press, 1952. $4.50.

Having written *Labor in Norway* and *Rival Unionism in the United States*, Galenson is well prepared to analyze comparative differences and similarities in labor movements. The uniqueness of Danish industrial relations appears in part to arise from such features of the Danish economy as great dependence upon international trade, high relative importance of agriculture, the predominance of small-scale industry, and the existence of a sizable entrepreneurial group. Also a spirit of corporatism in all economic matters, a product of the easy absorption of guild traditions in a country which experienced no sudden industrial revolution, has had a profound effect upon labor relations. The result has been two powerful organizations of labor and industry whose equals in strength probably cannot be found anywhere. Yet under a highly centralized collective bargaining system these two movements have been able to live in relative peace.

This Galenson accounts for upon the basis of an interesting set of institutional arrangements which have grown out of the so-called "September Agreement" of 1899 which ended a nationwide lockout at that

time. This agreement defined the position and acceptable tactics of the two groups. Over the years a system of voluntary collective bargaining and state mediators for the settlement of matters of interests and a system of arbitration boards and a labor court for deciding, and rigidly enforcing, matters of rights has been able to keep labor relations on a smoother basis than in such highly regarded "laboristic" states as Norway and Sweden.

Galenson find that Danish labor, while a part of a socialist movement which through coalition has controlled Denmark for several decades, has been far less interested in either socialism or economic planning than the English or other Scandinavian labor movements. Its interests have centered in collective bargaining and welfare state policies. Today Denmark spends a larger percentage of its national income for welfare services than any other state in the world. The labor movement has also been distinguished by a decided cleavage between skilled workers organized largely in compound craft unions and a general union of unskilled labor which has about 40 per cent of total union membership. While the labor movement over a half century does not appear, upon the basis of limited statistical evidence, to have altered the distribution of income between labor and other groups, it does appear to have narrowed wage differentials.

Pressure for higher wages, backed by political power, is beginning, however, in Galenson's estimation to develop some cracks in the collective bargaining system which cannot deliver the desired goods in an economy disrupted by one war and clouded by another. Direct political intervention by Parliament is increasing in labor dispute settlements, and this may augur ill for the continuance of the unique voluntary centralized collective bargaining structure that has been built up.

Meanwhile Danish labor, while hobbling economic mobility and productivity with a rigid apprenticeship system, has shown great interest in increasing production through joint labor-management committees. It has also shown at all times unswerving allegiance to democratic procedures. "If there is any nation that can peacefully adjust the social conflict arising from industrialization, with equal regard to the welfare of the individual citizen, whether he be worker, farmer, or business man, it is Denmark."

In my opinion this book is the best example to date of a study that not only describes the labor relations system of a country, but provides a significant economic analysis of it in terms both of its impact upon the workings of the economy and of the extent to which the movement itself is a product of the peculiar economic problems of the nation. OTHERS

ZINKIN, MAURICE. *Asia and the West.* Pp. xii, 300. London: Chatto & Windus (distributed in the United States by Institute of Pacific Relations), 1951. $3.50.

This lively book should be read by all who are interested in investment and trade in Asia, and in the problems that are created for investment and trade by the complicated political movements of Asia. The author was formerly a member of the Indian Civil Service and is now a representative in India of Unilever, a great British corporation that is active in many countries in both production and distribution. The introduction to the book is by Sir Geoffrey Heyworth, a director of Unilever.

There are some points in Mr. Zinkin's approach to the problems with which he deals that should be of special interest to Americans who are studying the same problems. Mr. Zinkin takes India as the geographical center from which he looks out at the rest of Asia, whereas the more usual American approach is through Japan or China. Mr. Zinkin was formerly an administrative officer of the greatest British imperial possession, and is now an executive of a great British corporation doing business in the same country, which has since become independent. This kind of combined experience is most exceptional in Americans writing about the problems of Asia.

Mr. Zinkin's Indian experience and knowledge give a special edge to his analyses of other countries in Asia; but unfortunately no one man can be equally authoritative about all the countries of Asia. The fact that therefore some of his opinions are decidedly open to challenge, because of insufficient knowledge, must however be offset against the fact that his opinions are always interesting, because he has an open, inquiring, and original mind.

For example, his statement that "it is very doubtful whether the Koreans were in the end any worse off because of Japanese rule" (p. 68) is certainly questionable; in fact, Mr. Zinkin himself provides the material for refuting this statement. With this statement may be contrasted the penetrating observation that politically British law and order in India "provided many of the concepts upon which the new free and liberal India is being developed," but that at the same time "economically it has been an almost unmitigated disaster" (p. 76).

Another statement that can be challenged is that "the most bankrupt countryside in Asia is the Chinese" (p. 111). It is this reviewer's opinion that the rural economy of India is more bankrupt than that of China.

Probably the most interesting statement in the whole book, coming from a representative of risk capital, is that Asia, "outside the Communist area . . . is moving Right at about the same pace as Western Europe, and for very similar reasons" (p. 287). OWEN LATTIMORE

Johns Hopkins University

COATES, W. P., and ZELDA K. COATES. *Soviets in Central Asia.* Pp. 288. New York: Philosophical Library, 1951. $4.75.

The authors of this book seem very close to the Soviet scene; in fact they are so close that not a critical word is mentioned regarding Soviet policy or the method by which it is implemented. Part I, the first third of the book, is a short historical sketch of a region which has a very long history. A short review of S. N. Tolstov's work on the Khwarzin Culture is new and of interest in understanding the background of Central Asia. However, the main purpose seems to be to set up a picture of desolation, slavery, exploitation, and poverty in order that one may be properly prepared for the sharp contrast of the beneficent Soviet regime. The people of Central Asia had domesticated most of the plants and animals used by the Western World long before any Russian was known in these parts. Also, agriculture and cities were as early here as at Sumer. How about the great achievements in ceramics and textiles? In the realm of ideas, Zoroaster is barely mentioned. The authors speak of liberation in 1917, but is it liberation to have the control of your country shifted from czarist to Soviet rule?

The latter two thirds of the book (Part II) is similar in content to the *Soviet Weekly* and the *Information Bulletin* of the Soviet embassy. All photographs are taken from these sources. The authors state that they were recently in Soviet Central Asia, but no dates were given nor any word indicating under whose auspices they were able to travel there. Obviously they could not photograph freely, or we might have had the treat of a fresh photograph. There is little doubt that some progress has been made under the U.S.S.R., but it is difficult to understand how the land has changed from one of poverty and slavery to milk and honey in a span of twenty-five years. The tone of the book is such as to imply that now Utopia has been reached. The description of achievements in large desert Kazakhstan is the same as in small mountainous Kirgizia and in each case tells that kindergartens, hospitals, and "houses of culture" are everywhere, and that all are working as one happy family.

The author's conclusion is an attempt to refute all argument that forced labor exists in the Soviet Union. To quote the final paragraph: "Forced labour could never produce such widespread feelings of pride and loyalty to their regime. It is only because the peoples of these republics feel themselves to be free and equal citizens with all others in their country, because they feel that they themselves are the masters of their destiny, that their work in the fields, mines and factories is work for themselves, their families and the good

of their own state, that they work with such enthusiasm, and that work in the U.S.S.R. is becoming more and more, in the words of the Turkmenian letter, 'a matter of honour, of glory, of valor and heroism.'"

Obviously, the many statistics in the book are official and must be assumed to be correct. The frequent mentioning of 8,000 kilowatt electric stations and 50,000-ton-capacity coal mines makes dull reading. In contrast to this favorable statistical picture the authors often say that "the sanitary conditions are very primitive but clean."

Soviets in Central Asia adds very little to what is already available in Soviet propaganda literature.

JOSEPH E. WILLIAMS
Stanford University

RILEY, JOHN W., JR., and WILBUR SCHRAMM. *The Reds Take a City: The Communist Occupation of Seoul, With Eyewitness Accounts.* Narratives translated by HUGH HEUNG-WU CYNN. Pp. xiv, 210. New Brunswick: Rutgers University Press, 1951. $2.75.

This volume is a résumé of 90 dark days of terror when the Reds occupied Seoul, capital of the Republic of Korea.

The authors have set forth a realistic account of how the Reds moved into South Korea, not only with military weapons but with tons of leaflets, posters, propaganda materials, and complete dossiers on key Republic of Korea personnel marked for liquidation and of personnel trained to administer the municipal function of a large city.

The blueprint of Communist occupation shown includes a program which runs the gamut between the extremes of the "mailed fist" and the proverb, "One can catch more flies with honey than with vinegar." Thought control, propaganda of the big lie repeated through every medium of communication, attacks on the United States and on the former Republic of Korea, praise for the U.S.S.R., arrests, "voluntary" confessions, trials, executions, lootings, people's courts, cultural meetings, and indoctrinations kept everyone busy every minute of the day and night.

The Reds even attempted to impose a number of long-overdue improvement programs such as higher taxes on business, land reforms, and the giving of more rights to women. However, from their point of view, and they never once lost sight of it, the elimination of the "reactionaries" was their main purpose, and they strove to achieve this objective throughout the entire occupation.

Clearly written by two university professors, the members of an American team of experts, the manuscript contains (1) sufficient background material necessary to understand the occurring events as well as (2) translations from personal eyewitness accounts and experiences of eleven representative Korean Democrats who survived the occupation and who by their dramatic and exciting stories reveal what may be expected by free people who are marked for liquidation or who are a part of the Democratic forces when the Communists occupy a city.

The personal experiences include stories of (1) a congresswoman who writes: "That night in a cell I tried to commit suicide by tying a stocking around my neck, but at the point of tightening, I thought of my children—how could a mother of seven do away with herself? I put the stocking down"; and (2) a newspaper man speaking on the "lack of water treatment": "Once I saw an old man fold a piece of paper, make a cup of it and use it to drink his own water. . . . Later while hiding out, I could no longer stand the thirst. I remembered what I had seen the old man doing, and I, too, drank my own water"; and (3) a professor fleeing, after being marked for liquidation, who stated: "Even to my wife who came out to the gate, I did not turn my head but said simply, 'There is no telling when we will meet again. Maybe after a few days, maybe after a few years. Meanwhile we must survive.' Then I left my family, my house and library."

The foregoing accounts are sad, but the people never lost their staunch opposition to the Reds. It is also interesting to note that the South Koreans were learning the Russian language but did not know it. As a law professor stated: "what the word 'dawai' means or where it originated is not known. However, when Red Soldiers take away the thing that belongs to others, the civilians say that they have been 'dawaied'!" The Reds looted radios, pianos, furniture, equipment, and food under the "dawai" procedure both for home consumption and for shipment to North Korea.

The word "dawai" comes from the Russian language, and simply means "give," but when you say "dawai" it is with the force of authority similar to that of a hold-up bandit who is armed with two six-shooters to enforce his request.

MORRIS BERZON
Boston, Massachusetts

WISE, GEORGE S. *Caudillo: A Portrait of Antonio Guzmán Blanco.* Pp. xvii, 190. New York: Columbia University Press, 1951. $3.00.

The inspiration for this little volume by Dr Wise is a happy one: to study the phenomenon of *caudillismo* as reflected in the career of a typical *caudillo*. The realization is less happy. Guzmán Blanco was Venezuela's best known *caudillo* and one of the more famous ones in all of Latin America. The author promises in his foreword that "We shall see that the various aspects of his rule and the conditions under which he ruled are integrally bound together . . . there are certain features in the rule of this caudillo that manifested themselves again and again in the history of other Latin American countries, and by a detailed analysis of his career we get a more intimate picture of the mechanisms involved than could have been attained by a broad comparative analysis of all or many caudillo regimes in Latin America."

After a treatment of Venezuelan colonial backgrounds and institutional development Dr. Wise discusses in four chapters the career of Guzmán Blanco himself. In four succeeding chapters he discusses the "aspects of a *caudillo* regime": ideological irresponsibility, the unqualified use of force, financial chicanery, and personalism. These chapters logically should provide the heart of the study, but that sort of organization inevitably provides a danger—one the author does not entirely succeed in avoiding—namely, that of repetition of what has already been said in the biographical chapters.

The volume contains no clear-cut working definition of either of the terms *caudillo* or *caudillismo*. In a case study of this highly important Latin American phenomenon and of one of such dramatic actors on the political stage that is a regrettable omission. If the author could have projected the elements which conditioned Guzmán Blanco's career into a general interpretation of *caudillismo* as a whole the study would have gained greatly in value.

Several instances of inaccurate or awkward translation occur. *"Derecho de gentes"* (p. 78) should properly be translated as "international law" rather than as "the rights of the people"; the word "colleges" (p. 83) would appear to have been translated from *colegios,* but that is a misleading translation; it is stated (p. 84) that a "decree created a national direction of primary instruction" but if the key word is translated from *dirección* it is again an infelicitous rendering; the author does not need to invert Guzmán Blanco's words (p. 166) and make him say: "the only one who can think am I, and the only one who does think am I."

We need more studies of *caudillos* and *caudillismo* if those leaders and that condition are properly to be understood. Unfortunately this volume, despite much useful information which it contains, does not give us the best sort of model.

COON, CARLETON S. *Caravan: The Story of the Middle East.* Pp. viii, 376. New York: Henry Holt and Company, 1951. $5.00.

This valuable book by a professor of anthropology is a real vade mecum on the Middle East. It is informative and makes fascinating reading; above all, it is full of learning. It provides a convenient summary of life and culture in nearly all the countries touched by Arab civilization, or where Mohammedanism is the dominant religion.

The general course of the narrative is given in the form of "case studies." Such is the detailed description of the society in Fez, the life in a village (Khunik, in northeastern Iran), or the ways of the Bedouins (the Bedawis of the author) in Arabia. Throughout there is a heavy sprinkling of most recent information, in the text and in footnotes, on many phases of most ancient history. Professor Coon disclaims any attempt to be up to date (p. 342), but he is well aware of new archaeological discoveries and linguistic theories. The story of the rise and spread of Mohammedanism has been narrated many times by others, but its impact on the nomadic and seminomadic Arab is most vividly presented by the author. It was just the type of religion which millions in these vast areas adopted, one that did not disturb the prevailing equilibrium.

Perhaps the best parts of the book (Chapters 11, 13, and 15) deal with the unenviable lot of the poor, especially in Iran. There, and in many parts of the Middle East, no matter how hard a tenant farmer works, his income is never more than a fifth of the crop, and that is barely enough to keep him and his family alive. The solution of that most acute problem, the elimination of widespread poverty in relatively wealthy countries, is the paramount task of our age; it is becoming a categorical imperative.

It would seem perhaps unkind to find shortcomings in such a book, but it is incumbent on a reviewer to point out some of them. Professor Coon thinks that the Moslem civilization anticipated and aimed toward the realization of the "One World." His interpretation of Moslem culture and Moslem dogma places other religions, and especially the Christian religion, on a different level. This point of view is open to serious criticism, but this is not the place. It may be that Oxford (England) was a market town (p. 253) when Moslem universities were in full growth, but it is rather misleading to call certain schools of the Middle East in the Middle Ages universities.

POLITICAL SCIENCE BOOKS FROM **OXFORD**

Pioneers of Russian Social Thought

Studies of Non-Marxian Formation in 19th Century Russia and of its Partial Revival in the Soviet Union

By RICHARD HARE. "Two cultural currents, Western and Slavophile, come to life in lively profiles of the most prominent representative of both sides. . . . More than an important volume on history, this is a highly topical and instructive work in the best sense. It throws a good deal of light on the enigma of Stalinist Russia."—*N. Y. Times Book Review*. Illustrated. $4.50

Principles of Social and Political Theory

By ERNEST BARKER. A penetrating examination of the fundamental principles on which the existence of Society and the State is based. The discussion of collectivism *versus* individualism today will be of particular interest to everyone concerned with the shape of modern society. $5.00

PRINCIPLES AND PROBLEMS of American National Government

By JOHN M. SWARTHOUT and ERNEST R. BARTLEY. An introduction to the government of the United States which stresses the why as well as the *how* of the development of the Constitution, public opinion, representation and functions of national government. The lively, straightforward style and sustained awareness of the undergraduate audience make the complex subject of government easily understandable. Illustrated. $4.25

Hobbes and His Critics

A Study in Seventeenth Century Constitutionalism

By JOHN BOWLE. This first systematic account of the contemporary criticism Hobbes provoked reveals how essential this context is to a full understanding of his challenge to the tradition of divine sanction for the state. $2.75

Elements of Democratic Government

By J. A. CORRY. This well-known presentation of democratic governments in action has been completely revised and greatly enlarged. It contains new material on the study of Government, Civil Rights, Democratic Trends and International Politics, with special emphasis on the contrast between dictatorships and basic democratic principles. New edition. $4.50

INDEX 197

The articles appearing in THE ANNALS are indexed in the *Readers' Guide to Periodical Literature* and the *Industrial Arts Index.*

FOREWORD

THIS volume of THE ANNALS contains the addresses delivered at the Fifty-sixth Annual Meeting of the Academy, held on April 18 and 19, 1952, on the general topic: "The National Interest—Alone or With Others?" An article by Frederick L. Schuman in the March 1952 issue of THE ANNALS, entitled "International Ideals and the National Interest," relates to the same topic.

The concept of the national interest is now being subjected to careful re-examination and analysis in the light of the epochal changes that are occurring in the pattern of international society. This re-examination and analysis have probably been more searching and more broadly gauged than at any previous period; but, as the articles in this volume reveal, there is still a wide divergence of views on the nature of the national interest and on the desirable ways and means of reconciling conflicting national interests, both within a state and among states.

This concern with the national interest seems to reflect a growing maturity of approach in this country to questions of foreign policy. The opening remarks of the first speaker at the Fifty-sixth Annual Meeting, Professor Hans J. Morgenthau, called attention to this point. "The very fact that a society like The American Academy of Political and Social Science can organize a two-day meeting around the concept of the national interest of the United States," said Professor Morgenthau, "is significant in itself, for it shows the profound change which has come about in American thinking on matters of foreign policy."

The question posed at the Fifty-sixth Annual Meeting of the Academy is, as Senator Sparkman declared, "a basic issue which the policy makers and all the American people must face squarely." We may assume as a matter of course that all loyal Americans sincerely desire to promote the national interests. Doubtless most of them are convinced that these interests can be advanced only "with others" and not "alone." But, as has been suggested, there are many views on the exact nature of the national interest in general and of national interests in particular problem situations. This latter point is a matter of everyday observation. It is reflected in all studies of the subject. Charles A. Beard documented it in his important study of *The Idea of National Interest,* published more than a decade and a half ago. Beard's own views of the national interest obviously did not coincide with those of Franklin D. Roosevelt, as even a casual examination of his bitter volumes on American foreign policy in the months prior to Pearl Harbor will show. The two distinguished members of the United States Congress whose addresses appear in this volume are united in their desire to further the national interests, but they are often far apart in their interpretations of specific policies of the Administration. It is quite clear that on this important question honest and able and patriotic men may profoundly disagree.

Beard advanced the thesis that two interpretations of the national interest were particularly meaningful in analyzing the basic trends and objectives of American foreign policy. These interpretations he called the Hamiltonian and the Jeffersonian. In the concluding paragraph of his book, *The Idea of National Interest,* he wrote:

"Evidently, then, the two inherited conceptions of national interest are in the process of fusion and dissolution. A new conception, with a positive core and

nebulous implications, is rising out of the past and is awaiting formulation at the hands of a statesman as competent and powerful as Hamilton or Jefferson."

No such statesman has yet appeared; perhaps even a Hamilton or a Jefferson would experience difficulty in formulating "a new conception" of the national interest in the present bewildering age.

It may well be, as some critics insist, that in recent years our leaders have not given adequate attention to the national interest. If conceived too narrowly, however, the concept may lead to policies which are dangerously self-centered and myopic. Somehow it must be related to ideals and principles, to considerations of the general welfare, and to a "decent respect to the opinions of mankind," to which the Declaration of Independence referred. "It is possible," as Professor Dexter Perkins has pointed out, "to sketch the history of American foreign policy in terms of principle, as well as in terms of interest, and it is necessary to bear in mind the fusion of these two factors in the actual evolution of policy" (*The Story of U. S. Foreign Policy*, Foreign Policy Association Headline Series No. 90, November–December 1951, p. 4).

Diverse views of the interests of other countries are also presented in this volume. Nearly half of the authors are not Americans. It is a fact of more than passing significance that every one of the six continents is here represented. This is most appropriate and fitting, for other nations too are re-examining their national interests under present conditions of transition and change, and the national interest of every country in this interdependent world must be considered in a global setting and in relation to the interests and policies of other countries.

Recently in the United States the concept of the national interest has been examined most thoroughly by those who belong to what may be called the "realistic" school. The views of this school are reflected in the brilliant article in this volume by one of its leading representatives, Professor Hans J. Morgenthau. Dr. Abraham Feller's article is an equally brilliant criticism of these views, and a defense of the so-called "legalistic-moralistic" approach (an awkward term which George F. Kennan has made popular). Perhaps in no other single publication have both the "realistic" and the "legalistic-moralistic" approaches been presented so clearly and so effectively.

From an international as well as from a national point of view the concept of the national interest may lead into blind alleys if it is interpreted too narrowly. One might profitably examine the "paradox" mentioned by Dr. Charles B. Marshall, "that we can serve our national interest in these times only by a policy which transcends our national interest." In his forceful presentation of the need for European unity Paul-Henri Spaak declared: "It is in forgetting our so-called national interests that we shall be able to create and support . . . a western community." The similarity in viewpoint of a member of the Policy Planning Staff of the United States Department of State and of a leading champion of European unity is striking and suggestive.

On the whole we may conclude that the concept of the national interest provides a useful guide to foreign policy if it is conceived broadly and realistically. The articles in this volume reveal both the possibilities and the limitations of this approach. They also provide an impressive answer to the central question: "The national interest—alone or with others?"

NORMAN D. PALMER

What Is the National Interest of the United States?

By HANS J. MORGENTHAU

THE very fact that a society like The American Academy of Political and Social Science can organize a two-day meeting around the concept of the national interest of the United States is significant in itself, for it shows the profound change which has come about in American thinking on matters of foreign policy.

A little less than forty years ago, one of the greatest of American statesmen, Woodrow Wilson, gave a speech at Mobile, Alabama in which he declared, "It is a very perilous thing to determine the foreign policy of a nation in the terms of material interest. It not only is unfair to those with whom you are dealing, but it is degrading as regards your own actions." Woodrow Wilson, in thus speaking, echoed an opinion which was widespread in his time. Some decades earlier, Gladstone had propounded in Great Britain a similar philosophy in opposition to the policies of Disraeli. Few would be bold enough today to express in so uncompromising terms their disparagement of the national interest. Even so, we have still to cope with a philosophy, very much alive in our midst, which, while it recognizes the national interest and its importance, defines it in terms which take the heart out of the concept and out of the policies intended to support it.

From the very beginning of American history, two irreconcilable philosophies have struggled for predominance over the American mind. One prevailed during the Federalist period of American foreign policy, that is to say, roughly the first decade of American history, and its outstanding representative was Alexander Hamilton. The other conception of the national interest of the United States seems to be the exact opposite of that of the Federalist, and is represented by any number of individuals and policies in recent American history. Woodrow Wilson is the outstanding exponent of it.

THE FEDERALIST CONCEPTION

The Federalist conception of the American interest in foreign affairs was based on three presuppositions. The first was that the interest of the United States in international affairs was fundamentally different from those interests which European nations traditionally pursued. The Farewell Address of Washington is a clear example of this presupposition: the idea that the United States was an experiment in government unique in its essential aspects and that one of the main purposes of American foreign policy was to protect this experiment against encroachments by the traditional ways of the European nations.

This purpose leads to the second presupposition of the Federalist conception of foreign policy, and that is what one might call the isolation of the United States. However, this conception was not similar to that which was propounded by the isolationists of the 1920's and 1930's and is still being defended to a certain extent by the neo-isolationists of today. They believe that there exists something like a natural isolation of the United States from the rest of the world, an isolation which can best be preserved by abstention from an active foreign policy and by retreat into what is now called the "continental fortress" of the United States.

The Founding Fathers had a clear conception of the relationship between the isolation of the United States from the affairs of Europe and an active foreign policy to be pursued by the United States. With the Founding Fathers, the isolation of the United States was not a gift of nature to be preserved by doing nothing. It was rather the result of an intelligent and deliberate foreign policy to be achieved by hard thinking and hard work.

The third presupposition of the Federalists was that, in order to make the United States immune from foreign interference and, more particularly, from being drawn into the squabbles of Europe, its foreign policy had to be a policy of the balance of power. Men like Alexander Hamilton, John Adams, and even John Quincy Adams realized that the isolation of the United States was a mere function of the balance of power in Europe. They realized that only as long as the most powerful European nations were pitted against each other, unable therefore to cross the Atlantic for adventures in the Western Hemisphere, was the United States safe from European intervention and from being drawn into the conflicts of Europe.

THE NEWER CONCEPTION

The other conception of the national interest of the United States has developed since the Spanish-American War. In both its manifestations, it denies the intimate connection between the isolation, that is the security, of the United States in the Western Hemisphere and a discriminating active foreign policy with regard to the other nations of the world.

I implied that there are two manifestations of that conception. One may be called isolationism pure and simple, that is to say, not only a retreat from intervention in the affairs of other continents, but a retreat from an active foreign policy altogether. The other manifestation may be called isolationism turned inside out. It is unlimited, world-embracing interventionism. It is a policy which makes no distinction between the interests of the United States and the interests of other nations, and within the interests of the United States it refuses to recognize a hierarchy of objectives. For instance, it is in favor of collective security as a matter of principle, and hence feels constrained to intervene whenever the security of any nation, regardless of its relation to the concrete interests of the United States, is endangered.

This radical isolationism on the one hand and this radical interventionism on the other are two different manifestations of the self-same underlying philosophy of foreign policy that identifies the national interest of the United States with some worth-while conception of human welfare and certain abstract principles of universal morality. Both derive from a misunderstanding of the Federalist position. They share the Federalist concern about the United States' becoming involved in the conflicts of Europe, but they misunderstand the rationale of that concern.

For the Federalists, the ultimate objective of American policy, domestic and international, was the integrity of the American experiment; the isolation of the United States from conflicts outside the Western Hemisphere was a means to an end, to be replaced by other means if the conditions of American existence should so require. For the twentieth-century isolationists, intervention in non-American conflicts is bad in itself, never to be indulged in; for the twentieth-century interventionist, intervention is always good, never to be refrained from. Both erect the issue of isolation versus intervention into a contest between two abstract moral principles, and hence lose sight

of the subordination of the issue, so brilliantly conceived and practiced by the Federalists, to the interests of the United States conceived in terms of national security and the integrity of the American experiment.

Some of you will not be surprised when I say that I have little sympathy with this new conception of the national interest of the United States, and that I firmly believe in the truth of the Federalist conception. I see in the development of American thinking and American foreign policy since the end of World War II a groping toward the rediscovery of the eternal truths of foreign policy which the Federalists discovered and which later generations tended to neglect and discard.

THE MORAL ARGUMENT

Let me make some general remarks in defense of that realistic conception of the national interest to which I adhere. Certain typical arguments are being advanced time and again against this conception. I want here only to mention two of them. One is a moral argument, the argument to which Wilson referred in the speech which I have quoted. It runs about as follows: It is something base, something immoral, for a nation to put its own interests above the interests of other nations or above the interests of humanity. From this assumption the conclusion is frequently drawn that a natural harmony exists between the interests of the United States and the interests of humanity; that, in other words, whatever the United States proposes to do and actually does in foreign policy is necessarily good not only for the United States but also for mankind.

This is not only, it seems to me, an untrue conception which flies in the face of all the experiences of history; it is also a very dangerous one. It comes dangerously close to the chauvinism of fascism and communism, which have advanced exactly the same pretenses for themselves. In practical policies, it leads of necessity either to national suicide through inaction or else to that unlimited interventionism to which I have referred above. The isolationist who has been challenged beyond endurance by the facts of experience will find it hard to resist the feeling that we should wipe from the face of the earth the nations which refuse to recognize that identity of our own interests with the interests of humanity. This philosophy, then, culminates in the policy of unconditional surrender and in the conception of wars as crusades fought for unlimited goals and waged with unlimited means.

WORLD UNITY AND WORLD DIVISION

The other argument to which I want to address myself for a moment runs about as follows: It may have been correct that in the eighteenth or nineteenth century, or in even more backward centuries, concern wtih the interest of a particular nation was justifiable and necessary. However, in the mid-twentieth century, the interconnectedness of the interests of all nations has become so great that no nation can really stand alone and take care of its own interests without jeopardizing those very interests.

This conception obviously appears to be quite plausible on the face of it; for it is patently true that in view of the technological revolutions in the fields of communications, transportation, and warfare, the technical preconditions for the development of an international community are today much greater than in any previous period of history. I must, however, call attention to the contrast between those technological potentialities, on the one hand, and the moral and political reality, on the other. For while this is, technologically speak-

ing, potentially one world, in actuality, from a moral and political point of view, never in the history of western civilization was the world, at least the politically active world, so divided as at present.

In times past, foreign policy always operated within a generally accepted framework of moral values and ways of life common to all the participants in the struggle for power. Today the two main power centers in the world, Washington and Moscow, are also the centers of two antagonistic political philosophies which have a tendency to transform themselves into political religions. These two power centers profess and act upon two incompatible conceptions of human nature, of society, and of government, and have found it at times hard to resist the temptation to try to make the world over in the image of these conceptions. Thus, while technologically speaking this is potentially one world, morally and politically speaking we live in a world which is separated by a deep and wide abyss from the other world behind the Iron Curtain.

THE ESSENCE OF FOREIGN POLICY

In such a situation it is vain to try to draw certain political or moral conclusions from technological potentialities; for in truth the essence of foreign policy has remained what it has always been, even though its manifestations have greatly changed. As John Quincy Adams put it, "I do not recollect any change in policy; but there has been a great change in circumstances."

This is as true today as it was then, and it has been true throughout history. The basic problems of foreign policy have remained what they were in ancient Greece and what they were in the Middle Ages and in the eighteenth and nineteenth centuries. What has changed are the manifestations of those problems, the circumstances under which we must meet those perennial problems of foreign policy. It therefore follows that, despite the profound changes which have occurred in the world, it still remains true, as it has always been true, that a nation confronted with the hostile aspirations of other nations has one prime obligation—to take care of its own interests. The moral justification for this prime duty of all nations —for it is not only a moral right but also a moral obligation—arises from the fact that if this particular nation does not take care of its interests, nobody else will. Hence the counsel that we ought to subordinate our national interests to some other standard is unworthy of a nation great in human civilization. A nation which would take that counsel and act consistently on it would commit suicide and become the prey and victim of other nations which know how to take care of their interests.

BASIC INTERESTS OF UNITED STATES

Let me then say a word about what, in concrete terms, the perennial national interests of the United States have been —what have, from the beginning of its history, been its unchanging interests that were pursued in different periods of history with different methods because the circumstances changed under which they had to be pursued. It seems to me that from the beginning of American history there have been two basic objectives which have determined the thoughts and actions of American statesmen.

Position in Western Hemisphere

There was, first of all, the security of the United States in the Western Hemisphere. At the very beginning of American history the situation of the United States was precarious, surrounded as it was by the outposts of great European powers; and so the security of the United States became necessarily the prime objective which American foreign policy had to pursue, the prime interest which it had to protect and promote. But even when, after the initial period, those immediate dangers passed, the United States still remained vitally concerned with its position in the Western Hemisphere. As the power of the United States grew and as it developed into predominance in the Western Hemisphere, unchallengeable from within, this concern with security was supplemented by concern with the preservation of American predominance. The Monroe Doctrine and, more particularly, the subsequent interpretations and political and military manifestations of that doctrine are the expression of this development of American concern from mere security to the safeguarding of American predominance.

European balance of power

This first concern leads with logical necessity to the second one, which is the maintenance of the balance of power in Europe. The United States was quick to realize that its security and predominance could not be challenged from within the Western Hemisphere. There was no nation in the Western Hemisphere, either to the north or the south, which, either alone or in combination with other American nations, could think of challenging successfully the predominant position of the United States. A danger to that position could arise only if and when an American nation would make common cause with a non-American nation for the purpose of challenging the United States. Thus the security of the United States in the Western Hemisphere was clearly recognized to depend upon conditions prevailing outside that hemisphere. Here we are again in the presence of the American concern for the maintenance of the balance of power in Europe, which is indeed the second great perennial concern of the United States in foreign affairs.

As long as there existed in Europe a multiplicity of nations of approximately equal strength, those nations had their hands full in defending themselves against their rivals on the European Continent. They had no possibility of making common cause with a Latin American nation for the purpose of challenging the predominant position of the United States in the Western Hemisphere. But if one great power would arise to a paramount position on the European Continent, such as the Germany of William II or of Hitler, or as the Soviet Union today, then such a nation, imperialistic in its policies and unchallengeable in its power from within Europe, could and was likely to embark upon adventures beyond the seas. There lay the great prize of the United States, almost irresistibly tempting to the would-be world conqueror, with all its wealth and power—and all its friendless isolation.

It is for this reason that the United States has always opposed the imperialism of those European nations which were most likely to be successful in their imperialistic designs if the United States did not oppose them. During the Napoleonic Wars, even so idealistic a statesman and thinker as Thomas Jefferson used to shift his sympathies in accordance with the shifts in the balance of power. Whenever Great Britain seemed to win over Napoleon, he wished for the victory of Napoleon; and whenever Napoleon seemed to win over Great Britain, he thought that after all Great Britain was not so bad as he had thought her to be. Our interventions in the First and Second World Wars, whatever their moralistic and idealistic justifications may have been, had their firm basis in the national interest of the United States in seeing the balance of power in Europe pre-

served, or, in case of its disturbance, in seeing it restored.

It seems to me that today, too, in our policy of containing the Soviet Union, in our policies of rearming ourselves and our allies, especially those in western Europe, we follow, even though with different concrete applications, the basic conception of the national interest of the United States as it was developed in the initial period of American history. That is to say, we feel that we cannot tolerate the subjugation of all Europe under one power which then will be free to look beyond the Atlantic for further conquests and adventures. And so we again embark upon an attempt to restore the balance of power in Europe, which this time is more radically disturbed than ever before.

Asiatic balance of power

The third basic interest which the United States has in the world is of newer date than the two I have mentioned so far. It concerns the balance of power in Asia. While the principle of the open door in China originally had a merely commercial connotation, certainly since the turn of the century it has been interpreted in primarily political and military terms. The intervention of Theodore Roosevelt in the Russo-Japanese War of 1904, the policies of Stimson, however ineffective, after the Japanese seizure of Manchuria in 1931—they all had as their rationale the conviction that the security of the United States would be endangered if a great power, Asiatic or European, controlled all of China or a considerable part of it. The catastrophe which has befallen our policies in Asia through the transformation of China from an ally of the United States into an ally of the Soviet Union can be measured by the perennial and fundamental character of our interest in maintaining the balance of power in Asia; for in Asia the balance of power has been destroyed and there is no rational way noticeable at present to restore it short of war.

THE RATIONAL VIEWPOINT

Those are, in necessarily brief outline, the general aspects of the national interests of the United States as I see them. I have said that no moral argument can be presented against a foreign policy which is based upon consideration of the national interest. Let me say now a word in conclusion about the intellectual and political aspects of that problem.

It seems to me that from a merely intellectual, from a rational, point of view, no nation can have a sure guide as to what it must do and what it need not do in foreign policy without accepting the national interest as that guide. One of the great weaknesses of American foreign policy in recent decades has been its inability to follow consistently certain standards of action and judgment in its conduct of foreign affairs. We were against Italy because of its aggression against Ethiopia, but we were against Franco because of his fascism. We seemed to like Mussolini because he made the trains run on time, but when he made an alliance with Hitler we did not like him any more. We did not like Stalin either; but when he was attacked by Germany and was defeating the German armies, we thought he was a somewhat uncouth democrat, essentially not so different from ourselves; and finally we turned around full circle, and regard him now as the incarnation of all evil.

It seems to me this stumbling from one extreme to the other, this inability to steer a clear course in foreign affairs, undisturbed by emotional preferences, results from the lack of recognition of the national interest as the only standard for judgment and action available to a great nation if it wants to pursue a successful and rational foreign policy. So from all points of view I conclude that there is no other standard of action and of judgment, moral and intellectual, to which a great nation can repair, than the national interest.

Dr. Hans J. Morgenthau, Chicago, Illinois, is director of the Center for the Study of American Foreign Policy and professor of political science at the University of Chicago. He formerly taught at Brooklyn College and the University of Kansas City since coming to the United States in 1937. Prior to that time he practiced law in Munich and Frankfort and was president of the Labor Law Court in Frankfort. His most recent books are Scientific Man vs. Power Politics; Politics Among Nations; and In Defense of the National Interest.

Foundations of Current American Foreign Policy

By John Sparkman

THE general topic under discussion —"The National Interest—Alone or With Others?"—is a basic issue which the policy makers and all the American people must face squarely. It is basic because, once faced and once decided, it is not an issue which can be redecided each passing day or by each session of Congress. To try to do so would be to negate the value of the decision—whichever way it went. Secretary Acheson once remarked that a gardener does not pull up his flowers each morning to inspect the roots.

I should have hoped that this issue of "Alone or With Others" or, if you will, "Isolationism versus Internationalism" had been decided some years ago. I should have thought that America's experience in two world wars had forever disabused us of the notion of isolationism. I should have thought that our enthusiastic commitment to the United Nations, the North Atlantic Treaty Organization, the Rio Pact for defense of the hemisphere, and the Mutual Defense Pacts with Australia, New Zealand, the Philippines, and Japan revealed a clear decision on our part. I should have thought that the dollars and the manpower we have expended since World War II in the Greek-Turkish Aid Plan, the Marshall Plan, the Military Defense Assistance Program, and Point Four had furnished proof positive of our firm intention to carry out that decision.

Our Place as World Leader

You will not be surprised to hear that I am a supporter of the fundamentals of our present foreign policy. This does not mean that I approve everything done by the State Department in conducting that policy, nor does it mean that I lack a lively sense of things left undone. But with respect to broad objectives, I believe that our national interest is served by American leadership in building collective security and in looking to basic human rights in a world still showing the scars of two world wars.

When I say leadership, I mean just that—not grudging gestures, but wholehearted dedication to the recovery of mankind and to clearing the way to new plateaus of well-being for all peoples. Our strength puts us in the vanguard. That is our destiny. We must live up to it. I can understand the chagrin of isolationists among us. "Men are not flattered," said Abraham Lincoln, "by being shown that there has been a difference of purpose between the Almighty and them."

John Hay described our foreign policy as consisting of the Monroe Doctrine and the Sermon on the Mount. That may have seemed sufficient fifty years ago, but it is hardly adequate today. As a matter of fact, Hay's definition was already obsolescent when he made it. It went out of the window when we got into the Spanish War in 1898. We left the monastery of self-containment in world affairs when we acquired the Philippines.

Speaking at Reno, Nevada, during his tragic cross-country crusade for the League of Nations in 1919, President Woodrow Wilson referred to German orders picked up during the fighting, the purport of which was, "Do not let the Americans capture such and such a post, because if they ever get there you

can never get them out." Wilson declared:

> The Americans were under the impression that they had come there to stay, and I am under that impression about American political purposes. I am under the impression that we have come to the place where we got in order to stay. . . . We are going to stay in. We are going to see this thing finished because that is the only possibility of peace; and the world not only desires peace but it must have it.

Wilson was proved wrong about America's intention after World War I. But today, at long last, Wilson's vision is being given form and substance. We are now engaged in proving that, having entered the partnership of free peoples the world over, we intend to stay.

But mere staying is not enough. We must at the same time be as effective as possible. And here we face dilemma heaped upon dilemma. We face the criticisms of experts who question America's capacity to conduct a skillful foreign policy. Dr. Hans Morgenthau has written a book in which he develops the thesis that our foreign policy has worked against the national interest because it is too sentimental and moralistic for the requirements of *realpolitik*. George Kennan has written a book in which he contends that our diplomacy is hampered because sentimentalism and moralism shape the decisions in the kind of democracy we have.

I do not share the pessimism of these experts. I see no clash between a wise idealism and the facts of international relations. I believe that the American system, despite its flaws, is still the best arrangement yet devised to enlarge the scope of life, liberty, and the pursuit of happiness for all men. Conceivably, a public opinion which is not so well informed as it might be can intrude harmfully on the shaping of foreign policy. Conceivably, grave and revered members on Capitol Hill can and do throw their weight around with unfortunate results. But I do not despair because of these mishaps. I feel that, just as running water purifies itself, so operative democracy cures its own mistakes. I am for the right admixture of spirit and letter, hope and method, in diplomacy, as in every other human activity.

Need for Patience

I believe the truth is mighty and will prevail—ultimately—if only we add patience to good will and understanding. We Americans are disposed to swift solutions. We are not gradualists. We give first place to the success which is quickly won. That tendency will not help us if it becomes markedly reflected in our foreign policy. It will not help us as we face the long pull of withstanding the Soviet challenge. On this score, Queen Juliana of the Netherlands recently brought us advice which we should take to heart. In her New York speech of April 7 she said:

> One of our western weaknesses is our underrating the value of the factor of time. Of course, acting quickly on the spot is right—in all those cases where one is sure of what one does. But rash and ill-considered action is often wrong. In the terrible hurry in which we live today we are constantly tempted to take rash decisions. A hasty action is dangerous, and forcing a situation is always wrong. Let us take time and cultivate patience and yet always be on the alert.

This is good doctrine for Americans. We have taken our own good intentions so much for granted that we sometimes forget the feelings of the other person. We are prone to forget that what counts is not merely the good purpose we have in mind, but the way in which we press it, the consideration we show to others, the impression we make. That failure

to put ourselves in the other person's place can count against us severely.

NEED FOR FLEXIBILITY

Queen Juliana has given us an inkling of how others see us with respect to one phase of our temperament and policy. Let me suggest another field in which we may be erring. A certain rigidity seems to have set in in our attitude toward the Soviet Union. There is danger of our substituting inflexibility for firmness.

This dilemma is posed acutely in western Europe. The steps taken by the western powers to solidify themselves against the Russian menace are of historic importance. At long last, Europe is giving up its divisiveness. Old jealousies are fading out by reason of a new approach to political, social, and economic values. Western Germany is to become part of the European defense community by contributing, under safeguards, to a supranational army. Western Germany is to have an equal and responsible status within the European community.

This growing cohesiveness of Europe has upset the Soviet apple cart. The Soviet Union wants a divided Europe. She has done everything in her power to keep Germany from regaining unity and stability. Now, completely reversing herself, the Soviet Union proposes a peace treaty providing for a reunited, unoccupied Germany, having its own army, producing its own war matériel, enjoying complete independence except that it is to be pledged to neutrality. To this proposal the Allies have responded with a note which in effect demands proof of good faith before we consider negotiations.

I think the Allied note is justified, but it must not be construed as slamming the door. The last thing we can afford to do is to let the rest of the world conclude that we are not ready to negotiate and to keep on negotiating in the pursuit of peace. The last thing we can afford to do is to spread the impression that we are thinking of armed strength as the only solution for the world's troubles. Yet that is the very conclusion which the peoples of Europe and Asia may reach unless we offer strong proof to the contrary. There is widespread sentiment abroad that America is emphasizing military power too strongly at the expense of other forms of security. This accounts in part for the growth of Bevanism in England and for the continuance of neutralism on the Continent. Bevan is arguing that the Soviet Union is not so great a threat as to justify expenditures on rearming which undermine social services. He maintains that the United States has been gripped by a militarism that threatens to become dangerous.

The outcries of the Bevanites and the other neutralists of Europe should not weaken our firmness of purpose, but we should make doubly sure that our true purpose is known. The one thing we must avoid is the appearance of inflexibility. We must not permit our friends or our critics abroad to believe that America is relying on armed strength as the sole cure for the world's ailments. We ourselves know that we seek peace second only to freedom. Yet we stand in danger of allowing the Soviet Union to gain the title of the true promoter of peace.

APPLICATION OF POINT FOUR

I believe it is vitally important that we stress the positive weapons in our foreign policy arsenal as well as the negative. A modern tank costs a great deal more money than a modern plow. The sum of our expenditures for military defense of ourselves and our allies must of necessity be infinitely larger than the total cost of Point Four. It must take more time in congressional

debate, capture more of the newspaper headlines, consume more of the nation's industrial effort. Yet, who can say with certainty which is more important for the long run? The tank, the gun, the jet fighter, that we build today we hope will some day be relegated to the junk heap; the tractor, the plane spreading DDT to combat malaria, we hope will start a chain reaction leading the peoples of the underdeveloped countries along the peaceful road to progress.

Because our purpose is peace, we must not allow the implements of war to hypnotize us. We are convinced that military preparedness is essential to the maintenance of peace as long as potential aggression holds the world in terror. But surely we can be single-minded in this conviction without having a single-track mind. We must not fail to emphasize our affirmative faith in man—our belief that all men, whatever handicaps they have borne in the past, are capable of rising to higher things.

In Point Four we are confronted with a great need for discretion in administering our programs. We must make sure that technical assistance does not mean that a bad social and political structure is maintained with our acquiescence and approval. That point was made by Dr. Charles Malik, Lebanese Minister to the United States, at a recent conference in Washington. He warned against a deepening of social and economic injustice "where it has been wreaking havoc for centuries." Dr. Malik asked, "What are the limits for urging real reforms?" and answered, "If there is real concern, ways and means will always be found for pushing those limits beyond any assigned point."

Later, at the same meeting, Mr. Justice Douglas carried the argument further. He contended that if Point Four is to be meaningful to the people for whose benefit it is intended, something will have to be done to assure social and economic changes. Justice Douglas even suggested that we encourage peasant revolts. I would not go so far as my friend, Justice Douglas, on that point. But I do believe we can be more effective than we have been in making certain that our aid gets down to the levels where it will do some good. Frankly, I am worried about the frequent charges that our aid has merely served to make the few rich ones richer and the many poor ones no better off.

It is a delicate business, of course, to try to impose our will and outlook on other peoples. But there is a difference between imposing our will and making clear our faith. To quote Dr. Malik again,

> Communism in Asia challenges the West to bring forth its *own* faith. Asians and Communists have every right to ask: But what do these people believe, what do they stand for, what are they after, what do they live by, *who are they?* Let the West answer!

John Sparkman, Washington, D. C., has been United States Senator from Alabama since 1947, and from 1937 to 1947 was a member of the United States House of Representatives. He is a lawyer by profession. He has represented the United States at various international gatherings and was a delegate to the Fifth Session of the General Assembly of the United Nations.

Are Our Present Foreign Policies Promoting Our National Interests?

By John M. Vorys

I AM under a considerable handicap in discussing my topic.

In the first place I once thought I knew what our national interests were; but after reading some of the writings of some of our political scientists, I have concluded that if they understand our interests, I do not. I have heard definitions from certain State Department people and others that amount to about this: Our national interests consist of carrying on our foreign policies. If this is correct, then of course our policies promote our interests, and our interests promote our policies. I think this is not correct.

In the second place, there is so much secrecy and confusion and change going on concerning some of our present foreign policies that I am not sure what they are.

Should the Question Be Raised?

In the next place, the question arises as to whether, in a time of crisis like this, any good American should question whether our policies are promoting the national interests.

One day during the United Nations Assembly last winter in Paris I heard Mr. Vyshinsky read from remarks I had made on the floor of Congress and in Foreign Affairs Committee hearings, and then proceed to make a very villainous and distorted comment on what I had said. Everything we say or do here is grist for the Soviet propaganda mill. This is often used to discourage critical discussion of our foreign policies. There is strong propaganda going on in this country for unity behind our present foreign policy, and the President has said that any discussion of foreign policies in this year's campaign is playing politics.

I know from experience, however, that no matter what we say or fail to say, the Soviets will use our words or silences to suit their own purposes, with appropriate distortions. I know also that unity for the sake of unity may be disastrous. History is strewn with nations that were united, but in the wrong course. I think we need to discover, if possible, and then to discuss our foreign policies this year in the light of our national interests. We should be patriotically temperate and sensible in what we say, bearing in mind that the Soviets and the rest of the world are listening, but there are certain advantages, as well as embarrassments, in carrying on our foreign affairs in a goldfish bowl of public discussion. This tends to prevent the double talk, double dealing, and deceit that go with the old-fashioned Machiavellian balance-of-power diplomacy that is coming into style again with some of our policy planners and their apologists and adherents.

A Minority Viewpoint

I have no authority and no desire to represent my party or anyone but myself in what I say. I am not going to make a stump speech. I am not a political science expert. I confess that I have heard people say that much that is labeled political science is neither good politics nor sound science. I speak merely as a congressman, a practitioner of the art of the possible, a minority member who has labored long and hard

in bipartisan and unpartisan efforts to help write laws involving our foreign policies. I can thus claim a degree of familiarity with certain policies, and a degree of detachment in assessing the results.

On this basis, many of the things we are doing are things that need to be done now. I will help to get them done in so far as Congress is involved. In this connection, there may be workers in factories and professors in colleges who are, like me, members of the minority. The worker thinks he is in a great plant, but disapproves of the present management and feels that it is responsible for turning out an inferior product. He uses his influence to change the management, but meanwhile does his best toward getting out the best product possible under the circumstances. The professor thinks he is in a great institution, but disapproves of the college administration. He will take such steps as he can to change the administration, but meanwhile he will do the best he can in his classes. Such workers, such professors, will sympathize with me in my work in Washington! In general, the net over-all answer to our question is, Our present foreign policies are not promoting our national interests, because of management trouble. But we must all do the best we can until we can change the management.

Our Foreign Policy Outlined

Now we come to the guessing game; what is our foreign policy? Here is the official answer from a pamphlet by the State Department, with a foreword by President Truman, followed by his picture. It is labeled *Our Foreign Policy 1952*, and on the cover is a photograph, not of Secretary Acheson and some diplomats or planners, but of a crowd of good American citizens, men and women, young and old, rich and poor, colored and white. Here are the official "Roots of our Foreign Policy" from page 6:

> Policies are the courses of action taken by a nation in the interests of the welfare of its people. . . .
>
> We are an independent nation, and we want to keep our independence.
>
> We attach the highest importance to individual freedom, and we mean to keep our freedom.
>
> We are a peaceful people, and we want to see the time when war and the threat of war are abandoned as instruments of policy by all nations.
>
> We are a friendly people. We have no traditional "enemies." We want to settle our differences with other peoples as "good neighbors."
>
> We believe in justice. A peace based on justice is the only peace which can endure.

These are noble words. We can all agree. The pamphlet says, "It is the job of government . . . to promote these national interests." Here we have it all—foreign policy, national interests. The trouble is that any connection between these words and the facts of life, what we are facing and what we are doing about it, is purely coincidental. In discussing foreign policies we are not talking about campaign pamphlets or paragraphs in state papers, but a moving picture; not just words, but action —"courses of action," as the pamphlet says. A modern football coach, after a game, runs through the movies of the game with his team and stops the film from time to time to criticize the plays. The stopping is helpful, but only if the players have seen what happened before. We can understand our present foreign policy only by watching it in action for a while.

Our Postwar Record

We are the richest, most powerful nation on earth, with nearly half of the

world's income. Seven years ago we won two wars at once, had a mighty army, the greatest air force and navy in the world, and exclusive possession of the A-bomb. We then reconverted from a war economy without a hitch. We had poured out $57 billion in foreign aid. The Soviet Union had been nearly defeated and was prostrate. The United Nations was founded on American soil. We were on the way, the leader of the world, and for the first time the world had a leader that had not sought leadership and wanted nothing out of it except peace.

Today, seven years later, let us stop the film. After pouring out over $30 billion more in foreign aid, we are in war and rearming desperately in preparation for more war, with the highest peacetime tax burden in history, with our economy subject to hated and ineffective controls; Britain, our so-called most reliable ally, is isolating herself from our efforts toward unity in Europe, and opposing our policies in Asia; western Europe, where we have spent the most money, has not yet taken steps toward that unity that Europe needs in war or peace; our prestige is at a new low in Asia and the Middle East. Certainly anyone who would say that our national interests have been promoted in these seven postwar years would have to answer the question, Promoted from what to what?

Is it fair to pass judgment on such a basis? I think that is the only sensible way to do it—the empirical test of results. Foreign policy courses of action involve a great deal of military and diplomatic secrecy. Congress does not know all that is going on. In congressional hearings dealing with foreign policy, such as on foreign aid, much of the testimony is secret, so neither the public nor all members of Congress know what courses of action have been taken or are intended. When the Executive asks for and receives power and money on such a basis, results are what count. Those who ask authority for action for secret reasons must assume public responsibility for the results of action.

But it will be said that at least we are not in all-out war with the Soviet Union, and that is in our national interest, on the plus side of our balance sheet. I agree, and we must continue courses of action designed to maintain that position. Our people have long recognized the grim and deadly nature of the world-wide Communist threat, and have been willing to take all necessary steps to meet that threat.

In view of this widespread sentiment in the United States, in view of the money and powers granted the Executive for diplomatic and military purposes, in view of our commanding position at the end of World War II, why do we find ourselves in our present situation? Here are some of the reasons:

THE GREAT DESIGN—SOVIET APPEASEMENT

1. The fundamental foreign-policy failure of the Executive has been the long failure to assess the Soviet threat and the way to meet it. Instead of implementing the instinctive suspicions of the American people, the "great design" of the Executive was to woo the Soviets, to secure their good will, to remove their suspicions of us. We required no commitments when we poured lend-lease supplies into the Soviet Union during World War II. Instead of attacking the "soft underbelly" of Europe, thus placing our forces in position to protect western Europe from Communism, we launched our second front as Stalin desired. We held off from taking Berlin and Vienna; we agreed at Potsdam to an isolated Berlin without an agreed corridor.

This "great design," implemented at Tehran, Yalta, and Potsdam, continued at San Francisco when the United Nations was founded. Alger Hiss, as Secretary General, was executing official American foreign policy when he helped to form the Charter as the Soviet Union desired.

It is now the style to blame Congress for our rapid demobilization in 1945–46. With Germany and Japan defeated, there was no need then for large American armed forces, in view of the appeasement policy of the Executive toward the Soviet Union.

At late long last came the realization that our "great design" fitted perfectly into the Soviet "great design" to communize the world, and we started to change our course of action; but by that time the State Department had become infiltrated with those who still believed in the Communist "great design."

TARDINESS IN MILITARY AID

2. When, belatedly, the administration realized that kindness to Communism was not working, it still did not realize the importance of arming ourselves or others. Even after the so-called Truman Doctrine was announced and promptly implemented in the Eightieth Congress by the Greek-Turkish Aid Act, the administration was reluctant to use anything except economic aid.

The European Recovery Program was enacted by the Eightieth Congress. I was sort of House floor manager. I attempted to secure administration approval for military aid to Europe, without success. On March 17, 1948 the President was to come to Congress for a foreign policy address. I had prepared a draft provision authorizing military aid to Europe, feeling that by furnishing economic aid alone we might be merely developing a richer prize for Stalin to take over. The White House sent word that the President would come from the joint session to our committee to confer immediately after his address. Our committee assembled promptly after the speech and, after waiting twenty minutes, found out from a reporter that the President had left for New York for a St. Patrick's Day speech. I have never learned the reason for the appointment or the failure to keep it, but I could get no one to support military aid to Europe then, so it was dropped.

Military aid for China in 1948 was provided by Congress over administration resistance, and was delayed eight months in delivery. Finally, in 1949, $150,000,000 economic aid for Korea was proposed, with no military aid at all, just as our troops were withdrawing.

Now military aid to other nations has been a highly controversial issue, with bipartisan support and bipartisan opposition; but two points are clear: (1) no military aid bill has ever been turned down by Congress; and (2) requests from the Executive for such aid have been slow—tardy I believe; and delivery of such aid to other countries has been slow—in certain cases, disastrously tardy. This is true in China; in Korea, where military aid voted in October 1949 did not reach Korea before the attack in June 1950; and in Europe, where less than one-tenth of the aid voted by Congress has been delivered, and Europeans and American officers in SHAPE have asked me "When is the United States going to send the arms it promised? There are men here ready to be called to the colors, as soon as the promised arms for them arrive."

When the charge is made that this routine tardiness, this course of *in*action, is a deliberate policy, the defense is that it is merely a breakdown in execution of policy. Certainly the practice does not promote our interests.

PREOCCUPATION WITH EUROPE

3. For fifteen years our policy makers have been obsessed with the importance of Europe and have failed to understand the importance of Asia. In 1939 President Roosevelt was refusing to label the Japanese aggression in China as war and referring to it as "the Japanese incident," for fear that he would have to invoke our embargo law. In 1941 we were attacked, not from Europe but by Japan at Pearl Harbor.

After the war we poured relief into Europe; but it required congressional action over administration opposition to include China in the Interim Aid Act of 1947. Meanwhile, the misguided Marshall mission was attempting to force coalition between the free Chinese and the Communists. In 1948 military aid and advice to China was delayed and military guidance was refused. In 1949 the "dust-settling" policy was justified in a White Paper that laid all the blame on our faithful ally, China, and its Chief of State, Chiang Kai-shek. We can stomach Tito in Europe, and have aided various governments that were corrupt and inefficient; but in China we made a whipping boy of Chiang in state papers, as a matter of policy. In Asia, instead of seeking ways to win, we have had a policy of seeking excuses for failure.

This preoccupation with Europe is demonstrated in words and dollars. In his State of the Union Message in 1951, President Truman said, "The defense of Europe is the basis for the defense of the whole free world—ourselves included." European nations heard that, and the reaction was, "If you have to defend yourself in Europe, Uncle Sam, go ahead—we will help." Asiatic nations heard that, and realized that they were second rate. As a cold-blooded matter of national interest, the military defense of Europe or any other place outside our hemisphere is important to us, but not vital. We could live if those places fell. If we made this clear, we might do better in stimulating defense action elsewhere.

This European preoccupation is shown in dollars. The Mutual Security Request for this year is $5.964 billion for Europe including $1.819 billion for economic aid, and $1.936 billion for the rest of the world—the Middle East, Africa, Asia, and the American republics—including $655 million for economic aid. Europe, with the highest standard of living next to ours, gets nearly three times as much standard-of-living support as the rest of the world.

Europe has had a four-year recovery plan, financed by us, which should end this year. It was justified and was economically successful, but it should be wound up. Nothing but actual defense money should go to Europe. Instead, economic aid is again in our program for Europe, under a new name. Meanwhile, technical assistance is increasing and becoming a new kind of economic aid, far beyond any modest sharing of know-how. We must cut down for Europe, instead of increasing elsewhere.

On the Mutual Security Agency stationery is a shield saying "Strength for the free world from the U.S.A." Our generosity has been so great that every free country expects to receive something from us. We must realize that we can bleed ourselves white by overspending, and must make other countries realize it, too, particularly in Europe.

SPENDING

4. Our policy, at home and abroad, has been, When in doubt, *spend!* We cannot afford that policy any more. Its practice has given color to Soviet propaganda that we have to spend to prosper. From now on, foreign aid must be clearly tied to some national interest of

ours and so labeled, so that the Soviets and others will no longer consider that spending in itself is our national interest.

We must go slow on Point Four, not only for reasons of economy but also of humility. It is not yet clear that our way is best for all the people of the world. The less-developed countries will gladly accept free supplies, but they may be reluctant, and rightly so, to accept our free advice. Remember this—that nations that do not practice gratitude as a foreign policy will be suspicious of charity as an unannounced foreign policy of another nation.

Foreign aid must become mutual security in fact as well as in name.

COLONIALISM

5. Our obsession with Europe has prevented our taking a clear-cut stand on colonialism, for fear of offending European colonial powers. This is a delicate subject, but it is one issue on which, by taking a constant and consistent position of sympathy for those who wish to do what we did in 1776, we should save ourselves embarrassment in the long run. By a policy of openly urging independence for colonies which can guarantee freedom for their people, we would follow our own great tradition, we would take care of any legitimate interests of our European allies, and we would win friends in undeveloped countries that now have no use for us. By making this a policy without exceptions, we should not be under the embarrassment of deciding what exceptions we needed to make.

INCONSISTENCY AS A POLICY

6. The inconsistencies and vagaries in our policies, the discrepancies between promise and performance, the differences between treatment of similar areas, the secrecy, cause untold uncertainty, confusion, and exasperation here and abroad. The defense is that we do different things at different times for different reasons, as will best serve our national interests. This cult of inconsistency among our planners is based on and excused by the George Kennan plan of playing old-fashioned, realistic, power politics, bilateral diplomacy, unembarrassed by the "legalistic-moralistic approach" or any multilateral foolishness. It sounds very sophisticated. Its practice to date has made us look foolish.

Judging our recent diplomacy by the dictionary concept, "dexterity or artfulness in securing advantages without arousing hostility; address or tact in conduct of affairs," our diplomacy is not working very well. Our officials talk too much, and are too careless about commitments. We have made commitments to Italy about United Nations membership and Trieste that can hardly be fulfilled. Ambassador Bowles talks of a billion in aid to India—an amount that will not be forthcoming. Big talk, that makes even generous action look small, causes disappointment and lowers our prestige.

On the other hand, there have been careless statements about what we will not do. When our President on January 5, 1950, and Secretary Acheson on January 12, 1950, said Korea was not in our security perimeter, that was an implied invitation to aggression in Korea.

Our officials need to be more cautious and guarded in saying what we will or will not do, because everyone is listening.

KOREA

7. Korea will be known in history either as the tragic end of a disastrous series of blunders or as the halting beginning of our reversal of policy in Asia; either as the beginning of Communist aggression by force or as high

tide in such aggression. The demand on Congress on June 8, 1949 for economic aid to Korea by June 30, with the assurance of Secretary Acheson that Korea would fall in a few months if the aid were not forthcoming, echoed the Lattimore line: "The thing to do is to let Korea fall, but not let it look as if we pushed. Hence the parting gift of $150,000,000."

The withdrawal of our troops, the delay in military aid voted by Congress, the disavowals of our President and Secretary of State in January 1950, the overnight reversal when the attack took place, the commitment of forces without congressional approval, the refusal to follow sound military defense principles, the long-drawn-out armistice negotiations, continued until our planes were outnumbered in MIG alley—all of this was overshadowed by the original policy mistake of permitting the mainland behind Korea to go to the Communists.

These mistakes will not be rectified by a patched-up, face-saving armistice, concluded so that we can gracefully bow out of Asia. We face a long-drawn-out period of helping the free Chinese to practice what we preach in the Declaration of Independence, in order to rectify the mistakes we have made, in order to promote our national interests in Asia.

CONSTRUCTIVE CRITICISM

Does all this sound critical of our foreign policy management? It is intended to be. But if Mr. Vyshinsky and his agents hear about it they will gain small comfort, because they know of the teamwork that goes on in this country in government, not only in spite of criticism but because of criticism. They know of it, but cannot understand it. They probably cannot understand that Senator John Sparkman,[1] whose views differ from mine, is my dear friend, whose character and ability I admire, whose opinions I respect. They ought to understand that there is no prospect of any substantial change in the roots of our foreign policy, no prospect of fundamental changes in the broad areas of action and interest in our struggle against Communism, under present or changed management.

But we need new management, that has had no connection with these diplomatic and military failures in foreign policy; an administration that will carry out every treaty and formal agreement to which we are party, but that can say, when side agreements, understandings, and bad precedents in action are brought up, "No connection with the old firm." A new administration could reassess our policies and courses of action; could restate our foreign policies with caution, clarity, and consistency. Our national interest will still be to go forward, not alone, but with others. We shall be more firm with others who insist on going it alone. We shall make sure that others go forward, too. And we shall have policies that promote—our national interests.

[1] See John Sparkman, in this volume.

John M. Vorys, J.D., Washington, D. C., has been a member of the United States House of Representatives from the Twelfth Ohio District since 1939. He taught for a year at the College of Yale in China, and subsequently practiced law in Columbus, Ohio for several years, and was a member of the Ohio legislature for two terms. He is a member of the House Committee on Foreign Affairs, and was a delegate to the Sixth Session of the General Assembly of the United Nations.

Strength of the Atlantic Community

By W. R. HEROD

IN the present world situation, I think it is recognized that, since the termination of World War II hostilities, the most significant fact on the international horizon has been the continuing and ominous division between the so-called "East" and the "West." The Communist seizure of governments in Poland, Rumania, Czechoslovakia, and elsewhere forced a number of the western nations, including the United States, to the reluctant conclusion that a greater measure of military strength was needed to ensure their security. These countries had a more or less common heritage of history and tradition. They held similar views as to the dignity of the individual and the values—material, intellectual, and spiritual—of western civilization. Accordingly, certain western European countries came together in defensive alliance in the Western Union.

ORIGIN AND PURPOSE OF NATO

Then somewhat later, with East-West tension continuing, the United States, Canada, Iceland, the United Kingdom, Norway, Denmark, the Netherlands, Belgium, Luxembourg, France, Italy, and Portugal became partners in the North Atlantic Treaty Organization. This group, known as NATO, comprehended the Western Union powers and others, and, being larger and potentially far more powerful, soon began to acquire eminence as an Atlantic community.

NATO's purposes, as stated in the treaty and reiterated on various occasions, were and continue to be twofold: first, to preserve peace—not peace at any price, but a respectable peace; and second, to promote free institutions, conditions of stability, and well-being. The preservation of peace is surely a defensive purpose. It is by no means aggressive.

Pursuant to these objectives, rearmament was undertaken by the NATO powers, primarily as a deterrent to aggression, thereby preserving peace, but further so that if peace should unfortunately be lost, aggression could be resisted and victory attained.

The form of rearmament and its level have been determined with a view to the following objectives: (1) to make the deterrent effective through building up defensive but not aggressive military strength; (2) to involve no unbearable burden which might break the economies or destroy the free institutions, stability, or well-being of the West; and (3) through international correlation, to strengthen each NATO nation and to bring added strength to the whole through "mutual reaction."

FACTORS IN COLLECTIVE STRENGTH

But fundamentally, individual and collective strength lies not alone in material elements. Just as important are various other factors, for example, character. There must also be a positive side, with an appeal to the hearts of men involving (1) conviction that their cause is just; (2) resolution and determination, which means a willingness to sacrifice and, if need be, to fight; and (3) hope, first, that war is not inevitable and that a respectable peace can be preserved; second, that a greater measure of spiritual, intellectual, and material satisfactions from life may be expected in the not too distant future;

and third, that if peace should be lost, the NATO West could win through.

Conviction, determination, hope—these intangibles contributing to the make-up of morale are as important as physical strength in battle against external aggression. They are also essential in the fight against subversion. But they must be supplemented by physical strength to ensure security.

Both these intangibles and military might have until recently been at a low level in western continental Europe since World War II. They were considerably lacking immediately after the outbreak of hostilities in Korea. Their absence was to be noted in all geographical areas of continental Europe and in all strata of western European society.

Today a significant improvement in both is evident. But the future course must be so charted as not only to preserve but to increase both of these elements of strength. We must avoid any course which, for an apparent gain in one, weakens or jeopardizes the other. We must not seek increased strength in guns, divisions, ships, or planes, if such is to be offset by increased dissension, internal difficulties, or sapping of morale. Hence the risk in courses which involve inflationary pressures, depression in levels of living, increased regimentation, or more and more restrictions. On the other hand, we must not neglect to increase military strength because too greatly we want "business as usual." But conviction, determination, and hope we must maintain. If they falter, both NATO objectives and more will be lost.

COMPARISON, EAST WITH WEST

But how about the relative power potentials of the East and the NATO West? It seems that prior to Korea, the Union of Soviet Socialist Republics was devoting a higher aggregate of man-years of effort and expenditures per million of population to military use than were the NATO nations. Further, it would appear that the Kremlin within the last eighteen months has taken active steps to increase the military strength of its European satellites. With reportedly some 175 to 200 divisions and a considerable air force, the U.S.S.R. has presently a military establishment of greater immediate striking power than has NATO.

This is not surprising, when one considers that the Soviet Union kept up her forces after World War II, whereas the NATO nations generally disarmed. The continental European NATO nations have, in effect, had to "start from scratch" in their rearmament after wartime destruction, military occupation, and dismantling. In this respect as well as in having a defensive sea moat, Great Britain, Canada, and the United States have been considerably better off than their continental allies. But even in these favored nations, the build-up of military power requires considerable time.

But NATO, with the recent admission of Greece and Turkey, now comprises fourteen countries, and NATO's aggregate economic power appears to be considerably greater than that of the U.S.S.R. and its satellites. For example, as of 1950–51 it appears that the fourteen NATO countries combined had a population of some 370 million, whereas the U.S.S.R. and its European satellites had perhaps some 300 million. NATO's aggregate of national incomes seems to be three to four times, and its steel and electric power production some four to five times, that of the Kremlin-dominated areas excluding China. The total energy, animate and inanimate, devoted to productive purposes by the NATO countries in 1948 has been estimated at about three times that of the Soviet Union and its European satellites. And in skilled labor force and heritage of technology, NATO greatly exceeds the countries east of the Iron Curtain.

Hence, if NATO were a monolithic unit, it would have overwhelming preponderance in physical resources. Unfortunately, while the U.S.S.R with its European satellites occupies a continuous and comparatively readily mobilizable area, NATO's population and resources are distributed throughout a multiplicity of separate nations on an extensive periphery.

DISTRIBUTION OF POTENTIAL WITHIN NATO

For example, of the NATO population, roughly 55 per cent may be considered as representing the European members. Approximately 50 million of these are in the United Kingdom, and 150 to 155 million on the Eurasian mainland. NATO's Eurasian mainland population is hence considerably less than that of the U.S.S.R. and its European satellites. Furthermore, it is greatly dispersed.

Likewise in terms of steel, electric power, and output of manufactures and of engineering industries, the industrial potentials within NATO are dispersed and unevenly distributed. In rough terms, some five-sevenths to three-quarters of the industrial potential of NATO is concentrated in North America, by far the greater portion being in the United States. The United Kingdom's industrial potential is of the order of one-seventh to one-sixth of NATO's total. And the continental NATO countries together have roughly another one-seventh to one-sixth. Of this last item, France has about one-half and Italy one-quarter.

Hence, in general, the industrial potential of the European NATO countries, including the United Kingdom, is two-sevenths to one-third of that of NATO, and about one-half of the entire European potential west of the Iron Curtain. European NATO's industrial potential is only slightly less than that of the U.S.S.R. and its European satellites. If Western Germany through a European army and a European defense community became associated with the NATO group, European NATO would possess a significant addition in manpower, and an industrial potential in excess of that of the U.S.S.R. and its European satellites. This advantage could be further increased to the extent that the industrial resources of Sweden and Switzerland, whether members of NATO or not, were predominantly available to the NATO group as compared to the Kremlin-dominated countries.

However, even if finances were satisfactorily arranged, except for certain basic items such as coal and steel, it would require two to four years to develop the industrial potential of Germany, for example, to the point of making any really significant contribution in heavy equipment.

Also, as the European portion of NATO's industrial potential is distributed over eleven national sovereignties, it is not integrated. In some cases the NATO nations are not even contiguous. Their individual economies are in many respects as competitive as they are complementary. Hence industrial units, with certain outstanding exceptions, are generally far smaller than in the United States. Industry has developed more "vertically" in Europe as compared to more "horizontally" in the United States. And there is more dependence upon direct labor and artisanship in Europe, with less availability of capital,

tools, and power per worker than here. As a result, the speed with which changes can be effected, such as the introduction of new products, the building of plants, and retooling, is only roughly one-half of that in the United States. And the product generally has a higher component of man-hours than here, perhaps double on the average.

These factors, combined with absence of modern designs, less availability of tools, and a lower limit of acceptability for the devotion of resources to the military, mean that (except in the United Kingdom) any considerable volume production of modern complex weapons is not to be expected within two or three years in western Europe, as compared with what may be expected in the United States.

Particularly is this true today; for new equipment now is highly complex and technically advanced, even as compared with that of World War II. For example, jet planes are now required, whereas we had practically none in World War II. There have been tremendous developments in guided missiles. Radar and electronics now apply to fire control, antiaircraft direction, and many other things. There is also the atomic field. Whereas Europe in many respects equipped American troops in World War I, we supplied the bulk of the munitions in World War II. And now the new armament developments have outstripped the technical and industrial ability of many of the individual European countries to build up equipment of the requisite quality speedily enough, without a violent readjustment of their economies.

SIGNIFICANCE

The significance of this can be illustrated by an example. Let us consider Italy. With roughly one-twentieth of the industrial power of the United States, with a steel production capacity of approximately 3 million tons per year, it is physically impossible for Italy to manufacture within a short period, enough big tanks, heavy bombers, or heavy artillery to make it worth while. The diversion of labor, the requirements of tools, the devotion of raw materials and facilities to these products, that would be necessary for any considerable output in two or three years, would be such that it would not be feasible to expect Italy to produce modern equipment in this field, even if the financial aspects of the problem were solved.

This likewise applies in various other European countries, for equipment such as heavy airplanes, heavy tanks, heavy-duty electronic equipment, heavy artillery, and presumably atomic weapons. In these categories, allowing for attrition, maintenance, and replacement, NATO Europe cannot, without going into a war economy, become self-sufficient within a decade, and perhaps not then. If the next two or three years are taken as being a period of critical risk during which build-up of forces is desired, without a war economy, in my opinion the bulk, by value, of the hard-goods requirements for the continental European NATO forces must come from the United States if the deficiencies are to be met.

RATE OF U.S.S.R.'S EXPANSION

If this is the case in NATO, what do we know about the U.S.S.R.? We must not be oblivious to the recent rate of expansion in economic power of the U.S.S.R. and its European satellites, which may, in percentages, have been greater than NATO's. Statistics are of course not altogether reliable, particularly those relating to areas behind the Iron Curtain. But if those published by the United Nations, the National Industrial Conference Board, and other reputable bodies endeavoring to get reasonably reliable data are taken, the

U.S.S.R. and its satellites have been going forward in a material way at a remarkable pace.

For example, the U.S.S.R.'s steel production in 1951 has been estimated at some 31 million ingot tons (metric). This is apparently an increase of 4 million tons over 1950, or 14 to 15 per cent. In electric power the estimated gain was 11 to 12 per cent. In energy devoted to productive purposes, the U.S.S.R.'s increase between 1937 and 1948 has been estimated as some 95 per cent, compared with about 90 per cent for Canada and 70 per cent for the United States. And in three and a half years, 1947 to 1950, the U.S.S.R. and its European satellites have been estimated to have roughly doubled their percentage of the world's industrial production. Their current output appears to exceed that of the European NATO nations combined, including the United Kingdom.

Of course, in the West also, in both Europe and America, production has increased, and rather remarkable percentages are sometimes cited. But the U.S.S.R. and its satellites probably had a lower starting point, and the percentage rate of expansion has seemingly been at least as high as, and perhaps higher than, that in the West. Furthermore, in the West people have more or less adjusted themselves to an increased level of consumption and investment commensurate with such increased production; whereas in the U.S.S.R. probably a greater proportion of the increased production has been put into investment and armaments, with less going into consumption. This may be important in estimating the psychology of sustaining an armament burden, as well as in estimating economic capability.

Also the Soviets' technological achievements in the armament field must not be minimized. According to reports there have been at least two nuclear explosions, apparently the only explosions of this type except those conducted by the United States. Their MIG airplanes are of high quality, and they seem to have been produced in reasonably large quantities. Their submarines with snorkel designs are said to be of high quality, and likewise are available in quantity. And their tanks appear to be formidable in size, armor, and firepower. U.S.S.R. radar and electronic developments in directed antiaircraft guns, and other applications, also indicate a high order of development.

It is doubtful if the U.S.S.R. story is all increase and improvement. I cannot believe that these Soviet armament developments represent a normally balanced strength. There must be blank spots. But in the field of armaments themselves and in the fundamental basic elements which could be devoted to war, we must not minimize Soviet developments. Particularly is this the case if, as reported from Moscow, with steel, oil, electric power, and basic industrial production rapidly expanding, there has recently been a reduction in the output of automobiles and tractors; for this might indicate an increased diversion of the Soviet Union's manufacturing capacity into weapons.

Hence, up to the present, even since Korea, the more rapid rate of finished equipment build-up may not yet have been on our side. We all have confidence in the United States, but that is only one individual country—though, to be sure, the most powerful of all. But we cannot be certain that for the combined NATO countries, the rates of production of equipment have exceeded those in the U.S.S.R. and its satellites to date, although surely we have the potential capacity to outproduce them. And when the geographical dispersion of NATO's resources are taken into account, we cannot be certain that time,

for NATO as a whole, is even yet on our side.

FACTORS IN APPRAISING NATO'S EFFORTS

In appraising our NATO allies' efforts, we in America are frequently inclined to overlook the rapid development in the technique of modern military equipment which I have mentioned, and the shift in the balance of industrial power so preponderantly in favor of the United States. As indicated, we cannot expect military self-sufficiency from Europe in the modern weapons now considered necessary, in a two-to-four-year period, at a level of military requirements of the order of that contemplated. And even if the build-up is assumed, the load on European industry for repair, maintenance, and replacements, for attrition and obsolescence even without hostilities, will require a high level and broad pattern of activation of industry.

In estimating physical capability to produce, one considers the availability of management, know-how, skills, and facilities such as floor space and tools, applicable to given items. These can be roughly appraised, but expected results cannot be predicted accurately. Capacity or physical capability generally assumes the availability of labor, raw materials, and finance in adequate quantities and at the right times; and these might not all be available at the time of need without serious diversion from other needed activity. Such can hence impose a ceiling to total effort, even where additional plant and tools exist. In general, the assembly and end-item fabricating capacity of European industry which could be devoted to armament is considerably in excess of the production which could actually be acceptably sustained, taking into account the diversion of men, money, and materials into such production.

The ceiling to the over-all envelope of European armament hard-goods production under today's conditions is hence determined more by the politico-economic limits of *acceptability,* than it is by sheer physical capability. In other words, from a physical standpoint, far more armament production could be undertaken on the Continent of Europe than is presently programmed. But economically, politically, and socially it has not been thought feasible or acceptable to devote the money, the labor, the materials, and other resources to it at the expense of diversion of these limited resources from other desired goals. Such a further diversion, if appreciable, has been thought to produce inflationary pressures, further scarcities, and increased tax burdens, all of which are damaging.

The determination of an acceptable limit is hence difficult. It is not merely a financial problem, though that is important; it involves accepting a financial burden and a diversion of resources, and therefore it presents political, economic, and social problems. And these determine the acceptable limit of effort at a given level of risk.

EFFECTS ON NATIONAL ECONOMIES

To illustrate this point, it should be noted that the European national economies are much weaker than that of the United States; and in the grip of world forces such as price fluctuations and material scarcities, the repercussions in Europe are frequently severe. They manifest themselves in internal dislocations and, among other things, difficulties in the balance of payments.

Great Britain

Take for a moment Great Britain. Its 4.7 billion pound three-year program has now been lengthened to some four years. To the extent of 40 to 45 per cent, it represents hard-goods equipment. Such hard goods, in value and labor content, represent a load of approximately 40 per cent of the normal output of Great Britain's engineering industry; and this industry in turn has contributed roughly two-fifths of Britain's exports. Hence, in this particular industry, diversion of money, men, and materials into armaments means probable reduction in exports and increased pressure on the balance of payments.

Further, this constitutes an inflationary pressure accentuating internal difficulties. Also, as a result of world price changes as compared with 1950, imported raw materials of Great Britain had by mid-1951 increased 76 per cent in price; total imports had increased 43 per cent in price; but exports had increased only 20 per cent in price. There was hence a deterioration in terms of trade, so great that if a balance had been effected through additional exports at those levels of prices, the aditional rate of exports in terms of manpower and material would have placed an added load on the economy exceeding Britain's then current rate of hard-goods armament production.

This situation has now changed considerably. Nevertheless, it has left its mark in the reduction of dollar and foreign currency reserves to such an extent as to weaken the pound and necessitate the imposition of severe import controls and a lengthening out of the rearmament production program.

Balance of payments difficulties have similarly been accentuated in France, Italy, and other countries. And although there has been a deceleration in the adverse trend and even an improvement recently in the terms of trade of certain areas, the strain on the foreign currency reserves and the readjustments required have left an awareness of the weakness of the European economies and of balance of payments difficulties and inflationary possibilities which are now quite general in Europe.

Italy

As another example, take Italy. The total engineering industry employment is only some 250 to 275 thousand in a population of about 45 million. Italy's currency, however, has depreciated to approximately one-fiftieth of its prewar value. Italy's total steel production is only about three million tons. Accordingly, with raw materials short, little diversion from essentials into armament is to be expected. With 1½ million unemployed and a million or so underemployed, the situation is difficult. The workers want to work, but finance and raw materials limit orders. In ships, vehicles, and certain other lines, Italy could produce much more for the rearmament program, by a multiple, than she is at present producing, if financial resources and raw materials could be found. We should be able to contribute to the solution of that problem through offshore procurement. This would help to strengthen Italy and the Atlantic alliance.

The Netherlands

Another example is the Netherlands. There industrial production is perhaps one-third greater than it was before the war. The country looks relatively prosperous. However, the Dutch still need and have a billeting law. With the great damage to houses and the expanded population, with only about 55,000 new dwellings being built per year, if one has so many rooms in his house, he must accommodate so many people. One is given thirty days in which to get in someone congenial. Otherwise one is assigned a "roomer." The reaction of the Dutch is the same as ours would be. They are no less against the Russians than are we. But they want to get the stranger out of

their house and enjoy the privacies of their home and family life before undertaking extensive devotion of additional finances, materials, and labor to rearmament. In a similar case I think our reactions would not be greatly different.

DETERMINATION OF ACCEPTABILITY

These examples illustrate various factors which influence the determination by each nation of its acceptable level of armament activity. With narrow political majorities and strong oppositions, with the protest vote frequently siding with the Communists in France and Italy, not so much because the people adhere to Communist philosophy as because they wish to protest against the existing scheme of things, one can see that [illegible] is required in urging increased devotion of money and limited resources to rearmament.

From this standpoint I think it is evident that, over the next two to four years, Europe cannot be expected to produce, within an acceptable limit, the equipment for European forces that are being currently talked about. Even if, through assistance in money, materials, designs, and know-how, the limit of acceptability were raised so as more nearly to approximate the physical capability or capacity limit, short of a war economy, there would still be calls upon the United States for the bulk by value of the equipment requirements in a build-up over the next two to three years.

These facts emphasize the tremendous importance in the scheme of things of United States support. Through our former military aid programs, Economic Cooperation Administration, and so forth, support in one form or another has been given. The present Foreign Aid Bill envisages a continuation of support, somewhat modified as to form, but its magnitude in dollars is roughly comparable to that last year.

THE BIG DETERRENT

In line with the above discussion, and trying to face the realities of the situation, one must query just what are the prospects of success in building a deterrent force to any possible Soviet aggression. I do not know what the Soviet intent may be. But I think it is evident, taking into account the historically expansionist trend of Russia, and the aggressive and subversive activities of the Bolshevik Communist regime, that if there are any political vacuums to be filled at a low price, the Kremlin will endeavor to fill them to its advantage. And if, in the Kremlin's thinking, the Russians have contemplated aggressive action at high price or at the risk of war, I personally am convinced that it is the potential strength and estimated determination of the American people, along with the belief that the United States would follow through if the Soviet Union started aggression with any NATO country, that is the principal deterrent to any such action. This, more than any present actual strength on our part or any strength to be derived from European NATO's efforts, is surely what is being factored into the Kremlin's calculations in estimating the price and risks of aggression. If this is so, we should make corresponding allowances. Such a situation can be used, and with proper guidance, our deterrent effect can be maximized. On the other hand, such a situation can be abused.

I think it is the opinion pretty generally held in continental Europe today that, more or less following the above principle, the "floor" or lowest level to which Europe's efforts must attain is that degree of rearmament which will assure the continuing interest of the United States in Europe. There are also, unfortunately, those who think that such level should be the ceiling of Europe's efforts. That would be an abuse. I do not believe that such opinion is general, but there are some who hold it, and the implications of it could be serious.

PROGRESS IN WESTERN EUROPE

Increased strength in western Europe, as well as the development of real strength in the United States, is essential. The British have realized this and have taken steps accordingly. Others have realized it but have not been in a position to take as many steps. But the increased physical strength which has taken place in western Europe within the last two years can be expressed in terms which appear to be impressive. For example, we hear that the rate of Europe's current production of armaments is a multiple of what it was a year ago, and a greater multiple of what it was two years ago. These ratios sound convincing. Likewise, the lengthened periods of training and the extension of conscription seem favorable. We have correspondingly favorable figures for the United States.

But while these expressions are heartening, we must not be deluded into thinking that even large multiples of a very small starting rate are necessarily satisfactory in relation to the requirements of the situation, if we assume hostile Soviet intent. In terms of progress expressed as multiples, the picture certainly appears favorable; but as compared with requirements and the time to meet them, the story is by no means so reassuring, particularly in physical terms such as trained, equipped troops, actual tanks and planes, and guns and ships in service and actually available for front-line duty, backed by reserves.

LEADERSHIP

But in spite of this, the opportunity is there for far greater progress. With the small economies and former depressed state of affairs in western Europe, external leadership and reliance upon external strength for security were absolutely necessary. With Germany divided and occupied, with France's political stability none too assured, with Britain's minimal mutualization of her interests with those of the Continent (which is completely understandable), and with Italy's economic, military, and political weakness, leadership of western European origin has been lacking. This can perhaps be built in the future. But unless Britain can actually participate more in continental affairs or France can better stabilize her political situation, the expectancy is that Germany will ultimately become the chief contender for western European leadership. Under an administration such as Adenauer's, this would not cause concern; but with two world wars behind them, the prospect of any German leadership for western Europe is not altogether a tranquil one to European countries.

In this situation, leadership has automatically fallen to the United States. And with a feeling that the power, the friendliness, and the determination of the United States were behind them, hope and a feeling of security have been engendered in western Europe. Vergil opened his *Aeneid* with *Arma Virumque Cano*, and in modern parlance one can sing of arms; but General Eisenhower has been the man. Not only has the presence of a man of his stature and personality been inspiring, as we all know, but, of even greater value, he has been the symbol of American friendship, support, and determination in assisting the western Europeans in their efforts. In this respect he has made by far his greatest contribution. But if American support should be withdrawn, or its leadership compromised before European leadership could be developed, in my opinion the structure of western Europe would be jeopardized.

European Attitudes

With American leadership, the change in spirit, particularly in the continental NATO countries, in the last two years has been remarkable. It is in this field far more than in the field of actual build-up of physical strength that the achievement has been noteworthy. Immediately after the outbreak of fighting in Korea, the sentiment throughout practically all western continental Europe was that war was inevitable, and there was almost a fatalistic resignation to defeat; though in Britain, where there had been no occupation and where they have a sea moat, the morale never sank so low as on the Continent. But today the majority of continental Europeans feel that war is not inevitable. That is a noteworthy change. And while they believe that if the Russians should march now, NATO might not be able to stop them at this point or that line, roughly half of them no longer accept the necessity of ultimate defeat.

Further, one finds more spirit today on the positive side. Some Europeans are already of the opinion that the price the Russians would have to pay to march into western Europe under today's conditions would be sufficiently high to be a deterrent to any such action, and that the Russians might not be able to go all the way to the sea. There is a feeling that even with NATO's present strength and spirit, and with the increased strength that could be built up, a stand might be maintained, and ultimately a counter-offensive mounted.

Against this there is now throughout Europe a far greater awareness of the vulnerability of the European national economies and of economic and financial limitations, scarcities of materials, and tax burdens. This has resulted in a great reluctance to expand armament efforts beyond the commitments made eighteen months ago. In fact, in certain significant cases, schedules have been further drawn out since then.

The reluctance may have become more sharply defined in the last eighteen months; but in my opinion, by far the major portion of it is currently based on sincere concern as to the wisdom of additional rearmament effort at the price of economic and social strain. A portion of the reluctance can, to be sure, be attributed to an attitude of wait and see what the United States may do; but I think there is less of this attitude than there was two years ago.

Further, there is a more widespread realization that the division of Europe into separate nationalities handicaps the growth of basic economic strength as well as military strength. Here too, although the mills of history grind slowly, important advances have been made. The Benelux experiment and the Schuman plan are concrete instances of successful negotiation, even though not yet carried to fruition. The importance now attached to the Council of Europe at Strasbourg is evidence of the wider appeal of greater measures of integration. The operations of the European Payments Union, and latterly the discussions regarding a European army and European Defense Community, are all straws in the wind, evidencing progress in this direction. The rate may be too small, but the direction is favorable.

Is Our Effort Worth While?

If the direction is favorable but the rate slow, is the effort worth our while, or should we retire to the defense only of our own geographical frontiers?

A sharp division between Eastern and Western Hemispheres would necessarily close the channels of trade for raw materials and finished products. This would throw upon us extra burdens for defense, which would mean increased regimentation and perhaps a war economy, almost the equivalent of an armed camp. To my mind, such a system offers no acceptable solution for the future. Furthermore, it would permanently cut us off from those great material, cultural, and spiritual contributions which western Europe has to offer. Accordingly, to me any prospect of the loss of western Europe is a threat to our own institutions and mode of life and welfare, which I feel should be resisted by force of arms, if need be.

But unless western Europe can be further integrated and more of its resources made available to NATO, it cannot hope to be able to stand alone at a satisfactory level of security within any short period of years. But with United States support in this intermediate period, there are prospects of its being able to widen its base and ultimately become self-sufficient with minimal future necessary dependence upon the United States.

We must promote such a goal. Our leadership may not always be wise, but our mistakes are not those of malicious intent. They are those of impatience and inexperience, and though they may be irritating to more mature European countries, I think it is generally felt that we are trying to do the right thing.

Hence, what are the prospects today? We in the United States, with a long record of tremendous opportunities and successful achievement, are frequently impatient, and we may expect too much in the way of material output in NATO Europe unless we understand the situation. Although, as a percentage of our national income and on an absolute scale, we in the United States are carrying a much heavier burden of rearmament, the "pinch" hurts more on the other side of the Atlantic than it does here. I know of few friends in America who have been unable to get a television set or a new automobile if they wanted one. But this is not the situation on the other side of the Atlantic. There is less "fat" over there, and "pulling in the belt" hurts more than here.

Summary and Conclusion

Accordingly, to summarize, we have embarked upon a course with allies in the Atlantic community. Those allies are making a real effort in relation to their resources. In certain cases the effort is as much as could be expected. In others, more could be done.

There are indications of growing economic strength in western Europe, but in spite of this, our allies are militarily weak in comparison with the U.S.S.R. and its European satellites. The potential strength and rate of economic expansion of present NATO western Europe do not warrant belief that those countries, unsupported by the United States, will gain sufficient defensive strength within a short period of years to hold western continental Europe against the Soviet Union if the Kremlin intended (and it is by no means certain that it does) direct aggressive action. However, backed by the United States, the over-all strength of NATO is predominant. The improved morale in Europe is not yet self-sustaining, but it can be built to a self-sustaining level if we assist during this transition period.

If the human and material resources west of the Iron Curtain but not presently within the NATO framework can be brought to the support of the NATO cause, the industrial strength of western Europe will exceed that of the Soviet Union and its European satellites. But if these additional resources should become available to the other side, western Europe's self-sufficiency at an adequate level of defensive strength would be indefinitely postponed, with serious repercussions upon the United States.

With continued strengthening of spirit

and an extension of the favorable changes which have already taken place, there is the possibility for increased unity and for a widening of the base of Europe's economy and social structure. This cannot be done over night, as such would result in unemployment and chaos. But done progressively, it can lead ultimately to a self-sustaining western Europe—not with ease, but it can be done. The opportunity and the challenge are enormous. The stakes are high, particularly when the rates of change east and west of the Iron Curtain are considered.

We can contribute to bringing about the creation of a self-sustaining western Europe, but we cannot dictate or pressure it into existence. Although the rate may appear disappointingly slow at times, measured in terms of history it is definitely progressive. And, in my opinion, we should definitely not sell western Europe short. We should continue to work, not alone but with others in the Atlantic community, in our national interest, to help rebuild a world with a self-respecting western Europe, which can through its own efforts, after a transitional period with our help, become self-sustaining and strong, not alone in defensive military power, but also again, as of old, contributing economic, spiritual, and cultural values to civilization, of which we as well as others are the beneficiaries.

W. R. Herod, New York City, is president of the International General Electric Company and is a director of many companies in the United States and abroad. He is a veteran of both world wars, and recently returned to the United States after a period of service as the first head of the Defense Production Board of the North Atlantic Treaty Organization.

An International Materials Policy

By MANLY FLEISCHMANN

THE general subject under discussion —"The National Interest—Alone or With Others?"—states accurately and succinctly the question to which American policy makers must find the right answer, at the peril of national catastrophe. Our task is made only a little easier because the answer itself is simple, obvious, and indisputable. What is not so simple is, Can that answer be put into effect in the years to come?

WE ARE NOT SELF-SUFFICIENT

The factual material to answer the question posed is clear, known to every responsible American official, and not subject to much debate. We must start by facing the unpalatable fact that America today is a "have not" nation with respect to a majority of the metals indispensable to the attainment of military strength, and consequently indispensable to national survival.

The world being divided, as it is, into two armed camps, it follows by relentless logic that if we are to defend ourselves we cannot go it alone; we must, in fact, import to survive in a universe where for the moment armed strength is the sole guarantee of existence as an independent nation. To pursue the syllogism further, since we must import a major portion of our minimum security requirements in many of the key metals, we must also be prepared to export some of the materials which we produce in substantial volume, even when such action may be uncomfortable, inconvenient, and even damaging to American industry in particular cases.

We cannot expect that foreign metal-producing nations will be responsive to our national needs for the things they produce if we turn a deaf ear to their own requirements. We need a somewhat broader view of this matter of international co-operation than that expressed by one critic of the recent exchange of American steel for British aluminum and tin, when he said that he highly approved of the transaction except for the part where the British were given some of our steel.

How has this very fundamental change in American self-sufficiency come about? In the first place, it should be noted that the theory of American self-sufficiency has always been to a considerable extent a myth, so the change is not so dramatic as might otherwise be supposed. During World War II we had to import many basic raw materials, even during the height of hostilities, when movement by sea was a hazardous and costly undertaking. To cite a single example, many American ships were lost by enemy action in the hauling of bauxite from the Caribbean to American shores during that war.

INCREASED REQUIREMENTS

Moreover, in the later years of World War II and ever since, great scientific changes have been afoot which have now culminated in what can be justly described as four major technological revolutions which have drastically altered military science and therefore the conditions of survival, and which certainly will in the next few years alter to a comparable degree the very circumstances of human life. I refer to the epic discoveries in the fields of atomic energy, jet propulsion, electronics, and petro-chemicals. Each of

these vast changes is or soon will be intimately related to the basic armament programs upon which our security depends, and their cumulative effect can hardly be overstated.

The impact of these tremendous scientific advances, focused as they were in the field of military science, came at a time when the nation was unwilling to accommodate to them. Unfortunately, each of these industrial revolutions inescapably increases our reliance on imported raw materials.

The end of World War II found the nation impatient of the discipline that would have been required to maintain an adequate munitions program, including the indispensable development of military technology. Military budgets were slashed to the bone and beyond. In the years between 1945 and 1950 the nation engaged in a frenzied demobilization which in retrospect seems to have escaped disaster by the narrowest of margins. Few of the materials most essential to our security were stockpiled in any adequate quantity.

As a result, we are in the main as dependent today as we were in 1945 on the uninterrupted importation of columbium, nickel, cobalt, and tungsten to support our jet aircraft program, to cite but a single example. That example might be multiplied many times. Out of thirty-eight important industrial minerals we are self-sufficient in only nine, and for another twenty domestic production provides less than 60 per cent of our requirements. For seven of these twenty we are dependent on other countries for just about 100 per cent of our requirements.

At the same time, the special material requirements of the mobilization program multiply our needs for particular minerals at a fantastic rate.

Thus, when the facts are known, the question posed for discussion becomes merely rhetorical, since the answer is patent. We may profitably turn to the more complicated problem of what to do about the dangerous situation in which we Americans find ourselves.

GOVERNMENT RESPONSIBILITY

I start with the proposition that the Federal Government has an inescapable responsibility to see to it that our mobilization needs for these imported minerals are met. That responsibility arises from the first and basic duty of any government, namely, the duty of defense and self-preservation. The present administration, or any other administration, would be derelict in its discharge of its constitutional obligations if it did not make every reasonable provision for the solution of these insistent problems.

Let me make it perfectly clear that I am not suggesting for a moment that the government should pre-empt the functions of free enterprise and private trade in any area where such a course is not urgently required. Indeed, it is my conviction that the area of government intervention in this, as in other commercial matters, should and can be held to an absolute minimum. But there is no blinking the fact that when ordinary commercial methods prove inadequate to ensure and protect our supply of these survival necessities, the government must assume the responsibility of making up the deficit. Unfortunately, that is the very situation in which we find ourselves today with respect to many of the materials in question.

The delineation of the proper responsibilities of government and private industry in this condition of international materials shortages is difficult and complicated. Obviously, the United States has the financial resources to set in motion an international auction of materials in which we would be the temporary victors. Such a victory would be a Pyrrhic one at best, however, since it could be won only at the expense of the disruption of the mobilization programs and the economies of our allies whose support we will surely need in the years ahead. Beyond that, such a course would bring in its wake an uncontrollable international inflation whose repercussions would certainly be most severe upon our own domestic economy. In this field, it seems clear to me that the path of wisdom is co-operation, and not cut-throat competition with our friends.

GOVERNMENT METHODS

Let me sketch a few of the methods being used by the government in this emergency period. In the first place, we have encouraged private concerns to expand their production of scarce minerals, here and abroad, by a variety of financial inducements. These have included accelerated amortization with accompanying tax benefits, loans and long-term purchase agreements, sometimes at premium prices designed to bring into production marginal facilities which would otherwise be unworked.

In some cases we have made government-to-government agreements, either for the exchange of materials, as was the case with the British arrangement, or for the unilateral delivery of particular materials by individual countries, as was the case with the agreement made with respect to Chilean copper in 1951 and the recent agreement for the purchase of Indonesian tin.

Finally, we have participated in the International Materials Conference, which is the present-day version of the co-operative arrangements worked out in the comparable emergency of World War II. There has been some criticism of the IMC in the course of recent discussion, on the assumption that there is involved some surrender of national sovereignty to an international agency and some invasion of the prerogatives of free enterprise. I believe that neither criticism is justified.

NATURE OF IMC

In the first place, the International Materials Conference, which consists basically of a meeting of some twenty-six nations of the free world having an interest in the equitable distribution of scarce materials, has no power of any kind, except to make appropriate recommendations to the various participating governments. Our government, and any other government, is free to reject any individual recommended allocation, or all of them, though to pursue the latter course would obviously bring about the speedy demise of the Conference.

The work of the Conference proceeds on the theory that the supply of certain materials is inadequate to meet the needs of all the nations of the free world in a time of international emergency. It is the conviction of those who have studied this problem that the worst way to solve such a situation is by unbridled competitive bidding-up of the short commodity; the best way is by co-operative agreements limiting each nation's consumption of the material until the shortage can be alleviated by restoration of a proper balance between supply and demand.

The IMC is by its very nature an emergency operation, and its existence will surely come to an end when the emergency ends. However, I know of no one who has studied the metals dilemma facing the United States who will predict exactly the date on which all our problems of this kind will be solved.

I should add that the operation of the International Materials Conference is not an allocation system comparable to the Controlled Materials Plan under which domestic distribution of steel,

copper, and aluminum is handled during the emergency period. It does not allocate any material from the source, and no nation or individual is required to sell any material to any other nation or individual.

If the arrangements are subject to criticism, it seems to me that the proper criticism is that their effectiveness is limited by the voluntary nature of the international commitments; but perhaps that weakness is inescapable, lacking the urgency of an all-out shooting war.

EFFECTS OF IMC

Based on the results to date, the IMC has unquestionably performed a useful function in bringing about a proper distribution of such key materials as copper, zinc, and sulphur, and the recent softening of international prices for these and other materials is certainly due in large measure to the success that has attended the operation to date.

I want to point out here, too, that had it not been for the collaborative and voluntary arrangements the United States Government has made with the nations of the International Materials Conference, the United States in my judgment would not have got the large share of vitally needed materials which we in fact did get—unless we had been willing to spend an unlimited amount of money, bid up world prices, and injure our own economy and that of our allies. Through IMC, for example, we have arranged to get a larger share of world supplies of copper than we did formerly, largely in recognition of the needs arising from our tremendous defense effort.

Finally, it should be noted that the IMC has not impaired the normal commercial operations of importers and exporters in the various countries in any manner. No agreements have been made or are contemplated requiring this nation or any other nation to take over exclusive purchasing functions with respect to the materials allocated pursuant to IMC recommendations. Normal trade channels are used and will continue to be used as long as they perform effectively.

The exclusive purchasing arrangements with respect to rubber and tin represented exceptions to the United States policy in this respect, and neither material has ever been subject to the operation of the IMC. As long as private enterprise can do the job, it is my firm conviction that this should be, and I believe will be, this nation's preferred and primary reliance in the field of international trade.

Here, as in many other areas at the very heart of the mobilization effort, cooperative efforts by the government and industry will surely solve our most pressing problems. I repeat the thought with which I started, however: any government that would ensure the survival of this nation must accept the ultimate responsibility for seeing to it that our imports of these vital commodities remain at a level sufficient to provide for the ever increasing appetite of the military production program, at least as long as the danger of all-out war is a real one.

THE CRISIS WE FACE

The years ahead will be, I think, among the most difficult in our history. We are faced with a crisis as great as any since 1776, and of a character which we are little qualified by experience to meet. This is a crisis of many years of tension, now heightened, now lessened, usually by the volition of our potential enemy. Anyone who follows the foreign dispatches must have been struck in recent months by a new note in the Soviet symphony—by overtones of appeasement and peace talk.

We can hope that this represents a true change of heart, but we must not rely on such assumption even for a moment. It must be apparent now to the Kremlin that the major result of its Korean enterprise has been the revitalization of a tremendous American industrial and military effort which already has favorably altered the balance of power between us.

It seems evident to me that the most strenuous attempts will now be made to rectify that costly blunder and to induce another sleep comparable to that which we enjoyed from 1945 to 1950—a sleep which in retrospect seems more like a nightmare.

A wise national policy will surely disregard such siren songs and will continue resolutely on the path of completing and maintaining an effective military establishment in the years ahead until an international settlement of a permanent nature can be reached.

The demands for imported materials which I have detailed will continue as urgently in 1955 and thereafter as today; as the military program reaches a plateau of preparedness, these demands will in all probability decline in volume, but not in their indispensable nature. We may well hope and expect that at such a time there will be less need for government interference and encouragement of extraordinary arrangements to increase international supply, but it is certain that the ultimate government responsibility in this field will not change.

If we are strong and patient and resolute, we shall certainly surmount this gravest of our continuing security problems. We have been burnt twice in less than ten years by national unpreparedness. It is my hope and belief that the nation has now learned the lesson and that it will not again forget.

TEST OF THE FREE NATIONS

Co-operation in the field of materials has provided one of the real tests to the nations of the free world in jointly achieving the mutual objective of security and the economic well-being necessary to that security. To date, with only minor exceptions, that test has been met successfully by the governments of these nations and by their private citizens whose enterprise and ingenuity in normal commercial operations make this possible.

I say to you that the circumstances of the world in which we live present a clear call to all free nations to continue with the greatest possible speed the development of their material resources and co-operation in their use. We must provide ourselves with the materials necessary to forge our defenses. We must share to survive.

Manly Fleischmann, A.B., LL.B., Washington, D. C., has recently resigned as Administrator of the Defense Production Administration. He also served at an earlier date as General Counsel and later as Administrator of the National Production Authority. He formerly practiced law in Buffalo, New York, and during World War II he served with the War Production Board, the United States Navy, and the Office of Strategic Services.

Can Germany Contain Russia Safely?

By Joseph C. Harsch

MAY I say at the outset that I do not know the answer to the question raised in the title of this article, nor do I consider it possible for anyone in the space permissible here even to begin to encompass the problem. All I will attempt to do is discuss some of the many aspects of this problem and come to a few tentative conclusions, all subject to correction by time.

Recovery of Germany

In considering the problem of Germany versus Russia and what we can do with Germany as a means of containing Russia, we should look at the Germany of today. I had the interesting experience of visiting Germany at the end of 1945, again in 1947, in 1949, and last fall. To me, what is happening there is one of the most fabulous stories of our times.

I shall never forget walking into Frankfurt at the moment of the German defeat, with an American Air Force officer who had himself contributed to the condition we saw about us. He looked about him with some pride and remarked with confidence, "It will take the Germans a hundred years to recover from this." I differed with him. I took a very rash stand. I said, "I think it will probably take them about ten years."

In 1947 and even in 1949 there were places in Germany where it seemed that the Air Force officer's guess might prove the correct one; but in November and December of 1951, I felt that my own observations had been fully justified. Germany is going to be recovered within ten years of the end of the war, I am confident. There is no more exciting physical manifestation of nature, human or otherwise, than this recovery of Germany.

In traveling through Europe one sees the manifestation of this recovery. Far down in Istanbul, driving along the highway from the airport into the town, practically every third sign is advertising a German product. In the hotels in Ankara German is spoken widely, freely. In Belgrade Germans come out of hiding. German can now be spoken in public without fear. The German is reclaiming his old trade empire to the southeast.

The recovery is apparent in Germany itself. It is seen in the appearance of the animals on the farms, in the well-tilled fields, in the cleaning up of rubble, in the new factories, in the pace of industrial advancement. The recovery of Germany is, I think, the most vital and most prominent feature of the European landscape of today. Power is blossoming in that country—power and product. It appears in western Berlin, where new individualism shows itself in architecture, in dress, in color, in the way the people live and behave. There is an enormous vitality in that city.

Now, this is one of the great forces of our times which is reasserting its energy, its vitality, and its potential ability to help shape the destiny of this world. Can it be used? Will it be used? Will it exercise itself to the advantage of a balanced, stabilized world, or is it a force which is again going to cause trouble?

Eastern Orientation of Germany

Let us take a look at what history may tell us about Germany and Germans. There is a long, fascinating record.

Germany does not belong entirely to the West. In the town of Cottbus, south of Berlin, a Slovak dialect is still spoken. The eastern Germans are not Germans, not Teutonic tribesmen. They are Slavs. There is a merging of the two races in Germany today and in the German nature. The Roman Empire never extended seriously beyond Trier. The Rhineland was Romanized and Christianized, but eastern Germany was not. There are many cultural currents in Germany which derive from the East rather than from the West.

Germans as Guardians of Frontiers

The Romans used the German tribesmen as guardians of the frontiers of the Empire. The idea of using Hessians as hired troops dates far back beyond the American Colonial period. As far as I know, the Romans invented it; I know of no earlier example. The British themselves, when Rome left them, followed the Roman example and brought Saxons over from Germany to help defend them against the Scots, the Danes, and others.

Those who employed the Germans to defend their frontiers have not always been happy with the results. Perhaps the English are glad that they were conquered earlier by Horsa and the German tribesmen, but the Roman Britons felt that their civilization and their values had been destroyed in the process. Perhaps it can be contended that the German was eventually civilized in Britain and has become part of an amalgamation, which is, I suppose, today better than what would have happened if the Germans had been kept out. Nevertheless, there was a period of considerable turmoil and pain during which the Germans who were brought into Britain to guard the British frontiers took over the country. That was true of most of the Roman Empire.

Is the German, therefore, a reliable guardian of the frontier? If the German were totally westernized in his point of view, I suppose the answer would be Yes. However, we must approach any affirmative answer to the question with restraint, and with some question as to whether it really will work out as we might hope it would.

Germans Favor German-Russian Merger

In the early period of the war when I was in Berlin, I had arguments over and over again with German government officials about the relationship of Germany with Russia. They took the attitude that sooner or later there would have to be a German and Russian merger. The one consistent note in the German propaganda of the early war period (and I suppose throughout the war, but I did not keep in touch with it after I left Berlin) was the complementary nature of the German and Russian areas, their economies and industries. The central thought behind the attempted conquest of Russia by Germany was that the two do belong together. The German, considering himself to be a master race, thought it only fitting and proper that the merger should be brought about through conquest of Russia by Germany, but the essential thing was not the conquest—it was the union between Germany and Russia.

If a Gallup Poll were taken of what is in the German mind, I think we should find that that element is still there—that feeling that Germany's future lies closely associated with that of Russia, that some day, somehow, by methods not yet perfected, there will be a German-Russian merger. Perhaps that does not apply to the Rhineland German as much as it does to the east-

ern German, but it is an element that is deep in the German mind. But any kind of a German-Russian merger, whether it comes about by German conquest of Russia, by Russian conquest of Germany, or by a political and economic partnership, is an extremely dangerous thing for us to have to contemplate.

Political Power of Russia

In the world as it existed up to the nineteenth century, Russia did not have to be considered very seriously in attempting to arrive at a stable political condition. Russia was not well organized, closely knit, efficient, or modern. She was not motivated by a sense of going some place. She was a kind of inchoate mass stirring around, causing trouble sometimes, but easily set back upon her heels by Swedes, Lithuanians, Poles, or others. She was not a major factor in setting up a balance of power in the world.

In the nineteenth century Russia became an important factor, and today she is a major factor in world politics. It is no longer possible to think of the civilized world (using civilization in perhaps an uncivilized way) as ending at the frontier of Russia, because Russia, whatever we may think of her culture, her politics, or her society, is a major power in the world—ideologically, physically, militarily. She has achieved organization and the ability to build power which can be projected beyond her own frontiers. She does project her power by way of ideas and by way of force beyond her own frontiers, and she is therefore one of the great powers of the world.

In the seventeenth century it was easy for Britain to establish a balance of power, because it was merely a matter of balancing France off against Germany. They were the two continental powers. But those days are gone; and when we visualize the world in terms of the power that exists in Russia, the conclusion is inescapable that there is no way of achieving stability sufficient to our interests and our needs if this merger of the Russians and the Germans, of which the Germans think so often, should ever become a reality.

Even if we take the Elbe River as a frontier between east and west, Europe is already dangerously narrow, shallow. The distance from the Elbe to the English Channel is a small thing indeed. The power that exists west of the Elbe is not a balance with the power that exists east of the Elbe.

Can We Rely on Germans and Japanese?

The Russians have been talking lately about letting loose a neutralized Germany. Suppose we agree with them to let this come about; what will happen? If we could trust Germany to be western in concept, if we could trust both Germany and Japan to be the guardians of the farther marches of the West along the frontiers of the Russian realm, we might have some kind of stability. But is the future leader of Germany likely to regard himself as serving the cause of the West—as one whose primary function is merely to protect the West from the "Russian bear"? Will there ever be a leader in Japan who will willingly accept that function, and serve us as our defender along the borders of Russia?

If the leaders of Germany and Japan would accept that function, the prospect would be quite a cheerful one; because I have no doubt that the potential military power of Germany and Japan, if backed by the industrial might of American and Britain, could actually contain the frontiers of Russia. The problem is not whether it can be done physically, but whether we can rely on the Germans and the Japanese to do it. I should like to believe we could, and perhaps we can. Certainly I suspect that we are going to have to try it. My own mind is incapable of coming up with any other solution of the problem.

Accord Despite Differences

The alternative is intolerable. Suppose that Germany were merged with Russia. It does not require the communization of Germany to produce such a merger. There have been many accommodations between Germany and Russia in the past when the ideologies of the two countries were not similar. Russia resurrected Germany at the Treaty of Rapallo at the end of the First World War, despite the fact that Russia was in the beginning moments of the great revolution and Germany had already decided not to go communist. In 1939 Russia was communist and Germany was fascist. That did not prevent the Russians from entering into the Molotov-Ribbentrop Pact with the Germans.

There is friction between the two peoples; there is great hatred between them. There is the memory of the many times they have come into conflict; particularly there is today in Germany the memory of the Russian occupation of eastern Germany, and there is personal antipathy that is very deep and probably will last a long time. But I doubt that we can rely on that to keep the German from being tempted by the prospect of the power which would become his if he entered into a partnership with Russia, even though he himself remained a political individual of the right and the Russian remained a political individual of the communist left.

And if the power of Germany, with the enormous ingenuity of its people, its industry, and its resources, were added to the vast manpower and raw materials of Russia, I do not know how the rest of us could contain that force. I do not know how we could continue to live in the same world with it.

I would submit as an unfortunate thesis that the containment of Russia cannot be achieved with certainty without Germany; but, on the other hand, there is the parallel thesis that there is considerable doubt whether Germany will for long participate fully with us in the effort to achieve it.

Possible Neutrality

Now, there is the third possibility, of course, that Germany on the one side of Russia and Japan on the other will make themselves truly independent of both East and West, and will again, like mountain ranges, separate Russia from the western civilization which we know and which we must attempt to safeguard and defend. If only we could believe that Germany and Japan would become solid, motionless mountain ranges, if they would be content to be that and nothing more, if they would not use their positions between East and West to play one off against the other for their own advantage, that would probably be the best thing that could happen.

I often think that the end of the cold war will probably come when there is a revival of a kind of twilight zone between East and West, an area which declines to be dominated by either, which insists upon having its own separate identity, in which both eastern and western influences exist and come into something of a balance. I hope it will work out that way.

An Unsolved Difficulty

But I do feel gravely upset over the idea that a German-Russian combina-

tion would outbalance the world and yet we seem to be having some difficulty to achieve a western combination with Germany. I am not at all sure that the Germans really wish to be part of a western combination. And if we did make all of Germany a part of the West, possibly the Russians would regard that kind of merger as being as fatal to them and their interests as we must regard the German-Russian merger.

I have only posed questions. I am sorry I cannot answer them.

Joseph C. Harsch, Washington, D. C., has been a correspondent of the Christian Science Monitor since 1929, and a news commentator of the Columbia Broadcasting System since 1943. In addition to serving for many years with the Monitor's Washington Bureau, he has been a foreign correspondent of that newspaper. He is the author of Pattern of Conquest, and The Curtain Isn't Iron.

France Today

By MAURICE FERRO

TO understand the political aspects of present-day France, we must go back to June 17, 1940, when the voice of an old man addressed the people of France in their confusion and distress and announced that Marshal Pétain had asked Hitler for a merciful, honorable armistice, as one soldier to another. As if it were possible to conclude any pact in honor with German Nazism! Or to talk as soldier to soldier with an ex-corporal of the *Wehrmacht*, Adolf Hitler!

BIRTH OF FRENCH RESISTANCE

Twenty-four hours later another voice was heard throughout the world, through the British Broadcasting Corporation. It was a real French voice—that of General Charles de Gaulle. The General proclaimed that France had lost a battle, but she had not lost the war. Beyond the seas (he was referring explicitly to the United States of America) was the arsenal of democracy—immense forces which were not yet developed but which would some day enter into action alongside the other forces of freedom against Nazism and Fascism.

The French resistance was born June 18, 1940, in London. A few months later, on November 11, 1940, a few hundred French students marched along the Avenue des Champs Élysées to lay flowers on the grave of the Unknown Soldier. They were immediately dispersed and arrested by the Gestapo. It was the first manifestation of the spirit of French resistance on the soil of France—not only against the aggressor but also against the internal power of Marshal Pétain. After a war which ends in defeat and occupation, a country tends toward anarchy or toward despotism. Unfortunately, we went toward despotism under the Vichy regime. But a few months later the spirit of freedom was revived in France with the simple gesture of a few hundred students.

Then, little by little, side by side, every faction of French public opinion arose against German power and Vichy power. France is a free country, and every opinion can be freely expressed, from Communism to faith in royalty (for, strange as it may seem, there is still a small sector of the French people that would favor the return of the monarchy). But the main characteristic of the French underground movement was that everybody fought side by side against despotism and tyranny.

AFTER LIBERATION

And in 1944 when France was liberated, thanks to the power of our allies and the French resistance, it seemed that a spirit of co-operation had emerged from the great turmoil in which we had been thrown together for four years. It was thought that the sacred French unity which prevailed on August 4, 1914, when we started the first war against German aggression and imperialism, might be revived. This is why General de Gaulle was acclaimed in every city, town, and village in France as a liberator.

General de Gaulle's forces had grown from a handful in 1940 to about 250,000, resulting in the first French Army. He is represented in this country as a prima donna, the man on horseback, the dictator in being. He could have established a dictatorship in

France. But instead, he told the French people that he had been a trustee for the Third Republic and had kept in force its constitution and laws, and he now asked them to decide, through a plebiscite, whether they wanted to retain the constitution of the Third Republic or adopt a new one; and if they wanted a new one, they should elect a constitutional assembly. The people of France answered that they wanted a new constitution, and they elected their representatives to draft it. The draft was not completed in the seven months assigned by the plebiscite, so the constitutional assembly was re-elected.

STRUCTURE OF FRENCH GOVERNMENT

The resulting constitution is not at all perfect. It represents a compromise between all French trends, from the extreme left to the extreme right. Of course all political elements were united and willing to co-operate to restore to France her sovereignty and her past glory. But the Communists could not refrain from emphasizing the powers of the new National Assembly. We formerly had a House of Representatives, which we called Chamber of Deputies, and a Senate. But the Communists did not want a Senate. They wanted to concentrate power in one assembly, which would be controlled by the people, instead of having an upper chamber—the Senate—which during the Third Republic was much more conservative than the Chamber of Deputies. But the center and rightist parties still wanted two houses and a strong government. So they worked out a compromise constitution, under which the National Assembly, which is the House of Representatives, is empowered with the so-called vote of confidence.

The other house, the Council of the Republic, is merely an advisory body, without legislative power. When a bill is passed in first reading by the National Assembly, if the Council advises against enactment, the bill is returned to the Assembly and it requires a two-thirds majority in the Assembly, instead of the normal majority, to override the Council.

The first vote of the National Assembly was a big vote of confidence in General de Gaulle. He was designated President of the Provisional Government of the French Republic, by 555 votes.

THE FRENCH COMMUNISTS

Unfortunately this unanimity did not last. The center and rightist parties had thought that during the fight against Germany and against tyranny the Communist Party had become a *French* party—holding very leftist ideas, but imbued with French sentiments. But it developed that the Communist Party in France was not loyal to French interests, but was taking direction from Moscow. So in 1947 the French Government dissolved the coalition with the Communists, and since then it may be said that the Communists are no longer part of the French community.

It is often thought that since we have in France about four million Communist voters, that means that we have four million Communists in France. I wish to emphasize that that is not true. I assure you that the hard core of French Communists numbers only about 100,000 or 150,000, who in case of war could be controlled and would not hinder French mobilization.

BACKGROUND OF NORTH ATLANTIC TREATY

The bulk of the French people cannot bear the idea of having France occupied a third time in less than half a century. Eleven departments [counties] were occupied in 1914, and the whole of France was occupied during World War II. And as we dislike the thought of being occupied again, we also dislike the thought of being liberated; that would mean a great deal of destruction, as it did in 1944. In fact, it would be worse than in 1944, since we are now in the atomic age. Since we do not want France occupied by the Russians, or by anybody else, and do not want the necessity for liberation, we felt it necessary to organize our defenses in common with our allies, especially with our great ally, the United States of America, in order to deter any possible aggression.

After the Communists took control of Czechoslovakia in 1948, just ten years after Hitler's occupation in 1938, France signed the Brussels Treaty with the tiny Benelux countries. Was this really a treaty to stand together to fight aggression? It was merely a moral alliance. We had only three divisions in Germany, the British had three, and the Benelux countries could muster only one division, and that with great difficulty. The Brussels Treaty was concluded mainly to prove to our friends in America that we were morally determined to repel any kind of aggression.

Therefore, just a few days after the treaty was signed, the French Minister of Foreign Affairs, Georges Bidault, conveyed a note to the Department of State asking whether the United States were ready at that time to pledge to stand by her European friends in case of Soviet aggression. General Marshall, who was at that time Secretary of State, felt that public opinion in this country was not prepared for such a pledge. The United States was a member of the United Nations, and so in 1948, even after the Communist coup d'état in Czechoslovakia, even after the voting of the very generous Marshall plan, it would have been very difficult for public opinion to sanction a formal guarantee to foreign countries without the establishment of a pact. And so, very wisely, General Marshall and that great American, the late Arthur H. Vandenberg, worked out an agreement.

In 1948, as now, this country was involved in an election campaign, and not much attention was paid to the very explosive, revolutionary content of the so-called Vandenberg Resolution. But a few weeks later, on July 5, 1948, General Marshall and the French, Canadian, and British Ambassadors to the United States held a secret meeting in Washington. This was the first step toward the North Atlantic Treaty which was signed on April 4, 1949.

I have outlined this bit of history to show that the people of France, with a will to deter any aggression coming from the East, asked this country to make a pledge. This is what I am saying in my newspaper columns to those in Europe who represent the North Atlantic Treaty as a weapon of American imperialism. One can recognize in this criticism the stooges of the Kremlin.

UNITED STATES AID

For one year, the North Atlantic Treaty, like the Brussels Treaty, was a paper alliance. Then in September 1949, Congress voted the first lend-lease to Europe, and you started to ship to France, Great Britain, and other countries your surplus material. But this was not enough to arm the freshly mustered divisions, and we realized that we had to do something more.

On June 25, 1950, the first armed Communist aggression burst by the invasion of South Korea by the Communist North Koreans at the instigation of the masters of the Kremlin. In August 1950, the French Government, represented by Monsieur René Pleven, sent to the United States Department of State two memoranda, which may be summarized as follows:

Was the United States ready to send more troops to Europe than the three divisions in the occupation force in Germany? If so, what would be the extent of American aid? Could we set up an agreement about these American forces?

No answer came. On September 8, 1950 the White House issued a communiqué in which President Truman said that the United States was ready to send ground forces to Europe to stand by the Atlantic allies, the British and the French. Four days later, on September 12, 1950, at the North Atlantic Council held at the Waldorf-Astoria, Secretary of State Acheson made it clear that this new American pledge to the European North Atlantic allies meant that we had to accept German participation in the defense of western Europe.

FRENCH MILITARY CONTRIBUTION

France at first rejected this point of view, for many obvious reasons, the main one being psychological. The matter was not decided until December 1950, when, at a meeting in Brussels of the new Council of Ministers of Foreign Affairs, we pledged to the North Atlantic Alliance twenty divisions.

In the press of this country it is pointed out that Yugoslavia has thirty divisions and Spain has thirty-two divisions. But these are divisions of 10,000 men, without any armament, or with obsolete armament. When we speak of divisions in France, we mean not only fighting men but also supporting elements, and every division numbers 45,000 men. That means that by the end of 1953 we should have a permanent force of 900,000 men, out of a population of continental France of 42,000,000 people.

Now I must say a word about the heavy strain of the Indochinese war. Only a few years ago it was tagged in this country as an imperialistic war. Now, since the 1950 aggression of the North Koreans, it is generally recognized that we are fighting Communism in southeastern Asia. We have there 174 battalions, each consisting of 900 men. In this struggle are involved 8,000 career officers and 37,000 noncommissioned career officers.

So, if we are lagging a little behind schedule in rearmament, it is because we are involved in a shooting war—as you are involved in Korea—against Communism. And we have not the huge means of this wonderful country of the United States. We are waging a war of attrition against Communism in southeastern Asia which is costing us every year one billion dollars. That means an average of three or four hundred million dollars more than we received under the Marshall plan assistance.

In closing, I can tell you that the people of France are forever grateful to the people of America for what they have done for France. We will ever stand by the United States, and we too have a saying, as you have, "United we stand, divided we fall." Let us stand united!

Maurice Ferro, Washington, D. C., is Washington correspondent of the French newspaper Le Monde. Prior to World War II he practiced law before the International Court of Appeals in Alexandria, Egypt. After the French armistice in June 1940, he joined the Free French forces and served in the Middle East, the Mediterranean area, and France. He was a first lieutenant in the French Navy at the time of his discharge in October 1945. Turning to the career of journalism, he became a foreign correspondent of Le Monde.

Europe in a Western Community

By PAUL-HENRI SPAAK

THE Second World War ended on a great note of hope, not only because we were victorious, not only because odious forms of government had collapsed, but also because, renewing President Wilson's great and generous endeavor, President Roosevelt was going to try to create a new universal, international institution, the task of which would be to maintain peace with justice and respect for the rights of all.

THE BASIC DELUSION

But the Charter of the United Nations is based on a delusion—that the world today is one.

When we had drawn up the principles on which the Charter was to be built, we agreed with enthusiasm to the text Marshal Smuts had prepared. It is always with emotion that I hear these noble words that eloquently express some of our most cherished ideas. But looking at the whole thing more closely, who can fail to see today the terrible equivocality, not to say the great lie, which made us admit that such a text could be accepted in the same way by democratic nations and by totalitarian nations?

". . . faith in fundamental human rights, in the dignity and worth of the human person . . .

"to establish conditions under which justice . . . can be maintained . . .

"to promote social progress and better standards of life in larger freedom . . .

"to practice tolerance and live together in peace with one another as good neighbors . . ."

Yes, for us, for the democracies of America and of Europe, this means something—something vital. But have we not cheapened, spoiled, tarnished our ideal in pretending to believe that it was also that of countries where one is arrested without a warrant, deported without judgment, tried without safeguards, tortured without mercy; where freedom does not exist, where religion is persecuted, where elections are a mockery, and where the will of the state is the only law?

It is high time to open our eyes. The world today is more torn apart than it has ever been before. Communism is not only an economic doctrine; it also claims to be a form of civilization, a rule of living. It is in this respect that it is opposed not only to some of our material interests, which after all would not be so important, but also to what is the basis of our spiritual life.

The world today is divided in two, and it probably is going to be so divided for a long time. For these reasons I cannot believe at this moment in a real world community; but at the same time, I strongly believe in a western community, and I even think that our most important duty is to work to reinforce it.

To reach this goal it is absolutely necessary to solve the European's problems, giving back to Europe its strength. In this problem of the western community, Europe is something of a dead weight that has to be dragged along—a body that has to be helped, rather than an active and powerful force.

EUROPE, MUTILATED AND MISERABLE

The Europe we speak about is a terribly mutilated Europe. Since 1939, that is to say in less than fifteen years,

Europe has lost, one after the other, Latvia, Estonia, Lithuania, Poland, Czechoslavakia, Rumania, Bulgaria, Hungary, and Eastern Germany. Dozens of millions of men and women belonging in heart and mind to western civilization, wishing to live according to our moral and political rules, are thrown to the domination of a minority which oppresses them cruelly, both materially and morally.

In that part of the world is being developed one of the most cruel political operations in the history of humanity. We watch it powerless. There lies one of the most manifest proofs of our weakness and our decline.

Our Europe is not only mutilated, it is miserable. It is obvious that if we had not had the benefit of Marshall aid in 1947, we should never have been able to solve the economic and social problems with which we were confronted as an inevitable consequence of the Second World War.

In 1947, the European deficit, expressed in dollars, was 5,800 million. This made it impossible for us to get food or supply our industries with raw materials; it meant, therefore, want and unemployment. Without Marshall aid the whole of the Europe that is still free would have known a situation even worse than during the bitterest years of the war, and we could not have prevented the triumphant spread of communism as far as the shores of the Mediterranean and the Atlantic—a communism which would have been nothing else than the expression of the despair of the peoples.

EUROPE, TIMID AND FACING REVOLT

A multilated Europe, a miserable Europe, but also a Europe which lives in the fear of war, for she knows that she has not the strength to repulse an eventual Soviet aggression. For the first time in their history, even the greatest, the strongest, European countries know that alone, isolated, they can no longer defend their borders, their independence, their freedom. They find themselves in a situation they have never known before. We know well in Europe that even all together, having mustered, co-ordinated, rationalized all our forces, we cannot feel secure without the constant and powerful support of the United States.

In fact, we live in fear of the Russian, and subsist thanks to American generosity. It is neither very pleasant nor very dignified.

Mutilated Europe, miserable Europe, timid Europe, and that is not all: Europe against whom Asia and Africa are in revolt.

In the United States people are quite stern regarding Europe's colonialism—I sincerely feel, rather too stern. This is not the time to look deep into the matter, to admit some abuses and underline a civilizing work that is not without grandeur. I merely want to acknowledge a fact. The people of Asia and Africa no longer accept Europe's domination, and they make no bones about it.

War in Indochina costs France one billion French francs daily, hundreds of officers, and thousands of soldiers. It forces her to an effort which according to all observers is one of the main elements of her present difficulties.

Egypt, Iran, Tunisia, Algeria, Morocco are in an uproar. Yesterday, all these countries were contributing in a very large measure to Europe's might and prosperity. Today, they set formidable problems before her.

EUROPE ECONOMICALLY THREATENED

Mutilated, miserable, timid, facing rebellion—this is Europe today. Alas, that is not all. She is threatened by the most serious economic crisis. There is something really tragic in what is happening to her. The whole successful effort accomplished since 1947, all the progress achieved toward equilibrium and stability, is in question once more.

Let me remind you that in 1947 the European deficit—a but too evident sign of our poverty—was about six billion dollars. In 1950 it had been reduced to 2,700 million dollars, or more than 50 per cent. Success was in sight; American help together with a true effort on the part of Europe had brought good results. Little by little European economy was finding its bearings. Another year or two and Europe could manage without the help of the United States. I need not emphasize what that meant for us and for you.

The Korean war and the necessity of rearming stopped all progress, disrupted once more every factor of the problem, and by the end of 1951 had brought Europe back to a situation even worse than in 1949. The dollar gap has once more reached 4,800 millions. The old problems are set again, and this time under conditions far more unfavorable both materially and psychologically. Every one of the measures taken within the Organization for European Economic Cooperation must be revised. The liberation of inter-European exchanges is once more in question. France and Great Britain are again reducing their imports. The European Payments Union is collapsing.

One goes back, step by step, to the most deplorable bilateral relationship—that which forces European countries to come to the level of the weakest. At the time when we ought to produce more and do it more cheaply, the cost of living is increasing dangerously and barriers more and more numerous are being set, impeding more and more the free circulation of goods.

EUROPE'S RESOURCES

The great question which confronts us is, Can the situation be changed? Personally I think so, because it seems to me that the situation of western Europe, considered in itself, is far from being desperate.

I have often spoken of the power and strength of the United States. However, let us make a comparison between the United States and western Europe of today.

It is true that the territory of the United States is immense, but the combined territory of the states of western Europe—especially if we add to them the African possessions controlled by some of these countries—is not less important than what the United States has. There are 150 million Americans, but there are 270 million western Europeans. There are in the United States considerable wealth and large quantities of raw materials; but there are considerable wealth and large quantities of raw materials in Europe, too.

We have in Europe practically everything we need to live. And yet we witness a difference in might which is really extraordinary. We see in the United States a world which continually develops, springs up, grows; and in Europe a world which shrivels up and stagnates. Why? Each time I use this word "why" I have a slight hesitation, because the answer I am going to give to this immense question is so simple that I wonder if it is not too simple, seeing the importance of the problem. But it is possible, after all, that even for the greatest question the answer can be simple.

A NEW EUROPE ENVISIONED

For me, the answer is simple. What is it that makes the difference between the United States and Europe? Only

this: In the United States 150 million inhabitants have one border, one economy, one market, one currency; and in Europe 270 million inhabitants have fifteen borders, fifteen markets, fifteen economies, fifteen currencies. Let us have the courage, the audacity, to solve the problem on the same lines as the United States, and we can do just as well. Our fifteen borders, our customs barriers, our high tariffs, constitute an impossible obstacle. We must create a wide and single market for our 270 million inhabitants, permitting mass production and cheap production. There, and there only, is the possibility of success.

Mr. Paul Hoffman said one day:

> You have in western Europe 270 million citizens, hard-working and resourceful. Yet, last year, your net national income only totaled 160 billion dollars. In the United States where the population is but 150 million, the net national income totaled last year 260 billion dollars.
>
> Had the individual average of production of the European been the same as that of the American, the global net production of Europe would have been 470 billion dollars.

Actual income, 160 billion dollars; possible income, 470 billion dollars; difference, 310 billion dollars. The sum of 310 billion dollars is what we pay every year in Europe for keeping our borders, our so-called sovereignty, our customs, our selfishnesses. It is a great deal. I contend that it is far too much. Those extra 310 billion dollars would allow us to solve satisfactorily the formidable problem which is now bearing so heavily on our future. But for that a new Europe is indispensable.

IMPORTANCE OF GERMANY

I should now like to draw your attention most closely to the problem set by Germany to western Europe. I do not think I exaggerate in saying that the whole future of Europe, and to a certain extent that of the Western world, hangs on the manner of dealing with that problem.

Germany vanquished in 1945 is, in 1952, a kind of arbiter of the world's policy, whose support is sought by both the Russian and the western sides. Both are indeed fully aware of the decisive importance of having her as an ally.

It is high time for the Western world to settle its German policy, and, having settled it, to carry it out with continuity and logic by accepting everything it involves. A few more hesitations, a few more delays, and events will get out of our control. There will be nothing left for us but to suffer them, not having been able to manage them.

WAYS OPEN TO GERMANY

Several ways are open to Germany today. The most dangerous of all is to accept an alliance with the Union of Soviet Socialist Republics. Is that an altogether improbable hypothesis? I do not think so. The Russians have two choice baits at their command. They can, if they wish, restore unity to Germany and offer her industry a prodigious field of action by associating her with the economy of the U.S.S.R. and her European satellites and particularly her Asiatic satellites.

The price of such an alliance would be for Germany severance from the Western world, the end of democracy, and the loss of human liberties for the Germans. For a generation reaching maturity but politically educated under Hitler, is this too high a price to pay? I am not entirely sure.

The passage of Germany into the Soviet camp would be a moral blow for Europe. The Communists alone can accept such a solution, which I repeat, not without real anguish, is not impossible.

In Europe, the memories left by two wars are such that many right-minded people think that Germany ought to be demilitarized and neutralized. I thought so myself immediately after the war, but since then the Russian danger has become more definite.

To neutralize and disarm Germany means drawing back to the Rhine and the Maas the borders of the Western world. The operation is not without risk for France and the Benelux countries. It means creating in the middle of Europe an immense vacuum into which the dishonest partner (and who can it be?) will at his chosen moment hurl his armored divisions. It also means depriving us of a few hundred thousand excellent soldiers at a time when we do not have too many.

It means to create a political danger more serious than any of the military drawbacks. That neutral and disarmed Germany could be established only with the guarantee of the United States, France, Great Britain, and the U.S.S.R.; and since there is more than a fair chance that the last-named would try to do in Berlin what was so successful in Prague, it is almost certain that the situation would lead to the third world war. This solution of compromise must therefore be discarded.

We might perhaps let things go. Germany would resume, little by little, her absolute sovereignty, her full independence, her army, her large military staff, her entirely independent foreign policy, and her economic power without limitations. Then, I put the question: Why would not the same causes bring back the same effects? Why would not that Germany be the replica of that of 1914 and 1939, and why would she not be the same cause of trouble and difficulties in Europe and in the world?

In my opinion, she would be even worse. For, thrown out of balance by the loss of Eastern Germany, overindustrialized, overpopulated with her ten million refugees, she could, this time with some cause, lay claim to a wider living space and try to get it by the worst means. Not a single sincere friend of peace could accept this lightheartedly.

THE POSSIBLE WAY OUT

But then, what is to be done? Only one thing. Try courageously the only chance we have left. Say to Germany: "You will not recover your full sovereignty, your total independence, your autonomous foreign policy, your national army. You are going to make a certain number of sacrifices at the altar of the new Europe. You are going to give up some of your prerogatives, certain aspects of your former power. But at the same time, in the same manner, and in the same proportions, the other countries of western Europe are going to make the same sacrifices, and all together we are going to create a new Europe, where our forces will be integrated, co-ordinated, on every level. We are going to form a great political, military, and economic unity, the whole power of which will be put to the service of the western cause and to its defense."

Honestly, I cannot guarantee the absolute success of such an experiment, but I can honestly say that outside of it, there is only chaos for Europe, a chaos out of which the worst may come.

There are the problems for Europe. What about the future? The future of Europe hangs on the three great projects which will be discussed and perhaps achieved this year: the Schuman plan, the European army, and, over all, the assembling of a European constitutional convention.

THE SCHUMAN PLAN

The Schuman plan is, as you know, the creation of a single market for both

coal and steel, for France, Germany, Italy, Belgium, the Netherlands, and Luxembourg. For these two essential basic products there are to be no more borders, no more customs, no more artificial measures of defense; free circulation is ensured and production brought to its maximum at the lowest prices. It is a decisive step in the right direction.

The Schuman plan is not only important in itself: it is also important and perhaps even more so, by the inevitable consequences it involves. Already the problem of the co-ordination of transports within the continental community is set, and I am convinced that before long the whole of the monetary problem will have to be settled. It is therefore permissible to state that the economic integration of western Europe is in process of formation.

THE EUROPEAN ARMY

The problem of the European army raises greater difficulties. You probably remember how it originated. When, in September 1950, Mr. Dean Acheson announced that American troops would be stationed in Europe in large numbers, he added that Germany's rearming was called for. But the French Government, unable to make the resurrection of a German army acceptable to its public opinion, proposed to integrate the necessary German forces into a European army.

This was at first very guardedly received in the United States. But in the course of 1951 the American authorities came around to adopting the plan, and urged forward its carrying into effect. They understood that it was probably the only way of rearming Germany without causing a serious crisis in France. Let us acknowledge it: the debates on this matter which took place in the various parliaments previous to the recent conference in Lisbon were rather alarming.

In Germany, at first sight, things seem to be going on well enough. Chancellor Adenauer's government and his majority seem resolute. However, one has to ask a very serious question: Are we sure that in this matter the present German Government truly represents the feelings of the German masses? At the last elections the question of rearming had not been put to the electorate. At that time, the rearming of Germany was inconceivable. We were in 1949. Since then, in quite a number of restricted elections, the Socialists have gained victories, often important ones, by passionately opposing rearming, under the present circumstances.

Moreover, the Germans, fully aware of the strong diplomatic position they hold, have presented quite a list of demands. Some are logical and justified, such as equality of rights; others are far more extraordinary and disquieting, such as the liberation of German officers condemned for war crimes.

FRENCH OPPOSITION

In France, the debate revealed the sharp clash in public opinion regarding Germany. On the one hand, many understand the necessity for associating yesterday's enemy with the defense of the West; on the other, many are incapable of forgetting their resentment and their sufferings. A deputy imprisoned by the Nazis during the war, tortured in a concentration camp, cried out his indignation and his grief at the idea that his children and grandchildren might one day serve side by side with the sons of his torturers. The French Assembly, deeply moved, gave him an ovation.

Other deputies (and this is perhaps more serious) have expressed their fear of a situation which increasingly leaves France and Germany confronting each other in isolation. A real inferiority complex on the part of the French, to my mind hard to explain, is beginning to develop. A great number feel that the presence of Great Britain in the European community is indispensable to counterbalance German power; that France alone is unable to accomplish this task.

Lastly, against the project of a treaty for a European army a double opposition has developed: that of the nationalists who deplore the partition of the old and glorious French Army, and that of the advocates of the new Europe who feel that the project is not audacious enough, as it does not create a real supranational authority.

The debate in the French Assembly ended with a rather confused voting. I am not quite convinced that the conference in Lisbon has removed all misunderstandings.

NECESSITY FOR CONSTITUTIONAL CONVENTION

Yet, from all these difficulties something good arose. In discussing the treaty for a European army, the ministers became aware that they were using the wrong method; that there was something basically illogical in wanting to make a European army before having made Europe or at least outlined the legal framework of a new Europe.

They found out, too, that it was dangerous and even impossible to make a single European army if there was not one single foreign policy for Europe. An army is nothing but the instrument of a policy. Whom must the European army obey? What policy must it serve? There is an aggregate of preliminary general problems which must be solved before broaching purely technical questions.

The ministers of the six states concerned have therefore decided that a kind of European constitutional assembly ought to be convened without delay, to propose a draft constitution. I want to stress the point that this return to logic seems to me to constitute the great hope at this moment.

To retain British collaboration, we have been trying, in good faith, for the past three years to employ a very empirical method, which consisted in trying to make Europe without solving the basic problems. This method has failed. Today we must accept the decisive test. We must see if we are capable of creating a real European confederation.

THE COURSE IS CHARTED

The year 1952 is for us something like 1788 was for Alexander Hamilton, James Madison, and John Jay—a decisive, crucial year. It is clear that it is in the history of the United States that Europe must now seek her reasons for hope. The work for us to accomplish this year is quite clear. We must use every possible means to convoke a constitutional convention and ensure the success of its action. Public opinion must be mobilized to bring about a favorable result.

We are a few men in Europe determined to attempt everything to succeed. We are resolved to organize a big confederacy in continental Europe to support the idea of a constitutional convention. We are resolved to collect millions of signatures from people in all segments of society, asking for the calling of the convention and ready to accept and support the idea of a European federation.

We will work on that for three

months. Then we will organize a big meeting where all the signatures collected will be brought together, and at that time we will discuss a draft constitution which is being prepared.

We sincerely believe that this kind of pressure from public opinion will force the governments to act with some boldness and to keep their word and officially convoke a constitutional convention.

HOPE ON THE HORIZON

In spite of certain appearances and serious difficulties, we may very well be on the eve of a radical change in Europe—a change so deep that in less than ten years the Europe of today which I painted to you, mutilated, miserable, timid, can have regained her economic power, her military strength, and her spiritual radiance. Think of what it would mean for the world and especially for the western community! By the addition of our strength to yours, it is utterly certain that we should be able to contain the aggressive action of Communism and ensure peace.

It is in forgetting our so-called national interests that we shall be able to create and support not perhaps a world community but a western community, our world, and to save our civilization.

Paul-Henri Spaak, a native of Belgium and an advocate of European unity, is chairman of the International Council of the European Movement. He has been a Socialist Deputy in the Belgian Parliament since 1932 and has held various Cabinet posts, including several periods as Minister of Foreign Affairs. He was Prime Minister of Belgium in 1938–39 and in 1947–49. He was president of the First Session of the General Assembly of the United Nations; first chairman of the Council of the Organization for European Economic Cooperation; and first president of the Consultative Assembly of the Council of Europe.

Tensions in the Middle East

By N. SAIFPOUR FATEMI

THE subject I am going to discuss here is the history of what has been happening in Iran during the past one hundred and fifty years, showing that the present tension can be traced to causes in the past. My remarks about the colonial governments are no reflection on the character of the individual people of those nations, for I have great respect for the British and the French. Those nations have contributed much to democracy and to world civilization. What I wish to point out is what imperialism or colonialism can do to a nation, and I desire to suggest one or two remedies for the present situation.

REVOLUTION IN THE MIDDLE EAST

It is a great pity that the question of the Middle East, North Africa, Egypt, and Iran, has not been presented to the American public as it is. It is a very simple question. It is a revolution. What is happening over there is no fanatical movement. It is not hatred of the Europeans. It is not a pro-Soviet or pro-Communist movement. It is a movement against foreign exploitation, against misery and poverty, and against those groups of the ruling class who, under the auspices and with the blessing of the foreign governments, have exploited the people. In simple English, it is what you did in 1776.

The people say, Why should we be taxed by foreign governments? Why should foreign companies take out from Iran and other areas what rightfully belongs to us? They say, Since the beginning of the nineteenth century we have been exploited by foreign companies, and after a hundred and fifty years we are the most miserable and the poorest people on the surface of the earth.

You will be surprised to know that in my country—a country which has twenty-five centuries of recorded history, a country which has contributed much to culture, literature, and art, a country which has contributed to science and to the civilization of the world—the national income right now is $100 per capita per annum.

Unfortunately it has been the destiny of the people of the United States to be the uneasy spectators of this supreme drama of history: the revolution in Iran and other Middle Eastern countries. Through all but a small fraction of world history, Iran has dominated a great area of the world, both politically and culturally. Only since the beginning of the nineteenth century has it regressed into impotence, and it is now destined to resume its pre-eminence. Since the end of the Second World War there has been a revolution against foreign exploitation and the corrupt ruling class. Side by side with this revolution there has been a fight between the West and the East for the mind of the people of Iran.

RUSSIAN AND BRITISH IMPERIALISM

The Persian experience of both Russian and British imperialism has been a bitter one. During the last one hundred and fifty years Iran has been five times invaded by Russia: in 1812, 1827, 1908, 1920, and 1941. All their lives, the people of the northern provinces of Iran have lived in fear of the Russian Empire. They remember the provinces stolen from Iran by Alexander I and

Nicholas I; they remember the threats which drove Morgan Shuster from Iran; they remember that England has been an accomplice in all these crimes, and that twice Great Britain agreed with Russia to the partition of Iran: in 1907 and 1915. Izvolski's mailed fist and Sir Edward Grey's threats sound as a knell in the hearts of the Iranians.

In 1919, after the Russian revolution, England tried to establish a protectorate over Iran. The Foreign Office bribed three members of the Iranian Cabinet to consent to the notorious Anglo-Persian agreement. It was the resistance of the people of Iran and the support of a great American President, Woodrow Wilson, that saved Iran from the fate of Egypt and India.

Since 1870 Iran has been used as a laboratory of British imperialism. For sixty years banking and for fifty years telegraphic communications in the country were British monopolies. In southern Iran, England had a monopoly of oil, the only industry in that part of the country.

THE D'ARCY CONCESSION

In 1901 an Englishman by the name of William D'Arcy got a concession for an area of about 400,000 square miles, or all of Iran except the five northern provinces. Under this concession D'Arcy obtained exclusive rights to the exploitation, production, and refining of petroleum for sixty years, as well as the exclusive right to lay pipelines within the area of the concession. In return, the concessionaire agreed to make a cash payment of $100,000 and also to issue to Iran paid-up shares representing a 10 per cent ownership of the company organized, called the First Exploitation Company. In addition, the concessionaire agreed to pay Iran a royalty of 16 per cent of the profits.

The D'Arcy concession was a simple exploitation contract in which a weak and impoverished nation surrendered control of state resources to foreign interests for an immediate cash payment. This contract had two weaknesses, weaknesses which were bound to cause dissension between the contracting parties. The first lay in the absolute unilateral control of development by the concessionaire. The second was the lack of any provision for the revision or renegotiation of the contract at stated periods or as the concession was developed.

During the last fifty years the Iranian people, instead of being benefited by the oil industry, have been subjected to tremendous pressure from the British Government. To quote Vincent Sheean, the distinguished author of *New Persia*:

> No chapter in the history of British diplomacy would supply a better theme for an Anglophobe than the story of the relation of the British Empire with Persia. Almost every action of the British Government with respect to Persia since the beginning of the nineteenth century can be interpreted as the result of aggressive or acquisitive ambitions. Especially is this so in the present century, when the progress of British influence in Persia has very often appeared to strike at the independence of that unfortunate nation. . . .
>
> Persia was filled with British agents, and bribery was the accepted means of persuasion. The expenses of the British establishment in Tehran were enormous, and British agents quite openly worked in elections, in Parliament, and in every political activity.[1]

The Anglo-Iranian Oil Company from the very outset, with the aid of British Government officials stationed in Iran, established itself as an independent state within the state of Iran. It established political relations with the tribal chiefs in the southern areas. In 1920, according to Henry Filmer, "Consideration would appear to have been given for a time by the British authorities to the safeguarding of its interests in the south under an independent southern Persia confederation."[2]

[1] Vincent Sheean, *New Persia* (New York: Century Co., 1927), pp. 162–163.

The company, throughout its history, directed, if not dictated, the policy of the British Government in its relations with Iran; few Iranian officials or individuals ever would risk the displeasure of the Anglo-Iranian Oil Company, and those who dared to do so were liable to disgrace or dismissal.

THE FINANCIAL ASPECT

Now let us have a look at the financial page of the company. The total cash invested by the British Government and other shareholders in the Anglo-Iranian Oil Company is $100 million. In fifty years the company has produced 2,508 million barrels of oil. It has paid to the British Government, in income taxes and discount for all its sales to the British admiralty, more than $2 billion; to the shareholders, including the British Government, $350 million; and has retained for the expansion of its oil empire $2,700 million. On the other hand, the total sum paid to the Government of Iran in fifty years has been $400 million. According to these figures, Iran has received only 9 per cent of the company's profit.

How was this sum spent? From 1909 through 1920 no royalties were received. From 1921 through 1930, Iran received about $60 million. From 1931 to 1941 Iran's royalties amounted to about $125 million, which, however, were earmarked for the purchase of military equipment from England. During World War II this equipment was delivered almost intact to the British and Russian forces which occupied the country. In the last decade the total amount of royalties paid by the company amounted to some $250 million. This money was supposed to be allocated for the development project of the Seven-Year Plan. This project was planned at the behest of His Majesty the Shah of Iran, in order to give better education, better sanitation, a better standard of living to the common man in Iran. Unfortunately the Anglo-Iranian Oil Company torpedoed the whole plan, and the American advisers to the Government of Iran had to leave Tehran, because the British Ambassador there said that the leader of the mission, Max Thornburg, was working for the interest of Iran rather than the interest of Great Britain. He was forced to leave the country because he was *persona non grata* to the British authorities in that area.

[2] Henry Filmer, *The Pageant of Persia* (New York: Bobbs-Merrill, 1936), p. 343.

THE WORKERS

The company has always boasted of its service to the cause of the workers and the establishment of a secure and comfortable life for them. I wish to bring to your attention a report published by the International Labor Organization on the labor conditions in Iran:

> At the end of 1949 about 95 per cent of the salaried staff consisting almost entirely of British nationals had been given accommodation in company houses. On the other hand, out of 31,875 wage earners, only 5,298 or 16.6 per cent were in company houses. The great majority of the oil workers live in the older overcrowded section where more often than not an entire family, or three or four bachelors occupy one room. Rents are very high and an attempt made by the government to fix a ceiling on rents has utterly failed. Finally another group of workers live in huts and tents which the company put up in 1948 to accommodate homeless workers. . . .
>
> Distressing as these conditions are, they are incomparably better than that of the contract labor employed within the company's area who are excluded from all the

schemes which the company operates for its own workers. This exclusion is particularly serious in the field of health and services. Contract workers are not entitled to admission to the only hospital in Abadan, the company hospital.[3]

BRITISH OPPRESSION

This ruthless exploitation, coupled with the rule of a group of foreign stooges in the country, has produced the present tension in that area. The Shah of Iran is both progressive and democratic. He is always trying to do something for the people, and has divided all his property among the peasants. But the British authorities have not paid much attention to his warnings, and have not given much consideration to the good advice of the press and the Parliament of Iran. Instead they have tried to cow the Iranians into obedience and continue the policy of unjust enrichment. For four years the Government of Iran pressed for a settlement, and for four years the Foreign Office and the Anglo-Iranian Oil Company stalled a fair settlement. To quote the American Ambassador, Henry F. Grady:

> Great Britain called the signals, and called them very badly. Had I prepared a list when I went to Teheran as United States Ambassador in June of 1950—a list of all the blunders that conceivably could be made in dealing with the Iranian oil dispute—it could not have been more complete than the list of blunders which actually were committed. . . .
>
> Unfortunately, the dangers involved in the Iranian oil dispute were painfully slow to be appreciated either in London or Washington. The Anglo-Iranian Oil Company, without check from the British Foreign Office, fomented a situation which could not have served Russia's purposes better if she had planned it herself. . . .
>
> The concept that financial pressures would bring the Iranians into line and solve the oil problem in Iran was from the beginning the key to the British blunders which proved so costly. This notion springs from a colonial state of mind which was fashionable and perhaps even supportable in Queen Victoria's time, but is not only wrong and impractical today but positively disastrous. . . .
>
> The British attitude simply failed to take into account the rising tide of nationalist-independence sentiment in formerly colonial or semicolonial countries such as Iran. It led the British to underestimate Mossadegh beyond all reason, for it could hardly be easy to get rid of a man who regularly gets unanimous votes of confidence from both houses of the Iranian Parliament and who apparently has the support of approximately 95 per cent of the country's population.[4]

RISE OF THE MIDDLE CLASS

This revolution in Iran is in no way a Communist revolution, but to the contrary it is a revolution against Red imperialism as well as against British Black imperialism. There is now emerging in Iran a third social force—call it a middle class or an urban class—which is definitely altering the balance of power within the country, and is especially challenging the hegemony of the old traditional ruling class and the influence of Communists. In the last election in Tehran it was only this group who defeated the Communists, the crackpots, the Russia-firsters, and the Russian spies who ganged together hoping to be elected to the Parliament. Thus far the coherence of this new group has been largely shown in fighting against the Russian and British encroachment and against the reactionary and extreme elements; but I believe that in the new Parliament this group, which has a majority, will unite on a common ground of social interest to cooperate in the more positive task of introducing reforms so desperately needed in that country.

It is wrong to call the present movement in Iran and other Middle Eastern countries anti-West and pro-Russian. It is neither anti-West nor pro-Russian. It is anti-colonial and pro-Iran. The people of these countries say: "We are tired of being pushed around. For the last hundred and fifty years you have profited by our labor; we have toiled, sweated, and suffered in order that people in England should have a happy and gay life. Our present misery and poverty—they are inconceivable; they could not be worse; our patience is exhausted and we can endure no more. We are prepared to co-operate with the West on the basis of equality and partnership, but the British slogan, 'Just wait until the beggars need the money; that will bring them to their knees' is no longer true. We would rather die than accept British or Russian or any other domination over our fatherland. We are prepared to start with a new slate. We are ready even to forgive our oppressors, and if they are repentant of their past crimes we will accept their apology and co-operate with them in building up a peaceful, stable, and prosperous world."

THE MIDDLE EAST NEGLECTED

This co-operation of the peoples of the Middle East can come only through (1) redress of grievances, and (2) reforms by means of technical and economic aid. How do you expect Iranians and Egyptians and Tunisians to co-operate with you when British and French imperialism has plagued their areas? During the war we all shared the trials and tribulations, but when peace came all the big nations forgot us. My country and most of the other Middle Eastern countries have so far benefited very little from the generous help given by the United States to the shattered world. In Europe you started with the Marshall plan and followed with Eisenhower and military aid. How is it that in the Middle East, where so much is needed in economic aid and reforms, everybody is expecting us to do the impossible?

The Middle East could be turned into a strong democratic bastion only through American aid and Mutual Security aid. In Iran you spent $500,000 last year and you are going to spend $23,000,000 this year. This generosity has already won you many friends and has done much toward the betterment of the life of the common man.

IRAN REJECTS COMMUNISM

Despite the fact that the Iranians have been exploited, impoverished, and oppressed by the British, and in spite of their misery, poverty, and tribulations, they have never asked and will never solicit help from the Soviet Union or any other country that is not prepared to respect their national integrity, independence, and sovereignty. We are not going to jump from the frying pan into the fire. We have always resented Russian aggression and Communist propaganda. We are Moslems, and the Moslems believe that Communism is a replica of Nazism with a touch of Tartar sauce.

The first principle of Islam is the oneness of God. This article of faith has been the rallying point of all Moslems. Belief in God and the oneness of God is the heart of Islam, as is submission to the will of God. Other principles are acceptance of Mohammed as the prophet of God, and acceptance of the Koran as the revealed word of Allah. Still other principles are life after death, and divine justice with rewards for the righteous and punishment for the wicked.

Even a superficial comparison of the

[3] International Labor Office, *Labour Conditions in the Oil Industry in Iran*, Geneva, 1950, pp. 33, 34, and 36.

[4] Henry F. Grady, "What Went Wrong in Iran," Vol. 224 *Saturday Evening Post* (Philadelphia, Jan. 5, 1952), pp. 30, 56, 57.

principles of Islam with those of dialectical materialism and with the trend of Marxism and Stalinism confirms the incompatibility of Islam with Communism. Islam and Communism are like oil and water—the two never mix. In evidence, there is not only Lenin's oft-quoted declaration: "Religion is the opiate of the people," but also the entire trend of Communism, which has been antireligious and atheistic. For example, in 1946 the official organ of the Communist Party stated:

> Dialectical materialism, the philosophy of Marxism and Stalinism, and the theoretical foundation of the Communist Party, are incompatible with religion. The world outlook of the Party is based on scientific data, whereas religion contradicts science. . . . As the Party bases its activities on scientific foundations, it is bound to oppose religion.
>
> The propaganda of atheism has been a vital part of the activities of the educational and cultural organizations in Soviet Russia from the first day of the Soviet regime. The Party will continue antireligious propaganda as the means by which the complete liquidation of the reactionary clergy must be brought about.[5]

It is obvious that in Communism as we know it there is no place for God, for our great prophet Mohammed or his Koran, or for anyone else who has a conscience and believes in God and virtue. Communism is certainly the negation of Islam and all the traditions and principles which the Persians stand for.

Another Communist principle, state ownership of property and the means of production, conflicts with Islam. The institution of personal property and its sanctity are well established by the Koran and Moslem practice. There is, for example, the statement in Mohammed's farewell sermon: "Know ye . . . , that you are now one brotherhood. It is not right, therefore, for any one of you to appropriate unto himself anything that belongs to his brother unless it is willingly given to him by that brother." It is stated very clearly in the Koran that a Moslem is not to be deprived of his property or his liberty on any account.

Another point to be remembered is that Iran has twenty-five centuries of recorded history. She has one of the richest cultures and one of the oldest civilizations in the world. The great principle of our culture and our civilization is tolerance and humanitarianism. You all know the story of Cyrus the Great and his tolerance toward the Jews. He not only allowed the Jews to go back to Palestine but he rebuilt the Temple and appointed a Jewish governor over that area. How can a nation with such a culture and civilization succumb to Communism or any other ism?

Iran has resisted Russian aggression since the time of Peter the Great. It should be remembered that Iran was the first nation to revolt against Russian aggression in 1945. Of all the countries of the world, Iran is the only one that sent away the Soviet occupation force without accepting a puppet Communist regime.

A PARTNER TO THE WEST

It is the great American idea to "live and let live." It is the American tradition to help those who need help and can use it to the best advantage of mankind. If you, in accordance with this tradition, and along the line of Point Four, will accept us as a partner, help us to develop our natural resources, give moral support to the progressive elements all over the Middle East, and support us in our fight against both Black and Red imperialism, we believe we shall be able speedily to set up strong societies and communities which will be a great bulwark against any kind of aggression and will always support the cause of freedom and democracy.

We usually hate to fight for others, but we always fight for ourselves. Whatever aid which you give to the Middle Eastern countries will be a premium on a peace insurance policy.

The British are wrong when they say that we are anti-West. We are friends of all, but tied only to Iran. We desire consideration and respect from those who have always been benefited by us. It is a shame to call us fanatics and extreme nationalists. Iran has always advocated the cause of humanitarianism and internationalism. The most popular poet of Iran, Saadi, many centuries ago stated the fundamental principle of the Iranian belief:

> The sons of men are members
> In a body whole related,
> For of a single essence
> Are they each and all created.
> When Fortune persecutes with pain
> One member sorely, surely
> The other members of the body
> Cannot stand securely.
> O you who from another's troubles
> Turn aside your view,
> It is not fitting they bestow
> The name of "Man" on you.

N. Saifpour Fatemi, Ph.D., Princeton, New Jersey, is a member of the Department of Oriental Languages and Literature at Princeton University. In his native country, Iran, he was a newspaper editor and political leader, serving as Mayor of Shiraz, Governor of Fars, and member of the Iranian Parliament. He was a member of the Mossadegh mission to the United Nations Security Council last fall, and was the representative of the Iranian Government at the recent Cleveland UNESCO conference. He is author of Diplomatic History of Persia, 1917–1923 (1952).

Problems of Adjustment in the Middle East

By Adam Watson

WHEN an Englishman, especially one in an official position, addresses a group of Americans, there is one sentiment that he feels called upon to express, and that is acknowledgment for what America has been doing for my country in the last few years. I know you do it for almost every other country, too, but you have done a very great deal for us. We regard our war wounds as honorable. It is not our fault that we have been convalescing for so long. But you have really been exceptionally generous. Not merely have you paid money in the form of taxes, which is now helping to alleviate some of the difficulties in Britain, but also you have your string of big bomber bases in our country, which helps to make it more secure. And anybody who lived through the incessant bombing year after year in Britain during the war well knows how much it matters to have friendly bombers there, and planes of all kinds.

Also, you have your armies across the Channel standing between us and our enemies. And if anyone tells you that in Britain this is not appreciated, that person is unaware of how English people really think. English people grumble; and we are irritated by many things that are said and done by Americans here and in England, just as you are irritated by many things that we do. But this type of grumbling and criticism does not indicate any lack of appreciation. I cannot think of any piece of news, short of the announcement of a world war, that would more seriously disturb the minds of Britain than news that American aid and comfort and moral support were to be withdrawn.

Britain's Contribution

Furthermore, I think we are making good use of the aid you have given us. We have taxed ourselves very readily. We have a flat income tax of 45 per cent, with a surtax on top. Cigarettes now cost us 40 cents a pack and gasoline 50 cents a gallon, and we do not live any too well. Of all the European powers in the North Atlantic Treaty Organization, we put out about 40 per cent of the total armament; so I think we do our share. Also, we have more tanks at the moment, more armor, in continental Europe than you. That is reasonable, but it is certainly true.

Altogether—in Korea and Hong Kong and Malaya and other places—I think we are playing as big a part as a still convalescing country like ourselves could reasonably be expected to play. Therefore, I hope you will not feel that what you have contributed so far has been wasted, but that you have made a good investment.

The U.S.S.R. and the Middle East

Now, I want to talk about that part of the world where we have still major responsibility for defense apart from Europe, and that is the area to the south of the Union of Soviet Socialist Republics. To the west of the U.S.S.R. there is Germany and to the east of the U.S.S.R. there is Japan. These are great, powerful, industrial countries—united, strong, rich, capable, with mighty industries, with brilliant warlike traditions, with excellent civil services, and altogether powers of the first rank in the world. My friend Joseph Harsch has spoken of the revival of Germany,[1] and I entirely agree with what he says; and I think that much the same picture could be painted of the revival of Japan.

But this industrial skill, this know-how, this ability to field an army capable of standing up against the major armies of the world, does not exist to the south of the U.S.S.R. In the south there is a decided power balance. In Iran, which has always seemed to me among the most civilized and delightful of Middle Eastern countries, there are many things worth saving. But there is not at the moment the wherewithal to save them.

The crucial strategic problem is really this: The Russians have acquired in Europe a large area of buffer territory around themselves. They have pushed out a long way, and even if they do not keep all they have acquired since World War II, at least they have acquired a great deal of territory as a protecting area. In the Far East they have achieved rather more than they expected. And although we do not quite know what the relations between Moscow and Peking are, yet we do know that on the Soviet Union's southeastern front there is now a great and powerful government which is itself an ally, although its people may not wish to be friendly to the Soviet Union.

In the south, however, there is still nothing the Soviets have acquired. That is partly due to the fact that the power which has always opposed Russia in the south is ourselves, and that we did not, like Germany and Japan, lose the war. It is hard to say we won it, but we came through unbeaten, and that is one reason why the Middle East is still self-governing and tends to be more so.

Let us look, first of all, at the power problem in the Middle East. This is an area much coveted by the Russians. There was an agreement between the Russians and the Germans in which the Middle East was assigned to the U.S.S.R. for general expansion, as Europe was to the German government. I myself was in the midst of the victory celebrations which took place in Moscow, and I was able to have a few words with a member of the Politburo, Mr. Mikoyan. He told me that as a child he had stood on the Russian frontier and looked over into Turkey and Persia, because the place where he was raised was so near those two frontiers. Stalin himself also comes from that area, and so it is an area which interests the Politburo very much.

[1] See Joseph C. Harsch, in this volume.

Lack of Hard Goods and Technicians

The basic problem of the Middle East resolves into this: The whole area produces scarcely a million tons of steel, no aircraft, no tanks or guns or anything like that. All the hard goods must come from the West. Even England, although it is a manufacturing country, is not self-sufficient. But in countries like those of the Middle East, *all* the hard goods must come from the West. Much of it has come from the United States, and some from England.

In the second place, for many years to come, a great deal of the servicing of the aircraft and ships and guns will have to be carried out by western technicians. But one of the problems which faces us in the Middle East (a problem in which you must play an increasing part) is to see that Iranians, Egyptians, and Syrians are trained more and more to service and maintain these extremely complicated and easily upset modern weapons of war.

Third is the question of actual combat troops, many of whom are also technicians. The men who operate a modern jet bomber are really a crew of engineers, not just a crew of brave fighting

chaps. And for some time, therefore, if we are to prevent a power vacuum, we shall have to provide from the West a certain number of the fighting technicians, though perhaps a decreasing number. A basic problem of the Middle East is, What can the people themselves reasonably be expected to do, and what must we still do?

PROBLEM OF IMPERIALISM

Now, the picture is colored, of course, by the imperialistic past of the countries which have been associated with that area from outside, particularly ours. Dr. Fatemi [2] has expressed a viewpoint that is typical of much of the thinking in the Middle East, and that is another of the problems that we face. Fortunately, not all Middle Easterners feel as certain Iranian nationalists feel, and not all Iranians feel as those who compose the present government do.

We have tried in the last few years to alter any imperialistic course we may have pursued. One of the things which most convince English people that we have succeeded in doing this is the fact that India and Pakistan stayed with us when there was no power capable of holding them. And we are fairly popular in those countries today.

And there are other countries, like Iraq, which we took and built into nations, although when we first went in there was no civil service, no administration, not even really a country. And Iraq is a very different country from Iran, for it has decided that oil companies are not so corrupt as some Iranians have found them to be—perhaps because the oil companies in Iraq are partly American. The liberality of Americans and the pleasant green color of your money have definitely helped us to convert Iraq into a country which wishes to enrich its people by allowing the oil to be extracted on an equal basis. I have no doubt that in time other countries, like Iran, will arrive at approximately similar settlements.

[2] See N. Saifpour Fatemi, in this volume.

THE EGYPTIAN SITUATION

I do not think that we should emphasize the differences between one oil company in Iran and the local government as being a major factor in the whole Middle East. Much more important is the problem of general defense in the Middle East. America and Britain and France and Turkey (Turkey being the Middle Eastern member of the NATO team) proposed to the Egyptians, that there should be a Middle East Defense Command and the Egyptians said they could not agree to it as long as foreign troops remained on the Suez Canal. Now, we do not have our troops all over Egypt as you have your troops all over Britain. But we do have them on the Canal because the Canal is the place where the Indian Ocean meets the Mediterranean and where Asia meets Europe, and it is the obvious strategic center for defense.

I think we shall be able to work out with the Egyptians a satisfactory system. It is no longer necessary to have the Union Jack and British troops there, at great expense, to guard British interests. I hope we shall substitute a system, possibly under Egyptian command, which will include association with countries like Iraq and also with countries like yours. When my Prime Minister recently proposed in Washington that it would be a good idea to have American troops on the Canal, I thought I sensed a kind of groan in Congress; but maybe later on you will get used to having what are now called "uniformed technicians" there.

THE CORE OF THE MATTER

In any case, I am sure that the problem which we have in this very difficult and dangerous area is that of adjusting the national spirit of these countries, which is a very real and turbulent thing, to the grim reality of the power vacuum right on the Soviet Union's frontier. And I hope the American people will realize that this load is not something that the British can or will bear alone; that almost certainly, as everywhere else, you will make your contribution to the new system with the usual dollars and the usual GI's and other things that always seem to be necessary if any form of world defense is really to be successful.

This problem worries me very deeply, and I am sure it ought to worry you—How do West and East marry in this business of defense? In closing, I should like to quote a remark made to me by a very distinguished Iranian lady, Princess Ashraf, the Shah's twin sister. I was discussing with her the problem of backwardness in present-day Iran and she said, "You must be patient. You really must be patient. You Europeans have never learned to wait on developments." I explained to her that I thought time pressed, and she said, "But you don't make it any better by all this impatience. You must learn to be much calmer in dealing with people like ourselves."

And indeed I believe that to be true, that we need to be much calmer than we are.

Adam Watson, Washington, D. C., is Information Liaison Officer to the British Embassy. He has been in the British Foreign Service for fifteen years, serving in Bucharest, Cairo, Moscow, and Washington.

Report from the Middle East

By Ray Brock

MY viewpoint on the Middle East is that of a fairly hard-boiled American reporter who has been covering wars and the events leading up to wars for nearly sixteen years. I recently returned from the Middle East to complete what I consider an honest, realistic book on the people and the crises of that vast area of two million square miles—*Blood, Oil and Sand*—and now I am going back to continue my work.

In my opinion, the Middle East is going the way of the Far East with terrifying velocity. Postwar disillusionment has very nearly reached its depths in the hearts of teeming millions who had hoped that fumbling but benevolent American policy might succeed where British colonialism has so miserably failed. From the fortress of Gibraltar to the Afghan frontier, the Soviet Union and the increasingly dangerously divided western powers are interlocking in a gigantic struggle that may lead to World War III; for the Soviet pattern of power and conquest is based on the eventual subjugation and exploitation of the peoples and the riches of the mighty Middle East.

Since we are living in an age of moment, of potential mortal combat in a World War III, it behooves every American to know precisely what this area comprises. Militarily, it must be extended beyond the normal geographic confines of what has been loosely called Middle East. It must include Morocco, turbulent Tunisia, the vast stretches of North Africa through Libia to Egypt and down to Anglo-Egyptian Sudan. It incorporates Saudi Arabia with its immense oil wells and the Arab sheikdoms on the Persian Gulf. Of course it includes Iraq and Iran, Hashemite Jordan, and Syria and Israel. But my concept of the Middle East comes around in a wide circle to encompass the Balkans, which flank the Middle East; and that means Yugoslavia, Greece, and, most specifically, Turkey.

Turkey Our Ally

Because Turkey is so important to our fate in that dangerous area, I want to consider her first, and to remind you that until very recently indeed, and almost too late, Turkey was being forced into the position of a stubborn, neutral stepchild. The belated admission of Turkey, along with Greece, into the North Atlantic Treaty Organization was long overdue, and gained for us an incomparable ally—an ally we did not have in the last war, which nearly cost us our victory in that part of the world. To my mind, the Turks are today our only reliable allies in the entire Middle East. The Turks have, technically, twenty-seven divisions; but as military men see it, there are nineteen active mobilized infantry divisions, and seven to nine armored brigades. But these divisions are fully activated divisions of 20,000 men each, and the brigades are full-sized. They have been, and are daily being, superbly trained in air and infantry weapons by the greatest military mission the United States has ever sent overseas, headed by General William H. Arnold and now directed by our able new Ambassador, George McGhee.

Despite assurances of allegiance from the Arab League, despite halfhearted promises from Egypt and Iran, despite willingness of small and struggling

Israel, I repeat that the only reliable allies we have in the entire Middle East are the Turks. Recently I was reassured of this by a talk with a man I believe to be the most able diplomat in the entire United Nations, Selim Sarper, who is the Turkish delegate to the U.N. with the rank of ambassador. He is the man who almost singlehandedly drove through the condemnation of Red China's aggression in Korea, at a time when our British allies were in a very surprising position of abstention, and our Indian friends were in the peculiar political posture of siding *against* condemnation of naked aggression by a Communist nation. The Turks, I repeat, not only stood fast but moved to the attack as they have done so courageously in Korea. Sarper did not have a bayonet at the United Nations, but he is a man whose words are as brilliantly pointed at the enemy as any bayonet can be.

The Arab League

On the other hand, to discuss the Middle East intelligently we have to consider just where the Arab League stands, for it swings much more weight politically than militarily. The Arab League presumes to speak for the Islamic people—all the Islamic people. It presumes to speak for the diverse peoples inhabiting more than a million square miles, differing in rulers, political postures, political systems, and interests.

The Arab League does *not* speak for those peoples. It speaks for a clique, for a combination of the satrapy, the ruling classes, of those nations—a clique which is responsible for the filth and misery and degradation in which nine-tenths of the Islamic people live, and which is equally responsible for the irresponsible chaos and rioting that are racking, and potentially wrecking, Iran, Egypt, Tunisia, and many other danger spots in the Middle East.

The Arab League is under the control of Haj Amin el Husseini, former Grand Mufti of Jerusalem, who from his sanctuary in Egypt has directed the trail of blood and assassinations that has been drawn across the oily sands of the Middle East from Pakistan to Jordon to Egypt, culminating last January 25–26 in the bloody riots in Cairo in which some six hundred people lost their lives. Many, particularly those unlucky British who were in the Turf Club that afternoon, were seized and slashed, their eyes were gouged out, their bodies dismembered, and their remains tossed onto bonfires carefully built on the exact premises of British establishments. Martial law has held down subsequent violence, but that does not mean that violence is at an end.

Communist Designs

This is but a slight indication of what can happen when riot, bedlam, and the beginnings of revolution break loose. We have been told many times, in many ways, that these are spontaneous uprisings of the "people" against the "infidels." "Nationalism" has become a slogan, under whose banner hides Communist infiltration, guided by the crafty hand of ambitious little Haj Amin el Husseini. Riots and revolution serve no purpose but that of the Kremlin. And you may rest assured that the satrapy of Egypt, like that of Iran, is carefully directing, and fomenting, hatred of the West, the "foreigners," the British, thus hoping to turn aside all blame from themselves for the animal-like standard of living forced on their people, not by the British or the foreigners, but by their own corrupt, greedy selves.

These same arrogant, wealthy, and indolent men who control the destinies of these impoverished people insist that

they in turn are controlled by the foreigners—that they are under the thumb of the British. That is not entirely true. They invited the British in. The British came because there was wealth there. The hierarchy of those nations shared in that wealth. A portion of that wealth, it is quite true, went back to Britain; but vast amounts which might otherwise have lain buried beneath the sands of Iran and Iraq and Arabia—those areas where gallant and intrepid and able British engineers and intelligence experts and army went in—were turned into flowing gold. The trouble was that there was a dead spot in there, and that dead spot consisted of the pockets where the money stopped. Except in rare benevolent instances, it never got back to the people themselves.

By and large, the governments of the Middle East today are rotten from the top down. Specifically in Iran, Dr. Mossadegh is represented as being a great statesman, in having satisfied the nationalist aspirations of his people by throwing the British out. But to what avail? Iran has tossed out the British. It has lots of wonderful oil and the greatest refinery in the world. But the people have no tankers, they cannot get any more oil, and they cannot run that refinery. So the flow of wealth stops. And Iran is on the verge of starvation, riot, and revolution, making it prey to the Communist Tudeh Party, and offering an engraved invitation to the Kremlin and the Red Army to march in and take over. And they can do exactly that if revolution breaks out and the British must move in to protect their interests, which still exist despite more than a year of speeches and papers and fainting spells from Dr. Mossadegh.

Indifference and stupidity abroad have teamed up with tireless Communist propaganda to blind the western peoples to the real Soviet aims in the Middle East. Communist penetration is deeper and deadlier than has ever been reported in the western press. The Voice of America is hardly effective against the ceaseless, blaring Soviet radio which disguises itself in whatever form is most palatable to the particular peoples it is directed at. Our overworked, understaffed, and in many cases undertrained and downright uninformed diplomatic corps in the Middle East is hardly a match for the swarms of Soviet agents infiltrating and fanning out throughout the entire Middle East—agents who know the languages, the peoples, the customs, the lifelong hatreds and prejudices upon which they can play their particular tune, a tune aimed solely at dislodging the West in the Middle East. And if we lose the Middle East, we can soon roll up the map of the Mediterranean and Western Europe and start making indentations and marginalia in the Western Hemisphere.

Our Relations with the Middle East

It is still axiomatic that men of good will, or pretended good will, never abandon the fiction of diplomatic maneuvers, even though the logical aide of all diplomacy, force of arms, has received the order of battle. Our ruinous and bankrupt foreign *policies—or* lack of foreign policies—have undermined our relations with the Moslem world, state by state, nation by nation, people by people. Now or never, the West must measure its new neighbors and associates as equals, as human beings, as political peers, as military allies. Catastrophic wartime and postwar mistakes have denuded us today of virtually every bargaining point in the Middle East save naked force, and *money.*

The sickening realization is being driven home to us that money, incredibly, is not enough to elicit the faith and hope and co-operation of inflamed peoples bred on centuries of great-power perfidy, intolerance, exploitation, and arrogance; that sheer force of arms can coerce, but cannot impel, the Middle East's millions to ally themselves with the West against the common enemy, the Soviet Union.

Unless democracy can recapture the imagination of the Middle Eastern peoples, neither America nor Britain nor their handful of allies in the Middle East can hope to withstand the onslaught of implacable Communism.

And how can we recapture their imagination? Point Four and Mutual Security aid, increased and administered honestly and properly, would help. A cleanup of our diplomatic corps' dead wood in the Middle East would help. A true understanding of the peoples of the Middle East, with consequent intelligent planning of our Voice of America and Information Offices propaganda, would help. An informed and interested American public would help.

Whether we can yet quench the flames of internal disorder and bring piecemeal understanding before the oncoming holocaust is still a tossup. The odds are long against us at present. These selfsame peoples, hating the outside world and one another, profess to view with equanimity the oncoming struggle between the West and the Soviet Union, as if this hideous Armageddon were scheduled to be fought under Marquis of Queensberry Rules, or in some forest glade with lances and white chargers and the traditional spirit of noble knighthood. Why? Certainly they are almost as much afraid of war as we are. They have known the face of war down the centuries. They have tasted its dregs in every major conflict and invasion since the beginning of recorded time. But they are being given nothing to fight *for,* and little to fight *with,* except by the Soviets, who promise pie in the sky, and deliver secret small arms and ammunition with which to fight the "foreigners."

Marshal Tito

On the fringes of the Middle East, however, we are trusting a man who cannot be trusted—who is playing upon us the greatest hoax in history. That man is Jossip Broz, Tito, the Communist dictator of Yugoslavia. To me, a Communist is a Communist. There is no difference between Communists. We are faced with fighting the Communist Soviet Union, but we make an ally, so-called, of Communist Tito. He is an ally who takes all he can get from us—money, arms, ammunition, food—but who gives us nothing—no bases, no military mission in his country, not a single written agreement—if one could even trust a written agreement. His expansionist tendencies against Italy in Trieste are obvious; he does not have the support of his own people, particularly of the Serbs; he rules by terror and truncheon and tommygun; he murders his enemies and kills the genuine intellectuals of his country; yet he claims that his brand of Communism is different from Soviet Communism, that he has broken from Stalin and is a true friend of the West.

This, I say, is the greatest hoax in history. I need only remind you how we were told, and told, and told, that Chinese Communism was only agrarian reform; that Chinese Communism was not Russian Communism. Today we fight those same Communists in Korea; today China is a land of terror and murder and greater despair than ever before in her history.

Therefore when you support—and I mean you, the American people, because it is your dollars that are going to Tito—when you support a man like Tito, and you are told he is our friend,

you are being led up and down all the garden paths of the world. It is this very kind of contradictory reasoning in America that is losing us the faith and hope and trust of the peoples of the Middle East.

AN URGENT SITUATION

The western powers can no longer pretend paternal or fraternal interest in the peoples of the Middle East, and fob off these peoples and their own conscience with Korean-styled "police actions." The West must now stand and fight in the Middle East as if its very life depended on it—*which it does.*

Even now it may be too late. Militarily, 1952 is the Soviet Union's year. One year longer, and we may be strong enough to withstand Soviet attack—strong enough in arms, strong enough in international unity. The Soviet Union's fatal miscalculation may be based on the belief that a bankrupt, dreary, and disheartened England will not again unite with an unhappy and internally disunited France and a bemused but angering and incredibly powerful people in the United States to obliterate Communism from the earth in the event of any aggression in an area which cannot and will not be surrendered.

The policy of sweet reasonableness, appeasement, and surrender has been the watchword of western policy toward latter-day Napoleons since this writer has been covering wars and the journeys between them. Invariably, such policies have led only to more journeys and more wars. It is a thing devoutly to be hoped that this forthcoming journey will be the last one, to the last war.

Ray Brock, New York City, author, lecturer, and foreign correspondent, is now in the Middle East, and a few months ago he completed a trip there which took him to eleven countries. As a former correspondent of the New York Times and the United Press, he spent several years in the Mediterranean area, the Balkans, and the Middle East, and covered many international conferences. The results of his personal observations were incorporated in his newspaper columns and in his book—Blood, Oil and Sand—recently published.

Pakistani Principles and Policies

By S. M. BURKE

PAKISTAN is a parliamentary democracy. It is a federation of five provinces and the Princely States which have acceded to it. A full measure of autonomy is left to the units in matters of domestic administration and welfare. The responsibility of the Central Government is confined to foreign affairs, defense, communications, national finance and economy, and other matters of common interest.

INTERNAL PRINCIPLES

A Constituent Assembly is framing the final constitution of the state, and it enacts current legislation as an interim measure. It passed an Objectives Resolution on March 4, 1949 in the following terms:

In the name of Allah, the Beneficent, the Merciful;

Whereas sovereignty over the entire universe belongs to God Almighty alone and the authority which He has delegated to the State of Pakistan through its people to be exercised within the limits prescribed by Him is a sacred trust;

This Constituent Assembly representing the people of Pakistan resolves to frame a constitution for the sovereign independent State of Pakistan;

Wherein the State shall exercise its powers and authority through the chosen representatives of the people;

Wherein the principles of democracy, freedom, equality, tolerance and social justice as enunciated by Islam shall be fully observed;

Wherein the Moslems shall be enabled to order their lives in the individual and collective spheres in accord with the teachings and requirements of Islam as set out in the Holy Koran and the Sunna;

Wherein adequate provision shall be made for the minorities freely to profess and practice their religions and develop their cultures;

Whereby the territories now included in or in accession with Pakistan, and such other territories as may hereafter be included in or accede to Pakistan, shall form a Federation wherein the units will be autonomous with such boundaries and limitations on their powers and authority as may be prescribed;

Wherein shall be guaranteed fundamental rights including equality of status, of opportunity and before law, social, economic and political justice, and freedom of thought, expression, belief, faith, worship and association subject to law and public morality;

Wherein adequate provision shall be made to safeguard the legitimate interests of minorities and backward and depressed classes;

Wherein the independence of the judiciary shall be fully secured;

Wherein the integrity of the territories of the Federation, its independence and all its rights including its sovereign rights on land, sea and air shall be safeguarded;

So that the people of Pakistan may prosper and attain their rightful and honored place amongst the nations of the World and make their full contribution towards international peace and progress and happiness of humanity.

The Interim Report on Fundamental Rights of the citizens of Pakistan and on Matters relating to Minorities envisages: (*a*) protection of life and personal liberty and equality before the law of all citizens; (*b*) protection in respect of conviction of offense; (*c*) prohibition of discrimination on grounds of religion, race, caste, or sex; (*d*) prohibition of slavery, forced labor, and child labor; (*e*) equality of opportunity in matter of public employment; (*f*) protection

of rights regarding freedom of speech, expression, association, profession, occupation, trade or business, acquisition and disposal of property, and peaceful assembly without arms; and (*g*) freedom of conscience and free profession, practice, and propagation of religion.

INTERNATIONAL PRINCIPLES

In international affairs Pakistan has not pursued a narrow policy only to advance her own interest, but has shown herself anxious to co-operate with other members of the human family in the furtherance of peace and security, in the settlement of international differences by peaceful discussion, and in using her influence on the side of justice for politically and economically backward peoples.

In her differences with others Pakistan has never insisted that her point of view is infallible. She has always declared herself willing to accept arbitration by a third party. She has constantly given her support to the principle of universal membership in the United Nations. She has shown her high respect for the world's premier international organization by invariably deputing her Foreign Minister, Chaudhry Muhammed Zafrulla Khan, personally to lead delegations at its Annual Sessions.

In her advocacy for the uplift of underdeveloped countries and dependent colonies Pakistan has placed the welfare of the human race above selfish gain, and has at times displeased those countries with which it was to her material advantage to co-operate. As soon as she became a member of the United Nations she became a sponsor of Indonesia's case before the Security Council. Her open championship of the cause of freedom in Libia, Eritrea, Somaliland, Morocco, Tunisia, and elsewhere is well known. She has given support to Egypt and Iran in the fulfillment of their national aspirations. Our Foreign Minister declared in the National Parliament recently that "whenever and wherever there is a question of liberty and independence from imperialism or of opposing colonialism, of pushing forward a march towards freedom, Pakistan is always second to none."

In the General Assembly of the United Nations the Foreign Minister described our general policy in these words:

> The ideological conflict continues not only to divide the world but also to harass its peoples and to threaten peace and security. We recognize that the complexity of human problems necessitates approach to them from various angles and that diversities of points of view and differences of approach and method are essential conditions of advancement and progress and should, therefore, be encouraged rather than sought to be suppressed. What is needed, however, is tolerance, which should provide full scope for ideas to act and react beneficently upon each other. Pakistan's view is that every nation must be free to develop its social, economic and political systems and institutions, along lines best suited to its own needs and expressive of its genius. What must be insisted upon is that no force, violence, or coercion, organized or unorganized, should be employed or permitted to be employed, either inside the nation or from outside of it, to force a people to give up that which they desire to retain or to adopt that which they are unwilling or reluctant to accept.
>
> Whatever is attempted to be achieved must be undertaken openly and in the light of day, and carried through by peaceful means. If this could be accepted and put into effect on a world-wide scale, we venture to hope that the suspicion of sinister motives and the fear of secret and violent designs, which are at the moment poisoning international relations and constitute so grave a threat to the maintenance of peace and security, would soon be dispelled, making beneficent co-operation possible between groups of states that are today divided from each other by these suspicions and fears. We believe that one effort that would help to clear the atmosphere would be to foster knowledge in all spheres, and to provide accurate information and to facilitate and promote free intercourse and interchanges across national and international frontiers. The activities of the United Nations directed towards the lowering and removal of barriers restricting the free movement of ideas, information and individuals, must be intensified as these barriers hinder better understanding and deeper friendly relations between the nations. Pakistan may be relied upon to give its fullest co-operation towards the achievement of the ideals and purposes of the United Nations along the lines of the Charter of the United Nations.

In the words of Quaid-i-Azam Mahomed Ali Jinnah, the father and founder of Pakistan,

> We believe in the principle of honesty and fair play in national and international dealings and are prepared to make our utmost contribution to the promotion of peace and prosperity among the nations of the world. Pakistan will never be found lacking in extending its material and moral support to the oppressed and suppressed peoples of the world and in upholding the principles of the United Nations' Charter.

IMPACT ON WORLD POLITICS

In the last Annual Session of the General Assembly Pakistan was elected to the Security Council, to the German Commission, to the Balkan subcommission, and to the Disarmament Commission.

The Daily Mail in its "U.N.O. Round-Up" wrote:

> The emergence of Pakistan in a leading role as mediator in several major issues of international dispute this Session of the General Assembly has impressed United Nations diplomatic circles. Led by Chaudhry Muhammed Zafrulla Khan, the Foreign Minister, the Pakistan delegation has attempted to reconcile divergent views on the following issues: (1) the East-West dispute over disarmament plans; (2) the problem of free elections in All-Germany, and (3) the Anglo-Egyptian dispute. Observers here have noted that it was largely on Pakistan's initiative that the Big Four were encouraged to hold a round-table conference on the disarmament issue.

It was Pakistan that suggested that German representatives from both halves of Germany should give their views before the *ad hoc* committee on the responsibility of organizing free elections. Mr. Iqbal Singh, writing in the *Illustrated Weekly of India,* said:

> There was hardly any important public or private move with which Pakistan was not associated. . . . The presence of Chaudhry Muhammed Zafrulla Khan in Paris has been a clear indication that Pakistan has no intention of taking a back seat in world politics.

In the light of the above facts, I leave it for my readers to judge whether the policy of Pakistan is "The National Interest—Alone or With Others?"

S. M. Burke, Washington, D. C., is Counselor of the Embassy of Pakistan. He has been in government service for more than twenty years. He has served as a district officer in Punjab and as a district judge and has been in the Indian Civil Service. In 1946 he was president of the first Elections Petitions Commission; in 1948 he was secretary of the Pakistan delegation to the International Dominion Conferences with India; and from 1949 to 1952 he was Counselor to the High Commission in Great Britain.

National Interests and World Peace

By Norman Thomas

THE general question raised at this conference—"The National Interest —Alone or With Others?"—calls for the answer that in today's world it is not merely a matter of ethics but of common sense to affirm that the true national interest can be served only "with others." There is no nation—not even the United States—that is self-sufficient in its natural resources. All are of necessity vitally concerned with reasonable access to raw materials in other parts of the world.

Nature of Nationalism

It is very easy to make a case that nationalism, in its dominant and dogmatic form, is irrational, divisive, and a foe of peace. The fact that all peoples are thinking in terms of national interest makes it incredibly more difficult to travel than it used to be, as I am finding out in trying to get a passport for a trip that has suddenly become desirable. I am not at all sure that I shall succeed.

Nationalism was not a creation of logic. It has many roots, running back to tribal times. National lines very often fail to correspond to logical lines of geographic differences or economic interests.

Nevertheless, the nation state has an immense emotional response. We are held together by a variety of ties within nations which cannot be ignored, which cannot be dispelled by any process of reasoning, not even by a passion for peace. Nationalism is a fact with which we have to cope.

Moreover, I have lately come to see in nationalism advantages that I was once disposed to overlook or almost to deny. To a very high degree, it has been possible within the confines of the nation state to unite men as citizens and neighbors across lines of race and religious creed and class. It is only as we can extend this concept of unity of human interest to the whole world that we shall have any sound foundation for lasting peace.

Weakness of International Federation

Yet, it does not necessarily follow that internationalism or world government, unqualified and undefined, is the logical road to peace. I have long been a believer in the United States of Europe. I think it a necessity for a solution of Europe's problems. Yet I am keenly aware of the practical difficulties that the existing organization of nations creates, economically and otherwise, and these are not to be ignored in the practical business of working out formulas. It is conceivable that a world government would be so harsh that it would invite wars—possibly civil wars, but nevertheless wars.

There is much to be said for world federation, but it has not yet achieved power as a world force equivalent to that of socialism prior to World War I. Yet in that war Socialists fought Socialists, even as Christians fought Christians; and now, almost seven years after the end of World War II, it is possible for us Socialists sadly to remark, like the Belgian statesman Paul-Henri Spaak, that the thing that Socialists have learned how to nationalize best is socialism.

This situation derives from the fact that the nation state has become the most powerful factor in our social life. Such securities as we have are connected with it. Protections for farmers and workers are organized on national lines. If, in a transition from nationalism to internationalism, their insecurity should be even temporarily increased, they would act on the basis of nationalism. They and their children cannot today eat promises of bread—or cake—in a distant tomorrow. This is a hard fact that we have to consider when we contemplate a transition out of an economic nationalism which threatens both the peace and the prosperity of men.

Religion Is Not the Answer

I am very skeptical about the growingly popular cry that we hear in America that the hope of the world and the hope for us is a return to religion. The triumph of Christianity or democratic socialism is not a basis for peace. There are interpretations which would make the universal acceptance of either or both a boon to mankind. But when Christianity or any other religion is interpreted, as religions have repeatedly been interpreted in history, as the sole or principal possessor of saving truth, religion becomes the passive or active enemy of a general fraternity upon which peace depends. Some of the world's worst wars have been religious wars.

In the long history of cruelty and brutality through which our generation has lived, there has been nothing more disheartening than the wild outbreak of religious strife between Hindus and Moslems when India was partitioned. In that popular outbreak it is estimated that one million were killed or died of hunger, and twelve million were displaced. Nehru's emphasis on the secular state is in the highest degree ethical and essential for the well-being of India. And his dream of an Asian third force for peace is weakened by the fact of the Moslem League.

The great danger in Communism lies in the fact that it, more than any other ism, insists that it is the sole custodian of the truth on which the secular salvation of mankind depends, and that to promote that salvation, any lies, any deceit, any violence, any suffering, ordained by the Communist elite is holy. In short, the "true believer" is the enemy of peace.

Such a "true believer" is also necessarily the enemy of a valid and desirable internationalism. The successor of the internationally minded Lenin manages to be a passionate Russian nationalist at the same time that he is the head of the Communist international movement. Stalin would never consent to any genuine measure of world government unless or until he thought he could control that government. And if he did control it, those of us who want to protect the ideals which western man has painfully and imperfectly evolved would become opponents of a world organization in which there would be no city of refuge for freedom.

We do coexist with the Soviet Union as a nation, certainly, and we must coexist with Communism, but always in terms of conflict. War is a bad means of defense; but by appeasement or submission we should not be able to preserve either peace or liberty. For the break that occurred between Tito and Stalin would occur anywhere if any Communist dictator gained the universal power he seeks, because that power is divisive.

It is against the background of these considerations that the United States must interpret its legitimate interests and determine how far they are or ought to be common to mankind. It is easy to establish the fact that all rational men should be concerned for freedom, peace, and plenty, and that the ultimate

goal can best be phrased as a fellowship of free men who will employ their marvelous technological powers only for the destruction of poverty and preventable disease.

NEED FOR CRUSADING SPIRIT

This faith ought to be taught with a religious intensity. On it abiding peace depends. The chief trouble with us is that we have evolved no crusades (I use the word deliberately) which either fire us or inspire others. We have been astonishingly generous, compared with other nations, but we need some crusading ideas. Internationalism lacks the emotional support that nationalism elicits.

Obviously, the great idea is peace with liberty. The only common interest that I can find now among nations is a desire to avoid an atomic war and end the cold war with its arms race. I would remind you that our present prosperity is peculiarly precarious, based, as it is, on an arms economy. I would remind you of the tragic fate of the world in which, while children in almost every land (some even in ours) cry for bread, there is plenty of money for bombs and all that is economic waste.

The United States has said some correct things and is saying pretty correct things even now before the Disarmament Commission; but there has been a great failure to present ourselves as the lovers of peace. We are pursuing trends toward conflict—not the abolition of atomic war that requires disarmament. President Truman has said it and said it well, but there is no crusade. I assure you that it is one of the dangerous facts of our time that at least a year ago, when I was in Asia, many decent Asians believed that Stalin was more the friend of peace than we. He has at least put on a show, and we have not—at least not adequately.

I do not think that any dictator—certainly not Stalin—will accept forthwith a proposal for disarmament, which, to be effective, must necessarily include very rigid controls and inspection. I have no illusion. But I think a crusade would greatly change the temper of the world and would make Stalin, who is essentially cautious in certain matters, more careful, and in time (for time does march on) Communist tactics might change. It might even seem to the Communist rulers that coexistence would be easier if the weight of the armament race were off our backs, and if we could find other ways to carry on the conflict between rival approaches to life.

ONE WORLD

Our world is so organized that it does have to be one world, as Wendell Willkie discovered. And it is by no means ready to be one world politically. It is nonsense to talk of a peaceful world in terms of the interests, even the accommodated interests, of nations of such size and variety as we now have; for instance, Albania and the United States, both sovereign nations.

Morally it has to be one world. "Patriotism," said Edith Cavell, "is not enough." If we want any peace at all, or any well-being for the world, our interest must be thought of in terms of the interests of others also. We shall always have difficulty in keeping the peace while we have such differences in the economic well-being of peoples as represented by the fact that the new nation of Libia has an estimated per capita annual income of $35 against our $1,450.

IMPORTANCE OF POINT FOUR AID

We need a far more zealous interest in helping people to raise their own standards of living—a bolder and larger Point Four. I was very happy that a recent conference in Washington on the subject was well attended; but, as in most conferences, we worked up a lot of steam and did not do anything with it. We did not even adopt resolutions; there were too many associations there. We did not discuss anything practical, such as the relationship between public and private capital, or how to carry out the two principles which we applauded. The first principle was that the United States must not be the goat; the second was that we must support the American Revolution and not give a red penny to anybody who was very far from our general ideas.

I think there is a certain combination that could be worked out. This is of utmost importance. Democracy is not established on empty stomachs, because people do not eat freedom. We must demonstrate that it is possible gradually but certainly to win victories over bitter poverty and hunger, and we must show that we do it co-operatively; hence we should use as far as possible the imperfect machinery of the United Nations.

These are basic things, and they involve offering aid to many regions of the world as an alternative to the harsh imperialism of Communism.

TO DIRECT OUR COURSE

The sound interest of all opponents of totalitarianism requires provision for co-operative defense against the unquestioned menace of Communist imperialism. Its imposed peace would mean slavery. And then the Communist empire would break up in desperate wars bred by rivalry for power.

Our sound interest in peace with freedom also requires that we shall not fall victim to totalitarianism by imitation of Communism in the name of defense of liberty. That danger is real in America. McCarthyism is an excellent psychological preparation for totalitarianism. If I were a Communist, I should be quite philosophic about the growth of McCarthyism in America.

In world policy, aside from co-operative defense, the United States in its search for peace should set for itself two attainable goals which must be reached if we are to escape the disaster of World War III or a series of wars. These two goals are (1) a transfer of conflict out of the realm of modern atomic war by enough strengthening of the United Nations to enforce an agreement for universal disarmament; and (2) an assault on the world's bitter poverty and inequities, through progressive industrialization and the improvement of agriculture in backward regions.

The struggle for these two related goals will of itself have a corrective influence on an excessive and amoral nationalism and tend to promote an international spirit of fraternity on which the ultimate hope of mankind depends.

GOVERNMENTAL FAILURES

I expect to go shortly to the Far East. I shall go greatly disadvantaged by the decision of our government to abstain in the United Nations from any vote on the Tunisian request to be heard. I think the Tunisian complaints are valid, and we pay a great price, in adverse world opinion, for coddling a valuable ally.

I shall go handicapped by our failure to put our better beliefs and our better action into more obvious form in the war against poverty. I shall go handicapped by our failure to convince people that such moves as we have made for disarmament, which I think are sound, are not merely maneuvers. It does us no good to say that these people are wrong and we are right, because we have to live with them somehow in the interest of peace.

I am very doubtful whether we shall get very far by forcing Western Germany into a European setup with par-

ticipation in a European army, if the Germans believe that it means the permanent division of Germany. That is a dangerous challenge to a legitimate interest in unity. I doubt that we shall get a very good European army as long as the people who are our best friends in Germany and respect democracy—the labor movement, for instance, and the Social Democrats—are rightly or wrongly skeptical of arms on these terms.

If we have to think in terms of national interest, which should be transmuted into national responsibilities for us, we must remember that other nations also, especially some who have known deprivation of national pride, will want to think in terms of national interest, and our approaches to the larger unity must take account of that fact.

In terms of a national program for the protection of our own interests together with the interests of all who love plenty, peace, and freedom, our emphasis should be on co-operative defense by methods appropriate to the cause we are defending, a crusade for disarmament, and a co-operative war on poverty.

Norman Thomas, Litt.D., New York City, is the leader of the Socialist Party in the United States. He was twice Socialist candidate for Mayor of the City of New York, once for Governor of the State of New York, and six times for President of the United States—in 1928, 1932, 1936, 1940, 1944, and 1948. He is author or co-author of many books and of scores of magazine and newspaper articles and pamphlets.

In Defense of International Law and Morality

By A. H. FELLER

ANY reader of the now very popular Science Fiction will of course remember that ever recurring scene in which a group of people are riding in a space rocket which is shot out of the gravitational sphere of the earth and is approaching the moon; at one point, always very carefully defined by the science fiction writer, the passengers suddenly find everything turned topsy-turvy.

Anyone who wants to know that feeling can spare himself the expense and discomfort of a rocket trip to the moon. All he needs to do is read or reread the literature and debates on foreign policy of the last few years. This is the sort of thing he will find:

REVERSAL OF VIEWS

Almost from the moment of its birth, the United Nations has been belabored by some critics as a puny, ineffective creature, crippled by the veto, overridden by an antiquated conception of national sovereignty, and incapable of influencing the national policies of its member states. Now suddenly there is a whole new school of thought which pictures the United Nations as a monstrous supergovernment, endowed with mighty powers of interference in the internal affairs of its members, and intent on hamstringing their freedom of action.

For years the debating platforms in the legislative halls in the United States resounded with calls for the elimination or diminution of sovereignty and the immediate establishment of a world federation or world government. Earnest committees drafted detailed constitutions for a new world order to be set up right away. One state legislature after another called for an amendment to the Constitution of this country to enable it to join the new order. Now suddenly there is a movement to do just the opposite—to amend the United States Constitution to limit the normal and traditional treaty powers possessed and exercised since the foundation of this Republic.

Only a little while ago, all our scholars were calling for increasing world community and strengthened collective security. Now we are told that we must look at power realities and must govern our foreign relations by exclusive devotion to the national interest.

This rocket in which we seem to be riding is apparently not just shooting out into space. It is bobbing and weaving in addition. I think we are all getting slightly dizzy, and it is time we took our bearings before sense of direction is lost entirely.

BASIC FACTORS IN INTERNATIONAL POLITICS

There are two basic intractable phenomena of international politics. First, the world consists of separate states, each of them desiring to maintain its national identity and develop its own social and economic order. These states are extraordinarily diverse in size, strength, racial composition, stage of economic development, religious and ideological background, and devotion to the cause of peace. But they are extraordinarily uniform in their adherence to the concept of sovereignty and independence. Every one of them wants just that. The number of these sovereign states has increased in our

generation, and it will continue to increase for at least several decades.

The second phenomenon is that the spread of the western technological system—the development of communication and science, and particularly of the destructive capabilities of modern instruments of war—has rendered every one of these states incapable of living in isolation. This is true of the largest states as well as of the smallest. Moreover, as we are coming to learn more and more every month, belief in the possibility of progress through the conscious development of human and material resources—belief which was once limited to western liberal thought—has broken through ancient incrustations to stir up the ambitions and hopes of hundreds of millions in backward areas.

BASIC VALUE OF U.N.

The establishment of the United Nations in 1945 was the most important attempt in history to reconcile these two phenomena of disunity and unity, of sovereignty and community. The Charter was not the product of academic scholarship or visionary idealism; nor was it an opiate brewed by narrow-minded and scheming politicians to deaden the people's desire for true world government. It was drafted and adopted by the responsible representatives of the vast bulk of mankind. Its weaknesses are not due to lack of drafting skill or of devotion or of imagination; they are for the most part inherent in any practicable design for world order in the midst of world tension and conflict.

Whether these weaknesses of detail were inevitable or avoidable, they cannot obscure these two major and enduring accomplishments of the founders: first, a statement of purposes and principles which set forth for the first time a universal creed of aspiration for peace, security, the betterment of life, and the fostering of human freedom; and, second, the creation of an institution, universal in scope, organized to operate continuously on all problems of international concern.

ENTER THE NEO-REALISTS

These great contributions of the Charter have remained virtually unchallenged throughout the long debates which have been raging on the details of the structure and performance of the United Nations system. I find it a disturbing symptom of our present instability and unease that these principles are now being subjected to at least an indirect attack—and from a source from which I think we might expect something better. A number of scholars are telling us that the real trouble with American foreign policy is its reliance on what they call the "legalistic-moralistic approach"—a rather lengthy name for what we used to call idealism. In their view, foreign policy is essentially a struggle for power, waged by sovereign nations for political advantage, and they believe and tell us with great force that American foreign policy has suffered from the misguided belief that this struggle for power can be suppressed by the acceptance of some system of legal rules and restraints.

The spokesmen for this new school, which we might call the neo-realist school, are among the finest minds, among the most accomplished scholars in political science, in this country. But I think it important to examine the premises on which they have built this doctrine; because I fear that the doctrine, if readily accepted, may have fateful consequences for the future of the conduct of foreign relations.

A WORLD-WIDE CONCEPT

To begin with, it is a mystery to me why these able and sophisticated students of diplomacy have fallen into the obvious error of assuming that preoccupation with international law and moral principles is a peculiarity of American foreign policy. In fact, most governments, certainly very many, have shared a similar, if not as intense or consistent, preoccupation.

Just to take the beginning of this century, the Hague Conferences were not initiated by some American lawyer Secretary of State, but by the Czar of Russia. The relations of Latin American states are replete with treaties and declarations proclaiming general principles of law and morality. It is true that a United States President promoted the League of Nations, but more than forty other states carried it forward for two decades when the United States backed away. And there is no evidence that it took much inducing by the United States to get the other fifty-nine members to join the United Nations, and more than a dozen additional states are trying very hard to become members of that organization. Americans may, I think, be proud of the support and enthusiasm which many of them have been giving to the current efforts to create a wider European community, but it is the farsighted statesmen of Europe that are taking the practical steps toward that end.

As recently as November 1951, Anthony Eden, the Foreign Minister of a state whose foreign policy is not customarily thought to be afflicted with fuzzy-minded naïveté, said this:

> I am more than ever convinced that the nations of the world must submit to the rule of law and abide by it. Confidence can only be created and maintained on a basis of respect for international engagements. It is therefore the duty of all nations, as indeed it is their interest, to respect international authority and uphold it.

And at this moment the people of the Netherlands, with centuries of experience of diplomatic methods and balance-of-power politics, are engaged in amending their constitution to provide for the primacy of international organization and international law.

The point is that historically all states except those which were or are openly predatory have professed belief in an international legal order and have normally justified their actions on the basis of legal principle.

LIMITATIONS OF INTERNATIONAL LAW

This is not to say that nations have always been sincere in their professions, or that the rules of international law have not frequently been broken. We know to our sorrow that they frequently have been broken. The notion that peace could be established forever by the simple proclamation of a world law owes its currency to enthusiastic laymen rather than to international lawyers. These latter have constantly stressed the fragmentary and primitive character of international law and the relatively subordinate role it can play in the conduct of international affairs in a world of sovereign states.

For several centuries there has been an urge to extend the international legal system from the mundane matters dealing with the everyday relations between states to larger political conflicts. Lawyers have frequently cautioned against overambitious attempts to impose such wide-reaching legal restraints without a solution of the underlying economic and social problems and political and psychological tensions. They can only smile wryly when they are now told by one of the outstanding spokesmen of the neo-realists that the incomplete and modest system of international rules which we now have is a "legal strait jacket" impeding the assertion of legitimate national aspirations.

TO FACILITATE PEACEFUL CHANGE

In truth, law is a conservative influence tending toward stability and regularity. And this has been and will continue to be its major function in the international scene. At the same time, it has been the constant concern of international lawyers to reconcile this stabilizing influence with the problem of peaceful change, precisely in order to enable the proper expression of legitimate national aspirations. This is one of the reasons for the creation of institutional arrangements which can introduce the requisite flexibility into the legal order.

There is a perfect case in point in the last few years—the handling of the question of Libia. Here a colonial people has been enabled to fulfill its national aspiration to independence through the legal and institutional mechanisms of a peace treaty and the action of the General Assembly of the United Nations, and has done this without upheaval and with much less violence than has ever before accompanied the birth of an independent state. This is an ideal example of the reconciliation of stability and change, of legal principle and national aspiration.

WHENCE THE CONCEPT OF TOTAL WAR?

This neo-realistic thesis, if I may call it that, which I have been describing, possesses a novelty in that it is urged that the extension of the rule of law is a positive danger to international life. I find this a very startling proposition, and it is supported by imputing to what is called the "legalistic approach" a number of hitherto unsuspected vices.

The most serious charge is that this approach is responsible for the concept of total war and total victory. It is assumed, without proof, that this concept is a sort of American invention stemming from moral indignation over the failure of other nations to conform their behavior to American standards; in short, that Americans become so incensed at the failure of other nations to be as nice as we are that when we go to war with them we desire to annihilate them.

Surely it cannot be so soon forgotten that the concept of total war was first proclaimed by Imperial Germany in World War I and then by Nazi Germany in World War II. If the reaction of American and, one must add, Allied public opinion was a mistake, it must be laid to the character of the war initiated by the enemy, and not to a theoretical moral basis which is peculiar to the American character.

There is nothing inherent in legal principle that requires the imposition of the death penalty for all offenses; and there is nothing inherent in justified indignation against an aggressor state that compels war *à outrance* and the total extinction of the aggressor. A sufficient contemporary illustration is the limited character of the United Nations effort to stem aggression in Korea.

CRITERIA OF NATIONAL CONDUCT

Basically, if I understand the neo-realists, they consider it inherently impossible to judge the conduct of states by moral criteria. This is again assumed to be an American idea which, if I may quote one statement, considers it "implausible that people should have positive aspirations and ones that they regard as legitimate, more important to them than the peacefulness and orderliness of international life." And one spokesman finds "a profound and neglected truth," to use his words, in the dictum of Hobbes that "there is neither morality nor law outside the state."

With all due respect, I feel that these remarks do less than justice either to Americans or to other peoples. For many centuries, men have considered

political communities subject to moral standards of one sort or another. The notion of the inherent amorality of state conduct introduced by Machiavelli is an aberration, and not an immutable truth. The criteria by which the conduct of states may be judged are not necessarily always the same as those by which we judge the conduct of individuals, and the procedure and organs of judgment must be different.

Moreover, an international order must obviously take account of the relative dispositions of power and the natural limitations of law and sanction. The administration of such an order entails many compromises and much painstaking adjustment of conflicting interests which lie outside the legal realm. In that respect it is different in degree, not in kind, from any domestic order, where law and principle also have their definite limitations.

DIPLOMACY AND INTERNATIONAL ORGANIZATION

There is a tendency in these scholars to lump together in one concept legal-moral principles and the institutional framework for international action; and these two things, when lumped together, are opposed to what are considered to be the tried-and-true methods of old-fashioned diplomacy.

Now, there is no basic incompatibility between the methods of diplomacy and the institutions of an international organization. Conferences and treaties are as much a part of diplomatic technique as are private meetings of diplomats and the carrying of dispatches between capitals by couriers. When the United Nations deals with a political problem, as for instance Palestine or Kashmir or numerous others that I might mention, it seeks solutions which are compatible with power realities, and it operates through a whole range of techniques from private negotiation to full-dress debate before television cameras.

It has been said that the legalistic belief, the idealistic belief as we have previously called it, refuses to take the awkward conflicts of national interest and deal with them on their merits with a view to finding the solutions which are least unsettling to the stability of international life, but that it tries to find some formal criteria of a juridical nature which can define permissible behavior.

I suppose that what is meant by a statement of this kind is some sort of simple, formalistic notion like the Kellogg-Briand Pact, in which in one sentence all governments on earth undertook to outlaw war as an instrument of national policy. Certainly this reproach could not be applied against such an organization as the United Nations, which has devoted its energies to precisely what is recommended—the solution of awkward conflicts on their merits. And anyone who has followed the proceedings of the United Nations knows that that is not easy, and that frequently failure will come where success has been fought for.

It can hardly be discreditable to the United Nations system that, in trying to find solutions to these awkward conflicts, it also operates with some regard for a statement of principles subscribed to by all the nations as their common objective and aspiration.

OBJECTIVE OF DIPLOMACY

To my mind, the basic fault with this neo-realistic approach is that it offers nothing in place of moral principles—nothing, that is, but a return to "diplomacy" and "national interest." What do these mean? "Diplomacy" is merely a procedure. It has no more substantive content than "speaking" or "writing." The techniques of negotiation or persuasion are only a minor part of the

problem of the conduct of foreign affairs. I think it is very important for us to train our young men to know these techniques; but the heart of the problem is the question of objective—to what ends are we going to utilize diplomatic resources?

I certainly am not one of those who would decry the pursuit of the national interests as selfish or petty. A sound domestic economy, firmness in the protection of legitimate rights abroad, and the maintenance of strength to ward off attack are essential to national survival. But we cannot advance a concept of national interest abroad without some ideal standard and at the same time convince others that our purposes are beyond reproach.

A majestic procession of great Americans, most of whom have been lawyers, have been the idealists of foreign policy. To mention only some of these names, there are Root, Wilson, Stimson, Hughes, Franklin Roosevelt, Hull, Vandenberg. These men were quite clear that the national interest of their country could be served, and served well, by asserting the influence of the United States for the maintenance and extension of law and justice. They were neither so naïve nor so unrealistic as to ignore the significance of power in world affairs. They realized that the position of a nation in the world cannot be measured only in terms of the size of its armed forces. Without power, a nation may be impotent; without a moral standard respected by other peoples, it becomes the focus of hostility and fear.

Two Points Conceded

We certainly need to take to heart two lessons which these recent discussions have very properly read to us. One is that we must dispel a notion unfortunately all too prevalent among us, that a single formula-slogan like "world law," "international organization," or "disarmament" can solve the international puzzle. Our "realistic" scholars will forgive me, I hope, if I suggest that many of their readers will have gained the impression that they also have put forward a formula-slogan under such rubrics as "diplomacy" and "national interest."

The second lesson, and a very proper one, is that the empty mouthing of moral concepts without sincerity or intention to implement them can stultify a national policy. On this point there can be no shadow of disagreement.

A Necessary Concept

At the same time I must state my deep conviction that for the long run, the "legalistic-moralistic approach," awkward as those words sound, applied sincerely and with a realistic regard for its short-term limitations, will perforce remain the highroad of a decent and effective foreign policy. And it is only in this way that we shall preserve our balance and our sense of direction.

There are some who would have us believe that by following this road we make ourselves "slaves of the concepts of international law and morality." This is an extraordinary underestimation of the larger aims of foreign policy. The peoples will never believe that true and enduring world peace can be achieved without the eventual creation of a world order based on law and morality. In my view, they are perfectly right in their belief. A foreign policy devoted to the careful adjustment of power interests by professional diplomats may work for a time in a limited sphere, but it will never retain the allegiance of the mass of people who yearn for a better world.

U.N. Embodies Man's Broad Desires

In practical terms, the issue comes down to support of the United Nations idea and of the regional organizations which have recently been created along the same lines. The nations of the world have committed themselves to the Charter, and the United States is in the forefront. While the preservation and advancement of the national interest must be a cardinal aim of any foreign policy, the upholding of the United Nations and of the regional arrangements consistent with the Charter is an integral part of the national interest of every peace-loving state.

The Charter is no mere casual by-product of an American desire for "juridical tidiness." It is the embodiment of the deeply felt desires and needs of millions of people everywhere for peace, economic well-being, and respect for the development of human personality. These are just as significant as, perhaps more so than, the often ephemeral interests and spheres of influence so beloved by traditional diplomacy.

The United Nations system has its share of shortcomings and mistakes. Those voices which have criticized it have in the main demanded a better instrumentality, a surer and quicker way for attaining the same objectives. The objectives themselves are the common ground of mankind's will for survival with decency. It is the task of diplomacy so to conduct the adjustment of affairs between nations as to move toward the accomplishment of these goals.

A. H. Feller, New York City, has been general counsel and director of the Legal Department of the United Nations since 1946. He was formerly associate professor of law at Yale University, was connected with the Institute for Foreign Law and International Law in Berlin, and has taught at Harvard Law School. He has also served as special assistant to the Attorney General of the United States and as general counsel for the United Nations Relief and Rehabilitation Administration, and during World War II he was connected with various agencies of the United States Government, including the Lend-Lease Administration and the Office of War Information.

National Interest and National Responsibility

By C. B. Marshall

My assignment calls for me to relate the national interest to the problems of the United States in the present world situation.

The National Interest a Valid Concept

Let me comment first on that phrase, "the national interest."

Only a few years ago the economic interpretation of virtually everything was in vogue. Writers of considerable repute were fobbing off the significance of the national interest as a factor in foreign policy, interpreting it as merely a façade to conceal special interests and to deceive the public.

The return of the phrase to respectable parlance, indicating the recognition of a valid national interest paramount over particular interests, is a gain for straight thinking.

Often a decision in foreign policy is inseparable from the question of the domestic consequences of the decision. It is necessary in such an instance to recognize that our national destiny in a world of many nations is more important than the domestic group interests affected by the decision. In settling questions of conflict between the necessities of national security and group interests, the idea of national interest is valid and essential.

The phrase, moreover, indicates a step away from the utopianism beclouding too much the discussion of international affairs in the sequel to both World War I and World War II.

Nations do have interests. In some instances their interests coincide with the interests of other nations. Sometimes interests of different nations harmonize without coinciding. Sometimes they differ, but not incompatibly. Sometimes they are mutually exclusive. Out of these variations comes the real nature of international life. It is useless to try to ignore this by talk about global harmony and the universal state. Such talk, while edifying to those who like it, only hinders—it does not help—the handling of world problems.

So it is good to hear people talk about international problems again in terms of national interests rather than in the abstractions of world government and world law.

Indeed, it would be a blessed thing if all differences among nations could be translated into differences of interest alone and not differences of basic purpose and principle. It is unselfish to compromise on interests. It is unseemly to compromise on one's principles.

Here I myself stray off into utopianism of another sort. The world is nowhere near that stage of adjustment where all national differences can be dealt with as solely differences of interest, and the coming of that day is too remote for prediction.

Weaknesses of National Interest Idea

I have said enough in praise of the idea of national interest; now let me say some things in criticism.

The usefulness and significance of the phrase are limited. It begs more questions than it answers.

In appraising the significance of the national interest, I must distinguish between instances in which the decision turns on weighing our world position as a nation against the claims of particular domestic interests, and instances in which the issue lies simply between different lines of action in the foreign field.

I know of no case of the latter character in which the settlement of an issue of our national policy in the line of responsibility would have been facilitated by injecting the question: Shall we or shall we not try to serve the national interest? The question in the arena of responsibility in handling an issue involving foreign policy alone is not whether, but how, to serve the national interest. That involves the question of what is the national interest in a particular situation.

Indeed, I understand that between and among Republicans and Democrats this year there are considerable differences as to what is the national interest and how to serve it. Anyway, I have never heard Republicans or Democrats argue about whether the national interest should be served.

The question of serving the national interest is always a subtle and complex one in real situations. I am sure all of the following things are clearly in our national interest: to avoid war; to preserve our institutions; to have strong allies; to avoid inflation; to have a prosperous civilian economy; to find common grounds on which to stand with the various nations which have newly come to responsibility; to preserve our access to strategic waterways and vital raw materials; to protect the property and safety of our nationals abroad. I could extend this list by dozens of items.

Now, any matter of foreign policy pertaining only to the realization of one of those items would not present an issue at all. No one would have to work his brains overtime on it. No series of exhaustive meetings would have to be held. No protracted debate about the nuances and contradictions would be necessary. In such an instance the policy decision would crystallize spontaneously.

In any practical question presenting a real issue, the national interest has several aspects. Indeed, there are many national interests, not just one. The difficulties arise in the conflict of one interest with another—for example, in the clash of the interest in peace with the interest in preserving national institutions, in the clash of the interest in having a strong defense with the interest in having a strong civilian economy, or in the clash of the interest in preserving access to a waterway with the interest in eliciting the adherence of another country to one's cause.

I trust I have made my point of the inconclusiveness of the national interest as a guide in any particular policy problem.

Beyond that, I believe the concept of national interest is inadequate and misleading even as a broad concept on which to found a policy. It seems to me that a more appropriate guiding principle is the idea of responsibility. This is a very different sort of idea. I want to devote the rest of this article to the contrast between national interest and responsibility and to examination of the idea of responsibility as it enlightens our present problems.

First I want to discuss our special role in the world today.

Approaches to World Problems

The great political issues of our time revolve around rival approaches to the handling of the problems growing out of such circumstances peculiar to modern times as the massing of peoples—their expanded numbers and their increased concentration; the sharpening of the clash between cultures due largely to awakened consciousness of the disparities in well-being between peoples in relation to the advance or lag of production techniques; and the destruc-

tiveness of modern war due both to the concentration of industry and population and to the greater inherent efficacy of modern weapons—their huge lethal power and the capability for distance and stealth in attack.

One approach would exploit these circumstances for the purpose of widening the scope and strengthening the foundations of a monopoly of political power. The other approach seeks to compose clashes of interest and to work out patterns of accommodation. The difference between these two approaches may be expressed as the difference between organized conflict and conflict organized. The legitimate question of politics is not how to eliminate conflicts of interest—a utopian concept—but how to organize society so that conflicts can be adjusted rather than fought out.

This difference in approach is brought to bear both within and among nations. The lines of difference are intertwined and subtle, for the lines along which great issues form are never as sharp as a razor.

POSITION OF THE SOVIET UNION

In so far as the issue has crystallized among nations, however, the Soviet Union stands clearly as the champion of the first approach.

Internal political circumstances cast the Soviet Union in that role. It is ruled by tyrants, who reached the seat of power through conspiracy and, having achieved power, have not dared to risk their hold on it by resort to a valid procedure of consent. They have remained conspirators after becoming governors, combining the usages of conspiracy with the prerogatives of the state. Both at home and in the world at large, the conspiracy that walks like a state requires tension and conflict to maintain its grip. In the service of this purpose it employs a doctrine emphasizing the patterns of conflict—class war, subversion, and the like.

This rule is established over a great range, commanding great resources in people and materials. Huge military forces at its disposal are deployed in positions bearing on northern and central Europe, the eastern Mediterranean, the Middle East, southeastern Asia, the Republic of Korea, and Japan. The Soviet Union has auxiliaries in the form of embryonic governments under the guise of domestic political groups in territories beyond its imperium. The Soviet power is such that no combination of nations adequate to cope with it is conceivable without the support and participation of the United States.

POSITION OF THE UNITED STATES

The United States thus finds itself in the position of leadership among peoples which prefer to work out a method of handling the problems of our times alternative to the pattern offered by the Soviet Union and which are impeded in this effort by Soviet opposition. A failure to exercise this leadership would almost certainly result in a world power situation endangering the survival of our constitutional values. These are the values expressed in the Preamble of our Constitution. I do not doubt that you know them all, but let me enumerate them anyway.

The first is the perfection of our Union, the concept of a nation with steadily growing public values.

Second comes the idea of justice—of power subjected to standards superior to the mere attainment of the ends of power.

Third in the enumeration is domestic tranquillity, conveying the idea of a nation at peace with itself, a nation where issues can be decided by reason, by discussion, by compromise.

Then we come to the common defense—the protection of the nation from penetration from the outside.

The idea of the general welfare is another of the values set forth. It embodies the idea of a government which serves and is not master, which is accountable to all of its people as contrasted to a government which serves the exclusive interest of a dominant group.

Finally we have the blessings of liberty—the situation in which each person can make choices for himself regarding his life, the life of his children, his religion, and his thoughts.

The fundamental and enduring purpose of our foreign policy is to maintain in the world circumstances favorable to the continued vitality of these values in the United States.

I want to stress the novelty in the American consciousness of the responsibilities which the present world situation imposes.

DEVELOPMENT OF OUR POWER

Our power, whence come our responsibilities, has three main foundations: position, political strength, and economic resourcefulness. The circumstances surrounding the development of each of these were such as to conceal their eventual implications.

The diffusion of power among several nations of great magnitude provided the relatively stable and protective situation which enabled the Americans to move onward from an Atlantic beachhead to become a continental nation, singular among the great powers in that it lies in both the Northern and Western Hemispheres, faces on both the Atlantic and the Pacific, and stretches from the tropics to the Arctic.

The same circumstances enabled the Americans to preserve and mature a government based on stipulated principles of accountability and freedom. Their purpose in doing this was purely domestic. The strength of the government thus established is one of the great political facts of our time, important for all the globe.

The Americans developed a fecund agriculture and a productive industry, both without equal, through the expansion of an internal market. That circumstance concealed from them the eventual world importance that American economic strength would have.

Some sixty years ago Lord Bryce described the United States as living "in a world of peace" and as "safe from attack, safe even from menace." Such was the national situation in the historic past, when the United States was a remote and intermittent factor in the ratios of world power and when Americans were concerned almost exclusively with the problems of their own national development. Lord Bryce added: "For the present at least—it may not always be so—America sails upon a summer sea."

RESPONSIBILITY WITH LOSS OF FREEDOM

Within a lifetime the summer sea vanished. The world frontiers closed. Two world wars were fought. Germany and Japan were eclipsed in defeat. Other great powers suffered relative declines. Patterns of empire were sundered. Many erstwhile dependencies attained sovereignty. Revolutionary communism established a power base. Two nations emerged into positions of primary magnitude—the United States as one and the Soviet adversary the other.

So great an accession of responsibility in so brief a span has placed great moral tests on this nation.

One difficulty arises from the sense, as expressed recently by former Chancellor Robert M. Hutchins of the University of Chicago, that "this country has been thrust against its will into a position of world leadership." True, no

referendum on the issue whether or not to be a nation of such wide responsibilities was ever held. The choice was made unconsciously in many decisions of our past. We were thrust ahead not against but by our wills. The choice is none the less binding for having been made in unawareness of the consequences.

Here we have a paradox—an accession to great power accompanied by a sense of deprivation of freedom.

RESPONSIBILITY WITH LOSS OF EFFECTIVENESS

We feel that paradox in another way. In our historic past we viewed our role as that of standing normally aloof from the power balance whose benefits we enjoyed. At most, we would entertain the idea of throwing in our weight only momentarily to re-establish the balance whenever it might break down in general war. We regarded our role as like that of a pedestrian who might choose to vary his solitary walks by intermittently riding with others, without foreclosing himself from choosing to walk alone again.

Now that is changed. Our power makes our interposition essential to the preservation of the causes with which our interests lie. We must go along with others if we are to keep others with whom to go along. Our power is the basis of our essentiality, and our essentiality compels us to replace our historic sense of freedom by a new consciousness of responsibility.

While losing a sense of freedom, we lose also a sense of effectiveness. In the era when we stood normally aloof from the balance of power, our decision to become a world factor for a season had drastic and immediate results in redressing the balance. Now, by having become permanently involved in preserving the balance, we are no longer vouchsafed the opportunity to alter the situation dramatically and radically by sudden action.

This leaves for us the exacting course of seeking a solution in the long pull through persistent effort to make the best of the situation stage by stage in the knowledge that such is the only way of making the situation better.

OUR POLICY OF CONTAINMENT

Let us look for a moment at the foreign policy which this situation imposes. It gives us no promise of arrival at some calculable moment at which we can say that all our troubles are behind us, that everything henceforth will be tidy and easy, and that we have crossed the one last river.

I said this to a group of Texans with whom I was discussing our national policy recently. One of them asked me whether I actually thought coexistence with the Soviet Union was possible. That is a curious question. It makes a matter of speculation out of something known to be true. Coexistence with the Soviet Union is not simply possible; it is a fact. Coexistence with a great power that tries to lead a double life as state and as conspiracy is vexatious, certainly, but it is preferable to the tragedy of general war and its sequel, whichever side might win.

Our policy seeks to avoid the tragedy of war, to abate the difficulties of coexistence by correcting the circumstances affording special advantage to the adversary, and to work with other nations as best we can to guide international life toward the patterns of conduct preferable to us. This policy, often called the policy of containment, is sometimes criticized as if it aimed for a protracted, static confrontation—a sort of perpetually frozen status quo.

Such perpetual equilibrium is foreign to the processes of history. The policy is based upon no assumption of arresting change. It rests rather upon the assumption that the factors of position, population, talents, resources, and moral values redound to the ultimate advantage of the side of our interests, and that in the long pull it will be the adversary who must adjust his purposes.

This is not a foregone conclusion. What we and our friends do will be an essential factor in determining the outcome. This is no cause for disquiet. History presents no foregone conclusions. I know of no way to formulate a policy that will absolve us from the subsequent necessity of exercising resolution and restraint and paying the costs, whatever they may be.

HOW THE POLICY WORKS

The policy works along three general lines.

The first is to make coexistence more tolerable. This calls for improving our armed strength and that of the nations standing with us and combining them more effectively through a system of alliances; for helping the depleted and dislocated economies of our friends to regain a healthy level of activity and for helping the economically lagging countries to improve their production methods; for widening the area of peace by bringing the former enemy countries, Japan and Western Germany, back into collaboration with other countries.

The second line is to prevent serious deteriorations in the conditions of coexistence by avoiding losses in areas of sharp political conflict.

The third general line relates to the development of international usages and institutions of responsibility as instruments of free collaboration among nations instead of the collaboration by intimidation offered by the adversary.

To succeed in these endeavors will require the collaboration of others. They will not work along with us solely on the basis of our national interest. The collaboration must be founded on an identity among their interests and ours. The primary responsibility for discovering and developing that identity of interests is ours because we are in the position of greatest strength.

THE MEANING OF RESPONSIBILITY

This is not a simple responsibility. It is irksome and expensive, and contains no easy formula for complete success in a stipulated interval.

The policy of responsibility lacks the simplicity (here I use the word "simplicity" in the sense of Proverbs 1: 22) of the counsel of unlimited violence, a counsel based on the fallacy of trying to reduce all problems of power to the limits of the problems of force.

The policy lacks the utopian tidiness of the dream of solution by world government.

It lacks the traditional ring of the counsel of solution by default, by which I mean the idea of confining our security to this hemisphere—a counsel put forth by some claiming the mantle of statesmanship even though the formula on which it rests contains a fallacy recognizable to any schoolboy familiar with solid geometry. The fallacy inheres in this: Two points on the earth sphere can never be farther than a hemisphere apart; hence the whole world lies in the same hemisphere with us.

The policy based on the principle of responsibility lacks the crisp appeal of a phrase like "the national interest." It involves this paradox—that we can serve our national interest in these times only by a policy which transcends our national interest. This is the meaning of responsibility.

THE BURDEN OF FREEDOM

No nation could ask more of history than the privilege of coming to great responsibility. To satisfy our American

professions of the values of competition, we have at hand one of the most exacting contests in ideas ever experienced. To test our faith in freedom, we have abundant opportunity to make choices of action that will profoundly affect the course of human affairs. To test our devotion to values, we have the opportunity not simply to proclaim them but actually to support them by gifts and deeds and perseverance.

This juncture in our experience is not comforting for those who take the utopian approach to international problems—those who remind one of Kipling's lines:

Thinking of beautiful things we know;
Dreaming of deeds that we mean to do,
All complete, in a minute or two—
Something noble, and grand and good,
Won by merely wishing we could.

I recall the words opening one of Christina Rossetti's poems:

Does the road lead uphill all the way?
Yes, to the very end.

That is the road which a great and responsible nation must tread. It is an uphill road all the way. For Americans who do not mind walking that kind of a road, this is not a time for misgiving, but a great time in which to live.

C. B. Marshall, Ph.D., Washington, D. C., is a member of the Policy Planning Staff of the Department of State. He was a newspaperman for several years, principally with the Detroit News, and has served as a member of the Department of Government at Harvard University and Radcliffe College, as an Army officer, as transportation adviser to the Intergovernmental Committee on Refugees, and as consultant to the Committee on Foreign Affairs of the United States House of Representatives.

The Bases of Peace

By ALES BEBLER

AS the representative of the country which has, since the end of World War II, had a coalition government led by a Communist party, I think I am well entitled to start my statement with the contention that differences in ideologies or in the social structure of states are not the reason for international troubles in our day.

UNIFORMITY NOT NECESSARY

I consider and we do consider that the very widespread opinion in the West and more particularly in this country that the trouble is with Russian Communism is absolutely wrong. It is wrong not only because Russia is, in our opinion, not Communist, but primarily because it implies that peace is possible only if all nations embrace one and the same ideology.

There has never been a time when all nations had parallel ideologies and similar social structures; and it will be an extremely long time—possibly a few centuries—before the entire world will be on the same economic and social level and have, in the main, similar political and philosophical opinions.

Now, can we postpone a lasting peace in the world for several centuries? I think you will all agree that we must try to make peace, and a stable peace, right now; because the world has become so small and the destiny of nations so closely connected that we can have no more local wars without the perpetual danger of world wars. The two world wars of our time are precisely the best proof that the world has become small, and that it is essential for mankind, if it wants to survive, to make peace right now, and avoid new world wars which might destroy humanity.

Therefore my conclusion is that we must make peace despite the diversity of nations, including the diversity of ideologies; and I contend that this is possible.

We have had peaceful epochs in the world with a diversity of ideologies; we have also had wars and conquest with all kinds of ideological flavor and color. We have had conflicts from the time of the Egyptian Pharaohs to that of the modern conquerors, with all kinds of ideologies. We have found that every ideology can be stretched so as to cover and justify conquest.

We have had armed expansion of Islam at one time, and we have today absolutely peaceful Islamic states. We have had Christian crusades, and we have today very peaceful Christian states. We have had only one point in common in a foreign policy of war, the point being conquest itself, the reasons for which may have been extremely different. We could never analyze all the reasons, artificial and real, which have led nations to seek conquest; for it would be too late to save peace before we finished that analysis.

FIGHT NOT DIVERSITY BUT EXPANSIONISM

We have to find a way to save peace today in the world as it stands. The first thing to do is to embrace the thesis that we should not try to create uniformity in the world, that we should not try to do away with ideologies or social systems or political institutions that we dislike. We must discard the idea that any nation, however right it may later prove to have been at a cer-

tain moment, is entitled to impose its ideology or its political institutions on any other country. This idea leads to advocacy of preventive wars against so-called dangerous ideologies. In our time there is no such thing as a preventive war. There is war or there is peace.

What, then, is the trouble? What and how must we fight in order to preserve peace? We have simply to fight all kinds of expansionist tendencies, be they covered by one or another ideology. We have to avoid, to combat, to restrict, to contain as you say in this country, expansionist tendencies, so as to bring to reason those who want to expand, irrespective of their arguments for expansion.

There is another argument that differences of ideologies are not the trouble, the proof being very close to my heart, because it concerns my country. We have had long disputes with one of our neighbors, with the greatest of our immediate neighbors, Italy, about Trieste. You have read this story during the last few weeks very often. But the situation did not originate in the last few weeks, or even after the last war. It is a very old story, and one of the moments when it was most burning was the time immediately after the First World War.

Historians examining the situation in 1920 will find that Italy and Yugoslavia had exactly the same ideologies, exactly the same social, economic, and political institutions. Both countries had pretty much classic forms of the free enterprise system, as you call it. Both were monarchies with parliaments, and with governments responsible to those parliaments. Now what was the reason for this dispute about Trieste? It was expansionism. Whose expansionism? you may ask. I will tell you a story which you may not know.

History of Dispute with Italy

In the First World War, Italy vacillated about which camp to join, because she recognized the possibility of conquest through the victorious group. In 1915 she found that the price the Allies were ready to pay for Italy's entry into the war was high enough, and she signed a secret pact in London with Great Britain, France, and Czarist Russia. In this document those three powers promised Italy some southern provinces of Austria-Hungary.

When the end of the war came Italy asked for her pound of flesh, and it turned out to be not Austria-Hungary but Yugoslavia; because meanwhile the idea of the self-determination of peoples, which was one of President Wilson's Fourteen Points, had become important. In fact, it was so important that the shaping of the new Europe at Versailles was supposed to be according to ethnic borders, borders of languages and of nationalities. And here was Italy with a paper asking for part of Yugoslav soil, all of Dalmatia, and all of Istria, in addition to Trieste, a bilingual city.

A compromise was finally reached, and the principle of self-determination of nations was not entirely sacrificed. It was sacrificed only to the extent of approximately 50 per cent. Half of what Italy was demanding was given to it, and the other half was included in Yugoslavia.

The trouble started again when Italy occupied Fiume, which was not to be hers, when she claimed the greater part of the Balkans under Mussolini and occupied Albania so as to have a position in the Balkans, and waged war on Hitler's side against Yugoslavia. Dalmatia was foremost in the mind of Rome under Mussolini and before Mussolini, and unfortunately we find it so again today. Officially, Italy claims only Trieste and Zone B of the Free Territory of Trieste; but the press—not only the opposition press attacking the government, but the press of the leading party, the Christian Democratic party of Signor de Gasperi—again dwells on Dalmatia and even Albania. It speaks of the Yugoslavs as barbarians who should be driven away from Dalmatia, from the shores of the all-Roman Adriatic Sea.

The Expansionist Spirit

This spirit in Italy is unfortunately an expansionist spirit. We are sorry for it. We are sorry because this spirit becomes so virulent at times. We understand that the ups and downs and the noise made in Italy about this question are connected with internal problems. We know quite well that the noise made in 1948 was connected with the general elections; and the noise is swelling today because again there are elections in Italy—at the moment communal, but with provincial and general elections following.

The question is, Why should Italian political leaders compete among themselves in such a way, demanding foreign soil? Could they not compete and have ideas on how to improve relations with a neighbor?

We are sorry, on the other hand, that the great western powers gave in, to a certain extent, to these Italian politicians. In 1948, when the noise was so great because of the elections, a paper was signed by the three great western powers—Great Britain, France, and the United States—to the effect that the entire Free Territory of Trieste should be given to Italy and not remain a free territory as established by the peace treaty in 1946.

Again today, with a clamor of voices from Italy, we see the three western powers calling a conference in London, sitting around the table with Italy discussing Trieste and seeking a solution to the Trieste issue; but Yugoslavia was not invited to that conference. It is forgotten that Yugoslavia was an ally in this part of the world, that it fought on the side of the Allies throughout the war, that it lost about 11 per cent of its population in the war, and that material damages amount to more than $40 billion. It was an ally that really lost relatively most heavily in World War II, both materially and in human lives.

It is forgotten that Italy's expansionism is extremely dangerous today. It is dangerous because the entire world is faced with the problem of how to preserve peace in the face of the expansionism of one of the greatest powers of our time, and the relations of the world outside the reach of this power should be as amicable as possible.

It is forgotten that such tensions should at all costs be avoided, and they can be avoided for a long period only if expansionist tendencies are repressed. If you yield to this expansionist tendency of Italy, you will have more and newer claims. Once expansionism is appeased, as you say in this country, you know how appetites grow, and we never know where it will stop.

I have said that we all need unity because we are faced with the expansionist tendency of one of the greatest powers in the world today, the Soviet Union. The question is, How shall we face this danger?

Preparation for Defense

When I say simply what is generally said, solidarity, keeping together, preparations for defense, I always feel that an American audience may think,

"Well, it is very easy for you Europeans to speak about solidarity, because we are the ones who pay. We pay and you only receive." I wish to point out that in the two great wars of our time, Europe has had to pay a higher price than the United States for the victory of justice. Furthermore, our present sacrifices in Europe are relatively higher and our standard of living suffers more because of our defense preparations than yours. My colleague from Great Britain has given a few examples of this,[1] and I will give one from my own country. We are sacrificing today for defense 23 per cent, not of our national budget, but of our national income. We have a standing army far greater than such a relatively undeveloped country should have, because it is close to being beyond our material possibilities; but still we have to maintain it.

Again, it may be said, "You do what you are doing for your own defense. You do not care what happens to others. You would do it whether we assisted or not, whether we were interested or not. You do this quite alone for yourselves." My contention is that this also is not quite true. If the one who is in the front line is well prepared, he serves well all the rest.

Besides, without meaning to boast, it is a fact that we collaborate even in the defense preparations of the West according to our possibilities. It may be in a small way, but still we do it as far as we can. Let me give just one example. We provide the United States with very important strategic raw materials—copper, lead, and so on—and we offer them to the United States not at the prices of the world market but at various lower prices, fixed by your government. We consider it a duty.

I hope you will feel that the collaboration in the field of defense between such European countries as mine and many others and yourselves is the main stabilizing policy of our day.

[1] See Adam Watson, in this volume.

NEED FOR UNITED EFFORT

Naturally, preparation for defense is not everything. We must also work towards a situation where invasions and conquests will become more and more difficult. You Americans, in my opinion, have a tremendous task in this respect. You must keep your country aligned with all those who are ready to resist aggression. You must prevent one of the greatest dangers that I visualize today.

If a country like the United States were to become isolationist, this would be, I submit, the most outspoken invitation for aggression in Europe and elsewhere. I hope you will all understand, finally, that isolationism would mean not peace but war, not only for us in Europe and elsewhere, but also for yourselves. In both of the world wars you stayed out only a year or so before you had to join, and the next time you would also have to join; and your isolationism would have alienated quite a number of your friends, your allies.

Therefore it is better not only for us but also for you to be united from the beginning, because this may preserve peace and avoid war both for us and for you.

UPHOLD PRINCIPLES OF U.N. CHARTER

We have to strive for peace in yet other fields. We have to strengthen the United Nations. I do not mean to make the policy of the majority in the United Nations tougher. I think the United Nations must be tough in some respects, and in other respects very wise and mild. We must strengthen its ideas and its consistency in defending the fundamental principles of its Charter. We must be very tough indeed in questions involving fundamental principles such as sovereignty, inviolability of national territory, and equality of nations large and small. In those questions, and in opposing the reverse of them, the use of violence in international affairs, we should not know compromise. But we can be wise and mild in many other respects, in questions concerning peaceful settlement of disputes of all kinds, political, economic, and so on.

We should never even listen to any proposal going against the principles of the United Nations Charter, even if it is disguised as a proposal for saving peace. We have had such proposals.

THE SOVIET PROPOSAL

For instance, for several years the Soviet delegation has advocated in the United Nations, and still continues to advocate in most diverse forms in all kinds of congresses and conventions, a proposal to the effect that the five great powers should sign a pact outside the framework of the United Nations or at least without the participation of the rest of its members, for the preservation of peace.

On this question the last Assembly of the United Nations listened again to long speeches of Mr. Vyshinsky, but he never mentioned what that pact should actually be—what provisions, what new undertakings, what new commitments by the five great powers, he proposed.

Once I rose to the rostrum and said, "If you do not tell us what the pact should be, we shall be justified in believing that you propose a new Munich, a new division of spheres of influence of the big powers at the expense of the small powers; that you propose something similar to the pact between yourself and Ribbentrop when Poland was sacrificed 'for peace.' You want to sacrifice other countries 'for peace.' But we know that what resulted was war."

Vyshinsky said my speech was the speech of a traitor and what not, but he did not say a single word as to what that pact should be. Therefore I consider we are still entitled to believe that the idea behind such a proposal is a rotten idea. It is an idea that the Soviet leaders do not dare to explain in public. They would like secret parleys with other great powers and all kinds of arrangements in different parts of the world so that their empire would increase "peacefully" at the expense of the small powers, and they would authorize the other powers to seize some territories or to control some other territories as the price paid for their own expansion. These would be exactly the same type of arrangements as we had between the two wars, and all of them were steps leading to the Second World War.

In spite of rather violent answers that Vyshinsky got in Paris, I understand that this idea of a pact among the five big powers alone still lives in some quarters even in the public opinion of some great countries like the United States. I think that those who sincerely want to prevent a new world war must fight this idea, this way of apparently saving peace.

A WORLD-WIDE FORCE FOR PEACE

All those around the globe who sincerely want to save peace must stick to the principles of the United Nations Charter; because sooner or later we shall all find out that a really lasting peace can only be based on equality,

on what the Charter calls "equal rights . . . of nations large and small."

Fortunately this idea has become very strong in the world. The very fact that such a charter, and not a different one, was signed at the end of the last war is a sign that the conscience of mankind has risen rather high; and since the signing of this Charter, the ideas embodied in it have been embraced by many millions of people around the globe and have become a tremendous force.

It is true that the forces that drive us towards war, whether intentionally or because of a practical policy, are strong; but I think the ideas embodied in the United Nations Charter have become such a great force that they will finally prove stronger than the forces of war, and we shall win our battle for peace.

Ales Bebler, Doctor of Law (Paris), New York City, is Permanent Representative of Yugoslavia to the United Nations, with the rank of Ambassador. When the Nazis invaded Yugoslavia he became Partisan Chief of Staff in Slovenia. After the war he was Minister of Finance in the first Slovene government and then Deputy Foreign Minister of federal Yugoslavia. Since 1946 he has represented his country at many international conferences, and at all the regular sessions of the General Assembly of the United Nations. He has also been a member of the Security Council and many other U.N. agencies.

The Inter-American System Today

By ALBERTO LLERAS

I WISH to speak of the significance for the United States of the ties its inter-American policy has been forging with the twenty other republics that share the hemisphere with it. It may be surprising that a foreigner should discuss this particular topic; but I feel that because of the very fact of being a foreigner, I may be able to give an impartial opinion (in spite of my affection and admiration for this country), and one that may at least have the merit of presenting a picture of what many Latin Americans think of the various types of relations that have existed between the United States and its Latin American neighbors.

DEVELOPMENT OF THE SYSTEM

The Charter of the Organization of American States entered into effect in December of last year, three years after it was signed at Bogotá in April 1948. A long political and juridical process preceded the legal perfection of the world's oldest association of nations. Its historical genesis dates back to the birth of the new American republics themselves. Many of the Founding Fathers of the nations that resulted from independence from Spain realized the need for a federation of the peoples of the New World, at the time when the republican constitutions were being drafted.

Bolívar wanted to put this bold concept into practice, and he went so far as to call a Pan-American congress in 1826, with the immediate objective of a military and political alliance against any European attempt to dominate part of the hemisphere, including the possibility of joint action to free the Spanish possessions in the Caribbean; and another, more ambitious and nebulous objective, the establishment of a regional American league that might be the first step toward a world association of nations.

Sixty-four years later the United States took the initiative in organizing, cautiously but systematically, and as far as was then possible, the new republican world. The First International Conference of American States was held in Washington in 1890. In 1933 the fundamental obstacle to progress in inter-American relations was eliminated when, at Montevideo, Secretary Hull accepted for the United States the principle of nonintervention.

At the end of the Second World War, the Act of Chapultepec, signed in 1945 at Mexico City, laid the foundations for hemispheric solidarity by recognizing the fact that aggression against one American nation is equivalent to aggression against them all. In 1947, at Rio de Janeiro, the Act of Chapultepec became the Inter-American Treaty of Reciprocal Assistance. A year later, at Bogotá, the Charter of the Organization of American States clarified and defined the bases for the permanent association of the republics of this hemisphere, and at the same time the American Treaty on Pacific Settlement introduced an original and advanced method of ensuring proper legal solution for any dispute that might arise among the American states.

As may be seen, the idea that nations can and should live together in harmony, within an organized international society, renouncing the use of force in their relations, just as citizens

live within a country, has arisen with growing vigor at various times in the development of the American republics, until at last that viewpoint achieves definitive acceptance. It was one of the very members of this international society—the United States—that proposed a similar organization to avoid war for the entire world, after it had already been tried in this hemisphere. Wilson, and later Roosevelt, before taking bold action in international affairs, made earnest efforts to strengthen Pan-Americanism. It is no exaggeration, therefore, to say that the League of Nations and the United Nations, whose creation was the sole recompense sought by this country for the decisive part it played in the two greatest wars of our times, were unquestionably inspired by our inter-American organization.

We may also note that the inter-American system was the first significant international political movement of the United States that apparently ran counter to the isolationist advice of George Washington; and that after the First World War, when a disillusioned United States turned once more to isolationism, it went right on practicing with the other states of this hemisphere the principles of international co-operation that appeared to have been repudiated by American public opinion.

THE EXPRESSION OF U. S. FOREIGN POLICY

Every day, both in this country and abroad, we hear it said that the United States lacks experience in international affairs, lacks a definite foreign policy and good judgment in the management of its relations with other countries. The fact is, however, that in that section of the world in which the United States has had occasion to work out its international course over the longest period of time and under normal conditions, it has produced a genuine masterpiece. In its inter-American dealings are to be found intelligence and elasticity, self-control and tact, and the courage to promote great ideals without fear of the consequences; the difficult thing for a great power to do is to refrain from using its strength, substituting reason for force, without forfeiting its prestige. The inter-American policy of the United States not only has provoked no resistance, but it has been worked out in close co-operation with the twenty other member states in our Organization and has been accepted by them with enthusiasm.

If the rest of the world really wants to know what is the ultimate objective of the United States foreign policy, it need only examine the commitments this nation has made in the Organization of American States and its behavior since 1933 in this part of the world, where every development can vitally affect its own interests and its own security.

A CHANGE IN COURSE

This policy was not arrived at over night, and it has not always been in effect. It is the fruit of experience, and the end result of a courageous rectification. It is not usual for the world's great powers to correct their conduct, or to learn from the experience of others. That is why the inter-American policy of the United States deserves such high praise. In its early days the intercourse between this country and the other republics of the hemisphere started out very much along the same lines as the course followed by other strong states toward weaker neighbors: the use of military force, ruthless territorial expansion, armed intervention, economic penetration, diplomatic pressure. One section of public opinion here applauded these tactics which, in a way, could be construed as a sign that the nation had reached the status

of a world power. Those were the days of "manifest destiny." At that time all the European powers dreamed of empire; and in the United States there were those who sincerely believed that the natural limits of its empire should, for the moment, be the two great oceans and the two poles.

From that point of view, naturally, the imperialistic exploits of this country were very successful. All the more credit is due, therefore, to the reaction in American public opinion that put an end to them. This is why today we are not witnessing the liquidation of one more empire, but on the contrary the United States has twenty sincere friends who feel a sense of political solidarity with this nation. It is thereby relieved of continental cares at a time when it must conserve its energies to decide its own fate as well as that of the world at large at a crucial moment in history.

A NEW CONFIDENCE

I have mentioned that a change of course took place in 1933, because it was at the inter-American conference that met that year in Montevideo that this country accepted, for the first time, the principle of nonintervention which the other American republics claimed as fundamental to their foreign relations. Up to that time the inter-American system had been merely a faint-hearted exchange of pleasantries, with a considerable admixture of justifiable distrust. But from that day on, the American international organization bloomed with new vigor, and all the American states realized that they could sit down and discuss their mutual problems without hesitation, in the comforting thought that juridically they were all equals, whatever their territorial extent, their national population, their material resources, or their military strength.

These countries did not fear that this new deal would be changed, because they counted on its being supported by North American public opinion. That is, they reasoned that the foreign policy of a democracy would necessarily reflect the collective opinion of its people. The negotiation of treaties, conventions, or other agreements with a dictatorship is a waste of time, since there is no guarantee that they will be honored. A dictatorship is bound by no moral scruples either at home or abroad, but is held in check only by force. A democracy, on the other hand, cannot resort to war without first having persuaded the thinkers, the clergy, the army, the mothers, the wives, the farmers, the workers—the whole country, in a word—that no other course is open to it.

The Latin American republics know very well that the present international policy of the United States cannot suddenly trend toward intervention or imperialism, because Franklin Roosevelt did not just invent that policy. It was created, adopted, and supported by the American people, that enduring force that always welcomes righteous ideas with advocates, defenders, and, if need be, martyrs.

THE DEMOCRATIC METHOD

The inter-American system that our Organization administers is not a method of international dealing applicable to our hemisphere alone. It would work equally well throughout the world, and would unquestionably be the most generous boon that could be bestowed on future generations. In this system there are no privileged countries, none that are immune to the consequences of an adverse majority decision. That is, the veto is unknown in the councils of our Organization; not a single nation has the right to employ a veto. It is the democratic way, with all that this implies.

The United States, for example, might be systematically overridden at each of the meetings of the Organization of American States by the votes of just eleven member countries, even the smallest in the group. But this does not happen, in spite of the fact that in many cases the immediate interests of the United States do not coincide with those of its weaker neighbors. It does not happen, because there is a paramount interest in international amity, in maintaining the respect of those other nations with which one must work and live, and in preserving a set of principles and moral and political rules, impelling the member republics to keep faith with one another.

In a real democracy, moreover, the majorities, merely because they are stronger, do not league together against the minorities, even when the latter are wealthier and happier. And none of the Latin American states can find in our deliberations any sign that the United States wishes to follow a course that would be detrimental to the others. They realize that just as they should and do defend their own special interests, the United States must do the same for what concerns it. The result is almost always a compromise, that excellent formula of active democracy which does not permit the imposition of the majority will by brute force, but takes into account the strength, the interests, and the rights of all. One consequence is that the small and weak countries feel very keenly their responsibility to contribute to the common good, and they refrain from deliberately acting as hindrances.

THE PRINCIPLE OF NONINTERVENTION

There is one more characteristic of the inter-American system that we do not find in like degree in any other international policy. It is the principle of nonintervention that I have already mentioned. In my opinion, the evolution of international life will be retarded until this principle is adopted for the entire world and followed faithfully, as in the Americas. The nations cannot be won over by merely offering them peace and security, for these can be promised by any power with the physical might to guarantee an alliance of the traditional and well-known sort, like the protectorate. Many nations have preferred, and continue to prefer, insecurity to protectorates.

What would induce all the nations to give their sincere support to the international organizations would be an effective guarantee that no state or group of states would interfere in their domestic affairs. But this assurance, unfortunately, cannot be given as long as the veto is granted precisely to those powers that are in a position to interfere. On the contrary, the veto is a mighty weapon for intervention, an insidious weapon superior to the military pressure of former days, because it is less dramatic and spectacular. Around each nation enjoying the use of the veto is formed a sphere of influence that inevitably attracts other states wishing to share the international advantage, even at the expense of their independence.

Furthermore, collective international action against an act of intervention on the part of a nation armed with the veto is utterly out of the question. The American states, including of course the United States, can offer the world as their greatest contribution to the welfare of humanity the example of a hemisphere from which intervention has been abolished, both in theory and in practice. The totalitarian states are interventionist by definition, by their very nature. They can only conceive of their own type of world, and they fully believe that they must incorporate other nations into their system, whose peak of perfection will be reached when it embraces the entire globe.

The inhabitants of this part of the world see it differently. We feel that every state in its international life, even as the citizen in national life, is entitled to preserve a certain sphere of inalienable liberty, which other states, or even the international agencies, cannot invade under any pretext whatsoever. Within that sanctuary they shall not, of course, conspire against the liberty of the others, or commit any act that might endanger the rights of others. But a nation has its own individual personality, just as a man has, and its preservation from foreign intervention is a standard held aloft by the democracies. They must never lower it if they do not wish to lose it forever.

COLLECTIVE SELF-DEFENSE

After the creation of the United Nations, many thought that an organization such as that of the American states had lost much of its significance, and the need for it had been outgrown. This view was held by some of the delegations at San Francisco, when the United Nations Charter was being written. The American nations fought hard to preserve the autonomy of their system, and, thanks to their efforts, Article 51 was included in the Charter, recognizing the right to collective self-defense. On this a little later was built the foremost regional pact, the Inter-American Treaty of Reciprocal Assistance, which in turn served as a model for the North Atlantic Pact.

These are the two regional agreements that link this republic with a group of other powers for their mutual defense against aggression; and, in my opinion, prior to the passage of the "Uniting for Peace" Resolution by the General Assembly of the United Nations, they constituted the only juridical instruments we could rely upon to contain the aggression of international communism.

It can also be said, fairly and with juridical authority, that one of the foundation stones of that resolution is an amplification of the concept of collective self-defense embodied in Article 51, since it rests on the principle that there must be effective general action to repel aggression when the Security Council is paralyzed by the use of the veto.

MEANS TO A BETTER LIFE

Of course up to now I have only referred to the purely political aspects of the task the Organization of American States has been asked to perform. We can affirm, for example, that the present policy of technical aid to less-developed states is as old, within our organization, as the agency itself. For it was one of the original purposes of the inter-American organization to permit the member states to co-operate with one another by pooling the fruits of their experience and exchanging knowledge and technicians, in order to convert the development of the New World into a collective enterprise of generous proportions.

Were there no other arguments for selecting Latin America as an ideal candidate for technical assistance, there is an elementary one, of a political nature, that is rarely mentioned. The theory implicit in technical assistance, from the standpoint of the more advanced countries, is that the most adverse social conditions can be corrected, anywhere in the world, by the same methods that have produced western cultures with the highest standards of living the world has known. This means, in contradiction to international communism, that we do not need to invite mankind to engage in class warfare, in revolution and the total destruction of all that now exists, fol-

lowed by the eventual loss of all liberties, in order to bring about better living conditions.

Communism seeks as its ultimate aim, by way of bloody dictatorship, the very same thing that the United States has been achieving without dictatorship or anguish or sacrifice, but with a progressive increase in the happiness of the many, chiefly as a result of the marvelous growth of its science and technology. But the less fortunate nations, the oppressed, the poverty-stricken, look upon the American experience as something unique, as a miracle that could not occur a second time; whereas it requires only a minimum of effort for desperate men to take the short step leading to social revolution and communistic tyranny.

PROSPERITY CAN BE REPEATED

What must be demonstrated, therefore, is that the United States way of life is a much better and more exportable product than the communism that Moscow exports; that if the nations make up their minds to it, with a small dose of technical aid to stimulate and organize the latent forces, they will be able to create a prosperous and healthy civilization, protected by democratic standards and preserving for every man the full use of his rights and liberties.

The world would like to believe this, and to try it out. But it is held in check by a doubt arising from an apparent contradiction: what about Latin America? If those countries, in spite of their advantage of being near neighbors of the United States and enjoying its friendship, in spite of their feeling of solidarity from sharing a hemisphere that presents a united political front and from providing most of the raw materials for North American industry for many years, have nevertheless been unable to correct deplorable domestic conditions, what could more distant and less homogeneous countries hope to gain from technical assistance? Nothing could be more dangerous for the security of our hemisphere than to have the rest of the world convinced that North American civilization is but a miracle whose repetition elsewhere it would be futile to expect.

Everything, therefore, points to the need to repeat it, and the sooner the better, in a section of the globe that seems particularly suited for the purpose. That is why the United States Government, recognizing its responsibility for world leadership, has evolved the technical assistance programs, in the hope of arousing in all the less-developed countries a vigorous movement toward self-help. The philosophical core of western civilization is the belief that man and human society are susceptible of constant improvement, and that there are no conditions of injustice, pain, or poverty in the world that are irremediable merely because they are of long standing.

Communism offers a fallacious solution to men who each day become more conscious of their own plight, to a world in which human suffering in the remotest corner of the globe is at once utilized for propaganda purposes and for inviting the solidarity of the masses. It is a formula that appeals directly to the worst in every man, because it stirs up hatred, anger, and a desire to tear down completely all the structure that no longer seems to satisfy humanity's longing for a better life. Hence, no nation can successfully confine itself to the mere offering of its example and its way of life to the world. It must also demonstrate that these can be duplicated under less favorable circumstances than it has enjoyed.

These are the considerations that led to the adoption of the technical assistance program, and that appear to have prevailed in the councils of this nation when it took the initiative in proposing it to the world. They are no longer considerations of national policy alone. Their applicability to all the free countries of the world is obvious, both for the giver and for the recipient of technical aid. But an essential condition for the success of the technical assistance program is continuity; for we cannot expect to change overnight economic and social conditions that have prevailed for centuries in certain areas of the world.

Dr. Alberto Lleras, Washington, D. C., is Director General of the Pan American Union and Secretary General of the Organization of American States. For many years he was a newspaper editor and a political leader in his native country, Colombia. He held many cabinet positions, including the post of Minister of Foreign Relations in 1945. In 1943 he was Ambassador to the United States, and in 1945–46 he was President of Colombia.

Liberia: An American Responsibility

By Dihdwo Twe

THE resolution recently passed in Paris by the General Assembly of the United Nations, inviting African chieftains to bring their complaints before it, has raised the hope of a new charter for human liberties in Africa. It spells the doom of domestic dictatorship and tyranny.

Moreover, during World War II the nations of Europe made an important discovery: that because of its vast natural resources and its geographical position, Africa should be linked with all parts of the world and the Africans given full civil liberties for the safety of the Western Hemisphere. The occupation of North Africa by the Germans forced this conclusion upon the United States; therefore, it has since built bases in Liberia and elsewhere in Africa for military security.

French and English Policy

The French, however, were the first to express boldly a new policy of civil liberties and equality. The former subjects of the French African empire were declared citizens of France, eligible even to the presidency of the French Republic.

The English, too, have approached the problem wisely in many ways in their West African colonies. For instance, in Sierra Leone, in addition to other educational activities, they built the Bo School in 1908, especially for the training of the sons of chiefs, supplemented with a continuous program of social services. As a result, a strong intelligentsia has sprung up among the people of Sierra Leone, and today most of the ruling chiefs are literate. They have organized the population into district councils and into a Protectorate Assembly, with powers to manage their local affairs in consultation with the Chief Commissioner. Literate chiefs are periodically elected by the district councils to the Legislative Council in Freetown, capital of the colony. In short, the British have prepared and are still preparing their natives on the West Coast to become efficient and better rulers.

Forced labor is outlawed. Nobody works for the government without compensation. This is not the case in Liberia.

The internal development program in Sierra Leone, which, I understand, is sustained by local revenue, is very encouraging. For example, Bo, a native town, has been given a water system. In reference to a proposed water supply for the town, Mr. H. Childs, the Chief Commissioner, said:

> Government has already initiated action in regard to a water supply for Bo, and a preliminary report from the consulting engineers on this subject is at present receiving consideration. Surveys of the site [have been made] and a sum of £40,000 out of a total preliminary estimate of £218,000 has been included in the 1952 estimates.

The same kind of development as in Sierra Leone is applied in the other British colonies on the coast. Because of their larger areas and ample revenues, the development of the economic and human resources of Nigeria and the Gold Coast is far more extensive.

In short, preparation of the colonial peoples for efficiency and extension to them of the freer political and social institutions of the West seem to be the present-day policy of the European colonial powers on the West Coast.

Liberian Conditions

But how does this compare with conditions in Liberia? The Honorable Joseph C. Grew, formerly United States Acting Secretary of State, understands Liberia and Africa. In a memorandum of conversation between himself and a member of the Liberian Delegation, prepared by him after the United Nations Conference on International Organization at San Francisco, he expressed the concern of the United States over the extremely primitive and backward conditions in which Liberian natives, numbering about 1,500,000, were kept down by the ruling class of so-called Americo-Liberians, who represent 1 per cent of the total population.

Liberia's native policy was expressed in a nutshell in 1930 by the Honorable Jeremiah Harris, Liberian Secretary of Interior. He said:

> Unless the Government through the Commissioners centralized them [the educated natives], the responsibility of them becoming dangerous to good administration is probable. The instances shown in many of the investigations indicate that the Government should in time take steps towards preventing any confusion in the end.[1]

According to Harris, all literate natives should be separated from their illiterate tribesmen so that they might not breed sedition among them. The most effective way to do this would be to arrest literate men and send them to concentration camps. Obviously, this type of mentality is not confined to Mr. Harris. While Europeans are training their subjects to make them efficient and useful, the independent African republic of Liberia fears intelligence and education in its citizens.

Consequently, during the hundred years of its existence the education of the country has been almost wholly in the hands of missionaries. But they have been handicapped on all sides in their efforts to reach the people, because with the exception of the forty miles of road recently built by the Bomi Hill Mining Company, there is only one motor road from Monrovia to the interior; the rest of the country is inaccessible except on foot. And since most of the towns are far apart, it is impossible for a large number of the children to reach missionary schools in the interior and on the coast. As a result, hundreds and thousands are allowed to remain in ignorance.

However, efforts have been put forth to do something about education. But because of the difficulties already outlined, at the moment most of the activities will be centralized in Monrovia, the capital.

This brings us face to face with the fact that the one and one-half million natives who pay taxes annually receive nothing in return—no schools, no roads, no water works, no health facilities or social services, and no police protection or protection from the police. This and continuous forced labor are the biggest problems in Liberia.

The people in the interior cross and recross into adjoining British and French colonies every day. They see what services taxpayers are getting over there, and naturally they expect some benefit from their own government. The same is true of the coastal tribes who travel up and down the coast every year. The people feel that since they pay taxes every year, they should receive just compensation for their services when

[1] Report of the International Commission of Enquiry into the Existence of Slavery and Forced Labour in the Republic of Liberia, 1930, p. 85.

they work for the government. But this is not always the case.

FORCED LABOR

Compulsory human labor without compensation still exists in Liberia. In the interior and on the coast, government officials who travel are carried in hammocks by the natives without pay. The loads of soldiers are also carried in the same way. Motor road making is one form of forced labor which has done more damage. It has disorganized the economy of the people and has caused depopulation of town after town.

The Sinoe motor road on the Liberian coast is a typical example. All the communities along the beach within the county are taxed so many men per month; yet these men must supply their own tools and food while working on the road. Men collected by their chiefs to work on the road are sent, but are relieved by a new set at the end of every two weeks. In addition, from five to ten or more men are kept in readiness every day in every town to carry the loads of any officials or soldiers who may be passing.

SPAIN HOLDS LIBERIANS IN BONDAGE

Hundreds of Liberian natives are still held in bondage today on the Spanish island of Fernando Po. These had been rounded up in Liberia and shipped to work for the Spanish before the arrival, in 1930, of the League of Nations International Commission of Enquiry into the Existence of Slavery and Forced Labour in the Republic of Liberia. Although this Commission exposed what was virtually a slave trade, the return of the Liberians from the Spanish island to their homes was never arranged for.

In addition to this, the Spanish always recruited stevedores from Monrovia to unload and reload their ships along the coast, but according to the then existing agreement, the men had to be brought back to Liberia at the end of every voyage. But between 1932 and 1933, the captain of one of the Spanish boats actually kidnapped over a hundred Liberian natives, landed them at Fernando Po, and ran to Spain.

This is what happened. After the ship had been reloaded at Fernando Po, the captain told the headman that he had received urgent orders to proceed to Spain directly without touching at any other port; therefore he would land the men on the island to be picked up in three weeks' time, by the next boat, to take them back to Liberia. He landed them, and induced the headman to go with him as far as Las Palmas to return with the next ship for the men. At Las Palmas the company's agent put him on an English boat and sent him to Sierra Leone instead of the island.

No Spanish boat has ever returned for the men. Consequently, the ship's crew plus the first men are all in Fernando Po, held in bondage by the Spaniards on their cocoa plantations. If you go there today you will see them.

Fernando Po is an island; consequently they are cut off from communication with their families. Worse still, it is impossible for any of them to escape. These men have been in bondage for twenty long years, but there is apparently no way of having them released. The families of these men have been crying and are still crying for their return.

LIBERIANS ARE MIGRATING

Liberia, as a nation, was founded by Americans and is still regarded as being within the American sphere of influence. Today, despite the workings of a newly organized Point Four program which promises to be beneficial in the long run, large numbers of Liberian natives are moving into neighboring colonies and protectorates of Britain and France because there they enjoy better and more democratic treatment than they receive in their own country.

Dihdwo Twe, Washington, D. C., is a member of the Kru tribe of Liberia. He was educated in the United States and is a member of The American Academy of Political and Social Science. Early in 1950 he was nominated by the Reformation party, composed of aborigines and Americo-Liberians, to run for President of Liberia. His name was omitted from the ballot, however. After election the incumbent President caused the arrest of Mr. Twe's followers, and Mr. Twe was forced to flee to British territory.

Nationalism and the Asian Awakening

By B. R. Sen

THE ideal of world government has persisted through ages, taking different shapes and forms according to the prevailing circumstances. The present world situation is again compelling western European nations to think in terms of supranational authorities. A purely nationalistic attitude is now regarded in the West as unreal and out of date and an obstacle in the way of international peace and understanding.

Western View of Asian Nationalism

The West has always looked upon world problems in general and Asian problems in particular "from the vantage ground of the community of interests of the western nations." A certain lack of objectivity has, therefore, always been a factor in the western approach to Asian problems. Nowhere has this lack of objectivity been more apparent, or with more unhappy results, than in the appreciation of national movements in Asia which have been slowly gathering force since the beginning of the century and are now reaching a climax across the two continents of Asia and Africa.

There can be no doubt that nationalism is the greatest social and political force in the life of Asia today. But while some countries in the West have already, though somewhat reluctantly, come to recognize and accept the fact, the West has allowed its view of Asian nationalism to be colored by its own history and experience, and to invest it with the same character as its own. Nationalism in India, however, has a different history and has stemmed from somewhat different circumstances. In certain essential respects, therefore, it has assumed a character all its own, which it will be my endeavor here to explain.

Nationalism Defined

Nationalism has been described as an emotional fusion of two ingredients—nationality and patriotism. Nationality as an attribute of human culture and civilization has always existed in a general way, fostered by a common language, by shared historical traditions, by a distinctive complex of institutions, and often by politics and religion. Patriotism has also always existed, whether in its application to a small locality or to a vast empire. Nationalism as a political force is quite a recent phenomenon in the history of Europe.

From the days when Alexander the Great set out to conquer the world, Europe was dominated by the idea of a world empire. In such a world empire, a "national state" in the modern sense, even if it had been conceived of, had no place whatever. The idea was carried forward in the conception of the "Holy Roman Empire," and, when the Holy Roman Empire fell into decay, by individual monarchs who called themselves Caesars in the hope of better days to come.

The seventeenth and eighteenth centuries witnessed the attempt to consolidate personal monarchy and make it absolute, and to extend its power over weaker neighbors. Also during that period there emerged the concept of "great powers"—something which is more than the person and prestige of the monarch, something which vaguely

recognizes the growing importance of the common people (but mainly the trading and moneyed classes) as the ultimate source of power of a state.

It has been claimed that it was the French Revolution that first gave to the world the doctrine of national democracy and national self-determination. Others have found the idea of "nation" originating from the struggle of "great powers" in the nineteenth century. The historian H. G. Wells said:

> It greatly helped the diplomatists to carry on their game of Great Powers to convey politics in this form to the doubting general intelligence. To the common man, resentful that his son should be sent abroad to be shot, it was made clear that instead of this being merely the result of the obstinacy and greed of two foreign offices, it was really a necessary part of a righteous inevitable, gigantic struggle between two such dim vast divinities, as Britannia or Hibernia, or France or Germania.

On the conduct of the countries who made use of this idea, H. G. Wells sarcastically defined a "nation" as "in effect any assembly, mixture, or confusion of people which is either afflicted by or wishes to be afflicted by a foreign office of its own, in order that it should behave collectively as if it alone constituted humanity"!

European Nationalism

There can be no doubt that the revolutionary sentiment of liberty, equality, and fraternity, together with the idea that every people had the right to decide its own destiny, has had a profound influence on the course of European history over the last century and a half. The unification of Germany and of Italy, the political freedom of Poland, Finland, Norway, Czechoslovakia, Greece, and the Balkan States, and the breakup of the Ottoman, Austrian, and Russian empires, are some of the achievements that can be traced to this source.

It is also true that some of the major improvements in Europe in technology, in the industrial arts, in education, in scientific discovery, in aesthetics and the arts, owe a good deal to this urge of nationalism. The substitution of a secular, democratic ideology for religion as the determining factor in social and political life, the establishment of strong, centralized government working under the rule of law, the furtherance of the spirit of critical examination and experimental inquiry, the importance attached to the growth of human personality and the protection given to it from the hazards of arbitrary dispensation, are also some of the historic achievements of nationalism.

But it is a tragedy of history, if I may call it so, that nationalism in Europe soon lost its true course and found itself involved with quite another set of ideas—the ideas of imperialism, "in which a powerful and advanced nation was conceded the right to dominate a group of other less advanced nations who were expected by the dominating nation to be grateful for its protection and dominance."

This rather fortuitous alliance derived strength from the results which followed the Industrial Revolution. In the later part of the nineteenth century, increase of population in Europe drove European powers to make their colonies more and more a source of their food supplies, and the growth of their scientific industries demanded raw materials in increasing quantities which they could only have from their colonies. Exploitation of the colonies for these purposes, therefore, became increasingly the dominant motive in the administration of the colonies.

Thus, nationalism in Europe, which had very generous beginnings and had found expression in many fruitful directions, came to be inseparable from that aggressive imperialism by which Europe guided her conduct with Asian countries. That attitude unfortunately persists even to this day.

ORIGIN OF ASIAN NATIONALISM

On the other hand, the origin of nationalism in Asia was in the nature of a rebound from the European imperialism of the last century. Before the European incursion, life in Asia, which was organized on a village community basis, was carried on more or less undisturbed while invaders came and went and empires rose and fell. The impact of the western industrial civilization, with its need for raw materials and to sell its cheap machine-made goods, pulverized and disintegrated this community life. A situation was at last reached when regeneration of the mental, moral, and material life, and political liberty to achieve it, became matters of life and death for the people.

The inspiration for this reformist zeal and for conducting the struggle for national liberation was partly supplied by some of the great liberal thinkers of the West. The best illustration is to be found in the case of India, which was the greatest of the European colonies in the East, where both modern colonial government and the process of westernization made their first appearance. India is also significant because our struggle for freedom gave momentum for similar struggles in other parts of the Asian Continent. It may not be fanciful to suggest that the present turmoil for political and economic liberation in the Middle East and North Africa is also not entirely independent of the forces which were set in motion by India.

INDIA'S STRUGGLE IN NINETEENTH CENTURY

In the tangled web of history, four stages may be clearly traced in India's struggle to liberate herself from British rule. The faint beginnings of political nationalism were made by the establishment of the Brahmo Samaj in 1828. This comprised the advanced Hindu intelligentsia who had come into contact with western democratic ideologies through an English education. Although distinguished individuals, the leaders of this movement lacked a popular basis for their work. However, the increasing poverty of the Indian peasantry and the large-scale ruination of millions of artisans and handicraftsmen, together with the liquidation of a number of Indian feudal states by Lord Dalhousie, brought about the Revolt of 1857, which was the first organized expression of antiforeign sentiment. The revolt, as such, failed because it lacked a positive political program, but its bold challenge to British authority continued to serve as a source of patriotic inspiration down to our own time.

The period between 1857 and 1870 was quiescent, although it witnessed two anti-British movements the declared aim of which was the armed overthrow of the British Government. The establishment in 1885 of the Indian National Congress, which became the chief instrument of India's struggle for political freedom, marked the beginning of the third stage. During the early years of its history the Congress was dominated by the Liberals, who believed in constitutional agitation. The organization served as a focal point for the expression of national discontent, particularly of the educated classes. The Liberals did not realize that as an economic colony of British capitalism, India could not be permitted to develop her economy freely. Their main contribution lay in infusing a national consciousness among certain sections of the Indian people and in disseminating the conception of representative institutions.

As most of the important demands made by the Congress remained unsatisfied, there grew up a class of nationalists, led by Tilak, who declared their faith in action as against political argument. These nationalists drew inspiration from India's past, and their nationalism had all the burning ardor of religious experience. The philosophical poem *Bhagavadgita* became the Bible of the rising generation and was issued in hundreds of cheap editions with new notes and interpretations. The aim definitely was to turn away from appeals to the British rulers, and address the common people.

INDIA'S STRUGGLE IN TWENTIETH CENTURY

During the opening years of the twentieth century, educated Indians were studying European history, particularly the American War of Independence, the French Revolution, the national struggles of the Italian people against Austrian domination, and the Irish struggle for freedom. Their favorite authors were Burke, Thomas Paine, Mazzini, and Rousseau. The postwar revolutions in Germany, Austria, and Russia, which led to the overthrow of great and time-honored dynasties, created a profound effect on the minds of the Asiatic peoples.

All this set the stage for the last phase of the Indian political struggle, which may be said to date from 1919 when the promises of self-government given to India for her participation in the First World War were imperfectly fulfilled and the historic tragedy of Amritsar took place, where hundreds of peaceful citizens were killed or wounded at a mass meeting. This is the period when Gandhi came upon the scene and assumed leadership of the struggle, which he retained till the end.

The world now knows how this remarkable man brought freedom to India. He taught the people of India that the force of truth and of selfless suffering was greater than the might of generals and kings. Millions of people suffered punishment cheerfully, crowded the jails, lost their worldly possessions, even their lives, at his bidding. Nothing quite like it has been seen in the history of the world elsewhere. Gandhi's political movement was really an all-embracing social and cultural renaissance for India. He not only told his people to demand freedom but also to deserve it. The latter was certainly more difficult than the former, because it meant purging the body politic of the accumulated lethargy and abuses of several centuries. His program led to the emancipation of women, brought a new sense of dignity to the so-called untouchables and ultimately secured the abolition of this social stigma, and gave to India a new system of education, a new pride in her ancient heritage, a new national language, and above all an abiding dedication to the cause of peace.

GOALS OF ASIAN NATIONALISM

Such has been the course of nationalism in India. If in other Asian countries it has not been quite the same, it has this in common that it is galvanized by the great humanitarian urge to remove the hardships which have taken all zest out of life for the common man. In India, as elsewhere, there is a great demand that freedom should be made real to the great masses of the toiling

people; that the fruits of independence must percolate down and all harmful vested interests must go.

The political changes brought about by national liberation in Asia are so great that they are almost revolutionary. Justice Douglas has remarked that during his travels in the Middle East and India he found that "the spirit that motivates people is pretty much the same as the spirit that inspired the French and the American Revolutions." The abuses against which they are struggling are somewhat different from those that are listed in the Declaration of Independence, but they are just as specific and just as heavy.

From what I have said, it should be clear that nationalism in Asia fulfills purposes and destinies different from those it accomplished in Europe. Its present role is dynamic and creative in the best sense of the term: to set right the wrongs of centuries of predatory nationalism of Europe, to catch up with the technological progress the fruits of which form the basis of the life in the West. Professor Fairbank is perfectly right when he says that

> the true nationalist appeal in backward Asia consists not merely in preserving one's country from outside control, as might be sufficient in the West, but of constructing one's country anew, solving its many problems, uplifting its ragged millions, and making its society in every respect where it is now inadequate. Thus the higher patriotism of the modern Orient is compounded of love of country and belief in its potentialities, faith in its future rebuilding, and determination to carry through great social changes.

The moral and cultural aspect of Asian nationalism is no less important, consisting as it does in a cultural renaissance and a rediscovery of the forgotten values of an ancient tradition. Ultimately, the Asian nations will be better qualified to participate in a future internationalism after they have risen to their full stature through the assimilation of their national inheritance. As Professor Alfred Zimmern has said, "No task is more urgent among backward and weaker peoples than the wise fostering of nationality and the maintenance of national traditions and corporate life as a school of character and self-respect."

WESTERN CO-OPERATION

It is a pleasure to record that the United States, which was the first nation in the world to oppose colonialism, has once again assumed the championship of the underdeveloped nations of the world by inviting them to share, on a basis of equal partnership, the technological skills which have been perfected by generations of her scientific and industrial workers. President Truman's Point Four program will go down as one of the greatest acts of statesmanship of this century. To realize that poverty and mass suffering lead to an abrogation of the democratic way of life and to try to alleviate them by help freely sought and freely given, without any strings attached, is an entirely novel concept of international co-operation, but not more than what the times demand. Perhaps this is the only way to solve one of the most difficult political problems of the world—that of holding together in one international organization, without any trace of imperialism, nations which are equal in law but unequal economically and militarily.

In short, the free world must co-operate with Asia in carrying out its national reforms; it must associate with the dynamism of Asia and enable the newly liberated people of that continent to realize the values which are basic to democracy. There is no danger from

nationalism in Asia. What is happening in Asia today is only a natural and healthy development which Europe has already passed through. That some of the colonial powers still see danger in Asian nationalism is because they will not read the clear writing on the wall.

The danger which affects not only Europe and Asia but the whole world is to be found elsewhere—in South Africa, where a fantastic racialism is trying to crush the elementary rights and liberties of man. All eyes in Asia are now watching the outcome of this issue; everybody is anxious to know how the great democracies of the West, nurtured on the principles of the American and French revolutions, are going to throw their weight in the solution of this momentous question. There can be neither peace nor progress in the world if the extension of human liberties in one sphere is counterbalanced by their eclipse in another.

His Excellency B. R. Sen, Washington, D. C., is Ambassador of India to the United States, having previously been Minister of the Embassy of India in Washington from 1947 to 1950. He held important posts in the government of Bengal from 1931 to 1943. From 1943 to 1946 he was Director-General of Food of the Government of India, and in 1946 he served briefly as Secretary to the Food Department of the Indian Government. In 1950 and 1951 he was Ambassador of India to Italy and concurrently Ambassador to Yugoslavia.

NATO and Pacific Security

By Percy C. Spender

WE in Australia see some of the problems of the world with slightly different spectacles from those used by people on the East Coast of America and the people in Europe. It is not, however, to show differences but rather to emphasize a different viewpoint that I address these remarks.

Reason for Security System

In the first place, it is important for us to understand why the system of security, such as the North Atlantic Treaty Organization and the new organizations in the Pacific, whence I come, has been built.

Of course, the real reason is not that we have departed from the principles of the United Nations, to which your country and my country are dedicated, but because we realize that the substratum on which the United Nations was created has been destroyed. That substratum unquestionably was that every nation that pledged itself to the terms of the Charter would endeavor to fulfill those terms.

The nation that has destroyed the effectiveness of the Charter and therefore removed the substratum of the United Nations is the Soviet Union; since she has not sought at any time to support the principles of the Charter, but, on the contrary, has determined for her own ends to subvert them.

That is the truth of the position with which we are confronted. It poses the prime problem of how to secure the world today in the circumstances in which we are placed.

I want to repeat, so that there may be no misunderstanding about it, our security system does not mean a departure from the principles of the United Nations. It does mean, however, that when one major nation, such as the Soviet Union, withdraws—not nominally, but in substance—from the discharge of its obligations under the Charter, then the free nations of the world must find supplementary means, within the Charter we hope, to defend themselves.

Nature of the Problem

The second observation I want to make concerns the nature of the challenge which presents itself, because it does seem to us in Australia that sometimes there is an undue urgency to try to solve problems which cannot be solved within a limited space of time. I think the more Western a nation is, the more industrialized a nation is, the greater is its sense of urgency and the more inclined it is to believe that it can find a quick answer to any problem. That is why I want to make an observation about the nature of the problem which confronts us.

The problem is the struggle between democracy and communism. That is the basic struggle. It expresses itself in terms of imperialistic communism directed against the free world. The purpose of the various security arrangements, such as the North Atlantic Treaty Organization, is not to defeat communism as such, but to defeat imperialistic and militaristic communism, which, in my judgment, seeks to dominate the world—if I may be forgiven for oversimplifying the picture as I see it.

It is true that the actions of the Soviet Union may be attributable not only to the Marxist concept, which is the basis of the communist state, but also

to the imperialistic Russia to which the Marxist regime is heir. I do not doubt that we see today imperialist Russia, distorted and given momentum but retaining the basic concepts of imperialism, reflected in the regime which has been in power there since 1917.

The important point I want to make is that it is impossible for us to meet the challenge of imperialist communism if we imagine that this problem will be solved in a few years and we shall then move into an era of peace. There is a great deal of thinking, in my judgment, which proceeds upon the hypothesis that it is just a matter of dealing with a problem of emergency for a limited period and that accordingly our task is to find ways and means of solving the problem within such a period.

The Long View

All I have to say is this: I do not accept that proposition. I think if we accept it we shall be in grave danger of ultimately destroying our effectiveness to defend ourselves. Let me develop what I mean. In my judgment, the struggle will not find its resolution in one decade; it may require two or three decades. I believe that most of us today will see progress steadily being won, but not the ultimate resolution except over a very long period of time.

I mention that because you must realize that we must be patient in what we do and wise in building the organization to meet the long struggle; because a struggle which has to be waged over a long period of time requires an entirely different technique from, for instance, that required by a war which may last four or five years.

Therefore, the proposition which I wish to present for your acceptance is that we must regard the defensive need of the free world, the need to build up our defenses and to keep them built up, as a normal way of life for a very long period of time. I believe as profoundly as I can believe in anything that if we do see it that way, we shall organize more wisely and we shall witness the progressive destruction of imperialistic communism, and not only the survival of the free world but a widening of frontiers for all mankind.

Australia's Interest in NATO

NATO is the key to the defense of the free world. The continued unity of the North Atlantic group of powers is essential if the world is to be preserved against the catastrophic devastation and misery of another world war. And the strength and unity of that defensive group is in turn primarily and principally dependent upon the maintenance of the closest understanding and coordination of policy between the United States of America and the United Kingdom. Without this, the political, economic, and military co-operation which already has been achieved among the members of NATO would rapidly wither away.

Australia is of course not a member of NATO, but is interested in its growth, development, and operations, just as, indeed, is every other nation of the free world, since the protection it affords and will progressively afford extends far beyond the geographical area covered by its nation members. But Australia has a more direct interest than most other nations outside this group. Twice in less than forty years, hundreds of thousands of Australian men have served on the battlefields of Europe and the Middle East, in the air, and on the oceans of the Atlantic and the Mediterranean. We have already agreed in principle to participate in a Middle East Command.

The deliberations and the authority of NATO, bearing as they do on events which may affect not only the world at large but particularly areas of the world where Australians may again have to bear a substantial share of responsibility, underline the fact—which is not sufficiently appreciated—that apart from what is called and at times quite inaptly called "consultation," there is no existing machinery in which the voice of Australia can be heard in the formulation of decisions which can directly bear upon our destiny. Perhaps an opportunity will be provided in the Pacific Council, yet to be established under the terms of the Pacific Security Treaty between the United States, Australia, and New Zealand.

Scope of NATO's Activities

We have very great and special interests in that part of the world in which our people live. But we are becoming increasingly aware of the extent to which policy in southern and southeastern Asia and in the Pacific may be conditioned by the breadth and effect of the decisions which NATO is making.

We in Australia firmly support NATO and warmly applaud all that has been done to build up its strength. We acknowledge that, because of its geographical grouping, nations outside the area do not logically find a place within it—though the recent and very proper addition of Turkey and Greece has stretched its membership far beyond the areas originally contemplated.

It is inevitable, however, that the importance and extensive nature of its deliberations and planning will affect more and more not only the interests of its members, but those as well of nonmembers. It is not unnatural, accordingly, that Australia is especially concerned to ensure that its interests and the interests of other areas of the world —particularly those affecting the Western Pacific—are not inadvertently overlooked by members of NATO.

Global Requirements

For it is important to emphasize and re-emphasize that the Soviet Union's policy is essentially global in character. The Union of Soviet Socialist Republics recognizes (and every step it takes to dominate the world gives expression to this recognition) that there is a necessary and inescapable interdependence between European and Asiatic policy. In the case of the U.S.S.R., one is harmonized and geared with the other. I doubt that we have yet sufficiently realized how important it is that we too think and plan in similar terms.

We cannot, of course, in the foreseeable future hope to be strong in every part of the world. However, if we build up powerful striking power wherever we can, which if necessary may be employed quickly to meet aggression; if that striking power is maintained on the assumption that it will not only be necessary for a few years but will require to be on hand for an indefinite period of time; if we balance the demands which rearmament imposes upon the economies of participating countries so as to strengthen them, not weaken them —then, I believe, we shall avoid war.

Interdependence Between Military and Economic Strength

Our policy is to preserve peace. And to preserve peace our strength, both military and economic, must be strong enough to deter aggression, not merely during the immediate years ahead but as long as the present aggressive and expansionist policy of the Soviet Union is pursued. This assumes, as I believe to

be the fact, that the problems presented by the Soviet's challenge to the free world cannot be solved over any short period of time.

It is wise, therefore, for us to plan collectively so as to keep our military and economic strength in balance over a long period. While building up and maintaining our striking power, we must ensure that we do not too greatly distort our economies. For if we do, what avail will be our arms if our economies are not strong enough to support those arms? To increase our armed strength so that we can deter aggression—or if we are called upon to meet it, then ultimately destroy it—remains of course our overriding responsibility. But we must see this necessity not as something of an emergency character, but as part of our normal manner of existence for very many years.

The Western world (and the more industrialized the nation the more this tendency is revealed) is prone to believe that any problem, no matter how complex, can be solved within a limited space of time. What we need is a better sense of historical perspective and a clearer understanding that the conflict between democracy and communism will not be resolved except over a period of long duration. And if this is correct, as I believe it to be, it throws into clear relief the need so to plan the use of our resources, so to integrate our economic strength with our military might, and so to husband each our national strength that we may be able to meet the demands which prolonged preparedness against war will impose upon us all.

Interdependence Between Domestic and Foreign Policy

We have not sufficiently understood the bearing which domestic policy has upon foreign policy. Here again let me draw attention to one aspect of Soviet domestic policy which forms part of its foreign policy. There is no doubt that the U.S.S.R. has given special attention, over the past few years, to building up capital structures and diverting resources into basic industries and developmental works. This it has done by placing great sacrifices upon its peoples.

We have tended to be complacent about the relatively advanced stage of Western industrial development. But the Western world has been depleting its investment reserves, so essential to the maintenance of its strength and its capacity to expand and develop, at a rate which bears upon our ability to maintain the great margin of industrial efficiency which we presently hold over that of the Soviet Union. We must, however, constantly bear in mind—as I have had occasion before to observe—how quickly relative industrial capacities can change when a government, such as that of the Soviet Union, is prepared to impose heavy sacrifices upon its people, by forced labor and otherwise, in order to carry out the specific purposes of its foreign policy.

We Are Engaged in a Many-sided Struggle

The struggle to which we are committed is many sided. It is sufficient, however, to say that it is not merely a military problem. It is as well an economic problem. Each is related to the other. Economic resources, and especially waste of such resources, directly affect our capacity to rearm and to keep armed. The extent and nature of our armaments, especially over a long period of time, can and do affect our economic strength. Each must be brought into harmony with the other.

Such is the problem as I see it. If

we understand it properly and if the people are taken more into the confidence of governments so that they too will understand it and appreciate the demands made upon each of them and why it is necessary to make those demands, I do not doubt that we are so much richer in resources, in intelligence, and in moral strength than those who seek to dominate us, that we shall, if we are wise, witness the progressive decline and ultimate elimination of the evil forces of imperialistic communism and lead the world into security.

His Excellency Percy C. Spender, Washington, D. C., is Ambassador of Australia to the United States. He practiced law for some years before embarking on a political career. He has held high governmental positions in his native country, including those of Vice President of the Executive Council, member of the Advisory War Council and of the War Cabinet, Treasurer of the Commonwealth, Army Minister, and Foreign Minister. He has also been active in Commonwealth affairs and in the United Nations.

INTERNATIONAL RELATIONS AND WORLD GOVERNMENT

PERKINS, DEXTER. *The American Approach to Foreign Policy.* Pp. 195. Cambridge, Mass.: Harvard University Press, 1952. $3.25.

While George Kennan was delivering at the University of Chicago in 1951 the provocative lectures which reached us a short while ago under the title *American Diplomacy, 1900–1950,* Dexter Perkins was lecturing at the University of Uppsala. Now Professor Perkins' lectures are before us in a volume entitled *The American Approach to Foreign Policy.* Perkins' is the more comprehensive treatment; but these analyses, by the practitioner and the historian, respectively, of a good deal the same subject matter bring forth contrasts which are interesting indeed.

Speaking to an audience of Europeans, Perkins is concerned to dispel forebodings of American imperialism and fulfills the task well, disclosing broad erudition and a quiet judgment. As American history has developed so far, the case is strong. Frank Tannenbaum made the case also during 1951 in an article on "The American Tradition in Foreign Relations" printed in *Foreign Affairs* for October.

Had Perkins been addressing an American audience, his emphasis might have been on the dangers of an eventual American imperialism nevertheless. To his European audience he confesses the imperialism of the Mexico War and of 1900 but discusses these instances as one might the measles—a rash of early years which need not be expected to recur. As a practitioner keen to know how the decisions of 1900 were actually reached, Kennan elicits little or no assurance against similar concurrences of personality and circumstance again. Perkins endeavors to distinguish between expansion and imperialism. This is shaky ground, especially when "the expansion of the United States" is described as "a kind of biological process which could hardly have been arrested" (p. 17). One may doubt whether at the end of the Second Punic War the citizens of Rome envisaged imperial sway over the Mediterranean world. They possessed power. One thing led to another.

The safeguard which both Perkins and Tannenbaum see, as American power hovers near the imperial boiling point these days, is the moralistic temper in which Americans have habitually reacted to external problems. In quite another line of thought Kennan opines that "a war fought in the name of high moral principle finds no early end short of some form of total domination" (p. 101); which recalls George Canning's uneasy admonition to the Com-

mons on the French war in Spain in 1823: "This is no war for territory or for commercial advantages. It is unhappily a war of principle."

Certainly moral thinking has so far heavily weighted the course of the United States in world affairs, and Perkins served truth and politics by reassuring Europeans in this sense. It has still to be remarked in Kennan's mood that, with American power not yet diminishing, one broad road to an imperial denouement could be unrelenting insistence upon moral solutions (that is, solutions deemed to be moral) in a surrounding world which remains in large part unmoral.

Protesting to the Commons April 25, 1793 against the idea of pursuing to the death the regicides in France, Richard Brinsley Sheridan observed that to do so would be to embark upon "a war of vengeance," and that would be to arrogate a right which belonged to the Divinity, "to whom alone vengeance ought to be left." Henry Morgenthau had in effect to be reminded of that in 1945.

DEWITT C. POOLE
Princeton, New Jersey

LANGER, WILLIAM L., and S. EVERETT GLEASON. *The Challenge to Isolation, 1937–1940.* Pp. xv, 794. New York: Harper & Brothers, 1952. $7.50.

None will question that this is the most thorough, detailed, and systematic account of United States foreign policy for the years 1939–1940 that has yet been written. Another volume presumably of equal merit will bring the story down to Pearl Harbor. Several reasons may be given for this superior performance. In the first place, the authors have demonstrated ability: Professor Langer has established his reputation at Harvard as a foremost European diplomatic historian, and Dr. Gleason, formerly an associate professor at Amherst College, brings to his assignment a specialist's insight. It is also true that source material in the form of unpublished diaries (A. A. Berle and Wm. C. Bullitt), governmental records, and the private files of important statesmen were made available to these privileged investigators. Withal, the study was well financed; the Rockefeller Foundation contributed $139,000, and it has been reported that the Sloan Foundation brought this total up to $200,000.

Except for the introductory chapters, the authors concentrate their attention on diplomatic developments during 1939 and 1940—that is, from the end of the British appeasement policy to the destroyer deal. The detailed analysis that such a close investigation affords contributes a realistic insight into the formulation of foreign policy and an understanding of the relative importance of the several factors which collectively determine this policy. The extent to which conditions abroad and the policies of foreign countries were influential in the determination of United States policy is ably described. Public opinion, responding to traditional policies of isolation from Europe, or the Monroe Doctrine, only permitted the elected leaders to verbalize their displeasure with the aggressors. Finally, international law, at first narrowly and later more broadly interpreted, placed its mark on foreign policy.

The authors themselves would not consider their conclusions definitive. They regret, for example, that so few records of President Roosevelt's intimate discussions with American and foreign officials were available to them. Furthermore, until others have an equal opportunity to read and assess these records, the reader must keep in mind that such distinguished scholars as Professors S. B. Fay and B. E. Schmitt came to quite different conclusions about the origin of World War I. In this regard, it might be recalled that the Rockefeller Foundation Annual Report for 1946 stated that the original purpose of this study arose from the concern "that the debunking journalistic campaign following World War I should not be repeated." However, from the available evidence, the book concludes that President Roosevelt and Secretary of State Hull were far from the dynamic leaders they are reputed to have been, and even dragged their feet those few occasions when American public opinion approved interventionist policies. The book also seems to play down the German threat whether it concerned the challenge of German imperialism in Latin America, occupied France, or the United States. Simultaneously the Russian threat is dramatized, for example, in the criticism of United States nonintervention policy towards the Russian-Finnish War.

MARTIN B. TRAVIS
Duke University

STERNBERG, FRITZ. *Capitalism and Socialism on Trial.* Pp. 603. New York: The John Day Company, 1952. $7.00.

This is Fritz Sternberg's most ambitious book published in English. To American readers, too, he is known as a remarkably perceptive politico-economic analyst whose past prognostications have proved to be uncannily accurate.

Dr. Sternberg has undertaken the ambitious project of probing into the mysteries of capitalism and socialism, attempting to forecast their future trends. The scope of the book is so broad that it covers both Europe and America. The factual material is so rich that this book also qualifies as a volume of reference.

European capitalism in its earlier phases is shown here as a very potent force, irradiating the entire globe and vitalizing its way of life. However, gradually it began to exhaust its marginal potentialities, and then it turned toward imperialist expansion.

A few years before the First World War Morocco was brought under the sway of Europe's law, and thereby the imperialist circle closed. There was no more available colonial land, and it appears to have been no coincidence that shortly thereafter the Great War broke out.

Before it the Socialists discounted the ultimate victory of socialism. While capitalism in Europe lost ground during the war, socialism also lost ground. It had lost much of its potency because of its inability to forestall the great conflict. Also, it was weakened by the outbreak of competitive bolshevism. Now it looked as if the end of capitalism might lead to the beginning of barbarism.

In this book Dr. Sternberg elaborates on his noted theory that the Great Depression of the thirties has never been liquidated and that it has been merely forced between the dykes of the *Wehrwirtschaft,* defense economy. Capitalism, according to him, has not been able to solve the problem of modern business depressions, grown enormous on superpower-driven industrial productive capacity.

The productive forces of reconstruction proved to be so strong after World War II that prewar levels were surpassed far sooner than after World War I. But then the United States was faced with the problem of an industry producing more than one-half of the world total. "United States capitalism will have to find the answer to the question which no capitalism anywhere in the world has yet succeeded in answering: How is the problem of the crisis to be solved when external expansion can no longer play a decisive part in the process?"

The Soviet Union was last seen pondering at the fork of the road: one of them leading to imperialist expansion and the other one to its own garden which needs constant cultivation. The decision will be made partly in response to a situation created by the rest of the world.

A democratic socialist solution appears to the author to meet the needs not only of Europe but also of all humanity. A third world power of this nature would have neither the desire nor any reason to endanger the Soviets. In turn, such a European force, not afflicted by the contradictions of an outworn European capitalism, would be strong enough to fill out the Old World political vacuum and would definitely deter any possible Soviet aggressive designs.

EMIL LENGYEL
New York University

VAN ALSTYNE, RICHARD W. *American Crisis Diplomacy: The Quest for Collective Security, 1918–1952.* Pp. xiii, 165. Stanford: Stanford University Press, 1952. $3.50.

This is a somewhat uneven book. Those portions which describe the maneuvers incident to the birth of the United Nations make fascinating and rewarding reading, as does the discussion of Russia's relation to the war with Japan. Mr. Van Alstyne shows that our policy was dominated by the mistaken conviction on the part of our generals that a land invasion of Japan was necessary. He points out that it was the insistent pressure of our own top brass

which brought Soviet Russia into the Far Eastern conflict, thus fastening on the Pentagon a large part of the responsibility for our present Asiatic predicament.

The book is badly marred, however, by misstatements of fact and by what would appear to be serious errors of conclusion. One is the assertion that India, the Midway Islands, and Dutch Harbor constituted the last line of defense of the free world and that the capture of any one of these outposts by the Japanese "would undermine the immediate independence and territorial integrity of them all [the United Nations]." The United States is visualized as having been on the verge of war with Britain from 1916 to 1921 over the question of who was to command the seas; Czechoslovakia is referred to as "the most strategic and industrially valuable territory in Europe."

Discussing Israel's war for independence, the few hundred revolutionaries of the Irgun Zvai Leumi are described as "illegal Zionist armies operating under the local Jewish agency," and are declared to have conducted a massacre of the Arabs which led to the mass flight of some 600,000. This exodus, he states, enabled the Zionists "to bring practically the whole country, except a portion of Jerusalem, under their control." While one may overlook Mr. Van Alstyne's unawareness that the Irgun Zvai Leumi was at all times in sharp conflict with the official Jewish agency, a glance at the map would have shown him that the country actually was partitioned off between Israel and Jordan, with a small piece to the southwest around Gaza going to the Egyptians.

That a serious political blunder occurred at Yalta is not disputed, yet we find Mr. Van Alstyne declaring, "Yalta was a confession of faith, a catechism of good will between Russia and the West."

The author appears to recognize the provocative nature of Communist policy; nevertheless he accuses the Kuomintang "CC Clique" of seeking to obtain the upper hand "and refusing any compromise with the communists," thus frustrating the American government's well-intentioned ultimatum to Chiang to take the Communists into the government. He states that "repeated warnings to the Generalissimo . . . to reform the Kuomintang and practice good faith toward the communist leadership met with no encouragement."

Mr. Van Alstyne also believes that our action in preventing Mao from supplanting Chiang at Lake Success "caused the Chinese communists to resort to arms" and invade Korea. He is convinced that the Marshall Plan represented a great triumph for American policy, though it would appear to many that our relations with Europe are still in the same equivocal position as they were before, and that it may easily be suspected that the Marshall Plan, by acting as a palliative, actually prevented the only logical step by which Europe's sickness could have been cured, federation.

WILLIAM B. ZIFF

New York City

DENNETT, RAYMOND, and ROBERT K. TURNER (Eds.). *Documents on American Foreign Relations.* Vol. XII: January 1–December 31, 1950. Pp. xxvi, 702. Princeton: Princeton University Press, 1952. $6.00.

Once again the student of international affairs must record his annual debt to the World Peace Foundation and to the editors of this remarkable series. The twelve volumes now afford one of the most complete reference shelves available anywhere on recent diplomatic history. As usual, little but praise can be recorded even by the most critical reviewer.

The year covered in this volume most probably marks the turning point of the cold war with the launching of the communist military adventure in Korea. The pessimist may view this as the event which turned the post-World War II period into the pre-World War III period. The optimist may hope that the vigorous United Nations reaction with the first collective military defense in history may have ushered in a new era of world order. From either viewpoint the year was a crucial one. If the documents here assembled do not make pleasant reading, they at least supply a complete and—in the retrospect of a calendar year—highly informative record.

The organization of the volume follows that of last year's, except that regional security machinery (such as the North Atlantic Treaty Organization and the Organization of American States) is shifted here to the general section on International Peace and Security (Chapter V) from the geographic sections which formerly contained it. The reviewer agrees that this is an improvement; indeed consideration ought to be given the idea of transferring even more material from the geographic sections, which necessarily still contain much important information on security, economics, and other functional topics; so that the reader must look in two or more sections for a complete account of the Korean episode, for example. It should be added immediately however that the editors have supplied an eminently usable table of contents and index, which handily remedies any organizational flaw.

This reviewer does not wish to add to the very considerable burden of the editors, nor to carp at a most useful piece of work. He does wish though to repeat his previously expressed hope that they may find it possible in the future to index the names of all the players in their drama—and to supply the names in full. For the reference user, this omission often requires consultation of an additional work. This suggestion is not meant to indicate any dissatisfaction with the work as a whole, which stands as the best document collection on the subject available to the general student.

OLIVER BENSON

University of Oklahoma

ALLEN, JAMES S. *Atomic Imperialism: The State, Monopoly, and the Bomb.* Pp. 288. New York: International Publishers, 1952. $3.25.

There is a hoary admonition to the young attorney at bar that, if he does not have much of a case himself, he would do well to attack that of opposing counsel.

Whether Mr. Allen has much of a case for his obvious client, the Union of Socialist Soviet Republics, is not clearly apparent, so perhaps the parallel is inapt; but he certainly attacks the opposition with unbridled fury.

It is not necessarily definitive of the nature and substance of this interesting volume that, out of a personal index of over 200 names, he mentions only a few with warm and unqualified approval, among them Andrei A. Gromyko, A. Y. Vishinsky, Josef V. Stalin, and Frédéric Joliot-Curie; but it is unavoidably illuminating.

Briefly stated, the thesis of *Atomic Imperialism* is that the present atomic energy policy and program of the United States "represents the merger of State and monopoly at the highest possible national level . . ."; and that this corporate state "serves as the principal base of reaction with a fascist orientation and as the center of war incitement," marked by "the massing of atomic weapons and the threat to use them for the realization of imperialist objectives."

In support of his thesis, Mr. Allen has amassed a huge body of facts after apparently exhaustive research, and with admirable accuracy. He has ransacked the literature of the Atomic Energy Commission with praiseworthy industry. So far as this writer, with his limited information, is able to determine, there is not a single misquotation.

It is, obviously, in his interpretation of these facts—in the processes of balance and evaluation—that Mr. Allen's objectivity and hence his contribution to one of the most potent politico-economic issues of the day is to be weighed.

Toward the Soviet Union and its policies, Mr. Allen exhibits no objectivity. That requires no truly serious argument. Toward American industry, finance, and politics, he also exhibits none—only bitter and cynical rancor. It would be ingenuous to deny that there have not been—and, indeed, are—voices muttering undertones of jingoistic imperialism. One may hear *sotto voce* whispers of a preventive atomic war against the U.S.S.R. But to bundle these minor and often utterly discredited testimonies into a single package and ascribe to it the genuine purpose of the American people or to their most intelligent spokesmen seems to this writer only narrowly to skirt the ridiculous.

Even accepting his indictment of the American policy would not be too nauseous if the author had just once, in some minor degree—in a footnote, perhaps—conceded

that Soviet policy, as respects a certain imperialist tinge, is by any measure a sizable distance this side of Paradise.

VINACKE, HAROLD M. *The United States and the Far East, 1945–1951.* Pp. vii, 144. Stanford, Calif.: Stanford University Press, 1952. $3.00.

This slender little book is a slight enlargement of a data paper originally prepared for the Institute of Pacific Relations conference held at Lucknow in October 1950. The material added for purposes of publication as a book consists mainly of a chapter covering developments through the summer of 1951 and discussing, mainly in the form of a brief summary of the MacArthur controversy, the consequences of Communist China's intervention in the Korean war.

Professor Vinacke, the author of many notable works on the Far East, has attempted here to cover a big subject in a small compass. Inevitably, some of his summaries are so brief as to be elliptical. American relations with Southeast Asia are covered in eleven pages. Most of his space is devoted to the tangled China problem of these years and the mutual relations of the United States, the Soviet Union, Communist and Nationalist China, and Japan.

In his attempt to give a concise factual summary, Professor Vinacke makes a manful attempt to avoid controversial analyses. He does not always succeed, especially in some of his paragraphs relating to the civil war in China where he suggests the belief that if the United States "had been willing to act unequivocally and decisively" in support of the Nationalist government, "the outcome might have been quite different."

Even the simplest facts about American-Chinese relations since 1945 have become confusedly controversial. Professor Vinacke has some highly understated remarks to make about the problems created for both the historian and the policy-maker by the fact that Far Eastern affairs have become the hapless object of domestic partisan politics and have, as a result, been grotesquely distorted. What he has tried to do in the face of this situation is to give a dispassionate summary of some of the major developments. In this he is only partially successful. He says too little about too much. The result may add a little to the general reader's information, but it will not add much to his understanding.

HAROLD R. ISAACS
New York City

FISHEL, WESLEY R. *The End of Extraterritoriality in China.* Pp. xv, 318. Berkeley: University of California Press, 1952. $4.50.

The story of extraterritoriality in China is a reflection of the Western impact and of the emergence of Chinese nationalism which eventually overcame the earlier imposed forms of Western relations with the Chinese state. Mr. Fishel has studied the latter stage of this struggle in a most thorough and authoritative fashion. He describes the period of the development and decline of extraterritoriality, mainly the period from 1919 to 1943. His study is largely based on unpublished files of the State Department up to the year, 1933. In addition, the author has also used the files of the Department of Justice and of the United Nations Relief and Rehabilitation Administration as well as other sources. Of special importance is the introduction of the material by Silas H. Strawn, who was the chairman of the Commission on Extraterritoriality in China, and whose personal papers throw light on the problem which faced those who well-meaningly attempted to prepare the basis for the abolishment of the extraterritorial system in exchange for the same Western system instituted by the Chinese.

Aside from its rich documentation and great description of detail, the book indicates the basis of the whole attitude of the Western powers who "by the circumstances of their privileged position, which was bulwarked and buttressed by the weighty complex of Sino-foreign treaties, . . . were forced to adopt a conservative stand" (p. 72). Under the pressure of the nationalist revolution, however, opinion changed. A political reasoning took the place of the insistence on the duplication of Western principles until finally the war with Japan, during which extraterritoriality lost its practical usefulness, brought the end.

FRANZ MICHAEL
University of Washington

TREFOUSSE, H. L. *Germany and American Neutrality, 1939–1941.* Pp. iii, 247. New York: Bookman Associates. $3.75.

This is a study of the development of Germany's policies toward the United States during the years immediately preceding the outbreak of war between the two countries. After outlining briefly Hitler's aims, Dr. Trefousse, a professor of history at Brooklyn College, proceeds to a detailed analysis of the evolution and ultimate failure of Germany's neutrality policy toward the United States from the outbreak of World War II to the attack on Pearl Harbor.

Three basic theses are presented: (1) war between the United States and Germany was inevitable; (2) Hitler was determined to keep the United States neutral and out of the war until he was ready; and (3) he was thwarted in this determination because "through forceful measures of his own, President Roosevelt had compelled the Fuehrer to involve himself in adventures which wrecked Nazi plans designed to keep America neutral until Germany was ready for her, thus making certain of Axis defeat. . . ."

According to the author, although the United States played a comparatively minor role in Hitler's early plans, there can be no question that the ultimate conquest of this country was an integral part of his grand design. In support of this thesis, which hardly needs support, Dr. Trefousse points out (1) the militarist nature of the Nazi movement was bound to create difficulties for this country; (2) there existed an unbridgeable gulf between "the world's strongest democracy and the avowed enemies of that form of government"; (3) disagreement over fundamental economic policies "had bedevilled business relations between the two countries for years"; and (4) a Nazi victory would have "altered profoundly the balance of power not only in Europe, but also throughout the world."

The method by which Hitler proposed to accomplish his aims with respect to the United States was no different than that which he applied to the conquest of other nations, namely: (1) assurance of peaceful intentions; (2) isolation from potential friends and allies; and (3) striking and conquering when he was fully prepared and his victims were reduced to impotence. Although this timetable was important and effective in his conquest of European nations, it was absolutely imperative in the case of the United States, for under no circumstances did Hitler desire to engage the United States until he had fully liquidated Soviet Russia. In fact, even after realizing fully that the United States and, particularly, President Roosevelt could not be browbeaten into neutrality, Hitler was still loathe to take any action which might result in American entry into the conflict until he felt that the time was ripe.

Thus, during this period, German press attacks were kept at a minimum; diplomatic protests concerning American intervention on behalf of the Allies were few and far between; and a concentrated effort was made to stir up isolationist and anti-Administration forces and feelings in the United States by means of gigantic propaganda activities. In fact, the author emphasizes that Hitler was so anxious to keep the United States out of the war that he ordered the German Navy to leave American vessels alone. Finally, in an all-out effort to insure American neutrality until the time was ripe, Hitler attempted to persuade the Japanese to attack Singapore, rather than American territory.

Dr. Trefousse concludes that despite all of his efforts to keep the United States neutral, Hitler failed "because under the leadership of Franklin D. Roosevelt, America refused to be caught unaware and took the liberty of defending herself, building up her own armed establishment and rendering all possible aid to the Allies." "This line of action," says Dr. Trefousse, "was Mr. Roosevelt's great contribution to American foreign policy." He indicates, however, that Hitler's original policy was actually correct. Thus if he had been able to convince or compel Japan to move against the British or the Russians, instead of attacking American territory, President Roosevelt would never have been able "to get the isolationists to consent to a decla-

ration of war." Assured of American neutrality, Hitler could have moved against the United States when he was ready. The attack on Pearl Harbor, however, eliminated the isolationist opposition and so united the country internally as to give the President the strength he so urgently needed. "Consequently," concludes Dr. Trefousse, "they (the Japanese) solved the President's dilemma and contributed greatly to final Axis defeat."

This is an interesting, stimulating, and convincing little book. It is well documented and based largely upon current literature and official documents and records. Coming, as it does, however, more than ten years after the German declaration of war upon the United States, and seven years after Germany's unconditional surrender, it is doubtful whether it adds anything to what we already know. The real value of this work may well lie in parallels which may be drawn between the 1939–41 period and the current period. The lessons to be learned are (1) that appeasement of a totalitarian power in the hope of ultimate peace is an almost certain road to destruction, since the aggressor usually relies upon an appeasement policy; and (2) the alternative is internal physical and moral strength, coupled with a good system of collective security. However, this is a lesson which we appeared to have learned, although at considerable expense, during the past five or six years.

ELI E. NOBLEMAN

Washington, D. C.

AMERICAN GOVERNMENT, HISTORY, LAW, AND POLITICAL THEORY

MACIVER, ROBERT M. *Democracy and the Economic Challenge.* Pp. 86, ii. New York: Alfred A. Knopf, 1952. $2.50.

Professor Robert MacIver's slender volume comprises five William W. Cook Foundation Lectures, delivered at the University of Michigan. This reviewer cannot remember ever having seen so much wisdom and understanding of the present-day world compressed into so small a space—and, what is more, compressed without harmful elision and without making the reader uncomfortably aware of being fed a highly concentrated diet. The work expresses with such clarity this reviewer's own conception of the meaning of democracy and of its true relationship to the past, the present, and the future that this review might well consist of the single word, "Amen."

The author shows how, throughout the greater part of recorded history, when human society was predominantly agricultural, "authority, property and position united in a single focus of power" and how this "triple command separated the ruling classes from the masses." He then traces the rise of the middle class and the emergence of "private economic power," dissociated from political power, and shows how "the historical role of the middle classes was to bring democracy to birth." "Private economic power," says Dr. MacIver, "does not mean *laisser faire.* It means that there is always an area in which men can make a living and carry on their business without becoming the agents or employees of the state."

A number of forecfully stated definitions and distinctions will help to clear away familiar confusion. Thus: "The welfare state and the socialist state are quite different affairs. The welfare state is consistent with private economic power. The socialist state is by definition opposed to it." (Incidentally, the author points out that there is no such thing as a socialist state or a capitalist state—that all democratic societies are today "socio-capitalist.")

Tracing the rise of middle class power after the industrial revolution, Professor MacIver deals as remorselessly with *laisser-faire* "liberalism" as he later deals with Marxism. "Liberalism became a flaccid substitute for democracy. The old doctrine (the triple command based upon ownership of land) made democracy unattainable. The new doctrine made it merely impotent" (the new doctrine being the theory of beneficent automatic self-regulation through the free market). This chapter should be read by all worshipers at the shrine of Adam Smith.

The chapter on "Democracy and Planned Economy" should be read by all socialists (and answered, if they can find an answer). It demonstrates how *total* planning inevitably submerges the legislative branch of a democratic government, placing a corrupting power in the hands of a powerful executive, which sooner or later becomes unresponsive to the popular will.

The final chapter on "The Meaning of America" should be read by every thinking American—especially by those who do not realize that the greatest danger to our society emanates from our own failure to understand and live up to the principles of our own society, rather than from Moscow.

From this reviewer's point of view, the chapter on Marxism is the least interesting and the least satisfactory, perhaps because the subject has been so fully and so extensively treated by others; it seems, with all respect to Dr. MacIver, to dispose of the matter a little too easily. Yet this chapter contains two sentences which, alone, should make this book *must* reading:

"Nothing embitters the heart of a man like the brand of inferiority. Treat men squarely as fellow men, whatever be their race or color or religion; do not fasten on any groups the stigma of alienhood or inferiority—and, in a country like ours, communism will shrink to nothingness."

JAMES P. WARBURG

New York City

BIDDLE, FRANCIS. *The Fear of Freedom.* Pp. ix, 263. Garden City, New York: Doubleday & Company, 1952. $3.50.

This little volume should be read by every thoughtful American but, unfortunately, those responsible for initiating and fomenting fear will not be the ones who will read it. Even if they did, it is unlikely that they would see the parallelisms of history or accept the judicious reasoning by which this recent Attorney General concludes:

"Fears have become familiar ghosts that haunt us as we walk and sleep, outlived but without depth, undefined and because of their indefiniteness more terrible. We clothe our uncertain dread in the hackneyed formulas of familiar words . . . and face away from the real threat, from the ultimate danger, seeing no longer what we love but only that of which we are afraid. Reason is no longer free to combat the false opinion which we are afraid to tolerate."

One of the significant contributions of this book is that it puts the present hysteria into its historical context. Through factual descriptions of events within the total forces then at work, Mr. Biddle reviews the intolerant periods of our own history from colonial times to the Alien and Sedition Acts of the first World War, the Dies Committee of 1938, and the present Un-American Activities Committee. In two brief chapters, he shows their parallels in England, and in France.

In an interesting manner but with the same meticulous care the author reviews state action such as the Ober Law in Maryland and statements presented before state Un-American Activities Committees in Illinois. He also reviews the policies of educators regarding Communists on school and college faculties.

Throughout all the wealth of data, the author is judicious. He points out that the concept of guilt has shifted from action by the individual to guilt by association. But in this shift he blames not only those who foment fear but also the American people who have come to be afraid of resisting the trend.

The last chapter, "The Choice Ahead," is somewhat disappointing. The author himself states that the readers will wish for a positive program. He does present one, but it is so general in its suggestions that it still left this reviewer with the feeling that after so careful an analysis, some more specific recommendation for action could have been presented.

FRANCIS J. BROWN

American Council on Education
Washington, D. C.

TAYLOR, ALLAN (Ed. and interpreter). *What Eisenhower Thinks.* Pp. 186. New York: Thomas Y. Crowell Company, 1952. $2.75.

In this short book Allan Taylor, a veteran newspaperman, has edited and inter-

preted various speeches on public affairs made by General Dwight D. Eisenhower.

There are few surprises. According to Mr. Taylor, a boyhood in Abilene, Kansas contributed to the development in General Eisenhower of such basic characteristics as individualism, co-operation, and ability to work hard. While not born in a log cabin, the General happily possessed a background suitable for a subsequent career in politics. West Point and the Army did not stifle these characteristics.

As enumerated in a speech before the Economic Club of New York on November 20, 1946, General Eisenhower sees three principles as basic to American life (p. 43). These are: first, that individualism is our most precious possession; second, that all of our freedoms constitute a single bundle; and third, that freedom to compete plus co-operation makes our economic system the most productive on earth.

Surely, most Americans would at this point say "Amen." While a similar quality of vagueness seems present in most of the collected speeches, it is only fair to recall that an officer on active duty is far from being a free agent in the American tradition of freedom of expression. Nevertheless, in at least two areas, General Eisenhower has spoken out forcefully whether in or out of uniform. The first of these is the realm of foreign policy.

General Eisenhower subscribes with enthusiasm to the Administration's policy in Korea and in Western Europe. He views the North Atlantic Treaty Organization (NATO) as indispensable to American security and foresees a permanent solution in the eventual creation of a United States of Europe. If world disarmament should be attained, the General advocates a strong United Nations police force. The General is also positive on military matters, where he has recommended preparedness, unification of the armed forces, and the establishment of Universal Military Training. Except for UMT, he takes no sharp stand on domestic issues.

General Eisenhower is in favor of free enterprise and economy in government. He is opposed to regimentation, academic loyalty oaths, and federal aid to education. On specific issues, such as wage-price controls, rent control, the Taft-Hartley Act, the President's civil rights program, tidelands oil, he is silent.

The over-all impression which emerges from Mr. Taylor's selections is that General Eisenhower is as American as apple pie, is a middle-of-the-roader in domestic politics, is irrevocably committed to the continuation of the Truman-Vandenberg-Acheson foreign policy.

MURRAY S. STEDMAN, JR.
Swarthmore College

HOOVER, HERBERT. *The Memoirs of Herbert Hoover.* Vol. II: *The Cabinet and the Presidency, 1920–1933.* Pp. xiii, 405. New York: The Macmillan Company, 1952. $5.00.

Even before he entered on his eight years in the cabinets of Harding and Coolidge, Herbert Hoover had captivated the imagination of Americans as the "Great Humanitarian" and the very incarnation of American liberalism. Both of these can be documented. He was aware "that most of our employers were fighting legitimate development of trade unions." It is refreshing to see him in a Harding cabinet meeting severely denouncing Attorney General Daugherty's savage injunction against striking railway men whereupon Harding ordered it withdrawn. When he gave his views on collective bargaining before the Boston Chamber of Commerce in 1920 "the applause would not have waked a nervous baby." We must "push machines and not men" declared Hoover. Schwab and Gary of United States Steel denounced his condemnation of the twelve-hour day as "unsocial and uneconomic."

He disliked senators Penrose, Watson, Knox, and Lodge and their followers, was a warm advocate of the League of Nations, and the most persistent of conservationists. He advocated health inspection in schools and noonday meals for pupils in some areas. He horrified the National Association of Manufacturers by advocating the Child Labor Amendment. He expressed a deep concern over housing for the lower income groups. We must thaw out "inherited control of the tools of production by increased inheritance taxes" and must "tax earned incomes much lower than interest, dividends, and rent." He hammered persistently against economic practices that worked against the consumer and never forgot to plead the cause of the small business man.

What transformed this great liberal into a symbol of conservatism? Not the great depression but rather the way in which he met its impact. Scarcely had he proclaimed the approaching end of poverty than the dream was shattered by the stock market crash. So incredible was this event that he would balance the budget instead of applying his very own earlier proposal to expedite government construction in times of unemployment. So intensely did he believe in free enterprise that he had been planning unemployment insurance through the private insurance companies when the depression began. Doubtless his phobia of what later came to be called "creeping socialism" hampered adaptation of means to the end of alleviating distress. The encroachment of government on private enterprise he believed due to European ideology not the pressure of events. "I used my last breath in expounding the folly of Socialism," he had declared in 1920. Socialism was not an economic philosophy to be critically examined but a vicious fallacy to be summarily dismissed with the finality of supreme omniscience. Indeed it turns out to be a smear word. Senator Norris was a "devoted Socialist." Al Smith's defeat was partly due to "snuggling up of socialists." Opposition to his Stanford Food Research came from "the conglomeration of professors and intellectuals tainted with mixed socialist, fascist, and antique ideas."

The Great Depression itself was due to "the European economic hurricane that swept over us" rather than stock market speculation. Had he been re-elected he believed "we would have quickly overcome the depression" and saved the nation from the collectivism of the New Deal. Nevertheless it cannot be doubted that Herbert Hoover served sincerely in the public interest as he saw it.

WILFRED E. BINKLEY
Ohio Northern University

HARASZTI, ZOLTÁN. *John Adams & the Prophets of Progress.* Pp. xi, 362. Cambridge, Mass.: Harvard University Press, 1952. $5.00.

John Adams was at his best when he wrote informally. There may be some justification for the belief that the prominence of his descendants combined with the profundity of his own formal writings has served to obscure his greatness. This volume again demonstrates that John Adams was himself the greatest Adams.

Mr. Haraszti, Keeper of Rare Books at the Boston Public Library since 1934, has edited and arranged in logical sequence the notes which John Adams made in the margins of his books. It is apparent that Adams clarified his own thoughts by writing, and the margins of many books of his library are literally crowded with comments. The first fifty pages of Mr. Haraszti's volume are devoted to three chapters in which he analyzes Adams' background, education, political and social philosophy, and his character, position, and reputation. This is followed by twelve chapters in which the marginal notes are printed, usually verbatim, interspaced by such brief extracts from the texts as are necessary for an understanding of the subjects under discussion. The principal selections are from the works of Bolingbroke, Rousseau, Frederick the Great, Voltaire, Turgot, Condorcet, the Greek philosophers, and a number of less well-known writers of the eighteenth century.

A few thorough students have recognized John Adams as "the greatest political thinker whom America has yet produced." The annotations in the books of his library now tend to confirm this judgment. It is understandable that his contemporaries of the early Federal period may have gleaned from his conversations, letters, and informal writings more of his wisdom than is now fathomable from his formal writings.

Historians will find a fertile field for research in the Adams notes. Here is evidence revealing what President Adams did at Quincy during the seven full months in 1799 when he left the Capital and returned to his farm at the critical period of the French crisis. Perhaps his peremptory or-

ders for the departure of the French mission, upon his return to the Capital, were not entirely uninfluenced by his comments on the works of Frederick the Great which he had just read. Here, also, are the notes showing the reading which Adams did in preparation for the peace conference at the end of the Revolution, and the formal basis for his successful demand for confirmation of the American claims to the fisheries off Canada and Newfoundland.

Mr. Haraszti not only has called public attention to this rich and relatively neglected collection of source materials; he has also written a very readable volume. It is to be hoped that this revelation of the value of the informal writings of John Adams will inspire the executors of the Adams Manuscript Trust. A more comprehensive edition of the papers of John Adams obviously is indicated. A policy of more general research in the less formal papers of the various members of the Adams family should be encouraged.

CHARLES M. THOMAS

Maxwell Air Force Base, Alabama

WOOD, VIRGINIA. *Due Process of Law, 1932–1949: The Supreme Court's Use of a Constitutional Tool.* Pp. xi, 436. Baton Rouge: Louisiana State University Press, 1951. $6.00.

Professor Wood presents here a detailed and critical analysis of the attitudes and opinions of some twenty-one justices of the Supreme Court in their interpretation of that spacious and vague constitutional guaranty, due process of law. The years 1932–1949 were selected for this study because in that period new and complex social and economic problems, as well as many other problems involving civil or property rights, were presented to the Court. The situations facing our society forced both national and state action, very frequently restrictive action, in regard to many relationships, while during the depression and the New Deal attempts were made to improve conditions by far-reaching programs of ameliorative legislation. Those whose interests were thereby adversely affected quickly invoked the protection of the nebulous due process clause, as an invasion of a protected domain. Realizing that generalities are often little more than rhetoric, the author has examined the concrete cases in which the Court weighed the conflicting interests to determine if due process of law had been accorded.

Due process is considered from five points of view—the first amendment, socio-economic legislation, criminal procedeings, administrative action, and taxation. This arrangement has permitted a logical classification of the large number of cases decided by the Court. Since *Gitlow* v. *New York* (1925), there has been brought within the protection of the due process clause of the Fourteenth Amendment these guarantees of the first amendment—free speech, a free press, peaceable assembly, and the right of petition. In order to protect the fundamentals of constitutional government, the Court has extended the meaning of "liberty." Restrictive state statutes have been rejected when the judges believed them violative of basic civil rights; but they have been upheld when deemed justified. In this area the protection of property rights became secondary to the rights of freedom of speech and of the press.

In the vast and controversial field of economic and social control the Court, since 1932, has extended widely the domain in which Congress and the several states regulate the uses of property. Commodity price fixing in certain private industries, regulation of farm products prices, comprehensive wages and hours legislation, social security and unemployment insurance laws have been sustained. Professor Wood indicates how the earlier concepts of substantive due process have been overruled or abandoned. The Court assumed that the legislature is the proper judge of policy, and interfered only when the exercise of power was an "arbitrary" one.

It is well known that due process originally involved procedural methods with particular reference to criminal cases. From 1932 to 1946, the Court frequently went behind the record of the trial court to its own independent finding of fact, thus extending materially the scope of the due process clause of the Fourteenth

Amendment. This does not mean, however, that there has been read into that amendment all the specific guarantees of the Fifth and Sixth Amendments. Rather the Court has found it sufficient to interpret due process as demanding the "principles of decency and fair play—implicit in the concept of ordered liberty," and to make certain that criminal proceedings achieve that result.

In respect of the decisions of administrative bodies, the Court has maintained its authority to review both the law and the facts. A fair hearing must be afforded, and administrative power cannot be so exercised as to ignore civil liberties. In the domain of rate regulation, the Court apparently abandoned the requirement of a fair return on a fair value, and rate making has become a form of price-fixing.

Those who looked to the Court for relief from the burdens of taxation, national and state, will be disappointed. The interpretation of "jurisdiction" in state taxation has been so liberal as to render almost meaningless that limitation. Double taxation, excessive tax rates, and retroactive tax laws are not a denial of due process. Few restrictions on the national taxing power are found.

Two cautious conclusions may be drawn from this excellent and careful volume. The first is that there are no objective standards for the application of due process, procedurally or otherwise. Second, the standards used in applying due process make pertinent the statement of the late Charles E. Hughes (while governor) that "the Constitution is what the judges say it is."

THOMAS S. BARCLAY
Stanford University

HELLER, FRANCIS H. *Introduction to American Constitutional Law: A Selection of Cases and Materials.* Pp. x, 691. New York: Harper & Brothers, 1952. $5.00.

Professor Heller, who teaches political science at the University of Kansas, designed this collection of cases and materials as a textbook for a course in constitutional law for political science students. Many important aspects of American constitutional law which are included in the standard casebooks, such as those dealing with problems of jurisdiction, are either omitted altogether, or given very little space. Thus, the whole question of which law prevails in diversity cases in federal courts is discussed merely in a two-page editorial note, and only nine lines are devoted to the *Tompkins* case. The emphasis is upon broad issues of social policy, and approximately half of the book is concerned with civil liberties. The chapter on the Contract Clause has only four cases, but there are nine cases dealing with free speech.

The bulk of this book—I should guess approximately three-fourths—consists of opinions of the United States Supreme Court, including liberal cuttings from dissenting opinions. The "materials" part of the book includes a great many short editorial notes and selections from books and articles written by leading scholars in the field. Professor Heller's chapter on judicial review will illustrate his method. It begins with John Marshall's opinion in *Marbury* v. *Madison*, and that is followed by a chronology of events prepared by the editor to keep the story of the case straight. Then comes a very short cutting from Judge Gibson's celebrated rebuttal of Marshall in *Eakin* v. *Raub*. There follow portions of three essays on aspects of judicial review by Professors Carr, Cushman, and Corwin, and an editorial note briefly describing some of the historical antecedents. Finally three cases illustrating non-justifiable questions (*Luther* v. *Borden*, *Coleman* v. *Miller*, *Colegrove* v. *Green*) are given.

The first and last of the fifteen chapters of this book are designed to introduce the student to the subject and to relate the material to the broader context of public policy and government. In the opening chapter the author discusses the meaning of such basic terms as "constitution," "law," and "constitutional law" and explains how cases arise and how they should be studied. The discussion is conventional, and the observation that "an appellate court does not concern itself with questions of fact" (p. 13) is a dubious oversimplification. The footnote explana-

tion of the old writ of error in Supreme Court practice (p. 20) is completely misleading. The concluding chapter, under the heading "Political Issues and Legal Methods," presents seven cuttings appraising the judicial process and the legal profession. They should provoke students to think about the significance of the cases and materials they have studied.

Professor Heller's selection of cases will of course not please everyone. No casebook ever does. But this book is a judicious collection of the old standard cases one always expects to see, such as the great Marshall decisions, the *Cooley, Slaughterhouse,* and *McCray* cases, et cetera. At the same time, many very recent cases are included, such as the *Dennis, McCollum, McLaurin,* and *Shelley* cases. On the whole the book should give students a good speaking acquaintance with some of the major aspects of contemporary constitutional law.

I think this is an admirable textbook for a one-semester course in constitutional law for undergraduate nonlaw students. There is not enough material for a full year's course, and graduate students and law students cannot very well ignore the important jurisdictional problems which this book leaves out. But Professor Heller says at the outset that his purpose was to prepare a book for undergraduate instruction. For a one-semester undergraduate course there is, in my opinion, no better textbook available at the present time.

DAVID FELLMAN
University of Wisconsin

TURNER, JULIUS. *Party and Constituency: Pressures on Congress.* In "The Johns Hopkins University Studies in Historical and Political Science," Series LXIX, Number 1. Pp. 190, xv. Baltimore: The Johns Hopkins Press, 1951. $2.50.

Careful empirical studies of American legislatures are unfortunately rare. The recent flood of comment and exhortation concerning the Congress for the most part has not had its source in such research. Professor Turner's excellent study of some of the correlates of voting in the House of Representatives is, therefore, a contribution of great importance.

Building on the work of Lowell, Rice, and others, Turner has worked over a considerable body of historical and comparative material, but the heart of his study is the analysis of roll call votes in four sessions of the House between 1921 and 1944. The author makes no claims for the representativeness of this sample, and he is fully aware of the pitfalls in the path of one who undertakes to examine record votes. Following an introductory chapter in which some of these problems are intelligently discussed, two chapters, nearly one-third of the book, deal with the effects of party identification upon voting in the sample sessions. These are followed by four chapters which deal with the effects upon the voting of representatives of, successively, metropolitan and rural constituencies, the specialized demands from constituencies dominated by "foreign" and native stock, and sectionalism. A final chapter discusses the incidence of legislators' independence of both party and constituency group.

Space will not permit mention of even a few of the insights and ingenious analytical devices in which the book is rich. Important though some of these are, they are not the chief significance of the book in any case. The impact of Turner's study rather lies in his well-documented finding that party affiliation is an independent influence upon legislative voting and that it is consistently more important than any of the other variables that he studied. He satisfactorily demonstrates, moreover, that the issues on which the parties have differed significantly are matters of genuine substantive importance. Many of these, it is well to note, have been issues of social reform—precisely those types of issues on which most of the more strident of recent critics have professed to find Congress and the party system wanting. These findings apply only to the House of Representatives, and in some instances, as the author properly acknowledges, the number of cases which his sample provides is small for purposes of statistical analysis. Admittedly the findings might be altered not only by observation of the Senate but also by the results from a more complete sample. But Professor Turner has come forward with solid evidence with which any serious student of Congress and the party system henceforth must reckon.

MACDOUGALL, CURTIS D. *Understanding Public Opinion: A Guide for Newspapermen and Newspaper Readers.* Pp. xii, 698. New York: The Macmillan Company, 1952. $5.00.

It is, after all, a simple proposition that a thorough study of what we loosely call public opinion necessarily involves a preliminary study of man, both as an individual and as a member of a smaller or larger group, but especially of his limitations and his weaknesses as a thinking being. For this reason Professor MacDougall's book is both long and formidable; otherwise it would be superficial and without great value. As it is, it may be strongly recommended for the patient reading and thoughtful reflection not only of editors and of those who hope to become editors but of all who have anything constructive to do, for their own profit or for the profit of others, with what we also loosely call public movements.

Professor MacDougall takes the fiasco of the poll takers who predicted a Republican victory in the presidential campaign of 1948 as the starting point for his opening chapter, which is entitled "The Nature of Public Opinion." That the "nature of public opinion" was too complex for the poll takers to understand four years ago—whatever they have learned since—became obvious the moment the returns established the fact that, in spite of their solemn prophecies, Truman and not Dewey had been elected. One of the reasons which Professor MacDougall might perhaps have stated more simply is the multiplicity of conflicting and therefore confusing human interests in modern society.

Since this is a book by a profesor of journalism primarily intended for students and practitioners of journalism, note is to be made of a statement on the first page of the preface which contrasts, in its unsoundness, with the general soundness and very real value of the nearly 700 pages which follow. "With the idiosyncracies of most of those with whom he comes in contact in his quest for news," writes Professor MacDougall, "the reporter need not be concerned." On the contrary, the reporter—a good journalist always remains a reporter—should concern himself with the idiosyncracies of those with whom he comes in contact from the day on which he writes his first "story" until the day on which he writes his last. Only in that way can he extract the most news from them—or, in simpler language, get them to talk freely and to reveal themselves—whether they happen to be presidents of labor unions, presidents of banks, or presidents of the United States. The reticence of different men is to be broken down in different ways. Even Calvin Coolidge could be induced to talk—sometimes until one wished that he would stop.

RICHARD HOOKER
Longmeadow, Massachusetts

CARPENTER, WILLIAM SEAL. *The Unfinished Business of Civil Service Reform.* Pp. 128. Princeton: Princeton University Press, 1952. $3.00.

To use the author's words, this little book sets out "to relate public policy to the civil service." It outlines some of the main characteristics of current merit system administration, drawing briefly upon historical developments, upon the author's seven-year experience as administrator of New Jersey's system, and upon the activities of other jurisdictions—principally the federal service. In the brief compass of this book Dr. Carpenter necessarily paints with a broad brush. He concludes by urging three primary reforms as the "unfinished business": (1) a single commissioner to replace the civil service commission; (2) arbitration machinery to solve the problems of employer-employee relations; and (3) strengthening of citizen organizations interested in the promotion and extension of the merit system.

But these three conclusions do not give a clue to all that is important in the book. For example, one whole chapter is de-

voted to "Education and the Public Service," in which Dr. Carpenter makes a plea for the broad, liberal education as a foundation for public service. He deplores the tendency of civil service unions to oppose increased educational requirements for public employment.

The author also touches on the essentials of the spoils-versus-merit issue, on veteran preference, on salary scales, and on loyalty programs. He stresses the deterrent effect that some of the characteristics of these policies have on recruitment and advancement of able men in the public service.

An example of Dr. Carpenter's forthright treatment of controversial topics is his comment on current loyalty procedures in the federal government: "It is a fantastic situation in which an organization is entitled to a judicial hearing before it can be branded as subversive while an employee can be removed and stigmatized as disloyal without being confronted by his accusers or being furnished with specific charges."

The exact relationship of some of these introductory sketches of public personnel problems to the author's net conclusions is not entirely clear. The book is, to a minor degree, wanting in coherence.

The nearest thing to a central theme appears to be what Dr. Carpenter calls "the paradox of civil service reform"—namely that the merit system "has done much to recruit better people" but "seldom has helped the chief executive to gain control of the administration." This accounts for his recommendation for the single personnel administrator under the chief executive. He criticizes, however, a similar proposal by the Brownlow Committee in 1937.

The author's treatment of employer-employee relationships is not as satisfactory as one would hope. The significant experience of such organizations as the Tennessee Valley Authority and the Bonneville Power Administration is brushed over too lightly. How his analysis of the subject leads to the conclusion that arbitration machinery is the primary solution is not clear.

These criticisms should not be taken as depriving the volume of its over-all usefulness as a stimulating summary of current public personnel issues.

O. GLENN STAHL

Washington, D. C.

ALLEN, FLORENCE ELLINWOOD. *The Treaty as an Instrument of Legislation.* Pp. xxi, 114. New York: The Macmillan Company, 1952. $1.75.

This book discusses an important problem of policy consequent upon the shrinking world and the tendency for the line between subjects appropriate for international legislation and for national and local legislation to become blurred. Judge Allen recognizes the gravity of the problem although she seems unaware of the extent to which treaties in the eighteenth century and earlier dealt with the rights of resident aliens and consequently regulated a subject usually considered local in character. She proposes to meet the situation by procedures which will result in a careful scrutiny of international legislative treaties before ratification and by a constitutional amendment providing that treaties conflicting with the constitution or dealing with domestic matters shall be invalid (p. 105).

Few would question the value of the first of these remedies although some might doubt whether there had been any inadequacy in the scrutiny of treaties from this point of view in the American system with senators always alert to "states rights" and "national sovereignty." The second remedy which is along the line proposed by an amendment introduced by Senator Bricker of Ohio indicates misapprehension of the meaning of the term "domestic jurisdiction" in international law and misapprehension of the position of the treaty power under American constitutional law. Judge Allen is an eminent jurist but her legal discussion of these problems is hardly enlightening.

The World Court has dealt several times with the meaning of the term "domestic jurisdiction" and has indicated that it refers to any topic in which the discretion of a state is not impaired by any international obligation. The Court, however, has also made it clear that sovereign states are competent to assume obligations by making treaties on any subject whatever unless indeed to do so would encroach upon the rights of a third party. Once a state has assumed such an obligation the matter ceases to be within its domestic jurisdiction. It is, therefore, a contradiction in terms to refer to domestic jurisdiction as a limitation upon the treaty-making power of a state.

In the political sense, of course, the situation is quite otherwise. The treaty-making power may regard it as inexpedient to assume obligation in fields where suitable regulation can proceed through local or national legislation. The issue of whether the shrinking world, the interdependence of nations, the relations of reasonable respect for human rights with the preservation of peace, and the developing world opinion favorable to a general protection of human rights has made it expedient for the United States to enter into general engagements such as the proposed Covenant of Human Rights is a political question which cannot be solved by any legal definition of "domestic questions." The issue is whether it is wise to make the protection of human rights an international question and therefore to take it out of the realm of purely domestic questions.

The Supreme Court of the United States has held that a treaty made by the appropriate procedure is valid if it deals with a matter of international interest and does not violate any specific prohibition or limitation of the Constitution. The Court has further held that, if a treaty is valid, Congress has power to implement its obligations. As a consequence the so-called reserved powers of the states of the Union do not affect the validity of treaties or of implementing legislation, but, on the other hand, the Bill of Rights which limits all agencies of the government does limit the treaty-making power. These principles of constitutional law make it clear that American ratification of a covenant of human rights could not in any way impair the Constitutional Bill of Rights. It would set a universal minimum in the respect for and protection of human rights but would not enlarge the power of Congress to regulate rights beyond what is permitted by the constitutional guarantees. Treaty permissions are not treaty obligations and do not permit action which the Constitution forbids.

It is important that the well established principles of international law and constitutional law bearing upon the growing field of international legislation should be more widely understood. Unfortunately recent discussions of the American Bar Association have not contributed to this understanding, and it is to be feared that Judge Allen's book is similarly unenlightening. The basic problem is not legal but political and consists in the exercise of wise understanding in developing international legislation in fields where the conditions of the world make it necessary and in gearing national legislation into the obligations undertaken by treaties. Constitutional amendment is not needed but rather a wiser statesmanship in understanding the situation of the world and the most suitable method of dealing with its problems.

QUINCY WRIGHT

University of Chicago

CRAVEN, WESLEY FRANK, and JAMES LEA CATE (Eds.). *The Army Air Forces in World War II.* Vol. III: "Europe—Argument to V-E Day, January 1944 to May 1945. Pp. xxxix, 948. Chicago: University of Chicago Press (for the Air Historical Group, USAF), 1951. $8.50.

This is a worthy companion to the earlier fine volumes. However, there is not quite the same air of detached impartiality as one finds in Volumes I and II, for, although many errors of judgment are freely admitted, there is too often a determined effort to explain away the mistakes and support to the full the doctrine of victory through strategic air power. Most interesting is the brief account of the utter lack of co-operation even to the point of obstruction shown by the Russian government.

Although General Spaatz firmly believed that victory could be won by a *properly* conducted strategic air war alone, those responsible for War Plans regarded the strategic bombing offensive as primarily a preliminary to the invasion of Europe. After that, air power would support land

operations. From April 1943 to April 1944, the main effort of the Allied air forces aimed at the destruction by bombing of the German air-craft industry, ball-bearing plants, and factories manufacturing component parts. Parallel to this was the plan to destroy the Luftwaffe before the invasion of Normandy by shooting down German aircraft that rose to defend the factories.

Throughout 1943, the strategic bombing offensive had been indecisive. Air force commanders grossly exaggerated the amount of serious damage to aircraft production and as greatly underestimated the recuperative power of enemy industry. German aircraft production continued to expand until very late in 1944. In fact, air battles did much more to destroy the German Air Force than did the bombing of factories. By June Allied mastery of the air was complete, making possible the invasion of the continent. This was a major achievement, but it did not knock Germany out of the war.

Until April 1944, the main strategic air attack on German industry had proved disappointing—a failure due partly to the vast dispersal of German factories and the building of underground plants, but due even more to the faulty selection of bombing targets. Up to January 1944, air force commanders omitted from their plans for the strategic air war the bombing of oil production centers. However, in April, plans were changed to make the main priority a bombing offensive against important crude oil refineries and synthetic gasoline plants. This campaign, inaugurated by the Fifteenth Air Force on 12 May 1944, was from then on pressed hard by both the Fifteenth and Eighth Air Forces. In time the results were spectacular. By April 1945 German oil production of fuel and lubricants had virtually ceased with the direct result that transportation and all industry in Germany were thoroughly crippled.

In August another drastic change was made when a great strategic offensive against German factories producing tanks, trucks, and ordnance was placed second on the list of priorities. It was soon evident that the bombing of these factories did little more than cause a huge amount of structural damage which proved to be an annoying minor problem to the enemy but did not seriously affect its war effort.

In November 1944, in preparation for the invasion of Germany proper, the strategic air forces were given as second priority the bombing of the German transportation system for the tactical purpose of "interdiction." In six months, however, the result was an overwhelming strategic victory. By the closing weeks of the war the enemy railroads and canals were practically useless. Although the cost was huge, as the Eighth and Fifteenth Air Forces expended nearly 900,000 tons of bombs to destroy communications, the campaign proved to be the decisive blow that so completely disorganized and paralyzed German industry that it was impossible for the enemy to continue the war.

Thus, a careful comparison of the material in the second and third volumes indicates to this reviewer that the strategic bombing offensive was not *properly* conducted until the spring of 1944. The tragedy of it all was that the earliest list of target priorities compiled in August 1941 proved in the end to have been the correct one, while later revisions only piled error upon error. As a result much ineffective and extremely costly effort was made down to the spring of 1944, and even as late as January 1945 some air commanders were inclined to regard the strategic air war as almost a failure.

The excuse that "hindsight is better than foresight" (frequently used in this volume) has little validity in this case, for certainly it was the business of Intelligence and the economic "experts" to estimate correctly the most vital German targets. It is now clear that the proper conduct of the air war would have followed the earliest list of priorities (the electrical system, oil, and transportation). A vigorous campaign against chemical plants and the destruction of the five factories making ethyl fuel would have proven disastrous to the German war effort. Such an offensive would have resulted in a German defeat before May 1945.

The most important lesson to be gleaned from the three volumes on the air war in Europe is that victory through air power is largely a myth unless a small list of the most vital targets are attacked. The indiscriminate bombing of factories is not effective, and, moreover, the "victors" after the war have to spend huge sums of money to aid in the economic rehabilitation of the enemy country. It would seem more logical to allow the factories to produce while making it impossible for them to transport the products. If they produce but cannot haul, industrial enterprise is as effectively crippled as if all factories had been destroyed.

Nevertheless, even after all the errors are frankly assessed, it still is certain that Allied air power was decisive in winning the victory over the Axis powers. However, victory through air power alone may be feasible, but it depends on one thing—the air commanders must be omniscient.

ARTHUR P. WATTS

University of Pennsylvania

BEAN, WALTON. *Boss Ruef's San Francisco: The Story of the Union Labor Party, Big Business, and the Graft Prosecution.* Pp. xii, 345. Berkeley: University of California Press, 1952. $5.00.

In *Boss Ruef's San Francisco* Walton Bean has presented a smoothly written story of the rise of San Francisco's most famous political boss and of the debacle that brought his burgeoning political empire tumbling down in the drama of the graft prosecutions of 1907–1909. For some readers this story will not be really new. Fremont Older, the crusading editor of the San Francisco *Bulletin,* long ago gave the partisan's view of it in his book, *My Own Story;* and Franklin Hichborn has given it a vivid journalistic treatment in *The System.* Lincoln Steffens made the story a brilliant chapter in his muckraking of municipal boss rule at the turn of the century. Professor Bean, the historian, however, with these journalistic accounts at his disposal and having access to several collections of private papers and files of documents, has brought together a fuller and more balanced version, as one would expect from a trained historian. Professor Bean writes with relish of his subject, and with imagination. The result is a very readable book and one that will stand up well under scrutiny.

The rise and fall of Boss Ruef and his hand-picked mayor and board of supervisors covers a period that is rich in political events, not only for a major city but also for the rising state of California. The events were dramatic to say the least, and the particulars were unique in many respects. Ruef himself was unique in several ways. He was brilliant, cultured in many respects, and had a good university education. His political career began in the reform company of such distinguished citizens as Franklin K. Lane and John H. Wigmore.

However, an opportunistic bent led Ruef in a different direction. Shrewdly operating as a political broker, he succeeded in capturing the newly organized Union Labor party in the city's politics and, through that vehicle, came to control the mayor and the local legislative body. At the same time he pyramided a graft structure by collecting legal fees from utility companies that desired city franchises and from the pleasure establishments that found it necessary to have police immunity.

The avarice of Ruef's political associates ultimately proved to be the loose brick in the structure that brought the whole fabric down and led to the fantastic graft trials. Ruef and the mayor were convicted ultimately, the entire board of supervisors was forced to resign under terms laid down by the acting district attorney, and the prosecutor directed the naming of a new set of officials. When the prosecution went on to try to use Ruef as a witness to convict certain business leaders on charges of corrupting the city government the prosecutor was shot down in the court room. A young special assistant prosecutor who stepped in to complete the trials went on to become the trust-busting governor of California and the long-time United States Senator, Hiram Johnson.

This book, as the title would indicate, keeps the boss, Abraham Ruef, and his associate, Mayor Eugene Schmitz, in the spotlight throughout. Other personalities

are dealt with appropriately but kept at the back of the stage. The treatment of events is quite complete; there are no apparent loose threads. The author does not belabor the various implications for political philosophy and ethics that naturally arise from the story; he points them out, discusses them, and then leaves the reader room to draw his own conclusions.

WINSTON W. CROUCH
University of California
Berkeley

BOLLES, BLAIR. *How To Get Rich in Washington: Rich Man's Division of the Welfare State.* Pp. x, 309. New York: W. W. Norton & Co., 1952. $3.75.

Mr. Bolles is a modern day "muckraker" with a journalist's flair for words and the ability to compose an intriguing title. His thesis is simply stated: ". . . the welfare state has been undergoing a subtle change into the rich man's welfare state. . . . The agencies created to end privilege have become bulwarks of privilege. The bureaus which were established originally as balance wheels for segments of the national economy . . . [in fact] unbalance the economy by distributing the riches unevenly" (p. 12). The evidence for this charge Mr. Bolles has found in recent testimony given before Congressional investigations of the Reconstruction Finance Corporation, the Office of Contract Settlement, the War Assets Administration, the Maritime Commission, the Civil Aeronautics Board, and the Bureau of Internal Revenue, and in the workings of the tax amortization law. (The RFC occupies four chapters; one chapter is devoted to each of the others.)

Blame for the corruption and irresponsibility which Mr. Bolles finds is placed primarily on the shoulders of Congress and the President: ". . . Truman has hastened the transformation [of the welfare state] by . . . putting the agencies under the control of practical men who do not share the old opinion that the federal government is responsible for the welfare of all. . . . Congress has spread the confusion further by enacting a long succession of unrealistic laws . . . neither of them admits the effect of the tax laws and 'military socialism' on the principle of private enterprise, neither gives serious thought to the implications of the government's rise as the master of finance capitalism . . ." (pp. 13, 14, 27). The ineptitudes and failures of lesser government officials come as no surprise because such men "come to share the attitudes of the utilities they regulate . . . [and develop] an overweening pride in the establishment that employs them . . . [which] gives them confidence that their subordinates are as honest as they are" (pp. 233, 276, 70).

Mr. Bolles is a New Dealer with an ardent belief in the ultimate good sense and strength of the electorate and a faith in competition. While he has in no sense written a scholarly work, his book may be of interest as an example of partisan literature. Mr. Bolles feels, however, that he is presenting more than a partisan viewpoint; he hopes his book will give citizens an "intelligent awareness" of the way in which the government functions today. Furthermore, he hopes it will lead to important reforms in government. Since approximately three-fourths of *How To Get Rich in Washington* consists of anecdotes of corruption and irresponsibility, its impact may be quite different from that intended. Judged as an appraisal of postwar Washington, the book is grotesquely incomplete and biased. It should make money in an election year.

JOHN BUTTRICK
Northwestern University

MOWRY, GEORGE E. *The California Progressives.* Pp. xi, 349. Berkeley: University of California Press, 1952. $6.00.

This is an exciting, thorough, and useful work by a professor of history at the University of California, Los Angeles. It is one of a series entitled "The Chronicles of California" covering segments of that state's history and undertaken by the University to commemorate the centennial of "The Golden State."

The purpose of the volume is (p. ix) to "throw as much light upon the nature of national progressivism and recent American 'liberalism' as it may upon the history of the state." "I also hope," the author mentions, "that the book may say something not entirely insignificant about the more general problem of why American reform movements start and why they die" (p. ix). More particularly the quest was to determine "who were the Progressives, what prompted them to act, what were they trying to do, and where did they think they were going?" The book recounts dramatically the rapid rise in California of "progressivism" and its all too speedy decline. Some of the names of those concerned in the movement are themselves assurances of a thrill in reading—Francis J. Heney, Abe Ruef, Eugene E. Schmitz, Hiram Johnson, Rudolph Spreckels, Robert LaFollette, Meyer Lissner, the McNamara brothers, Harrison Gray Otis, Thomas J. Z. Mooney, Warren K. Billings, Frank Norris, Chester Rowell, Theodore Roosevelt, Charles E. Hughes.

What makes this book of special value for the reformer in government is, first, its presentation of the view that conditions in a locality must ordinarily be shocking before citizen revolt ensues. The beginning chapter, entitled "The Southern Pacific's California," limns the complete domination and degradation of the state and of all its parts by that "Octopus." Second, it shows that the uprising occurred and was fought almost simultaneously in both San Francisco and Los Angeles (p. 22). So, then, chapter 2 is entitled "The Struggle for the Cities" and is a welcome illustration of improvements in government starting as local, bipartisan, or nonpartisan, but bringing about ameliorations in the much wider fields of state and even national government. Third, it exemplifies how a citizen revolt need not come from the ranks of existing groups of population. In this instance, it originated with a group of supreme individualists (p. 22):

"The leadership in the battle against the railroad did not come from the ranks of organized business or agriculture or labor. Instead, it was seized by a group of supreme individualists, well educated and bound together by a particularistic point of view, a remembrance of things past, a new code of morality, and more than the normal dash, perhaps, of a sense of indignation and a desire for power. Many of them were not interested, initially, in planning a state-wide campaign against the railroad, but only in a limited struggle for the control of their home cities. The opening skirmishes of the crusade against the Southern Pacific were fought almost simultaneously within the urban confines of San Francisco and Los Angeles. Between the developments in the two cities there was at first little or no connection except for those broad compulsive movements of ideas and material facts that often control the destinies of men."

Fourth, the book contains the warning that reform movements are, in this country, likely to be, as this one was (1910–1916), tragically ephemeral. That the leaders in this movement were more economically independent than the rank and file workers and subordinate leaders in a professional political party meant that the reform chiefs could not be bossed and were so much individualists that rifts were driven in the ranks because of individual opinions, sometimes by personal jealousies and dislikes. The absence of bossism in an amateur political citizens' movement thus may lead and here did lead to many "Mexican generals" and disruption. A fuller analysis of the book would show other causes which contributed to the breakdown and which should be heeded to avoid debacles in similar movements. But such an analysis would transcend permissible limits of this review.

There is a good seventeen-page double-column small-print index. The print and format of the volume are excellent. But very just complaint may be made that the notes appear at the end of the text (p. 307, *et seq.*) and that their numbering begins with 1 in each chapter, so that anyone reading the book has trouble locating the supporting note. The necessary thumbing back and forth and exacerbation would have been diminished had a chapter number and heading appeared at the top of each page of the reference notes. However, no one will regret placing this book high up on the cumulus of one's home work.

MURRAY SEASONGOOD
Cincinnati, Ohio

LENS, SIDNEY. *The Counterfeit Revolution.* Pp. 272. Boston: The Beacon Press, 1952. $3.50.

Sidney Lens is certainly not the first to state that to become really efficient the struggle against Communism must be inspired not by anti-Communism alone but also by "pro-Something." However, this statement has rarely been presented backed by such a penetrating analysis and such an abundance of supporting evidence as it is in his book. Some of the author's observations and conclusions may appear controversial, but they are always at least stimulating, and most of the book makes fascinating reading.

The Communist revolution revealed itself as a "counterfeit revolution." But how, asks the author, is one to explain the fact that "millions of people this side of the Iron Curtain pay homage to this dictatorship, join its movement, work for it with religious fervor?" (p. 3). As noted on the cover, Sidney Lens traveled through twelve countries in Europe to gather material for his study. And he found that "the scarcest commodity in Europe is hope," whereas "hope is the only thing that can defeat Stalinism" (p. 207). If American aid has not, as yet, produced the expected psychological effects, it has been precisely because such aid has helped to consolidate the status quo which the large masses want to do away with. Very often they have no clear idea of what should be done, but they are looking for a promise; they need a hope. That is the main reason why so many turn to Communism with its promise of change and its "semi-religious" hope.

Many others who do not accept Communism do not have sufficient energy to fight it because they do not know what to fight for. The author asks for a "crusade against poverty and Stalinism" and makes concrete suggestions for the program and methods of this crusade, to be waged now —in peacetime. He recognizes that "military force, unfortunately, may be necessary even in the most idealistic crusade," but even the most complete military victory "without a political victory based on a grand political ideal . . . must in the end result in the loss of the peace" (pp. 245–46). The author's last conclusion is that the world today needs unification into a single economic pattern. The American people, and only they, "do have the wherewithal, the material resources necessary, to accomplish this task smoothly and peaceably. In the process they can destroy Stalinism and other philosophies which place the individual in a strait jacket" (p. 266).

GEORGE DENICKE
Washington, D. C.

FONER, PHILIP S. (Ed.). *The Life and Writings of Frederick Douglass.* Vol. III: *The Civil War, 1861–1865.* Pp. 448. New York: International Publishers, 1952. $4.50.

This third volume in *The Life and Writings of Frederick Douglass* examines the period during which the ideas of the abolitionist leader were most fully vindicated in the eyes of the nation. Although once considered a missionary in advance of his times, Douglass lived to witness the fulfillment of his efforts as a result of the emergence of the Civil War and the implications of the President's Emancipation Proclamation.

Frederick Douglass' writings present a broad, contemporaneous commentary on governmental policies and socioeconomic problems during the ordeal of the union. In compiling this work, Dr. Foner has drawn from his subject's editorials in *Douglass' Monthly,* speeches before civic audiences, and correspondence with prominent persons both at home and abroad. The portrait which emerges is that of a multifaceted individual who interested himself in politics, journalism, labor conditions, military affairs, diplomacy and race relations. More accurately than most of his countrymen, Douglass realized that the war and its aftermath would be long and difficult in spite of the North's physical superiority. "We take possession of rebel cities," he wrote prophetically in July 1862, "but not the rebel hearts."

Of special importance to the reader are Douglass' reactions to the major issues of the Civil War. His initial fears that Lincoln might compromise with slavery to preserve the Union, his elation that Sumter had forced the hand of the North, his demands for immediate emancipation and the recruitment of Negro troops, his criticism of colonization, and his stirring appeal for opportunity for the Negro instead of misguided philanthropy or cruel force are vividly recorded in this collection. There are also pertinent excerpts showing the delicate relations within the abolitionist camp, as Douglass, Garrison, Phillips, and Smith attempted to subordinate their past differences for the good of the wartime antislavery cause.

The editor provides an introductory essay in which he outlines the highlights of the Negro leader's public career during the course of the war years. At all times he is intent upon showing that "Douglass' interpretation . . . coincided with that of the fathers of scientific socialism." Nor does he resist the opportunity to project current political views back into history. Commenting upon the 1864 presidential campaign, Dr. Foner unhesitatingly exclaims that "already the reactionary wing of the Republican Party was foreshadowing its later betrayal of the Negro people." Greater care in distinguishing between editing and editorializing would have enhanced the value of this work tremendously.

LEONARD PRICE STAVISKY
Long Island University

TATUM, ELBERT LEE. *The Changed Political Thought of the Negro, 1915–1940.* Pp. 205. New York: Exposition Press, 1952. $3.00.

Those who are searching for a definitive work on the political thought of Negroes in the United States will not find it in Elbert Lee Tatum's *The Changed Political Thought of the Negro, 1915–1940,* for this little volume, contrary to its title, is really a superficial treatment of Negroes in the political life of the United States between 1619 and 1940.

The present study, which is the outgrowth of a doctoral thesis at Loyola University (Chicago), consists of a foreword by President Lawrence A. Davis of Arkansas Agricultural, Mechanical, and Normal College, a preface, an introduction, seven chapters, five appendixes (each of which contains one letter), and a bibliography, which the author says does not "include all materials used in this study, but only . . . [those] of most value" (p. 195). There is no index.

The first two chapters (about one-half of the text), which purport to treat the political significance of Negro migration, first to America and then to the North, present a cursory account of the Negro's importance in the political activities between 1619 and 1928. According to the author, the political significance of Negro migration to America lay in the large amount of attention which Negroes received in both the colonial and early state legislatures, as well as at the constitutional convention of 1787. However, Professor Tatum's claim that "More laws were enacted which dealt with the Negro during colonial times than any other subject" (p. 22) is certainly questionable.

The political significance of the "Great Migration" was very notable in the North. To the Negro, it meant an opportunity to participate actively in politics. To the large urban political machines, it offered groups of potential voters, a bonanza which they (the machines) almost immediately captured. Naturally, this new situation required Negroes to make a series of adjustments in both thought and actions. However, the author's claim that this politically immature group of migrants was "alert in realizing that [its] political interest should be local at first" instead of national is to be doubted, for Negroes, just as other politically untutored racial and religious minorities who migrated to northern cities, became pawns of one of the competing political machines.

The last half of the present study treats the political behavior of Negroes in a limited number of areas. (Missouri, the West, and the Northeast are ignored.) It considers their allegiance to the Republican party from 1865 to 1940, their shift to the Democrats between 1932 and 1940, their participation in the extra-party activities (such as committees and conventions), and

some of the public offices to which Negroes were elected or appointed before and after the "Great Migration." The author believes that it was logical for Negroes to stay in the Republican column because of that party's efforts in their behalf. He attributes the defection from the Republicans to: (1) "their tendency to forsake or ignore Negroes in the South"; (2) the failure of that party to keep its campaign pledges; (3) the effective overtures which Democrats made to "a great number of energetic and intelligent Negroes" who had migrated to the North since 1915. This shift in party allegiance, plus a slight tendency of a few Negroes to vote "independent of party labels," is what Professor Tatum seems to regard as "the changed political thought of the Negro" between 1915 and 1940.

It is quite disappointing to find no discussion of the "Negro's attitude toward communism" (except for two sentences on page 184) or toward the other liberal or reactionary politico-economic philosophies which have competed with the traditional political groups for electoral support in the United States since 1930.

Other things which mar the volume are: mistakes in spelling (pp. 10, 62, 77, 170, and in the bibliography), unsupported generalizations (pp. 77, 80, and 159), inconsistent statements (pp. 72 and 111), and inaccurate reporting (pp. 35, 36, 103, 158, 159, and in the bibliography).

Finally, in this reviewer's opinion, the one contribution which the present study makes is that of pointing up the need for a scholarly investigation of Negro political ideas in America from 1619 to 1952.

Lincoln University of Missouri

KNAUFF, ELLEN RAPHAEL. *The Ellen Knauff Story*. Introduction by Arthur Garfield Hays. Pp. xix, 242, 21. New York: W. W. Norton & Company, 1952. $3.50.

Ellen Knauff dedicates her book, a detailed chronology of her three-year battle to gain admission to the United States after being branded a "poor security risk" and excluded without a hearing, to "the United States of America and her amazing people." Her report is a tribute not only to her own faith in the American principles of justice and fairness, but to the "amazing people" who, once informed of the facts in Mrs. Knauff's case, rallied to her defense and by that most mysterious of group processes—public opinion—forced the Immigration Service to recognize its error, reverse itself, and permit Mrs. Knauff's entry to this country.

Widely publicized, this case of a German war-bride was fought by Mrs. Knauff's indefatigable attorneys, Gunther Jacobson and Albert Feingold, the *New York Post*, the *St. Louis Post-Dispatch*, the American Civil Liberties Union, and Congressmen Walter and Roosevelt because they believe that the democratic idea of due process—a fair hearing—must be continually defended, even in the face of small-minded and arbitrary thinking in a government agency.

Behind the many legal jousts and infighting between the executive and legislative branches of the government in this case is the theme which symbolizes the moral struggle that the free world is now waging against Communist totalitarianism: that a democratic government can provide a system of fair procedures in which respect for the individual is paramount and in which opportunity is given to disprove charges, and that only through full and impartial hearings can the truth be established. While security safeguards in a time of international tension are understandable, Mrs. Knauff's story points up what abuses can occur when these procedures operate without corresponding concern for individual rights.

The struggle to establish the principle of a full and fair hearing goes beyond Mrs. Knauff's tribulation. The State Department's Passport Division denies passports to American citizens for travel abroad if, in its opinion, such travel would not be in the "best interests of the United States." No specified reasons are given. No opportunity is given the citizen to answer openly whatever evidence the Passport Division may have, or to disprove the charges. All this indicates how far the pendulum can swing toward the side of security and away from liberty when fear, even when understandably grounded, dominates governmental action. The American Civil Liberties Union has recently initiated a test case challenging the constitutional right of the State Department to deny a passport without a hearing, and it is hoped that the Supreme Court will decide the issue soon.

Throughout Mrs. Knauff's book, despite the disappointments, the delays in the legal process, the pettiness of bureaucracy, runs a strong note of optimism and faith in the democratic process. She writes: "I do not wish anybody to be falsely accused. It is a bitter and frightening experience. Yet—if it were possible without the agony, I almost wish every human being could go through a similar experience, a similar, personal method of realizing what's important in this world—as I did on Ellis Island.

"Only when my own human rights and my own freedom were endangered did I realize the importance of freedom. Only when I experienced the deep, natural devotion of other people to justice did I myself become a passionate believer in freedom and justice—and in people. . . .

"For the people of America despise tyrants, be they of the great or the petty variety, and they are fortunate to have inherited a system of protection which makes every little man master in his house and in his country.

"The people of America saw to it that their elected representatives picked up my fight against arbitrary decrees of the frightened. And in turn, an official of the highest tribunal of the land brought the weight of his office to bear in my favor, in order to protect the authority vested by the people in their elected representatives.

"And finally, the Government itself, faced with an aroused public opinion and a relentlessly probing Congress, showed enough fortitude to admit it was not omniscient and could make mistakes."

As long as these forces are free to express themselves, and are willing to take up the cudgels—even for the single individual—when an injustice is committed, our brand of democracy will win out.

ECONOMICS AND INDUSTRY

GALBRAITH, JOHN KENNETH. *American Capitalism: The Concept of Countervailing Power*. Pp. xv, 217. Boston: Houghton Mifflin Company, 1952. $3.00.

Dr. Galbraith presents here, with characteristic sweep and verve, a number of interesting and challenging ideas concerning American economic and political life. The first half of the book is devoted to a careful criticism of some of the economic notions prevailing about 1935, especially in their more naïve business and academic forms. Chamberlin's discovery (1931) that economic life seldom conforms to "pure" competition is elaborated, and there is a brief popular summary of Keynes's attack upon "Say's law" that supply creates its own demand.

In the middle of the book, after a somewhat ambivalent but predominantly neo-Veblenite excursion into the "Unseemly Economics of Opulence," Dr. Galbraith develops his very interesting politico-economic concept of "countervailing power" (Chapters IX and X) and applies it to a number of different problems ending with inflation.

The first and last parts of the work are curiously dated in economic analysis with a very spotty coverage of postwar literature and ideas. There are also a number of inaccuracies. Students of economic history will be troubled, for example, to learn (p. 67) that "until 1930 a *really* serious depression was not part of the experience of Americans." Schumpeter's three cycle schema, the panic of 1837, and the fifteen years of "dull times" that followed the panic of 1873 have all alike been passed by. Dr. Galbraith also repeats (p. 75) the usual mistaken charge against Lord Keynes that he considered the rate of interest always and exclusively a purely monetary phenomenon. In addition the recent work of such sincere Keynesians as Professor Lloyd Metzler regarding wages and the "wealth effect" is entirely overlooked. There is nothing in the text to tell the reader that today it is generally conceded by most Keynesians including Samuelson, Klein, and Metzler that the

Keynesian unemployment "equilibria" must depend upon price rigidity; and further that, while we still may not favor money wage reduction as the best way to get full employment, writers like Metzler now concede that it is undoubtedly *a* way.

Turning, however, to the main issue, what does Professor Galbraith mean by countervailing power? Essentially the phrase seems to mean the *second* wage of organization. It does not merely mean "monopsony" (strong buyers) though one is apt to get that impression at first (p. 118). But Dr. Galbraith's very pregnant distinction between "original" and "countervailing" power (p. 143) shows that this is too simple. His main idea seems to be that when *either* side of the market falls into a few powerful hands those on the *other* side will tend to organize against them. Thus the farmers organize against the "middle-men," the unions against "oligopoly." But the concept is a bit elusive, because the chain stores are also spoken of as examples of "countervailing power." Can it be said that they merely organize against oligopoly? Rather in their case, I submit, it is also power used against standard marketing practice often obsolete and inefficient, rather than (universally) against small numbers.

Using his new concepts Dr. Galbraith makes a number of valid and intelligent suggestions. He points out the often-overlooked role of the large *retailers* in restraining the market power of manufacturers (but is this always a case of organization against small numbers?), and in his chapter on "Countervailing Power and the State" he indicates the role of the state as a fosterer of countervailing organization. He admits unequivocally, furthermore, that the job can be overdone (pp. 156–157) and almost seems to be gliding into a good word for the Taft-Hartley Act. Again Chapter IX has an interesting discussion of the economics of the housing industry and a still more suggestive treatment of the limitations of countervailing power as a regulator (it does *not* work, he says, in inflation, but rather in times of some slack).

We thus see that Dr. Galbraith has here offered a number of valuable ideas. It is not, however, entirely clear just how much is new in fact and how much is merely terminology. "Countervailing power" and "workable competition" seemed to me to keep gliding into one another. The basic weakness of the book, from the point of view of this reviewer, is, however, much more fundamental. It does not seem to me that Dr. Galbraith ever clearly distinguishes between the checks and balances of a *stalemate* and the decentralization and incentive which make for *adjustment*.

The ideas of *social turnover* and *independent opportunity* appear to be largely lacking in this book. Dr. Galbraith tells us (p. 39) that the "present generation of Americans, if it survives, will buy its steel, copper, brass, automobiles [and so on—a long list] from one or another of the handful of firms that now supply these staples. A moment's reflection will establish, there hasn't been much change in the firms supplying these products for several decades." But why? A hint can be found in Galbraith's text. He tells us (p. 37) that it is "indeed significant that the new arrivals" in many fields have had help from the Reconstruction Finance Corporation. But the book contains no mention of the effects, often cited, of our equalitarian income tax upon opportunity, mobility, competiton, and equity capital. Surely the point ought at least to have been mentioned.

Dr. Galbraith in some of his chapters (for example, VII) clearly appears to be advocating development and growth. Yet I suggest that he is also still, though more or less subconsciously, largely an adherent of the Veblenite philosophy of a smoothly flowing, but stationary, bureaucratic, and equalitarian world. I suggest that, without exactly realizing it, he is still largely the foe of those dynamic but unstabilizing creative forces in American life which have led people to refer to it as the "permanent revolution," and that he has discovered that the "permanent revolution" can be ended as well by complacent *business* socialism as by the socialism of the left. Therefore he is for business socialism. This verdict is perhaps oversimplified, but that seemed to me the essence of the book. However, such a society is scarcely capitalism. And the massive stalemate of a few big security-minded unions and a few big security-minded firms, which to me Galbraith seems to be advocating, leaves little room either for growth or true democracy.

DAVID MCCORD WRIGHT
University of Virginia

LINCOLN, JAMES F. *Incentive Management: A New Approach to Human Relationships in Industry and Business.* Pp. 280. Cleveland, Ohio: The Lincoln Electric Co., 1951. $1.00.

The basis for the arguments advanced by Mr. Lincoln in this book is the phenomenal success enjoyed by the Lincoln Electric Company in Cleveland, Ohio. Through adaptation of the systems of piece-work pay and profit sharing to win the enthusiastic participation of the labor force (ranging from 404 employees in 1934 to a high of 1,245 in 1943 and numbering 1,005 in 1950), Lincoln Electric has achieved remarkable records of production per employee and an average annual wage level of $7,701 in 1950, while demonstrating that higher wages can mean lower costs. Lincoln Electric manufactures arc welding equipment and arc welding electrodes.

Mr. Lincoln was at one time captain of the Ohio State University football team. He praises the efforts which amateur athletes put forth and throughout his discussion urges transplanting the teamwork and superior individual effort of amateur sport to the work situation. He stresses that the head of an industry should be the leader—the captain rather than the boss. Many of the observations and injunctions propounded could well be read and pondered by anyone who occupies a position of supervisory responsibility; certainly he has touched on many of the barriers which hinder successful and productive relationships in the world of business and industry.

Mr. Lincoln declares frankly that he is advocating a second industrial revolution. There are few of the accepted practices, usages, and mores of industrial management, labor-management relations, and other social arrangements which he does not challenge during the course of his exposition. What has been accomplished at the plant in Cleveland is, in fact, set in the background. Mr. Lincoln gives attention to most of the problems of the nation and of the world as they appear to him, offering solutions from his philosophy, based on his own experience.

The author does not leave the reader any doubts as to his dislikes. It is difficult to judge, however, whether he has stronger feelings against government or against organized labor. Despite his advocacy of increased productivity, he seems certain that no means would succeed in increasing the productivity of government employees. Despite his interest in enlisting the participation of the work force, he never allows the thought that highly successful labor-management co-operation leading to active worker participation and rising productivity can and is being achieved in situations where unions speak for the work force, as evidenced by the numerous applications of the "Scanlon Plan," for instance.

Certainly Mr. Lincoln has a remarkable achievement from which to prescribe. His prescription, however, impressed this reader much as those advanced for the remaking of society 150 years ago by that successful cotton spinner of New Lanark, Robert Owen, who, too, did not hesitate to urge that the world should be remade according to his philosophy.

JOHN NEWTON THURBER
Bureau of Labor Statistics
Washington, D. C.

LINDHOLM, RICHARD W. *Taxation of the Trucking Industry.* Pp. xv, 141. Columbus: Bureau of Business Research, College of Commerce and Administration, Ohio State University, 1951. No price.

This volume is more than a study of the taxation of the motor-carrier industry. Two chapters deal with fundamental questions about financing highways through user taxes. In fact, the greatest value of this book lies in the thoughtful analysis of this problem.

The practice of tying highway use payments to gasoline consumption, the author points out, tends to destroy the possibility of applying strictly economic tests to the provision of highways. The contribution to highway support paid with the purchase of gasoline is incidental to the purchase of the gasoline and the utilities to be derived therefrom, and the total contributions of highway users from such a tax is no measure of the highway services for which they are willing to pay. Such revenues might contribute more or less than highway users would be willing to pay directly for highway facilities.

The author also makes some observations about the relation of revenues from particular highways to highway expenditures which should be of interest to those concerned with the application of economic criteria to highway building. "The idea that roads should pay for themselves is apt to bring about an undesirable use of resources," he says (p. 46). Under the prevailing system of highway user taxation, the tax revenues produced by main highways are used to support secondary and tertiary roads which do not produce enough tax revenues to finance themselves. Although it may be asked whether it is equitable to make persons who utilize certain highways pay for highways which they do not use, the distribution of highway expenditures on the basis of the tax revenues which they produce would result in excessive expenditures on the main roads and wholly inadequate expenditures on less used roads.

Turning to matters in the volume which are more strictly embraced within its title, we find that between 1940 and 1949 the operating taxes and licenses paid by for-hire motor carriers of property varied from 4.43 to 7.26 per cent of their operating revenues. The author points out that taxes on motor carriers, over the period considered, increased less rapidly than their operating revenues. It is difficult, however, to accept his statement that the failure of operating taxes to move upward as rapidly as operating revenues "has, in a real sense, provided a subsidy to the motor-carriers of property" (p. 10). A chapter on what truckers think of taxes brings out both the advantages and limitations of the various types of taxes levied upon motor carriers.

D. PHILIP LOCKLIN
University of Illinois

CHILDS, MARQUIS. *The Farmer Takes A Hand: The Electric Power Revolution in Rural America.* Introduction by Senator George D. Aiken. Pp. 256. New York: Doubleday & Company, 1952. $3.50.

Marquis Childs has written about the Rural Electrification Administration (REA) and American farmers with sympathy for the electric co-operative movement under REA aegis. The effect of electrification on American rural life is an engrossing story of human struggle for improved working and living conditions. REA's contribution as adviser-financier to rural electric development since 1935 is today legend in many farm communities. But for most city readers and many rural folk this book is an eye-opener.

The Farmer Takes A Hand challenges the contention that REA is an ignoble instrument of federal bureaucracy and a symbol of state socialism. Initially a New Deal relief agency, the REA has become a permanent lending agency providing funds for the generation, transmission, and distribution of electric energy in rural areas. This book describes the events leading to the establishment as well as the operation of REA. However, its main focus is upon the history of REA's chief borrowers, the electric co-operatives. Mr. Child's thesis is that the electric co-op movement—even though backed by federal funds—strengthens free enterprise. He maintains that REA co-operatives have been supported by the essentially conservative American farmer. The utilities' high service charges and their cream-skimming practices originally gave rise to demand for cheaper rural electricity. Once REA was established, most private companies and municipalities were unable or unwilling to expand electrification with REA funds. This propelled the co-op into position as REA's leading borrower. The author cites the competition between REA and the co-operatives on the one side and the monopolistic utilities on the other to support his generalization that free enterprise has prospered from the activities of REA and the co-ops. He describes the early utility opposition to the co-operatives as well as to the REA and shows that recently the utilities have been trying to keep ownership of generation and transmission facilities away from the co-ops and to take over faltering co-operatives. In random fashion, he describes the areas of conflict. While keener organization and analysis by the author would have strengthened his argument, he has told the story well enough to prompt the general reader to discount the utility propaganda against REA and the co-operatives.

As a text, however, the book does not adequately tell the story. Some significant aspects of the REA and co-operative experience appear to be beyond its scope. These include the effects of the rural electrification program on the rural economy, the future of REA activities including evaluation of its newest responsibility—rural telephone development—and the role of REA in the expanding area of federal administration. Moreover, in presenting statistics and in quoting remarks, Mr. Childs provides precise citations for only a portion of the material; there are no footnotes to fill in the rough corners, and the book has no index. Nonetheless, as a spade in the scholar's hand, the volume has substantial merit in its description of REA and the electric co-operatives. This narrative should invite scholarly inquiry into the desirability of further experimentation on the REA pattern as a means of bolstering sound free enterprise in other businesses and industries.

MARVIN HENRY MORSE
New Haven, Connecticut

ROSE, ARNOLD M. *Union Solidarity: The Internal Cohesion of a Labor Union.* Pp. xx, 209. Minneapolis: University of Minnesota Press, 1952. $3.00.

Through the method of the questionnaire survey, Professor Rose has systematically studied a random sample of the 8,500 members of Teamsters' Local 688 in St. Louis. The attitudes of the members with regard to participation in and evaluation of their union, the extent of opportunities for democratic control of the local, attitudes toward employers, incentive pay, job seniority, political action, and workers' education are some of the many significant areas probed into.

That the study is subject to the limitations imposed by the questionnaire survey method, as the author clearly indicates, should be recognized by the reader. Nevertheless, some of the descriptive findings have important practical and theoretical value. For example, the conclusion that there is a strong loyalty to the principle of unionism despite criticisms of its specific policies and practices is one that can assure the union leader that he has a firm foundation upon which to build even if part of his superstructure is faulty. Professor Rose does not point out, however, that the limits of membership loyalty may be considerably lessened where the local leadership is less given to democratic procedures than is Local 688's Hal Gibbons. The conclusion that loyalty to the union does not mean disloyalty to the employer can be noted by social psychologists to indicate, as the author points out, that individuals can have conflicts of attitudes when the attitudes are at different levels.

The conclusion that union loyalties of the members are attached to the local union and not to the International or Federation would indicate that the leadership at those levels has failed to impart to the rank-and-file membership the significance and role of the International or Federation. In a different area of the study, the author examines membership attitudes toward minority groups and concludes that the union is least effective in changing the attitudes of its members when the changes run counter to the basic values or deep-seated cultural patterns of the society as a whole. These are only a few of the more significant conclusions reported in the study.

The study would have been generally more readable if less of its content had been devoted to charts and tables and more given over to interpretation of findings and general description of the internal functioning of the local union.

Though this is only one study of a sample of the membership of a single one of the 65,000 to 75,000 local unions in something like 209 Internationals which com-

prise the American labor movement, it is an important contribution to a vast literature on trade unionism which has thus far all but completely overlooked the rank-and-file member in his local union.

BERNARD KARSH
University of Chicago

DAVEY, HAROLD W. *Contemporary Collective Bargaining.* Pp. xi, 532. New York: Prentice-Hall, 1951. $5.50.

The promotional materials advertising Professor Davey's book refer to it as "a work that will not quickly become dated since it does not merely describe current conditions. Instead, it comes to grips with concrete, major problems of continuing significance in the vital area of collective bargaining." Happily enough, this assertion is substantially correct. I think I would be fair in recommending this text very highly as an introductory text in a course on collective bargaining.

The chapters which yield the most in terms of the above promise are "Managerial Authority and the Scope of Collective Bargaining" and "Wage Determination Under Collective Bargaining," for these two chapters provide the reader with a schematic perspective into the many factors which necessarily pervade the bargaining process. Since collective bargaining is a complex mixture of situational relationships rather than a controlled experiment between labor and management, a catalogue of the many factors which must be considered in examining the motivations and behavior of the participants is welcome. Other chapters of the book including, unfortunately, "Collective Bargaining and Industrial Jurisprudence" give an almost overwhelming emphasis to the content or substance of labor contracts. Too little attention in these other chapters is given to the role of precedent, policy considerations, and community pressures.

The last hundred pages of the book contain the latest collective bargaining agreements drawn up by General Motors and the Swift Packing Company as well as the text of the Labor-Management Relations Act. These appended materials will be useful for classroom work. More revealing, however, would be transcripts of the bargaining negotiations which led to these agreements.

ROBERT C. SORENSEN
College of Law, University of Nebraska

GALENSON, WALTER (Ed.). *Comparative Labor Movements.* Pp. xiv, 599. New York: Prentice-Hall, 1952. $6.50.

In this symposium, seven scholars have reported on the history, organization, and operation of labor movements in Great Britain, Scandinavia, Australia, Germany, France, Italy, and the Soviet Union. In a discerning introduction the editor states his convictions that the future of democracy is closely bound up with the fate of trade unionism—"The greatest economic institution of our time"—and that a most fruitful approach to an understanding of this institution is the method of comparative analysis. A major purpose of these seven essays is to stimulate further research in the area of comparative labor systems, and the editor modestly declares that more intensive work will have to be done before valid generalizations can be made.

Yet at least suggestive hypotheses and tentative generalizations flow from these reports which were written independently by authorities living in different countries. For example, the historical descriptions indicate that the development of trade unionism is especially influenced by the type, timing, and tempo of industrialization. The metamorphosis of trade union structure in each country reveals that there is an irresistible tendency toward the growth of industrial unionism as economic aggregates become larger and skills are broken down by the machine. But the trade union structure, molded by diverse socioeconomic environments, varies from the highly centralized federations of Norway and Sweden to the loosely organized British Trades Union Congress.

In addition to an analysis of wages and wage trends, each chapter contains a description of collective bargaining processes. Beside adding to our understanding of collective bargaining, it should be useful in clearing up misconceptions especially in reference to industry-wide bargaining. Mr. Walker's discussion of compulsory arbitration in Australia also serves to clarify another much abused subject.

In discussing the influence of labor ideology on the trade union movement, Professor Flanders explains the impact of the Fabian Society on British workers, and Professor Taft shows the effect of a social democratic philosophy on the German trade unions. In the chapters on France by Mr. Lorwin and on Italy by Professor Adams consideration is given to the significant question as to why communism dominates the major trade union organization in each country. Knowledge of labor ideologies is valuable in understanding the role of trade unions in relation to the state which is constantly increasing its control over the national economy. An extreme example of such control appears in Mr. Deutscher's study of Russian trade unions which have been completely absorbed by the Soviet State.

With the increasing interest in comparative labor movements, this up-to-date, authoritative text book meets a genuine need of college teachers and scholars. It should also be helpful to governmental and trade union officials concerned with international labor.

MELVIN J. SEGAL
Michigan State College

BRADY, ROBERT A. *The Citizen's Stake in Price Control.* Pp. 161. Paterson, N. J.: Littlefield, Adams & Co., 1952. $1.50.

Any price control is some control of people. This book reflects the judgment that, in the interest of people affected, we need now both more effective control of prices by government and more effective breaking of private price control. The latter objective comes out in the author's apparent feeling that pressure groups—business, farm, labor—have warped existing controls so badly that the main purpose is getting lost in the shuffle.

Professor Brady provides a pointed sketch of policy on defense controls and of requisites in price control. However, the very statement on such requisites as civilian control, emphasis on production, promotion of competition, and maximum public participation shows his basic concern with an essentially political hope, namely, for an organized citizenship to hold the pressure groups in check.

It seems hardly debatable that the present price control law reflects group buck passing—perhaps more than it reflects coherent controls in the common defense. Where the citizens predominantly do stand or might stand with respect to a revamped plan seems less certain.

Do the citizens generally want effective price controls? The only previous trial of extensive controls was when without doubt there was war. Now, differences of judgments about the likelihood of another war are obvious. Our commitment of the economy to defense is far less than it was when we went grudgingly into World War II price controls. Western Europe is not occupied. Is there not considerable likelihood that the hesitant and divided congressional action on this problem has been about proportionate to the hesitant and divided temper of the country?

But if the citizens do want controls and should make their wants known, what kind of controls should we expect? Most citizens have been taught, formally or by social exposure, to buy freely for as little as possible and to sell freely for as much as possible. That simple doctrine, acceptable in peacetime for the buyer or the seller too small to affect the market significantly, has been stretched in many seats of power to include wartime and to include corporate "persons" of whatever dimensions, except where gross collusion is proven. When the defense program makes the government the biggest of all market giants, the citizen, seeing that collusion is not relevant, has to learn some arithmetic of size before he can understand the emergency need. And since that might have peacetime repercussions without respect to collusion, the lessons come slowly.

J. P. WATSON
University of Pittsburgh

CASSELMAN, PAUL HUBERT. *The Cooperative Movement and Some of Its Problems.* Pp. xiii, 178. New York: Philosophical Library, 1952. $3.00.

This is a much needed and useful analysis of the consumer co-operative movement.

Consumer co-operative literature is remarkable for its enthusiasm and for its dearth of critical evaluation. Through the first nine chapters the author, a professor at the University of Ottawa, Canada, demonstrates a fine objectivity, but in his final chapter his restrained enthusiasm is revealed.

In a foreword Dr. Coady says: "Scientific thinking involves much more than enthusiasm and zeal for group action—it is rather the possession of a sound philosophy, and the ability to apply it." The author does not regard co-operation as a panacea. Although he is a labor economist he thinks the consumer function is a fundamental approach to economics and one which has been neglected. "Cooperation is an economic system with a social content. Its idealism penetrates both its economic and its social elements." Its principles have evolved from the experience of common men and have been tried by a century of use. By contrast the principles of socialism and communism are the products of theoretical thinking. The well-known principles of co-operation are regrouped around the more basic principles of universality, democracy, liberty, fraternity and unity, self-help, economy, and equity.

Lack of planning has been a disadvantage to the co-operative movement. For example, most of the credit union movement in the United States operates outside of the regular co-operative movement. A planned co-operative movement would develop in this order: first financial co-operatives, then retail co-operatives, then wholesale co-operatives, and finally processing co-operatives.

In discussing co-operatives and the state Professor Casselman expresses the view that the policy of political neutrality has stood the test of time, but he would use a lobby to defend consumer interests. He rejects the co-operative commonwealth ideal as utopian and one which hinders the movement. Co-operatives are the most effective means of controlling monopoly, fraud, and false advertising. Co-operation resists communism by the force of ideas rather than by the force of arms.

Although the co-operative movement has been promoted as an alternative to socialism it is neither a form of socialism nor a type of capitalism, though it may possess characteristics of both. The author thinks that co-operative leaders who espouse socialism will lead the co-operative movement into difficulty; they must make up their minds whether they want a consumer economy or a worker economy. The greatest obstacle to the co-operative movement in its second century may well be socialist political regimes.

Professor Casselman analyzes the status of co-operatives with reference to taxation objectively and ably. Failure to see the difference between profit business and co-operative business as regards motive, role of capital, ownership, and control is the root of the tax problem. Far from having a competitive advantage, co-operatives are in an inferior position in Canada and in the United States.

LELAND J. GORDON
Denison University

NEWMAN, PHILIP CHARLES. *The Development of Economic Thought.* Pp. xiv, 456. New York: Prentice-Hall, 1952. $5.00.

This book begins with mercantilism, but its treatment of writers before about 1850 is sketchy and unoriginal. The consideration given to economic thinking since that time, apart from the general background of thought movement, is somewhat disjointed but otherwise well done. How Marx's ideas on production and the business cycle compare with what is now taught on these subjects, and what is the nature of the Walrasian theory of mathematical equilibrium which lies behind the *Value and Capital* of Hicks, are explained satisfactorily here. To students who want a survey of recent writings from this viewpoint Newman's book is recommended.

But this reviewer questions whether an adequate understanding of economic literature is obtained if developments in associated areas of thought receive so little attention as they do in this volume. Adam Smith's work in economics was a logical consequence of the Enlightenment, of the works of Hobbes, Locke, Voltaire, and others, in a wider territory. His *Theory of Moral Sentiments* dealt at some length with the subject matter of Veblen's *Theory of the Leisure Class,* a point of which some of Newman's comments suggest he is unaware. Welfare economics and Keynesianism are not only things of themselves but parts of a general thought-trend away from laissez faire. Price control and social security will appear in a different light to students who have been familiarized with medievalism than they do to those to whom they come as novelties. Newman's book largely ignores all this.

A welcome feature is the inclusion of accounts of individuals whose writings are studied, although some comments are made which appear in poor taste. It is an unkind judgment of James Mill to explain his views in terms of personal dependence on the "dominant employer class," and teachers may feel that the remarks on Mrs. Veblen are objectionable. Readers of the later essays in Hayek's *Individualism and Economic Order* and *The Road to Serfdom* may be surprised to see that "in 1937, Oscar Lange delivered the *coup de grace* to the anti-socialist critics," although other books than Newman's have said this. The theory of comparative costs in international trade appears to be attributed to the younger Mill, despite Ricardo's famous prior statement. It is said that Marshall "began the diagrammatic method," when probably "began with" is meant, a difference which may mislead students. A number of other slips of various kinds suggest inadequate checking.

SOCIOLOGY AND EDUCATION

BARKER, ERNEST (Ed.). *Golden Ages of the Great Cities.* Pp. xx, 340. London and New York: Thames and Hudson, 1952. $5.00.

Sir Ernest Barker in his introduction to this symposium explains that "the plan of each of its chapters is to provide . . . a synoptic view of each age of culture as it reached its height in some great city—a view which takes account at once of the city's history and its political and economic structure, of its art and literature and manners and customs, and of the general pattern of its social system and the general nature of its social life."

Nine of the cities "show to America what Europe has given in the past to the accumulated treasure of civilization." They are Periclean Athens; Rome, first under the Antonines, again under the Popes; Christian Constantinople; Paris, first as the center of medieval European learning and then in the *Grand Siècle* of Louis XIV; Medicean Florence; the Venetian Republic; Madrid under the House of Austria; Vienna under Metternich; and the London of Victoria's Jubilee. Twentieth-century New York is included "to show Europe what America is already giving and will continue increasingly to give," thus serving "as a link (or intellectual 'Atlantic Union')." Ten of the authors are British scholars, *litterateurs,* or journalists; two are French historians. Even the chapter on New York is by the Washington correspondent of several English periodicals.

An urbanist will applaud the premise that a portrait of a great city will be the noblest reflection of the golden age of a culture. But it is a tall order to provide the "synoptic view" in twenty-five to thirty pages, and the results in this collection are not uniformly good. The Greek cultural heritage may be adequately portrayed in a short essay on classic Athens with its 200,000 citizens; but there is an inevitable confusion of focus in Mr. Robert Waithman's attempt to picture New York—its skyline, the standard of living of its workers, its local government—and at the same time its "modern culture marked with its own unmistakable stamp." Of eleven novelists, poets, and painters named as the most distinguished representatives of this culture, not one is a New Yorker; they are identified with and identify themselves with New England, the Middle West, California, or the South.

The three contributors who picture a city *and its life* most vividly are Jérôme Carcopino (Antonine Rome), Steven Runciman (Byzantine Constantinople), and Roger Fulford (Jubilee London). Cecil Sprigge

seems to find no focus for his Papal Rome; Sir Maurice Bowra remains largely in the Olympian realm of philosophy, drama, and art rather than portraying life in Athens.

The uniformities and differences that appear are both of interest. It is perhaps to be expected that all great capitals have been cosmopolitan, that they are centers of trade, that they have a pulsating life in the streets. We expect to find governmental responsibility for social welfare and economic stability in nineteenth century Vienna and London. But it is unexpected when we read of public aid to dependent children in Antonine Rome and of the regulation of the height of buildings both in ancient Rome and in Constantinople. Students of cultures and of cities will find a majority of the essays in this collection rewarding, each in terms of his own interest.

CHARLES S. ASCHER
Brooklyn College

REINHARDT, JAMES M., PAUL MEADOWS, and JOHN M. GILLETTE. *Social Problems and Social Policy*. Pp. ix, 590. New York: American Book Company, 1952. $4.50.

Although the jacket states in large type that this book is "new" and the copyright date is 1952, on the copyright page the following words also appear: "Based on *Current Social Problems* and *Problems of a Changing Social Order* by Gillette and Reinhardt, copyright, 1933, 1937, 1942." There is some evidence in the present volume that the older material has been revised, but evidence also exists that this has not been thoroughgoing. For example, out of twenty-nine reading references at the end of Chapter 2 only two bear a later date than 1940; out of twenty-eight references at the end of Chapter 9 all except five are dated earlier than 1936 and the latest is dated 1938; with respect to Public Health dealt with in Chapter 15, all the references at the end of the chapter are old (between 1928 and 1932). This situation is likewise found at the end of other chapters and also with respect to some of the tabulations. In the matter of child welfare much has been accomplished in the last twenty years, and yet for the greater part of Chapter 11 dealing with that subject, the discussion is highly utopian and based largely on a so-called "Children's Charter" formulated at a Conference on Child Health and Protection held in 1930. A similar condition is found in Chapter 14 which deals with crime, in which much of the discussion is based upon reports of the National Commission on Law Observance and Enforcement published in 1931.

The following statements are also out of date: "Between one and two per cent of our national population are engaged in some governmental occupation" (p. 55). In 1951, general government employed at least 4 per cent of the population. Likewise, during a time when government spending for military purposes has risen from $17.8 billion in fiscal year 1950 to $26.4 billion in 1951 and is estimated at $49.7 billion for 1952 and $65.1 for 1953, arguments in the book are based on an estimated expenditure of only $2.5 billions for such purposes (p. 571).

In a book as comprehensive as this one, it is unavoidable that generalizations be stated briefly without much discussion. In less than 600 pages and in twenty chapters such problems are treated as the nature of democracy, resource utilization, technology, economic insecurity, city and rural problems, population change, migration, family adjustment, problems of the child, education, racial minorities, crime, public health, defective groups, eugenics, alcoholism, internationalism—all of them related to public welfare and social control. Despite this broad sweep, however, it would seem unnecessary that dogmatic statements be substituted for open-mindedness where controversial issues are concerned; and the number of controversial questions covered in this book are legion. The following are samples of statements with which many readers will undoubtedly take issue or about which will at least raise a question as to meaning or significance:

Regarding social problems it is asserted: "During thousands of years, no doubt, if problem conditions existed, there were no persons sufficiently intelligent to see them; and so, practically, there were no problems" (p. 7).

"If all material structure and goods were destroyed, culture would remain, and men could rebuild and replace the material things" (p. 25).

"Anything that becomes different in society represents social change. . . . Social evolution is an aspect or result of social change. . . . There is a tendency to conclude that social evolution always means improvement or progress. Probably this conclusion is generally true" (pp. 26–27).

Under the heading "An Economy of Abundance in the Offing," after stating that "we may have enough to go around, but it fails to get around democratically," and after failing to catch an important typographical error regarding the size of our national income, the authors state that "a democratic realization of the division of wealth and income would go far to make the economy of abundance a reality" (pp. 44–45).

"Government must be as resilient as rubber, as resourceful as the mother of a big family on a small income, as pliable as a plastic figure, and as adjustable as a chameleon. If it endures at all it is fortunate; and it is bound to change" (p. 41).

"'Be not anxious about tomorrow' was an injunction of an agricultural society which knew little about business cycles, cut-throat competition, iron-curtain communication, or imperialistic rivalries. It is hardly a fitting social philosophy for the vast, congested, poorly-articulated, diseased, impersonal, swift, expensive, wasteful, megalopolitan culture centers of the twentieth century!" (p. 116).

"Technology is fundamentally a new, a modern methodology of social adjustment. . . . The personal imbalances of insecurity and fear are the tribute money we pay for the privilege of technological exploitation of our physical and social worlds" (pp. 102, 115).

"Urbanism fosters economic insecurities through its monetarization of human relations, its job dependence, its business irregularities, its industrial conflicts, and its rapid technological changes" (p. 188).

"Planning is essentially the foresighted and cooperative adaptation of means to ends" (p. 190).

"Population, at the human level, . . . is a socio-biological fact" (p. 198).

"The most important functions of the family seem to be reproduction and the care of children and the provision of a money income sufficient to buy the services expected by a culture-patterned and high standard of living" (p. 251).

Most of the book, though interesting and readable, is in the form of a brittle superficiality such as is illustrated in the examples given above.

JOSEPH MAYER
Miami University
Oxford, Ohio

HERBERTSON, DOROTHY. *The Life of Frédéric Le Play*. Edited by VICTOR BRANFORD and ALEXANDER FARQUAHARSON. Pp. 120. Ledbury, Herefordshire: Le Play House Press, 1951. 12s. 6d.

As the literature of a discipline becomes more and more voluminous, it becomes less and less possible for any one person to read all the classics first hand; we become increasingly dependent on cursory digests, brief summaries, and textbook sketches. Authors become typed and the richness of their actual contribution is lost sight of.

Frédéric LePlay is generally known as the father of monographic surveys based on careful field studies of families. But the usual statement of his contribution overlooks many other aspects of his thought. He was an occupational sociologist and, in a sense rivaled Marx as a philosopher of history. Compare, for example, Marx's materialistic interpretation of history with LePlay's occupational interpretation as summarized by the author of the book under review: "He saw . . . that every occupation leads to the development of a certain type of family, adapted to the nature of the occupation. Around this family type spring up religious, moral and ethical ideals which become part of the soul of a nation and make it what it is" (p. 48).

Few modern students of social surveys surpass or even equal LePlay in the breadth of conception which they bring to

the analyses of data. The appendexes of one of his monographs—on a Sheffield cutler—deal, for example, with such topics as: "(1) the social transformation of England since the middle ages; (2) the elements of social disorganisation introduced within the last century into English industrial life by the opening up of the coalfields; (3) the misconceptions current in England during the last century of the social relations of masters and servants; (4) English Friendly Societies; (5) Sheffield Trade Unions" (p. 26). Other monographs were similarly broad in their scope, including such topics as differential fertility among classes, and relief policies. The publication of this biography of Le-Play, which includes a sympathetic account of his theories as well as of his life, is a favor to the sociological public. It is more appreciative than critical; it is amateurish in flavor; but it is a useful contribution for which students of family, of community, and of research methods will be grateful. There is a portrait of the subject.

JESSIE BERNARD
Pennsylvania State College

LOEWY, HERTA. *The Retarded Child.* Pp. 160. New York: Philosophical Library, 1951. $3.75.

The emergence of organized groups of parents of mentally deficient children has been a noteworthy development in this field during recent years. With spontaneous initiative and under wise direction and guidance many such parents who were bewildered, ashamed, and heartsick have found some hope and encouragement through banding together to further the care and training of their handicapped children. There has been an initial public enlightenment and growing progress in this movement, but parents themselves implore means of better self-education which will help them to understand their children and suggestions as to practical tools of child training.

In *The Retarded Child* Herta Loewy is partially fulfilling this need. The subtitle states that this is "A guide for Parents and Teachers," and the author obviously has had considerable intimate experience in teaching and training the backward child. Published originally in Great Britain where Miss Loewy has worked, this book translates rather successfully for the parents (a) the dynamics of the retarded child and (b) the techniques of the teacher who understands these dynamics.

A practical combination of lay psychology and specialized teaching is offered. Psychologically, parents may profit by the author's over-all approach to the child—her emphasis upon total personality development, her explanation of abilities and goals, her caution against overclassification, and above all her sympathy with and sensitivity to the retarded child as an individual who cannot be collectively grouped as the "garden type of amentia." Psychologically, too, parents should entertain appropriate reserve when the author becomes somewhat pseudopsychiatric in her interpretations of fear, obsessions, insight, and sex. The positive factors, however, far outweigh the negative ones. The glimmer of false hopes which has appeared in certain contemporary writings may be dimly seen here in stressing progress, primarily among the higher grade mentally handicapped, implying that, as a whole, they can be developed into almost normal adults.

Pedagogically, parents should welcome the simple, practical training lessons which Miss Loewy translates into games and so clearly explains. These programs of sense and habit training, set forth in separate chapters, are precisely what parents have been requesting. Though the author speaks of "my system," neither methods nor materials are new, for they have been employed in special classes since the days of Itard, Seguin, Montessori, Decroly, Binet, and other exemplary teachers. However, Miss Loewy presents them clearly, dispassionately, and with unusual understanding of the nature and characteristics of the retarded child. The techniques described will probably be of greatest value to parents in helping them to meet most pressing needs. *The Retarded Child* is a worthy addition to the undernourished literature in this field.

E. L. JOHNSTONE

Woodbine, New Jersey

POLLAK, OTTO, and collaborators. *Social Science and Psychotherapy for Children.* Pp. 242. New York: Russell Sage Foundation, 1952. $4.00.

Occasionally an idea, a person, and a situation unite in achievement. This book describes one of those instances. It is a kind of landmark in applied social science.

The idea, in this instance, is that the relation of research to practice in the disciplines and professions concerned with social behavior should be improved. This is the central emphasis of the Russell Sage Foundation as pointed out by Dr. Donald Young in the Foreword. The person is Dr. Otto Pollak, the principal author of this book. The situation is that afforded by the personnel and the practice of psychoanalytically oriented child guidance at the Jewish Board of Guardians (JBG) as described by Bertram J. Black in the Introduction. The achievement consists in adapting several social science concepts (family of orientation, social interaction, socialization, cultural relativity, culture conflict, social roles, status, youth culture, and reinforcement from stimulus-response-learning theory) so that they correct and supplement psychoanalytic theory to help social caseworkers with "(a) a new type of perceptivity and (b) tools for an ordering of reality."

The various chapters, save the first and last, were written in collaboration with caseworkers from the JBG to show the implications for practice of one of these concepts and to illustrate the implications with case material. These chapters, beautifully written, show clearly the value of theoretical concepts for an art of practice when they are properly integrated. For them this book should become a widely used reference for courses in child guidance under whatever academic or institutional auspices they may be given.

The last chapter is an evaluation from the psychiatric point of view. In it Dr. M. R. Friend points out that one of the things which "social science at its present state of development can do for psychotherapeutic processes is to break down the concept of environment into its various components. The individual chapters of this book demonstrate the diversity and plurality of factors which fall under this blanket term" (p. 225). One gathers that the collaboration was judged to be successful, for he also points out: "Neither emphasis on social science concepts alone nor emphasis on psychic mechanisms alone can be considered adequate attempts at diagnosis and therapy. Only their integration can make constructive therapy" (p. 230).

In the first chapter, Dr. Pollak, the social science consultant and principal author, describes the successive decisions that led from directive to operation. These include his conception of the role of a consultant (by definition not a decision maker). He also outlines the steps used in establishing liaison between social science and child guidance practice: (a) months devoted to the consultant's getting acquainted with the work of the clinic and learning the technical terminology used by the practitioners, (b) the formulating of a tentative list of ideas about how social science could be adapted to child guidance, (c) the recognition that the body of psychoanalytic knowledge upon which the clinic staff depended was deserving of respect, (d) the effort to show how a synthesis of psychoanalytic knowledge with social science could be achieved, and (e) the choice of those areas of professional discomfort about the clinic's diagnostic and therapeutic procedures as the places to focus these efforts at synthesis. The pages devoted to these points (24–36) comprise a "book of etiquette" for consultants. They should be read by all novices attempting to play the role. The fact that Dr. Friend, clinical director of the Child Guidance Institute of JBG, recognizes (last chapter) that a social scientist entering a field of practice as a consultant can do much to "give new impetus to the expression of clinical concerns which had been somewhat dormant" attests the success of this etiquette and the spirit which must underlie it.

Dr. Friend also remarks that the effectiveness of a consultant is threatened by "the narcissism natural to every professional discipline." He, the other administrators of the JBG and the staff of the Child Guidance Institute also deserve to feel satisfaction that they were able to

achieve such "a degree of freedom from defenses that the study was possible."

It would be interesting to know if the proportion of "treatment failures" is reduced as a consequence of this broadening of the conceptual base of child guidance. But this is another venture. Whether it is reduced or not, this book describes an interesting and valuable instance of successful collaboration between social science and practice in child guidance. It should be widely read.

J. McV. HUNT

University of Illinois

SLOTKIN, J. S. *Personality Development.* Pp. x, 401. New York: Harper and Brothers, 1952. $4.50.

This is a book about personality by a social anthropologist. It is a very curious book. Most of us in the field of personality investigation would agree with Professor Slotkin's statement in his preface, "The field of personality development is in its infancy" and would find the age of the works he cites a bewildering contradiction. Half of the references are to works written or published in 1928 or earlier. Of the (by rough count) 684 references, fewer than 10 per cent (66) are to works published between 1942 and 1951, while on the other hand an equal number of references are to works dated 1600 or earlier.

Authors *not* cited by Slotkin make a list little short of a twentieth century "Who's Who in Social Psychology, Anthropology and Personality Research." For example, K. Horney, E. Fromm, A. Kardiner, C. H. Cooley, W. I. Thomas, H. S. Sullivan, M. Sherif, F. Allport, T. Newcomb, E. Hartley, K. Young, G. Murphy, K. Lewin, K. Davis, R. Merton, S. Stouffer, R. Benedict, and M. Mead are among the scores who are nowhere mentioned in this book. The lone reference to Ralph Linton is not to his stimulating and provocative little *The Cultural Background of Personality* (1945) but to *The Study of Man* (1936).

Probably the foremost publication representing the collaboration of cultural anthropologists with specialists in other disciplines in the study of personality is the symposium edited by Clyde Kluckhohn and Henry Murray, *Personality in Nature, Society and Culture* (1948). This book is not mentioned in the Slotkin volume. Thirty-seven authors contributed to the Kluckhohn-Murray volume. Of these only six are cited by Slotkin. By contrast there are *over twenty* citations of Thomas Aquinas, *fifteen* of Erasmus, and there are references to such great scientists of human behavior as Augustine, Boccaccio, Byron, Cervantes, Samuel Clemens, Descartes, Emerson, John Donne, Fichte, Hobbes, Horace, Hume, Jerome, John of Salisbury, Leibniz, Leo Hebraeus, Machiavelli, Maine de Biran, Montaigne, Nemesius, Petrarch, Rousseau, Saxo Grammaticus, Seneca, Spinoza, Swift, Thomas à Kempis, Vives—to mention only a few of the writers of earlier centuries.

It comes to this, that Professor Slotkin has every right to write a book on personality drawing chiefly on what the scholastics and other prescientists had to say about human behavior, but at least the book ought to be titled in such a way as to make clear to the purchaser what he is getting. And it is either naïve or dishonest of the author to say in the opening sentence of the preface of this book, "In this volume I have tried to develop a systematic theory of personality development, out of the hypotheses and evidence from various relevant sciences." Nowhere else in the volume that I could discover did he mention science, or give its tenets or its criteria for the admissibility of evidence—and his unqualified and indiscriminate use of materials leads one to wonder whether he is acquainted with the distinctions between scientific and folk knowledge, either in the differential manner in which each is derived or in the differential dependability of each in prediction and control. For example, there are fourteen quotations from the Itard account of the Wild Boy of Aveyron without one single question raised regarding the authenticity or dependability of the account.

The four main parts of this volume are entitled "Inheritance," "Socialization," "Culturization," and "Individualization." Socialization, however, does not mean what it usually means as employed by the social scientist, but instead the two terms —socialization and culturization—refer to the differential impact on personality of society and culture. While the distinction between society and culture is most useful for the analysis of groups, institutions, and civilizations, the distinction seems to have little if anything to offer in the way of clarifying problems in the scientific study of personality. For example, this reviewer finds it impossible to see how we might differentiate between "social selves" and "cultural selves" (Slotkin's terms) in any empirical study of self-attitudes. The whole thing moves toward absurdity when, in addition, we must differentiate "the biological selves" and "the particular selves."

The book is written in a most trying style. One or a few sentences written by the author are frequently followed by several lengthy quotes, each with its own peculiar frame of reference, often centuries and civilizations apart in context. The author does no interpreting of these quotations. This puts the reader in an almost unstructured situation.

It is possible that the use of this book as a textbook in an undergraduate course in personality would *not* develop in the student a trained incapacity to be a scientist in the study of personality. But it would come very close to it.

MANFORD KUHN

University of Iowa

GLUECK, SHELDON, and ELEANOR GLUECK. *Delinquents in the Making: Paths to Prevention.* Pp. viii, 214. New York: Harper & Brothers, 1952. $3.00.

Delinquents in the Making is a condensation for the general reader of the authors' recent technical report *Unraveling Juvenile Delinquency.* Both present findings of a ten-year inquiry into the causes of juvenile delinquency based on an analysis of the characteristics of 500 institutionalized delinquent boys and a like number of nondelinquent boys. Separate substudies were made in the fields of social work, constitutional medicine, psychology, and psychiatry.

The Gluecks, from these studies, have reached the conclusion long ago accepted by the majority of observers whose approach to delinquency research has not been warped by excessive professional myopia, that there is no unitary cause but rather that delinquency is the product of converging adverse forces. They have, however, gone beyond most of their forerunners by bringing a variety of professional disciplines into the actual research team, and they have also avoided a weakness of many other studies which gathered a wealth of data about delinquents only to discover that data about nondelinquents, necessary to filter out the traits more or less particular to delinquents, were lacking. The sample group of nondelinquents which the Gluecks studied provides this highly desirable safeguard. The Gluecks have also gone further than others in appraising the apparent causal effect of hundreds of conditions which others have considered "causes of delinquency," rejecting some so-called causes and accepting others.

In summary, the Gluecks see delinquency as being the product of defects in temperament uncontrolled by adequate parental guidance and not offset by constructive community forces. The aggressive, restless boy is more likely to get into trouble than is his more sedate neighbor, but he is less inclined to neuroticism. Given two boys of equal general intelligence, the boy whose slant is toward the concrete is a poorer risk than the boy who shows superiority in the solution of abstract problems. Chunky, muscular boys (mesomorphs) are more likely to become delinquent than are boys of other body types. Boys who have both older and younger siblings are more likely to become delinquent than their oldest or youngest brothers or than only children or children from two child families. The Rorschach test is believed to be an effective tool in identifying potential delinquents.

Agreeing with the general conclusions reached by the authors, other scholars have challenged details of the work. The structure of the sample (with the possibility that the limitation of the delinquent group to institutionalized boys created certain biases in the statistics), the depth of the psychiatric interviews, and the extent to which correctional experience has produced some of the attitudes revealed in psychiatric interviews and in the Rorschach responses, were among the aspects of the

study which reviewers of the original report *Unraveling Juvenile Delinquency* tended to question.

The Gluecks themselves make no claim of finality or conclusiveness. Their work, in its present stage, points the way to further research and deeper correlations both within the materials of their own studies and in parallel studies by other students of delinquency problems.

DOUGLAS H. MACNEIL
New Jersey Department of
Institutions and Agencies
Trenton, New Jersey

Community Services for Older People: The Chicago Plan. Prepared by the Community Project for the Aged of the Welfare Council of Metropolitan Chicago, Project Director Elizabeth Breckinridge; with a foreword by Ernest W Burgess. A Wiebold Foundation Project. Pp. xv, 240. Chicago: Wilcox & Follett Company, 1952. $3.00.

This is the record of four years of searching effort to deal with the unmet needs of older persons in metropolitan Chicago. It may be compared to the report of an exploratory mission abroad digging into rather unknown territory. The mission has returned from its investigations with an array of facts, assumptions, tentative plans; also with a substantial list of suggestions for additional fact-finding, and some changes in program.

The material is grouped around the six focal points of: Community Education (Ch. 1); Unemployment and Retirement (Ch. 2); Housing and Home Services (Ch. 3); Health (Ch. 4); Recreation and Education (Ch. 5); and Casework and Counselling (Ch. 6). In each of these areas the needs of older people, verified in different ways, are presented briefly; major attention is given to a survey of all existent community programs, actual and potential resources for older people. In most areas, and this is the rather unique aspect of the Project, some service activities—in line with tentative recommendations—were developed under Project auspices (or at least stimulated by Project findings), with some aid by Project staff.

The research aspects of the Project, obviously, had to be limited by its multiple objectives with simultaneous translation of fact-finding into community education and action consuming a substantial part of staff time. Project staff also gave some direct service to older people in an effort to meet urgent demand, largely brought into the open by the Project's widespread publicity and educational services. These activities yielded, as an important by-product, additional insight into the range of acute problems as they trouble older persons and their relatives and friends.

The report reflects these live contacts and the growing awareness of the interrelatedness of most of the needs. An initial study of the case records of 550 people (of sixty years and over), who in the spring of 1948 were actual clients of public and private social agencies in metropolitan Chicago, concentrated on defining the range and frequency of problems as brought to the agencies. Many of them were not met because the client would not "cooperate." In other instances, solutions were unknown or doubtful, but on the whole agencies showed considerable ingenuity in using a combination of community resources to meet the felt needs.

"The difficulties that agencies had in meeting the needs showed that community recourses are far from adequate in relation to all the problem categories in this Study. This conclusion is no new discovery. It has been expressed time and time again by agency workers, and by the Study Committee in the course of this research" (p. 230).

Each section of the record lists next steps and specific recommendations, often reflecting excellent common sense, for strengthening local resources. A final chapter repeats and integrates slightly all the recommendations of the Chicago Plan. It attempts, at the same time, to establish three types of priorities, but even those of the lowest ranking category "must be met before the Chicago Plan can be considered to have grown into a minimum community program" (p. 193).

The book is an interesting supplement to the growing list of field studies dealing with the aged. As a community survey with consistent attention to needs and resources of one age group only, it provides Chicago agencies with a valuable and suggestive guide for further planning and concrete program adjustments, which may also prove pertinent to a few other metropolitan areas.

Smaller communities, and those fortunately less tradition bound or less weighted by a competitive system of innumerable independent agencies, may find it possible to approach the same problems in a simpler, more organic, and more direct form. Instead of releasing their own civic creativity, they might become rather discouraged in studying the Chicago Plan.

The report should be read with care as a stimulating experience, rich in tentative plans. It will be of special advantage to those interested in community organization for social welfare. Could we possibly learn to do any better in rendering "technical aid"? If so, might the labors of this devoted group have produced more results for helping the aged, here and now? Meanwhile, we should make full and critical use of all findings, tangible products of four years of faithful co-operation between leading citizens, researchers, and professional workers—with the benefit of a one hundred thousand dollar grant of a generous foundation.

HERTHA KRAUS
Bryn Mawr College

CARR, LOWELL JUILLIARD, and JAMES EDSON STERMER. *Willow Run: A Study of Industrialization and Cultural Inadequacy.* Pp. xxii, 406. New York: Harper & Brothers, 1952. $5.00.

This book is a study of forced social change—a study of how one community readjusted to the impacts of industrialization and population invasion in wartime. Both authors took bomber jobs for several weeks in the winter of 1943–44 and lived in the area as participant observers. There was a readjustment lag involving the living conditions of the workers explained by the fact that American culture, handicapped by power politics, has no pattern of procedure for dealing with social change.

There is a description of Willow Run before the bomber plant invasion. This description goes back to the Indian days when the Potawatomies kept reappearing to "bedevil nervous housewives." Willow Run was a "semirural" community when it was invaded by "the biggest bomber plant in the world—and some tens of thousands of hillbillies, C.I.O., unionists, and transients from the end of the continent!"

Fifty-four pages were given over to appendixes including data tables, wartime population movements, statements on permanent housing, selected bibliography, and an index. Chapters 5 to 8 include the diaries of workers and investigators. Chapter 9 is the statement of "The Little Typist Who Hated Her Job." There are more than one hundred pictures, charts, graphs, and tables, but these are not listed by pages in the front of the book.

This book will have a limited value for courses in sociology on social change, the community, and methods of research. There is more criticism of conditions than objective description of interactive factors within the community.

There is some unusual terminology rarely found in social research. "Technology: outside the town more or less went to pot" (p. 9); ". . . the nation's rubber supply went glug-glug down the drain!"; "The idea . . . turned a seasick green"; "housing and community building turned out to be a mess" (p. 14); "banks flat on their faces" (p. 16); " . . . transportation facilities, a pain in the neck" (p. 16); ". . . lived where they darned pleased" (p. 65); ". . . thumbed his nose at trailer-camp law and the Washtenaw County Health Department" (p. 75); "In a community developing à la Robinson Crusoe or Herbert Spencer, low morale gets built in as inevitably as redheads get freckles" (p. 86); ". . . parked cheek by jowl with hillbillies from Tennessee and urban foreign-born mechanics from Weehawken and St. Louis" (p. 89); "in summer they fried all over" (p. 91); ". . . Willow Run Mess" (p. 203); ". . . a replica jazzed up and headlined from coast to coast" (p. 207); ". . . sent absenteeism through the roof" (p. 210); ". . . sent labor turnover likewise through the roof" (p. 210); ". . . 'the halt, the lame and the blind' from the Tennessee and Kentucky hills" (p. 211);

". . . these people bodied forth" (p. 200); ". . . Community . . . found itself pockmarked with some of the less desirable stigmata" (p. 221); ". . . technological castration" (p. 349).

STEIN, CLARENCE S. *Toward New Towns for America.* Introduction by LEWIS MUMFORD. Pp. 245. Chicago: Public Administration Service, 1951. $5.00.

That one architect-planner should be intimately associated with most of the significant plans for community building in his country and generation may seem surprising if viewed as coincidence. Clarence Stein's book reveals the reason: the intellectual and social leadership of a strong, sensitive, and inventive personality consistently following an ideal and developing a principle. That ideal is the building of an appropriate setting for the lives of people, well adjusted to their ways of living in modern times.

The principle of community design which Mr. Stein unfolds cannot be stated simply, for it is not a formula. Its growth and change can be followed in this volume from the early experiment at Sunnyside Gardens in Queens, New York, where houses were turned around to face upon a garden court within a hard, rectangular street pattern, through a succession of communities to Baldwin Hills Village on the other side of the continent. Radburn, in New Jersey, conceived and partly built as a "town for the motor age"; Chatham Village of Pittsburgh, so beautifully married to the site that it remains one of our loveliest developments; Phipps Garden Apartments and Hillside Homes in New York—all were proving grounds for components of the principle. The Greenbelt towns of the Resettlement Administration: Greenbelt, near Washington, Greenhills near Cincinnati, and Greendale near Milwaukee, taking their inspiration from the British Garden City idea, added the element of a permanent "green belt" of open space to protect the planned community and integrate it with the natural environment.

But to Stein, the ideal remains not yet fully attained and the principle is still growing and developing. He challenges the future, and, at the same time, helps its accomplishment through clear-eyed analysis of the intentions and the assumptions, the accomplishments, and the limiting circumstances, which were a part of the experience in these communities.

Both narrative and evaluation, the book illustrates techniques of analysis valuable to students and practitioners; and it is richly illustrated with plans and photographs. A foreword by Lewis Mumford, ostensibly to portray the setting of Stein's work from the point of view of a close friend and associate, is a worthy essay in the philosophy of community building.

The remarkable and fortunate fact is that Clarence Stein has set down and evaluated his experience in what Mumford called the "preliminary studies for the new towns that a bolder and more humane generation, less victimized by the false gods of finance, will eventually build."

WINSLOW, C.-E. A. *The Cost of Sickness and the Price of Health.* Pp. 106. Geneva: World Health Organization (Monograph Series No. 7), 1951. $1.50.

A sound health policy combined with resolute steps for the improvement of socioeconomic conditions offers immense opportunities to reduce economic losses as well as human suffering caused by illness, to increase man's vigor and productivity, and to promote national prosperity. The heart and center of a forward-looking health program is prevention of the occurrence of those diseases which can be prevented with the knowledge at our disposal and prevention of serious stages, complications, and prolonged illness through early diagnosis and prompt treatment of any condition. The cost of a well-conceived and properly organized preventive health service is small compared with the staggering financial burden imposed on the human race by needless disability and death. These are the major themes of Professor Winslow's monograph prepared for the World Health Organization.

In four brief and concise chapters the author reviews and summarizes estimates on the cost of sickness, the methods employed and achievements attained in reducing the burden of disease, the problems of planning national health programs and their costs, and the available information on the interrelationships of poverty and disease. He offers a wealth of illustrative material drawn from a large number of countries. The leitmotiv "prevention is not only better than cure; it is also cheaper than cure" (p. 10) reappears in each of these four chapters and is carried to a climax in the concluding section dealing with the development of international co-operation in promoting organized health service under the Technical Assistance Program.

A book covering such a vast ground and, naturally, containing much technical matter might be criticized by narrow specialists for weaknesses in detail. Such an attitude would be utterly unfair. Professor Winslow does more than submit a technical report both on the striking accomplishments in some countries and on society's sins of omission in applying available scientific knowledge to the control of preventable diseases. He interprets and re-emphasizes fundamental concepts and principles of prudent action, displaying remarkable breadth of erudition and skill of presentation. He refrains from painting fluffy silver-clouds only and, realistically, shows the heavy fog of ignorance, indifference, and defeatism as well. Again and again Professor Winslow admonishes the experts to ponder anew and where indicated offers constructive criticism of his own. Forcefully he exhorts those responsible for the public health in every nation to do what can be done today to preserve and enhance modern society's most precious capital, man. FRANZ GOLDMANN, M.D.
Harvard University

EARLE, CLIFFORD J. *How to Help an Alcoholic.* Fifth publication of The Westminster Pastoral Aid Books. Pp. 96. Philadelphia: Westminster Press, 1952. $1.50.

Clifford Earle, secretary of the Division of Social Education and Action of the Presbyterian Board of Christian Education, now presents his second book dealing with the problems of alcohol, this one on alcoholism. The present volume describes a few typical alcoholics and their problems, notes the extent of alcoholism and the proportion of alcoholics and problem drinkers to all drinkers. There follow chapters dealing with the manifest behavioral symptoms accompanying progression in the illness, probable factors in its development, current treatments, what the friends and relatives should avoid doing, useful steps they may take, the role of religion in recovery, and reports of members of Alcoholics Anonymous.

This little book has several advantages over many volumes published in the past five years on alcoholism. It is brief, modest, written in simple style, not argumentative, and it promises to be of help to family and friends of the alcoholic as well as to ministers who meet the problem in their parishes. Some criticisms might be made on rather technical grounds, but only one would appear to this reviewer as meriting comment—namely, the thesis that more than half of all alcoholics become such because of their drinking.

Scientifically such a proposition is invalid for the reason that drinking manifestly does not have this effect on more than 90 per cent of all drinkers; the drinking of alcoholic beverages as a single factor obviously cannot explain alcoholism. Therapeutically such a statement is most unwise since it implies that more than half the alcoholics need only stop drinking to recover from the condition—an implication the author has denied by the entire tenor of his book. Other criticisms are not only minor but somewhat irrelevant. This is not a scientific treatise and makes no pretensions in this direction. It is intended to help people, and this it will do.

The book will be a surprise to those individuals who may feel that American Protestant churches are by definition "Dry" and furthermore are prone to emotional intemperance and intellectual rigidity in their adherence to that position. This book is only one evidence among many that caricatures of Prohibitionists of 25 to 100 years ago are quite inapplicable to the

greater part of church thinking and action today. There is full realization of the complexity of problems related to alcohol, a discriminating perception of differences among those problems, a mature understanding of the need for greater knowledge and for patience, a recognition of pertinent resources of the church as well as recognition of the appropriate resources of other institutions and groups in meeting these problems. The position of voluntary individual abstinence is urged on grounds of prudence for the self and, more importantly, of responsible care for others in the Christian community—others who may be hurt by the example set by moderate drinkers.

In viewing the serious and extensive fact of alcoholism as a challenge and responsibility for which the church has both general and specific resources, Clifford Earle has made a contribution not only to the meeting of the problems of alcoholism but also to the church in its application of religious strength to the solution of problems of our time.

SELDEN D. BACON
Yale University

TAX, SOL, and members of the Viking Fund Seminar on Middle American Ethnology. *Heritage of Conquest: The Ethnology of Middle America.* Pp. 312. Glencoe, Ill.: The Free Press, 1952. $5.00.

This is an unusual volume, embodying the efforts of a group of students of the cultures of one area of the world to present not only some conclusions about those cultures, but also to make clear the manner of arriving at their agreements and to give us the stimulating loose ends of thought and interpretation which the summary conclusions do not reveal. It is to be hoped that it sets up a model for publications of similar type in other social science fields, for it tells more about the existing state of knowledge and represents more truly the method of science than do the usual neatly packaged symposia.

The book is in large part a summary of the large amount of ethnographic description and anthropological interpretation which has been carried out in central and southern Mexico and in Guatemala during the past quarter century. Most of the Latin American and North American investigators who have participated are among the contributors: Ralph Beals, Julio de la Fuente, Paul Kirchoff, Wigberto Jimenez Moreno, J. Alden Mason, Robert Redfield, Sol Tax, Alfonso Villa Rojas, Nathan L. Whetten, and twenty-three others. There is a chapter each on economy and technology, ethnic relations, social organization, the supernatural world, religious and political organization, the life cycle, ethos and cultural aspects of personality, and acculturation. The whole is preceded by a chapter on "General Characteristics of Present-Day Mesoamerican Indian Society" by Redfield and Tax. This eight-page summary is a remarkable item —as dry and nearly as abstract as a mathematical formula, and useful in a similar way. It in itself is indicative of the scientific coming of age of cultural anthropology.

This is a specialists' volume, not a simplified account of a field of knowledge for laymen. Its great value lies in its delineation of the problems by which the ethnologists and social anthropologists who are carrying on work in Middle American cultures orient their research. They seem to be concerned ultimately with explaining the variations which exist as between central Mexicans and highland Guatemalans, between Yucatecs and the people of the Isthmus of Tehuantepec, and so on. To explain the differences they have first to define precisely the varying cultural patterns and next to determine the factors making for the differences. It is in the definition of the patterns that they succeed best, but they also agree more or less that three sets of factors explain the differences: (1) the habitat whether highland or lowland, (2) the influence of the early distinct cultural heritages from Mayas and Aztecs, and (3) the nature of the contact continuum between Spaniards and Indians. They emerge with the beginnings, but only the beginnings, of a sort of classification of the varieties of cultural systems in terms of which the modern peoples live. In doing this they offer a basis for understanding economic, political, and other events in nonurban Middle America.

As John Gillin, one of the participants, said at the close of the seminar: "This Seminar has been primarily concerned with modern Indian cultures, but this is only one kind of culture. We have at least half the population of Guatemala and probably two-thirds at least in Mexico who are modern Latin American, or whatever we want to call them. This culture has to be understood too, and it will probably be soon because of international policy . . . if anthropologists do not take the responsibility of trying to define the basis of modern Latin American cultures, someone else will have to do it. I don't think anthropology can do the job alone. My plea is for several approaches to be used so that we can understand what this whole culture situation is now and in what direction it is moving. Studies of modern area are now under way in Japan; several of the modern contemporary cultures of Europe are under study . . . Russia, for example—and in all of these, not only traditional ethnological material but everything that can be gathered from the social sciences and the humanities is centered or concentrated on the focal problem."

EDWARD H. SPICER
University of Arizona

FENLASON, ANNE F. *Essentials in Interviewing: For the Interviewer Offering Professional Services.* Pp. xiii, 352. New York: Harper & Brothers, 1952. $4.00.

This text is one of the "Harper's Social Science Series" under the editorship of F. Stuart Chapin. It is divided into two parts of almost equal length; the first part deals with the theory of interviewing, and the second part presents some illustrative material for class discussion.

Although the author, who was a professor of social casework at the University of Minnesota, describes interviewing as "a tool common to many professions" and uses documentary material from other professions, the text is obviously intended for students in social casework. The interview is presented as a "purposeful conversation," therapeutic in itself rather than a method of obtaining accurate and verifiable data upon which to form professional judgments. In some treatment situations, as for instance child guidance clinics or family service agencies, this concept of the interview may be sound; however, the question may be raised as to whether it is the proper orientation for the prospective public assistance worker whose first objective is the prompt establishment of eligibility.

The understanding and feeling of the interviewer are emphasized. Chapter four explains how the "worker's attitude plays a major part in the success or failure of an interview," and that "working with human beings demands that the worker have an articulate and integrated personal and social philosophy. His practice involves both theoretical and practical ethical considerations." Since the "interviewer does not observe in the scientific sense of observing," there is practically no mention of the possibilities of improving the methods of interviewing through research of the process.

The insight needed by the interviewer, according to the author, comes from accepting a series of nineteen concepts, presented in chapter one on cultural backgrounds and in chapter two on the dynamics of human behavior. Many of these concepts are not scientifically proven generalizations and do not have universal acceptance among anthropologists, psychologists, and social caseworkers.

In chapter three entitled "Essentials of the Interviewing Method," two edited interviews by teacher counselors with disturbed adolescents are analyzed. In neither case is it clear that the interview achieved its purpose or that the method of interviewing was sound or unsound. It would seem to have been sounder pedagogically if the author had analyzed interviews of an experienced, professionally trained social case worker with expressed judgments as to the soundness of the method employed.

The second part of the book consists of illustrations of some of the concepts mentioned earlier in the text and examples of conferences and interviews. These are interlarded with questions designed to draw

out the student as to how he thinks and feels about the material.

RALPH CARR FLETCHER
University of Michigan

BOWER, WILLIAM CLAYTON. *Moral and Spiritual Values in Education.* Pp. xv, 214. Lexington: University of Kentucky Press, 1952. $3.50.

During the past decade thoughtful persons throughout the United States have manifested a growing concern about the emphasis on values in education. They recognize that the secularization of the public schools has been due chiefly to sectarian competition and divisiveness, not to hostility to religion as such. Accepting as they do the principle of the separation of church and state, they are searching earnestly to fill in the vacuum which has been created in the entire realm of values.

There are encouraging developments which begin to point toward a solution. In 1944 the American Council on Education appointed a representative committee of leaders interested in both religion and education. The first report of the committee, *The Relation of Religion to Public Education: The Basic Principles, 1947,* presents a sound orientation to the secularization of Western civilization and stands forthrightly for study *about* religion and religious institutions in the regular school curriculum.

Perhaps the document which has arrested the widest attention of the public, however, is that of the Educational Policies Commission of the National Education Association. Its *Moral and Spiritual Values in the Public Schools, 1950,* asserts that no society can survive without a moral order, delineates the major values upon which virtually all Americans are agreed, and presents in broad outline the role of the schools in inculcating these values.

William Clayton Bower's *Moral and Spiritual Values in Education* is the most important contribution to this growing literature which has appeared since the pronouncements of the American Council on Education and the Educational Policies Commission. Here is an inspiring account of what has been done in Kentucky where the State Department of Education, the University of Kentucky, a number of public schools, and many citizens have developed a program of action research in education for values.

Dr. Bower's book states the problem admirably and in terms which are understandable to citizens and teachers. He proposes and analyzes a basic philosophy which is true in every aspect to the American scene. He says "the discovery and development of moral and spiritual values is not something that can be done *to* pupils or *for* pupils. It is something that can be done only *with* pupils." Here we have an insight which is sound psychologically and true to the democratic ideals. One is not surprised, therefore, to find as a central emphasis that moral and spiritual values are inherent in the school environment and curriculum.

Moral and Spiritual Values in Education is not a blueprint of a plan to be adopted uncritically by a community and its schools. Nevertheless, Part III, "Techniques of a Program of Emphasis," which reports the developments in the Kentucky experiment, is replete with ideas and suggestions which no community concerned with improving its program of moral and spiritual values—and what community isn't?—can afford to overlook.

Washington, D. C.

MONROE, WALTER S. *Teaching-Learning Theory and Teacher Education, 1890–1950.* Pp. vii, 426. Urbana: University of Illinois Press, 1952. $6.50.

Students who used Monroe's famous *History of Education* as a text will remember the author's careful organization of the material and his meticulous care in citing and relating varying points of view. This volume is of the same high quality of scholarship but limited to the two related fields: the theory of learning and teaching and the evolution of purposes and practices in teacher education. Although the major portion of the work is devoted to the period 1890 to 1950, a sufficient amount of earlier developments are described to put this period in its historical perspective.

One of the significant contributions of this volume is its comprehensiveness in covering the literature in the field and analyzing it in terms of basic controversies and resulting trends. For example, in the author's analysis of the development of the learning-teaching theory, he quotes from many writers to illustrate the conflicts among the four general ideas: (a) developing powers of the mind; (b) teaching subject matter; (c) directing learning activities; and (d) guiding pupil experiencing.

An interesting analysis is given of some of the heated controversies such as: teaching as an art vs. teaching as a science; the subject-matter specialist versus the expert in methodology; and the separate courses versus an integrated program of teacher education.

Not only does Dr. Monroe summarize the publications of individuals, commissions, special committees, and organizations, but he includes also excellent analyses of the development of teacher training institutions and of courses and programs at both the undergraduate and graduate levels. The only omission, and that by design, is the development of in-service education of teachers.

After analyzing so many points of view, it is interesting and significant that the author concludes as follows as to whether or not a sound teacher education program has developed:

"We may note the tendency during recent years to get away from the either-or point of view in our thinking. . . . The present writer is inclined to characterize the current status as that of the 'unanimity of the wise' or at least as the beginning of that stage. In practice, however, there is still 'disagreement of the inquiring.'"

FRANCIS J. BROWN
American Council on Education
Washington, D. C.

PHILOSOPHY AND RELIGION

VON WRIGHT, GEORG HENRIK. *A Treatise on Induction and Probability.* Pp. 310. New York: Harcourt, Brace & Co., 1952. $5.00.

In the history of philosophy two major crises have emerged: the first arose in connection with Zeno's paradoxes of motion, and the second was provided by David Hume's attack upon the idea of necessary causal connections. Ever since the appearance of these two destructive arguments, philosophers have been trying to refute the negative positions of Zeno and Hume. In connection with the second crisis, some writers have described the status of empirical logic as a "scandal," and have sought to escape the "intellectual suicide" of Humean skepticism by developing a logic of induction that restores our confidence in the possibility of a methodology of natural science. To this category of investigation the present work belongs.

The author of this book, a professor of philosophy at Cambridge University, hopes to contribute to the opening of a new era in the development of the logic of induction. He believes that the main defect of most investigations into the nature of scientific thinking is that of oversimplification. In correcting this defect, von Wright employs the methods of modern symbolic logic in the analysis of inductive reasoning. Starting from the traditional division of human knowledge into two branches—formal truth and material truth—Professor von Wright examines how we proceed in the field of material truth in deriving those propositions which are anticipations of the future, including here those general applications which are called "laws of nature."

The author does not agree that the "logic of induction" implies the possibility of a "logic of discovery"; this is a mistake that has its roots in the history of the subject. After isolating the major problems, (1) the psychological problem of the origin of inductive inferences, (2) the logical problem of analyzing the inferential mechanism of induction, and (3) the philosophical problem of the justification of induction, the author proceeds to examine the various views held, especially the probabilistic approach in its various forms as promulgated by Keynes, von Mises, Reichenbach, Carnap, and others.

The author follows this viewpoint but develops further the idea that increase in

probability reflects an underlying process of elimination. He provides a thorough analysis of the logical mechanism of the elimination of alternatives and develops an extended form of the Bacon-Mill logic of induction.

The treatment in this book is quite abstract—singularly lacking in concrete illustrative material from the natural sciences—but the author promises to compensate for this "narrowness" in later studies. One must therefore reserve judgment concerning the validity of this approach until the full story is in. It seems unfortunate, however, that the possibilities of a multivalued logic (as an alternative to the two-valued logic of "true" and "false") is not explored, especially in relation to the calculus of probabilities. One may also express regret that there is no reference to Dewey's approach in his *Logic, The Theory of Inquiry*, where the whole problem of the relation between formal and material logic (deductive and inductive inference) is restated and many traditional issues are circumvented. The author's views will be important to the professional logicians, but of little help to the practicing scientists.

OLIVER L. REISER
University of Pittsburgh

WILLIAMS, GARDNER. *Humanistic Ethics.* Pp. xii, 223. New York: Philosophical Library, 1951. $3.75.

Professor Williams has written a breviary of positivism as the religion of modern man. The tenets of that creed are put together into an orderly sequence. Brief arguments expound rather than prove the articles of a radically secular faith. Hardly an attempt is made to render them plausible by defending them against possible objections. In the place of demonstration an appeal is made to the reader's willingness to believe.

A credo need not shrink from absurdity, and assuredly the one before us does not. Yet it differs from most other creeds by its insistence on its own alleged rationality. This is its peculiar absurdity. "Hedonic individual relativism," a kind of Epicureanism, is laid down as a first law. At the same time altruism is called a duty. This, however, is no reason for alarm to the practitioners of the maxim "good is what pleases me." The word duty as used here does strike us with that familiar harsh and demanding ring. It is reassuring to learn that helping others is a moral imperative for the individual only "whenever it will satisfy him most deeply in the long run" (p. 33).

Positivistic or "naturalistic" philosophy, as the author conceives it, provides the means of formulating the principles of "Basic Religion." Teaching that religion seems to him a matter of great importance, and he thinks that "Churches are especially designed for it" (p. 213). But churches, in our part of the world, are generally designed for Christian worship, a religion brushed aside by the authoritative assertion: "The alleged supernatural is fictitious" (p. 213). According to a conviction widely shared by philosophers both pagan and Christian, the good, in order to be truly good, must be done for its own sake. The writer disagrees: an individual "will help others as means to getting help from them in return. This is ethical" (p. 33).

So we arrive, however reluctantly, at the conclusions that the writer's rationality is not sufficiently reasonable, his ethics not quite ethical enough, his religion the abrogation of religion, and that the modern man for whose benefit he preaches his gospel belongs to a nearly extinct and little regretted race.

HELMUT KUHN
University of Erlangen

WILLIAMS, DAVID RHYS. *World Religions and the Hope for Peace.* Pp. xiv, 221. Boston: Beacon Press, 1951. $2.75.

This popular exposition by a religious liberal of the lives and teachings of some of the significant prophets of mankind and founders of its faiths may be construed as an inspirational presentation of the elements of comparative religion through significant personalities. The volume purports to discover a spiritual dynamic as the basis of world understanding and cooperation. Dr. Williams' endeavor springs

out of the faith basic to religious liberalism that in the diverse religions there are enough common elements to "enable the nations of the world to understand one another's systems of values and to lay upon them the moral obligation to keep on striving for a just and durable peace." Thus this explication of the postulate of a great accord vibrating through the world's religions constitutes a tract for the times. At its heart is a deep conviction that such knowledge of basic ideals and professions of the various peoples of the earth is indispensable if world co-operation is to be achieved.

Eighteen charismatic personalities from a variety of world cultures are studied, not all of whom, incidentally, are in the category of religious prophets or founders (for example, Socrates, Asoka, Marx, and Gandhi). Yet all of them have contributed to the great world religions somehow or have set into vibration profound currents of historical change comparable to those stimulated by religion. The Chinese culture complex is revealed in three great spiritual powers: Confucius, apostle of reasonableness, Lao-tzu, exponent of the inner life, and the political philosopher, Mo Ti, who stressed the will to peace. India is revealed through Buddha and his eightfold path, Krishna and the law of compensation, and King Asoka, author of the rock edicts. Ikhnaton, Zoroaster, Socrates, and Marcus Aurelius speak for their respective civilizations. Judaism is reviewed in a chapter on the Hebrew prophets and the heart of religion. The contribution of Christianity is revealed in analyses of Jesus and Francis of Assisi; and Islam is expounded in a review of Mohammed. More recent religious movements are surveyed in chapters devoted to Bahaullah and world federation and to Mary Baker Eddy and the conquest of fear. The great quasi-religious dynamic of communism is delineated in an analysis of Karl Marx and the religion of communism; and the *élan* of the twentieth century nationalism of colonial peoples receives exposition in the treatment of Gandhi and the power of soul force.

Stress is laid on the universality of certain religious strivings—the golden rule and the hope of immortality—as the basis of unified effort in behalf of a united world. On the other hand Dr. Williams notes that religious liberalism, based on the operation of the free mind principle, is the only foundation for a new world order. The final chapters of the volume are devoted to a lucid summarization of the essence of religious liberalism. Throughout Dr. Williams displays a large-minded internationalist perspective made possible by liberal religious faith, which enables a reasonable, functional approach to problems. At the heart of his attitude is the principle of universal toleration—the will to respect one another's rights in spite of all differences as the minimum requirement. Dr. Williams expresses the profound conviction that the religious (or philosophical) foundation of New World Order involves some such envisagement of common needs of mankind and expanding vision; and that this is the inevitable philosophy behind any step toward federation and international action.

As the goal of the book is to serve as a popular inspirational introduction to comparative religion and as an appeal for the affirmation of world unity, one must not seek in it any far-reaching sociological or metaphysical analysis. Welcome must be accorded it as a genial, aspiring treatment by a religious liberal of the great theme of the possible unification of mankind. Were it possible to demonstrate that nine-tenths of the human race is familiar with the religious ideals dominant in the North American culture pattern, it would be an encouraging argument in behalf of expanding world unity. Yet the basic thesis as to the identity of values in the world's religions may be challenged. Dr. Williams himself admits that the cleavage between communist and noncommunist worlds is difficult to transcend, and that the cleft between liberalism and totalitarianism may even be less possible to bridge over. Indeed, may not the question be raised—without implying that religion is the sole or primary factor in historical causation—to what extent some of the religious values construed by Dr. Williams as the basis of

world unity are themselves the *fons et origo* of various totalitarian, antidemocratic, and antiliberal trends abroad in the world today?

EPHRAIM FISCHOFF
American International College
Springfield, Massachusetts

O'NEILL, JAMES M. *Catholicism and American Freedom.* Pp. xii, 287. New York: Harper & Brothers, 1952. $3.50.

There is an old story coming from the early days in the West, where a judge, having heard an eloquent plea from the plaintiff's lawyer, turned to the other side and said: "The Court has no desire to hear from the defendant; to hear both sides has a tendency to confuse the Court."

O'Neill's book, *Catholicism and American Freedom,* is an answer to Paul Blanshard. Society owes a debt to O'Neill for having written this book, for obviously the intelligent way to meet opposition is by the presentation of the other side, and it is clear that O'Neill was the man to make this presentation. This is particularly so, not only because O'Neill is a Catholic and a scholar, but because his general attitude toward democracy is emphasized by the fact that he was at one time chairman of the Academic Freedom Committee of the American Civil Liberties Union.

When, a few years ago, the schools of New York refused to renew their subscriptions to the *Nation* on the ground that articles of Paul Blanshard (later, his book *American Freedom and Catholic Power*) might offend Catholics in the community, there were strong protests from many sources. My own view was that the Catholics, instead of attacking the publisher, should answer the Blanshard articles. This Mr. O'Neill has done, and done effectively.

At times O'Neill writes with considerable heat and bitterness on the assumption that Blanshard attacked the patriotism or the "Americanism," whatever that might mean, of Catholics. Blanshard denies this. He contends that the Catholic hierachy engages in politics and that many of the doctrines of the Catholic Church are contrary to what Blanshard and a good many of the rest of us regard as best for the country. However, any fair-minded man must realize that we are talking of our own brand of Americanism, and of what *we* may think is best for the country. Mr. O'Neill and some of his fellow Catholics have their own brand of Americanism which, in some respects though not in fundamentals, is different from ours.

Mr. O'Neill questions the authorities on which Blanshard relies, many of them men and Catholics of eminence. More effective, however, it seems to me, is his emphasis on the fact that the very differences among the Catholics show the unfairness of a claim of universal approval by the Church of many of the things which Mr. Blanshard attacks. O'Neill points out that the Catholic Church takes an authoritative stand only on matters which it regards as involving moral questions.

It is unfortunate that because of these differences anybody would question the loyalty, the patriotism, or the good faith of those with whom he differs. The health of our country and its institutions will continue only so long as we recognize that the law concerns acts, not views or opinions, and that all individuals and groups under a democratic system have a right to use such pressures as they can to make their views prevail.

ARTHUR GARFIELD HAYS
New York City

KAGAN, HENRY ENOCH. *Changing the Attitude of Christian Toward Jew: A Psychological Approach Through Religion.* Pp. xvi, 155. New York: Columbia University Press, 1952. $2.75.

Rabbi Kagan's study of ways that Christian misconceptions about Jews may best be transformed into constructive understanding is an original contribution. It is a guidepost for religious leaders and educators. Dr. Kagan tested the tools that may repair interreligious prejudice and has given us evidence of which are the most effective.

Roger Williams Straus, in the preface of his thoughtful book of essays on *Religious Liberty and Democracy*, pointed out how necessary it is "that proper techniques be developed to advance the cause of brotherly love." This book heeds this admonition.

In his study, Rabbi Kagan reports the results of work with 525 young men and women belonging to the Methodist and Episcopal churches. Working with these young people in summer camps, Dr. Kagan tested the effectiveness of several techniques intended to reduce the prejudice of Christian toward Jew. In the process of his study a special test was given to each Christian young person to identify his attitudes toward Jews. After administration of the test, three different methods were used experimentally in attempting to reduce revealed prejudice. After these methods had been applied, attitudes were again tested in order to determine which of three approaches appeared to yield the best results in terms of constructive understanding.

Rabbi Kagan called his three approaches the indirect method, the direct method and the focused interview. The indirect method called for traditional, factual teaching *about* Jews and the Jewish heritage. No effort was made to discuss anti-Semitism or attitudes toward Jews. The second method, termed direct, brought into the study group a frank discussion of contemporary anti-Jewish attitudes and opportunities for students to discuss their own feelings and possible hostility toward Jews. The third method, the focused interview, called for supplementing the indirect approach with individual interviews between the Jewish teacher and the Christian student in which a direct discussion of anti-Semitism was undertaken. Rabbi Kagan has described these methods in detail, providing case histories, records of discussion, and detailed statistics.

From his study of these three methods, the author derived strong evidence in favor of the direct method. Certainly Rabbi Kagan's study with a small number of cases must withstand the scrutiny of critical examination by all who are interested in the improvement of intergroup relations. It seems clear, however, as Professor Gordon W. Allport has said, that "the results already create grave difficulty for those who hold that the most effective way to handle prejudice is to overlook its existence or to engage merely in factual education that will blanket—and presumably smother—hostile attitudes."

COMMONWEALTH OF NATIONS

CONE, CARL B. *Torchbearer of Freedom: The Influence of Richard Price on Eighteenth Century Thought.* Pp. 209. Lexington: University of Kentucky Press, 1952. $3.75.

The obituary notice in the *Gentleman's Magazine* on the death of Dr. Richard Price predicted that his name would be recorded with those of Franklin, Washington, Lafayette, and Paine. Condorcet spoke of him as "one of the most formative minds of the century." And yet Dr. Price would probably be completely forgotten today if he had not been the subject of Burke's attack in his *Reflections on the French Revolution.* We are therefore indebted to Professor Cone for resurrecting the memory of an important eighteenth century character.

The younger son of a substantial Welsh family with strong dissenting beliefs, Richard Price entered the ministry and spent his life in London as a preacher (usually a dull one), a moral philosopher, and a political and financial pamphleteer. This combination of interests would be strange indeed, were it not for a unity of purpose which inspired all his work—a passionate devotion to human liberty.

His theological position, stated in his first book which appeared in 1758, contains the basis of his political views. The virtuous man obeying God's law had freedom of action and will. It would therefore follow that he must be free in his political life. So also a mathematical flair made it possible to take an interest in life insurance and the national debt, for the benefit and the greater freedom of his fellow-men.

Most important was Price's fearless advocacy of the American and French revolutionaries. His pamphlet, *Observations*

on the Nature of Civil Liberty, the Principles of Government, and the Justice and Policy of the War with America, was published in 1776. It was a best-seller on both sides of the Atlantic; but unfortunately it had no effect on government policy. Price's famous sermon delivered at the Old Jewry Chapel on November 4, 1789, did not even have popular support. Instead, it led to Burke's more famous reply. Fortunately for his peace of mind, Dr. Price died six months after the publication of his sermon.

To his contemporaries he was known as "good Dr. Price" and as the "Father of Mankind." He was indeed a loving husband and a loyal friend, and, in the words of Joseph Priestley, he possessed "the most amiable simplicity of character." Professor Cone, avoiding undue adulation, has written a sympathetic account of a man with strong liberal opinions and a courageous heart. In eighteenth century terms, Dr. Price "deserves well of posterity," and his biographer has given him that due.

E. A. BELLER
Princeton University

FORBES, DUNCAN. *The Liberal Anglican Idea of History.* Pp. x, 208. New York: Cambridge University Press, 1952. $4.00.

"A conception of history which was practical, yet not Rationalist . . . which was Romantic, yet concerned with general laws and based on critical scholarship, which was related to an organic conception of the state, and which was deeply religious, the Liberal Anglicans discovered in the German historical movement, and in Vico who stood behind it." In these words Mr. Forbes characterizes a distinct school of British nineteenth century historians, including Thomas Arnold of Rugby, Richard Whately, the Hares, Connop Thirlwall, and Henry Hart Milman, who have never before been given detailed consideration as a group; though, of course, they have been discussed as individual practitioners of history, both ancient and ecclesiastical. Like the Anglican Church itself, they took the middle path between extremes, avoiding the abstract theorizing of the eighteenth century rationalists and the refusal to generalize of the mere factual chronicler, though Mr. Forbes deals rather with their philosophy of history than with their success or failure as narrators of events. In many ways they seem highly modern and pragmatic, and Arnold, in particular, is rescued from Lytton Strachey's too familiar "caricature" (p. 111).

One of the most interesting aspects of the Liberal Anglican approach was its rejection of the conventional division of history into ancient and modern, and the substitution of primitive and sophisticated phases for *each* culture. To them, history went in cycles of barbarism, civilization, and decadence—inevitable for nations, though Christianity could rescue individuals, and perhaps humanity as a whole, from this fate (pp. 56–60). The Old Testament is not a model to us, for its virtues and vices were those of a crude and primitive age (pp. 76–77), and it is unjust to judge Abraham and Joshua by nineteenth century standards. The Roman Catholic Church in the Middle Ages was, on the whole, a great good to mankind; but it was better suited to the "childhood" of the Teutonic nations than for their present manhood. As Arnold put it, "The mere change of time and circumstances may alter the character of the same party, without any change on its own part; its triumph may be at one time an evil and at another time a good" (p. 90). Thus democracy is neither good nor bad in itself; one can only say that it is well- or ill-adapted to a particular stage of social development.

FINBERG, H. P. R. *Tavistock Abbey: A Study in the Social and Economic History of Devon.* Pp. xi, 320. New York: Cambridge University Press, 1952. $5.00.

This volume is the second in the new series of "Cambridge Studies in Medieval Life and Thought." The first series was inaugurated by the late G. G. Coulton in 1920. It contained fourteen volumes. The new series is being edited by Professor David Knowles.

The abbey of Tavistock was founded in 968, when the old monastery at Exeter was revived under Abbot Sideman. It was an old English foundation, established by King Edgar and his ministers as one of numerous Benedictine houses scattered throughout the realm. Here learned and pious monks would contribute much to religion and scholarship, while at the same time this institution could be depended upon to administer a large estate in close relation to the Crown. It was situated across the river Tamar from the County of Cornwall in the extreme western portion of Devon, the third largest county in England.

The author has reconstructed not only the first history of an important abbey but also of the social and economic developments in Devonshire from the second half of the tenth century until the dissolution of the abbey in 1539. He was obliged to study a large number of separate accounts, since the register of the abbey disappeared in the eighteenth century and a chronicle, if ever written by the monks of Tavistock, is also missing.

This monograph has been carefully written and published. Its index and documentation are excellent, while the map provided for the convenience of the reader and the two helpful illustrations render the volume highly useful. Among the topics treated in the ten chapters are the endowments of the abbey, the agrarian landscape, the social structure, the monastic economy, and the final dissolution at the order of King Henry VIII. Numerous tables in the text indicate how much grain was produced by the monks and how cattle flourished there. The whole study is a credit to both author and editor. It should also be noted that among the four admirable appendixes there is one which deals with the printing press at Tavistock. This alone is a significant contribution to our knowledge of English civilization in early modern times.

ALBERT HYMA
University of Michigan

DE JOUVENEL, BERTRAND. *The Ethics of Redistribution.* Pp. ix, 91. London and New York: Cambridge University Press, 1952. $1.75.

The new book by Baron de Jouvenel, author of *Power* and of *Problems of Socialist England,* contains again an eloquent defense of the conservative point of view. The little book is based on a number of lectures given by the author at Cambridge University in the fall of 1949. The first lecture treats of "The Socialist Ideal," the second of "State Expenditure." There is an appendix on "The Potentialities of Pure Redistribution." The work by no means supersedes the great antisocialist documents of our generation: Mises' monumental treatise, now thirty years old and again available in a new edition, and the prophetic essay on "The Era of Tyrannies" by Élie Halévy, the Frenchman who was so profound a student of British institutions.

The welfare state, as it has emerged in Britain, provides subsidies for education, housing, and food, as well as a comprehensive social-security scheme. The resulting reduction of pronounced inequalities in consumption standards is accompanied by drastic taxation. Mr. de Jouvenel intentionally does not concern himself with the effects of such taxation on incentive and production. His critique of the redistributive aspects of the welfare state is based on the identification of the latter with a socialism of inferior variety. The ideal of more equal consumption appears to him as a perversion of the "original socialist ideal" of "fair rewards and brotherly love," where "material goods are shared without question *because* they are spurned." This seems to me an interpretation more germane to the austerity of Plato's ideal state and similar types of social organization than to the utilitarian wellsprings of British socialism. As to fairness of rewards, the author is critical of the leveling tendency afoot in modern societies, contrasting it with rewards proportionate to individual endeavor as well as with rewards proportionate to the services received by the community. He does not inform the reader, however, how a conception of justice other than one of equality could be made operational.

Mr. de Jouvenel then goes on to distinguish between relief—"an unquestionable social obligation . . . laid on the State for want of any other agency"—and the raising of median working incomes, and he

questions whether policies of redistribution are the best means of dealing with the latter problem. His discussion brings out a number of interesting points: the small amount of income available for redistribution, the need for investment in élites as well as in capital, the increasing power of the government if it is to assume functions formerly fulfilled by people of large means. Last but not least, there are a number of illuminating remarks on the role of the modern corporation.

The book is well written, and teachers of courses on current economic problems, contemporary economic systems, and the like will want to consider it for inclusion in their list of collateral readings.

HENRY WILLIAM SPIEGEL
The Catholic University of America

GRENFELL, RUSSELL. *Main Fleet to Singapore*. Pp. 238. New York: The Macmillan Company, 1952. $3.75.

The book under review is a story of three tragic disasters for Great Britain in World War II: (1) the sinking of the *Repulse* and the *Prince of Wales* by Japanese aircraft; (2) the loss of the great bastion of Singapore upon which 20 million English pounds had been spent; and (3) the loss of Malaya to the Japanese. It is pointed out that had the Japanese known the true situation after the fall of Singapore, they could have controlled the Indian Ocean, and invaded India.

There is set forth with clarity the chronological sequence of events leading to the sinking of the *Prince of Wales* and the *Repulse*. In particular, stress is laid on the lack of air cover for the battleships and the failure by Sir Admiral Tom Phillips to report the first Japanese air attack. A prompt request could have effected the arrival of British land based planes that might have averted at a critical time in world history the loss of the powerful ships.

The superb torpedo plane attack doctrine of the Japanese, firing torpedoes at a comparatively high level, ever pressing home the attack in waves, with the superior performance of Japanese planes, was an "eye opener" to the British and to the world. The "too little and too late" story of the Allies is accentuated. The general mission in that theater was the defeat of the Japanese sea-borne invasion of Malaya. As Grenfell phrases it, "This was one of the main reasons for the existence of the Navy: to protect British territories everywhere against sea borne attack." But the small force sent out by the Admiralty, with no carriers, and with little hope of adequate shore-based air support, had the odds against them from the start.

The Battle of the Coral Sea and the decisive Battle of Midway are clearly and tersely described.

To both Churchill and Roosevelt he ascribes a share in the disaster of Malaya—Churchill for his faulty global strategy and Roosevelt for endeavoring, as the author alleges, to provoke the Japanese into firing the first shot that would mean war but not hurt us too much.

Most informed American readers will agree that in those confused times Roosevelt and the American Asiatic Fleet receive from Grenfell a shade more than their due of criticism.

It is a brilliant, thought-provoking book by a British expert of interest to the expert, the amateur strategist, or the general reader, all told with vividness, accuracy, and an unusual command of language.

SLAVIC COUNTRIES

MAZOUR, ANATOLE G. *Russia—Past and Present*. Pp. vii, 785. New York: D. Van Nostrand & Company, 1951. $9.00 trade; $6.75 text.

The author, an associate professor at Stanford University, made an interesting attempt "to construct a topical rather than a strictly chronological design of Russian history." He is not the first who tried to find a new approach to the complicated problems, so numerous, in Russian history. B. H. Sumner, in his *Survey of Russian History* (London, 1944), went even farther than A. Mazour.

This new method has its advantages but also its great disadvantages. It is true that a mere enumeration of political events makes Russian history uninteresting to American students. I would still rather prefer a more chronological study, of course with detailed description of the degree of civilization reached by the nation at successive periods.

The study of different aspects of civilization is often omitted in books on Russian history. It should be stressed that the author did not commit this mistake. He incorporated into his book studies on modern Russian literature, music, theater, and painting. He devoted also many pages to the economic evolution of modern Russia. In general the part of the book dealing with Russia in the nineteenth and twentieth centuries gives abundant information and will be of good use to students.

The main defect of the book is its disproportion. The author devotes more than four hundred pages of his book exclusively to the history from 1855 to 1951. As he speaks of modern evolution also in many of the preceding chapters, there is not much discussion of the medieval evolution of Russia. He does not omit it completely. While he gives some general indications, for example, on the literary activity in the Kievan period, yet he omits completely the early Muscovite period and continues his survey of literary evolution with A. Radishchev (1749–1802). He says a few words on Krijanich (1617–1680) in the chapter on ideologies and orientations.

He also devotes a few pages (pp. 44–73) to the Russian Church, but these are the weakest part of the book. He would have been able to correct some of his errors if he had consulted my book, *The Making of Central and Eastern Europe*, published in London in 1949. He would have found there, also, more bibliographical material on the Kievan period.

Again, he devotes to the war of 1939–1945 almost a hundred pages. His description is useful, but could it not have been condensed and more space devoted to the Kievan and early Muscovite periods? The same could be said on Russia in World War I (pp. 387–472). The student can find this information elsewhere, but is at a loss when trying to discover, for example, how it happened that a nation which had a democratic political structure at the beginning of its history accepted meekly the autocratic regime which had grown up in Moscow. He gives only a few indications of the solution to these problems (pp. 76–90).

The book will be helpful to students of the modern history of Russia, but we still need a good English survey of medieval Russian history and civilization and of the Russian Church.

F. DVORNIK
Harvard University,
Dumbarton Oaks, Wash., D. C.

NYARADI, NICHOLAS. *My Ringside Seat In Moscow*. Pp. 320. New York: Thomas Y. Crowell Company, 1952. $3.75.

In Hungary's first postwar elections (November 1945) Communists fared badly, polling only 17 per cent of the votes cast, but, thanks to the Allied Control Commission Chairman Marshal Voroshilov, a coalition government was imposed upon the country and the Communists secured three key cabinet ministries—interior, communications, and public welfare. The non-Communist author of this book became the minister of finance in that government, and in that capacity he led a Hungarian delegation to Moscow for the purpose of settling the $200 million bill which Russia had presented to Hungary as the value of German assets in that country. During his seven months' stay in Moscow (May–December 1947), and in his conferences often lasting ten, twelve, and sixteen hours (p. 103), he became thoroughly inured to the Soviet method of "sweating out" opponents, and at the end he was able to reduce the original claim to about $21 million, a superb accomplishment for the representative of any country negotiating with the Soviets.

As memoirs, Mr. Nyaradi's work is of uneven value. His ringside seat was in the office of General Merkulov, the Deputy Minister of Foreign Trade. He did not get inside the Kremlin, and of course he did not see Stalin (except at a sports festival at Dynamo Stadium). He had nothing to do with the highest Soviet officials except Mikoyan, and the latter saw

him rarely. But Mr. Nyaradi did pay the price of a ringside seat for each day's stay at Hotel Moskva: $31 for room alone, and almost $400 for a simple dinner for seven. To this reviewer the better parts of the book are the author's views and comments on Soviet communism and on certain postwar international developments. Our ignorance of the situation in Eastern Europe made it easy for Stalin to win political control over that region at Yalta and economic control at Potsdam (p. 47). Later, whenever we protested against what seemed to us Soviet outrages, we were restrained by these agreements. Today we cannot hope to enlist the wholehearted support of satellite peoples unless we "admit that trusting the Russians at Yalta was a mistake" (p. 141).

Mr. Nyaradi scorns the idea of keeping the West-East trade route open. As everything sold to the satellites goes to Russia, so everything in Russia goes to Stalin's war chest. Nations anxious to trade with Russia seem to be ready to dig "their own graves in the interests of a quick dollar" (p. 210).

We of the West, combating communism as an idea, often forget that the real problem is not only communism but Russian brand of communism. Today Russians are pro-Russian. Therefore, "we must become pro-Western, firmly, staunchly, passionately" (p. 296). The last quotation may be the key to our problem. When the battle for one's soul rages from the Bay of Finland to the streets of Tokyo, we must show honest conviction and passionate faith in the soundness, even in the sacredness, of our Western heritage, for without that we are in danger of losing much.

A. O. SARKISSIAN
Library of Congress
Washington, D. C.

JASNY, NAUM. *Soviet Prices of Producers' Goods.* Pp. vii, 180. Stanford, Calif.: Stanford University Press, 1952. $2.00.

This little volume is the third in a series of essays by the same author, dealing with various aspects of prices and pricing in the Soviet Union. While the earlier essays, published in 1951, dealt with "Pricing in the Plan Era" and "The Soviet Price System," the present volume contains an evaluation and interpretation of "Soviet Prices of Producers' Goods."

Although admitting at the outset that there is a kernel of truth to the unanimous reaction "that such a study is impossible for lack of data," the author nevertheless attempts to do the seemingly impossible. But it is debatable whether his painstaking investigation and research have brought much order out of what he considers Soviet planned "price chaos." He contends that his explorations have made him lose his feeling "of navigating without a compass in the ocean called Soviet socialist economy when [his] findings began to take shape." But it is doubtful whether many fellow navigators would share this feeling with him. The limitless array of assumptions, premises, guesses, and conjectures are as confusing and unconvincing as the cited source materials themselves. Yet he seems to feel that with the aid of the price indexes which he has put together "the size of investment and its rate of expansion during the Plan era can be established with reasonable certainty."

The indexes computed by the author, based on his interpolation of the official prices of Soviet producers' goods, reflect price level changes in many series of items, such as industrial construction, civilian machinery, and housing. He concludes his study by observing somewhat apologetically that, in general, "fully reliable conclusions seem impossible to attain, at least within reasonable time. If one seeks the whole hog or nothing, he will have nothing." His relative proximity to either the whole hog or nothing in this study must be left to the judgment of the critical reader.

The author appears to derive considerable satisfaction from his exposé of alleged Soviet falsification and manipulation of statistics. He feels that the findings of this study, in spite of shortcomings, "may prove useful to those who are not satisfied merely with staying excited over Soviet phenomenal achievements."

Any objective interpreter of the Soviet economy, analyzing official data, would scarcely show any more excitement "over Soviet phenomenal achievements" than does the author of this essay. The anti-Soviet bias revealed in this study by frequent caustic critical remarks tends to detract from an otherwise meticulous piece of research.

KARL SCHOLZ
University of Pennsylvania

ULAM, ADAM B. *Titoism and the Cominform.* Pp. ix, 243. Cambridge, Mass.: Harvard University Press, 1952. $4.00.

Among the latest studies of the rift between the Soviet Union and Yugoslavia, Ulam's scholarly volume is one of the clearly and ably handled contributions to this controversial field. In the sense that Ulam has produced an orderly account of the origins and development of a highly complex situation, the author has compiled a skillful piece of work. One is, in fact, inclined to say that his is a more useful survey than Hamilton Fish Armstrong's *Tito and Goliath,* which covers much of the same ground. Ulam has added somewhat to the documentary evidence available on this topic and has tried to handle his material with more objectivity. He deals more carefully with the background of the problem and hence induces the reader to understand the crisis with more understanding.

But from another point of view, Ulam's book resembles that production of Hamlet that was so fine—except that Hamlet himself was left out of it. After pointing out that "the history of the Communist Party of Yugoslavia is not materially different from the histories of many other Communist Parties" and that it "offers no clear clues to the Party's eventual rebellion against Moscow" (p. 3), he concentrates on the events leading to Titoism and the actual break between Tito and Stalin in 1948. But, in this respect, Ulam tends to underplay such glaring factors as the basic attitudes of the Yugoslav people and their leaders; they are treated merely as pawns in the game of power politics. Ulam seems to feel that the Yugoslavs themselves are unaware of the basic cause of their break with the Soviets. Furthermore, he appears little concerned with the question of what alternatives were open to Tito within the framework of power relationships of the chaotic postwar world and the huge task of rebuilding the shattered social and economic structure of the country.

Ulam's conclusion that Titoism is, in essence, merely Stalinism transplanted successfully (and hence, to the Russians, intolerably) to non-Russian soil (p. 222) should be clarified. It is certainly not necessary to agree with Tito's system; but some important recent changes in Yugoslavia should not be overlooked, since it is only in this light that a solution can be sought for the enigma of having the anti-Communist America help a Communist country like Yugoslavia. Specifically, Tito has supported the United Nations concept of collective security in Europe and has denounced Soviet imperialism and aggression—steps which have benefited Tito in his relations with the free world. On the domestic front, we must note Yugoslavia's trends toward greater political and economic decentralization, the curbing of bureaucracy, and the comparative enlargement of the area of individual and social freedoms.

Ulam's bibliographical "note" (pp. 235–236), however, is quite inadequate. There are several other studies not noted by the author—in addition to "the most useful" materials he has found in writing about "Communism in Eastern Europe" (p. 235), Andrew Gyorgy's *Governments of Danubian Europe* and Hugh Seton-Watson's *The East European Revolution.*

JOSEPH S. ROUCEK
University of Bridgeport

KAZEMZADEH, FIRUZ. *The Struggle for Transcaucasia (1917–1921).* With an introduction by Michael Karpovich. Pp. xv, 356, map. New York: Philosophical Library, 1951. $5.75.

Dr. Kazemzadeh's monograph fills an important gap in our knowledge of a significant period of Transcausian history—that of the revolutionary era of 1917–1921, when, for a brief moment, it seemed that the peoples of Azerbaijan, Georgia, and Armenia might emerge into independent statehood and federation. Strategically, the area with which the author deals is an important one, for it lies between the

Caspian and Black Sea, between the Soviet Union and Iran, and has received rather little attention in specific and detailed studies since the November 1917 revolution.

By way of beginning, the author provides appropriate historical backgrounds for an understanding of the revolutionary period of 1917, treats of both the March and November revolutions in the Caucasus region, and then plunges into the development of events which led to the establishment of independent states in Georgia, Armenia, and Azerbaijan, and both their internecine struggles and their fight to maintain themselves. One by one, of course, and completely so by the spring of 1921, they all fell to the "liberating" forces of the Russian Bolsheviks, although in all cases the "native" Bolshevik parties were decidedly in the minority. In part, the war situation itself, together with the tragic aftermath thereof in the area, and the fact that the Western Powers were too distant from the scene, however much interested at times, explains both the development of the Transcaucasian states and their downfall. But, as the author well points out, national sentiment had been most highly developed among the Armenians; the Armenians and the Georgians had lost their independence to the Ottoman Empire before the sentiment of nationalism had become "all-consuming"; and Azerbaijan had never existed as an independent nation. Georgian nationalism had been preserved by the nobility, which lacked wide popular support, although the Socialist party, strangely enough, provided an organization around which the nationalists could rally against foreign domination. In the author's view, it was during this tragic era that "probably for the first time in their history the Georgian, the Armenian, and above all the Azerbaijani masses realized their national and cultural separateness, though their independent political organizations had to give way before the overwhelming might of their northern neighbour" (p. 330).

Born of Iranian parents in Moscow, Dr. Kazemzadeh comes to his study well prepared linguistically and otherwise. His research has been based on a wide variety of sources, much of it obtained from the Hoover Library at Stanford University. He appears to have missed very few items, although his chapter on the Paris Peace Conference (Ch. XVII) could have been filled out more had he used the Miller Diary, the thirteen volumes of the Paris Peace Conference Documents, published by the Department of State (which contain some significant materials especially on Armenia), and the King-Crane Report. Moreover, the famous six-day speech of Kemal Atatürk (1927) contains useful material about some of these events. The volume contains a fine map of the area and an excellent bibliography. It is very well written, and all those who seek a detailed knowledge of the period must consult this volume.

HARRY N. HOWARD

Arlington, Virginia

TENENBAUM, JOSEPH. *Underground: The Story of a People.* Pp. ix, 532. New York: Philosophical Library, 1952. $4.50.

This book is a very valuable contribution to the history of the martyrdom of the Jews in Poland under Nazi tyranny. Many books dealing with this subject have already appeared during the last few years, but this appears to me superior to them all in various respects. It is more comprehensive and detailed than any of them, and the descriptions of outrages are supplemented by interesting accounts of the life, activities, and cultural achievements of Polish Jewry as a whole and of its previous numerous thriving communities, which enable one to appreciate the magnitude of the castrophe and the loss it has entailed both for the Jewish people and for the world in general. It is a damning indictment of the unparalleled wickedness of Hitler's Germany, the severity and cogency of which indictment consist not in rhetorical phraseology but in the cumulative effect of a series of narratives of appalling barbarity based upon a prodigious amount of inquiry and research.

This volume is the product of a journey through Poland by Dr. Joseph Tenenbaum, a well-known American physician born in that country, who was well qualified by his knowledge of its peoples and languages, and also by his own experience as a public worker, to gather the maximum amount of information about the most terrible calamity of modern times. He has presented the results of his laborious investigation in a methodical manner and in readable style, without straining after effect, but also without concealing his strong feeling in relating some particularly tragic episodes.

This is not only a circumstantial record of the organized orgy of sadism, whereby the Germans reduced the 3½ million Jews in Poland to fewer than 100,000 within about two years. It also constitutes an epic story of Jewish heroism, which in many respects surpasses many a lauded exploit on the battlefield. Nobody can read the thrilling account of the battle of the Warsaw Ghetto, which lasted much longer than is generally supposed, without feeling the highest admiration for the Jews who fought against overwhelming odds. Nor was Warsaw the only place where the Jews offered resistance, with such limited weapons as they were able to obtain, against the powerfully armed thugs bent upon their destruction. Dr. Tenenbaum describes many other desperate struggles, both in ghettos and in extermination camps, and also the means by which the Jews in one city were informed of what was happening in others. Especially noteworthy are his numerous sketches of individual acts of bravery, by which many girls as well as men distinguished themselves. He throws considerable new light upon the part which thousands of Jews played among Polish and Russian partisans and does not mince matters in writing about Poles who attacked or betrayed them (although there were others who helped them) or in giving instances of Jews who were informers against their own people. What will surprize many readers is the author's description of the varied cultural activities conducted by Jews in inferno-like conditions, and what must sadden all is his account of the murders of Jews by Polish fascists after the war. He gives credit to all authorities, sources, and individuals, from whom he collected parts of his mass of information, and he provides a selected bibliography and an index.

ISRAEL COHEN

WESTERN CONTINENTAL EUROPE

TALMON, J. L. *The Rise of Totalitarian Democracy.* Pp. xi, 366. Boston: The Beacon Press, 1952. $4.00.

The Rise of Totalitarian Democracy is conceived as a three-volume work analyzing the origins of totalitarianism in France, in western and eastern Europe, and in the Far East. This first volume, which deals with eighteenth century France, is a book of great wisdom which I recommend to anyone who not only wants to broaden his knowledge of the French revolution but also wishes to understand the basic—that is the intellectual—causes of the modern world crisis. Dr. Talmon's work meets the highest academic standards.

Almost from the inception of modern democratic thought, there was a bifurcation of the concept into liberal and totalitarian branches. Early totalitarianism was elaborated in France by thinkers like Rousseau, Morelly, and Mably, by practical politicians like the Jacobins, Robespierre, and Saint-Just, and by conspirators like Babeuf and Buonarrotti. The liberal democrats assumed politics to be a matter of trial and error, a pragmatic endeavor to find specific solutions to practical and ever-changing problems. They recognized that many spheres of life must remain outside the field of politics. "The totalitarian democratic school, on the other hand, is based upon the assumption of a sole and exclusive truth in politics. It may be called political Messianism in the sense that it postulates a preordained, harmonious and perfect scheme of things, to which men are irresistibly driven, and at which they are bound to arrive. It recognizes ultimately only one plane of existence, the political. It widens the scope of politics to embrace the whole of human existence. Politics is defined as the art of applying this philosophy to the organisation of society, and the final purpose of politics is

only achieved when this philosophy reigns supreme over all fields of life."

In tracing the development of the totalitarian ideology, Dr. Talmon points up the far-reaching implications of the inconsistent and fallacious "general will" concept, the inadmissibility of opposition and political parties in a regime based on allegedly incontrovertible truth, the inevitability of terror in such a regime of metaphysical contention, and the necessarily oppressive and dictatorial character of a government which is convinced that it not only possesses all the true answers but also that it is imbued with rationality and virtue.

Highly interesting are the economics of political messianism. While most of the eighteenth century thinkers and politicians ambiguously upheld the right of property, they ultimately came to believe in expropriation and bureaucratic economic planning. Yet none of these thinkers "thought of economics in terms of expansion and increase of wealth and comfort." To them trade and industry were the "excrescence of the acquisitive spirit on the part of a small, selfish and unscrupulous class: not a possibility of improvement for the workers, but a new way of degrading and enslaving them."

Without specifically treating this aspect of the matter, Dr. Talmon's book bares the remote origins of bolshevism. It becomes painfully evident that most of the so-called "new" bolshevik ideas were born in the France of the *Ancien Régime* and the revolutionary *Terreur*. Bolshevism and democratic totalitarianism, therefore, have their roots in preindustrial society. This they have in common with the American Constitution which also reflects the conditions of an agricultural economy. But while the American Constitution merely outlines general principles of government which, by and large, could be applied in any modern country, the revolutionary doctrine prescribes concrete solutions to problems the existence and nature of which it does not even recognize. In Dr. Talmon's words, "there is no more baffling feature in French eighteenth-century social philosophy than the almost total lack of presentiment or understanding of the new forces about to be released by the Industrial Revolution. Few saw in the expansion of trade and industry a promise of increased national prosperity." To this day, revolutionaries preoccupy themselves with the egalitarian distribution of wealth rather than with the dynamic concept of expanding productivity.

Dr. Talmon, a professor at Hebrew University, Jerusalem, is to be congratulated on a first-rate performance. It is to be hoped that the American academic world will give full recognition to his penetrating volume.

Georgetown University

MASON, HENRY L. *The Purge of Dutch Quislings: Emergency Justice in the Netherlands.* Pp. xii, 199. The Hague: Martinus Nijhoff, 1952. No price.

Collaboration with the Nazis, during the German occupation, was in the eyes of the Dutch people a despicable crime. Those who were known to be guilty of it were treated as outcasts. There may have been some who were actuated by a perverse idealism, but most of them were prompted by ignoble motives: vanity, thwarted ambition, greed, envy, revengefulness, cowardice. The Dutch hated those traitors worse than they hated the Germans, and as the dark months under the Nazi terror lengthened into years the pent-up wrath found vent in dire threats against their disloyal compatriots. The day of liberation would be *Bijltjesdag*, that is Hatchets Day. The word was not a new coinage. In the annals of the Netherlands the fifteenth day of November is designated by that name. The news of Napoleon's defeat at Leipzig was the signal for a popular uprising at Amsterdam. But no hatchets were swung at the heads of Frenchmen and Gallophile traitors. The men who started the revolt were themselves called *Bijltjes*. They were the carpenters of the shipyards. By a common transfer of meaning they were known by the name that belonged to the tool of their trade. That historical *Bijltjesdag* was a bloodless revolution; the one that the Dutch, in the early forties of this century, were looking forward to was to be a day of reckoning in dead earnest.

The clamor for merciless retribution caused deep concern to the government in exile. It admonished the nation over the radio to leave the punishment of the guilty to the law courts. The angry people's bark proved worse than their bite. When the day of reckoning came the avengers showed remarkable self-restraint. Immediately after the German capitulation between 120,000 and 150,000 suspects were taken into custody, and, although the arrests were made by local units of the erstwhile underground resistance, revengeful bloodshed did not occur anywhere.

The authorities were anxious to see impartiality and fairness observed and drew nice distinctions between the defendants' motives for their actions. To that end they set up various kinds of courts and tribunals and introduced a novel element into the jurisdictional system: the use of lay judges. Two of the three judges of each tribunal were nonjurist representatives of the people. War had opened the way to various forms of unethical and treasonable conduct for which existing criminal law had not provided proper punishment. It was widely felt that treason deserved the death penalty, but this had been abolished in the Netherlands in 1873. It was reintroduced by Royal Decree, contrary to the time-honored principle *nullum delictum nulla poena sine praevia lege poenali*, which the Penal Code itself had incorporated in its article 3. A public opinion poll showed that 73 per cent approved the death penalty for the worst Quislings, and it is more than probable that without this safety valve the popular craving for revenge would have resorted to lynching. The purge of the collaborators was emergency justice and bore all the earmarks of a makeshift. It elicited from all sides more criticism than approval, which is perhaps an indication that the judges did their work impartially.

Mr. Mason has carefully avoided the temptation to turn his subject matter, which is rich in excitement and romance, into a thriller. He has done his work conscientiously and accurately in a matter-of-fact, dry-as-dust manner as befits a candidate for the doctoral degree. He has even avoided mistakes in the spellings of Dutch words, a rare achievement in American publications, as this writer knows from long and irritating experience.

ADRIAAN J. BARNOUW
Columbia University

MAYER, KURT B. *The Population of Switzerland.* Pp. xiv, 336. New York: Columbia University Press, 1952. $5.00.

While this book deals primarily with demography, its contribution goes beyond that field. Swiss vital statistics are among the best available, and thus a person like Professor Mayer who is equipped to make comparisons and evaluations has the material for making an excellent study. The author has made comparisons of the Swiss population trends with trends in other European countries. Of particular value has been the presentation of social problems in Switzerland in the setting of variations in language and religion. It was found that the cultural and religious equilibrium has remained relatively constant notwithstanding the high degree of industrialization and the presence of four national languages.

Professor Mayer has given us a very excellent and clear-cut analysis of the demographic organization of the Swiss population which helps to explain the stand of the people of the country on internal and external problems. This volume should serve not only as a valuable help in understanding Switzerland but as an example of the type of study which could be made of other countries as an aid to international understanding.

GATHORNE-HARDY, G. M., A. G. SPENCER, AGNES H. HICKS, and G. TURVILLE-PETRE. *The Scandinavian States and Finland: A Political and Economic Survey.* Pp. viii, 312. New York: Royal Institute of International Affairs, 1952. $4.00.

"A glance at a map should be sufficient to bring home to everyone the fact that the importance of the Scandinavian countries in world affairs has lately increased to an extent which is almost startling," G. M. Gathorne-Hardy writes in the preface to this exceedingly competent report on Scandinavia, which was initiated by the

Council of the Royal Institute of International Affairs and prepared by four scholars: A. G. Spencer, Agnes H. Hicks, G. Turville-Petre, and Gathorne-Hardy, who acted as chairman.

This opening statement sets the tone of the book; the material is grouped around its theme; the elements of the national power of Sweden, Denmark, Norway, Finland, and Iceland have been carefully selected to support the report's fundamental proposition that here is a region of the world well worth attention because of its strategic importance "in a world divided, as at present, by an 'iron curtain.'"

With few variations, these elements of national power—"land and people," "agriculture," and "industry"—are included in the study of all five of the Scandinavian states. In this comparative analysis the reader is able to comprehend the relative strength of the five states; he gets an excellent view and review of the strong and weak points in their political, industrial, and military armor; it is perhaps the best guide to a unified understanding presented so far of these minor powers.

The keen interest with which both the United States of America and the Union of Soviet Socialist Republics follow developments in Scandinavia—their mutual interest, for example, in keeping this area of the world "pacified"—confirms the conclusion of the authors that "in these circumstances it is natural that [we] should have thought the preparation of a report on these countries . . . desirable."

Of the five states, Sweden undoubtedly is the most interesting, as well as the most important one; for one thing, she is the most powerful of them all. What she does at home and abroad is of greater consequence, comparatively; her decisions, for example, to continue her traditional policy of neutrality (now called "non-alliance") rather than joining NATO (the North Atlantic Treaty Organization) has had more far-reaching consequences than Norway's and Denmark's choice to ally themselves with the so-called North Atlantic states. This decision has seriously impaired NATO's "Scandinavian" program; it excluded the strongest member of this bloc, the only state in this area which is in a position to offer effective resistance to Russia in the Baltic region; at the same time, Sweden's decision prevented Finland from moving closer towards the Western camp; and Finland, though small and demobilized, would be, next to Sweden, the most valuable Scandinavian member of NATO. But a tradition of peace nurtured for more than a century by a people chronically opposed to international risk-taking combined with a national attitude that "neutrality" is tantamount to political wisdom, has made it unsafe for any Swedish cabinet to defy a national doctrine so inbred in the Swedish character.

Without editorializing in the above manner—for which the reviewer alone is responsible—the authors observe: "Most Swedes at present hope that their current foreign policy may keep them out of a future war."

As long as such a state of mind prevails in the largest and strongest of the Scandinavian states, a successful containment of Soviet ambitions in this part of the world is problematic, to say the least.

Among the chief virtues of this highly concentrated report (less than 300 pages of reading matter devoted to the study of five allegedly important countries) is the best introductory chapter on Scandinavia this reviewer has ever read. And it is only seven pages long!

Little known facts about these states are brought out; for example, Sweden's Boliden mine alone produces more gold than the rest of Europe; more than 90 per cent of the Norwegian farms are owned by the farmers; Iceland's parliament—the Althingi—is the oldest in the world, dating back to 930; Finland's economy as a whole has never been in better shape—in spite of heavy war reparations to the Soviet Union; Denmark is the only Scandinavian state with a colonial "empire"—Greenland, except for Australia the largest island in the world.

Within its narrow frame, this report has crammed more facts and figures and significant data than any other report or work on Scandinavia to date presented by "outsiders." It deserves to be read in every college and university (including those in Scandinavia) where courses are given or planned in Scandinavian government.

KOCH, HAL. *Grundtvig.* Translated from the Danish with Introduction and Notes by Llewellyn Jones. Pp. xx, 231. Yellow Springs, Ohio: The Antioch Press, 1952. $3.50.

We have here the first competent study in English of a leading figure in modern Danish history, Nicolai Frederik Severin Grundtvig (1783–1872). The author of many of Denmark's most popular hynms, the severe critic of the schools in which he had studied under protest, the indefatigable advocate of reforms that aimed to make the state religion (Lutheran), and the church which proclaimed it, living forces in the citizen's daily life, the tireless awakener of interest in his country's heathen past and its great literature, the scholar who translated the ancient chronicles of Saxo and Snorre because of a conviction that through history man might "reveal his substance and true shape" and approach the solution of the riddle of his own existence, the reformer who laid the groundwork of his country's significant contribution to adult education—this versatile genius has become, as Mrs. Olive D. Campbell found thirty years ago, a legendary figure. (See her *The Danish Folk School,* New York, 1922.) Hal Koch, professor of church history at the University of Copenhagen, has undertaken here to present to modern readers the man behind the legend. As one of the editors of a monumental edition of Grundtvig's work still in progress, he is eminently qualified for the task. Moreover, he writes a vigorous and readable Danish prose to which the translator has given an acceptable English rendering.

After soul-stirring personal experiences, involving a narrow escape from an unfortunate love affair, Grundtvig found himself in Copenhagen just when his country was involved on Napoleon's side in a war with England. He found solace in a prolonged study of Denmark's ancient history which bore fruit in an essay on "The Asa Doctrine" (1807) and in *Northern Mythology* (1808), his "first and greatest scholarly contribution" (p. 33). By making a careful distinction between the elder poetic Edda and the later Snorre's Edda, Saxo, and the Sagas, he helped inaugurate a long series of scholarly studies by other men that were to probe deeper into the problem of the boundary between Danish mythology and history.

His theological studies while preparing for the clergy raised doubts as to the efficacy of the church in awakening the Danish people to live Christian lives. His arguments and verbal duels with the university theologians, waged through books and pamphlets, and even in libel suits, helped prepare him for his mission as "awakener" of church and people.

The campaign for a written constitution that was waged during Christian VIII's reign (1839–1848) was not to Grundtvig's liking; he was after all born in the era of the Enlightened Despotism. When, as he wrote in 1848, "the reign of peasants [*bönder*] and the masses is at our door," he entered politics as a member of the Lower House and became "a fanatical champion of freedom in all spheres of life, not merely in church and school but in business and trade as well, in government and legislation" (p. 113). Once the 1849 constitution was adopted, he was determined to do all that he could to make it work. He was more successful outside of the chamber than within it. By his poems, psalms, and stories of Danish folk life and traditions, he reached a large and appreciative public and thus blazed the way for much of Denmark's future social program.

His great contribution to popular education was the folk high school calculated to reach the adults through the "living word," to reach—in Grundtvig's words—the "nation's root and trunk, the tenants and freeholders both great and small, artisans of all kinds, seamen and traders," especially since in homogeneous Denmark "the same aptitude for culture is found in huts and in high-ceiled halls." The basic idea of the folk high school was Grundt-

vig's, though its realization was the work of many men, such as Christian Flor (1844), Kristen Kold (1851), and others.

To an understanding of modern Denmark, Hal Koch's penetrating study of Grundtvig provides an excellent introduction.

OTHERS

BATES, MARSTON. *Where Winter Never Comes: A Study of Man and Nature in the Tropics.* Pp. 310. New York: Charles Scribner's Sons, 1952. $3.50.

What are the distinctive characteristics of the tropics in contrast with other parts of the world? Particularly, what do the tropical lands of the world mean to the people who live there and to us who do not?

Marston Bates's latest book is a readable and informative answer to these questions. The author has good professional standing as a research worker in a branch of tropical biology (concerning mosquitoes), has good amateur standing in a wide range of other tropical subjects (especially concerning people), and has facility of expression for popular reading.

Though nontechnical and informal the book is accurate and well-balanced, not overloaded with details, but filled with sound and sensible ideas and coming to valid conclusions on tropical people, tropical culture, occidental civilization in the tropics, climate, clothes, disease, food, forest, seas, government, and current problems.

Among large ideas about the tropics the following are clearly stated: (1) that rain forest is not a jungle of tangled undergrowth but a shady place of fairly open ground under the dense crowns of tall trees; (2) that ways of life in the tropics are not the result of natural environment, nor of racial biology, but have arisen in the wayward course of culture history; (3) that our difficulties and failures in the tropics are due to maladjustment of our middle-latitude occidental tools and practices, not to inherent shortcomings of tropical nature; (4) that we have only hacked away at the margins and have hardly begun to utilize the indigenous resources of the tropics; and (5) that nationalism and colonialism are outmoded in the age of global contacts and that neighborhood understanding is needed.

This all deserves praise except for one small fault. That fault deserves adverse mention because it slips often unnoticed into scientific popularizing and needs to be exposed and avoided for the benefit of all concerned. The book gives an impression that the author has reached his conclusions intelligently and accurately in contrast with academic scholars who hold foolish contrary views—"the anthropologist," "the historian," "geographers like Ellsworth Huntington."

Actually his views are held by anthropologists, historians, and geographers. In quoting from older works that do not agree with these views the author is raising a dead issue. He resurrects the old theory of environmental determinism as if this were held by modern geographers, and he fails to identify as a geographer one of those from whom he has gained contrary ideas (Carl Sauer), who can speak for modern geography far better than the Huntington of a previous generation.

The author's major theses (paraphrased above) have been stated earlier by other writers and accepted widely by their readers. They could be presented as common knowledge among modern scholars rather than as original findings of the author.

Thus sharing in the findings of science, the author seems also to share in a vague belief common among highly specialized scientists: that the salvation of the world is to be found within science itself. This appears only in the closing pages as an attempted flight of faith which fails to rise from the ground. It hardly detracts from the book as a contribution to popular scientific understanding and is unnecessary as an aid to ultimate faith, for which we can look elsewhere more reasonably and hopefully than within the range of modern science.

ROBERT S. PLATT
University of Chicago

INTERNATIONAL LABOUR OFFICE. *Vocational Training in Latin America.* Pp. iv, 320. Geneva: ILO (distributed in the U. S. by ILO Washington Branch), 1951. $2.00.

For over three decades the International Labor Organization has been providing us with very valuable source material on labor conditions and labor problems in various parts of the world. Sometimes this material is presented in such dry and unimaginative form that it makes rather difficult reading. This is unfortunately the case with regard to the present publication.

Vocational Training in Latin America is the result of a one-man mission sent to Latin America by the ILO early in 1949 to study this subject, and of certain other materials collected by the Economic Commission for Latin America. The body of the report consists of six chapters which include a discussion of "Basic Factors"; the "Organization and Administration" of vocational training in the region; the training of young people; the training and retraining of adults; "Training Abroad and Technical Assistance"; and a chapter of "Conclusions." Appendixes present more detailed information on vocational training in thirteen different countries of the region and resolutions on the subject by the 1946 and 1949 American ILO Conferences.

In reading the report one is struck by the rather extensive facilities which are already available for vocational training in the region, as well as with the rather hodgepodge way these have come into existence. In the process of industrialization, employers have realized from time to time the necessity of training their own workers or the children of their workers. This has been done in an attempt to build up not only a well-trained work force but a steady one. The provision of adequate skills for workers by an industrial employer will not only raise the output of those workers but will also in most cases assure their continuance in the employ of the industry which has trained them.

On the other hand, training the sons of first-generation industrial workers to take the more skilled jobs in an expanding factory tends to insure for the employer a much smaller labor turnover than might otherwise be the case.

As the report points out, governments in the region have also become aware of the fact that one of the great stumbling blocks in the path of industrialization in the region is the lack of adequate training for the factory work force. They have attempted to meet this lack with a variety of training schools and apprenticeship programs. Perhaps the principal criticism that can be made of efforts in this direction, is their lack of over-all planning. Such planning is among the recommendations made in this volume.

The report notes the resistance of many of the older educational institutions, particularly those of university level, to penetration of the more mundane industrial subjects into their curricula. In Chile, Argentina, Mexico, and some other countries progress has been made in the direction of integrating the vocational training program into the general educational system. However, as the report points out, and as any student of the labor situation in Latin America can testify, educators and industrialists alike are still amazed and perhaps a little shocked at the willingness of "respectable" educational institutions of both secondary and university grade in this country to accept "practical" subjects in their courses of study.

Although it reviews the extensive vocational training facilities already available in Latin America, this report notes the great need for more such resources. The job of turning the rural semi-serfs who are flocking into the towns to man the new industries of the region into trained, disciplined industrial workers is a large one. The present volume indicates the need not only for expansion of present training facilities in Latin America, but the need for help from outside the area.

This ILO volume is certainly not intended for that mythical character "the general reader." However, for one who is interested in educational problems in Latin America, or in the problems of economic development of the region, it is undoubtedly something which he should read. It is an exceedingly valuable source of infor-

mation concerning the educational aspects of the great movement toward economic diversification and industrialization which is under way in Latin America.

ROBERT J. ALEXANDER
Rutgers University

TOWNSEND, WILLIAM CAMERON. *Lázaro Cárdenas, Mexican Democrat.* Pp. xiv, 379. Ann Arbor, Mich.: George Wahr Publishing Company, 1952. $4.00.

General Cárdenas sought to dissuade Mr. Townsend from writing this biography saying that as a friend he was apt to be prejudiced in his favor. It is the present reviewer's impression that the general's fears proved to be well founded. Evidence of bias was probably noted by Professor Frank Tannenbaum, for in his foreword to this book he states that "it is difficult for anyone who has known General Cárdenas to write about him dispassionately."

General Cárdenas is represented as a man of honor, nobility, integrity, tact, idealism, moderation, modesty, sincerity, liberalism, tolerance, vision—and countless other virtues. As page after page was read, and as the number of the virtues mounted, this reviewer sought anxiously for some confession of shortcoming, some fall from virtuous grace. On the very few occasions when the fact of error was conceded, this was defended by the author as an extenuating circumstance. For example, when President Cárdenas, who stood for honest elections and noninterference by the Executive (*sic*), winked at the fraudulent counting of the votes after the Almazán-Camacho election, it was because Almazán's threat to revolt had caused the President "to lose concern about the counting of the votes."

William Cameron Townsend, who has spent most of his adult life among Indian tribes of Mexico and Guatemala, first became acquainted with Lázaro Cárdenas in 1935 when the President of Mexico discovered Mr. and Mrs. Townsend living in an Indian village in Morelos teaching the Indians to read in their native Aztec language. A long and intimate friendship developed, affording Mr. Townsend an excellent opportunity to become well acquainted with Lázaro Cárdenas, the man. The particular value of this book, therefore, is to be found in the warm, sympathetic character delineation of General Cárdenas rather than in the sketchy, disjointed, and thoroughly inadequate chapters on the Cárdenas administration. For a more penetrating, comprehensive, and orderly view of the problems and achievements of the Cárdenas administration we must still rely on the Weyls' *Reconquest of Mexico.*

Mr. Townsend is at his best when describing Lázaro Cárdenas on his many trips of personal inspection into the far back country of Mexico. These numerous tours, indicated on maps on the inner covers of the book, constituted a new technique of government, the circuit-riding system. The President, seemingly distrustful of others, felt that he had to go himself direct to the people, not only to acquaint himself with their problems, but whenever possible, to solve them on the ground. According to Mr. Townsend "the peasant-loving president" radiated "a paternal joy from his close contact with the masses." But Mr. Townsend does not tell us that this unique method of administering justice, reminiscent of that of benevolent sovereigns of old, short-circuited the local authorities and was bad for their morale and prestige. Moreover, it perpetuated the harmful tradition of viewing the government as an individual.

The book contains a number of factual errors. A few of these follow. The *jéfe politico* was not "federally appointed" (p. 15); this was a state officer appointed by the governor. Cárdenas did not "give the Church her constitutional rights" when he threw off the yoke of Calles (p. 341). This attempt to excuse Cárdenas of responsibility for the vigorous attack on the Church is novel; Cárdenas persisted in the anticlerical, if not antireligious, campaign until the crisis of the oil expropriations forced him to desist. Also, we are told that, following the adoption of the constitutional amendment requiring socialistic education, "some church schools closed" (p. 80). These schools did not exist, for they had been abolished many years before by the original Article 3 of the Constitution.

On September 17, 1939, President Cárdenas referred to the recently declared war in Europe as "an *international conflict* between ambitious, unscrupulous, and imperialistic interests"—the communistic line. Mr. Townsend makes no reference to this statement. At the least it detracts somewhat from the stature of Lázaro Cárdenas as "a man of vision."

J. LLOYD MECHAM
The University of Texas

INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT. *Report on Cuba.* Findings and Recommendations of an Economic and Technical Mission organized by the International Bank for Reconstruction and Development in collaboration with the Government of Cuba in 1950, Francis Adams Truslow, Chief of Mission. Pp. xxiv, 1052. Washington, 1951. $7.50.

This massive report is primarily an encyclopedic survey of the Cuban economy. It also analyzes the problems and policies affecting the economic progress of Cuba, and it suggests a long-term strategy for future development.

The fifty chapters of the report are grouped in ten books. Book I outlines the report and highlights its major findings and recommendations. Book II is a capsule description of the economy. Books III through VIII, including some 700 pages, contain a detailed description of the major sectors of the economy. Each book, and usually each chapter, includes a general survey, the major problems, and recommendations. Book IX, which outlines a strategy for Cuban economic development, is presumably the climax of the report. Book X, dealing with technical problems and possibilities, is really a glorified appendix.

The report poses Cuba's primary economic problem as the reduction of dependence upon sugar. Diversification is feasible because of Cuba's financial position, as well as because of its unused human and material resources. Such development will not be easy, however, for the Cuban economy has long been static and top-heavy, and growth will be impeded by unsuitable attitudes, a widespread lack of confidence, and inadequate institutions.

The report's "strategy for development" is directed toward four specific objectives, each of which involves reducing Cuba's dependence upon sugar exports. Twelve criteria to guide development are suggested, most of these stressing Cuba's resources and needs. A course of action to foster development, encompassing expanded applied research, improved education, better labor-management relations, government policies encouraging "dynamic development," and government reforms is proposed. A number of actions to increase agricultural and industrial production are outlined, and lastly, five specific projects are urged as "most essential, most immediately feasible and most likely to benefit Cuba as a whole."

As a painstaking and comprehensive description of the Cuban economy, this report should be a standard reference book. As a set of recommendations for development, it should also be useful, for its suggestions seem practical and make good sense. They are also, however, cautious, piecemeal, and perhaps not overly imaginative. The report envisages, incidentally, a very limited and conservative role for the Cuban government. This role may be more appropriate for the prosperous Cuban economy than it would be in other underdeveloped countries not so blessed by a booming sugar industry. In this, as in a few other respects, Cuba may be somewhat atypical. Yet, this report should be of value not only to those interested in the Cuban economy per se, but also as a case study for the larger public concerned with economic development throughout the world.

C. ADDISON HICKMAN
University of Illinois

PENDLE, GEORGE. *Uruguay—South America's First Welfare State.* Pp. viii, 100. New York: Royal Institute of International Affairs, 1952. $2.50.

This book is a timely addition to the relatively scarce literature regarding Uruguay—a gallant little nation to whom a lack of signposts has been a challenge rather than a deterrent to social and political experiment.

Actually, *Uruguay* is not so much a study of "South America's First Welfare

State" as it is an orderly and illuminating encyclopedia, in capsule form, of the essential facts and characteristics of the country and its people. The author has not attempted much by way of interpretation or comment, and as a result his book is slightly heavy reading in spots. Nevertheless, the flaming spirit of an intensely democratic and aggressive people is evident behind every fact and figure.

Chronic disorder, political and otherwise, characterized Uruguay's early history. By the turn of the present century, however, the people apparently had begun to get their fill of anarchic individualism. A forceful and farseeing leader in the person of José Batlle y Ordóñez not only helped them reach this conclusion but was successful in focusing energies, which theretofore had been dissipated in strife, on a long-range program of social and political reform.

Batlle contended, the author tells us, "that the employer should always set the public welfare above private gain; that the employer should pass on a greater share of his profit to his employees; and that the employer and the State should aid the poor, the sick, the old, and the young." Acceptance of these ideas seems clearly reflected in Uruguay's welfare legislation which is outlined in the book. Hours of work have been controlled since 1915; minimum wages were set for some workers beginning in 1926; a family allowance program with funds derived from a tax on payrolls was established in 1943; workmen's compensation started in 1914; and unemployment compensation was started in a limited way in 1939. The old age pension law was passed in 1919 and provides benefits for those who have "reached the age of sixty and to anyone (regardless of age) who is totally incapacitated and in poverty." Uruguay has no national system of health insurance but, as the author points out, through no lack of agitation on the part of the Batllistas who are still vocal and well organized despite the death of their leader in 1929. They regard their program of social reform in no sense complete.

Uruguay also summarizes the country's experience with state ownership of a number of industrial and commercial undertakings. Many of these, whether successful in paying their own way or not, are no longer regarded as experimental. The educational system is briefly described. Religion is dispatched with a brief mention. The facts of finance, production, transportation, communications, and foreign trade follow with the grim and uncompromising inevitability of a government yearbook.

The author concludes his work, after a brief excursion into lighter topics such as radio and sports, with a statement on foreign relations and party politics with politics properly predominating.

WILLIAM L. MITCHELL
Social Security Administration
Washington, D. C.

WALES, NYM. *Red Dust: Autobiographies of Chinese Communists, as told to Nym Wales.* With an introduction by Robert Carver North. Pp. xiv, 238. Stanford, Calif.: Stanford University Press, 1952. $5.00.

Red Dust is a collection of twenty-four "autobiographies" orally recited to Miss Wales during her five-month visit to Yenan in 1937. The individual stories vary greatly in length—from two to twenty pages—and are also uneven in intrinsic value and importance. They do, however, tell what twenty-four Chinese Communists thought about themselves, their movement, their leadership, and their personal reasons for identifying themselves with the Chinese Communist movement. This handsome volume therefore incorporates a great quantity of autobiographical raw material of historical and psychological value—even if many of Miss Wales's characters have dropped from sight during the intervening years, and the passage of time has deprived their stories of current topical interest in 1952.

The personalities prevailed upon by Miss Wales to tell their stories include politicians, militarists, educators, propagandists, industrial proletarians, medical and professional workers, and cultural workers (including writers, artists, and actors). With few exceptions, these people represent lower leadership levels. A few currently prominent personalities in Communist China are included: one Politburo member (Tung Pi-wu), a regional political-military commander (Lin Piao), the head of the youth federation (Liao Ch'eng-chih), a provincial governor not identified as such (Wang Shou-tai), and one Central Government minister (Hsieh Chüeh-tsai)—but their stories are not brought down to date, and in three instances the stories are too brief to be revealing or of great significance.

Robert North makes two important contributions to the volume. His introduction (pp. 3–22) is an informing and perceptive essay on Chinese Communist history by a leading American student of the subject. He has also compiled, in an appendix, brief statements in the style of *Who's Who* about twenty-seven of the most important Communist leaders in contemporary China, a feature that adds notably to the utility of the volume.

Why did these Chinese go Communist? Not from intellectual conviction or from conversion following a study of the basic Marxist texts. In nearly every instance, the individual reacted to an adolescent emotional situation or experience of his private life, and thought he found in communism a solution for his own personal problem, as he saw it. The real mystery is that individuals who could protest on independent personal grounds against the circumstances in which they found themselves could also embrace with such apparent enthusiasm the total discipline (and negation of personal choice or judgment) imposed upon them by the Communist Party.

H. ARTHUR STEINER
University of California at Los Angeles

LEHRMAN, HAL. *Israel: The Beginning and Tomorrow.* Pp. v, 358. New York: William Sloane Associates, 1952. $3.75.

Mr. Lehrman's report on the first few years of Israel's life adds to the impression that the tiny new state is the most hopeful and interesting spot in the world today. An excellent reporter, he senses the drama behind life in Israel and knows how to transmit his impressions to others. His book makes absorbing reading.

Mr. Lehrman is not a blind admirer. He never was and apparently is not now a Zionist. He sees a great many faults which, if not rectified soon, may weaken the new state to the point of endangering its existence. Some of these faults are due to inexperience; and Mr. Lehrman has much to say which is both amusing and disconcerting about the new officialdom as well as about the new government's lack of diplomatic skill. More basic are his criticisms of social and economic policy. He doubts the wisdom, though he admires the fact, of the "ingathering of the exiles." Hard-headed policy should have stopped the influx of immigrants far short of the vast accretion which has placed an unbearable social and economic burden upon a new state and an underdeveloped country. Sentiment has prevailed, though the author thinks it was not sentiment alone, but that defense needs have been equally compelling. Admittedly, however, neither age nor ailment has kept immigrants out of the country.

The economic problems would have been serious enough without these immigrants. The country desperately needs a more favorable trade balance and the rapid development of new industries. Here a different kind of sentiment has stood in the way. Israel has not been able to shake off the socialistic doctrines which most Palestinian settlers during the past half century had brought into the land along with their hopes and Zionist ideals. Mr. Lehrman discusses at some length the difficulties which Mapai, the dominant party in the government coalition, has placed in the way of American capital eager for investment in Israel. Concessions have come late and there is still, Mr. Lehrman thinks, ground for suspecting the economic ambitions of Histradut, the Israel federation of labor, closely allied as it is with the government.

Israel cannot avoid a religious problem. The newcomers from Moslem lands have no understanding of a secular state, while a good many of the older settlers from Eastern Europe are opposed to the slightest deviation from religious orthodoxy.

Mr. Lehrman has no sympathy for any such viewpoint. He shows no evidence of appreciating the part played by Judaism in the fate and experience of the Jewish people either in the Diaspora or in the Palestine settlement. Nor does he appear to understand that for many Jews a secular Jewish state is a contradiction in terms. He is more objective in his discussion of the problem presented by the Arab population within Israel and the refugees outsides its borders. Finally, he offers an excellent discussion of the relations between Israel and the United States, as well as between the Jews building their state and the American Jews eager to do all they can to help in this new experiment.

Mr. Lehrman's book is among the best of many which have dealt with this subject during the past few years.

SOLOMON GRAYZEL
Philadelphia, Pennsylvania

FREEMAN, KATHLEEN. *God, Man and State: Greek Concepts.* Pp. vii, 240. Boston: The Beacon Press, 1952. $3.25.

Ancient Greek thinkers had unbounded confidence in the powers of the mind. Pure reason, either unaided or illumined by divine intelligence, sufficed for the ascertainment of truth—eternal truth that transcended mere erudition.

Today, when classical studies and philosophy receive ever-diminishing attention, the content and spirit of Greek thought are virtually esoteric lore for scholars trained in the humanistic tradition.

Kathleen Freeman knows all that is important about ancient Greece. She has made the thinking of the Greek masters so completely her own that she is able to accomplish a difficult task of condensation and exposition with lucidity and perspective that merit the admiration of scholars. From the Homeric epics; the works of the scientists of the "Atomic School"; the teachings of Socrates, Plato, and Aristotle; and, to a lesser degree, the Neo-Platonists, Epicureans, and Stoics, she has distilled the essence of the Greek concepts of God, man, society, education, and law.

Greek religion the author characterizes as "beautiful and rich in emotional appeal, but with little moral and no intellectual content, and with many elements both stupid and ugly as well as cruel" (p. 9). Such appraisal is indeed a welcome contrast to the banalities of the usual "appreciation" literature. Again, the Greek concept of the nature of man is aptly summarized in the statement that the philosophers "analyzed Man's nature into component parts; they tried to show him how these could best be used, what was his place in the universe, and what was the right way for him to live" (p. 72).

Another pithy summary is the author's remark that for Plato "This life . . . is nothing but a training-ground for the soul or mind, where it learns to ignore all else but the pursuit of reality, and so to fit itself for the world where only reality exists" (p. 103).

The fundamental question, however, is whether the volume achieves its purpose. To this reviewer it seems that too much detail is presented to interest "ordinary intelligent men and women" who may know little and care less about Greek philosophy. Of course, one must agree that "Greek philosophy with its passion for truth, its rational method, its belief in intelligence allied to goodness, can and must be called in to help the Christian ethic and love of humanity to save the world" (p. vi). But something more intriguing than this almost textbook-like work must sound the call.

CHARLES EDWARD SMITH
Louisiana State University

STAVRIANOS, L. S. *Greece: American Dilemma and Opportunity.* Pp. ix, 246. Chicago: Henry Regnery Company, 1952. $3.25.

Professor L. S. Stravrianos' book on Greece, dealing with the period from 1936 to 1950, gives the general reader a clear-cut and objective account of the complexities of Greek politics and of their entanglement with the power politics of the Great Powers. The author vividly describes the Metaxas dictatorship which increased the vigor of those liberal, socialist, and communist groups which played so important a role in the resistance movement during the German occupation. The analysis of the nature of the resistance movement, showing how a united front known as the National Liberation Front (EAM) created an effective National Popular Liberation Army (ELAS) in both of which organizations the Communists played an important role, is admirably done.

The author throws light on the civil war in Greece between the Royalists and EAM during the Nazi occupation, on the mutiny in the Greek navy at Alexandria and in the Greek military units in Egypt due to British meddling in Greek politics in support of the Royalists and the Monarchy.

What is most revealing, and may prove shocking to the reader, is the author's explanation of how British intervention in Greek affairs was largely responsible for the Communist revolution. He claims that the Churchill government helped to put in power and continued to support corrupt, inefficient, ruthlessly oppressive Rightist governments determined to restore the monarchy and crush all resistance be it centrist, liberal, socialist, or Communist.

The fiasco of Churchill's policy and the ineptness of Bevin are effectively exposed and the reasons for Britain's failure in Greece are carefully analyzed. The description of the situation thus created, which faced the United States when it assumed responsibility for Greece under the Truman Doctrine, prepares the reader for the main thesis of Professor Stravrianos—the American dilemma and opportunity.

It is discouraging to note that the author is of the opinion that after an expenditure of some $700 million in Greece "between March 1947 and June 1949," four years after the United States assumed its present role and two years since the destruction of the guerrilla forces, "we have made no progress in Greece except in the military sense. The Greek army is larger, but the same politicians control Athens and the same poverty grips the country." The author warns fellow Americans "that our military victory will quickly evaporate and that we will find ourselves fighting a second 'Democratic Army' a few years hence" if we repeat the mistakes of the British.

WILLIAM YALE
University of New Hampshire

LETTERS TO THE EDITOR

Dear Sir:

The review of Howard W. Odum's *American Sociology* by Dr. Howard Becker, which appeared in your March issue (pp. 204–205), contains such sharp criticism of the book's publishers that we feel a rebuttal is justified.

Dr. Becker writes: ". . . Odum has placed American sociologists permanently in his debt. Words similarly appreciative cannot be bestowed, however, on the publishers. To have forced Odum to eliminate 300 pages, presumably with an eye to textbook sales, means that Odum himself has suffered through inadequate presentation of his views and that every instructor and student using the book will suffer with him."

Without any prompting from the publishers, Dr. Odum desired to have his book priced so that it would be readily available to students, and, in order to gain this wider distribution, he voluntarily reduced his original manuscript to the appropriate length.

As for the material eliminated from the original manuscript, this consisted, as Dr. Odum states in his Acknowledgments, of a limited "Who's Who" of some four hundred sociologists, which "logically grew too big" for the book; "segments on definitions, concepts, and specialisms; critical appraisals of special 'theories' of individual sociologists; the rich periodical literature; the bibliography of borderline sociology; and the history of sociology in specific institutions." Dr. Odum was the sole judge of what was to be left out, and he obviously retained the more important and eliminated the less important. One may well doubt that the elimination of this less important material has hampered the author in the presentation of his views, or that instructors and students using the book will suffer appreciably.

The publishers of Dr. Odum's book are primarily commercial, not academic, publishers. Whether the publishers are "crassly commercial" is a matter of opinion, but, as Dr. Becker well knows, during the 228 years of the firm's continuous ex-

istence, it has published some notable contributions to sociology including, among many others, the works of the Hammonds, the Webbs, Rowntree, Havighurst, and now Odum. Credit for a worth-while contribution in any field belongs primarily to its author; the publisher is certainly of secondary importance. The contribution, if good enough, will almost always find a publisher. Unless he is endowed, any realistic publisher hopes at least to break even, and the author hopes to gain either an enhanced reputation or a money profit, and perhaps both, since neither publisher nor author is fed by the birds. Any tangible gain to either depends largely upon the activity of the publisher in marketing the books produced, for, like automobiles and television sets, books must be "peddled." Dr. Becker would doubtless be annoyed if his publishers made no effort to sell his books.

In the December 1951 issue of *Social Forces*, Dr. Read Bain closed his review of Odum's book with this sentence: "Well, it won't make either Odum or Longmans rich, but it should make all sociologists grateful to both of them." We regret that such a strong dissenting voice has been raised against part of this sentiment.

ROBERT L. STRAKER
College Editor
Longmans, Green and Co., Inc.

Dear Sir:

The only adequate reply to Mr. Straker's letter would be one written by Dr. Odum himself, and under the circumstances, this can hardly be expected.

Where my own comment is concerned, I can add little to what I have already said in the review with which issue is taken. If the reader will refer to that review, he will find that it is precisely with regard to the material eliminated, listed in paragraph four of Mr. Straker's letter, that the adverse judgment was made. Therefore, nothing need be added to that paragraph; Mr. Straker has stated my case.

In conclusion, let me say that I am quite sympathetic with the plight in which publishers now find themselves; namely, high costs of labor, paper, and binding. Whether the smaller publishers, such as The Free Press, Glencoe, Illinois, have been able to diminish their difficulties by cutting down on overhead is a question that I am not prepared to answer. I can only say that in the entire course of my teaching experience I cannot recall ever having adopted a book because it was called to my attention by a publisher's sales representative. I am also appreciative of the free entertainment provided at sociological conventions by such representatives; I have thoroughly enjoyed myself at many such gatherings. Here again, however, it is to be doubted as to whether the entertainment policy really produces favorable results on the publisher's balance sheet. Does it increase the cost of books to the purchaser?

HOWARD BECKER
University of Wisconsin

Dear Sir:

If space permits, I should like to comment on the recent review by Professor Theodore Abel of my *Through Values to Social Interpretation*. It is not my purpose to take issue with the opinions advanced by Professor Abel, but rather to correct certain errors of fact.

1. Professor Abel asserts that various essays included in the collection have all been published previously. A comparison of texts, such as a careful reviewer might be expected to make, would show that in almost every case the two versions previously published were drastically abridged. Two of them, in fact, included only two-fifths of the versions made available in the present collection. Whether there is any merit in presenting, in readily available form, the full texts of the essays is an open question, but Abel's statement as it stands is not strictly accurate.

2. It follows from this that his assertion that the essays "are easily available in their original form" is somewhat untrue. Over and above this, however, is the fact that two of the more important essays appeared in a book now out of print. The plates were melted for war metal after only 1,500 copies had been printed. Here again, reasonable care would have prevented the reviewer from making a misstatement.

In conclusion, I should like to point out that in the review as printed there is nothing specific about what the book includes or does not include. Moreover, one half of the brief review is devoted entirely to the expression of opinion about the worthwhileness of collections of essays issued while the authors are still alive. Here the reviewer doubtless had in mind the recently published volumes by Parsons and Merton as well as the present writer's efforts. I am flattered to be included in this trio, but it is with some hesitation that I call attention to the fact that collections of essays by Giddings, the older Faris, and several other sociologists far more distinguished than those of the recent vintage to which I belong, were published without the services of a literary undertaker. If, however, Professor Abel would like to volunteer for the task indicated by his remark on "the undoubtedly more critical and discriminating selection of some future editor of his [Becker's] posthumous work," I shall certainly be willing to mention him in my last will and testament.

Sincerely yours,
HOWARD BECKER

Dear Sir:

In the March issue of THE ANNALS you have a review of my *The Impact of the Labor Union* by Mr. Sar A. Levitan containing a number of strikingly inaccurate statements concerning the contents of the book.

Mr. Levitan says, "Wright, the editor of the volume, contributes two papers dealing with aggregate wage problems," and he goes on to say *"The Impact of the Labor Union* is limited to the economic aspects of union activities and fails to deal with their socio-political effects."

May I say that Mr. Levitan either has not read my book or else is deliberately misrepresenting its contents. The first of my papers deals explicitly and exclusively with the "socio-political effects" of the labor union. The second paper deals with aggregate wages, but the first deals with precisely the questions which Mr. Levitan says I ignore.

In addition to my paper, the various discussions by Boulding, Samuelson, and others contain many references to the socio-political activities.

May I point out that this is the second time in which my work has been libeled in THE ANNALS within the last year. My book on *Capitalism* was entrusted to the notorious pro-Communist, Paul Sweezy, with results which your readers are now familiar with. It is perhaps a compliment to my work that my critics are invariably forced to resort to misrepresentation, but I do not see how THE ANNALS can expect to retain its scholarly reputation and continue to publish slanted reviews of this type.

On the merits I suggest that Mr. Levitan was anxious to minimize a book which contained the following jingle concurred in by all participants, including Samuelson and Boulding:

"We all or nearly all consent
If wages rise by ten per cent
It puts the choice before the nation
Of unemployment or inflation."

I would deeply appreciate it if you would publish this letter.

Yours very truly,
DAVID MCCORD WRIGHT

Dear Sir:

A rechecking of Professor Wright's first paper confirms my original belief that the book fails to deal with socio-political effects of trade unions. For purpose of accuracy I might have stated that it fails to deal *effectively* or realistically with the problem. In my brief review I referred to the more significant of Professor Wright's two papers, the other seven participants in the symposium having contributed one paper each.

Mr. Wright is quite correct in stating that other contributors made reference to socio-political activities of unions, but these references were in the nature of parenthetical remarks and did not attempt to discuss any aspects of the subject with any degree of completeness.

I therefore conclude:

Alas this reviewer cannot reneg,
For a single socio-political leg

Hardly begins to fulfill the need
Of an economic centipede.

Sincerely yours,
SAR A. LEVITAN

BOOKS RECEIVED

Applied Statistics. A Journal of the Royal Statistical Society. Edited by Leonard H. C. Tippett. Vol. I, No. 1 (Mar. 1952). Will be issued three times a year—in March, June, and November. Pp. 80. Edinburgh: Oliver and Boyd, 1952. $4.00 per year.

Identification of the Principal Issues

By CLAUDIUS O. JOHNSON

THE issues in every Presidential campaign call forth millions of words, spoken and written, yet there are usually public questions of significance that are discussed but little, and some that may be considered not at all. An issue may be stressed, played down, or ignored, candidly met, obliquely handled, or distorted, depending upon the convictions, moods, attitudes, and techniques of candidates and upon the overall plans of the party strategists. Yet, on the whole, questions of governmental policy do play an essential part in political campaigns, and the campaign of 1952 will probably be no exception. From what source do issues arise? How are they developed? What are the main issues for 1952? Will the campaign and election bring a decision on them, or on any of them?

ORIGIN OF THE ISSUES

Whence come the issues? It is elementary to say that few of them originate with the party in national convention assembled. The party in convention is a sort of clearing house for the issues, a broker of plans, projects, ideas, and policies. Issues are commonly introduced by economic and social groups —organizations which may have no strong affiliation with any political party. Such organizations often carry on a program of public education simultaneously with their approach to party leaders and party organizations, their purpose being to win the support of the party by demonstrating their strength among the voters.[1]

The time that may elapse before a movement is strong enough to win the endorsement of a political party may be long or short, depending upon the popular strength of the proposal and the inclination of party leaders toward the policy advocated. It is probably doing no violence to the facts to say that the temperance and prohibition movements for many years made relatively slow progress with political conventions, not so much because they failed to win substantial popular support but rather because they ran counter to the personal inclinations, interests, and convictions of so many party organization men. The same may be said of the movements for the direct election of United States senators and the national income tax.

On the other hand, policies that are more palatable to party leaders—policies like restrictions on immigration and aliens, the assertion of the rights of the United States abroad, and the care of veterans—find easy acceptance with party organizations. Indeed, on such matters politicians may actually run ahead of those groups who would ask for consideration of their programs. Only a few citizens will speak *for* the aliens, and fewer still will stand *against* the sovereignty of their country or the interests of the veteran.

Issues are presented or may present themselves at any time. Pressure groups watch for opportunities to influence the

[1] Of course not every group desiring recognition of its interests by a political party would carry on a campaign of propaganda for public support. For example, an association seeking an opportunity to exploit a valuable natural resource might well decide that an effort to win the public to its side would have an effect adverse to its interests, would serve to remind the public of the issue of conservation.

President, Congress, and other agencies and officers of the government, and their campaign to educate the public through the press, radio and television is a continuous process. The President may make a variety of issues by the use of his constitutional powers to conduct foreign relations and to command the Army and Navy. The action of a foreign power may pose a question that must be faced, and a diplomatic blunder on the part of our government may with dramatic suddenness present an issue. A great management-labor dispute may push the question of labor relations to the fore; industrial depression and unemployment may creep upon us and take the center of the stage of issues; a disastrous flood may give the control of waters a leading place in the public mind; and inadequate medical and hospital care may raise the issue of national health insurance. Issues, then, are arising all the time, some selected by public authorities or precipitated by the action of such authorities, others consciously shaped by private groups, still others resulting from forces beyond control.

There are issues that are not always clearly discernible—dormant issues at the "grass roots," perhaps accumulated grievances, or unfulfilled aspirations. Or there may be among the people a vague general feeling of helplessness and apathy. The party that can diagnose the trouble and offer a promising remedy will profit greatly. In such cases, however, the people are more likely to find release in a person than in a party, for only a personality can show the understanding, the warmth, and the spirit necessary to make articulate the basic social needs of the millions. Such men as Jefferson, Lincoln, Bryan, and the Roosevelts expressed the unformed thoughts of sturdy men, giving them issues and self-respect. Party leaders who neglect to look to the base of democracy for issues are missing not only a chance to profit for themselves but also the much greater opportunity to do their country a splendid service. If responsible leaders fail here, the demagogue will exploit the opportunities they have neglected.

PARTY PLATFORMS

It is in the year of the Presidential campaign, of course, that the issues, from whatever source derived, are given a somewhat systematic examination and evaluation by the public. Each political party (our concern here is with the major parties only) is supposed to state its position on the issues of the day in its platform. On this document the public has become rather too cynical, so cynical that not a third of the voters read any part of it, and probably not one per cent read it in its entirety. Even the party leaders often fail to take their platform seriously, but at other times and on specific issues they show no lack of conviction and sincerity. Thus, in 1920, the Democratic convention took an unequivocal position in support of the League of Nations; the Republican party has often stated its position with relative clarity on the tariff; and in 1948 both parties took intelligible positions on the Taft-Hartley Act.

Platforms are not wholly without value as guides to party policy. They sometimes declare for a particular course on a specific issue, and they very commonly indicate the general direction of the party. The platform may also serve as a mild restraint on the President or on congressmen who would ignore the party's announced program. It must be admitted, however, that, in general, the platforms are disappointing. On some subjects the platforms of the major parties are usually in substantial agreement, and on controversial matters they often make broad statements signifying nothing. For example, in 1920, the Republican platform, dodging the issue of the League of Nations, declared for "agreement among the nations to preserve the peace . . . an international association."

The major parties frequently adopt several virtually identical planks because the two parties must appeal to millions who hold essentially the same views on public questions. It is a commonplace that many Republicans whose parents rejoiced in the Square Deal of Theodore Roosevelt have lived without dismay through the New Deal of Franklin D. Roosevelt and the Fair Deal of Harry S. Truman. Equally well known is the affinity of hundreds of thousands of Democrats, especially in the South, for the domestic policies of the right wing of the Republican party.

On what great issue during the last fifty years have Democrats and Republicans lined up and fought as parties? Did all the Republicans at the turn of the century favor "sound money"? Did all the Democrats favor "16 to 1"? Have there not always been both high tariff and low tariff Republicans and Democrats? Did the Democrats unanimously support and the Republicans solidly oppose acceptance by the United States of membership in the League of Nations? Were the Democrats Wet and the Republicans Dry? Was the New Deal legislation the exclusive work of the Democrats, or did most of it have the support of a strong Republican minority? The obvious answers to these questions contain the explanation for the Janus-faced generalizations of the typical party platform.

Suppose the Democratic platform of 1932 had declared for the policies it later put into effect: under the conditions obtaining, the Democrats might still have been victorious, but what Democrats would have dared present such a platform in July 1932? It remained for the Socialist platform to advocate, among other things, appropriations of $10 billion for relief, slum clearance, and public works; unemployment insurance and old-age pensions; legislation to protect farmers and small home owners from mortgage foreclosures; the guarantee of the right of labor to organize; and the recognition of Soviet Russia. Thus, a minor party with no hope of office in the immediate future, and not seeking to attract voters by watering down its program, more nearly stated the policies the successful major party was to carry into effect than did that major party.[2]

CANDIDATES MAY CLARIFY PLATFORMS

If the platforms of the major parties run to generalities and sameness, the Presidential nominees have on more than one occasion given specific issues a clear meaning and emphasis. Thus in 1920, James M. Cox developed more fully the Democratic platform declaration favoring the League of Nations. In 1928, Alfred E. Smith practically changed the Democratic platform pledge from "an honest effort to enforce the Eighteenth Amendment" to an earnest campaign to remove it from the Constitution. Franklin D. Roosevelt's first campaign gave substance and scope to a New Deal not elaborated in his party's platform. In 1940 Wendell Willkie approved a peacetime selective draft, a point on which the Republican platform was silent. Four years later, Thomas E. Dewey went beyond his party's platform in his endorsement of the reciprocal trade program.

It may happen, however, that a candidate will do little to explain and interpret a party platform. Perhaps the best modern example of a candidate's

[2] Charles Edward Merriam and Harold Foote Gosnell, *The American Party System* (4th ed., New York: The Macmillan Company, 1949), p. 60.

failure to clarify an issue occurred in 1920 when Warren G. Harding "interpreting" the Republican plank in favor of "an international association" seemed always to oppose *the* League, and at times appeared to be for and at other times against *a* league. Neither the position of the party nor that of its nominee for the Presidency was clarified by a statement of 31 distinguished pro-League Republicans to the effect that the election of Harding would be the surest way to "bring America into an effective league to preserve peace."

THE PRINCIPAL ISSUES IN 1952

Foreign policy

Foreign policy probably holds first place as an issue in 1952. It may develop either as a partisan or a nonpartisan issue. The bipartisan policy in reference to European affairs, the policy of the Vandenberg days, has come to grief. It is by no means improbable, however, that we may return to such a policy. A Republican President who is in general accord with our present foreign commitments might easily hold Democratic support, or a conciliatory Democratic President might by skillful and patient consultation with like-minded Republican leaders win support for a bipartisan policy. But there seems to be some doubt as to whether the leadership of an isolationist or near-isolationist President could bring a sufficient number of Republicans and Democrats together to promote a bipartisan policy.[3]

A discussion of a foreign policy of isolation appears to be almost academic. What responsible leader of either party advocates complete isolation? The nearest approach to it is Mr. Herbert Hoover's proposal that we withdraw to the Western Hemisphere. There is, however, a modified isolationism for which Senator Robert A. Taft is the principal spokesman. This policy appears to favor limited obligations and responsibilities in Europe as distinguished from our broader commitments of recent years; to advocate a stronger line in eastern Asia, suggesting from time to time the use of Chinese Nationalist troops; to minimize the danger of Russian aggression; to show a marked lack of confidence in the United Nations; and to take a skeptical view of the North Atlantic Treaty Organization. The difference between the policy thus briefly sketched and that of the present administration is sufficiently wide to present definite alternatives.

Internal security and civil liberties

The drive against communism and disloyalty in the United States raises the fundamental question of how we can maintain internal security and at the same time preserve our civil liberties, retain or regain "the happy privilege of an American, that he may prattle and print, in what way he pleases, and *without any one to make him afraid.*"[4]

Is the McCarran Act, or a slightly modified McCarran Act, the best possible legislation for dealing with the threat of some thirty thousand Communists in the United States and seven or eight times that number of persons

[3] Professor James L. McCamy very seriously questions the advisability of a bipartisan foreign policy, maintaining that it "removes the proper testing of executive proposals, leaving this function to the chance opposition that might possibly come from individuals who typically will not have as much standing as would a political party." *The Administration of American Foreign Affairs* (New York: Alfred A. Knopf, 1950), p. 345.

[4] Quoted in John C. Miller, *Crisis in Freedom: The Alien and Sedition Acts* (Boston: Atlantic-Little, Brown, 1951), p. 83, from James T. Callender, *The History of the United States for 1796* (Philadelphia, 1797), p. 39.

who are able and ready to do the party's work? Does the McCarran Act in any unnecessary manner menace loyal Americans? Is the Federal Loyalty Program properly balanced between protecting the public service from subversives and guarding the rights of individuals? Have some committees of Congress and a few individual members thereof in their zeal to eradicate Communists and other subversive elements greatly damaged the reputations and impaired the usefulness of certain intelligent and patriotic citizens?

As long ago as 1777, Edmund Burke, in a letter to the Sheriffs of Bristol, conceding that liberty must have some restraints, gave this caution: ". . . it ought to be the constant aim of every wise public counsel, to find out by cautious experiments, and rational, cool endeavors, with how little, not how much, of this restraint the community can subsist; for liberty is a good to be improved, and not an evil to be lessened."[5] Dispassionate, nonpartisan discussion of civil liberty is needed in 1952. Such discussion we probably shall not get.

One of our standing issues is that of racial and religious discrimination. Long an announced policy of the Republican party, in the last score of years antidiscrimination has been a Democratic principle also. The parties might even be accused of "nursing the issue," although it should be said that there are constitutional obstacles to be overcome and sectional bitterness to be removed before equality of rights can make any marked progress. As the issue now stands it is one on which we may continue to expect a wide difference between party promises and performances. In both major parties there are large elements that hold to the theory that removal of discrimination is the responsibility of the individual states, and in both parties there may be individuals who believe that a little discrimination is a good thing.

[5] *The Works of Edmund Burke* (London: George Bell and Sons, 8 vols., 1891–1897), Vol. II, pp. 30–31.

Government finance and fiscal policy

The issue of government finance assumes large proportions because of the cost of national defense and aid to the free nations. Whether the present defense policy is continued or an alternative one is adopted, the question of how to meet the cost will remain. Is a "pay as we go" policy possible? How would the proposed constitutional amendment that would limit personal and corporate income taxes to 25 per cent of income affect the revenue system and individual taxpayers? Would a constitutional amendment limiting the amount of government expenditures in any one year to a certain percentage of the national income constitute a realistic approach to the problem of expenditures? Should government borrowing be subject to constitutional limitations? Then there is the question of how to resist or control inflation. How much can be accomplished by wage and price controls; and how much reliance should be placed upon monetary controls by the Federal Reserve System? Can fiscal policy be made an effective instrument for keeping business on an even keel? These are some of the questions the voters should hear discussed. On the whole they are nonpartisan matters, and our political leaders ought to discuss them objectively.

Labor relations

The labor issue continues to be a leading one, particularly the problem of labor disputes in large industries. The Taft-Hartley Act does not appear to be the complete answer. Its 80-day injunction to prevent a strike that would threaten the national health or safety

does not of itself bring about a settlement. What are the alternatives to Taft-Hartley? What is the basic impact of government intervention in major strikes? How can the government intervene in a labor dispute without favoring one side or the other? Is it possible to devise a penalty system that will hit both sides with equal severity? Is compulsory union membership ever justified? Such questions are ever with us in times of emergency, but only a few experts are competent to deal with them, and the public has difficulty in understanding the problems, not only because of their complexities but also because the public is often emotional on labor questions. Decisions on specific labor questions must of necessity be left to our duly chosen officials, but campaign discussion of the basic problem should be profitable to both voters and candidates.

Agriculture

Both major political parties seem committed to price supports for agricultural commodities, although many Americans would like to hear a discussion of the merits of continuing this depression-born device. If such supports are to be continued, should the parity concept be retained? Does it adequately serve agriculture and the national economy? In the matter of foreign trade in agricultural products, questions are raised as to the wisdom of continuing the Wheat Agreement and as to the sense and justice of imposing barriers against the importation of dairy products. What are the best ways and means by which the federal government can support soil conservation? Despite present surpluses we shall later need more production. What should be the relative places of irrigation and soil improvement in meeting this demand? Agricultural economists raise another significant question: What should be done to get young people out of agricultural areas, particularly in the South, where they are not needed and where wages are low to areas where they can find better employment? What suggestions do our political leaders have to offer on this and other essentially nonpartisan questions on farm problems?

Conservation

There is practically no dissent to the proposition that our natural resources should be conserved, but there is considerable disagreement on what constitutes the best type of conservation. Should the states or the United States have title to the oil lands beneath the marginal seas? In other words, should a few coast states have this property, or should it belong to the whole country? This is an urgent question, involving not only millions of dollars but also the broader question of conservation. It is one specific question in relation to conservation that might be directly considered in the campaign and possibly even settled by the election. Another conservation question, one that will probably be a subject of debate for some time to come, is that of the multiple-purpose water resources projects. How far should the federal government go to improve the navigation of our rivers, control their floods, utilize their water for irrigation and their power for generating electricity? Under what system or plan should such enterprises be administered? And what part in hydroelectric development is to be left to private organizations?

Social security

Government responsibility for the aged, the unemployed, and others who might be dependent upon charity seems now to be generally accepted in principle. The issue is on how inclusive such programs of insurance and assistance should be and how substantial the benefits. The outstanding issue at this time appears to be that of national health insurance. Perhaps a single basic question on social security could be phrased in this way: Considering the rapid strides we have made, have we gone far enough to stop for a time and take our bearings?

Ethical standards in government

Surely all political parties and practically all sorts and conditions of men endorse integrity in the public service. But such universality of approval does not preclude public ethics as an appropriate political issue. In the practical world of affairs integrity is often a relative matter. Eternal vigilance is the price of an integrity that goes beyond ordinary money honesty to include such traits of character as the eschewal of "honest graft" and abstention from harmful gossip and slander even to accomplish a noble purpose. Ethical standards maintained in a political campaign are by no means the least significant evidence on which the voter may make his decision respecting the claims of men and parties to public office.

Presidential power

A President may stretch the powers of the office gaily and with gusto, or he may exercise wide powers with reluctance, or he may hesitate when he should act, giving rise to the complaint: Why doesn't he do something? In the twentieth century, however, the complaint is more commonly made against an executive for alleged excessive use of power. Even the normal course of development would gradually change and reshape the executive power, sometimes making it an issue. A crisis, a period of stress, usually forces executive action and hence the issue of power. What are the limits of the executive power to make international agreements, engagements that have practically the same force as treaties? Do the President's powers as Commander in Chief extend to any civilian activities related to the national defense? The President has the Constitution and the statutes for guides, but his actions under them depend upon his understanding of his office.

It is probable that the duties and powers of the President will never be exactly defined. They may be expanded, delimited, and refined by law, judicial decision, and custom, but there will remain areas in which power is in doubt. How could it be otherwise in a country moving rapidly on its own motion and as a result of outside pressures? As the situation changes, the nature of the issue changes, and in consequence its discussion in campaign after campaign is more than a formality. The American people seem generally able to grasp the larger aspects of this problem. It would therefore seem to be a most appropriate one for campaign discussion.

WHAT CAN THE CAMPAIGN DECIDE?

Whatever the issues of a campaign may be, the voter will usually find himself confused. In the first place, candidates and their backers commonly fail to meet some issues squarely. Understandably they want to appeal to as many voters as possible. Consequently, the tendency of party spokesmen is to take a middle course, or at least to avoid specific declarations. Furthermore, public men no less than some of our newspaper publishers and entertainers seem to underestimate the capacity of the public to distinguish, to appreciate, to understand. It is the belief of this writer that the average voter is capable of grasping, indeed eager for, much more solid reasoning than the typical political orator puts into a speech. The intensity with which the people have hung onto the words

of able and sincere men who have "known what they were talking about" —men like Woodrow Wilson, Charles Evans Hughes, Alfred E. Smith, George W. Norris, and William E. Borah—would seem clearly to indicate that the electors will stand for, even prefer, a much richer campaign diet than they usually get.

In the second place, the issues present a problem to the voter because he is often unable to find the party or the candidate who represents his views on all the leading issues. Suppose the voter favors minimum commitments abroad and a very aggressive anti-subversive program at home, a program that calls for a narrow interpretation of the civil liberties guarantees of the Constitution in order that all possible disloyal persons may be located and rendered ineffective. And suppose one party favors this voter's foreign policy and the other party favors his views on internal security? Obviously the voter will have to cast his ballot against one of the policies he favors. The situation of course becomes further complicated as the issues increase in number. If the voter is a good party man he resolves his doubts on the issues in favor of his party. But, if he is of the 25 or 30 per cent of voters with independent leanings, he may be troubled. He must make his choice of party and candidate on the basis of their standing on the main issue or issues.

Possibly the candidates may be more significant in the voter's mind than the issues. The candidates themselves, or one of them, may be the main issue. Or the principal issue may be: "Do we want a change?" or, "Time for a change." Many factors help the voter make up his mind—the traditions of the parties; the issues of the day; personalities; and general impressions. An individual may "feel somehow," and with considerable intelligence, that this is the man or the party for the time. Without having given the matter systematic thought, the American voter knows that compromise, accommodation, and contentment with less than full satisfaction are essential to the operation of free government.

An election may settle one or two principal issues immediately or in months to follow; or it may settle practically nothing. The election of 1896 amounted to an immediate decision *against* gold and silver coinage at the ratio of 16 to 1 and *for* the protective tariff. In 1912 the people seem to have voted for the progressivism of the New Freedom rather than for any specific policy or policies, and in 1920 they resoundingly recorded that they had had enough of it. The election of 1932 proved that the American people, not knowing what to do, were willing to try a bold experiment in government.

Other elections since 1896 would seem to represent general trends rather than hard and fast decisions. The suggestion that burning issues are not settled in every election is no indication of disease in the body politic. Since our elections must come every four years whether or not there are significant issues for consideration, and since issues may arise and be settled between elections, it is not at all to be wondered at that campaign issues are sometimes less than epoch-making.

What issues may we hope to see settled in the campaign and election of 1952? It does not seem probable that the Korean "police action" will be or can be settled by an election. It is possible, even probable, that the political activities of this year will indicate whether co-operation with and aid to the free nations should be continued in their present proportions or substantially reduced. Such issues as civil liberties, labor relations, agricultural promotion, and public finance will probably not be settled. They are continuing issues demanding legislative attention from year to year. We should not expect this election to mark any particular break with the past, as did those of 1920 and 1932. The most that we have reason to expect is that the voters will indicate a general approval of present policies or a preference for some modification of them.

Claudius O. Johnson, Ph.D., Pullman, Washington, is professor of political science at the State College of Washington. He has served as professor of political science at the University of North Dakota and the University of Chattanooga, and he has been a member of several governmental commissions in the state of Washington. He is author of Carter Henry Harrison: Political Leader (1928), Borah of Idaho (1936), Government in the United States (1933, 1937, 1944, 1947, and 1951), other college textbooks on American government, and various articles for professional journals.

How Can We Secure Dependable Allies?

By D. F. Fleming

IT is hard to think of a more difficult question than the one raised in the title, or a more urgent one, for the kind of future we are to have depends on finding the right answer.

Can we get and hold enough allies to keep our way of life alive and flourishing in a large part of the world? Or are we doomed to alienate our allies and lose them in a crisis?

Our *volte-face* on the subject of alliances is one of the swiftest and most sweeping developments in our history. Down to 1914 we rejected the very thought of "entangling alliances." We were careful never to call ourselves an ally during World War I, always an "associated power," and afterwards the "no alliance" principle was our slogan for instant retirement into isolation. In World War II we welcomed allies, even Red Russia, and actually called them by that name; but it is only since 1947 that we have actively sought allies.

Our Western Alliance Structure

During the past five years we have accumulated allies at a phenomenal rate. We started with a backlog of some twenty Latin American allies which had stood by us well during both world wars, with the notable exception of Argentina. The addition of Canada, our too often forgotten ally, accounted for all of the Western Hemisphere.

The Truman Doctrine

Greece and Turkey were added on March 12, 1947, when the Truman Doctrine for the containment of both the Soviet Union and communism was proclaimed. This doctrine, which applied throughout the world, expressed our resentment at the Soviet organization of eastern Europe, and our conviction that the land bridge between Europe, Asia, and Africa was a strategic position which must be held.

This was during the period of our atomic monopoly, when we believed that we had a decisive weapon which could make our will effective on this planet. President Truman had made up his mind after the first abortive Council of Foreign Ministers, in September 1945, to contain the Soviet Union. Frequently dissuaded from issuing his doctrine, he insisted upon its proclamation in connection with our assumption of Britain's role as the defender of Greece.[1]

In accord with the law of world politics that what seems strictly defensive to one side always seems highly offensive to the other, the Soviets considered containment to mean encirclement. They replied by organizing the chief Communist parties of Europe into the Cominform in September 1947, and the Czechoslovak Communist party seized control of Czechoslovakia in February 1948.

NATO

This act loosed the first real wave of fear throughout the West and led in rapid succession first to a defense treaty between five west European states and then to the North Atlantic Treaty of April 4, 1949, in which twelve Atlantic states contracted to defend each other against attack. The new allies were

[1] See the two authoritative articles by Arthur Krock in *New York Times*, March 23, 25, 1947.

the United States, Canada, Great Britain, France, Italy, Belgium, Netherlands, Luxembourg, Norway, Denmark, Iceland, and Portugal.

The North Atlantic Treaty Organization had little military substance until the outbreak of war in Korea in June 1950, coupled with the Soviet achievement of the A-bomb, deeply alarmed the United States. The Truman administration, which had found no way to prevent a gigantic breach in the Truman Doctrine in China, now felt compelled to fight for South Korea. Americans in general feared having to fight a long series of debilitating wars with Soviet satellites without ever being able to strike at the Soviet Union, and the western Europeans feared that this development in Asia would leave them open to Soviet absorption.

German rearmament

France promptly sent two lists of searching questions to Washington, on August 5 and 17, 1950, asking if we would defend Europe on the ground. Our Joint Chiefs of Staff said yes, but insisted on the rearmament of Western Germany and its inclusion in NATO,[2] a demand which surprised the French and British Foreign Ministers when presented suddenly by Secretary Acheson on September 12, 1950. Both demurred, urging the prior development of NATO forces, but after a few days they capitulated to "great pressure."[3] Though they yielded, "the urgency the United States felt over the European and world situation had not been sold to the European powers," and some of them felt that they were "becoming not much better than satellites."[4]

[2] James Reston, *New York Times*, March 2, 1952.

[3] Harold Callender, *New York Times*, September 17, 1950.

[4] Drew Middleton, *New York Times*, December 20, 1950; Daniel Schorr, *Christian Science Monitor*, December 22, 1950.

Effects of our arms drive

Simultaneously the United States launched an enormous military program, calling for 100 billions in two years, applied full pressure on our NATO allies to act accordingly, and launched an intense program of buying raw materials for military use and stockpiling. These moves helped Britain's dollar balances, but made it extremely difficult for our allies to get their share of the needed materials in competition with us, while inflation soared internally among them in response to the rearmament pressures.

Painfully achieved European recovery was distressingly set back, and a new financial crisis began in Britain which no palliatives can solve. Britain must reduce the drain of the Malayan war and her other imperial commitments sharply, along with rearmament, or suffer a slump in her low standard of living that would have incalculable consequences.

Likewise, France must cut the losses of her Indochinese war, both in manpower and in money, if she is to have any chance of balancing Germany in Europe. During the two years since the French proposed the Schuman plan and the European integrated army, the Germans, unburdened by any rebellious colonies, have forged far ahead of France economically into a position of prosperity and ability to finance a new army,[5] while France faces a further reduction in her standard of living which would add to the quarter of her voters who already vote communist.

NATO extended

Meanwhile NATO has been extended to include Greece and Turkey, neither of them Atlantic powers. In July 1951

[5] Theodore H. White, "Germany and the Allies Great Gamble," *The Reporter*, June 24, 1952, pp. 9–14.

the State Department abruptly announced that it favored the entrance of the two Mediterranean powers, and our NATO allies reluctantly acquiesced at the Ottawa Council Meeting on September 20, after exacting promises that the nonmilitary functions of the organization would receive greater attention.[6] "Rightly or wrongly the Western European allies believe Washington has overemphasized the military aspects of the Soviet problem"—a feeling which "reached the proportions of a quiet but stubborn revolt" at Ottawa.[7]

Spain

However, Allied protests have not prevented the United States from taking the ultimate step in alliance-making, the decision to make an ally of Franco Spain which was signalized by Admiral Sherman's visit to Franco in July 1951. After a careful investigation in Washington, Demaree Bess decided that the Franco alliance signified a conclusion by Acheson that "all-out war is almost inevitable."[8] It remains to be seen whether our insistence can gain admission to NATO for Franco over the nearly unanimous moral repugnance of our NATO allies, Portugal excepted, to such an association.

ALLIES IN THE EAST

Concurrent with these developments in Europe we have erected a complete structure of alliances in the Pacific centering in Japan, a peace treaty for her being negotiated through diplomatic channels and ratified by a conference at San Francisco in September 1951.

The terms of the treaty elicited indignant protest from the Philippines, which resented its loss of reparations. This loss was partly compensated by the United States. Burma protested, and India requested three important revisions. Indonesia asked that Communist China be a party. Australia voiced strong objections and joined with New Zealand in vainly requesting that Japan be forbidden to have an air force or a navy.[9]

Britain objected to our desire to have Chiang Kai-shek sign the treaty, but finally accepted an agreement that neither Peking nor Formosa should sign, Japan being free to choose either later.[10] Six weeks afterwards a group of our Senators revealed that John Foster Dulles, the architect of the treaty, had promised them that Japan would sign with Formosa, and she did. Later she recognized the Nationalist government as the government of all China.[11]

The ample provisions for making Japan an American military base aroused resentment in Japan itself. Many Japanese felt compelled to take sides in an explosive world situation. A public opinion poll showed well over half opposed to the continuance of American forces in Japan, and the press almost universally described Premier Yoshida's trip to Washington as "the mission without honor."[12]

Like the Germans, great numbers of Japanese who had just accepted with relief the American teaching that they must abandon armaments and war now learned with shock that the orders were reversed and that the pains of conscription and armaments must now be accepted again.

During the summer of 1951 some thirty changes were made in the treaty draft, all of them comparatively minor. The concessions did not meet the main objections of Burma and India, both of whom refused to attend the treaty signing.

Australia and New Zealand were reassured by a mutual defense treaty with the United States, and a similar pact was signed with the Philippines.

Reference to the treaty "ceremonies" having led to renewed criticism, it was decided to allot four days for discussion, though without any right of amendment. Then the Soviet Union suddenly caused alarm by accepting her invitation to attend. A set of drastic rules of procedure was hastily adopted which allotted to each of the invited delegates a single hour in which to express his views. The Chairman, Secretary Acheson, was given full power to decide all points of order, and he gaveled the Russian and Polish delegates so firmly that he won national applause from the television audience. Even Senator McCarthy agreed that Acheson "did a good gavel-banging job."[13]

Our technical triumph was unquestioned. We had made the former barbaric enemy, Japan, into the apparently docile ally of the present. Yet it was a strange victory. We made a peace deeply affecting Asia in which all of Asia that mattered would have no part. The Soviet Union, China, and India, representing a full billion Asians, were outside the treaty and opposed to it. Even Carlos Romulo, of the Philippines, said at San Francisco: "It is straining credulity to believe that Japan has been completely transformed from the aggressive, feudal, militarist police state which it has been for centuries into a thoroughgoing democracy." James Reston agreed that this was the consensus at the conference. He wrote: "Nobody here has any illusions about the democratization of Japan. Nobody thinks Japan is going to be happy with a United States dole and a United States policeman in the corner."[14]

WEST GERMANY INTEGRATED

Japan having been tied into the American alliance system, Secretary Acheson pursued the drive of our Joint Chiefs of Staff to do the same thing with Germany. At the Rome meeting of the NATO Council, in November 1951, it was made plain that the United States would have a German army, even if it was necessary to "go ahead with some alternative plan for German participation," in the teeth of French opposition.[15] This threat was renewed in February, with the backing of both the Pentagon and the Congress.[16]

The integration of Western Germany into the European Defense Community —with France, Italy, Belgium, the Netherlands, and Luxembourg—was steadily pushed at the Big Three meeting with Chancellor Adenauer in February 1952 and at the Lisbon meeting of NATO, which set up a permanent secretariat and indicated for NATO a status overshadowing the United Nations.

In the United States the Lisbon con-

[16] James Reston, *New York Times*, February 13, 1952.

ference was celebrated as a great victory; but in London the *Times* asked, on February 26, what purpose was served by the talk of fifty divisions in 1952 and a hundred still more imaginative divisions in 1954. This kind of "mock publicity" which attempted "to combine military security with political propaganda" indicated that the military planners "do not really know what they want or what they need." The *Economist,* on March 1, deplored the "round figures, flat assertions and high aspirations tumbled into print together," and bluntly termed it a dishonest practice to pretend "that Franco-German difficulties over a European Defense Community are not so serious after all."

French reluctance to accept German rearmament was expressed in the warning of *Le Monde* that the "autocratic and militaristic apparatus which was responsible for two devastating wars and the ruin of Europe would rise again."[17] Attempting to explain the difficulty in bringing German rearmament about, Reston wrote that behind the resistance to "Mr. Acheson's sudden diplomacy" lay the fact that "the French and Germans had never really accepted the United States estimate of the meaning of Korea, on which the proposal was based in the first place."[18]

On March 10 the entire venture was imperiled by the receipt of a Soviet note proposing the creation of a unified Germany with an army and an air force of its own, neutralized to the extent that it would agree not to join NATO. This offer led to renewed determination in Washington that the negotiations with Germany must be speeded to conclusion before still more attractive Soviet offers could arrive, and both the peace contract with Germany and the European Defense Treaty were signed on May 27, 1952.

The strong pressure of American diplomacy had made another great enemy state into an ally, if the agreements could be ratified by deeply troubled German and French parliaments.

DIFFICULTIES IN THE U.N.

This was recompense for the difficult victories won by the United States in the 1951 U.N. General Assembly meeting at Paris, where Foreign Secretary Eden's opening address contrasted so sharply with the harsh, implacable speech of Acheson that he received warm applause and continued appreciation.

The Soviet motion that the United States was guilty of intervention in the Cominform states, because of the provision in our Mutual Security Act of 1951 that $100,000,000 be spent to aid refugees from those states and help to form them into armed units, was defeated, 42 to 5 with 11 abstaining; though the *London Times* of December 22, 1951 thought it hardly surprising that the Soviets took the provision for organizing and helping "selected persons residing in" those countries to mean spies and saboteurs.

An American proposal which would allow NATO to take command of United Nations forces and those of nonmembers was watered down with a shower of amendments until it had little substance left in it.[19]

The election of a successor to Yugoslavia on the Security Council led to an even more Pyrrhic victory for the United States, which sponsored Greece against the Soviet candidate Byelorussia. Most of the members of the Assembly felt that the gentleman's agreements of 1946, allotting seats geographically, should hold, and all our most dependable allies united in believing that no good could come from insisting on the absolute isolation of the Union of Soviet Socialist Republics in the Security Council.

These convictions gave Byelorussia a majority on all the early ballots. She led on the eighth ballot 32 to 27, December 6, but by December 13 American pressure reversed the vote 36 to 23. The nineteenth ballot, on December 20, eventually produced the required two-thirds majority for Greece. The vote was 39–16–4. The full power of the United States had been required to compel the Assembly to reverse itself.

On the issue of admitting new members we had a still closer call. "Over bitter United States opposition" the Political and Security Committee voted for the Soviet resolution to admit thirteen waiting applicants to the United Nations, instead of Italy alone, as we desired. The vote was 21–12–25, the 25 abstentions being especially significant. In the Assembly itself the vote was 22–21–16, though the Assembly saved the United States from defeat by accepting its contention that because of the far-reaching importance of the Soviet resolution a two-thirds majority was required.[20]

The extreme difficulty of averting defeat in these cases indicated clearly that future Assemblies are likely to break away from our leadership principle of total hostility to the Soviet bloc.

WHY OUR ALLIES FEAR US

Can we have loyal and dependable allies? We can if our allies feel, and continue to feel, that the alliance gives them two things: military protection, and acceptable living standards. They may accept a reduction of standards for a short time if convinced that their security is really at stake, but it will be extremely difficult to maintain the alliance if standards are depressed in the long run.

Today a large proportion of the people in all the states allied with us believe: (*a*) that the Soviet danger is not so great or so urgent as we think it is; (*b*) that our insistence upon heavy armament at the earliest possible moment unduly imperils and reduces their standards of living; and (*c*) that our rashness and impatience are driving them rapidly toward a world war which will destroy them, whatever it does to ourselves and the Soviets.

These are grave and growing fears; and unless we can remove them, we cannot expect that the vast and complicated structure of alliances which we have so hastily built will hold together. We are a young, impatient people which has suddenly, historically speaking, acquired half the economic power of the world. We have won every war in our history, the late ones bringing us vast increases of wealth and prosperity. No nation has ever successfully defied us, and we are in no mood to permit the Soviet Union to do so. It is therefore very hard for us to examine the fears of our allies objectively, especially when we are subsidizing them very heavily. Yet it is imperative that we should know where we are headed.

Our failure in Korea

In trying to see where we are going, the first step is an understanding that we have woefully mismanaged the Korean war. We went into South Korea, under the banner of the United Nations, to defeat the North Korean aggression. We did that relatively soon, and with

[17] Quoted in *Foreign Affairs,* April 1952, p. 361.

[18] *New York Times,* February 20, 1952.

[19] *New York Times,* September 12, 1951, January 5, 9, 1952.

[20] *New York Times,* January 26, February 2, 1952.

comparatively small loss of life and treasure, thereby winning a great and precious victory for the principle of collective security. Then we decided to invade the North Korean Republic and abolish it, gambling on the extremely long chance that two great communist powers would permit us to establish a model American democracy on their most sensitive and strategic frontier. Another eight months of heavy fighting ensued, resulting in more than a million casualties and ending in a stalemate.

At the end of the first year of war a Soviet offer of a cease fire at the 38th parallel led finally to negotiations, but not before we had decided that the fighting must continue until we had a more defensible line, a little north of the 38th parallel—a decision which set the contest of wills that blocked peace for another year.

When the truce talks eventually got under way, we insisted on "an artificial separation between military and political considerations" which led to intermittent Communist propaganda successes and "resulted in a halting and uncertain approach" to the desired cease-fire objective.[21] Eventually, our mismanagement of the prisoner-of-war question made it the sole issue preventing an armistice, undermined the confidence of our allies in our ability to manage either the larger or smaller issues involved, and left them hanging on the precipice of constant danger that a vastly expanded war in Asia would break out. The mission of Lord Alexander, the British Defense Minister, to Korea in mid-June 1952 to find out for the British Government where it was being led, underlined to the world the fact that the Korean war had become a strictly American deadlock.

[21] Hanson W. Baldwin, *New York Times*, May 15, 1952.

It did not help, either, that we bombed the Yalu power plants, without notifying our allies, while Alexander was in Washington. The resulting storm in Britain aroused the entire Labor party and deeply embarrassed the Churchill government. "Almost without exception" the principal organs of British public opinion "deplored the failure of the United States to inform and consult Britain in advance," and France complained officially.[22]

By that time it was apparent to everyone that there was no good way out of the Korean war for our side. Simultaneously, it became clear that we had lost the war politically by backing the reactionary regime of President Syngman Rhee, who had been overwhelmingly repudiated by the South Korean people in the election held only a month before the Korean war broke out.

In May and June 1952, with a Presidential election by a hostile National Assembly at stake, Rhee jailed twelve Assemblymen, declared martial law, and threatened to dissolve the Assembly. Flying visits from Generals Van Fleet and Clark apparently induced him not to take troops from the front to enforce his will, but a personal telegram from President Truman expressing "shock" and a similar message from U.N. Secretary General Lie did not resolve Rhee's feud with the Assembly. Instead, he denounced the United Nations, banned the Voice of America from his radio, and heavily censored all foreign publications which criticized his government.

A German Korea?

This record in Korea does not incline our allies in Europe to certainty that the American prescription for Germany and Europe is infallibly right. If

[22] Clifton Daniel, *New York Times*, June 29, 1952.

the Americans have so plainly overreached themselves in Asia, may they not also do it in Europe?

There is a great deal to be said for our effort to force the unification of western Europe around Western Germany. The whole area is a deficit and declining region; unification might save it. But there is not much historical warrant for believing that we can compel federation in order to create a powerful bulwark for our defense.

The quick arming of Western Germany also opens up the immediate prospect of a vaster Korea in the heart of Europe. A new army in West Germany means a rival army in East Germany. The East Germans have already laid waste a border zone down the center of Germany, preparatory to closing the border. The West German enclave in Berlin has a sick economy which must grow gradually weaker even without a new blockade, which the Soviets are now in position to impose without fear of any effective reprisal short of a world war.

There is no reason to believe that the West Germans will give up their passion for unity, and our plan gives them no prospect of achieving it except by building up such superior armed strength that, with the support of the United States, they can enforce the unification of Germany upon the Soviet Union. This is the direction in which our policy plainly points, and the successful development of West German military power would enable us eventually to take down the Iron Curtain, as we did the 38th parallel, at the cost of another world war.

This is the logic of a world split evenly in two, with every important country which is not a satellite of the Soviet Union or China committed in alliance to the United States. Such an organization of the world is logical and thoroughgoing, but it leaves small hope of survival to our democratic allies in western Europe. For this reason they must try to draw back somewhere short of that complete and frightful destruction with which the forcible unification of Germany threatens them. Our allies know that Japan was not a matter of life and death to the Soviet Union, but that Germany is.

East-West trade

Another reason powerfully impels our allies to break with us—the stern insistence, expressed in our Battle Act, that they must cease to trade with the communist half of the world in any goods which might have military value. This act required the Mutual Security Director to terminate aid to our allies who sell "strategic" goods to the communist bloc countries.

Our allies agree to the principle. The difficulty comes in deciding which of thousands of items are really strategic. There is great leeway for disagreement; our interpretation is strict, and theirs in favor of trade.

This is a crucial matter to countries like Germany and Japan, which might develop a large trade with the expanding industrial systems of the Soviet Union, eastern Europe, and China. Indeed, no one has ever explained how Japan is to live permanently without renewing economic intercourse with the Asiatic mainland, and it is equally impossible to foresee expanding markets for a swiftly resurgent Germany outside of the communist lands. Without such trade, these two highly industrialized powers must cut increasingly into Britain's precarious world livelihood, to mention only one consequence.

Our European allies need to restore trade with the East. It is vital to some of them, and it becomes increasingly so as the current drive in this country to

raise tariffs and keep out their goods gains momentum. Our allies have a powerful long-term interest in restoring East-West trade, in order to live, to raise their standards of living, and to gain independence from us.

For these reasons our drive to throttle trade between the two worlds will be self-defeating if continued much longer.

What price defense?

It is essential to our future safety and security to recognize that we have let the Korean war throw us, and the entire world of our allies, dangerously off balance. Instead of conducting a careful and prudent police operation, we not only got ourselves into an impasse in Korea, but jumped to the conclusion that we and our allies must and would prepare at forced draft to fight victoriously in every part of the globe, on land and sea and in the air. This cataclysmic decision brought our allies face to face with the acceptance of inevitable war, and it misread the long-term nature of our world struggle with communism, which is mainly an ideological and political conflict, not a military one.

SOME REQUISITES FOR DEPENDABLE ALLIES

We can have dependable allies if we will do these things:

1. *Moderate the arms race*

The evidence is overwhelming that we have overburdened our allies. Harvard economist Sumner H. Slichter summed it all up in his article in the January 1952, *Atlantic,* "Rearmament: Too Much, Too Soon." The living standards of our allies have been undermined in three ways: by leaving less goods for consumption, by raising the price of Europe's imports faster than her exports, and by inflation. Even more serious, our feverish arms drive is reversing the spirit and the policy of the Marshall plan. It is time, says Slichter, "to halt the retrogression in the quality of thinking on national security and foreign policy that has characterized the United States for more than a year."

We should pause to consider that "security has meaning only to nations whose peoples have social gains to preserve." [23]

The economic effects of our intense pressure for arms have already produced a rightist government in France, and the rightist parties are growing in Italy. "If across all Europe the Atlantic alliance has to be imposed by governments of the Right against the opposition parties of the Left and the working classes, the alliance will lose greatly in prestige and strength." [24]

Surely this is an understatement. It is too late for a neofascist Europe to succeed. But developments may not go that way. Excessive prosecution of the cold war by us may produce a leftist government in Britain and a de Gaullist regime in France, both dedicated to emancipation from us—along with a growth of communism in France, Italy, and elsewhere.

2. *Negotiate settlements as we go*

The Acheson policy of no negotiation

[23] Quoted from the excellent study by William T. R. Fox and Annette Baker Fox, *Britain and America in the Era of Total Diplomacy,* Princeton Center of International Studies, March 1952, p. 39. The best economic study is *Rearmament and Anglo-American Relations,* The Brookings Institution, January 1952. See also the entire issue of the *Columbia Journal of International Affairs,* "American Foreign Policy: a Critique from Abroad," Winter, 1951.

[24] Jean-Jacques Servan Schreiger, "Premier Pinay and the Men of Vichy," *The Reporter,* June 24, 1952, p. 9. See also in the same magazine, "Italy: A Fighting Chance," by Claire Sterling.

with the U.S.S.R. until we have developed "situations of strength" is heavy with the implication that we will not negotiate until we are strong enough to impose our will. Do we really believe that the Soviets would yield East Germany when we had mere parity of strength? And what kind of predominant power would it require to compel her to abandon eastern Europe to us?

The idea that we can have a grand settlement with the communist world, all around the globe, when we are finally "strong enough," is a complete illusion. The result can only be world war, as all our European allies, old in experience with alliances, know well. Either the weaker side will strike while there is time, or the dominant side will eventually dictate its will on the battlefield.

There is no hope whatever in amassing power for a final diplomatic showdown. There is hope only in Foreign Minister Eden's formula of building peace "gradually, agreement by agreement." That means the liquidation of profitless wars in Asia, and it means an early German settlement which will remove the nightmare of another German-Soviet war from the minds of the Germans, the Soviets and their allies, and all of *our* allies.

If this means a united and neutralized Germany, armed for defense but belonging to neither side, who is to say that this would be worse than another war? There would be dangers; there will always be dangers; but would they not be more manageable than those involved in a plunge toward the Koreanization of Germany? That prospect is likely to lose us all of our European allies, for they can survive only if war is avoided.

3. *Welcome third forces and promote deviations in the communist world*

Our ruling dogma that everybody must choose sides and belong to one alliance system or the other is self-defeating. The bulk of the Arab-Asian world is determined to be neutral. There are European states which will not abandon their neutrality, and others which can be pushed into it.

It is an illusion, also, to insist that Moscow can control indefinitely the vast Chinese people, now coming swiftly into the modern age. Moscow has already lost one important satellite, Yugoslavia, and when the current wars subside it should be our policy to give others, especially China, alternatives to a tight embrace with Moscow, and an atmosphere conducive to greater independence.

In a world balanced among several powers, all of them on speaking terms in the United Nations, we should not have to have scores of allies everywhere. It may well be wiser to stop with NATO and the British Commonwealth than to seek sure supremacy and perhaps get universal disaster.

4. *Accelerate economic aid to our allies and the depressed peoples*

The question of economic aid is the most difficult transition facing us. Our military complex leads us to make economic aid the handmaiden of military policy. That is one of the main reasons why we lost the Chinese people; they did not wish to be our bulwark. And the Europeans may come to the same conclusion. There is weighty evidence behind the statement of Dr. George B. Cressey that no other country is as alarmed as we are, and he adds: "Since World War II, we as a nation have deliberately tried to buy friendship and have failed." [25]

We shall continue to fail, also, as long as we try to get credit and returns for ourselves. Only when we seek to help the depressed peoples for their

[25] George B. Cressey, *Foreign Policy Bulletin,* January 15, 1952, p. 2.

own sakes, and preferably through the United Nations, will we achieve real headway in making friends and averting communism. A Chilean delegate to the U.N. has warned us that because of depressed living standards "90 per cent of the people in Asia, Africa and Latin America are indifferent to the struggle against Communist aggression." [26]

It is vital, also, that we should increasingly buy the goods of our allies. Doles and subsidies are no substitute for the satisfaction of earning one's own way. Our long-term penchant for selling much more to the world than we buy may finally cost us the loyalty of our allies.

5. *Substitute prodemocracy for anticommunism*

The ideological conflict is another area where emphasis means everything. We cannot advance our cause merely by excoriating and fighting communism. Nor can we protect our way of life by bolstering all the reactionary, feudalistic elements in the world. That is a losing struggle. Only by living, believing, and practicing democracy, at home first, can we recover the dynamic appeal which will extend our way of life in the world, not merely "defend" it.

6. *Resolutely strive to avoid war*

Avoidance of war is the decisive te: by which all our allies will ultimatel judge us.

There is a world morality whic transcends all racial and national boun daries, and it is coming to the conclu sion that modern war is ridiculous senseless, and intolerable. No nation however mighty, can any longer affor to let the old cycle of rivalry, fear arms race, and war grind through to its appointed conclusion. It has become absolutely imperative that national "defense" be kept from mushrooming over into disaster in the ancient manner.

It is essential to remember constantly, also, that our reservoir of good will in the world is already considerably diminished. For example, no single American believes for a minute that we have waged germ war in Korea; but it is not necessary for us to be guilty of bacteriological war to be convicted of it, since our use of the atomic bomb at Hiroshima and Nagasaki, plus our bombing in Korea, has prepared the mind of the Asiatic world, and beyond, to believe that we are capable of anything. Our free use of napalm in Korea deepens that impression.

The Council of the Federation of American Scientists pointed out, on May 9, 1952, that "the question raised in the world's mind is not so much whether we did *use* BW in Korea, but whether we are in fact *prepared* and *willing* to use it in the future." [27]

We need to bear in mind incessantly that the nation which is believed by world opinion to be responsible for another world war will be such an anathema to mankind that all its lethal weapons are likely to fail. The nation which has ready the vastest quantities of these frightful weapons, and is believed to be willing to use them, is also the one most likely to be held responsible by world opinion if they are used.

[26] *The Nation,* December 8, 1951, p. 493. There is growing resentment among our Latin American allies over our long-continued absorption with the problems of other continents, which the July visit of Secretary Acheson to Brazil will hardly remove. Our southern friends feel neglected, and they are resentful over our sternness in fixing the prices of their raw materials, while the prices of their imports from the United States soar. They also fear that NATO is swamping U.N., and are apprehensive about being involved in war. Some are considering an increasingly independent attitude in U.N. Robert M. Hallett, U.N. correspondent of the *Christian Science Monitor,* May 19, 1952.

[27] *Bulletin of the Atomic Scientists,* June 1952, p. 130.

THE FUTURE

Beyond these changes of tactics in our search for security and peace, it is equally essential that there should be an accompanying moderation of methods in dealing with our allies.

Our great power gives us a duty to lead, but it does not give us the right to win every vote, and make every decision and enforce it on the small fry in our camp. We cannot treat our allies as satellites, since we do not have the totalitarian power to enforce our decisions. Ours must often be the deciding voice, but a fixed habit of insisting that our voice be equal to our paying power will be fatal to our alliances. Wisdom does not always go with wealth.

In a world which is sick to death of war and the fear of it, the preservation of loyal allies requires a great deal of patience, prudence, and tolerance, as well as some firmness. It means the acceptance of less than ideal solutions, and the sinking of our national will in the common good. We must learn both to lead and to collaborate. We cannot afford to continue to appear to our allies as "a young giant whose impetuous and headstrong intervention in Old World politics appears to follow no predictable pattern." [28]

The game of balance-of-power politics has always been very dangerous, but the current version is the riskiest of all. We had better play it cautiously, coolly, and with iron restraint, for it cannot be played through to its usual end without giving western civilization its death blow. Communism thrives on war and chaos, as its conquest of half the world during the past two world wars amply proves; neither democracy nor capitalism does. Our need for peace and order and slow evolution is negated by the anarchy of ever more colossally destructive wars.

We cannot really look forward to the future with confidence until we have disposed of the chief bones of contention in the cold war and returned to belief in a universal United Nations with enough moral authority to alleviate and regulate the stresses and strains in an ever changing world society.

[28] Fox and Fox, *op. cit.* note 23 *supra,* p. 14.

D. F. Fleming, Ph.D., Pe.D., Nashville, Tennessee, is professor of international relations at Vanderbilt University. He is a long-time student of balance-of-power politics, concentrating since 1947 on the conflict between the Soviet Union and the West. He is the author of The Treaty Veto of the American Senate (1930); The United States and the League of Nations, 1918–1920 (1932); The United States and World Organization, 1920–1933 (1938); Can We Win the Peace? (1944); and The United States and the World Court (1945).

Policy of Containment

By David J. Dallin

THE American popular attitude toward foreign affairs at the present time is governed by a set of controversial impulses. There is indignation about what we politely call the "dynamism" of the Soviet government—its course of action and line of propaganda—and at the same time there prevails a deep-seated urge to appease, not to offend, and not to provoke the opponent. On the one hand, the conviction is general that preparation for defense on a large scale is the only way to avoid a hot war; but simultaneously the American people and the United States Congress seek to avoid new, heavy expenditures in order to prevent inflation, and thus they retard the process of remilitarization. That help must be given to Europe has become an almost universal precept in this country; on the other hand, there is a growing disappointment with Europe's insufficient efforts and anti-American sentiments. Finally, there is the juxtaposition of Europe and the Far East: shall we concentrate on Europe and try to solve the Far Eastern conflict in a compromise, or shall we pay more attention and send more men and supplies to the sore spot of international affairs, Korea and Japan?

Public opinion is torn between these extremes. On the solution of the questions involved depends the course of foreign policy of the future administration—indeed, in view of the present role of the United States in world affairs, the fate of the world.

The situation is unprecedented, not only for the United States but for Europe as well. Europe has known Russia as an expansionist power for two centuries. A state of great tension, a kind of cold war, has often existed in the relations between St. Petersburg on the one hand and London and Paris on the other. But the Kremlin of our day is not the simple heir to St. Petersburg of the nineteenth century, nor is Washington merely the successor to London in the family of the great powers.

Background for Stalin Foreign Policy

Stalin's course in international affairs since the end of the war has been part of his general concept of Soviet foreign policy. And the basis of his general concept is essentially a modified theory of Lenin and Lenin's predecessors about the so-called "marschrout"—the itinerary of the Social Revolution.

From Karl Marx, from Friedrich Engels, from the Socialist International, and from his Russian teachers, Lenin had inherited the old, classical concept of the transformation from a capitalist to a socialist society. Dependent on her history and her present social setup, the theory went, each country, sooner or later, enters a period of political tension which more often than not will assume forms of political violence. At the end of this revolutionary path will stand a society renovated in a political as well as in a social sense.

However, the bell does not toll for all nations at the same time; rather, revolutions will develop without logical or geographical regularity. Today they will flare up in central Europe, tomorrow in the Far East, then in America, then perhaps in Europe again, and so on. This drawn-out process of social revolution will be like summer lightning at night, flashes occurring in any part

of the darkened sky without visible order—in the north and south, east and west, in a sequence close to chaos. Only at the very end of this protracted critical stage will the great transformation, engulfing the whole globe, be completed and the battered strongholds of capitalism be replaced by the edifice of Socialism.

Even after Lenin and his party had attained power in Russia this concept prevailed for a long time. Russia's influence in world affairs was based on ideology rather than on force, and Lenin saw no reason to credit the first Soviet country with more than secondary importance in the conflict between the old order and the new. His Russia was poor and weak, its army badly trained and badly supplied. He looked to other nations not only for economic assistance but even for new revolutionary initiative. He saw Russia as only the source of inspiration and a haven for its standard-bearers.

Lenin died without revising the inherited concept. Trotsky, who died sixteen years after Lenin, remained faithful to it until his very end.

The Stalin Doctrine

The Stalin doctrine, which was ripening in the first stage of Soviet history, deviated from these concepts. Stalin had seen the first Communist government in Hungary suppressed by Admiral Horthy while his Russia stood by unable to help. A little farther to the west a Communist government emerged in Bavaria; no outside assistance was forthcoming, and it was destroyed. On the other hand, wherever the Red Army was able to arrive in time and fight, the chanoes of a Communist victory appeared high. Independent Georgia was quickly transformed into a Soviet republic in 1921; so was the "Far Eastern Republic" when the Japanese withdrew in 1922. Socialist transformation will be successful—Stalin drew the conclusion for himself—only if and where the military force of the first Soviet fatherland is able to penetrate.

In other words, only revolutions in areas adjacent to Russia can be assisted to the extent necessary to achieve victory. Once transformed into Socialist organisms, these territories can either be formally incorporated into the Soviet Union or, for special reasons and for a certain time, allowed to retain their formal status of sovereign nations. "History has shown," Stalin told the Party Congress in 1921, "that single nations, if they set up the Soviet system, are not able to live as separate units while imperialism reigns outside the Soviet sphere and to defend themselves successfully without the economic and *military assistance of the adjacent Soviet republic.*" A year later Stalin announced that "access to the Soviet Union is open to all Soviet Republics: to those that exist and those that will emerge in the future."

In this concept, the role of Russia, of the Russian state, of Russia's military power, of Russia's government is raised to such a height that Russia overshadows all other nations, great or small, advanced or backward. Russia is the great center of the expanding Socialist community. This community expands in *concentric circles*. There is no longer any trace of the old theory of spontaneous and irregular social revolutions. In the new conception, the Socialist world grows like an ink spot on blotting paper. The role of popular movements, barricades, and revolutionary fighting diminishes almost to the vanishing point. The military might of the great Socialist Fatherland now does the job.

Furthermore, it is the duty of the Soviet government and of every Russian Communist, the Stalin doctrine says, to promote the expansion of the great Socialist community until it embraces at

least all the great nations. No respite is permitted so long as the roads are not blocked and progress is possible. This basic precept of Stalinism underlies the "dynamism," or relentless expansion, which we have been witnessing for the last thirteen years.

The notion of Russia's new *grandeur* and decisive role in the abolition of capitalism makes it necessary to preserve her from all danger, and this is the other side of the medal. To the adherents of this doctrine Russia's downfall today would be a catastrophe. To prevent this, and for this purpose to make concessions to foreign powers, is just as reasonable and necessary as it is to expand by leaps and bounds when the possibility offers.

THE SOVIET GOVERNMENT AND THE TRUMAN DOCTRINE

Here is precisely where the Truman Doctrine stepped in. If, out of apprehension for its very life, the dynamic Soviet regime can become cautious and moderate, then a different policy by the United States might produce what the earlier pro-Soviet attitude had failed to achieve. In a direct challenge to Moscow, President Truman called on the nation, on March 12, 1947, "to help free peoples to maintain their free institutions and their national integrity against aggressive movements that seek to impose on them *totalitarian regimes*." Three months later the Congress took the first steps to increase the United States military forces. What the lofty principles of all the charters had failed to achieve—Washington was saying by implication—must be won, in Dean Acheson's words, by a "situation of force."

The task in Washington now was to find the most vulnerable spot in the Soviet armor and then to let loose on it a rain of cold war arrows. This search became a continuous groping that lasted several years.

Moscow was not much impressed by the first American moves and marched consistently on. The Soviet radio and press, of course, accused the American government of aggressiveness, of preparation for war, of a capitalist-profit motivation. But Moscow refused to revise its course, because, in its view, no real force was behind the "Truman threats." Never had the preponderance of Soviet military power over that of the United States been as great as in 1947 when the doctrine was announced in Washington.

Challenges to the Truman Doctrine

Two months after the announcement came the first real Soviet reaction. This occurred in Hungary. In May 1947 the Communist Party, having won only 22 per cent of the votes in the elections, overthrew the democratic state structure and seized all power. President Truman described the upheaval as an "outrage" and promised that "the United States would not stand idly by." As a matter of fact, the United States had to stand idly by because it had no weapon other than words.

The second challenge to the Truman Doctrine was sounded in February 1948, when governmental power in Czechoslovakia was actually seized by the Communist Party. This was followed, as usual, by a reign of terror and the tightening of ties with Moscow. On March 17 President Truman, in his message to Congress, termed the situation "crucial." Again no action could be taken.

The next Soviet challenge in Europe came a few months later. This was the blockade of Berlin, the brain child of Vyacheslav Molotov, and approved, of course, by Stalin. The temptation to oust the Western powers from Berlin was very great. If it succeeded, the prestige of Soviet Russia, her superiority over her Western opponents, her invincibility, and the utter emptiness of the Truman Doctrine would be demonstrated to the peoples of Europe with such convincing force that subsequent successes would be easy—or so it seemed to Moscow.

The conflict developed between July 1948 and April 1949. It proved to be a failure for Moscow—in fact, the first telling defeat in Russia's postwar drives. It must be recognized, however, that this failure was not due to America's policy alone. Other events played a prominent role in the developments of 1948–49, and among them the defection of Tito in Yugoslavia was of primary importance. Yugoslavia, highway to industrial northern Italy, a Communist stronghold, was also the base of support of the Communist rebellion in Greece. With her army, then the best among all the satellites, Yugoslavia initially was the great hope of Moscow as far as the southeast of Europe was concerned. That was why Moscow postponed the first break with Belgrade for almost two years.

When the break did come, it meant that new limits had to be set to the Soviet drive. The Communist campaign in Greece was doomed; Italy's precarious situation improved overnight; the Yugoslav conflict with Austria ended. The whole situation became unfavorable for the Soviet offensive. The loss of Yugoslavia and Greece and the defeat in Berlin were the high lights of the European situation in 1948–49. The consequence of these failures, apart from the demotion of Molotov, was a shifting of Soviet attention and Soviet forces to the Far East, at least for the time being. Now the logical fields for Soviet "dynamism" were China, Korea, and Japan.

Soviet expansionist drives

The four years from 1944 to 1948 were that unique period in Russian history when a Russian government was in a position simultaneously and successfully to engage in expansionist drives in Europe and the Far East. Since the nineteenth century, Russia has been one of the few nations (Germany is another) with both its western and eastern frontiers dangerously vulnerable. While such a situation opens great new vistas, the policy and strategy of a two-front power are inevitably complex and difficult. In fact, her two fronts have often been a source of trouble for Russian governments in the past. Strong resistance in Europe (such as the Russian defeat in the Crimean War in 1856) would have the effect of diverting the attention of St. Petersburg to central Asia or the Far East; failure in the Orient (for example, the defeat in the Russo-Japanese War of 1904–5) would bring increased Russian activity in Europe.

It would have eased the tension considerably if the diversion of Soviet activities to the Far East in 1949 had been consistent and systematic and part of a great concept. At least, Europe would have been secure from new offensives for the foreseeable future; stability would have returned to the Continent, and whatever conflicts might loom in the Orient, they would not compare, in bloodiness, in destruction, in their impact on civilization, with total war on the plains of Europe.

The Soviet "German Problem"

Yet the shift of Moscow's particular attention to the Chinese-Korean-Japanese triangle was purely empiric, not programmatic, and it was provisional, not constant. Things had reached such a stage that, even if Moscow wanted to,

it could not simply recede from central Europe. Retreat from East Germany would mean more than the loss of an industrial area with its millions of skilled and intelligent inhabitants. If Germany were reunited, it would border on the satellite states of Poland and Czechoslovakia, while Austria, Germany's neighbor and natural ally, borders on southeastern Europe. A reunited Germany with her 66 million population, the first nation in Europe after Russia, would exert the strongest influence on the long belt of Soviet satellites. Stalin does not believe in an effective and durable demilitarization of Germany. He has stated that, in his view, a period of twenty years is about the maximum of effectiveness of forcible demilitarization, as far as Germany is concerned.

In the complex relationship of neighboring nations there develops something that might be called "Radiation of Power." It is the case of a small state adjacent to a great power with a strong government; the former complies with the wishes, interests and demands of the strong neighbor and submits to it without a shot being fired. Through trade, propaganda, bribes, and in devious other ways, Nazi Germany and Soviet Russia both have been in a position to influence the fate of their smaller neighbors. The same was true of old Austria-Hungary and Imperial Russia. Today even Finland and Sweden, though free and non-Communist, cannot adhere to the Atlantic community and cannot fight their Communist parties as they wish because of the influence radiating from the Soviet capital.

As soon as an independent Germany is reunited and its waves again strike at the borders of the east-European satellites, a new situation will arise for the Soviet Union.

The stronger Germany grows as an industrial and war-potential nation, the more shaky will become Moscow's hold on its satellites. The very existence of the Soviet empire in Europe will be put in question. Either the Kremlin will abandon its proud edifice of its own accord or it will be forced to do so. Either development would mean a defeat of the first magnitude. After the sky-high hopes of the last decade, such a retreat might imply, for the first time, a profound internal crisis.

This is the real meaning of the "German problem" for Russia today. It is also the reason why the Soviet government, which, as we have seen, was not disturbed by the Marshall plan or the Truman Doctrine, nor even by the signing of the North Atlantic Treaty,[1] has reacted violently to the first real steps toward a resurrection of Germany and the creation, under any form, of a non-Soviet German armed force.

After the meager success of all its past attempts to "contain" Russia, the United States has cautiously, almost timidly, seized the lever capable of upsetting the balance.

GERMANY IN THE SOVIET TREATIES OF ALLIANCE

The Soviet satellite bloc is based on a number of treaties between Moscow and each of the satellite governments. In every case, with no exception, the German danger is advanced as the reason for this international coalition. According to the Soviet-Polish Treaty of Alliance (1945), the two nations will take all necessary steps "to prevent the menace of aggression *on the part of Germany or any other state uniting with Germany* directly or in any other form"; in case of such aggression, the partner is required to enter the war as an ally.

The Soviet-Rumanian Treaty of Alliance (February 1948) aims "to remove the menace of renewed aggression on the part of Germany or of any other state uniting with Germany in whatsoever form"; in case one of the two allies is involved in a war with Germany "or with another state acting with Germany," the other party is under obligation to assist.

The same wording was chosen for the Soviet-Hungarian Treaty (February 1948) and the Soviet-Bulgarian Treaty (March 1948).

Germany as the source of danger has been the most convenient pretext for treaties actually pointed at the United States and Britain. There was, however, more than merely a propaganda motive in this reference to Germany: in Stalin's political concepts, as well as in Russia's traditional strategical blueprints, Germany is the only country with whom a war in Europe can be fatal for the Russian nation.

From the events of the last fifteen years, from the Soviet-Nazi Pact, the German-Russian war, the Soviet-American conflicts on the German issue, the West could have learned much concerning the place Germany occupies in the Soviet concept. To Russia in general, no other country and no other international issue can be as important as Germany.

As an ally, Germany is a shield; it makes Russia invincible. As Russia's enemy, Germany is ominous; war with Germany in coalition with the West would be fatal. The slogan of a Soviet Germany inspired the Communist International for two decades because it was actually Stalin's main blueprint. Stalin's fateful delusion that Hitler's advent to power in 1933 was the brief prelude to a Soviet Germany was responsible for the passivity of the Communist Party in the face of the Nazi danger.

In December 1931 Emil Ludwig, the German writer, asked Stalin in the course of an interview:

"Everywhere in Russia I have observed an extraordinary respect for everything American, even a worship of everything American. Is this impression correct?"

"You exaggerate," Stalin replied. "We have no special respect for everything American. . . . If one is to speak about our sympathies for any nation or, to be more correct, for the majority of any nation, one would, of course, speak of our sympathies for the Germans. There can be no comparison between these sympathies and our feelings for the Americans."

SOVIET MILITARY CONCEPTS

In Russia's military concepts as well, Germany occupies a most prominent place. The view that mainly land forces will have to resolve the East-West controversy is part of the traditional Russian conception, as it is of the specific Communist ideology. The possibility of victory by air power alone has no place in Russia's blueprints; her great expanse would reduce the effectiveness of air attacks. Still less importance is ascribed to atomic weapons. Nor do Soviet military authorities accept the notion that sea power can be decisive. Russia's continental nature makes her almost invulnerable in a naval war unless it is coupled with an offensive on land. In addition, a land army is "the people in arms," "the masses," whose great role better accords with Marxist ideology.

Thus Moscow does not believe that the Anglo-American bloc, mainly—at least initially—a sea-air force, can inflict a great defeat on the Soviet Union. Germany, on the other hand, is the one nation that can rival Russia in Europe.

In some respects the situation in the Far East is similar to that in central

[1] When the treaty was signed it was announced that the new Defense Community would not be enlarged to include Germany.

Europe. In all of the Soviet conceptions of the Orient, priority goes to Japan—Japan's policies, Japan's military forces. Not Korea, not Indochina, not even China herself, occupies first place in the Soviet blueprints. It has always been Japan. Even the Korean war of 1950–52 is actually a war about Japan.

The situation in the Far East since 1945 is reminiscent of the great Russian drive toward Manchuria and Korea at the start of the present century. The Siberian railroad had just been completed, and the Russian armies newly dispatched to the East were so overwhelming a force that no nation was expected to resist. Britain, the dominant power of that period, was forced to stand aside. A solution was reached by the Anglo-Japanese Treaty of 1902, followed by the war in 1904–5; the court cabal, which actually ruled at St. Petersburg at the time, was not intelligent enough to foresee Russia's inevitable defeat in a war.

The present Russian government is more enlightened and better prepared than was its predecessor fifty years ago. It may retreat before it engages in a hopeless military affair. It will not retreat, however, before an American or a United Nations force alone; and a Formosa-Chinese force cannot attain sufficient status as a military power. This is why Russia will employ every means to prevent the rearmament of Japan.

The treaty of alliance between Soviet Russia and Communist China, signed in February 1950, contains essentially the same formula as the satellite treaties of Europe, but here Japan replaces Germany as the convenient pretext for the anti-American combination. The two allies, the treaty says, will take all necessary steps to prevent a new "aggression and breach of the peace on the part of Japan or of *another state which would directly or indirectly combine with Japan* in acts of aggression." In such case the two nations are required to render one another military assistance.

In the Far East the Russian government is apprehensive of no Western power unless it acts in alliance with Japan.

TECHNIQUES OF DIPLOMACY

As far as the techniques of American-Soviet relations are concerned, considerable revision is urgently needed—with the clear understanding, however, that no kind of technique can play more than a secondary role; that the relations of the two nations unfold against a background of power relationships; and that therefore nothing fundamental can be achieved so long as the "situation of force" remains unchanged.

Long-drawn-out international conferences and propaganda speeches by Soviet delegates have become a standard method of Soviet foreign policy; invective and insults are hurled broadside at the Western nations. In this connection it is important to remember an agreement concluded between Maxim Litvinoff and Joachim von Ribbentrop at the end of 1938 (when Nazi Germany had already grown strong and Moscow feared her power) to the effect that the press, the radio, and, in general, the propaganda line of the two countries should refrain from attacking or insulting the two respective Leaders. Another instance of amazingly fast work was the Soviet-German conference in Moscow on August 23, 1939, when, in the course of 24 hours, two agreements were concluded which shook the world to its foundations.

There is room for much revision in the techniques practiced by the United States at the present time. It is not necessary, for example, to accept every Soviet suggestion of a conference, for fear that refusal might be interpreted as a hostile move. Normal diplomatic channels can often serve better than parleys.

Flaws in American techniques

Too often the propaganda angle is overlooked by the West in dealing with these conferences and with diplomatic notes; Moscow has been more skillful in this respect. Not only have the diplomatic documents emanating from Washington been restrained in their language, but, in general, they are too matter-of-fact and businesslike. Their effectiveness would be considerably increased if their influence on public opinion were taken into consideration.

There is also need for a degree of synchronization of public statements made by the President, members of the government and members of Congress as well as support from the press. The amount of uniformity is limited, of course, by the very nature of a democratic system. Within the framework of a democratic setup, however, better-organized publicity on international issues would greatly strengthen Western policy.

The "bacteriological war" campaign against the United States was launched by Moscow as early as January 1952, but the American side simply overlooked it until it reached tremendous proportions three months later. It would have been possible to turn the tide of propaganda against the Communists if the meaning of the drive had been grasped earlier. It should have been pointed out that ever since 1925 the Soviet side has shown a great interest in methods of germ warfare, and that it was the intention of the Communist Korean-Chinese Command to use bacteriological weapons in a new offensive under the cover of "retaliation."

Reciprocity is another principle that should be applied with greater vigor in the West's relations with the Soviet bloc. For example, the United States Government publishes the magazine *America* in Russian and allegedly has distributed some 20,000 copies in Russia, but, in exchange, the embassies of Moscow and its satellites have made abundant use of America's printing resources. Whether *America* reaches the Russian readers is doubtful; that Soviet satellite propaganda is flourishing is a fact. It was only recently that, for the first time, a publication by the Polish Embassy in this country was banned.

The Soviet bloc has a large staff, diplomatic and other, in this country, while American personnel in the respective satellite countries has been cut to a minimum. Certain members of the Soviet-satellite staffs (military attachés and others) serve openly as the chiefs of espionage for their countries, relying on their diplomatic immunity.

The American diplomatic personnel in Moscow and in the satellite capitals are closely watched in every move they make, their travel is restricted, their opportunities for contact with the population are almost nil. The first steps toward reciprocity were taken by the State Department early this year, but a more consistent policy is possible.

"Containment"—long-term implications

For several years "containment" was just a notion, the abstract term "doctrine" being the most appropriate word found to define the new political course of the United States Government. The notion was empty; a long experimental period was needed to learn how best to give it content.

The inference drawn after a few years that limited revival of the defeated nations is advisable is further proof that no essential parts of the global setup can be simply eliminated, and no arbitrary international structure

can be imposed by the will or whim of any one group, not even by the victors in a great war. A world built around a certain number of great nations cannot find a balance unless the other nations continue to exist and to function. Political nature, too, seeks to avoid a vacuum.

This principle, which is slowly becoming a maxim of American policy, does not imply, of course, that the great and bloody conflict of 1941–45 can be forgotten or that the potential aggressiveness of the defeated nations should be overlooked. Once the great threat from the Soviet empire has been removed, it will be the first and most urgent task of the pacified world to prevent a resurrection of aggressive, bellicose, and expansionist movements in other parts of the globe. The ideas, principles and charters of a united world, discussed at such length in the United Nations during the last seven years, will then attain significance and purpose. The question of disarmament will be placed on the agenda, and the ghost of the United Nations itself will return to real life. And then, perhaps —but not until this stage is reached— the noble dream of a world government will become a reality.

David J. Dallin, New York City, is an author who was born in Russia. He was exiled from 1911 to 1917 but returned after the Revolution and was a member of the Moscow Soviet as opposition deputy until 1921 when he was forced to leave the country again. He lived in Germany, Poland, and France, and came to the United States in 1940. He is the author of Wages and Social Movements (1913), After Wars and Revolutions (1923), Soviet Russia's Foreign Policy (1942), Russia and Postwar Europe (1943), The Real Soviet Russia (1944), The Big Three (1945), Forced Labor in Soviet Russia (1947), Russia and the Far East (1948), The Rise of Russia in Asia (1949), and The New Soviet Empire (1951).

Is Isolation Possible and if Possible Desirable?

By FRANK M. RUSSELL

ON a June day in 1914 at Sarajevo a Bosnian student shot and killed Archduke Francis Ferdinand and his wife. One month later Austria-Hungary declared war on Serbia. Under the system of alliances of the day a chain reaction resulted, and shortly the great powers of Europe were at war.

The first reaction of President Woodrow Wilson to these developments was one of startled dismay. It was also authentically American. To him, the war was "this incredible European catastrophe." [1] Likewise, to Americans in general it was the latest of "Europe's wars," the resultant of the "European system." And it was a "catastrophe" which could only mean death to millions of men, widespread destruction, and the disruption of civilized life.

It was inevitable that the outbreak of a general war should bring painful disillusionment to millions of sincere pacifists on both sides of the Atlantic. Many had confidently expected that the spread of democracy would bring an end to war; and throughout the nineteenth century, democracy had been steadily on the march, autocracy in retreat. War was the "sport of kings," but peace was the natural order of things in a democratic world. Moreover, in the economic sphere many American pacifists had observed the unprecedented growth of international trade during the nineteenth century and had drawn the unwarranted conclusions not only that the resultant "interdependence" in the fields of trade and finance would range bankers and traders against war, but that their influence would be powerful enough to prevent it. Now, without warning, as far as most Americans were concerned, "Europe" had betrayed these high hopes.

It was therefore unthinkable to most Americans that the war was any of our business, however much we might deplore it. Only President Eliot of Harvard at the outset took a different view of the matter when he wrote President Wilson suggesting that the United States should co-operate in an immediate blockade of Germany and Austria-Hungary in order to paralyze their war efforts and stop the conflict before it got fully under way.[2] At that time even ex-President Theodore Roosevelt took the position that we should remain neutral, although by October 1914 he had changed his mind and called for our joining other neutral nations in guaranteeing the neutrality of Belgium which had been violated by Germany.[3]

THE FAILURE OF NEUTRALITY

That President Wilson, on the other hand, should proclaim the neutrality of the United States and seek to maintain it was quite in accord with the American tradition and with the current desire of the overwhelming majority of the American people. To be sure, there were millions of Americans with ancestral ties ensuring their sympathy with one or the other side in the terrible struggle that was engulfing most of Eu-

rope and spreading beyond the Continent as well; but though to George Bernard Shaw "America . . . seemed mad with British patriotism, Polish nationality, and Belgian freedom"[4] a shrewd observer on the scene could understand that it was the "madness" of spectators who might applaud their respective sides but wanted to remain on the side lines.

Under these circumstances President Wilson might hold the government to a neutral course of conduct, although his admonition to Americans to be neutral in *word* and *thought* as well, demanded more than could be expected. Moreover, the German Government and German officials were singularly obtuse in the conduct of their diplomacy, as well as unimaginative in their failure to take account of imponderables in the waging of the war. Thus American public opinion, more exposed and more vulnerable to British propaganda in any event, was constantly shocked at German deeds and the amoral attitude of the German Government in explaining them.

For example, Germany, at the beginning of the war, violated Belgian territory in disregard of a treaty bearing her signature. But Bethmann-Hollweg reacted in pained surprise when Great Britain declared war on Germany merely because of "a scrap of paper." The sinking by a German submarine of the passenger liner *Lusitania* on the high seas without warning, and the consequent drowning of noncombatants, including women and children, was another "incident" which German officials could charge off against the English blockade which, they asserted, was starving German civilians. But American public opinion and the American Government were thoroughly aroused, and eventually the resumption of submarine warfare brought the United States into the war. Thus the attempts to remain isolated and aloof failed.[5]

The war ended in a clear-cut victory. The Allies meantime had formally accepted most of President Wilson's Fourteen Points peace program, including the far-reaching injunction that "a general association of nations must be formed under specific covenants for the purpose of affording mutual guarantees of political independence and territorial integrity to great and small states alike." In this Fourteenth Point the American President revealed that he had traveled a long way in his thinking about the needs of an international society from that day in August 1914 when he proclaimed American neutrality; for in that single sentence he sought to proclaim the end of American isolation, and the continuous association henceforth of the United States with other nations for the maintenance of international peace and justice.

THE RETURN TO ISOLATION

That President Wilson would not have the country solidly behind him in this implicit repudiation of the long-held assumptions and the hitherto almost universally accepted dicta upon which American foreign policy had been based had already been made clear to him. His resolute policy toward Germany after the sinking of the *Lusitania* had resulted in the defection of his Secretary of State, William Jennings Bryan, who regarded the President's policy as unneutral and likely to lead the United States into war.[6] And of even more significance were the signs of defection at the White House "sunrise conference" of 1916. On this occasion Speaker Champ Clark, House Majority Leader Claude Kitchin, Senator William J. Stone, chairman of the Foreign Relations Committee, and Representative Henry D. Flood, chairman of the Committee on Foreign Affairs of the House of Representatives, reportedly warned the President that the continuance of his policy toward Germany would meet with their resistance in Congress.[7]

These events were dramatic foreshadowings of the bitter opposition which President Wilson was shortly to encounter in his efforts to have the United States become a member of a League of Nations. One may grant that the Republican opposition under the leadership of Senator Lodge had fretted under what they regarded as the dictatorial methods of this Democratic war President, and were glad to have the opportunity to humiliate and discredit him. To be against what the President was for was also a temptation with a national election in the offing. But it is probable that in any event the country as a whole was so tired of war, so fearful of "involvement" abroad, and so anxious to get back to "business as usual," that it was quite ready to acquiesce in a repudiation of any policy which would or might lead to new "entanglements."

The succeeding administrations of Harding, Coolidge, and Hoover reflected and encouraged the disposition of the country to cut loose politically, as far as possible, from the remainder of the world and seek peace through authentic American prescriptions. They promoted disarmament and the Pact for the Renunciation of War, but shied away from implementing peace through such institutions as the League of Nations and the Permanent Court of International Justice. Our attitude seemed to Europeans to suggest that we regarded ourselves as possessing sounder judgment than they, which they did not believe, and greater rectitude, which they were even more unwilling to acknowledge. We seemed to be saying: "We are for peace; if you likewise sincerely desire it, follow the American example, cut your armaments, abide by the Kellogg Pact and discourage aggressors not through the employment of physical sanctions against them, but by refusing to recognize the validity of territorial acquisitions in violation of the Kellogg Pact."

CONCENTRATION ON THE HOME FRONT

When Franklin Delano Roosevelt entered the White House, the paralysis of a world-wide depression was prostrating the country and working havoc in international trade and finance. He decided to deal with the situation confronting him as one requiring primarily a domestic solution, rather than one involving a restoration of international trade and financial stabilization by international agreement.

In this decision President Roosevelt was to find widespread support. Dean Wallace Brett Donham, of the Harvard Graduate School of Business Administration, declared that Americans must first of all put their own national house in order; and that if they would be free from world wars and realize prosperity,

[4] Quoted from Thomas A. Bailey, *A Diplomatic History of the American People* (New York: Crofts and Co., 1940), p. 611.

[5] It is not suggested that the resumption of submarine warfare by Germany, which precipitated President Wilson's War Message, was the sole or even necessarily the chief cause of the entry of the United States into the war. For various viewpoints on this question see Samuel Flagg Bemis, *A Diplomatic History of the United States,* Third Edition (New York: Holt, 1950), p. 615; Walter Lippmann, *United States Foreign Policy: Shield of the Republic* (Boston: Little, Brown & Co., 1943); Charles Seymour, *American Diplomacy during the World War* (Baltimore: Johns Hopkins Press, 1934), pp. 207–11; Charles Callahan Tansill, *America Goes to War* (Boston: Little, Brown & Co., 1938), p. 657.

they must work out most problems at home.[8] Our concern should be to seek to restore the buying power of the American people, for they constitute 90 per cent of the market, and the home market is not subject to the disturbing influences, quite beyond our control, which make foreign markets undependable and hazardous. We should give up trying to solve the problems of a world we neither control nor understand.[9]

Another academician, Charles Beard, took a similar position. We should reverse our policy of opening doors and pushing trade in all parts of the world, with all the risks involved, and follow that of opening doors at home, substituting "an intensive cultivation of its [our] own garden for a wasteful, quixotic, and ineffectual extension of interests beyond the reach of competent military and naval defense." [10]

Among the popularizers of this thesis, Samuel Crowther and Garet Garrett reached millions of readers in the thirties through their articles in the *Saturday Evening Post*. It was reiterated that

> the first problem is that of mending the internal economy of nations, each one to find how it shall balance its own budget, reëmploy its own people, restore its own solvency . . . no one need worry about foreign trade. It will come back in due time, as the nations severally need it and can afford it.[11]

Samuel Crowther, admonishing Americans to "Sell America," reduced the process of international trade to such simple terms that he could rule out the import of foreign manufactures altogether:

> If we export manufactured goods and get paid for them in manufactured goods, we have done nothing whatsoever unless the manufactured goods we receive are such as we cannot make. Practically speaking, there are no such goods, so the import of manufactured goods is out.[12]

On the eve of the meeting of the World Monetary and Economic Conference in London in June 1933, President Roosevelt cabled that the Conference should seek to stabilize currencies, revive world trade, and take "international action to raise price levels"; but it soon became evident that he had concluded that this was the wrong emphasis. Repudiating the compromise proposals of the American delegation designed to effect an agreement between the "gold bloc" and the "off gold" countries, he declared in favor of planned national currencies and a "sound internal economic system." And under the National Industrial Reçovery Act, designed to implement these views, the policy was to raise prices and wages, the President being empowered to protect such increases, where necessary, by raising customs duties.[13]

Among others of the self-containment persuasion were Lawrence Dennis, *Is Capitalism Doomed?* New York: Harper, 1932; Stuart Chase, in *Scribner's*, September 1933; and John Maynard Keynes, *The Yale Review*, Summer issue, 1933.

[13] John Holladay Latané and David W. Wainhouse, *A History of American Foreign Policy*, Second Revision (New York: The Odyssey Press, 1940), pp. 824–26. Thirteen years earlier, under the influence of Woodrow Wilson, and as a candidate for Vice President in the campaign of 1920, Roosevelt emphasized the importance of foreign trade, and in general the necessity for the United States to

REACTION TO FOREIGN DISORDER

If national policies related to the world-wide depression were not such as to promise a restoration of international trade and an easing of economic tensions during that period, there were even more disquieting developments in the area of international politics. In 1931 Japan resorted to unilateral military action in Manchuria, contrary to treaty obligations, and defied the efforts of the League of Nations and the United States to have her take her grievances to the Council table. In 1935 Mussolini, likewise in violation of the Covenant and the Kellogg Pact, attacked Ethiopia.

The reaction of the American Government to these illegal acts and those that were to follow was influenced by a rather widespread popular conviction of the futility of once more attempting to win a durable peace by taking up arms against aggressors, and by the hope that whatever course others might choose, we could remain at peace if resolved to do so, and if we "minded our own business." Consequently, beyond admonishing the Mussolinis and Hitlers not to attack their neighbors, and seeking by diplomatic pressures to restrain the Japanese, the Roosevelt administration adopted at the outset a policy of great caution. Likewise Congress, anticipating an Italo-Ethiopian war, hastily devised neutrality legislation prohibiting the export of "arms, ammunition, or implements of war" to any belligerents. This was the beginning of the policy, which was further implemented in successive acts, of attempting through domestic legislation to insulate the United States against war.[14]

In the Act of 1936 all long-term loans and credits to belligerents were forbidden. This, our legislators felt, would not only save us from building up a stake in the victory of either side, as they asserted we had done during the First World War, and help us to preserve a firm neutrality; it would also serve to discourage necessitous belligerents from waging war. Peace was our passion. But when it was proposed to embargo all trade with belligerents in order more completely to insulate the nation against war, Congressmen drew back. What effect would this have upon our economy? Eventually, however, they hit upon the cash-and-carry expedient, which was written into the Neutrality Act of 1937. Under it belligerents could purchase in the American market what they needed, other than arms and ammunition, by paying cash-on-the-barrel-head and taking their purchases away in their own ships. Senator Borah described this ingenious device as follows: "We seek to avoid all

participate actively in world affairs. ". . . modern civilization," he pointed out, "has become so complex and the lives of civilized men so interwoven with the lives of other men in other countries as to make it impossible to be in this world and not of it." (Quoted in Emil Ludwig, *Roosevelt* [New York: Viking Press, 1938], pp. 84–85.) By 1943 the administration-sponsored Reciprocal Trade Agreements revealed that the President and Secretary Hull were anxious to promote international trade insofar as it would not adversely affect the domestic economy.

[14] In the Ethiopian conflict Mussolini was well armed for aggression against a weak African state, and was not embarrassed by our neutrality legislation. If all the nonbelligerent states had passed similar legislation, Italy would still have been able to prosecute the war, but Ethiopia, weak and relatively unarmed, would have been struck down even more quickly by the attacker. It may be observed, parenthetically, that if the most important consideration is to *shorten wars* in such cases, a universal arms embargo (which the American Government obviously would have welcomed at the time of the Italo-Ethiopian conflict) may well make a powerful contribution to such a result by contributing to conditions which will enable the armed aggressor to win quickly against the weak or unarmed victim.

risks, all danger, but we make certain to get all the profits." [15]

INTERNATIONAL RELATIONS DETERIORATE

In the meantime, international relations steadily deteriorated east and west. Japan proceeded with fire and sword to establish her co-prosperity sphere program in the Far East. Hitler remilitarized the Rhineland in 1936, seized Austria in 1938, and first blackmailed the powers to acquiesce in his occupation of the Sudetenland, and then took over Bohemia and Moravia to provide Germans with *Lebensraum*. It became clear that if he were to be stopped it would have to be with something stronger than protests.

Until October 1937 President Roosevelt sought, as he said in an address to Congress on January 3, 1936, "through adequate defense to save ourselves from embroilment and attack, and through example and all legitimate encouragement and assistance to persuade other nations to return to the ways of peace and good will." [16] And as late as August 1936 he declared: "We shun political commitments which might entangle us in foreign wars; we avoid connection with the political activities of the League of Nations. . . . We are not isolationists except in so far as we seek to isolate ourselves completely from war." [17] But by the summer of 1937 Japan was waging a full-scale war against China in violation of her commitments under the Nine-Power Treaty negotiated at the Washington Conference of 1921–22, and the President's advisers believed it would be helpful if he were to advise the nation on the deterioration in international relations.

The "Quarantine Speech" of October 5, 1937, which originated from their suggestions, somewhat dismayed the President's advisers, however; for by implication, at least, it called for an abandonment of American neutrality and the acceptance of the principle of collective security:

> Peace-loving nations must make a concerted effort in opposition to those violations of treaties and those ignorings of humane instincts which today are creating a state of international anarchy and instability from which there is no escape through mere isolation or neutrality. . . .[18]

Apparently the President did not have in mind the imposition of physical sanctions against treaty violators, but seemingly was thinking of an international agreement which would define aggression and pledge the signatories to cut off intercourse with an aggressor.[19] In any event, the reaction in the country to the suggestion that an abstentionist policy was not enough was distinctly unfavorable, and President Roosevelt cautiously refrained from repeating or elaborating it.[20]

THE PRESIDENT EXHORTS THE AGGRESSORS

The President, however, was not denied the right to exhort the aggressors to mend their ways. When the Munich crisis developed, and war seemed imminent in spite of the concessions made to Hitler by Great Britain and France at the expense of Czechoslovakia, President Roosevelt made an appeal both to Hitler and to Beneš to remember their obligations under the Pact of Paris, and not to break off negotiations. Hitler rejected any responsibility for the crisis, and a second appeal from the President met with no success. Hitler's demands were substantially met by the French and British on September 29, 1938; and Hitler, having the Sudetenland and the strong Czech fortifications, was good enough to refrain from invading Bohemia and Moravia until the following March, when he made them a protectorate of the German Reich.

Next on the German timetable were Danzig and the Polish Corridor. Once more President Roosevelt made a direct appeal to Chancellor Hitler to refrain from attacking or invading the remaining continental nations, at the same time suggesting that the United States would be willing to participate in a disarmament conference to relieve the peoples of the world of the burden of paying for heavy armed establishments, and to explore the question of restoring international trade. Hitler made no reply, but stepped up his propaganda against the Poles.

Further appeals were addressed by President Roosevelt to the King of Italy, the President of Poland, and once more to Hitler. These pleas were obviously without benefit of bayonets, and were couched in language which probably amused the author of *Mein Kampf*.

On September 1 the German legions marched into Poland, Great Britain and France announced that they would come to her assistance, and another war engulfed the nations of Europe.

Several months prior to this, President Roosevelt asserted that the arms embargo was unwise and should be repealed. Its practical operation, he said, was to take away from Great Britain "the one great advantage which it had built up over the years . . . to offset other advantages which the land and air power of Germany had created against Great Britain." [21] Nor did he believe that the arms embargo would keep the United States out of war, for things going into the manufacture of war implements were being sold by United States citizens under the Neutrality Statute. On the other hand, he declared that the arms embargo played into the hands of aggressor states, since the latter knew that their intended victims, being less well prepared, could not expect to buy the means of resistance from us.[22] But Congress was strongly isolationist, and was not impressed by the President's arguments at the time. Senator Borah warned that repeal would bring us into the war, and undoubtedly he expressed the feelings of a large majority in Congress.[23] However, when war actually broke out in Europe, the President called an extraordinary session, and succeeded, after protracted debate, in getting the arms embargo repealed.

PUBLIC OPINION AGAINST INVOLVEMENT

That Congress reflected rather faithfully the strong antiwar feeling of the country during that period, as far as public opinion polls could measure that feeling, is evident. Even after Hitler's blackmail tactics had opened a path for him to overrun Czechoslovakia, the Gallup polls indicated that about two-

[23] The *Springfield Weekly Republican* (Springfield, Mass.), October 5, 1939; see also the *San Francisco Examiner*, October 23, 1939 for excerpts from radio address of Senator Gerald Nye in which he declared that the repeal of the arms embargo would end American neutrality.

thirds of those interviewed continued to believe that Congress should retain the arms embargo, and that close to 95 per cent were opposed to the participation of the United States in another European war.[24]

A breakdown of this sentiment in terms of population groups cannot be presented precisely, but it became clear, for example, that several German-American publications in the United States were able to marshal the sentiments of millions of Americans of German descent against being drawn into war against Germany. The propaganda machine of Goebbels sought to take advantage of and intensify this sentiment; and after Hitler's dazzling successes in his campaigns against Poland, the Low Countries, and France, it was understandably strengthened. Among chronically anti-British elements of the population, the Irish, in general, were almost pathologically opposed to being drawn into a war on the side of England, the hereditary enemy.

Liberals and pacifists in large numbers felt that we had been bilked in the First World War, that we had spent billions, were owed more billions by our defaulting European debtors,[25] and had been betrayed in the peace settlement. Moreover, they had memories of the intolerance and bigotry in this country which constituted one of the ugly by-products of the First World War, and they feared that another war would bring the same result.[26]

As for the Communists, they, of course, derived their inspiration from Moscow. As soon as the Soviet Government signed itself out of war with Germany in August 1939, and Germany attacked Poland and found herself at war with the Western powers, the American Communists declared that the war had been made in Downing Street, that Wall Street and Roosevelt were seeking to push the United States into it, and that we should remain neutral.[27]

Organized labor, whether under CIO or AFL leadership, was also for the maintenance of American neutrality. Both groups were strongly anti-fascist, and both were fearful that should the United States enter the war, American workers would lose the gains they had achieved under the Wagner Act and would have to work longer hours and pay higher prices, so that their real wages would be less than before. Moreover, the great majority of those who would do the fighting and dying would be from the working class.

ATTITUDES OF BUSINESSMEN

In general, business, big and little, was opposed for various reasons to our becoming involved in the war as an actual participant. Some businessmen expected Hitler to win, and argued that we should leave the door open so as to do business with him after it ended. They also observed that in Nazi Germany there was no trouble with labor unions, and we might actually learn something from Hitler. On the other hand, many did not want to see us in a war on the side of England, which they expected to go socialist when peace should come. Finally, business in general realized that our participation in a costly war of long duration might well bring government controls over prices and profits, as well as higher taxes on business.[28]

By far the most active, far-flung, and influential organization carrying on propaganda designed to counter William Allen White's Committee to Defend America by Aiding the Allies[29] was the America First Committee, organized late in 1940. Its Acting Chairman was General Robert E. Wood, chairman of the Board of Sears, Roebuck and Company; and among its business supporters was Max W. Babb, president of Allis-Chalmers Manufacturing Company of Milwaukee, Wisconsin. Charles A. Lindbergh, by then a wealthy businessman, made speeches at mass meetings throughout the country under its auspices.[30] He believed that "France and England courted disaster when they, unprepared, declared war over the German invasion of Poland," and that "for us to enter the conflict in Europe at this time would result in defeat and humiliation." [31]

Henry Ford also counseled the American people to stay out of the conflict, since he saw "no righteousness in either cause." On the other hand, we should give "both sides the tools to keep on fighting until they both collapse," after which the United States could "step in and help them both make a just peace. . . ." [32]

Herbert Hoover, who at the end of the First World War spoke out on behalf of the League of Nations and American membership in it, likewise testified to his disillusionment. We should stay out of the war in Europe, strengthen free institutions in the Western Hemisphere, and prepare ourselves along with the other twenty nations of the Americas against invasion or successful attack. Hitler's forces would eventually collapse, after which we would be in a position to aid in peaceful reconstruction.[33]

OTHER VOICES AND THE PROPULSION OF EVENTS

On the other hand, the consequences of the cyclone-cellar doctrine of the isolationists were pointed out by other Americans as the Axis legions callously snuffed out the freedom of one nation after another in the late thirties. Henry L. Stimson in a letter to the *New York Times* on March 6, 1939 declared, "Our foreign policy cannot with safety be geographically limited to a defense of this hemisphere or of our own continental boundaries." To him the relentless advance of these powers represented "a radical attempt to reverse entirely the long evolution out of which our democracies of Europe and America have

[25] The Act of April 13, 1934, the so-called "Johnson Act," reflected in its title the bitterness felt toward these debtors: "An Act to prohibit financial transactions with any foreign government in default on its obligations to the United States."

[26] Prominent among the intellectuals who in general subscribed to these views were Robert Maynard Hutchins, president of the University of Chicago. See his address of March 30, 1941: "The Proposition is Peace," and Charles A. Beard's "Giddy Minds and Foreign Quarrels," Appendix to the *Congressional Record*, Vol. 87, part 12, p. A 3351.

[27] Even after the Lend-Lease Act of March 11, 1941 was passed, the Communists continued to sabotage aid to Britain, and advised the American people to put a stop to measures calling for the execution of the act, since they would be supporting a "Washington and Wall Street" war. *Daily Worker* (New York), March 12, 1941.

[28] It might also be observed that munitions manufacturers, publicized in the thirties as "merchants of death," probably calculated that they would make more money if the United States stayed out of the war, since Congress had repealed the arms embargo, and since if we entered the struggle the forces who sought to "take the profits out of war" might push through the necessary legislation.

[29] See Walter Johnson, *The Battle Against Isolation* (Chicago: University of Chicago Press, 1944), for its organization and activities.

[30] For full account of various addresses by Lindbergh, see *San Francisco Examiner* for May 4, 11, July 2, and October 5, 1941. See also text of address of another American millionaire and isolationist, former Ambassador to England, Joseph P. Kennedy, as reported in the *San Francisco Examiner*, May 25, 1941.

[32] As reported in the *San Francisco Chronicle*, February 16, 1941.

[33] *Ibid.*, September 18, 1941.

grown. . . ." The question was how best to try to prevent the outbreak of a general war which in any event would be difficult.

> Shall we bury our heads in the sands of isolationism and timidly await the time when our security shall be lessened and perhaps destroyed by the growing success of lawlessness around us? Or shall we use our present strength and security from attack to throw our weight into the vacillating scales in favor of law and order and freedom? [34]

Mr. Stimson left no doubt as to his own answer, but the American public still clung to the hope that if we would only "mind our own business" while others were losing their freedom, the power-drunk dictators would graciously permit us to continue to cultivate our own garden in our own way.

The blitzkrieg against the Dutch and the fall of France began, for the first time, to raise doubts among large numbers of Americans as to whether we could longer afford to rely entirely upon our own rectitude and Hitler's forbearance. The Committee to Defend America by Aiding the Allies, taking account of the strong isolationist sentiment in the country, sought to point out the real danger which now threatened our peace and security, and the necessity of taking all measures "short of war" to aid those countries still resisting him, in order to give the United States time to prepare. In particular the point was stressed that American aid must be rushed to Britain in order to prevent her defeat and the possible surrender of the British and French fleets to Hitler. Should this happen, our own security would be in great jeopardy.

Slowly the country and Congress responded. We were still not ready to "go to war," but more and more people began to feel that the war was "coming to us." Under these circumstances the President, by September 2, 1940, was able to conclude the destroyers-bases transaction with relatively little congressional criticism.[35] And early in 1941 the United States escaped from the "strait jacket of isolationist legislation" [36] by the passage of the Lend-Lease Act. These "provocative" measures did not embroil us in war with Germany, as isolationists predicted they would. However, a few months later we were bombed into the war by the Japanese attack at Pearl Harbor.

Is Isolation Possible or Desirable?

A glance at history reveals that the idea of isolation as a state policy is not of recent origin and not particularly associated with the American experiment in government. Ancient Sparta, relatively isolated by geography from other states, tried it with unhappy consequences, by expelling foreigners and forbidding Spartans to trade with or travel in other countries. Plato's ideal state was envisioned as one so situated that it would not be tempted to seek commercial intercourse with other states. As far as possible, it should be economically self-contained. Thus it could be free to perfect its own institutions and provide the conditions necessary for its citizens to live the good life without distracting wars and outside influences.[37] The Chinese long assumed and acted on the assumption that they were "all under Heaven," and foreign devils were not thought worthy of intercourse. Until Admiral Perry's "black ships" entered Japanese waters, the Land of the Rising Sun likewise sought a good life apart from the rest of the world. And yet these things could not be. Human energy, curiosity, the spirit of adventure, and man's inventiveness were all against them.

It is understandable that Americans, with their rich, separate—though not isolated—experience should in their turn harbor the illusion that they are set apart by destiny to build an ideal commonwealth. It is equally comprehensible that they should want to be insulated against world wars. But if past history may be relied upon, and the full significance of recent technological developments is understood, the ideal of a closed state today is fantastic.

Moreover, in a "cold war" era like the present, it is dangerous to formulate policy on assumptions of national or hemispheric self-sufficiency, whether economic or political.[38] According to estimates of the Bureau of Mines for 1951, the United States had "a lowered self-sufficiency in 25 commodities, including such materials as copper, lead, zinc, and iron ore. . . ." [39] In others, of course, it is largely dependent upon importations from foreign countries outside as well as inside the Western Hemisphere.

In the political sphere, surely it is becoming clearer each day that it is at best a counsel of despair to talk about writing off our European allies and withdrawing our lines of defense to the Western Hemisphere. To abandon western Europe would be to sacrifice western civilization, its peoples, and their resources to the suffocating grip of Communism. And after that, what? We would then, without allies, be in the not altogether enviable position of being swallowed last.

Policy, however, must look to the future as well as take account of the present. Crisis policies may preserve the existence of a nation; they do not provide a foundation for a healthful coexistence with others in the future unless courageous and imaginative parallel efforts are made to hold the line and advance it as far as possible in the area of international co-operation. Specifically, this means, among other things, that the United Nations—at present admittedly the imperfect embodiment of nations' hopes and aspirations for the preservation and improvement of their common civilization—should be regarded and continuously utilized as the ultimate forum before which all nations may present special claims as well as voice common interests. This is the minimum price of their survival.

Defense Expenditures and the National Economy

By Robert A. Brady

ON the available evidence we seem to be entering a defense economy which is likely to be sustained on an unprecedented scale—short, even, of an ever possible "all-out war"—for an indefinite period of time. No one has yet suggested any terminal dates for the program other than to name certain provisional maximum points of direct military defense outlay, currently placed between 1953 and 1956. Yet patently neither the upper figure nor the date expresses anything more than an unsubstantial hope. It is a way of saying that at best we "see through a glass darkly," and that what we see is mostly menacing and baleful. Even the European defense pact is welcomed as a possible addition to strength which barely outweighs the complex dangers that underlie it. Its very existence, with its concomitant more careful delineation of the Eurasian territorial lines of interest and conflict, provides an occasion for mounting emphasis on our own enhanced military power.

The Central Conflict

The most optimistic have difficulty in finding signs more favorable to peace on the horizon. A culling of news, comment, and opinion on the United Nations and its multifarious activities will show that most of those who do not skeptically view its future in terms of another League of Nations see ahead an organization that is coming more and more to be conceived as the core of a grand alliance of the noncommunist world against the ecumenical communist threat. All in all, the proper analogy for this global "time of troubles" might be something like the Thirty Years' War which ruined the Germanies between 1618 and 1648 and which provided such a terrible starting point for this century of carnage: long drawn out, but intermittent and desultory, conflict where the issues in process of appearing to become more definite yet become ever more difficult to define, and where the doctrinal emphasis upon rational differences over time shades insensibly into ever more bitter, irrational, and fanatical ideological confusions.

Nationalism, political and social reform, cultural conflicts, racial hostilities, economic development, waxing and waning imperial controls, religious controversies—all these and more, and in endlessly varying combinations, are mixed into the Korean and Vietnamese wars; into the impending civil wars in Morocco, Egypt, Iran, and the vast areas of western, central, and southern Africa, where the Malan policies of *apartheid* are being viewed by the Negroes as an augury of a menacing future; into the various movements which threaten either to crystallize against the West or to fraction into petty warring principalities the Arabic and Hindu areas; into what only outsiders believe to be the petty internal squabbles of South American republics.

All these issues, nevertheless, are everywhere being drawn into, and somehow or other related to, the central conflict between the communist and noncommunist global power blocs, and the significant thing is that very few see any hope of any short-run lessening of the tensions. On the contrary, official and expert opinion generally speaks of increasing, not decreasing, danger of

war. To cite a single example, after extensive hearings in which dozens of organizations and expert spokesmen from virtually all walks of American life had testified and offered their own recommendations, the Committee on Banking and Currency probably summarized the general sentiment pretty well in its final recommendations for revision of the Defense Production Act when it said that "with the passage of time the chances for an all-out attack upon us increase." [1] From this the Committee drew the conclusion that the huge expansion of industrial capacity that accompanied and largely dominated the first two years of defense production not only took logical priority over direct military outlays, but was also the necessary precondition to anticipated future military production on a still more extensive scale.

Fear of American Depression

There are still further reasons for supposing that we are facing a long-run prospect of high, and possibly mounting, military expenditure. Among these, two seem particularly important. First, business, labor, and economists and other experts in this country, and similarly posted persons in foreign countries whose economies are closely interlaced with ours, share a deep and abiding worry over the possibility of another major business depression. Outside the Soviet-dominated areas, the United States is clearly the key to this problem. A depression in one of the European countries might be successfully resisted elsewhere, and particularly might be overcome by prompt aid from the ample resources of the United States. But a depression in the United States would be catastrophic for the rest of the noncommunist world.[2] On this point there is universal agreement, including that in the entire Communist-dominated areas, where spokesmen have been predicting such a depression ever since the war, and where they are sensitive to the enormous propaganda victory to be scored from fulfillment of such a Marxian prophecy.

The fear of an American depression is one of the principal sources of "Bevanism" in Britain—a sentiment, incidentally, which has been gaining, rather than losing, support on the continent of Europe.[3]

Fear of Allied Unrest

Behind the scenes, more is actually made of this danger by European countries than of the related fear that their own rearmament programs will mean a serious slowing down of the increase, or an actual curtailment, of their domestic standards of living.[4] Yet even the lat-

[1] Senate Report No. 1599, from the Committee on Banking and Currency, "To Amend and Extend the Defense Production Act," May 27, 1952, p. 4.

[2] "Mr. Harriman pointed out that in 1947, when this country experienced a 6 per cent decline in its industrial output, imports dropped 20 per cent, with those of some nations falling by as much as 70 per cent and those of the Marshall Plan countries averaging a 37 per cent drop. . . . The MSA chief said that the United States, although it has only 10 per cent of the population of the free world, produces one-half of its goods. This, he pointed out, gives this country a tremendous responsibility which it cannot afford to overlook." Thus "even a slight drop in American business activity" might unstabilize the entire economies of "countries furnishing us raw materials," and these countries include most of the noncommunist areas throughout the world. *Journal of Commerce*, May 20, 1952.

[3] "France will soon announce that its promise of 12 divisions by the year's end will have to be cut to 10. Dutch sources report Holland is having trouble filling its quota, too. Britain earlier slashed its projected defense spending by more than one-third." *Wall Street Journal*, May 5, 1952.

[4] "By the middle of 1951 industrial production of the western European countries had . . . by now mounted above prewar levels by

ter plays a role in promoting our own defense expenditure, for the resulting internal unrest places those countries in a position to demand that the United States carry a part of the increased armament load imposed on them by the new military program. In critical underdeveloped areas, such as Iran and Pakistan, this argument possesses even greater potency.

Since any internal unrest whatsoever is now likely to be viewed in this country as preparation of a possible seedbed for communist ideas and actions, we must now at least stand ready to shoulder a larger share of the burden the instant such situations arise. The possibilities of what is scarcely more than mere blackmail, as indicated in the cases of Iran, Spain, and the Argentine, are tremendous, and it is exceedingly difficult to see how, in terms of present American foreign policy, further possibilities of this sort can be avoided in the future.

SELLING PROGRAM PROMOTED

Blackmail or not, it becomes easier, in the second place, to view the prospect of high or mounting defense expenditures with complacency for the reason that enhanced production of military supplies, and of plants specialized to produce them, siphons off output which might appear to be increasingly in excess of the domestic capacity to consume or reinvest. It has long been an *idée fixe* in the business community that capacity to produce tends constantly to outrun the propensity to consume, and that a situation is bound sooner or later to occur where a goods glut will have disastrous consequences for the economy as a whole.

For a quarter of a century at least, one or another version of this common superstition has provided the standard justification for increased business appropriations for advertising and high pressure salesmanship. Since the afflatus of Keynesian doctrine, however altered or vulgarized by various economists and governmental officials, a similar idea has caused economic *expertise* to rally to the cause.[5] In a recent series of articles *Fortune* has been attempting to unite experts, businessmen, labor, and government officials in a common drive to save the American economy from the disaster of depression by promoting a vast selling program.

This program is being promoted in face of the huge military outlays summarized below, and with an eye to the thesis that failure of salesmen to mop up such savings as may still remain after paying the huge new tax levies will bring on such a depression that it will not only weaken the American economy internally, but will also cost this country its capacity to lead the world against communist forces. It is argued that this will everywhere undermine the willingness of old or new allies to accept American leadership at the very point in human history when this leadership is seen as the only hope of stemming the Red tide.

Under these circumstances, the prospect of a peace which might result in general disarmament would appear as a disaster. Contrariwise, armament at the current (or an expended) level seems to guarantee sustained full, or close to full, employment.[6] This means jobs for labor, profits for business, markets for farmers, power and stability for the country as a whole, leadership, and capacity to back up leadership, throughout the world in the common struggle.

about 40 per cent, and their total production by more than 15 per cent. On a per capita basis, the increase in their total production has been more than 5 per cent above prewar levels." The bulk of the increase appears, however, to have been in the field of producers', not consumers', goods, and would be, accordingly, available for future increase in real national income if not absorbed by rearmament. *The Midyear Economic Report of the President*, July 1951, p. 7.

[5] "Yet Keynes concludes that *so long as classical principles stand in the way of something better*, gold digging, burying and unburying old bottles with banknotes, pyramid building, earthquakes, wars, etc. all will add to the community's wealth." Seymour E. Harris, *The New Economics*, pp. 411–12. Italics in the original.

ALTERNATIVES EXAMINED

To be sure, there are other ways of accomplishing economic stability, but they are generally and increasingly looked upon with distaste. We might, for example, give away surplus to needy countries, as with the United Nations Relief and Rehabilitation Administration (consumer goods) or the Marshall plan (primarily industrial goods). Or we might go in for a vast program of overseas Point Four economic development. Or again we might attempt to sell more to reluctant and already oversupplied domestic consumers.[7] Or still again, we might wait until decline begins and then shore up the economy with public works, reinforced with deficit spending and appropriate changes in monetary and fiscal policies.

But in general, such alternatives are currently disapproved. Of the above, the first is coming to be viewed by powerfully placed persons as charity "at the expense of the American taxpayer" extended to people who are forgetting "how to work." The second is dependent upon the creation of a "climate favorable to free enterprise," and the weather prophets of history offer little but inclement times ahead on this score. The third may well be impossible. And the fourth is commonly seen as a variant of, when not a prelude to, "socialism," and this dangerous un-Americanism has effectively been labeled as a sort of "pink communism." But paradoxically, defense expenditure spreads wholesome benefits with a free hand throughout the economic system at large.[8]

All these trends and elements combine to promote large-scale and possibly expanding military expenditures for an indefinite period of time.[9] We are involved in a gigantic arms race. All the evidence points this way. The Soviets are matching us step by step. Every new "position of strength" is lost the instant it is matched. Neither party can rest at any given point. Al-

[6] "The expenditure of $43 billion on military rearmament during the coming fiscal year will probably forestall any possibility of a general business recession in the country for the next 12 months." Summary of a speech of Nelson A. Miller, Office of Civilian Requirements, before the Linen Supply Association of America. *Journal of Commerce*, May 20, 1952.

[7] "A large part of our production goes into goods and services which consumers can pass up without any very severe inconvenience . . . some estimates place this as high as 40 per cent of total production." Robert A. Weaver, chairman of the Board of the Ferro Enamel Corporation, Cleveland, Ohio, from a speech reported in *Retailing*, December 7, 1951.

[8] "Direct Government defense spending in the first three months of the year climbed to an annual rate of over $47 billion. This was about 14 per cent of the total national output of goods and services, called the gross national product, which almost reached an annual rate of $340 billion. But, in addition to direct Government spending, the defense program spurs the economy in many other ways. For example, defense accounts for a large part of the estimated $24 billion which private industry plans to spend for plant expansion this year. About six million of the nation's 60 million employed civilian workers are working in the defense program. These payrolls, plus military payrolls, give a boost to almost all private business . . . up to one-third of the nation's total business activity now springs from the defense buildup." *Journal of Commerce*, May 20, 1952.

[9] "Larson says stockpiling is planned 'in terms of years or even decades.'" Editorial heading, *Journal of Commerce*, November 1, 1951.

ready the Soviet Union appears to have overreached us in direct strategic air and ground armament.[10] An arms race must continue to mount expenditure. But take, first, the present actual burden. How heavy is this burden, and how well may it be borne?

ACTUAL SCALE OF MILITARY EXPENDITURE

Mr. Wilson testified in March 1951 that the peak of defense expenditure would be reached in 1953 at a figure of about $65 billion, and would thereafter taper off for an indefinite number of years to an annual outlay of some $50 billion. The latter expenditure, he said, "probably is about the right figure to produce the degree of might that we ought to have in the foreseeable future."[11] Actual expenditures have lagged behind. Thus, by March 1952 only $26 billion of military goods had been delivered over the period of some twenty months following the outbreak of the Korean war, and of the total of $94 billion previously appropriated by Congress, only $71 billion had been obligated. In the intervening year the whole security program had been slowed down.[12]

The principal reason for the slowdown has been given in some quarters as a "triumph of Bevanism" in the United States. It is actually nothing of the sort. Mr. Wilson attributed delay to the problem of "lead time," or the lengthening time "it takes to complete the designs and also the tooling requirements for the new designs." A supplementary reason, less clearly stated in the official literature, is the heavy early emphasis on creation of additional industrial capacity, principally in steel, certain nonferrous metals such as copper and aluminum, and machine tools. It has been argued that once the new plant has become available, actual deliveries can be correspondingly increased so as to meet any defense need, however high. To defense in depth, accordingly, is to be added defense in breadth.

Is the burden, per se, too heavy to be borne indefinitely? There are many possible answers to this question, and some of the answers would require summary of vast quantities of data and at points some intricate reasoning. Avoiding these complications as far as possible, it seems entirely accurate to say that certain conclusions are virtually beyond dispute. Consider the following three.

STANDARDS OF LIVING MAINTAINED

First, defense expenditure has not thus far curtailed over-all civilian consumption, and there is no clearly visible reason for anticipating that it will, short of all-out war. "Considering the increase in consumers' stocks of durable goods since the end of the war, and the steady improvement in housing accommodations, it seems clear that living standards have thus far been rising."[13] The May 1952 issue of the *Survey of Current Business* shows a slow but steady increase in personal consumption expenditure from the beginning of the Korean outbreak.[14]

[10] On June 16, 1952 (A.P. dispatch), Secretary of Defense Robert A. Lovett said, "the Russians are outbuilding us—we are falling behind, relatively speaking, in the arms race."

[11] Defense Production Act Amendments of 1952, Hearings before the Committee on Banking and Currency, 82nd Cong., on S. 2594 and S. 2645, pp. 12, 20.

[12] Senate Report No. 1599, *op. cit.* note 1.

[13] *Economic Report of the President*, 1952, p. 6.

[14] Other data would indicate a slight decline in constant dollar terms. But this may be due to a buyers' strike on high-cost items, particularly in the field of durable goods.

Furthermore, a special study of the Department of Commerce shows that "real consumption expenditures per capita have been . . . expanding substantially since the mid-nineteen thirties."[15] The expansion continued uninterrupted during the entire span of the Second World War, and this includes the year 1944 when "nearly one-half of our total national output was used for war purposes." In contrast, "the present national security program will at the peak take about one-fifth of the nation's output of goods and services."[16] At the same time, there has occurred a vast diversion of national resources into the expansion of plant. It is hard to say how great this addition may be, but it seems quite probable that by 1955 it will lift capacity to produce in both essential military and civilian lines to rather more than 50 per cent above the pre-Korean level.[17]

When alongside these data are placed the tax figures, running currently somewhat less than increases in disposable income before taxes, it is clear that the country is not suffering any material diminution of real income. And with shorter working hours, vacations with pay, numerous and increasing "fringe benefits," and the already "highest standard of living in the world," it has not shouldered any very heavy burden. Most Europeans would be amused at the suggestion. Rather have the people of the United States acquired more "butter" while acquiring both "guns" and additional "tools" (plant).

[15] *National Income and Product of the United States 1929–1950*, Department of Commerce, 1951, p. 13.

[16] *The Midyear Economic Report of the President*, July 1951, p. 5.

[17] "Since the Korean outbreak, private investment in producers' equipment and nonresidential construction has averaged 37 billion dollars a year, compared with 32 billion dollar rate from 1947 through the middle of 1950, 14 billion in 1939 and 22 billion in 1929, all measured at the 1951 level." Agricultural output is up 50 per cent over 1939, and is capable of further rapid expansion. In the single year of 1951 steel capacity increased by 4 per cent and electric power by 10 per cent, while output of steel increased by 10 per cent and aluminum by 17 per cent. *Economic Report of the President*, January 1952, p. 6.

UNUTILIZED PRODUCTIVE CAPACITY

A second general conclusion is that we are not currently producing anywhere near the totals of which the productive capacity of this country is potentially capable.

For one thing, restrictionist policies, affecting both output and capacity, have been slowly permeating the American economic system. Without going into this complex subject, or consulting the voluminous historical records, a mere recital of application of such restrictionist policies over the past six months would astonish the average citizen who has become accustomed to viewing the country as more or less fully mobilized. Thus cutbacks in either or both production and plant expansion are currently being reported for steel, oil, several lines of synthetics including rubber and textiles, some chemicals, cotton textiles and wool, shoes and leather goods, canned foods, paper, consumer durables, lumber, plywood, and other items.

To deliberate restrictionism should be added large-scale wastage of both plant and manpower. We will note but two examples. With respect to plant, there are huge structural malproportionings in textiles, where the government has been supporting and encouraging expansion of synthetic fibers, when natural fibers (especially cotton and wool) are already suffering from vast overextension of plant. Again, the combination of railroad and road haulage capacity must now be 50 per cent or more beyond what the country requires on

the basis of any consistently carried through national road-rail rationalization program—even such as visualized in the various rather mild schemes that have come before the Interstate Commerce Commission over the past twenty-five years.

Also, there has been general failure to make extensive use of certain new lines of technological development which, taken together, offer possibilities of enormous increases in output with comparatively little additional investment costs. Thus standardization, when coupled with plant specialization, opens the way for complete plant automatization. As a recent article [18] makes quite plain, these methods may now be employed in an astonishingly wide range of processes; yet relatively little has been done by any of the defense agencies to exploit the possibilities inherent in such methods.

PRODUCTION CAPACITY OF ALLIES

A third general conclusion regarding the American burden of defense expenditures is that most of our industrial allies are rapidly getting to the place where they are ***able, if willing***, to produce much, if not all, of their own defense needs. As pointed out above, in western Europe industrial capacity is now close to 50 per cent above that prior to World War II, in the very industrial lines of greatest importance to defense programs. Meanwhile there has been added thereto the very great, rapidly expanding, and strategically located industrial capacity of Western Germany and Japan. Furthermore, there has also occurred a very great expansion, percentage-wise, in the capacity to produce both industrial goods and essential raw materials in Canada, Latin America, Australia, and even Africa (minerals; agricultural products). A net result is that it is conceivable that the overall western defense program might be greatly expanded from present levels without adding very much to the demands made upon the resources of this country.

[18] "The Factory of the Future," *Factory Management and Maintenance*, Vol. 110, April–May 1952.

ON THE SURFACE AND DEEPER

Conclusions such as these are pleasant and reassuring. From them one might well infer that the current level —or, indeed, a considerably expanded level—does not threaten to become a serious ***net*** burden on the national economy. One might go even further and endorse an argument that is becoming very general that on balance the country has gained more in terms of real standard-of-living increases from the program itself than it has lost by the burden the program appears to impose.

Yet there is reason for disquietude. Indeed, reverting to the first section of this article, the more one looks behind the superficial facts, the greater the uneasiness becomes. In fact, the case for a conclusion regarding the long run which is as pessimistic as the summary of the immediately felt direct burden is optimistic for the short run is so strong as to be almost compulsive. It is all the more important that it be faced with utter lack of illusion.

THE REAL LONG-RUN EXTERNAL BURDEN

In considering the probable scale of the long-run burden of defense expenditure, it is important to ask what the expenditure is intended to accomplish. By common agreement, it is *containment* of communism. There are three aspects of this policy which have a direct bearing on our problem—the strategic, the morale, and the economic.

The strategic aspect

As for the strategic aspect from the purely military point of view, four problems may be mentioned briefly—there is space for no more in this article. First is the geopolitical matter of the geographically strategic location of the contending forces. One might wonder what Mackinder, Kjellén, or even Haushofer would have to say at this point. The Soviet Union is the "heartland" area that fits almost all versions of this general formula, including the German. When it is realized what Germany was able to do in both world wars against vastly superior military and economic resources because of possession of a central position, where its internal lines of transportation and relatively short distances made possible quick and powerful shifting of its military resources to meet any threatened front, one wonders about the military potential of the Soviet position. Given ten more years, it might be at least three or four times as great as that of the Germans at the peak of their power, and it may well be even greater than this.

At the same time, the advances in military technique have not weakened the forces of defense. Possibly developments such as radar, supersonic airplane speeds, flak techniques, and dispersion of industry (which is apparently much farther advanced in the Soviet Union than anywhere else, and which largely nullifies the effectiveness of atomic bombing) have made the defense relatively stronger. The geopoliticians in general reckoned the inner position to be militarily (that is, man for man and resource for resource) from two to three or four times as strong as the outer or peripheral position. That is to say, in so far as *defense* plans *anticipate war* as at least a possibility, every new Russian or Chinese or Communist-dominated regiment must be militarily matched by two to four allied regiments; every airplane, every airplane field, every industrial plant behind the Iron Curtain will have somewhat the same relative power leverage.

A second aspect of the geopolitical positions has to do with relative economic potentials. However expansive we may feel about the preponderating strength of the United States and its allies, it is still true that the relative rate of plant expansion in Soviet-dominated areas is at least as great as the average in the combined economies of the United States and Europe, and it may be even greater. As for China, such scattered information as is available indicates that it is undergoing a rapid overhauling preparatory to the inaugeration of a vast economic development program similar to that launched in the Soviet Union under the Five-Year Plans. Uninterrupted, it may well be possible that China can within ten years approach the relative level of development reached by the Soviet Union in the early thirties. Furthermore, it also seems probable that she will be helped in this direction by trading—open or surreptitious and on an expanding scale—from Japan, and possibly from other industrial and raw materials areas.

It must further be pointed out that the position of both Japan and Germany is such that if they do not trade with the enemy, the whole structure of their respective national economies must increasingly be reoriented in such a way that they become more and more dependent upon American assistance. (1) For both countries the curtailment of East-West trade separates them from former supplies of basic raw materials and vast natural markets. (2) Competition for new markets brings them into direct conflict with England, France,

and other allied countries, with possible disastrous results in the form of competing demands for protection, international price wars, languishing industries, unemployment, and social unrest. (3) Zooming population rates multiply international interdependence. These and related factors enhance their capacity to demand assistance on the formula, "assistance or else."

Finally, there is very great danger that the type of military thinking which appears to be behind the case for a 143-wing air force will win out. This means a gigantic armament which must quickly become obsolete. The combination of advance in the scale of armament with rapid obsolescence is capable of adding a multiplier to defense requirements which overnight could lead to demands for expenditure beyond the wildest dreams of current planners. With such obsolete heavy armament we would then be in danger of becoming militarily like certain gigantic South Sea tortoises whose huge and unwieldy carapaces are rendered immediately and completely useless once an accident has turned them upside down.

The morale aspect

As for the second aspect—that of morale—it is scarcely necessary to comment that our ideological position has thus far remained almost entirely negative, and no generally negative program has ever in human history had much of a chance of commanding widespread popular support for any long period of time. James Warburg has put the contemporary case against this negativism in such trenchant words that it requires no elaboration:

1. It surrenders all initiative to the enemy.

2. It pre-empts the resources which might be used in furthering our own purposes.

3. It causes us to choose our friends and allies solely on the basis of the wartime yardstick—are they against the enemy. Once again we find ourself talking about a fight for freedom and attempting that fight hand in hand with such enemies of freedom as Tito and Franco. Worse than that, we find ourselves imploring the Germans to forget all about our democratic, anti-militaristic teachings of the past six years and to rearm themselves as quickly as possible.

4. Finally, and worst of all, our preoccupation with stopping evil instead of accomplishing something good tends to make us become more and more like the evil we are fighting. It tends to make us adopt not only the methods, but the premises of the enemy, thus leading us to betray at home and abroad the cardinal principles of the free society we seek to defend.[19]

The economic aspect

Furthermore, on the economic side, the negative policy generally precludes positive development and assistance, and renders us immune to even an understanding of its need. Thus, as a highly placed Indian economist put the matter last year on a visit to the University of California, "We will either have large-scale economic development in India within the next ten years, with or without foreign assistance, or we will have moved to a place where sooner or later we will have communism." While $50 billion is being spent to arm ourselves and $6 billion to arm our allies, real economic aid to all the rest of the underdeveloped areas of the world is less than $1.5 billion, "less than ½ of 1 per cent of our national product—the greater part . . . to be used to bolster the rearmament of Europe and for the procurement of strategic raw materials." [20] Meanwhile, the Indian story may be reproduced in all of Africa and Asia and in most of South America, the Near East, and elsewhere.

[19] Quoted by Wm. G. Lightbowne, in opening a panel discussion on American foreign policy with a speech entitled "Our Negative Foreign Policy," *The Commercial and Financial Chronicle*, June 5, 1952.

In general, the failure of economic aid, coupled with the failure to stand firmly and eloquently for long overdue social reform in these areas, is speedily preparing most of the underdeveloped peoples for conquest by propaganda from Moscow. Suppose all Asia and Africa were to go the Chinese way; what then of the depths of our fears and the scale of our military expenditures? But suppose that on top of this our policies give rise to fears that rearmament among our allies will undermine their standards of living (as in England), or to fears of aggression from other quarters (as in France from a rearmed Germany), or to justification for the estoppage of needed liberalization and social reform (as in Spain). What then becomes of the mettle of these allies? Will much of Europe "go Italian"—become, that is to say, inwardly lacking in any strong will to fight, as were the Italian troops in both world wars? What then of our security? our defense needs? the scale of our burdens?

It does not follow that there are no solutions; but it does follow that these issues cannot be ignored, postponed, or evaded without increasing the scale of our military expenditures, or without lengthening the shadows of fear which move us closer to the brink of all-out war. More than that, these issues cannot be dealt with in isolation and separately. They are interrelated by the stern facts of the current historical situation. Neglected they can operate against us, and they can do so in combination with terrifying effects. It is the crassest kind of self-delusion to suppose that this is not so. Yet this national self-delusion has gone so far, partakes so much of what Charles Mackay in an old classic dealt with under the heading of *Extraordinary Popular Delusions and the Madness of Crowds*, that one risks the spirit of the Inquisition in even questioning the policies that it engenders. A further by-product is equally total neglect of the incidence on our national future of the manner in which the defense burden is being distributed and managed internally.

[20] *Ibid.*

THE LONG-RUN INTERNAL BURDEN

Enough has been said of the direct burden of military expenditures at the current level. These may, despite all complaints to the contrary, still be borne with relatively slight national effort. But the *manner* in which the program is being conducted has certain "side effects" of a most extraordinarily serious character. All such effects would be exaggerated with either a lengthening of the time of high military expenditures or any increase in the scale thereof—both of which are probable, if not inescapable, on the basis of present policies. All are far too complex in their operations, interconnections, and effects for elaboration here. A few of the more important may, however, be called to mind.

Effects of high price levels

First, continuation of current high price levels over an indefinite period of time will consolidate them into a new price plateau which may not readily be lowered. Such a price plateau would involve a permanent rewriting of all previous debt obligations to the benefit of the debtor. This means reduction of all past savings accounts and fixed-value securities. Thus all depositors in savings and loan institutions, all private and social insurance policies, all holders

of government and corporate bonds, all owners of mortgages and similar debt obligations—in short, all savings for old age, retirement, or security will, depending upon the time when such savings were deposited or invested, have the value of their accumulations reduced by the extent of the general price advance. Such a gigantic forced transfer of property as this would involve has probably not been witnessed since the days of the enclosure acts or the Russian Revolution of 1917. Here is massive expropriation without compensation, with a vengeance.

A "ratchet effect"

Second, this condition is worsened by the fact that the means being taken to consolidate the individual prices that go to make up the price level are of such a character that they make any possible adjustment relatively easy upward, but very difficult downward. There arises what might be called a "ratchet effect" from any success in the use of (1) the parity price formula with respect to agricultural prices, supported by virtually all farm organizations; (2) the combination of minimum wage legislation with wage scales adjusted to cost of living with respect to wages, supported by virtually all organized labor; and (3) fixed dollars-and-cents or percentage margin cost-price formulas of the Office of Price Stabilization with respect to prices at the manufacturing, wholesale, and retail levels, supported by virtually all organized business. Furthermore, these separate ratchet effects not only may operate singly to force prices upward, but they may be compounded one on another.

Finally, the very structure and outlook of the special interest organizations operating to promote the use of these formulas is of such a character as to promote efforts to stimulate upward price movements by resort to (*a*) every known device of economic manipulation over the price-influencing factors of production, plant capacity, and technological innovation; (*b*) further implementation of policies by laws lobbied through legislatures in support of such programs, and by the demand—increasingly successful on both the national and the state and local levels—for the right to have like-minded people placed in administration of these special interest laws; and (*c*) advance inter-pressure-group (trade associations, labor unions, and so forth) collaboration in securing these results on the widest possible scale.

Toward the corporate state

Third, while the general effect is massive advance of monopolistic forms, tactics, and ideas, yet the advance is now being subtilized in such a way that it may not readily be seen or understood, even by the experts. It is less monopoly in the "antitrust" sense of the term, and more wholesale cartelization in the German sense of the term. But the term "cartel" is also misleading. It is more the slow drift toward the legally compulsory cartel policy, independently administered by the pressure group against the background of resort at need to the implementing sanctions of favorably drawn law when administered by persons coming from the industry or group and expecting to return to it. That is to say, we are moving with startling rapidity toward the forms and ideas of the corporate state.

Against this background, for example, the paradox of OPS is readily explained. Senator Aiken was unquestionably correct when he said,

> It is safe to say that for the last year and one-half, the prices to consumers have, on the whole, been higher than they would have been if no price controls at all had been applied or if there had not been any stimulation by Government officials or panic buying by consumers.[21]

OPS has acted not as an agency for curtailing the level of prices, but as an agency for stabilizing *interprice relations* in such a way as to supersede and render obsolete even the cartel-minded but so-called Fair Trade Practice laws of the country. The critical term is not "price control," but "price stabilization"; stabilization means *minimum* price fixing; minimum prices can advance, and all the *idola theatri* of modern times are set against decline. The OPS, in short, is coming insensibly to serve as a midwife in the accouchement of a cartelized and corporative-minded economy, self imposed by the vested interests of business, labor, agriculture, and other sponsoring groups, where private collusive decisions are made enforceable by public law. It can scarcely do otherwise.

Economic implications of peace

Fourth, in the mosaic of agencies which go to make up the over-all defense administration, there is a general disposition to see the long-run task in terms which visualize a vast expansion of the producer goods industries. So rapid has this expansion already been in the United States that, as pointed out above, bearish sentiment has been rising in Wall Street, even despite the current scale of military diversion of economic resources. Should peace "break out," as certain writers have so engagingly put it, this capacity would immediately hang over the market as a gigantic economic Tyrannosaurus. As Mr. Lightbowne has put it, "At the peak of an arms race there are so many people who have an economic reason for NOT making peace that the job becomes doubly difficult." [22]

But now these same people can argue that it is not the private interests alone, but, forsooth, the entire national interest—in terms of full employment, avoidance of depression with all its disastrous consequences—that requires the maintenance of these same levels of expenditure. But how? If not by a vast leveling up in the distribution of income which encourages a corresponding increase in spending for consumption, then shall it be accomplished by an enormous program of foreign investment?

As pointed out above, all organized business is set against the first; the second has few supporters in business or out of it.[23] Restrictionist policies could not yet cope with the excess plant that would then be left over. What remains is the easiest solution of all: continue, and if need be expand, the military program. If the alternatives appear to be high or expanding defense spending on the one hand or world-wide economic depression on the other, who doubts what the answer will be—particularly with such a *casus belli* as this?

THE END OF THE ROAD

Finally, there is occurring throughout all this defense activity a series of moves which are designed, purposely or not, to deprecate or make impossible criticism of either the causes which seem to occasion defense expenditures on a mounting scale, or the manner in which they are spent. Critical evaluation of *basic* policies is swiftly becoming unpatriotic. Economies are seen by

[21] *Congressional Record*, May 29, 1952, p. 6320.

[22] "Our Negative Foreign Policy," *op. cit.* note 19. Capitals in original.

[23] For a notable exception see Benjamin A. Javits' "trillion dollar" Point Four program in *Peace by Investment*, with a Foreword by Charles E. Wilson, New York, 1950.

military spenders—by us in both world wars, but also by military requisition systems in all armament races or wars of recorded history—as possible only on the domestic front.[24]

Sustained, the end of this road is the "garrison state."[25] It is bound to be expensive.

[24] "We must continue to hold back on the construction of hospitals. Total construction for schools, although at record levels, must be held below the real need. New natural resource development projects, including flood control, navigation, and reclamation projects, are being postponed unless they are essential because of electric power or other urgently needed features." *Economic Report of the President,* 1952, p. 12. In discussion of economies, already being debated by Presidential candidates, two things may be noted: (1) economies are possible on a big scale; (2) military expenditures must not be curtailed.

[25] Clippings gleaned from the commercial press for the past year show increasing reference to the "garrison state," the "regimented economy," and synonymous expressions. It is rarely questioned as an impending fact; the only problems have been "when" and "how much."

Robert A. Brady, Ph.D., Berkeley, California, is professor of economics at the University of California. He is author of Industrial Standardization (1929), The Rationalization Movement in German Industry (1933), The Spirit and Structure of German Fascism (1937), Business as a System of Power (1943), The Crisis in Britain (1950), and The Citizen's Stake in Price Control (1952).

Are Taxes Too High?

By HAROLD M. GROVES

THERE are many intriguing aspects of this assignment which we shall be obliged to mention rather than discuss. Should we spend the huge sums projected in current budgets? Should we spend so much *if* we are not willing to tax accordingly? Should we maintain (or increase) taxes only if something new and different can be added to the tax system by way of diversification? Can we get the revenue to avoid new taxes or reduce existing ones by plugging loopholes and improving administration? Can we avoid high taxes and still have adequate services by eliminating waste?

These questions we shall have to dismiss except for one comment. Students of public finance have reason to know that too many people castigate taxes when public expenditures are the real villain in the piece. They also know that security in our kind of world comes high and its cost is infinitely elastic. We can do without the good things of life, but we cannot have them (in times of full employment at least) without paying for them.

Are taxes too high? An affirmative answer could rest upon either of two economic grounds: (1) that taxes are undermining incentives and thus hindering economic progress; and (2) that taxes are causing inflation. To these may be added a third possible ground: (3) that taxes are so high as to hamper unduly the effectiveness of administration. The first and the third of these grounds might lead to the conclusion that more revenue could be raised with a lower schedule of rates. We shall consider each of these approaches in the order named.

INCENTIVES AS AFFECTED BY TAXES

What do we mean by incentive? We mean the price that it is necessary to pay in order to draw forth production. On the farm it is necessary to feed "the old gray mare" a certain amount of oats in order that she can and will pull. And so it is with the economic factors of production such as capital and labor. This all goes back to the fact, it is said, that working, saving, and risking are irksome and grow more irksome as more of these "sacrifices" are expected. The sacrifices are induced by certain rewards, and if taxes take a large share of these rewards, people will not work, save, and risk—or will do so on a reduced scale. It is true that man does not live by bread alone, but economic incentives are powerful and necessary.

Now there are certain advantages of the taxers over the taxed which support the conclusion that incentives are nowhere near as sensitive to taxation as one might a priori suppose. One is that a general tax like the net income tax can be so arranged that the relative rank of the taxpayer will not be disturbed. Prestige may depend upon income before tax or on relative rank in disposable income (after tax), but in either case it will remain as a motivation. It is said that what makes the most difference to the individual is whether his income is higher or lower than the general level. Much of the cost of the factors of production is "opportunity cost"—that is, the price that must be paid to attract them from competitors. But the income tax circumvents opportunity cost by taxing all competitors.

Another factor in the sensitivity of incentives to taxation is that taxpayers receive something in exchange for their so-called tax burden. They may not be satisfied with their *quid pro quo*, but the case would differ greatly if no return were forthcoming. A good many discussions of taxation and incentives talk as though the money one paid to government were dropped into the bottom of the sea. Or, as one writer put it, "taxation is like the hail which destroys part of the crop." But there is ordinarily a wide difference between taxes and tribute. For example, the largest part of our taxes are now going to stop aggression in Asia and to prepare to stop aggression in other parts of the world. The blindest taxpayer cannot fail to realize that he has some equity in this program. When we have a draft of manpower to carry out the military program, no one, no matter how bitter his criticism, can fail entirely to perceive that any contribution he may make in dollars is a mere token compared with contributions made by others in the flesh.

Of course the quality as well as the quantity of public expenditures has a bearing on incentives. Wholesale waste in government can be more damaging than high tax rates.

Work and risk incentives

A further point about incentives is that a taxpayer will fight to preserve a standard to which he has become accustomed. This *may* mean that taxes will induce him to work all the harder. As farm prices and farm incomes fell during the Great Depression, farmers sought to compensate not by planting less but by working nights. Of course, the degree of the levy is of some importance here. It probably is true also that men rebel less against a gradual rise in taxes than against increases in large installments. The greatest problem in the relation of taxes to work incentives occurs where an expanded labor force is needed and must be induced through overtime or through an appeal to wives of workingmen.

Labor's work incentives are of course protected to some extent by the fact that the tax rates applicable to them are the low bracket rates. Business executives have no such protection. However, we have the evidence of Dr. Thomas H. Sanders, after substantial interviewing, that executives are in considerable part driven by nonmonetary motives and that, while taxes may make them somewhat less willing to move from one job to another, "for the most part, with considerable exceptions, businessmen are currently working as hard under high tax rates as they did under low tax rates." [1]

Risk incentives appear even more vulnerable to taxation than work incentives. The differential return from risky investments, it would seem, is cut down to the point where no one could afford to take a risk. But investment is protected to some extent by the fact that risk is not irksome to all people. John Maynard Keynes summed this up as follows: "If human nature felt no temptation to take a chance, no satisfaction (profit apart) in constructing a factory, a railway, a mine, or a farm, there might not be much investment merely as a result of cold calculation." [2] Moreover, investment decisions take account of the probability of loss as well as that of gain. And the income tax, in effect, often promises to share the investor's loss as well as his profit.

Reflection in economic progress

Perhaps these factors account for the fact that the global statistics offer little support for the view that the tax burden is a drag on economic progress. Taxes were rising during the thirties, and it could then have been argued plausibly, perhaps, that high levies were the cause of unemployment and low output. But the greatest acceleration of tax burdens has occurred during the 1940's and 1950's, an era which has been characterized by heavy investment, very high output, relatively full employment, and satisfactory increases in productivity. President Truman seems to have been well within the bounds of the evidence when he recently remarked: "This growth of the productive sector of our economy indicates that neither the size of the military build-up nor the high level of taxation enacted to finance that build-up has repressed business investment initiative. Instead, the problem has been to hold the expansion down to non-inflationary proportions." [3]

Whatever may be the effect of taxation on economic progress, one may subscribe to the view that certain other positive factors have a great deal to do with the latter. Among them are a favorable ratio of resources to population; a wide free-trade area; a high interest in and adequate support for technological research; willingness to scrap old techniques and equipment; adequate competition; wide educational opportunity and open ladder for the advancement of talent; and avoidance of war.

The author has no disposition to assert that taxes have no effect on incentives. The question is at what point the effect becomes a matter of vital or overwhelming concern. As to the personal income tax, the view recently expressed by Dr. Blough,[4] that the political limit to taxation is reached considerably before the economic limit, seems convincing. As to the corporation income tax and excess profits tax, where the marginal rates on profits can go as high as 82 per cent, the conclusion seems warranted that we are now at or near the economic limit.

Whether or not the above opinion be accepted, there can be no doubt that taxes should be so ordered, other things being equal, that they weaken incentives no more than necessary. In this respect, the more generous postwar allowance for losses is a genuine gain.

INFLATION AS AFFECTED BY TAXES

Let us next consider the bearing of high taxes upon inflation. A convenient point of departure will be Colin Clark's widely circulated thesis that whenever taxes rise above 25 per cent of the national income they ipso facto become inflationary.[5] Undoubtedly our present tax load is well above Clark's danger point.

Clark bases his hypothesis largely upon an analysis of the historical experience of several countries at several times. His cases are far from conclusive, as he himself acknowledges. Indeed it is doubtful if they are even persuasive. In at least most of the instances cited, inflation could be explained without bringing in the factor of high taxes at all. War deficits, excessive borrowing, war damage, and other causes would suffice for an explanation. One surely may not jump to the conclusion that the inflation would

have been less had high expenditures been accompanied by lower taxation and higher deficits. It follows that it was expenditures rather than taxes which were the root of the trouble. Now it is generally conceded that a sharp rise in public expenditures (whether or not accompanied by a parallel rise of taxes) is, in times of full employment, inflationary. Undoubtedly our economic problem would be easier if we did not find it necessary to augment the expenditure side of the budget so rapidly and so much. One is less secure in the conclusion that a high level of expenditures, as such, must forever exert an inflationary influence. Quite possibly a new equilibrium can be reached where the effects of the acceleration will have spent themselves.

Clark is on strongest ground in his suggestion that a democratic people will not legislate to provide taxes that yield more than 25 per cent of the nation's income and that, therefore, high expenditures will lead to inflation. The evidence does not support this thesis very consistently either. But even if it did, the conclusion would not follow that we cannot (rather than will not) exceed his limit.

But even conceding the proposition that high expenditures, as such, are inflationary and that this will be so even if budgets are balanced, the Clark thesis, in this modified form, still requires important and extensive qualification. Surely some of the following factors will make an important difference:

(1) the policy toward and the volume of private bank credit;

(2) the attitude of taxpayers toward the adequacy of the *quid pro quo* received in return for their outlay;

(3) the kind of taxes employed to balance the budget;

(4) the per capita income.

The author finds it very hard to believe that no country at any time or under any circumstances can make a decision to spend collectively more than 25 per cent of the national income without incurring insuperable monetary problems.

If high taxes, as such, are inflationary, they would have this effect mainly because they impair incentives (and thus output) or because they exert a direct upward pressure upon prices. We have considered the matter of incentives in the previous section of this article. With regard to the upward pressure on prices, we confront first the question of the incidence of various taxes. This is too large an order to examine in detail here, but it will suffice to say that there is very little support for the view that all taxes are passed on to consumers. And even if they were, their effect on prices need not be one of permanent upward pressure. Thus it is the acceleration of taxes (or, more properly, of expenditures) that causes the trouble. The high level, as such, is not the problem.

ADMINISTRATION AFFECTED BY TAX RATE?

It can be argued that taxes—at least specific taxes—have reached so high a level that they cannot be administered with tolerable effectiveness. There can be no doubt that high taxes, whatever may be their effect on other incentives, do sharpen the incentive to avoid and evade. M. S. Howard offered one explanation of this phenomenon as follows: "When both the taxpayers and the community consider the rates of tax fair, the taxpayers find two formidable obstacles to their circumventing the tax: (a) their own conscience, and (b) the conscience or disapproval of their fellows." He adds that "the state should never throw away these two powerful assets by imposing excessive rates." [6]

No one will deny, of course, that this line of thought has some validity. It would be happier for administration if taxes need not be so high. But it may be doubted if present administrative difficulties are in any sense prohibitive. It should be recalled that we are very far from exhausting the available remedies for weak administration. The Bureau of Internal Revenue is now getting the reorganization which has been long overdue. The Revenue Act of 1951 extended information at the source to cover all dividends paid by corporations. It might have gone further to apply withholding to dividend and interest payments. The Bureau, at long last, is embarked upon a research program to determine by intensive auditing of a sample of returns how large the enforcement problem is and where it can apply its resources most effectively. The Bureau is, and always has been, inadequately manned. Study of 1948 returns indicates that the Bureau has the personnel to examine only one quarter of the returns that are in error.[7] Moreover, the data show that even in working the small returns, where recovery of taxes is least, an auditor can earn $9,400 per year, well above the salary required to enlist him.

Moreover, it is in the area where taxes are lowest that administrative problems are greatest. The returns of farmers, small businessmen, and professional men are particularly difficult to check for accuracy. It is true that the average size of error increases sharply with the size of the return, but the percentage of error (to tax liability) decreases as one goes up the brackets. The large returns, according to the Bureau, pay sufficiently well to warrant regular processing. As rates increase, the margin of profitability, presumably, is pushed downward. And it is yet to be demonstrated that we could not afford to audit all returns as thoroughly as the Bureau has worked its samples. Certainly we cannot conclude that the income tax at present levels is incapable of administration until we have made a decent effort to administer it.

Bad administration could constitute adequate reason for convicting present tax levels on either of two grounds: (1) that administration is so weakened by high rates that more could be collected with low rates; or (2) that the inadequacies of collection seriously undermine the equity of the tax. As to the first, such evidence as we have of the quantity of error indicates no such amounts as to suggest a point of diminishing returns. The second is a much more serious problem. An income tax, which in theory is a highly equitable tax instrument, can become a most capricious affair if the administration is riddled with holes. But again, the situation calls for closing the holes rather than acknowledging defeat on the score of administration.

CONCLUSION

Reviewing the argument concerning the specific grounds on which it might be concluded that taxes are too high, we come out with a largely negative answer. On the matter of incentive, it is hard to believe that any disinterested appraisal of the evidence can lend support to the view that taxes are seriously impairing our economic effort. Corporation taxation, where political protection is small, does indeed seem to have been pushed to the practical limit.

But personal taxes and excises are quite another matter. Here the levies in the lower and middle lower brackets are still modest compared with those in some European countries that have made a very impressive postwar recovery. Our excises are also low compared with many; the Canadian cigarette tax is twice ours (taking account of state additions), and the British tax is nearly four times as high. Our per capita net income—more than half again as high as that of any other nation—would enable us to raise much higher taxes without incurring as high a real burden as that of our allies. This is not to deny that all taxes do weaken incentives nor to argue that incentive aspects of taxation need be of no concern. But it is to say that in the case of most federal taxes, the limits are much more political than economic. The political nerve is much the more sensitive of the two.

As to the inflationary aspect of high taxes, we have suggested that the root of the trouble is in the acceleration of expenditures in time of full employment. There probably are cases where taxes are more inflationary than borrowing, but they are rare.

High taxes are difficult to administer, but we should use up our reserve administrative powers before we conclude that we are stopped in this direction.

Taxes are too high only in the sense that they are extremely painful to pay.

Harold M. Groves, Ph.D., Madison, Wisconsin, is professor of economics at the University of Wisconsin. He has been a member of the Wisconsin Assembly (1930–31), the Wisconsin Tax Commission (1931–32), and the Wisconsin Senate (1934–36). He has served also on the Committee on Intergovernmental Fiscal Relations, U. S. Treasury (1941–42) and on the research staff of the Commission for Economic Development (1943–44). He is a director of the National Bureau of Economic Research. Take-Home Pay and Levels of Living

By EWAN CLAGUE

IN times of business depression, the attention of the average man and his family is firmly fixed on the dangers of unemployment and destitution. The emphasis is on job protection and social security. During the long depression of the 1930's, these issues began to assume paramount importance in public policy, and far-reaching new social programs were adopted as a result.

CHARACTERISTICS OF PROSPERITY

In times of business prosperity, the picture is reversed. Jobs are plentiful, prices are rising, wages are increasing, and security becomes secondary to opportunity. For more than ten years now, the American economy has enjoyed sustained prosperity and comparatively full employment. Minor recessions, such as those of 1945–46 and 1949, have been scarcely more than surface waves on a deep sea. In addition, the normal characteristics of a peacetime business boom have been intensified by the requirements of war and mobilization. The productive capacity of the American economy under forced draft has proved to be tremendous; yet there has scarcely been a time during this period when there were not serious shortages of one kind or another.

People in general have not yet forgotten the meaning of depression. For millions of adult Americans it remains as a memory of a horrible economic nightmare. Even the young workers coming to maturity remember their experiences as children in the families of the unemployed. It would take another decade to rear a new generation of workers with no experience and no memories of what depression and unemployment can mean.

At the same time, the problems and experiences of prosperity are now impressing themselves firmly upon the minds of working people in general. Jobs are plentiful and easy to get. Labor turnover statistics emphasize the freedom which workers feel to quit their jobs voluntarily and seek better ones at higher wages. Wages and salaries are increased from time to time. From the point of view of an unemployed worker in the depressed 1930's, the nation's economy of 1952 would seem like the millennium.

For example, in 1934–36 the Bureau of Labor Statistics made studies of the family expenditures of some 12,000 families of wage earners and lower-salaried clerical workers. The income of the average family at that time was about $1,500. A similar survey made by the Bureau for 1950 showed that the income of the average family was approximately $4,000. In neither case were unemployed families included. In 1934–36 unemployment averaged about 20 per cent of the nation's labor force, while in 1950 it was less than 5 per cent.

However, to the average American family in 1952 this is not the way it looks; something is missing. The answer is, of course, that high wages and full employment have been only partially translated into higher levels of living.

Let us take as an illustration the average weekly earnings of production employees in manufacturing industries as compared to the Consumers' Price Index of the Bureau of Labor Statistics.

TABLE 1—AVERAGE WEEKLY EARNINGS COMPARED TO CONSUMERS' PRICE INDEX

Date	Average weekly earnings in all manufacturing		Consumers' price index (1939 = 100)
	Amount	Index (1939 = 100)	
August 1939	$23.77	99.6	99.2
January 1941	26.64	111.7	101.4
January 1943	40.62	170.2	121.5
January 1945	47.50	199.1	128.1
November 1945	40.77	170.9	130.3
September 1948	55.16	231.2	176.3
June 1950	58.85	246.6	171.2
May 1952	66.32	278.0	190.1

Table 1 brings out the fact that the manufacturing worker's real wages have increased. In May 1952 his earnings index was 278 when the price index was 190, a differential of 88 points. At the wartime peak in January 1945, his earnings represented a potential increase in real buying power of over 50 per cent as compared to prewar. However, his actual level of living did not rise to anything like this extent. The reason, of course, was that large amounts of this purchasing power were set aside for war purposes. Higher taxes and voluntary purchase of war bonds drained off a considerable portion of this purchasing power at the source; rationing restricted the purchases of American families even beyond the purchasing power they had left. This was all clearly understood by the public, although there were some vigorous wage disputes during the war period.

It was after the brief flurry of reconversion that the wage earners and others began to reach for the fruits of their high wages and high incomes. Unfortunately, the shortages created by world war could not be made up in a few months, so when controls were removed in 1946, the effort to convert current income and wartime savings into refrigerators, washing machines, automobiles, and other consumer goods brought mostly higher prices. At the peak of prices in September 1948, the purchasing power of the wage earner's weekly dollar was no higher than it had been at the end of the war.

But two full years of peacetime production had created a flood of consumer goods, and in 1949, when output finally caught up with demand, the purchasing power of the wage earner's dollar increased—the level of living really began to rise. This rise would surely have gone on during the business prosperity of 1950 had normal peacetime conditions continued. But the Korean crisis brought about new mobilization requirements, and so once more, as in the early days of World War II, large amounts of labor and materials had to be diverted to war production. With memories of wartime shortages in their minds, consumers rushed to buy goods during the second half of 1950, and succeeded only in raising prices about 10 per cent. In an effort to limit the rise in the cost of living, government controls were instituted in January 1951. But about the same time taxes were increased, so during the past year and a half there has been little change in current real income.

PUBLIC BEWILDERMENT

Thus, in summary, the average factory worker in 1952 is far ahead, from an economic point of view, of where he stood in 1939. He has a better job, a higher income, and a higher level of living; but it is not as much higher as he thought it was going to be when he got his last raise. To him, money is constant in value and is the true standard of measurement. It is only the sophisticated student of social sciences that gauges the purchasing power of the dollar itself with a coldly calculating eye. And even in an economist's family, a salary increase seems at first blush to be a gain in purchasing power which should somehow be translatable into better living conditions. Practically everyone confidently expects a rising income to be reflected soon in a higher level of living. It is only on second thought, and after some experience in the markets, that one realizes how relative all things are. The small salary increase may turn out to be a loss, because others gained more and can buy more.

So the plentiful jobs and the rising incomes make promises which are not fully delivered in the market place. During the war, this was accepted and understood; in the inflation of 1946–48, it definitely was not understood; and now in 1952, the American worker is not sure what, if any, sacrifice is required in the goods he can buy.

Public understanding is clouded by further complications in this whole subject of consumer buying power. At the present time, perhaps 3,500,000 workers in this country have their wages or salaries changed every three months in accordance with changes in the Consumers' Price Index. Other millions of workers and salary earners are affected by general wage stabilization policies which are related in part to the behavior of the Consumers' Price Index. So there is probably no single statistical figure in the country that is more widely known or more closely watched than the Consumers' Price Index. The average citizen knows that it is about 190, even though he may not always know exactly what 190 means. He gauges its fluctuations with his own experiences in buying, and at times it seems to him to be out of accord. What is the matter?

The fact is that the Consumers' Price Index, like the average man, is itself an average. It is designed to represent all the multitude of expenses that the average family incurs. The index represents the average of such price changes. But, of course, some commodities and services have risen much more than others. For convenience, the Bureau of Labor Statistics classifies family purchases into six main groups. Thus, at a recent date when the index was 189.0 (1935–39 = 100), the figures for the major groups were as shown in Table 2.

TABLE 2—CLASSIFICATION OF FAMILY PURCHASES

Foods	230.8
House furnishings	205.4
Apparel	202.3
Miscellaneous	171.4
Fuel, electricity, and refrigeration	144.6
Rent	141.3

First, note that the food group has risen far higher than any other group. Food prices make a strong impression on the consumer's mind, partly because food costs make up about one-third of the average family's budget, and partly because most food purchasing is by the week, so the cost of food is forced upon the consumer's attention regularly and frequently.

Furthermore, among the foods, meats —with an index of nearly 272—have risen more than the average. Beef and veal are at 311 and fish at 345. Chicken at 175 is better priced from the consumer's point of view. However, any family which eats meat regularly is convinced that this part of the cost of living has tripled.

Fresh fruits and vegetables are another item that attracts consumers' attention with high prices. The index for this group was recently 283. Canned fruits and vegetables at 164 are much lower priced, but they cannot compete in public attention with the prices of potatoes, tomatoes, cabbage, and beans.

At the other extreme, the rent index is only 141, so many families can make savings on this item of expenditure.

However, rent controls do not exist throughout the country, and in some cities where they have been removed, the rent index is over 200. In addition, even where rent controls exist, many families are not able to find apartments and houses for rent, so this is a cause of dissatisfaction. Finally, rent is paid once a month, so the advantage of low rent does not offset in the consumer's mind the disadvantage of high prices for food which is bought almost every day.

THE UNAVERAGE FAMILIES

Just as the Consumers' Price Index represents an average of price changes covering a wide diversity of prices, so, too, the income of the average family does not reflect the situation of all families. In addition to families with incomes of $4,000 a year, there are others with $2,000 and $10,000 and, of course, beyond these in both directions. In general, the higher the income of the family, the lower the proportion of the family budget which is spent for food. This is because food is a necessity which must come first. Automobiles, refrigerators, and other household appliances come after food.

Now it is clear from Table 2 that the pressure of food prices on the family budget is much more severe among low income families. Such families are not only more acutely conscious of the rise in the cost of living, but they are in fact actually squeezed more than the average family by high food prices. It is true that many of these families may have been among the unemployed in time of depression, and may have subsisted for years on a Work Projects Administration budget. But now they have jobs at good wages, and at the same time they are strongly affected by the high cost of living.

This group should theoretically be offset by a higher income group which should be getting some of the advantages of higher income, namely, less expenditure on food and more money for the amenities of life. In actual fact, this is the situation even of the average family. When the Bureau of Labor Statistics made its family expenditure studies in 1934–36, the weight of the miscellaneous group in the total family budget was only about 22 per cent—less than one-fourth. The postwar studies during the last few years show that this group has risen in importance until it comprises fully one-third of the family budget. In this group is included a wide variety of items such as personal care, amusements, transportation (including automobiles), television and radio sets, and medical and hospital care. The expansion of these expenditures reflects a rising income and a higher standard of living. Is not the average family, then, better off than it was before?

FUTURE INCOME MORTGAGED

In one sense the answer is, "Certainly yes." The number of automobiles registered in the United States, the number of television sets bought in recent years, the purchase of medical care on an ever larger scale—all these are clear evidence of the fact that these families are using their incomes to raise their standards. Yet this does not prevent many of these families from feeling pinched in their budgets. The purchase of a car or a television set represents a heavy capital expenditure for the average family. Most of these things are bought on the installment plan, with monthly payments running over extended periods of time. While installment selling enables the purchaser to have his commodity immediately, it also commits him to future payments which reduce his remaining disposable income. Hence the family budget is squeezed, even with a higher income.

A short spell of unemployment or a rise in current expenditures can throw the family budget out of balance and make the family feel poor. It is this factor that makes many higher income families feel that their income is not adequate to cover the cost of living.

There is no doubt that the system of installment selling has had a tremendous influence in raising the American family's standard of living, and in bringing pressure for higher incomes to meet that standard. By contrast, in some western European countries, such installment selling is unknown. The family has to save its money until it has sufficient funds to pay cash for the costly items in the budget. Statistics of sales of consumer durables in such countries show what a marked effect this has on consumer buying.

In fact, one can imagine what the effect in the United States would be if each family had to save $2,000 to buy a car or $300 to buy a television set. Some families probably would never have the will to save such amounts in anticipation of a major purchase. Others would certainly require a long period of time to save such an amount. And finally, by the time it was obtained, the family might have acquired such saving habits that it would not go through with the planned expenditure. These are factors which seem to be present in the psychology and the practice of European families.

The ease with which an American family can achieve a new level of living by mortgaging future income has undoubtedly served to quicken the rise in the American standard. It helps to convert wage and salary increases into immediate improvements in living conditions. The result is a strong pressure of expenditures on income. This system also causes a rise in the standard to spread quickly throughout the American economy. Television was unknown in 1939; it was unique in 1946; it is commonplace in 1952. Without installment selling, it could never have acquired such status in the average family budget. At the same time, this expansion produces an urge for higher income in order to balance that budget.

THOSE WHO LAG BEHIND

No mention of averages and divergencies would be complete without some reference to the classes and groups of people who have not kept pace with the procession, either in income or in expenditures. It is quite clear that a family which does not have approximately double its 1939 income has not gained much in its level of living during the past decade. Yet there are many groups in the population which have not achieved this. There is no need to elaborate this point, and it is sometimes difficult to define exactly the groups which are behind.

Curiously enough, some of the least skilled and lowest-paid workers—such as domestic servants and farm laborers—have done better in wage increases than the average worker. There is nothing abnormal about this. These are the groups which suffer most from unemployment and low wages in depression periods. Their gains are proportionately greater in times of good employment. Yet they may still be, in absolute terms, somewhat low in the income scale. In general, under conditions that have existed in this country during the past ten years, there has been a definite telescoping in the range of incomes, with the lower incomes crowding closer to the higher ones.

It is the white-collar workers' families, such as teachers, clerks, and various other types of middle-class occupations, that have been losing out relatively. Some of them may have actually suffered declines in their level of living. Also (while this has nothing

to do with the problem of the take-home pay of wage earners), there are large groups of people living on pensions, public assistance, annuities, and dividends, whose level of living is steadily falling under rising costs.

EFFECTS OF TAXES

There is another item which vitally affects the average American family; that is taxes. The Bureau of Labor Statistics, in constructing the Consumers' Price Index, follows the practice of pricing articles at retail with sales and excise taxes included. A package of cigarettes in a certain city would be priced at 22 cents, not 14 cents, or whatever it might be if all such taxes were excluded.

One reason for this practice is the difficulty of actually segregating the taxes which are imposed in the process of manufacture and distribution, although this technical difficulty might be overcome with some statistical effort. The Bureau has made a study in one city to find out how important all such sales and excise taxes are in the price index for that city. However, apart from these technical questions, there is a simple, logical reason for including such taxes in the index. Commodities or services on which taxes are specifically laid cannot be obtained at all without the payment of the tax. The consumer would not recognize the price of cigarettes without taxes, nor could he obtain them at the price so calculated.

This practice of the Bureau was approved by the Steed Subcommittee of the House of Representatives Education and Labor Committee, which studied the Consumers' Price Index in the spring and summer of 1951. Thus, to some extent, changing taxes are reflected in the Consumers' Price Index, and their influence on family budgets is reflected in the preceding analysis.

However, direct income and withholding taxes are not included in the Consumers' Price Index, but are considered as a deduction from income. This is in fact the situation of the average family, since the bulk of these taxes are withheld at the source. Furthermore, such taxes are not attached to any particular goods or services. And finally, such taxes fall unevenly on families of various incomes and sizes. A single worker without dependents is in a very different situation from one with five or six dependents. A low income worker is affected less by changes in income taxes than one with higher income. So, for all these reasons, it is more logical to treat income taxes as a subtraction from wage and salary incomes.

TABLE 3—GROSS AND NET AVERAGE WEEKLY EARNINGS

Year	Gross average weekly earnings	Net spendable average weekly earnings			
		Worker with no dependents		Worker with 3 dependents	
		Current dollars	1939 dollars	Current dollars	1939 dollars
1939	$23.86	$23.58	$23.58	$23.62	$23.62
1941	29.58	28.05	26.51	29.28	27.67
1944	46.08	38.29	30.28	44.06	34.84
1946	43.82	37.72	26.88	43.20	30.78
1948	54.14	47.43	27.43	53.17	30.75
1951	64.88	54.18	29.02	61.41	32.89

TABLE 4—ANNUAL COST OF LIVING FOR A FOUR-PERSON FAMILY

Date	Washington, D. C.			New Orleans, La.		
	Total cost of budget	Cost of goods and services alone	Difference	Total cost of budget	Cost of goods and services alone	Difference
June 1947	$3,546	$3,180	$366	$3,092	$2,806	$286
October 1949	3,773	3,467	306	3,295	3,064	231
October 1951	4,454	3,965	489	3,812	3,441	371

For a number of years, the Bureau of Labor Statistics has prepared statistics on this point. Table 3 shows the gross average weekly earnings of production workers in manufacturing industries and the net spendable average weekly earnings, first for a worker with no dependents, and second for a worker with three dependents.

What this demonstrates is that the worker with no dependents has come out after a dozen years at a relatively different position from that of the worker with three dependents. Note that in 1939 there was an insignificant difference (only 4 cents per week) between the two workers. In 1951, a gross average weekly earning of $64.88 would result in take-home pay of $54.18 for the worker with no dependents and $61.41 for the worker with three dependents—a difference of over $7.00 per week. When converted into 1939 dollars, this differential amounts to nearly $4 a week. The gain over 1939 in real net spendable earnings is substantially greater for the worker with dependents than for the worker with none.

THE COST OF LIVING

Another type of comparison is that involved in the City Worker's Family Budget prepared by the Bureau of Labor Statistics. This is the annual cost of a "modest but adequate" level of living for a four-person urban family in each of thirty-four large cities. The budget shows the cost of goods and services, as well as the total for all costs, including personal taxes, social security deductions, life insurance, and occupational expenses. This type of budget was undertaken by the Bureau at the request of the House of Representatives Appropriations Committee in 1945, and was first prepared for the two periods, March 1946 and June 1947. Later pricings of this budget were obtained in October of each of the last three years —1949, 1950, and 1951. Among the cities of the country, Washington, D.C., has usually showed the highest cost, while New Orleans, Louisiana, has always been the lowest. A comparison of the costs in these two cities is shown in Table 4.

No prewar comparisons are possible, since no such budget is available for those years. However, it is of interest to note that for this particular type of family, it required an income of $3,546 in Washington, D.C., in June 1947 to cover not only the $3,180 needed for the goods and services in the budget, but also the $366 for state, federal, or local income taxes, social security deductions, minimum life insurance, and occupational expenses. Tax reductions by October 1949 had brought down these latter costs to $306, but by October 1951 they had increased to $489. Some part (but not all) of the rise was due to tax increases since the outbreak in Korea. The figures for New Orleans show similar trends.

The significance of this budget for our discussion here is that it emphasizes the diversity in living costs in different parts of the country, and also shows the importance of some of the factors which affect the level of living which are not directly related to the purchase of goods and services.

This type of budget should not be compared with average incomes, because the particular type of family—man, wife, and two children ages 13 and 8—is not exactly average for the American people. In several places it has been possible to compare the incomes of this type of family with the budget estimates shown here. In all such cases, something like two-thirds of these families had actual incomes in excess of this budget, while an additional proportion had incomes not far below it. Nevertheless, there was a minority of families of this type which had incomes sufficiently far below this budget to indicate a failure to sustain this minimum standard of living.

WHERE WE ARE TODAY

On the whole, it is clear that the wages and salaries of the average American worker have risen more during the last ten years than the cost of living. This is true even when income taxes and other types of income deductions are included in the calculations. There is also unmistakable evidence that the level of living of the average family in the United States has risen significantly during the past ten years. The level in the United States today is higher than it has ever been before, even though we are in the midst of a rearmament program. Thus far, at least, the American people have been able to have both guns and butter.

But at the same time, there are classes, groups, and segments of the population which have not shared equally in this general advance. Some indeed have lost ground; others have gained something, but have lost in relative position. These dissatisfied elements are sufficient to make up a comparatively large minority who have some reason to question the gains of the past decade. The fact that they see others getting ahead of them only intensifies their dissatisfaction and their sense of unequal treatment.

These lagging groups will eventually be in a better position. Some of the lag is due to the slowness with which certain types of wages and salaries move—in federal, state, and local governments, for example. Compare the frequent and precise adjustment of wages to the Consumers' Price Index in some collective bargaining contracts with the more cautious and infrequent adjustments made by certain state and local governments. Furthermore, most collective bargaining agreements of this kind include a factor for productivity and the rising standard of living, whereas no governmental legislation makes any such provision. And the great majority of governmental bodies—federal, state, or local—have no automatic provision at all for salary increases. Nevertheless, such salaries are eventually adjusted upward and will be so again. So time may bring about some amelioration in the incomes and the living conditions of the lagging groups.

EFFECTS OF POSSIBLE BUSINESS DECLINE

What is the import of all this for the future? The expanding American economy has created and sustained rising standards and levels of living for American families. They have met new standards to some extent through installment buying and consumer credit which have mortgaged future incomes. A sharp contraction in the economy sufficient to produce a considerable volume of unemployment and part-time work would have serious consequences for the American consumer. With his income partially mortgaged for past purchases, any reduction in earnings would hit his current expenditures. The effect would be to put a tight squeeze on the family's budget. Two things would happen immediately. First, the consumer would be compelled to cut his current purchases, and all types of business dependent on those would find their markets sharply reduced. Second, many consumers, faced with the hazards of possible unemployment, would try to increase their savings, and would thus further reduce the demand for current production. The effect would be to make the consumer, more than ever before, a factor in the business cycle.

It would not take long, however, for the worker and his family to become deeply and vitally concerned about proposals for maintaining employment and earnings. The pressure to prevent a business readjustment from proceeding very far would be very great. The depression of the 1930's has already produced many protective devices—unemployment insurance, guarantee of bank deposits, and others—designed to provide some security against these hazards. However, these would not in themselves reverse the economic forces of declining employment, once the latter got well under way. Hence, there would almost surely arise an insistent demand for new policies and concrete measures for preventing a depression. The fears of the American worker have been allayed by a decade of prosperity, but they will be easily and surely aroused by any substantial decline in business. This is a factor which any future administration in power in Washington will have to take into account.

Ewan Clague, Ph.D., Washington, D.C., is Commissioner of Labor Statistics, United States Department of Labor. For ten years he was associated with the Social Security Board, holding the position of Director of the Bureau of Employment Security, 1940–46. He has served as professor and Director of Research and Statistics at the Pennsylvania School of Social Work, and as research assistant with the Yale Institute of Human Relations and with the Metropolitan Life Insurance Company. He is author of Charitable Trusts (1935) and co-author of Ten Thousand Out of Work (1933) and After the Shutdown (1934).

Labor and the Distribution of the National Income

By Gordon S. Watkins

ELECTIONS, whether presidential or congressional, revive office seekers' interest in the economic status of the laboring population in general, and in labor's share of the national wealth and income in particular. The reason for this solicitude is clear: the workers are not likely to be responsive to the appeals of any political party or candidate unless, in pre-election platforms and speeches at least, there is expressed a serious concern for the well-being of the wage-earning class. How the national income is being distributed and what factors determine the division of its shares among the various agents of production, subjects which are of perennial interest to the economist, thus become problems of immediate concern.

In discussions of the problems of our national economy one invariably discovers a more compelling interest in the distribution of wealth and income than in production and consumption. This is quite understandable. In the first place, there is a quite general conviction that the United States, with its phenomenal scientific and technological discoveries and inventions, has to a considerable extent solved its problems of production, and that developments in the science of psychology have given us adequate answers concerning the motives that govern the behavior of consumers. Secondly, the problem of distribution continues to be something of a terra incognita which the economist has not yet explored with sufficient success to warrant any degree of certainty as to exactly what and how income shares are determined.

Distribution—Theory and Fact

In their analyses of the distribution of wealth and income, economists have devoted their principal attention to the determinative forces that are responsible for the division of shares among the several factors of production—land, labor, capital, and the entrepreneur. In recent years there has been a tendency to shift the emphasis in this analysis away from the refinements of the distributive process to causal relationships between levels of consumption and the increase of the national income, and the influence of private investments and public spending on the stability of the economy.[1] However, the division of the national income in the form of rent, wages, interest, and profits continues to be the central problem in economic analysis. This is because the income of every individual in the national economy consists of one or more of these payments. This area of "functional distribution" always constitutes an intellectual challenge to the economist.

On the other hand, "personal distribution," which commands the interest of economic and social statisticians and provides such abundant grist for the reformer's mill, is the problem with which labor is most vitally concerned. This is because personal distribution has to do with the division of the national income among individuals and family units. Statistics rather than economics is the instrument of analysis here. Apportionment is measured quantitatively to indicate the relative income status of classified groups and individuals.

[1] See L. Reed Tripp, "Labor's Share in the National Income," The Annals, Vol. 274, March 1951, pp. 47–56.

The question frequently is asked: Why, in view of our miraculously enhanced productive capacity, does the problem of distribution claim so much attention from economists and statisticians? The answer is, of course, that even in the most advanced and efficient economies, the output of commodities and services is inadequate to satisfy all the wants of the entire population. Shares must therefore be apportioned, either by arbitrary social control, as in collectivistic societies, or by natural forces, as presumably they are in purely competitive economic systems. There is nothing to which individuals and groups are more keenly sensitive than the failure of the distributive process, whatever its nature, to provide complete satisfaction of their desires. Consequently, there is persistent inquiry as to why some toil so much and receive so little, while others toil so little or not at all and receive so much. This dissatisfaction manifests itself in social reform movements designed to secure a redistribution of wealth and income, and perennially appears in election campaigns.

Acceptable Formula of Distribution Lacking

Despite the confidence of social reformers in the practicability of dividing the national income equitably, the most impartial and objective plan of apportionment of income shares would in all probability fail, partly because of the persistent factor of scarcity, and partly because of the absence of a generally acceptable and workable formula of equitable distribution. Thus far, neither economists nor moralists, much less social reformers, have been able to construct a set of distributive criteria acceptable to everybody or even fulfilling the rudimentary requirements of justice and providing simultaneously the necessary stimulus to economic effort. Divergent in the extreme are the formulas suggested. Some would apportion income according to contributive effort, others on the basis of equality, and still others according to individual and family needs.

Any arbitrary apportionment of income shares according to the criteria of equality or needs does violence to the fundamental principles of economic philosophy based on a belief in the adequacy of competitive forces, functioning under the aegis of natural law, as the final determinants of distribution. Economists generally believe that rent, wages, interest, and profits are best left to the arbitrament of the free market in which buyers and sellers, motivated by self-interest, decide what is the value, and consequently the just share, of each productive factor. The forces of marginal utility and marginal productivity, bringing to focus the interacting influences of demand, supply, and price, determine income shares according to the essential requirements of equity and incentive. As far as labor is concerned, economists have not yet successfully related theory to fact in this domain of distribution.

Labor's Basically Practical Interest

Theories of distribution not only are generally unintelligible to the leaders and the rank and file of the laboring population, but command little attention from them. Labor's view concerning the division of the national income is predominantly practical. This fact does not, of course, invalidate theoretical income analysis, but it is relevant to any discussion of the practical problem of

distribution. Labor's interest is realistic and pragmatic; it is concerned with *more here and now*. Higher wages, fewer hours of work, improved physical conditions of employment, and numerous other items that enter into collective bargaining negotiations are the center of attention. Group interest dominates labor's approach to the distribution of national product and national income. Even if they were interested in the intricacies of distributive theory, the workers would hardly accept the conclusion that natural law, functioning independently of the free will of men, determines their wages.

Viewed historically, the gains of labor have been the result of varied forces: the enlightened policies of progressive employers, increasing productivity resulting from science and invention, the sympathetic intervention of friendly governments, labor legislation, and, above all, effective collective bargaining implemented through strong unionism. What has been appropriately described as "business unionism" has constituted a notable influence in labor's increasingly large share of the national income of the United States.[2] Collective bargaining is described by labor leaders as a "never ending struggle to make human progress"; but viewed more objectively, labor's interest is group-centered rather than broadly socially centered.

Specifically, labor's interest in the distribution of the national income is articulated through demands for higher wages, fewer hours of work at the same or increased pay, improved job environment, and a seemingly inexhaustible list of so-called "fringe benefits." The last-named include such gains as seniority rights, time and half for overtime, double time for Sundays and holidays, cost-of-living escalator clauses in trade agreements, graveyard and night shift premium pay, paid vacations, company-financed pensions and health programs, with hospital and medical care, and a guaranteed annual wage. This is accurately described as labor's "progressive and dynamic program."[3]

Labor's "dynamic wage policy," designed especially to procure for the workers an increasing share of the annual national income, stems partly from the belief that the relationship between wages, prices, and profits is in a state of imbalance. Consequently, correction is believed to consist in the continual increase of real wages which yield for the workers a larger share. Automatic wage adjustments to keep pace with increasing productivity are viewed as indispensable. The guaranteed annual wage, which is destined to become an increasingly general demand by organized labor, is looked upon as a means of assuring full and sustained employment, as well as of achieving the desired measure of economic justice and stability. Such a wage, it is believed, will contribute much to production planning, thus enhancing the shares of both industry and labor.

Collective bargaining is thus seen as a means to diversified ends, all of which are translated into terms of a more equitable division of the national income and ultimately expressed in a progressively higher standard of living for workers and their families. Political action, as we shall see later, is a major ally with economic action in the attainment of these objectives.

A Revolutionary Trend

When one turns from the more general considerations of the distribution of the national income to the specific facts of America's increasing productivity and its effect on distributive shares, some extremely interesting data come to light which may have great significance for management and labor, as for the owners of capital and land. In this connection the following comment is pertinent:

> . . . few Americans and still fewer Europeans are aware of the transformation in the distribution of our national income that has occurred within the past twenty years—a transformation that has been carried out peacefully and gradually, but which may already be counted as one of the great social revolutions of history.[4]

In the recent economic growth of the United States, which has surpassed the increase in population, the central facts indicate an extraordinary increase in productivity per worker and a significant rise in real income per capita between 1929 and 1950. The population increased by one-fourth, from 122 million in 1929 to 152 million in 1950, and the number of gainfully employed persons increased in similar proportion. The gross national product amounted to $283 billion in 1950, as compared with $104 billion in 1929, a change which, of course, reflected the combined influence on current market value of a greatly increased volume of output and a considerably higher price level.[5] Because of the inflation incident to World War II and postwar economic activity, the general level of prices in 1950 was more than 50 per cent above that for 1929. But even allowing for this factor, the physical volume of national output, as measured by the gross national product in constant dollars, rose 80 per cent over the twenty-two year period. In terms of real output per capita the increase was 44 per cent, and the annual rate of expansion was in excess of 2.75 per cent.

The national income rose from $87 billion in 1929 to $239 billion in 1950, an increase of 175 per cent. Here, too, the rise reflected not only expansion of physical volume of production, but also the sharp rise in prices prevailing in 1950.

Shares of Productive Agents in National Income

The compensation of employees in private industries registered a rise from $45.5 billion in 1929 to $130 billion in 1950, or from 55 to 60 per cent of the total national income. In prosperous peacetime years employee compensation represented over three-fifths of the total income originating in regular business entreprises, but only a minor fraction of the total from rent (excluding that represented by owner-occupied homes) and interest.

Of considerable importance is the fact that there was an internal shift in the compensation of employees to a somewhat lower proportion of wages and salaries and to a higher proportion in the form of supplements to wages and salaries. This doubtless was a result of organized labor's successful demands for "fringe benefits." These supplements were an inconsequential element in 1929, consisting chiefly of accident compensation. The growth to a significant proportion (nearly 3 per cent of private national income in 1950) is attributable to various social insurance programs and

[2] See Robert Franklin Hoxie, *Trade Unionism in the United States* (New York: D. Appleton and Company, 1917), Ch. III.

[3] For an analysis of this program, see Walter P. Reuther, "Practical Aims and Purposes of American Labor," THE ANNALS, Vol. 274, March 1951, pp. 64–74.

[4] Arthur F. Burns, "Looking Forward," National Bureau of Economic Research, *Thirty-first Annual Report*, New York, 1951, pp. 3–4. Supporting evidence for this optimisttic view is found in Simon Kuznets, *Shares of Upper Income Groups in Income and Savings* (in press), National Bureau of Economic Research, New York, 1952.

[5] The data presented here are from the U. S. Department of Commerce, Office of Business Economics, *National Income and Product of the United States, 1929–1950*, Government Printing Office, Washington, D.C., 1951.

to the marked growth in recent years of private pension and welfare funds. Employers' contributions to these funds, both public and private, are viewed as supplementary compensation to employees.[6] The current trend in union demands clearly indicates that such supplementary payments are likely to increase substantially in the future.

There may be considerable social importance in the fact that the percentage of income taken by profits and interest together was not significantly higher in 1950 than in 1929. The combined share manifested remarkable uniformity throughout the period. Corporate profits increased from $10.5 billion in 1929 to $36 billion in 1950, or from 12.5 per cent to nearly 17 per cent of the national income; but to a considerable extent this increase reflected the greatly reduced burden of corporate debt and did not reveal a commensurate expansion of the property share of current income. In combination, profits and interest originating in corporate business rose in this period by only half as much as profits alone in relation to total private national income.[7]

The distributive share of net interest was the only one to show absolute decline from 1929 to 1950. It fell from $6.5 billion, or 8 per cent of private national income, to $5.5 billion, or 2.5 per cent. This drastic change was attributed chiefly to a nearly 50 per cent reduction in interest rates and the relatively small expansion of private debt.

Rental income showed a sharp proportionate decline over the twenty-two year period under consideration. The $5.75 billion paid to persons in this form in 1929 constituted 7 per cent of private national income, while the $8 billion received in 1950 represented about half that much, percentagewise.[8]

[6] *National Income and Product of the United States, op. cit.* note 5, p. 7.

[7] *Ibid.*, p. 8.

Expansion of Personal and Family Income

The increase in personal income showed a favorable advance in the period 1929–50, the total in the former year being $85 billion and in the latter $225 billion. On a per capita basis, the total increase was from $700 to $1,480, or more than 100 per cent. Even per capita real personal income was 50 per cent higher in 1950 than in 1929, the figure for 1929 being $699 and for 1950 (in 1929 prices) $1,053. However, because of higher taxes in 1950, per capita real disposable income was only 41 per cent above that in 1929, the exact figures being $677 for 1929 and $957 (1929 prices) in 1950. After deducting taxes, there remained disposable personal income of $204 billion in 1950, as compared with $82.5 billion in 1929, or, on a per capita basis, approximately $1,350 in 1950 as compared with $680 in 1929. With consumer prices averaging about 41 per cent higher in 1950 than in 1929, the increase in real disposable income per capita was thus about 40 per cent.[9]

Available information on the incomes of families in the United States indicates some interesting changes since 1939. In 1939, the median wage or salary income of primary families was $1,200. In 1944 this figure had doubled. With the end of World War II wage incomes leveled off, but they resumed an upward trend as the United States economy converted to postwar full employment. From $2,400 in 1944, the median rose to $2,900 in 1947, and advanced to $3,200 in 1950. Between 1939 and 1950 the wage or salary of the average employee increased greatly, from $800 to $2,100.[10]

[8] *Ibid.*, p. 7.

[9] *Ibid.*, p. 10.

In 1939 three out of four families in the United States had incomes under $2,000 a year, whereas in 1949 only one family out of three fell within this classification. The others had moved into higher income groups. Even when the rise in the cost of living is accounted for, some five million families had, by 1949, moved up out of the lower income groups into brackets with a purchasing power equivalent to the 1939 level of $2,000 or more.[11]

From the standpoint of the wage-earning class, these and other data on the shift in the distribution of the national income are a source of considerable interest and encouragement. A study completed by Professor Simon Kuznets for the National Bureau of Economic Research shows that whereas in 1929 the highest 5 per cent of the income recipients obtained 34 per cent of the total disposable income of individuals, by 1939 their share had dropped to 27 per cent, and by 1946 to 18 per cent. This was a decline of 16 points in the 17-year period. On the other hand, Professor Leo Wolman has found that straight-time hourly earnings in manufacturing in the United States show that money wage rates of factory employees rose from 22 cents to $1.44 in the period 1914 to October 1950, or more than sixfold, and that even real wages rose about threefold.[12]

Other studies reveal that during the past thirty-five-year period the share of the top 1 per cent of income receivers has shrunk from 16 per cent to 9 per cent. Similarly, the proportion of families in the lowest income brackets declined by almost two-thirds. There is an evident tendency for middle income groups to grow most, while the highest and lowest income groups are tending to shrink.

The distribution of families (including single individuals) by income groups in 1950 was as follows:

Amount in Dollars	Per cent
Under 2,000	26
2,000 to 3,000	16
3,000 to 4,000	18
4,000 to 5,000	13
5,000 to 10,000	23
Over 10,000	4

The median income in 1950 was $3,400, compared with $3,100 in 1949 and $3,120 in 1948. The mean income for these three years was $3,990, $3,750, and $4,020, respectively.[13]

The United States Department of Labor's estimate of the minimum income adequate for a decent standard of living for a family of four (worker, wife, and two children) in the United States at the end of 1951 was $4,095, inclusive of federal and social security taxes. A very large number of families have fewer than four members, and there are a great many single individuals in wage-earning and salary groups. On the basis of this fact, it has been estimated that about 85 per cent of the wage and small-salaried groups in the United States currently receive incomes adequate to provide a standard of living equivalent to the Department of Labor's *City Workers Family Budget*.[14]

LABOR'S VARIABLE SHARE AND REAL GAINS

Contrary to a common impression, there is an evident tendency for wage and salary shares of the national income to rise during depression and to fall during prosperity. All estimates clearly indicate that labor's relative share in the net national income goes up when business is bad and goes down when business is good, and further, that on the average the distributive share of the workers as a class constitutes about two-thirds of the net national income. Employees' share of the national income in 1949 absorbed about 65 per cent of the total, a ratio almost identical with that of 1939, which was 66 per cent. A decade earlier, in 1929, the share of employees accounted for 58 per cent of the national income; but in 1933, at the bottom of the Great Depression, it rose to 74 per cent of the total.

On the face of it, this seems like a strange contradiction. The evidence shows, however, that in periods of great economic activity and prosperity, the share of the national income going to businessmen in the form of profits and to other propertied agents in the form of rent and interest invariably increases, so labor obtains a relatively smaller share of the larger total product. On the other hand, in the midst of a depression, losses rather than profits characterize entrepreneurs' participation, and even rent and interest decline sharply, with the result that employees obtain a larger share of a smaller national output. As already indicated, some significant changes may be taking place in this historic pattern of distribution.

Workers in general are much more interested in the actual conditions of prosperity and depression than in relative shares of the national net income. Absolute income in terms of purchasing power, rather than proportionate division of the national product over a period of marked economic fluctuations, is the focus of labor's attention. During World War II and the postwar period of prosperity (1939–1948) the national income rose rapidly from about $72 billion in 1939 to approximately $223 billion in 1948 but there was a slight decline to $217 billion in 1949. In the same period (1939–1948) the average annual wage or salary income increased by 150 per cent, a figure reflecting both the rise in wage rates and the increased working time incident to emergency production needs. This distinction between wage rates and earnings is of basic importance in the measurement of labor's share of the national income. Increased working time and premium pay for overtime may cause workers' incomes to rise sharply, as between 1939 and 1950 when the differential due to these factors was about 40 per cent.[15]

Significant also, of course, is the distinction between money wages and real wages, the latter being defined as the purchasing power of nominal or money wages. Thus, while average weekly earnings increased 141.9 per cent in the period 1939 to May 1950, real weekly earnings, with allowance for cost-of-living changes, increased only 42.6 per cent.[16] This explains why in recent years organized labor has become increasingly interested in escalator clauses in trade agreements.

The median income of consumer spending units rose 11 per cent in 1950,

Workers' Budgets in the United States: City Families and Single Persons, 1946 and 1947, Washington, D.C., 1948.

[15] Ewan Clague, U. S. Commissioner of Labor Statistics, "Summary Statement of Wages and Salaries as a Part of the National Income" (typed paper, read before the Workshop on Economic Education, Indiana University, July 24, 1950), pp. 2–3.

[16] *Ibid.*, p. 3.

and aggregate personal income in 1951 was nearly 12 per cent above that in 1950. These gains in average money incomes represented real gains, inasmuch as they were only partially offset by 1 per cent rise in consumer prices and in the proportion of income going for federal personal income tax.

Equally important is the fact that the rise in average money income was accompanied by an increased frequency of high incomes and a reduced frequency of low incomes. The data reveal that 20 per cent of all spending units had incomes of $5,000 or more in 1950, compared with only 16 per cent in the previous year. In 1946 the proportion was only 10 per cent. Incomes of less than $2,000 declined in frequency from 40 per cent in 1946 to 33 per cent in 1949 and to 30 per cent in 1950.[17] The increase in personal income in 1951 was especially pronounced in the wage and salary sector. The result is that there has been a significant increase in the proportion of spending units having annual money incomes of $4,000 or more, which, despite some offset in prices and taxes, suggests sustained progress for working groups.

CONTRIBUTING CAUSES OF IMPROVED DISTRIBUTION

It is impossible to determine exactly what have been the most inportant contributing factors in this improved distribution of national income in the United States during recent decades. Among the major determinants one must certainly recognize the acceleration of technological improvements issuing from education, research, and invention; progressive managerial policies; increased industrial productivity due to a combination of factors; the friendly co-operation of government; full employment occasioned by war and preparation for war; and the impact of increasingly powerful labor organizations. Perhaps the most reassuring fact is that this gratifying progress has taken place within the framework of the free enterprise system, without the compulsions and regimentation of totalitarian regimes.

FUTURE PROSPECTS

Considerable pessimism prevails in the business community, as among the workers, as to whether our national economy can indefinitely sustain its capacity to provide for wage earners and other groups in the population an increasing measure of economic well-being, as was done in the period 1929–50. The dynamic quality of our economy has been amply demonstrated throughout our economic history, and there is every reason to expect that its remarkable record will be maintained or surpassed, with probable setbacks of a temporary nature due to business dislocations, recessions, and depressions.

It has been estimated that the population of the United States will increase from approximately 153 million in 1952 to a total of 175 million in 1960, and will continue this sort of growth in foreseeable decades. Also, it is estimated that, assuming continuation of the 2.5 to 3 per cent annual growth in national productivity, a net annual national product of over $400 billion (in terms of 1951 dollars) may be expected in 1960, representing an increase of over $100 billion.[18]

An increase of one-third or more in the total output of the national economy

[18] Sumner H. Slichter, "Prospects for Growth in the American Economy" (reprinted from *The Commercial and Financial Chronicle*, April 3, 1952), p. 1.

is bound to yield to American labor, as to other groups in the nation, a considerable increase in material well-being.

POLITICAL AND SOCIAL IMPLICATIONS

The dynamic quality of the American economy, reflected in the extraordinary increase in productivity and unprecedented growth of the national income, may have significant immediate and long-run political and social consequences. The immediate consequence will probably appear in the results of the 1952 Presidential election, in which labor, organized and unorganized, may play a decisive role. The more remote consequences may be revealed in the outcome of the ideological conflict between the free world and the unfree world. Our interest here is in the former result.

It is an interesting question whether a party in power in the midst of so general prosperity as is currently enjoyed in the United States is in serious danger of losing the labor vote. That vote can assume significant proportions in view of the approximately 15,000,000 unionized workers, who, with their families, constitute so large a percentage of the adult population. There are many who speak of the current economic status of the American wage earners as "an illusion of prosperity" that disregards rising prices and greatly increased taxes. If the increase in the real income of the working class in the United States during the past two decades has been an "illusion," it has been a welcome and pleasant one.

LABOR VOTES DEMOCRATIC

The direction of the labor vote is never absolutely predictable in any election, whether local, state, or national. Senator Robert M. La Follette's campaign of 1924, the John L. Lewis episode of 1940, and Senator Robert A. Taft's notable victory of 1950 are conclusive evidence of this fact. It is true that during the past two decades organized labor has consistently voted Democratic, and that it is likely to do so again in 1952; but no party can foretell with certainty the trend of the labor vote. One can, however, safely hazard a guess that, the economic situation being what it is, a significant switch in the labor vote from Democratic to Republican in 1952 is hardly to be expected. As one worker put it, "Labor never had it so good."

The contention that union officials can deliver the labor vote has little factual or experiential support. Indeed, the evidence is on the other side.[19] There is no assurance that endorsement by union officials of a particular party or candidate will swing the labor vote in a desired direction. The workers do not vote en masse in response to official union recommendations. John L. Lewis discovered this fact in 1940 when, as head of the Congress of Industrial Organizations, he sought to swing substantial labor support away from the Democratic party. Not only did he fail to defeat Mr. Roosevelt, but a post-election American Institute of Public Opinion poll indicated that of the members canvassed, fully 79 per cent had voted contrary to Lewis' advice.

A further illustration of the difficulties facing union officials who believe they can chart the direction of the labor vote is found in Senator Robert A. Taft's victory in the Ohio senatorial race of 1950. Although he was among the Senators and Congressmen whom organized labor sought eagerly to defeat, Mr. Taft, co-author of the Taft-Hartley Act which is bitterly hated by labor leaders, received a majority of 430,000

[19] See George Gallup, "How Labor Votes," THE ANNALS, Vol. 274, March 1951, pp. 123–24.

—this despite the fact that organized labor had spent a very substantial sum of money to defeat him. Altogether, the evidence indicates that American workers are quite independently minded in political matters, no matter how responsive they may be to the counsel of their leaders on the economic front.

The labor vote invariably will follow the dictates of group interest. The election of labor's friends and the defeat of labor's enemies is still a persuasive slogan among unionists. The sympathetic policy of the Democratic party, which many believe is reflected in the 1952 crisis in the steel industry, has doubtless been effective in influencing the labor vote. In 1944, for example, not fewer than 78 per cent of the members of the Congress of Industrial Organizations and 69 per cent of the American Federation of Labor voted Democratic. In 1948, both the AFL and the CIO support went almost entirely to Democratic candidates, a fact which doubtless was partly responsible for the re-election of Mr. Truman and the transfer of both House and Senate control from the Republicans to the Democrats.

DOUBTFUL LEGISLATIVE INFLUENCE

Despite these evidences of political strength, the legislative influence of organized labor is always doubtful and uncertain, partly perhaps because union labor constitutes not more than 25 per cent of the gainfully employed in the United States. Whatever the reasons, the fact remains that such so-called "antilabor" laws as the Smith-Connally Act of 1943 and the Taft-Hartley Act of 1947 were passed when organized labor was at the height of its power. Whether the CIO's Political Action Committee and the AFL's Labor's League for Political Education can change this situation remains to be seen.[20] Perhaps greater co-operation and unity between the CIO, the AFL, and the Railroad Brotherhoods would provide the answer.

[20] See Avery Leiserson, "Organized Labor as a Pressure Group," and Jack Kroll, "Labor's Political Role," THE ANNALS, Vol. 274, March 1951, pp. 108–117, 118–122.

From 1925 to 1949 he was professor of economics at the University of California at Los Angeles, where he also served as dean of the summer session (1930–36) and dean of letters and science (1936–47). On two occasions he has been special editor of THE ANNALS, *and he is author or co-author of numerous publications in the field of labor relations, including Labor Problems and Labor Administration (1920), Labor Problems (1922), Labor Management (1928), The Management of Labor Relations (1939), Labor Problems (1940), and The Management of Personnel and Labor Relations (1950).*

Is Your Subsidy in the Public Interest?

By J. P. Watson

A SUBSIDY of direct form is commonly thought of as a special payment, in cash or equivalent service or goods, by a national government to another national government for its support, or such payment to a domestic business to induce production of designated kinds of goods supplemental to what might be expected from the market without that stimulus. The possibilities of indirect forms of course are numerous. We have had some experience with foreign aid and with federal subsidy of business. Our experience with subsidies, however, is such as to require expansion of that common definition. Our states may, and do, subsidize business; they may, and do, empower their local governments to do so. Federal aid to states and state aid to local governments are of the subsidy family. We have public subsidy of private nonprofit agencies, including churches. And we have very diversified and extensive private subsidy of these nonprofit agencies.

Because of the diversity of names and of forms, it would be most difficult to prepare a comprehensive statement of past and present uses of subsidies and of closely kindred interventions. There is certainly no intent here to do so. But the sentiment in favor of re-evaluating our interventions is surely such as to justify examining them; and subsidies are among the significant forms of interventions. Let us merely sketch the types.

Foreign Aid

Foreign aid is associated mainly with the defense plans. One becomes easily confused in trying to piece together our attitudes toward the Atlantic area, the Far East, and the various intervening spots involved in the containment policy. Sometimes the loud protests against England, France, Germany, or India seem to add up to an irresistible chorus of opposition. On the other hand, apparently the heat of congressional objection is concentrated mostly against, say, about the upper tenth of the defense budget, not against its major items. But even with general consensus on need for defense, are we at all clear on whom we are aiding, and with what? Do we see clearly that the old protectionist ideal of keeping foreign goods out is hardly suited to the development of strength among our allies? Do we have understood and accepted policies of frankly providing positive inducements?

A special part of the program of foreign aid is associated with the Point Four concept—of technical aid and highly selective material aids in sections that include peoples far removed from recognized military threat. In view of the numerous materials of great importance, such as tin, copper, chromite, manganese, and graphite, which we must obtain in whole or in part from various corners of the world, it is clear that we need friendly populations in and around the areas producing these things. Helping them to help themselves is thought by many to be a worth-while gamble for their friendship. Can we recognize this as a mutual aid program without trying to make it into mere *quid pro quo* bargaining?

Federal Aid to the States

Until about the middle of the 1930's, federal aid to the states was mostly for highways, agricultural colleges and experiment stations, agricultural extension, and vocational education. Those types of aid have continued to grow, but others have shown more spectacular growth, in recent years. In 1950, for example, more than half of the aggregate of federal grants-in-aid to the states was made up of "welfare" items —mostly old age assistance and aid to dependent children and the blind.[1] Within recent years there has been increasing intensity of popular debate on general federal aid for education.

There is no uniform basis of allocation, but such aids are considerably loaded to help weaker states. That fact is singled out in the objection against alleged transfer from the haves to the have-nots. It is likewise recognized in the favorable argument that such aid is a useful and flexible device for federal promotion of services beyond some local abilities.[2] In the developing defense effort, we can hardly ignore the weaker spots. But how can we reconcile our wish to preserve some state autonomies with the requisite of relying on central government in the defense program? There are fears that conditions attached to federal aid will undermine the rights of the states in the federal system. Might there not be fears that state weakness would jeopardize central defensive strength?

One of the major needs in mounting defense is manpower. One of the characteristics of the weaker states is relatively poor opportunity in employment and earnings, reflecting relatively high ratios of labor to resources and equipment. What form of aid carries least risk of perpetuating essentially uneconomic conditions? In our tariff argument, we readily justify aid to certain industries for defense reasons. Might not certain areas likewise be aided for defense reasons? Might not excess labor in the weakest area be aided in moving? And how, if not by some subsidy-like device, can aid be funneled into specific chosen areas?

To some extent we have had the appearance of direct federal aid to local governments—especially in emergency relief, in wartime housing, and in airport construction. In view of the necessity of state enabling acts, however, this seems to stand merely as a variant to grants-in-aid to the states.

State Aid to Local Governments

We have had a strong tradition of depending mainly on the property tax for revenue to local governments. With increased industrialization and urbanization the concentrations of taxable property often were poorly matched, were even freakishly unrelated, to the location of citizens, school children, highway needs. With rising requirements for local governmental funds, there has been an increased dependence on other taxes.

As the struggle for other sources of revenue developed, the conviction spread more and more that the fruitful alternative taxes—such as those on personal income, business net income, and sales —could be administered by the state better than by the local government. To some considerable extent, then, what came to be called state aid was an arrangement for sharing taxes collected by the state. But increased use was made of grants-in-aid—that is, allocations on some basis assumed to be more nearly in keeping with the purpose of raising minimum standards.[3] Thus enters the

[1] United States Department of Commerce, *Compendium of State Government Finances, 1950.*

[2] For a very useful record and evaluation, refer to Council of State Governments, *Federal Grants-in-Aid,* 1949.

[3] Council of State Governments, *State-Local Relations,* 1946.

kinship with subsidy, in that this scheme makes net withdrawals from the denser concentrations of income and makes net payments to the weaker local areas.

State aid to local governments does not affect the constitutional structure of government, but it may strain the customary structure. In problems raised by increased state control of localities, some see reason for fears about grass-roots (or pavement) democracy.

In such aid, as in federal aid to the states, one crucial consideration is the risk of perpetuating uneconomic conditions by encouraging people to stay where they cannot in truth be self-supporting.[4] One of the best local examples of this possibility is the ghost town abandoned by industry or the ghost community left after exhaustion of forests or minerals. This danger may not be of major proportion so long as the aid is primarily for highways and schools and is not concerned with local efforts to offer such inducements to business as low-interest loans, low rent, or tax exemption.

PUBLIC AID TO PRIVATE NONPROFIT INSTITUTIONS

Perhaps the more important instances of direct state aid to private nonprofit institutions are appropriations to universities and hospitals in that category. The merit of state support of higher education is not here in question, but there are questions about conditions that maintain and promote educational standards, and there are risks of involvement in controls by religious sects, not in keeping with separation of church and state. The problem of maintaining good standards and of assuring equality in the right of access and treatment is basic in state aid to private nonprofit hospitals.

The far greater prevalence of the subsidy effect lies in the provision of public services to agencies not having ordinary tax liability, considered later.

SUBSIDY TO BUSINESS

Initiation or increase of a subsidy to business may be taken to induce market reactions different from those which might reasonably be expected without the change in subsidy. Such market changes represent favorable treatment for some and unfavorable treatment for others. Continuance of a series of constant subsidy payments tends to support continuance of market conditions different from what might reasonably have been expected without the subsidy and perpetuates the favorable and unfavorable relationships. Presumably in a large measure what can be said of the outright subsidy can be said of the more roundabout aids that stand in the category of positive inducements, such as low-interest loans, tax preferences, and guarantees of prices above the market.

But of course it seems equally true that initiation or increase of a protective tariff induces market conditions different from what might reasonably be expected without the change, and this also favors some and is unfavorable to others. And continuance of a protective tariff unchanged surely must be taken to support continuance of market conditions different from what might reasonably have been expected without the protective tariff, thus perpetuating the favorable and unfavorable relationships. And presumably the same thing may be said of other measures which, like the tariff, are repressive of competition—such as buy-American or prefer-American-ships.[5]

So, if we are disposed to act against the subsidy, we might, for consistency, remember the tariff. If we choose to reduce or abolish either, we encounter the fact, which often seems forgotten, that reduction or abolition of preferred treatment also has the effect of favoring some and of being unfavorable to others. But minimizing such intervention minimizes discriminatory treatment for the future.

The predominant economic judgment in this country is against unnecessary intervention. However, there seems to be a solid economic judgment also that the free market is not a machine for defense or war. And at this point we encounter a neglected point on much of our recent use of subsidy. During World War II we experimented with subsidy on certain commodities—for example, copper, lead, and zinc. In general, these experiments came in a period of price control. Since price increases of the magnitude likely under the circumstances were not permissible, special inducements in the form of subsidies were offered to maintain or increase production in spite of price control.

Because of the obvious need for general fiscal and monetary measures to control inflation, there is some tendency to dismiss specific controls entirely. It might be that general fiscal and monetary controls, plus necessary allocation of industrial supplies and materials for defense, plus allocation of consumer supplies by rationing, would solve the more crucial aspects of the problem. But these general controls and allocations simply do not solve the extraordinary price pressure created by a war program on many of the required materials. And if price controls become necessary, subsidy also may be required.[6]

AID TO FARMERS

We hear much of aid to farmers. Facilitating farm credit was a developing plan in the twenties. Subsidy provisions were in the McNary-Haugen bills in 1927 and 1928, vetoed by President Coolidge. With later developments, such as the parity idea, soil conservation payments, and the surplus-disposal method, the beneficiaries were not always identifiable, but it was reasonably well understood that the measures were designed to aid farmers—even if others also profited (as in surplus disposal). When the Office of Price Administration was set up, it was authorized to buy or sell, to fix prices, and to pay subsidies. There was a sort of preferential arrangement, however, under which farm price controls were tied to parity. Whether or not the earlier unfavorable terms of exchange for the farmers were justifiable, they probably affected the arrangement.[7] In part subsidies were paid to processors of farm products in the hope of keeping rollbacks from dropping to the farmer level. Other payments were made directly to producers. Since the war, probably most of the discussion of farm protection has been with reference to price guarantees in relation

[4] This risk and others are indicated at various points in a distinguished group of British studies by the Oxford University Institute of Statistics, entitled *The Economics of Full Employment*, Oxford: Basil Blackwell, 1944.

[5] Cf. Research and Policy Committee of the Committee for Economic Development, *Tax and Expenditure Policy for 1952*, especially pp. 16–17.

[6] On these tangled problems, the most concisely comprehensive treatment seems to be in two Twentieth Century Fund publications in 1951, namely, Albert G. Hart, *Defense Without Inflation*, and Albert G. Hart and E. Cary Brown, *Financing Defense*.

[7] Cf. Theodore W. Schultz, *Agriculture in an Unstable Economy* (New York: McGraw-Hill, 1945), p. 123.

to the parity concept. Alternative proposals widely discussed have been of the income guarantee type.[8]

SUBSIDY IN HOUSING AND REAL ESTATE

Subsidy in housing and real estate has been a measure of some significance in recent years. The vast holding operation symbolized in the Home Owners' Loan Corporation, despite its method of recording surplus, seems, on full accounting, to have carried a subsidy effect traceable to substantial interest-free advances on stock.[9] We have hardly begun to evaluate the subsidy involved in mortgage guarantees, public housing, and urban redevelopment.

TRANSPORTATION SUBSIDIES

Ocean shipping has long had perferential treatment, first of the protectionist stripe, but later inclusive of subsidy combined with legitimate pay for hauling the mail.[10] Recent stories of the financing of our new record-breaking ship, the *United States*, suggest that we have that kind of confusion confounded with major defense features. The extent of subsidy in inland waterways is any man's guess. But the considerable possibilities are suggested by the enormous volume of bulk freight moving in channels made navigable and kept so mainly at public expense.

Back of railroad construction lay, especially, aid in the form of great land grants. Whether it was then helpful is hardly a question, although the railroad companies are now disposed to feel that those early lifts should be considered water over the dam. The heavy investment of public money in airports adequate for the public carrier lines is common knowledge. The wrangle over mail subsidy to airlines is also a familiar story.[11] As to commercial motor vehicles, the argument never ends over indirect subsidy represented in our enormous highway development.

We need not here extend the record or labor the point of business subsidy. If we try to explain the why of subsidies we get caught in a record of defense emergencies, logrolling, attempts to balance out some effects of protectionism, and some attempts to counter the devastation we have wrought against our resources.[12] It may be hoped that occasionally we shall haul out the record for review to see whether and how subsidies and kindred special measures, along with the protective devices and similar measures, add up to mere hodgepodge or fit into some semblance of policy.

TAX EXEMPTION OF PRIVATE NONPROFIT AGENCIES

Concerning subsidy to religious and charitable institutions in the form of significant public services without general tax liability, one rarely hears objection. Questions are being raised, however, about tax exemptions on investment properties and business holdings acquired in the process of accumulating endowment. For churches, the usual constitutional provision concerning property used for public worship is hardly confusing enough to cause honest men much worry. But it might cause worry if allegedly new modes of worship should appear as claimants. As for exemption for private nonprofit educational institutions and hospitals, there are problems on investment properties, but the central question is on nondiscriminatory service to the public.

[8] A useful quick reference of able and diverse statements of description, history, and evaluation is found in *Subsidy for Farmers*, compiled by Robert E. Summers, New York: H. W. Wilson Company, 1951.

[9] Rosalind Tough, "Life Cycle of the Home Owners' Loan Corporation," XXVII *Land Economics*, No. 4, November 1951.

[10] Paul M. Zeis, *American Shipping Policy*, Princeton: Princeton University Press, 1938.

[11] Cf. *New York Times*, June 8, 1952, editorial page, letter to the editor from Langdon P. Marvin, Jr., and others, stressing the need for determining openly whatever subsidy is to be paid.

[12] The latter point is developed in K. William Kapp, *The Social Costs of Private Enterprise*, Cambridge, Mass.: Harvard University Press, 1950.

PRIVATE SUBSIDY OF PRIVATE NONPROFIT AGENCIES

It may seem strange in a discussion of subsidy to consider private donations to nonprofit institutions when we take so much pride in great privately endowed educational institutions, hospitals, and research organizations. But beyond the direct question of tax exemption for the agency itself lies the question of deductibility of donations in determining the tax liability of the donor. If about the same proportion of income year by year enters the deductible list of donations, there is no substantial change of impact on income tax due. But actually there are vigorous drives to increase such donations on the basis of the general fact that the increased donations are effectively tax exempt. If the public budget were balanced and a substantial increase in such giving took place with no change in income levels, the budget balance would disappear, and, for a given expenditure level, increase of income tax rates or other rates would be required.

Such problems are not solved by the "sacred-cow" formula. These exemptions result from social decisions. If we look squarely, we might continue them, we might increase them, we might reduce them.

SUBSIDY AND THE PUBLIC INTEREST

We have seen so much of the world collapse in antagonisms that we ought to aspire for some peaceful solutions. On many of our tangled economic issues we have had quite too much emoting. Surely most of us do not want chaos, even of the unplanned variety.

At the heart of the democratic procedure is deliberative discussion, in mutual respect, aimed at finding bases of agreement which we can reasonably expect to keep on observing. Surely one topic for frank consideration is the array of economic interventions; and, in the process of such consideration, subsidy and its cousins should be scrutinized for their varied relationships with the public interest.

J. P. Watson, Ph.D., Pittsburgh, Pennsylvania, is director of the Bureau of Business Research at the University of Pittsburgh and a member of the City of Pittsburgh Planning Commission. He has taught economics at that university and made a special study of water power for the National Resources Committee. He is co-author of Energy Resources and National Policy (1939).

The President as a National Symbol

By Wilfred E. Binkley

IN a flash of intuitive insight the late Henry Jones Ford perceived

that in the Presidential office as it has been constituted since Jackson's time, American democracy has revived the oldest political institution of the race, the elective kingship. It is all there: the prerecognition of the notables, and the tumultuous choice of the freemen, only conformed to modern conditions.[1]

Had he chosen to give details, Ford might have mentioned the elaborate ritual of the inauguration, suggestive of the coronation, the twenty-one-gun salute on arrival and departure of the President, and the throngs that gather to see and hear him. It is all significant of a deep-seated human longing for symbolism. However, this was not just the work of the Founding Fathers. Their efforts were frustrated by a long generation of resolute resistance of the Jeffersonians to the investing of the office of President with any trace of symbolism.

British Attachment to Royalty

Whoever has observed the behavior of Britons with respect to their monarch will have some conception of the profound significance they attach to the "oldest political institution of the race"; nor is this significance confined to the unthinking masses. The writer recalls the sober conviction of an internationally known Oxford don, expressed in a casual conversation, that the United States ought to establish a monarchy. Imperturbable and indomitable as the British are, one can only wonder what might be the effect of the sudden loss of the myth of royalty, especially when incarnate in the lovely personality of Elizabeth II. That is something we shall never know, but it is conceivable that the blasting of London by the *Luftwaffe* was but a mosquito bite in comparison. Sir Ivor Jennings writes:

Certain it is that democratic government is not merely a matter of cold reason and prosaic policies. There must be some display of colour, and there is nothing more vivid than royal purple and imperial scarlet. During the present century, therefore, we have placed almost intolerable burdens on the royal family. They must not only head subscription lists and appear on State occasions; they must, also, inspect this and that, open this and that, lay this stone and that, and undertake a thousand other dull tasks in a blaze of publicity. We can hardly blame Edward VIII if he preferred to make toffee in the kitchen.[2]

Of course, the Queen does not have to open a baseball season by tossing out the first ball, or shake hands with interminable lines of people. But the fact that custom has imposed upon the President extra official burdens similar to those of royalty is indicative of the symbolism of the President. By and large, he symbolizes the American Government to the American people. How many Americans have proudly declared, "The President shook this hand of mine." President Hoover reported that after these daily ordeals his hand would be so swollen that for days he could not write.[3]

[1] *The Rise and Growth of American Politics* (New York, 1898), p. 293.

[2] *The British Constitution* (Cambridge, England, 1950), p. 116.

Early American Loyalty to the King

When Washington was inaugurated in 1789, all adult native Americans had been subjects of George III; and they did not suddenly, on a particular day, cease to be such subjects. The transition was somewhat gradual. For months after Bunker Hill, American chaplains were reverently remembering the King in their prayers. Even as late as 1776 and not so many months before the Declaration of Independence, the King's health was still being toasted nightly in the officers' mess presided over by General Washington.[4] Fortunately there was no Un-American Activities Committee in that day.

Nor were these professions of loyalty to the King inconsistent. The grievances of the patriots were over ministerial policies, and Washington was battling the "ministerial troops," as his letters then expressed it. So professions of loyalty to the King persisted for nearly a year after the first shot had been fired at Lexington.

Loyalty to the King evaporated rapidly in the spring of 1776. The shift in the attitude of patriots toward King George found expression in a pamphlet published with perfect timing. In Thomas Paine's *Common Sense* not only was King George denounced with savage ferocity, but the symbolism of royalty was covered with obloquy. The Norman Conquest as a foundation stone of British monarchy was given a breathtaking reinterpretation.

A French bastard, landing with an armed banditti, and establishing himself king of England against the consent of the natives, is in plain terms, a very paltry, rascally original. It certainly hath no divinity in it. . . . Let them promiscuously worship the Ass and the Lion, and welcome. I shall neither copy their humility nor disturb their devotion. . . . The plain truth is that English monarchy will not bear looking into.

Nearly every literate patriot read *Common Sense* while the ink was still fresh, and its ideas struck a responsive chord. Thomas Jefferson's indictments in the Declaration of Independence were consequently directed against the King, not Parliament.

Undoubtedly the destruction of the symbolism of the King created a psychological vacuum. However, it scarcely mattered, since there was then little sentiment of nationality that needed to be symbolized. It was state independence, not national, that had apparently been declared. The Continental Congress was an assembly of ambassadors lacking in prestige, and at its best, a congress can scarcely constitute an impressive national symbol. When the Constitution of 1787 invested Congress with specific legislative powers, the opponents of ratification cried out, "We did not dethrone King George only to enthrone King Congress."

Ingrained Monarchal Tendencies

The inauguration of President Washington, as well as the later procedures and etiquette introduced by the Federalists, precipitated a controversy over appropriate symbolism of the President. Vice President John Adams declared, "Take away thrones and crowns from among men and there will be an end of all dominion and justice."[5] Accordingly, while presiding over the Senate, Adams was urging an elaborate and high-sounding title for President Washington and was horrified when the simple title prescribed by the Constitution

[4] S. E. Morison and H. S. Commager, *Growth of the American Republic* (New York, 1937), Vol. I, p. 77.

[5] *Gazette of the United States*, March 1790; quoted in V. L. Parrington, *Main Currents of American Thought* (New York, 1927, 1930), Vol. I, p. 311.

was retained precisely as set down. "What," he asked, "will the common people of foreign countries, what will the sailors and soldiers say, 'George Washington, President of the United States'? *They will despise him to all eternity.*" [6]

In the Constitutional Convention Hamilton had avowed a preference for monarchy. Soon President Washington was being maneuvered into something of the separateness of a monarch under the management of public affairs by his vigorous Secretary of the Treasury. Hamilton assumed the role (secretly even the title) of prime minister, recommended measures to Congress, and pressured Congressmen to enact them, with the consequence that the legislative program of the first administration still stands as Hamilton's, not Washington's. If the precedent then set had not been battered to bits by the opposition, the President might never have become, as he did, a combination of king and prime minister.

UTILITARIAN VIEW OF THE PRESIDENCY

Adams' and Hamilton's "aping of monarch" brought about a strong emotional reaction on the part of the agrarians. Jefferson coined a word "monocrats," and, to the glee of his partisans, applied it to the Federalists.[7] Even Washington's inauguration, thought Jefferson, had been "not at all in character with the simplicity of republican government and looking, as if wistfully, to those of European courts." So when the time came for Jefferson's inauguration in 1801 he walked unostentatiously from his boarding house over to the Capitol to deliver his inaugural address to the two houses assembled in the Senate Chamber. He was, as he said, putting the ship of state on its republican tack. The Puritans had not been one whit more determined to eradicate popish symbols from their churches than were the Jeffersonians to divest the President of the trappings of royalty. Deprived of its symbolism, the office of President was to be nothing more than a purely utilitarian agency of government, merely a means to an end.

During the twenty-four years of the Virginia dynasty, not only did the President lose his symbolism, but the very prestige of the office sank to its nadir. Congress took charge of the Executive, nominating the candidate for the presidency by congressional caucus, and, under the prevailing one-party system, nomination was equivalent to election. Madison, for example, was so completely the prisoner of Congress that he could scarcely have been less a factor in the government if he had spent the eight years of his Presidency at home on his plantation.[8]

THE PRESIDENT AND HIS FAMILY AS A SYMBOL

It was the upsurge of the recently enfranchised masses and their election of Andrew Jackson to the Presidency as their champion in 1828 that terminated the purely utilitarian conception of the Presidency and made the President peculiarly the symbol of the national government. State legislatures had been selecting Presidential electors, but this ceased in 1828, and Jackson was practically the first popularly elected President. In the then prevailing classical vogue he was proclaimed a "tribune of the people," one who would check a patrician Senate by shouting his veto against measures granting special privileges, as indeed

[6] James Hart, *The American Presidency in Action, 1789* (New York, 1948), p. 36.

he did in vetoing the Bank Charter. To this day, a Presidential veto tends to strengthen the prestige of a President. The idea of the tribuneship persists, no matter what Congressmen may think of it.

A generation after Jackson's election, so exalted had the President become as the symbol of the Federal Government that the symbolism became a major factor in the secession movement. Secession could scarcely have been based on a cool calculation of the results of the election of 1860. The fact is generally overlooked that, although the Republicans had elected Lincoln (with a popular minority vote of about 40 per cent), they had nevertheless lost both houses of Congress. They had only 31 of the 66 Senators and 105 of the 237 Representatives. Had the southern Senators and Representatives maintained their position, Lincoln could not have made one important appointment —not even of his Cabinet members— without the consent of opposition Senators. When the southern Senators and Representatives walked out they turned the government over to Lincoln, and thus paid an unconscious tribute to the symbolism that had become attached to the office of President.

Day after day English newspapers and periodicals must feed the insatiable public appetite for pictures of the Queen and her family. This has its counterpart in the President and his family. Since the first Roosevelt, the White House family has belonged to the nation as an essential element in the symbol of the Presidency. Theodore Roosevelt's children running bareheaded out of the White House on their way to school, Quentin riding his pony into the Executive Mansion and getting it on the elevator, the vivacious young Alice keeping Washington agog with her quips and her unconventional and unpredictable ways, were all part of the first Roosevelt regime. The death of Coolidge's son touched the heart of every American parent. As the barometer registering Truman's popularity strikes a new low, one wonders how much more it might fall if Bess and Margaret were out of the picture. What would happen to the Presidency if Governor Warren and his bevy of daughters should ever move into the White House? The President's family is part of the national symbol which constitutes the Presidency.

PARTY LEADERSHIP AND NATIONAL LEADERSHIP

A Presidential nominee becomes the titular head of his party. In the case of candidates such as Blaine, McKinley, and the two Roosevelts, the position may be actual as well as titular. Vice Presidents such as Theodore Roosevelt, Calvin Coolidge, and Harry Truman attain the titular role upon succession to the Presidency. One would scarcely consider William Taft, Warren Harding, and Herbert Hoover party leaders before their nominations. Even as Presidents their leadership was titular, unless one would except Truman. Franklin Roosevelt, however, had already attained outstanding party leadership before his first nomination as a Presidential candidate.

Because of the extraordinary economic crisis of March 1933, Franklin Roosevelt's inauguration constitutes the most striking instance in American history of a transition from party to national leadership. The desperate condition then prevailing provided precisely the opportunity for a President endowed with imagination and daring. President Roosevelt galvanized a panic-stricken people, paralyzed with the fear of social disintegration, by his confident assertion that there was nothing to fear but fear itself. During those first hundred days, even party lines disappeared.

One nationally known Republican businessman said "he had voted for Hoover and hoped God would forgive him and that he believed Franklin D. Roosevelt was the greatest leader since Jesus Christ."[9] Before Franklin Roosevelt had been President two years, there were Republican Congressmen campaigning for re-election on the ground that they had supported the President in his legislative program combating depression. The President as a symbol had attained its zenith.

The President as a symbol of national leadership is not a persisting one, even in the case of Franklin Roosevelt. Crises are temporary, and other means are needed to sustain the leadership—even party leadership. Presently patronage was being dispensed by Roosevelt to deserving Democrats, and the test of desert was starkly realistic. "What was your preconvention position on the Roosevelt candidacy?" was put to patronage-seeking Congressmen.[10] A quarter of a century earlier another President Roosevelt had busied himself rounding up southern delegations to make sure that William Howard Taft would succeed him. President Woodrow Wilson made a frank partisan appeal for the election of a Democratic Congress before the guns had ceased booming on the western front. President Truman "gives them hell" in a successful whistle-stop campaign and stands ready to repeat the performance for the Democratic candidate in 1952.

The transition from party leader to national leader is not so very deftly done, and sometimes scarcely at all. As to the reverse, the transition from national to party chief, few Presidents have done it. The party has a new chief when the President makes his final exit from the White House, except perchance when the opposite party has captured the Presidency. Then the retiring President, if a defeated candidate, may and theoretically does retain a titular leadership of his party until the next Presidential campaign.

[10] Pendleton Herring, "The First Session of the 73rd Congress," *American Political Science Review*, Vol. XXVIII, No. 1, p. 67.

PRESIDENTIAL LAWMAKING

The Presidency is pre-eminently a political office; that is, it is concerned with the formulation of policies even more than with the execution of law. The Constitution invests Congress with lawmaking powers, but directs the President to give Congress information from time to time on the state of the Union and recommend measures for its consideration. The Constitution gives him the veto power over acts of Congress, and thereby, in effect, makes him a third house whose negative vote is equivalent to two-thirds the vote of the House and of the Senate.

These provisions of the Constitution, together with the forceful leadership of several Presidents, have so intimately tied the President with the lawmaking process that the late Howard Lee McBain denominated him a "Chief Legislator." It has been said that whenever President Franklin Roosevelt urged Congress to enact a law, lying right under the message would be a bill with the last "t" crossed and "i" dotted, and Congress came to expect it. A President campaigns for re-election on his legislative achievements, or, as in the case of President Truman in 1948, attacks Congress for failing to enact his program. This is but a frank acceptance of the role that public opinion has assigned the President.

POPULAR DEMAND FOR LEADERSHIP

"We can symbolize our national unity in the Presidency, our sectional interests in the Senate and our localisms in the House" wrote E. Pendleton Herring.[11] But in the absence of co-ordination of these three, confusion inevitably ensues. There are those who would seek to solve the riddle by clapping a parliamentary system on us, ignoring the fact that political systems are natural growths—folkways and mores translated into stateways. Madison's *Notes* make abundantly clear that the framers of the Constitution understood this, and sought diligently to discover what practical devices the states had developed that might be adapted to the needs of a federal government. The late Alexander Johnson pointed out that

> the Presidential electoral system was almost the only feature of the Constitution not suggested by state experience, almost the only feature which was purely artificial, not a natural growth; it was the one which met with least criticism from contemporary opponents of the Constitution and most unreserved praise from *The Federalist;* and democracy has ridden right over it.[12]

Whatever Senators and Representatives may think of Presidential leadership, the American electorate seems to sense intuitively the need of it. The voters serenely ignore the charge of dictatorship. The four elections of Franklin Roosevelt indicate that he was looked to pre-eminently as a national leader. Truman's breath-taking re-election signified an electoral approval of the championing of public policies. The campaign of 1952 signifies a popular search for a strong leader, a symbol of vigor and strength in the national government, a promoter of policies in the public interest. It is simply inconceivable that the American people would today seriously consider the candidacy of a Calvin Coolidge, satisfactory as he may have been in the placid twenties. Not one of his type was among the numerous candidates seriously considered as potential nominees this year.

[11] *Presidential Leadership* (New York, 1940), p. 14.

[12] Alexander Johnson, "What the Federal Constitution Owes to the Constitutions of the Several States," *New Princeton Review*, September 1887.

In a year tense with the dread possibility that a cold war could, in a single moment, become red hot, the American people are in dead earnest, and no mediocre candidate will do. The delegate strength developed by Kefauver was indicative of the hope that a new dependable leader had been discovered. The delegate strength acquired by Eisenhower, even without an active campaign, was another indication of the passionate search for one who might measure up to the symbolism that is the President.

THE QUESTION OF RE-ELECTION

The Twenty-second Amendment may yet prove to be a piece of tragic folly. It went through with a minimum of publicity and discussion—a near conspiracy of politicians venting spite against one no longer living. In effect the amendment says, "We of this generation elected one President four times, but we propose to see to it that no future generation ever has that privilege. This generation assumes a guardianship over those who come after us."

Here is a matter in which the wisdom of the fathers might well have been consulted. In the 72nd article of *The Federalist,* Alexander Hamilton argued cogently the wisdom of the Constitution's unlimited re-eligibility of the President. The possibility of re-election he considered an inducement to good behavior and a reward for fidelity, and reasoned that it would give the nation the advantage of the President's experience. "There is no nation," he declared, "which has not at one period or another experienced an absolute ne-

cessity of the services of particular men to the preservation of its political existence." Hamilton doubtless envisaged some future able and revered ex-President who commanded popular confidence and in a critical time would need to be recalled to service as President. The Twenty-second Amendment would forbid the re-election of a Washington or a Lincoln, no matter how great the crisis, after a second term.

Hamilton could not have the advantage of what we know today confirming the wisdom of his opinion. The President is now a chief legislator, as the legislative product of the first term of Theodore Roosevelt, for example, abundantly demonstrates. But his second term was quite barren because of the error he committed on the night of his election for a second term. He pledged himself not to seek another term, with the consequence that he thereby reduced himself to relative legislative impotence. President Coolidge prudently delayed until late in his elective term his decision not to seek re-election; and President Truman revealed his decision not to seek re-election only when the tumult of the campaign for delegates to the National Convention made it difficult to delay longer. In limiting the President to two terms, the Twenty-second Amendment means that Presidential leadership will be significant only in his first term. Thus in an age when Presidential leadership is more important than ever before, it is practically cut down 50 per cent.

PRESIDENTIAL MATERIAL

It is because the Senate symbolizes sections and the House our localisms that Congress is incapable of providing a focus of the national interest. The House, with its overrepresentation of rural population and the habitual rise through seniority to leadership of only Representatives of practically one-party districts, develops anything but habits of search for norms of national welfare. It is no accident that only one Speaker of the House ever reached the Presidency—James K. Polk—and he was chosen because of a successful experience as Governor of Tennessee. In the last hundred years, six Senators have attained the presidency: Pierce, Buchanan, Johnson, Benjamin Harrison, Harding, and Truman—scarcely a list of notable Presidents. Truman may turn out to be the best of the list.

Long service in either house does not necessarily incapacitate one for the Presidency, but it does compel conformity to the complex of interests of a limited geographical area, and tends to develop habits different from those essential to the Presidency. Finding the common denominators, or points of equilibrium, in the multigroup society of the nation is an art developed by the governors of some of our states that have a complex of group interests resembling that of the nation. Since the Civil War the state governors elected to the Presidency have been Hayes, Cleveland, McKinley, Wilson, Coolidge, and the two Roosevelts. It is interesting to compare them with the non-governors elected President in the same period: Grant, Garfield, Benjamin Harrison, Taft, Harding, Hoover, and Truman.

It is not just the big electoral vote of New York that accounts for the Presidents that state has provided. The group structure of the state's voters is almost as complex as that of the United States. A governor accustomed to finding his way about in New York's maze of economic, religious, ethnic, and social groups is a pretty normal candidate for the Presidency. Why should anyone have been surprised that Dewey had a program as a Presidential candidate similar to that other governor of New York, Franklin Roosevelt? The vocabulary, the voice, and the delivery were different, but the program in each case was what it takes to be elected governor of New York. It ought not to be a bad program for the nation. Nor should it be overlooked that Dewey came nearer winning the Presidency than any other Republican since 1928.

THE PRESIDENT AS CHAMPION OF CIVIL RIGHTS

The time is long past when any President or Presidential candidate can ignore with impunity the interests of enfranchised group-conscious minorities. Civil rights is an issue that cannot be hushed, because the groups concerned have learned the art of throwing their weights as needed—the balances that decide Presidential elections.

These minorities tend to concentrate in the metropolitan centers of New York, Boston, Philadelphia, Chicago, Detroit, St. Louis, and Los Angeles. Because these cities can overwhelm and have overwhelmed the trend of the rest of the voting in their respective states, the Presidential candidate who can carry conviction to the mass of the voters in these cities, voters largely interested in civil rights, can tie up 185 electoral votes—no mean advantage in a Presidential election.

In the competition of the Presidential candidates of the major parties for these electoral votes, both of them become pledged to the advocacy of a program of civil rights. No matter which candidate wins, a champion of civil rights will occupy the White House. Whether Congress can be persuaded to follow his leadership cannot be predicted.

THE EMOTIONAL PRONOUNCEMENT

If anyone asks for conclusive evidence of the symbolism of the President, let him recall the extraordinary demonstrations of personal grief manifested by ordinary people when President Franklin Roosevelt died. Unforgettable are the pictures of these people with streaming tears as they looked at the passing funeral procession. It is conceivable that Americans mourned as profoundly the passing of President Franklin Roosevelt as the English people did the death of King George VI.

Nor is such grief anything new. The writer can never forget how he found his father, just after the news of McKinley's assassination had arrived, weeping as bitterly as if he had lost a child. So it was to others when Lincoln, Garfield, and Harding died in office. The son who protested Harding's lack of merit to his mother whom he found weeping over news of the President's death got this significant response: *"Ach, aber er ist doch der Präsident."* [18] Here we have the essence of the symbolism. No matter what hard-boiled public officials and politicians may think of such conduct, it is the feeling of the rank and file of Americans, their emotional reaction, that determines the matter of the President as a symbol of the nation.

The President as Legislator

By Lawrence H. Chamberlain

HOWARD LEE McBAIN was probably the first person to use the term "Chief Legislator" in his trenchant book *The Living Constitution*. He wrote in 1927, six years before the Presidency of Franklin Delano Roosevelt. Professor McBain used the term to bring out the fact that the measure of a President's stature is to be found in the legislation enacted during his incumbency, rather than in his executive or administrative actions.

Politics is more concerned with *what* shall or shall not be done than with *how* it shall be done. This is merely another way of saying that people are more responsive to issues of policy than to details of administration. Voters are remarkably indifferent to the quality of governmental management. They respond apathetically to allegations of waste and corruption. Even less attention is paid to demonstrated excellence in administrative matters. Recent Presidential elections have served to emphasize the public indifference to campaign appeals grounded on nothing more substantial than avowals of good administration.

Importance of Legislative Role

Interest in Presidential elections indicates the importance the American public attaches to the Presidency. This concern is based chiefly on the policies which the various candidates can be expected to follow, if elected, with respect to foreign aid, governmental expenditures, taxation, labor-management policy, farm policy, and civil rights. These are essentially matters of legislative policy. It is not surprising that the voter associates these problems with the Presidential election, because the past half-century has left little doubt that the President is the chief legislator in our governmental system. This is not to say that he is the lawmaker, or that his legislative views always prevail. It is a recognition that if he holds strong convictions and if he possesses the skill to utilize the various resources available to him, the President can achieve much success in translating his program into law.

Although the President's legislative role has always been important, it has become increasingly so as federal legislation has permeated all tissues of our economic and social structure. When so much of the life of the individual is influenced by federal legislation, the attitude of the President toward this legislation and his skill in gaining legislative approval of his proposals are matters of practical interest to millions of people for whom federal action formerly meant relatively little.

This may help to explain the two decades of Democratic success, because the Democratic program has been one of mass appeal and the masses have felt that the differences between the two parties were clear enough and important enough to warrant action on election day. If reform means expansion rather than retrenchment of governmental activity, and if reform programs are demanded by the voters during periods of social and economic unrest, can a party or a candidate whose platform is basically one of retrenchment hope for electoral success? There is no clear answer to this question, but a little history may cast some light on the general problem.

Only once in the twentieth century has the Republican party nominated a man who might be classified as an expansionist: Theodore Roosevelt in 1904. Even here, the case is not clean cut. The Roosevelt legislative program, while indubitably expansionist or interventionist when compared with that of other Republicans of the period, was in no sense as radical in its socioeconomic proposals as the Democratic platforms of the same era. Moreover, Roosevelt carried the Republican label, but he had in a sense sneaked in by the back door. The accident of his elevation to the Presidency by McKinley's death enabled him to nominate himself in 1904 notwithstanding the fact that many regular Republicans had little enthusiasm for the move. When he attempted to reidentify the Republican party with his political program in 1912, without the leverage of Presidential power and prestige, he found to his disillusionment that his cherished policies were not Republican. Since then the Republican party has not nominated other men who have been strong advocates of governmental intervention, and the voters have tended more and more not to elect any other kind.

A longer glance backward, however, suggests that in the surging ebb and flow of political advantage the pendulum has swung from periods of popular (here used in the sense of mass appeal) ascendancy to periods when property holders and entrepreneurial groups held the advantage. It has been true, moreover, that popular government has tended to coincide with strong executive leadership, but the eras of property-oriented government have appeared during those spans when the Presidents yielded or lost the legislative initiative and Congress dominated the legislative process. Though the record is not entirely consistent on this point, it is worthy of note that the periods of strong executive leadership (mass-oriented government) have generally occurred when the Democrats were in power, but the periods of congressionally dominant (business oriented) government have coincided with Republican periods of political success.

President's Philosophy of Government

The success a President may enjoy as legislator will depend upon a number of variables, including his own personal philosophy of government and his conception of his relationship with Congress. A brief look at some of our most vigorous Presidents will illustrate.

Andrew Jackson, although a champion of the common man and an outspoken exponent of executive independence, added little to the stature of the President as legislator because his own conception of national legislative power was limited. His veto of the Second United States Bank bill reflected his deep conviction that power and responsibility for regulating the financial and commercial functions of the nation should rest with the states rather than the national government. To him the important obligation was to protect the President's independence by repelling any legislative action which might threaten executive prerogatives. It is not surprising, therefore, that his chief contribution to the development of the Presidential office took the form of a much expanded use of the veto power. This basically defensive contribution is characteristic of both the man's personal qualities and his philosophy of governmental authority.

Abraham Lincoln also entered the White House with a negative conception of the President's legislative prerogative—and responsibility. Early in his administration he declared:

By the Constitution the Executive may recommend measures which he may think proper, and he may veto those he thinks improper, and it is supposed that he may add to these certain indirect influences to affect the action of Congress. My political education strongly inclines me against a very free use of any of these means by the Executive to control the legislation of the country. As a rule, I think it better that Congress should originate as well as perfect its measures without external bias.

This unequivocal statement of principle is hard to reconcile with Lincoln's actions when he was confronted with the critical problems raised by the Civil War. Less than any other President before or since did he look to Congress to "originate as well as perfect its measures" in the fashioning of policies to prosecute the war. On the one hand, he submitted his bill for compensated emancipation of the slaves with the request that it be enacted without alteration. Furthermore, to an extent then unprecedented and never since duplicated, he frequently chose to attain his objectives by executive decree without recourse to Congress, except to report his action ex post facto with the suggestion that Congress could, if it chose, approve his action by clothing it with statutory authority.

Lincoln's second method had the merit of being both simple and effective, but it so patently transgressed both the letter and the spirit of our Constitution that it has not been repeated as a basic operating principle by succeeding Presidents. Occasional incidents involving sweeping executive orders unsupported by legislation have occurred in a number of administrations, but there has been no general and sustained attempt to bypass Congress.

Grover Cleveland's claim to recognition as a strong President lies chiefly in his resolute use of his executive powers. He did not present a dynamic legislative program, but he employed the veto more vigorously than any President up to that time.

William McKinley is not regarded as a President who by philosophy, temperament, or inclination wished to assume the role of legislative leader. He had little desire to lead Congress through the rigors of an ambitious legislative program. Such was not his conception of the Presidency. Whether at least part of the explanation lay in his congressional background is not clear, but McKinley was not the focal point of national legislative policy. He was by no means impotent in his relations with Congress, however. Although he did not take a strong hand in shaping legislative proposals, he was directly responsible in several instances for legislative acceptance of important measures formulated by other executive officials. Of his effectiveness in this regard, Secretary of War Elihu Root observed, "He had vast influence with Congress. He led them by the power of affectionate esteem, not by fear."

At the other extreme was the experience of Herbert Hoover, who, whatever his economic philosophy, had the greatest desire to function as the key figure in the legislative program of his administration, yet found himself frustrated almost from the beginning. Even during the first two years, before he lost his party majorities in 1930, he experienced painful difficulties and embarrassments with his Congress.

PARTY MAJORITIES

Party majorities may be accepted as among the more fundamental conditions antecedent to harmonious Presidential leadership of Congress. Other things being equal, a President can count upon a more friendly reception for his legislative proposals when he is looking to

fellow party members to pilot his program through the parliamentary shoals. Significant exceptions may be noted, however. During Woodrow Wilson's first two years in office, he did not have a Democratic majority in the Senate. Nevertheless, virtually his entire legislative program was approved in substantially the form in which he proposed it. Included in this program were the Federal Reserve Act, the Clayton Anti-Trust Act, and the Underwood Tariff Act, the latter embracing a field in which congressional influence has traditionally been dominant.

Conversely, Franklin D. Roosevelt suffered some of his most striking defeats in the Seventy-fifth Congress (1937–38), with its enormous Democratic majorities which had been swept into office with his overwhelming reelection in 1936. Not only was he repudiated on the Supreme Court bill and his undistributed profits tax proposal; his veto was overridden on the War Risk Insurance Act, the Veterans Bonus Act, and the Farm Mortgage Interest Rates Act. Presidents Coolidge, Hoover, and Truman also found that party majorities provide no guarantee of congressional acquiescence.

DIVISION BETWEEN PRESIDENT AND CONGRESS

Because the President is elected on a national basis with a program—expressed in general or specific terms, depending upon the subject and the degree to which public opinion has crystallized on a particular subject—he is thought of as focal point of legislation. But Congress is also elected to govern. Each Congressman is elected, by his particular constituency, to work for a program. He may be a member of the President's party but elected on a program quite different from that of his party chieftain. Or he may belong to the other party, elected on a platform which harmonizes or conflicts with that of the person elected President. Just as the President accepts responsibility to *his* constituency, so does the individual Congressman. There is nothing in our Constitution or in our political and governmental traditions to suggest that the individual Congressman's obligation to the President's program is paramount to his obligation to his own constituency.

To this *political* obstacle to a unified program between President and Congress must be added a *governmental* factor that operates as a divisive rather than a unifying influence: the organic separation of the executive and legislative departments. The Constitutional separation of powers which establishes the Congress as an independent organ of government is a stubborn fact that cannot be ignored, although at times the President may believe that his mandate from the entire country entitles him to press for a particular bill or legislative program and urge Congress to adopt his legislative proposals promptly and with little change.

The volume of popular support the President may enjoy in his advocacy of a particular legislative program will depend upon a multitude of factors and will vary greatly from one time to another. Similarly, the reaction of Congress will probably be influenced by the same factors. In a crisis situation, decisive action is at a premium. Public opinion tends to crystallize momentarily, and Congress is both a reflection and an embodiment of this opinion. Congressional behavior under such circumstances may be unduly precipitous. Unable to process the President's legislative proposals through its conventional, time-consuming machinery, Congress may yield to public pressure and "rubber stamp" the bill he presents.

THE CONGRESSIONAL VIEWPOINT

Such uncritical action is not popular with Congress, because it amounts to legislative abdication, with all the distasteful consequences that follow. Eventually the onus for such defects or shortcomings as the legislation may reveal will fall upon Congress. A rubber-stamp Congress does not enjoy high prestige. Furthermore, congressional self-esteem requires that the national legislature retain its freedom of action. Each time that it accepts a clearly subordinate role in the lawmaking process weakens commensurately its ability to recapture its Constitutional position as a full co-ordinate partner in legislation.

It follows that congressional jealousy of its legislative prerogatives may ordinarily be expected to assert itself in the form of congressional refusal to accept Presidential dictation except in crisis situations. Normally the President's legislative proposals will receive attention, but they will be subjected to searching if not systematic scrutiny and weighed against congressional counterproposals before they are approved.

In the course of this ponderous and frequently protracted process, the bill in question is likely to undergo such extensive amendment that it emerges quite different from the way it entered. What originated as an administration measure ends up as a congressional one. Whether it is a better piece of legislation than the original is problematical, but this is the way our legislative system works, and the cause is to be found in both our party system and our Constitutional framework.

Much discussion has centered around the desirability of providing mechanisms or procedures for achieving greater co-operation or co-ordination between the executive and legislative departments in their common task of formulating our laws. But although there seems to be general agreement between the President and Congress concerning the need for greater harmony of action, there is much less unanimity on the form this unifying action should take. Here deep, almost fundamental, differences exist.

Some hold the view that Congress should be limited to discussing and approving, with little or no amendment, the legislative proposals of the President. This point of view has many able supporters. There has, for example, been an increasing tendency among administrators to believe that the initiative in proposing legislation should rest chiefly with the executive branch, and that Congress should limit its activity in this respect. In the words of Paul Appleby, a well-known authority on public administration, "Congress would retain the right to initiate, but use it less and less frequently."[1] Many students of government accept this view as sound principle, but it is safe to say that few of them are members of Congress. It seems desirable, therefore, to look more closely at the actual working relationships between the two governmental organs that share the lawmaking power under our Constitution.

PRESIDENT'S RELATIONS WITH CONGRESS

A President must necessarily deal with Congress through its duly selected leaders. Only rarely is he able to do much in choosing or influencing the choice of these key figures. Occasionally a President has been instrumental in dictating a Speaker or a Majority Floor Leader, but such instances are exceptional. It is even doubtful whether he has been the gainer in such instances, in view of the resentment and antagonism engendered because of the feeling in Congress that such intervention was

[1] Paul H. Appleby, *Big Democracy* (New York: Alfred A. Knopf, 1945), p. 163.

an unwarranted invasion of its prerogatives.

Even when comfortable party majorities exist in both houses, there is no certainty that the party leaders who hold the vital parliamentary and committee posts will share the policy preferences of the President. With the premium on seniority, the patriarchs of the legislative houses are likely to come from states or districts where the ferment of bipartisan politics is less marked. As stated earlier, the character of their constituencies may differ markedly from that to which the President owes his legislative mandate. The New Deal and Fair Deal programs of Roosevelt and Truman have thus had to contend with the political conservatism of many southern Democratic leaders. Republican Presidents have not escaped this dilemma. Theodore Roosevelt found his strongest opposition among the leaders of his own party, notably Speaker Cannon in the House and Senators Aldrich and Hale. His only recourse, in his own words, was "by appealing over the heads of the Senate and House leaders to the people, who were the masters of both of us."

One of the hard realities probably not adequately appreciated by the average voter when he casts his ballot for President is the complication of the legislative process and the degree to which the Chief Executive must depend upon the faithful and abiding assistance of his legislative leaders in translating his proposals into completed legislation. Unless there is to be virtual congressional abdication of its legislative responsibility, the process of drafting and perfecting a major piece of legislation is intricate and laborious and offers many opportunities for delay, not to say emasculation of vital provisions.

When his party lieutenants fail to sustain the pressure necessary to keep a measure moving along the legislative transmission belt, whether because of their lack of enthusiasm for the bill itself or through personal or political disaffection, a President may find his program stalled despite his mandate from the people. Congressional party leaders have achieved their posts of influence only after long years of legislative service. It is not surprising that they manifest some reluctance to accept the role of parliamentary expediter for a newcomer in the White House. If the newly elected President also happens to be a political neophyte, the tendency toward congressional skepticism may be magnified. For this reason, the experience of those Presidents who have attained office without extensive political experience and party relationships has not been notably happy.

THE PRESIDENT'S PARTY POSITION

Legislation is not a one-man affair. The synchronized efforts of many individuals requires some kind of propulsive energy to maintain momentum. Party harmony is an important generative force, but the wellsprings of party lie deep and are not always easily tapped. The President's party position is anomalous. Perhaps it can best be understood by a brief comparison with party politics in Britain. There we find two national party organizations. Each party functions with a strong central organization and a recognized party leader. The leader of the party in power is the head of the government. His opposite number in the other major party is the officially recognized leader of the opposition. To him will fall the responsibility of heading the new government when his party succeeds to power.

When the wartime coalition government headed by Prime Minister Churchill was voted out of office in 1945 it was a foregone conclusion that

the cloak of government would fall upon the shoulders of Clement R. Attlee, who for many years had been the duly elected leader of the Labor party. Similarly, when in 1951 the Conservative party was returned to power by the British electorate, everyone knew that its long-time head, Mr. Churchill, would again become Prime Minister.

Each party has its leader, and, conversely, each leader has his party. When the legislative program which he and his party associates agree upon is drawn up, he can reasonably assume that it will be enacted into law by the party majority which elevated him to office. Should individual members of his party find themselves out of sympathy with his legislative program, they have little choice but to go along, because they know that the Prime Minister can terminate their period of office by dissolving Parliament, and, more important, he can use his power as head of the party to deny them party support in the new election. Without this support, chances of political survival are negligible. Thus it is that the chief executive in Britain *can* coerce his legislative body to support his legislative program.

All this is quite alien to the American system. Presidential coercive power is virtually nonexistent. This is chiefly so because of our different party situation and the Chief Executive's different position in that system.

Here we find no highly disciplined national party organization with a program and an officially designated leader. Here party leadership is titularly assigned to the party nominee for the Presidency. The temporary holder of this title may or may not have had a record of service in his party. His claim to the title of party leader depends, however, upon his success at the polls. If elected to the Presidency, he continues to be recognized as the official leader of his party, although the capital that he can make of this designation depends more upon his personal qualities than upon any prerogatives that inhere in his political post.

Perhaps it is no exaggeration to say that the position of the American President with respect to party and government is the exact opposite of that of the Prime Minister in Britain. Here, his possession of governmental power gives him some political influence. There, his position as party leader, with the political power it carries, gives him the governmental power to achieve his legislative program. His political power invests him with coercive leverage which his legislative colleagues cannot safely resist. Our President has no comparable arsenal of weapons with which to wage his legislative campaign. Governmental authority to dissolve Congress does not exist. Political leadership with its opportunity to employ the sanction of withdrawing party support is not his to wield. His only recourse is the people. If he can marshal public opinion behind his proposal, and if he succeeds in arousing active and enthusiastic popular support, he may persuade an otherwise reluctant or inert Congress to acknowledge his leadership and enact his program.

PRESS RELATIONS

In his reliance upon the people to supply the solid underpinning for the legislative program he presents to Congress, the President is fortunate when he can count on a favorable and friendly press. The appearance of radio and television has undoubtedly reduced somewhat the President's dependence upon the newspapers as a means of retaining contact with the people, and both Franklin D. Roosevelt and Harry Truman have made frequent use of these media to counteract what they have regarded as inaccurate and unfair treatment at the hands of the nation's press.

Despite the possibility that some of the harmful effects of a poor press can be overcome, the value of fortunate press relationships can hardly be overstated. There is nothing coincidental in the fact that throughout our history successful press relations have gone hand in hand with the popular favor which the President has enjoyed and capitalized upon in his dealings with Congress.

In this era of ballyhoo, mass communication, and high-powered public relations counsels, we tend to assume that favorable press relations have only recently come to be looked upon as a vital component of successful statecraft. The historical record does not support this assumption, however. Presidents Washington and Adams writhed under the lashings of unfriendly journals; but Jefferson, the first politician to serve as President, characteristically took positive steps to utilize the power of the press constructively as an instrumentality of political support. During his Presidency there appeared for the first time an official administration organ financed through public funds.

Succeeding Presidents for the ensuing half-century retained the policy of employing an official newspaper to ensure accurate and favorable reporting of governmental news. The practice was discontinued by Abraham Lincoln because he felt that it had outlived its usefulness; but it is not to be supposed that Lincoln placed any less importance on the power of the press or on maintaining friendly press relations. No occupant of the White House before his time and few if any since have sensed more deeply the importance of public opinion or contrived so effectively to win its support.

Franklin D. Roosevelt was credited with great astuteness in his skillful utilization of newspapermen in his own administrative family. As in so many other shrewd political moves which paid off handsomely, Roosevelt's role here was that of the adapter rather than the innovator. That other great man of the people, Andrew Jackson, who perhaps surpassed all other Presidents in his vigorous use of the press for partisan purposes, was the first to adopt a systematic policy of appointing newspapermen to public office.

THE PRESS CONFERENCE

Another practice which Franklin D. Roosevelt took over and, for a time at least, exploited with almost phenomenal success was the Presidential press conference. In this instance Mr. Roosevelt was following in the footsteps of another New York Democratic Governor who had transferred his base of operations from Albany to Washington, D. C. After his election in 1884, President-elect Cleveland broke precedent by holding daily press conferences. He did not adhere to the daily schedule after his inauguration, but he did continue to hold occasional conferences for the press throughout his administration.

The custom of the press conference was advanced one step further during the McKinley administration, when the President's secretary met daily with press representatives. The Presidential press conference as we have come to know it today made its appearance when Woodrow Wilson formalized it as a twice-a-week regularly scheduled meeting.

As the record of the last three or four decades has revealed, Presidential incumbents have had varying success in utilizing the press conference to their own advantage. To some it has been nothing less than a recurring ordeal, frequently a nightmare; to others, a sometimes diverting battle of wits and

words. It is probably true that all Presidents have found these periodic exchanges wearing and worrisome, but they regard them as one of the unavoidable concomitants of the office, to be endured with as little pain and embarrassment as possible. Let each new President enjoy his honeymoon while he may. Sooner or later the idyl will be dispelled, and for the remainder of his term the Chief Executive will be fortunate if he can emerge from the conference room without having put his foot in his mouth.

GAINING POPULAR SUPPORT

Legislation at the national level is in large part dependent upon factors which lie outside the realm of narrowly partisan politics. Party majorities, though normally helpful, do not alone guarantee the President's success in achieving his legislative program. The demands of localism and the pressures of conflicting interest groups place a high premium on inertia, and Congress is unlikely to move unless the President can find extra leverage to keep his program moving when progress seems about to be halted. If he can summon it to his aid, the persuasive power of public opinion is well-nigh irresistible, and Congress cannot long withstand its force. Quite independent of party considerations, the President who can marshal enthusiastic popular support for a particular issue can approach Congress with bargaining strength that cannot be ignored or repulsed.

In the contest for public attention and the popular support essential to the successful realization of a particular legislative objective, the President enjoys real advantages. Through his use of the special message he can always gain national attention. If he wishes to do so, he can go to the people directly, and he is assured of a nation-wide radio audience. Nothing Congress can do will command quite the same kind of attention. Nowadays, when Congress tends to remain in session almost continuously, the President's leverage is perhaps even greater than formerly, because the average Congressman is less able to counter Presidential pressure than he was in the old days when he could have long periods at home to poll and cultivate local opinion.

There is nothing automatic about the President's ability to generate a popular ground swell which will sweep Congress off its feet. He must use this weapon wisely and sparingly, else it will lose much of its potency. Experience has demonstrated that too frequent or ill-considered resort to the people is self-defeating. Nevertheless, in skillful hands the special message probably remains the single most effective Presidential instrument for achieving a legislative objective.

USE OF THE SPECIAL MESSAGE

Special messages have been used since the founding of our government; but the conscious exploitation of this device as a strategic weapon of great value is distinctly a twentieth-century phenomenon. Theodore Roosevelt was truly innovative in his use of the annual message to dramatize his dynamic conception of federal power. His annual messages in point of length and coverage have probably never been surpassed before or since. The first Roosevelt seems to have missed a bet, however, in his failure to foresee the possibilities of the special message. Only a half-dozen or so special messages are listed among the voluminous collection of his communications to Congress.

Interestingly enough, it was Mr. Taft, a President not famous for his success as a legislator, who first made deliberate and consistent use of the special message. During his four years in the White House, he sent twenty special messages to the Congress. He employed the device primarily for the purpose of urging action upon specific bills. It remained for Woodrow Wilson to capitalize upon the strategic potential of the special message. Because he chose to deliver all but one of his thirty-one messages—regular and special—in person, he achieved a dramatic effect that contributed significantly to his effectiveness as legislator. Since Wilson's day the special message has been accepted as one of the most potent legislative instruments in the possession of the President, although succeeding Executives have revealed wide disparity in their skill in using it.

THE PERSONAL MESSAGE

The same must be said for the personal message. Wilson's practice of delivering his messages in person pleased Harding's sense of pageantry, and he continued the custom, with no particular result one way or the other. Coolidge, from what motive it is not known, decided to retain the tradition. In his first annual message he called attention to thirty-three different items of suggested legislation. Congress responded by passing only one. Whether this rebuff was too painful or whether for other reasons, this was the first and last message Coolidge delivered in person. All his subsequent communications were read in the houses by the clerks. Their reception was something less than cordial if legislative results may be accepted as a criterion of judgment. In his biography of Coolidge, Mr. C. M. Fuess quotes a newspaper editor's comment, "Congress has devoted itself to bloodying the President's nose, boxing his ears, and otherwise maltreating him." [2] The record seems to bear him out.

VARIED CONFIGURATION

Presidential leadership in legislation remains a fascinatingly speculative topic. As the foregoing account demonstrates, there is striking variation among different Presidents in the influence they wield in legislation. Constantly changing combinations of factors, including the personality, the attitude, and the philosophy of office of the incumbent, and such external considerations as party composition, contemporary conditions, and the conjuncture of events, bear directly upon the President's legislative achievements. Even the weakest is far from being totally without influence, while the strongest is by no means omnipotent. The man who enters the White House with no well-defined philosophy of office cannot remain there long without being compelled to formulate at least a few rule-of-thumb precepts with which to meet his legislative problems. Similarly, he who takes with him into the high office a well-formulated theory of executive leadership must soon find situations which do not lend themselves to the deductive method.

To paraphrase a great Chief Justice who was also a one-time candidate for the office of Chief Legislator, the Presidency of the United States is what the incumbent conceives it to be—provided he can persuade Congress to accept his view.

Lawrence H. Chamberlain, Ph.D., New York City, is professor of government at Columbia University. Since 1950 he has also been dean of Columbia College. He has served as a research and staff consultant in state and local government. Among his books are President, Congress and Legislation (1946) and Loyalty and Legislative Action (1951).

The President as Administrator

By Herman Miles Somers

IT may be that full performance of the duties which have accrued to the President is impossible. William Allen White, who knew the job in less frenetic days, thought "the devil invented the Presidency by combining all the futile despairs of Sisyphus with the agony of Tantalus and shaking in a jigger of the nervous irritation of a man with ants in his pants."

Too Big a Job?

Even in days when the nation and its government were smaller and simpler, Presidents cried for help. Almost every President in this century has publicly complained that he could not fully cope with his administrative responsibilities. More than fifteen years ago, President Roosevelt transmitted to Congress the historic study of the Federal Government made by the Committee on Administrative Management, and added:

> . . . they say, what has been common knowledge for twenty years, that the President cannot adequately handle his responsibilities, that he is overworked; that it is humanly impossible, under the system which we have, for him fully to carry out his Constitutional duty as Chief Executive, because he is overwhelmed with minor details and needless contacts arising directly from the bad organization and equipment of the Government. I can testify to this. With my predecessors who have said the same thing over and over, I plead guilty.[1]

Twelve years later, the celebrated Hoover Commission reported as its first findings: (1) "The executive branch is not organized into a workable number of major departments and agencies which the President can effectively direct. . . ." (2) "The line of command and supervision from the President down through his department heads to every employee . . . has been weakened, or actually broken, in many places and in many ways." (3) "The President and the heads of departments lack the tools to frame programs and policies and to supervise their execution." [2]

More recently *Fortune* reported that "according to old hands around the White House, the job of the Presidency has doubled in scope even since the peak effort of World War II." [3]

Under the best of circumstances, the proper management of the executive branch alone, now numbering 2,500,000 civil servants, plus the military organization of which the President is also administrative chief, would be a back-breaking ordeal (quite aside from the President's other full-time jobs); but neither the Congress nor the American people seem interested in helping to create the best of circumstances. On the contrary, a formidable array of obstacles, nettles, and mousetraps has been thrown in the President's path. These are frequently called "safeguards"; but just what or how they guard has never been made clear. In fact, they are in part the painful expression by Congress of its own frustrations. In part they represent the normal compromises, concessions, and contradictions of conflicting forces in a highly pluralistic society.

This discussion attempts to: (1) enumerate some of the impediments unnecessarily hampering the President, (2) appraise the internal co-ordinating machinery available to him, (3) describe the difficulties in departmental organization, (4) suggest the manner of man who might best meet the challenges of the job, and (5) suggest some initial and practicable reforms for the new administration.

Impediments

A legislative assembly cannot govern. Consequently, the Constitution wisely gives the President indivisible executive authority. "The unity of the executive," advocated in *The Federalist* papers, remains a cardinal principle of the formal Constitution (and of most theories of organization), but has never been achieved in practice. Congress and the courts have diffused executive authority and fragmented the executive branch into relatively autonomous units at several levels. The pressure groups also promote an atomized bureaucracy, which, like a disorganized Congress, they find much easier to manipulate.

The Constitution charges the President with the responsibility "that the Laws be faithfully executed," but the doctrine is not supported by the necessary machinery.

1. The President is denied authority to determine the organization and structure of the executive branch for which he is responsible. The first recommendation the Hoover Commission made to Congress was that the President be given authority to initiate reorganization plans, subject to veto by joint resolution of Congress. This resulted in a grant of authority which expires in April 1953.

2. A substantial portion of the executive functions of government has been placed completely out of the reach of the President in a category often referred to as a "headless fourth branch of government."

3. Committees of Congress, themselves fairly independent of Congress, have undertaken to direct the affairs of individual departments or bureaus through direct relations with them. The United States Corps of Engineers, for example, which neither the Secretary of the Army nor the President of the United States has been able to control, likes to refer to itself as "the engineer consultants to, and contractors for, the Congress of the United States." [4] As far back as Jefferson's administration, Fisher Ames complained that congressional committees had become "ministers." [5]

Because of its internal anarchy, the Congress has itself become imprisoned by the usurpation of power by individual committees. Agency officials, trained to smell the sources of power, sometimes form alliances with congressional committees against the fulfillment of portions of the President's program. This has led one of our most acute students of government to observe that "the real issue is then between the executive bureau and the congressional committee, on the one hand, and on the other hand, the Congress as a whole and the President." [6]

4. Personnel policy and personnel administration lie at the very heart of top executive management. This indispensable tool has been denied to the na-

[4] For an able account of this unofficial revision of Constitutional doctrine, see Arthur Maass, *Muddy Waters: the Army Engineers and the Nation's Rivers*, Cambridge, Mass., 1951.

tion's Chief Executive, despite the urging of every important study of the Federal Government. The Committee on Administrative Management charged that the United States Civil Service Commission was no exception to the rule that "board administration tends to diffuse responsibility, to produce delays, and to make effective co-operation or vigorous leadership impossible." It recommended unification of responsibility in a Civil Service Administrator. Congress refused. The recommendations of the Hoover Commission twelve years later did result in the allocation of administrative authority to the Chairman of the Commission, but the recommendation that he become part of the President's Office was not followed.

5. Although the executive budget is almost universally accepted as a sine qua non of effective administration, the President does not have the power of "item veto," which has been demonstrated to be a primary source of economy and good management in many state governments. Also, appropriations are often made in such great detail that administrative form and process are strait-jacketed.

6. In practice, Presidents have found that their ability to handle the most difficult administrative job in the world depends, in large degree, upon the same factor conditioning their capacity to cope with the "built-in" rivalry of Congress: political strength, based on popular and party authority. Recently even this resource of popular Presidents has been abridged. The Twenty-second Amendment to the Constitution assures sharp curtailment of Presidential leadership, at least during the latter half of a second term.

The word and intent of the Constitution notwithstanding, without adequate control of the bureaucracy the President cannot meet his administrative responsibilities. Administrative integrity cannot be achieved without Presidential control of the organization and personnel of the government and its internal co-ordinating machinery.

Clearly, the problems of Presidential administration go far beyond legal authority and procedural mechanics. Perspective requires that the issues be recognized as reflecting the composite of political, social, and economic relations of our society. And much depends on the caliber of the man. But the *possibility* at least of securing co-ordinated and responsible administration rests in giving adequate administrative authority to the Chief Executive.

Co-ordinating Machinery

Only recently have we recognized that while executive accountability is ultimately centered in a solitary individual, the *Presidency* is an institution. It is an organization, a group enterprise, of which the President is in charge, setting the pace and determining its character. Only through the effective operation of this institution, which furnishes the staff tools of executive co-ordination and control, can the President be expected even to approximate his Constitutional obligations. Were it not for some structural continuity in the institution, a new President would hardly stand a chance.

The issue of staffing the Presidency is old (Congress resisted importunities for assistance made by Presidents in the early nineteenth century); but the modern conception of an Executive Office of the President dates back only to 1937 and the Report of the Committee on Administrative Management, though in a germinal sense one might look to the discussions surrounding the Budget and Accounting Act of 1921. The Committee's signal contribution was its sharp portrayal of the Presidency as the pivot of federal administration, all other aspects being secondary. As a consequence, the Executive Office of the President was formally established in September 1939, one of the great landmarks in the administrative history of this nation.

Structural weakness and changes

The passage of years, however, revealed some impressive shortcomings in the original structure as well as in the Committee's recommendations. By present-day standards, the Committee construed "administrative management" narrowly. It concentrated upon personnel management, fiscal management, planning management, and administrative reorganization of the government. Little consideration was given to the broader administrative responsibility for program and policy co-ordination on a systematic basis. Partly because of this omission, no provision was made in the Executive Office for any form of staff integration or internal co-ordination. The Office was an amorphous array of separate units.

It may be that the Committee was placing reliance on the Cabinet for such policy co-ordination. It is, however, the uniform judgment of close observers and the testimony of former Cabinet officials that the Cabinet has never been an effective instrument for formulating policy or for co-ordination. In its present form, it is unlikely so to develop.

World War II dramatized both the tremendous assets of an organized Presidency and the shortcomings of existing arrangements. Throughout the period of defense preparation and the early part of the war, there were widespread demands for an "over-all czar" to cope with the apparent lack of adequate machinery for central policy and program co-ordination. A series of improvisations culminated in creation of the Office of War Mobilization in 1943, which satisfied immediate needs and, in large degree, furnished necessary staff leadership in the Executive Office.

Since that time, important changes have been made in the design of the Executive Office. The postwar additions reflect the growing recognition of the need for better facilities for policy and planning control at the pinnacle.

The Council of Economic Advisers (1946) and the National Security Resources Board (created 1947; added to the Executive Office in 1949) may be broadly construed as replacements for the ill-fated National Resources Planning Board (eliminated by Congress in 1943). The National Security Council (1947) was created in an attempt to obtain better policy and program co-ordination of military and diplomatic goals, through the long-advocated device of an active Cabinet-level committee with a secretariat.

In June 1950 the President appointed Averell Harriman "Special Assistant" in connection with matters requiring "the integration of the various interests of the departments and agencies concerned with the development of government-wide policies related to our international responsibilities." The title lapsed with the passage of the Mutual Security Act of 1951 which created the office of Director for Mutual Security in the Executive Office, and Mr. Harriman moved over into the new post.

Within a few months after the outbreak of hostilities in Korea, the President created the Office of Defense Mobilization (December 1950) in the Executive Office, with direct authority over all phases of governmental activity related to economic mobilization.

Present setup

At the present time the Executive Office is composed of the following units:

1. The White House Office (includes the President's secretaries, aides, and administrative assistants);

2. Liaison Office for Personnel Management (technically separate, but in practice always occupied by one of the administrative assistants);

3. Bureau of the Budget (the oldest and largest unit in the Executive Office, and its institutional core);
4. Council of Economic Advisers;
5. National Security Resources Board;
6. National Security Council (whether it is, in fact, the Council or its secretariat that is in the Executive Office might be argued);
7. Central Intelligence Agency (operates under the direction of the National Security Council and therefore is perhaps improperly shown as a separate unit);
8. Office of the Director for Mutual Security;
9. Office of Defense Mobilization;
10. Office for Emergency Management (not presently in operation, but the President can bring it back to life any time he wishes. It proved an important legal convenience during World War II for the quick establishment of emergency agencies through Executive order).

Hoover Commission's findings

The Hoover Commission's approach to problems of the Executive Office was generally similar to that of the Committee on Administrative Management. It too recognized that the effectiveness of the Government of the United States rested on the ability of the Chief Executive to provide "firm direction to the departments and agencies" and orderly "organization for development and execution of policy." It found the President still dangerously "handicapped" for the performance of his responsibilities. In its first report the Commission submitted specific recommendations and valuable conceptual principles regarding the Office. It said that the President must be boss of his own office and "should be given complete freedom to adjust the internal relationships." It also said, "Statutory authority over the operating departments should not be vested in any staff or staff agency of the President's Office."

It appears that Congress does not intend to follow these recommendations. In 1951, for example, it legislated that a Director for Mutual Security, who would serve as co-ordinator in this entire field, should be located in the Executive Office and that the same man who held this post should be the administrator of a large operating agency, the Mutual Security Agency. Congress thereby flew in the face of the Hoover Commission precepts and violated other elementary principles of organization by making a single official both protagonist and umpire in interagency disputes.

The Hoover Commission enunciated the principles that multiheaded bodies, in the nature of full-time boards, could not serve effectively as Presidential staff, and that the heads of staff agencies in the President's Office "should be appointed by the President without confirmation by the Senate, except the Civil Service Commission." It specificially pointed to the Council of Economic Advisers as an example of violation of both principles, and recommended that it be replaced by an Office of the Economic Adviser with a single head. This was not done. The authority of the National Security Resources Board was transferred from the Board to its chairman, but his appointment still requires Senate confirmation.

The Commission took cognizance of the lack of organization within the Executive Office, pointing out especially that there is no place in the Office where the President can look for a current summary of principal issues on staff work or assignments to departments and agencies. Its recommendation to meet this deficiency indicated that it is much easier to determine what is wrong than to reach agreement upon a solution. The compromise proposal was a new staff secretary whose prescribed functions suggest a high-class clerk for clearing and assembling papers for the President. Some of the Commission's members apparently hoped that such a position, once established, might grow into a more affirmative and influential role of "staff leader."

Deficiencies and progress

Meanwhile, the crucial issues of coherent organization and internal staff relationships in the Executive Office remain unresolved. This affects more than the adequacy of assistance. A Chief Executive can become a prisoner of the imbalances in his own organization. Ultimate decisions must rest upon the solitary figure of the President. He must therefore be sure that when issues reach him for decision they have had staff appraisal from all the different aspects of Presidential responsibility, and that all viewpoints on vital controversies reach him through persons representing such different views. This protects the President's judgments and his position.

The present deficiencies of the Executive Office should not, however, becloud the remarkable progress made during the last decade. The Executive Office is only thirteen years old. Large sectors are post-World War II developments. That it has not yet shaken down to a cohesive and orderly structure should not be discouraging. More informal coordination has been achieved internally than the formal structure suggests. In part, such institutions tend to achieve balance through an evolutionary process. For example, more and more of the legislative clearance function, basically located in the Bureau of the Budget, is passing into the hands of the White House staff without any formal ordering.

The general competence of the Executive Office is high. Acceptance of its Presidential functions are being achieved throughout the government. The present Chief Executive appears to make broader use of staff assistance than did his predecessor, and it may be as *Fortune* has optimistically noted, that this development "has provided the President of the United States for the first time with the machinery and manpower necessary to run an orderly government in these complex days." [7]

DEPARTMENTAL ORGANIZATION

Proper staffing of the Presidency will not alone provide a solution of the President's organization problems. Departmental organization is also vitally important. Three issues stand out:

1. The existence of commissions executing some of our most important statutes, claiming virtual independence of the Chief Executive, mocks attempts at meaningful co-ordination of government policy and administration. The independent agencies are generally regulatory in nature. Regulation is essentially political, concerned with the formulation of public policies. Independence of the Executive and, in some cases, even of the legislature, makes these agencies essentially irresponsible. There is indeed "very great danger in any doctrine that pretends we can preserve democracy and still vest economic powers in a governmental agency that is not clearly subject to officials who in turn are responsible to the people." [8]

2. There are entirely too many agencies for effective direction from the top. According to the Hoover Commission:

> At the present time there are 65 departments, administrations, agencies, boards and commissions engaged in executive work, all of which report directly to the President—if they report to anyone. This number does not include the "independent" regulatory agencies in their quasi-judicial or quasi-legislative functions. It is manifestly impossible for the President to give adequate supervision to so many agencies.

[7] *Fortune*, February 1952, p. 79.

[8] James W. Fesler, "Independent Regulatory Establishments," in F. Morstein Marx, Ed., *Elements of Public Administration* (New York, 1946), p. 228.

The Hoover Commission, like its predecessor Committee on Administrative Management, made useful recommendations for an orderly combining of agencies to reduce the total number. It is now clear that for the most part, Congress cannot heed such recommendations.

Recently, interesting proposals have been made for creation of a new echelon of command, between the departmental and Executive Office levels, through grouping of departments and agencies with particularly related activities.[9] If modeled after the integrated structure of the Department of Defense in which are combined three administrative departments, as distinguished from its predecessor the National Military Establishment which had statutory authority only of a holding-company character and proved to have no basis of strength, such redesigning may have administrative merit. But, in any event, it is unlikely to appeal to congressional committees.

3. Authority within departments is diffused and uncertain, partly because of statutes through which Congress has too frequently spelled out the internal organization of departments and agencies and has given authority directly to subordinate officers. In part, the situation is due to the informal power relationships which align bureaus and agencies more closely with congressional committees than with their organizational superiors.

In greater or less degree, all three of these impediments to unified executive administration reflect the congressional-Presidential rivalry within our system. Even more, they reflect the lack of organization within Congress. As long as Congress remains a congeries of warring factions, its committees are encouraged to usurp powers properly belonging to the whole of Congress, and to divide up the executive branch into colonial empires directly subject to committee domination.

The danger is great on many scores. As one distinguished scholar recently warned,

> It is extremely doubtful if government by congressional committees can be justified on either democratic or expediential grounds, because the standing committees of Congress are very nearly the *least representative* institutions in the government.[10]

It is insufficiently recognized that the proper organization and functioning of the executive branch is greatly dependent upon the internal organization and management of the legislature. As long as Congress is disorganized, it will continue to promote the disorganization of the executive branch. As long as the executive branch is fragmented, it will be difficult if not impossible for the Congress to hold it accountable. Only by strengthening the control of the Chief Executive, with whom it can deal in direct and unitary fashion, can the Congress ever assure to itself administrative accountability of the bureaucracy.

PRESIDENTIAL QUALIFICATIONS

Adequate administrative machinery is indispensable, but it will not do the job alone. The office of President properly remains flexible and keeps being recreated in the image of the man who occupies it. The character of the President will be foremost in determining the quality of leadership which will be exercised and the quality of personnel which will be attracted to and selected for key positions. The best of formal equipment can remain unused or misused. What manner of man appears most promising for the most complex administrative job in the world?

[9] For one such proposal, see George A. Graham, "The Presidency and the Executive Office of the President," *Journal of Politics*, November 1950, p. 619.

[10] E. E. Schattschneider, "Congress in Conflict," *The Yale Review*, Winter, 1952, p. 189.

As White House correspondent Merriman Smith put it a few years ago, "A President is Many Men." Other aspects of the job are discussed in other essays in this volume. Although it is convenient for analysis to distinguish the facets of total responsibility, it would be an error to suppose that these can really be compartmentalized in practice. Long experience has demonstrated that a President is likely to succeed in most of his jobs or in none. They are mutually dependent. A President who is not a skillful political leader is not likely to be able to rise above his administrative handicaps. The President is not politician *and* administrator; he is rather a *political administrator*. His administrative success will depend not alone on management skills in the more conventional sense, but also on his skill in political manipulation and on his popular support.

The "pros" have done well

The task of the Chief Executive is thus essentially a job of good management made possible through political leadership and inspiration. It is therefore not surprising that, with few exceptions, the men who have most ably filled the job have had a long nurturing in party politics. Of the six American Presidents voted "great" by a poll of fifty-five scholars of American history and government,[11] four were professional politicians—Lincoln, Franklin Roosevelt, Jefferson, and Jackson. A fifth, Wilson, had served with distinction as Governor of New Jersey (and it is perhaps incorrect not to count his previous presidency of a university as toughening political experience). Only Washington falls in a special class. Of the four Presidents voted "near great"—Theodore Roosevelt, Cleveland, John Adams, Polk—all were professional politicians.

On the other hand, the men who were relative strangers to party politics and party leadership when they entered the Presidency have a much lower average. Grant, for example, strictly a military hero before his first nomination, is one of the two American Presidents acknowledged as "failures," while Zachary Taylor, who had never voted before he moved to the Presidency, is generously graded "below average."

The "great" Presidents were great leaders of their parties.

> Washington aside, all the titans had their hearts set upon becoming President and, defying the adage that the office should seek the man, spared no effort to bring it about. Elected as political chieftains, they continued, moreover, to function in that capacity in the White House, one badge of their greatness being the ability to advance their country's interest at the same time as their parties'. Scratch any of these demigods and you find a party man—a fact which tends to be forgotten in later years when the heat of partisan strife has cooled and the men themselves have become wax images in school histories.[12]

Former governors

Among the politicians, the tendency is for former governors to be most at home in the political administrative duties of the White House. The governorship of a large state is, on a smaller scale, the job most nearly resembling the Presidency. Although this is not the primary reason Americans have in this century chosen more Presidents and Presidential candidates from among state governors than from any other group (even though there are obviously twice as many Senators from whom to choose), this appears to have been a course of wisdom. There have been thirteen election campaigns in this century. Fifteen of the twenty-six candidates of the two major parties were former governors (not including W. H. Taft, who was governor of the Philip-

[11] See Arthur M. Schlesinger, *Paths to the Present* (New York, 1949), pp. 93–111.

[12] *Ibid.*, p. 104.

pines). Of the nine men who have occupied the office of President, five were former governors. Of the other four—Taft, Harding, Hoover, and Truman—only two had served in the Senate. Former governors have been in the Presidential seat more than thirty-four of the fifty-two years in this century.

Type of leadership

The combination of training in the school of electoral politics and experience as political executive appears generally to work out best. The successful administrator in business enterprise or in military combat generally finds that his skills are not directly transferable or convertible to political administration. The different kinds of administration not only represent different habit patterns, but seem to require different types of personality. The man accustomed to giving orders with the expectation that subordinates will automatically follow or bear the consequences will find the Presidency frustrating and baffling. The man who operates by making up his mind what is "right" and then driving ahead accordingly, irrespective of opposition, is likely to find the Presidency a strait jacket with taunting shackles.

The political administrator makes his leadership felt by media of persuasion, by winning wide public support, and by being a successful "lubricator of human relations." He cannot be doctrinaire or unyielding. He must be a man who can elevate compromise and draw out of it a creative principle. The necessity of harmonizing conflicting interests of functionally divergent groups in a pluralistic society is the most crucial task of top-level administration, just as it is of politics.

The President undertakes to coordinate not only the activities of an array of federal agencies but, through them, the conflicting tendencies and desires of our whole socioeconomic system. The basic conflicts cannot be "ordered" out of existence. Their reconciliation, issue by issue, is the keynote of democratic administration. And experience has taught us that "democracy is more efficient than efficiency."

Yet the great Presidents have also been strong and affirmative leaders. All were regarded as relatively "radical" in their own day. Each made the office as big as he could, and each left it more influential than he had found it.

A variable formula

However, it would be a mistake to attempt to fix the most desirable background for the Presidency into a mold, just as it is to fix the "right" procedures for him to follow. Human personality is flexible and unpredictable. Not every political background or business background or military background is the same as every other, nor does it have the same effect upon every man. For example, detractors of one of the possible candidates of 1952 (this is being written before either nominating convention), General Eisenhower, allege that he never was a real combat general, but rather a "chairman-of-the-board" commander or a political organizer in the military field. If true, this illustrates that intended derogation in one field may be commendation for another, as such talents are greater assets for the Presidency than those ordinarily associated with combat effectiveness.

Moreover, as President Franklin Roosevelt said of the Presidency, "It is pre-eminently a place of moral leadership." The consciousness of this fact and the searing responsibilities of the office have had a remarkable influence in molding the personality and the ability of men after they have assumed office. Presidents have often surprised themselves and their generations by their growth in office.[13]

[13] For a perceptive discussion of this phenomenon, see Eric F. Goldman, "The Presidency as Moral Leadership," THE ANNALS, March 1952, pp. 37–45.

THE NEXT ADMINISTRATION

The Presidency is today the prime motive force in our Constitutional system. Our political and economic evolution and the nature of our party system have focused upon the President responsibility for the origin of major policies and programs and for the implementation and effectuation of policies approved by Congress. The American system, in which the Presidency is a representative institution—elected by universal suffrage—emphasizes the fact that co-ordination of politics and administration is necessary in a democratic nation.

In our complex society, responsible leadership must have the means of ensuring that policy will not be distorted in its administration, and must have control of the ever broadening areas of decision-making and policy determination which are implicit in the administrative process.

Presidential administrative difficulties are intertwined with the fundamental issues of political organization facing American society, including the complex problems of deficient party organization and party discipline. The basic factors are the same as those which encourage increasingly dangerous stalemates between President and Congress, which make the legislature and the bureaucracy unduly vulnerable to powerful private interests, and which give to extremists in Congress a disproportionate influence. The fate of the largest share of even so popularly dramatized reforms as those proposed by the Hoover Commission and endorsed by the leadership of both parties illustrates the unreality of treating administrative revisions as things distinct from the political environment.[14]

Suggested improvements

Nevertheless, there are several administrative improvements which, on the basis of precedent or related experience, appear to have a chance for practical achievement if demanded by a new and popular President during his "honeymoon period." Among them are four points which ought to be regarded as a minimum program for early achievement.

1. The President should be given permanent authority to initiate plans for internal reorganization of the executive branch, such plans to take effect unless rejected by joint resolution of both houses of Congress within a specified time. Presidents have already been given similar authority for temporary periods. Congress has demonstrated that its power of veto under such an arrangement is amply adequate. Such permanent executive initiative would go far toward correlating authority and responsibility and would offer some operational basis for workable reordering of the executive branch structure. Considerable useful reorganization has already been achieved in this manner which could never have been accomplished otherwise; for example, placing the collectors of internal revenue under the merit system.

2. The highly successful operation of the National Security Council has provided a case study of how the Cabinet may be made a viable instrument for executive policy co-ordination and how the Executive Office may be molded into a coherent organization without the monolithic dangers of a single "chief-of-staff" arrangement.

The NSC has demonstrated that Cabinet-level committees, given a circumscribed area of jurisdiction and continuing responsibility, with members selected because of direct functional

[14] See Avery Leiserson, "Political Limitations on Executive Reorganization," *American Political Science Review*, February 1947, pp. 68–84.

relationship to the committee's jurisdiction, can be effective instruments for Presidential counsel and co-ordination. One of the elements in its success has been the continuous efficient staff work of an able professional secretariat. The experience argues for similar Cabinet committees for other large areas of governmental responsibility which cut across departmental lines, each to be served by a full-time secretariat.

3. The various Cabinet committee secretariats should be interlocking and all attached to and assigned from the Executive Office, where they would be part of a central Presidential secretariat. The central secretariat would co-ordinate the work of the several committee secretariats, and, thereby, of the committees themselves. It should serve as a continuous channel of communication to the President, to whom it would be responsible. The Executive Office would thereby acquire the integrating amalgam it has long needed.

4. The administrative structure is composed of people. If the President cannot reasonably control, within the law, the personnel system of government, it is difficult to conceive how adequate democratic control can be achieved. The merit system, now covering over 90 per cent of federal personnel, can become a boomerang, and is itself endangered, if it is independent of the political officers of government. The objective must be a reconciliation of the principle of merit with the principle of administrative control. Progress toward such an objective can begin by creating a director of personnel, directly accountable to the President. A continuing civil service commission or board should act only in an advisory capacity.

Importance of reforms

Such reforms are within the realm of possible realization by a new administration. Important in themselves, they can also serve as a vehicle for Presidential leadership in continuous administrative reform, with the target of bringing the total job under control. We must all realize that "the reality of responsible government is dependent upon the ability of the President to control the executive branch." [15]

What I am placing before you is not a request for more power, but for the tools of management and the authority to distribute the work so that the President can effectively discharge those powers which the Constitution now places upon him.[16]

This is the type of plea the next President of the United States, whoever he is, is also likely to make. It would be well that he be heeded. It is tempting fate to continue to play the game of challenging greatness to surmount unnecessary and unreasonable barriers. The stakes of government are now too high!

Congressional Contests and the Presidential Election

By JAMES MACGREGOR BURNS

THE conduct of congressional campaigns this fall will reflect the wonderful diversity of American life. In the big cities, candidates for Congress will operate through an elaborate network of strongly entrenched party organizations. In midwest rural areas they will work through loose alliances of local and county party wheel horses controlling "courthouse" machines. In industrial areas many candidates will link themselves closely with labor organizations and will direct their appeals to workers at the factory gates. In the South most of the candidates, having fought their main battles in the Democratic primaries, will have easy coasting against Republican opponents. And in California, with its "wide-open" primary, a few candidates, having won both the Democratic and Republican nominations, will do virtually no campaigning at all.

Will there be any common denominator in the 435 congressional campaigns and 32 senatorial races across the country this fall? To what extent will legislative candidates, chosen locally, campaign on national issues? How will the winners balance the claims of their states and districts against the claims of the general welfare? What "correctives," if any, are desirable in Washington, in the form of Presidential leadership, congressional reorganization, or changes in the rules of the game, to offset "special" claims? These questions involve not only the elections of 1952 but the shape of American government and of American democracy for years to come.

All these questions embrace in one way or another a classic issue of American domestic statecraft—the scope to be left for decisions at the grass roots. This issue, also couched in terms of federalism or decentralization, is old enough to have demanded close attention by the authors of *The Federalist*, old enough to lie at the heart of John Calhoun's doctrines, and new enough to be heard a thousand times this year as politicians orate about "states' rights."

THE CONGRESSMAN'S RELATIONSHIPS

Members of Congress cannot but represent the hardy localism of American society. Ernest S. Griffith, in his informed study of Congress, says:

> The congressman cannot escape the fact that he is a product of [a] dispersive society—elected by his state or district as its representative, elected in all probability because he is "one of them," believing as these voters believe, his opinions the product of their social milieu, his mores theirs. If his subsequent education and experience have given him a broader view, a deeper insight, he must not openly stray too far from the pattern of thought of his district or he will not return after the next election.[1]

And as George L. Grassmuck has emphasized in his searching study of sectional factors in congressional foreign-policy making,[2] the Congressman is not merely a representative of his constituency, but also a constituent himself.

It would be misleading, however, to look at the problem only in terms of

[1] Ernest S. Griffith, *Congress: Its Contemporary Role* (New York: New York University Press, 1951), p. 108.

[2] George L. Grassmuck, *Sectional Biases in Congress on Foreign Policy*, Baltimore: Johns Hopkins Press, 1951.

national versus local pressures. Actually the candidate for Congress and the member of Congress operate amid a complex set of pressures and vacuums, only a portion of which can be comfortably included within the "national versus local" rubric. Many local influences are also national influences. The local Legion post that has an eye cocked for veterans' legislation, the local doctors who are mobilized against "socialized medicine," the local unions that pass resolutions against Taft-Hartley, cannot be separated from the interest groups operating nationally and focusing their attention on Washington. Our social and economic structure is interlaced by too complex a web of interests to allow us to deposit one set of influences in a compartment marked "local" and a second set in a compartment marked "national."

It is, indeed, impossible for the local candidate to pick up any one strand of action or policy without finding himself enmeshed in a tangle of relationships stretching from his district to Washington, other national capitals, governors' offices, state legislatures, interest group headquarters, and many other places. If and when the candidate goes to Washington as Senator or Representative, moreover, he will become fully enmeshed in the "web of government" in all its intricacy. Less than ever will he find himself involved in a simple locality-versus-nation duality, except perhaps in the case of some straight pork-barrel legislation. Usually he will find himself balancing the assumed interests of certain minorities against those of other coalitions of minorities. Just where the interests of his district fit into the constellation of interests involved, just where any general interest lies, is often far from clear.

Institutional and psychological influences in Washington, moreover, tend to pull the member of Congress away from a total concern with the particular interests of his state or district. In the first place there is the influence of Washington itself, a politically cosmopolitan city, with its opportunities for rubbing shoulders and drinking cocktails with foreign envoys, bureaucrats, military officials, Cabinet members, lobbyists, specialists of all kinds, and so on. Second, there is Capitol Hill, a center of national debate and a nerve apparatus attuned to the slightest tremors in opinion. Third, there is the system of reciprocal personal obligations in each house, which compels a legislator to recognize the interests of his colleagues if he wishes to advance his own. Granted that this system has received far less attention from scholars than it deserves; granted, too, that it often dissolves into a kind of legislative feudalism under the principle of mutual back-scratching; still, its cumulative impact on the legislators cannot be ignored.

COMPARATIVE IMPORTANCE OF PROBLEMS

This emphasis on the multiplicity of influences affecting the member of Congress, rather than on the simple local-versus-national duality, has significant implications. It compels a shift of attention from a smaller and perhaps more difficult problem to a bigger and perhaps simpler one. The smaller problem is the extent to which the Congressman should represent and act for his constituents regardless of the relation between his behavior and the national welfare. Admittedly this is a difficult problem, both because the local and the national good are inextricably mingled, as indicated above, and because the relation between locality and nation is a problem of ethics and of values as well as a question of politics.

Yet this remains the smaller problem; for our system was peculiarly well designed to perform the task of assigning "local" problems to local government. The federal system does not work perfectly. It has shown unfortunate rigidities and some hardening of the arteries. But in its own clumsy way it has managed to sift out the problems that imperatively demanded national attention from those that could be handled with some effectiveness at the state or local level. Moreover, a whole battery of ingenious devices—from grants-in-aid "with strings" to co-ordinating and research agencies like the Council of State Governments—has helped to prevent the federal system from becoming a constitutional strait jacket.

It is at the national level that the problem becomes far more urgent. The domestic and international demands facing our national government during this time of cold war simply overshadow the less grave—although often knotty—problems besetting states and localities. Our problem, in short, is one involving the separation of powers among branches of the national government, not one involving the division of powers among different levels of government (to the extent that the two are separable).

The paramount problem at the national level is a relatively simple one: Can government act? To be sure, government must act wisely, and it must act in response to—or at least with a sense of responsibility toward—popular needs and expectations. But an even prior question with our system is the elementary one of whether the national government can summon its resources flexibly and persistently in the face of an endless tide of problems demanding quick and effective action.

DIFFUSION OF POWER

The main obstacle to effective national action is a familiar one: the fragmentation of power and responsibility. This fragmentation takes many forms: conflict between President and Cabinet members, among Cabinet members themselves, among rival bureaucracies, between military and civilian establishments, and, to a less extent these days, between judges and elected officials. Behind much of this conflict, inspiring it and intensifying it, are the 531 members of Congress who reflect in their actions and views the pushing and hauling of diverse economic, social, and ideological interests.

Legislators not only reflect the heterogeneous group life of the nation and the internal group life of the legislature; they are themselves members of a multiplicity of overlapping groups, as David B. Truman has made clear in his important recent study, *The Governmental Process*. He says:

> A prime reason for the complexity of the legislative process in the Congress and various of the state legislatures is the absence of an integrated and continuing leadership. The diffusion of power within the legislature, the multiple lines of access, and the diverse means of leverage make an inherently complex process still more complicated. Under such circumstances, logrolling and alliances between groups—inevitable elements in a process that relies upon the device of majority rule to settle differences—become a means for compensating for the diffusion of power.[8]

As Truman emphasizes throughout the study, the diffusion of power exists not only in Congress but throughout the whole governmental system. The institutional source of this diffusion, however, lies chiefly in Congress, largely because of its legislative power and its control of appropriations.

What is the significance of this fact for 1952 and the years ahead? It has

[8] David B. Truman, *The Governmental Process* (New York: Alfred A. Knopf, 1951), p. 392.

been argued that Congress will be a fatal chink in our armor in the event of all-out war. Slow-moving parliamentary institutions, it is said, are incompatible with the demands that would be imposed on a government mobilized to resist a large, industrialized nation. This argument is not wholly valid. As Lincoln, Wilson, Franklin D. Roosevelt, and Truman have demonstrated, in time of war (even of limited war, as in Korea) the President can resort to a plethora of emergency powers. Congress will not stand in the way. To be sure, the Commander in Chief will be subjected to heckling, investigations, and occasional flank attacks from the congressional ranks; but Congress will not fatally handicap the mobilization of military and economic power.

OUR BALANCE-OF-POWER POLICY

The problem is not one of war, but of preventing war while maintaining national security. Our present foreign policy, supported in broad principle by both political parties, is designed to prevent all-out war and to protect our security by means of balance-of-power methods operating through an elaborate system of alliances. The balance-of-power methods embrace economic and ideological techniques as well as military. The system of alliances covers much of the free world.

Whatever may be said about the wisdom of this kind of foreign policy, one thing is clear: it is the most difficult of all types of foreign policy to carry out. Compared with it, strategies of isolationism such as the United States pursued in the 1920's, of aggression such as Hitler pursued in the 1930's, or even of "neutralism" such as Switzerland pursues today, are child's play. Balance-of-power policy calls for the most careful evaluation of shifting power relationships, and for a capacity to move quickly on different geographical fronts and with different instruments of power, to mobilize economic and military power quickly and selectively, and to maintain political leadership and "followership" for a program that seems to many voters to be neither one of peace nor one of war. And it calls for a delicate balance between firmness and restraint that would tax any democratic polity.

A balance-of-power foreign policy also calls for ample governmental power and for effective governmental mechanisms through which that power can be channeled quickly and focused on the problem at hand. It requires not one mighty effort intended to solve a foreign policy problem once and for all, but rather a series of actions day in and day out, year in and year out, perhaps over a period of decades. These actions are addressed to a tremendous variety of specific problems, from a military action in Greece to a famine situation in India, from a trade relationship with Denmark to an ideological tactic in the Far East. The essence of the handling of all these activities, however, is the co-ordination of them; for careful blending of all our policies, economic, diplomatic, military, and ideological, is by definition the cardinal requirement of a balance-of-power policy.

CENTRIFUGAL NATURE OF CONGRESS

It is precisely in this respect that Congress is put to the most exacting tests and often fails to meet them. As virtually every study of our national legislature has indicated, Congress expresses not a concentration of power, but its dispersion. Operating amid a swirl of influences, it embodies superbly the pluralism of America, but by the same token it reflects our separatism and disunities.

The difficulties are well known. The leadership has some centripetal influence on the members, but not very much. Party organization and discipline, which do the job of integration in some legislatures, are largely lacking in Congress. Both Senate and House have machinery capable of central direction, such as caucuses and steering or policy committees; but these lack real power. The important existing machinery, such as the committee system and the seniority rule, works toward diffusion rather than integration. The parliamentary rules, such as those permitting filibusters in the Senate, both reflect and exacerbate these dispersed-power arrangements.

A mere listing of the recent cases in which these arrangements in Congress have disrupted or threatened to disrupt our foreign policies would take many pages. Examples could be cited such as the interminable delays in appropriating for foreign aid money previously authorized by Congress; the inclusion in legislation of arbitrary requirements responsive to "special" interests; the McCarthy type of attack on foreign-policy makers—attacks almost as embarrassing to responsible opposition leaders as to the administration itself; the disruptive pressures exerted by Congressmen on individual agencies; the tendency of Congress to respond to the alternating popular moods of frenzied concern with foreign policy and apathy toward it so well analyzed by Gabriel Almond in his study of *The American People and Foreign Policy*.[4]

It must be stressed again that many of these failures involve matters that may not reach the headlines. For example, an epic battle was fought in Washington following World War II over the question of the sale of some tankers to foreign nations. The problem was not of urgent concern compared, say, to establishing the Marshall plan or to building adequate air power.

[4] Gabriel A. Almond, *The American People and Foreign Policy*, New York: Harcourt, Brace and Company, 1950.

Yet it was typical of the kind of recurring issue the successful resolution of which may well determine the long-term success or failure of our foreign policies. The handling of the tanker sale (well described in one of the case studies of the Inter-University Case Program), reflecting both bureaucratic and congressional breakdown and finally consummated only after months of delay, confusion, bickering, and waste motion, raises serious questions as to the governmental and political resources we can mobilize behind our balance-of-power foreign policies.

DOMESTIC POLICIES

So much for the international aspects of the problem. Equally grave questions can be raised about the handling of domestic policies (if they are separable from foreign policies) in 1952 and the years to come. Here again the indictment of Congress cannot be a blanket affair. Congress has repeatedly shown its capacity to meet individual economic or social problems, as indicated in recent decades by labor legislation, social security provisions, agricultural programs, and the like. The rub comes in matters involving action to meet general economic problems cutting across groups and geographical sections.

The dimensions of this broader economic problem, which received considerable attention in the depression and New Deal years, have been obscured in recent years, largely for two reasons. In the first place, we have been enjoying unprecedented prosperity except in a few sectors of the economy such as textiles. Second, there is a general feeling, aided and abetted by certain economists, that in the event of recession or depression the authorities need only open the sluice gates of governmental spending in order for the economic ship to right itself.

This hope may be a valid one. Yet in the opinion of some observers, the economic crises of the future may call for more complex recipes. Such crises may demand highly co-ordinated programs involving carefully timed action on a number of economic fronts: spending, taxes, wages, prices, investment, profits, building development, resources, and others. If this expectation is correct, the same factors that cripple Congress in the face of the demands of modern foreign-policy making will cripple it in the face of domestic economic policy. Action would be piecemeal, spasmodic, unco-ordinated, reflecting day-to-day shifts in public opinion rather than comprehensive and long-term planning.

AVENUES OF REFORM

If this is a valid diagnosis of the fundamental problem of Congress as it faces the 1952 elections, what can be done about it? Scholars, politicians, businessmen, and many others have devoted a good deal of attention to the issue of reform. Some have stressed the need for Constitutional reform. Others have called for mechanical reforms in the operations of Congress or in the relations between legislators and President. Still others have urged changes in the organization of political power in the party system.

Each of these approaches has its advantages, but each suffers from some crippling weakness. Proposed Constitutional changes, such as those calling for the election of the President by Congress and the power of Presidential dissolution of the legislature, have the advantage of going to the heart of the central problem, namely, the chasm between the Chief Executive and the lawmakers. The trouble with them is that such Constitutional changes would be immensely difficult to achieve, given our amending processes, and even if achieved, they might give us unity between Capitol Hill and White House only at the expense of a grave contraction of Presidential power and initiative. This would be a dangerous experiment at this juncture of our affairs.

Organizational and mechanical changes would help. Indeed, a few minor ones have been put into effect in recent years, with some success. Yet they would do little more than scratch the surface of the problem; for that problem involves not simple communication among legislators or between President and Congress. It involves not merely the flow of work and the need for efficient handling of the colossal pile of business. It involves essentially the organization of power—the problem of who gets what, when, and how.

The power situation of the average Congressman turns largely on his relations with the voters back home. Those relations in turn depend on the multiplicity of pressures and vacuums amid which the legislature operates, as noted above. Organizational and mechanical changes will not deeply touch those relations, for they lie largely outside the ambit of congressional structure.

To be sure, such changes might reorganize the pattern of influences operating on the Congressman in Washington, and these influences are not unimportant. Still, such influences are not central compared to the broader forces at work in the state or district, and in any event, attempts to change them by frontal attack might bring some unforeseen results.

PARTY REFORM

It is for these reasons that many students have considered political party reform to be by far the most promising way to bring the President and Congress together and to enable the national government to act. A great virtue of party reform is that no formal Constitutional change is called for. Another virtue is that party activity is so extensive and pervasive that it could be applied to the multitude of governmental joints that need greasing, rather than being limited to one or two. Party reform, for example, would be designed to invigorate the party caucus in House and Senate, to strengthen congressional leadership, and to reduce the powers of congressional committees, minority blocs, and filibusterers. Such reforms would aim at unifying the bureaucrats to an extent hardly observed so far in our era of big government. Such reforms would seek to link Congress and the President without depriving the Congressmen of Constitutional powers, and to stabilize Presidential leadership without stifling it.

Party reform, however, faces many practical difficulties. Perhaps the most serious one is the popular belief in the independence of the Congressman and the popular fear of party discipline. It is significant, for example, that some of the ablest political scientists have opposed party reforms advocated by their brethren (especially by a committee on political parties established by the American Political Science Association), largely because of a fear that party reforms would not allow the necessary adaptability of party ideology and organization to local conditions. Specifically, they have suggested that centralized party control would make it impossible for local organizations to exist effectively in certain parts of the country.

It is probably true that such fears do not take into sufficient account the fact that *any* reorganization of the two-party system would still allow tremendous discretion for local parties in program and action, because of the diversity that would have to be tolerated within any major party, however organized, under the conditions of American life. Still, the very existence of the fear is an index to the depth of the feeling involved.

THE PRESENT ISSUE

Does all this seem far removed from the hurly-burly of the 1952 elections? It should not. If there is any common denominator in the hundreds of congressional races this fall, it will consist of a common recognition by virtually all candidates that the key issues for Americans in the mid-twentieth century are the maintenance of peace and security abroad and of widely distributed economic well-being at home. Not one candidate will take a stand against these goals. The issues of the 1952 election, as far as the role of Congress is concerned, will not be the candidates' position on these questions, or their sincerity in wanting to realize these goals. The issue will be whether our national legislative arrangements will allow Senators and Representatives to help translate popular aspirations into practical realities.

James MacGregor Burns, Ph.D., Williamstown, Massachusetts, is associate professor and chairman of the Department of Political Science at Williams College. He has served as a legislative assistant in Congress, with several federal agencies, with the Hoover Commission, and with the "little" Hoover Commission in Massachusetts. He is the author of Congress on Trial (1949) and co-author of Government by the People (1952).

Present Party Organization and Finance

By Dean E. McHenry

UP to the eve of the national conventions of 1952, no striking innovations marked either party organization or finance. The same customary national party structure prevailed. In the states, with few exceptions, legislation dictated the form of party organization in considerable detail. Money raising continued in the familiar pattern, with major stress on relatively large contributions from well-to-do individuals, businesses, and groups. Federal law regarding campaign finance remained static, despite overwhelming evidence that it is ineffective and as much honored in the breach as in the observance. Recent developments, however, have changed emphasis and have provided new insight into old problems.

Permanent Organization

Much has been written about the formal organization of political parties. The permanent organization consists of the tiers of committees that reach from top to bottom of the party hierarchy. The periodic organization includes the party primaries and conventions, which take place annually, biennially, or quadrennially, and which decide highly important questions of party policy and structure.

Once in four years, in the Presidential campaigns, these party bodies achieve their greatest activity, beginning when the national committees set the time, the place, and the apportionment of the national conventions, and ending after the first Tuesday after the first Monday of November in the exhilaration of victory or the despair of defeat. After the national convention has produced the nominees, the Presidential candidate makes known his choice for national chairman, and the new national committee ratifies it as a matter of course. The chairman, acting under the authority of the national committee and through an executive committee of his own choosing, manages the party's campaign and the party national headquarters. The campaign committees—senatorial and congressional—direct campaign efforts to elect party nominees to national legislative posts.

Below the national level, all states have party state central committees, but their composition and role vary considerably. Some state central committees bear the principal responsibility for conducting the campaigns of the party tickets. In other states, leading candidates may prefer to run "lone wolf" campaigns separate from or parallel to a general campaign under official party committee auspices. State committeemen are chosen in a variety of ways, by election or by appointment, and represent legislative districts, counties, or some other subdivision of the state. They range in size from a handful in some states to more than seven hundred in California.

Informal Organization

Since the primary has become almost universal in the United States, and because in many areas nomination is tantamount to election, attention ought to be concentrated upon organizing and financing primaries. Data on primary operations are difficult to obtain. Official party structure plays little or no

part in the nominating process in most states. The federal corrupt-practices law does not apply to primaries,[1] although such application would probably be held valid in the courts.[2] There are no primary candidates' financial returns on file in Washington inviting analysis. The most recent investigation of campaign expenditures by a House of Representatives committee showed that congressional candidates reported raising and spending more in the 1950 primaries than they did in the general election.[3] The vast area of activity indicated by this expenditure is not ordinarily covered in general descriptions of party activity.

Whether it be a Presidential aspirant working for pledged delegates or a strong vote in preference primaries, or a candidate for state or congressional office, an initial step usually is the formation of a committee in support of the candidate. For the higher offices, such committees often are incorporated as nonprofit corporations in order to free the candidate and his supporters from individual financial liability. Varying widely with state law, the purposes and objects of the corporation may be stated in terms of promoting the candidacy, co-operating with other bodies, developing interest of the electorate, receiving and expending money, suing and being sued, contracting and being contracted with, and other purposes. The candidate himself normally is not a member of the corporation, and is thereby free to disclaim responsibility for the financial transactions of the entity.

The unofficial political committee, while usually free to choose its own internal organizational pattern, often develops one similar to those of official bodies. The top echelon is made up of a general chairman and perhaps a strategy committee composed of chairmen of various staff-type committees, such as finance, organization, and publicity. As in all forms of organization, especially those hastily improvised, strong personalities stand out, and when the campaign ends, someone who was never assigned a regular position may be in de facto charge of some of the most important operations.

The Volunteer Worker

The enthusiasm and energy of the volunteer workers rank with money in importance in building an effective campaign. In many instances, it is dislike or hate of an opposition candidate that provides the initial impetus for the volunteer to offer his services. His transformation into an effective, positive campaign worker generally depends upon the qualities of the candidate and the skill of those whose job it is to put volunteers at constructive work. Although the layers of inertia that blunt the civic consciousness of urban man may be penetrated by hate, his full usefulness after being aroused requires an affirmative cause in which he can believe.

Many experienced campaigners have noted that men and women are increasingly hard to interest in political activity. Preoccupied with his own job or family responsibilities, and absorbed by the opiate of mass entertainment reaching within the home itself, the voter demonstrates unprecedented unawareness of the necessity for widespread political participation in a democracy. In 1952 many a political

House of Representatives, Special Committee to Investigate Campaign Expenditures, *Report of the . . .*, 81st Cong., 2d sess., House Report 3252 (Washington: Government Printing Office, 1951), p. 19. Hereafter cited as *1951 Report*. Committees, however, spent more in the general election.

meeting went unattended and many candidates' work went undone because of habits of listening to or viewing particular programs on given nights on radio or television. The voter appears to be far less informed than he was a generation ago. The proportion of real political activists is declining alarmingly. Can democracy survive with political fertility as monopolized as is reproductive capacity in a beehive? [4]

The able, energetic volunteer passes along some of his enthusiasm as he works through the lists of voters and makes personal contacts with them. In the street canvass or on the telephone he encounters the callous and the timid, the "don't know" and the "don't care." To many he brings their only direct contact with the world of politics. His work is at once invaluable to his candidate and a great contribution to the working of democracy.

WHO CARRIES THE TICKET?

Insufficient attention has been given in the past to the interrelationship of nation-wide campaigns with those of state and district candidates. It has been assumed rather widely that the national ticket carries along with it candidates for state and congressional office. So it does when there is a landslide victory for a Presidential candidate. In given states or districts, however, the state and local candidates may save the day for the national slate. Without strong candidates for governor and senator like Adlai Stevenson and Paul H. Douglas, one could doubt President Truman's ability to carry Illinois in 1948. Great figures like Franklin D. Roosevelt carry in their wake many fellow partisans who otherwise could not have been elected. A lesser Presidential candidate may have to lean heavily upon state and district candidates who are relatively stronger in their own bailiwicks.

The interrelationship between campaigns wholly within a particular state deserves study, also. Weaker candidates, sometimes for higher offices and sometimes for lower, may attempt to sweep to victory holding onto the coattails of those stronger in money-raising or vote-getting power. The technique, carried to the extreme, may be designated "Operation Cowbird," after the bird that lays its eggs in other birds' nests and thereby receives free hatching service. In primary campaigns, and sometimes in finals, candidates that team up for slate operations ought to be able to make relatively equal contributions to the joint effort.

Strategy of a given campaign must, of course, be determined on the basis of the fullest possible information regarding the product to be marketed—the candidate—and the circumstances under which the sale must be made, including an assessment of buyer resistance. A final election in a predominately one-party state presents no special difficulty; the job is to get out enough partisans to make sure that the opposition, such as it is, pulls no surprise. In November 1952, with the American electorate about equally divided between Democrats and Republicans, the national strategists will try both to get out the converted and to attract independent voters. The independent must be cultivated assiduously, for he holds the balance of power, and victory for either side will require his conversion.

CAMPAIGN SPENDING

The best information we have on campaign finance comes from the investigations made by committees of either or both houses of Congress after

[4] In summertime one queen to 200 males to 80,000–100,000 immature females.

elections. Armed with the power of subpoena and the ultimate sanction of punishment for contempt, these committees have built up a great mass of facts and figures upon which some generalizations may be based. Unfortunately, however, Congress did not study expenditures in the 1948 campaign. Reliance must be placed upon the figures reported to the Clerk of the House and to the Secretary of the Senate.

In 1948 the national committees ostensibly conformed to the Hatch Act limitation that restricts spending to $3,000,000. The Republicans reported expenditures of $2,828,651 and the Democrats $2,127,296. The Republican senatorial campaign committee reported spending $500,254, and the Democratic only $49,273. On the Republican side there were also the expenditures of the congressional campaign committee, the National Farm Committee for Dewey and Warren, the National Patriotic Dewey for President Committee, and many others. The Democrats were aided by their congressional campaign group, a National Truman-Barkley club, the National Citizens Committee for the Re-election of President Truman, and others. Labor political organizations reported 1948 expenditures that aggregated $1,291,343, much of which went to help Democratic candidates.

The objects for which campaign money is spent show little change from campaign to campaign. The House committee that studied the 1950 congressional campaign finance reported that the average candidate spent money for the following (in declining order of amount): newspaper and magazine advertising, radio and television time, salaries and expenses of campaign workers, and billboards and signs. Increasing emphasis is being placed on radio and television. Chairman McKinney of the Democratic National Committee announced that $1,000,000 of the committee's budget of $2,800,000 would be spent for broadcasting and telecasting.

SOURCES OF FUNDS

In examining sources of funds, legal restrictions must be taken into account. Federal law and most state laws forbid corporation contributions, but this is easily evaded by paying bonuses or other extra compensation to officers and having them contribute to campaigns. Since 1943 trade unions have been forbidden to contribute, and under the Taft-Hartley Act they are forbidden to spend union funds on political objectives. These restrictions do not apply to sums from unions' political funds that are raised through voluntary gifts. The Hatch Act restricts individual contributions to $5,000 per year to each political committee. This is evaded by contributing $5,000 each to a large number of committees.

The individual contribution from the well-to-do person remains the mainstay of party finance. Large sums are raised indirectly from the same source through high-fee dinners and advertisements in party papers and programs.

It is impossible to assess with any degree of certainty the amount of money that flows into politics from businesses and unions despite the limits on corporate and labor union sources. Not only is the prohibitory law evaded regularly, but the government also loses tax revenue when these concerns pay printing or other bills on behalf of candidates and obscure it in their books as a business expense.[5]

[5] See U. S. House of Representatives, Select Committee on Lobbying Activities, *Report and Recommendations on Federal Lobbying Act*, 81st Cong., 2d sess., House Report 3239 (Washington: Government Printing Office, 1951) for many examples of money sought in this way for political propaganda.

FAILURE OF FINANCE REGULATION

Most of the existing federal laws relating to campaign funds are archaic and ridiculous. Sometimes they do more harm than good. For example, the $3,000,000 limitation imposed by the Hatch Act and the $5,000 ceiling on individual contribution have induced the proliferation of political committees, which has decreased responsibility for spending. The existing maxima on spending by Senate candidates at $25,000 and by House candidates at $5,000 are so far below realistic levels that even the conscientious candidate in a large state or district finds himself referring matters of campaign finance more and more to committees that often do not report their expenditures under federal and state law.

Ceilings on expenditures are unworkable under present enforcement provisions. The honest step is to repeal all limitations on amounts, as California did recently. The main purpose of our corrupt-practices law should be to turn the light of publicity on spending. Consequently, primary emphasis ought to be placed on getting full reports and fixing responsibility for spending. The outstanding weakness of our law can be corrected only when expenditures on behalf of a candidate can be made legally only by that candidate or his appointed agent.

Dean E. McHenry, Ph.D., is professor of political science at the University of California at Los Angeles, and is Democratic nominee for Congress in the 22nd District of California. He formerly taught at Williams College and Pennsylvania State College. He is author of monographs on the political parties of Great Britain and of Canada, and is co-author (with John H. Ferguson) of The American System of Government (1950) and Elements of American Government (1950).

Campaign Methods of Today

By HUGH A. BONE

PERHAPS the first question posed for candidates and their managers is the intensity of campaigning by the nominees themselves, often contrasted in the extreme by the terms "front porch" or "swing around the circle."

THE FRONT-PORCH CAMPAIGN

In the first case, the candidate does a limited amount of traveling and his workers carry the burden of the campaign. In a sense, this technique is the strategy of a superior position of an incumbent, a position gained by reason of a record known and commended to large numbers of voters. It has worked well for many nominees for local office.

On a national scale, Roosevelt in 1940 and in 1944 attempted a stay-at-home campaign, pointing out that the war emergency was keeping him from the usual partisan campaign. On both occasions, however, the President ended by delivering a few speeches outside Washington, D.C. Herbert Hoover in 1932 likewise had to abandon, at least partially, his front-porch campaign. Many of his managers felt that his last-minute tour across the country was a case of too little and too late.

Nonincumbents Abraham Lincoln and William McKinley in their first Presidential campaigns, and Warren Harding in 1920, successfully used the front-porch technique. In each instance they were favored with certain fortuitous circumstances making speechmaking and widespread appearances unnecessary. In each case the country was in a strong mood of protest against the incumbent party, and minor parties promised to siphon off what might normally be some Democratic votes. General Dwight Eisenhower was able to capture many delegates and voters in Presidential primaries in the spring of 1952 by simply remaining on the job in Europe and leaving the management of his campaign to his supporters.

RIDING THE CIRCUIT

Most of the time, however, Presidential candidates "ride the circuit" and make one to several cross-country tours. In certain of the larger doubtful and pivotal states a large number of appearances are made. Maine, Vermont, and New Hampshire and those states south of Mason and Dixon's line are seldom favored with extensive appearances of Presidential nominees. Often the candidate fails to make a single speech in those areas, on the theory that they are "safe" either for himself or for the opposition, and that campaigning there will not change the outcome. With the South in some mood of revolt, Presidential nominees may pay more attention to that section in 1952.

A barnstorming campaign may be the only type holding any promise of success for an "unknown" or for an "underdog." Wendell Willkie, for example, was almost unknown, inasmuch as he had never before run for public office. It became necessary for him to "be seen" and get out and talk to the people. President Truman, though well known, entered the 1948 campaign as an "underdog" with virtually no one giving him any chance for election. His only hope seemed to rest with touring the country, making "whistle stops," and conducting a fighting campaign in language understood by the thousands who flocked to crossroads to see him in brief

rear-platform appearances. It was indeed, as the *New York Times* phrased it, "a miracle of electioneering" based on an informal "off-the-cuff" style.

"Riding the circuit" probably helped Harry Truman to snatch victory from defeat and greatly aided Jackson in 1828, Wilson in 1912, and Roosevelt in 1932. On the other hand, the record-breaking barnstorming campaigns of Bryan and Willkie were unsuccessful. Neither the front porch nor the intensified campaign is a sure thing. Conditions, the personality of the nominee, and the nature of the opposition will govern the selection of one strategy or the other. With both parties running new candidates for President in 1952, it may be safely predicted that each nominee will make widespread appearances.

OFFENSE OR DEFENSE?

Another factor entering into over-all strategy is the balance between offense and defense. Where an incumbent seeks re-election against an opponent who has little in his record to attack, the incumbent will probably have to wage a defensive campaign. For the party in power, sometimes attack is the best defense. In 1948 the Democrats vigorously attacked the record of the Republican Eightieth Congress; in fact, Truman made it the central issue of the campaign. Governor Dewey, though having no connection with this Congress, nonetheless was forced into a position of having to run, at least in part, on its record. For a time Dewey maneuvered Truman into a defensive position, but in the closing days the President was able to get on the offensive with his attack on Republicans in Congress.

To politicians, at least, the politics of protest offers promising strategy. This is based on the assumption that people would rather vote against than for something—that a candidate's liabilities are more important than his assets. They point to the pent-up discontent against the Wilson and Hoover administrations as the reason for their being voted out of office. Many popular Democratic congressmen were retired in 1946 as a protest against price controls, meat shortages, and other inconveniences. Undoubtedly protest is a formidable motivation, and it is sound politics for the "outs" to center some of their fire around the shortcomings and mistakes of the party in power. At the same time, it appears unproved as yet that a purely negative approach is necessarily a winning one. Presidents Roosevelt and Truman succeded in campaigning on the basis of positive programs already "delivered" or promised, which benefited farmers, workers, and various minorities.

Numerous campaign managers believe in the wisdom of evasion. In essence this means avoiding issues about which there is sharp controversy and where to take a specific stand or position might alienate blocs of voters. Campaign managers very carefully select the issues and often ghost-write speeches for their nominees which deal in the most general terms. To a considerable extent Wilson's "New Freedom" and Roosevelt's "New Deal" were first spelled out in general language, and the Dewey-Warren "unity" campaign likewise avoided being too specific. Many observers felt that this method was the reason for the latter's defeat, especially when Mr. Truman countered by specifically endorsing measures in which certain groups were interested.

In many respects the principle underlying campaign methods and strategy is that campaigns cannot be based upon principles. Broadly speaking, campaign arguments grow out of the political and economic environment of the moment, the character of the nominees themselves, and the imagination of their managers. There are, however, two or three "reliables" or issues considered perennial and axiomatic. An incumbent will probably warn or attempt to raise fears of the danger of changes. For over a hundred years, the challenger has campaigned against the "extravagance" and "bureaucracy" of the party in power. Both sides usually employ "guilt by association" techniques. Republicans are associated with "Wall Street" and moneyed lobbies, and Democrats with socialists and left-wing labor leaders. Beyond this, the key words in campaign management are flexibility, adaptability, resourcefulness, and opportunism.

THE BIG SHOW

Campaign managers for Presidential nominees are convinced of the value of a good show. Even as recently as a half-century ago, torchlight parades were common campaign methods. About the only modification of this today is the absence of torches and the use of motor caravans and motorcycle escorts. Many Chicagoans still remember the Michigan Boulevard parades staged by Mayor William ("Big Bill") Thompson, replete with cowboys, cowgirls, and donkeys, and "Hizzoner's" sombrero. Wendell Willkie rode hundreds of miles in cities standing up in an open automobile waving at crowds and pushing from his eyes the showering confetti. Soldier's Field, Chicago, and the Los Angeles coliseum provide typical sites for monster outdoor rallies, as do New York's Madison Square Garden and hundreds of armories for indoor events. Some of the most impressive rallies have been staged in California with the appearances of well-known Hollywood actors and singers.

On the local level, rallies are still a part of the campaigners' stock in trade. Prior to the arrival of the candidate for the state's major office, a build-up has been prepared by bands, songs, entertainers, and political smaller fry. Sometimes incidents are staged to drive home a point. Frank R. Kent's classic story about Congressman Hill's campaign centering about the repeal of prohibition offers an excellent illustration. Walking onto the platform where, under the candidate's instructions, a pitcher of water and a glass had been placed, he would start to take a drink.

> Suddenly and dramtically he would throw the water out of the window or dash the glass to the floor. "What is this," he would shout, "water? We don't want water in this district. We want beer; and boys if you send John Phillip Hill to Congress he will get it for you." Then he would grab an American flag (also planted), the band would strike up, and the crowd would go crazy.[1]

For the most part, rallies are attended by loyal partisans for whom the rally becomes a "pep" session. It is doubtful that many votes are changed as a result of the rally. The seasoned manager of a campaign recognizes that the election is going to be won by the side that gets the large measure of the independent votes and the votes of the lukewarm partisans of the opponent. These voters generally do not attend rallies in large numbers, and must be reached by radio, press, and brief but extensive public appearances.

The last-mentioned dictates that the nominee be seen by some and photographed for those not present, doing things which "humanize" him and strike a responsive chord in the heart of the viewer. Candidates are photographed gaffing a salmon in Washington State, pitching hay in Illinois, picking apples in New England, or washing dishes in Sauk Centre. Senator Taft was shown wearing a big sombrero in Texas, Dewey being initiated by loggers in Oregon, Roosevelt fishing, and Alf

[1] *Political Behavior* (New York, 1928), p. 99.

Landon roughriding. Eisenhower forces brought an accordion player, a hook-shot basketball artist, and a Broadway show troupe to New Hampshire to conduct the primary campaign for their candidate *in absentia*. The coonskin cap of Senator Kefauver brings color to his campaigns. A few candidates have found that traveling about in a helicopter is certain to attract crowds. The sound truck is used to muster groups for street-corner rallies, a technique which is becoming increasingly popular. In politics the show must go on; the show must be taken to those who do not attend rallies.

GROUP APPEALS

Not all voters can be be won by friendly handshakes, by seeing in person the candidates with their attractive wives and children, or through demagogic or near-demagogic speeches. Strong attachment to certain groups and programs is a characteristic of millions of American voters. The strength of this attachment is a moot point and open to debate, but it is common to speak of the Negro vote, the Irish vote, the veterans' vote, the Catholic vote, and so on. An important characteristic of campaign methods today is the energy and the money spent on appeals to special interests.

From an organizational standpoint, this may be facilitated by (*a*) auxiliary agencies within the party and (*b*) by nonparty groups. In the former case special divisions are created within the party organization which will determine and execute policies designed to strengthen the cause with the various groups. In larger cities it is not uncommon to find Italian, Negro, Polish, veterans', labor, and other divisions within the campaign headquarters. Specially prepared literature, sometimes in a foreign language, is distributed among these groups setting forth the party's position on programs of interest to the minorities.

Materials of this kind must be judiciously handled, lest they backfire and stir up racial, class, and religious antagonisms.[2] In a Maryland election an incumbent seeking re-election for a state-wide office circulated literature in Negro districts in Baltimore purporting to show all the jobs which Negroes obtained under his administration. His opponent immediately took all available copies and distributed them among white voters on the Eastern Shore, with the explanation that the incumbent sought to destroy "white supremacy." It was widely believed that this unpolitic error of an overly enthusiastic appeal for Negro votes cost the nominee the election.

In numerous states having large "melting pot" populations, parties often prepare their slate of candidates on the basis of a "balanced ticket." This calls for the placing of at least one person representing a sizable ethnic or religious group, on the theory that Jews, Catholics, Poles, the Irish, and so on are likely to vote for their "own" candidate and for the rest of the ticket as well. This assumption has often been incorrect, but continues to enjoy acceptance among many if not most professional politicians.

A second method of seeking the vote of minorities is through existing and specially created organizations outside of the party. In the case of the former, friends of the candidate in various business, labor, agricultural, and fraternal groups arrange to have the candidate appear before their clubs, give out campaign literature, or engage in other activity. A sizable number of these groups are now creating "political" arms

[2] The writer has included many specimens of this type of campaign literature in his *Smear Politics: An Analysis of 1940 Campaign Literature*, Washington, 1941.

or adjuncts during campaigns. The Political Action Committee of the Congress of Industrial Organizations and Labor's League for Political Education of the American Federation of Labor are probably the most widely known of these campaign auxiliaries.

These action committees remain intact between campaigns and conduct an educational program, lobby, and study the voting records of legislators. During campaigns they register voters, ring doorbells, publish campaign literature, and electioneer in much the fashion of a political party. The American Veterans Committee, Americans for Democratic Action, and adjuncts of the medical and dental societies are other groups engaging in increased political activity. Where in the past actual electioneering was done by the candidates and the party organization, the political arena today is filled with rival activities by nonparty associations. Organizationally, the role of these groups is one of the most distinctive characteristics of current campaigns.

It might also be pointed out that various temporary political committees are also enjoying much vogue. These are associations of persons who for one reason or another prefer not to channel their political activities—and their campaign contributions—through the party organization. One sees literature and paid newspaper advertisements over self-styled "Italian-Americans of Middletown," "Glenwood Friends of Freedom," "Mothers of America," "Business Men for Dewey," "Veterans Committee for Truman and Barkley." The "Win With Willkie" clubs formed all over the nation had much influence in securing Willkie's nomination, and carried a sizable burden of his campaign. Eisenhower clubs likewise sprang up all over the nation in 1952.

The success of both the permanent and the temporary nonparty groups is dependent in part upon their ability to prove by appeals either to emotion or to reason that "we" businessmen, "we" workers, "we" independents had better get on the bandwagon and support the candidate who is for "our" best interest. To the objective observer and to many nominees, there remains a question as to how much aid these groups are in helping one to be elected. The role and the success of independent, nonparty groups in campaigns, and the implications of their place in the party system, offer one of the most fertile areas for research and thought.

THE WOMEN'S VOTE

Potentially the largest single bloc of votes is cast by women. Here again there is little evidence that there is such a phenomenon as the "female vote." Indeed, an authority in public opinion polling finds the division of sentiment among women almost identical with that among men.[3] This is not to argue that a husband and wife, for example, may not have different motivations for supporting the same candidates. Also, in school elections and on certain referendums one may find occasions where men and women show marked differences. In campaigns, however, elections are often won by a few percentage points or by a fraction of a per cent. It is here that the women's vote may be important. There is at the outset the need for activating the women to come to the polls. The CIO-PAC and League of Women Voters regard the women's vote as especially important for this reason.

In the next place, women are extraordinarily helpful in routine work at campaign headquarters and in speaking to women's clubs. In several communities their energetic campaigns by telephone (each women calls at least ten other women on or just prior to election

[3] See William Lydgate, *What America Thinks* (New York, 1944), pp. 116 ff.

day) have swelled the total vote. For these and other reasons the parties now have established women's divisions at almost every level of party organization both during and between campaigns. There is a growing number of precinct committeewomen and women delegates to the party conventions.

With women now in the majority, will campaign methods be gradually revised? If one were to believe the claims of the suffragists made a generation ago, the answer would be in the affirmative. During the first thirty years of universal women suffrage there is no striking evidence that the vote of women has substantially affected the methods of campaigning. Women's activities, however, are being felt in the party organization, in campaign organization, in registration of voters, and in local elections on such matters as school bonds. Politics is no longer the preoccupation of the males, and the increasing part played by women in campaigns is one of the most significant developments in the history of American politics.

RADIO AND TELEVISION

Radio has come into its own as a campaign device. Several types of programs are used. One of these, inexpensive by comparison, is the spot or station-break announcement, running from a few seconds to a minute and attacking the opposition or extolling the wares of one's own candidate. The spot announcements often feature testimonials of prominent journalists, lawyers, political bolters, and civic leaders. Many campaigners feel that this is a more effective, if not more economical, way to campaign than to purchase fifteen to thirty minutes for speechmaking which will compete with popular programs on other stations.

One enterprising candidate for United States Senator purchased a fifteen-minute spot on a dozen stations simultaneously; so the listener had the choice of hearing the speech, turning off the radio, or trying to locate a program on a distant station. The candidate in a sense had a "captive" audience. The candidate could have a captive audience also where a community has only one television outlet. It may be, therefore, that candidates will reach more people where there is only one channel than where the televiewer can switch to another program.

In terms of showmanship, radio and television are becoming established campaign methods. An indication of this may be found in the growing use of entertainers in political campaigns, especially in broadcasts. The Hollywood for Roosevelt Committee put on self-styled "million dollar" two-hour network shows both in 1940 and in 1944, as did the Dewey-Warren committee on election eve in 1948. The top names in screen and radio appeared to put on skits, read patriotic addresses, and give testimonials. Serious appeals were interspersed with gags from comedians, songs from favorite crooners, and music from well-known orchestras. Studies conducted on these programs plus the huge volume of mail revealed the existence of large listening audiences. It is in this realm of only partly political shows that television may see its greatest use and exploitation in campaigns.

The most frequently asked questions with reference to political campaigning today are likely to center around the use of television. Is television an effective vote-getter? What kind of TV show will gain the largest audience? During the preconvention campaign, Robert A. Taft's managers in seeking national convention delegates for the Ohio Senator laid great stress on the fact that Taft is a "great personality on television." Undoubtedly campaigners and their managers and adherents, as well as the student of elections, would like to know the results which might be expected from extensive use of television.

Definitive answers cannot be provided at this time. The 1952 campaign is likely to be to television what 1928 was to radio, a year of extensive experimentation with a new method of communication. Radio increased the costs of campaigns and intensified activities, but it failed to bring about a great revolution in campaign methods. Such may very well be the case with television. Television will be added to the existing methods of reaching the voter, but it seems doubtful that it will replace methods which politicians still regard as tried and true.

Television, especially in the 1952 Presidential campaign, is unlikely to take the place of older forms of campaigning, for several reasons. At this writing there are only 108 television stations and some 15,400,000 sets in the United States, and there will be no drastic increase in these figures by November 1952. Not all of the stations can be brought together for a network program which will blanket the entire nation simultaneously. Moreover, there are thirteen states and parts of several others which have no television stations. However, nearly all the larger metropolitan areas now have at least one station. The expensiveness of television time is bound to have profound effects on campaign finance, especially on minor-party and independent candidates. For this and other reasons, television will not be practical for most candidates for the state legislature and other minor offices.

THE PRESS

The press has long been a stand-by in political campaigns. Candidates avidly seek newspaper coverage of their speeches, meetings, and activities, and, if possible, editorial and cartoon support. Presidential candidates now make provision for newspaper correspondents in their entourages, and the latter are supplied with advance copies of speeches and abundant opportunities to take photographs. Both major national committees maintain high-powered publicity divisions which furnish mats, press releases, and proof forms to weaklies and dailies. R. D. Casey estimates that 361,000 press releases were distributed by the Republican publicity division in 1936.[4] Parties try also to get the support of newspaper columnists whose reading audience is presumably much larger than for ordinary editorials. In addition, the advertising columns of newspapers are usually open to all candidates. Many campaign managers today are skeptical of political advertising, and it seems doubtful that the candidates for national offices are purchasing as much space as in former years. For local elections, however, advertising in newspapers remains one of the frequently used methods of getting the voters' attention.

One should not ignore the publications of special interest groups, such as the farm journals, labor union periodicals, and business magazines. Many of these print specially prepared messages of the aspirants, roll-call votes, or other aspects of the records, and often make endorsements. Some of these journals have circulation running into seven figures.

It is difficult to determine whether the press of these associations has more influence on the voter than do the ordinary newspapers. Class or occupational journals probably confirm more than they convert. The same may be said for the not too well developed party newspapers in the United States. The

[4] "Republican Propaganda in the 1936 Campaign," *Public Opinion Quarterly*, April 1937, pp. 27–14. See also his "Party Campaign Propaganda," in THE ANNALS, May 1935, pp. 96–105.

Republicans have published a monthly newspaper intermittently for several years. The *Democratic Digest*, also a monthly, has been published for several years. Both go mainly to party workers, local headquarters, and rabidly loyal partisans. The magazines are profusely illustrated and popular in content, but have little appeal for the independent voter.

Newspapermen, social scientists, and campaigners have studied the influence of the press on the outcome of elections. In Presidential elections, the majority of the press appears to have been on the winning side less than 50 per cent of the time. President Truman had almost no press support in 1948. In 1944, according to *Editor and Publisher*, dailies with 64 per cent of the total circulation supported Dewey, 14 per cent endorsed Roosevelt, and 22 per cent refrained from taking a position. In the matter of the Presidency, the voter apparently does not always follow the press. In local elections, however, there is some evidence that the recommendations of the press may be followed to a greater extent. The same is true on technical matters, amendments, and other propositions appearing on the ballot.

The question as to the influence of the press in getting one elected is not of real concern to us here. What is important is that the press is one of the most prominent devices by which to reach the voter. Campaign managers will continue to pour money into schemes to get newspaper publicity on their causes and nominees. Radio and television have not resulted in any appreciable lack of attention to the press on the part of those who seek to be the people's choice.

One comparatively new development is the growing importance of the widely circulated picture and news magazines. Both of these are becoming increasingly important in the build-up of candidates prior to the primaries and conventions, as well as in the general elections. The combined circulation of *Time, Life, Look, Newsweek*, and a host of similar magazines is almost fantastic. These appear to be featuring more pictures and more comment on the 1952 election than on any previous election. The lively, fast-moving, jaunty style of commentary is more inviting to many, if not most, readers than the front page and other stories in the daily newspapers. The "personal touch" as revealed in masterful shots of the candidates or in picturesque phraseology does much to humanize and dramatize the campaign. The reader was better able to view Governor Warren in Wisconsin snowdrifts campaigning for delegates, Kefauver by a stove in a little New Hampshire town hall, Taft on an Illinois farm, and so on, in these magazines than in most country or even urban newspapers. Supporters of a candidate reprint these photographs by the millions for general distribution, showing the belief that this constitutes an effective campaign method.

CAMPAIGN LITERATURE

Perhaps the one staple in the campaign pantry which seems assured of immortality as a device is literature. No matter how many rallies or radio and television programs or how much press publicity a candidate has, he will still prepare some literature for distribution. For the lowly coroner or sheriff, literature is often about the only method used to reach the voter.

Over a hundred million pieces of campaign literature were shipped from the Chicago headquarters of the Republican party in 1896 on behalf of William McKinley, and four years later six million copies of his acceptance address were printed. The "Cross of Gold" and other speeches of William Jennings Bryan were distributed by the millions and translated into eleven different languages. Charles Michelson said that at least one hundred million pieces of literature were distributed by the Democrats in 1936, and the CIO-PAC in 1944 distributed over 85 million items. Many of these were translated and placed in foreign language presses. When one adds all of the pieces of literature issued by national, state, and local parties and by various nonparty groups in a given election year, the figure assumes astronomical proportions.[5]

The diverse sizes, shapes, and forms of campaign publicity reflect great ingenuity and unbelievable imagination on the part of the designers. Originally, handbills, dodgers, leaflets, pamphlets, and fly sheets were probably the most common; these were often sent through franked mail. In time many other means of conveyance were added, such as "open" and personal letters, windshield and envelope stickers, automobile bumper signs, and calling cards. Billboards first came into effective use in 1916 and have been widely employed ever since. Lithographs, widely used in 1920 by Harding supporters, are probably used much less today, but candidates' pictures still adorn telephone posts, campaign headquarters, some stores, and numerous taverns.

The newest type of literature is the color picture book fashioned after the Walt Disney publications. In a search for the origin of these books, the writer finds the first large-scale experimentation in New York City only a decade ago. One suddenly saw persons reading the books in the subways. In "superman" fashion, the life of Candidate-for-Mayor William O'Dwyer was portrayed. The Democratic National Committee sent out millions of a fourteen-page colored magazine on Harry S. Truman in 1948. In a considerable number of contests for the United States Senate in 1950, the books appeared. Not all of them extolled the life and "great" accomplishments of their candidates. One was issued against Senator Taft in Ohio, which in caustic if not libelous fashion portrayed the Senator as a tool of the "exploiters," a foe of the consumer and of the less privileged. The love for comic books remains undiminished, and in 1952 we can expect further extension and experimentation with these mass magazines.

One candidate for the state legislature gave out paper caps bearing his name to children in his district. Another put the same thing on free kites for the kiddies. Liquor interests in one state put a message on beer bottle caps to carry appeals to defeat a hostile initiative sponsored by the "drys." In Seattle a highly popular method of political advertising is the "traveling billboard." This consists of placing large signs on the city-owned transit buses. One hundred such signs carry the message 90,000 miles per week, with a million stops. There is great demand for the space, and the transit system makes a good deal of money on the proposition. All candidates are treated fairly, in the sense that the system takes orders on a first-come, first-served basis.

Much more space could be given to naming unique campaign literature and contrivances. For a nation treated daily to radio, press, second-class mail, and high pressure salesmanship, there is undoubtedly a good deal of resistance to the attention-catchers employed by candidates. It remains doubtful that any substantial amount of campaign publicity is carefully read and studied,

[5] Casey hazarded the guess that 400,000,000 pieces of literature flooded the country for Landon in 1936. "Republican Propaganda in the 1936 Campaign," *op cit.*

or that it wins votes. Much of it never reaches the voter's eye. A "throw-away" left on a man's front porch is usually thrown away. Yet a candidate seeing literature being put out by an opponent feels that he must do likewise. For minor offices on a bewilderingly long ballot, some of the literature may help the voter to identify a nominee enough to feel that he can vote for him.

At the risk of oversimplification, perhaps we might conclude that the success of campaign literature depends in part upon an attractive format with an easily understood message. Too many campaign leaflets are overcrowded. The real key to effectiveness, however, is distribution. A good piece of publicity reposing in campaign headquarters or in a precinct captain's home wins no vote. The technique of getting the material to the voter at a time and a place where he will read it is of prime importance. Candidates for local offices, particularly, feel that, however expensive, mailing the item to the voter's home is the most effective type of circulation.

SMEAR POLITICS

By means of campaign literature the party can deliver a sharper mailed-fist blow at the opposition than is possible through newspapers or over the radio or television. Even the most rabidly partisan newspapers will not carry personal and other attacks on the opponent in as uninhibited style as is possible through campaign literature. In recent years committees of Congress have become concerned over "scurrilous" campaign publicity.

One such type is the use of the composite photograph. This was used against Mr. Roosevelt in 1940. And in 1950 Senator Millard Tydings of Maryland was shown, by means of trick photography, talking with Earl Browder, one-time Communist candidate for President. Opponents of General Eisenhower in the New Hampshire primaries in March 1952 attempted to represent him as pro-Communist by means of a photograph purporting to show him drinking with Russian Marshal Zhukov. The caption ran "Zhukov, Communist general, decorates drinking partner Eisenhower at Frankfurt, Germany." These tactics are widely denounced, but nevertheless continue to be employed.

Personal attacks on the candidates and his family date back to Andrew Jackson, if not even to George Washington. During the present generation, Willkie's ancestry was attacked as German and therefore pro-Nazi, and Roosevelt was alleged to be Jewish, having changed his name from "Rosenfeld." Maps purportedly prepared by Alfred E. Smith were distributed to show non-Catholic voters that upon election Mr. Smith planned to move the Vatican to Chevy Chase, Maryland, next to Washington, D.C. The accusation that a candidate is a "nigger lover" is also a recurring motif, especially in some parts of the country. It should be noted that a great many but by no means all of these attacks appear on anonymous campaign literature or through the channel of the whispering campaign. Methods which stir up hatreds among ethnic and religious minorities or which promote deep personal rancor against opposing candidates do not further the purposes of democracy or of the election.
