This alternation from restriction to encouragement has not benefited anybody. Mills have not been able to follow a manufacturing programme framed in accordance with market requirements and constant changes have affected both quality and efficiency. The consumer has been at the mercy of decrees whose general effect has been only to produce wide fluctuations in supplies and prices. In the midst of the confusion that prevailed at the end of last year, the Government decided to appoint an expert committee to make a comprehensive enquiry into the problems of mills, powerlooms and handlooms, and their proper relation to one another in the textile economy. The Bombay Millowners' Association in a recent memorandum to the Government reiterates with some justification the view that the findings of this committee should have been awaited before fundamental changes were ordered in the working of the industry.

By compelling mills to produce fewer dhotis, the Government has achieved precisely what the industry feared it would six months ago. The restriction has been in force for less than five months but, the Association points out, already there is a shortage of dhotis and prices have risen. A representative of the industry predicted last December that "other qualities will have to be manufactured instead of dhotis as merely to close down the looms in question is not an acceptable answer to the problem and in a very short while there will be too little of one variety and too much of others." This expected diversion of manufacturing capacity has apparently taken place in the direction of long cloth, for more of it has been produced than the market can absorb, prices are

depressed and stocks are accumulating with mills. As large a cut as 40 percent in dhoti production can hardly have been achieved smoothly, and the Association claims that the restriction has been relaxed in the case of certain mills and completely removed for one in Orissa. Eight cotton textile mills in West Bengal which are alleged to have exceeded the ceiling of 60 percent have been asked by the Central Government to explain why, otherwise "the matter will be referred to the police." The less fortunate mills understandably enough regard the reported relaxation as discriminatory and look forward to a more comprehensive official explanation.

Obviously something must be done to help the handloom weavers, but it is questionable whether the best way is to sacrifice the interests of mills (by compelling them to distort production schedules and manufacture unsaleable cloth) and of consumers (by leaving them no choice but to buy the more expensive handloom cloth). The Bombay Millowners' Association points out that the Government itself has no precise statistics on the demand and supply of dhotis, nor can it say whether the handlooms will be able completely to fill the gap left by reducing the output of mills. Having for years advocated higher production and lower prices, the authorities now seem well along the way to encompassing the opposite aims. Efforts are now being made to develop the market for handloom products in India and abroad. If some of the energy shown in limiting the competitive strength of mills had originally been devoted to improving the production and marketing practices of handloom weavers, there would not be the prospect of a dhoti shortage but there might have been more of the goods handlooms are peculiarly suited to produce.

CURRENT COIN

Totalitarian Finance.—In his annual statement to shareholders of the Punjab National Bank Ltd., (a summary of which appears on page 546) the Chairman, Mr. Yodhraj, says that "private enterprise is expanding, industrial and agricultural production going up and total employment in factories increasing. With the progress of the five year plan we will be saving a large amount of foreign exchange now utilised for the import of foodgrains. As the industries of the country develop on the basis of increased agricultural production, including jute, cotton, oilseeds, etc., banking is bound to expand and the habit of saving to grow. We should therefore look forward to larger profits resulting from an increased prosperity of the country." Discussing the financing of the plan, Mr. Yodhraj speaks approvingly of practices followed in Soviet Russia and Nazi Germany and urges the generous use of Central Bank credit. By making a few changes in its statutory powers, he says, the Government could enable the Reserve Bank to play an active part in mobilising credit for its plans as the Nazis did with the Reichsbank. Their system made it possible "to finance new investments without the pre-existence of savings. It was essentially a transitional and temporary phase, as the credit created through these instruments was but in anticipation of future saving which was bound to emerge from increased economic activity and liquidate the loans." Mr. Yodhraj goes on to recommend Nazi Germany's "methods of diverting institutional saving into Government loans, which can be adopted with profit in India." The chief of these methods is the "packing of their assets with Reich long-term paper; virtually eliminating alternative investment channels; and imposing restrictions upon the issue of securities of the mortgage type." He thinks "the main emphasis should be on increasing the total deposits of the banks and increasing the banks' holdings of Government securities. If the banks could hold more Government securities they could help the State in avoiding resort to deficit finance." Mr. Yodhraj feels that the deposits of scheduled banks can be increased if they are guaranteed by the Government of India and "the law so modified as to protect fully the liquidity of bank assets and ensure the ultimate realisation of deposit liabilities." Loans and advances and cash should "be limited to a certain percentage. These ratios may not be fixed legally but should be considered as 'norms' from which no deviation should be allowed by the Reserve Bank. The suggested 'restrictions on purely consumer and speculative loans will not adversely affect the private sector.' Suitable machinery would have to be set up to examine periodically the statement of assets, including loans and advances, of each bank, and to give necessary directions to the management. Mr. Yodhraj says projects could also be entrusted to private enterprise..... with a State guarantee of minimum profit." He concludes, "The signs are favourable. The rise in industrial production during the two years has resulted in checking the rise in prices and stabilising them at a lower level..... The increased production has taken place mainly in the private sector of industry which has been able to

achieve these results by additional investment of Rs. 4,900 million during the period 1947 to 1952. The rise in production has contributed to economic stability..... Therefore the Government of India is in a favourable position to frame sound (sic) monetary policies for providing adequate finance for the successful completion of the plan. The armament programme of the U.S.A. has reached such a proportion that any further stockpiling may not continue at the present rate. The markets may therefore experience a slump. In these circumstances a judicious expansion of credit will not only provide finance for the plan but may prove highly beneficial for maintaining the economic stability of the country by acting as an antidote against the apprehended slump." Mr. Yodhraj's optimism is encouraging and his faith in the fiscal techniques he suggests that the Nazi and Soviet régimes developed those features that make them utterly obnoxious to all liberal opinion. We are not cynical enough to suppose that what is all wrong in Europe is all right in Asia.

Pakistan's Favourable Trade Balance.—Pakistan had a favourable balance of Rs. 10.28 crores on private account in sea-borne trade in March 1953, according to provisional figures released by the Pakistan Central Statistical Office. Total exports were valued at Rs. 14.57 crores as against total imports of Rs. 4.29 crores for the month. The import figure for March was the lowest in recent years. Pakistan's trade position on private sea-borne account during July-March, 1953, shows a favourable balance of Rs. 28.28 crores exclusive of Government account transactions. In March Pakistan exported by sea 485,705 bales of jute valued at Rs. 5.62 crores and 189,118 bales of cotton valued at Rs. 7.60 crores. Other principal exports were hides and skins (Rs. 42 lakhs), wool (Rs. 31 lakhs) and tea (Rs. 12 lakhs). Provisional data show an additional export of 111,423 bales of jute by land. On the import side, machinery and metals were the largest imports in March, being valued at Rs. 76 lakhs and Rs. 68 lakhs respectively. Other principal imports were mineral oils (Rs. 52 lakhs), cotton piecegoods (Rs. 25 lakhs), vehicles (Rs. 23 lakhs) and instruments (Rs. 21 lakhs). Sharp declines were registered in imports of cotton piecegoods and twist and yarn. Comparable figures for March 1952 were Rs. 3.02 crores for piecegoods and Rs. 1.51 crores for yarn as against Rs. 25 lakhs and Rs. 3 lakhs respectively in March, 1953. Total private sea-borne trade at Karachi totalled Rs. 11.64 crores in March 1953; Chittagong Rs. 5.09 crores and Calcutta Rs. 2.13 crores, during the month.

Cloth Exports Improve.—A marked rise in India's cloth exports in the past few weeks and better overseas enquiry have made the cotton textiles market more optimistic. Exports during March rose by 10 million yards to 45 million yards. In the last two months India has shipped about 11 million yards of cloth to China. Indonesia is likely to place cotton piecegoods on the open general licence; details of the scheme have yet to be finalised but the market is wondering whether the terms will encourage the expansion of Indian business. If the Korean peace talks succeed the free port of Singapore is likely to emerge as an important centre of entrepôt trade with China and other countries. Most goods which have been going there through Burma will then pass through Singapore.

Peace and the Metal Markets.—Among the major reasons for the decline in non-ferrous metal prices in India and abroad is the trade's view that prospects of peace in Korea have improved substantially in recent weeks. To some extent the decline is in sympathy with a much older trend in the commodity markets, though some of the hope that trade have recently looked up in peace negotiations succeeded. The Bombay Metal Traders Association is reported to have squared livery in accordance with its recent decision; it has also suspended forward trading indefinitely. Lively circles there believe that the new deflationary measures might not be opened for three or four weeks. Tin prices have been among the chief victims of peace rumours; they have declined Rs. 432 per cwt. in Calcutta a month ago to Rs. 630 per cwt. on Tuesday, and similar falls have been reported on the London and Far Eastern markets. Some believe that the Indian quotations are too low, but they are very susceptible to fluctuations abroad and uncertainty dominates the market. Buyers are deferring their purchases of electrolytic copper with an eye on the declining international price trend, and holders are anxious to sell; the Calcutta rate has fallen from about Rs. 188 per cwt. a month ago to Rs. 170 per cwt. on Tuesday. Apart from the developments in Korea, the reason why zinc prices abroad are lower is that demand is poor and speculators are anxious to sell. Although supplies on the London

Metal Exchange are not plentiful prices recently touched their lowest since zinc was returned to free trading at the beginning of this year. In Calcutta the decline in the case of electrolytic zinc has been from Rs. 59.8 per cwt a month ago to Rs. 50 per cwt on Tuesday. However, one factor that may tend to improve world prices is the possibility of some American mines closing because they do not find it economical to work at present-day prices; this has caused forward rates in London and America to rise. Lead prices in Calcutta have shown a smaller decline over the past month and have steadied at Rs. 64 per cwt. recently, but demand is not encouraging and buyers are taking up as little as possible. Contrary to the general trend, antimony prices have been steady and the mercury market has risen since the Government announced that it would allow the remaining quota of 10,000 flasks to be exported. Aluminium prices are not usually affected by the trend in other non-ferrous metals, but off-take has suffered because the demand for utensils has been at a low ebb.

The Future for Tin.—The rapid fall in the prices of tin recently, with Eastern markets tending to still lower levels, faces the Tin Study Group as well as the industry with something of a poser. No such early recession was anticipated at the recent meeting of the Group in London, though it was realised that towards the end of this year, when the United States' existing stockpile contracts are completed, a surplus and a lack of balance in the market might appear. The Working Party was set up with the idea not so much of pressing for an immediate international regulation scheme for tin as of exploring the possibilities and, if feasible, having them established so that a quick move could be made. Now it seems that the Working Party may have a more pressing problem to consider at its first meeting on 15th June. An international tin agreement likely to receive enough support to be effective is not easy to visualise. The only kind of scheme which anyone would consider is a combination of buffer stock and output regulation. But a buffer stock without production control would be quickly ineffective, because the high-cost producers would be kept in production filling up the buffer pool. On the other hand, the price at which the big producers would agree to control output is fairly high. It must be so if Bolivian adherence to the plan is to be obtained. Even so the interests of the producers are difficult to reconcile, and it is by no means certain that agreement can be obtained. The fact that the feasibility of a scheme might be established and that a conference within the terms of the Havana Charter obtained while the Americans still refuse to ratify any agreement is recognised. Some producers feel that it might be possible to go ahead without American ratification, but that is open to doubt.

Business in the Antipodes.—The latest quarterly survey of the Australia and New Zealand Bank Ltd. says that the partial lifting of import restrictions since the beginning of this month indicates a marked improvement in Australia's international trading position; overseas currency reserves have risen to over £(A) 400 million, a level at which they could stand a somewhat increased drain from spending on imports. Good seasonal conditions in Australia and maintenance of prices for most export commodities have brought a much better export revenue this season than last. Although the volume of exports shipped in the early months of the financial year was greater than in the corresponding period of the preceding financial year, because of seasonal conditions and improved transport services, the latter part of the season promises to yield further good returns. The aggregate wool clip is larger and is selling at better prices than last season; the export quota of wheat is higher than last year; and dairy produce and meat have responded to the favourable conditions throughout most of the pastoral and dairying districts. Base metal exports continue at a high level, and there are signs of some recovery of gold production. With prospects of a material improvement in Australia's overseas currency reserves in the twelve months to 30th June the partial relaxation of import cuts appears to be a safe measure. Importers however are likely to be careful in their buying policy to avoid the danger of overstocking. Freer imports will mean cheaper finished goods for Australian consumption, and cheaper raw materials for Australian manufacturing industries. This will not only mean a saving of real cost of purchasing these goods, but will tend to restrain the price-cost structure, with beneficial effects on exports, thus helping to expand the volume and value of exports, supporting overseas funds, and in the end, paying for the greater volume of imports. Business conditions are satisfactory in New Zealand, well supported by rising earnings. The season has favoured expansion of production in major export lines, and prices for meat, butter and cheese are higher than last season. The Dominion's local production is providing an increasing proportion of the nation's needs but, as the National Bank of Australia Ltd. pointed out last month, the crop

position is in marked contrast to the general bright picture. Yields of wheat have been exceptionally low and samples show poor colour. Oat crops, however, have progressed well, and barley crops also are excellent. Heavy rains in some districts have adversely affected the potato crop and it is probable that Australian imports will again be sought. If the present good conditions continue, New Zealand will have a record export income this year.

To Cyprus by Viscount.—Last Saturday marked another milestone in British aviation history; it is in fact the second time in just under a year that a British airline has scored over its foreign competitors. This was the inauguration of the first service with the Vickers Viscount airliner by British European Airways. Eleven months ago the world's first airliner service opened with the Comet flying from London to Johannesburg. Now the Discovery class Vickers Viscount, carrying 47 passengers will fly at 20,000 feet, cruising at approximately 300 miles an hour—100 miles an hour faster than the piston-engined aircraft it replaces—over B.E.A.'s twice-weekly service between London and Cyprus, via Rome and Athens. It is expected that fairly shortly other services will be opened covering the Middle East, Scandinavia and Switzerland. The introduction of the Vickers Viscount service will benefit other B.E.A. routes as it will release the new Elizabethan airliners to take over some of the shorter routes.

Employment Opportunities Contract.—The employment situation deteriorated during February; there was a fall in registrations and employment opportunities declined to their lowest point in the last few years. Employment exchanges registered 99,352 persons as against 114,617 during the previous month, and placed 18,013 persons in jobs as against 20,378. The number of vacancies notified to exchanges was 23,172 as compared to 23,912 during January. Under the training schemes of the Ministry of Labour, 10,081 persons, including 469 women and 2,312 displaced persons, were receiving training at different training institutes or centres at the end of February. In addition, there were 118 instructor-trainees at the Central Training Institute for Instructors, Koni-Bilaspur (Madhya Pradesh). Under the apprenticeship training scheme for displaced persons, 627 apprentice-trainees were receiving practical training in production work at the end of the month in Uttar Pradesh and West Bengal.

Coal Statistics for 1952.—During 1952, 862 collieries were reported to have worked and an average of 348,663 persons were employed daily. Of the latter 182,762 were men employed underground; 114,433 men and 51,468 women were employed above ground. The overall percentage of absenteeism was 13. The output in tons per man-year for miners and loaders was 309, for all persons employed underground and in open workings 167 and for all persons employed 104. The output in tons per man-shift worked for miners and loaders was 1.05, for all persons employed underground and in open workings 0.57 and for all persons employed 0.35. A total of 36,301,865 tons of coal was produced during the year. The quantities (in tons) produced in some of the important coalfields were Jharia 13,303,184; Raniganj 12,074,285; Bokaro 2,485,947; Karanpura 1,014,740; Madhya Pradesh 3,449,077; and Hyderabad 1,434,194. About 111,396 tons of hard coke and 1,302,016 tons of soft coke were also manufactured; 31,183,666 tons of coal, 120,806 tons of hard coke and 1,319,874 tons of soft coke were despatched during 1952. Coal stocks at collieries on the last day of the year were reported to be 3,019,795 tons.

Trade Not Aid ?—Earning more dollars by doing more business with the United States is not always easy, for apart from the stringent tariff barriers which surround that country, there are only a limited number of goods and services which foreign countries can hope to supply in the U.S.A. at competitive prices. More discouraging are occasions when tenders for an American Government contract at a lower price than any offered by an American company are turned down outright. This is not a frequent occurrence, for it is rare for a foreign company to be able to tender such an offer, but when it does happen it casts doubt on the sincerity of the American business men's admonitions to American business men. The case in point is the tender by the English Electric Company to construct generators and transformers for the Chief Joseph dam in the north-west United States. The company's tender was \$900,000 below the lowest American tender and but for the tariff duties payable would have been \$1.6 million lower. The Secretary for the Army rejected the offer on a technical point in spite of the fact that the U.S. State Department recommended that it be accepted. Last July a bid by Ferranti, also for a Government contract, which was \$200,000 below the nearest American tender, was accepted after some hesitation although it did not conform to the requirements of the "Buy American" Act.

GILT-EDGED AND DOMESTIC
ISSUES BOUYANT

OILS DISAPPOINTING

London, 22nd April.

THE chief factor in the markets during the past week has been the Budget. The first reaction was to mark domestic shares rather wildly higher, particularly those affected by the Excess Profits Levy. Later thoughts, however, resulted in some reaction, but on balance prices were higher. Gilt-edged were the chief beneficiaries. Big money which had been held in abeyance came into this section and some institutions took advantage of the big rise in industrials to cash in and switch money into these funds. Prices dipped later in the period following the announcement of the new British Electricity Authority issue, but the movement brought in fresh buyers and the market made a good recovery.

The main feature elsewhere was the market reaction to the South African election. First results brought in heavy Cape offerings of Kaffirs which were absorbed by London and the Continent. Second thoughts in South Africa, however, resulted in that quarter endeavouring to regain shares sold. This they did, but at considerably enhanced levels.

The most disappointing section was oils. They advanced early in the period, in line with other equities, but the movement soon petered out and talk of a reduction in petrol prices resulted in

considerably lower levels being established. Foreign bonds were enlivened by President Eisenhower's call for peace, and Germans, Japanese and Chinese issues gained ground. Chinese were particularly prominent in the later stages, but Japanese lost ground upon consideration of the election results in that country.

Dealers in commodity shares were less inclined to take a pessimistic view of prospects in the event of a slowing down of stockpiling. Many feel that ordinary demand for domestic purposes could go a long way to offset this. Rubbers and teas were consistently firm while coppers were slightly erratic because of the technical position and general nervousness regarding the African situation.

Apart from a short period near the opening of the week, conditions were again difficult on the money market. Heavy calling from the banks continued without let-up and the position had to be smoothed out on most days by aid from the authorities. Late during the week there were expectations of more comfortable conditions because of the disbursement of Milk money but these did not materialise and the market remained short. Applications for £230 million Treasury Bills amounted to £360,820,000 of which the former amount was allotted at an average rate of 48s 3.51d percent. This week's offerings are £210 million. According to the Bank of England Return active note circulation was practically unchanged around £1,517,000,000 but bankers' deposits fell by £11 million to around £269 million.

B. E. A. Issue

The British Electricity Authority will issue £125,000,000 of British Electricity Authority 4½% guaranteed stock 1974-79 at £100. The dividend

dates are 26th March and 26th September. The stock is in addition to the £150,000,000 issued on similar terms in April 1952.

Grain Market

Although officially the import into Britain of cereals and feeding stuffs will not be completely returned to private trade until the end of the present harvest around 1st August, the licensing of private imports will start on 1st May. The Government is known to have sufficient grains to tide over up until August-September and is, it is learned, now retreating from the grain market. The business that grain traders are now reported to be booking for May and June shipment is mainly dollar grains and is in anticipation that import licences will be forthcoming from 1st May. Private trading in feeding grain has commenced in the U.K. Operators reported good demand for Canadian No. 1 feeding barley and business was effected at £26-2-6 to £26-6-6 per ton, c.i.f. according to a discharging port for May and June shipment. A small quantity of No. 2 yellow American maize was also sold at £28 per ton, c.i.f. April shipment from Atlantic Coast port.

U. S. Cotton and Wheat Crop Quotas

The House Appropriations Committee has authorised the Agricultural Department to start work immediately on preparing acreage allotments and marketing quotas for 1954 cotton and wheat crops. In view of the current production outlook for the 1953 wheat and cotton crops, it now appears acreage and marketing controls will be necessary on the 1954 crops of these commodities, the House Committee said.

Chemicals Market

Despite some disappointment, the chemicals market reacted favourably to the Budget and an increased enquiry was noted. Both home and export markets continued to be competitive but the volume of shipments remains at recent levels. Zinc compounds are cheaper following a further weakening in prices of the metal, while in pharmaceuticals, lower rates for either have been announced following the recent reduction in alcohol. In tar products a regular movement to both home export markets continued in pitch refined tar, tar fuel and cresote but naphthalene continues slow despite the recent reduction.

Wool Auctions

The next London wool auctions are to be shortened from three weeks to two weeks, starting on 4th May, because it is anticipated there will be insufficient wool available to justify a three week series.

Singapore Rubber Stocks

Total rubber stocks of all grades at Singapore at the end of March were 44,551 tons compared with 47,294 a month earlier and 55,493 at the end of March 1952. The total consisted of 32,299 in dealers hands, 8,567 at ports, 56 on estates and 3,629 on transshipment from non-Malayan ports.

Tea Auctions Steady

With the exception of stalky and thin liquoring kinds which were easier, prices on Monday generally held steady at last week's rates. A total of 31,947 packages of North Indian, Pakistan and other growths were offered. Clean Common Broken Pekoe, free from stalk, was quoted at 40½d against 40½ to 41d previously.

Market Newsletter

The Investor's Chronicle market newsletter states: The unexpectedly favourable budget is a big stock exchange factor and should counteract the deflationary conditions arising from peace moves. It may prevent the bull market changing into a bear market. The Chancellor may be able to grant even bigger tax cuts next year. The market should not be unduly restrained by expectations of Government borrowing later this year to cover capital expenditure, as the authorities may sustain the gilt-edged market so as to borrow as favourably as possible.

CASTORSEED ESTIMATE

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, Government of India, the all-India final estimate of castorseed, 1952-53, puts the area and production at 1,349,000 acres and 107,000 tons against 1,428,000 acres and 105,000 tons respectively in the partially revised estimate for 1951-52. This shows a decline of 79,000 acres or 5.5 percent in area and an increase of 2,000 tons or 1.9 percent in production. The decline in current year's acreage has occurred in all castorseed growing States except Bombay due to unfavourable weather conditions at sowing time. The decline was marked in Hyderabad due partly to late commencement of the South-West Monsoon which adversely affected the sowings and partly to diversion of area to food crops. The decrease in acreage has, however, been offset to some extent by the increase registered in Bombay due to favourable climatic conditions at sowing time.

Despite a decrease in acreage, there has been an increase in production of castorseed during the current year. The increase in production has been reported by Bombay only and has been attributed partly to increased acreage and partly to favourable weather conditions at the growing period. This increase has been offset to a large extent by decreases registered in all other States, mainly in Hyderabad and Madras due partly to a decrease in area and partly to scarcity of rains during the growing period of the crop.

HINDUSTHAN MERCANTILE BANK LIMITED

BALANCE SHEET AS AT 31st DECEMBER, 1952.

THE PUNJAB NATIONAL BANK LIMITED

ESTABLISHED IN 1895

Head Office: "SHREE NIWAS", 8, UNDERHILL ROAD, DELHI.

Directors' 106th Report to the Shareholders for the year ended 31st December, 1952.

The General Board of Directors beg to submit to the Shareholders the audited Balance Sheet and Profit and Loss Account for the year ended 31st December, 1952. The transactions for the year under report have resulted in a profit of Rs. 39,46,306-7-0 (including Rs. 5,33,828-14-11 brought forward from the previous year's account). The following amounts have been appropriated for the under-mentioned purposes:—

	Rs.	As. P.
1. Bonus paid to staff during the year	5,48,492	3 3
2. Transferred to Income-tax Provision	15,00,000	0 0
3. Transferred to Contingency Reserve	2,00,000	0 0
4. Transferred to Reserve Fund	1,45,707	10 11
5. Scaling down of Pakistan Assets in view of Displaced Persons (Debit Adjustments) Act 1951	7,92,275	4 6
6. Charities	42,256	4 4
7. Ad-interim Dividend at 6% p.a. free of income-tax for the half-year from 1-1-1952 to 30-6-1952 paid	2,62,500	0 0
Total	34,91,201	9 0

The Directors recommended that the balance of Rs. 4,55,104-14-0 be disposed of as follows:—

(a) Dividend at 6% p.a. free of income-tax for the half-year from 1-7-1952 to 31-12-1952	2,62,500	0 0
(b) Carry forward to the next year's account	1,92,604	14 0

The Bank rate remained unchanged at 3½% p.a.

The Directors consider that the working of the Bank has been satisfactory.

By Order of the General Board of Directors,

YODHRAJ,

Chairman.

Delhi, 7th March, 1953.

Balance Sheet as at 31st December, 1952.

1953-54 TEA EXPORT QUOTA REDUCED

ABOUT 100 MILLION POUNDS FOR EXPORT THIS YEAR

THE Government of India has decided that exports of tea in 1953-54 are to be reduced. Export quotas vary from year to year as a percentage of a "standard" quota fixed by the International Tea Committee in London. India's percentage for the 1952-53 season was 135, which says the Government, was "very unrealistic". In fact India exported only about 128 per cent—about 448 million lbs. For the 1953-54 season the Government has decided to reduce the percentage to 115, equal to approximately 400 million lbs. This seems to be a reasonable figure bearing in mind that the current year's crop is to be reduced by about 50 million lbs. If during the course of the year there is any substantial increase in demand and prices are favourable, there is nothing to prevent India exporting more than 115 per cent. Pakistan has made a similar cut in her tea exports to 115 per cent.

Assessment of Package Tea for Excise

A Press Note says that representations have been received in the Finance Ministry that under the recent changes in the assessment of package tea, tea cleared from the gardens on payment of an excise duty of three annas per lb. will have to bear a further duty of three annas if it is taken into a Packers' or Blenders' premises after the 15th April for such blending or packing. The Government has therefore authorised Collectors of Central Excise to collect only an additional one anna per lb. on such tea at the time of clearance after packing from the blenders' or packers' premises where it is established from documentary evidence to the Collector's satisfaction that such tea brought into the blenders' or packers' premises after the 15th April had paid excise duty at the rate of 3 annas at the garden. The Collectors of Central Excise have also been authorised to accept at their discretion any documentary evidence which would establish reasonably that such duty of 3 annas has been paid. Normally it is believed that it should be possible to relate the marks of invoice number, quality, garden, etc. on the tea chests with the excise documents under which they were cleared from

the gardens on payment of the duty of three annas.

LONDON TEA SALES

An average price of 3s. 8.28d. a pound, against 3s. 8.10d. at the sale for the week ended 18th April, 1953 was secured for the 77,064 packages on offer at this week's tea auctions in London. Clean common broken pekoes is quoted at 3s. 4½d.

Results obtained by some of the companies are given below:—

	No. of packages.	Av. per lb.
Amalgamated	884	3/ 7
Assam Co.	1,228	3/ 10
Assam Frontier	1,362	3/ 10
Bagracote	399	3/ 4

Rajawella Prod.	462	4/ 0
Singlo	398	3/ 6
Standard	792	4/ 4
United Planters	570	4/ 0
Upper Assam	636	3/ 6

COCHIN TEA SALES

At Sale No. 8 held on 15th April, 1953, just over one million lbs. were printed for Auction. Quality showed a considerable decline and liquors were no longer good enough to compensate where appearance was brown and stinky. Demand, though considerably weaker, was fair with Fannings grades the strongest feature of the sale. Common teas were firm at last rates with teas for price occasionally dearer. Mediums and low mediums were irregular with the better sorts showing about 1 to 1½ annas per lb. decline in value. Good mediums sold at about 4 annas per lb. below last rates, while high grown, most of which had lost their flavour, were disposed of at prices as much as 12 annas per lb. lower than valuations and withdrawals of these types were frequent. O.

Ps. were very weak, but well made Fly. Pekoes received some support at much lower rates.

Low Grown Travancore	B.O.P.	1 13 0	1 13 0
Medium Grown Travancore	B.O.P.	2 0 0	2 2 0 to 2 3 0
Anamallai	B.O.P.	2 4 6	2 5 6
Best Liqueuring Nilgiri	B.O.P.	3 8 0	3 13 0
Black well made	O.P.	2 2 0	2 4 6

With effect from the 15th April teas packed in containers holding more than 60 lbs. are subject to duty at 1 anna per lb. at source while teas packed in containers of 60 lbs. and less will attract duty at 4 annas per lb.

A few transactions were effected in Special Licence this week at 1½ pies there are however large sellers at 2½ to 4 pies. Business Export quota was done at 6 pies.

At Internal Sale No. 'G' held on 9th April, 1953, there was a little over 1,84,000 lbs. of Dust printed for sale. Selection was about average for the time of year and demand was fairly general. Milled dusts were irregular and weaker, but other dusts were strong and generally dearer.

COLOMBO RUBBER PRICES

The following prices are issued by the Indian Rubber Board from the weekly rubber market report issued by the Colombo Brokers Association. Closing prices of 10-4-53 Average prices for this week:

	(Rupees per lb.)	(Rupees per lb.)

UNITED NATIONS

Important New Publications

STATISTICAL YEARBOOK 1952

554 pages. 177 tables.
Clothbound Rs. 37/8/- Paperbound Rs. 30/-

The latest available statistical information on world economic and social conditions is presented in the United Nations Statistical Yearbook 1952. The Yearbook contains official data from nearly 250 countries and territories on such subjects as: Population, Manpower, Agriculture, Forestry, Fishing, Production, Mining, Manufacturing, Construction, Electricity & Gas, Consumption, Transport, Communications, Internal & External Trade, Balance of Payments, Wages & Prices, National Income, Finance, Social Statistics, Education and Culture.

ECONOMIC SURVEY OF ASIA AND THE FAR EAST 1952

104 pages. Rs. 5/-

This is the sixth in an annual series of economic reports prepared by the Secretariat of the U. N. Economic Commission for Asia and the Far East. It presents an official review of the economy of the area during a crucial period in the life of the region. During the months under review there was a collapse in the raw material boom of 1950-51 and a world recession in textiles. These events immediately influenced the markets for the principal export commodities of the region and led to a worsening in the terms of trade and a decline in foreign exchange reserves.

ECONOMIC SURVEY OF ASIA AND THE FAR EAST 1951

430 pages. Rs. 12/8/-

Published in November 1952, this report by the Secretariat of the U. N. Economic Commission for Asia and the Far East assesses Asian and Far Eastern economic developments during 1951. Part I of the study covers trends in production, foodstuffs, raw materials, fuel and power and manufactures. Part II discusses international trade and payments. Money and credit, public finance and inflation and deflation are reviewed in Part III.

ECONOMIC SURVEY OF EUROPE SINCE THE WAR

400 pages. Rs. 17/8/-

Already widely discussed in the press, this new book reviews the major developments in the European economy since the end of World War II. Among the important subjects covered are: the present stagnation of the European economy, problems of economic integration, trade with dollar areas, balance of payments difficulties, European manpower resources, etc. Two chapters are devoted to the economic policies, achievements and problems of the Eastern European countries and the U.S.S.R.

DEMOGRAPHIC YEARBOOK 1952

518 pages.
Clothbound Rs. 37/8/- Paperbound Rs. 30/-

Official statistics from the major countries and areas of the world on population, births, deaths, marriages, divorces and international migration are provided in the Demographic Yearbook 1952. This is a volume which will be of special value to business executives, professors, students, population experts, etc.

PRELIMINARY REPORT ON THE WORLD SOCIAL SITUATION

180 pages. Rs. 8/12/-

This study is the first major attempt by the United Nations Secretariat to review world social conditions and problems. In separate chapters, the Report surveys the international situation with regard to population, health, food and nutrition, housing, education, conditions of work and employment, special circumstances of need and general levels of income and welfare. The three concluding chapters are devoted to a survey of social conditions in three less-developed areas—Latin America, the Middle East and South and South-East Asia.

Finance in India & Abroad

THE CALCUTTA MONEY MARKET

EASIER CONDITIONS IN SIGHT

Wednesday, 22nd April.
MONEY is generally a shade easier than it was and there has been a fall in trade demand for funds. Sugar advances have decreased slightly again, at the approach of the end of the crushing season, and jute mills are also reported to have reduced their overdrafts. There has been a substantial expansion of the currency and the prospects are that conditions will be easier for a few weeks at least. In the interbank market money is still fairly tight and rates are unchanged at 2½ percent for overnight money and 3 percent for call loans.

There has been very little doing in the exchange market; there is no tea export sale again this week. Remittance has been exiguous. Exchange rates are steady at last week's quotations.

The larger amount of Rs. 1,29,50,000 was offered for Rs. 1 crore of three-month Government of India treasury bills this week but the average rate of acceptance was unchanged at Rs. 2-7-0 percent per annum, tenders at Rs. 99-6-3 percent and above having been accepted. Tenders for another Rs. 1 crore of treasury bills will be received up to Tuesday of next week at Bombay and up to Monday at Calcutta, Madras, Kanpur and Delhi. During the week ended 17th April, treasury bills for Rs. 2,59,25,000 were sold in favour of the Reserve Bank of India.

Silver ruled very firm last week and the price rose from the previous week's level of Rs. 157-4 to Rs. 161-12, although the close was slightly shaded today at Rs. 160-9 on profit-taking. Keen upcountry off-take and reduced arrivals contributed to the rise. The ready rate was quoted at a premium of 5 annas. The price fell to 73½d. in London basis forward, but the ready rate was unchanged at 74d. The price in New York continued unaltered at 74d.

Gold was maintained in sympathy and was quoted at Rs. 88-8 as also the sovereign at Rs. 58-12.

The return of the Reserve Bank of India for the week ended 17th April, 1953, showed a fall of Rs. 76 lakhs in notes in circulation to Rs. 1,165.47 crores, while the total note issue was fractionally up by Rs. 37 lakhs to Rs. 1,174.84 crores. Notes held in the Banking Department consequently rose by Rs. 1.12 crores to Rs. 9.37 crores. In the Banking Department, deposits of the Government of India and other Government accounts diminished by Rs. 36 lakhs and Rs. 4.75 crores to stand at Rs. 97.99 crores and Rs. 16.90 crores respectively. Balances of commercial banks at Rs. 45.08 crores were about Rs. 2.39 crores higher than the last return. Balances held abroad fell by Rs. 3.73 crores to Rs. 123.95 crores and other loans and advances decreased from Rs. 23.28 crores to Rs. 20.61 crores, of which advances to scheduled banks against usance bills totalled Rs. 2.24 crores against Rs. 99.18 lakhs. Ways and means advances were shown at Rs. 4.14 crores (Rs. 3.77 crores).

The statement of the position of Scheduled Banks for the week ended 10th April, 1953, discloses Demand and Time liabilities at Rs. 543.72 crores (Rs. 13.01 crores on account of borrowings from the Banks) and Rs. 317.39 crores (Rs. 2.06 crores) compared with Rs. 542.04 crores (Rs. 14.49 crores) and Rs. 311.81 crores (Rs. 2.21 crores) respectively in the previous week. Cash and balances with the Reserve Bank have declined by Rs. 1.20 crores and Rs. 7.80 crores to aggregate Rs. 32.39 crores and Rs. 43.34 crores, respectively. There is a rise of Rs. 42 lakhs in investments to Rs. 301.67 crores. Advances and bills discounted at Rs. 530.99 crores reveal a drop of Rs. 78 lakhs. The ratios to total liabilities of cash and balances and of advances and discounts are, in consequence, shown at 8.8 percent and 61.7 percent against 9.9 percent and 62.3 percent.

The return of the Imperial Bank of India for the week ended 10th April, 1953, shows a drop of Rs. 1.91 crores in total deposits to Rs. 219.24 crores. Investments in Government securities and other authorised investments are up by Rs. 64 lakhs and Rs. 25 lakhs to Rs. 71.71 crores and Rs. 11.41 crores respectively. Loans, cash credits and overdrafts have decreased by Rs. 2.43 crores to aggregate Rs. 100.50 crores, while bills dis-

BRITISH INDUSTRIES FAIR

Banking Facilities

Lloyds Bank is providing comprehensive facilities at each section of the British Industries Fair, which is being held in London and Birmingham from 27th April to 8th May 1953. Customers of the Bank who wish to bring their products to the notice of overseas buyers will find a number of invaluable services at their disposal—

Introduction to foreign importers and agents

Local reports on overseas market conditions

Confidential reports on the credit standing of overseas buyers

Interviews arranged with trade consultants from certain overseas countries

Advice on all problems connected with the export trade

These temporary offices and the numerous other Branches in London and Birmingham and throughout England and Wales will be pleased to do all they can to help visitors who call on them.

LLOYDS BANK LIMITED

WARNED!

Violating Railway Rules and ignoring safety measures, passengers often carry explosives and inflammable articles as personal luggage. Such practice is known to have started fires in compartments, causing loss of life.

It is not only strictly against the Railway Act to carry explosives and inflammable articles as personal luggage but it is against your own safety.

Explosives and Inflammable Articles cannot be carried as Luggage in Compartments or Brake Vans under any circumstances.

(Continued from page 545)

counted and purchased have increased by Rs. 45 lakhs to stand at Rs. 25.53 crores. Cash and balances are, in consequence, shown at Rs. 15.67 crores or Rs. 5.55 crores less.

The working of the PUNJAB NATIONAL BANK for the year ended 31st December, 1952, produced satisfactory results. Profits rose from Rs. 9.28 lakhs to Rs. 20.29 lakhs. Adding Rs. 5,33,828, there is an available balance of Rs. 39,46,306. Interim dividends at 3 percent absorbed Rs. 2,62,500. The final dividend has been declared at 3 percent, making 6 percent (4 percent) for the year. Other notable allocations include taxation Rs. 15 lakhs (Rs. 1 lakh), contingency reserve Rs. 2 lakhs, reserve fund Rs. 1.46 lakhs and scaling down of Pakistan assets Rs. 7.92 lakhs (Rs. 8.99 lakhs), leaving Rs. 1,92,604 to be carried forward. A rise of Rs. 7 crores in deposits to Rs. 58.94 crores was more than absorbed in investments and advances which increased by Rs. 2.25 crores and Rs. 5.07 crores to total Rs. 28.80 crores and Rs. 29.29 crores respectively. Cash at Rs. 6.53 crores showed a small decline of about Rs. 38 lakhs.

The HINDUSTHAN MERCANTILE BANK made a net profit of Rs. 1,49,605 for the year ended 31st December, 1952, as compared with Rs. 71,810 in the previous year. Adding Rs. 3,806 brought in, the available balance is Rs. 1,53,412. Reserve is allocated Rs. 30,000 (Rs. 12,500) and taxation Rs. 1,22,000, leaving Rs. 1,412 to be carried forward. Deposits fell by Rs. 21 lakhs to Rs. 2.27 crores, but cash was about Rs. 13.47 lakhs higher at Rs. 54.39 lakhs. Investments at Rs. 53.89 lakhs showed a small decline of Rs. 22,000. Advances diminished by Rs. 32 lakhs to total Rs. 1.20 crores.

The HINDUSTHAN COMMERCIAL BANK made a profit of Rs. 5,45,608 including Rs. 53,220 brought in for the year ended 31st December, 1952, which compares favourably with the previous year's Rs. 4,45,220 (Rs. 5,46,658). The writing off of bad debts absorbs Rs. 4 lakhs (Rs. 3.80 lakhs). Investment reserve has been allocated Rs. 1 lakh, leaving a carry-forward of Rs. 10,603. Deposits at Rs. 4.51 crores are about Rs. 47 lakhs less than in the preceding year. Cash is consequently about Rs. 15.01 lakhs lower at Rs. 71.02 lakhs. Investments at Rs. 2.89 crores and advances at Rs. 3.03 crores disclose little change.

The following is a statement of the cash balances of the Central Government on the last day of January 1953:

(1) At the Reserve Bank of India in India	168,96,06,000
(2) At treasuries in India	1,37,73,000
(3) In England (Sterling converted at 18d. the Rupee)	2,17,37,000
Total	172,51,16,000

The provisional figures of foreign Sea and Airborne Trade of India on private and Government accounts during March, 1953, according to data so far available in the Department of Commercial Intelligence and Statistics, Calcutta, are as follows: Merchandise, excluding transit trade of Pakistan but including that of other land frontier countries: Exports Rs. 4,484 lakhs; re-exports Rs. 36 lakhs (transit trade Rs. 3 lakhs); imports Rs. 4,603 lakhs (transit trade negligible). Total trade Rs. 9,123 lakhs. Treasure. Exports (including re-exports of currency notes) Rs. 10 lakhs; of others nil; imports of currency notes Rs. 1 lakh; imports of others negligible. The merchandise import figures are exclusive of the value of certain consignments of government stores awaiting adjustment.

Without Prejudice

WRITING OFF BAD DEBTS

"PRACTICALLY" IRRECOVERABLE SUMS

(FROM OUR LEGAL CORRESPONDENT)

WHEN you say that X is "practically" an idiot, does this mean that X is to all intents and purposes permanently incapable of rational conduct or does it mean that X is not an idiot at all but almost one? Personally, the writer has avoided the world ever since years ago he read a denunciation of its use by that stickler for style, A. P. Herbert. It is an ugly word. One cannot imagine its appearing in the Bible, the Book of Common Prayer, in Shakespeare or Macaulay, or its employment by Chesterton or Belloc or Galsworthy or Churchill or Hemingway or even by Somerset Maugham. And style apart, it is incorrectly used in the sense mentioned above. "Practically" means "in a practical manner" and it is nonsense to say that X is in a practical manner an idiot. Macaulay would have said, as in fact he did very wrongly say of that genius Boswell, that X was "virtually" an idiot, meaning that he was almost one. And if one means that the person criticised is almost an idiot why not say so or employ the correct adverb "virtually"? Though the use of the word as meaning "very nearly" has been sanctioned in recent years by several dictionaries, it is nevertheless colloquial slang or virtually such. Wherefore one is delighted to observe that the learned Chief Justice of Bombay has discouraged its use in official documents.

The case concerned a sub-section of the Income Tax Act which has from time to time come in for a good deal of adverse judicial criticism. Section 10(2) (XI) which deals with "bad and doubtful debts." "We entirely agree," said Chagla C. J. (Tendolkar J. concurring), "with the Tribunal when it takes the view that this particular clause has not been very happily drafted. If anything the Tribunal has used very moderate language in considering the wording used by the legislature. But we have to construe it as we find it and when we turn to that clause it deals with a deduction under Section 10(2); and the deduction in case of a person who is doing business and whose accounts are not kept on a cash basis is: 'Such sum in respect of bad and doubtful debts.... as the Income Tax Officer may estimate to be irrecoverable but not exceeding the amount actually written off as irrecoverable in the books of the assessee.'"

At this stage we stopped our perusal of the report, and as is our custom sought illustrative illumination in the pages of Sir Jamshedji Kanji and Mr. N. A. Palkhivala's monumental work on the subject. The first thing to note is that the allowance under the clause is confined to debts which have become bad in the relevant accounting year. A debt or loan which had in fact become irrecoverable before the "commencement" of a particular year cannot properly be deducted in ascertaining the profits of that year because the loss has not been sustained in that year. (At the risk of being adjudged pedantic the writer lodges here his meek protest at the use of the word "commencement", fortified again by Sir Alan Herbert. In the whole of Macaulay you will not find the word used. Why adapt a French word when we have a venerable English one meaning the same thing? As well start the Old Testament with "At the commencement God made Heaven and Earth" instead of the majestic dignity of "In the Beginning....").

Where the debts are owing by close relations who are solvent and the assessee through motives of relationship abstains from recovering the debts, he cannot deduct them as bad debts. If the credi-

tor has taken any security no part of the debt can be written off until the security has been realised or valued. A debt which is not statute-barred does not necessarily become bad at the date when the debtor absconds.

What if a debt is time-barred? Is the debt then a bad debt? No, not necessarily, any more than a debt which is not time-barred is necessarily good. The onus lies always on the assessee to prove that the debt has become irrecoverable in the accounting year. If he can prove that the debt is statute-barred that raises a presumption, and a fairly strong one too, that the debt is bad but it is not conclusive. The debtor may be solvent and have a sense of honour. Moreover it must be remembered that the statute bars only a suit at law. A solicitor for example may have a lien on his client's valuable papers, or a hotel proprietor on his guest's goods. Or the debtor may die leaving a will directing that "all my just debts be paid" and the executors may elect not to plead the time bar. Nor does a debt necessarily become a bad one if the debtor is adjudicated an insolvent. And if such a debt does become irrecoverable, generally speaking the only date on which it can be said that it has finally become a bad debt is when the Official Assignee or Receiver declares a final dividend and then that portion of the debt will be bad which remains outstanding after the final dividend has been declared.

Whether a debt is a bad debt at all, what portion of it is a bad debt and the year in which it becomes a bad debt are questions of fact to be determined by the Income Tax Department.

Now, in the light of these observations let us return to the word "practically." The assessee was a money-lender and he had advanced a sum not exceeding Rs. 40,000 to a film producer for the completion of a motion picture. *The Path of Glory* the picture was called and it turned out to be the path to financial disaster. It was a failure. Therefore on 16th April 1941 the assessee entered into an agreement with one Garcher for the latter to improve the picture and then exploit it, the original producer, one Niranjan, to whom the money had been advanced, having absconded in 1937, leaving the assessee to complete the picture. Under the agreement with Garcher certain amounts were received by the assessee. There were no receipts at all in S.Y. 1999 and therefore on 11th October 1944 (S.Y. 2000) the assessee sold four positive prints of the picture for Rs. 850 and then wrote off the balance due to him from Niranjan as a bad debt which had become irrecoverable in that year, S.Y. 2000.

Now a loan becomes irrecoverable or a debt becomes a bad debt when the creditor has no reasonable expectation of recovering it from the debtor, or, as it has been put in some cases, when there is no ray of hope at all on which the creditor can rely for recovering the amount from his debtor.

But the Income Tax Act specifies no procedure whereby the exact time or year when reasonable expectation of recovering disappeared or the last ray of hope of payment vanished is to be ascertained. It is a question of fact not left to the creditor's choice but for the Income Tax Officer to determine on the circumstances of each particular case when the debt became irrecoverable.

But, difficult though such a task is, the Income Tax Officer must supply a definite answer. He were in this case. The assessee was not vague in hope disappeared in S.Y. 2000 when he received bad debt, nearly seven years after Niranjan absconded.

"Unfortunately," said Chagla C. J., "in this case [Jan had become 'practically irrecoverable' in S.Y. 1997 and in the question which has been submitted to us, also the expression used is: 'whether there was material on which the Tribunal could have come to the conclusion that the loan to Niranjan Prakash had become practically irrecoverable in S.Y. 1997, if not earlier'. It is not sufficient for the Tribunal to hold that it (the loan) had become 'practically irrecoverable' in S.Y. 1997. The Tribunal must find as a fact that the loan had become not 'practically irrecoverable' but irrecoverable at a time prior to S.Y. 2000. The Tribunal has not so found."

The Court referred the matter back to the Tribunal. (Mukundlal v. I. T. Commissioner.)

A DITCHER'S DIARY

THE peremptory dismissal of Khwaja Nazimuddin while he was completing plans for a meeting with Mr. Nehru would have caused more disquiet in India had it not been for the favourable reputation of the new Prime Minister, Mr. Mohammed Ali, which outweighed the presence in his new Cabinet of several names associated in the recent past with advocacy of more robust policies toward India. Mr. Mohammed Ali is well known and well thought of in Bengal and the United States where his most notable work has been accomplished, but he must be largely unfamiliar to the politicians and officials in Karachi with whom he will now have to begin work at a very difficult phase in Pakistan's brief history. Just how difficult the situation has become is not easy to judge, because we do not seem to have received frank reports on what happened in the Punjab last month; it is only plain that Mr. Nazimuddin came near to losing control over a very dangerous situation but managed, after some fumbling, to assert the power of the Centre over the rebellious Daultana. Having survived that crisis he was no doubt quite unprepared for the sack, but Mr. Ghulam Mohammed appears to have been concerned about the continuance of sectarian strife about the Qadianis and the absence of any improvement in the economic position of the country. I have seen it suggested that the sudden change of régime might provide a suitable moment to devalue the Pakistani rupee; indeed it would be the most face-saving opportunity of recent months, but with the prospect of heavy wheat imports over the next year a cheaper rupee is the last thing Pakistan now needs. Further progress toward better relations with India is, however, a prime necessity and as soon as the new administration settles down it is to be hoped that Mr. Mohammed Ali will take up where Mr. Nazimuddin left off, with even greater energy. He has already given an earnest of his intentions in this connection. There has been some glibbling about the manner of the late Cabinet's dismissal but, apart from the fact that it would be incongruous to censure palace revolutions in a country that has no constitution and no elected representatives, there is an Islamic polity in the Middle East that has contrived to change its Government more peaceably since the war?

The exodus of ditchers of the early twenties' vintage continues. The latest to depart was Mr. A. M. Walker, Secretary of the Eastern circle of the Imperial Bank, who left India last weekend after serving that institution continuously since 1921. During those 32 years he worked for the Imperial in Burma, Bengal, Assam, Bihar, the United Provinces and the Punjab, and became deputy secretary and treasurer in 1946 and secretary and treasurer two years later. He lent his professional abilities to many societies and charitable institutions for whom he acted as honorary treasurer, most important among them the Managing Body of the Indian Red Cross Society whose honorary treasurer he has been since 1948. He was also an executive trustee of the Victoria Memorial and a member of the Finance Subcommittee of the Bengal Chamber. A modest figure of whom we saw less than we wished, "Johnnie" Walker was a respected adviser among the many prominent Indian industrialists with whom he came in contact. In circles where sound judgment and no frills were appreciated he was deservedly popular. He returns now to his native Lanark where he will cultivate his garden somewhere within easy distance of Glasgow.

1921 also saw the arrival in India of Mr. D. J. McIntosh who retires from the chairmanship of the Indian Cable Company, Ltd. next week after

more than three decades in an industry which is not much older than that in India. Mr. McIntosh arrived in Calcutta to join the staff of British Insulated Cables Ltd. after distinguished service in the first war, and took charge of the Indian Cable Company at the beginning of the second. He has served for many years on a variety of industrial associations including the Association of Rubber Manufacturers of India and the Indian Electrical Manufacturers Association, and he has given of his wide experience to the Indian Standards Institution since its inception. An even earlier arrival in Calcutta was Mr. C. R. B. Woolford who retires from the chairmanship of Shalimar Paint this week after 34 years' work in India. Like Mr. McIntosh, he came to India after service in the first war and played a vigorous part in building up one of the smaller modern industries that are now a familiar part of the industrial scene. His contribution to its development has included active membership of the Paint Federation, of which he was chairman in 1947. He has also served his community in this city through the committees of the United Kingdom Citizens' Association and the East India Clinic. In the Auxiliary Force, which was disbanded at the time of Independence, he rose from the rank of private in the Calcutta Scottish in 1921 to Colonel of the Regiment from 1942 to 1947. Both these gentlemen leave behind many friends who will wish them well in their new roles at home.

Mr. Churchill in Glasgow called President Eisenhower's challenge to the new rulers of Russia "a massive and magnificent statement of our case," while Mr. Bevan says it contains a "range of humility conditions, giving nothing at all." As an ordinary, inconsistent sort of person, I am a little inclined to agree with both of them, though I notice that a good section of the British Press comes down more on Mr. Bevan's side, in much less violent language. If the Russians and the Chinese are indeed on the point of making substantial concessions, which I still think unlikely, it would of course be as well to be ready with genuine counter-proposals which have some hope of acceptance—and the request that the leopard change his spots forthwith and no more nonsense scarcely comes within the range of reasonable counter-suggestions. Granting so much to Mr. Bevan one might nevertheless doubt whether the best way to put forward reciprocal offers is from the housetops. Mr. Churchill appeared to have grasped the mood of the moment better when he hinted at "conversations at the highest level, even if informal and private, between some of the principal powers concerned." This was taken, quite wrongly I should suppose, to mean that a Big Four conference was in the offing and Mr. Dulles has said that he knows nothing of such a meeting. But the point is that we cannot know what there is in the friendly noises emanating from behind the Iron Curtain until diplomats from both sides get down to business under the conditions of the sort Mr. Churchill suggested—and for that some list of possible concessions needs to be drawn up. But to indulge in premature and public magnanimity of the sort Mr. Bevan evidently had in mind—"we'll do this if you'll do that"—would only give one's hand away and start arguments in the West before it was known if any good was to be achieved. President Eisenhower would only get into trouble at home and do no good abroad if he announced at this stage that there was a seat waiting for Peking at the United Nations if the Chinese Communists turned off the heat in Asia, but it is clear at the same time that he will have to have

that possibility in mind if any progress at all is made toward a Far Eastern settlement.

I suggested here lately that the introduction of no par value shares be considered in India to meet some of the criticism of Indian companies' dividend policies. A correspondent quite correctly pointed out that n.p.v. shares are liable to various sorts of abuse, but I learn that the Association of Certified and Corporate Accountants in the United Kingdom has now come out in favour of n.p.v. shares and has drawn up a list of safeguards against all the known varieties of abuse to which they are subject. The precautions are nine in all, and are relatively simple; they include such stipulations as that only public companies be allowed to issue n.p.v. shares, that all of any one company's ordinary shares be of the same type—with or without a par value—and that all the proceeds of such an issue go into the capital account and not be available for distribution as in Canada and the United States. The Association comments: "The introduction of n.p.v. shares would greatly contribute towards making balance sheets more simple and comprehensible... would clearly bring out the size and growth of the proprietors' real stake in the business... and would thus enable profits and dividend distributions to be brought into realistic proportion to the proprietors' total capital contribution." These views have been submitted to the Board of Trade which is considering the permissive introduction of n.p.v. stock. The Cohen Committee also accepted the logical arguments in favour of the proposal although it did not include it among its recommendations.

An assiduous researcher into the annals of cricket has been delivered of the discovery that the slower scoring side rarely wins a match, in other words that the team that wins is usually the team that has been putting up its runs more quickly. In fact in Test matches, it is claimed, there has been only one exception to this rule. This announcement comes opportunely at the beginning of a Coronation tour of England by the Australians, and if taken well to heart by visitors and hosts alike it might produce some of that brighter cricket we have been hearing about for years. The series promises to be bright enough, for the Englishmen must have regained about as much confidence as the Australians have lost as a result of the South African victories last year; just how much that is we shall not know for a few weeks. If the best batsman in the world and the worst weather in the world produce the effects desired of them at the appropriate moments, the M.C.C. should manage to make good some of the reverses of the last few years. And if the English can beat the Australians, climb Mount Everest and crown a young Queen in the same year as the Chancellor takes sixpence off the income tax, I shall really believe that a new Elizabethan age has begun.

The very successful run of the Prevention of Crime exhibition in Calcutta is my excuse for reprinting here the following piece of evidence that the police in Britain are moving with the times. A reader of the *New Statesman* found it in a handbook entitled *Questions and Answers on Police Duties*, by an author with the suitable name of C. C. H. Moriarty.

Q.—What charge could be preferred against a man who was found in possession of a small atomic bomb?

A.—Knowing having in his possession an explosive substance under such circumstances as to give rise to a reasonable suspicion that it is not for a lawful object.

TROMBAY REFINERY PROJECT MAKES GOOD PROGRESS

**LOWER RETURN FOR SUGAR
INVESTORS FORECAST**
(FROM OUR OWN CORRESPONDENT).

19th April.
THE Oil Refinery Project Committee met last week at the Secretariat. Mr. A. K. Chanda, Secretary to the Ministry of Production, Government of India, presided over the meeting which included representatives from Burmah-Shell, Standard-Vacuum, the Central Railway, the City Corporation and the Port Trust. It was disclosed at the meeting that the Government of Bombay had assured both companies that it would assist them in obtaining land. An assurance was also given by the Municipal Corporation for the supply of water and electricity. The General Manager of the Central Railway stated that a survey had already been completed on the provision of a railway link with the refinery site and a line would be laid by the time the refineries went into production. Mr. Chanda announced that work was going ahead and, as a result of some special measures taken, it was now expected that the Standard Oil Refinery would go into production by July 1954, that is, six months earlier than had been expected.

Outlook for Sugar Industry

While stock exchanges and forward commodity markets in the country view future prospects with optimism, a prominent spokesman of the sugar industry in Western India, reviewing the future of this industry, has said that investors should reconcile themselves to the possibility of more modest returns in the future. He said that while the cost

of production tended to increase because of present efforts to improve working conditions and wages, there was no corresponding improvement in efficiency and output and there was also a progressive decline in sugar prices. Mr. Gulabchand Hirachand, Chairman of the Ravalgaon Sugar Farm Ltd., addressing the general meeting of the Company, said he thought that shareholders should expect dividends to be lower than in the past. "I do not like the rôle of a prophet of gloom, but it is good business to face facts rather than to gloss over them." At the same time he observed that there was nothing wrong with this industry, which supplied one of the primary daily needs of the people and that barring misfortunes and unforeseen events, it should be able to provide a satisfactory margin to investors and good service to the community and the country.

Railway Centenary Celebrations

As the place where the first railway lines were laid and the first Indian railway train ran, Bombay has been celebrating the railway centenary this week. On Thursday, 16th April, which marked the turn of the century for the railways, the headquarters of the two railways, the Central and the Western, their terminal stations and other railway offices, workshops, hospitals and institutes were illuminated. A crowd, estimated at half a million, turned out to witness the celebrations, which were opened by the Governor at the Victoria Terminus station of the Central Railway in the evening. The rush of spectators was so great that five people lost their lives while travelling on the footboards of trains on their way to the terminus.

Art in Industry

Mr. G. S. Bajpai, Governor of Bombay, said when he opened the annual Art in Industry Exhibition at the Jehangir Art Gallery last week that it was not only large scale industry but the cottage industry also which needed the services of art and that he wanted artists to publicise and popularise "our own individuality in art." He suggested that the Government should explore the possibility of persuading the master craftsmen of India's hand-made textile industry to train students to carry on these great traditions. He admitted that as the purchasing power of the people was low, they might not be able to patronise such artistic fabrics, but that wealthier countries like the United States, where things rare and beautiful were in demand, would provide a good market.

Motor Vehicle Taxation

The retiring President of the Western India Automobile Association, Mr. Dayabhai Patel, disclosed in his farewell speech last Wednesday, at the annual general meeting of the Association, that good progress had been made toward forming a federation of automobile associations in India and that the constitution and other matters were now being considered. Giving a history of the anomalous position of motor vehicles taxation in Western India, he said: "The vehicle tax for cars in Bombay has been raised generally speaking by 50 percent, almost synchronising with the enhancement of the sales tax on petrol from two annas to six annas a gallon. With the increase in the municipal tax, the steadily mounting operational cost of motor vehicles, the increase in the vehicle and petrol taxes inflicts an unbearable burden and the net result, I am afraid, will be the discouragement of motor transport leading to a shrinkage in petrol consumption and the accruing revenue." Mr. Patel pleaded that the Government should expedite legislation covering the recommendations of the Motor Vehicles Taxation Enquiry Committee, made nearly three years ago, so as to place motor taxation on a rational basis. He urged the Government of Bombay to create an independent Road Transport Board to speed up road development. Mr. D. N. Khandke, the senior vice-President of the Association, was elected President for 1953-54.

I.L.O. Efficiency Expert

Mr. J. B. Shearer, an efficiency expert from the I.L.O. who has been in India at the invitation of the Government of India to examine ways of improving the productive capacity of the Indian textile industry, speaking at a meeting of the Rotary Club last week, expressed concern at the deteriorating conditions in the industry. Mr. Shearer said that if India wanted to compete in world textile markets, she would have to produce a better quality cloth than at present.

Steel Retention Prices

For the last two days, the Tariff Commission, presided over by Mr. M. D. Bhat, Chairman, has been discussing with representatives of the steel industry the proposed increase in retention prices. The case for the Tata Iron and Steel Co. was presented by Mr. J. R. D. Tata, Chairman, and Mr. Jehangir Ghandy, a Director. It is believed that the talks are progressing satisfactorily and the outlook for a substantial increase with retrospective effect is hopeful.

E.I.C.A. Reception

The Chairman and Directors of the East India Cotton Association, one of the biggest and wealthiest trade organisations in India, this week held a reception in honour of Mr. R. G. Saraiya, the newly elected President of the Federation of Indian Chambers of Commerce and Industry, and Parekh, vice-President, of the Indian Merchants' Chamber, Bombay. Sir Purshotamdas Thakurdas, who presided at this function, spoke of the contributions which each of the guests had made to the country's industry in general and to the cotton trade in particular.

London

BUDGET WELL RECEIVED

"GREATER REWARD FOR EFFORT"
(FROM OUR OWN CORRESPONDENT)

18th April.

THIS despatch is being written without the aid of the findings of any pollsters as to the reactions of the general public to Mr. Butler's second Budget, which he himself has asked, in radio and television appearances, should be called an "incentive" Budget. On the other hand, the subject has been discussed in the House of Commons for three days, with the fourth and final day due next Monday, and in the same period of time it has been possible to study the views and feelings of a fair cross-section of the populace. If it is possible, after all this research, to arrive at what might be regarded as a consensus of opinion—free, it is noted, from political considerations—the answer would surely be that Mr. Butler has taken risks, calculated risks permissible to a Chancellor of the Exchequer which would seem little short of foolhardy in anyone else, to produce what Mr. Clement Davies described in the House as a fair Budget and one which was justly popular. For the first time in a decade the Budget imposes new burdens on an already overburdened people. Instead, there are reliefs almost all along the line, with the main emphasis on stimulating industrial production and expansion. There are four main and seven minor concessions. Of the former, the reduction by 6d. in all rates of income-tax and an all-round reduction of one-quarter in purchase tax are aimed at helping both the individual and trade and industry, while the proposal to end the excess profit levy with effect from 1st January, 1954, and the immediate re-introduction of initial allowances on capital expenditure ought to serve as encouragement to industry to re-equip for greater efficiency, produce more at less cost and to expand exports. The minor reliefs include the exemption of cricket and amateur sports from the additional tax on light motor-cycles, an increase of £10 in the allowance for dependent relatives or housekeepers, a small stamp duty exemption for documents used by National Savings Committees, the acceptance of chattels in payment of estate duty, and allowing authors to spread royalties received two years after publication in the same way as lump sum payments. Less than 2,000 people will definitely be worse off as a result of the Budget. They are the residents of the Scilly Islands, off Lands End, who because of defective machinery of assessment have hitherto enjoyed exemption from tax on income and profits. Mr. Butler in from tax to "bring that happy state of affairs to an end."

Approach it from whichever angle you like—Mr. Butler has done exceedingly well; and not least of all from the political angle, since he has left few obvious openings for Opposition attack. As one Labour supporter is reported to have said: "If it doesn't benefit you it doesn't harm you. That's the awkward thing about it." Nevertheless, they have attacked the Budget, as they had to do, but so far, apart from Mr. Harold Wilson, who laid the stress on the risks Mr. Butler was taking, the other arguments have been unimpressive. Mr. Dalton and Mr. Aneurin Bevan have yet to have a suitable say, but it is considered unlikely that a suitable opportunity will be found for dividing the House when the Budget resolutions are put forward for passing next Wednesday.

£440 Million Deficit

Undismayed by last year's overall deficit of £436 million, Mr. Butler has accepted a deficit of about the same amount, £440 million, for the current year, and budgeted accordingly. Of the risks the Chancellor has taken, the two most important ones are those of increasing total private consumption at home at the expense of exports and secondly of reviving inflation. The total incentive which Mr. Butler is offering the economy is £169 million—a "shot in the arm" as Mr. Gait-skill described it, though he doubted whether it would revive the patient—and in return he is expecting industry not only to maintain but to increase exports to hold the balance of payments position and increase our gold and dollar reserves and also counting on idle private funds being placed at the disposal of public finance. As Mr. Butler himself said in concluding his 30-minute speech: "The success of the policy I advocate will depend on the extent to which industry and the public respond to the call. I have confidence in the response of our people. So, in this spirit, we take a new direction. We step out from the confines of restriction to the almost forgotten but beckoning prospects of freer endeavour and greater reward for effort."

Turning from the general to the more specific, the Budget concessions in the field of overseas profits have proved to be less than were expected. For the moment only two of the three recommendations in the interim report of the Royal Commission on Taxation dealing with this subject are being acted upon. The Chancellor proposes that the overriding limit on the amount of unilateral relief for overseas taxes shall be the full amount of the U.K. taxes as against the present limits of 75 percent in the case of Commonwealth tax and 50 percent in other cases. The other proposal suggests an option to postpone payment of tax on such part of income arising abroad as is shown to be unremittable under local currency regulations, which serves to formalise the concession recently

granted as a matter of administrative practice. The cost to the Exchequer is small, only £2½ million this year and £3 million in a full year.

March Trade Figures

The Board of Trade figures for March seem to justify Mr. Butler's incentive attitude. They record a slight recovery in the export trade, but this is more than offset by a much larger rise in the import bill. Exports were almost £213 million, against £195 million in February, but a year ago they were as much as £240 million. Imports jumped from £243 million in February to more than £285 million in March. The comparable figure a year ago was £333 million. As a result of these changes the trade deficit (after allowing for re-exports) is £62 million in March, against £39 million in February and an average of £41 million in the last quarter of 1952. The only reassuring feature of these returns is that trade with the dollar area is still improving. Exports to Canada were more than £12 million in March, and total exports to North America in the first quarter of this year were 20 percent higher than in the same quarter of 1952.

As a pendant to these returns, the Treasury bulletin for industry says that "a large increase in export earnings is now needed." It suggests that "prospects in the European markets may improve as a result of the measures of liberalisation recently announced by this country." A number of markets are either open or have recently become more liberal. Belgium, Holland, Sweden and Portugal are given as examples. The bulletin, however, repeats the almost general warning that "the world market has become intensely competitive over almost the whole range of manufactures."

This reference to European trade lends interest to the U.K. position in the March settlement of the European Payments Union. It disclosed a net surplus of £7,511,429, which reduced the U.K.'s cumulative accounting deficit with the E.P.U. to £296,693,928. Of this reduction £1,348,215 was settled as to 70 percent by the reduction of the Union and as to 30 percent by the reduction of the credit previously extended to the U.K. by the Union, and the balance of £6,163,214 as to 30 percent in gold and 50 percent repayment of credit. Accordingly, the United Kingdom received gold amounting to £4,025,000 and repaid credit amounting to £3,486,429. The total amount of gold paid by the United Kingdom to the Union has thus been reduced to £95,347,143.

Retail Tea Prices

Two interesting developments in the commodity markets are worth recording. The rising prices at the London tea auctions—the outcome, it is said, of Indian growers reducing production—are finding their way into the retail trade. Last week some retailers raised the price of cheaper brands of tea from 3s. 4d. to 3s. 8d. per pound, and it is fairly generally expected that there will be a rise up to 4s. per lb. within the next few months. Dearer teas are keeping fairly stable, but here also an increase of about 2d. per lb. would come as no surprise. Later in the year, of course, when the new season's teas start arriving in July and August, it is expected that prices will fall back again.

Currency arrangements for the London wool terminal market, which expects to start dealing on 29th April, will be similar to the provisions which have been made for other futures markets. In making this announcement, the Bank of England stipulates that the market must have a regular organisation and that if the Bank gives notice to the Executive of an excessive position or unwarrantable speculation the Executive must take steps to check its further development. Subject to that somewhat unusual proviso, participants are allowed to operate freely for sterling area residents without the necessity of exchange control documents for the payment of differences. For permission for the appropriate Exchange Control form must be completed, but bankers are authorised to approve payment of differences. Permission is granted members to do arbitrage on markets outside the scheduled territories, which means on the French, Belgian and U.S. wool markets.

National Savings Deficit

For the fourth year in succession the National Savings Movement has recorded a deficit on the year's working. Receipts for the twelve months to 31st March last, at £966 million, were £43 million higher than in 1951-52, but withdrawals were £81 million higher at £1,084 million, leaving a deficit of £118 million, against £85 million in the previous year, £89 million in 1950-51, and £68 million in the year before that. Against total savings still outstanding of more than £6,020 million (£1,000 million more than at the end of the war), the fourth year disasterous period may not what has been a rather difficult period may not be unduly high. The trouble is that the trend continues, and it remains to be seen whether Mr. Butler's "incentive" budget will succeed in altering this.

Brevities

The Sulphur Committee of the International Materials Conference is to be dissolved at the end of this month. This follows naturally after the ending of international allocations of crude sulphur with effect from 1st March last. It also indicates that there is a continuing improvement in the supply and demand position of sulphur.

A Ministry of Materials order has been made this week by which any person will be free to trade in bristles in Britain or to use them for any purpose, without a licence. Imports and exports of bristles, however, will still be subject to licence.

Uttar Pradesh

INCREASED UNEMPLOYMENT IN U.P.

**MATATILA IRRIGATION DISPUTE
SETTLED**
(FROM OUR OWN CORRESPONDENT).

Lucknow, 18th April.

A STEADY deterioration in the employment situation has been reported by the Regional Director of Resettlement and Employment, U.P., in his report for March. A number of factories and mills remained closed or resorted to lay-offs because of accumulating stocks or shortage of raw materials. There was also large-scale retrenchment in a number of Government and semi-Government establishments, and as many as 22,845 people registered with the exchanges during the month. The vacancies notified to the exchanges were only 6,551. The only redeeming feature of the employment situation in the State, according to the report, was the large number of vacancies created by the mass resignation of patwaris in the villages some time ago. The Shiva Rao Committee on employment exchanges visited Lucknow last week and held discussions with the Labour Minister, Mr. Sampurnanand. District employment exchanges in the State have been maintained wholly at the cost of the State Government and it is believed that the State has now expressed its inability to foot the bill without some measure of Central assistance.

Irrigation Dispute Settled

Work on the Rs. 6 crores Matatila dam in the Jhansi district which was held up for a time because of differences between the Governments of U.P., Madhya Bharat and Vindhya Pradesh will shortly be resumed following a settlement of the dispute. Under the terms of the agreement, the U.P. Government will irrigate 6,500 acres of land in Madhya Bharat and 40,000 acres of land in Vindhya Pradesh out of a total area of 400,000 acres which the dam is expected to irrigate. The U.P. Government will construct canals from its own funds to irrigate the territories in the other two States and will also administer these canals itself. Irrigation rates in all the States will be on a par with each other.

Improving Cattle Breeding

The U.P. Board of Animal Husbandry has undertaken to meet the Defence Ministry's requirement of 500 horses and 500 mules per year to replace the present imports from Australia. It is stated that the Defence Ministry is anxious to terminate the arrangement with Australia as supplies can no longer be obtained at fixed rates and the animals have to be bought in the open market. Meanwhile, the State Government has appointed a committee, the chairmanship of Sir. Sita Ram to suggest ways of improving cattle breeding. The committee, it is announced, will also review the existing regulations regarding the slaughter of cows and the need for legislation on this matter.

District officials have been asked by the Government to take the necessary steps to increase the acreage under cotton in the State. According to the Planning Commission's target, U.P. should have a production of at least 1 lakh bales of cotton, and it is proposed to plan the extension programme so as to bring at least 3.5 lakh acres under cotton cultivation during the planning period. Present acreage under cotton is estimated at about 2.25 acres. During 1953-54 efforts are to be made to bring a larger area under American varieties.

Local Fund Accounts

The Examiner of Local Fund Accounts, in his annual report for 1951-52 which has been released, has commented on the unsatisfactory state of affairs prevailing in the District Boards in the State. He says: "The disclosures made by audit from every point of view were anything but complimentary to the Boards. Advice given and suggestions made through the audit notes for the betterment of accounts were generally paid little or no heed." Irregular, wasteful and avoidable expenditure continued to be incurred, liberal remissions were made and there was a general reluctance on the part of the Board authorities to resort to statutory coercive measures for the recovery of taxes. He mentions in particular the Bahraich District Board whose members were left completely untaxed. "Their names," he says, "were not even entered in the Demand and Collection register."

Tax Relief

The Allahabad High Court answered in the negative to a reference made to it whether "the expenditure incurred for the maintenance of staff of a selling agency during the period when it carried on no business was an admissible deduction under Section 10(2)(XV) of the Income Tax Act against the assessee's other income." The case arose from the contention of a sugar dealer to the contrary. Chief Justice Malik and Mr. Justice Bhargava, in the course of their judgment, pointed out that by reason of the sugar control order and the notifications issued thereunder, the assessee could not sell any sugar. Merely by maintaining an office in Kanpur it could not be said that the assessee was carrying on business, the expenses of which he was entitled to deduct. Their Lordships added that there being no business, no question of computation of its income or of any deduction of expenses incurred wholly or exclusively for such business should arise.

The papers which have been read on the subject placed beyond all doubt that double shift working does mean the effecting of economies in most cases where it is undertaken. The uncertain element is that there ought to be in existence a sufficiency of orders to justify such a course, or, at any rate a reasonable prospect of them being forthcoming in the near future, that is, soon after the transition has been accomplished. Theoretically, the fact that economies have been accomplished should mean that the lower costs resulting would open up wider markets. That assumption might fairly be regarded as almost inevitable sequel in a free trade world; but there is no guarantee that this pleasant state of affairs would ensue, when even countries within the British Commonwealth introduce highly protectionist

Trade union opposition to the idea of double shift working has died out considerably, and there is now much less insistence than formerly that beginning work early in the day is continuing until well into the night undermines the domestic life. (The usual times worked in factories and mills which have introduced double shifts are 6 a.m. to 2 p.m. for the first shift and 2 p.m. to 10 p.m. for the second, with a break of at least half an hour). Therefore, the prospect is for the double shift system to make further headway in Britain. Meanwhile, there is the significant fact to ponder that in 1952 the United States became the world's largest exporter of cotton piece goods and that Britain cannot afford to neglect any step which will enable her to become more competitive.

Something like a reversal of the cotton spinning industry's previous attitude to the purchases of raw material has taken place during the past few weeks. It will be recalled that when the Conservative Government restored a comparative freedom of buying last year, only a small proportion of companies took full advantage of the opportunity. But now there was offered of getting away from the Raw Cotton Control these companies, in fact, which had been most vehement in their denunciations of cotton control. The beauties of free enterprise and of reluctance to interfere with existing institutions suddenly became expounded in unex-

pected quarters. Indeed, there were resounding declarations on the part of one of the most important of the spinning concerns that it had much fear which to thank the Commission. It has been said that these policies should be ascribed to a reluctance to come into apparent opposition to the Commission, whose aid, after all, might still be useful, and which, conceivably, would be most heartily accorded to its known supporters. Certainly, discretion is the better part of valour, even in the prosaic world of commodity dealing and this factor may have had an influence. What has undoubtedly been a part in bringing about a more adventurous feeling on the part of spinners is the revelation of the strength of the Government's determination to lessen commercial restrictions in any direction where it has power to do so. Now that it is known that the Government's aim is commercial freedom is not a lackadaisical expediency but a real policy, there is no longer any reason to fear a brooking of the Raw Cotton, or any other Commission's displeasure. For, on the best view, the Commission's powers are limited by its Whitehall dependence, and, on the worst, those who take an independent line have powerful friends at Court.

Some people, by the way, had thought that the Government would have frowned on the futures market in wool which is being started in London and which will come into operation during April. But such has not proved to be the case so far, although the project is hardly palatable to Australia. This taking over by the Government of the little that is left of Liberalism under has given a sharp and much needed impetus to merchandising, and has greatly encouraged those who believe that the revival of merchandising activity is a forerunner of expansion of trade.

The most pronounced textile recovery has been in the synthetic industry, where production is now as high as it was before the recession. The tendency asserted itself that is, the greatest decline has been in staple rayon. The explanation lies in the continued resort to blending of fibres, in which process staple plays an outstanding part. There is no likelihood of this use diminishing, unless there is a sharp fall in wool prices with little prospect of recovery to former levels. The current position is that buyers of wool are quite willing to pay the prices now ruling.

The fact that India is importing large quantities of penicillin justifies a reference to the latest claims on behalf of that product. A strong campaign has been initiated in Britain urging the use of anti-biotics in livestock feeding, with the emphasis chiefly on penicillin. The theme has assumed such dimensions that a report is to be issued on the subject by the Agricultural Research Council, as soon as it has completed investigations. The chief claim is that the use of penicillin in

The chief claim made for penicillin in this direction is that it is a health promoting and that pigs having doses of penicillin admixed with their food can be made to yield a larger amount of flesh. The human consumption and the use of penicillin beyond dispute, as also that penicillin influences flesh forming by cattle. Opinions differ at present as to how this comes about or why it should do so. Doubts have been expressed as to whether this stimulation (if such it can be called) is likely to have long-term deleterious effects, causing, for example, a change in the quality of meat or affecting the breeding capacities of the animals. There is the further consideration of whether the prolonged eating of such flesh might not have some drawback to health or bring about physiological changes. The experiments now being undertaken are of a relatively short nature and probably the cumulative dietetic effect over many years will have to be left to imagination and conjecture. However, the Agricultural Research Council's report will provide the best basis upon which to form a judgment, which may have to be revised as further evidence comes to light. A number of the approach experts have published letters urging that the approach to the whole subject be a very cautious one.

Aerogeneration

A survey undertaken some time ago led to the conclusion that the percent of Britain's total electric power needs could be met by utilising the wind. Such a proportion, having regard to the large amount of power used, is by no means negligible and would justify generation by this means, provided that it was economical. That costs would not be excessive is indicated by the two medium-sized generators erected in Scotland and Wales. Nevertheless, it was felt that much more required to be known about "aerogeneration," as it has come to be called, before a decision could be reached upon whether a large scale obtaining of power by means of the wind should be attempted. Opinion in favour of such projects has strengthened. Although generators of fairly advanced design have been used on the Continent, especially in Denmark, it is thought that further improvements could be made and experiments to this end are being officially sponsored.

ACCORDING to a statement published in the Press last week and broadcast by All India Radio, a spokesman of the Commerce and Industry Ministry discounted reports circulating in Calcutta of an impending decision by the Government of India to permit a cut in the output of jute goods by sealing looms. Some of the statements attributed to this spokesman in New Delhi of the late lack of appreciation in New Delhi of the realities of the position. The spokesman was reported to have said that representations had been received by the Government that 71 per cent of the looms should be sealed but that no final decision had been taken. That was already known some time previously. He also said that "the Government had already sealed 121 per cent of the looms." If he has been correctly reported the statement is wrong. These looms were voluntarily sealed by the I.J.M.A.—and it was done some years ago, so the statement is not only wrong but misleading for it would imply that these looms had been sealed recently. He stated that, in the opinion of the Government, the position of the industry was not as bad as made out in certain quarters and, though he admitted that "the exports in January and February were not, perhaps, good" the figure for March was "quite encouraging." Apparently he was unaware that stocks of heavy sacking had been increasing steadily since June, 1952, and that from 1st July, 1952, to 28th February, 1953, they had gone up by 43,400 tons or 83.6 per cent, the equivalent of more than one month's output. So far as the March figure is concerned it should be obvious that a considerable portion of the shipments in March were made up of goods which had been held back in confident expectation of a reduction in the export duties made in the budget. It can, of course, be argued that the additional shipments were the result of the reduction in the duties but that must be qualified by the fact that the goods shipped had been purchased previously. There was little or no indication that fresh buying had been stimulated by the reduction in duties and that was what the industry needed.

The spokesman went on to say that the effect of the reduction of duty on sacking could only be noticed after a month or two. He said "American buyers normally entered the market in June or July." In fact apart from small quantities of nitrate bags and so on, America buys hardly any sacking. If New Delhi is expecting the Americans to make increased quantities of sacking because of a reduction in the duty it is probable that there will be a dissipation of the Jute manufactures bought by both North and South America are almost entirely hessian (burlap) which is not affected by the reduced duty.

In a recent article on this page it was pointed out that in the last pre-war year the Far Eastern countries took more than one-third of the total output of heavy sacking whereas in 1952 they took only one-sixth. The figures for 1952-53 so far to hand show a further reduction. If other consumers of sacking had increased their purchases the position would not have been so disquieting but there has been no increase of buying by other markets to balance the losses in the Far East. It would seem, therefore, that for the time being, the industry must reconcile itself to the loss of at least one-sixth of its outlet for sacking. The possibility of peace in Korea and subsequent easing of the position in other countries in Eastern Asia which are at present distraught with civil conflict may encourage hopes that these markets may ultimately be recovered but that is a vision of a relatively distant future. What we have to deal with is the realities of the present and, with at least one-sixth of the outlet for sacking closed, the I.J.M.A. proposal to seal sacking looms to the extent of $\frac{7}{8}$ percent of the total looms appear very reasonable. Maybe the delegation that has gone to the Antipodes will be able to produce the rabbits out of the hat or some fortuitous circumstances may arise to balance the loss in the Far East made; but that is wishful thinking. Meanwhile it is inappropriate that, while the I.J.M.A. delegation is in Australia trying to induce that country to import more sacking from India, the Government of India should announce that the import of raw wool from Australia is banned. For that going to encourage Australia to buy more woolpacks?

Manufactured Goods: There has been very little movement in the finished goods market this week and prices have fluctuated within narrow limits. Demand from America for Calcutta hessians kept this section steady and fairly good business was done through both in 9 and 11 porter goods. Over the past few weeks there have been very few reports of Continental markets underquoting Calcutta hessians, and it is thought that as long as these prices continue the U.S.A. will not look elsewhere for requirements. There has not been very much demand for heavy goods, but local bazaar covering a

the former Indian market have helped to keep sackings steady and a better market than for some weeks before the new ruling. Although gunny rates remained almost constant it was not so with the jute market, which jumped about Rs. 1-8 over the previous week. Mills were not able to cover the cost of production as last week, and the result was a loss of Rs. 1-10 per sack. It is a rumour that the Argentine Government is short-sighted to place an order with India. Towards the close this was having the effect of restricting activities, and operators were holding back in the India market while waiting for official confirmation. Business with the other goods section, however, continued as of old. A small way with local bear-covering and rates showed very little alteration. A feature of the market this week has been the way in which the market sagged every day towards the close, but recovered overnight to open more or less at the same level.

every morning.

At the opening of the goods market on Thursday last, there was a general increase in rates as it was announced that U.S. consumption of hessians in March had risen by 11 million yards to 69 million yards. Hessian prices rose 6 annas whilst heavy goods moved up 8 annas to Rs. 39-2 per 100 yards, and hessians were quoted at Rs. 89 per 100 bags with B Twills at plain heavy Cees. 89 per 100 bags. Small business was done at in hessians and on Friday this section continued to rule steady with a 2-anna increase to Rs. 39-4. But in the absence of interest the heavy goods section was quiet; plain heavy Cees were at Rs. 89 per 100 bags. B Twills recorded a fall of 2 annas to 87-8 per 100 bags. On Saturday hessians were unchanged, as also were plain heavy Cees, but due to some late local covering B Twills regained the 4 annas lost the previous day. Over the week-end local covering business continued, this time mainly in plain heavy Cees, which rose 8 annas to Rs. 89 per 100 bags. Monday morning. Both 40" 10 oz. and 40" 12 oz. Twills showed a small decline. The market in the absence of interest and throughout the day within narrow limits, but the tendency in the hessian section was nearly always upwards. By Tuesday morning opening quotations were Rs. 39-2 per 100 yards and 40" 10 oz. Twills were at Rs. 89 per 100 bags. The highest rate touched was 2 annas up over the previous day's opening rate, but 4 annas down for plain heavy Cees satisfied, with the demand for 8-anna increase of the previous day fabric fell back to Rs. 88-8 per 100 bags. B Twills recovered slightly to open 4 annas up at Rs. 87-8 per 100 bags. At this stage, hessians and B Twills showed five days of minor fluctuations, steady except on the five days of minor fluctuations, steady except on the same figures as at the opening of the market. On Thursday last the market was shown a drop of 8 annas.

At the close the market is slightly quieter with quotations 2 to 4 annas down and mills showing little interest. Opening quotations on Wednesday morning were as follows:—

	April	May-June	July-September
	Rs.	Rs.	Rs.
40" 8 Oz.	31-4	31-6	31-6
40" 10 Oz.	39	39-4	39-8
Heavy Cees			
(Plain)	88-8	89-8	90
B Twills	87-4	87-12	88-4
Cornsacks	89-8	90	90-8

Raw Jute: Once again mills have shown an increasing interest in the raw jute markets and their purchases over the week have been about 300,000 to 400,000 maunds of jute. Good business has been transacted daily as a result of which the market has shown a steady rise from the opening. The steadiness in the finished goods market has also contributed to the firmer jute market and in many cases sellers have withdrawn in anticipation of yet higher rates. The demand for high-grade jute has not been quite so great as in the previous week, but the market has held firm this week, but the small lots that changed hands were at premium rates. Over the week, the mills have purchased about 100,000 maunds of jute of all descriptions in the local Cossipore markets and upcountry held in the local Cossipore markets and upcountry godowns. Sellers are now free to re-stock with jute at a much cheaper rate and with the improvement in the market are in a position to cut their prices. The former sales it has been necessary for sellers to deliver is an increasing tendency for sellers to deliver jute very early in the contractual period, and although in a few cases this has been ascribed to distress selling, the general opinion is that they are not keen on again carrying large stocks of jute and are eager to clear their godowns. Towards the end of the period, the price gap between Indian and Pakistani jute has narrowed, and a large number of purchases of considerable quantity at low rates. This has the effect of stemming the rise in the Indian market, when shortly afterwards the same group purports to have been indicated that they would buy Indian jute at a rate about Re. 1 or more below the current quotation at the time. Many sellers, however, put interest at the lower rate and the market completely.

At the opening of the market last Thursday rice quotations showed an increase of 8 annas per maund over the previous day and were at Rs. 20 per maund. Upper Assam Bottoms for April-May period. Prices continued to rule firm at Rs. 20 per maund. Friday brought with it a further increase of 8 annas per maund. This was repeated on Saturday when Ordinary Assam jute was available at not less than Rs. 20 per maund. This proved to be the highest price touched during the week, but for the week-end when business had been suspended at this rate both Monday and Tuesday prices became easier and mills indicated their unwillingness to follow the further advance. This caused rates to fall away and a quiet tendency prevailed.

Pakistan Jute:
Jat & Semi-Jat:—Rs. 24-8 per md. for Middles and
Rs. 21 per md. for Bottoms for May shipment
on C.O.D. terms.

Dhubri (Supervised).—Rs. 20-12 per md. basis Bottoms for one month's shipment.
 Dhubri.—Rs. 20 per md. basis Bottoms for one month's shipment.
 Assam (Supervised).—Rs. 19-12 per md. basis Bottoms for one month's shipment.
 Assam.—Rs. 18-8 to 20 per md basis Bottoms for one month's shipment. (option of delivery ex local godown.)
 Northern.—Rs. 23 per md. for Middles only for one month's shipment.
 Rs. 19 to 21 per md. basis Bottoms for one month's shipment.
 Murshidabad Tossa.—Rs. 19 per md. basis Bottoms for one month's shipment.
 Daisee.—Rs. 24 per md. for Middles only for 15 days' delivery.
 Rs. 20 and 21 per md. basis Bottoms for one month's and 15 days' delivery.
 Cut Mesta.—Rs. 24 per md. for Middles only for one month's delivery.
 Rs. 20-8 per md. basis Bottoms for one month's delivery.
 Bimili.—Rs 14-8 to 16-8 per md. for F.A.Q. for one month's shipment.
 Rs. 19 per md. for Middles only for one month's shipment.
 Pakistan NC Cuttings.—Rs 62 to 64 per bale for one month's delivery ex local godown.
 Mill Firsts.—Rs. 135 and 140 per bale for one month's delivery.

At the close the market is a little easier with quotations 8 annas down and mill indications being given at below this rate. Business was again done in Pakistan jute at the previous levels and it is reported that over the week about 3 lakh maunds of Pakistan jute was purchased. Opening prices on Wednesday morning were as follows:—

Wednesday Morning		Thursday Morning	
	Aprill- May Rs.		Landed at Mill
Pakistan Jute:			
Jat	22	per md.	basis Bottoms
District	21	"	"
Northern	21	"	"
Indian Jute:			
Lower Assam	20-8	"	"
Upper Assam	20-8	"	"
Northern Bengal	15-6	"	"
Murshidabad White	17	"	"
Bihar	16	"	"
Daisee	20-8	"	"
Bimil	16	per md.	for F.A.Q.
Mill Rado	180	per bale	"
Mill Firsts	140	"	"
Mill Lightnings	125	"	"
Mill Hearts	110	"	"
Dundee Daisee			
(Short Group)	140	"	"
Dundee Daisee			
(Long Group)	125	"	"
Indian Cuttings	61	"	"
Pakistan Cuttings	87	"	"

Tossa is offered at Re 1 to Rs. 2 per md. above the rates for white jute.

Mufussil: In India the improvement in the up-country markets continued and business was put through at advancing rates. More stockists came out as sellers at the higher prices and the increased activity resulted in an appreciable drop in the stock position. The demand for high quality jute has slackened, it is scarce and the price asked for it is far higher than anything mill prices in the country. Imports still are negligible and the business transacted so far has once again been for stock jute. Prices have not increased to the extent that one might have expected considering the amount of business done, and general quotations are only 8 annas a maund or over last week. Local quotations are Rs. 16-8 p per maund for Dhubri Bottoms and Rs. 13-8 p per maund for Upper Assam. Consignment markets in the country have shown a bigger increase than the up-country probably because mills want quick delivery jute. Rates have advanced by Re. 1 per maund. Re. 1-8 per maund and quotations are based on Kishanganj jute at Rs. 20-8 to Rs. 21 per maund for garsat quality. Northern jute is more popular with the mills these days than ever before, and jute from these areas is being used in large quantities. Dhubri jute is being used in small deliveries of the latter were disappointing. Higher prices are being asked, and prices for good quality Northern fibre. Imports into Calcutta remain at about 40 wagons daily but the majority contain low quality fibre. The demand for Daisee is still strong and as imports have now practically stopped in the Daisee markets a large quantity jumped by Re. 2 to Rs. 22-8 in the South Indian markets. Quotations are based on Rs. 20-8 per maund for garsat quality.

There has been very little activity in the Pakistan jute market this week and quotations are unchanged, from last week. Imports are gradually falling off, and in Narayanganj are down to about 8,000 maunds daily, of which about 25 percent is Tossa. The demand for Tossa jute is still good and the premium varies between Rs. 3 to Rs. 5 per maund. Latest quotations in Narayanganj (in Pakistan rupees) are as follows: J. A. NW-1—Rs. 15.00; m. basis Bottoms—Tossa—Rs. 14 to Rs. 19; m. basis Bottoms. District White—Rs. 14 to Rs. 15; m. basis Bottoms. Tossa—Rs. 17 per maund and Bottoms.

Arrivals of raw jute in Calcutta and mill sales during March 1953 amounted to 4,83,645 bales compared with 4,10,821 bales in February 1953. The arrivals for July 1952 to March 1953 are now 43,41,100 bales, of which 31,41,905 bales (72.3 percent) were from India and 11,54,200 bales (27.7 percent) from Pakistan. * Of the arrivals in March 1953, 3,79,390 bales (78.6 percent) came from India and 1,04,210 bales (21.4 percent) came from Pakistan. Arrivals from Pakistan in March showed a slight improvement of 2 percent over the February figure, but were still 17 percent less than the imports in March 1952. In the period July 1951 to March 1952 total arrivals were 41,81,032 bales, of which 25,03,394 bales (60 percent) came from India and 16,77,638 bales (40 percent) were from Pakistan, origin of jute during the recent years imports from Pakistan are still about 20 percent less than the 1951-52 season.

**AND NOW
THE EUCLID
TRACTOR &
SCRAPER
FOR STERLING...**

This new Euclid Tractor and Scraper (12 cu. yds. struck capacity), manufactured in Great Britain, is now available for sterling. Powered by the famous Leyland Diesel Engine developing 154 brake horsepower and a top loaded speed of 29 miles per hour, this Tractor and Scraper with its open bowl, positive hydraulic control and steel angle dumping ejector can greatly reduce costs on your earthmoving project.

ARGENTINA INVITES TENDERS FOR 10,000 TONS OF HESSIANS

A Reuter message from Buenos Aires says that the Argentine Trade Promotion Institute has called for tenders, to be opened on 21st June, for 10,000 tons (20,000 bales) of hessians from India—5,000 tons 40" 10 oz. and 5,000 tons of 40" 9½ oz. Although the Institute has indicated its intention of buying 10,000 tons, this figure could go as high as 40,000 tons (which is Argentina's normal requirement for bagging grain crops) through the expedient of buying parcels of 10,000 tons each from several suppliers. Traders say that Argentina might be seeking a commercial purchase from India through the normal trade channels (for which she would pay in sterling) because she is urgently in need of hessians for the next crop which will be harvested from October onwards. Meanwhile, delivery is proceeding normally both ways of the 40,000 tons of hessians and 255,000 tons of wheat which were arranged in a barter deal between the Indian and Argentine Governments last October. The Institute's latest call for tenders is regarded as confirming the view that overtures between the two Governments for a new barter (which was reported a few weeks ago) fell through because of disagreement over the relative values of hessians and wheat.

The order placed in the United States by the U.S. Corps of Engineers, which was reported last week, was for 40,330,000 sandbags.

LAND PREPARATION RETARDED IN ORISSA AND W. BENGAL

In their fifth crop report for the current season which covers the week ended 18th April, Messrs. Sinclair Murray & Co., Ltd., say that the weather in Assam has been fairly favourable but some areas report excessive rainfall and that strong sunshine is required. The river levels in Assam are slightly higher than last year. Weather in West Bengal and Orissa has continued to be very hot and dry and rain is now urgently required to allow preparation of land to commence. River levels in Bengal and Orissa are below normal.

DANPUR (Orissa): The weather has been very hot and dry and rainfall is required to allow the preparation of land to be started. Negligible sowings

have taken place in the protected area by irrigation with canal water.

JAIPUR ROAD (Orissa): The weather has been very hot and dry and rainfall is urgently required to enable cultivators to commence ploughing fields.

RANAGHAT (West Bengal): The weather has been very hot and dry and until rainfall is experienced agricultural preparation will be held up. Sowings have not yet commenced as compared to -3/- at this time last year.

COSSIMBAZAR (West Bengal): Weather conditions have been extremely hot and dry. Preparation of land cannot commence until there is a heavy shower of rain. -14/- of jute cultivated land had been prepared at this time last year and -7/6 sowings had taken place.

NOWGONG (Assam): The weather has not been very favourable due to heavy rainfall. Strong sunshine is now required for further sowings as well as to assist the growth of young plants. First weedings on lowlands have been suspended due to heavy rainfall. Condition of young plants is satisfactory. Sowings to date amount to -10/- as compared to -10/- at this time last year. The river level is slightly higher than last year.

GAUHATI (Assam): The weather has been fairly satisfactory but it is reported that a spell of dry weather is required as some areas of the lowland are water-logged. The condition of the midland is quite satisfactory but some damage was caused to the lowland crop due to heavy rain. Sowings to date amount to -10/- as compared to -13/- this time last year. The river level is slightly higher than the corresponding period last year.

DHUBRI (Assam): Dry and hot weather followed by a shower of rain has been favourable for the standing crop. The growth of young plants is reported to be satisfactory. Sowings to date amount to -11/6 as compared to -12/6 this time last year. The river is about 1 ft. higher than last year at this time.

KHARUPETIA (Assam): Weather conditions have been favourable with alternate rain and sunshine. A spell of strong sunshine is now required to assist the growth of young plants. Sowings to date amount to -10/- as compared to -12/6 at this time last year. The river level is reported to be normal.

DAISEE DISTRICTS: Hot and dry weather has continued and this has held up preparation of land for sowings. A small quantity of White and Mesta has been sown but the condition of the young plants is very unhealthy and probably will have to be re-sown when rain is experienced.

PAKISTANI SOWINGS LAGGING

In their seventh crop report for the current season which covers the week ended 18th April, Messrs. Sinclair Murray (Pakistan) Ltd. say that the weather has been favourable in most districts, but in western areas further rainfall is required. Despite favourable weather conditions sowings generally continue to lag behind last year. Condition of the standing crop is generally good but there are reports from Western areas that the midland crop has been attacked by insects. River levels are slightly higher than this time last year.

NARAYANGANJ: The weather has been favourable in view of the rainfall over last weekend. Further rainfall is now required to enable cultivators to complete highland sowings. Sowings to date amount to -6/- as compared to -12/- last year. Lowland and midland sowings have been completed at -5/6 as compared to -11/- for these areas last year. Condition of young plants is good and range from seedlings to 1' 9". The river level is about 1' 8" higher than at this time last year.

DACCAR: The weather has been hot and dry except for two good showers over last weekend which were favourable for young plants and have also allowed cultivators to resume sowings. Sowings to date amount to -5/- as against -10/- this time last year. Condition of young plants are healthy and range in height up to 1' 6". The river is slightly higher than last year at this time.

CHANDPUR: Weather conditions have been favourable with alternate rain and sunshine, and this has been beneficial to the young crop as well as for further sowings. Sowings to date amount to -6/8 as compared to -15/- last year. Sowings in lowland and midland areas have been completed at -6/- as compared to -13/- for the corresponding areas last year. Condition of the young plants are healthy and range in height up to 1' 8". The river level is about 2' higher than last year.

HAJIGANJ: The weather has been favourable. Sowings to date amount to -5/6 as compared to -12/- at this time last year. Condition of young plants is good. The river level is 2' 5" higher than last year at this date.

AKHAURA: Alternate rain and sunshine has been experienced and this has allowed sowings to be completed at -8/- as compared to -12/- last year. Condition of young plants is quite satisfactory. The river level is normal for this time of the year.

ASHUGANJ: The weather has been favourable with timely rainfall. Sowings to date amount to -7/11 as compared to -10/- last year. Condition of plants is satisfactory. The river level is normal.

NIKLIDAMPARA: The weather has been favourable with alternate rain and sunshine. Sowings to date amount to -6/- as compared to -14/3 at this time last year. Condition of the young plants is satisfactory and range in height from seedlings to 6". The river level is about 1' 7" higher than last year at this date.

SARISHABARI: Apart from a slight shower during last weekend there has again been no rain. Rain is urgently required to enable cultivators to complete midland sowings. Sowings to date amount to -7/4 as compared to -13/- at this time last year. Growth of lowland plants has been slow during the week but the general appearance is very good. Seedlings generally are disappointing. The river level is about 3' 10" higher than this time last year.

SERAJGANJ: The weather has been favourable with good rainfall at the commencement of the week and strong sunshine during the latter part. Sowings to date amount to -5/- as compared to -11/- at this time last year. Condition of the young plants in lowland areas is satisfactory and range in height up to 3'. Young plants in the midland area have been attacked by insects and a heavy fall of rain is urgently required to promote the growth of the plants. The river is about 2' higher than last year at this date.

NAKALIA: Rainfall was experienced during the early part of the week but since then the weather has been hot and dry. Further rainfall is required for sowings and to benefit the standing crop. Sowings to date amount to -4/6 as compared to -7/6 at this time last year. Condition of the lowland crop is healthy and plants range in height up to 2' 6". The river level is about 2' higher than last year.

BHANGORA: The weather has been excessively hot and dry and rainfall is urgently needed to allow further sowings. Sowings to date amount to -4/6 as compared to -7/6 at this time last year. Condition of the young plants is fairly satisfactory but further rainfall is urgently needed. The river level is about 9" higher than the corresponding date last year.

THE FOREIGN JUTE MARKETS

(FROM OUR OWN CORRESPONDENT)

Dundee, 16th April.

The jute markets generally continue quiet, with Calcutta leading the depression, though conditions have improved to some extent there in the past few days. Shippers of Calcutta goods are not now quoting the very cheap prices of last week and there are hopes that the improvement will continue, as the whole situation has become rather dismal because of the weakness displayed by the primary market. Continental manufacturers were not inclined to lower their terms below those of the cheapest Calcutta rates, but no doubt they will round about Calcutta levels. There are certainly no depressing reports from any of the Continental producing countries, as they have done pretty well in the export past several months. The reduction in the export tax on sackings from India and the withdrawal of the special export fee on raw jute from Pakistan to India has to a fair extent mitigated the advantage in price enjoyed by Continental manufacturers.

Dundee spinners are probably the best off in the whole industry. Demand for jute yarns from menal and the U.K. carpet industry is phenomenal and there is an acute scarcity of hessian qualities. Spinner-manufacturers are in the market for supplies and the position of the firms who weave only is most unenviable. To make matters worse, spinners are falling further behind with deliveries of yarns on order and it is impossible to place new contracts.

Commodity Markets

WORLD WHEAT PROSPECTS

RECORD AUSTRALIAN YIELD EXPECTED

ALTHOUGH there has been some reduction in the planted acreage of wheat during 1952-53 there is every prospect that the crop will prove to be a bumper one. The American winter wheat crop, which was expected to fall short of the 1951-52 figure by a very large margin, is estimated at 14 million bushels compared with 1,053 million bushels in the preceding year. Despite this reduction, given a reasonable spring harvest, and with the substantial carry-over from last season, there will be a total supply for the 1953-54 season of some 1,515 million bushels, very little less than the 1,545 million bushels available for trading in the current twelve months.

After three good harvests, prospects for the Canadian crop have been less favourable because of the lack of moisture. However, above average rainfall since mid-January has improved the outlook and the moisture condition is now improved. Sowings of spring wheat in Canada are estimated to be about the same as last year when 25.9 million acres were seeded. The official estimate for this year's Argentinian crop is 7.8 million tons although to date the export movement has been rather slow.

Australian Outlook

A record yield per acre is expected for Australia's wheat crop. The total crop is now officially estimated, says the Financial Times, at 192,971,190 bushels with a record yield of 19 bushels per acre. Commenting on this fact, Broomhall's Corn Trade News gives the following comparisons.

AUSTRALIA'S WHEAT CROP

Year	Area acres	Crop bushels	Yield per acre bushels
1952/53	10,107	192,971	19.1
1951/52	10,134	159,750	15.4
1950/51	11,968	183,445	14.3
1949/50	12,240	218,221	15.7
1948/49	12,583	190,703	13.3
1947/48	13,680	220,166	19.3
1946/47	13,180	117,262	9.0

The exportable surplus of wheat from this year's harvest in Australia is estimated at 103 million bushels, or 28 million bushels above the present I.W.A. quota. Broomhall's report that the prospect—at least in Victoria—is for larger sowings of wheat and barley for the 1953-54 harvest, but that the area under oats is expected to be reduced. The drop in values of the latter grain has definitely disappointed growers, it is stated.

Crops in Britain are reported to have been affected by the recent floods while in some of the more important growing areas on the Continent dry conditions have retarded growth. Wheat yields in India have been good and have made up for the slightly reduced area sown. Prospects in Pakistan are not so favourable and it is understood that dry conditions have cut the planted acreage to 85 percent of the previous year. In Russia it is generally believed that winter crops were favourable.

BAGASSE TO BE USED IN RAYON TEXTILES

Tropical raw materials are playing an increasing part in supplying the paper and textile requirements of the Philippines. This week a Filipino industrialist, J. Amado Araneta, announced the imminent construction of what he described as the world's first complete rayon plant utilising sugar cane waste (bagasse) for the production of rayon textiles. The integrated factory, which will be built and operated for a Filipino-owned corporation by a New York textile firm, will be located on the Bago River on the west coast of Negros Island. It will utilise the bagasse from the sugar centres of Negros as raw material. Construction is expected to be complete by the third quarter of 1954, Araneta said.

This week also saw the pioneer Philippine producer of high grade paper from bagasse report that it had made 4,720 tons of bond and writing paper, 840 tons of chipboard and 56,917 litres of hydrochloric acid from sugar cane by-products in its factory on the east coast of Negros.

WHOLESALE PRICE INDEX

The official wholesale price index (with the year ended August '39 as 100) declined 0.8 percent to 382.0 during the week ended 4th April, 1953. The index was lower by 0.2 percent compared to the corresponding week of last month but was 0.6 percent higher than that of a year ago. During the week under review, Foodstuffs fell by 1.0 percent to 359.1. Industrial Raw Materials declined by 2.3 percent to 445.4 because of decreases in the prices of jute (-7%), linseed in Calcutta (-4%), manganese ore (-3%), cotton (-2%), rapeseed, castorseed in Bombay and cotton seed (-1%) each. The prices of castorseed in Madras and lac (+3% each) and linseed in Bombay (+1%), however, advanced during the week. The index for Semi-Manufactures stood at 350.1 compared with 350.5 for the previous week. The index for the Manufactures group at 367.1 fell by 0.6 percent. Higher prices of tobacco-leaf (+8%) and cashew-nuts (+2%) were responsible for a rise of 3.2 percent in the index for Miscellaneous which stood at 604.0. Prices of black pepper and betelnuts, however, declined by 2 percent each.

MIDDLE CLASS COST OF LIVING INDEX NUMBER FOR CALCUTTA (Base: August, 1939)

THE Middle Class Cost of Living Indices, by groups, have now been brought up to March 1953. As compared with February, the March Index for Food shows a drop of 7 points, while that of Clothing reveals a rise of 8 points. The Middle Class Cost of Living Index Number for Calcutta. Prices in August, 1939=100

In recent years the cinema has become one

of the most vivid mediums of instruction

available to educationalists.

The Shell organization early realised that

the story of oil, its development and its

supreme importance in our modern world,

were of special interest to universities,

schools, business and training colleges,

scientific societies, etc. So they sponsored

a series of films which tell the story of oil—

the story of a great modern industry.

Burmah-Shell maintain, at Bombay, Calcutta

Madras and Delhi, a library of 16 mm.

and 35 mm. films together with 16 mm.

portable sound projection equipment. We

shall be only too pleased to arrange showings

of these films to interested groups or to

lend our films. Please write to your nearest

Burmah-Shell Office for full particulars and

a catalogue of the films available.

Saint Frères Circular Looms installed in Italy.

SAINT FRÈRES CIRCULAR LOOMS

Hundreds of Saint Frères Circular Looms are in use—in new factories and old, sometimes working alongside flat looms—in the Belgian Congo, in South Africa, Sweden, Norway, Italy, Great Britain, Germany, Belgium and France.

These looms were originally designed for making tubular cloth from jute. Deliveries of a Saint Frères Circular Loom for hard fibres are now available. Saint Frères Circular Looms are manufactured by Urquhart Lindsay & Robertson Orchar Ltd, Dundee, Scotland.

WARP STOP MOTION—Immediately a warp thread breaks the individual compensator is pulled upwards by the action of its spring and brought into contact with the control bar, automatically stopping the loom.

Vol. CXXX No. 3256

TECHNOLOGICAL PROBLEMS OF ASIAN INDUSTRY

THE TRAFFIC IN EXPERTISE: TRAINING THE N.C.O.'s FOR ECONOMIC PROGRESS

THE appearance since the war of numerous new international organisations offering to supply technical assistance to Asian countries might seem to imply that Asia has never before been given the opportunity to benefit from the advanced technological achievements of the European peoples. Indeed several of these organisations studiously give the impression that they are working in virgin territory, and to read some of the more optimistic prophesies of the good that will be done in Asia by U.N., U.S. and Colombo Plan experts one would imagine that Asia had never seen an expert before. In fact of course what these excellent new organisations are doing is taking over from imperialism its useful functions and ensuring that when colonialism gives up the ghost there will be no sudden interruption of the scientific and industrial services it has been rendering in Asia for the last century. The hiring of foreign experts, the training of Asian technicians and the importation of expertise and equipment are not new developments in the East. If they were, one would be hard put to explain the existence of, for example, the Indian Railways which have just been celebrating their hundredth birthday. What is new is the adjustments that have to be made in consequence of the withdrawal of imperialist political power, the assumption of purely local responsibility for public works, the liquidation of such "technical co-operation schemes" as the old Indian Civil Service, and the rise of economic nationalism which has limited the flow of foreign initiative by way of private enterprise.

Leaving its considerable political defects quite aside, imperialism had certain economic advantages over the new systems in the provision of technical knowledge to the backward countries. The flow of what in the new era is called "know-how" went on smoothly, efficiently and economically under the colonial régimes instituted by Britain, France and Holland in Asia. Experts could be recruited from those countries—and during the nineteenth century when the system came to maturity, those countries were the world's scientific and industrial leaders—with a minimum of fuss and shipped out to the East with a definite job to go to, a caste with its stable code to join, and the promise of secure tenure and a pension. Spending years, in many cases a lifetime, in the Asian country to which they had been recruited, the old-style experts learned the peculiarities of working with advanced methods in backward lands, formed a sounder judgment of the technical potentialities of the people they worked amongst and were generally protected from the superficial and impatient optimism that attacks the high-pressure expert who drops down in Asia for a few weeks or months in between assignments in the West. These advantages explain the very substantial achievements of the old system in Asia, of which we have quoted one example in the Indian Railways but of which we could furnish dozens more if they were not already quite familiar.

That system had to go, and its passing is not regretted. The technological services of imperialism were constantly in danger of being discredited by the political inequities that inevitably accompanied them. The resistance to these latter meant that full support and enthusiasm could not always be obtained from the local people and the best indigenous talents not always recruited and developed. The flow of expertise was usually (though by no means invariably) limited to one metropolitan power and its colonies, whereas in the middle of the twentieth century Asian countries are often less interested in the skills supplied by Britain, France and Holland than they are in the new techniques developed in the United States, Canada and Australia. In any event, with the surrender of European political domination, new ways of maintaining the supply of technological

assistance had to be devised which would accord with the independence, self-respect and nationalist feeling of young Asian countries. The Technical Assistance Administration of the United Nations, the training programmes of the specialised U.N. agencies, the American Government's schemes lumped under the heading "Point Four" and finally the Technical Co-operation Council of the Colombo Plan are the instruments that have been designed to meet the new situation.

The progress of these institutions can be judged fairly only if we remember that they are doing an old job in a new way. They have the great advantage of complete and enthusiastic co-operation from the Asian Governments they are assisting—although they can still run into political difficulties, as the recent dismissal of American experts from Burma showed. As youthful organisations, their reports of progress made are often rather fulsome, and it is salut

logical one. Organisers, teachers and instructors are more important than straight professionals. Of course, the teachers must themselves be practitioners but it is a truism that the best instructor is not always the best man at the job. ("He who can do, he who cannot teach," said Shaw and as usual there is a grain of truth in his exaggeration.) The Technical Co-operation Council's report describes several intelligent methods that have been adopted to combine the educative and technical aspects of Asia's development requirements, which we have not the space even to summarise here. To say that the progress achieved by the Colombo Plan countries in this field has been sure and modest is not to damn it with faint praise, for the important thing about winning Asia's ancient conservatism over to modern Western industrial science is that the job must be taken slowly and the excellent beginning made by now-discredited imperialism must be continued in a different spirit but with the same patience. Those who have the time to study the full report of the Technical Co-operation Council will see that the task is being approached in a temperate and sensible way and that the work so far done constitutes the most encouraging feature of relations between Asia and the West since the rise of the new nationalism.

EISENHOWER VERSUS MALENKOV

THE COST OF ARMS AND THE DANGER OF DEPRESSION

CYNICS with a streak of pessimism in their make-up have suggested that M. Malenkov has a firmer grasp of world economics than M. Stalin had of world politics. Fortunately, the same might be said of Messrs. Eisenhower and Truman. If it is possible that capitalism will be weakened by a trade slump, it is also possible that the spread of Communism will be checked by economic aid. Expenditure on armaments is barren, and if carried to extremes it can so lower living standards and weaken peaceful industry that it defeats its own purpose. The Marshall Plan recognised another principle, that living standards and the vitality of industry were political factors (Mr. Truman described the plan as "a segment of foreign policy"); and it appears that the present American Administration contemplates a switch of its campaign against Communism from, mainly, the military to, almost entirely, the economic plane. There is no avoiding the fact that adjustment to a real peace—a peace which may not be attained but for which we must strive and against whose consequences we must prepare—is one of the biggest tasks of our generation. Peace, like rearmament, has its problems. For America, for Europe, for the sterling area, for the primary-producing countries. It is doubtful if these problems can be solved unless they are treated as a whole; which is why Mr. Eisenhower's proposal of a global aid fund has been welcomed over most of the world.

If peace means reduction of expenditure on armaments and on materials for strategic stockpiling, its most obvious threat to economic stability is in America and in the primary-producing countries. America's industrial capacity had grown so fast that the possibility of a major recession of trade, due to the inability of consumers (heavily committed with payments for goods bought on credit) to absorb current output, and to the consequent slackening of investment in new equipment, was seriously discussed before there was any hint of peace. Recession in America, spreading inevitably to the other industrialised countries, would sharply reduce buying of the primary producers' commodities. The problems of Europe, of the sterling area, of the industrialised eastern countries, are related but not quite similar to those of America and of the primary producers. The immediate reaction would be most obvious in Japan; no other country's economy has been so closely geared to the Korean war, and a major reorientation of its trade would be needed to replace the dollars accruing from the war. Europe would benefit immediately from the lowering of import prices which would result from the weakening of demand for materials, and of food in sympathy; but if prosperity collapsed in the primary-producing countries some of the export markets of the industrial countries would collapse with it.

Economic opinion in London is not altogether happy about the prospect of peace in relation to the sterling area as a whole. Britain herself, buying more cheaply (or not as cheaply as had been feared), might be comfortably placed for some months. But the political as well as the economic effects on the primary-producing colonies could be serious. Even the "threat" of peace has caused such falls in the value of rubber and tin that Malaya faces the possibility of a new crisis. Reduction of earnings from metals, fibres, foodstuffs, would come most inopportunistically to the African continent in its present turbulent state. Of more immediate concern is the effect of a commodity slump on the

sterling area's payments position, especially the dollar account. The price falls that have occurred already must have upset the precarious balance achieved last year, and a slump could cause a new payments crisis as bad as any experienced since the war. Yet there is an undercurrent of confidence. The future can be much more favourable than the present if bold policies are adopted promptly in America, the only country whose policies alone can be decisive. If America, with all her experience and forewarning, allows herself to be caught up in a slump, the countries at present co-operating in Europe, with their associated currency areas, need not stand by helplessly until they too are engulfed: monetary policies and trading agreements can at least partly isolate them from America.

It is a reasonable assumption that genuine peace would mean not only less costly political hostility but also more profitable commercial intercourse between the two political and economic systems. The 800 million people behind the Iron Curtain offer a vast market for manufactures and for some commodities. Indeed, adaptation to peace might be impossible for Japan without free access to China. The capital needs of the other underdeveloped areas have been estimated by United Nations experts at \$10,000 million, merely to raise national income a head by 2 percent a year. To the developed countries, also, peace offers opportunities that have eluded them for many years. High taxation to pay for arms has restricted and distorted capital investment in industry. Roads and other public works have been sadly neglected. With markets assured by bold international and national plans, employment—useful employment—could be maintained and living standards could rise. If M. Malenkov envisages that capitalism will be weakened by a slump, and Mr. Eisenhower that economic aid can penetrate the Iron Curtain, the rest of us may reap the benefits. How substantial those benefits might be was emphasised by Mr. Eisenhower in a recent speech when he said: "The cost of one modern heavy bomber is a modern brick school in more than 30 cities. It is two electric power plants, each serving a town of 60,000 population. It is two fine, fully equipped hospitals. It is some 50 miles of concrete highway. We pay for a single fighter plane with a half-million bushels of wheat. We pay for a single destroyer with new homes that could have housed more than 8,000 people. . . . This is not a way of life at all, in any true sense. Under the cloud of threatening war, it is humanity hanging from a cross of iron."

CURRENT COIN

Savings and the Estate Duty.—In his presidential address at the annual general meeting of the Indian Chamber of Commerce in Calcutta on Friday, Sir B. P. Singh Roy offered a number of helpful and constructive suggestions on the implementation of the Estate Duty Bill. The minimum exemption limit of Rs. 50,000 in the case of property belonging to a Hindu joint family and Rs. 75,000 in other cases was too low considering that "the number of dependents on an earning member is usually large and the State is not in a position to give any unemployment relief." The provisions regarding allowances for quick succession, both as regards the rate and the period within which the duty becomes payable on successive deaths, would "create considerable hardship." Sir Bijoy felt that no duty should be charged on the second death if it occurs within five years of the first for public charitable purposes should be completely exempted and there should be no time limit for such exemption. The Bill provides that where a trust was declared by the deceased and he himself was the trustee, the property would be included in his estate unless he handed over possession to the beneficiary at least five years before his death in the case of ordinary trusts and one year in the case of public charitable trusts. Sir Bijoy thought these periods should be reduced to two years and six months respectively. Gifts inter vivos made genuinely one year or more before the death of the deceased should also be completely exempt from duty and the provisions governing insurance policies liberalised. The dwelling houses of families should not be considered part of the deceased's estate; if they were, "middle class families particularly will suffer a great deal." Finally, he suggested that the rates of duty should be specifically laid down in the Act itself instead of in the Finance Bill each year, and "appeals should not lie to the Central Board of Revenue but to an independent Appellate Tribunal on the lines of the Appellate Tribunal under the Income Tax Act to be created for the purpose. With these modifications the estate duty might have a less deterrent effect on savings and the future development of our industries." Sir Bijoy chafed at indigenous products; it should start Calcutta, Bombay and Kanpur to exhibit the needs of departments which buy large quantities of stores and equipment "so that in course of time all Government requirements are met from indigenous sources."

Business in Bihar.—Mr. B. P. Agarwalla, president, said at the annual session of the Bihar Chamber of Commerce in Patna last week that the levy and administration of the sales tax "should be so rationalised as to cause the least inconvenience and grievance to those whom it affects. And the second thing needed is absolute uniformity in the incidence of this tax among the various States." He urged the Bihar Government not to impose sales tax on raw materials for important industries or on foodstuffs and medicines. Nationalisation of road transport had not brought about any improvement, although much money had been spent which could have been used for more urgent welfare schemes. The policy should not be extended; rather should efforts be made to enforce proper standards of efficiency on private operators. Mr. Agarwalla said the new steel plant should be located in Bihar "where the raw materials are available plentifully and will not involve unnecessary transport." The Central Government, he complained, would not allow re-rolling mills to be started in Bihar on the ground that re-rollable scrap materials were not available in adequate quantities there. But these materials, and fuel, "are being transported from Bihar over vast distances to places in PEPSU, Punjab, Delhi, Uttar Pradesh and West Bengal." By adjusting railway freights the Centre had encouraged the transport of finished rather than unmanufactured products and thus harmed the State's oil crushing industry, but was not prepared to apply the same policy to re-rolling mills. In conclusion, Mr. Agarwalla criticised the increase in the maximum cess rate on coal and stressed the need for more transport facilities.

Stockbroking in Madras.—At the annual general meeting of the Madras Stock Exchange Association Ltd. last Friday, Mr. J. V. Somayajulu, president, recalled that there had been a continuous decline in the volume of business in all stock markets during the past few years and investors had suffered "colossal" losses. Among the major reasons for this was the "almost complete absence of surplus savings," and contributory factors were the "prevalence of high interest rates, apathy of bankers to encourage advances against stock exchange securities, failure of a number of mushroom industrial enterprises started during and after the second world war and the adverse influence brought about by the heavy decline in commodity and other markets." Mr. Somayajulu said that as long as a certain sector of the economy was reserved for private enterprise, stock exchanges would "occupy a very significant position" not only in mobilising surplus capital and savings but also in directing them to the most profitable channels of investment. A stock exchange was a very delicate and sensitive mechanism, recording changes in the economic weather; it provided "continuous liquidity to the securities quoted on it" and "certainly restricts and guides speculation." Mr. Somayajulu recalled that after the sudden collapse in commodity and bullion markets last year the stock markets slumped heavily in the first week of March 1952 resulting in the closure of the Bombay market for over two months. The Calcutta share market suffered a similar sharp fall. "Our market, however, withstood a sympathetic fall, mainly by virtue of its being primarily an investment market." The markets had been presenting a rather cheerful appearance since the beginning of this year and Mr. Somayajulu hoped that "the present consolidation of prices after the recent rise in prices as well as in turnover." He listed the international and domestic factors which "are likely to influence the future price trends in our stock markets in a favourable manner." Among the latter were deficit financing and decontrol. Mr. Somayajulu thought that the chances of "savings flowing into the stock market for investment are greater than into other forms of investment under the present set-up." Turning to the internal problems of the Madras Stock Exchange, Mr. Somayajulu said that its growth was "rather stunted" since there were only seven founder and seven non-founder members at present, excluding one who resigned last year. "I would fervently appeal to the founder members voluntarily to give up the privileges they enjoy and thus contribute to the future growth of our Association." Mr. S. M. B. Easwaran has been elected president of the Association for 1953-54. Mr. V. Rangachari is vice-president, Mr. S. Ramaswami Naidu Honorary Treasurer, and Messrs. K. Venkataraman and H. Subramaniam Joint Honorary Secretaries.

Better Industrial Relations.—Provisional statistics on labour disputes, released by the Labour Bureau, show that there was a marked improvement in industrial relations during February 1953. The lowest figures for some months were recorded for disputes resulting in work-stoppages (42), for disputes involving (23,284) and man-days lost (116,398). Eight of the disputes resulted in lock-outs, affected 3,246 workers and accounted for 34,211 man-days. Six of these were in West Bengal and the others in Bombay and Punjab. Apart from strikes and lock-outs resulting from industrial disputes, there was one work-stoppage in Bombay not

connected with any industrial dispute; it involved 3,188 workers and lasted for a day. During the month 27 disputes ended, of which 17 had lasted for five days or less. In three cases, however, the duration was more than a month. Wages, allowances and bonus were the main points of dispute in 14 cases while grievances relating to personnel accounted for 15 disputes. Thirteen of the 27 disputes which ended during the month resulted in complete or partial success for the workers but in eight cases they were unsuccessful. The results of the other disputes were either indefinite or not known. Almost all States and industries showed considerable improvement, though plantations were a notable exception.

Second-hand Tonnage Values.—Slightly more activity has been evident in the ship sale and purchase market during the first quarter of 1953, although it has been confined for the most part to Liberty tonnage. Values have been maintained at the levels recently established, i.e., around £275,000. The demand, state Harley, Mullion and Co., Limited, in their latest review, has been sporadic, without, however, any substantial inquiry, sellers being sufficiently rare to make it necessary for buyers to pay current prices. The general feeling is still that present prices for Liberty tonnage are not justified by earning capacity, and values to a large extent have been sustained by international events and to a lesser extent by the slightly improved freight markets. Apart from American ownership, Liberty tonnage is largely in the hands of Greek operators, who are reputedly reluctant sellers, and this has no doubt had a stabilising influence on values. On the other hand, during March three British liner companies placed Liberty tonnage on the market, and this may indicate a trend on the part of liner owners to dispose of vessels which many of them have always regarded as stop-gaps until such time as they could be replaced by tonnage really suitable for their trades. If this trend were to attain substantial proportions it would naturally have an adverse effect on values, as the demand is not of sufficient volume to maintain present prices, unless, of course, it was accompanied by an appreciable improvement in freight markets or increased international tension. The breaking-up market has been more prominent, with the principal demand coming from British breakers, although the Japanese have returned to the market in a limited way and have purchased the twin-screw motorship Ocean Venus, about 6,665 tons gross, built 1919, at a price of £230,000. The British market continued in a subdued state and until February only one sale had been reported, namely, that of the *Macgregor Laird*, 5,850 tons dwt., built 1930, speed 12 knots, which in a quiet market fetched the surprisingly good price of £135,000 from a major British oil company. In March a sudden, if minor, demand flared up on behalf of Greek buyers for Liberty vessels, and the *Tulca*, 10,926 tons dwt., built 1943 by Bethlehem-Fairfield, was sold at £265,000, delivery United Kingdom, June-July. This was soon followed by the sale of the *Bendoran*, 10,926 tons dwt., built 1944 by Bethlehem-Fairfield, for about £280,000 with delivery West Coast U.S.A.—the more attractive delivery accounted to some extent for the higher price, but, nevertheless, it showed a distinct improvement over the *Tulca* sale and reflected the keener demand. British buyers are still reluctant to operate at present prices, and there is little inquiry of a serious nature.

American Cargo War Risk Rates.—It is reported that members of the American Cargo War Risk Reinsurance Exchange have announced reductions in cargo war risk rates in many trades. It is stated that cargo war risk rates between the United States and the United Kingdom and Eire, the Continent of Europe, Gibraltar-Murmansk range (excluding the Baltic), have been reduced from 10 cents per \$100 to 7½ cents. Similar reductions have been made in shipments between the United States and Italy, France, Spain and Mediterranean, Turkey, Greece, Albania, Trieste, Yugoslavia, Malta, Red Sea (excluding Egypt), Gulf of Aden, Israel, Palestine, Lebanon and Syria. The rates to and from India and Pakistan ports and to and from Burma ports are also similarly reduced; the rate to and from Egyptian ports is reduced from 12½ cents to 10 cents. Additional rates are charged for strikes, riots and civil commotions cover on shipments to or from the interior of Egypt, India, Pakistan, Burma, Malaya and Indonesia.

Reading Newspapers.—With its newsprint production reduced by 42 percent since pre-war, and newsprint consumption to less than half, the United Kingdom still ranked first in 1951 in the circulation of newspapers with 612 per 1,000 of the population. The U.S.A. increased its output of newsprint by 13 percent during the same period and consumed 5,421,000 metric tons—an increase of 68 percent since pre-war—yet was only eighth in the consumption of newspapers per 1,000 of the population, the figure being 356. The highest increase in the production of newsprint was recorded in Canada (40 percent since 1937), accounting for more than half of the world's production. These figures are revealed in an interesting chapter on

"Education and Culture" in the United Nations Statistical Year Book, 1952. There are no figures for the U.S.S.R., but according to the Year Book, the United Kingdom consumed 608,000 metric tons of newsprint, the second largest consumption in the world, followed by France (349), and Canada (327). The second highest production of daily papers was in Sweden, 490 per 1,000 of the population, followed by Australia (455), Iceland (455), Luxembourg (452) and Norway (403). At the other end of the scale were India with 80 copies per 1,000 of the population, Libya also with 80 and Haiti with 30.

The Locust Menace.—A meeting of considerable importance is now in progress in Rome, and as a result of its deliberations will rest the action to be taken during the next year of the fight against the present desert locust plague. Ten governments already have agreements with FAO under the Technical Assistance Programme, for help in Desert Locust Control, and so too has the East African High Commission, representing Kenya, Uganda and Tanganyika. The latest recruits during 1953 are Afghanistan and Iraq. The meeting, which is of the technical advisory committee on this subject, is taking place at a really critical period in the campaign. The situation is in fact worse than a year ago, and there is a grave danger of swarms breaking out and affecting an area stretching from French North Africa to Pakistan and India. So far this year, no serious damage to crops has been reported, but should swarms get out of control this would be almost inevitable, with consequent loss of foodstuffs. One important item on the agenda concerns the possibility of expanding the idea of strategic reserves, suitably located and ready to be rushed to any danger point in the vast area affected by the plague. Recent operations have on several occasions shown the value of this system, and it is hoped that it can be further developed. FAO has, in fact, already spent around half a million dollars on equipment for this purpose. Other items on the agenda concern the possibilities of establishing an international radio exchange of locust information covering all countries affected by the desert locust; new developments in control techniques; recent operations by the USA/TCA Regional Locust Control Unit; a forecast of the probable course of development of the plague, and a discussion of long-term planning to prevent any breakdown of control which might result from financial or other causes.

World Trade Fair.—The sixth annual World Trade Fair will be held in San Francisco from 24th to 28th June, 1953. It is being sponsored by the San Francisco Chamber of Commerce and the World Trade Association of San Francisco, in conjunction with the city and county authorities. In past years 12 to 16 foreign governments have officially participated in the Fair, which in 1952 displayed products and services of more than 200 exhibitors from 20 countries. The attendance at the Fair in 1952 was approximately 50,000 and this year it is expected to be even greater. The Fair authorities this year are emphasising consumer goods exhibits. Concurrently scheduled to be held with the Fair is the Eighth Junior Chamber International Congress expected to bring some 600 to 800 Junior Chamber delegates from all over the world. One of the larger exhibition halls, about 5,000 square feet, which is about one-third of the total exhibit space, has been set up at the Fair as a temporary sub-zone of the San Francisco Foreign Trade Zone No. 3 for the special purpose of exhibiting foreign merchandise. Additional information about the Fair may be obtained from the organising authorities at the Palace Hotel, Market Street, San Francisco, California.

Workers' Living Costs.—The working class cost of living indices for February (base 1944=100) remained fairly steady. In most towns there was a fall, though a small one. In Ajmer the index number declined two points to 166, the lowest figure in the last three years. There was a recession in food prices and a fall of 10 points in clothing. In Jamshedpur the index rose one point to 150 because of the higher quotations for rice and an increase in the miscellaneous index, although there was a decline in clothing prices. In Dehri-on-Sone the index number fell one point to 167, the lowest level since February 1950. Food rose a point but there was a decline in fuel and lighting and in clothing. In Monghyr there was a rise of one point to 152, and all groups rose slightly. In Gauhati the index fell two points to 132, touching the lowest level in the last two years. Although the clothing group rose, food declined four points and the index for the miscellaneous group was lower. In Tinsukia there was a fall of one point to 121 which brings the index back to the level prevailing in March and May of last year. Both fuel and lighting and miscellaneous declined. In Ludhiana there was a fractional rise in the index to 144. The food group declined while there was a rise in the miscellaneous group index. In Kharagpur the index number declined two points to 126 after remaining stationary for two months. Food fell, although this was partially counter-acted by increases in both clothing and miscellaneous.

CONSTRUCTION OF INDUSTRIAL SIDINGS

PLEASE DO NOT COMMIT YOURSELF BEFORE CONSULTING THE RAILWAYS

In your own interest, please consult the Railway authorities before you decide to acquire land etc. for the purpose of building factories, mills, working mines or such other projects as may require the construction of special sidings. Please consult the Railways in advance to find out if the Railways are in a position to transport your raw materials and finished products by rail.

The Railways will extend all possible help and advice to you in advance whether or not it will be practicable to construct a siding on such a site. Each case will be examined by the Railway experts. This will save you unnecessary delay and expenditure.

REPORT OF THE AUDITORS TO THE MEMBERS OF LLOYDS BANK LIMITED.

We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit. In our opinion proper books of account have been kept by the Bank as far as appears from our examination of those books, and proper returns adequate for the purposes of our audit, in our opinion proper books of account have been kept by the Bank as far as appears from our examination of those books, and proper returns adequate for the purposes of our audit, in our opinion proper books of account have been kept by the Bank as far as appears from our examination of those books, and proper returns adequate for the purposes of our audit.

We have satisfied ourselves as to the Cash, in hand, with Bank of England and Eastern Reserve Banks, the Balances with, and Cheques in course of collection on, other Banks in the United Kingdom and Ireland, the Balances with Banks abroad, and the Bills. We have also verified the correctness of the Money at Call and Short Notice and the securities representing the investments of the Bank. We have examined the above Balance Sheet and Profit and Loss Account, and to the best of our information and according to the explanations given to us, the said accounts give the information required of banking companies by the Companies Act 1948, and on the basis authorised therein, the Balance Sheet gives a true and fair view of the state of the Bank's affairs as at the 31st December, 1952, and the Profit and Loss Account gives a true and fair view of the profit or loss for the year ended on that date.

In our opinion the group accounts (comprising the Balance Sheet and Profit and Loss Account of the Bank and the annexed accounts of The National Bank of Scotland Limited), have been properly prepared in accordance with the provisions of the Companies Act, 1948, applicable to banking companies and, on this basis, give a true and fair view respectively of the state of affairs and of the profit of Lloyds Bank Limited and its subsidiary dealt with by such group accounts so far as concerns members of Lloyds Bank Limited.

3, Frederick's Place E.C. 2. 13th January, 1953.

Finance in India & Abroad

THE CALCUTTA MONEY MARKET

MORE EXPORT BILLS PASSING

Wednesday, 29th April.

CONDITIONS have been very slightly easier in Calcutta during the past week. Further small declines in jute mills' advances have been reported but in view of the recent firming up of raw jute prices some increase can be expected on this account in the near future. Sugar-cane crushing is now past the peak and is expected to end this week in eastern Uttar Pradesh; sugar advances have been generally steady with small declines in some areas. In the interbank market conditions are much the same as last week, and rates are unchanged at 21 percent for overnight loans and 3 percent for good money.

There has been more activity in the exchange department in consequence of the substantial Argentine purchase of hessian. Some big gunny bills have been reported, but with the end of the tea export auction season there have been very few tea bills. Remittance has been normal. Exchange rates are unchanged at sterling T.T. and O.D. is 53d; three months' sight bills is 61; four months' sight bills is 64d; U.S. dollars Rs. 47.58.

Tenders for the weekly offer of Rs. 1 crore of three-month Government of India treasury bills fell to Rs. 1,00,50,000 this week, but the average rate of acceptance was unchanged at Rs. 2.7-0 percent per annum, tenders at Rs. 99-6-3 percent having been accepted. Tenders for another Rs. 1 crore of treasury bills will be received up to 11 a.m. on Tuesday of next week at Bombay and up to Monday at Calcutta, Madras, Kanpur and Delhi. During the week ended 24th April, treasury bills for Rs. 4 crores were sold in favour of the Reserve Bank of India.

Silver was quietly steady last week. Early in the week the price fell from the previous week's level of Rs. 160-9 to Rs. 159-15 due to profit-taking. Thereafter there was a rally on bear-covering and the price ended higher at Rs. 160-11 today. The ready rate was quoted at a premium of 4 annas. Silver was unchanged at 74d. and 73d. for spot and forward in London. The price was also unaltered at 85 cents in New York.

Gold eased on lack of demand, followed by larger offering. The price fell from Rs. 89-12 to Rs. 87-15. The sovereign at Rs. 58-3 showed a loss of 9 annas.

A fall of Rs. 5.72 crores in notes in circulation to Rs. 1,159.75 crores was the outstanding feature of the return of the Reserve Bank of India for the week ended 24th April, 1953, while the total note issue was up by Rs. 81 lakhs to Rs. 1,175.65 crores. Notes held in the Banking Department consequently rose by Rs. 6.53 crores to total Rs. 15.90 crores. The Bank's holding of rupee coin increased from Rs. 86.87 crores to Rs. 87.62 crores. In the Banking Department deposits of the Government of India increased by Rs. 6.15 crores to Rs. 104.14 crores due to good tax collections, but other Government accounts diminished by Rs. 1.37 crores to stand at Rs. 15.59 crores. Balances held abroad fell by Rs. 5.67 crores to Rs. 118.28 crores. Other loans and advances declined from Rs. 20.61 crores to Rs. 19.94 crores.

of which advances to scheduled banks against usance bills rose from Rs. 2.24 crores to Rs. 4.69 crores. Ways and means advances were shown at Rs. 3.97 crores (Rs. 4.14 crores). Balances of commercial banks at Rs. 43.11 crores were about Rs. 1.97 crores lower on the previous week.

The statement of the position of Scheduled Banks for the week ended 17th April, 1953, discloses Demand and Time liabilities at Rs. 541.59 crores, (Rs. 13.66 crores on account of borrowings from Banks) and Rs. 319.22 crores (Rs. 2.01 crores) compared with Rs. 543.72 crores (Rs. 13.01 crores) and Rs. 317.39 crores (Rs. 2.06 crores) respectively in the previous week. Cash has advanced by Rs. 1.09 crores to aggregate Rs. 33.48 crores, while balances with the Reserve Bank have declined by Rs. 1.01 crores to stand at Rs. 42.33 crores. There is a rise of Rs. 6 lakhs in investments to Rs. 301.73 crores. Advances and bills discounted at Rs. 526.59 crores reveal a drop of Rs. 1.60 crores. The ratios to total liabilities of cash and balances, and of advances and discounts are, in consequence, shown at 8.8 percent and 61.2 percent against 8.8 percent and 61.7 percent.

The return of the Imperial Bank of India for the week ended 17th April, 1953, shows a fall of Rs. 2.63 crores in total deposits to Rs. 216.61 crores. Investments in Government Securities are down by Rs. 16 lakhs to Rs. 71.53 crores, while other authorised investments remain unchanged at Rs. 11.41 crores. Loans, cash credits and overdrafts have declined by Rs. 3.79 crores to aggregate Rs. 102.77 crores, while bills discounted and purchased have advanced by Rs. 69 lakhs to stand at Rs. 26.22 crores. Cash and balances are, in consequence, shown at Rs. 17.41 crores or Rs. 1.74 crores higher.

The working of Lloyds Bank for the year ended December, 1952, discloses the usual satisfactory results. Profits rose from £1,815,853 in 1951 to £1,964,665. General reserve has been allocated £1,200,000. Dividends have been maintained, leaving a carry-forward of £418,242 (£596,807).

Deposits of the Indian branches totalled Rs. 35.63 crores. Investments were at Rs. 17.87 crores and advances at Rs. 20.25 crores.

We have received the balance sheet and profit and loss account of the Union Bank of India Ltd. for the year ended December, 1952. Profits at

Rs. 20.21 lakhs are about Rs. 80,000 less than in the previous year in pattern with the general trend. Transfers to the reserve fund and investment account have been diminished by Rs. 16,000 and Rs. 7½ lakhs to Rs. 4.05 lakhs and Rs. 50,000, respectively. Taxation absorbs Rs. 7½ lakhs against Rs. 4 lakhs. The dividend has been maintained at 3 percent to absorb Rs. 7,77,048, leaving Rs. 1,37,555 to be carried forward. A fall of Rs. 2.70 crores in deposits to Rs. 26.66 crores has been adjusted by falls of Rs. 1.10 crores and Rs. 1.06 crores in investments and advances to Rs. 13.12 crores and Rs. 13.25 crores. Cash is also about Rs. 67 lakhs lower at Rs. 3.90 crores. It may be observed that the holding of Government securities, of a book value of Rs. 10.35 crores, was estimated to have a market value of Rs. 10.05 crores.

According to the returns received in the Department of Commercial Intelligence and Statistics, the total gross Sea and Land Customs Revenue collected in India during the month of December, 1952, amounted to Rs. 14.58 lakhs as compared with Rs. 16.71 lakhs in the corresponding month of the previous year. The following comparisons should be taken to refer to that of the current figures with those of the corresponding period of the preceding year. Of the total customs revenue collections, import duties accounted for Rs. 11.19 lakhs as against Rs. 11.13 lakhs, export duties for Rs. 3.05 lakhs as against Rs. 5.09 lakhs and land customs and miscellaneous for Rs. 34 lakhs as against Rs. 49 lakhs. The total gross collection of Union Excise duties amounted to Rs. 4.77 lakhs as compared with Rs. 6.77 lakhs. During the nine months, April to December, 1952, the grand total of gross Customs and Union Excise Revenue realised was Rs. 196.30 lakhs as compared with Rs. 242.36 lakhs during the corresponding period of the preceding year.

THE BULLION MARKETS IN 1952

DECLINE IN GOLD PRICES: NARROWER FLUCTUATIONS IN SILVER

THE annual bullion review for 1952 published recently by Samuel Montagu and Co., whose editorially last week, recalls the major events of 1952 and says that apart from the Bank of England's decision to allow London firms to act as agents for the sale of newly mined gold from the Commonwealth and the Colonies to buyers against U.S. dollars outside the sterling area there was no relaxation of the general ban on free market operation, though the liberation of other commodity markets encouraged the bullion market to continue to hope. The Bank's buying and selling rates remained unchanged during 1952. The year began with prices in Europe quoted around \$39 per fine ounce. They remained very close to this level until the beginning of March, when settlement difficulties in the Bombay gold market caused a sudden collapse there which eventually severely curtailed buying in Europe from those Eastern centres mainly gold into India. Prices moved downward until at the end of March they were at a time either side of \$39.25, then dropped to \$37.50 in the middle of April, following the ban on Egyptian imports of gold and the forecasts at that time of an early truce in Korea, which discouraged demand from the Far East. By the beginning of May prices had receded still further to just below \$37, but during the second half of that month some fairly solid buying on the Paris market lifted the rates to over \$37.50. From that time until early in November the market remained quite uneventful with a price range between \$37.25 and \$37.75. Then once again the weight of supplies began to exert its influence and a middle rate of \$36.75 was recorded by the end of November. During the second week of December, a renewal of French buying brought prices once more over \$37, and by the end of the year Continental markets had reacted to over \$37.50 per fine ounce.

On 30th October last the Thailand Government authorised a newly created syndicate at Bangkok to import gold for free sale internally, fixing the first monthly quota at 40,000 ounces. Previously the import of gold had been officially banned, but efficient smuggling had hitherto kept the local market well supplied, so that this new development should not have much effect on the total Far East demand for gold. The birth of this new free gold market coincided with the end of the former active Chinese gold markets, whose insatiable demands only a few years ago forced the free market prices to over \$50 per ounce.

At the end of November, it was reported that the Canadian Government had decided to extend for 1953 the Act which provides for a Government subsidy to be paid to Canadian gold mines with high cost of production and to increase the amount of the subsidy payable. This subsidy is determined by the difference between what is termed the "standard cost of production" and the actual cost. The "standard cost" formerly fixed at \$22 per ounce is now to be calculated at \$18 per ounce, and the maximum subsidy permitted will be \$13.50 instead of \$11.50. This will reduce the amount of Canadian production gold offered on the free markets as only the few low-cost mines and the producers of gold as a by-product (the latter are not eligible for the subsidy) will continue to find advantage in the reduction will be market. The extent of the reduction will be determined by the free market price, but at any time near the present price, most of the produc-

ers eligible for the subsidy will prefer to take it and sell their gold through official channels. Two small additions to potential free market supplies were announced during 1952. As from 1st May and 26th August respectively, Fiji and New Zealand gold outputs became available for that purpose.

Variations in Silver Prices

During the year 1952 the official price of silver varied between 77d. and 72½d. per ounce 999 fine, for both cash and two months' delivery, with quotations for the two positions ruling level throughout. The range of 4½d compares with 8½d in 1951. The New York quotation ranged between 88 cents and 82½ cents per ounce. The fall in the London price during November and December was a break from the tie with New York and meant that the price moved below the figure at which the authorities in London would provide silver for essential industries. Actually, the silver required during this period was forthcoming from the market, a lack of demand for exportable silver resulting in silver from sterling area, as well as from internal sources being offered for essential purposes in the absence of other outlets. Purchases for essential industries in 1952 amounted to about 8.8 million ounces and an additional 1.6 million ounces were taken under the "Float Scheme" for export in fully or partly manufactured form. Of the total of 10.4 million ounces, about 8.9 million ounces were obtained from official stocks and the balance of about 1.5 million ounces from market sources. The total offtake shows a considerable decline from the 1951 figure of 16.7 million ounces, due in some measure to the use for essential purposes during 1952 of silver derived from scrap material. It is understood that during the year under review, no silver accrued to official stocks from the demonetisation of silver coin.

The Open Market

From the beginning of the year to about the middle of March, the price of exportable silver ranged between 7d. and 9d. premium over the official quotation, in conformity with the movements of the dollar-sterling rates quoted on the Continental free exchange markets. It had been apparent for some time past that a good proportion of Continental imports from the U.K. had been re-exported to the U.S.A. to complete dollar-sterling exchange transactions on these markets. On 14th March, however, the authorities announced that no more licences for the export of bar silver to the Continent would be granted without the production of a written undertaking that the silver was not ultimately destined for the Western Hemisphere. Following this announcement the premium over the official price dropped to about 5d. and later disappeared altogether because of a decline in purchases. For a short period in June, shortage of supplies established a premium of about 1d., but this too ran off as, although offerings remained small, they more than sufficed to meet a reduced Continental demand, now shared with competitive selling from Belgium and Germany. Towards the end of the year, there was an increase in supplies to the market and the lack of demand continuing, silver from sterling area sources was tendered for essential purposes.

U.K. imports of silver bullion in 1952 are estimated to have amounted to about 10.1 million ounces, of which more than half was received from Australia. Of the 13.7 million ounces estimated to have been exported during the year, over 10 million ounces were destined for the Continent. Imports of demonetised coin for refining and realisation, which were an important feature in 1951, did not continue, but silver derived from concentrates imported from Australia was again available to the market, the amount thus provided was possibly about 3 million ounces which, added to the bullion imports, would show import and export figures more or less in balance.

The Western Hemisphere is estimated to have produced 141 million ounces in 1952, which would be about 4 million ounces more than in 1951. The output of Mexico, the world's largest producer, at 45 million ounces shows an increase of 1.2 million ounces whilst that of the United States of America at 40.5 million shows a modest improvement of 500,000. Canadian production rose by 800,000 to 25 million ounces. Central and South American production as a whole was up by 1.5 million mainly because of higher figures for Peru. Outside the Western Hemisphere, Australia probably produced about 11 million ounces and Japan, now assuming some importance as a producer, had an estimated output of 7 million ounces. Those sources, for which reliable estimates are possible, would thus appear to have provided some 159 million ounces, but information from other quarters is lacking. However, based on figures for previous years, there should have been an additional 12 million ounces at least of new production, which would give a tentative total for 1952 of 171 million ounces.

Consumption by Industry

By far the largest proportion of the amount of silver used in industry was taken by the U.S.A. where, it is estimated, requirements were 95 million ounces. Canadian and Mexican absorption for industrial purposes were put at 4.2 and 2.2 million ounces respectively. Outside the Western Hemisphere 11.3 million ounces were used by Germany and at least 10.4 millions by the United Kingdom, the latter having been augmented to an extent not ascertainable by metal recovered from scrap material. A further 3.5 million ounces is

THE most principled republicans seem to have their royalist moods. All sorts and conditions of people who are not in the least affected are going to enjoy themselves thoroughly over the next few months reading about, and seeing pictures of, the coronation of Queen Elizabeth. Already interest is keen (especially in the women's papers) in the republics of France and the United States, while the republic of India has special reasons to watch the event with close attention. Even the Russians will be represented, and so presumably a tendentious account of the proceedings will get across the Iron Curtain. But the greatest tribute to mankind's royalist instincts comes from the shabbiest and most disreputable republic of them all—Francoist Spain. For the poor Spaniards are not to be allowed to hear anything at all about what happens in London this summer. The very word coronation is censored in the Press and airlines are not allowed to mention the crowning of heads in their posters. Bing Crosby told a Madrid paper the other day that he was off to London for the coronation but the offending reference was blacked out before the sheet reached readers' hands. The Caudillo may imagine that the lively interest the whole world is taking in the anointing of a young queen conceals monarchist passions which could unsettle second-rate dictators, but he is spoiling nobody's fun but his own folk's.

Boys, I always thought, will be boys. But several members of the Council of States have discovered that they will be "non-adults". This distressing name for young people is only slightly better than "non-availability", which means, translated, shortage or scarcity. The negative approach to the common nouns of the language, apart from being cacophonous, must be objectionable on logical grounds for it is surely plainer to say what a thing is than what it is not. There are a few hallowed precedents which no doubt will always be with us—nonconformist and non-resident in Britain, and non-violent and non-Indian in this country—but they should not be taken as excuses for further mutilation of quite simple expressions. Fowler issues a specific warning against negative word-building by use of the Greek prefixes a- and an-, which can lead to such neologisms as "amoral", but his editors should now enter a protest against the much more common misuse of the Latin participle. There is one common word beginning with "non" which tells us how much sense there is in the practice of negating every noun we come by.

The debate in the Council that produced the expression "non-adults" did not produce anything equally original on the subject then under discussion, the low standard of most films. I would hasten to agree with most of the speakers that the general run of films, Indian, American or Russian, is just pitifully bad though I have yet to see it proved that bad pictures "bring out the beast in man" or pervert the morals of the young. The young, under their new pseudonym, were introduced into the debate when it was contended that many films shown to children were suitable only for adults. In fact I would have thought that the main fault of the movies was just the opposite: most of the films shown to adults are suitable only for children. A little less concern for our supposedly delicate moral sense, and a little more concern for our intelligence would assist the improvement of the films. I notice that the "profit motive" was dragged in for its customary whipping when a member recommended nationalisation of the film industry as a step toward higher standards. But it seems idle to get rid of the people who make profits out of rubbish while doing

A DITCHER'S DIARY

nothing about the people who will contribute the profits to see rubbish. It is depressing to read that not one of the participants in the debate, at least not one of those reported by the newsagency, could think of anything but more stringent censorship to better the quality of films. This faith in the infallible artistic taste of our rulers is touching, but quite unsupported as far as I know by any historical example.

While so much dismay is being expressed about the rate of English Electric's tender for the Chief Joseph dam contract, the continued refusal of the American authorities to grant airworthiness certificates to the Comet is attracting less attention. Yet this deprives Britain of a potentially much greater source of hard currency earnings. Obviously the Americans are entitled to insist on their own standards of airworthiness and they cannot be expected to take the word of a foreign country, least of all the country that hopes to sell them jet airliners. But they have had every facility to satisfy themselves about the new craft and they have seen a number of other equally scrupulous Governments accept the Comet for internal use. The argument that certificates cannot be granted until a jet liner has flown in the United States, and yet British jets cannot fly in the United States until a certificate is granted, will not impress many people. It comes down to saying that Britain cannot earn dollars with jet airliners until American manufacturers have overtaken the substantial lead now enjoyed by their British competitors.

The magnitude of the replacement and modernisation problems of Indian industry does not diminish as the years pass without concerted action to meet them. Calculations of the cost of re-equipping several major industries are depressing enough today, but they will be quite formidable if wear and tear continue at the same rate for a few years more. Mr Charles Innes last year ventured an estimate of the cost of modernising the jute industry, and a correspondent does the same for the cotton textile mills elsewhere in this issue of Capital. Mr K. C. Mahindra, chairman of the Indian Aluminium Company, put forward a suggestion on the subject in his address to the annual meeting of the company in Calcutta last week. "It is not outside the practical experience of each respective industry," said Mr Mahindra, "to raise enough funds by a voluntary cess for the purpose of setting up co-operatively a machine-building industry to serve its respective plant requirements and of supplying credit finance for individual units to purchase locally manufactured machinery. If a few of the major industries, e.g. cotton textiles, jute and sugar, were to follow this suggestion (already introduced to a small extent by the cement combine) there will be taken a great forward step in strengthening our production facilities and lessening our current dependence on imports." The valuable part of this suggestion is the notion of a co-operative approach by a whole industry to the enormous problem of re-equipment. Admittedly industry by itself cannot encompass the task unless the Government grants tax relief—Mr Mahindra mentioned "a real tax holiday on productive capital investment"—but a concerted lead from a whole manufacturing industry would make Government assistance easier to obtain. The weakness of Mr Mahindra's suggestion is that, apart from whatever savings were derived from co-operative

action, his plan would increase the already staggering cost of purchasing new plant. To establish new machine-building industries in India and to rely on them to provide modern equipment for mills and factories might multiply costs many times over—as has already been discovered in some Government rehabilitation projects. Almost any proposal to promote modernisation of Indian productive equipment sounds somehow utopian or far-fetched—tax holidays and the like—but the fact is that the need is great and urgent, and unless one or other of these improbable-sounding suggestions is acted upon well within the next decade much of Indian industry will be, quite simply, worn out.

The directors of the new Commonwealth Development Finance Company would be flattered to learn that they have been described by a Calcutta newspaper (not Communist) as a "new East India Company." As was explained in Capital India Company, this minor offshoot of the last Commonwealth Conference has an authorised capital of only £15 million and is empowered to borrow up to twice that sum. (Admittedly, the original 125 shareholders in the East India Company put up only £72,000, but in days when the profit expected was 100 percent at least per voyage, the amount of issued capital was less important.) The commonest judgment on the new Corporation has been that it is a splendid idea but that it scarcely has the resources to change the face of the Commonwealth in our time. However, some folk can see sinister designs in the most innocent gestures, and a Bengali-language contemporary wrote last week: "It is necessary that we should take note of this company. There is enough ground to treat this concern as a second edition of the East India Company. . . . British traders will enter with the stick of trade in Asia and Africa and will again make efforts to win back their liquidated empires. . . . This is the old game of the East India Company being repeated again." I only wish the Corporation had the power to perpetrate such inquiries, for if it had it would also have the power to make a substantial contribution to the development of the Commonwealth's resources. As matters stand, it is quite inconsistent for a British Government that takes literally tens of millions sterling in taxes from companies operating in the overseas Commonwealth to set up a development body with a few millions supplied by the Bank of England to exploit colonial resources.

The days when Land's End was also taxes' end closed this month when Mr. Butler decided that the inhabitants of the Scilly Islands should henceforth contribute to the Exchequer. This great fiscal innovation set me enquiring into the financial habits of the Scillonians, and I find that this is not the first time the mainlanders have held them in fee. In the 14th century the isles were farmed out by the earldom of Cornwall at a yearly service of "6s 8d or 600 puffs". What anybody would do with 600 puffs, even in the 14th century, defeated me until I learned that these unprepossessing sea-parrots used to be a sort of Bombay duck in reverse; "they were kept salted and reputed for fish". For having connived at this deception, for living off shipwrecks and for having been too intimately involved with smuggling and piracy in the past, the Scillonians probably deserve to be taxed.

Company Meeting

INDIAN ALUMINIUM COMPANY, LIMITED

MR. K. C. MAHINDRA ON PROGRESS OF EXPANSION

The fifteenth ordinary general meeting of the shareholders of the Indian Aluminium Company, Limited was held in Calcutta on April 23, 1953. Following are extracts from the speech delivered by Mr. K. C. Mahindra, Chairman of the Company:

The audited accounts of the Company for the 15 month period ended Dec 31, 1952, together with the report from the directors have been circulated to the shareholders.

The period of 15 months covered by the report involved a severe shake-up in the trading world. I will not use the word "regression" because industrial pointers do not indicate that there has been a setback of the type associated with this word. It is, nevertheless, apparent from our experience that the purchasing power in this country has shrunk and the average consumer either has not the funds or has decided to conserve his resources in contrast to the habits and inclinations displayed by him in previous years.

The problem of replacement of old and worn-out plant and machinery is looming large on the industrial horizon in India. Your directors have been continuously studying this problem. The total cost of the fixed assets of the Company in 1950 amounted to about Rs 250 lakhs. Against this, we had made a provision of Rs 85 lakhs by way of depreciation and a replacement reserve of Rs 20 lakhs. That is, in other words, by the end of 1950 we had provided for 41% of the original cost as a measure of assurance for the future. But I should like you to bear in mind that costs have increased four-fold since 1930. Keeping this factor prominently before us, my personal view is that provision should be made by this Company to bring up the depreciation and the replacement reserves to a figure of at least 100% of the total fixed asset costs in 1950 at as early a date as possible. I hope and trust that the future operations of this Company will enable your directors to make such recommendations over the course of the next few years so that we will have to deal this problem of replacement finance in a scientific and assured manner.

Expansion Schemes

In my address to you last year, I gave you a brief description of the immediate expansions which your Company has undertaken. The progress at Belur and at Alupuram has been according to schedule. It is expected that while the modernization and expansion of Belur Mills will be virtually finished by the end of 1953, the Alupuram expansion will be completed in time to make use of the additional power which is promised for the summer of 1954.

A brief reference has been made in the director's report to the new developments at Hirakud. While our negotiations with both the Central and the State Governments are taking their usual course, there has been a certain amount of criticism over the forecast and anticipations of the Planning Commission and of the objectives clearly delineated in its report in respect of the aluminium industry. It has been stated in certain responsible quarters that India will not be able to consume as much as 20,000 tons of primary ingots by the year 1956. Such pessimism possibly prompted by shortsighted self-interest and certainly by very inadequate market appreciation does a great harm to the development of an infant industry. India has not been a great consumer of aluminium products for the one principal reason that aluminium was not available in large quantities in the various forms and alloys at reasonable prices.

Mr. Mahindra then referred to the future prospects and to the probable expansion in the uses of aluminium in transport, electrical development, grain storage and housing and continued: The most important task ahead of your Company in the coming years will be the implementation of the Hirakud scheme. I have briefly referred to the potential consumption uses for aluminium products in the country within the next few years. It is, therefore, appropriate that with the specific approval of the Planning Commission, your Company should proceed to formulate proposals for installation of additional production facilities within the country. The Planning Commission has stated that the expansion programme in respect of the aluminium industry over the next few years will cost something in the region of Rs 9 crores. The bulk of this finance will require to be furnished un-

der the aegis of the Indian Aluminium Company. How is this to be procured?

Deficit Financing

There has been considerable talk in the last few months about "deficit financing." This is an unfortunate phrase. If there is a gap between State revenues and State expenditure, the gap is usually called a surplus or a deficit. The deficit again under orthodox canons of public finance, is usually sought to be covered either by additional taxation or by public borrowings or in the last resort by printing of currency notes.

In the words of the British Banker, "there is no such thing as a State purse, but only a State sieve. Into this sieve is poured a large number of your earnings and mine, to be poured out again in many directions, some essential, some desirable and some waste." It should be added that into this sieve one should hesitate to pour in currency notes of Government's own volition because the pouring out can lead to no other result than a rapidly mounting inflation. Discarding, therefore, the use of the printing press, the gap between revenue and expenditure (both current and development) should, under normal circumstances, be bridged by additional taxation and public loans. For satisfaction of these two purposes, there is an immediate and intensive need to induce the formation of capital in the country. Such increments of capital could be syphoned into the development programme of the Government through public loans or used to stimulate the growth of private enterprise.

Savings

India admittedly is a poor country and therefore the total volume of her savings is negligible as compared with the resources required to implement our development programme when the saving habits of individuals are extremely uneven, example is usually better than precept. It behoves the Minister of Finance, therefore, to deliberate whether the mounting Government expenditure on civil services and ancillary activities could not be drastically curtailed. There are today nearly 150 Ministers in various States functioning throughout the country, in contrast to perhaps 30 Executive Councillors in the old regime in undivided India. I suggest that the Government should indicate the way to bring direct example and thus encourage savings by the average citizen.

Mr. G. D. Birla recently stated that capital is only a synonym for resources and hardwork. India does not suffer from want of capital; it suffers because there is absence of conditions which will impel men to work hard. But the only realistic compulsion for work known to man proceeds either from the stick or from the carrot. In our country, however, the use of either of these is limited—Democratic concept forbids slave driving; welfare economy restricts individual incentives. What will be more correct to say is that while a pitiless tropical sun engenders lassitude in action our inherited philosophical approach to life begets resignation and individual unemployment. It is difficult to control the tribulations of tropics, but it should not be difficult to instil and develop pride of individual performance and so encourage ambition. It should not be a discredit to accumulate money, just as it is no reflection to accumulate political wisdom. Savings will be the result of hard work alone and it should be the continuing consideration of our Government today to induce hard work and thus develop the habit of savings by each and every means under any circumstances.

Disincentives

It will not be denied that in the last few years there has been a plethora of disincentives against investment in industrial construction. It is not enough that these disincentives should be removed. With the acceptance of the Five Year Plan, it devolves upon the Government, not only to remove the disincentives but provide positive measures for encouragement to save, channel such savings into investments both public and private, to direct corporate earnings into expansion and to provide recognition and dignity to risk capital.

Submissions have been made to the Government that the problem of replacement of worn-out plant and machinery in itself is a colossal problem of finance and for this purpose alone, several desirable steps

could be formulated. I give prominence to one such self-revolving co-operative method. At present the majority of our industries depend upon overseas suppliers for the bulk of their machinery requirements. It is not outside the practical experience of each respective industry to raise enough funds by a voluntary cess, for the purpose of setting up co-operatively a machine building industry to serve its respective plant requirements and of supplying credit finance for individual units to purchase locally manufactured machinery. If a few of the major industries, e.g., cotton textiles, jute and sugar were to follow this suggestion (already introduced to a small extent by the cement combine) there will be taken a great forward step in strengthening our production facilities and lessening our current dependence upon imports. We should not always look upon the Government to furnish this climate or that for our salvation, but by concrete examples provide ourselves with the sinews to build up for our deteriorating production economy and thereby earn the trust and confidence of our legislators for further beneficence.

Tax Reliefs

Amongst other measures, one may ask the Government to consider the granting of relief in income-tax on undistributed profits of companies and on such individual savings which are invested in approved industrial enterprises. The Government should also consider the removal of double taxation in cases where certain companies held shares or stocks in other companies and are, therefore, subject to double Corporation taxes. Liberal depreciation allowance and permission to write off fixed assets of certain mature age would be of some assistance. In fact, there should be a real tax holiday on productive capital investment.

In the context of capital formation, use of foreign investments has not been ruled out. The views of a foreign industrialist, sympathetic to India, were prominently displayed a little while ago. It was stated that between the Government and the public, the Press and the Parliamentary Opposition, a potential foreign investor is faced by a long series of nightmares. Many of these, however, have been exaggerated. It is nevertheless true that doubts are there and resolved on an integrated plan of production in all spheres, encouragement should be afforded wherever possible and in whatever form it is practicable to increase the physical product yielding facilities in the country, irrespective of the source of their financing.

Canadian Economy

In this context, India should take a long and searching look at what has happened in Canada where the economy in the past 15 years has been transformed from one based largely on primary industries such as agriculture, mining and forestry, to one which now includes a highly developed and wide range of manufacturing industries. Canadians will readily admit that the enviable position in which their country now has come about as a result of the favourable climate policies of the Government which, along with the natural resources of the country, has proved an attraction for outsiders possessed of the requisite capital and know-how. It does not seem to worry the American-owned. Why then should we in India as citizens of a Sovereign democratic Republic with an acknowledged need for foreign capital and know-how and with every right to safeguard absolutely at nightmarish and make it virtually certain that the assistance we need will not be forthcoming in time and in the measure required?

It should be remembered that under our planned economy, interest rates and the supply of credit together with the provisions of the Essential Goods Supplies Act and Industries (Development & Regulation) Act constitute perhaps the most powerful weapons of economic control and, therefore, there can which may run away from the ambit of budgetary vista.

Private Industry's Role

It is the general thesis of the Five Year Plan that agricultural development of the country is but a prelude to industrial development. In the development man has still a great role to play. To the extent that he meets the challenge, he will justify the continuation of trust in the system which he represents. Now that the Government has indicated very clearly Five Year Plan it is only realistic to hope that suitable climate for capital formation, for the growth of men and material would be furnished in ample measure, through a genuine co-operative effort between the Government and the industrialists.

Your Company has undertaken a gigantic task of expansion and construction. I am sure that shareholders who have shown such admirable faith in the future of aluminium and particularly in the prospects of the Indian Aluminium Company will continue to bestow their confidence on the management and the board of directors who have steered the Company through these years with determination and with hope, to a more bountiful crop.

The employees of your Company deserve a special word of praise for their loyal and ungrudging services during the difficult period and I commend them for your thanks and appreciation.

Stocks and Shares

QUIET WEEK ENDS ON STEADIER NOTE

JUTE SHARES' CONTINUED RECOVERY: GILT-EDGED GENERALLY FIRM

Wednesday Evening.

AFTER a quiet and featureless week, the Calcutta share market improved today under the leadership of jute company shares. Firmness in the raw jute and jute goods markets, and hope that the new regime in Pakistan means business with its offers of renewed friendship, have encouraged sentiment, with beneficial effects on prices. There has been an increase in the volume of transactions today. Indian Irons moved up to Rs. 25-12 and might have gone higher had it not been for the persistence of rumours about labour trouble at Burnpur. Bombay advices have been strong, with Tata Deferreds standing at Rs. 1,920.

The improvement in Government securities has been well maintained and with the continued shortage of scrip, prices have hardened further. Three percent Conversion Loan was taken higher from Rs. 82-2 to Rs. 82-12, but the enquiry appeared to have been satisfied and at the close there were inclined to be more sellers than buyers.

Medium-dated issues were once again the feature of the section, and most loans showed good gains, as will be seen from the following table:—

	22-4-53	29-4-53
2½% Loan 1961	Rs. 90 9	Rs. 90 10
2½% " 1962	" 91 9	" 91 11
3% " 1959-61	" 96 5	" 96 9
3% " 1963-65	" 92 10	" 92 14
3% " 1964	" 92 10	" 92 14

Among short-dated loans, 2½ percent 1954 and 2½ percent 1955 were both enquired for at Rs. 98-5, while 3 percent 1958 was better at Rs. 98-9. Three percent 1957 was unchanged at the previous quotation of Rs. 98-12, and business was reported in 3½ percent 1954-59 at Rs. 100-8. In long-dated, 3 percent 1970-75 was the top bidder at Rs. 86-11, while 3 percent Loan 1966-68 was higher at Rs. 90-9. No business was reported in Provincial Loans, and quotations remained unchanged.

There was an unsatisfied demand for miscellaneous Preference shares, but offerings were limited. Carew & Company, on the announcement that the arrears of Preference dividend for 1950 were to be paid, improved to Rs. 94 cum-dividend, with buyers over. Calcutta Electric were sold on London account at Rs. 12-2. Dalmia Cement Fully-Paid eased to Rs. 73, and P. & C. Osler to Rs. 47. Indian Aluminium had buyers at Rs. 69 and India Steamship at Rs. 89. Indian Irons fluctuated narrowly around Rs. 106-4 ex-dividend. Indian Rubber Manufacturers were bought at Rs. 98, and there was an enquiry for Indo-Burma Petroleum at Rs. 89 and Martin Burn at Rs. 102. Brooke Bond, Jardine Henderson, and Shaw Wallace were in demand at Rs. 83, Rs. 90 and Rs. 84. Amongst Jutes, Clive 'A' were sold at Rs. 98, Gourepore were offered at Rs. 102. Hastings at Rs. 104, and Kamarhaty at Rs. 109. There were small buyers of Hooghly at Rs. 14-12, Hukmchand at Rs. 112 and Lansdowne at Rs. 112.

More enquiry was noticeable for selected Coal shares during the week, including Amalsatmat at Rs. 19-10, Bengal at Rs. 530, Borra at Rs. 29-12, East India at Rs. 23-2, Equitable at Rs. 44, Pench Valley at Rs. 19-12 and Rewa at Rs. 18 ex-dividend. Katras Jheriah were a feature, improving from Rs. 41 to Rs. 43, buyers. New Beerbhoom came under selling pressure and dropped from Rs. 21-2 to Rs. 20-6. Central India and Western Bengal met with limited support without affecting prices.

After a dull opening there was a slight improvement in the Jute section today following better advices from the gunnies market. Agapara were steady at Rs. 19-6, Anglo-India were taken at Rs. 222 and Birla were quoted at Rs. 36-8. Champdany were supported at Rs. 161-8, and there were buyers of Delta at Rs. 233. Howrah were done up to Rs. 24-12, but closed easier at Rs. 24-11. Khardah recorded a sharp rise from Rs. 155 to Rs. 165. Nuddea met with some enquiry today and were steady at Rs. 43-8 as were Reliance at Rs. 13-6. Kelvin had buyers at Rs. 240 against a previous quotation of Rs. 225.

Investment demand for first class electric supply shares continued. Bhagalpur were done up to Rs. 9-8, and Calcutta Electric accounted for a fair turnover at the improved rate of Rs. 14-6. Patna Old were marked at Rs. 10-14, and United Provinces at Rs. 158-8. Shahjahanpur Electric recorded a smart rise from Rs. 6-12 to Rs. 8 ex-dividend.

In the sugar section, business was reported in Carew at Rs. 5-12, Darbhanga at Rs. 9-12 cum-dividend, and Dyer Meakin at Rs. 5-14. United Provinces came to hand at Rs. 16-8. Cawnpore were scarce at Rs. 29, while Ramnugger Cane were offered at Rs. 16-10.

The turnover in Indian Iron & Steel shares was much reduced and the shares fluctuated narrowly between Rs. 25-4 and Rs. 25-10, to close at the latter rate. Braithwaite changed hands at Rs. 11-2, Britannia Engineering at Rs. 19, Indian Galvanizing New at Rs. 12-8, and Kumardhubi Engineering at Rs. 8-1. Jessops recovered to Rs. 25-1, and Marshalls were quoted at Rs. 5-9.

In the Miscellaneous section, India Paper Pulp were wanted up to Rs. 159. Mysore Paper and Shree Gopal paper were a shade better at Rs. 13-14 and Rs. 19-6. Orient Paper and Titaghar recorded business at around Rs. 32-8 and Rs. 35-3. There were sellers of Dalmia Cement at Rs. 6-13, and Sone Valley at Rs. 7-2. New Asiatic Insurance and Ruby General were unchanged at Rs. 4-2 and Rs. 4-14, and there were small sellers of Standard General at Rs. 7 and Great Pyramid at Rs. 3-4. Hercules and Triton were exceptions, being scarce at Rs. 29 and Rs. 156. On rumours of improved working, India General Navigation met with investment support up to Rs. 85. India Steamship fluctuated around Rs. 6-5, while there were buyers of Port Shipping at Rs. 12, but no sellers below Rs. 12-8. Angelo Brothers weakened further to Rs. 17-8. Assam Saws on profit-taking eased from Rs. 6-13 to Rs. 6-10, Balmer Lawrie were offered at Rs. 297 and British India Corporation were offered unchanged at Rs. 8-5. Bararee Coke were a steady feature, improving from Rs. 17-4 to Rs. 18. Cherra Chatak were steady at Rs. 8-4, and several deals were reported in Dunlop Rubber at Rs. 28-10. There were keen buyers of Ganges Rope at Rs. 195. Godfrey Phillips continued to be bought on Bombay account, but offerings were few and far between. Indian Cables were steady at Rs. 18 and Indo-Burma Petroleum came to hand at Rs. 55-4. There were sellers of Indian Wood Products at Rs. 37-8, while Martin Burn met with renewed support at Rs. 19. National Insulated Cables at Box at Rs. 19-10. National Rolling Mills at Rs. 11-8, and Shaw Wallace at Rs. 12-12. Rallis met with some selling pressure, with the price dropping from Rs. 76-8 to Rs. 75-4. Textile Machinery were unchanged at Rs. 5-8, as were Walford Transport at Re. 1-9.

In the mining section there were buyers of Orissa Minerals at Rs. 34, but no sellers below Rs. 35. Because of the strike at the works of the Indian Copper Corporation, these shares were neglected throughout at Rs. 2-15. Consolidated Tin were a nominal market at Re. 1-4. Karanpura Development were quoted at Rs. 13-4, with sellers over.

Dull conditions continued to prevail in the tea section and business was once again on a restricted scale. Bokakhat were recorded at Rs. 48, Dhela-khat at Rs. 10-4, and Tezore at Rs. 15-12. Dimachkhat at Rs. 31-4, Dufflaghur at Rs. 26, kusi were steady at Rs. 16-14, as were Seajuli were a shade easier at Rs. 23-8. The enquiry for small-priced shares continued, with Moheema being marked up to Rs. 2-13, Baitakhal to Rs. 4-2, and Loobah to Rs. 2-3. At the close there were further buyers at these prices. After a long lapse, business was reported in Pahargomiah at Rs. 303. New Chumta were slightly better at Rs. 17-4, but Gungaram were marked down to Rs. 154.

Commodity Markets

OUTLOOK FOR RAW COTTON TRADE

PROBABLE FALL IN DEMAND

SOME "quite formidable" arguments for expecting trade in raw cotton to remain at a relatively high level during the present season are set out by the International Cotton Advisory Committee in its April review. According to the Committee, the level of demand will probably remain below the level of last season.

The first of the Committee's reasons is that consumption in exporting countries is expected to increase, mainly because of the expected higher consumption in the United States and the further growth of domestic textile industries in cotton-growing countries. In Western Europe, whose consumption normally accounts for well over 60 percent of world cotton imports, consumption is expected to be less this season than last. This, however, may be offset in part by the growth of yarn and cloth production in Japan, so that on balance, consumption in importing countries may be not much less than in 1951-52.

Secondly, stocks in many importing countries on 1st August were on the low side.

Thirdly, "and perhaps the strongest argument of all," is the possible effect of lower prices. Normally, lower prices would stimulate demand and even encourage the buying of cotton for stock above current seasonal needs. Buying for stock will depend largely on the trend of prices in the rest of the season and this in turn is related to the probable level of cotton production during 1953-54. It appears likely that there will be some decline in world production next season. This is, however, highly conjectural, depending largely on weather conditions and how much cotton will be grown in the United States. "If an appreciable drop in world production was indicated, it might affect market values at the end of the present season and induce heavier purchases of old crop cotton."

Lastly, exchange difficulties in cotton trade are being countered by dollar loans and grants, by special payments agreements and commercial treaties concerning cotton, and by barter arrangements. These should promote larger exports of cotton.

RECORD U.S. IMPORTS OF MANGANESE IN 1952

Imports of all grades of manganese ore into the United States during 1952 were over 50 percent higher than in 1951 and constituted a record, according to Bureau of the Census figures. The actual figure was 2,671,729 short tons. India was by far the largest supplier with 1,028,288 tons, other major ones being the Gold Coast (370,685), South Africa (319,718), Cuba (259,232), Brazil (169,370) and Mexico (135,606).

French Mining Agreement

Negotiations between private French and American companies and French Government services with a view to setting up a mining company to explore the manganese deposits in Gabon (French West Africa) have now reached their final stages, reports Reuter. Investment will be: 21 percent by the French Overseas Mining Office (a Government body), 15 percent by the Compagnie Minière de L'Oubangui Oriental, 15 percent by the mining group, Mokta el Hadid, and the remaining 49 percent by the United States Steel Corporation. United States Steel will undertake to buy 300,000 tons of manganese per year when commercial production starts, probably not before 1960.

SUGAR PRODUCTION ESTIMATE

The total production of sugar in India during the season 1952-53 (November-October) is estimated at 12.97 lakh tons as against the actual production of 14.8 lakh tons in the preceding season, according to the second forecast on the production of sugar directly from cane. The total quantity of cane to be crushed during the 1952-53 season is estimated at 130 lakh tons as against 155 lakh tons in the previous season. The production of sugar is expected to go down in almost all the States, except Bihar, West Bengal and Hyderabad. The decrease in the all-India production is expected to be roughly 12-15 percent compared to the 1951-52 season.

The percentage recovery of sugar from cane is, however, expected to go up and this is attributed to the late start of the crushing season, when the sugar content in cane rises. The all-India recovery of sugar is estimated at 10.01 as against 9.57 last season. Out of the 157 existing sugar factories in India, 134 are working during the current season as against 139 in the previous season. The actual duration of season is expected to be shorter in almost all the states, except Bihar, West Bengal and Hyderabad. While in West U.P. the factories are closing earlier, due perhaps to the shortage of cane, those in East U.P. and Bihar will work for a longer duration this year. The all-India duration of season may be estimated at 112 days as against 133 in the 1951-52 season.

WHOLESALE PRICE INDEX FIRM

The official wholesale price index (year ended August 1939 as 100) remained almost unchanged at 382.2 during the week ended 11th April, 1953,

as compared with 382.1 (revised) for the previous week. The index was lower by 1.0 percent compared to the corresponding week of last month but was 1.7 percent higher than that of a year ago. During the week under review, Food-stuffs advanced by 1.8 percent to 365.4 because of increases in the prices of rice at Patna (+6%), Bija (+4%), wheat at Jabalpur, gram at Hapur, tea and salt (+5% each), gur and dal arhar (+4% each), sugar and coffee (+1% each). Prices of gram at Patna (-7%), wheat at Hapur (-6%) and Jowar (-1%), however, declined during the week. The index for Industrial Raw Materials, on the other hand, declined further by 1.4 percent to 439.0 as a result of decreases in manganese ore (-17%), jute (-5%), Bengal fine cotton in Bombay (-3%), groundnuts at Cuddalore, linseed and lac (-2% each), Jarilla cotton in Bombay, cottonseed at Amravati and silk (-1% each), despite advances in rapeseed (+4%), groundnuts in Bombay and gingellyseed (+2% each). Umera cotton at Amravati, cottonseed in Bombay, castorseed and copra (+1% each).

The Semi-Manufactures group also moved down by 0.1 percent to 350.1 from 350.6 (revised) for the previous week. Items which recorded noticeable variations during the week were: zinc and gingellycake (-6% each), goat skins (-4%), mustard oil and coconut cake (+3% each), sheep skins (-3%), coconut oil, castor oil, brass and copper (-2% each). The index for Manufactures declined by 0.7 percent to 364.5 because of lower prices of jute (-2%) and cement (-3%) and the reappearance of the price quotation for Fujisilk at a lower level. The Miscellaneous group also showed a fall of 0.5 percent to 601.0 on account of decreases in the prices of turmeric (-8%), black paper (-3%) and cashewnuts (-2%), despite a rise of 3 percent in the prices of chillies during the week under review.

DEALINGS IN B.E.A. ISSUE COMMENCE

TWO NEW DEBENTURE LOANS LAUNCHED

London, 29th April.

THE highlight in the stock markets this week was the British Electricity Authority's £125 million issue of 41 percent stock, redeemable 1974-9, offered at 100. Application lists for the issue closed on Friday, 24th April, after being open only half an hour. Dealings commenced the same day at 1/16th discount. Applications for amounts of stock up to and including £250,000 were allotted in full, but over that sum allotment was about 70 percent of the amount applied for. Both the quantity and quality of buying in stock markets left much to be desired during the past week. Nothing startling occurred on the domestic scene, the behaviour of Wall Street being held responsible for the quiet state of affairs. The only section claiming real attention was gilt-edged where buying was considerable.

However towards the end of the week competition appeared in the form of two new attractive debenture issues—£3,000,000 at 41 percent by Tate and Lyle and £1,000,000 at 5 percent by Bakelite—and funds lost some ground. Industrials turned quiet as institutions who bought here after the Budget returned to gilt-edged. By the end of the week a scattering of small losses was recorded although textiles and electrical equipments tended to resist the trend. The undertone of oils was disturbed by the reduction in petrol prices but they regained most of the losses and closed about unchanged.

Gold shares were none too bright, the undertone having been rather unsettled by political speeches made since the South African elections,

but as the week drew to a close some confidence appeared to be returning. Commodity shares generally have been quiet though coppers suffered small losses following the lowering of copper prices, but this in turn was offset by apparent difficulties in the Korean truce talks. Rubbers and teas again had a quiet week with hardly any change, while late firmness in tins faded away to leave these shares about unchanged. Most activity in foreign bonds occurred in Far Easterns where Japanese and Chinese lost ground on armistice talk difficulties.

Cement Imports

Associated Portland Cement manufacturers have been forced to import 15,000 tons of cement a week from the Continent to meet rising home demand. A spokesman for the firm said that this was a temporary expedient in an effort to make up for the large amount needed for repairs to the East Coast sea walls. He said that the amount of building had increased tremendously and the firm was importing cement from Belgium and Western Germany to keep builders at work. The Company lost 100,000 tons of cement and had four factories out of action in the floods, the spokesman added.

Deratation Prospects

It is understood that Britain's Food Minister may be able to deration further foodstuffs before the end of the year. Bacon, butter, margarine and cooking fats have been mentioned although nothing official is yet known. Although sugar deratation may be delayed, it is likely to be carried out by November. Shipments of sugar bought by Britain from Cuba begin next month but this raw sugar will have to be refined before distribution. The sugar ration will be increased by two ounces to 12 ozs weekly on 17th May and it is possible that there will be a further increase before deratation. If bacon is freed, it might take place in autumn.

Tea Stocks and Landings

Stocks of tea in the United Kingdom bonded warehouses totalled 116,004,735 lbs on 17th April compared with 116,239,020 lbs a week previously. Landings during the week were 10,711,785 lbs and deliveries 10,946,670 lbs.

Raw Cotton Imports

United Kingdom raw cotton imports during the past week were 41,624 bales compared with 23,875 bales. Shipments comprised of 22,639 United States, 7,296 Sudans, 2,308 East African, 758 Peruvian, 491 Mexican and 8,132 bales Syrian and other growths. The quantity presently afloat is 63,869 bales mainly Brazilian, Pakistan, Syrian and African descriptions.

Linseed Oil Easier

Linseed oil after pretensions of steadiness ended the period on an easier note and Uruguayan oil was offered for May-June shipment at £90 1/2 per ton, in bulk, c.i.f. or 15s lower on balance. No trading was reported but it was noted that Belgian mills would have accepted 13,000 Belgian francs per metric ton for May-June shipment. Castor oil has had a quiet market with the little demand being for early shipments of India. On 22nd April the Hull mills reduced June-August deliveries by £4 per ton but held to previous rates for spot delivery. Groundnut oil was a slow market and sellers were mostly below the original offering May-June at £141 per ton, in bulk with a few lots of Chinese rather less.

Rubber Market Steady

On the London market rubber prices held very steady throughout the period supported by fairly consistent demand for near and afloat parcels. There was also some interest in covering against anticipated Russian orders in the near future. Consumer activity was slight with off grades and crepes largely neglected. Potential demand appears good but buyers are not prepared to meet the market. Values showed a general advance of a farthing a pound on the week.

Market Newsletter

The Investor's Chronicle market newsletter says: An easing of the international situation and the prospect of reduced arms have become a dominant Stock Exchange factor after the temporary impact of the budget which, however, will somewhat counteract world deflationary conditions. The emphasis has switched from commodity shares, and to a lesser extent from industrial shares, to money stock but any industrial setback would doubtless bring quick monetary and other counter-measures.

REHABILITATION FINANCE FOR THE COTTON TEXTILE INDUSTRY

DEPRECIATION ALLOWANCES INADEQUATE

(BY A CORRESPONDENT.)

LIKE most of the old-established industries in the country, the cotton mill industry is faced with the serious problem of plant replacement and modernisation. Equipment that long ago became obsolescent is still being used by a number of mills which cannot change over to more modern machinery. The Industrial Finance Corporation in its second annual report, says: "During the war years, the machinery and plant of the textile mills were put to intensive use, and renewals and replacements could not be carried out on an adequate scale, partly as a result of the restrictions imposed on imports and the diversion of the productive capacity of the supplying countries to war purposes. Since the cessation of hostilities, the supply of new machinery has not been adequate to meet the demand, and while the prices are approximately three times pre-war or higher, deliveries are extended over long periods."

Perhaps, the most crucial part of the Corporation's observations is its view that, "generally speaking, very few textile mills have adequate reserves or resources to pay for new equipment at present prices to replace their old machinery and plant." Since there is no comprehensive survey, it is of course difficult to estimate precisely how much money the industry would require for replacement but there is no doubt that it is considerable. It is noteworthy that, according to Mr. C. A. Innes, till recently President of the Associated Chambers of Commerce, the rehabilitation requirements of the jute mills alone are estimated at "not less than Rs. 70 crores—a staggering sum." In a memorandum prepared last year, the Federation of Indian Chambers of Commerce and Industry estimated that the programme of renovating the industrial equipment of the country would involve a capital outlay amounting to "anything between Rs. 600 crores and Rs. 800 crores." Obviously the cotton mill industry, the largest industry in this country, will need a large proportion of this sum for its rehabilitation.

Some Approximate Estimates

Some approximate appraisal of its needs has, however, been made by industrial courts in Bombay and Ahmedabad in connection with bonus awards to mill workers. According to the findings of these courts, cotton mills in Bombay City will require Rs. 72 crores for plant renewal and modernisation. Similarly, replacement finance for the Ahmedabad mills has been estimated at Rs. 55 crores. But the fundamental defect of these estimates is that they were based on the original cost of plant and machinery raised 2.7 times only. Indeed, in terms of present costs, mills in Bombay City alone would require Rs. 120 crores, but their actual resources are most inadequate in comparison. Mills in Ahmedabad would also need much bigger sums than they now have.

Inadequate Assistance

The Government is aware of the seriousness and the magnitude of the problem. In its final report, the Planning Commission says in regard to the textile and other industries that the emphasis should be "on increasing the efficiency of existing plants by renovation and modernisation and by securing a better balance in the plants." But this objective will never be achieved as long as the depreciation allowances permitted to the industry are related only to the historic or original cost of the machinery and not to the actual replacement cost.

Several suggestions have been made that liberal concessions should be granted in the shape of additional depreciation allowances and a lower rate of tax on undistributed profits ploughed back into the industry for the specific purpose of financing plant renovation programmes. In support of such arguments, a number of analogies in foreign countries, and more especially in France, are cited. Only recently a spokesman of the cotton textile industry said in Parliament that the Government should treat this problem with a sense of urgency and not leave it to the leisurely consideration of the Taxation Enquiry Committee whose findings might not be available for another two years or more. The Finance Minister, however, said merely that the "necessity of prompt and immediate relief" was not apparent to him.

Diverting Excise Revenue

Whatever Sir Chintaman Deshmukh's conception of urgency might be, the Government should consider diverting a portion of the excise revenue from mill cloth for this purpose. There has been a phenomenal increase in the incidence of this levy which is expected to yield Rs. 21 crores during the year 1953-54. About Rs. 6 crores are proposed to be spent from this source on assistance to the khadi and handloom industries. There is no reason why similar allocations should not be made for the rehabilitation of the mill industry whose stability and prosperity are as urgent a necessity as the survival of cottage industries.

The belief that the mill industry is fabulously rich is disproved by the fact that most marginal

Commonwealth are building up their own textile industries, and recently further efforts have been made to secure preferential treatment for these, compared with outside suppliers." A recent study of eastern markets for the British engineering industry shows that China has made plans to add five million spindles to step up yarn and cloth production in that country.

Japanese and U.K. Competition

Secondly, Japan and Lancashire are making determined efforts to regain the markets they lost during the war. Japanese textile industrialists propose to establish an organisation which will help expand exports of cotton products by stabilising prices at international levels. With a capital of 1,000 million yen, the new organisation will "buy, sell and keep in stock cotton goods qualified for export." In Britain considerable emphasis is being laid on improving techniques of production and lowering manufacturing costs. Mr. William Howarth, chairman of the Bolton Master Cotton Spinners' Association, declared in Manchester recently that the industry was determined to develop its trade organisation, "to make alterations in machinery and lay-out, to make greater use of research and to take all possible action to improve efficiency to increase the export of textiles which still make a material contribution to the national income." The well-known Shirley Institute is rendering valuable service to the industry by inventing new production techniques.

Stiff competition is likely to be faced in foreign markets and it would be foolish to assume that all is well with the Indian industry. The run-down condition of plants will seriously hamper efforts to build and stabilise textile exports in a rapidly shrinking world market. The Government should help the industry equip itself with up-to-date machinery and thus achieve greater efficiency. This would promote the two-fold objective of reducing cloth prices at home and increasing the competitive strength of the industry abroad.

In March, U.K. car shipments rose to almost 25,000 (28,897), nearly 4,000 more than the average for the first two months of the year. Commercial vehicle exports at more than 9,500 (9,212) showed a rise of over 600 (653) on the same comparison, while nearly 9,000 (8,501) agricultural tractors beat the previous monthly rate so far this year by 1,700 (1,702). Car exports over the first quarter of 1953 as a whole showed a startling increase in dollar sales when compared with the first three months of last year. Sales of British models to the U.S.A. more than doubled at little short of 10,000 (4,978 c.f. 4,327), and the 5,300 (5,323) sent to Canada was just over ten times greater (528). These figures reflect the enormous sales campaign which British manufacturers have been pursuing on the North American Continent.

The structural advantages and the long-term economies of concrete make this modern building material commend itself to the attention of the sponsors of India's Community Development Projects. At their disposal are the free technical services of the Concrete Association of India.

INCOME TAX (AMENDMENT)
BILL PASSEDAIR FARES AND FREIGHT WILL NOT
BE RAISED, SAYS MINISTER

(FROM OUR OWN CORRESPONDENT)

25th April.

THE budget session of Parliament is due to conclude on 15th May. The Lower House has passed the Income Tax (Amendment) Bill and referred to a select committee the Air Corporations Bill and the Industries (Development and Regulation) Amendment Bill. Priority has been accorded to the Tea Bill, the Patiala and East Punjab States Union Budget, the Patiala and East Punjab Cinematograph Bill. There was a stimulating discussion on the Industries (Development and Regulation) Amendment Bill. The Commerce Minister, Mr. Krishnamachari, claimed that the Government was in the position of a trustee and, as such, should have the power to direct or control the management of industrial undertakings. He gave a categorical assurance that it was not intended to use the Bill to nationalise an undertaking. Because of the temporary nature of price control legislation, he said, it was necessary to assume the power to control supply, distribution, price, etc. of the products of scheduled industries. The Government might take action to expand industries or promote the flotation of new ones or give a guarantee on the returns of certain selected industries. It had to ensure that an industrial unit did not run at a loss or make unduly high profits. This was an additional reason for price control. As for development councils, the Government had decided to watch the working of the two Councils recently set up before establishing any more. The Commerce Minister also envisaged the formation of a body for industries analogous to a court of wards, which looks after landed estates when the owner is a minor or imbecile. Under the Court of Wards Act the Government can take over and manage an estate and ultimately hand it back to the rightful owner. Referring to foreign firms, Mr. Krishnamachari said that if they were not wanted they could be asked to leave. "But as long as they are permitted to function here, they must be treated like anybody else."

Carry-Forward of Losses

During the discussion on the Income Tax Bill, the Finance Minister moved an amendment necessitated by a recent judgment of the Supreme Court in the case of the Anglo-French Textile Co. Ltd. The Supreme Court took the view that the carry-forward of losses under the head "business" to a subsequent year was permissible only if the loss was set off first in the year in which it was incurred against income from any other head; if there was no other head of income, the loss could not be carried forward. Sir Chintaman Deshmukh said that this was never the intention of the Government and the latest amendment sought to ensure that even if an assessee had no other head of income the loss could be carried forward. In providing for unilateral relief to a resident whose foreign income was assessed in India, it has been made clear in the Bill that in determining the rate of foreign income tax, the excess profits tax or business profits tax imposed by the Government of that country will also be taken into account.

The Communications Minister, Mr. Jagjivan Ram, winding up the debate on the Air Corporations Bill, assured the House that, unless there were some abnormal circumstances beyond its control, fares and freights would not be raised and the frequency and efficiency of services would be increased.

Telco Locomotive Manufacture

The Government is examining the recommendation of the Public Accounts Committee that it should take over from the Tata Locomotive and Engineering Company the manufacture of locomotives and boilers and run it as a State-owned industry. The paid-up capital of the Company on 31st March, 1952, was Rs. 4.5 crores, while its assets were estimated at Rs. 11.12 crores. All the preference shares in the company are owned by the Government of India. Under the terms of the agreement with the Government, the Company is entitled to profits on its outturn of locomotives only when it has attained, and is in a position to maintain, manufacture at the rate of four locomotives per month. According to the Company's present schedule this stage will be reached by about the middle of 1954. During the last six years, its net profits after providing for taxation and making allocations to the depreciation fund were: 1946-47 Rs. 77,543; 1947-48 Rs. 2,63,920; 1948-49 Rs. 1,07,452; 1949-50 Rs. 6,01,217; 1950-51 Rs. 5,65,380; and 1951-52 Rs. 2,27,008.

Using Oil Refineries' By-Products

The three new refineries, when working at capacity, will produce 3.4 million tons of refined oil and consume about 3.8 million tons of crude oil a year. For the Bombay refineries the Middle East is the nearest source of crude oil but in the case of the Vishakhapatnam refinery the possibility of obtaining crude oil from less distant sources will be explored. Meantime, prospecting for oil is going on in India and some encouraging results have been obtained in the Bengal basin. There will be numerous by-products from the refineries, the more

and propane and other gases. Most of these can be used in the chemical industries, but this involves a further heavy capital outlay, which the refinery companies are not yet prepared to make because they wish to complete the main refineries first. The possibility of setting up plants to use the by-products is, however, being examined, and the refinery companies have been asked to make suitable provisions in their lay-out for the future addition of such plants. For some time the refinery gases could be used economically only as fuel. The refineries' need for a large quantity of sulphuric acid should facilitate the development of a sulphuric acid industry using either the refinery gases or gypsum. The saving of foreign exchange resulting from the establishment of the three refineries in India is expected to be about Rs. 10 crores a year.

Administrative Rationalisation

The formation of an Organisation and Methods Division in the Government of India is being considered. It is explained that for better administration there must be a constant review of the Government's working. Individual Ministries and officers often do not know how their counterparts work and most of them share a common fault in that they wish to be self-sufficient and independent. In some cases they have neither time nor the inclination to review their own methods and organisation periodically. A Directorate of Methods, Organisation and Training is therefore considered necessary. Its main function would be to carry out a continuous organisational investigation of the various Ministries in order to rationalise administration, improve methods, and increase efficiency. Britain has such a directorate and it has proved its worth. An organisation of five officers is suggested here, its head being of the status of a Secretary. He will be assisted by one officer of Deputy Secretary's rank and three of Under Secretary's rank. All five officers will have to be specially trained. The Directorate will study the methods of work of each Ministry and make suggestions. Should there be a difference of opinion between the Directorate and the Ministry the matter will be referred to the Cabinet. Once orders are passed, the Directorate will see that they are carried out.

Retrenchment in Railway Collieries

The number of surplus workers proposed to be retrenched by State railway collieries is about 4,100, it is disclosed here. The main reason why labour has become surplus is that there are fewer working faces, especially in the Giridih collieries, because of the gradual exhaustion of the working seam. The problem was investigated by the Railway Collieries Enquiry Committee two years ago.

National Productivity Centre

It is proposed to establish a National Productivity Centre this year and staff it initially with the present members of the I.L.O. Productivity Mission, and if possible with the two Indian trainees who are at present in Britain on I.L.O. Fellowships. The Centre will assist in implementing the proposals of the five year plan in the field of productivity and will further the application in India of modern techniques to raise productivity, especially those which require little or no new capital investment. The Mission arrived here last December for a six-month visit ending on 31st May. The question of extending its term is being considered. Productivity studies and their application, rationalisation and modernisation of equipment are intended to reduce labour costs, and usually affect employment. But the Government says it is opposed to a reduction in employment, which raises the question as to how much use the Productivity Centre will be.

Compensation for Refugees

The next meeting of the Cabinet committee on compensation for displaced persons will be held on 28th April, it is learned. There are three issues before the committee. Firstly, is the Government committed to give compensation from its revenues? Secondly, would compensation, if granted, reduce the yearly liability of the Central Government for the resettlement and rehabilitation of displaced persons? The third issue relates to titles. According to lobby reports, the Rehabilitation Ministry claims that the grant of compensation would entail a net saving of Rs. 35 crores and displaced persons would be deemed to have been resettled and rehabilitated if the Central Government paid Rs. 15 crores, in addition to writing off Rs. 82 crores spent so far on housing and loans. This claim of the Ministry is disputed.

The issue of titles is even more complex. Evacuee properties are valued at Rs. 90 crores, including those outside Punjab (I). The point raised is: is one group of refugees (those from West Pakistan), entitled to be compensated by properties outside Punjab (I)? If the principle that displaced persons have a claim on evacuee property is accepted, it will have to be shared by all displaced persons, including those from East Pakistan. The plea that as the evacuee property law was not extended to West Bengal displaced persons from East Pakistan have no claim is disputed in responsible quarters. The fundamental issue is that, if the principle of compensation is accepted, can it be applied to displaced persons from West Pakistan and not to those from East Pakistan? Some say that this would amount to discrimination and would therefore be unconstitutional. The lobby view is that it would lead to strong resentment and agitation. It is also recalled that

did not exclude displaced persons from East Pakistan. One view here is that Bengali leaders are closely watching this controversy and will demand equal compensation for displaced persons from East Pakistan if the principle is accepted. The Cabinet committee, which is expected to hold several meetings, will have to consider the full implications of all these issues before it reports to the Cabinet.

Sugar Excise and Cane Cess

The annual report of the Central Sugarcane Committee for the year ended March, 1952, makes some important observations on the sugar industry. It says that production was 15 lakh tons of white sugar during the year, but consumption was about 10 to 11 lakh tons, leaving a surplus of nearly four lakh tons which greatly disturbed the economy of the factories since the high cost handicapped efforts to establish export markets. A considerable reduction in the price of sugar, with freedom of movement, would increase home consumption. A clear policy is also necessary to encourage fruit preservation, syrup and squashes industries, which are likely to use substantial quantities of sugar if supplied at concession rates. The price of gur is a major influence on the price of cane. The latter is determined not by the demands of sugar factories but by those of gur producers. Factories crush at the most about 23 to 24 percent of the cane produced. The price of gur declined steadily and throughout the 1951-52 season it remained far below the official ceiling. In future, therefore, the price of sugarcane is bound to be affected.

The report discloses that in 1940-41 the price of sugarcane was 4½ annas a maund, of sugar Rs. 9-8 a maund and of gur Rs. 5-3-9 a maund. The estimated total production of sugarcane in that year was 51,157,000 tons. In 1946-47 the price of sugarcane rose to Rs. 1-4 a maund and in the following year to Rs. 2 a maund. Production of sugarcane also increased from 46,526,000 tons in 1945-46 to 58,170,000 tons in 1947-48. The price of sugarcane in 1951-52 ranged between Rs. 1-12 a maund and Rs. 1-13-5 a maund while production reached the record figure of 58,950,000 tons. During the last 12 years the price of sugar has risen from Rs. 9-8 a maund in 1940-41 to Rs. 35-7 a maund in 1947-48 and Rs. 34-14 in 1951-52.

The report also discloses a quarrel with the Government of India. The Committee claims that it should get the entire proceeds of the sugar excise fund raised from the sugar excise duty. The Central Government, however, has been allocating funds at the rate of one anna per cwt. from the sugar excise duty. Even this grant, it is alleged, has been withheld since 1949-50. The Committee by a resolution has demanded the payment of arrears, amounting to Rs. 33 lakhs, and doubling of the grant. Reference is made to a statement by the Food Minister, Mr. Kidwai, in Parliament on 7th April that in 1952-53 the sugarcane cess in Uttar Pradesh, Bihar, Bombay and Madras had yielded Rs. 607 lakhs, of which only Rs. 168 lakhs were spent on sugarcane development. While Bombay had spent Rs. 3 lakhs more than it got from the sugarcane cess, Madras had spent nothing out of the Rs. 11.11 lakhs. Bihar had spent nothing lakhs out of Rs. 140 lakhs and Uttar Pradesh Rs. 44.14 lakhs out of Rs. 405.33 lakhs. This issue was discussed by the Tariff Board, which criticised the use of the sugarcane cess for general purposes since these two States are the major beneficiaries from the activities of the Central Sugarcane Committee they should make a substantial contribution to its funds.

I.L.O. Post for Labour Secretary

The Labour Secretary, Mr. V. K. R. Menon, has been offered, and is believed to have accepted, a high post in the International Labour Organisation. He is expected to join the I.L.O. later this year.

Cargo for Indian Ships

Since shipping was privately run Indian shipping companies must themselves take the initiative to secure more cargo, said the Transport Minister in Parliament this week. The Government could render only limited assistance.

Children's Bill

A Children's Bill is being considered by the Government of India and will be introduced in Parliament, it is announced here.

National Academy of Letters

A National Academy of Letters will soon be established with headquarters in New Delhi, it is announced here.

Economic Adviser to Finance Ministry

Mr. J. J. Anjaria has been appointed Economic Adviser to the Ministry of Finance, and his task will be to organise a fully equipped Economic Adviser's Office in the Finance Ministry. He will also continue as Chief of the Economic Survey and Finance Division in the Planning Commission.

Indian Representation on World Bank

Mr. G. R. Kamat, Joint Secretary to the Ministry of Finance, is expected to become India's representative on the World Bank, replacing Mr. B. K. Nehru, who will return to New Delhi, it is learned here.

United States steel production reached a new record of 10,153,000 tons of ingots and steel castings in March, year to a new quarterly record of 24,081,137 tons, according to the American Iron and Steel Institute.

A record world rice crop is expected to be produced this year, according to the U.S. Foreign Agricultural Service. Estimates place the 1952-53 crop at 178,000,000 tons of rough

Pakistan

DEVALUATION RUMOURS
DISCOUNTEDJUTE AND COTTON EXPORT PROSPECTS
GOOD

(FROM OUR OWN CORRESPONDENT)

Karachi, 24th April.

THE political changes in Pakistan seem to have revived the perpetually recurring rumours in India about the possible devaluation of the Pakistan rupee. This has caused some astonishment, and indeed some amusement, in Karachi, where it has become recognised that nothing of the slightest importance can occur in Pakistan without Indian observers somehow regarding the event as a portent of devaluation. Has it been forgotten that in his budget speech on 14th March, Mr. Mohammad Ali, the Finance Minister, described such rumours as displaying a lack of understanding of Pakistan's economic position? Admittedly, official denials in a matter of such moment are not always deserving of credence, but Mr. Mohammad Ali did not merely deny; he set forth some cogent arguments why Pakistan's economic position did not warrant any change in the exchange rate. He pointed out that jute at present prices was the cheapest fibre in its class and that cotton prices were fully competitive; an adjustment in the rate of exchange could not be expected therefore to bring about any improvement in the country's exchange earnings, and would, on the contrary, make the position worse. On the other hand, Pakistan needed to import large quantities of capital goods and foodgrains.

No Benefit to Jute and Cotton

Nothing has happened since which would affect the validity of these arguments. On the other hand, recent developments have made it even more clear that devaluation would be a disastrous move for Pakistan. Its main presumed advantage would be that it would enable greater quantities of jute and cotton to be moved. But the present prospects of these crops have changed considerably, as compared with last year. Last year, admittedly, any measure which would have assisted in the sale of jute for export would have been welcomed, but the latest estimate of this year's sowings are sufficient to prove that the Pakistan Government have been extremely successful in their efforts to limit acreage. The target, it will be recalled, was 42 lakh bales; but in the opinion of the Pakistan Jute Board, which is confirmed by independent estimates, sowings have been reduced to such an extent that the crop is not likely to exceed 40 lakh bales. The Board's latest estimate of exports during the current season is 55 lakh bales and it is thought that the carry-over will be between 25 and 30 lakh bales. Bearing in mind that the Indian crop is also expected to be much smaller, the total amount of jute for disposal will be by no means excessive. Prices are likely to firm up and there would, therefore, be no point whatever in reducing the external value of the Pakistan rupee. From the foreign exchange point of view this would probably produce a loss rather than a gain.

Likewise there is no cause for anxiety about the disposal of the cotton crop. In the current season sales have already reached 12.75 lakh bales, leaving a balance of 4.25 lakh bales for disposal. Japan has undertaken to buy 2.5 lakh bales during the remainder of the season, and as much as 6½ lakh bales (equal to about half the normal exportable crop) next season. These figures speak for themselves. Devaluation is certainly not called for in regard to the two commodities which form 90 percent of Pakistan's exports.

On the import side it stands to reason that the Pakistan Government will not lightly forgo the great advantage they enjoy from the present par value. Admittedly, judging by the free market value this is artificially high, but so long as it is recognised by the International Monetary Fund it must be accepted by the other countries. Pakistan is thus able to purchase her requirements of capital goods, wheat, etc., at a big discount. Even if the Americans are so kind as to supply a million tons of wheat in the form of a gift or a loan, it will still in all probability be necessary to pay for substantial imports.

Encouragement of Foreign Business

The new Prime Minister has already put some heart into foreign business interests which were becoming somewhat discouraged by the policy of the late Government. Admittedly, we were continually being told that foreign capital was welcome, especially on the industrial side, but in practice a good deal had happened which was discouraging, if not positively deterrent. At his first Press Conference, Mr. Mohammad Ali was asked whether he was aware that foreign companies were not treating their Pakistani employees fairly. He replied that he was not aware of this and went on to say that he considered it important that foreign capital should be encouraged and thought that undue interference in the internal administration of foreign companies would only have a discouraging effect. He was careful, however, to explain that he was not expressing the views of his Government but was only "thinking aloud." Incidentally, he might have given a short reply by asking the questioner to give an honest answer to the question whether Pakistanis in general prefer to seek employment with foreign firms or with Pakistani firms. The

truth of the matter is that the foreign firms are fully conscious of the desirability, indeed of the necessity, of giving their Pakistani employees fair and equal treatment, so much so that they are deluged with applications for every vacancy that occurs. They are also taking pains to comply with the spirit of the Pakistanisation rules in the Registration of Importers Order.

Khulna Newsprint and Shipbuilding Projects

Thanks to the increased allotment for industrial development, the financial stringency has had little effect on the programme of that energetic body, the Pakistan Industrial Development Corporation. They have every intention of proceeding with the scheme for establishing a newsprint factory at Khulna, using wood available locally in the Sunderbans. This wood, which is the same as is being used in the Ispahani match factory at the same place, has been tested and found suitable for the purpose. Also at Khulna will be a ship-repairing and shipbuilding yard of some importance. The Pakistan Industrial Development Corporation expect to spend about Rs. 80 lakhs on this project and have secured a larger river frontage close to the match factory below Khulna. The idea is to commence with repairs to inland water craft and later to proceed with the construction of launches and boats. The P.I.D.C. have retained, as their consultants in this scheme, the German firm which has been advising them on the proposed shipbuilding establishment at Karachi.

The contract for the new cement factory being set up by the P.I.D.C. at Hydrabad will, it is understood, shortly be awarded. It seems almost certain that it will go to a big Danish concern.

London

INDUSTRIALISTS SUPPORT NO
PAR VALUE SHARES
MARCH TRADE FIGURES
UNIMPRESSIVE

(FROM OUR OWN CORRESPONDENT)

25th April.

SHARES of no par value form the subject of a joint memorandum from the Association of British Chambers of Commerce, the Federation of British Industries, and the National Union of Manufacturers submitted as evidence to the Committee on the matter under the chairmanship of Mr. Montagu Gedge, O.C. The conclusions of the three bodies are that the Companies Act should be amended so as to permit the issue of shares having no nominal value under certain conditions, including the following: (i) The facility to omit mention of a value in the designation would be confined to ordinary shares. It could not be used for shares which have a prior right to a specified amount of capital before participating, if at all, in a division of the remaining assets in a liquidation. The term should not be used to indicate more rights to participate in profits or in a surplus on liquidation if the rights do not reflect a contribution made to a capital fund which is available for the payment of creditors. (ii) If a company has any part of its ordinary capital in the form of shares of no nominal value it should convert all its ordinary shares of the same class to that form in order to avoid confusion. (iii) Shares of no nominal value should be fully paid at the time of issue or shortly thereafter, and in any event before the issue of the share certificates. (iv) The entire proceeds of the issue of shares with no nominal value, after paying expenses, should be booked to capital account. In the case of a subscription otherwise than in cash the value booked to capital should be the value at which the subscription appears on the asset side of the balance sheet—reduced by expenses. (v) As a rule premium reserves arising from previous issues of shares with a nominal value should be incorporated in capital prior to the creation of shares with no nominal value. There can be other capital reserves arising from exceptional surpluses on the realisation of assets which can be left to meet exceptional capital losses, but as a rule surpluses arising from the revaluation of the company's assets should be incorporated in capital so as to prevent their distribution as profits without passing through the scrutiny provided for a reduction of capital. (vi) The combination or splitting of shares of no nominal value should be permitted subject to the condition that the shares carry the designation of "combined" or "divided" as the case may be for a reasonable period, say twelve months thereafter and certainly until after the old share certificates have been replaced by new certificates. (vii) Consideration should be given to the question of whether the adoption of the no par value system does not involve the recognition of losses of capital by the transfer of a deficit on the profit and loss account against the capital account without the necessity of seeking the approval of the Court to a reduction of capital. (viii) Consideration should be given to the incidence of Stamp Duties on the creation issue and transfer of no par value shares so as to give to them similar treatment to that given to par value shares. (ix) Consideration should be given to the appropriate legal description of the share.

March Pattern of Trade

The pattern of trade is so important, not only to this country but to the sterling area as a whole, that the regular references to changing trends which find inclusion in this despatch call for no apology. The detailed figures for March, referred

to briefly last week, are now available, and the picture they present, save for a couple of bright spots, is not particularly encouraging. According to the Board of Trade, it "appears likely" that the volume of exports was no higher in the first quarter of this year than in the last quarter of 1952, but imports over the same period cost us about 3 percent more than the quarterly average in the second half of last year, in spite of lower import prices. The index figures record a drop from 93 to 97 in export prices—an indication of greater competition as well as our willingness to meet it—whereas import prices remained steady at 91. The ratio between the two (1952=100) was 94 in March against 93 in February, a slight worsening of the terms of trade, though they are still a lot better than they were a year ago, when the index figure stood at 104. Of the brighter aspects, the rise in imports would seem to be in volume, which in turn suggests rising production, and it is important to observe that the increased imports are from the sterling area; while the drop in export prices (they fell three points in the case of metal and engineering exports against only one point in manufactured exports as a whole) is an indication that the benefits of lower raw material imports are being handed on to overseas buyers and this may ultimately result in an increase in their volume. It is encouraging to see further recovery in car exports, particularly to North America although the improvement is fairly general. Cotton textiles are still making little headway—encouraging Lancashire to press for Budget relief in the matter of Purchase Tax—but yarns and wool and rayon are less affected.

Budget Debate Ends

The "popularity" of Mr. Butler's Budget has, as anticipated, been confirmed by the Gallup Poll, and neither Mr. Dalton nor Mr. Aneurin Bevan, the main Opposition spokesmen during the final day of the general debate last Monday, were able to shake the Chancellor's equanimity. The latter condemned their efforts to stir up class feeling, though in prevailing circumstances, and particularly in the face of the responsible and common-sense approach adopted by the T.U.C. in its restrained criticism of the Budget proposals, this emotional fury undoubtedly represents their best line of attack if indeed it is not the only one left open to them. The T.U.C. General Council has followed the Party line, but its main criticism is that the Government's policy will not overcome the difficulties which lie ahead, for it has been dictated by "fortuitous" improvements for which it is not justified in taking any credit. In effect, Mr. Butler is "taking a gamble" on the future, which is what he did last year to some effect, and which his predecessors had done, but without as much success! There is much in the Chancellor's proposals which the T.U.C. likes, with certain reservations. Other things it mistrusts. But there are no threats, not even warnings. The T.U.C. is, in fact, being "statesmanlike."

Meantime, one looks for small pointers as to how things are going to develop. That the cost of living on 17th March was a point higher at 113, mainly resulting from increases in the cost of vegetables and coal, was not encouraging, but against that there is the prospect of a fall in the prices of petroleum products because of lower freight charges. On the other hand, last week was an unusually good one for new savings, which exceeded withdrawals by almost £5½ million, and the British Electricity Authority's new £22½ million loan met with rather more success than the market had anticipated. Steel and pig iron outputs are still rising, and the introduction of a voluntary distribution scheme for steel plate might well lead to better allocations of this still scarce product where it would produce the best results. And finally, there are prospects that other commodities, in addition to sugar, will be up for rationing before the end of this year or early next year, including margarine, cooking fats, butter and bacon, with consequent reductions in the food subsidies.

Guillotine for the Transport Bill

In Parliament Labour's efforts to delay the Transport Bill during the House of Commons' consideration of the 70 amendments passed by the House of Lords, to which they tabled a further 69. Two long sittings, with the Opposition filibustering as hard as they could, made little impression on this formidable task, and Party feeling ran high, with the Government in the end deciding to utilise the guillotine procedure next Monday. Efforts to avoid this proved unavailing, and it is unfortunate in view of the importance of the Bill. Against this, Lord Jowitt, in the House of Lords, proposed a compromise to take the Iron and Steel Bill out of party politics, but as it was a personal not a party proposal, Lord Salisbury, though sympathetic, was unable to accept it.

Vikings Grounded

The grounding of Viking piston-engined airliners operating in humid, equatorial areas is the outcome of advice tendered by the maker's, Vickers Armstrong Ltd., following upon an accident to a Viking in Central Africa towards the end of last month. According to the company, the investigation into this accident has definitely established the part which failed, and as a precautionary measure it was decided that other aircraft of this type which have flown for a comparable period in similar turbulent conditions ought to be grounded pending their restoration to serviceability by the replacement of the part in question. These parts are being manufactured as a matter of great urgency, so the grounding period is not likely to be very long.

Bombay

DIVERGENT VIEWS ON COTTON TEXTILE PROSPECTS INDUSTRIAL CONDITIONS IN STATE CRITICISED

(FROM OUR OWN CORRESPONDENT).

26th April.

THE annual general meeting of the Millowners' Association is an important event in Western India. The retiring Chairman's speech, as is customary, dealt with all important issues affecting the industry. Summing up, Mr. G. D. Somani said that despite mounting consumer resistance and the industry's dependence on exports, the situation did not justify a pessimistic outlook. Regarding the many evils and malpractices which seemed to have crept into business methods, Mr. Somani's advice was that the industry must conform to the highest standards of managerial efficiency and integrity. Whether Mr. Somani's optimism is justified or not, the general feeling in textile circles here is that as long as the industry has to depend largely on exports for its prosperity, the future must be regarded as uncertain. Statistics of the exports of mill-made cloth given by Mr. Somani himself show that while in 1950 these amounted to almost 1,100 million yards, in the following year they fell to 732.3 million yards and in 1952 exports totalled only 542.6 million yards. Judging by the figures for exports during the present year to date, it is feared that instead of reaching the target of 1,000 million yards set by the Government and the Planning Commission for 1953 the actual figure at the end of the year might be even lower than for 1952.

It is also thought that with internal consumption reduced because of a decline in purchasing power, and with exports running at a low level, increased production, instead of proving a boon to the country and the industry, might in reality prove a burden. Though this is an extremely pessimistic view, the facts on which it is based cannot be entirely discounted. It is difficult to reconcile Mr. Somani's optimistic outlook for the industry with his observation in the same speech that between labour's demands for increased basic wages, dearness allowance, bonus, festival holidays with pay, etc., and the Government's social welfare schemes such as provident fund, employees' State insurance scheme and holidays with pay, coupled with consumer resistance, "this great national industry is being gradually squeezed." There is little likelihood that Mr. Somani's appeal to the

Central and State Governments, that a halt should be called in the imposition of additional burdens on the industry until the Taxation Enquiry Committee's report is available, will be heeded.

Condemnation of Industrial Conditions
The most forgotten Industrial Conditions Enquiry Committee, appointed in 1947 by the Bombay State Government, has come into the limelight again by submitting its final report last week. The Committee considers industrial conditions in the State appalling, industrial management moribund and shortsighted, and trade union leadership and labour policies unenlightened. It condemns the approach of the Bombay textile and other industries to industrial problems and criticises the former for evading provisions of the Factory Act prescribing minimum facilities for workers. In the opinion of the Committee the conditions of workers in the Ahmedabad textile mills are better than in Bombay. Even the Government machinery for inspection of factories and enforcement of the Factories Act has not escaped strictures at the hands of the Committee which has recommended that the inspectorate and the labour welfare department should be reorganised completely. The Committee is not satisfied with the Bombay Industrial Relations Act and other legislation governing conditions of work in factories, which are reputed to be far in advance of those in all other States in the Union, and suggests the passing of a comprehensive Labour Code to improve industrial conditions in the States.

Reactions to Sastri Award

The reaction of the banks and the business community so far to the Sastri All-India Bank Disputes Tribunal's Award has been on the whole favourable. The business community is pleased because the award will ensure Saturday clearing of cheques and also because it is believed that whatever fresh burden has been placed on the banks will be such as can be borne by them without passing any portion of it on to clients. They view favourably the new classification of banks into four groups according to their working funds, and into three by areas, as being more realistic; the uniform rate of dearness allowance is held to be better than the provisions of the Sen Award where this allowance was linked to the cost of living index. Under the old award the cost of overtime work was almost prohibitive and the tendency of the banks was to cut down services to customers rather than to incur overtime. The more modest basis for overtime allowances will at least ensure that the present standard of services to customers is maintained. As they discover new "anomalies" in the Award, the reaction of employees is, however, becoming more critical.

Increased Unemployment

With the advent of the hot weather, the situation in the famine affected areas of the State is deteriorating. Water is in short supply and though fodder is also scarce the authorities hope to be able to relieve this situation to some extent. The monsoons, it is hoped, will bring some relief to scarcity areas although this is not a certainty since the rains have failed in the last two years. The Government is also faced with the serious increase in the unemployment of literates attributable partly to famine conditions. The Prime Minister, Mr. Jawaharlal Nehru, is expected to tour the famine-affected parts of Maharashtra this week.

Groundnut and Linseed Trading

This week saw the resumption of trading in specific delivery contracts in groundnut and linseed, under the auspices of the Bombay Oilseeds Exchange. Business of this nature had been suspended by the State Government a year ago because of difficulties and deadlocks that followed the heavy slump in commodities in March 1952. Forward business in castor seeds was resumed some time ago. There will be no free forward trading in groundnuts and linseed but operators have devised ways of turning specific delivery contracts into speculative forward trading. Business at present is being done in the June-July and August-September deliveries in this season's crop. The wisdom of allowing such trading this year so late in the season, when it is known that the crop has been much smaller than in the previous year and when spot prices are already ruling very high, is questionable.

Steel Retention Prices

The Tariff Commission has completed its enquiry into the Tata Iron and Steel Co.'s application for an average increase of Rs. 100 per ton in the retention prices of its products and it is believed that the Commission will submit its report to the Central Government at the end of this week or the beginning of the next. The Award is expected to be announced by the middle of May and market circles confidently expect an increase of at least Rs. 50, with retrospective effect for the last two years.

All-India Seafarers' Federation

A new All-India Seafarers' Federation will be formed on 9th May, as the biggest difficulty, the drafting of a constitution meeting with the approval of all seamen's unions in Bombay, has now been overcome. A Convention of Seamen is being called on this date to ratify the constitution, when national Transport Workers' Federation, who was made preparations a month ago to initiate and to present. Representatives of seamen's unions from Calcutta and other major ports may participate in the Convention as well as in a conference. The general secretary of the following two men's Union of India, Mr. A. K. Mohamed Sarang, has already gone to Calcutta to persuade the unions there to join the proposed Federation.

FERROSPEED ELECTRODES

were used for welding structural steelwork for the NEW AUTOMATIC TELEPHONE EXCHANGE, CALCUTTA, and on many other important industrial projects throughout India. FERROSPEED are all-position, structural grade electrodes for use on A.C. or D.C. Quality controlled. Approved by Lloyd's.

FERROSPEED are made in India and cost less than any comparable imported electrodes.

THE WORKING OF THE INSURANCE CODE

COMMISSIONS ON RENEWAL PREMIA: REDUCTION OF EXPENDITURE

(By N. T. Raju)

DRASTIC revision of the Insurance Act, 1938, had been considered for a long time before the Amendment Act was passed in 1950 after careful deliberation. Even so, immediately after it was passed, there was a feeling that further amendments would soon be necessary. The 1950 Act placed a limit on expenses of management and created a Life Insurance Council consisting of representatives of life offices operating in India. Limits for expenses of management, depending upon the size of each office, have been laid down in the Insurance Rules prescribed under the Act. Apart from the overall limit for expenses, the Act also restricts the maximum commission payable to insurance agents.

The Life Insurance Council acts through its Executive Committee and is empowered by the Insurance Act to aid, advise and assist in establishing sound standards in the conduct of the business and in controlling expenses, and to frame regulations to carry out its duties. The Executive Committee at its meeting in August 1952 appointed a sub-committee to examine the question of malpractices and irregularities and to devise a Code of Conduct for life offices. The report of the sub-committee was considered at a meeting held in November last year and the Executive Committee framed a Code of Conduct early this year, which has now been in force for nearly four months.

The Code deals broadly with three main aspects: agents' commission, field organisation of offices, and premium rates. The Act restricts the agents' commission to 35 percent of the first year's premiums. The code imposes further restrictions by setting up a graded scale of commission within the statutory ceiling according to amount of business done. This will certainly make it less remunerative for the casual agent and the part-time agent who canvasses only a small volume of business. The practical utility of this additional restriction is very doubtful. Offices which did not until now have a graduated scale for commission rates will certainly save something. It is a general complaint that the insurance agent in India is not properly equipped or trained and that the casual or part-time agent is to a large extent responsible for the high lapse ratios. As long as there is no scheme to train agents, merely to scale down the commission of small agents may not help. The Life Insurance Council is empowered to hold examinations for agents and only those who qualify may be granted licences. The Council would have done better by simultaneously introducing qualifying tests for agents. In that event the part-time agent would soon vanish or become unimportant, the trained and full-time agent would face less competition and earn more.

Regional and Zonal Offices

Another provision in the Code is that a big life office (that is, an office with more than Rs. 10 crores of business on its books) should not engage more than one intermediary between the branch manager and the insurance agent. It may not be very common for offices to engage more than one such intermediary but some of the big insurers have been maintaining regional or zonal offices to supervise the working of branches within a given area. As the Code of Conduct defines a branch office as a unit working directly under the head office and having an exclusive territory of operation not less than that of an administrative district, the regional or zonal offices which made possible closer supervision of branches may have to be abolished. The provisions in this respect come into force from 1st July this year. The Executive Committee of the Life Insurance Council has invited the offices to place before them any difficulties they are likely to experience in observing the Code; it is hoped that the existing organisation of some offices will be left undisturbed so far as they are not deemed to be indulging in malpractices or irregularities.

The restrictions on agents' commission and on the number of intermediaries are intended to curtail expenses but as there is an overall limit on expenses, and penalties for exceeding the limit, these restrictions appear to be superfluous. One of the drawbacks of the Insurance Act, as amended in 1950, is that it provides for the examination of expenses some time after they have been incurred. The inclusion of further provisions in the Code restricting certain items of expenses implies that an overall expense limit does not work as well by itself as in conjunction with simultaneous limits on the components of overall expenses.

High Percentage of Lapses

Among the major defects of Indian insurance is the high percentage of lapsed policies. Early lapses result in a loss to offices so that any reduction in lapses would automatically reduce expenses. The disparity between the remuneration allowed to those who procure new policies in the first year and what they get in subsequent years is to a large extent responsible for the many lapses. At present it is at least 50 to 60 percent of the first year's premium and 5 to 7 percent of the subsequent premiums. In any statutory scheme to improve standards of insurance business, measures encouraging agents to give greater importance to renewal premiums should be seriously considered so that both lapses and expenses may be reduced.

The provisions of the Code of Conduct, either in respect of agents' commission or employment of intermediaries, are not comprehensive. They deal

with only part of the problem and consequently might not produce the expected results. They have not been welcomed either by the field workers or by a majority of life offices. The former complain that the graduated scale of commission saves money for offices at the expense of agents and that the conditions for employment as salaried intermediaries in small insurers are onerous. The latter feel that when the Act has restricted expenses and other functions of life offices, there should be no interference in the details of day-to-day management.

In addition to the above provisions, the Code of Conduct prohibits the offering of reduced premium rates to special categories of persons, except to employees of the office and under schemes approved by the Controller of Insurance. In theory, the offering of such rates is perfectly justified since premiums are always adjusted to correspond to the risk involved. In practice extra premiums are levied on under-average lives and in the case of hazardous occupations.

Offering Special Terms

The life of the European is usually healthier and longer than that of the Indian so there is a wide gap between life premium rates in U.K. or Europe and India, the former being lower. When a European comes to India, he can take out a life policy in his own country and continue premium payments here. For convenience, however, non-Indian insurers used to offer Europeans in India the lower "Home" rates. Later, high-ranking Government officials and commercial executives were also given the benefit of those rates irrespective of nationality on the assumption that they led much healthier lives than the average Indian. To compete with these lower premium scales of non-Indian insurers, some Indian insurers introduced what are known as Staff Insurance Schemes under which they reduced the ordinary premiums by a specified percentage in case of certain categories of persons. In course of time the original intention of the reduced premium plans were conveniently overlooked and they began to be offered by some of the offices indiscriminately, thus leading to unhealthy practices. The Code of Conduct has taken cognisance of this vice and has rightly prohibited all such plans. The prohibition is not reactionary; it is embodied, for instance, in the New York insurance laws which are considered a model for State regulation of private insurance.

The Code includes two more provisions—one requiring the life office to intimate the options available to the policyholder when a premium is not paid, and the other dealing with special agents. Regarding the office from giving notice to the policyholder if the options are set forth in the policy issued to them and it is difficult to say how far the Life Insurance Council is justified in disallowing the statutory exemption. It is recommended that credit should be given to the special agent in respect of policies on which premiums are paid more frequently than annually in the year in which the last instalment premium of the first year is received. But the Act provides that credit should be given only for policies procured in the calendar year for which the first year's premiums have been paid in full. As such the recommendation would appear to contravene the absolute provision in the Act.

Calcutta Markets

FAIR DEMAND IN TEA EXPORT AUCTION

INTERNAL SALES RESUMED

AT Export Sale No. 45 held on 27th and 28th April, 1953 there was a fair demand for the offerings which consisted mainly of end of season's teas and Exporters were operating on a limited scale. Whole leaf grades were in most demand and prices for these remained about steady but rates for all other types showed a decline of up to two annas per pound.

After an interval of two weeks while awaiting clarification of the new Excise Regulations introduced on 15th April, there was a good demand in the Dust sale and except for residual types which were neglected and the best CTC Assams which were one anna lower, prices for all other types were firm to dearer. In the Internal Consumption leaf sale prices showed a decline of 2 to 3 annas over last rates.

Quotations		1953	1952
Medium Doonars Dust	1	8 0	1 5 0
Medium Assam Grainy Dust	1	9 6	1 0 0
Best Assam CTC Dust	1	15 0	2 0 0
Approximate Quantity Offered			
Export	24,400	Pcks.	48,600
Internal	2,400	Pcks.	2,200
Dust	19,970	Pcks.	20,500

FREIGHT MARKETS-BUSY

GRAIN FIXTURES A BRIGHT FEATURE

CONDITIONS in the freight markets have remained steady and good demand continues to be dealt with in several of the leading trades. Further fixtures of coal from Calcutta are reported, two ships being fixed to South Korea at 75s with topping up at Vizagapatam at 15s less. A British flag ship accepted the previous rate of 62s for Japan, while a prompt Japanese ship accepted the lower rate of 60s. Ore from Bombay to the Northern Range was fixed at \$10.50 for a May

loader while a subsequent similar fixture was done at the lower rate of \$9.50. A small ship was fixed for scrap iron from Bombay to West Italy at £14.250 lump sum f.i.o. and stowed.

The Australian market continued active with several fixtures being reported. 85s was paid for oats in bulk for Antwerp-Hamburg discharge and a handy-sized motor vessel accepted 85s for flour in bags to Ceylon, while a larger ship accepted the lower rate of 75s for a similar cargo. Wheat in bulk to India paid 72s 6d and 70s was accepted for wheat in bulk ex silo for Karachi for two fixtures. There was also considerable movement of sugar from Queensland, several fixtures being reported for U.K. discharge at rates varying between 122s 6d and 118s 9d for discharge in U.K. for bagged sugar. Sugar also moved from Mauritius to U.K., 65s being paid for bagged sugar and 66s 6d for sugar in bulk.

Mixed cereals from North China to Antwerp-Hamburg was arranged at 97s 6d and a further cargo of rice from Whampoa to Colombo was done at 53s 9d.

There was a considerable movement of grain from the St. Lawrence and a feature of that market was the commencement of chartering from the St. Lawrence to U.K. under the Board of Trade's new arrangement for open individual licence. Several fixtures were made at 51s 3d per ton for heavy grain for May-June loading with the option of barley at 2s extra. Coal from Hampton Roads to the Continent was done at the slightly lower rates of 35s 6d and 35s, while a Mav loader to Japan paid the slightly lower rate of \$9.25.

In the time chartering section a small motor-ship of some 4,000 deadweight tons accepted \$21,000 per month for six months trading while a slightly smaller oil-burner accepted \$17,500 per month for 12 months trading. A Liberty steamer accepted \$2.50 for 12 to 15 months trading, while another Liberty vessel accepted 16s 6d for four months trading with delivery at Singapore.

SUGAR MARKET STRONG

During the week ended 28th April, the sugar market was strong because of a rise in the prices of gur and khandasari. Rates for ready sugar ex-Kantapur delivery were Rs. 29-10 a maund for ordinary grain, Rs. 31-6 for big grain, and Rs. 28-12 for old ordinary grain. Ex-mill delivery quotations ranged between Rs. 27-12 and Rs. 29-12 a maund for Bihar mills, and Rs. 28-8 and Rs. 30 a maund for West U.P. mills. Stocks amounted to 70,000 bags; arrivals averaged 5,000 bags daily and sales 2,500 bags for local and Assam markets. A quota of 150,000 tons was released but there were no big enquiries from South India at the higher rates.

HIDES AND SKINS

The market remained steady and fluctuations were narrow. Stocks were less than in the previous week.

Bazar Sales

(Between 21st and 27th April, 1953.)

Cowhides:—Wet salted (Ord.) 10,000 pcs. on the basis of Rs. 9 to Rs. 10; Wet salted (Slauhtered) 800 pcs. on the basis of Rs. 13-8 to Rs. 23-12; Wet salted (Buffaloes) Annas 7 to Annas 8.

Goatskins:—Wet salted (Daisee, Killed) 28,170 pcs. on the basis of Rs. 200 to Rs. 375; Assam-Dinajpur-Murshidabad 15,700 pcs. on the basis of Rs. 245 to Rs. 315; Purneah-Kissenganj 7,100 pcs. on the basis of Rs. 270 to Rs. 285; Patna (Ord.) 13,600 pcs. on the basis of Rs. 200 to Rs. 240; Muzafferpore-Darbhanga-Samastipur-Pakur 8,500 pcs. on the basis of Rs. 250 to Rs. 282-8.

Bazar Stocks

(27th April, 1953.)

Cowhides:—Wet salted 1,41,500 pcs.
Goatskins:—Wet salted (Daisee, Killed) 27,800 pcs.; Assam-Dinajpur-Murshidabad 58,100 pcs.; Muzafferpore-Patna-Pakur-Purneah-Kissenganj 1,07,000 pcs.

WEEKLY SHELLAC MARKET REPORT

During the week ended 28th April the market remained quiet throughout the week. The volume of business was not great. The range of quotations was as follows:

Standard Pure Buttonlac	Rs. 84 to Rs. 85 buyers
Pure Buttonlac	Rs. 80 to Rs. 82 done and buyers.
Lemon No. 1 Shellac	Rs. 80 done and buyers.
Lemon No. 2 Shellac	Rs. 75 to Rs. 76 done and buyers
F. O. Std. 1 Shellac	Rs. 70 to Rs. 72 done and buyers.
Pure TN Shellac	Rs. 65 to Rs. 66 basis done and buyers.
4% I. T. N. Shellac	Rs. 58, due.
No. 1 Kusmi Seedlac	3% Rs. 77 value.
No. 2 Kusmi Seedlac	3% Rs. 68 done and buyers.
Fine Bysaky Seedlac (Manbhum)	3% Rs. 64 to Rs. 65 done and buyers.
Fine Bysaky Seedlac (C.P.)	3% Rs. 59-8 to Rs. 60 done and buyers.
Ordinary Bysaky Seedlac (C.P.)	5% Rs. 56 to Rs. 57 done and buyers.
Ordinary Bysaky Seedlac (C.P.)	5% Rs. 52 buyers.
Kirelac	Rs. 27-8 done and buyers.

Shipments during April until the 25th were 20,049 packages.

Without Prejudice

AN "ACCIDENT" AS A SERIES OF EVENTS

WORKMEN'S COMPENSATION CASE LAW

(FROM OUR LEGAL CORRESPONDENT)

HERE is a real teaser on which the writer is almost prepared to guarantee that the reader will go wrong, in which event he will have for company a goodly array of English judges during the past sixty years, and also, in his humbler sphere, this deponent. Yet on the face of it the problem is one of extreme simplicity. All that is required to solve it correctly is a knowledge of the meaning of one simple English word; and that word is "accident". If the word is interpreted rightly by the reader he will be able to say whether Chhillu Kahar in the following circumstances sustained an "accident" arising out of and in the course of his employment and became consequently entitled to compensation under the Workmen's Compensation Act. Incidentally, the case raises a very important question under the Act for the first time in India, and the Calcutta High Court in the absence of any Indian decision on it had to rely on English authorities, themselves conflicting. Chhillu Kahar was employed by Messrs Burn & Company, Ltd. In what capacity is not quite clear and does not much matter, since he was admittedly a "workman" within the meaning of the Act. He made a claim for compensation and, in order to sustain it, he had, of course, to show that he had sustained an "accident". Chhillu's work was in the vicinity of a furnace and his duty was to beat heated pieces of iron and steel into shape. He claimed, more than this, that he was not a mere hammerman and that his duty was to "join iron into the furnace" and to take it out on re-opening the door of the furnace. His employers denied the latter fact but the High Court, while not deciding that point, rendered it virtually immaterial by opining that "he was himself required to throw into the fire and draw out the pieces of iron and steel which he was required to beat up."

Chhillu was employed at this work. His eyesight suffered, slowly, as he claimed, at first and then as a result of "a sudden flash", he became completely blind. We may disregard the "sudden flash" and the "complete blindness" in view of the Commissioner's findings of fact. They were these: (a) That the appellant (Chhillu) had lost 50 percent of his eyesight; (b) that such partial loss of eyesight had not been caused by old age but was the result of continuous exposure to the high light of the furnace in the course of his employment; and (c) that nothing extraordinary had happened on 9th March 1930—the date of the alleged "sudden flash"—which in any way aggravated the malady.

Such being the facts the reader will have perceived the point he has to consider. Could this gradual impairment of vision, spread over a period of twenty years be said to have been caused by "an accident"? If it could, then Chhillu was entitled to compensation, otherwise not.

Now what is an accident? In the ordinary common-sense everyday meaning, of the word, which is also the dictionary meaning, one would say that an accident is a single event as distinct from a plurality of events. It is an unexpected event, one the cause of which is unforeseen, a casualty, a mishap. "Fire, tempest or other inevitable accident", as solicitors say in leases. One of the essential elements of it is suddenness, lack of warning, abruptness, abnormal rapidity. Another essential element of it is, one would think, that it must be capable of being timed as having occurred on a specific day, even at a specific hour or minute. Again it must be fortuitous, happening by chance, not in any way to be calculated upon or anticipated. The essence of an accident is that it should be haphazard.

If this view of the meaning of the word is correct then the gradual development of an illness or disability is the very antithesis of the opposite to an accident.

Chhillu suffered from optic neuritis, a "condition which can develop if a man works in strong artificial light for a long time. There is absorption of ultra-violet rays if a man works in a strong artificial light. This process goes on increasing gradually leading to the destruction of tissue fibres." Thus said the eminent eye specialist who attended Chhillu; and his opinion was accepted by the Court.

What the Tariff Board says:-

"We are satisfied that the quality of the indigenous product does not compare unfavourably with the imported ones...."

Insist on "Indo" Brand Cotton & Hair Belting.

India Belting & Cotton Mills Ltd.
Sasapiri Lane, Serampore.

It will be seen therefore that in the contracting, coming into being, of this distressing and painful malady every single one of the elements ordinarily attributable to an accident was missing. The illness, the reader may think, was one of the normal risks of the job and inherent in its duties.

Whatever the law may be the above viewpoint seems just plain common sense.

Nevertheless there was a good deal to be said on the other side, and Mr P. K. Sanyal said it, if one may say so, with great ingenuity. The Commissioner had held that Chhillu was bound to fail unless he could prove a definite accident which had taken place on a particular day and which had resulted in the injury of which he complained. This, on appeal, was denied. According to Mr Sanyal not merely a single accident but a succession of accidents also were accidents contemplated by the Act and, if an injury, physical or physiological, was caused by a continuing series of successive accidents, each small in character, but resulting in their cumulative effect in the injury of which the workman complained there would be "an accident" to furnish a proper foundation for the claim. Which means, if one understands the English language at all, that a number of accidents may total up to one single accident.

What the insurance reader, with his greater experience, will think of this point of view, one does not know. To the writer it just does not make sense, and is nonsense. However it is very far from being nonsense and Mr Sanyal was able to produce the highest judicial authority for it. Several authorities, in fact. Here are two of them.

Miss Maggie Selvaie was a young girl employed by an English company, Burrell & Sons Ltd., as a finisher of shell adapters and in the course of her work she sustained abrasions on her hands from day to day and these ultimately resulted in blood poisoning leading to arthritis. The House of Lords held that the injury had been caused by an accident and the accident was no less such, because it occurred on a series of occasions instead of one. In their lordships' view even if a disease or injury was not due to one specific or definite accident but to a series of accidents, each one of which was specific and ascertainable though its actual influence and the resulting illness could not be precisely fixed, the disease or injury would be one caused by an accident and the workman would be entitled to the benefit of the statute. This was Burrell's case and is a judicial landmark in the law of Workmen's Compensation.

Another case on which Mr Sanyal relied was Fitzsimmons' case. Mr Fitzsimmons was a workman employed as a rotary fletcher and his work consisted in holding, tightly gripped in the left hand, a hand machine which was electrically operated and vibrated 2,800 revolutions a minute, whilst with his right hand he pressed it against the material to be cut using the weight of his body to increase the pressure. The performance of these duties produced in Mr Fitzsimmons the condition known as Raynaud's disease and the medical evidence was that each vibration caused by the evidence was a sharp instrument was a tiny blow to his hand and arm, transmitted to the nerves and ultimately cutting off the flow of blood needed to keep the hand in a healthy condition. The trial Court held that the workman's condition could not be attributed to "an accident", but the Court of Appeal reversed this decision, following Burrell's case.

These are decisions—amid a welter of conflicting ones—are undoubtedly good law. What becomes then of our, and we trust the reader's, attempt to explain the meaning of the word "accident" in such a connection? The answer is that the House of Lords has driven a coach and four through it and, as we think, has evolved a juridical meaning to the word which it does not grammatically or in ordinary everyday usage possess, in favour of expediency and broad principles. They have done this in view of inconsistent judicial decisions, as Chakravarti J. put it, in this case, "almost in despair."

That great Master of the Rolls, Henn Collins M.R., admitted it quite frankly. Lord Halsbury, the Lord Chancellor, had held in one case that something fortuitous and unexpected was involved in the word "accident". There must be something "haphazard" about it. In another case an almost equally eminent Law Lord, Lord Macnaghten, held the exact opposite and that the element of the haphazard should be excluded in the concept of the word. Whereupon, faced with these two and other contradictory principles of equal authority, Henn Collins M.R., said in effect "I give it up," and virtually stepped down from the Bench. His lordship's words were: "If I am to conceive of an accident from which the element of haphazard is to be eliminated, I am required to perform a feat beyond my powers and therefore I will decide the case as a man in the street." (*Steel v Cammell Laird & Co., Ltd.*)

The fact is that nowadays in Workmen's Compensation, as in other modern branches of industrial law, the Courts lean towards the workman so far as they legitimately can.

As Chakravarti J., finding for Chhillu, put it: "Reading the reports in the books it is impossible to avoid the feeling that a desire to assist a workman in distress who had undoubtedly suffered from causes arising out of his employment has often led to a stretching of the language of the statute.... Even if, therefore, the view taken by the highest Courts.... be a view which only a stretched construction of the Act can bear, it will not be wrong to follow it, so long as it is not something violently opposed to fundamental principles." (Chhillu Kahar's case, 57 C.W.N. 149).

Books and Publications

THE INTERNATIONAL LABOUR CODE

IDEALS OF EMPLOYMENT POLICY

The International Labour Code 1951, two volumes, Second Edition. By C. Wilford Jenks. (Published by International Labour Office, Geneva. £3; \$10. Vol. 1 CLV + 1,181 pages, and Vol. 2 XXXIX + 1,220 pages.) Book reviewing and the merits, if any, and demerits of reviewers have been to the fore lately. Reviewers seem to be generally suspected by authors and publishers of not reading the books which they castigate or praise. Wherefore this reviewer hastens to admit that he has not adequately read more than one-third of this truly gigantic work. But for what he has managed to digest he has nothing but praise. Some 13 years ago in some top room in a building in Geneva a legal gentleman settled himself down to a task which might well have turned out to be arduous, for the situation of his employers, the International Labour Organisation, was precarious in the extreme. It was on the rock and appeared likely to become a total wreck. However the Organisation survived, is now an established and indispensable institution, and Mr Jenks produced the result of his labours of which the present work is a second and even more comprehensive edition.

We have used for the first time in a notice of a book the adjective "gigantic". And that is what the work is. Nothing less than a systematic codification of every single Convention and Recommendation adopted by the International Labour Conference from 1919 to 1952, including Appendices embodying other standards of social policy framed by the I.L.O. during that period. To these are added copious explanatory notes and cross-references the preparation of which must have involved Mr Jenks and his coadjutors in enormous labour.

The distinction between a Convention and a Recommendation is that the former is intended to create a binding obligation to comply with it whereas a Recommendation is merely a guide and defines a desired standard. Every phase of service and industrial relations is dealt with by one or other of these means, which are the result of the joint work of the members of the I.L.O., represented as to each of them at the Conference by four representatives, two Government nominees, one labour, and one employers'.

It would be easy to exaggerate the importance of all this and to be cynical about its value; and, indeed, opening the first volume at random almost anywhere in its 1,200 pages, one realises at once how greatly practice falls short of the ideal. Nevertheless it is an ideal. It is the conscience of the free world awake and fully roused, at work by continuous and concerted international effort through which men of goodwill, representatives of Governments, workers and employers, all of equal status have with the single-minded object of promoting the common welfare evolved this Code. The International Labour Code as such binds no one, not a single nation, not a single employer, not a single workman. But as country after country accepts and ratifies the code of standards which it enjoins, as they have done and are doing, so the ideal is being realised and practised. Slowly, painfully, inch by inch. But it is progress. "And where the vanguard camps today, the rear shall rest tomorrow."

Board of Trade Journal. British Industries Fair Supplement. (Published by Her Majesty's Stationery Office. 44 pages.) As a preview to opened on Monday, the Board of Trade Journal articles are in a special supplement. Most of the cent progress and development in industries which are represented at the Fair. In a magazine for which there can be nothing but praise, the piece entitled "Royal Patronage of Industry and Crafts—Charter of the Leathersellers' Company granted presented to Queen Victoria in 1841; and the Wedgwood Room at Windsor Castle. As usual Earls Court, one at Olympia and the heavy industrial section is at Earls Court and there is an interesting article in the supplement on some of the goods that will be displayed there.

Jute

FACTORS IN THE PRICE OF INDIAN JUTE GOODS

NEED FOR RECONSIDERATION OF EXPORT DUTIES

IT may be a matter of only two or three months before it is known which of the divergent opinions held by the I.J.M.A. and the Government of India regarding the effect of the reduction in the sacking export duties is correct. Exports of heavy sacking last month were slightly in excess of production but it is believed that the main reason for that was the export of goods whose shipment was delayed in anticipation of the reduction in duties. The shipping instructions received by mills so far this month are better than was expected but that is partly because of instructions given for the despatch of goods on Government of India account—goods which were purchased many months ago. So far there has not been much evidence of fresh buying on overseas account to justify expectations of an early reduction in mill stocks. However, the prospect of shorter supplies of raw jute might stimulate buying just as the glut of raw jute in 1952 deterred buyers of jute manufactures.

All these considerations relate to the comparatively near future. Taking a longer view, it would appear that the time has come for a fresh examination of the whole subject of export duties in relation to the circumstances of the industry and different from what it was when the duties were first imposed in 1916. At the time of their introduction, the Finance Member of the Viceroy's Council, while admitting the disadvantages of export duties in general, claimed that since jute was virtually a monopoly of India no harm would be done to the industry. Though jute goods were manufactured abroad, India was the only source of the raw material and had certain advantages over foreign manufacturers which made it difficult for them to compete. Moreover, the export duties imposed on raw jute balanced those on manufactures so foreign manufacturers gained no advantage over Indian mills from the duties.

Competitors and Substitutes

Since that time, and particularly since the last war, conditions have changed. Other tropical countries, such as Brazil, have succeeded in growing jute, and even in some cases they cannot grow it as cheaply as in India that does not deter those who aim at self-sufficiency. Other countries have succeeded in manufacturing jute bags from fibres which are indigenous to them and though, in some cases, the bags may not be as good and may cost more, again in the interests of self-sufficiency and to be sure of regular supplies at prices which are not governed by the whims of gamblers, the Governments of these countries are prepared to give support to their local industries. The Indian industry now faces a narrowing outlet for its products; moreover, jute goods from whatever source, have participated, as their rivals have, in the increasing demand which might have been expected from the worldwide increase in productivity.

It has also to be borne in mind that since partition India has ceased to be an exporter of raw jute and has become an importer. For a substantial portion of her raw material she has to depend on imports from Pakistan and on these imports has to pay the export duty levied by Pakistan. Thus the consumer of Indian jute manufactures has to pay a price which includes export duties charged by both Pakistan and India.

Then there is the wage factor in India. At the time when the duties were first imposed India was a cheap producer and the wage factor in the price structure was believed to be smaller than in the U.K. or on the continent of Europe in spite of more workers having to be employed per loom in India. All that has changed. Because of industrial awards, etc. India has become a high-cost producer and still employs more hands per loom than her competitors.

Taking all these factors into consideration it will be seen that the arguments which were put forward at the time when the duties were first imposed have lost their force and are no longer tenable. It is no longer a question of tinkering with reductions in export duties in the hope of stimulating demand and recovering lost markets, but of total abolition of the duties so that the industry may be restored to capacity working and prosperity and put into an unassailable position vis-a-vis its competitors.

The Government's Revenues

It will, of course, be argued that the country cannot afford to lose the revenue from the duties. These revenues form a big percentage of the total revenue of the Central Government and the jute revenue of the States is derived therefrom. If, however, their abolition resulted in mills running to full capacity, the loss might not be as great as at first appears. Indian-made jute goods would be in a position to knock out all competitors and instead of the industry operating only 87½ percent of its machinery for 4½ hours a week it is possible that it would be able to utilise all its machinery for 54 hours a week. That would mean increased employment, greater wage distribution, and consequently increased demand for the accessories of jute manufacture, resulting in more employment in the trades concerned. Insurance, banking and shipping would also benefit. More coal, oil and electricity would be consumed. Lastly, the Government

Rs. 90 per 100 bags of plain heavy Cees. Covering business by blank shippers and local operators continued to push rates up and this, combined with mills purchases of raw jute, caused a very steady sentiment to prevail. Over the day the largest increases for some time took place and by Tuesday morning 40" 10 oz. hessians had improved by 14 annas to Rs. 40-2 per 100 yards, B Twills by Rs. 1-12 to Rs. 89-8 per 100 bags, and plain heavy Cees by Rs. 1-8 to Rs. 91-8 per 100 bags. Rates continued to improve throughout the day and mill business was put through for forward delivery hessians.

At the close the markets are slightly down from the highest rates touched on Tuesday evening, but continue to be steady. Opening quotations on Wednesday morning are as follows:—

	Ready	May	June	July-Sept.
40" 8 oz.	Rs. 82-8	Rs. 82-8	Rs. 82-8	Rs. 82-8
40" 10 oz.	Rs. 40-12	Rs. 41	Rs. 41-4	Rs. 41-4
Heavy Cees	Rs. 92-4	Rs. 92-4	Rs. 92-4	Rs. 92-4
(Plain)				
B Twills	Rs. 89-8	Rs. 91-8	Rs. 90-12	Rs. 91-4
Corn sacks	Rs. 92	Rs. 92-8	Rs. 93	Rs. 93-8

Raw Jute: After a quiet opening the jute market rallied on increased mill interest and a fair amount of activity took place, resulting in business to the extent of about 4,00,000 maunds during the week. With the finished goods market improving, daily mills took the opportunity of selling small quantities with each rise, and in most cases these sales were immediately covered by jute purchases. In this way fairly steady business was done throughout the week, and by the week-end raw jute rates had recovered the loss of Rs. 1-8 sustained at the opening. As rates increased it was noticed that the amount of jute on offer each day dwindled, and sellers were not anxious for big business but were content to sit out and wait for higher prices. Towards the end of the period it was very difficult to find any sellers at all, and many mill indications were completely ignored as sellers withdrew from the market. Mills' main interest has still been for good quality jute, suitable for the manufacture of hessian goods, and with this in view they have been purchasing an increasing amount of Middles alone and good quality cut jute. Jute in this category however is still very scarce and premia of Rs. 2 to Rs. 3 per maund have been paid for special lots.

Raw jute at the opening of the markets last Thursday showed a drop of 8 annas per maund as the buying pressure from mills relaxed, and Ordinary Assam jute was quoted at Rs. 19 per maund basis Bottom for April-May shipment. Business was done at below this level, however, but general indications remained unchanged until the week-end, when good business was done both in raw jute and finished goods which resulted in rates jumping Rs. 1-8 per maund by the time the markets opened on Monday morning. The improvement continued throughout the day and by Tuesday morning Ordinary Assam jute was quoted at Rs. 21 per md. basis Bottoms. Sellers were very reserved at this stage and were offering only small quantities in anticipation of higher prices. Towards evening of Tuesday in sympathy with a very firm finished goods market, jute rates hardened still further and sellers withdrew their offers completely.

The following business was reported during the week:—

Pakistani Jute: Pakistani Jat Jute.—Rs. 23 per md. basis Bottoms for May shipment.

Indian Jute: Dhubri.—Rs. 25 per md. for Middles only for one month's shipment.

Dhubri.—Rs. 21-8 per md. basis Bottoms for one month's shipment.

Assam.—Rs. 17-8 to Rs. 18-8 per md. for one month's delivery from agency and/or local godown.

Northern Bengal.—Rs. 25 per md. for Middles only for one month's shipment. Rs. 23 per md. for Middles only for one month's delivery. Rs. 19-3 per md. basis Bottoms for April-May shipment.

Northern Bengal Tossa.—Rs. 22 per md. basis Bottoms for April-May shipment.

April 30, 1953.

Local—Rs. 17-8 to Rs. 19 per maund basis Bottoms for one month's delivery guaranteed free from jungle.

Katimpur Tossa—Rs. 18 to Rs. 19-8 per md. basis Bottoms for one month's delivery.

Bongson Tossa—Rs. 18-8 to Rs. 21 per md. basis Bottoms for one month's shipment.

Cut Mesta—Rs. 24 to Rs. 25 per md. basis Bottoms for one month's delivery.

Mesta—Rs. 15-8 per md. basis Bottoms for one month's delivery.

Daisee Mesta—Rs. 17 to Rs. 17-8 per md. basis Bottoms for one month's delivery.

Daisee—Rs. 27 per maund for Special Middles free from samla Rs. 25 per md. for Mids only for 15 days' and one month's delivery. Rs. 18 to Rs. 20 per md. basis Bottoms for one month's delivery.

Rs. 23 per md. basis Bottoms for one month's delivery.

Binli—Rs. 15 to Rs. 16 per md. for F.A.Q. for one month's shipment.

Pakistan N. C. Cuttings—Rs. 63 and Rs. 64 per bale for one month's delivery ex Calcutta.

Indian Cuttings—Rs. 60 per bale for one month's delivery.

Mill Firsts—Rs. 135 to Rs. 145 per bale for one month's delivery.

At the close the market is steady with sellers very reserved and all quotations have increased by about 8 annas per maund on the strength of the business done on Tuesday. Opening quotations on Wednesday morning were as follows:—

Pakistan Jute:	April-May	Landed at Mill.
Jat	Rs. 24	per md. basis Bottoms.
Dharpel	23	"
Northern	23	"
Indian Jute:		
Lower Assam	22-8	"
Upper Assam	21-8	"
Northern Bengal	22	"
Murshidabad White	18-8	"
Bihar	17-8	"
Daisee	23	"
Binli	17-8	per md. for F.A.Q.
M.H. Reds	130	per bale
Mill Firsts	150	"
Mill Lightnings	125	"
Mill Hearts	120	"
Dundee Daisee (S. Group)	150	"
Dundee Daisee (L. Group)	125	"
Indian Cuttings	65	"
Pakistan Cuttings	70	"

Tossa is offered at Re. 1 to Rs. 2 per md. above the rates for white jute.

Mofussil: Steady conditions continue in the up-country markets in India and sellers are very reserved with practically no business passing. The main reason for this is unfavourable weather conditions in the jute growing areas which, it is said, will have an adverse effect on next season's crop. For this reason, sellers are inclined to hold on to their present stocks in anticipation of higher prices. Any business done is put through at advancing rates, especially for good quality jute, for which high premia are being paid. Imports are practically negligible and over the week quotations have advanced by about Rs. 2 or more per maund. At the close local quotations were on the basis of Rs. 19-8 per maund for Dhubri Bottoms and Northern Bengal Bottoms, and Rs. 17-8 per maund for ordinary Assam Bottoms, but very few sellers could be found at this rate. Similar conditions exist in the local Cosipore market but here a fair amount of business has been transacted mainly for quick delivery, and rates have improved by about Rs. 2 per maund. Towards the close, with the finished goods market ruling very steady conditions prevailed. Imports have dropped to between 20 and 25 wagons daily and have done little to relieve the demand for good quality jute, for which high prices are being paid. Kishanganj jute is currently being quoted at Rs. 22-8 per maund for garat quality. Daisee jute continues to come in for a great deal of attention, and in spite of no imports fairly good business has been put through. High quality Daisee has been fetching good prices, but general indications in Shoorpuli are based on Daisee at Rs. 23 per maund for garat quality.

In Pakistan the jute markets are very steady and demand for all grades of jute has developed but very little business, except inter-bale, has been reported. Interest is mainly in the overseas export market, but lower grade jute is in fairly good demand for shipment to India. Tossa jute is in very short supply, and the premium for this fibre is still about Rs. 5 per maund for good jat quality. Reports on new crop jute indicate that progress is far from satisfactory because of the lack of rain and this is causing current jute rates to rise. Imports into Narayanranj have dropped considerably and only about 5,000 maunds daily are arriving in this centre. Latest quotations (in Pakistan rupees) are as follows:—Jat White Bottoms—Rs. 15-8 to Rs. 16 per maund. Tossa—Rs. 18-8 to Rs. 19 per maund. District White Bottoms—Rs. 14-8 per maund. Tossa—Rs. 19-8 per maund basis Bottoms.

ARGENTINE HESSIAN ORDER

The Argentine Trade Promotion Institute confirmed on Friday, 24th April, that it had bought 20,000 tons of hessian in India. The purchase, equivalent to 73 million yards, is for May-July shipment and was made at a price of approximately 844d. per hundred yards f.o.b. Calcutta. It comprised 40" 10 oz., and 4 inch 9½ oz. material. No further orders are expected for the time being.

SLOW PROGRESS OF INDIAN CROP

In their sixth crop report for the current season covering the week ended 25th April, Messrs Sinclair Murray & Co. Ltd. (India), say that the weather in Assam has been hot and dry but this has been favourable for the growth of young plants. However, further rainfall is required to allow cultivators to complete sowings. The weather in West Bengal has continued to allow the land to be prepared for sowings. The weather has also been mainly hot and dry in Orissa but high scattered showers have been reported from some areas. The river levels in Assam are slightly higher than last year and in Bengal and Orissa are below normal.

DANPUR: The weather has been hot and dry with a few light showers which are not sufficient for sowings. Sufficient rain, however, was experienced in some districts and this has enabled cultivators to sow against -1/2 on the corresponding date last year. The river level is abnormally low.

JAIPUR ROAD: The weather has been very hot and dry and the preparation of land in this area has been suspended.

RAJAGHAT: The weather has been hot and dry and land preparation has been suspended. Sowings to date are nil as compared to -7/3 at this time last year. The river level is normal.

COSIMBAZAR: The weather has been extremely hot and dry and rain is urgently required to enable cultivators to prepare their lands. Sowings to date are nil compared to -1/2 at this time last year.

NOWGONG: The weather has been hot and dry but this has been beneficial for the growth of plants and weeding. Further rainfall is required to allow sowings to be resumed. The condition of young plants is healthy. Sowings to date amount to -10/1 at this time last year. The river level is slightly higher than normal.

GUAHATI: The weather has been hot and dry and this has delayed further sowings. The condition of young plants is satisfactory and they range in height up to 23". Sowings to date amount to -11/1 as compared to -11/6 at this time last year. The river level is 5" higher than last year at this time.

DIUBRI: Weather during the week under review for sowings and also for the standing crop. Condition of the standing crop is not very satisfactory and young plants would benefit from further rainfall. Sowings to date amount to -11/6 as compared to -11/4 at this time last year. The river level is 5" higher than last year at this time.

KATAPETIA: The weather has been hot and dry but this has been favourable for the growth of young plants. Further rainfall would allow cultivators to complete highland sowings. Sowings to date amount to -10/6 as compared to -11/4 at this time last year. The condition of the standing crop is satisfactory and plants range in height up to 13". The river level is normal.

DAISEE DISTRICTS: The weather has been very hot and dry and the preparation of land is still held up. Negligible sowings of white and mesta have been made, but the plants are very healthy and will require to be re-sown. Sowings last year at this time were -3/8.

PAKISTANI SOWINGS MAY BE REDUCED BY HALF

In their eighth crop report of the current season covering the week ended 25th April Messrs. Sinclair Murray (Pakistan), Ltd., say that the weather has been mainly hot and dry and further rainfall is now required to allow sowings to be completed. This is where sowings were suspended last week due to lack of rain. There are reports from some areas that the Midland crop is not progressing at all well due to lack of rain. River levels on the Eastern side are normal and on the Western side higher than at this time last year. It would now appear that sowings this year will certainly not be more than half of last year's sowings.

NARAYANGANJ: The weather has been hot and dry but not unfavourable. Good general rainfall is now very essential to enable cultivators to complete sowings and for the benefit of the standing crop. The condition of the lowland crop is very good but more crop plants are healthy and range in height from seedlings to 23". First weeding on midlands have been completed. Second on lowlands is now in progress. Sowings to date amount to -10/6 as compared to -11/4 at this time last year. The river level is now 2" lower than at this time last year.

DACA: The weather has been hot and dry and plants are very badly needed to enable cultivators to complete sowings and also for the benefit of young plants. The condition of young plants is still healthy and they range in height up to 19". Sowings to date amount to -10/1 as compared to -11/2 at this time last year. The river level is normal.

CHANDPUR: Weather has been favourable with highland areas of rainfall. More rain is required in the lowland areas to complete Tossa Sowings. The condition of young plants is generally satisfactory and they range in height from seedlings to 22". Sowings to date amount to -7/7 as compared to -16/1 last year. The river level is 2" lower than last year at this time.

HAIGANJ: The weather has been favourable with alternate rain and sunshine. The rain will enable but is inadequate for the standing crop. In highland areas are reported to be attacked by insects. Young plants of rain would improve their condition. Sowings to date amount to -6/1 as compared to -13/1 at this time last year. The river has fallen during the week and is now 1" lower than last year at this time.

AKHAURA: The weather has been hot and dry. Young plants range from 2" to 1" but their growth is somewhat retarded due to lack of rainfall. Sowings to date are nil as compared to -10/1 at this time last year. The river level is normal for this time of the year.

April 30, 1953.

Plantation Topics

LONDON TEA SALES

BETTER TONE DEVELOPS

A BETTER tone prevailed at the London tea auction on 27th April compared with the previous sale. Under generally good demand, good liquoring kinds often advanced up to a penny per pound, while other kinds ruled steady to sometimes dearer. Clean Common Broken Pekoe, stalk free, were quoted at 40½ to 40½ pence compared with 40½ last week. Offerings consisted of 35,225 packages comprising North Indian, Pakistan, Nyasaland, Uganda and Portuguese East African.

A fairly good demand was in evidence for 17,781 packages of Ceylon tea put up for auction on 21st April. Poorer liquoring kinds up to about 4s per lb were irregular with prices, especially for Broken Pekoes, sometimes in buyers' favour. Above this figure but excluding Fines invoices which are slightly easier, prices were steady to dearer. A certain amount of export demand was reported chiefly on Continental account. Clean Common Broken Pekoe was indicated at 41d to 41½d while Low B.O.P.s were mentioned at 42d to 45½d and Medium B.O.P. Fannings at 47d to 51d. Of 6,840 Southern Indian's Good Liquoring and Mediums were steady - last rates but poorer Mediums were frequently slightly lower.

On 22nd April a distinctly easier tone developed when 22,123 packages of North Indian Pakistan and Miscellaneous teas were offered. Medium and better qualities fell by 1d to 2d per lb while the poorer kinds generally were 1d lower. Withdrawals were heavy. Clean Common Broken Pekoe, free from stalk, was quoted at 40½d, while Low Assam Fannings were indicated at 41½d. Low Assam Broken Pekoes at 41d. Good Medium Assam Fannings at 42½d and Good Medium Assam Broken Pekoes at 41½d.

Results of some of the companies are given below:—

	No. of packages	Aver. per lb.
Amalgamated	1,089	3/ 6½
Assam Co.	1,479	3/ 8
Assam Frontier	1,535	3/ 9
Budla Beta	618	3/ 8
Buxa Doors	504	3/ 8
Central Province	1,032	3/11½
Cons. Estates	474	3/11½
Cons. Tea and Lands	690	3/ 6
Darjeeling Co.	304	3/10½
Doors	906	3/ 5
Eastern Produce	948	4/ 1½
Jhanzie	833	3/ 6½
Jokal	1,481	3/ 7
Jorehaut	1,102	3/ 7
Lunuva	1,116	4/ 0½
Malayalam	2,003	3/ 8½
New Dimbula	192	4/ 5½
Rajawella	534	4/ 1½
Scot. Assam	312	3/ 7
Singlo	412	3/ 6½
Standard	612	4/ 4½
Tea Corp.	444	3/ 9½
United Planters	486	4/ 2

COCHIN TEA SALES

Internal Sale No. 'H' was held on 23rd April, 1953, a little over 1,13,000 lbs. of Dust teas were presented for sale on 21st April. Because of the confusion regarding the procedure for the collection of the new excise duty, the sale was postponed until 23rd April. The situation has still to be properly clarified and buyers of chests containing less than 60 lbs. feel they are liable to further penalties by way of excise tax, and therefore, were not prepared to pay last rates. Demand despite this was fairly active but irregular at about 2 annas per lb. below last auction prices.

There has been very little business done in Special Licence quota is quoted at 11 pices. New Season's export quota is quoted at 12 pices and there are buyers at this rate. An interim release of 70% Export Rights for Season 1953-54 has been announced.

SALE OF U.S. SYNTHETIC RUBBER PLANTS RECOMMENDED

President Eisenhower recommended to the U.S. Senate recently that it pass legislation for the sale to private industry of the government-owned synthetic rubber facilities. President Eisenhower recalled that, in accordance with the Rubber Act of 1948, the U.S. Reconstruction Finance Corporation (RFC), the agency responsible for the Government's synthetic rubber operations, had reported to the President and the Congress on March 1st, 1953, concerning disposal of the plants. "Having considered 'that report,' the President said in the message, 'I recommend the prompt enactment of disposal legislation.' The President stated his 'heartly accord' with the long-standing congressional policy that the security interests of the United States will best be served by the development of a free, competitive synthetic rubber industry."

He also recalled that the Government's huge synthetic rubber industry was created, at a cost of \$770 million, at the beginning of the last world war when the United States was denied access to its normal supplies of natural rubber. There remain in government ownership, he pointed out, facilities which cost approximately \$550 million and which now supply nearly all the nation's requirements of synthetic rubber. In 1952, he noted these requirements amounted to 806,500 long tons out of a total U.S. consumption of 1,260,000 long tons of new rubber.

INDIAN RUBBER PRODUCTION AND CONSUMPTION IN MARCH

Indian rubber output in March was 390 tons, according to the Indian Rubber Board. No rubber was exported in March. The quantity of rubber imported during the month was 150 tons. Consumption by manufacturers was 1,698 tons of which 177 tons were imported. Stocks with estates and dealers on the last day of March totalled 5,676 tons, including 1,129 tons in transit. Stocks with manufacturers at the end of the month were 3,371 tons of which 181 tons were imported. Manufacturers also used 195 tons of reclaimed rubber, the month-end stock being 317 tons, and consumed 1 ton 833 lbs. of synthetic rubber, of which manufacturers held a total stock of 6 tons 2,159 lbs.

COLOMBO RUBBER PRICES

The following prices are issued by the Indian Rubber Board from the weekly rubber market report issued by the Colombo Brokers Association: Closing prices on 18-4-53. Average prices for this period:

	(Rupees per lb.)	(Rupees per lb.)
Sheet—		
No. 1	1.36	1.36
No. 2	1.33	1.33
No. 3	1.30	1.30
No. 4	1.16	1.16
No. 5	1.11	1.11
Sheet Cutts		80

Creepe		
R.M.A. 1X	1.00/02	
R.M.A. 1	cts. 96/99	
Creepe 2		89-94
Creepe 3		85-88

Scrap Creepe		
Sc. Creepe 1	c's. 80 Nom.	
Sc. Creepe 2	c's. 72-75	
Flat Bark	cts. 65-70	
Sc. Creepe 3X		71

To arrive at f.o.b. Colombo prices add 20 cents per lb. to the above market prices.

COFFEE RELEASE

The Marketing Committee of the Indian Coffee Board met in Bangalore on Wednesday the 22nd April 1953. Mr. Ivor Bull, Chairman of the Board, and Mr. S. Bhootalingam, joint secretary to the Government of India, Ministry of Commerce and Industry, also attended the meeting. The Committee agreed to release coffee to Co-operative Societies and the Propaganda Department at Rs. 200 per cwt. for Plantation A, Rs. 174-8 per cwt. for Arabica Cherry Flats and Rs. 140-8 per cwt. for Robusta Cherry Flats, and proportionately for other grades from May onwards. The Committee further agreed that the reserve prices for Pool auctions in May and June 1953 should be continued at the present levels and that the reserve prices for auctions in July would be notified before the end of May.

TEA GARDEN WORKERS' WELFARE

In reply to a question by Shri S. N. Mazumdar on welfare schemes for plantation labour, Shri Abid Ali, Deputy Minister for Labour, said in the Council of States last week: "A sum of Rs. 4 lakhs was secured from the Central Tea Board in 1951-52 for promoting the welfare of tea garden workers. As decided at the 3rd session of the Industrial Committee on Plantations, the State Governments concerned were required to prepare welfare schemes. These were to provide for recreational facilities for workers and their training in useful handicrafts like tailoring, knitting, weaving, basket-making, etc." In reply to another question by the same Member, Shri Abid Ali affirmed that the recommendations of Dr. Lloyd Jones on standards of medical care for tea plantations were accepted in full by the Industrial Committee on Plantations, and added: "Many of the progressive employers began implementing the recommendations. The progress has, however, slowed down following the crisis in the industry."

PLANTING AND COMMERCE

A weekly review of plantation affairs and the West Coast trade which began to be published from Ernakulam recently. It is edited by Mr. V. L. Chacko, whose name will be familiar to readers of Capital. Coverage is comprehensive and comment restrained and informed. There are usually a number of useful articles, newsletters, labour notes and market reports. Printing and lay-out seem to be gradually improving. The price is 10 annas a copy and the publishers' address Post Box No. 60, Ernakulam, South India.

Saint Frères Circular Looms installed in Italy.

SAINT FRÈRES CIRCULAR LOOMS

Hundreds of Saint Frères Circular Looms are in use—in new factories and old, sometimes working alongside flat looms—in the Belgian Congo, in South Africa, Sweden, Norway, Italy, Great Britain, Germany, Belgium and France.

These looms were originally designed for making tubular cloth from jute. Deliveries of a Saint Frères Circular Loom for hard fibres are now available. Saint Frères Circular Looms are manufactured by Urquhart Lindsay & Robertson Orchar Ltd., Dundee, Scotland.

WARP STOP MOTION—Immediately a warp thread breaks the individual compensator is pulled upwards by the action of its spring and brought into contact with the control bar, automatically stopping the loom.

Engineering and Transport

ELECTRIC POWER PRODUCTION
RISING IN EUROPEE.C.C. REPORT ON RECENT
DEVELOPMENTS

ELECTRICITY production in Europe (not counting the Soviet Union) during 1951 increased by 12 percent over 1950. It brought the annual consumption per inhabitant to 820 kWh. This compares with an increase of 14 percent in the Soviet Union and 11 percent in the United States. Per capita consumption in 1951 totalled 500 kWh in the USSR and 2,820 kWh in the USA. These and many other interesting facts are analysed in a study* published in Geneva recently by the Secretariat of the United Nations Economic Commission for Europe (ECE). The study, entitled "Recent Developments in the Electric Power Situation in Europe, 1951-1952," reveals that by 1951, after intensive development during that year, hydro-power capacity in Europe had reached a level 70 percent above that of 1938. Thermal plant capacity had increased by about 40 percent compared to 1938. (For Europe as a whole, the ratio of hydro to thermal production was the same in 1951 as in 1938—38 percent hydro and 62 percent thermal.)

While from 1938 to 1951 hydro capacity rose by 70 percent and thermal capacity by 40 percent, the output of both nearly doubled over the same years. Thus, utilisation "improved considerably," the ECE Secretariat points out. But there is still room for further improvement, the study declares. It cites recent developments in the Soviet Union and the United States to prove this. This greater productivity of power plants together with a similar development for transmission and distribution equipment had a favourable influence on production costs and, among other factors, explains why, compared with the cost of living index, average electricity prices in all European countries have decreased by about 30 to 60 percent during the period 1938-1951.

Total thermal-power production in Europe increased by 10 percent in 1951 compared to 1950, reaching a total of 211,000 million kWh. The total amount of fuel used to produce the power rose by only 7 percent. The increase in average fuel efficiency produced a "particularly important" saving of 4.5 million tons of coal for Europe in 1951.

Despite the difficult coal supply situation that year the relative proportion of coal as a fuel dropped only slightly to 71 percent of all fuel used. Thermal plants in 1951 burned about 114 million tons or 19 percent of the total coal supply in Europe.

Total hydro-electric production in Europe increased by 15 percent in 1951 compared to 1950, reaching a total of 129,000 million kWh. Many European countries, which have up till recent years mainly depended on thermal power production, are at present engaged in large scale development of their hydro resources, for example: Albania, Bulgaria, Czechoslovakia, Greece, Portugal, Roumania, Turkey and Yugoslavia. There is, however, a contrary tendency in a few countries where hydro resources have already been exploited to a point at which maximum utilisation is in sight. In Italy, for example, it is expected that thermal power will slowly grow in importance. As a whole, Europe has still sufficient unexploited hydro resources to continue a rapid increase of hydro production at least for the next 10 to 15 years, the ECE Secretariat study declares.

Growing Importance of Electricity

The main reason for the rapid increase in electricity consumption in recent years has been the growth in industrial output, although increased uses of electricity for domestic purposes and for railways have also contributed. While electricity is still a minor part of the total energy supply in Europe, the ECE Secretariat states that the long term development points towards a relative increase in the rôle of electricity as a source of energy. This is also the trend in the case of two other refined sources of energy, oil and gas. Electricity was thus in 1949 responsible for 5.1 percent of the total supply of energy made available to consumers, against 3.3 percent in 1937. During the same period coal consumption actually decreased, although it remained in 1949 by far the most important energy source, supplying 75 percent of all energy made available to the consumers. The figures for individual countries with differing local resources, of course, vary greatly.

As in previous years, trade in electricity in Europe during 1951 was mainly composed of power exchanges between hydro and thermal regions. Guaranteed supplies of electricity over the boundaries remained low. As a whole, electricity exports in 1951 represented 1.6 percent of the total electricity production of 340,000 million kWh, against 1.4 percent of 1950's total output of

*Recent Developments in the Electric Power Situation in Europe, 1951-1952, United Nations Economic Commission for Europe, Geneva, 1953; pp. 140 pages including 32 tables mimeographed with cover. May be ordered in English or French edition from Sales section, United Nations, Geneva; price \$0.60, 4s. 6d., 2.50 Swiss frs.

303,000 million kWh. The increase was due to the favourable hydrological conditions in continental Europe with greater exports of surplus power from the hydro countries to neighbouring thermal countries. East-West trade in electricity in 1951 was concentrated to the power exchange between Eastern and Western Germany and was maintained at about the same level as in previous years.

The extensions of national transmission networks in Europe during recent years have been characterised by the adoption of new high voltages for the main transmission systems. The outstanding example is the new 380 kV line in Sweden, which operated with full voltage since the spring of 1952. This is the highest transmission voltage operating in the world at the present time. Several other European countries foresee the introduction of 380 kV as their future main transmission voltage; certain lines in France, Western Germany and Switzerland have been constructed for this voltage although they are now operating with 220 kV.

The electric power industry in the European countries invested in new power plants, transformer stations, transmission and distribution lines between 2 and 17 U.S. dollars per inhabitant in 1951. These investments amounted to as much as 12 to 14 percent of total investment in some hydro-power countries, in Norway, for example. The ECE Secretariat study points out that governments were in general rather favourable towards the electric power investments although financial difficulties put a limit in some countries.

Future Developments

To meet new requirements for electric power in the future, and to overcome present capacity shortages, all European countries have adopted "ambitious" plans for constructing new power plants, the ECE Secretariat study declares. A country-by-country table reveals that during the four-year period 1952-55 it is planned to increase total thermal-plant capacity in Europe by about 21,000 MW (against a 4,300 MW increase in 1951) and total hydro-plant capacity by about 14,000 MW (against 2,400 MW in 1951). If these plans are carried through, total power capacity in Europe in 1955 should be about 40 percent higher than in 1951, with an estimated total production of about 460,000 million kWh, of which 65 percent would be thermal and 35 percent hydro-power. It should thus be possible to meet a rate of increase in demand of about 9 percent a year. The projected development of European power resources during the next four years may seem enormous, but it is still less, both in absolute and relative terms, than the corresponding increase planned in the United States, and it is also relatively less than planned development in the USSR. Production capacity per head of population will increase more in the United States (by 0.28 kW per inhabitant) than in the most highly developed European countries, and the figure for the USSR, which is 0.10 kW per inhabitant, exceeds slightly the European average of 0.08 kW per head.

The study "Recent Developments in the Electric Power Situation in Europe—1951-1952" was prepared by the Electric Power Section of the United Nations Economic Commission for Europe and is the first of a series of analyses of electricity consumption, production, trade, prices, etc., to be published each year. The ECE Secretariat will publish shortly a study entitled "Hydro-electric Potentialities in Europe and its Gross, Technical and Economic Limits."

THE ECONOMICS OF AIRLINER
OPERATION

The Society of British Aircraft Constructors has published a new version of its Standard Method for the Estimation of Direct Operation Costs of Aircraft—a Standard which was devised as a yardstick for comparing the economic efficiency of different types of aircraft. The new issue contains values which for the first time enable operators to compare jet and turboprop aircraft with each other or, of course, with piston-engined types. British constructors will use the method when giving customers a technical assessment of the economic capabilities of their airliners. The SBAC Standard Method, first introduced in 1950, has been widely used because it gives objective formulae based on standard value by which operators can easily judge the operating costs of any airliner over any route—or which of two airliners shows the more favourable costs.

Operating costs fall into two categories—direct and indirect. It is the direct costs which depend on the characteristics of the aircraft, and the SBAC method takes these only into account—that is, the sum of all the costs of flying and maintaining an aircraft, together with appropriate allowances for insurance, obsolescence, and landing fees. Indirect operating costs, for example those involved in attracting and handling the traffic, or office administration, are virtually independent of the aircraft's characteristics and are not taken into account. There is one exception—the method adds workshop overheads into the labour rate quoted for airframe, engine and propeller maintenance and overhaul.

Direct Operating Costs

The method lists the different items which make up the direct operating costs in such a way that they can be added up to give the cost per hour of

running the aircraft. This can then be reduced to give the cost of operating the aircraft for each ton/mile (that is, of carrying a ton of payload over a mile) or the passenger/mile costs (that is, carrying a passenger a mile). Direct costs fall into three main categories—annual costs, maintenance and overhaul costs, and flying costs. The annual costs, (consisting of such items as insurance and obsolescence) and each year's maintenance and overhaul costs are reduced to hourly running costs. The hourly flying costs, the third category, change according to the distance which the aircraft is flying, because of varying fuel and oil costs, landing charges, etc.

The SBAC Method sets out all these items in standard form under the three main headings. The operator or constructor has only to fill in the appropriate cost figures for his aircraft and route, and the final figure gives the flying costs under a set of declared conditions. The operator can, of course, easily vary the assumptions to suit his particular operating circumstances.

The improved Proteus engines for the new Britannia will give over 10 percent more power than the existing type, enabling the aircraft designer to put another 10 feet on the fuselage, boost the gross weight from 135,000 lb. to 155,000 lb. and at the same time increase the air liner's useful payload more than proportionately.

More Economy

The reason for developing these more powerful engines, and hence bigger and faster aircraft, is that they mean more economical operation for the user. Statistics given for the new Britannia 300, calculated by the SBAC Standard Method, show that over a range of from 1,500 to 3,000 nautical miles the operating cost is almost stationary at about 1.4d. per passenger nautical mile. For a similar piston-engined aircraft, the comparable costs start at 1.75d. for 1,500 nautical miles and start rising rapidly after 2,000 nautical miles to well over 2.2 pence at 3,000 nautical miles. Other comparisons show the turboprop to similar advantage. Because of its economy of operation, this version of the Britannia will also be built as a freighter, giving promise of the world's fastest cargo-carrying service.

PORTABLE POWER

A steam engine of revolutionary design which may one day become the "odd-job man" of the by the National Research Development Corporation. The engine and boiler can be carried by Parliament in 1949 to see that useful inventions received the support they deserved. It already holds rights in more than 1,700 inventions. The report of the Corporation for 1951-52, published recently, says that it appeared that this invention was of "considerable importance" and of such public interest that it was decided to sponsor the project. It was hoped that the engine would contribute materially to the interests of the Commonwealth.

The inventor of it is Sir Harry Ricardo, who designed petrol engines for the tanks of the 1914-18 war and has since contributed many important advances to high-speed oil and petrol engines. The latest device is said to embody a new approach to steam power and has many of the features of a small motor car engine.

An official said that the project was at present in its early stages and some years might elapse before it was ready to be marketed. It should help to meet the large demand for small sources of power. In its present form Sir Harry's steam engine weighs under 1 cwt. and is of 2.5 hp. with cent, and is easily assembled. It draws its steam from a separate boiler "about the size of a domestic stove."

MODERN FIRE FIGHTING

Nylon, in conjunction with canvas, is now being used extensively for the manufacture of hose, a gain in lightness of handling being thus achieved. Discussion is taking place on the fully combated by production of a fine mist when any considerable breeze exists, since the water poured forth in the ordinary way, it would be noted, as bearing upon this matter, it has been accepted for some time past that there is a relation between the fire quenching efficiency of the water sprays and the size of the drops sent forth. The smaller the size of the drops the spray, the greater will be the absorption of radiation, thus increasing area of heat. The mist theory—for as more tests are known—may be carrying the small that, whilst the creating of mist would have power to fire fighting by means of both outpouring of small drops and the spreading of water vapour may be the answer.

In a Press Note dated 31st January, 1953, the Government of India announced that castor oil would be licensed freely for export up to 30th April, 1953. The Government of India export up to 31st July, 1953.

COMPANY AND PUBLIC NOTICES

CAREW & COMPANY LIMITED.

Report and Accounts for the year ended 30th June, 1952.

NOTICE is hereby given that the Ordinary General Meeting of the Shareholders of this Company will be held at the Registered Office, No. 4 Fairlie Place, Calcutta, on 11th May, 1953 at 12 Noon for the purpose of:—

1. Receiving the Directors' Report and passing the Accounts to 30th June, 1952.
2. Declaring a Dividend on the Preference Shares
3. Electing Auditors for the current year and fixing their remuneration.
4. Transacting such other business as may be brought before the Meeting.

The Transfer Books of the Company will be closed from 2nd May, 1953 to 11th May, 1953 both days inclusive.

Preference Shareholders and holders of Preference Shares under Blank Transfer should note that upon the declaration of the Dividend the Dividend Warrants will be posted to Registered Preference Shareholders or their Mandates. No application for payment will be necessary.

GLADSTONE LYALL & CO. LTD.,

Managing Agents.

4, Fairlie Place,

Calcutta, 23rd April, 1953.

To the Shareholders of M/s. CAREW & Co., Ltd., and in particular to:—

THE GANGES ROPE COMPANY, LIMITED.

NOTICE.

NOTICE is hereby given that the One hundredth Ordinary General Meeting of the Shareholders of the above Company will be held at the Registered Office of the Company, No. 2, Fairlie Place, Calcutta, on Tuesday, the 12th May, 1953, at 3 P.M., for the following purposes:—

- (1) To receive and consider the Directors' Report and the Accounts for the half-year ended 30th September, 1952.
- (2) To declare a dividend.
- (3) To transact any other competent business that may be brought forward.

The Share Transfer Book of the Company will be closed from the 5th to 12th May, 1953, both days inclusive.

By Order of the Board,
MACNEILL & BARRY LTD.,
A. W. TAYLOR,

Managing Director,
Managing Agents.

2, Fairlie Place,

Calcutta, 21st April, 1953.

THE HOOGHY FLOUR MILLS COMPANY,
LIMITED.

NOTICE is hereby given that the Eighty-fourth Ordinary General Meeting of the Members will be held at the Registered Office of the Company, No. 4, Bankshall Street, Calcutta, at 4-20 P.M., on Tuesday the 12th May, 1953, for the following purposes:—

- (1) To receive the Directors' Report and the Audited Accounts for the half-year ended 31st December, 1952.
- (2) To declare a Dividend.
- (3) To elect a Director.
- (4) To appoint Auditors for the current year.

The Transfer Register will be closed from the 5th to the 12th May, 1953, both days inclusive.

By Order of the Board,

SHAW WALLACE & COMPANY, LTD.,

Managing Agents.

Calcutta, 18th April, 1953.

THE GANESH FLOUR MILLS COMPANY

LIMITED

DELHI.

NOTICE

NOTICE is hereby given that the 61st Ordinary General Meeting of the Shareholders of the Company will be held at the Registered Office of the Company at Subzami, Delhi, on Sunday the 17th May, 1953, at 6 P.M. to transact the following business:—

- (A) To receive Directors' Report and to pass Audited Accounts for the year ended 30th September, 1952.
- (B) To declare Dividend.
- (C) To elect Directors in place of Shri Satya Narain Gupta and Shri Bal Rai who retire by rotation and are eligible for re-election.
- (D) To appoint Auditors and fix their remuneration.
- (E) To consider and if thought fit to pass the following resolution as special resolution with or without modification:—

"Resolved that the payment of Rs. 25,000/- as donation to Shri Moti Lal Nehru Memorial Society be confirmed".

The Transfer Books of the Company will remain closed from 3rd May to 17th May, 1953 (both days inclusive).

By Order of the Directors,

KIRPA NARAIN,

Manager.

Delhi, 20th April, 1953.

MUTTRA ELECTRIC SUPPLY CO., LTD.

NOTICE is hereby given that the 30th Ordinary General Meeting of the Shareholders of MUTTRA ELECTRIC SUPPLY CO. LTD., will be held at the Registered Office of the Company, at No. 15, Shib Thakur Lane, Calcutta, on Saturday, the 23rd May, 1953 at 2 P.M., to transact the business on the following Agenda:—

AGENDA

- (a) To receive the Directors' Report for the year ended 31st March, 1952 and to approve the dividends recommended.
- (b) To receive the Audited Accounts for the year ended 31st March, 1952 and to adopt the same.
- (c) To transact any other competent business which may regularly be brought forward.

N.B. The Share Transfer Books of the Company will be closed from the 16th May, 1953 to the 23rd May, 1953, both days inclusive.

By Order of the Board,

G. D. BHAGAT,

Chairman.

Calcutta-7.

The 24th April, 1953.

INDUSTRIAL FINANCE CORPORATION

KEELING ROAD NEW DELHI

NOTIFICATION

IT is hereby notified that the Share Register of the Corporation will be closed and the registration of transfers suspended from 16th June, 1953 to 30th June, 1953 (both days inclusive).

V. R. SONALKER,

Managing Director.

Dated, 21st April, 1953.

THE BENGAL FLOUR MILLS CO. LTD.

The Board of Directors has decided to recommend to the forthcoming Ordinary General Meeting of the Company a dividend of 12½% per annum for the half-year ended 31st December, 1952.

By Order of the Board,

BALMER LAWRIE & CO. LTD.,

Managing Agents.

21, Netaji Subhas Road,

Calcutta, 21st April, 1953.

THE SHAIJAHANPUR ELECTRIC SUPPLY

CO., LTD.

A dividend at the rate of 5% for the year ended 30th September, 1952 without any deduction of Income Tax paid by the Company has been declared payable at once.

OCTAVIUS STEEL & CO., LTD.,

Managing Agents.

Calcutta, 24th April, 1953.

LINSEED

Very firm conditions prevailed last week and appreciable advances were recorded. Trading was also on a somewhat increased scale. Because steady prices prevailed upcountry, local sellers became reserved and forward delivery was quoted at a premium. Arrivals improved, but were mainly in fulfilment of previous sales. Crushers showed a keen interest on the whole and there was a fairly large daily turnover. The oil section was more active with an increased demand from local buyers at improved prices. No fresh business was done for export, but there was some short covering.

thought to have been absorbed by Japan. The total acquired by these countries appears, therefore, to be about 127 million ounces. As regards silver used for coinage, the U.S.A. was again the largest consumer with an amount estimated at 57.3 million ounces, provided from Treasury stocks; this was 13 million ounces more than were coined in 1951. Saudi Arabia again figured largely in this field, having secured 23 million ounces from Mexico for the coinage of silver rials, whilst Mexico's own needs were 8.3 million ounces. Canadian coinage absorbed 4.2 million ounces. There was no mintage of importance in Europe, except in the case of Western Germany, where 8.8 million ounces were coined in the course of the year; of this quantity, some 4 million ounces were imported, whilst the balance of 4.8 million ounces was obtained from demonetised silver coin. Consumption for coinage by the countries mentioned amounted to 101.6 million ounces. The total off-take for industry and coinage by the principal consumers for these purposes was thus about 228 million ounces.

Conditions in India

In the Bombay market, conditions at times were very unsettled and a wide range of prices was seen during the year; the highest was Rs. 193.5 per 100 tolas quoted towards the end of January, whilst in December it was reported to have been as low as Rs. 140. The sterling equivalent per ounce are approximately 92.2d. and 67 Ad. respectively, a difference between highest and lowest of 25 Ad. which compares with a variation of about 13d. in 1951. In March, settlement difficulties resulted in a state of emergency being declared and dealings were suspended early in the month; although spot trading was resumed in about a fortnight, the market was not reopened for forward dealings until 8th May. From then on the market maintained some degree of stability which lasted until November when, however, a sharp break in prices commenced. This was attributed to distress-selling resulting from the failure of crops, which brought in its train liquidation by bulls, with the result that the price declined below parity with prices in the world markets; these, however, were not affected, as Indian markets remained isolated since there has been no easing of licensing restrictions on the movement of silver into and out of India. Internal consumption of silver in India in 1952 is estimated at only about 5 million ounces. The decline in commodity markets and the crop difficulties having greatly reduced the purchasing power of consumers.

Lend-Lease Silver

The coming into force of the Japanese Peace Treaty, on 28th April, 1952, brought the state of emergency in the United States to an end and silver received under Lend-Lease conditions is returnable within five years from that date. According to the last figures the amounts outstanding were as follows:

BRITISH COMMONWEALTH

Australia	11,773,093
Fiji Islands	196,364
United Kingdom	88,073,878
India	225,339,904
	326,043,239

miner works for 394 or about 4 days in a week." In the Bihar mica mines it is said that about one-third of the labour force does not turn up the day after pay-day, and in the rains the attendance drops to 10 percent. Altogether it is calculated that workers in mica mines do no more than 3 or 3½ days' work a week. In the Madras mica mines absenteeism varies between 40 and 60 percent, while on the Kolar gold fields the rate is 5 percent among company labour and 16 percent among contract labour. On Assam tea gardens the daily average labour strength is approximately three-quarters of the total on the books. It is notable that the attendance of women and children is frequently more regular than the men's; there appears to have been an improvement between the 'thirties and the war, but by 1946 the situation had deteriorated again.

The study mentions poor housing conditions as a cause of absenteeism and quotes a Jharia coal mine where better housing brought the rate down from 25 to 15 percent. Higher wages, more attractive working conditions and paid holidays also contribute to reducing absenteeism. The last-named is plainly the most effective, if only because it amounts to regularising absenteeism, organising it as giving it another name. But to suggest more paid holidays for workers because they are absent more often than in other countries misses the point that the Indian worker already enjoys more festival and statutory leave days than are granted elsewhere; even the Catholic countries of Europe are a long way behind India in this connection. The basic cause of absenteeism in India is the fact that the industrial worker is still part-time peasant and until he cuts his connection with the soil his attendance will be irregular and his adjustment to modern industrialism insecure.

POINTERS AT THE BRITISH INDUSTRIES FAIR

NEW PRODUCTS AND NEARER DELIVERY DATES

THE British Industries Fair, which has been held between 27th April and 8th May this year, is always watched as a kind of barometer of industrial and trading trends. This year the signs are being watched more closely than ever, for the volume of output by British industry has been disappointing for many months past, exports have failed to achieve their scheduled expansion, and the international trading prospect is uncertain. The Fair seems to be making a favourable impression. Buyers looking for novelty have found that designers have not stood still. Many firms have taken advantage of their freedom to obtain almost any materials without restriction of quantity, though in the case of metals this freedom is relatively recent. The quality of design is said to be noticeably cleaner in the engineering sections of the Fair at Birmingham, but some of the fancy goods show the worse effects of a Victorian tradition which the Coronation has revived. The Coronation motif is prevalent in many sections—fancy and toilet goods, jewellery, stationery, glassware, textiles, and others. It is, so to speak, a quick-selling line, though most of the souvenir trade is already coming to an end. The textile section has made the most imaginative use of the motif, with specially woven velvets, satins, damasks, cloth of gold, emphasising regal colours rather than merely picturing the royal emblem.

The textile display is of special interest, because, in profoundly different conditions, it recalls the magnificence of this section of the Fair two years ago. Then many firms were showing their best only for prestige; it was purposeless to book orders which they had no hope of fulfilling within a reasonable time. Now the exhibitors can promise fairly prompt delivery, and they are glad to book new orders. What is encouraging is that they are able to show products of such quality, with so many new materials, and variations and mixtures of old ones, that buyers are keen to do business. The textile industries have quite firmly decided that, no matter what economists may think of the relative possibilities of producer and consumer goods in the next era of world trade, the struggle for textile markets is well worth the effort.

The clear distinction that was still observable a year ago between industrial equipment and consumer goods (demand for equipment was more than the capital industries could satisfy, while over most of the consumer range manufacturers were looking for orders) has already become blurred. The order-books of British industry as a whole, not only of one broad section of it, are much lighter than a year ago. Only in a few capital industries, such as heavy electrical equipment, is there work on hand for a long time ahead. This is the first Fair since the war where British industry as a whole is displaying its goods with the earnest intention of attracting custom immediately. Working off orders has, however, one big advantage. It is now possible to quote much earlier delivery dates than those which overseas buyers

found so inconvenient that, with less than their usual regard for price, they placed much of their business elsewhere. In the matter of price British goods are competing more actively than at any other time since the war. The tendency of some material prices, metals, for instance, has lately been more favourable to manufacturers in Britain than in America. Independently of this trend (which does not show its practical effects immediately) some firms have reduced their prices substantially for the occasion of the Fair.

Another encouraging pointer this year is the development of new industries. One that has aroused particular interest is prefabricated building. The traditional principle, that the basic work of construction is done where the finished structure will remain, is no longer accepted as necessary. Prefabrication means that buildings, like motor cars or radios, can be made as standardised products in a mechanically equipped modern factory. These buildings range from simple sheds for gardens and farms to great aircraft hangars and hospitals. The industry, of which a score of the leading manufacturers are exhibiting in a new section of the Fair, comprising a "transportable town", plans to export buildings of a modern and efficient but not monotonously uniform character to countries which have never had the resources or the technique to develop building beyond its primitive form; and also to advanced countries, such as Canada and Australia, whose populations are increasing so rapidly that their building needs cannot be easily satisfied locally.

Other industries, not quite so recent but still relatively new, are showing good progress. Oil industry equipment is a post-war growth in Britain; so, in anything like its present form, is office equipment. The industries closely linked with science, such as chemicals, instruments, electronics and other associates of radio, are developing in Britain as elsewhere, more rapidly than mechanical industries; but the benefits of scientific advance are percolating through almost the whole of industry. It is to be hoped, however, that British firms, not all of whose exhibits are on the same high level as the best of them, will closely follow developments abroad by visiting the corresponding fairs of other countries. Otherwise they will be made aware by more painful means that Britain is not the only country where technique is improving and industry widening its range of products.

CURRENT COIN

Labour on Coal Conservation.—Critics of the coal conservation scheme will find it instructive to read an article by Mr. B. P. Sinha, a Bihar trade union leader, on how this policy appears to workers. Writing in a recent issue of *The Indian Worker* (an INTUC organ), he says that the Coal Mines (Conservation and Safety) Act "provides for stowing, washing and blending, but the Board never thought of these at the initial stage and enforced pegging energetically and exclusively as its prime sheet-anchor for conservation of metallurgical coal." Although the Government said that there should be no appreciable retrenchment of labour and no colliery should be affected adversely, the Coal Board felt conservation to be a national necessity and assumed that labour must make sacrifices. "Union officials and labour representatives are irresistibly led to the conclusion that despite their pretensions to the contrary, the Coal Board do not mean well to labour and have planned to achieve conservation at their expense." Mr. Sinha says that many collieries have retrenched labour because of the restriction of output and the confusion resulting from official policies. At one stage the Board asked producers of selected A and B grades of coking coal to develop their lower seams and switch over to the production of grade I and II coals "so that workers who would be surplus at the selected A and B mines due to restricted output might be employed at those lower seam mines. Apparently the Board knew and expected that as a result of pegging a large number of workers would have to be retrenched, but as this would be against the Government's policy the new policy of developing the lower grade mines was invented so that the workers thrown out of employment at the upper seams might be transferred to the lower seam mines. But before the scheme matured, the authors of the scheme themselves gave it a go-by with their plan to restrict the output of grades I and II coking coals to their level of 1952 production. This shows that the Board's intention to provide for re-employment of the surplus labour at the pegged selected A and B grade mines was neither serious nor sincere." Mr. Sinha says that in the interests of the country's economy and industrial relations it would be much better to conserve coal on these methods but official policies have led to serious confusion, he says. Stowing and washing would involve a large capital outlay; producers have placed orders for plant and machinery "but they now find that the Government's final decision about these matters is yet to come and that they

may or may not be able to utilise the plant and machinery they have already ordered."

Cost Inflation in Industry.—In his presidential address at the quarterly meeting of the Association of Indian Industries in Bombay last week, Mr. Prabhu V. Mehta said that one of the most disquieting features of India's economy was that "while prices of manufactured goods are falling, production costs are still mounting." The Government was imposing on industry an increasing burden of labour welfare measures such as provident funds, health insurance, etc.; wages had increased as a result of the demands of workers or the awards of industrial courts and tribunals; the cost of fuel and motive power had risen, as had such imposts as the sales tax and excise duties. Apart from steel and cement where selling prices and distribution were controlled by the Government, most industries could not increase the prices of their finished products because buyers controlled the market. Both Government and industry must try to reduce costs. The implementation of labour welfare measures will have to be slowed down in keeping with the capacity of industry to bear increased burdens. Taxation should be reduced, and wages and allowances linked to productivity; industry, on its part, should reduce costs by adopting quality control and standardisation. Mr. Mehta urged the Bombay Government to exempt the essential raw materials used by each industry from the multi-point sales tax. He thought that Tatas should be allowed to build an electricity generating station of 100,000 kilowatts at Trombay. The Government was believed to have advised a station with only half increase. Further, the bigger station would be more economical since it would cost Rs. 11 crores as against Rs. 7 crores for one with half its capacity. Mr. Mehta urged the establishment of a State electricity board and criticised the Government's insistence, when issuing building permits to industries under the Building Control Act, that they provide housing for 60 percent of their labour force.

Mr. C. P. Shah, vice-president, speaking at the same meeting declared that many new industries were being set up with very little capital, inferior labour and technicians and obsolete machinery. Financiers were often interested more in making profits quickly than in establishing more in making on a sound foundation. "Factories with inadequate funds even when they go into production make poor and headway as the standard of quality is Provision of adequate finance on the capital side working charges for a reasonable period of unlost sight of." Modern machines can never be technicians should be employed. There were cal personnel and other facilities to establish or expand industries but they did not have adequate capital. However "this disability will be fast for a Financial Corporation, set out to aid and encourage the development of industries."

Pepper Prices.—Although the prices of Indian pepper recovered from the bearish list given by the Korean peace negotiations and touched the year's high level of Rs. 3,500 per 656 lbs (ungarbled) late during April, Cochiti declined by nearly 20 percent exporting centres of Indian black pepper, now quote about Rs. 3,000 per candy. Importers in New York bought at 155 cents per lb in March, and June shipment. Sellers, however, are asking 133 cents for spot and 137 cents for floats. New York and they compare the rise this year to the rise in 1951, when prices advanced early in the year. Reports indicate that not much will be sold even weeks or so has been very limited. Although im- about 138 cents is too high, growers in India appear Indian crop is officially estimated to be smaller by 1,340 tons at 21,625 tons despite the area having increased slightly. It is officially stated that the weather is mainly responsible for the decrease in trends does not encourage replanting with the result that vines are growing older and yielding less. Recent high prices have caused marginal areas to be cultivated and interplanting is often too concentrated, so that yields have fallen. Pepper ex- in the Open General Licence so that more dollars and Imports recently discussed the question with chambers of commerce in Cochiti. No price change is expected in New York, at least till the Lampong crop begins to move there late this summer.

Hindrances to Freer Trade.—We made reference in these columns recently to international action for the reduction of trade documents so as to increase the flow of world trade. An interesting example of these hindrances was given to the recent session of the International Chamber of

Commerce by a large British industrial firm. The company in question manufactures large quantities of products which cannot be stored in great bulk and it therefore depends on a smooth and easy flow from the works to its customers at home and overseas. Import regulations in many countries have become so complex that the instructions issued to the firm by its subsidiary branches cover not less than two printed pages. An instance was quoted where the following documents had to be prepared: 16 copies of the bill of lading, 9 copies of the commercial invoice, 8 copies of the certificate of analysis, 8 copies of the certificate of inspection, 8 copies of the packing sheet, 4 copies of the cable advising the buyer's bank of the shipment, and 4 other forms. Another considerable difficulty is due to the system of import licences. Where the company was previously able to export in lots of, say, 2,000 tons, its subsidiary company now receives import licences for only a proportion of this and various customers provide import licences in their names for the larger proportion of trade. This has led to something like ten times the number of orders being handled for the same quantity of goods than was the case before the war. Moreover, many of the customers being relatively small firms or firms whose financial standing is not always sufficiently known, a considerable part of the dealings is made against letters of credit. Last year the total of such transactions dealt with by the firm in question amounted to some £10 million sterling.

Fund for Economic Development.—A detailed plan for a Special Fund for grants-in-aid and low-interest, long-term loans to under-developed countries for their economic development, is contained in the Report, made public recently, of a 9-member Committee appointed by the Secretary-General of the United Nations. The Report does not discuss the possibility or advisability of establishing such a Fund but deals only with the technical problems of how the Fund, if established, would be organised and how it would work. No estimate of the size of the Fund is made, but the Report recommends that should the establishment of the Fund be decided by the competent organs of the United Nations, it should only come into being by the voluntary pledging of the equivalent of a minimum of \$250 million by at least 30 countries. This is one of 88 specific recommendations—all unanimous—put forward by the authors, who served on the Committee in their personal capacities, which will first be considered by the Economic and Social Council at its next session in Geneva, after which the Report will go to the Assembly. In a preface to the Report, the Secretary-General states that the financing of economic development "has been foremost among the problems which have commanded the attention both of governments and of the United Nations." He recalls that in a memorandum which he submitted to the fifth session of the General Assembly on the development of a 20-year United Nations peace programme, it was suggested that "member Governments should develop a sound and active programme for the encouragement of broad-scale capital investment for economic development, using all appropriate private, governmental and intergovernmental resources." The Secretary-General adds that "an effective concerted effort aimed at promoting the economic development of under-developed countries, of which financial assistance would be an integral part, should constitute a sound investment in peace and stability and lead to a mutually beneficial expansion of world productivity and world trade." This unanimous report, adds the Secretary-General, is a "notable step forward" and he expresses the hope that the concept of a Special Fund "will gain the support of the United Nations as an additional important instrument of economic and social progress throughout the world." Prefacing in turn its unanimous recommendations, the Committee declares that the Fund should, in its essence, be an express of the principles of the United Nations; it should be an effort of a co-operative character undertaken in the spirit of international solidarity for the purpose of fighting poverty, raising standards of living and increasing the output and productivity of the peoples of under-developed countries. The Fund, it says, should have the duty of encouraging in every way the development of methods of self-help so that the assistance given by it may be doubly fruitful. Finally, if the international community is to give further substantial aid to the under-developed countries, that aid must be so administered and applied that its prudent use and most fruitful application can be assured so far as is humanly possible. The Committee included Mr. S. Amjad Ali of Pakistan, President of the Economic and Social Council of the United Nations during 1952; and Sir Cyril Jones, K.C.I.E., C.S.I., Director of the Mercantile Bank of India Ltd., and former Finance Secretary to the Government of India.

Coal Statistics for March.—According to the Chief Inspector of Mines in India, 828 collieries

and eight coke plants were reported to have worked during the month of March, 1953. On an average 340,294 persons were employed daily and 8,383,832 man-shifts were worked. The overall percentage of absenteeism was 14.40. The output per man-shift for miners and loaders was 1.06 tons, for all persons employed in underground and open-workings 0.57 and for all persons employed 0.36. Production totals were : 3,075,992 tons of coal, 119,227 tons of soft coke, 182,992 tons of hard coke and 13,583 tons of other kinds of coke; 2,684,451 tons of coal, 127,465 tons of soft coke, 41,412 tons of hard coke and 3,375 tons of other kinds of coke were despatched during the month. Coal stocks at the collieries on the last day of the month were reported to be 3,376,006 tons.

International Shipping Federation.—The International Shipping Federation, at the invitation of the Union des Armateurs Belges, which was one of the founder-members in 1909, holds its annual meeting this year in Brussels on 7th and 8th May. The agenda is an interesting one, and in part at least will be of importance to Eastern countries. Among the international questions to be discussed are the composition of the Joint Maritime Commission of the I.L.O. which is now being enlarged both on the shipowners' and seafarers' sides; the present state of ratifications of the Seattle Conventions of 1946 and, in particular, the proposal that the Wages, Hours and Manning Convention should be divided into two; and the application of the U.S.A. McCarran-Walter Act to foreign ships' crews, in which connection President Eisenhower's latest moves may make some difference even before the views of the Federation become generally known. The meeting will also consider questions regarding the Asian Regional Conference which is to be held in the autumn and which will discuss, in particular, methods of recruitment and engagement of Asian seafarers and their welfare in Asian ports. This is the first time that the I.L.O. will be holding a regional conference on maritime questions, and it is a departure not without some significance and value. Developments in the proposal that a tripartite regional conference should be held to standardise hours and manning of seafarers in north-west Europe will also be considered.

Employment Statistics for March.—During March 1953, there was, for the first time in six months, a small increase in the number of job opportunities notified to employment exchanges. The increase was entirely in the public sector, the decline in the private sector having continued for the seventh month. The employment situation in general remained unsatisfactory. During the month, 1,10,293 persons were registered for employment assistance as against 99,353 in February. The cumulative total of registered unemployed persons at the end of March was 929 less than at the end of the previous month. The number of persons placed in employment during March was 17,785. Under the training schemes of the Ministry of Labour 9,882 persons, including 401 women and 2,197 displaced persons, were receiving training at the different training institutes or centres at the end of March.

CORRESPONDENCE

"NOT NON-PERMANENT"

TO THE EDITOR OF "CAPITAL"

Sir, If Ditcher winces at "non-adult", what would he say to "not non-permanent"—a term used by the Central Ministry of Finance to describe certain posts under the Government? I have long puzzled over the meaning of this term and could come to only one conclusion, namely, that it proves the case for abandoning English as the official language of India.

Yours faithfully,
STATISTICIAN.

Calcutta, 2nd May.

Survey of Mining Industries

CAPITAL'S mid-year industrial survey for 1953 will deal with Indian mining industries and minerals, of which it will provide as complete and authoritative a coverage as the Jute and Plantations Surveys did of those industries in 1951 and 1952. Specially commissioned experts will deal with coal, iron ore, copper, gold, petroleum, mineral fuels, aluminium, gypsum, chromite, kyanite, sillimanite, mica, manganese and other mining products, as well as mining equipment and labour. A feature of particular interest will be an extensive and up-to-date report on research into the beneficiation of Indian coals, which includes designs and cost calculations for coal-washing plant and practical instructions on operation and maintenance. This special issue will be supplied free to registered subscribers to the newspaper and will be available to others at a price of Rs. 5. Enquiries regarding advertising, and orders for extra copies, may be addressed to the Manager, CAPITAL, 5, Mission Row, Calcutta-1.

NEW DEBENTURE ISSUES
OVERSUBSCRIBED

AUSTRIA DEVALUES SCHILLING

London, 6th May.

THERE has generally not been a sufficient quantum of business in the past week to give stock markets any marked tendency. Yet there was little to account for this falling off in active interest. The general impression was that investors were inclined to favour a fixed interest at the expense of equities, but towards the end of the week interest was switched around into industrial equities. Two outstanding items were the new issues which were heavily oversubscribed. The Tate and Lyle debenture issue was oversubscribed 20 times and the Bakelite offer was also well supported. Both these issues took a certain amount of money out of the market in application money. When dealings started in the Tate and Lyle debentures they were marked at a three points premium. Glit-edged showed a tendency to drift although not seriously.

Mining shares remained largely under the influence of the South African elections but at the close of the week the freeing of copper caused some marking down in share prices. This was soon followed by both local and Continental demand with increases generally recorded. Among foreign bonds Germans, Japanese and Chinese moved slowly up and down reflecting various news items concerning peace or truce negotiations with only a professional element operating. There was little activity in teas during the past week with changes generally small either way.

With the number of balances left over from the week-end, conditions on the short loan market were very easy at the outset. Banks were ready lenders at low rates and outside calling was extremely light. This situation held until mid-week when outside calling became very heavy and reversed the position and authorities' help was required. However, the market again turned easier by the close, despite £35 million call on the recent British Electricity £125 million issue. Applications for £210 million Treasury Bills totalled £331,070,000 of which the former amount was allotted at an average rate of 47s 7.37d percent. This week's offering is £240 million. Active note circulation was £3 million higher at £1,514 million according to the Bank of England Return. Bankers deposits, however, were £11 million down at £262 million.

Austrian Schilling Devalued

The Austrian National Bank announced that effective from 1st May the Austrian schilling has formally been devalued to the rate of 26 schillings to the U.S. dollar from the old rate of 21.36 schillings.

Monsanto Chemicals

So far Monsanto Chemicals Limited has successfully met what now appears to be well established Continental, Japanese and American competition in many of its important foreign markets, says the company's annual report. The company notes that with only a few exceptions, raw materials were in adequate supply during 1952. In general, however, raw material prices continued to rise while the company's selling prices, especially in overseas markets, were falling as a result of competition and the surplus of some chemicals and plastics. This year competition is expected to continue and there are no signs of any immediate relief from import restrictions in the traditional export markets. The trend towards local manufacture seems likely to continue. The company will strengthen its selling and service organisation and improve quality, at the same time continuing to seek additional markets.

Linseed Oil Dull

Linseed oil apparently attracted only a modicum of interest and the only business reported was a rather special contract for April-May shipment of Uruguayan oil at a premium figure of £91 per ton in bulk, c.i.f. Meanwhile, May-June shipment held steady at £90. Argentine offers were limited, the selling reticence no doubt being encouraged by the recent conclusion of the trade agreement with Russia and the prospective one of linseed oil from Argentina and it may be that she will become a less important factor in future open trades. Stocks in the United Kingdom are considered ample for some time, while Belgian crushers have recently made reductions in prices. There was an initial tendency to firmness in castor oil but later weakness set in and prices slipped by 2s or so with business rather poor. Indian BSS May-June shipment was offered at £160 and below while commercial twos May shipment were sold Indian groundnut oil in bulk was quoted for May-June shipment at over £140 with re-sellers unable to get on even at £138 per ton, c.i.f.

U.K. Cement Output

The productive capacity of the British cement industry in 1953 will increase by 500,000 tons, the Chairman of the Rugby Portland Cement Company but due to higher costs a material drop in cement prices is unlikely in the next few years.

U.K. Rice Import Restrictions to Go

The Ministry of Food announced that control over rice imports, distribution and price will cease on 31st July. Imports by private traders will, however, be permitted from 1st July under the open individual licensing procedure. The Ministry adds that it is expected that the Board of Trade will make licences available to importers in time for them to arrange shipments for arrival from early July.

Malayan Rubber Stocks

The weekly review of a prominent Singapore trader says it is reported that South America has purchased rubber. Both Russia and South America have been expected to buy for some time now. Quantities of rubber available in Malaya at the moment appear somewhat below normal which is accounted for the scarcity of sellers during the advance of the last week or so, the review said. Factory inventories in most countries are reported to be on the low side which, together with the time being constitute a healthy market with no fear of any serious setback, the review added.

North American Newspaper

After being in short supply for several years, with inventories generally falling throughout North America. However, the Powell River Company anticipates no problem in marketing at satisfactory price levels. Its maximum output this year, currently producing 10 percent more newspaper than a year ago.

Hong Kong Gold Prices

Hong Kong gold prices moved higher in the past week, advancing to the high of \$273, but finally eased slightly to close at \$271. Factors contributing to the firmness were the Indo-China situation, small local stocks and the higher value of tael and unofficial trading totalled 11,790 arrivals and unofficial 23,500 taels. There were no arrivals from Macao. Unofficial exports were estimated at 14,000 taels and forward contracts, 12,800 ounces at U.S. \$39.94 c.i.f. Macao.

BURMAH-SHELL... IN INDIA'S LIFE AND PART OF IT

WHAT DO WE MEAN BY
'PLANNED LUBRICATION'?

JUST THIS:

ANALYSIS of the lubrication requirements of your plant, engines and machines. RECOMMENDATIONS of proper lubricants together with specific instructions as to when and how they should be used. SCHEDULED CHECK-UPS for all critical and unusual machinery. THIS ADVICE is given without obligation on your part and we are pleased to give all the assistance we can on any lubrication problem you may be tackling.

SUGAR

Once upon a time some sugar-processers came to us with a tricky problem. They explained that during the processing season, machinery operates at very high speeds and a tremendous strain is placed on all the working parts. They asked us if we could devise a special lubricant to protect their machines. So we sent some expert chaps with high foreheads to the factories to study the problem at first hand. They came back full of carbo-hydrates and ideas and got busy in their laboratories. After making many brews they finally produced a lubricant which dealt with the problem, and the sugar-processers have lived happily ever after. This true story is just one of the many chapters in Burmah Shell's history of 'planned lubrication'—the service which we bring to Indian industry.

Consent of the Central Government has been obtained to this issue by an order of which a complete copy is open to public inspection at the Head Office of the Company. It must be distinctly understood that in giving this consent the Government of India do not take any responsibility for the financial soundness of any schemes or for the correctness of any of the statements made or opinions expressed with regard to them. A copy of this Prospectus has been delivered for registration to the Registrar of Companies, West Bengal.

The Subscription List will open on the 8th day of May, 1953, and will close as soon as the Directors may decide and in any case not later than the 31st day of May, 1953.

JENSON AND NICHOLSON (INDIA), LIMITED

(Incorporated under the Indian Companies Act, 1913.)

Authorised.	SHARE CAPITAL	Issued and fully paid.	Now to be issued.
4,00,000	Ordinary Shares of Rs. 10/- each	3,25,000	...
30,000	Redeemable Preference Shares of Rs. 100/- each	...	20,000

LOAN CAPITAL

The Company has no mortgages, debentures or other loan capital outstanding other than an overdraft with the Chartered Bank of India, Australia and China secured by Hypothecation of all existing and future stocks of Paint, Varnish, Enamel and all raw materials, whether raw or in the process of manufacture and all articles manufactured therefrom, now or hereafter, belonging to the Company wherever stored or kept and whether in the possession of the Company or of the Bank or in the possession of any third party including stocks in course of shipment, transit or delivery and also all documents of title, negotiable instruments, policies of insurance, and other documents and instruments relating to such stocks. As at the 1st April, 1953, such overdraft amounted to Rs. 22,78,979/-.

ISSUE OF

20,000 7½% REDEEMABLE PREFERENCE SHARES OF RS. 100/- EACH AT PAR PAYABLE IN FULL ON APPLICATION.

The Company is advised that the Redeemable Preference Shares are "Approved Investments" within Section 27A of the Insurance Act, 1938. The Directors are aware of firm applications for 14,000 Redeemable Preference Shares and propose to allot these in full.

REDEMPTION

The Redeemable Preference Shares confer on the holders thereof the right to receive a fixed cumulative preferential dividend at the rate of 7½% per annum on the capital for the time being paid up or credited as paid up thereon subject to the deduction of Indian Income Tax at the rate of time to time current dividend and rate for dividend in priority to the other shares of the Company and also confer the right in a winding up to repayment of the amount paid up or credited as paid up thereon together with any arrears of dividends whether earned or not calculated to the date of the repayment of capital in priority to other shares of the Company but do not confer any further right to participate in profits or assets.

The Preferential Dividend will be payable annually not later than the 30th June in each year in respect of the year ending on the preceding 31st December and the first payment of such dividend (calculated from the 1st May, 1953, to the 31st December, 1953, and amounting to Rs. 5/- less tax per share) will be payable not later than the 30th June, 1954.

VOTING

Subject to any special rights or restrictions as to voting upon which any shares may be held, on a show of hands every Member present in person being a holder of Ordinary Shares shall have one vote and every person present as a General Proxy (i.e. a Proxy who is appointed otherwise than for a specified Meeting only), who is not a Member of the Company or who is a Member not qualified to vote on behalf of a holder of Ordinary Shares shall have one vote and upon a poll every Member present in person or by proxy shall have one vote for every Ordinary Share held by him provided that no Company shall vote by Proxy so long as a Resolution under Section 80 of the Indian Companies Act is in force. The Redeemable Preference Shares do not entitle the holders to vote at any General Meeting unless (a) at the date of the notice convening the Meeting the dividend on the Redeemable Preference Shares or any part thereof is six months or more in arrears and so that for the purpose the dividend shall be deemed to be payable yearly on the 30th day of June in respect of the year ending on the preceding 31st day of December, or (b) a proposal is made for the winding up of the Company or for the modification of any special rights or privileges attached to the Redeemable Preference Shares. At any meeting at which or upon any question upon which the holders of the Redeemable Preference Shares are entitled to vote, the said Redeemable Preference Shares shall, on a show of hands, confer the same voting rights as Ordinary Shares and on a poll shall each confer the number of votes which is represented by the nominal value of a Redeemable Preference Share divided by the nominal value of an Ordinary Share for the time being.

No Member is entitled to be present or to vote on any question either personally or by Proxy or as Proxy for another Member at any General Meeting or upon a poll or be reckoned in a quorum whilst any sum or other sum shall be due and payable to the Company in respect of the shares of such Member.

TRANSFER

The Articles contain no restriction on the free transfer of shares but the Directors may refuse to register any transfer of shares upon which the Company has a lien and in the case of shares not fully paid up may refuse to register a transfer to a transferee of whom they do not approve.

MODIFICATION OF RIGHTS

The special rights attaching to any class of shares may be modified or abrogated or dealt with by Agreement between the Company and any person purporting to contract on behalf of that class, provided such agreement is (a) ratified in writing by the holders of at least three-fourths of the nominal value of the issued shares of that class, or (b) confirmed by an Extraordinary Resolution passed at a separate General Meeting of the holders of the shares of that class, subject to the special provisions as to quorum contained in the Articles of Association.

BORROWING POWERS

The Directors may from time to time at their discretion raise or borrow either from the Managing Agents or elsewhere, subject to the provisions of Section 87E of the Indian Companies Act, and secure the payment of any sum or sums of money for the purposes of the Company, and may themselves lend to the Company on security or otherwise.

DIRECTORS:

Andrew William Taylor, O.B.E., 2, Fairlie Place, Calcutta. (Chairman).
Bernard John Nicholson, M.B.E., Jenson House, Carpenter's Road, Stratford, London, E. 15.
(Mr. B. J. Nicholson is at present out of India and has appointed Mr. Henry Stafford Challis, F.C.I.S., of 2, Fairlie Place, Calcutta to act as his Alternate).

Calcutta.

AUDITORS:

Lovelock & Lewes, 4, Lyons Range, Calcutta.
(Chartered Accountants).

PARTICULARS

HISTORY & BUSINESS

The Company was incorporated and registered in Bengal as a private limited Company on the 2nd December, 1922. It was formed for the purpose of manufacturing in India Paints, Enamels, Varnishes and Distempers including the well known "Robbialac" Brand. It was converted into a public Company on the 22nd day of April, 1953.

The Company is a subsidiary of Jenson & Nicholson, Ltd., of London, England, a name associated throughout the world with the manufacture of high quality Paints, and under an Agreement entered into between the Company and the English Company the latter agreed to place at the disposal of the Indian Company the benefit of its technical knowledge and experience in the manufacture of paint.

The Company's up-to-date factory, which is one of the largest of its kind in India, is situated at Naihati on the River Hooghly, 28 miles from Calcutta. Since its inception the policy of the business has been to manufacture products of the highest quality and to this end continuous research work is carried out in its own Research Department.

The products of the Company's manufacture have made sustained progress over the last 30 years and are well established throughout India. Such brands as "Robbialac", "Jensolin", "Jilmil" and the many popular varieties marketed under the "Umbrella" mark need no introduction. The Company manufactures a varied range of natural and synthetic protective and decorative materials, including an extensive range of industrial finishes to meet the increasing needs of India's Industry. A modern laboratory for advanced research work is maintained.

The quality of the Company's manufactures, coupled with a wide marketing organisation and discerning publicity, has established the popularity of the Company's products throughout India.

DEVELOPMENT

During the course of the past two years the Company has spent nearly Rs. 7,00,000/- in the modernisation of its Naihati Plant, including the construction of a new Department for the manufacture of Cellulose Finishes, and the provision of additional amenities for its Factory workers (provision of a Sick-Bay, etc.).

A new Canteen for use by the Company's Factory workers, with living quarters above for certain of the Company's employees, is now nearing completion at an approximate cost of Rs. 1,25,000.

In the course of the next few years the Company plan to erect a new Despatch Department and build new quarters and enlarge existing quarters for the senior members of the Company's Factory Staff, and to construct new dwellings for a number of the Company's Factory workers, at an overall estimated cost of some Rs. 5,00,000.

APPLICATION OF PROCEEDS

Of the total proceeds of the issue, approximately Rs. 6,00,000/- will be applied towards the cost of completing the development outlined above. The balance of the proceeds will be utilised as working capital.

PROSPECTS

Whilst they can make no representations, the Directors naturally hope that the recent capital expenditure and development will be reflected in additional profits. The Company's products are well established in the Indian Market and the Directors are of the opinion that the Company's Plant should be profitably employed for many years to come, particularly as the expansion of India's Industry should lead to increasing demands for the Company's wide range of Industrial Finishes.

Saint Frères Circular Looms installed in Italy.

SAINT FRÈRES CIRCULAR LOOMS

Hundreds of Saint Frères Circular Looms are in use—in new factories and old, sometimes working alongside flat looms—in the Belgian Congo, in South Africa, Sweden, Norway, Italy, Great Britain, Germany, Belgium and France.

These looms were originally designed for making tubular cloth from jute. Deliveries of a Saint Frères Circular Looms for hard fibres are now available. Saint Frères Circular Looms are manufactured by Urquhart Lindsay & Robertson Orchar Ltd., Dundee, Scotland.

The J.2 Loom (2-leaf, 4-shuttle) weaves single and double warp plain and tubular cloth for sacks and for the manufacture of single width cloth woven in tubular form with a double false selvage for wrappers, etc.

May 7, 1953.

THE shocking aeroplane tragedy near Calcutta last Saturday was a grievous blow to the British community in Eastern India whom it robbed of so many respected members. Since little more than the list of names has appeared elsewhere in the Press, I venture to record here a few details of the Indian careers of those who boarded the plane in Calcutta. Mr. Donald Storey was born in the Argentine 47 years ago and spent his early life in South America before going to England for education at Felsted School. He came to India in 1927 as an assistant to the Imperial Tobacco Company of India Ltd. and travelled widely throughout the country. After serving as manager for various branches, he was made director in 1944 and three years later, at the relatively early age of 40, was appointed chairman of the board in Calcutta. He was a keen golfer, a vigorous worker and a true friend. His widow and four daughters are now in England. Mr. R. A. Landsman was a Dundonian who was educated at the Morgan Academy and qualified as a chartered accountant in 1939, joining the firm of Thomas Duff and Co. Ltd. in the same year. As a member of the Bengal Artillery he went on service with the 245th Medium Battery in September, 1940, was commissioned in 1941 and became a Captain in the Royal Artillery (Anti-Aircraft). After the war he came back to Thomas Duff and was appointed senior accountant. He was a keen sportsman—he was only 37 years of age—and leaves a widow and two young children, all of whom had left for the United Kingdom in January of this year. Mr. Gideon K. Farquharson, whose wife was with him in the disaster, came from Aberdeenshire where he was born in 1899. He came to India in 1922 as an assistant to the Chubwa Tea Co., Ltd., in Assam, which company he served throughout his career in the East. He was manager of the Kellyden tea estate, a division of the Chubwa Company, at the time of his death. He and Mrs. Farquharson were going to Britain on leave; they had no children. Two other Aberdonians on the plane were Mr. Harold Pearson and Mr. John Milne. Mr. Pearson was born in 1897 and came to India after service with the Royal Air Force in the first World War. He joined the Borelli Tea Company as an engineer assistant in 1919 and remained with that company for ten years. He became manager of Rupajuli in 1931. In 1938 he took over the superintendency of the Majuli Tea Company, a position he held until his death. Mr. Pearson was a prominent figure in the Bishnauth area of Assam for many years and was until lately vice-chairman to Zone Three of the Assam Branch of the Indian Tea Association. In that association he was regarded as a very able planter and a sound counsellor whose wide experience will be greatly missed; his wife was killed with him. Mr. Milne was borne in Aberdeen in 1916 and after qualifying as an engineer came out to India in 1939 as an assistant to the Majuli Tea Company. In 1941 he joined the Indian Army and served until 1945 when he returned to the tea industry. Last year he had been appointed manager of the Phillobari division of the Bordubi Tea Company. Mr. A. B. Avila served with the Army in India during the war and returned to Calcutta six years ago to join the staff of Shaw Wallace and Company Ltd. He very quickly made his mark in this city where he had many friends, both Indian and European. He was a well-known member of various amateur theatrical groups, and many readers will recall seeing him on the stage. He was active in the Calcutta Cricket Club, the National Cricket Club, the Dramatic Club of Calcutta and was a member of the Committee of the 300 Club. Mrs. and Miss Maltman were the wife and daughter of Mr. James Maltman, Macneill and Barry's seniormost colliery agent, resident in Asansol. To the families of all these people will

A DITCHER'S DIARY

go the deep sympathy of their many friends in India.

The Prime Ministers of India and Pakistan, though widely separated in age, are equally capable of the most harrowing physical exertions. Both have just completed tours through uncomfortable country at the height of summer which fill the air-conditioned ditcher with awe. Mr. Nehru has done a twelve-hundred mile tour through famine-stricken Maharashtra, addressing hundreds of thousands of villagers at all times of day and night. Mr. Mohammad Ali got back to Karachi last weekend after a tour through the gruelling heat of Sind during which he made 15 speeches a day and treated with two hundred political leaders. His comment on reaching the capital was "I enjoyed myself", while Mr. Nehru was so impressed with the distress and fortitude he had seen that he over-looked to say even that much. Exertions of this sort would prostrate lesser men, and even politicians, who count on having to undertake something like it once every few years during an election campaign, would shrink from such labours as part of the normal routine of office. Both Prime Ministers must have got back to their offices to find a mass of accumulated problems that made all thought of a rest impossible, especially since there must be work to be cleared up before both journey to London for the no less important, but I hope considerably more enjoyable, duties attending on the Commonwealth Prime Ministers' conference and representation of their respective countries at the coronation. It is after that that they will meet to discuss the outstanding issues still dividing India and Pakistan, when we can expect that the two most hard-worked leaders in the Commonwealth will spare themselves no more in their efforts to restore the fraternal spirit without which further progress in this subcontinent will be very difficult to achieve.

Before he left India late last year Mr. Rowland Owen, till then the United Kingdom's Senior Trade Commissioner in India, completed the second of the Overseas Economic Surveys dealing with India, which is I imagine the most valuable single document the business man can possess on the commerce and industry of this country. The first was written in 1949 and has been of great service since, but the economic scene has changed a good deal in the last few years and the new survey is brought up to date and much enlarged. Its 400-odd pages cover all the subjects dealt with in the ordinary comprehensive textbook of Indian economics, but the approach is strictly practical and usually leads straight to the sort of direct answer the business man requires. It is a tribute to the success with which Mr. Owen has overcome the difficulty of obtaining reliable statistics on the Indian economy that his book will be as indispensable to those who live and work here as to firms in Britain that hope to do business with India. Having been sent to the printer last September, the survey ante-dates the final version of the five year plan but I should say that together with the short summary of the plan published by the Government of India this year, it makes up a useful commercial library on India. I understand that copies can be had from the local office of the British Information Services.

When Stalin died in March, I wrote in this column: "The wonder is that the very fact of Stalin's death was so readily accepted in the rest of the world; when Lenin died it was weeks before many Western observers could be persuaded that he really was dead..." Well, they have taken

some time about it but some people have now chosen to doubt whether Stalin died really in March. They want us to believe that "as a matter of sober fact Joseph Stalin died some time early in January, 1953." You think it fantastic? So do I, but then most of the events that reputedly happened just before and just after Stalin's death were no less fantastic—the doctors' plot, for instance, and the counter-plot against security officials. These doubters have found a spokesman in Mr. Richard Chancellor who contributes an article on "When Did Stalin Die?" to a recent issue of the Spectator. There he puts forward the hypothesis that the Great Khan breathed his last soon after the New Year and that his successors decided unanimously that the news must be kept secret until necessary precautions had been taken and a collective line of action agreed upon. There were nine doctors who knew of Stalin's death and I suppose of the measures required to preserve the body and those nine were kept silent by "the swift and well-tried Russian method of immediate incarceration." That was the doctors' plot. The supposed informer who gave them away, the woman doctor Timashuk, was an invention who "never existed in flesh and blood." When the new policy had been decided upon, the news of the death was broken to the world and soon afterwards the doctors were released, the Order of Lenin being withdrawn from the shadowy Timashuk. The only strains of evidence Mr. Chancellor can produce in favour of this ingenious theory are the undoubted fact that Western observers detected a significant change in Russian policy in mid-January, the curious wealth of clinical detail that accompanied the announcement of Stalin's death (this struck me at the time, but I put it down to the suspicion under which all Moscow medicines lay after the plot), and the extraordinary speed with which reorganisation at the top level took place after the "death" in March. I don't believe all this, but neither do I believe the official version of what went on in the Moscow medical world last winter.

The new round of truce talks at Panmunjon have been going just over a week and criticism of American handling of the negotiations has already been revived. This strikes me as quite unfair. It is easy enough to give advice on how to handle tricky customers one has never met, to judge their intentions from brief news summaries and generally to direct negotiations from an armchair thousands of miles away, but from my own exiguous experience of horse-trading, and similar occupations one needs to be on the spot to gauge the sincerity of one's opposite number. True enough, Lieutenant-General Harrison's declamations sometimes seem rather histrionic and I cannot see such a great deal of difference between what he is asking and what the Chinese are offering. But the art of skilful stalling is always to appear almost on the point of agreeing with the opponent; by maintaining just the finest shade of disagreement one avoids a conclusion and yet gives the bystander the impression of being a willing negotiator. The Communists have practised enough of this in the past to make General Harrison's claim that they are at it again seem at least probable. General Mark Clark's offer of a purse of dollars for a MIG jet plane (which has now been backed by the city of Detroit with the bait of a soft bed, a good job and juicy steaks) might not be other people's way of obtaining military information. It certainly is not the Russians' way; they used Nunn May, Klaus Fuchs and the like. Perhaps it is cheap, even contemptible, to offer bribes to deserters from the enemy but no one has so far suggested more elevated methods of securing Russian secrets.

THAL DEVELOPMENT PROJECT

WHAT is claimed to be the largest land reclamation scheme in Asia is now proceeding in West Pakistan, in the sandy country of the Thal between the Indus and the Jhelum rivers. A desert area is being flattened out, irrigated, and cultivated under the Thal Development Authority. For generations, the rolling dunes of the Thal have been useless, but already the T.D.A. has 350,000 acres under cultivation, following the completion seven years ago of a canal leading in from the Indus, with its huge barrage at Kalabagh.

Each settler in the Thal is to have fifteen acres with a little house of two rooms, a cattle shed, and a wash-room. He may grow wheat, cotton, or sugar-cane. The T.D.A. hopes eventually for over a million acres of wheat, two million of cotton, and fifty thousand acres of sugar-cane, which will add greatly to Pakistan's internal economy. The Thal is offering an outlet to thousands of refugees from India to Pakistan. The planned network of roads amounts to seven hundred miles of highway, and some 250 square miles are to be designated as a national park, and planted with trees. The Thal hopes to have six sizable towns and nine hundred villages.

What makes the Thal undertaking more than usually interesting and encouraging is the way in which many countries and organisations are contributing to it. Faith in Pakistan's future has brought in the World Bank with a loan to cover the provision of 144 tractors, 144 bulldozers, 16 heavy tractors, and 160 ploughs. Under the Colombo Plan, Australia, Canada and New Zealand are, between them, providing an agricultural research station, a cattle breeding farm, a poultry farm, and a hospital laboratory. New South Wales is sending three hundred merino sheep and fifty rams, and Canada a cement plant to produce 100,000 tons a year.

In five years the T.D.A. has given new life and opportunity to 24,000 families in 240 villages, and, with admirable pride, points out that eighty years ago British engineers looked at the Thal and gave it up as hopeless. To-day, Asian leadership is winning a creditable victory over an abandoned land.

USE OF METHANE IN A GAS TURBINE

The British Ministry of Fuel and Power states that methane can be used in a particular type of gas turbine and has announced that an experimental model for this purpose has been ordered from the English Electric Company. This may prove to be an important development in coal economies. On the average, about six tons of air is pumped through colliery galleries for every ton of coal mined and the methane in the air is sometimes as high as 1 percent. It has been estimated that if the average was as low as 0.25 percent, the recovery of the energy in the methane (which is at present wasted) would be equivalent to three or four million tons of coal a year.

There are two possibilities—to drain off the methane before it gets into the ventilation air, or to use it as it is in the ventilation air without trying to separate it. This requires a gas turbine. One of the projects which has been suggested to the Ministry by one of its scientists, is that the energy released would "provide a large part of the power needed in the collieries". It is proposed to extract this energy by heating the methane and passing it rapidly through the turbine with a blast of air. Rapid combustion is necessary as the gas will be in the hot chamber only for a matter of milli-seconds.

Two of the main questions which must be answered are: at what temperature will the combustion start, and can the methane be burned at lower temperatures by the addition of other

vapours? The recent "Coal Survey" has shown that the amount of available methane in a colliery probably depends on the movement of the coal caused by mining operations or natural processes. In the Point of Air mine in Flintshire, where methane is being used for heating along the North Wales coast, the gas is stored naturally at high pressure in faults and has to be drawn off before working the coal. In most other pits the methane will be drawn off through the ventilation shafts where (it is hoped) it can be used in a turbine.

COCHIN PORT'S RECORD PROFIT

Cochin port has established a record during 1951-52 both in respect of tonnage handled and profit made. Against the past record of 1,347,178 tons handled during 1950-51, the total volume of trade that passed through the Port in 1951-52 was 1,580,847 tons, an increase of 17 percent or 233,669 tons. The working of the Port during the year resulted in a surplus of Rs. 16.96 lakhs, a record in the history of the Port, comparing with the previous record of Rs. 15.28 lakhs in 1944-45. The surplus has been arrived at after allowing Rs. 3 lakhs for capital fund.

Receipts under the Cochin Port Fund reached a record level at Rs. 73.64 lakhs during the year, against Rs. 65.24 lakhs in 1949-50. Imports during the year reached the record figure of 1,262,638 tons against 1,098,214 tons in the previous year, an increase of 15 percent. Excluding bunkers, exports during the year increased by 69,245 tons to 318,209 tons. (248,964). Foreign trade rose 31 percent—both foreign imports and exports contributing to this. Coastwise trade, however, showed a further decline during the year as a result of a fall in imports—exports, maintaining the previous year's level. The value of the total trade of the port during 1951-52 amounted to Rs. 14,187.74 lakhs, imports being valued at Rs. 7,136.99 lakhs and exports at Rs. 7,050.75 lakhs.

NEW CALTEX GROUP TANKER

The tanker S. S. Caltex Manchester was launched successfully on 29th April, 1953, according to an announcement made by the Caltex Trading and Transport Co. Ltd., agents for Overseas Tankship (U.K.) Ltd. The 17,000 ton ship was launched by Lady Guttry, wife of Sir Norman Guttry, K.B.E., C.B. Deputy Secretary, Ministry of Transport and Civil Aviation.

Eighth ship to be launched in Overseas Tankship (U.K.) Limited's construction programme, the Caltex Manchester was built by R. & W. Hawthorn Leslie and Company at Hebburn-on-Tyne, England. The ship is 544 feet in length and turbine gear powered to give her a trial speed estimated at 15 knots.

NEW NON-PRIMING PUMP AT B. L. F.

A revolutionary type of pump of extremely simple design, which is being shown for the first time at the Birmingham section of the British Industries Fair, has attracted much attention. Known as the Cyclone-Plunge pump, its unusual features are that it is completely non-priming and has only three moving parts. The pump has passed stringent tests with the British Sugar Corporation and is considered suitable for pumping molasses. This is a considerable achievement, as up to the present the pumping of molasses has had to be done by a heavy machine weighing over one ton. The new pump weighs 23 lb. It gives 300 lb. pressure and a 27-ft suction lift.

Following the removal of Sheet and Plate Glass, Glass and glassware not otherwise specified and safety razor blades from the Quota Restriction Scheme for the January-June 1953 period, the Government of India, it is understood, has decided that apart from applications based on imports in the best year of the basic period, applications in respect of these three items may also be entertained and considered by the licensing authorities on the basis of the licences held by the applicants for the period January-June 1952. The last date for presenting such applications has been extended to 15th May, 1953.

ECONOMIC EVENTS IN APRIL

1st—Nazi-muddin approaches Nehru for talks on Indo-Pakistani disputes; Working Party on Cotton Textile Industry reports; Reserve Bank appointed sole banker to Hyderabad; Russia announces price cuts.

2nd—Indian aluminium output expansion plans outlined; report on Reserve Bank's survey of banks' investments; Britain's gold and dollar reserve figures announced.

4th—Indian Life Assurance Officers Association celebrates silver jubilee; Air-India International orders two Comet aircraft; River Research Institute opened; U.P. sets up Cow Enquiry Committee; Russia releases doctors held on murder charge.

5th—U.N. and Communists begin P.O.W. exchange talks in Korea.

6th—Russians arrest ex-Minister.

8th—Bombay Metal Traders' Association suspends trading; India and Iraq negotiate trade pact.

9th—Greece devalues currency.

10th—Hongkong relaxes ban on imports from Japan; Pakistan signs jute-wheat barter deal with West German firm; Japan buys Persian oil.

11th—P.O.W. pact signed in Korea.

12th—Madras Tramways Company suspends services; Australia announces grant to Pakistan for wheat purchase; Building Research Institute formally opened.

14th—Changes in tea excise duty announced; British Budget presented.

15th—Iron and steel scrap export ceiling announced.

16th—J.J.M.A. mission leaves for Australia and New Zealand; century of Indian Railways; further electric power cuts in Madras; Commissioners of Community Development Projects meet.

17th—Pakistan Governor-General dismisses Nazi-muddin Cabinet; India signs International Wheat Agreement; Malan's party wins South African election.

18th—No import licences to be issued for tea chests; Kidwai leaves for trade talks with Burma; new Pakistani Cabinet announced.

19th—All-India Railwaymen's Federation and Indian National Railway Workers' Federation decide to merge; Pakistan releases private seaborne trade figures for March; Egypt signs trade pact with Greece.

20th—P.O.W. exchange begins in Korea.

21st—Pakistan freezes all yarn stocks; annual general meeting of Bombay Millowners' Association.

22nd—Indian cloth output and export figures published.

23rd—Award of Bank Disputes Tribunal published; scheme for merger of Bombay and Sindia Steam Navigation Companies published; Pakistan amends Insurance Act.

24th—Knighthood conferred on Churchill; Pakistan issues final cotton crop forecast.

25th—N.A.T.O. approves defence programme of over \$70,000 million; steel allocations for July-September, 1953, announced.

26th—Plenary armistice talks begin in Korea.

27th—British road transport denationalisation bill passed; Persia cuts oil price by half.

28th—Nehru promises to appoint Linguistic States Commission; Russia offers to discuss five-power peace pact.

29th—Wool futures market opens in Britain; Iraqi oil production figures issued.

30th—Indian wheat offer to Pakistan reported.

The number of employed persons in the United States was 61,600,000 in mid-March, 1953, according to the U.S. Chamber of Commerce. This was a 560,000 gain from February and a 1.7 million increase over the level of a year ago.

Stocks and Shares

SHARES DULL BUT STEADY

GILT-EDGED EASIER: SELECTED JUTES IN DEMAND: SMALL TURNOVER IN IRONS

Wednesday Evening.

THE share market has been dull over the past week with much less business being done in all sections. Despite the small turnover prices show no sign of weakness, although the close today was below the week's best. This relative steadiness in face of several weeks' continued absence of demand is further evidence of the sound position of the local market. Little news of immediate market significance being forthcoming, speculators have lost interest but there is no inclination to sell.

Easier conditions prevailed in the gilt-edged market during the week, and the recent buying inquiry appears to have been satisfied, although there was scattered demand earlier for various dated loans. The 3% Conversion Loan 1966 once again turned sellers and was marked down sharply from Rs. 82-12 to Rs. 82-6, without attracting support. In short-dated loans, 3% 1958 eased by one anna to Rs. 98-8, but met with support at this level. Both 2½% 1954 and 2½% 1955 were taken at Rs. 98-5, but 3% 1957 was offered at Rs. 98-12. Among medium-dated loans, business was reported in 3% 1959-61 at around Rs. 98-8, while 3% 1963-65 and 1964 were both quoted at Rs. 92-14. The 2½% 1961 Loan had buyers and improved to Rs. 90-11, and 2½% 1962 met with good enquiry at Rs. 91-11. In the long-dated section, 3% 1966-68 was steady at Rs. 90-10, but 3% 1970-75 turned easier at Rs. 86-10. Little interest was shown in provincial loans.

There was a good demand for selected jute and miscellaneous Preference shares with buyers prepared to pay higher prices to obtain their requirements. In jute, Hastings, after being marked at Rs. 103 found buyers at Rs. 104, and Hooghly improved to Rs. 15-2. Kelvin were wanted at Rs. 119, Hukumchand at Rs. 114 ex-dividend, Howrah 7½ at Rs. 125, and the 'A' Preference at Rs. 118. On the other hand, Waverley were a shade easier at Rs. 44. Among miscellaneous issues, in the absence of offerings, very little business was completed. Dunlop Rubber 1st and 2nd and Burn 6½ and 7½ continued to be in good demand. Indian Iron and Steel met with strong enquiry up to Rs. 107-8, and Rohtas 'B' were wanted at Rs. 56-4.

In the Banking section, Imperial Bank Fully-Paid and Contributory were quoted nominally at Rs. 1,855 and Rs. 452, with little business being reported. United Bank of India were marked at Rs. 3-14.

No transactions were reported in Railway shares.

Business in Cotton shares was on a restricted scale. Basanti were marked at Rs. 3-13, Bengal Nagpur at Rs. 14-14, and Cawnpore Textiles at Rs. 8-6. Elgins were done between Rs. 16-12 and Rs. 16-14. There were sellers of Kesoram at Rs. 19-12 and New Victoria at Rs. 1-7.

Coal shares were dull and business was difficult to complete. Amalgamated were marked at Rs. 19-12, Bengal between Rs. 525 and Rs. 532, and Bengal Nagpur at around Rs. 14. Bharat Collieries were 2 annas better at Rs. 6-2 and Burrakur lost 4 annas to close at Rs. 10-8. Central India were unchanged at Rs. 4-15 and East India were reported at Rs. 22-14. Contrary to the general trend, there were ready buyers of Katras Jheriah at Rs. 43-8, Nazira at Rs. 16-6 and Rewa at Rs. 19-8 ex-dividend. Ronegungur, after being marked up to Rs. 9-4, closed lower at Rs. 9. West Jamuria were offered at Rs. 18.

Selected Jute shares met with some enquiry during the week, the outstanding features being Reliance and Gourepore which improved from Rs. 13-4 to Rs. 15, and Rs. 283 to Rs. 305. Towards the close however prices tended to sag. Business was reported in Agarpara between Rs. 19-2 and Rs. 19-6, Barnagore at Rs. 165, Champdany at Rs. 156-8, Delta at Rs. 231 and Ganges at Rs. 71-6. Birla met with buying support and were quoted at the higher rate of Rs. 37-4. Howrah after being done up to Rs. 24-14 closed easier at Rs. 24-7. Shares on offer included Belvedere, Caledonian, Dalhousie and Naitati.

In Electric, the only shares dealt in during the week were Patna New and Calcutta, the latter being supported at Rs. 14-5. There were buyers of Agra at Rs. 156, Bareilly at Rs. 13-14 and United Provinces at Rs. 158-8 cum the dividend of Rs. 5 per share which has been recommended for the half-year ended 30th September, 1952. Jubbulpore were freely offered at Rs. 14.

Steady conditions prevailed in the Sugar section throughout the week. Carew and United Provinces provided the outstanding features with their prices improving to Rs. 7 and Rs. 18. Closing quotations however were slightly below the best. Dyer Meakin Breweries were marked up to Rs. 6-4, Cawnpore to Rs. 29-8, and Champaran to Rs. 21. Belsund, Darbhanga and Samastipur were dealt in at around their previous quotations.

In the Engineering section Indian Iron & Steel fluctuated between Rs. 25-3 and Rs. 25-9 to close at Rs. 25-4. In the absence of any outside news

affecting the market, both bulls and bears showed little interest in this popular speculative counter, and there was a sharp contraction in the volume of business. Britannia Engineering had ready buyers at Rs. 19, Bharia Electric at Rs. 12-15, and Burn at Rs. 272. Indian Galvanizing New met with small enquiry at Rs. 12-8 as did Jessops at Rs. 24-11. Indian Steel & Wire Products Fully-Paid Ordinary were scarce at Rs. 62, while the Deferred and Contributory were freely offered at Rs. 37-4 and Rs. 16, without attracting buyers. National Iron eased to Rs. 5-10 with sellers over, while Britannia Building improved further to Rs. 6-4.

Features in the Miscellaneous section were Ganges Rope at Rs. 190 ex-dividend, Godfrey Phillips at Rs. 28-8 ex-dividend (Rs. 38 per share against Rs. 2 for the previous year), and Orissa Minerals at Rs. 35-8. Paper shares displayed a sagging tendency, with Orient being quoted at Rs. 32-8, Star Paper at Rs. 8-3, Shree Gopal at Rs. 19-2, and Titaghar at Rs. 35-2. Dalmia Cement were unchanged at Rs. 5-14, as were Sone Valley at Rs. 7-4. There were many sellers of Ruby General Insurance at Rs. 4-9, and Standard General were marked lower at Rs. 6-7. New Asiatic Insurance showed no change at Rs. 4-3. There was a good demand for Hercules and Triton Insurance at Rs. 29 and Rs. 156. India General Navigation met with limited support up to Rs. 85. Amongst other shares Balmer Lawrie were done at Rs. 295, with further sellers at this price, but Bararee Coke, after being sold at Rs. 17-10, found buyers at Rs. 17-12. British India Corporation were a shade better at Rs. 8-10, while Calcutta Trams were easier at Rs. 14-6. F & C. Osler declined to Rs. 5-3, but Indian Cables met with investment support at the higher rate of Rs. 18-9. There was good enquiry for Indo-Burma Petroleum at Rs. 55-8 and National Insulated Cables at Rs. 12-4. There were sellers of Martin Burn at Rs. 19, Metal Box at Rs. 19-8, and Shaw Wallace at Rs. 12-12. Textile Machinery were unchanged at Rs. 5-6.

With the labour strike continuing at the works of the Indian Copper Corporation, there were sellers of the shares at Rs. 2-14. Burma Mines were lower at Re. 1-1, while Consolidated Tin and Tavoy Tin shares were unchanged at Re. 1-4 and 9 annas.

Dull conditions prevailed in the tea section throughout the week and with the exception of certain low-priced shares, sellers were in the majority. With little interest being shown, however, business was on a restricted scale. Dhelakhat were marked down to Rs. 9-15, Dibrugarh to Rs. 7-2, and Sapoi to Rs. 8-12. Teesta Valley were reported at Rs. 17-8 and Singtam at Rs. 3-10. There were further sellers of Hasimara at Rs. 25-4, Bishnauth at Rs. 25 and Basmatia at Rs. 24-2, but no interest could be aroused. On the other hand, buyers continued to ask for Eastern Cachar at Rs. 3-2, Kaliti at Rs. 2-12, and Pathemara at Rs. 3, while Loobah were marked at Rs. 3, but sellers in all cases were scarce.

records in both attendances and business done will be broken. There is certainly every encouragement to do business, for perhaps the outstanding feature of this fair is the fact that changed circumstances have enabled manufacturers not only to bring down prices to what are undoubtedly competitive levels, but even more important, to quote delivery dates in weeks or months where previously they were given in months or years. Another noticeable development which is certainly worthy of mention is the increasing attention which British manufacturers are paying to the special requirements of particular markets—equipment for the needs of the underdeveloped countries, cheap and easily operated plant for remotefarmsteads—with particular attention to products hitherto supplied mainly by America, which has the two-fold objective of saving dollars in the Commonwealth and earning them by offering an alternative product in the dollar countries.

Wednesday saw the opening in London of the first wool futures market in this country. The trading on that day was reported as being brisk, but undramatic. The turnover was 56 contracts of 5,000 lbs. of Bradford 64s. Prices, representing in money some £180,000. Price variations were small, 158d. to 159½d. per lb. for the nearest position (September) and 139d. to 143d. for the most distant (October, 1954). It is significant that the initial London futures prices are slightly below current Bradford prices for actual tops at around 167d. per lb. The Yorkshire industry has shown some resistance to the new market, but it is agreed that growers, merchants and importers will find it useful, that it ought to bring in considerable earnings in foreign exchange, and ultimately that the public will benefit from lower and more stable prices. Already 33 overseas firms have become associate members. Nearly half of these are from the United States, but Belgium, Israel, Italy, Japan and most of the Commonwealth countries are also represented. The confidence of the sponsors has been justified.

The frigates *Bedale* and *Lamerton* of the Royal Navy, which are being lent to India, were formally handed over to Mr. B. G. Kher, the Indian High Commissioner, at a function at Trafalgar Dock, Liverpool, this week. They were renamed *Godavari* and *Gomati* for their new rôle in the Indian Navy.

Meantime, the Government, undeterred by Opposition threats, fears and even, at times, obstructions, is continuing to give effect in gradual stages to the policy which, rightly or wrongly, it feels will lead to the economic revival of the country. No time is likely to be lost when the Transport Bill receives Royal Assent next week in getting to work on the reorganisation of the railways and perhaps in the early introduction of more competitive charges, while City financing houses have already created machinery to aid private interests in the acquisition of road haulage fleets when the Disposals Board starts work, probably at the beginning of June. Government expenditure over a wide sphere is being brought under review. A departmental inquiry into the working of London Transport is to ascertain what practical measures can be taken to secure greater efficiency and economy to be set up soon. A further committee is to examine the working of the Health Service to ensure that full value is received for what is spent on it and to prevent it becoming a rising charge, and yet another committee, under the chairmanship of Lord Waverley (formerly Sir John Anderson) is to decide the best way to transfer responsibility for further development of atomic power from the Ministry of Supply to a non-departmental organisation. Finally, and this is of importance to overseas countries, there has recently been a decided change in the Government's policy on assistance to manufacturers exporting capital goods. The latter have been pointing out that to beat competitors on delivery, quality and price is still not enough to secure orders, for customers are now insisting on a lengthy repayment period. The President of the Board of Trade has recently announced that exporters could be given "greater freedom in granting credit terms which they wished to offer overseas buyers." This has been taken to mean that exporters may now be able to offer terms beyond five years—a development which the balance of payments position and growing competition would justify. At the same time, the Exchange Control Committee are unlikely to work to any hard and fast rule.

The Labour Party Executive spent last weekend putting the final touches to the five year plan.

The Select Committee on the Industries (Development and Regulation) Amendment Bill, in its report to Parliament, has suggested that punishment for contravening or attempts to contravene, the provisions of the Bill should be imprisonment which might extend to six months, or a fine which might extend to Rs. 5,000, or both. In the case of continuing contravention, the Committee has recommended an additional fine which might extend to Rs. 500 for every day during which such contravention continues after conviction for the first contravention. The punishment originally proposed in the Bill was imprisonment extending to three months, or fine extending to Rs. 2,000, or both. The Select Committee has also recommended that the Government should have the power to extend beyond five years the order under which taken over by it. It must, however, lay every order of extension before both Houses of Parliament.

All five members who have signed notes of dissent are agreed on the principle of the Bill. Amin feels that Mr. G. D. Somani and Dr. I. H. take over an industrial undertaking are "drastic" while others, including Mr. T. K. Chaudhuri and Mr. K. K. Basu, think that they are inadequate. The Committee seeks to ensure through an amendment that provisions requiring registered companies to obtain licences for producing new articles do not apply to undertakings owned by the Central Government. In another amendment, it says that the directions issued by the Government should override the memoranda and articles of association of the undertaking, taking them over by the Government under the Act. A new provision had been incorporated under the Act that a reasonable price is fixed for articles in respect of which orders are issued by the Government requiring persons holding stocks to sell part or whole of the stocks to such persons and in such circumstances as might be specified in the Government schedule of the Act. The Committee had also added a new provision that the Government schedule of the Act textiles, made wholly or partly from staple fibre, and also "other toilet

The next meeting of the Import Advisory Council will be held here on 22nd May under the chairmanship of the Minister for Commerce and Industry. The Export Advisory Council will meet on the following day.

A number of senior officers of the Central Government are proceeding on leave this summer. Ranganathan, who is working in the Works Ministry, Mr. S. Sunday and Mr. K. V. R. Pillai will go on two months' leave next month. The Joint Secretary to the Ministry of Puri will officiate for the Ministry. Mr. S. Boothalingam, of the Commerce Ministry, will officiate when Mr. H. V. R. lengar goes on leave for four months' deputation and Mr. B. Sachdev, from the Punjab Ministry, will become Director-General of Supplies and Disposals after Mr. Buch goes on leave. Later this summer the Defence Secretary, Mr. H. M. Patel, will go on leave. Mr. V. K. R. Pillai, Adviser to the Government of Patiala and East Punjab States Union, is to become Secretary to the Health Ministry.

The value of lac exports from India during 1951-52 was the highest so far recorded, according to the annual report of the Indian Lac Cess Committee. In quantity exports were the highest since 1914-15. Total exports were the highest since 712,736 cwts. valued at Rs. 14,84,904. The biggest purchaser of seedlac was the United States; the United Kingdom, which came second in total purchases, was the biggest buyer of shellac. Germany was the biggest purchaser of other types of lac and accounted for 77 per cent of the total exports of these types. The total estimated production of sticklac in India in 1951-52 was 1,219,400 maunds compared with 1,002,900 maunds in the preceding year.

The year 1951-52 was a period of reorganisation for the Indian Lac Cess Committee. On the research side a new programme relating to both the entomological and chemical sections of the Indian Lac Research Institute was inaugurated.

Every day, Bombay's 260 trams and 350 buses carry an average of 12,05,000 passengers. Every day, Bombay's Electric Supply and Transport Undertaking receives—through its Hollerith installation—closely analysed returns of this vast traffic: a contribution of inestimable value to the economy of a great Corporation serving a great community. Throughout Asia, Hollerith installations in leading industrial and commercial undertakings are contributing similarly to the promotion of efficiency and reduction of costs. CONTINUED PROTECTION FOR
SERICULTURE FAVOUREDNEED TO ENCOURAGE COTTON
TEXTILE EXPORTS URGED

(FROM OUR OWN CORRESPONDENT)

3rd May.

THE Tariff Commission has been conducting a public enquiry this week into the continuance of protection to the sericulture industry beyond 1953. Mr. M. D. Bhat, Chairman of the Commission, who opened the enquiry, said that in spite of the industry having been assiduously nursed by tariff protection and active financial assistance from the State Governments and the Central Silk Board over two decades, there did not seem to have been any significant progress, if volume of production and improvement in quality were any criteria. Mr. Bhat said that annual production in the three years up to 1950 was a little over two million lbs but had declined to 1.7 million lbs by 1952. Similarly while there had been some improvement in quality between 1948 and 1951, there was no evidence of any further advance in the last two years apart from Kashmir silk. Internal demand for raw silk was declining, he said, partly because of greater use of artificial silk and rayon and partly because consumers could not afford to purchase silk cloth. Finally, Mr. Bhat revealed that producers, importers, consumers and the Government were in favour of continuing protection though importers had asked for a reduction of the import duty.

Cotton Textile Problems

Mr. A. D. Shroff, who is in charge of the group of textile mills managed by Tatas, last week reviewed the present position of the textile industry at the annual general meetings of the Svadeshi and the Tata mills. According to Mr. Shroff, who is regarded as one of the leading authorities on this subject in Bombay, the cotton textile industry faced a difficult situation, because it could only maintain and improve the present high level of production if the progressive decline in the volume of exports could be halted. Production could be increased still further if the installed capacity of the industry was brought into operation, but this would be ruinous if the urgent problem of marketing was not satisfactorily solved. To do this, he said, it was necessary to reduce the price of cloth. Instead of aiding the industry's efforts to lower the cost of production, the Government put fresh burdens on it such as the Employees Provident Funds Act, Employees State Insurance Act and the levy of a cess of 3 pies per yard to assist the handloom industry. These have increased the cost to consumers, who cannot be expected, therefore, to buy more cloth. The only way the industry could reduce the price of cloth and maintain its position in international markets was to increase the pace of rehabilitation and modernisation. Mr. Shroff pleaded for more generous depreciation allowances and the immediate removal of the export duty thus giving added incentive to exporters. He feared that the inability of the industry to export 1,000 million yards a year might necessitate a curtailment of production and increase unemployment, which had already assumed rather large proportions.

Mr. Kilachand Honoured

At a function organised by the Bombay Oilseeds Exchange to present an address to Mr. Ramdas Kilachand, President, for services rendered by him to the oilseeds trade for many years, and especially for getting this Exchange recognised by the Government under the Bombay Forward Contracts Control Act, Sir Homi Mody gave some good advice to the business community. Sir Homi admitted that since the war the imposition of controls had made business more difficult and the

element of risk had increased. Relations between business men and the Government were not very happy, he said, though they had improved recently. His advice to trade organisations was to secure co-operation from the public by meeting consumers' grievances instead of merely passing resolutions. This could only be done if the business community established a high standard of business methods. Sri Homi said that Mr. Kilachand was an enlightened business man with a modern outlook who had rendered signal service to the oilseeds trade in Western India and he hoped that he would continue to take the same interest in future.

Bank Employees Condemn Sastri Award

May Day celebrations provided an opportunity for bank workers to demonstrate against the Sastri tribunal award at an open air meeting on the Chowpatty sands. Speaker after speaker condemned the award, and one even went to the length of making serious allegations casting reflections on the integrity of the tribunal itself, which he accused of being prejudiced against the workers because of the presence of interested members. The meeting, after condemning the Sastri award, pressed for the implementation of the Sen award. The resolution also implied that there might be a general strike by pointing out that unless the Sastri award was modified, bank employees would take it as a challenge to them and would fight the issue to the last.

May Day celebrations were organised here on a political party basis, each party stressing the need for unity in workers' organisations. The I.N.T.U.C., did not participate by sponsoring processions or meetings.

Mr. Nehru's Tour of Famine Area

The Prime Minister, Mr. Nehru, toured the scarcity and famine areas in Maharashtra this week, inspecting various relief works organised by the Bombay Government and addressing large meetings in the region. Mr. Nehru was impressed by the State Government's relief organisation and by the bearing of the people in the affected areas. He commiserated with the people and assured them that he would do everything possible to minimise their distress. Speaking in the extreme south of the State in the Kanarese areas, he decried regionalism of an extreme type as exemplified in the recent disturbances for the creation of a united Kannada State and the inclusion of the Bellary taluk in the proposed Andhra State. Mr. Nehru said, in a reference to increasing unemployment, that when the five year plan was completed, many new openings would be created for large scale employment. "The day is not far off when we will have economic plenty, employment for all and achievement of a minimum standard of living."

Requisitioning of Property

Mr. L. S. Dabolkar, President of the Property Owners' Association, broke new ground in his address at the seventh annual general meeting of the Association last Friday. He suggested that the legislature should treat the housing problem as one of national importance and should lift it above the level of party politics or sectional interests. He contended that rent control in Bombay State had ceased to be a subject for emergency legislation. Among other suggestions made by Mr. Dabolkar was that requisitioning of house properties by the authorities in peace-time be restricted to a minimum since such requisitioning on a large scale during the last few years had reduced private building activity. He also pleaded for a reasonable increase in rents of premises built before 1940 and for increased incentives for new construction, such as the provision of suitable building sites at a reasonable cost, loan facilities from banks and insurance companies and the provision of building materials at cost.

The amount of new life assurance business written by the Oriental Government Security Life Assurance Co., Ltd., in 1952 amounted to Rs. 21,22,44,571 from 71,359 policies.

Uttar Pradesh

FALL IN U.P. SUGAR
PRODUCTIONPROTEST AGAINST INCREASED
SALES TAX ON SUGAR

(FROM OUR OWN CORRESPONDENT.)

Lucknow, 2nd May.

A FALL in sugar production in the State is expected during the current season, and there have been complaints of short supplies from a few markets. To some extent the decline in production of cane has been offset by the increased sugar content of cane. It is stated that this year 9.78 maunds of sugar have been recovered from every 100 maunds of cane crushed by the factories compared to 9.40 maunds last year, which was a peak year for sugar production in the State. Sixty-six sugar factories were in production this season; in 21 of them crushing ceased by 15th April while in the rest it is expected to continue till 15th May. So far 180 million maunds of cane have been crushed yielding 645,000 tons of sugar. The figures for the corresponding period last year were 200 million maunds of cane and 710,000 tons of sugar. Even with the increased sugar content of the cane, total production this year in Uttar Pradesh is not expected to exceed 700,000 tons compared with 800,000 tons last year.

Sugar Merchants' Memorandum

The decision of the State Government to enhance sales tax on sugar from two pies to six pies in the rupee has evoked protests from sugar interests. The Kanpur Sugar Merchants' Association has submitted a memorandum to the Government arguing that the higher sales tax will affect the distribution system of sugar merchants. The memorandum says: "Under the sales tax constitution, the mills are free to despatch sugar outside the State without the charge of sales tax either from their mill godowns or from other distributing centres where booking facilities are available to them. The result will be that in order to swallow the sugar trade of various important centres in the State, the manufacturers will open their own sale depots and will despatch sugar outside the State, thus reaping the full advantage of the sales tax."

"The sugar merchants on the other hand," the memorandum points out, "will not be able to compete with these manufacturers at the distributing stock holdings at the rate of six pies per rupee which comes to As. 12-6 per maund. Naturally the customers of the various districts in the adjoining States will not purchase their requirements from the sugar merchants whose sugar will be cheaper than the sugar of the mill depots at such centres." Kanpur has been the main distributing centre for sugar in the State and it is stated that if refund of the sales tax is not allowed to the merchants on their stock holdings, their business will be ruined. Hitherto, when the sales tax was only two pies in the rupee, there was no great difference in price charged by the merchants and mill depots, but now it is feared that the mills will keep the sugar on their own account and oust the sugar merchants from the trade.

Employers' Association Meets

Presiding over the 16th annual general meeting of the Employers' Association of Northern India, which was held in Kanpur this week, Seth Munshi Jaipuria said that last year there was a general slump in business and the conversion of the labour situation into a buyers' market. The labour situation in Kanpur, he said, though not as peaceful as in the rest of India, was better than in the previous year. The declining rate of capital formation, the rising tempo of unemployment and other signs were, he declared, "pointers to the fact that the taxable capacity of this country has almost reached the recommended limit." Mr. Jaipuria generally welcomed the recommendations of the Planning Commission, in particular its suggestion that wages should be related to productivity. "The employers should get more wages, but such wages should be related to the productivity of labour and the capacity of the industry to pay."

Rice Purchases Suspended

The U.P. Government has decided to suspend further purchases of rice, including Nepal rice, which were being made on behalf of the Government of India for the requirements of the deficit States. There is also to be no procurement of wheat, although barley and gram procurement was begun last month. The Government may collect a few thousand tons of coarse grains this season, the exact quantity being determined by the offtake from their present stocks of over 500,000 tons. In an effort to unload some of these stocks the Government offered them on auction, but prices were too low and they have been withheld while the position is reviewed.

Rope from Rice Stalks

The workshops of the Agriculture Department are conducting experiments on the possibility of manufacturing an economic type of mechanical appliance for making ropes and matting out of rice stalks. The State Government some time ago obtained from Japan a machine for this purpose and it is proposed to produce more machines locally on the same model.

A small increase in the production of paper has also been reported in the State—from 1.18 lakh cwts to 1.22 lakh cwts. The production of straw and paper boards has also recorded a small

Plantation Topics

CONTROL OVER TEA PRICES
AND DISTRIBUTIONMR. KRISHNAMACHARI EXPLAINS
AIMS OF NEW BILL

THE Commerce Minister, Mr. T. T. Krishnamachari, moving the Tea Bill for consideration in the House of the People on 2nd May explained at some length the changes introduced by the Select Committee. The Committee, he said, had recast Clause 31 because it felt that, in order to have effective control over the tea industry, the Government should be able to control not only prices but also the distribution of tea. In regard to export quotas, it had suggested that no quota should be allotted to a tea estate which did not co-operate with the aims of the Bill. Apart from estate owners, manufacturers, brokers and dealers should also be made to furnish returns. The penalty clause had to be recast.

The Commerce Minister referred to the report of his Secretary, Mr. H. V. R. Iengar, who toured recently the tea districts in Assam. According to Mr. Iengar, two elements in the industry faced special problems. One was Cachar district, and the other was the Indian section of the industry. In Cachar district, soil conditions were very different from those in the rest of Assam. Planters there felt that their tea gardens suffered natural handicaps as compared to those in other parts of Assam. The price of tea grown in Cachar was at least four annas a pound less than that of teas from Assam Valley. As regards the Indian section of the tea industry, the Commerce Secretary felt that its condition was bad. It owned inferior land and did not have enough money. Financial stringency compelled it to economise on items where it was fatal to economise, namely, the provision of fertilisers, shade, trees etc. Methods by which the Government could either develop a land mortgage institution or otherwise provide assistance to poor tea gardens were being considered. It was intended to give aid, not doles.

Foreign Interests

Mr. Krishnamachari went on: "The other factor is that 80 percent of the industry is in the hands of people who are not sons of the soil. I have no intention of disturbing their position by a stroke of the pen, because oftentimes it happens that when an estate is sold somebody in Bombay buys it for a price he is asked to pay, he looks to the returns of the last five years and pays Rs. 75 lakhs merely a speculator and he would like to make money by trying to sell it for Rs. 80 lakhs but when the prices go down he is not interested and he writes it off as loss. Whether the Income tax Department will allow it to be set off against his other income or not is a different matter. That is not the type of people we want in the industry."

"As regards participation by foreigners the process of change has to be gradual. I have no intention of discriminating against foreigners in this industry provided they play the game. The last Chairman of the Indian Tea Association and his Deputy were positively obstructive. We have at the present moment a Chairman who came and saw me the other day. He looks to be a reasonable man, at any rate realistic. He sees that there is no point in fighting with the Government. Of course, vested interests are not always like that and do not realise it very often, and if at any time they vested interests fight the Government it is they who suffer and not the Government. I do believe it is possible to obtain the best of both worlds for the changes that we want to effect for the betterment of labour, for better production and also to establish a name for Indian tea, which we are fast losing merely because of better propaganda and better sentimental support for Ceylon tea. So while I recognise the presence of the foreign element in the industry, I would also beg of them not to stress on the point because the mere elimination of the foreign element does not produce something which is better. I would like you to know the circumstances in which we are placed and see that the national industry is improved and at the same time that our labour gets a fair and square deal. This Bill is one step towards that end."

Wages and Amenities

The Commerce Minister said that the cost structure of the industry would determine whether it could pay reasonable minimum wages and give labour the amenities regarded as essential: the price paid for the product was the determining factor. "We cannot but adjust our cost structure to the prices that will be available for tea in the export market. So it becomes a matter of pre-emption when we are not sure whether this industry will support a high wage structure. It might or it might not, but the factors on which it is dependent are not the factors which are under the control of the Government, or for that matter anybody, unless the industry is subsidised."

The Commerce Minister spoke of the industry having enjoyed an uninterrupted period of prosperity since 1931 and declared that there must be something radically wrong with it if it did not build reserves for wage equalisation and to meet losses. This fact made it necessary that the Government become a conscious and deliberate partner in this industry rather than abdicate its right in favour of one or the other type of vested interests. In conclusion, he said the Government

would not dominate the Tea Board, but would exercise its powers consistent with its obligations to the industry and to the economy generally. The Government bore a responsibility to consumers also, and no vested interest, however powerful, could rig the market and thwart its wishes. "I am not going to accept the position in which I will hand over the industry to vested interests."

LONDON TEA SALES

Offerings of 13,924 packages of Ceylon tea on 28th April, met improved but rather selective demand. Better class teas were well supported and where quality was better prices advanced by 1d to 3d per lb. Where quality was unchanged, prices were half to one penny higher. Poorest Mediums and low grown teas showed no significant price change. Some export demand was noted. Clean Common Broken Pekoe were indicated around 41½ and Low Broken Orange Pekoes at 42½ to 43½. Offerings of 5,003 packages of Southern Indian met generally a ready clearance, especially better qualities. Plain sorts were sometimes easier. About 23,116 packages of North-Indian, Pakistan and other miscellaneous kind which were offered on 29th April met generally good demand for all descriptions. Prices were about steady except for dull liquoring low types which generally moved in buyers favour. Certain amount of export demand were chiefly on Continental account reported. Clean Common Broken Pekoe, stalk free, was quoted at 40½, per lb. against 40-½d. to 40½, previously.

Results of some of the companies are given below:—

	No. of packages	Aver. per lb.
Amalgamated	798	3/ 6½
Assam Co.	1,386	3/ 8
Assam Frontier	1,596	3/10½
Buxa Doars	554	3/ 7½
Central Province	732	4/ 1
Cons. Estates	498	4/ 0½
Cons. Tea and Lands	1,388	3/ 5½
Darjeeling Co.	106	3/ 8
Doors	1,014	3/ 4½
Eastern Assam	678	3/ 9½
Eastern Produce	1,092	4/ 3½
Jhazie	368	3/ 6½
Jokai	1,843	3/ 8½
Jorehaut	1,109	3/ 7½
Lunuvu	1,056	4/ 2
Malayalam	1,170	3/ 8½
New Dimbula	84	4/ 6½
Single	419	3/ 6½
Standard	438	4/ 5½
United Planters	360	4/ 4
Upper Assam	612	3/ 6½

COCHIN TEA SALES

At Sale No. 9 held on 28th April 1953, about 1,370,000 lbs. were printed for sale. Quality showed a seasonal decline and there were very few teas as was apparent that there were only limited orders with flavour on offer. Demand was weak and it was in hand. Commonest types were firm but all others were considerably easier to buy according to quality. Low mediums and mediums were irregular and showed from 1 to 2 annas drop in value while the better medium types were three annas down. High grown teas took the brunt of the weaker demand and were sold between eight and twelve annas per lb. below last rates. Pairings grades of all descriptions were not so popular as in recent sales while O. Ps. were mostly neglected.

	Rs. as ps.	Rs. as ps.
Low Grown Travancore	B. O. P. 1 11 6	1 13 0
Medium "	B. O. P. 1 14 0	2 0 0
Anamallai	B. O. P. 2 1 0	2 4 6
Best liquoring Nilgiri	B. O. P. 2 9 0	3 3 0
Black well made	O. P. 1 15 0	2 2 0

Limited business has been done in Special Licence Export Quota at 14 pies. New Seasons is quoted at 11 pies and brisk business has been done at this rate. The market is inclined to tend easier. Export Sale No. 10 will be held on Tuesday, 12th May 1953 at 9 a.m.

TOBACCO ESTIMATE

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, the all-India second estimate of tobacco, 1952-53 puts the current year's area at 743,000 acres as against 750,000 acres of the corresponding adjusted estimate of last year. This is a nominal decrease of 7,000 acres. The decline in acreage has occurred particularly in Madras. This fall has, however, been offset to a large extent by increases in Bombay and Hyderabad. The information given in this estimate covers the period up to the end of February, 1953. Till then the condition of the crop was reported to be generally satisfactory except in Madras, where the crop was adversely affected by delayed and insufficient rains in many districts. Besides the ground-battle attack in Guntur and a cyclone in November, 1952 in the Tanjore district also caused some damage to the crop. This estimate does not cover the entire area sown to tobacco. Past experience shows that the acreage at the Supplementary (Final) Estimate stage is about 6 percent higher than the second estimate.

Castings of
Infinite variety

for railways

The uses to which cast iron is put by railways are innumerable. Cast iron chairs and bearing plates, pipes of all kinds, pillar water cranes for locomotives and water tanks are only a few of these. ISCO manufacture all these and many other products for railways with the utmost skill.

in Madras... they know that

more motorists use triple-action Mobiloil

than any other motor oil in the world!

The people of Madras, endowed with an enviable gift for pronouncing long names, are also noted for their proficiency in mathematics. The Madras motorist, for instance, has no hesitation in saying 'Mobiloil' as he pulls in at the sign of the Flying Red Horse; and on adding up his accounts, he readily proves that Mobiloil reduces his running costs.

Like his fellow motorists all over the world, he knows that Mobiloil is a Heavy-Duty oil, giving greater protection than regular or premium-type oils — and can see for himself that it...

SAVES ON WEAR by lubricating properly at all temperatures;

SAVES ON REPAIRS by preventing harmful carbon deposits in the engine;

SAVES ON PETROL by preventing acids eating away the metal parts, which causes loss of power.

Stop at the sign of the Flying Red Horse

The Flying Red Horse is the sign of helpful service for your car. Go there for regular Mobilubrication — the complete motor service — and for Standard-Vacuum products backed by 87 years of leadership in the oil industry.

Jute

THE INTERNAL MARKET FOR JUTE MANUFACTURES

THE Indian Central Jute Committee recently issued a pamphlet by Mr. A. K. Mukherjee, the Committee's Publicity Officer, entitled "Structure of the Home Market for Jute Goods." The purpose of the pamphlet is to examine the trends of consumption of jute goods in the Indian market and to suggest that measures should be taken for its development. It is copiously supplied with statistics showing the comparison between internal and foreign demand for jute manufactures and between home demand for jute bags and jute cloth. Unfortunately these statistics start off with the year 1930 and, as the years 1930 to 1933 were slump years, no dependable inference can be drawn. The statistics for the internal market show a general trend towards expansion over the period in question but it would have been more enlightening if the figures had started off with, say, those of 1925. It would also be advantageous to have information regarding crops, prices and other local conditions to explain divergences from the general trend. As for the war years, conditions were so unusual that the statistics for these years can provide no guide.

In the post-war years Mr. Mukherjee notes a declining trend in internal consumption but it has to be borne in mind that, from 1947, the figures for internal consumption presumably exclude Pakistan. The large wheat producing areas in the north-west were a good market for jute bags as were also the rice-growing districts in what is now Pakistan. There can, therefore, be no proper comparison between the figures for the years before partition and those immediately afterwards. In fact what was once a good part of the internal market is now a foreign market supplied in a large measure by its own growing industry.

Apart from these criticisms it is satisfactory that attention is being drawn to the internal market which is by no means small and could be developed further. In fact there are markets within India, for instance the South India market for onion bags, which have been lost to the jute industry in the past 20 years or so. It might be worth investigating why this business has been lost and whether it can be recovered. Another matter which could be enquired into is why so many difficulties are put in the way of transport of jute goods to other parts of India by rail. In some areas the obstacles are so great that scarcity conditions have been created which make jute goods dearer than they should be to the Indian user.

THE JUTE MARKETS

Manufactured Goods: The upward tendency which was noted last week continued and there was considerable activity up to the last day of April. Quotations were Rs. 40-12 for 10 oz. 40" hessian and Rs. 90-8 for B. Twills for May shipment on the morning of 29th April, and by the evening had moved up to Rs. 42-6 and Rs. 94-4. Mills took advantage of the rise to sell considerable quantities of both hessian and heavy goods. This spurt was attributed in part to bear covering by speculators and shippers, the latter showing some eagerness to secure goods for 15th May shipment. Bulls were also reported to be operating for forward deliveries, having taken courage from reports of continued drought in the jute-growing districts and the virtual certainty of crops being smaller than last year. Good business was reported with American buyers and there were persistent reports that the Argentine had called for further offers of hessian. Prices rose further on 30th April and at one time touched Rs. 43 for 10 oz. 40" hessian and Rs. 95-4 for B. Twills for May. Mills made further sales and there was profit-taking by bulls, while bears had completed their covering and a reaction set in with the closing quotations down to Rs. 42-6 for 10 oz. 40" hessian and Rs. 94-4 for B. Twills. On 1st and 2nd May bear-covering having spent itself and there being no fresh incentives, prices continued to decline. Monday was a quiet day with prices easy and little activity. These conditions continued on Tuesday and reports were current that stocks of heavy sacking had increased during April, though these reports did not tally with the statements made previously that good shipping instructions had been received. Late on Tuesday afternoon the market again firmed up. There is good demand for specialities but mills are not keen on accepting business because the prices offered do not give sufficient premium over standard makes to cover the extra cost.

The market opened steady but quiet on Wednesday morning with quotations as under:

	Ready	May	June	July-Sept.
	Rs.	Rs.	Rs.	Rs.
40" 8 oz.	32-14	33-0	33-0	32-2
40" 10 oz.	41-12	41-14	42-0	42-4
Heavy Cees (Plain)	94-0	94-0	94-0	94-0
B. Twills	92-6	92-12	93-0	93-8
Corn sacks	94-4	94-4	94-8	94-8

Raw Jute: Firmness in the goods market and unfavourable crop reports produced their natural effects on raw jute and prices tended upwards in the early part of the week. Good business was done with mills at advancing rates in the last few days of April and by Saturday quotations for Assam Bottoms had moved up to Rs. 23-8. The easier tone in the market for manufactures after

the end of April was reflected in a reduced turnover in raw jute, but there was resistance to price-cutting because of firm conditions in the mofussil where imports were reported to be increasingly scarce. In the absence of business, however, sellers weakened, and during the week-end small business was reported at prices well below the quoted rates. Premiums continue to be paid for the higher grades of white jute, tossa and daisee but the quantities available are small. While the undertone is steady because of expectations of a small crop sellers are very sensitive to price movements in the manufactured goods market and on Tuesday afternoon conditions were somewhat firmer.

During the week the following business was reported:

Pakistan Jute:

Pakistan Jat:—Rs. 31 per md. for Middles only for one month's shipment from Pakistan.

Rs. 22-8 to 25 per md. basis Bottoms for one month's shipment from Pakistan.

Pakistan District: Rs. 22 to 24 per md. basis Bottoms for one month's shipment from Pakistan.

Pakistan Jat: Rs. 24-8 per md. for Bottoms ex Calcutta.

Rs. 22 per md. for HJ ex Calcutta.

Indian Jute:

Dhubri (Supervised): Rs. 23 per md. basis Bottoms for one month's shipment.

Dhubri: Rs. 21-8 to 23 per md. Bottoms for one month's shipment.

Assam (Supervised): Rs. 22 per md. basis Bottoms for one month's shipment.

Assam: Rs. 20-8 to 23-8 per md. basis Bottoms for one month's shipment.

Rs. 19-8 per md. basis Bottoms for one month's delivery.

Northern (Tossa): Rs. 26 per md. basis Bottoms for one month's shipment.

Northern (White): Rs. 21-8 to 24 per md. basis Bottoms for one month's shipment.

Rs. 20-8 per md. basis Bottoms for one month's delivery.

Bongaon Tossa: Rs. 20-8 to 21 per md. basis Bottoms for one month's shipment.

Dhulian Tossa: Rs. 20 per md. basis Bottoms for one month's shipment.

Murshidabad Tossa: Rs. 20 to 22 per md. basis Bottoms for one month's shipment.

Local Packing (free from Jungli): Rs. 18-8 to 20 per md. basis Bottoms for one month's delivery.

Cut Mesta: Rs. 23 per md. basis Bottoms for one month's delivery.

Mesta: Rs. 20 per md. for X Bottoms for one month's delivery.

Mesta Cuttings: Rs. 60 to 62 per bale.

Daisee (guaranteed free from samla): Rs. 30-8 to 32 per md. for Middles only for one month's delivery.

Daisee: Rs. 26 to 28 per md. for Middles only for one month's delivery.

Rs. 22-8 to 24 per md. basis Bottom for one month's delivery.

Pakistan NC Cuttings: Rs. 70 to Rs. 75 per bale for one month's delivery ex Local Godown.

Special NC Cuttings: Rs. 82 per bale for one month's delivery ex Local Godown.

Mill Reds: Rs. 180 to 185 per bale for one month's delivery.

Mill Firsts: Rs. 165 per bale for one month's delivery.

Quotations on Wednesday morning were as follows:

Pakistan Jute:	Rs	Landed at Mill
Jat District	24-8	per md. basis Bottoms
Northern	23-8	"
	23-8	"

Indian:

Lower Assam	22-0	"
Upper Assam	23-0	"
Northern	23-0	"
Murshidabad	20-0	"
Bihar	19-0	"
Bimil	18-0	per md. F. A. Q.
Daisee	23-0	per md. basis Bottoms
Mill Firsts	150-0	per bale
Mill Lightnings	135-0	"
Mill Hearts	120-0	"
Dundee Daisee (S.G.)	150-0	"
Dundee Daisee (L.G.)	135-0	"
Indian N. C.	65-0	"
Pakistan N.C.	70-0	"

For Indian jute sellers are asking the option of delivery ex Calcutta. Tossa is quoted at Re. 1 per md. above the rate for white jute.

Mofussil: In Pakistan imports are small and decreasing. Early in the week the market was excited with good enquiry from abroad at higher prices but this appears to have fallen off. A fair amount of business was reported with India, especially in low qualities for export as Bottoms. Good qualities are in demand by balers and premium prices are being paid, especially for tossa. The market is now easier and prices are lower. In Narayananj the highest prices touched were Rs. (P) 17-8 for Jat Bottoms and Rs. (P) 95 for Export Firsts but on Tuesday Jat Bottoms were down to Rs. (P) 15-8 and Export Firsts to Rs. (P) 92. The weather has been more favourable for sowing and for the young plants but the general opinion is that the crop will be less than half of last year.

In India it is reported that there are hardly any imports coming in from the cultivators and arrivals in the hats are from arathdars, mahajans and other stockists. Cultivators' stocks are reported to be very small but there are fair stocks in the hands of middlemen. Quality is poor and there are hardly any Middles in the present imports. Prices are above the parity of those in Calcutta. The weather in Assam is favourable and sowings are progressing. In central Bengal no sowing or ploughing has been done but rain during the week-end will allow ploughing to commence. In Bihar there have been scattered showers but the drought continues in most places.

WEATHER RETARDS SOWING AND PREPARATIONS FOR INDIAN CROP

In their seventh crop report of the current season covering the week ended 2nd May Messrs. Sinclair Murray & Co. Ltd., say that the weather has been hot and dry in most districts and although this has been favourable for the standing crop in Assam it has not been conducive to sowings in districts of West Bengal and Orissa. In Assam sowings are almost completed and plant condition in general is satisfactory. In other parts of India sowings are still suspended but over the weekend rainfall has been experienced in most districts which should help cultivators to proceed with the preparation of land and to commence sowings in earnest. River levels in Assam are normal to slightly higher than at this time last year.

DANPUR: (Orissa) The weather has been hot and dry and this is unfavourable for land preparation and sowings. Some rainfall however was experienced towards the end of the week but heavier rainfall is still required before crop progress can be made to any appreciable extent. We estimate however, that to date 1/2 of sowings have been done as compared to 1/4 of the corresponding date last year. The river level is abnormally low for this time of the year.

JAIPUR ROAD: (Orissa) The weather has been hot and dry but moderate rainfall was experienced

THE INDIAN OVERSEAS BANK LTD., MADRAS

For those who trade abroad The Indian Overseas Bank provides an efficient service through its own branches and a world wide system of Agents and Correspondents.

SAFETY LOCKERS: For those people who prefer to keep their documents and valuables etc. under their own private control, SAFETY LOCKERS of various dimensions are available at our Calcutta Branch.

towards the latter end. However, more general rainfall is still required before land preparation and sowings can commence.

RAVAGHAT: (West Bengal) The weather continued to be hot and dry but light rainfall was experienced over the weekend. Land preparation has been started but to date no sowings have taken place against -8/- sowings at the corresponding date last year.

COSSIMBAZAR: (West Bengal) The weather was extremely hot and dry but some rainfall has been experienced over the weekend. Land preparation has begun where possible. Sowings to date are nil as against -5/4 at the same date last year. Heavy showers are urgently required to enable full preparation of land to take place.

NOWGONG: (Assam) The weather has been hot and dry and further rain is essential for the growth of young plants and for the continuation of sowings. To date we estimate that -10/8 has been sown as against -14/- last year at this date. Plant condition is still satisfactory and they range in height from seedlings to 2' 3". Weeding operations on low and midlands are being carried out freely. The river level is somewhat higher than normal and higher than at the corresponding date last year.

GAUHATI: (Assam) The weather has been fairly favourable with good sunshine and a few light showers of rainfall. Sowings of White jute are now completed and it remains for further sowings of Tossa to take place for completion of sowings. To date, we estimate that -12/8 sowings has taken place as against -16/- completed sowings at the corresponding date last year. It is estimated that -1/- damage has been experienced in the lowlands due to excessive rainfall previously experienced. Plant condition is satisfactory and they are healthy ranging in height up to 3' 6". The river has fallen during the past week and is now normal for this time of the year.

DHUBRI: (Assam) The weather has been favourable due to heavy showers and this has been beneficial for the standing crop. Sowings to date amount to -11/- as against -16/- completed sowings at the same date last year. Plant condition is satisfactory and they range in height up to 2'. Second weeding on lowlands are completed and first weeding of the midland crop should be completed in the near future. The river level has fallen slightly during the week but is still 2' 5" higher than at the corresponding date last year.

KHARUPETIA: (Assam) Weather conditions have been favourable for the standing crop and for promotion of sowings due to alternate spells of sunshine and rainfall. Sowings to date amount to -11/- as against -15/- sowings at the same date last year. The condition of the standing crop is satisfactory and plants range in height up to 2' 3". Weeding operations are being carried on as required and the river level is normal.

DAISEE DISTRICTS: The weather has been mainly hot and dry but there has been some scattered rainfall in some areas. Rainfall experienced is not yet enough to promote land preparation and sowings are still being held up. Sowings to date amount to only -11/- as against -12/- sowings at the corresponding date last year. The condition of young plants is very unhealthy and they are not making satisfactory progress. Since the above report, we have now had a further report that satisfactory rainfall has been experienced during the weekend in some districts but full particulars are not yet to hand.

SOWINGS COMPLETED IN SOME PAKISTANI DISTRICTS

In their ninth crop report of the current season covering the week ended 2nd May Messrs. Sinclair Murray (Pakistan) Ltd. say that the weather has been mainly favourable in that general rainfall has been experienced to allow completion of sowings in the Eastern districts and for continuation of sowings in the Western districts. River levels are in the main normal, although in Western districts the rivers have risen steadily and are reported higher than at this time last year.

NARAYANGANJ: Sowings completed -8/- The weather has been favourable and sufficient rainfall has been experienced to enable cultivators to complete highland sowings. Plants are generally healthy and range in height from seedlings to 3". Weeding operations are being carried on as required. The river level is about 1' higher than at this date last year.

DACCA: Sowings completed -8/. Apart from a slight shower during the early part of the week, weather has been mainly hot and dry. More rain is necessary to assist the growth of young plants. Condition of young plant is satisfactory and they range in height up to 2' 3". The river is slightly lower than last year.

CHANDPUR: Sowings completed -8/. Favourable weather has been experienced with alternate rain and sunshine which has enabled cultivators to complete sowings in the highlands. Plant condition continues to be satisfactory and they range in height from seedlings to 2' 9". The river level has risen over 2' during the past week and is now about 1' higher than in the corresponding period last year.

HAIJIGANJ: Sowings completed -7/-. Favourable weather has been experienced with alternate rain and sunshine to allow cultivators to complete sowings in the highlands. Germination in the midland area has been reported as somewhat unsatisfactory as insufficient rainfall was experienced before the time of sowing. However, plant condition is satisfactory and they range in height from seedlings to 1' 3". The river level has risen during the past week and is now slightly higher than last year at this time.

AKHOURA: Sowings completed -8/-. The weather has been mainly favourable but more rainfall is necessary to promote growth of the standing crop. Sowings have now been completed in the highlands and the condition of plants has improved with the recent rain and they now range in height from 3" to 1' 3". Weeding operations are going on as required. The river level is normal for this time of the year.

ASHUGANJ: Sowings completed -8/-. Sufficient rainfall has been experienced to allow cultivators to complete sowings in the highlands. The condition of young plants is satisfactory and they range in height from 3" to 2'. Weeding is going on freely as required. The river has risen during the past week but is still slightly lower than last year at this time.

NIKILIDAMPARA: Sowings completed -6/3. Although some scattered rainfall was experienced earlier in the week the weather has been hot and dry and rain is still urgently needed to promote growth of the young plants. Sowings have now been completed and weeding operations are in progress in the low and midlands. Plant condition is very satisfactory owing to inconsistent rainfall which has retarded their growth. The river level is the same as at this date last year.

SARISHABARI: During the early part of the week the weather continued hot and dry but some scattered showers were experienced towards the latter end, which has allowed cultivators to resume sowings. To date, we estimate that -8/- have been sown as against -16/- completed at this time last year. Plant condition is still generally favourable and they range in height from seedlings to 2' 6". The river has been rising steadily and although the rise is now checked, it stands at about 7' higher than last year at this time.

SERAJGANJ: The weather has been mainly hot and dry although heavy rainfall was experienced towards the latter half which was beneficial for the progress of sowings and growth of plants. Sowings have been commenced on the highlands and to date we estimate -5/- has been sown as against -16/- completed at the same time last year. Plant condition is now satisfactory and they range in height from 1' 9" to 3' 3". Weeding is being carried on as required. The river has risen 1' during the past week and is estimated to be 5' higher than last year at this time.

NAKALIA: Alternate rain and sunshine has been experienced and sowings have been recommenced. To date, we estimate that -8/- has been sown as against -13/- at the same time last year. Plant condition is now fairly healthy and they range in height up to 3'. There are reports in the midland areas that being re-sown. The river is rising and is about 3' 6" higher than at the same date last year.

BIANGOORA: Weather has been hot and dry with only scattered rainfall and more rain is needed for promotion of sowings and young plants. To date we estimate that -5/- of the crop has been sown as against -15/- completed at the same time last year. Condition of plants is not very satisfactory and they range in height from seedlings to 1' 3". Weeding operations are going on in lowlands as required. The river has risen during the past week and is about 1' 3" higher than at the corresponding date last year.

THE FOREIGN JUTE MARKETS

TRADE CONTINUES TO IMPROVE
(FROM OUR OWN CORRESPONDENT).

Dundee, By Air Mail.
Improvement in the jute trade has continued and the general opinion is that the prolonged spell of dull trading is over. The placing of orders for hessians by the Argentine has greatly assisted the overall position and now we have raw jute values tending to advance. A number of shippers are quoting prices in excess of those prevailing in Pakistan, and all those who were naming less than the minimum rates have withdrawn. Mill Firsts are quoted at anything from £85 to £99 per ton. Mill Lightnings, which could formerly be bought at £72 are now from £75 to £78, all c. and quoted, said to be due to scarcity, but Tossa—4's can be bought at £87 for crack marks and £82 for grade c. and f.

Prices for Calcutta hessians have risen to 78s. 0d. for 10 oz. 40 in. and 58s. 0d. for 7½ oz. May/June, while "B" twills are up to 157s. 0d. and Liverpool twills to 178s. 0d., May/June, all f.o.b. Calcutta.

Commodity Markets

WORKING PARTY FOR COTTON TEXTILE INDUSTRY REPORTS

REHABILITATION OF MACHINERY

AN URGENT NEED
THE Working Party for the Cotton Textile Industry, whose report is now available, has made some important and useful recommendations on the rehabilitation of the industry. It says that most of the plant and machinery is not only old but also completely outmoded; renewal is an urgent problem for grossly inadequate attention has been paid to maintenance. The remaining life of machinery is very limited. Production is poor and involves higher costs for mills. Workers are at a disadvantage in discharging the proper workload because of the nature of the machinery. To add to the complexity of the situation, certain mills changed hands and have come under the management of persons who have little knowledge of the industry. The Working Party therefore urges that in the interests of consumers, of labour and of the economy generally, proper rehabilitation, renovation and replacement of plant and machinery should be undertaken.

Financial Needs

Finance for rehabilitation is the next question discussed by the Working Party; it regrets that despite specific recommendations, warning by the Government spokesmen and the lessons of the first World War, profits made during the war years and particularly after 1943 were distributed on a vastly larger scale than ever before. The magnitude of the problem could be judged by the fact that Rs. 80 crores were needed for the rehabilitation of the industry in the Island of Bombay alone, against only Rs. 30 crores in reserve and other funds earmarked for new machinery. The Millowners' Association had a plan under which a small cess varying from six pence to ten pence should be added to the ex-mill prices of cloth and yarn for a period of ten years to form a fund to be drawn upon by mills for rehabilitation. The plan can only be worked under the scheme of price control and it seems that the Millowners' Association expects controls to continue for at least ten years. Another suggestion made by some units of the industry was that a portion of the present excise duty on cloth and yarn should be given as loans to various units. A third proposal is to withdraw the excise duty and permit the industry to collect a surcharge varying according to the nature of the cloth; the amount so collected would be deposited to the credit of the rehabilitation unit with the Reserve Bank of India for the rehabilitation amount under the Income Tax Act by each unit would in turn be credited to the Government from this surcharge credit with the Reserve Bank. The Working Party, however, holds that it would be difficult to justify the virtual grant to mills of an amount representing all surcharges less depreciation. It recommends that the money can only be found by a loan granted by the Government at a low rate of interest, not exceeding four percent.

Other Recommendations

The following are some of the other recommendations of the Working Party:

"While we are in sympathy with the general opinion expressed by the textile industry that it may be left free to cater to the needs of the consumer without the irksome intervention of the present control measures, we are equally clear that unless the industry as a whole is in a position to put its house in order and adopt measures which will expose erring members and mete out suitable punishment to such, if necessary, by claiming powers from the Government for such reform measures, it will be difficult to get out of the era of controls which many of them desire.

"We would strongly recommend that a more consistent policy should be followed by State Governments without exception, and that without interfering with the grow-more-food campaign priority should be given, at least with respect to areas where cotton was being grown a decade ago, to the growth of such cotton. It is clear that strenuous efforts must be made to enlarge the area of cultivation where staple and long staple cotton can be grown and to give every facility States where such areas existed to grow such varieties. These States, however, would need an assurance from the Centre that their requirements of food would be adequately met if it is found necessary by them to divert certain areas of low food production to the comparatively high yielding cotton production of the requisite staple and long staple kinds.

"We see no objection to mills being permitted to use larger quantities of staple fibre and to import such fibre as a means of relieving the shortage in cotton supply, provided it is made perfectly evident to the consumer that the cloth produced is of staple fibre.

Changing Patterns of Production

"The evidence and report of the Technical Sub-Committee reveals that, in quite a number of mills, there is constant change-over from one pattern of production to another pattern of production at somewhat short intervals. A large number of mills producing a large variety of cloth and

certainly been a source of diminishing the quantity, and in fact putting on the market types of cloth which are often unwanted.

"The present system of distribution involving the nominees of Government taking the cloth wanted and unwanted together, and trying to recoup their loss on the unwanted by larger margins on the wanted, has made it easy for some mills to go in for this variegated system of production. Some of the mills at least have gone in for types of cloth which they know may not be easily consumed partly because they have no responsibility for its distribution and ultimate sale and partly because the margin of profit thereon is better than on other qualities.

"We feel in the light of what we have seen regarding the production programme of various mills and the complaints about the nature and quality of cloth produced by mills that the recommendations made by the Textile Production (Control) Committee, 1948, regarding the regulation of mill production may now be implemented by the Government, particularly as they have had the full support of the industry's representatives on the Committee. We feel that the lead and whatever measure of control is necessary regarding the regulation of mill output may preferably come from the industry itself; that millowners' organisations are best calculated to check the tendency to produce unwanted cloth or cloth of inferior quality by some of the mills; and that provided millowners' organisations can exercise the power to take punitive measures against erring mills, the disease may to a certain extent be checked.

Export Incentive

"We are unable to commend the suggestion that mills which produced quantities of yarn or cloth above a prescribed target by special inducements to workers or by improved efficiency methods may be permitted to export 50 percent of such surplus production. We feel that there are a number of mills in the country which do not require such a temptation for expanding their production and we believe that we shall be guilty of giving the wrong kind of encouragement for increased production by adopting the method that has been suggested. Having regard to the conflicting views, the committee has come to the conclusion that it cannot recommend the system of bulk purchase by an individual on behalf of the entire body of mills, or by a committee of millowners at the present stage, but it nevertheless feels that there are obvious advantages in such a system of bulk purchase of foreign cotton and would commend the idea to mills in the hope that, if not for the entire body of mills which require foreign cotton at least for a group of mills in common, an agency can be designed voluntarily and a common purchase on behalf of these mills can be effected.

"Having given due consideration to all factors, the committee feels that if mills can take the responsibility for the bulk purchase of mill stores through an organisation of their own associations, facility should be given to them to do so; the present state of controls over imports necessarily means that licences for import of these mill stores should be granted to the organisation which mills may establish for the purpose, and we recommend both to the Government and to the industry that these steps may be adopted. The committee agrees with the need for encouraging these industries (mill stores) and helping them to be firmly established and feels that the one method by which it can be done is to make it obligatory for mills to purchase their requirements in the non-excepted categories from local producers.

Deterioration in Quality

"There is too often a tendency particularly in recent years for quality to deteriorate and for manufacturers to produce articles which are cheap, especially when an embargo is placed on the import of such articles, and the consumer is obliged to buy locally produced materials. While we strongly recommend that protection should be afforded to these industries (mill stores) by virtual compulsory purchase from local manufacturers, we feel that there is a clear need for constant inspection of the goods so produced and for the quality being approved by some agency set up either by Government or by the mill industry itself. The committee is bound to record that the industry as a whole has shown great uneasiness in regard to the compulsory utilisation of either the ring frames or the looms which are of indigenous manufacture.

"We would emphasise that, in the manufacture of capital goods, a higher degree of technical efficiency has to be guaranteed and that the industry should not be averse to utilising the experience of foreign experts in the initial stages of production. We also feel that, apart from the level of protection that may be granted, it should be obligatory to have a proper system of inspection of the machinery produced locally, particularly when the Government has decided that every purchaser should purchase a certain ratio of his requirements from the local producer. We suggest that the highest priority should be given to the question of scientific assessment of the workload for the industry as a whole and its application with proper modifications according to the circumstances existing in each individual mill.

Managing Agents' Functions

"The managing agents' should have no direct financial interest in the sale of the products or purchase of articles for the mills and other agencies unconnected with the managing agencies

should be set up if it is necessary to have such an organisation for this purpose.

"The committee recommends that a company should, out of the profits, first set apart the depreciation fund according to income tax regulations; next give 10 percent or 12½ percent commission out of the balance to the managing agents; then an amount which will give a 6 percent dividend on the paid-up capital and out of the balance remaining allocate equal amounts for distribution to workers, for reserves for rehabilitation, and for additional dividends to shareholders.

"It seems to us that the Planning Commission's estimated figure of production in 1955-56 is to some extent an underestimate, and that it can confidently be expected that, with better conditions of availability of cotton more regular working of mills and such improvements in the plant and machinery as may be effected, the target may be revised to at least 5,000 million yards of cloth. The reform measure suggested by the Technical Sub-Committee of mills producing fewer varieties, over continuous periods, of good quality cloth suited to the needs of the consumers may bring down the price of cloth and may incidentally increase the production and determine more effectively the per capita consumption of cloth by the year 1955-56. It is essential for the good name of the country and for maintaining continuously the export markets abroad that some measures have to be adopted either by the Government or by the industry to control the quality of goods exported."

WHOLESALE PRICE INDEX

INDUSTRIAL RAW MATERIALS' SUBSTANTIAL RISE

THE official wholesale price index (base year ended August 1939 as 100) advanced by 0.9 percent to 385.4 during the week ended 18th April, 1953, as compared with 392.0 (revised) for the previous week. The index was 0.3 percent lower than in the corresponding week of last month but was 2.0 percent higher than that of a year ago. During the week under review, Foodstuffs rose by 0.3 percent to 366.4 as a result of higher prices of wheat, gram and sugar (+2½% each), dal arhar (+8%) and gur at Ahmednagar (+3%), in spite of decreases in bajra at Hyderabad (-7%), tea (-4%), gur at Muzaffarnagar (-2%), coffee and salt (-1½% each). Industrial Raw Materials showed a substantial advance of 3.6 percent to 454.2 from 438.5 (revised) for the previous week, because of increases in the prices of manganese ore (+16%), jute (+8%), cotton (+5%), cottonseed in Bombay (+4%), rapeseed (+3%), linseed, castorseed and gingellyseed (+2½% each) and groundnuts (+1½%). Raw hides (-6%), copra (-4%), lac (-3%), cottonseed at Amravati (-2%) and silk (-1½%), however, declined during the week.

The effect of lower prices of zinc (-5%), sheep skins (-3%), goat skins, cow and buffalo hides (-2½% each) and castor oil (-1½%) was more than offset by the higher prices of groundnut cake (+8%), mustard oil (+7%), brass (+3%) and linseed oil (+1½%) and, in consequence, the index for Semi-Manufactures stood at 351.4 compared with 349.7 (revised) for the previous week. The Manufacturers group moved up by 0.2 percent to 365.1 because of a rise of 2 percent in the prices of jute manufactures, although the index for cigarettes was lower by 4 percent during the same period. Chillies (+6%), black pepper in Calcutta (+3%), betelnuts (+2½%) and cashewnuts at Quilon (+1½%), caused a rise in the Miscellaneous group index by 0.4 percent to 603.4. Prices of cashewnuts at Mangalore, however, declined during the week.

LONDON INSURANCE LETTER NO TAX RELIEF FOR PENSIONS

By Air Mail.

ONE reform which professional and managerial people hoped for (if they did not expect it) in the Budget was absent. Nothing has yet been done to allow as expenses free from tax the sums set aside by these individuals to provide themselves with pensions. The value of endowment insurance—in particular, the "top hat" policies which have found increasing favour among higher executives—is undiminished. Some tax relief is obtainable on the premiums, but it is small compared with the benefits available to employees, a half of whose contributions is usually paid by their firm.

Income from Investments

As the remaining reports for 1952 come forward, with accompanying dividend-increases, it becomes clearer that rates of interest established last year—which have been approximately maintained this year—have suited the insurance companies well. The benefits of the increases in investment income were nullified until the latter part of 1952 by depreciation of the capital value of portfolios, but those benefits are now accruing, and continuance of interest-rates at their higher level would be generally approved. Whether the companies' wish will be granted depends on the trend of monetary policy in economic conditions which will be governed mainly by deficit-financing at home and by political settlement internationally. If deficit financing proves inflationary it may yet be necessary to raise bank rate again. If peace moves cause a recession of business it may be desirable to lower bank rate. On present indications, the two forces will approximately counteract each other. So investment conditions may continue favourable.

Meantime, the companies are still actively seeking industrial outlets for their funds. Often they find it economical to by-pass the new issue market and arrange to take up new issues privately. Of £10 million of 5 percent debenture stock placed recently by Esso Petroleum the largest single block—£2.4 million—was acquired by Prudential Assurance. In all, nearly 20 insurance companies (including Canadian) took up more than £7 million of the loan.

The Chairman of the United Kingdom Provident Institution, Mr. John Benn, has raised in his annual statement this year the question whether insurance companies are sufficiently venturesome in regard to equity investment. Some of the companies hold a large total of ordinary shares—the U.K. Provident itself has more than 40 percent of its marketable securities, 20 percent of its total assets, in this form. But in general the interests concerned are well-established businesses, not new ventures. Mr. Benn's contention is that so large a proportion of the nation's savings passes through the insurance institutions that the whole of industry will suffer unless these institutions make risk capital available more freely—"All will suffer," he says, "if the fixed-interest mentality should come to dominate British industry for lack of resources for taking risks and promoting enterprise." For the individual office the problem is to square the needs of industry with the prime responsibility to policyholders.

Insuring Bad Debts

The International Credit Insurance Association has gathered in London at the end of April with distinguished representatives of the Bank of England, the joint-stock banks, the discount houses, and industry, in its midst. The event, in which about a dozen foreign credit-insurance companies have participated, marks the 25th anniversary of the founding of the Association. The special concern of this meeting is the deterioration of world trade—or certain sections of it such as textiles. But it is recognised that it is for such a problem that credit-insurance exists. It was little known until the 1920's, but its subsequent growth has been rapid.

In this country the turnover of goods insured against the inability of customers to pay for goods sold on credit was not quite £210 million in 1946; it rose to about £110.5 million in 1952. Last year, however, the business was being consolidated, rather than markedly expanded; the increase in turnover insured, compared with 1951, was only about £15 million.

It is expected that more use will be made of the cover offered if present uncertainties in national and international trade persist. The Trade Indemnity Company, whose business is mainly at home, experienced a steep rise in claims last year, from £61,000 in 1951 to £294,000, in consequence of the recession of textile trade in the late months of 1951 and the early months of 1952. It seems, however, that the general improvement in trade later in 1952 did not persuade policyholders to discontinue their policies when they fell due for renewal. It is not, indeed, clear whether demand for this protection is determined more by the risks or by traders' ability to afford the premiums.

The Export Credits Guarantee Department is an official body, operating on the international plane where monetary and commercial policies of governments affect customers' ability to pay. Despite difficulties in some countries (exceptional difficulties in Brazil, where the Department's liabilities are nearly £15 million), it has made profits—for under commercial principles. About 3,000 exporters hold about 4,000 of the Department's policies; whereas less than 300 exporters held less than 300 policies before the war. But in this year's report the Select Committee concerned deplores the fact that many firms are still unaware of the facilities offered.

Calcutta Markets

FREIGHT RATES EASIER

FEW COAL FIXTURES

OVER the past week, an easing of the freight rates in some markets has become discernible. Activity in the North American markets has slackened after a period of sustained activity while the grain elevator workers' strike at British Columbian ports continues. In Eastern trades rates have fallen perceptibly, a fixture from Whampoa to Colombo being done at the lower level of 53s.

Activity in the Calcutta coal market continues but fixtures have been few. Rates have fluctuated within a small bracket, recent fixtures being done at 61s and 62s 6d. Ore from Vizagapatam to U.S.N.H. was arranged at the reduced rate of \$9.75.

Australian grain enquiries were on a reduced scale, wheat and/or flour in bags being fixed to India at 80s and wheat in bulk was arranged at 72s 6d. Barley in bags for Pusan from South Australia was done at 105s and a part cargo of sugar in bags from Queensland to U.K. was arranged at the lower freight of 117s 6d.

Interest continued in the Time Charter section, a handy sized oil-burner being fixed at 16s for seven months' trading and a British motor vessel of 8,590 tons d.w. accepted 26s for six months' trading.

GOOD GENERAL DEMAND IN TEA DUST SALE

At Sale No. 44 (now called Sale No. 46), held on 5th May, there was a good general demand in the Dust auction although the fall in the quality of the offerings was reflected in the generally easier rates prevailing. Doars and poor liquoring Assams were about 1 anna cheaper while Medium Assams were from 1 to 1½ annas lower. Middle East types again were in good demand and were firm. The few leaf teas for internal consumption met with good enquiry at dearer rates.

Quotations	1953	1952
Medium Doars Dust	1-7-6	1-7-6
Medium Assam	1-9-6	1-9-6
Grainy Dust	1-10-6	1-10-6
Best Assam C.T.C. Dust	1-15-6	1-15-6
Approximate quantity offered		
Internal	1,180 Pkgs.	2,200 Pkgs.
Dust	19,800 Pkgs.	22,500 Pkgs.

SUGAR ARRIVALS INCREASE

During the week ended 5th May, the ready prices of sugar ex-Kantapur delivery were Rs. 29-8 a maund for ordinary grain, Rs. 31-6 for big grain and Rs. 28-12 for old ordinary grain. They rose by 8 annas a maund at first but soon came back to the original levels. Arrivals increased to 7,000 bags a day, and sales to the local markets and to Assam averaged 2,500 bags a day. Stocks amounted to 70,000 bags. Ex-mill delivery rates were Rs. 27-12 to Rs. 29-8 a maund for Bihar mills and Rs. 28-8 to Rs. 30 a maund for west U.P. mills. Demand from Madras declined because mills there were reported to have sold sugar at Rs. 82 a bag.

LINSEED

Although a general firmness was the main feature throughout most of the week, a reaction set in towards the close and there was a notable decline in prices. Arrivals from upcountry showed a distinct improvement and there were keener offerings for early and forward delivery. The demand from crushers was fairly constant on the whole, but latterly there was a tendency to cover small quantities only at lower prices. In the oil section demand slackened somewhat and prices declined gradually. With fair stocks in hand local millers were keen sellers. There were no fresh export sales and the local demand was small. Latest quotations were as follows: May Rs. 19/- per maund; June/July Rs. 19/8/- per maund.

WEEKLY SHELLAC MARKET REPORT

During the week ended 5th May, the market ruled steady throughout the week. The volume of business was not great. The range of quotations was as follows:

Standard Pure	Rs. 87 done.
Butonlac	Rs. 82 to Rs. 83 buyers.
Pure Butonlac	Rs. 80 to Rs. 81 done.
Lemon No. 1 Shellac	Rs. 76 to Rs. 77 done and buyers.
Lemon No. 2 Shellac	Rs. 71 to Rs. 72 done and buyers.
F. O. Std. 1 Shellac	Rs. 67 to Rs. 68 done and buyers.
Pure TN Shellac	Rs. 58 done and buyers.
4% I. T. N. Shellac	Rs. 78 buyers.
No. 1 Kusmi Seedlac 3%	Rs. 70 value.
No. 2 Kusmi Seedlac 3%	
Fine Bysaky Seedlac (Manbhumi)	Rs. 65 to Rs. 67 buyers.
Fine Bysaky Seedlac (C. P.)	Rs. 61 to Rs. 62 done and buyers.
Ordinary Bysaky Seedlac (C. P.)	5% Rs. 57 to Rs. 58 buyers.
Ordinary Bysaky Seedlac (C. P.)	5% Rs. 52 to Rs. 53 buyers.
Kirelac	Rs. 27-8 buyers.

Shipments during April were 26,269 packages.

THE HINDUSTAN COMMERCIAL BANK LIMITED

SIR PADAMPAT SINGHANIA'S REVIEW

Following are extracts from the speech delivered by Sir Padampat Singhania, Kt., Chairman, Hindustan Commercial Bank Limited, at the Ninth Annual General Meeting of the Shareholders of the Bank on the 25th April, 1953.

Gentlemen,
The working of the year under review including the balance of Rs. 65,220-4-3 brought forward from the last year and after providing for all the working expenses, depreciation, etc., resulted in a net profit of Rs. 5,45,608-13-0 which indicates an improvement, though small, on the previous year's working. As you would have noticed in the Directors' Report already submitted to you, your Directors decided to utilise Rs. 4 lacs in writing off Bad Debts. Of the balance, a sum of Rs. 1 lac has been transferred to Investment Reserve Fund and Rs. 35,000/- provided for Bonus to the members of the staff. The balance of Rs. 10,608-13-0 has been carried forward to the next year's account.

Cash and dues from banks amounted to Rs. 71 lacs and represents about 16% of the total deposits and about 32% of the demand liabilities. The proportion of the cash in hand and with bankers including the unencumbered securities, to the total deposits will amount to 41% which is double of the statutory requirements. The figures will also indicate that the Bank's demand liabilities have almost been fully covered by the cash resources of the Bank, and this position has throughout been maintained since the inception of the Bank in order to maintain a sound liquid cash position.

Investments.

The Bank's investments in the securities of the Central and State Governments and also Port Trust debentures, surely represent a position out of proportion to our deposits. This also explains our larger borrowings from the bankers against those securities. Market conditions did not and do not permit our disposing of a part of it, although we have had a careful watch on the market operations. Apparently the difference between the book value of these investments and the market value is a big sum. You will, however, notice that the difference between the book value and the maturity value is below a lac of rupees, and a reserve of rupees one lakh to cover the same has been created from out of the profits made during the year under review. The figures given below will indicate that most of these securities are short and medium dated, maturing for payment within nine years, when full value will be realized.

1. Securities maturing within 5 years	Rs. 2,12,900
2. Securities maturing within 7 years	Rs. 85,85,000
3. Securities maturing within 9 years	Rs. 1,23,68,200
4. Securities maturing after 9 years	Rs. 17,17,800

In the matter of investments in the shares of the Joint Stock Companies, which are mainly in Cumulative Preference Shares, the position almost continues to be the same as indicated by me last year. I am confident that position will improve with the improvement in the Stock Exchange markets of the country.

Profit and Loss Account.

A comparison of the Profit and Loss Account for the year 1951 and 1952 will reveal an all round improvement on the income side. As for the expenses, they almost continue to be the same excepting an increase in the matter of interest paid. This was necessitated by a higher rate on Deposits and the Borrowings from other banks. In the matter of establishment charges, the position is more or less the same in spite of the retrenchment here and there of the surplus hands. The effect of the reduction under this head in the numerical strength either equalises or is even outweighed by the annual additions in the shape of increments even to the reduced number of the staff. The total earnings and analysis of the figures as a whole will surely indicate an improvement on the earning capacity of your institution. As I have said, your directors are doing their best in the matter of improving the earning capacity and exercising every possible economy without impairing the efficiency. I have no doubt that this progress will continue and, in the years to come, we will be in a position to show still better results.

On a review of the various factors connected with the banking system and structure in the country, I feel that the number of the Bank's offices in the country is far below the requirements. Looking to the vastness of our country, its population and its unification after Independence, the development of banking habits amongst our countrymen, is far from satisfactory. The habit of thrift and of savings is inborn amongst our people and to mobilise the same for the purposes of Nation-Building Programme, proper machinery is not available.

The Central Government has introduced certain measures of tapping the savings of the urban people by introducing several schemes of attracting money on more remunerative terms but the question of mopping up the savings of the rural population is still a problem. The Rural Banking Enquiry Committee recommended that the Imperial Bank of India acting as the agents of the Reserve Bank of India should open branches in the country-side for receiving deposits from the rural population. But no tangible results have been achieved so far, although the problem is pressing specially during the period of planning. My suggestion is that an opportunity should be given to the scheduled banks of the country and the initial losses which may be incurred by them during the operations may be met by Government. Encouragement can be given to them by lightening labour legislation as applicable to rural branchings and also permitting the local authorities and Panchayats to make deposits of their surplus funds in these banks.

NORWICH UNION INSURANCE SOCIETIES

Speaking at the Life Society's 145th annual meeting in Norwich on April 28 the President, Sir Robert Bignold, said the net new Life business for 1952 at £47,393,310, an increase of over £3,200,000 on 1951, constituted another record in the Society's history. In addition there had been another increase in Pension Scheme business. The mortality experience had been very favourable, the expense ratio had remained unchanged, whilst the net rate of interest earned was £4.04%, an increase of 2s. 8d% over the previous year.

Of the new investments of nearly £11,000,000 made in 1952 61% had been invested in first-class mortgages.

Total funds increased by £71 millions during the year to a total of over £94 millions.

The Fire Society

At the 155th annual meeting of the Fire Society, the Chairman, Sir Robert Bignold, said the 1952 premium income reached a new peak figure at £14,558,980, an increase of £1,584,732. Fire premiums now totalled £6,604,715, the profit in the Fire account being £801,516.

The accident income had advanced by £1,242,878 to a new record figure of £6,587,811 and against the previous year's loss of £82,000, the Accident account now showed a modest profit of £120,042.

Marine premiums advanced by £199,082 to £1,388,434 and £75,000 had been transferred to profit and loss.

Taxation was charged at £57,511 against £379,302; dividend required £151,700 net; £425,000 was transferred to the Investment Inner Reserve.

Total assets had increased by £1,428,196 to £19,452,442.

Norwich Union in India

Mr. W. G. Wylie, F.C.I.I., Calcutta, is the Manager for the East of the Fire Society and Mr. J. S. R. Spelman, Bombay, is the Manager for the East of the Life Society.

THE GANESH FLOUR MILLS COMPANY LIMITED

DELHI

"CAPITAL" STOCKS AND SHARES INDEX*

The Capital Stocks and Shares Index (Base: 1939) has now been brought up to March, 1953. Compared with February, the March Index for Government Securities reveals a rise of 0.3 points, while that of Preference Shares discloses a drop of 1.4 points.

There were increases in Bank (3.2 points), Cotton (4.5 points), Coal (9.2 points), Cement (0.2 points), Tea (6.3 points), Paper (19.9 points) and Sugar (7.0 points), while decreases occurred in Jute (3.2 points), Mining and Oil (4.6 points) and Miscellaneous (11.8 points). The Index for Engi-

neering remained unchanged at 165.3 points.

Correlating all the factors the Capital variable yield securities index shows that the Index for stock prices in the above classes of shares advanced by 0.8 points during March, 1953.

JOINT STOCK COMPANIES' PREFERENCE SHARES

Dividends are cumulative and the shares carry a preferential claim on the property for the payment of capital and on the profits for dividend except in case of companies marked otherwise. (For reference see notes below.) Months against names of companies indicate approximately times of payment of dividends.

Dividend in arrears from—

(1) 1-4-44

(2) No preference claim to repayment of capital.

(3) Entitled to cum 2 per cent non-cum.

(4) Entitled to cum 2 per cent non-cum.

(5) Carry preferential claim (in case of liquidation) to arrears of div. and one-fourth of the surplus assets.

(6) The dividend is convertible into Ord. Share at par up to 31-12-49 on 6 months' notice.

(7) Cumulative up to 3 per cent.

(8) Cumulative up to 7 per cent.

(9) No special right of cum. div. before an distribution of profits to Ord. Shareholders.

(10) Ranking in winding-up pari passu with Ord.

(11) Entitled to 25 per cent of the profit thereafter.

(12) Redeemable at Rs. 106 on one month's notice.

(13) 8 per cent cum. div. also 20 per cent non-cum. div. payable after 8 per cent paid on the Ord. div.

COAL COMPANIES

O, P, F and Dd, indicate Ordinary, Preferred Ordinary, Founders' and Deferred shares, respectively. P next to the name of the company indicates that the company also has Preference Shares. Figures in "accounts closed" column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer to the Key (last page) under the numbers indicated.

PAKISTAN'S NEW GOVERNMENT MAKES A GOOD START

THE LEGACY OF ECONOMIC DIFFICULTIES: PROMISE OF MORE REALISTIC POLICIES

SUFFICIENT time has now elapsed since the Governor-General's dramatic action in dismissing the Nazimuddin Cabinet for an appraisal to be attempted of the changed scene in Pakistan. The Cabinet changes have been carried through smoothly, no new parties have come into being to contest the leadership of Mr. Mohammed Ali, and there is no doubt that a new life has been infused into the flagging spirits of the administration and the people. The main thing that was lacking, as had been plain for the past six months or more, was firm and decisive leadership. Khwaja Nazimuddin was indeed a man of ripe political experience, and when he succeeded the late Mr Liaquat Ali Khan it was hoped that this, together with his irreproachable personal character, would give him the strength needed for his difficult task. Unfortunately, time and events showed that he lacked the forceful personality required of a leader of a young country which has not yet quite found its soul or established its position in the world, and is threatened by forces of disruption and economic decline. A Jinnah was needed, or a Liaquat; and it was painfully obvious that Khwaja Nazimuddin did not measure up to the standards of those two. It may be true that his successor, Mr Mohammed Ali, owes his selection primarily to the fact that he is a Bengali himself (and for political reasons it was necessary that East Pakistan should provide the successor to Khwaja Nazimuddin) but his personal qualities have already made a favourable impression. The changes in the Ministry have probably been more welcome and beneficial than even the change in leadership.

to the country. The change of Government has, however, by no means given the quietus to provincialism, and while the provinces of West Pakistan have welcomed it, East Pakistan appears to be in a somewhat difficult mood. Mr. Mohammed Ali's preliminary discussions with Mr Nurul Amin, the Chief Minister, and some of his Ministers, seem to have been inconclusive, and there is a good deal of speculation about the attitude of the province. On the other hand, some experienced observers feel that the East Pakistanis are "putting on an act" and that no serious opposition to the Government need be expected from that quarter. East Pakistan should, as a matter of fact, have no reason for complaint, seeing that the new Prime Minister is a native of the province and that he has promised to bring one or two more East Pakistanis into the Central Cabinet.

The theocrats have probably sustained a sharp reverse with the coming to power of Mr. Mohammed Ali, for the new Ministry both by reason of its more modern temper and its stronger purpose will be less liable to suffer the intervention of the fanatical supporters of mullahism. The attempt to frame a polity in which temporal objectives were subject to the putative requirements of the faith, as divined by reactionary scholastics, was never viewed with any pleasure by large sections of Muslims, and certainly not the minorities. This check to political clericalism should also permit a lowering of the tension under which the unorthodox sects of Islam have lived in Pakistan since the beginning of the anti-Qadiani agitation.

With regard to economic policy in general a full post mortem on Mr Fazlur Rahman's policy would be a lengthy undertaking. The main defects, however, were a failure to take timely steps to cut down imports, particularly of cotton piecegoods, so as to check the rapid drain of foreign exchange reserves, and an obstinate reluctance to reduce export duties. In the first half of 1952 the Commerce Minister and his colleagues seemed convinced that they could both have their cake and eat it; that is to say, that they could defy the commodities slump by retaining the two-and-twopence rupee and also the fantastically high export duties on jute and cotton, to say nothing of tea. Had the export duties been brought down to their present levels in, say, April 1952, it would not have been necessary to introduce the costly support schemes for jute and cotton and a far healthier situation would have developed. As it was, Mr. Fazlur Rahman was complacently denying even up till June 1952 that there was any serious economic crisis. On the import side, he and his colleagues were less to blame, for the commercial community in general fully supported them in their desire to maintain a liberal import policy till the last possible moment. There was a general and natural reluctance to revert to an era of shortages and their attendant evils. The Government, however, took so many successive bites at the cherry before it finally abolished the Open General Licence that the business community became confused and bewildered beyond reason.

No magic wand can be waved by the new Government—which is still incidentally lacking a Commerce Minister—to restore the situation. It has complete control of the situation, but even the virtual abolition of imports over the past two months has not served to bring back the dwindling gold and sterling reserves to a healthy level. Exports have been moving reasonably well, at prices which, though low, must now be regarded as normal, but the chief difficulty seems to be that the Government, in the palmy days of the boom, committed itself to very heavy expenditure on development and defence which is now hardly supportable. These requirements are of course being given priority, though efforts have been made to cut them back as far as possible, and the result is that commercial imports have been relegated to a back position. Hardly any licences for ordinary commercial requirements have yet been issued and it will be some months before the flow of imports on commercial account will recommence; and it is clear that it will even then be no more than a trickle. The natural result is that prices of imported goods are rising sky-high. Price control measures are being introduced but there is not much use in imposing price and distribution control when the goods are simply not there to be controlled.

*

The business community is indeed going through a hard time and can only expect it to continue for at least another twelve months. Retrenchment and pay cuts are the order of the day. Foreign business interests, with their relatively high overheads, are particularly hard hit. They have, however, received encouragement from the Prime Minister's evident desire that discrimination against them and interference which would have a deterrent effect should be avoided. They have also welcomed the assignment of the portfolio of Economic Affairs to the other Mr. Mohammad Ali, the Finance Minister, in whose good sense and good judgment they have great confidence.

How will the new Government handle the development programme? Will it be guided by a realistic appreciation that financial solvency must come first, or will it follow the somewhat Micawberish policy of its predecessors? It is believed that the programme is to be reconsidered and fresh priorities allotted, so that projects which are not likely to be rapidly productive will be deferred to better times. Much of course depends on the generosity of the United States. If Pakistan is to receive a gift, or a loan on easy terms, of a million tons of wheat, there is some hope that a reasonably ambitious programme of development can be pushed forward. Otherwise it will be necessary to drop all schemes which are not immediately productive except to the extent that they are financed by Colombo Plan or other forms of foreign aid. At all events, Pakistan has been through a chastening experience and it can be taken as certain that prudence and realism will henceforward be the watchwords.

In the international field no startling changes are to be expected, for Pakistan was already firmly aligned with the Western democracies, and the experimental overtures to Russia, which were tried from time to time in earlier years, are a thing of the past. Mr. Mohammed Ali, however, is known to be a particularly firm believer in the value of the Commonwealth and of close friendship with the other Commonwealth countries and with the United States of America. In regard to India the various statements he has already made on the subject of friendlier relations speak for themselves. There are, however, many who doubt whether the mere hand of friendship will be sufficient to crack the nut of Kashmir. In respect of this problem, and equally perhaps the problem of the canal waters dispute, India is in the stronger tactical position, and it is therefore the Government of India which must be prepared to make concrete proposals; public opinion in Pakistan would hardly stand for any compromise over Kashmir which would involve surrender of the claim for a free plebiscite in the Valley. These major issues are then likely to cause trouble for some time to come. There is, however, no reason why their existence should affect the trade relations between the two countries, and these should continue to improve.

Political concord within Pakistan has for some time been vitiated by the protracted and unsuccessful efforts to achieve a Constitution which should be acceptable not only to all provinces but to all shades of social and religious opinion. It would hardly be correct to say that the report of the Basic Principles Committee was still-born (for it was a noisy infant) but all that now remains is to give it a decent burial. On the vexed question of provincial representation at the Centre, it pleased neither West nor East Pakistan, and a fresh formula will have to be found. It is possible that Malik Firoz Khan Noon, the new Chief Minister of the Punjab, who enjoys in a remarkable measure the respect and affection of the East Pakistanis, may be the chosen instrument of fate in bringing about agreement between these two provinces. If so, and if he should succeed in his efforts, he will have rendered an immense service

THE AMERICAN BOOM CONTINUES

THE May letter of the National City Bank of New York says that the trade and industrial situation in the United States shows no great change from earlier months this year. In a few lines new orders appear to have slackened a little, but a much more pronounced drop would have to occur before production and employment would be materially affected. Supported by well-filled order books, the productive facilities of the country are about as fully engaged as it is ever reasonable to expect, and the output of goods and services in the aggregate is about as great as available supplies of materials and labour will permit. The Federal Reserve Board's industrial production index set another high in March at 242 (1935-39=100). Apparently there has been no falling off in April, although short-lived strikes or materials shortages have hampered operations in a few places. As seasonal activities open up, employment evidently will reach a new high level. The purchasing power created by this immense productive activity flows through the economy and supports a record volume of trade. Preliminary reports leave little doubt that total retail sales in April, as in preceding months, have run higher than a year ago. Despite feelings in many quarters that the automobile manufacturers are over-optimistic, new car sales thus far in the spring season—at least for the more popular makes—have reached very satisfying totals. In short, the boom has continued. The increases in bond yields and bank lending rates are evidence of the strength of the demand for money, which in turn is a manifestation of the strength of the demand for goods and services. The effect of tightening money and falling bond markets is to check rising demands, and probably these changes have strengthened the opinion that business generally is about as high as it can be expected to go. This will almost certainly be so if money available to finance expansion of instalment purchases of consumer goods should soon begin to reach a limit, as it may in some areas. Upon capital investment, however, the restrictive effects of higher financing costs develop slowly. Programmes for plant and equipment expenditures are still moving ahead under strong momentum, as are State and local government construction projects, including civic buildings, schools, hospitals and highways. It seems more likely that a slackening of production, when it occurs, will first appear in automobiles and other consumers' durable goods; for, even with encouraging retail sales, many of these items are being turned out at rates not expected to be maintained through the year. In some of the heavy household appliances curtailment may be imminent. The steel industry still has all it can do to supply requirements, and must now provide material for a stepped up ammunition programme. Thus it expects to extend capacity operations at least into the third quarter. Beyond that, continuance of the present level of demand from the automobile and appliance manufacturers seems less certain, and probably there has now been substantial replenishment of inventories depleted during last summer's strike.

CURRENT COIN

Index of Industrial Activity.—Corrected for seasonal fluctuations Capital's Index of Indian Industrial Activity shows an increase of 6.8 points between November and December, 1952. Contributing to the rise were increases in the production of cotton, jute, cement, paper, coal and electricity, while output of steel ingots and pig iron fell. Cheque clearances and notes in circulation also advanced because of greater business activity.

Coal Export Surcharge Goes.—The Government's decision to abolish from 11th May the surcharge on coal exports has not come too soon. The surcharge was supported by the Working Party for the Coal Industry, which assumed that foreigners were so keen to buy Indian coal that they would tolerate a series of discriminatory levies. Last year the surcharge ranged between Rs. 1 a ton on exports of non-oking coal to Ceylon to Rs.11 a ton in the case of Pakistan; in the latter country's case it was raised to Rs.12-10 a ton but abolished under the Indo-Pakistan trade pact in March this year. Since then abolition has been expected in the case of other countries too, but administrative and procedural difficulties have delayed the final decision. Coal exports rose steadily from 1.5 million tons annually before partition to 3.3 million tons in 1952, but have declined seriously since October. One reason is that the surcharges have been a serious competitive handicap in markets that can now obtain their supplies more easily. The other is that little has been done to improve facilities at Calcutta port, which colliers are not fond of visiting after last year's experience of long delays and heavy demurrage charges. During the last quarter of 1952 exports totalled 475,283 tons, or about three-fourths of the corresponding 1951 figure. Between January and March this year there has been

a further decline to 329,895 tons, or about 56 percent of the corresponding 1952 figure. Exports continued at the disappointing rate of 76,511 tons in April. India has lost one of her best temporary customers in Australia who bought 400,000 tons last year but produces so much coal herself now that she has cancelled a contract for 500,000 tons this year. Britain bought 40,000 tons in 1951 but nothing last year because her own output increased. Exports to Hongkong have shrunk from 25,000 tons to 3,000 tons monthly because the colony is getting supplies from elsewhere. In contrast, Japan remains an important customer: she bought 750,000 tons in 1952, has negotiated contracts for 700,000 tons this year and might have bought more but for sterling exchange difficulties. South Korea took 100,000 tons last year and has asked for 250,000 tons this year; she pays in dollars. India's competitors, present and potential, in the world coal market include China, Australia, South Africa, Britain and the United States. The Government is reported to be aware of the fact that foreigners prefer South African and U.S. coal because of its smaller ash content; but it does not yet seem to have arrived at the logical conclusion that the export of good Indian coal therefore deserves special encouragement. Now that the surcharges have been abolished, the interests of India's export trade demand that parallel action be taken to rehabilitate the confidence of shipowners and charterers in the ability of Calcutta port to handle coal traffic. The port is said to have the facilities to load coal on 28 ships a month for export to foreign countries: actually only 12 ships came to be loaded in March and another 12 in April.

Supreme Court on Sales Tax.—The controversy regarding the right of Part B States to levy sales tax on goods in the course of import or export, which had been going on for 18 months following the Travancore-Cochin High Court's decision quashing some assessments made by the sales tax officials of that State, has been closed by a decision of the Constitution Bench of the Supreme Court on Friday. The decision of the Travancore-Cochin High Court quashing the assessments made on nine cashewnut exporters in respect of goods in course of export and import has been upheld by the Supreme Court. The cases have been sent back to the sales tax authorities for making new assessments according to law and in the light of the judgment of the Supreme Court. The Supreme Court has said that purchases made by an exporter for purposes of export, and sales effected by an importer against orders pursuant to which the imports were made, are beyond the scope of the exemption from sales tax envisaged in Article 286 (B) (1) of the Constitution. However, sales or purchases effected by the mere transfer of shipping documents, while the goods are beyond the customs frontier, are within the exemption provided by Article 286 (B) (1) and not subject to sales tax. Late in 1951, the Travancore-Cochin Sales Tax Department assessed sales tax on nine cashewnut exporters based on their returns for the period 17th August, 1949, to 29th May, 1950. The firms sought exemption from the levy on purchases made after 26th January, 1950, when the Constitution came into force, on the ground that according to Article 286 of the Constitution Part B States had no right to levy sales tax on sales or purchases made outside the State, or in the course of export or import. Their appeals were rejected by the Sales Tax Department. Cashewnut exporters in Travancore-Cochin do a large volume of business and earn much foreign exchange; raw cashewnut is collected within the State and is also imported from Africa through indentors or importers in Bombay. It is processed into cashew kernels and cashewnut oil, both of which are then exported.

The cashewnut exporting firms, following the rejection of their plea by the department concerned, appealed to the Travancore-Cochin High Court seeking exemption from the levy under Article 286 of the Constitution—which broadly says that no State should impose tax on the sale or purchase of goods made (a) outside the State; (b) in the course of the import of the goods into or the export of the goods out of India and (c) in the course of inter-State trade and commerce. In January 1952 the High Court of Travancore-Cochin quashed the sales tax assessment in respect of the sales and purchases after 26th January, 1950, and asked the State Government to refund the tax overpaid. The State Government appealed to the Supreme Court against this judgment. The Supreme Court had already given its decision on the interpretation of Article 286 (1) (A) and 286 (2) of the Constitution, restricting the powers of States to impose tax on sales or purchases taking place outside their territory and in the course of inter-State trade and commerce, in the Bombay sales tax appeals. To a limited extent, so far as the direct export sales or import purchases were concerned, the Court had also dealt with restrictions on the powers of the States to impose tax on the sale or purchase of goods in the course of their export from or import into India in the Bombay company's case. The scope and extent of Article 286 (B) of the Constitution was the main question before the Supreme Court

in the Travancore-Cochin appeal. The Chief Justice and B. K. Mukherjee, Bhagwati and Ghulam Hasan JJ. agreed but Mr. Justice S. R. Das gave a dissenting judgment.

The Chief Justice, giving the majority judgment, said that the only question debated was whether, in addition to the export sale and import purchase, which had been held in the earlier decisions to be covered by the exemption under Article 286 (1) of the Constitution, the following categories of sale or purchase would also fall within the scope of this exemption: (a) the last purchase of goods made by the exporter for the purpose of exporting them to implement orders already received from a foreign buyer or expected to be received subsequently in the course of business, and the first sale by the importer to fulfil orders pursuant to which the goods were imported or orders expected to be received after the import; and (b) sales or purchases of goods effected within the State by transfer of shipping documents while the goods were beyond the customs frontier. The Chief Justice thought that the first category did not fall within the protection of Article 286 (1) (B). The second category, he felt, was within the exemption provided by the terms of the Article 286 (1) (B) and would be entitled to protection and exemption. The Court examined in detail three categories of transactions which were the subject matter of taxation in the present appeal, and the Chief Justice held that (i) purchases of cashewnuts effected in the domestic markets were not exempt from taxation; (ii) purchases of cashewnuts from nearby areas of Madras State, in these particular cases, would not be exempt from taxation; and (iii) as regards the import of raw cashewnuts from Africa, the exemption would be available if and when the Bombay party (through whom it is generally imported) acts as an agent of the importer and not if the Bombay party is the importer himself.

Employment and Industrial Activity.—About two months ago Mr. Nehru said that employment rather than production was the measure of economic progress. By either standard, the coal industry has been in reverse gear because of official policies, but it is interesting to examine what success has attended efforts to increase employment opportunities in other sectors of what is assumed to be an expanding economy. The registers of Employment Exchanges are an incomplete and unreliable guide to the unemployment story; the latest figures, which were quoted last week, show that for the first time in six months employment opportunities notified to Exchanges increased slightly in March. The increase was entirely in the public sector, the decline in the private sector having continued for the seventh month. The official review says that the situation "continued to be unsatisfactory" and labour leaders have in recent weeks spoken of a deterioration in many parts of the country, a deterioration which in their view covers both the public and private sectors. In the former, they have been disturbed by the move to retrain more than 4,000 workers in railway collieries and hundreds of others in ordnance factories. Bihar's Labour Minister, Dr. A. N. Sinha, said in Patna last month that there had been "a spate" of retrenchments, closures and lock-outs in industrial undertakings in the State. "The depression in shellac is responsible for throwing out of employment about 11,000 workers. The slump in mica has caused the unemployment of about 25,000 men and women. On account of certain restrictions on the export of bidi leaves to Pakistan several thousand workers have been rendered jobless." The Madras Tramways Company suspended operations last month because it had been working at a heavy loss; and other industries in that State have suffered as a result of the drastic cut in power supply. An official enquiry committee is reported to have agreed with the decision to close down the Ooregum gold mine at the end of this month; about 3,600 workers will be affected, of which only 1,000 might be re-employed in the Champion Reef gold mine. More jobs are now available on tea gardens but an uncertain prospect faces all the information available permits—which is add up to substantial, country-wide retrenchment but it does forcibly suggest that the assumption that the Indian economy is expanding is open to question.

Pakistan's Cotton Textile Industry.—Pakistan's cotton textile industry has made rapid progress in recent years and it is claimed that if the current rate of expansion is maintained the country might be self-sufficient by 1956. Figures published in the latest Statistical Bulletin of the Central Statistical Office show that cloth production increased from 106,295,000 yards in 1950 to 127,666,000 yards in 1951 and 174,160,000 yards in 1952. The output of cotton yarn for sale increased from 13.4 million pounds in 1950 to 20.2 million pounds in 1952. The amount of domestic cotton consumed by textile mills rose from 40.2 million pounds in 1950 to 73.5 million pounds in 1952. Spindle and loom capacity has risen sharply; there were 390,800 spindles in 1952 as against 281,200 in 1950 and 177,400 at the time

of partition. About 200,000 new spindles were being installed early this year. The number of looms in the industry rose from 5,535 in 1950 to 8,556 in 1952. Spindle hours increased from 1,155 8,556 in 1950 to 1,882 million in 1952, a gain of 63 percent; while loom hours rose by 82 percent 63 percent; in 1950 to 31 million in 1952. In from 17 million in 1950 to 31 million in 1952. In February this year, 11.9 million yards of medium quality cloth were produced compared with 1.1 million yards of coarse cloth and only 248,114 yards of fine cloth. Medium cloth consisted largely of grey goods (9.1 million yards) and coloured materials (2 million yards). Only 776,851 yards of the printed varieties were produced. Total production of yarn in February was reported to be 6.4 million pounds, of which a surplus of 2.4 million pounds was available for sale to cottage industries.

Asian Exports Lower.—The recent announcement from Colombo that no more licences for dollar imports are to be granted for the rest of this financial year—particularly in view of the fact that until recently Ceylon was a substantial net earner of dollars—draws attention to the remarkable change which has taken place in the Asian economic situation of late. Indeed, as things are going, it is open to question whether India, Pakistan and Ceylon can continue for long, in the absence of some response from the new American administration to the reduction of trade barriers, to fulfil the main pledge given at the Commonwealth Economic Conference that each sterling country would live within its overseas income. Not without some difficulty. India and Pakistan managed to call a halt to the drain on their foreign reserves. Ceylon has apparently been less successful. Pakistan's ability to maintain her balance in the face of her present food difficulties is at least doubtful. The main trouble, of course, is the drop in commodity prices. For all three countries are dependent, to a greater or lesser extent, for balancing their budgets or providing finance for development programmes on export taxes or import duties. India's position is the healthiest. Two-thirds of Pakistan's revenue comes from customs duties, and both Pakistan and Ceylon are receiving less from export duties owing to the fall in raw material prices, and are getting less from imports as these are progressively cut to keep within the imposed limits. Malaya, too, has suffered from the drop in commodity prices and the reduced yield from export taxes is causing concern. The whole picture has undergone so much alteration that it will not be at all surprising to find economies calling for quite as much attention at the meetings of the Commonwealth Prime Ministers in London after the Coronation as the questions of defence and international political developments.

Cashmere Stocks and Imports.—Cashmere stocks in India are so large that some merchants think imports should be restricted, and in a memorandum to the Central Government a Bombay firm of importers has suggested that no imports at all should be allowed in the second half of this year. Present stocks, it is claimed, are enough to last more than a year. About 10 lakh pounds are already available and another 2 lakh pounds are "in transit" to Bombay against the July-December, 1952, quota. The quantity licensed for January-June, 1953, is much more than in the previous half-year and newcomers are said to have got licences of up to Rs. 10,000 each. At the present price of Rs. 1-3 a pound, c.i.f., about 19 lakh pounds can be imported for Rs. 28 lakhs—which is believed to be the total value of the licences issued for January-June, 1953. When this quantity arrives, the total stocks with importers will be around 31 lakh pounds, against an annual requirement of 8 lakh pounds. It is argued that a ban on imports would not cause prices to rise because stocks are so large, but this is an argument we have seen belied many times before. If local supplies are really so greatly in excess of demand, one would expect imports to fall away without the intervention now being sought in Delhi.

Import Duty on Pearls.—The decision to levy an import duty of 20 percent on real unset pearls has disturbed jewellers and other pearl dealers. The Jواهرi Mahajan, an association of dealers in genuine pearls, says in a representation to the Central Government that these articles are the principal raw material of the pearl-jewellery industry and should not be considered luxuries. Although some measure of rebate will have to be given when the finished goods are exported, the association fears that the duty will encourage smuggling, especially through foreign possessions in India. It will cause trade to be diverted to Persian Gulf ports, it is claimed, and will affect the competitive strength of Indian goods. This country imports about Rs. 30 lakhs worth of unset genuine pearls every year, most of which are exported to Europe, America and the Middle East after being processed into finished pearls. The foreign exchange so earned (dollars included) is not inconsiderable.

Freedom for Copper.—The British Minister of Raw Materials announced last week that private

trading in copper was to be restored as soon as possible. It is required that Commonwealth producers shall have three months' notice of the termination of bulk-buying contracts, so free dealings in copper are scheduled to begin on 5th August and it is expected that the London Metal Exchange will reopen for dealings in copper on that date. This brings the list of non-ferrous metals restored to free trading to four: tin, lead, zinc and now copper. In the last few months the price of the metal has fallen and U.K. industrial output from the Ministry of Materials has declined. The fall in consumption was foreseen since it had been expected that copper would be freed fairly soon and industry has been taking only enough to keep plants going. If experience gained from the freeing of the other non-ferrous metals is any criterion, prices may fall further and producers and consumers alike will accept this as an added encouragement to use less for the time being. The decision will strengthen the London Metal Exchange and it may well be that the international price of copper will again soon be determined in London. It is feared in some quarters that the restoration of copper to free trading may entail an added drain on dollar reserves. This point was answered by the Minister in the House; he gave an assurance that should this happen, restrictions would be reimposed. In fact with increasing Commonwealth supplies America should be quite independent of Chile for copper and if anything the metal may earn Great Britain more, not less, dollars. About three-quarters of the 83,727 tons of copper worth over £22,000,000 which Britain imported during the first quarter of this year came from Commonwealth countries. The bulk came from the rich ore-bearing territories of Northern Rhodesia which sent just under 53,000 tons worth £13,500,000 while Canada despatched 10,570 tons worth just under £3,000,000. Other main sources were Western Germany, Belgium and the U.S.A. During the same period Britain exported 10,763 tons of unwrought copper and copper manufactures to a value of nearly £3,500,000, much of it to Commonwealth countries.

Meeting Textile Competition.—A suggestion that bulk marketing of cotton textiles was one way to prevent Lancashire being priced out of markets exposed to Far Eastern competition was put forward by Mr. A. C. C. Robertson, President of the United Textile Factory Workers' Association, in his opening address to the Association's annual conference at Morecambe. "We know," he said, "that there are open to us or will be open to us markets for goods if we can by some means be competitive with Far Eastern producers. To this end it would be necessary for all concerned with these particular types of cloth to join together in a scheme for bulk marketing to retain the trade." If some means of doing this were not found, said Mr. Robertson, much of the cheaper quality trade would be lost. Since the Association's last conference the industry had experienced a grave slump and was now well coming a gradual recovery. While it was little comfort to the Lancashire operatives, it was nevertheless true that the slump had had its counterpart in every other textile producing country. Surely then, said Mr. Robertson, it must soon occur to all countries interested in cotton—as growers or as manufacturers—that it was time to get together to plan how much material it was necessary to produce to provide for the normal requirements of the world, and then to grow and sell to that end.

Easing Currency Restrictions.—A first, though admittedly rather limited and tentative, step towards greater freedom in the utilisation of European currencies is expected to come into force very soon. It is understood that Britain, France, Germany, Switzerland, Belgium, Holland and Sweden, all members of the European Payments Union, have agreed to arrangements whereby a bank in any of the countries concerned will be able to deal in any of the participating currencies with banks in any of the other countries. For instance, British banks will be able to buy or sell Swiss francs in Paris, Brussels, Amsterdam and other centres, as well as in Zurich, whereas at present such dealings would be confined solely to Zurich. The general effect of the new arrangements will be to increase the transferability of the participating E.P.U. currencies. There is no suggestion of any widening of the International Monetary Fund. Nor is there any question of convertibility, since the arrangements will not include the U.S. dollar and there will not be any relaxation of exchange controls by the various central banks. Nevertheless, the new relaxation will be welcomed both by the banks and by traders, and will also serve to indicate to the U.S. administration that although it has for the moment caused the virtual shelving of the free convertibility issue—at least until 1954—advocated by the Commonwealth Economic Conference and subsequently supported by O.E.C.C., those countries have by no means abandoned that line of approach to the solution of the world's economic difficulties.

Air circuit breakers for medium voltages

and 3.3 kV systems

'ENGLISH ELECTRIC' pioneers of
heavy duty air circuit breakers,
have had unrivalled experience in the design
and manufacture of this highly specialised equipment.

Backed by more than 40 years' experience of switchgear manufacture,
'ENGLISH ELECTRIC' have developed type OB indoor air circuit breakers for use on medium voltage and
3.3 kV systems, in power stations and for industrial consumers.

The type OB.3 air circuit breaker illustrated has a rating of 1,600 amps., 660 volts and 25 MVA when tested
to BS.116, and can be supplied in either single or double tier cubicles with hand or electrical operation.
'ENGLISH ELECTRIC' type OB air circuit breakers are designed for safe and consistent operation, for
reliability under all conditions of service, with the minimum maintenance cost.

THE I. J. M. A. fact-finding mission returned to Calcutta yesterday after a tour of Australia and New Zealand in the course of which they attained a close and detailed understanding of those important markets such as the jute industry has not possessed before. This information they will be laying before their associates in the industry in due course but I might recount here their leading impressions as they described them yesterday. Firstly they were struck by the immense goodwill the Indian jute industry enjoys in the Southern Dominions, both because it is Indian and because it still provides the best packaging material for their agricultural produce. The mission met the friendliest possible welcome, and everywhere encountered keen official and unofficial interest in the extent to which Calcutta can continue to provide containers for the crops and fleece on which the Dominions depend for their international livelihood. They were at the same time surprised at the progress that bulk handling has made in claiming fields previously served by sacking; a very large proportion of the Australian wheat crop is handled in bulk and will probably continue to be so, though much can be done to see that as the output of grain increases more jute sacks are used. Jute has appeared to hold its own in these expanding economies because as one door closed, another opened; but the process of expansion is gathering momentum and if Calcutta can guarantee reliable supply at reasonable prices the future for jute packaging in the South is very hopeful. The Australians appear to have laid great stress on the need for regular, dependable supplies and the mission felt that the governing factor in their approach to the whole question was the fear that by reason of one of those upsets to which the jute trade is liable they might be left without a covering for part of a huge grain crop which would then rapidly lose its value. It is because emergencies of this sort have arisen in the past, with all available jute cloth being diverted to essential agricultural needs, that jute has lost markets in commodities, such as fertiliser, that could be forced to use paper packing.

High prices and scarcity have taught farmers how to get the longest possible life out of their bags, and the mission saw sacks that had been in constant use for six years. As for the immediate outlook, the Australian Government is holding stocks that will take anything from nine months to a year to work off and there is not much hope of a spectacular increase in demand before that time. The mission travelled widely in both countries and return home with knowledge that they feel will be invaluable to the industry. Messrs Walton and Goenka are to be congratulated on a very energetic and thoroughly successful tour on behalf of the country's largest export industry. The Chairman of the I. J. M. A., Mr. G. J. Gardner, has lately returned from a visit to Singapore where he was able to hear at first hand from Indian trade representatives in South-East Asia their views on the prospects for jute goods in those areas. With information of this sort, together with the advice regularly supplied from the United States and the United Kingdom by the Association's agents there, the jute industry is now better equipped than it has ever been to maintain that close contact with consumers which is essential to holding and extending its markets in a changing world.

The 1890's were one of the most eventful periods of modern India's history, which accounts for the fact that centenaries are now following one another thick and fast. The Railways, postal services, and Bengal Chamber's centenaries fall this year, and now the textile industry is making plans to celebrate its 100th birthday next

A DITCHER'S DIARY

year. (The jute mill industry will be 100 years old in 1955 and will no doubt watch the cotton textile centenary with more interest for that reason.) The Textile Association of India has chosen next February as the anniversary month, during which it will stage a textile industrial exhibition, a joint effort by all the cotton interests in India with the co-operation of foreign firms and associations. The eleventh all-India Textile Conference will be held in Bombay at the time of the celebrations. Actually the first steps towards a modern cotton cloth manufacturing industry were taken in India as early as 1817, in which year a small mill was established near Calcutta, but it was only in 1854 that the foundations of the great mechanised textile industry were laid. It was then that Cowasji Nanabhoj Daver established a power-driven factory in what was to be the future capital of the industry, Bombay. Incidentally, in a recent and very interesting study, *The Indian Cotton Textile Industry: An Economic Analysis*, Dr. S. D. Mehta remarks: "Contrary to popular belief, the cotton mill industry was never exclusively Indian, looked at from any point of view—whether finance, personnel or ownership. C. N. Daver's mill was owned partially by Englishmen and the technique and personnel were unmistakably Lancastrian in character." The earlier venture in Calcutta had been made by Britons; it failed. The Fort Gloster Mills were put up in 1830 in Bengal under European management, and even when the great Indian pioneers of the power-driven industry, like Daver and Ranchhodlal Chhotatal, set out on their successful careers in Bombay and Ahmedabad "the Englishmen's contribution was vital." Dr. Mehta mentions in his account of the early days of the industry such famous British names as the Sassoons, Greaves and Cotton, Bradbury and Brady, Harvey, Stanes and Killick Nixon. This early influence stamped the industry with certain important characteristics it has retained long after it has become almost entirely Indian. I commend the book from which I take these facts as a first-rate analysis of India's largest industry and one which has some topical interest in view of next year's centenary.

The Tories have been so cock-a-hoop about Mr. Butler's "popular" budget that the reverses of the local elections must have come as a substantial disappointment to them. The *Daily Herald* calls the result "a formidable swing to Labour", but I decline to believe that the vote represented an endorsement of Mr. Bevan's latest plans for grabbing a share in I.C.I., or of the other equally fatuous nationalisation proposals that have been aired on the Left lately. It is difficult to know just what to blame for the apparent decline in the Government's popularity and, until we do know, the Socialists would be premature in claiming too much from the results. The margin separating the two parties in the public favour is still very narrow and quite minor movements of support can produce politically significant consequences; there will be plenty of time for similar movements in the opposite direction before the Ministry actually goes to the country. The worrying thing is that the move against the Conservatives might indeed have been censured for the restrained realism the Chancellor has brought to the questions of food subsidies and free State services—worrying, not because it dims the Conservative Party's electoral prospects, but because an electorate that bridled at the reduction of food subsidies would be in no mood to accept the considerably more energetic limitation of State

bounties that might prove necessary before the country's finances are put in healthier condition.

The importance of developing tourist traffic to this country has often been mentioned in this newspaper and I was glad to learn that a practical beginning has been made by the Tourist Division of the Indian High Commission in London with monthly Tourist Film Shows. At the second of these, held recently, my informant says there were present more than 100 representatives from travel agencies and shipping and air companies in the United Kingdom, who displayed a very lively interest in the three films projected—"Madhya Bharat," "Glimpses of Assam" and "Drums of Manipur". The High Commissioner addressed the gathering at the first of these shows, and said that India was interested in tourist traffic not mainly as an earner of invisible income but more as a way of fostering Indo-British goodwill and co-operation in every sphere of life. At the second show Mr. E. M. Munsif, Officer-in-Charge of the Division, had the useful idea of having the guests addressed by one of their colleagues. This was Mr. Warrington, of Cox and Kings, whose experience of India covered more than 20 years. Mr. Warrington assured his audience that they need have no hesitation whatsoever in recommending their clients to visit India. To get there might be costly, but living in India was not expensive, the hotels were as good as anywhere else and no more expensive than those in England, the trains were extremely good, the air services offered everything the traveller could ask, there was no language difficulty except in remote parts, the people were hospitable and helpful, and in hardly any other country were there eight months of sunshine and warmth each year. Mr. Warrington also mentioned the tourist ticket which could be procured in Britain and which carried with it many concessions and facilities in regard to permits and customs regulations. Allowing that the speaker is a travel agent himself, this seems a fair enough description of the facilities available, though the bit about warmth and sunshine might not be appreciated by all readers just now. The very best mod. cons. India can offer would probably be regarded by most tourists as "roughing it", but the important thing is to convince them that the country is so infinitely more interesting than the comfortable places that it is worth the trouble.

Sir Eric Bowater has forecast that Britons, who read more newspapers than anybody else, will shortly once again have 12-page daily papers, for the newspaper position has eased remarkably in recent months. I may be wrong, but I seem to have noticed that our Indian daily papers have lately begun to expand unostentatiously in size; the eight-page morning offering is giving way to ten pages of print. It is not before time that we should get something more for our two and a half annas. The price of many daily papers was increased in India because of the high cost of newsprint, but since costs began to fall precipitously nothing has been heard of cheaper dailies. This has not prevented some daily papers from accusing the tea distributors of maintaining the price of a packet of tea, or of charging cigarette manufacturers with collecting higher duty before they were obliged to pay it over to Government, and of posing generally as the "consumers' defenders." Meantime they have also increased the number of columns to a page, thereby in fact raising the cost of advertising space. Such ardent defenders of the consumer's interests might have given thought before this to bringing newspaper prices back to what they were a few years ago.

INDUSTRIAL DISPUTES IN INDIAN BANKING SOME FEATURES OF THE LATEST AWARD

(BY A CORRESPONDENT.)

ADJUDICATION of industrial disputes concerning banking companies has been going on since 1946 when a consent award was passed by Mr. Justice H. V. Divatia in the dispute between the Bank of India and its employees working in the city of Bombay and its suburbs. This award was followed by a number of references to one-man tribunals appointed by provincial Governments. Mr. B. B. Singh made an award in March 1947 which applied to the employees of 40 specified banking companies at all their offices in the U.P. Mr. Justice Divatia was again called upon to make another award in disputes involving 30 specified banks at their offices in the city of Bombay. This award was published in April 1947 and was extended in April 1948 to bank employees in Ahmedabad. In Bengal several awards were made in respect of individual banks, of which the award made by Mr. R. Gupta in August 1947 in the dispute between the Imperial Bank of India and its employees, and the two awards made by Mr. S. K. Sen in December 1947 and March 1948 in disputes concerning the Central Bank of India, deserve mention.

An ordinance promulgated on 30th April, 1949, transferred to the Central Government the jurisdiction over labour disputes in banking companies operating in more than one state. In June 1949, a tribunal consisting of three retired judges was appointed to adjudicate in disputes affecting banks coming within the purview of this ordinance. The tribunal gave its award, known as the Sen Award, in August 1950, but it was declared void by the Supreme Court in a majority judgment pronounced on 9th April, 1951. An attempt was then officially made to settle the unresolved disputes through the machinery of conciliation. The attempt failed. A legislative measure was thereafter enacted to freeze certain provisions of the Sen Award, and a new tribunal was formed in July 1951 with Mr. Justice Divatia as chairman; but the legality and appropriateness of the constitution of the tribunal came to be questioned, and all its members resigned. Then, on 5th January, 1952, another Tribunal was set up with Mr. S. P. Sastri as chairman and Mr. M. L. Tannan and Mr. V. L. D'Souza as members. The award passed by this Tribunal was published by the Central Government in the Ministry of Labour, in terms of notification No. S.R.O. 738 dated 26th March, 1953. It remains to be seen whether the Sastri Award will be put to the test of practical working, or whether, like its predecessor, it will invite the legal tests of validity, equity and justice.

Changing Conceptions

The events preceding the Sastri Award make up not only a story of labour unrest but also a story of rapid sociological progress. Being near to events we often fail to comprehend the magnitude of changes our social and economic structures have undergone in the course of last three decades. The old-fashioned entrepreneur employing "land", "labour" and "capital" as factors of production has ceased to be an economic postulate. The entire economic organisation is being reconstructed on the changed basis of the entrepreneur and labour being partners in a venture, and on the further assumption that contracts made between different agencies and in respect of different factors of production are subject to the surveillance and direction of the State.

Though there are important differences of details, the Sastri Award broadly follows the pattern set by the Sen Award. Banks are grouped according to their resources, though (having regard to the recommendations of the Rural Banking Enquiry Committee) an additional group is introduced to meet the case of small banks requiring special consideration. Each group is classified according to the population of the area in which it operates; and like the Sen Award a three-fold classification is adopted, but without differing treatment in respect of the Sen Award. The special inclusion of Ahmedabad in Class I area as made by the Sen Award is however upheld.

Twelve scales of pay have been laid down for the 12 classifications arrived at on the basis of size and area; but the pay schemes for both clerical and subordinate staffs have been so framed that there is in effect for each scheme "one single continuous scale with appropriate increments spread over a span of 25 years". Provisions have been made for dearness allowances, house rent for places with a population of over 700,000, special allowances for specified categories of employees, special increments for employees like special qualification and extra fuel allowance washing allowance, hill allowance, bonus, provident fund, gratuity and medical aid. Adjudication has been made on questions of service, transfer, recruitment, conditions of employment, disciplinary action and subsistence allowance during periods of suspension. The Tribunal has also dealt with miscellaneous matters pertaining to cash deposits, fidelity bonds and other securities furnished by the staff, pension schemes where they are in force, compensation to refugee employees and recognition of unions. Lastly, modi-

fied applications of the Award have been provided for banks working under schemes of arrangement, amalgamating banks, and also in respect of settlements arrived at between banks and employees during the course of the proceedings before the Tribunal and recognised by the Tribunal as compromise awards.

The Important Features

The scope of the present article does not permit detailed discussion of the provisions of the Award. But in order to enable an idea to be formed of the impact of the overall scheme, the essential features are stated below:

(1) Group A comprises banks with working funds of Rs. 25 crores and more. Group B comprises banks with working funds of less than Rs. 25 crores but not less than Rs. 7½ crores. Group C comprises banks with working funds of less than Rs. 7½ crores but not less than Rs. 1 crore. Banks having working funds of less than Rs. 1 crore belong to Group D.

(2) Class I area includes the cities of Calcutta, Bombay, Madras, Delhi and Ahmedabad. Class II area includes towns and cities having a population of one lakh and more, other than those belonging to Class I. Class III area comprises all places not included in Class I and Class II.

(3) The combined running scale of pay for clerks ranges between Rs. 51 and Rs. 280 with progressively higher rates of annual increments rising from Rs. 3 to Rs. 15. As regards the subordinate staff the combined scale is from Rs. 28 to Rs. 72 with annual increments of Rs. 2 during the earlier years of service and Rs. 1 towards the end. Dearness allowance is granted to clerks at 33½ percent of pay (including special allowance and officiating allowance) subject, however, to the minimum of Rs. 35 for Class I area, Rs. 30 for Class II area and Rs. 25 for Class III area, and a maximum of Rs. 70, Rs. 60 and Rs. 40 for the respective areas. Dearness allowance for the subordinate staff is fixed at flat sums varying between Rs. 10 and Rs. 35 a month. Adjustments of dearness allowance will, however, be made for each rise or fall in the all India average working class cost-of-living index number, by more than 10 points over 144 which represents the figure for 1951 using 1944 as the base year. House rent allowance will be Rs. 8 a month for employees (whether belonging to the clerical or subordinate grade) drawing pay not exceeding Rs. 100 a month and working in Calcutta or Bombay and Rs. 6 for employees drawing the same pay but working in a place with population of over 700,000 other than Calcutta or Bombay. Similar allowances of Rs. 12 and Rs. 9 respectively will be paid to employees drawing pay exceeding Rs. 100 but not exceeding Rs. 200 a month, and of Rs. 16 and Rs. 12 respectively to employees with pay exceeding Rs. 200 a month.

(4) Rules have been made for the transition to the revised scales of pay. The adjusted pay will have effect as from 1st April, 1953.

Employees on Transfer

(5) It has been provided that an employee on transfer will be governed by the pay-scale of the higher area but not if he is reverted to a lower area before completion of one year's service in a higher area.

(6) Actual hours of work (exclusive of the recess period) will not exceed (for the clerks) four hours on Saturday and 6½ hours on other working days. Overtime work is allowed up to a total of 120 hours, if the employees agree, otherwise 90 hours in a calendar year, and subject to a maximum of two hours on a day (unless the employees agree to an extended overtime for any day). Payment for overtime will be made for every 15 minutes of work on any day after the first half hour, for which no payment will be made. Work on holidays for half-yearly closing of accounts will be subject to special treatment. These provisions will also apply to the subordinate staff with a modification of hours of attendance.

(7) Bonus will be paid to staff to the extent of 50 percent (in the case of banks under Groups A and B) and of 60 percent (in the case of banks under Groups C and D), of the surplus of profits available after providing for reserves, taxes and payment of dividend at 6 percent on paid-up capital and reserve funds.

(8) Contributions to provident fund will be made at the rate of 8½ percent of pay by banks included in Groups A and B and 6½ percent by other banks.

(9) Subject to certain variations, gratuity will be paid at one month's pay for each completed year of service, but not exceeding a maximum of 15 months' pay for Group A banks, 12 months' pay for Group B banks, 9 months' pay for Group C banks and 6 months' pay for Group D banks.

Medical Expenses

(10) Expenses for medical aid have been so determined as to vary between Rs. 15 per annum for an employee in Group D-Class III area banks and Rs. 90 per annum for an employee in Group A-Class I area banks.

(11) No pension scheme shall contain a rule requiring a pensioner to obtain permission of the bank before accepting any new employment.

(12) Exchange banks are asked to provide wider opportunities for promotions to responsible posts.

It is too late in the day to animadvert on the competence of an outside authority to guide and

determine the policy of a bank in respect of matters of such outstanding importance as expenses on, and relations with, staff. But arguments against such outside intervention are based on weighty considerations, and need not go unacknowledged.

A reputed American writer observes that a policy of "wholesale adjustment of salaries once a year" fails to secure the primary object of "employee satisfaction" which depends upon "salary differentials" recognising "in clear-cut fashion difficulty, importance and responsibilities of different kinds of work and the degree of competence attained by the individual worker." It also deserves to be noted that expenses on staff (without allowing for bonus) accounted for more than 46 percent of total expenses and more than 36 percent of total earnings of scheduled banks in 1951.

Standardisation of Wages

It should not be concluded, however, that the Tribunal was not alive to these considerations. The Tribunal recognises that "standardisation of wages is not generally feasible in the business of banking, although the clerical staff does the same kind of work, because of the difference in the contribution of mental exertion which they make to the profit-making capacity" of the banks in which they are employed. But the Tribunal feels that it is required to be guided by the directive contained in Article 43 of the Constitution and by the principles laid down in the Fair Wages Committee's report and also in the Planning Commission's report, regarding a "living wage" and other conditions of work including measures of comfort and insurance against certain eventualities. The Tribunal appears to consider that the Award provides for "the lower limit of the fair wage" and that the determination of the upper limit has been left to the discretion of individual banks according to their capacity to pay. It expresses the view that a banking unit which is unable to pay the subsistence wage has no right to continue to function.

It seems possible to argue that the grouping of banks according to resources and the relating of bonus to profits run counter to the contention that the remunerations fixed by the Award represent the minimum "subsistence" wage. The formation of the Tribunal and the terms of its Award also seem to have been vitiated by incongruities. Section 10 (2) of the Banking Companies Act empowers the Reserve Bank to determine the sufficiency of remuneration paid by a bank to its employees. The manner of formation of the Tribunal and the result of its work seem to have rendered this provision of the banking law ineffective. Again, the direction regarding bonus seems to involve a violation of Section 10 (1) (b) (iii) of the above-mentioned banking law. Last, but not least, while the extensive study undertaken and valuable suggestions made by the Tribunal should prove helpful, in view of the short duration of the validity of the Award as provided in the Industrial Disputes Act, the elaborate directions contained in the Award seem neither calculated to ensure industrial peace nor designed to facilitate smooth discharge of administrative responsibilities.

Comparison with U.S.A.

In this connection a comparative study of the position in the U.S.A. and India yields interesting results. In the U.S.A. net profits of the insured commercial banks worked out to one percent of their total assets in 1951, while that of the smaller banks amounted to 1.26 and of the larger banks to 0.93 of total assets. Despite the lower earning capacity of the bigger banks, the average salary of their clerical and subordinate staffs was more than double that of the smaller banks. In India the net earning of all scheduled banks worked out in 1951 to a little below one percent of total assets; and that of smaller scheduled banks was slightly higher than the other banks, but still below one percent of their assets. As regards the proportion of staff expenses to total earnings, it appears that this charge increased in the U.S.A. from 28.8 percent of total earnings in 1950 to 29.6 percent in 1951, while in India, in spite of the larger emoluments granted scheduled banks were 37.2 percent of total earnings in 1951 as against 38.8 percent in 1950. A larger fall in this percentage has been observed in the case of exchange banks. It will appear, therefore, that the necessity of conserving the resources of smaller banks, on the one hand, and opportunities for participation in increased earnings, on the other hand, have been better secured by private arrangements born of a reciprocal feeling of authoritative imposition. It is stimulating to union in the U.S.A. a perfect spirit of camaraderie characterises employer-employee relations there, and that unions of bank employees in England have for long been engaging in activities directed not towards carrying on disputes or disputations with employers but towards promoting mutual welfare.

An automatic temperature control unit for studying the temperature rise in mass concrete has been designed in the National Physical Laboratory, Delhi. The use in concrete dams induces cracks which destroy the condition of stress and stability. The cracks are also of points for erosion and disintegration. With the help of this apparatus a study of the rise of different design mixtures have been taken up in the Bhakra-Nangal Concrete Laboratory. The data will be useful in fixing the cement content to a minimum and thus help in the elimination of temperature cracks.

Stocks and Shares

MORE BUSINESS DONE IN JUTE AND COAL SHARES

GILT-EDGED DULL AND STEADY: TEA SHARES EASIER: TURN-OVER STILL RESTRICTED

Wednesday Evening.

THE Calcutta share market has been fully steady at a low level of activity over the past week, but in the last day or two there has been an encouraging broadening of enquiry for jute and coal shares. The increased interest in coal shares followed naturally after the removal of the surcharges on coal exports, but the demand for jute shares is reported to be investment buying on a fairly substantial scale. The better state of the jute goods markets, together with the prospect of American buying in the near future, are behind the renewed enquiry for mill shares, and almost every scrip in the list now stands several points above the values of last month. The gambling counters are steady with Indian Irons subdued at around Rs. 25-8.

The gilt-edged market continued dull and inactive, but a slightly better feeling was in evidence towards the close. The 3 percent Conversion Loan continued on offer during the earlier part of the week and receded at one time to Rs. 82, but after market offerings were absorbed the price recovered at the close to Rs. 82.5, with small buyers. In short-dateds 2½ percent 1954 met with good enquiry due, possibly, to the approach of the interest date (15th May), to be quoted at Rs. 98.5, with few declared sellers; 2½ percent 1955 also met enquiry at around Rs. 98.5. Three percent 1957, however, was slightly easier at Rs. 98-11, while 3 percent 1958 continued to be quoted at Rs. 98-8, with business passing freely at around this price. In medium-dated loans, 3 percent 1959-61 had buyers and improved from Rs. 96-8 to Rs. 96-10, and 4 percent 1960-70 was also taken higher to Rs. 102-6, with few declared sellers. Two-and-three-quarter percent 1962 was also supported at Rs. 91-11 due again, perhaps, to the approach of the interest date (15th May) and business was reported in both 3 percents 1963-65 and 1964 at their previous level of Rs. 92-14. Among long-dateds 3 percent 1966-68 was taken at about Rs. 90-10, while 3 percent 1970-75 after easing to Rs. 86-9 had small buyers, to improve at the close to Rs. 86-10. Among provincials, 4 percent U.P. 1964 continued to be enquired for at Rs. 100-8, while 4 percent West Bengal 1964 turned sellers and the price eased to Rs. 100-10, without attracting buyers. Little or no interest was shown in other provincial issues.

Demand for first-class Preference shares continued unabated, but in the absence of sellers little business could be completed. In the miscellaneous group, Allahabad Bank were marked several times at Rs. 132 and Bharat Collieries were taken at Rs. 47. Large parcels of Calcutta Electric were sold on London account at Rs. 12-2, and it now appears that the order has been completed. Discharge Power 1st Preference were placed at Rs. 103. Chrestien Mica rose sharply from Rs. 55 to Rs. 65. Humayan Properties came to hand at Rs. 11-2 ex-dividend, and Indian Iron were steady at Rs. 107-8. Karanpura Collieries were marked at Rs. 4. Kesoram Cotton at Rs. 127-8, and Patrakola at Rs. 85. Dunlop Rubber 1st and 2nd, Burn 1st and 2nd, Bengal Paper, Bengal Assam Steamship, Jardine Henderson, and Shaw Wallace were among other shares enquired for. In Jutes, a small lot of Anglo-India was crossed at Rs. 132. Bally were placed at Rs. 117, and Clive 6 percent came to hand at Rs. 95. Kamarhatti were marked at Rs. 108 and Northbrook 5½ percent were transacted at Rs. 96.

Imperial Bank of India Fully-Paid and Contributory met with some selling pressure, but towards the close prices recovered to Rs. 1841 and Rs. 453. Hindustan Commercial eased to Rs. 10, and Hind Bank were offered at Rs. 19-8. United Bank of India were steady at Rs. 3-15.

Basanti Cotton, on buying enquiry improved further to Rs. 4-4, as did Elgins to Rs. 17. Cawnpore Textiles were unchanged at Rs. 8-7. Kesoram at Rs. 18-12, and New Victoria at Rs. 1-6.

The announcement of the removal of the surcharge on coal exports to all countries was well received by market operators, and selected coal shares met with some enquiry. Bengal were steady at Rs. 535 and Katras Jherria improved to Rs. 41-8. Amalgamated and Pench Valley were done at Rs. 20-7 and Rs. 20-12 respectively. East Indian and Equitable came in for investment support at Rs. 23-4 and Rs. 44-8. Burrakur fluctuated narrowly around Rs. 10-10, while Rewa were better at Rs. 21. Amongst small-priced shares, Central India and Western Bengal were slightly better at Rs. 4-15 and Rs. 5-1. Bharat Collieries were steady at Rs. 6-1.

Following the rise in the prices of finished jute goods, bargain hunters were active in the jute section, and quotations improved moderately in a number of cases, as will be seen from the following table:—

	Opening	Closing
	7-5-53	13-5-53
Anglo-India	230 0	234
Belvedere	198 0	207
Delta	232 0	231

Dalhousie	131 0	140
Ganges	71 8	76
Gourepore	305 0	320
Kamarhatti	194 0	200
India	127 0	135
Kankannarah	144 0	158
Nuddea	44 8	49
Northbrook	19 2	21 4
Howrah	24 7	25

Other shares which met with enquiry were Agarpara, Budge Budge, National, and Reliance, Lansdowne and Naihati.

Calcutta Electric continued to be the centre of attraction in the Electric Supply section, with business being done up to Rs. 14-7. Selling orders, however, continued to be received for these shares on London account. Benares Electric were done at Rs. 17-12, Patna Old at Rs. 11, and Upper Ganges at Rs. 12-10. There were many buyers of Sijua (Jherria) at Rs. 10-13.

On reports of better working, sugar shares came in for enquiry. Amongst these were Balmampur at Rs. 7, Belsund at Rs. 7-14, Dyer Meakin at Rs. 6-6, Champaran at Rs. 21, Ramnugger at Rs. 17, and Samastipur at Rs. 13-14.

Mr. Setalvad's suggestion that Tata Iron & Steel Deferred shares should be converted into Ordinary shares, in the proportion of one to six, produced no effect on Indian Iron & Steel shares, which fluctuated narrowly between Rs. 25-5 and Rs. 25-11; tonight's closing quotation is Rs. 25-8. Other Engineering shares, however, were fully steady, including Burn at Rs. 277, Braithwaite at Rs. 11-6, India General Navigation New at Rs. 12-14, Indian Standard Wagon at Rs. 79-4, Jessop at Rs. 24-14, and Saran at Rs. 10-4.

In the miscellaneous section, Orient Paper eased to Rs. 32 and Titaghur to Rs. 35. Shree Gopal, in contrast, were steady at Rs. 19-4 as were India Paper Pulp at Rs. 165. Dalmia Cement and Sone Valley fluctuated narrowly around Rs. 6-2 and Rs. 7-4. New Asiatic and Ruby General were the only shares dealt in in the Insurance section at Rs. 4-4 and Rs. 4-12. Hercules and Triton were in request, but in the absence of sellers no transactions were recorded. Bengal Assam Steamship were marked higher at Rs. 150, Calcutta Landing & Shipping at Rs. 10-10, and India General Navigation at Rs. 85.

India Steamship were 2 annas up at Rs. 6-5, while Port Shipping were unchanged at Rs. 12-2. Alkali & Chemical on continued support improved to Rs. 13-14, and Angelo Brothers were marked to Rs. 17-4. Airways (India) eased to Rs. 11-5, around Rs. 17-4. Assam Saws improved to Rs. 6-11. There were many buyers of Bararee Coke up to Rs. 18-6. Balmer Lawrie changed hands at Rs. 295, and British India Corporation were steady at Rs. 8-10. Shares which came in for good enquiry were Dunlop Rubber, Eastern Investments, Ganges

CALCUTTA TEA SALES IN APRIL
ONLY TWO EXPORT AUCTIONS

ONLY two tea export sales were held during April. Sale No. 43 consisted of 47,000 packages and Sale No. 45 24,000 packages. It is expected that Sale No. 1 of the new season will be held on 1st June. The bulk of the offerings in the two sales came from Assam and were generally end of season in character, with dull, plain liquors. Demand was less active, according to the monthly market review of Carritt Moran & Co., Ltd., than in recent months and while there was no notable change in rates in the earlier sale, a general decline of about two annas per pound was witnessed in Sale No. 45, with the exception of well made whole leaf grades which remained a strong feature.

Internal Market

Because of the Centre's announcement regarding the readjustment of the excise duty on tea, the internal sale scheduled for 15th April was postponed until 28th April. Under the provisions of this bill, excise duty payable by producers at the time of clearance from the factory will be reduced from three annas per pound to one anna per pound. Blenders and packers, however, will pay an additional three annas per pound on all packets of less than 60 lbs in weight on clearance from factories or godowns. On the other hand dealers in loose tea will be required to pay an extra one anna per pound.

In Sale No. 45—originally printed as Sale No. 43—20,000 packages of dust were offered and 1,420 packages of leaf. There was a good general demand for dusts. The market opened with an easier tone, but firmed up as the sale progressed and at

the close was irregularly dearer. The small amount of leaf teas sold at about two annas below last rates.

Export sales up to and including Sale No. 45 totalled 1,841,986 chests at an average price of Re. 1-6-6 compared with 1,953,693 chests at an average price of Re. 1-12-8 a year ago. Internal sales at 33,773 chests of leaf and 658,188 chests of dust (Re. 1-0-7 and Re. 1-5-10) go against 96,960 and 620,163 chests (Re. 1-2-8 and Re. 1-10-8) in the corresponding period of last year.

During the first week of the month business in Special Export Licences was transacted at 2 pies per pound. The price subsequently declined to 14 pies and remained steady there. New Season's Quota opened at 13 pies per pound but at the close of the month business was being transacted at 12 pies. The Government of India have authorised the Licensing Committee to allot export quota for 1953-54 to tea estates on the basis of an export allotment of 115 percent of India's standard export figure pending declaration of the Indian export allotment of tea for the year 1953-54. It has been decided by the Licensing Committee to release, for the present, export quota for 1953-54 to the extent of 105 percent of the standard export figure corresponding roughly to 70 percent of the crop basis of tea estates. The balance of export quota will be released later on.

Arrivals (in chests) in Calcutta warehouses during the period 24th March to 23rd April, with the corresponding period of last year in parentheses, were as follows: by rail 11,523 (4,225), by steamer 19,989 (23,095); by air 5,840 (3,354). Since the beginning of the season, 1st April, 1952, and up to 31st March, 1953, arrivals have been 924,169 (749,146) by rail; 3,313,884 (3,602,630) by steamer and 130,064 (225,459) by air; making a total of 4,368,097 (4,577,235) chests.

COCHIN TEA SALES

At Internal Sale No. 'I' held on 5th May 1953, there were about 1,48,000 lbs. of Dust printed for sale. Quality was average and demand was fair. Prices were irregular and showed about 2 annas decline except for black leaf types which were about steady.

Business in New Season's Export Quota has been done at 91 pies and Special Licence remains unchanged.

Internal Sale No. 'J' will be held on Tuesday, 19th May 1953.

LONDON TEA SALES

Demand was quieter than recently for the 30,371 packages of North Indian, Pakistan and miscellaneous teas offered on 11th May. Prices moved irregularly but were generally about steady on balance although low medium and common kinds mostly declined by 1d. per lb. Quality was often indifferent. Clean Common Broken Pekoe, free from stalk, was quoted at 40d per lb.

North Indian, Pakistan, African, British Malayan, Portuguese East African and Indonesian teas totalling 33,496 packages met with a good general demand on 4th May. Best descriptions higher where changed. Ordinary Mediums and Clean Common sorts were inclined to be irregular but prices on balance remained steady. Stalky thin liquoring varieties were easier. Clean Common Broken Pekoe, free from stalk, was indicated unchanged at 40d per pound. The balance of offerings, amounting to 25,291 packages of North Indian, Pakistan and other miscellaneous teas were quickly cleared at fully steady prices on 6th May. A feature of the Indonesian offerings was the sale of 63 chests of superior Broken Orange Pekoe at 13s 2d per lb. believed to be the highest realised since the auctions reopened in April 1951. Clean Common Broken Pekoe was indicated at 40d per lb.

Results of some of the companies are given below:—

	No. Packages	Average Per lb.

NORTH INDIAN TEA CROP REPORTS

The following summary of crop and weather telegrams have been received from different districts for the month of April, 1953.

UPPER ASSAM.—Weather generally seasonable but rainfall for the month has generally been excessive; severe storms without hail reported from Sonari and Jorhat; hailstorms causing little damage reported from Panitoli; outturn last month poor to normal; immediate prospects fair.

CENTRAL ASSAM.—Weather abnormally dry in Golaghat and unfavourable in Moran but normal elsewhere; outturn last month very poor to about normal; immediate prospects bad to fair.

LOWER ASSAM.—Weather generally seasonable; red spider blight prevalent in Borsola and Loober blight reported at Dheekialuli; hot and dry weather is interfering with outturn in Nowgong; immediate prospects fair to good.

NORTH CACHAR.—Weather generally favourable but hot and dry in Happy Valley and is interfering with outturn; red spider blight prevalent in some districts of Lakhimpur; outturn last month about normal; immediate prospects fair.

SOUTH CACHAR.—Weather abnormally hot and dry and is interfering with outturn; severe storms without hail reported from Chutia, Bheel and Langai; red spider blight prevalent; outturn last month poor to about normal; immediate prospects fair in Hailakandi and Longai; unless rain falls shortly leaf prospects in Chutia Bheel will generally be poor.

SYLHET.—Lungia reports outturn last month about normal; immediate prospects good; red spider blight prevalent; weather favourable.

EASTERN DOOARS.—Outturn to date is considerably under last year; weather seasonable but rainfall for the month has been deficient; immediate prospects fair; red spider blight prevalent.

WESTERN DOOARS.—Outturn last month about normal; hot and dry weather is interfering with outturn. Outturn to date is about level with last year; of the year; rain badly wanted; crop prospects generally are favourable; red spider blight severe.

DARJEELING.—Outturn last month about normal; immediate prospects fair; weather reasonable; red spider blight severe in some districts; thrips prevalent generally.

TERRAI.—Rain badly wanted; crop prospects generally are favourable; some hail; red spider blight prevalent; helopeltis in evidence.

New Delhi

OFFICIAL LEAVES FOR TRADE
TALKS WITH EGYPTLOWER HOUSE PASSES BILL TO
AMEND INDUSTRIES ACT

(FROM OUR OWN CORRESPONDENT.)

9th May.

MR. H. V. R. IENGAR, Secretary to the Ministry of Commerce and Industry, left for Bombay this morning en route to Cairo where he will discuss a fresh trade agreement with Egypt. The last Indo-Egyptian trade agreement expired at the end of February this year. Under it, Egypt had agreed to export 300,000 bales of raw cotton; 550 tons of cotton yarn of counts 80s and above; 50,000 tons of rock phosphates; 10,000 tons of gypsum anhydrite; and 6,500 tons of flax.

India's exports included tea (4,000 tons); tobacco (2,000 tons); groundnut oil (1,000 tons); linseed and castor oils; cotton piecegoods (grey, fine and superfine); shellac; tanned hides; iron and steel manufactures worth £10,000; cutlery and electrical goods worth £5,000 each; sanitary fittings worth £4,000; rubber tyres and tubes worth £2,000; woollen manufactures worth £10,000; drugs and medicines worth £6,500; pottery worth £1,000; essential oils, chemicals, art silk piecegoods, sports goods and jute goods.

Because of Egypt's currency difficulties special importance is attached to the forthcoming talks, which will cover payments problems. In recent years India imported much more than she exported to Egypt. During 1949-50, 1950-51, 1951-52 and 1952-53 (April to December) imports were worth Rs. 40,21,06,000, Rs. 32,86,68,000, Rs. 40,49,47,000 and Rs. 9,80,01,000; and exports amounted to Rs. 7,86,40,000, Rs. 5,73,57,000, Rs. 6,36,48,000 and Rs. 3,79,17,000. India's imports of raw cotton were worth Rs. 34,03,88,000 in 1949-50; they declined to Rs. 32,35,39,000 in 1950-51 but rose to Rs. 39,84,14,000 in 1951-52. Cotton twist and yarn imports during these three years were worth Rs. 13,00,000, Rs. 7,21,000 and Rs. 14,11,000 respectively. Manure was another important commodity imported by India. Its value rose from Rs. 8,77,000 in 1949-50 to Rs. 20,09,000 in 1950-51 and Rs. 34,46,000 in 1951-52. Jute manufactures topped the list of exports to Egypt. During 1948-49, 1949-50, 1950-51 and 1951-52, gunny bags worth Rs. 4,91,18,000, Rs. 4,43,38,000, Rs. 2,79,13,000 and Rs. 2,36,22,000 were exported. Jute cloth exports during the period were of the value of Rs. 81,30,000, Rs. 32,70,000, Rs. 70,10,000 and Rs. 1,48,82,000 respectively. Jute goods of other kinds were also exported to Egypt in considerable quantities. Exports of tea during 1948-49, 1949-50, 1950-51 and 1951-52 were valued at Rs. 14,22,000, Rs. 1,70,48,000, Rs. 66,70,000 and Rs. 71,08,000. Exports of unmanufactured tobacco during the same years amounted to Rs. 37,71,000, Rs. 26,67,000, Rs. 23,91,000 and Rs. 39,42,000. Oils worth Rs. 11,67,000, Rs. 12,28,000, Rs. 7,83,000 and Rs. 5,41,000; spices amounting to Rs. 9,80,000, Rs. 26,68,000, Rs. 18,22,000 and Rs. 23,83,000; and coir mats and matting worth Rs. 1,46,000, Rs. 1,10,000, Rs. 2,16,000 and Rs. 1,13,000 were exported to Egypt during 1948-49, 1949-50, 1950-51 and 1951-52. Cotton piecegoods valued at Rs. 23,43,000, Rs. 61,38,000, Rs. 8,58,000 were sent to Egypt during 1949-50, 1950-51 and 1951-52. Rubber manufactures worth Rs. 93,000, Rs. 2,31,000, Rs. 2,19,000 and Rs. 6,000 and shellac worth Rs. 74,000, Rs. 4,44,000, Rs. 5,69,000 and Rs. 4,48,000 were exported to Egypt during 1948-49, 1949-50, 1950-51 and 1951-52. Chemicals and chemical preparations exported during the same period were valued at Rs. 1,78,000, Rs. 9,000, Rs. 77,000 and Rs. 1,64,000; drugs and medicines were worth Rs. 3,000, Rs. 75,000, Rs. 1,49,000 and Rs. 1,49,000.

After negotiating the trade agreement in Cairo, Mr. Iengar will visit Britain, Germany, Switzerland and other Continental countries to study prospects of expanding the market for Indian tea. He will consider what arrangements can be made to promote sales in the British and Continental markets since India has withdrawn from the International Tea Market Expansion Board.

Amendment of Industries Act

Three important Bills were passed by the House of the People this week: the Industries (Development and Regulation) Act Amendment Bill, the Tea Bill and the Air Corporations Bill. An abortive attempt was made to bring mica and the plantation industries within the scope of the Industries Bill. Rejecting the proposal, the Commerce Minister said that the plantation industries did not fit into its general framework. There were practical difficulties in including similar provisions in the Tea Bill. As for the rubber industry, the Commerce Minister explained that the Tariff Commission had been asked to enquire into "the profits made in past years, the price advantage gained by way of additional equipment and financial help given in wartime and whether the prices charged are correct. I cannot see how a measure of this nature can alter the structure of industry in this country so far as ownership is concerned. That has got to be done by other means." He felt that "the position of Dunlops is much better compared to Firestones, where the capital is smaller, profits are larger and it is a private limited liability company where all the profits are just sent away. Dunlops are much better because a part of the capital is held by Indians."

The House accepted two official amendments. Under one, the Government was given powers to control the prices not only of stocks held by undertakings but also of goods manufactured or in the

process of being manufactured. The other provides the owner an opportunity to be heard in certain cases before the registration of his undertaking is revoked.

Composition of Tea Board

The Tea Bill had a stormy passage through the Lower House, the opposition to it coming mostly from the Congress members of South India who represent plantation interests. Two assurances were given by the Commerce Minister. He said that he had no intention of being arbitrary in deciding the composition of the Tea Board and would provide in the rules that the representation of the appropriate associations be kept in mind when making nominations. The Government would also take into account the position of trade unions in different areas and give fairly wide representation to labour. The Commerce Minister declared that he could not deny representation to non-Indian interests, such a provision, he added, was neither necessary nor fair. These assurances were not regarded as adequate by the critics of the Bill. Two amendments were pressed and carried, one providing that the chairman of the Tea Board would be elected from among the members of the Board instead of being appointed by the Government. The other amendment required a member of the Board to obtain authorisation in writing from the chairman before he could inspect a tea garden. Two amendments were also made in the clause relating to powers over the distribution of tea waste. One sought to clarify the Government's power to direct any person growing, manufacturing or holding in stock tea or tea waste to sell the whole or part of it. The other provided that in such sales the price shall be that agreed upon, consistent with reference to the controlled price, or in the absence of a controlled price the price calculated at the market rate prevailing in the locality on the date of sale.

Air Nationalisation Bill Passed

During the debate on the Air Corporations Bill, the Communications Minister, Mr. Jagjiwan Ram, emphasised the need for two air corporations and defended the compensation clauses. He reiterated the assurance that the personnel of existing air companies would not be retrenched after nationalisation. Two amendments were accepted. The first provided that the Central Government might authorise the voluntary winding up of a company on the application of the existing company or of a majority of its members representing three-fourths (in value) of the ordinary shareholders. The second amendment, made by inserting a new clause, provided that the authorisation given by the Government for the voluntary winding up of a company might include directions to distribute the net assets among the various classes of members of the company in such a manner as the Government might specify, "having regard to the amount subscribed, the different classes of members or having regard to the circumstances relating to the issue of the shares to the various classes of members." Such directions would have effect, notwithstanding anything contained in the provisions of the Indian Companies Act or the articles of association of the company.

Sugar Industry Warned

The Government has given an ultimatum to the sugar industry that it must reduce prices within a week or face the consequences, which include the freezing of stocks at mills, it is learned. Sugar prices have risen by Rs. 2 to Rs. 3 a maund during the last few weeks but the Government holds that there is no good reason for this. During the last five months as much as 94 lakh tons of sugar have been released for sale; during the five months ended April 1953, seven lakh tons of sugar were moved out of mills as against five lakh tons in the corresponding period of 1951-52. The total stock of sugar today is 18 lakh tons as against an approximate offtake of 11.7 lakh tons during the last season.

Reorganisation of Secretariat

Reorganisation of the Central Secretariat is slowly progressing. The tenure system is again being enforced and officials of the status of Joint Secretary or Deputy Secretary are being reverted to their home States in order, firstly, to bring fresh minds to the Central Secretariat and, secondly, to provide officers an opportunity to acquire greater experience. There have been a number of changes among the administrative heads of Central Ministries. There are new permanent heads in the Cabinet Secretariat and in the Ministries of External Affairs, Commerce, Home, Transport, Communications and Works. The Labour Secretary will leave the Indian Civil Service and will shortly be replaced by a senior officer. The Defence Secretary, Mr. H.M. Patel, will leave that Ministry when he goes on leave in July and will be replaced by another senior official. There have been some changes in the Finance Ministry also. One Joint Secretary, Mr. P. C. Bhattacharyya, became Financial Commissioner of Railways some months ago. Another Joint Secretary, Mr. G. R. Kamat, will shortly change places with Mr. R. K. Nohru, who has been India's representative on the International Bank.

The Government has decided to have only Secretaries, not Joint Secretaries, as the permanent heads of Ministries. Mr. V. K. B. Pillai will soon become Secretary to the Health Ministry, which has so far been under a Joint Secretary, Mr. Madhava Menon. A Secretary will also replace the present Joint Secretary in the Irrigation Ministry. Younger officials are being given a chance to gain experience by officiating for seniors; Mr. S. Boothalingam and Mr. S. Ranganathan officiated for their Secretaries in the Commerce and Works Ministries last year. Mr. Boothalingam is again officiating for his Secretary, Mr. H. V. R. Iengar, for four months. A Deputy Secretary in

the Works Ministry has been appointed to officiate as Joint Secretary in place of Mr. Ranganathan, who has gone on leave. Two other proposals are being considered. Firstly, the Service section is proposed to be transferred from the Home Ministry to the Cabinet Secretariat. Secondly, the Indian Administrative Service School will have a whole-time principal.

Powers of Planning Commission

Mr. K. C. Neogy has agreed to become member of the Planning Commission and will join shortly. He will be in charge of the industrial sector, previously held by Mr. G. L. Mehta, now India's Ambassador in Washington.

The Planning Commission appears to be having some organisational worries. It has been looked upon as a parallel Government by the Secretariat since its inception, and this feeling has grown since its members were made ex-officio members of the Economic Committee of the Cabinet. Two of them resigned some time ago but have not yet been replaced. Sir Chandulal Trivedi was at one time supposed to become a member, but he will now probably be appointed Governor of Andhra State. The present members are: Sir V. T. Krishnamachari (a man of considerable age), Mr. Nehru, Sir Chintaman Dasmukh, Mrs. Durgabai Deshmukh and the Irrigation Minister, Mr. Gulzarilal Nanda. The three Ministers are already far too busy to find much time for the Commission, which is now in the most difficult stage of its work—implementing the plan. Some here feel that the Ministers should no longer be members of the Commission. Of the three Regional Advisers one, Mr. Rau, has become Administrator of the Patiala and East Punjab States Union. States have their notions of autonomy and are not too fond of these advisers.

Some think that the Commission has been encroaching on the executive field. The national extension scheme, with which the existing community development programme is being integrated, will be implemented through the Commission. The scheme covers nearly 120,000 villages, with a population of about eight crores. Within the area covered by the extension programme, intensive development work will be taken up in selected regions, thereby making the community projects a permanent feature of rural development. Extension work and the community programme will thus run concurrently, the only difference being that the former, which is somewhat restricted in scope, will cover a wider region while the latter, aiming at all-round development, will concentrate on particular areas. The programme will be carried out jointly by the Central and the State Governments and is expected to commence on 2nd October, 1953. Under the scheme, about one-fourth of the country will be covered by 1956. Twelve hundred development blocks, each consisting of 100 villages and a population of about 56,000, are to be taken up. Of these, nearly 300 will be included in the community development programme which has been in operation since October last year. The remaining 900 blocks are to be covered under the extension programme; 180 will be taken up in 1953-54, 270 in the following year and 450 in 1955-56. Of these 400 will be chosen for intensive development work on the lines of the community projects. Thus, of the 1,200 blocks which are expected to be taken up during the plan period, 700, consisting of 70,000 villages and a population of about 4.62 crores, will receive attention under the community programme, while 500, consisting of 50,000 villages and a population of about 3.3 crores, will receive attention under the national extension service. Total expenditure on the scheme will amount to Rs. 101 crores, for which provision has already been made in the five year plan. For the community development programme alone the plan provides Rs. 90 crores. The Central Government, it has been decided, will bear 75 percent of the non-recurring cost and 50 percent of the recurring expenditure. The rest of the expenditure will be borne by State Governments. After the completion of the programme each development block will retain on a permanent basis the personnel of the national extension organisation. The Central Government will be prepared to bear 50 percent of the recurring expenditure on such staff. This obligation will be subject to review after five years. It is felt that the Commission is rapidly becoming another department of the Central Government. Steps should be taken to strengthen its personnel and retain its advisory role.

Trade with China

Mr. T. T. Krishnamachari, Commerce and Industry Minister, stated in the House of the People this week that the Government would not permit any trade discrimination against China in any manner whatsoever by anybody doing business from this country, no matter whether he was an Indian or a foreigner. He said this in reply to the acting leader of the Communist group, Professor Kiren Mukerjee, who asked for an assurance that the Government would not agree to the request for trade discrimination against China received from the United Kingdom Government in accordance with American policy. Mr. Krishnamachari said: "Our policy in regard to the export and import trade is that it is multilateral and completely non-discriminatory and we do not propose to discriminate against any country, no matter what other complications are and who does something else." Restrictive regulations that might be enforced on ships registered in the United Kingdom would not apply to Indian ships even though they might be registered under the United Kingdom Merchant Shipping Act. "So far as trade with China is concerned, we put no hindrance. We would like the development of trade between the two countries."

Bombay

GOVERNMENT'S ATTITUDE TO BUSINESS MEN DEPLORED

ENCOURAGEMENT OF SECONDARY INDUSTRIES IMPERATIVE

(FROM OUR OWN CORRESPONDENT)

10th May.

MR. S. K. Patil, President of the Bombay Pradesh Congress Committee, has long championed the cause of the business community in Western India, thus helping to bring a closer understanding between business men and the Government. Last Thursday, Mr. Patil gave further proof of his understanding of the difficulties under which industry has been labouring because of, in his opinion, the wrong approach of the Government in trying to solve economic problems. Mr. Patil can be very frank when he chooses and he was devastatingly so while inaugurating the sixth All-India Plastics Manufacturers Conference last Thursday. He said that the Government had been at fault in the past in its dealings with industry and suggested that business men keep the Government advised of their viewpoint. Deplored the Government's attitude of suspicion towards the business community. Mr. Patil declared that no Government could boast of a moral stature higher than that of the elements composing it and wondered why the Government did not even take experienced business men into its confidence or seek their advice. What he wanted was some kind of a plan by which the Government could harness the best industrial talent in the country to achieve all round economic advancement and observed that the initiative for seeking out such talent should come from the Government. Mr. Patil also sympathised with industry's complaint about the plethora of labour legislation and agreed that the quantity of legislation passed during the last six years had beaten the record of any other country. He was equally critical of the country's trade representatives abroad who did little to encourage the sale of Indian goods and acted merely as post offices. Dr. K. A. Hamied, who presided over the Conference, believed that there was a great future for the plastic industry and pleaded for the establishment of an indigenous chemical industry which could supply raw material. Speaking about the industry in general, Dr. Hamied thought that the proposed amendments to the Industries (Development and Regulation) Act of 1951 would destroy all incentive and act as a deterrent to the establishment of new industrial concerns.

Speaking at a meeting organised by the Association of Merchants and Manufacturers of Textile Stores and Machinery last week, Mr. A. D. Shroff said he considered the small number of secondary industries in the country was one of the greatest handicaps to the development of large scale industries. He welcomed the fact that the Planning Commission had emphasised the need for a rapid development of small scale industries which would in turn make it possible to start new large scale concerns and that the Industries Department of the Government of India had recognised the need to build up a number of secondary industries. In support of his thesis Mr. Shroff revealed that even in the industrially advanced countries like the U.S.A., 78 percent of industrial workers belonged to small industries and that in India, against about 15 million persons engaged in small and medium scale industries, there were only a little less than four million working in the bigger industries such as textiles, cement, iron and steel and jute. Small scale industries in India contributed about Rs. 860 crores to the national income against Rs. 640 crores earned by the bigger industries. According to Mr. Shroff, the biggest difficulty facing small industries was the paucity of finance and he therefore wanted a special financing agency which could cater for the needs of these small industries. At the same time, Mr. Shroff urged the leading banks to adopt a more conservative attitude towards small industries. The Government for its part could help these industries by providing technical assistance and facilities for testing their raw materials, processes and products. Mr. Shroff also suggested that increasing assistance be sought from national laboratories. On the administrative side, Mr. Shroff suggested the appointment of a special Deputy Minister in the Ministry of Commerce and Industry to give his undivided attention to the development of these industries.

Bombay Port Development Plans

The Bombay Port Trust has some very ambitious plans to modernise the docks here which would cost about Rs. 9 crores. As the scheme's implementation depends largely on the amount of financial assistance the Central Government would give to the Board of Trustees, the Board has decided to send a three-man deputation to New Delhi to discuss this question with the Transport and Finance Ministries. Two of the docks, Princess Docks and Victoria Docks, were opened in 1880 and 1888 respectively and as they are both tidal with single gate entrances and of restricted depths in their basins, they are unable to provide berths for the big steamers of today. Only the Alexandria Dock can accommodate them. The scheme prepared by the Port Trust includes an extra entrance lock for both Princess and Victoria docks, the widening of the communication passage between them and the readjustment of berths to take bigger ships. The Bombay Port Trust has also asked the Central Government for a loan of Rs. 4 crores for the construction of a marine oil terminal in connection with the two oil refineries which are now under construction. The Port Trust has requested that this loan should be interest free for the first 12 years and that it should be repayable at the end of 30 years. The rate of interest suggested after the initial period of 12 years is 4 percent.

Road Transport Taxes

The Policy Committee of the Transport Advisory Council met here at the beginning of last week with Dr. Jivraj N. Mehta, the State Finance Minister, as Chairman. The Committee is composed of State road transport Ministers and representatives of these Governments. Several important questions relating to octroi and other local taxes as well as State road funds and the equalisation of freight on petrol throughout the country were considered by the Committee and a number of recommendations intended to eliminate obstacles to road transport development and to further the adoption of a uniform policy of taxation of motor vehicles were made to the Advisory Council. The Committee recommended that the Government of India appoint another committee to examine means to avoid delay in the through transit of goods and that octroi duty should be confined only to goods consumed within the towns where it is levied. There was a difference of opinion concerning the creation of a petrol freight pool between the maritime States and those in the interior and it was left to the Government of India to examine this question.

Textile Centenary

The Textile Association of India, comprising technicians and executives employed in the textile industry, will celebrate the Textile Centenary in 1954 on an elaborate scale. The first power driven textile mill in the country was erected in Bombay in February 1854 and from this modest beginning it has now developed into the biggest industry in the country. The credit for giving a start to the Daver industry goes to Mr. Cowasji Nanabhoy Daver of Bombay who was responsible for this unit. The celebrations will include a textile industrial exhibition in Bombay.

Taxation Enquiry Commission

The Taxation Enquiry Commission headed by Dr. John Matthai began its work here last Thursday. It has already received a large number of statements and memoranda from various sections of trade and industry to enable it to prepare the questionnaire which is expected to be out about the middle of June.

London

SECOND READING FOR FINANCE BILL

TRADE AND DOLLAR EARNINGS

(FROM OUR OWN CORRESPONDENT)

9th May.

APART from the debate on the Opposition centred motion last Tuesday, when Mr. Aneurin Bevan in particular really let himself go, the week has been a comparatively quiet one in Westminster, despite the fact that all the business which came before the House of Commons was of a controversial character. Perhaps the answer lies in the fact that local government elections were in progress all over the country and occasioned a certain diversion of interest. At all events, the House was but sparsely populated for all but the Finance Bill, and even when division times were reached the Government had little difficulty in maintaining a majority of over 20 votes. The Finance Bill itself was defeated by a majority of 29, and a similar majority was secured for a Government amendment which turned the tables on the Opposition by accusing them of "filibustering." Anyhow, the Transport Bill, which was at the root of all the trouble, has now received the Royal Assent and is out of the way. Central African Federation occupied two days of the House of Commons' time, and on the second of these Mr. Attlee's calm and reasoned contribution to the discussion was a highlight after all the vituperation which had preceded it.

On Thursday the Finance Bill secured an unopposed second reading, but the speeches of Mr. Jav and Mr. Gaiskell indicated that the Committee stage will not pass quite so uneventfully. Nevertheless, it may not be without some significance that Labour's idea now appears to be to "improve" Mr. Butler's Budget whereas earlier the emphasis was on condemning it out of hand. For his part, Mr. Butler raised a corner of the curtain which has hitherto obscured the results of his talks in Washington. He admitted disappointment about the progress of trade between the two countries up to the moment and this had been frankly discussed with the American Ministers. He agreed that there would be a period of difficulty—in particular while the new U.S. administration settles down—but insisted that it would be wrong now to abandon the objectives of widening trade and tightening closer our ties with the United States. The frankness of the discussions, he contended, had been matched by the understanding which they had created.

April Trade Figures

In the circumstances, it is reassuring to find, after the moderate setback recorded in March, that April was another good month for the dollar earnings of the sterling area. There was a surplus of \$107 million to be added to the gold reserves, which were thereby raised to \$2,273 million. The surplus included \$20 million in defence aid received from the United States during the month and \$11 million received from the European Payments Union in partial settlement of the March surplus. This means that net earnings in trade with the rest of the world, excluding American aid, were \$76 million, against only \$15 million in March. The setback in March can now be explained by what was probably a seasonal factor, heavy dollar expenditure on tobacco purchases when the Government relaxed the import restrictions. There are no special movements to explain the improvement in April, and in view of the fact that the prices of sterling raw materials, which form so large a part of the area's dollar exports, have continued to decline, the return to the February level is all the more satisfactory. In transactions with the European Payments Union also things went well during April. The sterling area's surplus was doubled, at £15,200,000, of which one-half will be settled this month in gold or dollars.

It may not be out of place here to correct a misapprehension which might be created by the American decision to reduce defence aid to Britain. This will not have any immediate impact on the balance of payments position, for in his Budget Mr. Butler took into account £140 million in American aid, all of which has already been appropriated and will not be affected by the new decision. As regards the future, since Mr. Butler's "trade not aid" plans must obviously have contemplated the complete cessation of direct aid sooner or later, that contingency could obviously be taken care of either by adjustment of the rearmament programme or, if his anticipations prove justified, by the American administration's final decisions with regard to its imports policy.

Wage Claims and Exports

The industrial outlook in this country is also showing signs of improvement, though any optimism this may engender is tempered by the thought that wage increase demands are being put forward now which may well result in our exports being priced out of world markets. The demand for a 15 percent increase, approved by the A.E.U. and likely to be accepted by the Confederation of Engineering and Shipbuilding Unions later this month, which would apply to some 3,000,000 workers and cost the engineering industry an additional £125 million a year, is the most serious of these but by no means the only one. Just the same, the brighter features are certainly welcome. Most encouraging of all, perhaps, is the remarkable rise in the demand for the products of the British motor car industry. A month ago it would have been pos-

certainly any of the more expensive models, within a week. To-day the best one could hope for would be delivery by August. Exports are booming once again, and many manufacturers are setting up new production records and new sales records in dollar markets. Associated to some extent with this development, and influenced also by the approach of summer, unemployment is dropping. In March-April there was a fall of 21,200, bringing the total to 375,000, against 467,000 a year ago. Coal output is also rising, though not as much perhaps as the N.C.B. would like from its new campaign with the National Union of Mineworkers to step up production. So far this year output is half a million tons up on last year's figures at the same time.

By far the greatest encouragement to industry itself, however, lies in the steady implementation of the Government's intention to do away with controls. Except for tinplate, rationing of all types of iron and steel came to an end this week. Production this year is expected to be about 174 million ingot tons, sufficient to meet home demands and to provide somewhat larger quantities for export. On the other hand, if demand increases beyond estimates, it is anticipated there will be no difficulty in purchasing additional steel from abroad. In point of fact, stocks in the hands of consumers are now some 200,000 tons higher than in June, 1950, when the wartime rationing scheme was ended, and with rearmament needs less concentrated now and raw materials in somewhat better supply, there should be little danger of a repetition of the 1951 situation, when the rationing scheme had to be reintroduced. Also this week has come the announcement that free dealings in copper will begin again on the London Metal Exchange on 5th August. Notice has been served on the Rhodesian copper producers that Government buying will cease on that date, but it is expected that on the basis of outstanding forward commitments and its stock, the Ministry of Materials will support the market for a while. Aluminium, magnesium, tungsten ore, sulphur, pyrites, jute, iute goods and soft hemo are still controlled, but their return to private trading will follow as soon as circumstances will permit.

Comet Production Plans

Last week's anniversary of the Comet going into regular passenger service for B.O.A.C. was observed just before news was received of the tragic accident to one of these planes soon after taking off from Calcutta on the return journey from Singapore. The official inquiry by the Indian Government will no doubt establish the cause of the disaster, and

it is never safe to anticipate such verdicts, but that has not prevented newspaper speculation on a variety of possible explanations. To those with some knowledge of the freak conditions which a nor'wester can produce it will probably be appreciated that no aircraft or pilot could have avoided or overcome such a million to one risk. Nevertheless, Sir Miles Thomas, Chairman of B.O.A.C., has done well to lose no time in reaffirming the Corporation's confidence in the Comet itself and to announce the continuation of all Comet services that can be maintained with the existing fleet. De Havillands would appear to hold similar views, for not only are they proposing to double their authorised capital to £12 million, but they are going ahead with a substantial expansion programme for the Comet over the next few years and the Comet II is now undergoing flight tests under tropical conditions in Africa after reducing the London-Cairo record of its predecessor in the series by a substantial margin earlier this week.

Mention is made of these facts because it has just been announced that Air-India International have confirmed an order for two Series III Comet aircraft, on which they took up an option some time ago. These aircraft are intended for use on an express "luxury" service which the company— which by then will be part of the State Corporation—intends to establish between India and the United Kingdom. The purchase of these aircraft will still be subject to the conclusion of a contract now being negotiated. Air-India, however, is only one of many airlines in the queue for Comet aircraft. B.O.A.C. had a fleet of nine (now reduced to seven) Comet I aircraft of the 21 which De Havilland planned to build of this and the modified IA type, most of which have already been delivered to their orderers. Next deliveries to B.O.A.C. will be their 12 Comet II aircraft, and they have an option on 10 Comet IIIs, which are unlikely to be available until 1956-57.

Brevities

Mr. E. G. Gough has resigned from the Board of Thomas De La Rue and Company on becoming Managing Director of the Pakistan Security Printing Corporation, in which De La Rue has a substantial interest.

The Rotary House of Friendship at 21, Portman Square, London, will be opened temporarily from 11th May to 27th June for the reception and information of overseas Rotarians from all parts of the world coming to London before and after the International Convention in Paris and for the Coronation.

RAYON FOR MODERN TEXTILES

The National Rayon Corporation, situated on the Ulhas River at Kalyan, near Bombay, is making a major contribution to India's Textile Industry by producing rayon, an indispensable element in the fabrication of modern textiles. Installed in the Corporation's factory are nearly 4,000 specially designed G-E pot motors, revolving at 6,900 r.p.m. and spinning and collecting from chemically treated wood pulp over seven million pounds of rayon every year.

General Electric is the largest electrical manufacturing organisation in the world with a production range of 200,000 different items—from tiny switches to giant generators, from lamps to locomotives. Inaugurated 75 years ago in U.S.A., when its parent company was first established, General Electric's unlimited resources, skill and research have been used and are available to India for the development of her natural resources.

MAIN PROVISIONS OF TRADE AGREEMENT WITH JAPAN REGISTRATION OF KARACHI COMPANIES

(FROM OUR OWN CORRESPONDENT)

Karachi, 8th May.

ALTHOUGH the full trade agreement between Pakistan and Japan has not yet been published, and presumably will not be published until it has been ratified by the two governments, a summary has been issued of the main provisions. The summary, however, does not give any details of the arrangement for "deferred payments" for import of capital goods from Japan, and these will be awaited with keen interest, not only in Pakistan but in other countries. Now that Pakistan's foreign exchange resources are in such extremely low water, it is clear that any country which hopes to get a substantial share in supplying Pakistan's development needs must be prepared to enter into some sort of similar arrangements.

The arrangement in respect of Japan is understood to be as follows. The Pakistan Government will issue "single country" import licences for capital goods to the value of £6 million from Japan. The Japanese exporters will be required to open non-resident rupee accounts in banks in Pakistan, and they will receive deposits from the importers in those accounts in mutually agreed instalments. The Pakistan Government will then permit the importers to make remittances to the exporters, in sterling, against the amounts held in the non-resident accounts, until the full c.i.f. value of the capital goods has been remitted. This will be done in instalments, on the following lines, over five years:

approximately 10 percent of the c.i.f. value of the goods will be remittable at the time of placing orders; approximately 15 percent will then be remittable on proof of shipment from Japan; and thereafter the balance in approximately equal half-yearly instalments over a period of five years from the date of the contracts. No interest will be charged on instalments or on outstanding balances. This is plainly a very attractive proposition from the Pakistan point of view. Some British manufacturers, it is understood, are prepared to offer almost equally generous terms, but so far Her Majesty's Government does not appear to have taken a hand in the matter.

Memoranda of Association

In a recent despatch I mentioned a difficulty which had occurred as the result of the appointment of a separate Registrar of Companies for the Federal Capital. There were a great many companies incorporated in Karachi whose Memoranda of Association stated that the registered office being, at that time, in that province. Such companies had been called upon by the Registrar either to open registered offices in Sind or to amend their Memoranda of Association so as to conform with the actual location of the registered office under the altered political boundaries. Such amendments would of course have to be confirmed by the Chief Court of Sind and it was felt that the action of the Registrar of Companies would throw much additional work and expense, not only on the companies affected, but on the Chief Court, which was already burdened with heavy arrears of civil work. The Karachi Chamber of Commerce and urged that the provisions of section 12 of the Companies Act should be waived in this case, particularly having regard to the fact that the change was only nominal and was beyond the control of the companies concerned. It is satisfactory to be able to record that the representation was accepted and the Ministry ruled that the separation of Karachi from the province of Sind had not actually brought about a change in the place of registered office and that it was not necessary for such companies to alter their Memoranda of Association.

Sadiq Soap Factory

It is reported that the Sadiq Soap Factory at Rahimyar Khan in the Bahawalpur state, a Lever Brothers venture, should be ready to go into production in the current quarter. Its capacity for household, laundry and toilet soaps will be 8,000 tons per annum and for refined glycerine 200 tons. Experiments in the use of cottonseed oil in the manufacture of a well-known toilet soap are reported to have been successful. The allied concern, the Sadiq Vegetable Oils and Allied Industries, at the same place has been in production for over a year.

U. S. Wheat Survey

Over 55,000 tons of wheat arrived in the fortnight ending 30th April, and over 37,000 tons were despatched to the deficit areas, mainly the Punjab. As harvesting of the new crop has now been nearly completed the position must be regarded as satisfactory for the time being. The crisis will come Government of the United States has acted with promptitude in agreeing to give Pakistan the expected loan of one million tons. In some ways it should have thought it necessary to send a mission. The mission, which consists of three experts under the leadership of Dr. Harry Reed of Purdue University, will of course be most welcome, but it might have been expected that the United States Embassy in Karachi would already have supplied Washington with all the facts and figures required. A brief tour is unlikely to be able to elicit further facts, though it will no doubt serve to carry personal conviction. It is reported that the committee of the United States House of Representatives and Senate will discuss the matter after the return of the mission, and it will then be placed before the Congress. There are therefore several hurdles to be crossed before wheat is actually shipped, though official circles are said to be hopeful that shipments will commence in June.

T. C. A. Fertilisers

The fertilisers which are being supplied by the Technical Co-operation Administration of the United States are expected to arrive very shortly and the Government, in preparation for this, is launching an extensive educational programme regarding their utilisation. American technicians are assisting in this and a series of meetings has already started at the Sind Agricultural College, Sakrand, at which local agriculturists will be trained so that they may carry the technical knowledge of fertilisers and its application to the cultivators themselves. The quantity to be supplied by the T.C.A. is 75,000 tons during the present year, and the bulk of this will be used to increase rice production.

Khan Abdul Qayyum Khan, the new Minister for Food and Agriculture, has hitherto maintained a prudent reserve on the subject and has pleaded for time to study the problem before he can announce what measures he contemplates for the meeting of the crisis. He has, however, already given proof of his personal drive and initiative in the matter of price control. In this connection, however, it may be said that the prospects of keeping prices of consumer goods within reasonable limits are dim indeed for it is rumoured that licences for imports on commercial accounts will, perhaps for the rest of the year, have to be restricted almost entirely to industrial requirements.

Madras

FINANCE MINISTER REVIEWS ECONOMIC DIFFICULTIES

HEAVY EXPENDITURE ON FAMINE RELIEF

(FROM OUR OWN CORRESPONDENT)

11th May.

MR. C. SUBRAMANIAM, Finance Minister, explained in a statement last week the financial position of the State Government and their request for Central aid. The resources of the Government had been strained, he said, not only by direct expenditure on famine relief but also by the contraction of all the main sources of revenue. Expenditure on famine relief exceeded Rs. 11 crores. As a result a deficit of Rs. 5 crores had been incurred in the Revenue Account of 1951-52 and there might be a deficit of Rs. 8 crores in the accounts of 1952-53 as against the deficit of Rs. 5.4 crores estimated in the Revised Account of the latter year. The outlay of Rs. 20 crores in 1952-53 on capital projects of irrigation and electricity was met partly by the sale of securities to the Reserve Bank, by open market loans and by advances from the Special Development Fund under the control of the Government of India. The net result of the revenue deficits and the capital transactions was a shortfall of about Rs. 17 crores on 31st March, 1953, against which the Government held stocks of foodgrains and chemical manures worth Rs. 10 crores.

The Finance Minister said that assistance so far rendered by the Centre for famine relief amounted to a special loan of Rs. 2 crores, besides meeting half the cost of gruel centres. The Government of India had since granted a temporary accommodation of Rs. 17 crores to cover the overdraft on the all deficit and the consequent overdraft on the Reserve Bank as it stood on 31st March. The Reserve Bank as it stood was now being adjusted in conjunction with the Central Government. The Finance Minister revealed that the State Government had asked the Centre for a loan and temporary financial accommodation. The extraordinary situation now prevailing in the State had no precedent elsewhere, because no other part of the country had faced failure of seasonal rains over six consecutive years as Madras had. Meanwhile relief was still required in many parts of the State. Capital works now nearing completion had also to be sustained as part of the five year plan and the State Government had exhausted their reserves already and Central assistance was absolutely necessary unless these works were to be stopped or slowed down. The Government was making strenuous efforts to tap all possible sources of revenue, the Finance Minister said. Mr. T. T. Krishnamachari, Union Minister, is now touring the drought-stricken southern districts to assess the extent of assistance which the Centre might have to give to help relieve distress.

Congress Party Reviews Taxation

In a critical survey of the State Government's finances in the first three years of the five year plan, the latest review of the Madras Legislature Congress Party says that the yield (around Rs. 37 crores) of State taxes and duties has remained practically constant since 1946-47 when excise duties brought in Rs. 14.68 crores and sales tax Rs. 6.96 crores. The loss of excise revenue was, of course, soon made good by the increased yields of sales tax and other commercial taxes. That in spite of the increase in the rates of some taxes and the introduction of new ones, the tax revenue as a whole should have remained inelastic over a period of eight years is not altogether surprising, says the Review. It may be noted that most of the State taxes, barring land revenue, have already reached their optimum point of yield and diminishing returns have begun to set in. What is worse, there is increasing public resistance to any proposed addition to the list of such taxes on consumption. A redeeming feature is that the revenue on account of the State's share in the divisible pool of general income tax is now twice what it was in 1946-47. This points to the extension of direct taxes, where alone the fiscal prospects of the State Government appear to have a reasonable chance of being improved. The Review suggests a tax on bigger agricultural incomes and the empowering of the Union Government to levy estate duty on agricultural property situated in this State.

Import Licensing Policy

The Hindustan Chamber of Commerce told the Chief Controller of Imports and Exports here that the six-month period of validity of licences at present was causing inconvenience to the trade which had to study the market conditions and place necessary orders for imports. The Chamber suggested that the period in cases where the holder of the licence had opened letters of credit and made irrevocable commitments might be extended by a period of two months. The Chief Controller said in reply that in respect of a number of items, the period had been reduced from 12 to six months, the reason being that the Government were advised that availability of indigenous products was likely to improve within a shorter period than 12 months. At the same time he assured the members that sufficient time would be given to parties to negotiate letters of credit.

The Andhra Chamber of Commerce, in their memorandum, complained that in many cases

there had been inordinate delays in the issuing of licences. The memorandum urged the Government of India to exercise control over exportable commodities to the minimum and to let exporters have greater freedom. Licensing of exports, it said, should rest only with the Ministry of Commerce and Industry, particularly with the Chief Controller of Exports and Imports or officers subordinate to him. Much harm was done to the export trade by the Government delaying the announcement of their export policy on certain items. It was also urged that the Export Trade Control Handbook issued in 1951 should be made up-to-date and published every six months. The export control authorities should devise some means by which export cargo would receive priority assistance in the provision of wagons. Drawing attention to the difficulties of "actual users," the Chamber mentioned the complete stoppage of the import of spindles from abroad during July-December, 1952, and January-June, 1953; they stressed the need to allow imports of at least a proportion of high quality spindles from abroad. This was necessary, the memorandum said, to maintain efficiency in the textile industry. The Chief Controller said in reply that unless they were able to push up exports, it would be difficult to adopt a liberal policy. Delays mentioned by the Chamber were no longer usual as over 90 percent of the work of licensing had been expeditiously disposed of. On the import of spindles, the Government thought that it would not impair the efficiency of the textile industry.

The Southern India Chamber told the Chief Controller of Exports and Imports that the Government tended to sub-divide serial numbers to suit their licensing policy. This had necessitated re-classification of quotas. As a result of the insistence on minimum imports for each sub-division, many established importers lost licences since their basic import for that particular number was split up and the imports in the class of articles covered by each sub-division fell short of the minimum permitted under the quota. The Chamber also wanted a clear definition of newsprint. It mentioned that under the present regulations governing the import of fountain pens, import was possible if the value of a pen was Rs. 25 or more. It was suggested that the value of a pen for purposes of import should be brought down to Rs. 10. The Chief Controller said that fountain pen factories would be started in the country soon, but that till such factories were established the Government would consider the question of allowing imports of cheaper pens.

INDUSTRIAL TRENDS IN THE UNITED KINGDOM

INDUSTRY WELL EMPLOYED

London, By Air Mail.

WHILST those of the economists who have expressed their views during the past month or so—and they have been fairly numerous—have declared themselves pessimistically on the financial and industrial outlook, the fact remains that industry keeps well employed at present, and better than seemed likely at the beginning of the year. Undoubtedly, Mr. Butler's Budget has helped for it had an encouraging effect upon thoughtful people, who accepted it as the most creative piece of work, well reasoned, with concessions and reliefs widely distributed, and none of them ill-based or designed to secure popular approbation, although, in fact, they have done so. The capital positions of companies have been eased and taxation burdens lightened for men and women of moderate means, and as a result, a start has been made with the much needed revival of incentive. That revival may confound the weighty arguments of economists.

Textiles and Purchase Tax

Naturally, not everyone is satisfied. The outstanding example is the textile industry, which had been hoping for further relief from purchase tax. This was not forthcoming, Mr. Butler believing that the easement which was accorded a year ago ought to suffice for the time being. It would appear that, on the whole, the textile industry is indulging in rather special pleading; for a satisfactory degree of activity is now reported from all sections of the industry, with the possible exception of cotton, where business tends to be a little dull, but not uniformly so. But it has to be admitted that certain high class speciality fabrics for which Britain was formerly famous are not now being produced, and have not been for some years past. One reason for this is that the cost of production, plus purchase tax, results in a price at which the goods could not be marketed. Some of these fabrics have demanded a weaving skill which came as near to craftsmanship as is possible in a machine age. This craftsmanship is not now being exercised.

It would be idle to pretend that these distinctive fabrics have, for the past quarter of a century, constituted a large proportion of Britain's output of textiles, but they were beautiful, and it is regrettable that this class of work is declining. The explanation is not to be found in purchase tax alone. The great country households which formerly bought these fine fabrics are passing away and, indeed, are almost gone. Select town centres, such as Mayfair, London, have changed entirely since 1939 in the tastes and purchasing power

of their inhabitants, who have been forced to a less discriminating level of living. Moreover, many of the fine old houses are now occupied by offices. Apart from this special class of fabrics, the textile industry has not really a strong case in urging that an all round reduction of purchase tax is imperative. There are now plenty of moderately priced cloths in the shops. No doubt the reduction will come in time, and without the aid of a pressure group. A Chancellor with the reforming zeal of Mr. Butler must be aware that the tax is open to criticism on the grounds of fiscal policy alone.

London Wool Market Opens

The opening of the London Futures Market for wool at the end of April was generally counted a success. There had been sceptics; but these had underrated the financial strength and experience of the organisers. The London Produce Clearing House, which is the final guarantor of the Market's contract, has been in existence for 60 years, and it has the backing of the London Wool Importers' Association, with world famous firms as members. The man who has played the most prominent part in bringing the Market into being, is Mr. Gibson Jarvie, a redoubtable and successful individualist, well known in the City of London. Mr. Jarvie believes in the maximum amount of freedom for commodities, abhors State control of business in any form, and holds that speculation in a reasonable and scientific sense is the best safeguard against the occurrence of extreme movements in commodity prices. Some will think that Mr. Jarvie would find it hard to defend so absolute a position by an appeal to history and, much as they may love animals, want no more of bulls and bears, at least of the breed hitherto known. On the other hand, it is desirable that the genuine industrial buyer of wool should be able to have the opportunity of lessening his risks by means of buying for forward deliveries, if desired.

In the past a good deal of speculation in the commodity markets has been done by persons who have no industrial interests whatever. It is recognised by those responsible for the London Futures Market that some part of the total volume of their business may represent trading by operators who have no direct connection with the wool trade. But it is believed that most of the transactions will be on behalf of those who produce, market or process the commodity. There is, by the way, already a Bradford Forward Selling System in existence. The claim is put forward that the London Market will provide facilities for legitimate interests which cannot use the Bradford Market. It could be inferred that it is the merchandising interests who will be most in evidence upon the London Market. The basic contract adopted for the London Market is 5,000 lb. in weight of a Bradford 64s B top—one of the best known qualities.

Whether one is wholly enthusiastic about futures dealings or not, it must be granted that the opening of the Market has struck a refreshing note in the City of London and encouraged hopes that the day is approaching when that centre will again be effective in upholding commercial and financial freedom at every point.

Wool Research

Although the annual report of the Wool Industries Research Association indicates that a wider range of activity was pursued during the past 17 months, whether measured by the number of investigations or by the size of the staff now employed, no discovery of major importance was made. This is not surprising, in view of the fact that research has been carried on during recent years, thanks to the large funds available as an outcome of the great prosperity of the wool industry. There was the possibility of a diminution in research income as a result of the temporary setback which the industry sustained a year ago, and which necessitated the heavy writing down of the value of stocks by woolen manufacturers. But this possibility was forestalled by obtaining the consent of the Board of Trade for an increase of the research levy on the industry. The new rate came into force from 1st May, and as the condition of the woolen industry has much improved, and the possible financial emergency has not eventuated, funds for wool research activities are ample.

An administrative development is the increased tendency of various sectional research bodies to co-operate with one another and exchange ideas. This is done through the Textile Research Association, of which the bodies are members, and which has a chairman from outside the textile industry at present the Secretary of the Department of Scientific and Industrial Research. The Wool Industries Research Association mentions that it has found a meeting place in conjunction with the Lace, Linen and Jute Industry Research Associations. Joint discussions having been particularly concerned with the best methods of working with the manufacturers of finishing machinery.

The Wool Industries Research Association is already responsible for the invention of various types of machinery, and proceeds along the lines of handing over the manufacture of textile machinery firms, who usually work under licence. Considerable inventive drive is now coming from the research associations; it is a movement which delivers those institutions from the charge of being academic and helps to free the textile mechanists from the charge of conservatism or lack of imagination.

Calcutta Markets

FREIGHT RATES GENERALLY STEADY

MORE FIXTURES IN CALCUTTA COAL SECTION

RATES have remained generally steady and a bright feature was the ending of the grain elevator workers' strike at British Columbian ports which began in the middle of February. Over the week a considerable volume of business was dealt with in the various American trades and usually charterers have been able to obtain the rates previously ruling. Further fixtures have been reported in the Calcutta coal section at the rates previously ruling. Two handy sized motor ships accepted 55s for Hongkong and a fixture to Japan was done at 63s. A large ship was fixed at 62s 6d for coals to Japan with topping up at Vizagapatam with ore at the same rate while a subsequent vessel was done at 61s with topping up with coal at Vizagapatam at 15s less. Ore from Calcutta with completion at Vizagapatam was arranged at 65s for discharge in Holland and a Liberty ship accepted 35s for ore from Dungun to Japan, while a Japanese vessel was fixed at 35s 6d for the same business.

In the Chinese section two vessels accepted the lower rate of 52s for rice from Whampoa to Colombo for rice and a fixture at 55s is reported for coal from Chinwangtao to Chittagong. Sugar from Formosa to Po. Sudan was done at 56s and a similar cargo from Mauritius to the U.K. was fixed at 66s, while the previous rate of 117s 6d was paid for sugar from Queensland to the U.K. Slight activity continued in the Australian section with wheat being fixed to India at 61s 3d for one cargo, a later ship being done at 60s; 60s was also paid for a cargo from West Australia to Karachi. Sorghum in bags was arranged at 100s from Brisbane or Gladstone to East Coast India.

Several fixtures are reported for coals from Hampton Roads to Japan. A June and a September loader accepted \$8.75 while a contract was arranged at 65s for one loader a month from August to December. A fixture to Rio de Janeiro was done at \$6 and for Antwerp or Rotterdam discharge \$4.75 was paid. The North American grain market was active, several fixtures from the St. Lawrence to the U.K. being done at the recent rate of 51s 3d and 50s for discharge Antwerp/Hamburg range. There was a continued demand in the Cuban sugar

market; 73s 9d was repeated for August shipment to the U.K. while two June loaders were paid 75s. and a cargo to Vancouver was done at \$12.40 for an early June ship. In the time charter section a May oilburner with delivery Hamburg accepted 17s 6d for the trip out to Indo-China or Japan and a Japanese coal burner was fixed at 14s 6d delivery India for six months' trading. An oilburner was fixed at 16s for one West African round voyage delivery Liverpool.

STRONG GENERAL DEMAND IN TEA DUST SALE

At Sale No. 45 (now called Sale No. 47) held on 12th May, there was a strong general demand in the Dust Auctions although C. T. C. Assam Dusts were 1½ annas, and sometimes more, down. The poorest fibrous residue types were also easier by up to one anna. Dooars' colour dusts were dearer by about one anna. Medium Assam were fully firm and common sorts had a dearer tendency. There was no Export Sale this week, but the next one—the first of the New Season—will be held on 1st June.

Quotations.	
Medium Dooars Dust	1 8 0
Medium Assam Grainy Dust	1 9 0
Best Assam C. T. C. Dust	1 14 0
Approximate Quantity Offered.	
Internal Dust	2,400 Pkts.
Internal Dust	20,450

SUGAR MARKET QUIET BUT STEADY

During the week ended 12th May, the sugar market was quiet but steady. A further quota of 100,000 tons was released on Saturday, the Government's intention being to bring down prices. Rates in North India (which includes West U.P., Delhi, Punjab and Rajasthan) are higher than in Calcutta and small enquiries are coming in from Malabar. Prices of ready ex-Kantapur delivery are Rs. 29-6 a maund for ordinary grain, Rs. 31 for big grain and Rs. 28-12 for old ordinary grain. Ex-mill rates vary from Rs. 27-8 to Rs. 29 a maund for U.P. mills. Arrivals were about 6,000 bags a day and were enough for normal requirements. Stocks amounted to 65,000 bags and sales averaged 2,500 bags a day for local consumption.

LINSEED

Firm conditions prevailed last week and a notable advance was recorded. The scale of up-country arrivals diminished somewhat owing to a

general price increase in the producing centres. Local sellers were reserved and forward delivery was quoted at a premium. Local millers were in the market daily, and these prices. The oil section was very active. A fairly good demand from local buyers for both ready and forward delivery was met by crushers at gradually increasing prices. There were no enquiries for export. Latest quotations were as follows: May Rs. 20 per maund; June-July Rs. 20-8 per maund.

HIDES AND SKINS

The market in skins was slightly firmer. Stocks were less than in the preceding week.

Bazar Sales

(Between 5th May and 11th May, 1953.)
Cowhides:—Wet salted (Ord) 12,000 pcs. on the basis of Annas 7-9 to Annas 10; Wet salted (Ord) 11,000 pcs. on the basis of Rs. 9 to Rs. 10; Wet salted (Slaughtered) 10,000 pcs. on the basis of Rs. 14-8 to Rs. 26.

SHELLAC PRICES FIRM

During the week ended 12th May, the Shellac market was firm and moderate business passed. The range of quotations was as follows:

Standard Pure	Rs. 90 buyers.
Buttontlac	Rs. 85 to 86 done & buyers.
Pure Buttontlac	Rs. 82 to 87 done & buyers.
Lemon No. 1 Shellac	Rs. 78 to 80 done & buyers.
Lemon No. 2 Shellac	Rs. 73 to 76 done & buyers.
F. O. Std. I Shellac	Rs. 69 to 73 basis done & buyers.
Pure Tn Shellac	Rs. 59 to 63 buyers.
4% I.T.N. Shellac	Rs. 82 done & buyers.
No. 1 Kusmi Seedlac 3%	Rs. 71 to 75 done & buyers according to quality.
No. 2 Kusmi Seedlac 3%	Rs. 68 to 72 done & buyers according to quality.
Fine Bysaky Seedlac (Munbhum) 3%	Rs. 63 to 68 done & buyers according to quality.
Fine Bysaky Seedlac (C.P.) 3%	Rs. 58 to 60 buyers.
Fine Bysaky Seedlac (C.P.) under 5%	Rs. 54 to 56 done & buyers according to quality.
Ordinary Bysaky Seedlac (C.P.) 5%	Rs. 27-8 to 28 buyers.
Kirelac	Shipments during May until the 9th were 7,014 packages.

Jute

MODERNISATION AND RETRENCHMENT

LAST week the West Bengal Government announced that it had called a conference of representatives of the jute mill industry and jute mill workers to discuss the problem of employment in the industry. It is probable that this is the result of representations which have been made recently in Calcutta and in New Delhi against retrenchment. Not long ago the Government of India was urging the industry to modernise its plant and representatives were called to Delhi to discuss the matter, and whether Government help would be necessary. Now, modernisation means the replacement of old types of machines by new ones which will produce a greater quantity of goods in a shorter time with less intervention by the human element. If new mills were being erected with the latest machinery they would start off from scratch with only the labour required to operate the machinery. The case of old mills is different. If old machines are scrapped and replaced with up-to-date ones it follows that fewer workers will be required to operate the new machines than were needed to work the old ones. Some workers inevitably become redundant and if mills are compelled to continue to employ them, most of the advantage of modernising is lost. To get the full benefit of the installation of modern machinery there must be some reduction in the labour force. That, of course, does not mean that large batches of workers will be thrown out of employment all at once. The process will be gradual and possibly the result might be achieved merely by stooping recruitment while the normal wastage of labour adjusted the balance.

In India, however, the problem is complicated by the fact that more workers per machine have been required than in mills in any other part of the world. That is due partly to climatic conditions, partly to lack of skill but, probably in the main, to lack of willingness. Visitors to this country who are familiar with jute mills in Britain, in the Continental countries of Europe and in America have expressed astonishment at the number of workers in the jute mills here compared with those in their own countries even in mills there which are still operating the old type of machinery. Efforts to reduce the labour force in Indian mills have always met with opposition even when incentives were offered to the workers, and recent industrial legislation has tended to increase the number of redundant workers the mills have to carry on their registers.

Another factor is the number of fictitious workers who have to be paid. This may seem strange to those who have knowledge of only European and American conditions but it is a fact that probably every mill in India has quite an appreciable number of names on its books of workers who do not really exist. This is contrived by the sirdars who are among the chief beneficiaries from the system and it is probably impossible to eradicate it entirely.

All these circumstances combine to make the jute industry in India a high-cost producer and, in these days when jute-growing and jute-manufacture have ceased to be a near-monopoly, India cannot afford to be a high-cost producer. If the Indian industry is to hold its own it must modernise and rationalise, and retrenchment of redundant labour is inevitable. As has been said above, the process will be gradual and may not be to any extent noticeable but it must be done. If it is not done modernisation will be stultified and it should not need to be emphasised that modernisation is essential if the industry in India is to survive; for her next-door neighbour is starting off with the most up-to-date machinery and the command of raw material resources compared with which India's are second rate.

I.J.M.A. Stocks of Manufacturers

Stocks of manufactured goods held by members of the I.J.M.A. and mills reporting to the Association at the end of April showed an overall reduction of 1,300 tons. Rather surprisingly stocks of hessian increased by 3,900 tons while sacking stocks declined by 5,100 tons. The reduction in sacking stocks is particularly gratifying as the disposal of sacking has been the mills' main difficulty for the past few months. Sacking stocks are still, however, too high at 89,600 tons compared with 51,900 tons at the end of June last year. It is too early yet to say whether the increased export of sacking is the result of the reduction in the export duty or merely because more shipping space was available for clearance of goods bought previously. Developments in the next two or three months should be interesting.

Mills' Production

The production in April of mills reporting to the I.J.M.A. was 74,300 tons. Of this 32,200 tons or 43.4 percent was hessian and 39,800 tons or 53.4 percent was sacking. Production in March was 74,000 tons.

In April, 1952, total production was 81,700 tons of which 30.0 percent was hessian and 67.1 percent was sacking. These figures indicate the extent to which mills have adjusted their output to demand by switching machinery from the manufacture of sacking to hessian. They also show that, though stocks of sacking remained unchanged in March, and show a reduction in April, part of that improvement must be attributed to reduced output

and 10 oz. 40" hessian Rs. 42-2. About noon rumours began to be circulated about a Government order for sacking and the B-Twill price jumped up to Rs. 96-12 with hessian moving in sympathy.

During the week there has been persistent demand for specialities for early shipments but buyers appear to have waited too long to place their orders and have experienced difficulty in doing so even though good premiums have been offered. For standard goods demand has not been very active but mills have been reserved and are inclined to hold for better prices. No great volume of business has been reported but the undertone is very steady and the general tendency is upward. Rumours persist that a further order for hessian for the Argentine is being negotiated but that there are difficulties in the way of financing it.

On Wednesday morning the market opened firm and quotations were as under:—

	May	June	July-Sept.
Rs.	Rs.	Rs.	Rs.
40" 8 oz.	34-0	34-8	34-4
40" 10 oz.	43-0	43-4	43-8
Heavy Ceess (Plain)	96-12	97-0	97-8
B. Twills	96-10	97-0	97-8
Cornsacks	97-8	97-8	98-4

Raw Jute: At the beginning of the week Upper Assam Bottoms were quoted at Rs. 22 and a small but fairly general interest was taken by buyers. Sellers were reserved because of small imports uncountry and into Cossipore. The realisation that the new crop would be a small one and also that it would be late made sellers inclined to wait for higher prices. It is also becoming increasingly evident that before the new crop is available there will be a scarcity of hessian jute because of the poor quality of the 1952 crop and because of the big increase in the production of hessian by mills. The tendency is for the margin between Middle and Bottoms to widen and good premiums are being paid for jute with a high yield of hessian. X Bottoms are neglected.

On Friday and Saturday, in sympathy with higher prices in the manufactured goods market, jute prices rose sharply but the rise, combined with mills' inability to effect sales of goods at the higher rates, checked business. Monday and Tuesday morning saw dull markets with prices slipping back but on Tuesday afternoon activity revived and a fair amount of business was put through.

The following business was reported:—

Pakistan Jute:

European Marks.—Jat Rs. 29-8 basis Bottoms May-June; District Rs. 24-8 basis Bottoms May-June.
Indian Marks.—Jat Rs. 26 basis Bottoms May-June; Semi-Jat and District Rs. 24-8 basis Bottoms May-June.
All the above are for shipment ex Pakistan.
Middle ex Calcutta Rs. 29; Bottoms ex Calcutta Rs. 25 to Rs. 26.

Indian Jute:

Lower Assam Rs. 23 to Rs. 24-8 basis Bottoms for May-June shipment.
Upper Assam Rs. 22 to Rs. 24 basis Bottoms for May-June shipment.
Northern Rs. 23 to Rs. 25 basis Bottoms for May-June shipment.
Local Packing Rs. 19-8 to Rs. 22 basis Bottoms for one month's shipment.
Karimpur-Bongaon Tossa Rs. 22 to Rs. 23 basis Bottoms for one month's shipment.
Daisee Mesta Rs. 18 to Rs. 20.

THE JUTE MARKETS

Manufactured Goods: Last Thursday the market was dull with mills reserved and little interest being taken by shippers. Hessians for May shipment were quoted around Rs. 41-2 for 10 oz. 40" and B Twills at Rs. 92. The latter rose mildly during the day and on Friday touched Rs. 94 on reports of covering business but eased off to close at Rs. 93-8 when mills came out as sellers. On Friday, when it became known that sacking stocks had declined by 5,100 tons in April, speculators pushed the price of B Twills up to Rs. 96-4. Mills tried to sell but buyers were difficult to find and not much business resulted. Prices eased off and dropped back further on Saturday. On Monday conditions were dull and B Twills declined to Rs. 93-8 but recovered to Rs. 94 at the close. On Tuesday the opening was quiet with quotations for B Twills Rs. 94-10

USE OUR EXPERIENCE...

It has long been appreciated by industrialists that the cost of paint per gallon is by no means the best guide to the economics of painting. Production and maintenance costs merit careful study by all who aim to improve quality and efficiency.

I. C. I. have always advocated a realistic approach to this problem and in furthering this aim have recently produced two booklets entitled "Improving Paintshop Productivity" and "Better Housekeeping in the Paintshop"

Interested executives may obtain copies of these publications from the sole selling agents.

CONSTRUCTION OF INDUSTRIAL SIDINGS

PLEASE DO NOT COMMIT YOURSELF BEFORE CONSULTING THE RAILWAYS

In your own interest, please consult the Railway authorities before you decide to acquire land etc., for the purpose of building factories, mills, working mines or such other projects as may require the construction of special sidings. Please consult the Railways in advance to find out if the Railways are in a position to transport your raw materials and finished products by rail.

The Railways will extend all possible help and advice to you in advance whether or not it will be practicable to construct a siding on such a site. Each case will be examined by the Railway experts. This will save you unnecessary delay and expenditure.

Issued

IN THE INTEREST OF TRADE AND COMMERCE

by the
PUBLIC RELATIONS OFFICER, CALCUTTA.

Bimli Rs. 17-8 to Rs. 19-8 F.A.Q. for one month's shipment.
Daisee Rs. 22-8 to Rs. 25 basis Bottoms for one month's shipment.
Habi Jabi Rs. 18.

In pucca bales business was done in Lightnings at Rs. 137-8 per bale. Long Group Dundee Daisee at Rs. 137-8 to Rs. 145. Short Group Dundee Daisee at Rs. 165 and in combination, Short Group and Long Group Dundee Daisee at Rs. 160 and Rs. 148 respectively. Cuttings were sold at Rs. 70 and Rs. 72 for Pakistan cuttings ex agency and Rs. 75 ex Calcutta and mesta Cuttings at Rs. 60 to Rs. 64 per bale.

Quotations on Wednesday morning were as under:

Pakistan Jute:	Rs.	May-June Landed at Mill
Jat	25	per md.
District	25	"
Northern	25	"
Indian Jute:		
Lower Assam	25-3	"
Upper Assam	24-3	"
Northern and Purnea	25-8	"
Murshidabad Tossa	24	"
Bihar	22	"
Daisee	25-8	"
Bimli	20 F.A.Q.	"
Mill Lightnings	150	per bale
S. G. Dundee Daisee	185	"
L. G. Dundee Daisee	150	"
Cuttings Pak. NC	75	per bale

Mofussil. In Pakistan imports are small and declining. Sellers are reserved and though there has been less business than in previous weeks prices have tended upwards. Good qualities are scarce and command a premium. Good premiums are also being paid for tossa. On Tuesday, in sympathy with Calcutta reports and more enquiry from overseas, prices rose sharply and jat Bottoms are now quoted in Narayanjanj at Rs. (P)17-8.

In India imports from growers are negligible and purchases have to be made from stockists. Prices have been firm and tend to rise. They are everywhere above the parity of Calcutta prices. Arrivals in Cossipore average about a dozen wagons daily and prices tend upwards. A sharp rise was recorded on Tuesday.

Showers have been fairly general in East Pakistan, Assam and Northern Bengal and the crop there is progressing well. In central West Bengal and in Bihar rain is badly needed.

GOODS STOCKS DECLINE IN APRIL

The Indian Jute Mills Association announces that the total reported stocks of manufactured goods exclusive of Government orders at the end of April were as follows:—

Description	31st March 1953 (Lakh Yds.)	30th April 1953 (Lakh Yds.)	30th April 1953 (Tons)
Hessian Cloth & Bags	15.77	40.755	17.87
Standard Hessian (included in above)	12.92	32.855	14.99
Sacking Cloth & Bags	22.25	92.406	21.15
Standard Sacking (included in above)	18.79	76.763	16.95
Rope, Twine, etc.	2.144	2.041	
Total reported stocks of manufactured goods held on Government account			
Sandbags	4	83	1
Serim Cloth	2	57	2
Hessian Bags & Cloth and Canvas	30	379	24
Sacking Cloth and Bags	80	2,136	67
Rope, Twine, etc.	37	—	23

Summary	31st March 1953 (Lakh Yds.)	30th April 1953 (Lakh Yds.)	Increase over or decrease from last month (Lakh Yds.)
Hessian	15.77	40.755	+24.985
Civil	42	1.1	-40.9
Govt.	16.19	41.9	+25.71
Sacking	22.25	92.406	+70.156
Civil	64	2.3	-61.7

Others	2.1	2.0	-0.1
Civil	0.9	0.9	0.0
Govt.	2.1	2.0	-0.1
Grand Total	1,387	1,374	-13

* + Sign indicates an increase and — sign a decrease.
N.B.—These statistics include figures of all members and of Gagalbhai, March statistics contain estimated figures of Kathihar and April figures include estimated figures of Kodanath, Maheshwari and Kathihar.

THE FOREIGN JUTE MARKETS

CONTINENTAL COUNTRIES REPORT BETTER BUSINESS

(FROM OUR OWN CORRESPONDENT.)

Dundee, By Air Mail.
IMPROVEMENT in the jute industry is general and the changed conditions from the dismal times experienced for some months are likely to be maintained. France, Belgium and Germany are reported to be a good deal busier than they were and there is less cutting of prices in competition with Calcutta. Order books are more or less comfortable for delivery over the next several months. Italian jute manufacturers are not doing so well as there are several factors which govern their production costs. Recently, the Government put an import tariff of 5 percent on raw jute, and the lack of orders for cloth has resulted in curtailment of production, which enhances costs. More enquiry prevails for jute cloth in the U.K. and manufacturers are comfortably situated with orders for some months ahead. The abnormal demand for jute for the later months of this year. The position has been relieved somewhat in the carpet industry, which is exceptionally busy, by purchases being made of Continental yarns. A number of countries have surplus yarns to sell and offers are being freely made to the U.K. at prices not much above those quoted here, even after applying the import taxes of 10 percent on single and 15 percent on twists.

The Dundee trade generally is in a healthy state and Mr. Stephen Gillanders, chairman of the local board of the U.K. Jute Goods Association, said recently that as long as the trade had at its disposal assets of youth and brains of the calibre it possesses today it could go forward with reasoned confidence. He said that when he entered the jute industry 53 years ago he was assured by the Jeremiahs of the time that it was slowly dying. Anyone looking at it today would see no signs of its early demise. Mr. Gillanders, who is a director of Low & Bonar, Ltd., intimated that there would be a record attendance at the annual general meeting of the U.K. Association to be held at Pilochry on 11th June. He said that, in spite of recurring storms, their ship was still on an even keel, though it seemed to him that thinking people might well ponder what the position would have been during

the last few years had they not had the stabilising influence of the Jute Control, as well as the refreshing spirit of co-operation within the trade.

Raw jute prices have advanced to £89 for mill Firsts and £78 for mill Lightnings, c. and f. U.K.

Mr. Alexander Beedie, director of Boase Spinning Co. Ltd., controlling G. C. Taylor & Sons, Ltd., Dundee, Hull, Liverpool, Glasgow and Belfast, died suddenly in the train from London to Dundee on 3rd May. Mr. Beedie, who was 60 years of age, was well known in the jute industry, past president of the U.K. Jute Goods Association, and chairman of the Jute Sack and Bag Manufacturers' Association.

APRIL PRODUCTION FIGURES

The Indian Jute Mills Association reports the total production of manufactured goods during April as follows: (A) Total reported production of manufactured goods exclusive of all Government orders.

Description	Quantity
1. Twist and Yarn	
(a) For sale	1,164 Tons
(b) All other including that used in sewing bags	757 "
2. Canvas	320 "
	7.6 lakh yds.
3. Gunny Bags (Tonnage exclude sewing twist)	
(a) Hessian	1,362 Tons
(b) Sacking	31.9 Nos.
4. Gunny Cloth	
(a) Hessian	37,490 Tons
(b) Sacking	891.2 lakh yds.
5. Other manufactures (including ropes)	369.6 " Nos.
6. Total production (above figures combined)	
(a) All kinds	29,211 Tons
(b) Hessian (both bags and cloth)	11,485 lakh yds.
(c) Sacking (do.)	2,135 Tons
(d) Canvas (do.)	44.1 lakh yds.

(B) Total reported production of goods manufactured on Government account.

Description	Quantity
7. Sandbags	Nil
8. Serim Cloth	Nil
9. Hessian Bags and Cloth and Canvas	1,254 Tons
10. Sacking Bags and Cloth	46.0 lakh yds.
11. Ropes and Twine, etc.	177 Tons
	4.6 lakh yds.

Summary	April Average*	April Average*
Hessian	12.16	13.40
Civil	46	1.71
Government	12.62	15.11
Sacking	0.35	10.92
Civil	5	44
Government	9.40	11.36
Other manufactures	2.3	2.4
Civil	0.0	0.0
Government	2.3	2.4
Grand Total	74.3	80.8

*Based on production figures from July 1948 to April 1949 (full working months) excepting March with full complement working 48 hours a week.

N.B.—The above figures include returns of Gagalbhai Jute Mills and of all members of the Association with the exception of two mills whose production figures for April have been estimated.

INDIAN CROP PROGRESS REPORT

In their eighth crop report for the current season, which covers the week ended 9th May, Messrs. Sinclair Murray & Company Ltd. (India) say that weather conditions in Assam have been variable. Some districts report it as being very hot and dry while other districts have had favourable rainfall. In West Bengal sufficient rainfall has been experienced to allow sowings to commence but more rainfall would be beneficial. The weather in Orissa has been hot and dry and rain is required to allow cultivators to proceed with sowings.

DANPUR: The weather has been hot, dry and unfavourable, with practically no rain in the jute growing areas. Sowings to date amount to -2/- as compared with -6/6 on the corresponding date last year. The river level is very low for this time of the year.

JAJPUR ROAD: The weather has been hot and dry although moderate showers were experienced. Sowings to date amount to -0/6 as compared to -1/- at this time last year.

RANAGHAT: Moderate rainfall was experienced and this has allowed cultivators to make good progress with the preparation of land. Sowings to date amount to -1/- as compared to completed sowings at this time last year.

COSSIMBAZAR: During the first part of the week the weather was hot and dry but good showers were experienced during the latter part. This has allowed cultivators to proceed with the preparation of land and a start has been made with sowings. Sowings to date amount to -1/- as compared to -9/- at this time last year.

NOWGONG: The weather has been very hot and dry and rainfall is required to assist the growth of plants as well as to allow cultivators to complete sowings. Sowings to date amount to -11/- as compared to -16/- at this time last year. Weeding have been completed at -13/6 (with -1/- damaged) as compared to completed sowings at this time last year. The condition of the crop is satisfactory and plants range in height up to 2' 3". The river level is normal.

GAUHATI: The weather has been very hot and dry with the exception of a light shower in the latter part of the week. Further rain is urgently required for the benefit of the crop. Sowings have been completed at -13/6 (with -1/- damaged) as compared to completed sowings at this time last year. The condition of the crop is satisfactory and plants range in height up to 4'. The river has fallen and is now 2' 3" lower than at this time last year.

KHARUPEETIA: Hot and dry weather has been experienced. Sowings to date amount to -11/9 as compared to -16/- at this time last year. The condition of the standing crop is satisfactory and young plants range in height up to 3' 6". The river has fallen and is now below normal.

DIUBRI: Favourable weather has been experienced with alternate rain and sunshine. Sowings have been completed at -12/- as compared to completed sowings at this time last year. Condition of the standing crop is satisfactory and plants range in height up to 2' 6". The river has fallen and is now 1' 3" lower than last year at this date.

DAISEE DISTRICTS: The weather has been favourable with sufficient rainfall to enable cultivators to prepare land and commence sowings. Sowings to date amount to -7/- as compared to completed sowings at this time last year.

Rainfall	For the Week	Total from 1st Jan	Rainfall over the Weekend

N.B. As a basis of comparison last season's crop has been taken as 16 annas.

PROGRESS OF PAKISTAN CROP

In their tenth crop report for the current season, which covers the week ended 9th May, Messrs. Sinclair Murray (Pakistan) Ltd. say that the weather has been favourable with alternate rain and sunshine in most districts. Sowings have been completed in the eastern districts, but a small amount of highland sowings have still to be carried out in the western districts. The condition of the standing crop is fairly satisfactory. River levels are normal or slightly higher than normal for this time of the year.

NARAYANGANJ: Sowings completed at -8/- The weather has been favourable with alternate rain

and sunshine. This has enabled cultivators to continue weeding operations and has also improved the condition of the standing crop. Plants are healthy and range in height from seedlings to 4'. The river has fallen and is now 10' lower than at this date last year.

DACCA: Sowings completed at -8/- The weather has been favourable with alternate rain and sunshine. Although there are reports that some lowland crop has been flowering and that there has been some damage by hailstorms, condition of the plants in general is not unsatisfactory and they range in height up to 2' 9". The river is slightly higher than last year at this time.

CHANDPUR: Sowings completed at -8/- Favourable weather has been experienced with alternate rain and sunshine. Weeding operations are in progress in the low and midlands. Generally the condition of the standing crop is satisfactory and plants range in height up to 3'. The river level is normal.

HAIJIGANJ: Sowings completed at -7/- The weather has been favourable with alternate rain and sunshine and this has improved the condition of the standing crop. Plants range in height up to 1' 9". The river is 2" higher than last year at this date.

AKHAURA: Sowings completed at -8/- The weather has been hot and dry with occasional showers. Generally the condition of the crop is not unsatisfactory. Weeding is going on as required. The river level is normal for this time of the year.

ASHUGANJ: Sowings completed at -8/- Weather conditions have been favourable. Plants range in height from 6" to 2' 6". Weeding are going on as required. The river level is 1' 9" lower than last year at this date.

NIKLIDAMPARA: Sowings completed at -8/3. Weather conditions have been favourable. Recent rainfall has improved the condition of the crop. The river has fallen and is now about 7" lower than on the corresponding date last year.

SARISHABARI: The weather has been favourable. The condition of plants is more or less satisfactory but more rain would be beneficial. Sowings to date amount to -6/6 as compared to completed sowings at this time last year. The river level is about 2' higher than last year at this date.

SEGAJANJ: The weather has been favourable with alternate rain and sunshine. The condition of the midland crop is not very satisfactory due to previous lack of rainfall but recent rain has benefited it. Sowings to date amount to -6/- as compared to completed sowings at this time last year. The river has fallen and is now about 1' higher than last year at this date.

NAKALIA: Good rainfall during the latter part of the past week has proved favourable for sowings and the standing crop. The condition of plants is fairly satisfactory and they range from seedlings to 3' 6". Sowings to date amount to -7/- as compared to completed sowings at this time last year. The river is falling but is about 1' higher than last year at this date.

BHANGOORA: The weather has been favourable with good rainfall. Condition of plants is fairly satisfactory and they range in height up to 1'. Sowings to date amount to -7/- as compared to completed sowings at this time last year. The river level is normal.

Saint Frères Circular Looms installed in Italy.

SAINT FRÈRES CIRCULAR LOOMS

Hundreds of Saint Frères Circular Looms are in use—in new factories and old, sometimes working alongside flat looms—in the Belgian Congo, in South Africa, Sweden, Norway, Italy, Great Britain, Germany, Belgium and France.

These looms were originally designed for making tubular cloth from jute. Deliveries of a Saint Frères Circular Looms for hard fibres are now available. Saint Frères Circular Looms are manufactured by U'quhart Lindsay & Robertson Orchar Ltd., Dundee, Scotland.

The J.2 Loom (2-leaf, 4-shuttle) weaves single and double warp plain and tubular cloth for sacks and for the manufacture of single width cloth woven in tubular form with a double false selvage for wrappers, etc.

Good service to the sugar industry

SKF have considerable experience in the field of bearing applications for all types of cane-sugar machines. Excellent results have been obtained with SKF bearings, e.g. in knives, crushers, mills, and centrifugals. The above illustration shows an SKF bearing unit for centrifugals. Its most important advantages are:

Great reliability: The sleeve undergoes no wear and therefore never needs renewing.

Long life: The thrust ball bearing - i.e. the most heavily loaded bearing - can be chosen much more robust than for previous types of similar bearing applications.

Good economy: The complete SKF bearing unit is cheaper than the rolling bearing combinations hitherto supplied. Also a new separate bearing for the SKF bearing unit costs considerably less than the sleeve of old designs.

Engineering and Transport

MADRAS HARBOUR EXPANSION SCHEME

THE Madras Port authorities have undertaken demonstration work in connection with the Madras harbour southward expansion scheme. The scheme is designed to provide additional wet docks and berthing space for ships. It has been approved by the Government of India and sanction for funds is now awaited from New Delhi. A smaller scheme of development costing Rs. 1.5 lakhs has already been begun. The Police Rifle Range at the High Court Beach in Madras, which was being used by the Armed Reserve for several years, has now been handed over to the Madras Port Trust; this will help the expansion plans of the Port considerably.

The development scheme will provide greater facilities for passenger and goods traffic and is estimated to cost Rs. 6.05 crores. It is divided into two parts—A and B. Part A costs Rs. 1.15 crores and includes the conversion of the North Quay, which is now used mostly as a coal berth, into a general cargo berth cum passenger depot. Attached to it will be a double-storeyed transit shed the first storey of which will have Customs examination sheds and waiting rooms. A movable gangway will be provided so that passengers can disembark from the steamer straight on to the first floor. On the ground floor will be a transit shed for cargo. The berths on the South Quay, where passenger steamers are now berthed, will then be used solely for the landing of cargo. The creation of a coal berth at the southern end of the East Quay, and another further south for oil ships and ships for taking export cargo of ore, constitute other features of the development plan sanctioned under Part A. Part B of the scheme, estimated to cost Rs. 4.90 crores, covers the construction of a wet dock with four berths, mechanical equipment, transit sheds and warehouses.

In addition, a scheme for the construction of an oil dock to discharge petroleum inside the harbour is being considered by the Port authorities; their decision is expected soon.

SURVEY OF MINOR PORTS IN BOMBAY STATE

The survey of minor ports in Bombay State begun by Mr. Henry Krauss, a Dutch expert, is expected to be completed by the end of March next year. Mr. Krauss is guiding the marine survey unit of the Bombay Government in hydrographic surveys to ascertain, by means of soundings, the present condition of the approaches to and of the inner waters of the ports, and to prepare up-to-date navigation charts. The data so collected will help the Government to plan the development of the ports. The National Harbour Board has urged the Central Government that, for purposes of development, attention should be focussed on 18 of the more important minor ports in India, which should be classified as intermediate ports. These are Navlakhi, Bedi, Porbandar, Veraval, Bhavnagar, Okha, Broach, Ratnagiri, Karwar, Mangalore, Kozhikode, Tuticorin, Nagapattinam, Cuddalore, Masulipatam, Kakinada and Alleppey.

AIR SAFETY IN THE LEVANT

Some progress has been made with the scheme for the establishment of an air traffic co-ordination centre in the Eastern Mediterranean. The matter has been under discussion by various committees of the International Civil Aviation Organisation (I.C.A.O.) since 23rd June, 1952, and the final recommendation was made on 5th December, 1952. This recommendation was broadly to the effect that air safety in the whole of the Eastern Mediterranean region would be improved by the establishment of a flight information centre, to be called "Eastermed", at Nicosia, Cyprus, and that the member States of I.C.A.O. should contribute to the international financing of the project.

The objective is a location for the centre that would enable it to communicate equally with Beirut, in the Lebanon, and with Lydda, in Israel. The cost has been estimated at £17,270 for the present year, and the different States have been asked their views, and how much they would be prepared to contribute. The "Eastermed" centre would cover such places as Alexandria, Cairo, Lydda, Damascus, Beirut, and Aleppo.

ELECTRONIC SPINNING MULE COMPLETED

The completion of an electronic spinning mule at the University of Leeds is referred to in the report of the advisory Committee of the Department of Textile Industries and Colour Chemistry and Dyeing during the session 1951-52. The prototype of this electronic mule has now been demonstrated to representatives of trade organisations and the Textile Research Association. "Its performance is so satisfactory that the first large-scale model is now being built by Textile Machinery Makers (Research) for trial in a Yorkshire mill," states the report. Another important development is foreshadowed by work in developing a complete mathematical theory of the behaviour of the balloon in cap spinning. "The theory suggests that it should be possible to design a cap which, by keeping the tension constant during the filling of a bobbin, should produce a more uniform yarn. Confirmation of this deduction is now being sought in experiments with shaped caps and facilities for a pilot investigation have been offered by a number of Yorkshire mills."

Commodity Markets

FOREST POLICY IN EUROPE

SURVEY OF TIMBER TRENDS AND PROSPECTS

IN the autumn of 1947 when European reconstruction programmes were handicapped by an acute shortage of timber, the Timber Committee of the Economic Commission for Europe, serviced jointly by E.C.E. and the F.A.O., was formed to assist European Governments to overcome the shortage through concerted action. It continued the informal agreements among importing countries on purchasing limits and sponsored timber equipment loans granted by the International Bank of Reconstruction and Development to several European wood-exporting countries. Last month the Committee produced a Study entitled *European Timber Trends and Prospects* which discusses the trends in European timber production, consumption and trade, and which is the outcome of the work of the Committee since its inception.

The Study contends that the widespread belief that the low level of European trade in timber since the war is the consequence of a long-term downward trend in Europe's wood consumption is wrong. It is true that Germany and Britain have reduced consumption in that period—pre-war they accounted for some 46 per cent of Europe's consumption of industrial wood—but overall European consumption has nearly recovered to pre-war levels. Three factors have contributed to the decline in European timber trade. All over Europe less wood is being used today per unit of output than formerly. This change is particularly noticeable in housing where substitutes for wood have been developed. Although there is not as yet a substitute for paper, wood has lost ground in this field to other fibrous materials. The price of wood has risen sharply in relation to other competitive materials so that the margin in favour of wood has narrowed and in many cases disappeared. Far more important is the shortage of supply; this is the real reason why the consumption of wood has failed to keep pace with the rise in industrial output. Certainly it is the prime factor in the declining use of structural timber.

Timber Production

The most striking feature of European wood production in the forty years 1913-1953 is the stability of the annual wood cut. It has not, in this period, risen above 300 million cubic metres or fallen below 260 million cubic metres. Yet territorial changes added 61 million hectares to Europe's forest area at the end of the first world war and at the end of the last war the area was reduced by nine million hectares. Except in periods of trade fluctuations and war, forest owners have succeeded in keeping forest output reasonably constant. Under this deliberately conservative cutting policy, however, forest output has not risen in the same way as the output of other commodities or kept pace with the expansion of Europe's industrial output. In an expanding economy, it is abnormal that the production and consumption of a basic material like timber should remain constant for decades. Here lies a great danger, for as the Study points out, "if timber consumption does not rise in line with, although not necessarily at the same rate as, gross European product, then it is likely to fall. And the fall may not be merely a relative one, as measured in terms of consumption per unit of output or per head of population; it may in due course, through the loss of markets to other materials, become an absolute decline. There are already definite signs that this is happening, though there is still time to arrest such a development. The vital problem is to increase European wood production by means of a dynamic forest policy."

Bridging the Gap

Estimates have been made in the Study on Europe's consumption in 1960 on the alternative assumptions that its gross product would be 50 per cent or 20 per cent larger than in 1950. These

(European Timber Trends and Prospects. Published by the United Nations, 315 pages. Price 25s.)

two assumptions also mark different stages in Europe's economic development since a 20 per cent expansion is likely to be realised before 1960, while a 50 per cent expansion may only be achieved a few years later. There are various ways in which the supply of industrial wood can be increased almost immediately, without in any way infringing the principles of sound silvicultural management. The round cut can be raised by rendering accessible various minor areas of virgin forests, and, together with other methods it is estimated that annual fellings could be increased by about 30 million cubic metres without any danger of over-cutting. Secondly there are various measures by which better use can be made of the forest crop: by reducing forest losses; by diverting more fuelwood to industrial use; and by utilising sawmill and other industrial waste. It is suggested that a vigorous adoption of these methods by European countries could yield savings totalling 23 million cubic metres of industrial wood thereby raising the proportion of industrial wood in the total cut to 68 per cent in 1960 as compared with the 56 per cent recorded for 1950.

The purpose of the dynamic forest policy is to bridge the gap between Europe's prospective requirements and its prospective supplies and thereby avert a permanent decline in European wood consumption. The various short-term methods suggested consist essentially of drawing upon various known and hidden reserves to secure additional supplies in the next ten or 20 years. From a long-term point of view a bold plan of reforestation is called for. The Study says that it should be possible to stem an existing decline so that by the year 2000 plantations might add annually some 65 million cubic metres to Europe's wood supplies. The effects of both a dynamic forest policy and of securing maximum rather than minimum imports from overseas would be to limit the rise in the relative price of wood and to increase European consumption. On purely economic grounds the latter course is obviously preferable.

NEW PAKISTAN DEPOSITS OF FIRECLAY

The Director, Geological Survey of Pakistan, has reported a new find of fireclay of the kaolin type at the top of the Talchir Boulder Bed at Khewra in the Salt Range, Punjab. The thickness of the seam varies up to 10 feet with an estimated average of five feet. The reserves are stated to be spread over more than 100 miles and run into many millions of tons. The analysis of the clay shows the presence of alumina from 20 per cent to 45 per cent. The clay is suitable for the manufacture of fire bricks and can also be used as a filler in the cloth and paper industries. The deposits are easily accessible and communications in the Khewra area are fairly good and can quickly be improved. The clay can easily be turned by the pillar and stall method.

WHOLESALE PRICE INDEX RISES

The official wholesale price index (year ended August 1939 as 100) rose 1.0 percent to 389.2 during the week ended 25th April, 1953, compared with 385.3 (revised) for the previous week. Compared with the corresponding weeks of last month and a year ago, the index was higher by 1.1 and 3.1 percent respectively. The average for April 1953 stood at 384.7 compared with 385.2 for the previous month and 377.8 for April, 1952. During the week under review, Foodstuffs advanced 2.4 percent to 375.1 owing to increases in the prices of gur (+12%), dal arhar (+6%), gram (+5%), sugar (+3%) and bajra (+2%). Prices of coffee, however, declined by one percent.

The index for Industrial Raw Materials rose by 0.7 percent to 457.4 on account of an all round rise in the prices of oilseeds supported by the higher prices of Jariella cotton (+3%) and Bengal fine cotton (+2%), in Bombay, and jute (+1%). Karungani cotton at Tirupur (-9%), manganese ore (-17%), raw wool (-6%), raw skins (-3%) and lac (-2%), however, declined during the period under review. The index for the Semi-Manufactures group moved up by 1.4 percent to 355.8 from 351.0 (revised) for the previous week. Items which recorded noticeable variations during the week were: timber (+20%), mustard and linseed oils (+10% each), zinc (-13%), brass (-6%), copper (-4%), groundnut oil, coconut and gingelly cakes (+3% each), cow and buffalo hides,

sheep and goat skins (-2% each). A fall of one percent in the prices of jute manufactures brought down the index for manufactures to 364.8 from 365.1. The Miscellaneous group index also fell by 0.8 percent to 598.4 as a result of lower prices of tobacco-leaf (-5%), betelnuts (-2%) and black pepper at Cochin (-1%), despite increases in cummin (+16%), chillies (+12%), black pepper in Calcutta (+3%) and cashewnuts (+1%).

70, Forbes Street, Fort,

Bombay, 8th May, 1953.

TO THE SHAREHOLDERS OF

BOKARO AND RAMGUR, LIMITED.

NOTICE is hereby given that the Eightyninth Ordinary General Meeting of the shareholders of Bokaro and Ramgur Limited will be held at the Registered Office of the Company, No. 7, Wellesley Place, Calcutta, on Saturday, the 30th May, 1953, at 11-30 a.m. to transact the following business:—

- To receive the report of the Directors and to pass the Audited Balance Sheet and Profit & Loss Account for the half-year ended 31st December, 1951.
- To elect Directors.
- To appoint Auditors and to fix their remuneration.
- To transact such other business as may be brought before the Meeting.

The Transfer Register will be closed from the 23rd May, 1953 to the 30th May, 1953, both days inclusive.

ANDERSON WRIGHT (Bomgath) LTD.,

Managing Agents.

Calcutta, 8th May, 1953.

THE JAY SHREE TEA GARDENS LIMITED.

NOTICE is hereby given that an Extraordinary General Meeting of the Shareholders of the Company will be held at the Registered Office of the Company at 8, Royal Exchange Place, Calcutta, on Tuesday, the 23rd June, 1953 at 3-15 P.M., to consider and if thought fit to pass with or without modification the following Resolution to be proposed as a Special Resolution:—

"RESOLVED that the Managing Agents shall be remunerated by a Commission of 10% of the net profits of the Company as provided for in Clause 146 (ii) (b) of the Articles of Association of the Company effective from 1st January, 1953 in addition to an allowance of Rs. 1,000/- per month already sanctioned at an Extraordinary General Meeting of the Shareholders held on 29th October, 1946."

By Order of the Directors,

BIRLA BROTHERS LTD.,

Managing Agents.

8, Royal Exchange Place,

Calcutta, the 6th May, 1953.

Commodity Markets

(Continued from page 663)
export duties were too high and rendered the price of the Indian products uncompetitive.

Palm Oil Import Duty Cut

With effect from the same date the Government has also reduced the import duty on palm oil to 10 percent *ad valorem* (standard rate of duty) and abolished altogether the import duty on palm oil produced or manufactured in a British colony. Palm oil has however been removed from the Open General Licence No XXX from 12th May. Pending the grant of separate licences for palm oil, all outstanding licences for the import of coconut oil will, at the option of the importer, be valid for the import of palm oil. Importers, who have already entered into firm commitments with overseas suppliers for the import of palm oil are requested to furnish the Chief Controller of Imports and Exports, Church Road Hutments, New Delhi, with details of their commitments and all documentary evidence in support thereof by 25th May at the latest. They should also clearly indicate the extent to which their commitments can be met from their outstanding licences, if any, for coconut oil.

SECOND WHEAT ESTIMATE

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, the all-India second estimate of wheat for 1952-53 puts the current year's area at 22,141,000 acres as against the corresponding adjusted second estimate of 21,594,000 acres of 1951-52. This shows an increase of 547,000 acres or 2.5 percent in area. The increase in acreage under wheat during the current year has occurred in almost all the major wheat growing States as a result of favourable weather conditions at the time of sowing. This increase more than offsets the decrease recorded in a few States, mainly Madhya Bharat.

This estimate covers the period up to the middle of February, 1953. Till then, the condition of the crop was reported to be generally satisfactory in all States, except in Himachal Pradesh and the unirrigated areas of Bombay where the crop was reported to be in a poor condition because of inadequate rainfall. Some damage to the crop by hailstorms at the end of January 1953 was also reported from Madhya Pradesh. This estimate does not cover the entire area sown with wheat. The estimate is 7.2 percent higher than the second estimate.

"CAPITAL" INDEX OF INDIAN INDUSTRIAL ACTIVITY **

The Capital Monthly Index of Indian Industrial Activity (Base: 1935) has now been brought up to December, 1952. Compared with the preceding month there were increases in Cotton Consumption (12.2 points), Jute Manufactures (6.5 points),

Cement (7.8 points), Paper (1.8 points), Coal (8.3 points), Wagons Loaded (8.1 points), and Electricity (4.8 points), while decreases occurred in Steel Ingots (1.7 points) and Pig Iron (7.1 points). The Indices for Cheque Clearances and Notes

in Circulation revealed rises of 9.2 points and 3.7 points, respectively.

Correlating all the factors the Capital Index of Indian Industrial Activity increased by 6.8 points during December, 1952.

JOINT STOCK COMPANIES' PREFERENCE SHARES

Dividends are cumulative and the shares carry a preferential claim on the property for the payment of capital and on the profits for dividend except in case of companies marked otherwise. (For reference see notes below.) Months against names of companies indicate approximately times of payment of dividends.

Year of Issue	NAMES	Amount Issued in 100's	Rate per cent	Paid-up per Share	Market Quotations 12-5-53	A year ago	Year of Issue	NAMES	Amount Issued in 100's	Rate per cent	Paid-up per Share	Market Quotations 12-5-53	A year ago

COAL COMPANIES

O Po, F and Dd, indicate Ordinary, Preferred Ordinary, Founders' and Deferred shares, respectively. P next to the name of the company indicates that the company also has Preference Shares. Figures in "accounts closed" column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer to the Key (last page) under the numbers indicated.

TEA COMPANIES

O. Po and Dd indicate Ordinary, Preferred Ordinary and Deferred Shares, respectively. P next to the name of the company indicates that the Company also has Preference Shares. Figures in "accounts closed" column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer to the Key (last page) under the numbers indicated.

THE CONTRADICTIONS OF AMERICAN POLICIES

REPUBLICANS & TRADE: A RETURN TO HIGH PROTECTION

NOWHERE is there such an obvious gap between precept and practice as when the United States of America gives the world a lecture on the need for breaking down trade barriers and for freeing the heavily clogged channels of world commerce. Of American generosity no unbiased student of post-war problems can have the slightest doubt; but when American politicians talk, as they often do, of the desirability of liberalising commercial intercourse and the creation of unrestricted multilateral trading groups, their exhortations acquire a hollow sound as they echo against the background of America's own trade policies. The hubbub caused by President Eisenhower's recent request for a single year's extension of the Reciprocal Trade Agreements Act, and the evidence given before Congressional committees both by official and non-official witnesses, is proof (if any were needed) of the strong pressures that are once again seeking to consolidate the traditional high protectionist policy of the Republican Party. The affair of the Chief Joseph Dam tenders and the reluctance of United States shipping interests to see the Great Lakes opened to ocean-going traffic, by U.S. participation in the Canadian scheme for the St. Lawrence seaway, are other manifestations of the same unwillingness of American business men and politicians to practise what their administration so often preaches when addressing its friends and allies.

Nor is it merely the impoverished nations of Europe and Asia who complain. Canada, which enjoys a measure of prosperity second only to the U.S.A. itself, has recently been feeling the effect of the present restrictionist trends in her powerful neighbour's economy. Addressing the National Press Club in Washington a few days ago, the Canadian Prime Minister, Mr. St. Laurent, said: "For most of the countries of the world the United States appears to be the greatest potential market and source of supply. What many of these countries would wish to sell you does not amount to very much in proportion to your total national wealth, but it is often vital to them. ... American business has always proclaimed its faith in the wholesome effects of honest competition. Is it not, then, the part of wisdom to widen the area of competitive trade and see if more nations cannot make their own way into prosperity and strength?" This is but one extract from a pointed appeal to American public opinion, and it is all to the good that some straight talking should be forthcoming from the representative of a country which has close commercial and strategic ties with the U.S.A. but is entirely independent of its post-war bounty.

The British Chancellor, Mr. Butler, lately told the House of Commons that his Government was disappointed with the tardy acceptance of its general trade and payments policy by America and that he had so informed the latter's treasury chiefs. He was even more outspoken in an address to the French Chamber of Commerce in London when in an oblique reference to the subject of sterling convertibility, he declared it was no good removing exchange restrictions if they were to be replaced by import restrictions, adding that the dollar gap was as much a problem for "the other side of the Atlantic" as for Western Europe, which would only be able to put its house in order if America pursued "better credit policies". During his eighteen months of office Mr. Butler has consistently hoped for a better American understanding of Western Europe's economic problem, and it was in furtherance of this that he and the British Foreign Secretary paid an official visit to Washington last March to discuss the findings of the second Commonwealth Conference, held the previous December, with the freshly installed Eisenhower administration. In

administration and to substantial retrenchment in domestic expenditure. At least the Eisenhower administration would require time before committing itself to a project of this magnitude as well as some reasonable assurances that convertibility, once attempted, had more than a sporting chance of permanency. But it is ominous that at a moment when America is enjoying a bout of almost unprecedented prosperity the administration should appear so willing to adopt trade policies which must cause serious embarrassment to America's friends abroad and indeed must soon strike at the very roots of the collective security system which the State Department is so laboriously trying to build up. The committee hearings of the case for an extension of the Reciprocal Trade Agreements Act (not in itself a devastatingly radical piece of economic legislation) and the other matters we have cited seem to show that American thinking has not yet grasped the elementary fact that a certain minimum commercial access to dollars is a basic condition of the fabric of collective security, which cannot indefinitely be propped up by uncertain loans and gifts from Congress and offshore military purchases which, in due time, will have run their course.

A further point to be noted is that the cutting down of U.S. expenditure on aid and rearmament, as the latter moves to completion, must itself involve a contraction of world dollar trade. No one expects America to finance for all time an expanding world economy by armaments manufacture and purchase. After all, was it not the President himself who recently said that every gun that is made, every warship launched, every rocket fired, signifies—in the final sense—a theft from those who hunger and are not fed, from those who are cold and are not clothed? America, said Mr. Eisenhower, pays for a single fighter aircraft with half a million bushels of wheat and the cost of one modern heavy bomber would provide each of 30 cities with a modern brick school or alternatively 50 miles of concrete highway. The President's appeal to the new leaders of the Soviet Union, made a little over a month ago, was couched in fine and moving words which stand in sharp contrast to the sordid huckstering of the committee rooms.

It may be argued that other nations besides America adopt restrictive practices. In terms of comparative resources the argument is irrelevant, whilst by willingly permitting her allies to earn dollars the U.S. taxpayer is at least receiving a material return for his outlay, whereas military subventions or outright aid produce no countervailing benefit except a certain political support which would in any case be readily forthcoming from a prosperous and economically viable free world.

The U.S. Treasury attaches great importance to sterling achieving a wider measure of convertibility, though it is sometimes overlooked that over a very large area a transferable account arrangements already make sterling convertible at the central bank level. Whether the process is to be carried further, so that convertibility means what the ordinary trader thinks it should mean, must depend to some extent on action taken within the U.S.A. itself. As has been noted above, the present signs are not encouraging, for the first step towards wider convertibility is the establishment of a sterling area gold and dollar reserve big enough to take the stresses of international trade movements. Under the most favourable circumstances the creation of an adequate reserve would necessarily be a slow process calling for much patience and forbearance. But if America's own trade policy is now to be so fashioned as to heighten the already high tariff wall, in order to please the various pressure groups in Congress, wider sterling convertibility may well have to be postponed sine die, notwithstanding the fact that the British Treasury are every bit as keen on reaching this goal as the American financial authorities profess themselves in favour of a pound that can look the dollar in the face.

No one in Britain will give the slightest heed to advice calculated to reproduce the convertibility fiasco of 1947, nor is opinion in the country likely to favour convertibility at the cost of insupportable internal economic strains. Far from offering encouragement to move at a quicker pace towards convertibility, the actions of the Eisenhower administration in its short period of office

have reinforced almost every argument in the book in favour of an even more cautious approach to full sterling convertibility. Primary responsibility for determining the pace of the advance towards full convertibility rests with the British authorities, and thereafter with the other members of the sterling area whose involvement in the problem varies according to the extent of their sterling trade and assets. We may concede that America's interest is also genuinely related to her desire to see a more stable world, for which in so many ways she has striven with a true and noble purpose. Great concepts, however, require a certain consistency in their design for which organised American business does not yet seem to be psychologically prepared. Some liberalisation of American trade policies—or at least an assurance that they would not deliberately be made more restrictive than they now are—is an essential prerequisite to the attainment of equilibrium between the dollar and non-dollar worlds.

The evidence now suggests that the same repressive policies which were associated with the depression of the early 'thirties are gaining the upper hand in Washington. Between 1951 and 1952 sterling area exports to the dollar area dropped by some 16 percent, though the United Kingdom's own dollar exports increased in value by 9 percent to a new high record. Contrasting with the drop in exports, sterling imports from the dollar area were 4 percent higher for 1952 as a whole, though the second half of the year showed a sharp decline by comparison with the first. There was a reduction of 7 percent in imports from the dollar area into the United Kingdom. On the evidence of these figures it can hardly be contended that American markets are being swamped with sterling products, or that the American manufacturer or farmer is in danger of being put out of business by aggressive sterling area enterprise. The recent stiffening of U. S. policy derives effectively from the innate conservatism of the party now in power, which regards the slightest move towards more liberal trade with the utmost suspicion. Whether President Eisenhower will be able to keep a difficult Congress in humour without making concessions that will stultify his foreign policy remains to be seen. But upon his ability to do so may well depend the economic fate of the rest of the free world in the next few months.

SECOND THOUGHTS ON NATION-BUILDING

AUSTRALIA and New Zealand have undertaken since the war ambitious "nation-building" projects which resemble in many ways the planned development now in progress in India, so there is some local interest in reflections on the dangers of such schemes in the latest *Monthly Summary* issued by the National Bank of Australasia. "Nation-building", says the Bank, "is not a government monopoly and there are limits, more than officialdom is prone to recognise, to the extent to which it should even be a government priority. Countries grow in size and strength where industry and commerce prosper and private enterprise produces far more of industrial capital, employment and of social amenities than government works or social services can ever provide. Forcing the pace in the Government section can weaken the real substance of national strength and growth. In the balanced conditions which now prevail in industry and trade the lightning of tax demands is more than politically expedient; it is a national need. In the short term the methods of reducing taxation are by reducing government expenditure, by financing less of expenditure from current revenue and more from public loans or by the use of central bank credit. The latter method, although less unfavourably regarded in these times, has pitfalls if carried too far. The extent to which central bank credit is already being used is probably not far from the limit beyond which it would further inflate costs and prices, weaken the country's international standing and defeat the very purpose of national improvement to which much of high expenditure is directed. There is a significant portion of current expenditure under the heading of capital works which could legitimately be charged to loans thus lightening the burden on tax revenue were it not that the loan market is already heavily burdened with demands for State and semi-government works. Thus do the heavy demands of these authorities indirectly add to the tax burden. The need for income in government expenditure is a common cry. Rarely is it specific as to ways and means, for who, outside the official administration, can distinguish the non-recurring items or determine from published statements whether an amount is reasonably economic for its designed purpose? Yet the demand for economy in government, always legitimate, is never more so than in times such as now, when much of private industry is obliged to reduce its own costs in order to survive. Indeed, there can be little hope for a successful solution of the all-important cost problem if Governments, which are responsible

for such a large portion of expenditure, do not give a lead. It is clear from recent promises that some early reductions in rates of taxation are probable, whatever combination of economies and adjustments in Treasury accounts is to be employed in bringing them about. But in the long run, if peace prevails, a permanently lower level of taxation rates depends upon progress in raising national income so that Government imposts can be more easily borne. And this, in turn, depends much upon the forbearance of Governments themselves in forcing the pace of national growth with their own projects and in seeking electoral support by spending the electors' money. For, if more scope and incentive is allowed to individual and corporate enterprise it may well be found that the Government share, although a smaller portion of the whole, is in real terms undiminished and sufficient."

CURRENT COIN

Britain Underbids Again.—Two British companies have underbid American offers for equipment in a dam project on the Columbia River in Oregon State, it is learnt from Washington. One of the British bids was made by the English Electric Company, which recently underbid by more than \$1 million the nearest American offer for equipment for the Chief Joseph Dam in Washington State. (The Defence Department later rejected all bids and has called for new offers.) The new bids are for power-navigational installations on the McNary Dam project, to be built by Army engineers on the Columbia River. The British company of Ferranti submitted the lowest bid of \$857,600 (£306,300), said Army officials. The English Electric bid of \$898,081 (£320,740) was the second lowest. The nearest offer by an American company was \$983,228 (£351,150) made by the Moloney Electric Company, of St. Louis. An Army spokesman said the bids were being "evaluated" by Army experts before being submitted to the Secretary of the Army, Mr. Robert Stevens. "The bids are being evaluated to determine which, in terms of efficiency, utilisation of materials, etc., is the low bid," he added.

Hasty Law-Making.—In his presidential address at the first quarterly general meeting of the Indian Merchants' Chamber in Bombay recently, Mr. Ambalal Kilachand criticised the Government for making important amendments to the income tax law by means of the Finance Bill; since the Bill had to be passed before a stipulated period there had not been enough time to consider the far-reaching changes it embodied. "It is a matter for regret that changes like the one relating to restriction on the set-off of speculation losses have been put on the Statute Book without adequate opportunities being afforded for a detailed and dispassionate examination of the implications and the consequences. Similarly, later in the session a Bill to amend the Industries Act, vesting in the executive powers of an extraordinary character, the exercise of which powers would involve scant consideration to the accepted ideas in regard to right to property, has been rushed through without any attempt to elicit the public point of view." Mr. Kilachand regretted that "there has recently been an increasing tendency to depict an exaggerated picture of inequality of wealth and the need to attempt a levelling"; a tendentious reference to this problem had been made even in defining the scope of the Taxation Enquiry Commission. He quoted figures of income tax assessments to show that even if incomes were distributed equally there would be virtually no change in the general per capita level of income. Before exploring fresh avenues of taxation the Commission, he said, should consider how far the large increase in public expenditure "is justified and sustainable." He implied that the revenue from additional taxation was being largely absorbed by "expenditure on administration or expenditure of a non-developmental or non-productive character." Mr. Kilachand criticised the increased emphasis on direct taxation as a means of raising revenue and said that "the allocation of the income-tax burden is not rational or proportionate."

Mr. Chimanlal B. Parekh, Vice-President, described the Bill to amend the Industries (Development and Regulation) Act as "an extreme instance of far-reaching changes, involving issues of fundamental principle, being rushed through without adhering to the normal principle of eliciting in advance informed opinion." The most important change it introduced was to give the Government power to take over the management of an industrial undertaking, regarding which an investigation had been made, "without the procedure prescribed in the earlier provisions of first issuing directions to the management and waiting to see whether those directions were carried out." The Bill contained some "extreme provisions and the reactions caused by them would be such as to create elements of doubt in regard to the future place and prospects of private enterprise in industrial development." It was not enough for the

Government to say that these powers would be exercised judiciously and with caution; Mr. Parekh felt that definite checks should be introduced. Referring to import trade control, he declared that there had been "a general improvement in the procedural and administrative arrangements", and consultation through advisory meetings had helped remove some practical difficulties. Since supplies were easier to obtain, "the system of actual users' licences requires to be reviewed and such licences should hereafter be strictly confined to requirements in the sphere of basic raw materials and accessories." In view of complaints that excessive imports under these licences are sometimes diverted to the normal market, there should be a stricter check on the ultimate use of supplies and importers "should be accountable to the authorities in the matter of the disposal of the surplus."

Light on Lamps.—Prof. S. K. Roy, President, told the annual general meeting of the Indian Lamp Factories Association in Calcutta last week that lamp production had been in excess of requirements for the last few years and the problem became so acute last year that many units were faced with the prospect of closure. He regretted the Association's failure to restrict output voluntarily and recalled that the Commerce and Industry Minister had had to intervene to persuade factories with a capacity of more than one million lamps a year to cut their production by 25 percent. This restriction was introduced last December for a period of six months but Prof. Roy thought that since market prospects had not tended by six more months and later withdrawn only gradually. Some factories, he said, were curbing output by producing more lamps other than G.L.S. which could be used for general lighting purposes. The Government should therefore type of lamp separately and in greater detail. He said that imports were taking part of the market from indigenous lamps. The import and production figures for all non-G.L.S. lamps like minilamps, coloured, decorative and other gas discharge lamps should be shown separately. Many factories, for instance, started to produce auto-lamps glutted with the imported product, which was being sold at about one-twelfth the price. If indigenous industry, considering that present demand for G.L.S. lamps was 16 to 18 million pieces a year, the Planning Commission had been too optimistic in expecting that it would rise to 30 million by 1955-56. Admittedly many electric lamp production schemes were under way but decentralisation for lamps would not increase appreciably unless transmission and distribution facilities were made cheaper and the cost of household wiring reduced. Electricity suppliers would also have to bring down their charges. Prof. Roy said that "it will be difficult indeed to bring about an appreciable reduction in costs because of the high price of raw materials and components."

Paper Supplies and Costs.—In a statement issued last week, Mr. C. C. Mukharji, President of the Calcutta Paper Traders' Association, said that although the indigenous paper industry could possibly produce enough standard printing of the lighter varieties (6 lb. and 8 lb. foolscap, 12, 14 and 16 lb. Demy, and 19, 20 and 24 lb. Double Crown) which were most in demand and were regarded as standard in India. He declared that it was wrong to suggest simply because mills were concentrating on the manufacture of standard varieties. On the contrary, mills were producing special qualities and turning out certain heavier qualities of standard writing and printing paper. They were opposed to the import of cheap paper, especially newsprint, because "they look upon these qualities as competitive to their products." Foreign competitors, "with a lower price and decidedly better quality, can easily trounce the indigenous manufacturers complaining still of increasing cost of raw materials." Mr. Mukharji said that there was no unfair competition between imported and indigenous paper; the industry was given protection for more than 25 years to offer it a chance neither their quality nor their cost can come up to a state where they can stand firmly against the foreign products the conclusion seems irresistible that either they are not in a mood to stand competition or that they have not the power to do so."

Restrictive Business Practices.—A set of twenty draft Articles of Agreement for international operation in the prevention of restrictive business practices is contained in a report recently released

by the Ad Hoc Committee on Restrictive Business Practices. The report will be taken up by the Economic and Social Council at its sixteenth session opening in Geneva on 30th June. This report was prepared by the Committee following instructions by the thirteenth session of the Council to submit proposals on methods to be adopted by international agreement that would enable governments to take appropriate measures and co-operate with one another to prevent, on the part of private or public commercial enterprises, business practices affecting international trade which restrain competition, limit access to markets or foster monopolistic control, whenever such practices have harmful effects on the expansion of production of trade, on the economic development of under-developed areas or on standards of living. The Articles list practices which come within the scope of the proposed agreement and make provision for adding other practices to the list. The conditions under which restrictive business practices might be subject to investigation are also set forth. The practices considered are those which affect international trade, which are carried on by one or more private or public commercial enterprises possessing effective control of trade among a number of countries, and which have been the subject of a complaint lodged with the contemplated agency. Under the proposed agreement, states would agree to co-operate in the prevention of restrictive business practices. Provision is made for procedures of consultation, investigation and general study. Special procedures apply to services, such as transportation and telecommunications. The Committee notes that business practices would be subject to investigation only when they have a harmful effect on the expansion of production or trade, in the light of stated objectives. These objectives include the reduction of barriers to trade, governmental and private; the promotion on equitable terms of access to markets, products and productive facilities; the encouragement of economic development, industrial and agricultural, particularly in under-developed areas; the promotion of mutual understanding and co-operation in the solution of problems arising in the field of international trade in all its aspects; the achievement of a balanced and expanding world economy through greater and more efficient production, increased income and greater consumption; and the elimination of discriminatory treatment in international trade.

The draft Articles also cover the internal structure and procedures of an agency that would implement the substantive proposals made. In this connection, the Committee points out that it is not broaching the question as to what organisation would most appropriately implement these substantive proposals. The Economic and Social Council entrusted the making of such recommendations to the Secretary-General of the United Nations. However, the Committee has suggested internal arrangements and procedures which would be appropriate to problems that would be encountered by any international agency having to deal with restrictive business practices. Thus, the draft Articles and the body of the Committee's report set forth some views as to the nature and functions of a representative body and an Executive Board within the agency. The Committee also describes staff functions, to be performed by an executive secretariat and an advisory staff. In addition, it indicates how preliminary work on complaints and the subsequent conduct of investigations would be performed. The Committee's report and draft Articles of Agreement also touch on procedural provisions and problems that may arise in connection with the entry into force, amendment, withdrawal and termination of the agreement, and the nature of the relation between restrictive business practices and other barriers to trade. The Committee recommends that, in view of the interest of the European Coal and Steel Community in problems arising under the proposed agreement, the Economic and Social Council invite a representative of the Community to participate in subsequent deliberations on the subject. The Committee was composed of Belgium, Canada, France, India, Mexico, Pakistan, Sweden, United Kingdom, United States and Uruguay.

CORRESPONDENCE

DAILY NEWSPAPER PRICES
TO THE EDITOR OF "CAPITAL."

Sir,

You have earned the gratitude of the newspaper-reading public by raising in your columns (Ditcher's Diary, 14th May) the question of prices of the daily papers. Here is an example of fleecing the public by those who pose as the greatest guardians of their interest. In this connection I would like to point out that in the South (Madras State) the newspapers have not joined in this game of price-raising. There the Hindu a first-rate paper and of the same size (viz. 10 pages) is priced at -1/2- as. The other papers like the Indian Express with eight pages are priced -1/6. If they,

using the same imported newsprint, can manage with lower prices why cannot the dailies of Northern India?

Yours faithfully,
S. KAR

Calcutta, 16th May.

FACILITIES FOR TOURISTS TO THE EDITOR OF "CAPITAL"

Sir,

I quote from Ditcher's Diary of 14th May, adding my comments in brackets. "The importance of developing tourist traffic to this country has often been mentioned in this newspaper and I was glad to learn that a practical beginning has been made by the Tourist Division of the Indian High Commission in London with monthly Tourist Film Shows At the second show Mr. E. M. Munsif, Officer-in-Charge of the Division, had the useful idea of having the guests addressed by one of their colleagues. This was Mr. Warrington, of Cox and Kings, whose experience of India covered more than 20 years. Mr. Warrington assured his audience that they need have no hesitation whatsoever in recommending their clients to visit India." (Did he mention that India is eminently suitable for tourists during four months of the year, but fundamentally unsuitable during the remaining eight?) "To get there might be costly . . ." (All the more reason for being scrupulously accurate in the information given to prospective clients.) " . . . but living in India was not expensive . . ." (Living on a permanent basis in an upcountry station is still relatively cheap but the cost of living in the big towns is notoriously high even for the permanent dwellers in settled bungalows. For the tourist, who is subjected to the importunities of all and sundry, India is a very expensive country except to the few fortunate dollar visitors.) " . . . the hotels were as good as anywhere else . . ." (With one or two rare exceptions hotels in India are dirty, old-fashioned and uninspiring. In the majority the food is of poor quality unless the guest is prepared to take his meals in the grill room, which involves paying twice for each meal. In Bombay and Madras he cannot even get a drink with his meal.) " . . . and no more expensive than those in England . . ." (No more expensive than the Savoy, the Berkeley, or the Ritz, but very much more expensive than their equivalent in Europe if related to the service and comfort offered. How many, for instance, have efficient air-conditioning?) " . . . the trains were extremely good . . ." (They have improved recently, but remain far below pre-war standard. The trains, and the stations in particular, are filthy, the latter being cluttered up with the sorrowful spectacle of homeless refugees. The food—to the foreign traveller—is uneatable, and once again he cannot get a drink with his meals.) " . . . the air services offered everything the traveller could ask . . ." (Recent questions in Parliament do not endorse this statement.) " . . . and in hardly any other country were there eight months of sunshine and warmth each year." (By the same token he could recommend winter sports in Greenland.) "Mr. Warrington also mentioned the tourist ticket which could be procured in Britain and which carried with it many concessions and facilities in regard to permits and customs regulations. Allowing that the speaker is a travel agent himself, this seems a fair enough description of the facilities available, though the bit about warmth and sunshine might not be appreciated by all readers still now." (It is understandable that Mr. Warrington as a travel agent should over-advertise his wares, but is this really "a fair enough description of the facilities available"?)

Yours faithfully,
Accurist.

Calcutta, 18th May.

Survey of Mining Industries

CAPITAL'S mid-year industrial survey for 1953 will deal with Indian mining industries and minerals, of which it will provide as complete and authoritative a coverage as the Jute and Plantations Surveys did of those industries in 1951 and 1952. Specially commissioned experts will deal with coal, iron ore, copper, gold, petroleum, mineral fuels, aluminium, gypsum, chromite, kyanite, sillimanite, mica, manganese and other mining products, as well as mining equipment and labour. A feature of particular interest will be an extensive and up-to-date report on research into the beneficiation of Indian coals which includes designs and cost calculations for coal-washing plant and practical instructions on operation and maintenance. This special issue will be supplied free to registered subscribers to the newspaper along with the ordinary issue for 25th June, and will be available to others at a price of Rs. 5. Enquiries regarding advertising, and orders for extra copies, may be addressed to the Manager, CAPITAL, 5, Mission Row, Calcutta-1.

KAFFIRS AND GILT-EDGED
BEST IN DULL MARKET
OILS AND INDUSTRIALS WEAK

London, 20th May. FOREIGN political events subdued the London stock exchange in one of the quietest weeks for many months. The absence of buying power was most marked and a tendency to lower prices persisted for the greater part of the period. The only signs of revival were confined to the gilt-edged and Kaffir markets with the latter the best performers in the closing stages, being encouraged by outright buying from the Cape and local covering. Far Eastern bonds were the chief sufferers in the downward movement. Chinese fell away sharply on the disappointing news from Korea. Japanese suffered as a result of Press comment on the economic situation of that country though latterly there were signs of better sentiment in these issues. Commodity shares were hardly mentioned throughout the period but remained quietly steady.

News from Egypt unsettled the oil market and in addition, dividend announcements were not always helpful. A revival of institutional activity in Shell caused the market to recover its equilibrium but this proved temporary and the section closed the period on a dull note. Indifference accorded to some of the preliminary company statements caused a lowering of prices among industrials while heavy engineering and foundries were adversely affected by uncertainty concerning the Government's intention towards steel.

Conditions have been patchy in the short loan market in the past week. However, despite fairly

heavy outside calling and the inactivity of main banks at times, the special buyer's assistance was only required on the first day. The close was reasonably comfortable owing to the disbursement of Education Money and outside money returned to help those houses in need of additional balances. Applications for £250 million Treasury Bills amounted to £345,820,000 of which the former amount was allotted at an average rate of 475 8.01d percent. This week's offerings are £250 millions. The Bank of England Return shows about a £3 million increase in note circulation to £1,520 million but there was a fall of around £6 million to £263 million in Bankers deposits.

Market Newsletter

The Investor's Chronicle market newsletter says that political developments in Korea, Egypt and economic uncertainties in Britain and throughout the world have brought industrial share prices almost back to these prevailing at the start of the year which now seems likely to be a bear year, with prices ending lower than at its start. Seeing little scope, buyers are holding off except for individual stocks offering clear speculative promises. This general lethargy is likely to last for some time.

Tramp Freight Rates

The United Kingdom Chamber of Shipping index figure of sterling tramp freight rates in April showed another slight gain at 100.9 compared with 98.2 in March and 92.3 in February. The April level is the highest since May last year when it was 110.9. The increase over March is in line with general expectations and would undoubtedly have been much higher had not strike influences on the North American Pacific Coast caused vessels to seek other employment in the Eastern trades. The increased competition in the area resulted in sharp losses, especially for grain from Australia. These declines were outweighed by substantial demand for tonnage to move coal and grain from the North Atlantic seaboard.

Bangkok Foreign Exchange

Bangkok foreign currencies which have been soaring for the past week or so reached new high levels on Friday, 15th May, on the foreign exchange, Bangkok. Business in exchanges remained stagnant and local banks and exchange dealers were reluctant to quote rates because of shortage of sterling and U.S. dollars in the Bangkok market. Reliable banking sources attributed the shortage of foreign exchange firstly to lower prices for exports and secondly to the heavy decline in rubber and tin prices in world markets. Gold also advanced sympathetically and was quoted on Friday at 262 ticals per 15½ grammes for 94.5 percent fineness compared with Thursday's 356 and 336½ a fortnight ago.

Hides and Skin Market

The hides and skin market remained very erratic when the auction of tanned East Indian goat skins continued on Wednesday 13th May, and it is difficult to make a definite quotation. Prime tannages on average were 1s 6d below March. Middle class sorts have lost approximately 6d to 1s and rejections are mostly back to March prices. Light weights are now mostly selling at March values, except in primes where there are some heavy falls in firsts and seconds. Extra heavies continue to sell at the last sale rates to 6d and above.

Oilseeds Market

The London oilseeds market has been quiet during the past week with some irregularity in prices. British East African castor seeds continued to be depressed with business noted at £82 c.i.f. Iraqi 5 percent linseed was quoted at £58 c.i.f. and Nigerian groundnuts at £82 c.i.f. both £2 lower. Indian 3 percent nigerseed, however, was 10s higher at £60 while Indian cured cardiseed was quoted at £49 c.i.f. against £46. In oils, Uruguayan linseed oil was 1 down at £88½ c.i.f. but American crude cotton oil was 34d f.o.b. compared with 316 dollars.

Anglo-Dutch

Anglo-Dutch Plantation of Java announced that an extraordinary general meeting will be held in London on 9th June, to consider the resolution that the name of Company be changed to Anglo-Indonesian Plantations Ltd. and that new articles of association be adopted.

Tea Stocks

Tea stocks in London and Provincial bonded warehouses as at May 8th totalled 112,232,369 pounds compared with 111,517,140 a week earlier.

Hong Kong Gold Prices

Hong Kong gold prices fluctuated widely last week with trading very heavy for some time. Opening at \$271½ per tael, values climbed until some profit-taking caused values to react to period were a sharp rise in Bangkok, depreciation of sterling in New York, a higher local dollar rate, the situation in Thailand and Indo-China and lastly the low stock position here. Official offtake totalled 19,390 taels and unofficial 23,570. Arrivals in Macao were 12,000 ounces, unofficial exports 15,000 taels and forward contract 6,000 ounces at U.S. 39.90, c.i.f. Macao.

The Taxation Enquiry Commission has moved its Secretariat from Sudama House, Ballard Estate, Bombay to "White House", 91, Walkeshwar Road, Bombay. All letters, telegrams etc. should now be directed to the Secretary, Taxation Enquiry Commission at White House, 91, Walkeshwar Road, Bombay.

Finance in India & Abroad

THE CALCUTTA MONEY MARKET
CREDIT TIGHT, FEW BILLS PASSING

Wednesday, 20th May.

THERE has been little change in the Calcutta money market from the conditions reported last week. Jute advances are steady, and there has been no fall in outstandings on sugar account despite the end of the crushing season and large releases of sugar. Money is still tight in the interbank market where overnight loans quote 21 percent and good money 3 percent. The increase in the treasury bill tender suggests that easier money conditions are expected in the not too distant future.

The bill of exchange market is extremely dull and there are so few bills passing, even for what is normally a quiet month, that some brokers declare this to be their worst month for some years. There has been very little remittance. Rates are unchanged from last week, with the U.S. dollar standing at Rs. 476.

Tenders for the offer of Rs. 1 crore of three-month Government of India treasury bills rose to Rs. 1,94,50,000 this week. The average rate of acceptance declined to Rs. 2-6-8 percent per annum, tenders at Rs. 99-6-6 percent having been accepted in full and those at Rs. 99-6-3 percent allotted approximately 41 percent. Tenders for another Rs. 1 crore of treasury bills will be received up to 11 a.m. on Tuesday of next week at Bombay and up to Monday at Calcutta, Madras, Kanpur and Delhi. During the week ended 15th May, treasury bills for Rs. 3,37,00,000 were sold in favour of the Reserve Bank of India.

Silver ruled quiet and the price fell from the previous week's level of Rs. 163-6 to Rs. 159-3 quoted today. The easiness was attributed to long liquidation induced by larger offering. The ready rate was done at a premium of 6 annas. The price continued unchanged at 74d in London and at 85½ cents in New York.

Gold also eased fractionally in sympathy with silver and the price fell from Rs. 83-6 to Rs. 88. The sovereign at Rs. 57-8 showed a loss of 5 annas.

A fall of Rs. 5-28 crores in notes in circulation to Rs. 1,174.53 crores was the outstanding feature of the return of the Reserve Bank of India for the week ended 15th May, 1953, while the total note issue rose fractionally by Rs. 15 lakhs to Rs. 1,189.72 crores. Notes held in the Banking Department consequently increased by Rs. 5.43 crores to total Rs. 15.19 crores. In the Banking Department, deposits of the Government of India increased by Rs. 2.13 crores to Rs. 100.71 crores, but other Government accounts diminished by Rs. 1.30 crores to stand at Rs. 14.23 crores. Balances of commercial banks at Rs. 42.39 crores were about Rs. 2.45 crores higher than in the last return. Balances held abroad were up by Rs. 70 lakhs to Rs. 106.35 crores. Other loans and advances dropped from Rs. 33.82 crores to Rs. 31.09 crores, of which advances to scheduled banks against unsecured bills declined from Rs. 15.54 crores to Rs. 14.64 crores. Investments at Rs. 87.24 crores disclosed a rise of Rs. 90 lakhs. Ways and means advances were shown at Rs. 3.77 crores (Rs. 4.21 crores).

The statement of position of Scheduled Banks for the week ended 8th May, 1953, discloses Demand and Time liabilities at Rs. 524.18 crores (Rs. 10.91 crores on account of borrowings from Banks) and Rs. 321.72 crores (Rs. 1.85 crores) compared with Rs. 536.56 crores (Rs. 12.07 crores) and Rs. 320.97 crores (Rs. 1.65 crores) respectively in the previous week. Cash has increased by Rs. 32 lakhs to aggregate Rs. 32.13 crores, while balances with the Reserve Bank have decreased by Rs. 2.29 crores to stand at Rs. 38.34 crores. There is a drop of Rs. 20 lakhs in investments to Rs. 300.73 crores. Advances and bills discounted at Rs. 539.86 crores reveal an increase of Rs. 3.64 crores. The ratios to total liabilities of cash and balances, and of advances and discounts are, in consequence, shown at 8.7 percent and 63.8 percent against 8.4 percent and 62.5 percent.

The return of the Imperial Bank of India for the week ended 8th May, 1953, shows a drop of Rs. 5.10 crores in total deposits to Rs. 208.48 crores. Investments in Government Securities, and other authorities investments are down by Rs. 39 lakhs and Rs. 24 lakhs to Rs. 70.68 crores and Rs. 10.92 crores, respectively. Loans, cash credits and overdrafts have advanced by Rs. 69 lakhs to Rs. 108.60 crores, while bills discounted and purchased have declined by Rs. 13 lakhs to stand at Rs. 26.18 crores. Cash and balances are, in consequence, shown at Rs. 13.75 crores or Rs. 1.13 crores less.

During the fortnight ended 27th February National Savings Certificates amounting to Rs. 17,29,745 were sold in the State of West Bengal. During the same period applications totalling Rs. 5,63,500 for subscription to the 3½% Treasury Savings Deposit were also received by the Treasury and the branches of the Imperial Bank of India, West Bengal and the Public Debt Office at Calcutta.

During the fortnight ended 14th March, National Savings Certificates amounting to Rs. 17,42,565 were sold in the State of West Bengal. During the same period applications totalling Rs. 5,64,800 for subscription to the 3½% Treasury Savings Deposit were also received by the Treas-

suries and the branches of the Imperial Bank of India, West Bengal and the Public Debt Office at Calcutta.

The total amount of capital sanctioned under the Capital Issues Order for the five years from 1948 to 1952 (both inclusive) was Rs. 362.9 crores, said the Finance Minister, Sir C. D. Deshmukh, in a written reply to a question in Parliament recently. The amounts sanctioned were Rs. 125.7 crores in 1948, Rs. 63 crores in 1949, Rs. 74.8 crores in 1950, Rs. 59.6 crores in 1951 and Rs. 39.8 crores in 1952. Of the total of Rs. 362.9 crores foreign capital was Rs. 41.69 crores.

LONDON FINANCIAL LETTER

MOVEMENT OF INTEREST-RATES

By Air Mail.

THE movements of interest-rates in London and New York are being watched with more than usual attention. While American rates have been raised in deliberate restraint of credit, British rates have been allowed—whether as a matter of policy or not is unclear—to drift lower. Not only socialist critics of the 4 percent bank rate but also financial advisers of high repute have lately advocated that the London bank rate be reduced. The Chancellor of the Exchequer himself has hinted that the economy needs a fillip. In banking circles it is argued that bank rate is not the flexible instrument that the Chancellor intends it to be if it remains for long unchanged (it was put up to 4 percent in March 1952)—and in the present circumstances a change could hardly be upward. It has not, however, escaped notice here that since American rates were raised the Canadian dollar and then sterling have weakened; and the two movements are seen as associated. Higher interest-rates in New York have evidently induced American institutions to repatriate some capital. Tighter credit in that centre has also made it desirable to have more capital at hand. One of the gratifying responses to Britain's financial recovery was the movement—though it was not on a large scale—of American funds to London to take advantage of the relatively generous rates prevailing here. The movement began, of course, only when confidence in sterling was restored. The withdrawal of some of these funds does not mean that confidence in sterling has been lost; but the withdrawal itself has weakened sterling. There is now little difference between Treasury bill rates in London and New York, between 2½ percent and 2½ percent, but the long-term rate on Government bonds is still appreciably higher in London—around 4 percent—than in New York—below 3 percent. However, the whole scale of UK interest-rates has been tending lower since the middle of last year, and it is doubtful if the authorities can risk such a stimulus to the reduction as a cut in bank rate, while the U.S. trend is the other way.

Activity in Currencies

The foreign exchange market in London welcomes the new freedom for multilateral currency dealings in the principal centres of the European Payments Union. A considerable volume of arbitrage dealing is anticipated, restoring some of the invisible income which used to accrue to this country from such operations before the war. In advance of these dealings there were sharp adjustments in European exchange rates—notably appreciation of the Belgian franc and depreciation of the Swiss franc, while the Swedish krona and the Dutch florin also advanced appreciably—evidence of the artificiality of quotations under the old system.

There has been another innovation to interest the foreign exchange market—the arrangement whereby Japan can temporarily exchange surplus dollars for scarce sterling by selling dollars against sterling on the spot and buying dollars against sterling forward. An abundance of dollars in relation to sterling is, of course, exceptional—due in this case to American aid and the Korean war on the one hand and a substantial buying of sterling commodities on the other; so the normal procedure, a straightforward purchase of sterling against dollars, has not been adopted, partly because such disposal of "aid" dollars would probably be disapproved. Though restrictions on the entry of Japanese goods into the sterling area have been relaxed, it has yet to be proved that the sterling needed to buy back the dollars a few months hence will be available.

The plan to ease Japan's shortage of sterling also affects the discount market. Although the restriction of credit has hitherto prevented such a practice, Japanese importers are now permitted to arrange with their banks to draw bills on London for payment 90 days after sight, as well as sight bills as hitherto. The market would like to see more of such paper circulating.

Anxiety for Dollars

Suspicion that the American Administration's fine words about liberalising trade will not be matched with deeds has grown distressingly in recent weeks, and criticism of American policies has become sharper and more public here, even at ministerial level. When sterling commodity prices have mostly trended downward (whereas some of the principal dollar commodities are still officially supported), with adverse effects on the sterling area's ability to earn dollars and European currencies by exporting commodities, it may be impossible to avert a new dollar crisis unless the USA admits manufactures more freely. But there is no sign that such a change is contemplated.

The external policy of the Commonwealth and of the sterling area is conditional on America's

WARNED!

Violating Railway Rules and ignoring safety measures, passengers often carry explosives and inflammable articles as personal luggage. Such practice is known to have started fires in compartments, causing loss of life.

It is not only strictly against the Railway Act to carry explosives and inflammable articles as personal luggage but it is against your own safety.

Explosives and Inflammable Articles cannot be carried as Luggage in Compartments or Brake Vans under any circumstances.

BURMAH-SHELL... IN INDIA'S LIFE AND PART OF IT

policy in foreign trade. Hopes for a bold move ran high when the Eden-Butler mission set out for the United States early in the year, but they became perceptibly more cautious after that mission returned with no more than polite assurance that the Commonwealth plan would be duly considered. Scepticism has now reached the point where it is assumed that no material progress will be made this year in freeing trade and currencies. The discussions with European countries are, however, preparing the ground for a joint approach to convertibility by Europe and the sterling area. The Germans have shown themselves particularly interested in general convertibility.

IMPLICATIONS OF U.S. BUDGET CUTS

British newspapers have given prominence to President Eisenhower's announcement of his proposal to cut budgetary expenditure for 1953-54 by \$3,500 million, mainly by reductions in the defence and foreign aid programmes. In the absence of detailed figures showing how the proposed cut would affect foreign aid, preliminary reaction of informed quarters in London is confined to pointing out that the U.K. has consistently advocated a "trade, not aid" policy, and that it is hoped that any reductions in direct American aid will be accompanied by greater opportunity for trade, enabling British manufacturers to find new and substantial markets and to expand existing markets in the U.S.A. One way in which Britain has been assisted in her dollar problem has been the development by the U.S.A. of the practice of off-shore procurement (dollar financing of arms manufacture in European countries). Recent examples of this are the American purchase of British Centurion tanks for delivery to Denmark and the Netherlands, and the contract signed on the occasion of the recent NATO meeting in Paris for Hawker Hunter fighters and Seahawks. Such orders procure dollars for Britain, and an extension of this method would be most welcome to the U.K. While the precise effects of the proposed cuts cannot yet be assessed, it is noted in London that President Eisenhower's

statement makes plain his determination to maintain a steady build-up of a position of strength to deter any potential aggressor. In this connection, London observers draw attention to the following passages in the President's statement as cited in agency messages from Washington: "These savings will not reduce the effective military strength we will deliver to ourselves and our allies during the fiscal year 1954. Deliveries actually will be speeded up.....The programme we are presenting is a long-term programme calling for a steady and adequate flow of men and materials to present a position of strength to any would-be aggressor. The basic elements of our strategic problem have not materially changed in recent years, and certainly not in recent days. The areas and peoples vital to our welfare are the same as they have been for a long time. Security based upon heavy armaments is a way of life that has been forced upon us and upon our Allies. We do not like it; in fact, we hate it. But so long as such an unmistakable, self-confident threat to our freedom exists, we will carry these burdens with dedication and determination".

Saint Frères Circular Looms installed in Italy.

SAINT FRÈRES CIRCULAR LOOMS

Hundreds of Saint Frères Circular Looms are in use—in new factories and old, sometimes working alongside flat looms—in the Belgian Congo, in South Africa, Sweden, Norway, Italy, Great Britain, Germany, Belgium and France.

These looms were originally designed for making tubular cloth from jute. Deliveries of a Saint Frères Circular Looms for hard fibres are now available. Saint Frères Circular Looms are manufactured by Urquhart Lindsay & Robertson Orchar Ltd., Dundee, Scotland.

FAIRDAIRN LAWSON COMBE BARBOUR LTD.

LEDS, ENGLAND.

The 12 Loom (2-leaf, 4-shuttle) weaves single and double warp plain and tubular cloth for sacks and for the manufacture of single width cloth woven in tubular form with a double false selvage for wrappers, etc.

A DITCHER'S DIARY

As a foreign correspondent in Europe for the *Sphere*, Reuters and the *News Chronicle*, he came to Delhi as Director of Public Information to the Government of India, and it was while in that post that he laid down some excellent principles concerning relations between Government and the Press, which have lately been flouted in Bombay. In 1941 he was sent to the office of the Indian Agent-General in Washington where he remained until he resigned from the Government of India at the end of the war. He returned to this country the next year on behalf of the *Sunday Times* for whom he covered the eventful period before and after Independence. In 1948 he turned to stock-broking, becoming a partner in the firm of Place, Siddons and Gough, and it is in that capacity that he has been best known locally over the last five years. However, not even the cares of share market could still his pen and in 1950 he published his book *India and Pakistan in World Politics*, while he has recently completed another, *India, Democracy and Education*, which is to be published later this year. He now withdraws to the quietude of a village in Moray, from where no doubt we shall hear more of him.

Senator McCarthy's reply to "Comrade" Attlee last week furnished the *reductio ad absurdum* of the Senator's inquisitorial techniques. If he imagines, in producing a picture of Mr Attlee saluting Spanish Republican troops in the 'thirties, that he has shown that the man who formed Britain's policies from the end of the shooting war until well into the cold war is some sort of "security risk" for the Western world, then we know what his other charges are worth. If he will go so far, he may as well go the whole distance, as has been suggested, and impugn Sir Winston Churchill as a doubtful character for having consorted with such well known Communists as M. Stalin and for having long been a member of a notorious institution called the House of Commons which for years together contained several Communist members. The Senator is entitled to hold the most unfavourable opinions about Socialist policies in the face of the Communist threat, but his implication that a man who is good enough to lead the British people at a time of grave danger would not last long in the American political scene because he would be suspect of treasonable weakness, is sufficient to make his methods look ludicrous. As long as he stays on home ground, we foreigners must admit that it is just barely conceivable that the Senator is right when he implies that the American civil service has been rotten from top to bottom with potential and actual spies, but when he ventures abroad to question the past of people we know better than he does, even foreigners can see that he is talking rubbish.

Sir George Schuster's "aide-memoire" on his Indian visit of last cold weather, which the Federation of Indian Chambers of Commerce and Industry has done well to publish in full, is a much more meaty document than usually issues from such tours. Avoiding the pious truisms addressed to no one in particular which are the safest expedient for the imported luminary, Sir George follows the course he steered in his public speeches here: since a group of business men had brought him to the country, it was to them that he would offer his advice, rather than to their partners in labour and Government. Not that counsel to business men is uncommon today, but it rarely gets

beyond the stage of admonishing them to stop making profits (i.e. to cease being business men) and to be good boys by doing everything the politicians expect of them. Realising that either of these courses would lead to universal poverty, Sir George proffers sounder counsel. His reflections on the proper function of industrial associations and on relations with trade unions are valuable precisely because they get down to tin tacks, with concrete suggestions on things the Federation might do here and now. By venturing from the general to the particular, he naturally takes the risk of presenting conclusions about which there will be some controversy, but on the whole his memorandum is a more useful piece of work than I have seen in this line for some time. I will not make the mistake of attempting to summarise it here, but mention should be made of his specific suggestion to the Federation "to come out with a clear declaration that they want to see external capital come in for the genuine development of Indian industrial production". This is a question over which certain members of that body have wobbled somewhat in the last year or so, especially since the squeeze on profits began in 1952—as if temporary marketing difficulties could alter the economy's permanent need of substantial capital investment. An unequivocal statement by Indian business men (without any of the minatory if's and but's to which the politicians are addicted) that foreign capital was thoroughly welcome would clear the public mind on this important issue better than any Ministerial pronouncement.

Copies of the United Nations Statistical Yearbook for 1952 have now reached India and will be favourite browsing for those who like to pick up curious facts and astonishing comparisons from masses of tabulated figures. Being one such, I find it instructive to read that more than half the radio sets in the world are in the United States, that India has 159,000 motor cars and the USA has 42,000,000, that Mexico makes more long films as any country in Continental Europe, that Japan used to make about as many films as the USA and still makes almost as many as India, and that Britain prints more books by a long shot than any country in the world. It is perhaps permissible to read some of the character of our age into figures that show that railway freight traffic has increased in 20 years by 173 percent but shipping freight by only 83 percent, that more books are written on religion than on philosophy in all free countries except Israel, that the world drank most wine during the depression and just before the war began, but that Englishmen drank more beer than ever the year the war ended. Then again, perhaps it is not permissible to do any such thing. That is the beauty of statistics: you can make what you want of them.

The upsurge of patriotism that very properly accompanies the Coronation seems to be a godsend to the dye business, at least the red, white and blue sections of it. *Punch* reports an advertisement for red, white and blue sausages (on the outside only, *Punch* hopes); the *Evening Standard* says that the Commonwealth Division will fire smoke bombs of the same colours along the 38th Parallel on 2nd June; but it is an advertisement in the *Star* that takes the cake with a puff for "a strapless one-piece contralto" (a corset, I find on enquiry) "in elastic net and nylon voile in...red, white and royal blue".

What is claimed to be a new and revolutionary process for making wool unshrinkable has been announced by the Commonwealth Scientific and Industrial Research Organisation. The process involves depositing a small amount of synthetic resin on the wool, "spot welding" wool fibres to one another and stabilising the fabric, thus preventing shrinkage caused by wear and washing. Evolved at the CSIRO wool textile research laboratories at Belmont, Australia, the process is the joint work of Dr. M. Lipson head of the laboratories, and David Leonard Jackson, a young British scientist. The CSIRO has been conducting research on wool shrinkage since 1937. Three

Rs. 13,84,967 in 1951 to Rs. 13,34,372. The company was able to maintain the high reserve position of 100 percent to 132 percent in all departments. The distributable balance totals Rs. 1,79,493 including Rs. 18,249 brought forward and providing Rs. 1,50,000 for taxation. The ordinary dividend has been maintained at 3 percent, leaving Rs. 13,175 to be carried forward.

BOKARO AND RAMCURI, LTD. made a profit of Rs. 15,779 for the half-year ended 31st December, 1951, as compared with a loss of Rs. 10,194 in the preceding half-year. Providing Rs. 25,000 (same) for depreciation a debit balance of Rs. 1,46,404 has been carried forward. The dividend has consequently been passed again. Raisings totalled 505,572 tons (62,956 tons) and despatches 42,774 tons (40,001 tons). Raisings had to be restricted because of accumulated stocks resulting from the shortage of wagons.

There is a profit of Rs. 74,843, including Rs. 65,864 brought in of the GHUSICK AND MUSLIA COLLIERIES for the year ended 31st March, 1952, as compared with Rs. 1,66,864 (Rs. 61,480) in the previous year, after providing Rs. 40,000 (same) for depreciation. A sum of Rs. 50,000 has been provided for taxation after writing back from general reserve. The dividend has been maintained at annas 8 per share, leaving a carry-forward of Rs. 24,843. Raisings were 1,62,586 tons (1,76,265 tons) and despatches 1,37,657 tons (1,50,463 tons).

KATRAS JHERRIAH COAL COMPANY made a profit of Rs. 2,21 lakhs for the half-year ended 31st January, 1953 which compares unfavourably with the previous half-year's profit of Rs. 4,13 lakhs. Allowing Rs. 1,60 lakhs (Rs. 2,15 lakhs) for taxation and cesses, Rs. 75,000 (Rs. 90,000) for depreciation, transferring Rs. 25,000 (Rs. 50,000) to development reserve, bringing in Rs. 1,46,012 and meeting other charges, there is a balance of Rs. 1,89,882. The dividend has been maintained at Rs. 2 per share, leaving Rs. 89,822 to be carried forward. Raisings totalled 1,00,426 tons (1,23,883 tons) and despatches 1,61,548 tons (1,68,891 tons) resulting from a strike at the collieries.

The working of the **INDIAN WOOD PRODUCTS COMPANY** for the year ended 30th September, 1952, has produced satisfactory results. Net profits rose from Rs. 7,70 lakhs to Rs. 9,21,788. Adding Rs. 73,653 brought in, there is Rs. 9,95,441. Interim dividends at 15 percent (same) absorbed Rs. 2,25,000. The final dividend was lowered by 5 percent to 15 percent, although the capital was meanwhile increased by Rs. 5 lakhs through the capitalisation of reserves. General reserve has been allocated Rs. 3 lakhs, leaving a carry-forward of Rs. 1,70,441.

The **CHAMONG TEA COMPANY** incurred a loss of Rs. 90,710 during the year ended 31st December, 1952, as compared with the previous year's profit of Rs. 22,043. This was because of the smaller crop of 125,814 lbs. (155,732 lbs.). The average price also fell from Rs. 2-5-1/2 to Rs. 1-15-104 per lb. Adding back Rs. 75,000 from the reserve account and meeting other charges, there is a balance of Rs. 5,569 which is carried forward. The dividend has been passed, as against 21 percent in the previous year. Estimates for the current year have been framed for a crop of 136,000 lbs. at a cost of Rs. 2-10/10 per lb.

Messrs. **Martin Burn Ltd.**, managing agents of the **INDIAN IRON & STEEL CO. LTD.**, report the production of the company during April 1953 as follows: pig iron 52,210 tons, steel ingots 30,980 tons, semi-finished steel for sale 8,420 tons, and finished steel 10,670 tons.

The *Investor's India Year-Book, 1953*, compiled by Place, Siddons and Cough has recently been published and maintains the high standards its extensive readership has come to expect of it. Running to more than 400 pages and priced at Rs. 20, it remains the finest publication of its kind in the country and the new edition has some special features such as the latest amendments to the Trustees' Rules and an expanded tea section. 1952 has in many ways been a crucial year for industry and commerce; an excellent preface reviews the developments of the past year with competence and impartially and will prove of great assistance to investors. As usual, it pays special attention to the money market, and the coal, cotton textile, jute tea, sugar and miscellaneous industries.

THE KARACHI STOCK MARKET

In their report on the Karachi stock market for the week ended 15th May, Messrs. Merwanjee Bomanjee Dalal & Son say that almost no Central or Provincial loans were offered. Municipal and Port Trust Debentures were also scarce. Following the lead of textiles, the equities market was remarkably cheerful. Dawood Cottons are reliably of 25,000 additional spindles which should go into production within the next four or five months. The report for the year ended 31st March, 1953, management have impressed the public by their efficient and prompt handling of all the formalities including the refund of excess amounts in connection with their recent flotation. The assurance that share certificates will be issued within a few weeks is also welcome. Valika Textiles Jutes were firm and the share certificates are being distributed. Insurance shares reached a low level and recovery is possible. Demand for National, Habib and Muslim Commercial banks is revived. State Banks are cheap at the prevailing rate which includes a 4 percent taxable 8th June. PIFCOs were maintained. Glaxo Laboratories were weak but Hydrat Constructors and Muhammad Steamships had a reduced turn over but there was late buying enquiry. Pan-Islamic Steamships were dull, Spencers were Rawalpindi Electric resisted the decline and investment interest is again noticeable. Multan Steamship Preference were nominal, Muhammad Airways declined. Spencers were inactive and unchanged in the absence of sellers, and Colony Textile Preference did not attract much interest.

New Delhi

PROGRESS OF FIVE YEAR PLAN REVIEWED

I.L.O. PRODUCTIVITY MISSION SUBMITS INTERIM REPORT

(FROM OUR OWN CORRESPONDENT)

THE first progress report on the five year plan for the two years ended March 1953 was presented to Parliament before it adjourned sine die this week. The report indicates that all-round progress has been made but there is also an unrecurrent anxiety for the future. Under the federal system, the Centre has limited authority over the States, particularly in the development sector, while the Planning Commission has no authority at all. Even this limited authority is being resisted by the States and abjured by the Centre. The Planning Commission laments that States are squandering their resources by undertaking schemes outside the plan and that they have done little or nothing to raise additional revenues. Their financial contribution over the five-year period should be Rs. 532 crores but only Rs. 101 crores has been contributed in the first two years. In the case of Madras, Bihar, West Bengal, Mysore and Saurashtra, the target for the five years is Rs. 208.2 crores, as against a contribution of Rs. 20 crores in 1951-52 and 1952-53. The Planning Commission declares: "Except in the case of a few States, the additional measures of taxation have been of minor importance, and the proceeds realised in 1951-52 and 1952-53 have been very small. The increase in the tax revenue has, in fact, been more than absorbed by increased expenditure of a non-developmental nature on revenue account itself. In addition, several State Governments are spending larger sums of money on buildings, roads and development schemes outside the State plans, all of which have the effect of reducing the saving available from State revenues for the plan itself, despite the increase in tax revenue referred to above."

The Commission emphasises that "the raising of additional resources is a prerequisite for the successful implementation of State plans." The resources to be raised by State Governments over the five years amount to Rs. 532 crores. Of this, Rs. 67 crores is required mainly because some State Governments asked the Commission to expand their plans; "the upward revision in the targets of expenditure was accepted provisionally on the condition that the resources corresponding to these would be raised by the Governments concerned." The Commission expresses the pious hope that schemes outside the plan will be scrapped and resources used only to implement the plan.

Independent Appraisal Needed

The Central Government and the Planning Commission unfortunately have to rely on State Governments for their progress reports; they have no independent agency to assess the progress of the plan. The latest report gives no indication as to how the Planning Commission proposes to ensure that the results are correct and unbiased. Sir Chintaman Deshmukh has raised another issue—that of profitability in regard to development projects, particularly river development schemes. It is all very well for the Irrigation Minister, Mr. Gulzarilal Nanda, to produce "chits" from international authorities saying that a particular scheme is being implemented satisfactorily. But these "chits" do not prove that a project is profitable or even that it can operate on a no-profit no-loss basis. If the plan suffers when money is spent on schemes outside the plan, the Commission estimates of a project within the plan are raised. Lastly, there is a shortcoming in the plan itself. The highest priority has been accorded to agricultural development. Rainfall and soil erosion are related to forests but since the war there has been much unplanned deforestation, often to cover the loss from prohibition. The Central Government has an impressive forest policy and the five year plan attaches much importance to soil conservation. But in actual practice very little is being done. Multipurpose projects would be less beneficial if deforestation and soil erosion continue on the present scale. The progress report has little to say on this problem of national importance.

Budget Session Ends

The 72-day Budget session of Parliament concluded this week. On the last day, the Prime Minister made an important statement on foreign affairs in which he declared that the international outlook was brighter than it had been for a long time. During the 72 sittings of the Budget session, nearly 4,000 questions were answered—2,250 starred, 1,550 unstarred, and over 20 short-note. As many as 29 Bills were considered and passed. In addition to the 22 Bills pending at the beginning of the session, 26 new Bills were introduced—a large number when one considers that the main business of the session was to consider the Budget (Railway and General) and pass the Budget demands and the Finance Bill. There were also six half-hour discussions on subjects arising from Government answers during question hours, such as trade with China, hardship among jute growers, scarcity conditions in Madras etc. Under a new procedure initiated during this session, there were also some one-hour discussions. Four days were set apart for non-official Bills and resolutions. The session has been strenuous and considering its length

Bombay

TISCO SHAREHOLDERS MAY
SEEK ORDINANCEBANK STRIKE DANGER
(FROM OUR OWN CORRESPONDENT).

17th May.
To speed up the conversion of Tata Iron and Steel deferred shares into ordinary shares it has been suggested that the two shareholders' committees might approach the Central Government through TISCO to issue an ordinance embodying the mediator's recommendation, thus reducing the time lag that would otherwise ensue during the normal legal process of making the conversion. While extreme factions in both shareholders' committees will probably find fault with Mr. Setalvad's recommendation when it is officially placed before them, it is believed in business circles in Bombay that it will be accepted. Operators and investors are said to be satisfied with the proposal. After a couple of hectic days' trading in both the ordinary and deferred shares the market has turned dull and many big operators have transferred their interest to prominent textile shares.

The following is the text of the "opinion" offered by Mr. Setalvad:—

"1. In substance, what is to be achieved in the present case is a fair valuation of the deferred shares of a going concern in terms of the ordinary shares of the same concern. In such a valuation no question would seem to arise of winding up or sale values. It appears to me that the essential factors to be considered in arriving at the intrinsic or real value of the shares are: (a) the earning capacity of the Company; and, (b) the safety of

capital or assets backing. Of these two factors the paramount factor is the potential earning power of the company.

2. Though the market quotations for shares are not necessarily indicative of their true worth they certainly have to be taken as representing their market prices at a particular time because these prices are fixed in a free and open market by dealings between buyers and sellers. Thus though market value is not a conclusive test of real value, where there is a free market, it is cogent evidence of real value. The dividends paid over a number of years would also in some measure be indicative of the real or intrinsic value of the shares.

4. The true approach, in my view, would, therefore, be first to arrive at the fair value of the two classes of shares on the basis of a computation of the average maintainable profits. The average maintainable profits would be equivalent to the maintainable yield and indicate the prospective earning capacity of the shares. The fair value so arrived at can be checked by a valuation based on market quotations over a period of about ten years and by a valuation based on the dividends paid over a similar number of years. The equity value of the two classes of shares and their relative rights in a winding up will also have to be considered.

5. Having given careful consideration to all the relevant factors including the equity value of the two classes of shares and having given due weight in evaluating the ratio to the higher rights in a winding up of the deferred shareholders, I am of the opinion that the fair conversion ratio is six ordinary shares to one deferred share."

Sastri Award

It now appears certain that the All-India Bank Employees' Federation will appeal against the Sastri tribunal award and apply for a stay order

against its implementation. In the meantime, employees in all important banks are being asked by their leaders to prepare for a general strike.

Indo-Burma Trade Agreement

The Burmese Government's decision to terminate the Indo-Burma trade agreement from 1st October has come as a shock both to the textile industry and the cloth export trade in Bombay. Burma was one of the biggest buyers of Indian cloth and with the disappearance of the substantial preference it enjoyed over both Japanese and British textiles in Burma, it is doubtful if even their clientele in that country. While nobody questions the right of the Burmese Government to end the trade agreement, it is felt here that the Government of India has been remiss in not watching developments more closely, for the Centre had been informed about it a couple of months ago. If any steps are now being taken by the Indian Government, neither the trade nor the industry has been informed of them.

The trade is also agitated that the Government is doing little to retain the Indonesian market, which may soon also turn to Japan for cloth supplies if measures are not taken to encourage direct trade between Indonesia and India. Cloth textile exporters view this prospect with grave concern, since this country is gradually losing one foreign market after another for its cloth. Pakistan was lost even before its barter agreement with Japan for supplying cotton against cloth. Aden, which is a distribution centre for areas far beyond its narrow territories, has already moved more towards Japan. With Burma and Indonesia receiving increasing supplies from Japanese mills some think that there is little hope of India reaching the export target of 1,000 million yards, not only this year but even in the next few years.

Heavy Speculation in Oilseeds

Although shippers of linseed oil and linseed say that reduction in export duty on these two commodities, announced last week, was belated and will be of little benefit because foreign prices are still lower than Indian even with the reduced duty, the oil and oilseeds markets in the country are really firm. If linseed or linseed oil is really unsaleable abroad the increased supplies for internal consumption should bring down prices, but even this section of the market is advancing gradually in sympathy with groundnut and castor oil. Similarly, the complaint from shippers of castor oil removed soon foreign demand will disappear is not likely to be heeded by the Government, since both the forward and spot markets in castor seeds have been forging ahead recently. Export traders are rather bewildered by developments in the internal wave of speculation and forward trading on an unprecedented scale. Some traders in Western India fear that the pushing up of prices in this bring price controls and restrictions on movement with the freezing of stocks in various localities.

Ordinance Labour Unrest

The labour situation at several of the Defence establishments near Poona is still uncertain as workers continue to agitate against the Government's move to enforce retrenchment. Strike notices were served on the authorities in April. The Government then asked Mr. R. J. T. De Melo, the conciliator, to investigate the dispute and to hold in abeyance the scheduled retrenchment of about 2,000 men. The conciliator is likely to announce his findings at the end of this week. It is believed that the strike will commence some time in the last week of May. In the meantime, Organisation, broke his journey at Poona on his way back from Cochin to New Delhi and advised the workers leaders not to agitate for a strike. He made it clear that while the Government was doing everything possible to increase employment time and if a strike were precipitated as a result of the present retrenchment, the Government would be forced to close down these establishments. It is believed that this clear warning by a Minister may have some effect and that the decision to strike might be modified or postponed.

Development of Village Industries

The All-India Khadi and Village Industries Board has an ambitious programme to develop village industries in the State of Bombay. The Board's target for 1953-54 includes the introduction of 2,000 improved ghanis (bullock oil crushers) for the village oil industry, an organisation of co-operatives for hand-pounding rice and soap with neem oil. Two of the four demonstration units for soap making are to be located in this State. The hand-made paper industry also figures in the list, but the programme for this in development of existing centres of manufacture and the posting of experts to some of the important paper manufacturing centres.

Mr L. A. Hallsall

European business circles in Bombay bade farewell last week to Mr. L. A. Hallsall, permanent vice-president of the Bombay Chamber of Commerce for the last seven years, on his retirement and departure for the U.K. Mr. Hallsall was formerly associated as a director with such important concerns as the Tata Power Co. and the Bombay Dyeing and Manufacturing Co., and he has been Chairman of the Bombay European Relief Association for the last 15 years.

London

COMMONS DEBATE FOREIGN
AFFAIRSRECORD EXPORTS TO CANADA
IN APRIL

(FROM OUR OWN CORRESPONDENT).

16th May.

FOREIGN affairs, with a two-day debate in the House of Commons early this week to serve as focus, have occupied the attention both of politicians and the public almost to the exclusion of everything else. Sir Winston Churchill, in the absence of Mr. Eden, opened the debate with a masterly survey of the international scene and of the Government's policy in relation thereto. Not without justification, it has been referred to as one of the finest speeches he has made since his many historic pronouncements during the war. It covered the whole ground, realistically and objectively, favouring negotiation rather than any display of force in the settlement of outstanding problems, underlined and reaffirmed the solidarity of purpose and effort on the part of the democratic nations, favoured talks at the highest level in an effort at least to clear away some of the minor problems so as to pave the way towards a more complete solution to the present cold war deadlock, and finally interjected a typically Churchillian gesture—the suggestion of a Locarno-type treaty to guarantee both Germany and the U. S. S. R. against aggression from each other—and a shrewd test of the sincerity of the apparent change in Kremlin policy since the death of Stalin. It was soon evident that the broad lines of the Government's policy were approved by both the Labour and Liberal parties, and on the second day Mr. Attlee followed with an equally constructive and no less valuable a contribution, though it differed in its emphasis and has consequently given rise to some unfortunate resentment in America. The full text of the speech hardly seemed to justify this, but without awaiting that Senator McCarthy and other members of Congress jumped in to retort, Mr. Attlee was less prompt in replying, and the whole question has now been somewhat bedevilled by personalities. In all this turmoil it is good to learn from President Eisenhower that there is no serious rift between the British and American attitudes, save that the latter wants to be shown some demonstration in deeds of Russia's good intentions.

In all the excitement engendered by these developments, the fact that the House of Lords' amendments to the Iron and Steel Bill were agreed to by the House of Commons last Wednesday in a matter of only four hours and with only one division passed almost unnoticed. Subsidiary, also, were the headlines accorded to the surprising result of the South Sunderland by-election, though this is undoubtedly an event of first importance politically. It is almost 30 years since the candidature of a Government in office has gained a seat from the Opposition at a by-election. This Labour were fairly confident of holding this marginal seat after their success in the local government elections, particularly with the intervention of a Liberal candidate. The Budget was the main issue on which the election was fought, and although the Prime Minister's foreign affairs speech may have some last minute influence, the Government can claim that it now has a vote of confidence in its economic policy in addition to the useful increase of its overall majority in the House of Commons from 16 to 18.

Mr. Butler will no doubt welcome this support for his domestic economic policy as a reinforcement to the increasing support which he is attracting for his approach to the wider issues involved in the international economic outlook. He followed up his reference in the Commons to the theme of America's relations with the rest of the free world—mentioned in last week's despatch—with even greater candour when addressing a luncheon in London given by the French Chamber of Commerce. "In thinking of the dollar gap," he said, "it is the other side of the Atlantic that has to make advances by suitable creditor policies, and by enabling us to trade with them, as much as it is our duty to put our house in order. Until those conditions are available we shall not get that basis of solidarity in the economy and finances of the free world that we need. The fault is as much on that side as this, as I have freely and publicly stated." This argument has found unqualified support from Mr. St. Laurent, the Canadian Prime Minister, during his recent visit to Washington, and has since then been reinforced by the Council of Europe, meeting at Strasbourg.

April Trade Figures

Meantime, it is encouraging to find that U.K. exports to Canada in April were a record and that exports to the United States were also high. The Board of Trade provisional figures give a total of £298 million for exports to North America, or well over both the best month last year (£285 million in October) and the high level of some £27 million a month achieved in April to August, 1951. Canada took £16 million compared with a previous best of £15.6 million in July, 1951, and the United States £138 million, a total which was exceeded both in April, 1951 and October, 1952, but which compared with a monthly average of £127 million in the first quarter of this year.

The overall trading picture is less encouraging, for the trade gap in April is provisionally

given at £69.6 million, an increase of £7.7 million over March and the highest level since last June. The main cause was a further steep rise in imports to £293.4 million against an average monthly figure of £272.4 million in the first quarter of this year and of £263.3 million in the second half of last year. The figure is still well below the high levels of a year ago, but the levelling out of commodity prices suggests that we are now buying a greater quantity for the same amount of money, and that implies that British factories and mills are getting back into full production. This view is also supported by the figures for exports. In spite of growing competition, April exports were valued at £214.8 million, which compares favourably with the monthly average of £208.5 million in the first quarter of this year and of £213.1 million in the final quarter of 1952. This was against the seasonal trend, and was achieved in only 24 working days compared with an average of 26 in the first three months of this year.

Matches and the Monopolies Commission

It is unfortunate, perhaps, that the Board of Trade has found it necessary to issue the report of the Monopolies Commission on the match industry in this country after omitting therefrom certain information relating to overseas markets "whose publication would in their opinion be contrary to the public interest." Even so, the details will no doubt be of more than British interest, for the report finds that the industry is in fact a monopoly which operates against the public interest and that it has "taken all possible steps to eliminate competition with marked success"; that there is scope for reducing both costs and profits which are high; that a box of matches could be cheaper or there could be more matches to the box; that 95 percent of home production is controlled by the British Match Corporation and associates, with the chief shareholder the Swedish Match Corporation; and that the former can fix imports of matches through its trading agreements with the latter. It is a pretty general indictment, and it will be interesting to see what follows.

Coal Board's Annual Report

Two reports, both of which make rather depressing reading, have made their appearance this week. The more important of these is that of the National Coal Board for the year 1952, which discloses a deficit of £8,200,000 against one of only £1,800,000 in 1951. The accumulated deficit since the industry was nationalised in 1947

has now risen to £14 million. Even more disappointing than the financial results, however, is the evidence in the report that the high hopes which were held out for nationalisation—increased productivity and less absenteeism with the introduction of the five-day week, improved human relations in the coalfields which would eliminate strikes, a greater sense of responsibility to the community on the part of the miner following upon his receipt of high wages and better working conditions—have not been realised. In 1952 output per man year was 299 tons, four tons lower than in 1951, while output per man shift at the coal face was 3.15 tons and overall 1.19 tons, against 3.17 tons and 1.21 tons, respectively in the previous year. The increase in the labour force resulted in about 31 million tons more being won in the five-day week in 1952 than in 1951, but Saturday working produced about 11 million tons less. Strikes or "go-slow" actions were more frequent in 1952 than in recent years, and tonnage lost by these was 1,900,000 tons compared with 1,100,000 tons in 1951. Increased production costs—£2 16s. 9d. per ton, against £2 9s. 2d. in 1951—are attributed mainly to higher wages and higher prices of materials, but although there was a substantial saving on imports and greater exports, the latter produced less offsetting revenue than in earlier years.

In view of these facts, it was perhaps a good thing that Sir Hubert Houldsworth, Chairman of the Board, took advantage of the opportunity to indicate that there was some improvement in the situation so far during the current year. The loss of output through disputes has been slightly less, exports have been higher, and just recently production has increased by an average of 90,000 tons a week. Summing up 1953 prospects, he said: "We have a very difficult task. We have to carry a second week's holiday and we have to carry the losses that will occur through the Coronation. But there is a spirit in the industry to try to meet the difficulties and do the best we can." Predicting developments in the coal industry is always risky, for there are so many uncertainties. The Board obviously has a long way to go before it wipes out that deficit and breaks even, let alone starting to build up the reserves it needs for capital development in the big way which is regarded as essential to ultimate prosperity.

AUSTRALIA

The Australian aboriginal is an interesting example of the survival into the 20th century of the primitive

type. The tribes, who now mostly inhabit the Northern coastlands, live entirely by hunting as they did in the Stone Age. This link with the prehistoric past goes hand-in-hand with the essentially modern outlook of the country as a whole. The Australians are perhaps the most air-minded people in the world. With its great wool and cattle industries flourishing, and the rapid progress now being made in developing her heavy and light industries and increasing her farming, Australian prestige is rapidly increasing. Ready to meet the ever-increasing demand for high-quality petroleum fuels and lubricants, the Caltex organisation is constantly at the service of Australian Agriculture, Transport and Industry.

DRIVE FOR ECONOMY IN ADMINISTRATION

SALES TAX COLLECTION ON FORWARD CONTRACTS

(FROM OUR OWN CORRESPONDENT).

THE Chief Minister, Pandit Govind Ballabh Pant, has addressed a letter to all departmental heads and district officers calling upon them to "foster the climate and spirit of economy in public administration." The letter is part of the Chief Minister's drive to overcome the budget deficit of Rs. 4.5 crores. In the course of his budget speech last February, the Finance Minister declared that "the amount that can be found by making reductions in expenditure cannot be much" but he now takes the view that "we can not only wipe out the requirements of the plan and our existing resources." The State's five year plan, it may be recalled, is to cost Rs. 121 crores, excluding expenditure of Rs. 35 crores on the Rihand Dam which is to be met by the Centre. The Chief Minister has entered into a success which, with the exception of the U.P. Roadways, they are not at present. An Ministry and the Government also intends to appoint an economy committee to suggest ways to eliminate avoidable expenditure.

Sales Tax Dispute

A tussle has been going on for some time between Hapur traders and the sales tax department of the U.P. Government over the assessment of sales tax on forward transactions. The Tax Act provided that "where goods under a forward contract are not actually delivered the sale have been completed on the date originally agreed for delivery." This explanation was declared ultra vires by the Allahabad High Court, where Mahabir Beopari, Mandal ceased collecting sales tax from their members. They also applied for refund of the tax already collected, but this was refused by the sales tax officer who also directed forward transactions and inform all your court judgement, the two bodies have declined to collect the tax as directed, and some dealers have already deposited.

The sales tax department has, meanwhile, started recovery proceedings and also issued notices sales tax commissioner is reported to have told he was willing to stop recovery proceedings if it was stated that the sales tax officer, since the High Court judgement, while making final assessments has assessed ready transactions only, and left the assessment on forward transactions to a future date.

Offtake of Rationed Wheat Falls

A considerable fall in the offtake of rationed wheat has been reported all over the State— from 30,000 tons in March to 7,500 tons in April, and it is expected that there may be a further decline in May. The flow of cheaper wheat into the free market explains the phenomenon: the Government shops gives them an opportunity to build up reserves for the future. The Government of India have this year allocated U. P. 300,000 tons of imported wheat of which a little over 70,000 tons has already reached the State.

Amalgamation of Villages

Hitherto Uttar Pradesh was supposed to have only 55,000 villages, but within a year there will be extinct because of climatic changes and about 40,000 will be eliminated from the official records. This has become necessary since the formation of land management committees; villages with populations of less than 50 are to be amalgamated with neighbouring villages. Elections are now taking place for the formation of 55,000 "gaon samaj" bodies.

Research Institute Threatened

The vacaries of the river Gomati are threatening the 600-foot long basement of the Chatter Manzil in Lucknow which houses the Central Drug Research Institute. The basement of the building is about 25 feet from the bank which is being eroded by the river. The Advisory Committee of the Central Drug Research Institute has asked the Government of India for financial help to construct a concrete damp-proof wall between the river and basement for the protection of the building.

Sugarcane Development

The U.P. Government has decided to extend sugarcane industry in the State which was launched in 1948. During the past five years, the Indian Central Sugarcane Committee contributed about Rs. 30 lakhs and it has now decided to meet half the expenditure for the extended period. The total cost of the scheme for the extended period is expected to be Rs. 76.67 lakhs.

Jute

THE REDUCTION IN SACKING OUTPUT

PAKISTANI SHIPMENT OF HESSIAN TO U.S.A.

Recent articles in these columns we have drawn attention to the fact that mills have been transferring machinery from sacking to hessian in order to adjust their output to the diminishing demand for sacking. We have also pointed out that the lack of demand for sacking is mainly due to the loss of a large proportion of the Far Eastern markets because of the chaotic conditions prevailing there without there being any compensating increase in the consumption of sacking in other markets. In fact some of the other markets have been buying sparingly because they were already overstocked with goods previously purchased at higher prices.

In analysing the position it was revealed that Far Eastern countries took 33 percent of the total production of sacking bags in 1938-39 while in 1951-52 they took only 17 percent. Moreover the output of sacking bags by Calcutta mills was lower in 1951-52 than in 1938-39 by 18.4 percent so the absolute drop in consumption in Far Eastern markets was greater than the percentages would indicate. Some further reduction in Far East shipments has been recorded in recent months, but this was probably due in part to delay in shipment in expectation of a reduction in the export duty. However, taking the overall picture as revealed by the statistics available it would appear that the reduction in Far Eastern demand has been in the vicinity of 18 to 19 percent. Keeping in mind the fact that the Calcutta mills' output in 1951-52 was already much lower than in 1938-39 and taking into consideration the reduction of 18 percent in the output of sacking in the first four months of this year as compared with the corresponding period of last year, it would appear that the mills have now adjusted their sacking output to the changed circumstances. In fact, they may have gone a little too far and it is just possible that, if the reduction in the export duty really stimulated demand, a shortage of heavy sacking could develop. Gradual reduction in mill stocks of sacking is probable in coming months.

Hessian Production

As the mills have adjusted their sacking output to the reduced offtake without reducing their total production of manufactures it follows that their output of hessian has increased. If the Government had agreed to the scaling of sacking looms as proposed by the I.J.M.A. the adjustment would have been effected without any increase in the output of hessian, but the question now arises whether the mills can find markets for the increased quantity of hessian they have to sell. In the four months January-April 1953 the production of hessian amounted to 123,600 tons compared with 105,300 tons in the corresponding period of 1952. This increase has taken place in spite of the fact that, in those months last year, the mills worked 48 hours a week against 42 hours a week this year. It is hoped that, as Calcutta hessian is now fully competitive with the products of other manufacturing centres and with other packaging materials, there will be sufficient demand to absorb the extra output. The next few months will be the testing period, for these are normally months of good demand for hessian.

The Challenge from Pakistan

The following Press report is of no little significance to India. "Narayanganj. Pakistan's first exports of jute hessian were dispatched by the s.s. City of Bristol from Chittagong to the United States of America last Friday. The goods were produced at the Adamjee Jute Mills here. There is the challenge to India. Is India to meet it in time? There are no export duties on jute manufactures exported from Pakistan. The mills in Pakistan have resources in raw material which give them an advantage over the mills in India, while the latter have also to meet the Pakistani export duty on all jute brought to India from Pakistan. At present the output of Pakistani mills is small and cannot meet even the internal requirements of Pakistan, so the shipment referred to must be regarded as a gesture. But it is a gesture of which India should take note for it is also a warning. India can save its jute mill industry by acting now. We suggested in a previous issue that the way to do it is to abolish the export duties completely so that India may be able to expand its markets for jute manufactures at profitable prices and at the same time pay the growers prices which will encourage the growing of more and better jute. Since we first suggested total abolition of the duties on the proposal by addressing the Government of India on the subject. As we mentioned in a previous article the jute industry is the key to the prosperity of Bengal. If the jute industry falls into decay coal, shipping, engineering, banking, insurance and many other sectors of the economy will be gravely affected. Will India take action while there is yet time?

THE JUTE MARKETS

Manufactured Goods: The tone of the market has remained firm throughout the week although there have been considerable fluctuations from day to day. Business was reported from the U.K., the U.S.A., Europe and the Middle East but the volume was small. Enquiry for specialities continues and rumours of barter business with Burma in heavy goods and further hessian business with the Argentine persist.

The main buying, however, is said to have been by bazar dealers. Mills have taken advantage of each rising unload and the sequence seems to be that whenever prices are pushed up mills sell or try to sell, bazar buyers shy off, prices ease, and there is a pause, after which buyers resume their interest, prices rise again and the whole sequence is repeated. If, as is stated, overseas enquiry is still relatively small and the buying is mainly on bazar account, the reason for the firmness must be the raw jute position and there appears to be no doubt that crop prospects are exercising a powerful influence. Sales by mills during the week are stated to have included 40 10 oz. hessian for July-September up to Rs. 44 and B Twills for July-August at Rs. 100 on Friday. The market was easier on Saturday and Monday; B Twills for ready positions were down at one time to Rs. 96-6 but there was a recovery on Monday evening and the quotation was up to Rs. 97-4 on Tuesday. During the week mills are reported to have sold B Twills, heavy Cees (plain and green stripe), Cubans, cornsacks and woolpacks. The opening on Wednesday morning was quiet and quotations were as under:

	May	June	July-Sept.
40" 8 oz.	33-2	33-4	33-6
40" 10 oz.	42	42-2	42-4
B Twills	97	97-8	98-4
Heavy Cees (Plain)	96-12	97-4	98
Cornsacks	98	98-4	98-12

At the time of writing the Katni quotation is Rs. 98-4.

Raw Jute: Business has been reported daily, the largest amount being done on Friday. On Wednesday of last week Upper Assam Bottoms were quoted at Rs. 24-8 for May-June but, with buyers interested and sellers showing some reserve, prices rose on Thursday; on Friday large business was put through at Rs. 26 basis Bottoms for Upper Assam and Rs. 27 basis Bottoms for Lower Assam and Northern Bengal with the option in some cases of delivery ex Calcutta. On Saturday the market was pausing and, with sellers over at Friday's prices, an easier tendency set in which continued until Monday afternoon when a fair quantity of New Crop was taken by one group at Rs. 27 basis Bottoms for half Dhubri and/or Northern half Upper Assam for August-September. At the time of writing the market is pausing but the undertone is steady. The following business was reported:

Pakistani Jute:

Jat European—Rs. 31 to Rs. 92 basis Bottoms May-June.
Indra—Rs. 30 basis Bottoms ex Calcutta May-June.

Indian Jute:

Dhubri & Northern—Rs. 29 to Rs. 30-8 Middles only May-June.
Dhubri & Northern Assortment—Rs. 25 to Rs. 27 basis Bottoms May-June.
Upper Assam—Rs. 28 to Rs. 30 for Middles only May-June.
Upper Assam Assortment—Rs. 24-8 to Rs. 26 basis Bottoms May-June.
Upper Assam Tossa—Rs. 26-8 to Rs. 27 basis Bottoms May-June.
Murshidabad Tossa—Rs. 24 to Rs. 28 basis Bottoms May-June.
Local Packing—Rs. 22 basis Bottoms one month.
Daissee—Rs. 29 and Rs. 29-8 for Middles one month.
Daissee Assortment—Rs. 25 to Rs. 27 basis Bottoms one month.
Mesta Cut—Rs. 26 for Bottoms one month.
Mesta Uncut—Rs. 22-8 to Rs. 23-8 basis Bottoms one month.
Bimili—Rs. 20-8 to Rs. 21 basis Bottoms May-June.
Rs. 19 to Rs. 21 F.A.Q. May-June.
Mill Firsts—Rs. 160.
(Most of the above carried options of delivery ex Calcutta).
Daissee Short and Long Group Dundee combined Rs. 160 and Rs. 145.
New Crop & Dhubri and/or Northern & Upper Assam Rs. 27 basis Bottoms Aug-Sept.

Imports into Cossipore are very meagre and prices have risen fully Rs. 2 per maund during the week. Quotations on Wednesday morning were as under:

Pakistani:

	May-June	Landed at Mill
Jat	27-8	Basis Bottoms
District	26-8	"
Northern	26-8	"
Cuttings N.C.	72	per bale

Indian:

	May-June	Basis Bottoms	May-June
Lower Assam	25	"	"
Upper Assam	26	"	"
Northern & Purnea	26	"	"
Murshidabad Tossa	22	"	"
Bihar	22	"	"
Daissee	25	"	"
Bimil	20-8	F.A.Q.	"
Mill Firsts	165	per bale	"
Mill Lightnings	150	"	"
S. G. Dundee Daissee	165	"	"
L. G. Dundee Daissee	150	"	"

Mofussil: In Indian markets typical off-season conditions prevail and fresh imports are negligible. Buyers have to secure their requirements from stocks and what remains of the crop is well held with the result that prices are above Calcutta parity. The weather has been favourable in Assam. Sowings are reported to have been completed at about 12 annas of last year's Rivers are rising in Upper Assam. Rain has fallen in parts of Bihar but sowings are far behind and more rain is needed. In Central West Bengal rain is badly needed and sowings are very meagre. Daissee sowings are in progress but are late.

In Pakistani markets active conditions have continued with demand from both India and overseas. Imports into the main markets are small but some places report increases from last week probably of the better prices being offered. Rainfall has been general, except in some western districts, and conditions have mainly been favourable. Rivers are higher than normal and are rising rather rapidly on the Megna side.

Arrivals of Raw Jute

Arrivals of raw jute in Calcutta and mills and stations during April were 3,01,789 bales compared with 4,83,645 bales in March. The total for the period July 1952, to April 1953, was 46,43,694 bales, of which 34,51,758 bales were of Indian origin and 11,91,936 bales came from Pakistan. Of the arrivals in April 1953, 2,64,143 bales were Indian and 37,646 bales were from Pakistan. In the period July 1951, to April 1952, the total arrivals were 44,61,221 bales, of which 27,26,805 bales came from India and 17,34,416 bales from Pakistan. It is interesting to note that imports from Pakistan between July 1952, and April 1953, were only 23.7 percent of the total compared with 38.9 percent in the corresponding period of 1951-52.

SOWINGS COMPLETED IN SOME INDIAN DISTRICTS

In their ninth crop report of the current season, covering the week ended 16th May, Messrs. Sinclair Murray & Co. Ltd., say that weather conditions in Assam and Bihar have been favourable with alternate rain and sunshine. In West Bengal and Orissa rainfall has been experienced, but more rain is required.

DANPUR. The weather has been hot and dry although two moderate showers were experienced. Sowings to date amount to -2/6 as compared to -2/6 on the corresponding date last year. The river level is abnormally low.

JAJPUR ROAD: The weather has been hot and dry with the exception of one shower. Sowings to date amount to -2/6 as compared to -3/- at this time last year.

RANAGHAT: Slight rainfall has been experienced but more rain is required to allow sowings to be completed. Sowings to date amount to -4/- as compared to completed sowings at this time last year. Seed germination is reported to be satisfactory.

COSSIMBAZAR: Weather during the first part of the week was cloudy but during the latter part it was extremely hot and dry. Good rainfall is urgently required to assist the growth of young plants and to allow sowings to be completed. Sowings to date amount to -2/- as against -13/3 at this time last year.

For the attention of

Far-sighted Industrialists

HAVING LABOUR TROUBLE?

When you find you are having continuous labour trouble in one of your plants, you are not likely to put all of it down to subversive influences, within or without. You realise that these influences make their presence most felt where there is already an undercurrent of dissatisfaction based on genuine grievances. If you are satisfied with the personal qualities of your management, you next ask yourself if your Labour Department is organised to act effectively in dealing with complaints from the Labour Union, and whether its service records are

adequate to prevent nepotism and anomalies arising out of increments and promotions. Then you study your wage structure to see if each job is being paid at its true relative worth, and that sufficient channels of promotion are open to the ambitious. If any incentive schemes are in use, you review their working, as you realise that haphazard schemes can cause very serious trouble. Only when you have seen to the removal of weaknesses in the administration of your plant, can you honestly blame any remaining unrest on others.

FORBESGANJ: Favourable weather conditions were experienced with alternate rain and sunshine. Sowings to date amount to -8/- as compared to -14/- sown at this time last year. The condition of plants is satisfactory but further rainfall will be beneficial.

NOWGONG: Sowings completed at -11/6-. The weather has been favourable with alternate rain and sunshine. The condition of plants is healthy and satisfactory and they range in height from seedlings in the highlands to 3' in the lowlands. The river level is slightly lower than normal.

GAUHATI: Sowings completed at -13/6-. (-1/- damaged). The weather has been favourably wet. A spell of dry weather now would be beneficial to the crop. The condition of plants is satisfactory and they range in height up to 4' 3". Weeding has been suspended. The river level is steady and is 1' 3" lower than at this time last year.

DHUBRI: Sowings completed at -12/--. Alternate rain and sunshine has been experienced and this has been favourable to the crop. The condition of plants is satisfactory and they range in height from 3' on the highlands to 3' on the lowlands. The river level is 1' 7" lower than at this time last year.

KHARUPETIA: Sowings completed at -12/6-. Weather conditions have been favourable with alternate rain and sunshine. The condition of plants is satisfactory and they range in height up to 4' 3". The river level is slightly below normal.

DAISEE DISTRICTS: The weather has been favourable but further rainfall is required. Sowings to date amount to -9/- as compared to completed sowings at this time last year. Seed germination is reported to be satisfactory.

PAKISTANI SOWINGS COMPLETE

In their eleventh crop report of the current season, covering the week ended 16th May, Messrs. Sinclair Murray (Pakistan) Ltd. say that the weather has been favourable with alternate rain and sunshine but a spell of dry weather would be favourable to allow cultivators to proceed with weeding operations. Sowings have been completed in all areas and from an aerial survey and tour during the latter part of the

week it was ascertained that the crop on the Eastern side is healthy and growing well but sowings are such that the outturn is not expected to exceed 50 percent of last year. On the Western side germination in many districts has been poor and fields are patchy and badly grown. The outturn from this side is expected to be less than 50 percent of last year. Rivers are generally somewhat higher than normal for this time of the year.

NARAYANGANJ: Sowings completed at -8/--. The weather has continued to be favourable with alternate rain and sunshine but a spell of dry weather would be beneficial to allow cultivators to continue weeding. The crop is in a healthy condition although there are reports of flowering of the lowland crop in some areas. The second weeding of lowlands has been completed and also first weeding on the highlands. Plants range in height from 6' in highlands to 5' in the lowlands. The river is 2' higher than last year.

DACCA: Sowings completed at -8/--. The weather has been favourable with alternate rain and sunshine. The condition of plants is satisfactory and they range in height up to 3' 3". Weeding is in progress where necessary. The river level is slightly higher than last year.

CHANDPUR: Sowings completed at -8/--. The weather has been favourable with alternate rain and sunshine and plants are making satisfactory progress and range in height up to 3'. Weeding operations are going on as required. The river has risen during the week and is now about 3' higher than on the corresponding date last year.

HAJIGANJ: Sowings completed at -7/--. The weather has been wet and though this has been favourable for the standing crop in low and midland areas, it has not been so beneficial to the highland crop. Bright sunshine is now required to assist the growth of the plants. Weeding operations have been suspended because of wet weather. Plants range in height up to 2' 6" and their condition is healthy. The river is 2' 6" higher than last year at this date.

AKHRA: Sowings completed at -8/--. The weather has been favourable with good rainfall and alternate spells of sunshine which has been very beneficial to the crop. The condition of plants is satisfactory and they range in height from 1' 2" to 2' 4". Weeding operations are going on as required. The river is 10' lower than at this time last year.

ASHUGANJ: Sowings completed at -8/--. The weather has been favourable. Condition of plants is satisfactory and they range in height from 1 ft. to 3' 3". Weeding operations are going on as required. The river has risen during the week but is still 2' 6" lower than last year at this date.

NIKILDAMPARA: Sowings completed at -6/3-. The weather has been favourable with good showers of rain which have been beneficial to the crop. The condition of young plants is satisfactory and they range in height from 1' to 3'. Weeding operations are being completed in midland areas and are going on in the highlands. The river has risen during the week but is still about 1' lower than the corresponding date last year.

SARISHABARI: Sowings completed at -7/--. The weather has been very favourable with alternate rain and sunshine. The condition of plants is improving but is still far from satisfactory. The plants range in height up to 3' 6". Weeding operations are progressing. The river level is steady but is 1' 9" higher than last year at this time.

SIRAJGANJ: Sowings completed at -7/--. The weather has been favourable with alternate rain and sunshine. With the aid of favourable weather the condition of plants has improved. Weeding is going on where required. The river has been steady during the week and is about the same as last year at this date.

NAKALIA: Sowings completed at -8/--. The weather has been favourable with good rainfall and inter-vals of sunshine. Plants are fairly healthy and range in height from seedlings to 4'. The river is rising and is about 1' higher than last year at this time.

BHANGOORA: Sowings completed at -8/--. The weather has been favourable. The condition of plants is satisfactory and they range in height from seedlings to 2'. Weeding is going on as required. The river is rising slowly and the level is about the same as the corresponding date last year.

THE FOREIGN JUTE MARKETS

(FROM OUR OWN CORRESPONDENT)

Dundee, by Air Mail. The rapid advance in prices for raw jute has brought out much more interest from consumers of jute goods during the past week. Apparently the scarcity of offers of the fibre from the siderable excitement in the position there, and to the export countries. It is reported that consumers have practically withdrawn their offers timental spinners have bought fairly freely at the advance, but the Jute Controller has not been operating for the U.K. The value of Mill Firsts naming offers, while Mill Lightnings are now lowest at £88, crack Daisee—2/3 at £90 and grade marks at £80 and grade Tossa—4 at £88, all c. and f. U.K.

It is somewhat surprising to the trade that the Pakistan Jute Board has so far made no change in the fixed minimum rates that have prevailed for many months past, and it is hoped that they will not do so, as these prices are considered reasonable. It is believed that any material rise in values would adversely affect business and once again give substitutes the opportunity of competing with jute. It is reported that the U.S.A. have shown only slight interest in Hessians in Calcutta and that they are unwilling to pay the advance.

The Association of Jute Spinners and Manufacturers in Dundee is receiving applications from many industrial concerns, including the Indian Jute Mills Association for information regarding the job evaluation incorporated in the new wages agreement reached some weeks ago.

Latest prices quoted for Calcutta goods, f.o.b. Calcutta, are 78s. 0d. for 10 oz. 40 in. Hessians and 58s. 3d. for 7 1/2 oz., May/June, with "B" twills named at 162s. 6d. same shipment and 163s. 0d. for July/September.

THE CALCUTTA TEA MARKET IN 1952

REVIEW OF INDUSTRY'S "MOST SERIOUS CRISIS EVER"

IN their review of the Calcutta tea market during 1952, Messrs. J. Thomas and Co. say that the year witnessed the most serious crisis the tea industry has ever experienced. In June the Government of India appointed a team headed by Mr. Rajaram Rao to enquire into the problems of the tea industry. Its report to the Government was published in December. The degree of relief to hard-pressed producers recommended by the team was small and proved extremely disappointing, particularly to the smaller garden owners, after such a long period of suspense. By the close of the year most Cachar estates, whose teas had been selling well below the cost of production, were faced with only one prospect—closure. Accordingly, approximately 100 tea gardens, mainly in Cachar but also some in Darjeeling and the Doorgas, gave notice of closure to their respective Governments. When labour was faced with unemployment, the Government and producers came to a compromise and it was agreed in January, 1953, that there should be an upward adjustment of the price for concession foodstuffs supplied to labour in the Darjeeling, Doorgas and Cachar districts. This enabled the majority of estates to reopen their gardens in preparation for the start of the new season.

The market opened very quietly and the legacy from 1951 of a considerable quantity of poor liquoring, stinky teas had a depressing effect on the opening sales in June. Good quality teas sold at a premium and the difference in price between Common B.P. and Good Assam B.P. eventually ranged from 14 annas to Rs. 2-10 per lb. in July. In this month also came the depressing news that the North Indian crop was 42 1/2 million lbs. ahead of the previous season. This vast increase was mostly because of extremely favourable climatic conditions, not producers' desire for quantity at the expense of quality. Indeed, they deserve credit for whittling down this figure, month by month, by a policy of fine plucking, until at the end of the season the final crop figure showed a small deficit of 2.7 million lbs. compared to 1951. However, in August, buyers naturally assumed that there was likely to be a world surplus of tea. The increase in the tea ration in the U.K. to 3 ozs. in September 1952 and the subsequent freeing of tea in the U.K. from all rationing stimulus to offset this, with the result that prices declined in succeeding sales until by November slump conditions prevailed, with Common B.P. selling at 11 annas per lb. When approximately 50 percent of the offerings on sale were withdrawn without a bid, the crisis had become so acute that it was decided to cancel the last sale of November and to offer only half quantities in the next two sales in December.

It was also decided that future Export and Dust sales would be restricted to 55,000 and 20,000 chests, respectively, in an effort to stabilise prices. Little tea, therefore, was offered for sale either in Calcutta or London during December, in order to allow retailers' stocks in the U.K. to be diminished. The immediate collapse of the market was caused by the accumulation of hidden stocks by the households in the U.K. during the ration period. Retailers discovered that they had heavily overstocked themselves with the result that blenders and dealers were unable to operate until this unexpected hold-up could be eased and a more normal flow in retail sales resumed. The New Year sales opened on a brighter note, as the Christmas recess had allowed time for U.K. stocks to diminish. Moreover, with the sensational drop in the North Indian crop and the prospects of a 20 million lbs. shortfall in Indonesia, buyers were suddenly faced with a possible world shortage. They were quick to appreciate the situation and the concluding sales saw a return to conditions of a sellers' market in which U.K. operators and blenders for consumption in India were the strongest competitors. The price of Common B.P. rocketed from 13 annas on 1st January to Re. 1-12 in the last sale of the season. This phenomenal rise gave a completely misleading picture and by no means can it be taken as a sign that all is well with the tea industry. The crisis is not over as although attractive prices had been realised for all types of tea in the last few sales, the overall average for Cachar and the Doorgas was still only 15 as. 10 ns. and Re. 1-2-7 respectively. Thus, it can be realised that the majority of the gardens will be showing substantial losses for 1952.

Price Movements

Tea prices reached their peak in August 1951. September showed a big drop and the market gradually declined from that period till April-May 1952, when the lowest averages were reached. New season's teas brought some improvement to the market from June 1952 but this was shortlived. Soon the rot set in and the market declined each week until December 1952 when the lowest price level was touched for that time of the year since the war. The beginning of 1953 saw a vast recovery and by the end of April 1953 the average price had returned to the level of December 1951. The following table compares the average prices

(in rupees) of various districts during 1951-52 and 1952-53 and shows that while the overall North Indian export average dropped by 5 annas, Assams recorded the smallest decline of 4 annas, followed by Darjeelings and Doorgas. Cachar was the worst hit district and averaged fully 7 annas less than the last season:

Season	District Averages (For Export only)					All & Others Districts.
	Assam	Doorgas	Darjeeling	Cachar		
1951-52	1 13 4	1 8 4	2 1 8	1 6 11	1 11 7	
1952-53 (up to Sale 45)	1 9 3	1 2 7	1 13 1	0 15 10	1 6 6	

Favourable Weather Conditions

Weather conditions at the start of the season in North-East India were very favourable and the first four months produced such heavy flushes that by the end of July the crop was 42.6 million lbs. ahead of the previous year. The crop started falling from August onwards and the reduced plucking programme introduced in the latter half of the season together with the closure of some estates, especially in Cachar, helped to end the season with a shortfall in the crop by 2.7 million lbs. as compared with 1951.

Better Quality

Although 1952 could not be described as a vintage season, quality from all districts showed an improvement over the previous year. Early in the season exceptionally favourable growing conditions in North India militated against the production of any useful second flush teas. Indeed, favourable weather combined with the concentrated fertilisation scheme forced the bushes to flush to such an extent that at the end of July the North Indian crop showed a vast increase compared to the same period in 1951. Fortunately producers saw the danger and by imposing on themselves a voluntary restriction scheme crops were drastically reduced by the end of the year. The policy of finer plucking introduced in all districts made possible the manufacture of teas with good, clean leaf appearance and the cleanliness of the sorting compared very favourably with the excessively stinky semi-residue grades that flooded the market at the end of the previous season. Very few teas of this description have been seen on the market this year and this has had a salubrious effect on the general trend of prices at the Calcutta auctions.

Although second flush quality from all districts was naturally disappointing, autumnal quality teas from the Doorgas were the finest seen since before the war. These met with an enthusiastic reception from overseas buyers who paid extremely good prices in the auctions. Due to lack of foreign exchange, Iranian buyers remained completely inactive throughout the year. This resulted in the poorest grades being neglected and these grades only realised satisfactory prices when the leaf appearance was combined with good cup quality.

Darjeeling: Though showing some improvement over the previous year, the season has been disappointing in respect of quality and this has been reflected in the low level of prices realised by this district. A few early season's teas possessed some flavour but practically no good second flush teas were seen due mainly to the second flush period being extremely short. A few gardens by extra efforts succeeded in producing fair quantities of useful teas, while leaf appearance was stylish. Rains' teas became very plain in character and leaf appearance tended to become ragged. Quality improved towards the end of the year and some quite useful autumnal invoices were produced, although none could be described as being in the "fine" category.

Assam: The early season's teas were bright in character and quality could be described as average for the district. Second flush teas were in short supply although a number of useful liquoring teas of C.T.C. manufacture were produced. Quality showed a very sharp decline and rains' teas became very ordinary, with frequently a softish, heavy character. This was caused by the heavy flushing of the leaf due to the abnormally favourable climatic conditions. Autumnal quality from this district was also rather disappointing and very few flavoury teas of C.T.C. manufacture were seen from Upper Assam.

Doorgas: First and second flush teas possessed very little quality; leaf appearance was rather stinky due to its rapid growth. Rains' teas inevitably became plain in quality but leaf appearance remained satisfactory and showed a vast improvement over the previous season. Autumnal quality from this district was excellent and bright flavoury teas were in good supply. End-of-season teas were commendably free from stalk and fibre and reflected the finer plucking policy adopted by all gardens in the district.

Cachar: Leaf appearance was generally satisfactory and compared very favourably with the previous season. Clean, black, well-made teas were manufactured early in the season and this standard was well maintained throughout the year. Invoices with clean and sweet liquors were in much better supply, especially during the latter half, than in the previous season and the number of soft and dull liquoring teas from this district showed a marked decline. At seasonal periods, the liquors had some briskness and brightness in cun, which features were fully appreciated by buyers.

Supplies to Britain

The most important event of the year was the derationing of tea in the U.K. with effect from 5th October, 1952. The rush on the market which was expected to follow derationing did not materialise and as the wholesalers who were without orders in the first few months of free trading, withdrew their support from the auctions in London and Calcutta, prices crashed and touched an all-time low record at the end of 1952. Outstanding stocks, built in the hope of improved demand upon derationing, were gradually eaten up and from the beginning of 1953 shipments, particularly from North India, improved. In spite of this, however, stocks of tea in the U.K. at the time of writing stand at 116 million lbs., as compared with a pre-war average of 190 million lbs. for this time of the year. This should augur well for the future. Shipments to Britain during the calendar year 1952 were some 21 million lbs. short of 1951; although shipments from South India and Ceylon rose by 9.5 and 2.2 million lbs. over the previous year, those from North India, Pakistan and Indonesia declined by 13.5, 12.7 and 6.7 million lbs. respectively. The North Indian shipment of 225 million lbs. during the calendar year 1952 included approximately 48 million lbs. of tea of 1951 manufacture. Of this quantity nearly 171 million lbs. were sent to London for sale inclusive of a small quantity of private forward contracts estimated at about 10 million lbs., while 55 million lbs. were bought from the Calcutta auctions for shipment to the U.K. Re-exports from Britain increased from 132 million lbs. in 1951 to 23.6 million lbs. in 1952. It is thought that most of the increased U.K. re-exports went to the Continent of Europe.

Domestic Consumption

Buyers for the internal market again had to resort to Export catalogues for their requirements of the season as Internal Leaf catalogues were only nominal and were composed of residue,

MARION POWER EQUIPMENT

Marion machines will be found at work wherever major construction work, quarrying, mining or any similar activity is undertaken. This equipment is playing its part in the building of the Bhakra Dam, the Mor Canal, the Tungbhadra Dam, the Sardar Power Channel, and many others throughout the world. In irrigation schemes up and down this country Marion are filling an important role.

damaged teas, and teas with faults. The rate of the Export Quota during the year was the lowest since the war; while the market opened at 12 pies per lb. in May, by the end of July it had declined to 5 pies per lb. The price dropped even lower later in the season and by the end of March 1953, when quota rights were converted into special export licences, it was quoted at between 1 and 2 pies per lb. There was thus no substantial difference between the export and internal prices. Owing to the very low level which Broken Pekoe touched during the middle of the season, there was a tendency to crush this grade into dust and the market was glutted with a large quantity of artificially manufactured dusts. While the dusts enjoyed a satisfactory market right through the season as compared with leaf and broken, the artificial dusts, especially the very grey powdery types, were completely out of favour with the buyers. The quantity of dusts made during the season amounted to 13 percent of the total crop as compared with only 10.5 percent during the previous season. This was duly reflected in the average prices for dusts which dropped from Rs. 1-9-9 per lb. in 1951-52 to Rs. 1-5-11 per lb. in 1952-53. The consumption of tea in India is reported to have gone up in the past two years and is now estimated to be about 200 million lbs. a year.

Exports to other Countries

Out-market shipments from North India during 1952-53 amounted to 117.7 million lbs., being 7.3 million lbs. higher than 1951-52, but 141 million lbs. lower than 1950-51. Egypt, Red Sea ports, Australia and New Zealand mainly accounted for the improvement in out-market shipments, followed by the U.S.A. and Canada although there were much reduced purchases from South America and Eire. Iran was more or less completely absent from the North Indian market during the season.

Warehousing and Calcutta Port

While the season opened with fairly large stocks left over in the Calcutta warehouses, sales were regular and deliveries were good during the first three or four months of the season and it was not until mid-October that the effect of continued heavy withdrawals from sales was beginning to be felt. From this period the warehouses experienced near-congestion conditions and from December to February they were jammed to capacity. Early in January, a record quantity of 5½ lakh chests was held by the sale warehouses alone, while there were nearly 8 lakh chests in the port. Despite difficulties, 1952 was a fairly smooth year for Calcutta warehouses. A great strain was imposed on them by the small sales during the middle of the season but thanks to the improved market towards the end the transit warehouses were cleared of the bulk of the year's crop by March 1953. The sale warehouses still carry large stocks but with the selling season fast coming to a close, it is anticipated that these would also be largely disposed of before the teas of the new season arrive.

Transport and Communications

This was another satisfactory season the transport services and the bulk of the North Indian crop had reached Calcutta by the end of March. Although the North Indian crop was practically the same as last year, recorded arrivals in the port amounted only to 44 lakh chests as against 46 lakhs during the previous season; this was accounted for by the non-inclusion in the port arrivals of more teas which were directly unloaded in private seller's godowns during the season.

Packing

The percentages of indigenous and imported chests in use showed a slight change from 78 and 22 percent last season to 75 and 25 percent respectively during the current season. While the percentages of chests to be classified as fair and weak amongst indigenous brands showed a slight increase from 14 and 4 percent to 15 and 1 percent respectively of the total number of chests used, the percentage of indigenous chests infected by wood borers decreased from 7 percent

last season to 4 percent this season. On the whole, there was a slight improvement in the condition of indigenous chests but many cases of teas being tainted by panels and battens were reported during the season mainly because of the poor quality of wood of the indigenous containers. This caused some loss to the sellers of tea either by way of reduced price to be realised for their teas in their tainted condition or by way of claims from buyers at later dates owing to deterioration in the quality of tea.

Outlook for 1953

The general outlook for the industry is brighter than it has been for many months. However, producers would be well advised to adopt an attitude of guarded optimism since it has been clearly demonstrated how delicate is the balance between world supply and demand. In August 1952, when the North Indian crop was showing an increase of approximately 40 million lbs., it was clear that supply was outstripping world demand, and it was only by drastic voluntary restriction in the shape of finer plucking that the balance was adjusted before the end of the season. In 1953, the voluntary crop regulation scheme coupled with the curtailment of heavy fertilisation should ensure that an excessive crop is not harvested and that the standard of production will not decline. Furthermore, there seems little prospect of Indonesia increasing the past year's output of 80 million lbs. since internal security in that country still remains far from satisfactory. It can be expected that U.K. buying will continue on a more regular level during 1953 and there is every hope that the prewar per capita annual consumption of 96 lbs. may eventually be reached. The prospects of America and Canada buying on this market seem favourable since it is clear from 1952's increased purchases that the stockpile accumulated in previous years had largely been consumed. As there is every likelihood of another barter agreement of cotton for tea, it would appear that the Egyptian market has come to stay. It may also be reasonably anticipated that Turkey will again be a consistent purchaser on this market.

The absence of ex-factory sales of residue grades must have bolstered demand by approximately 20 million lbs. It is hoped that this policy will be continued since any secondary grades sold ex-garden have a decided adverse effect on the prices realised for the primary grades on the Calcutta auctions. The altered rates of excise duty may have a somewhat depressing effect on producers' realisations for teas consumed in India. The ratio of packers and blenders to loose tea dealers is stated to be 60 to 40. Thus the greater part of the teas consumed in India will be subject to an increased rate of excise duty. By whom will this increase be borne—the producer, the consumer or the distributor? If the producers for whom relief was originally intended are to suffer by lower auction prices, the declared intention of the Government will not be realised.

The 1953 season enjoys the peculiar advantage not experienced by any other postwar year of being able to make a completely fresh start to the auction sales in June. Other years have had to compete with a glut of old season teas composed mainly of unattractive residue grades which naturally have had a depressing effect on early sales. A good start is therefore assured, and with finer plucking it is expected that cup quality and leaf appearance should be of a high standard. There are two final optimistic factors. Firstly, the decision of the Central Government to reduce exports by 15 percent to 115 percent of the standard export figure. Provided that the 1952 special export licences are not extended beyond 31st May, this should have the effect of establishing larger and more representative offerings for consumption in India, as producers would be prepared to support the Internal market with suitable grades in the event of the Export Quota becoming appreciably dearer in price. The second factor is the U.K. stock position. In April, the stock was 116 million lbs. which was considerably below the prewar figure. This should ensure that U.K. buying will be on a substantial scale, at least during

the early months of the season. To sum up, the industry may face the future with growing confidence in the reasonable hope that conditions during 1953 may resemble much closer those of 1951 than during the critical year that has just passed.

LONDON TEA SALES

A buoyant tone prevailed on 18th May and under strong and well distributed demand prices of all descriptions ruled firm with any change favouring sellers. Fannings grades provided a particularly good feature and teas with autumnal flavour sold well. Export demand was not much in evidence. Offerings totalled 32,948 packages of North-Indian, Pakistan and miscellaneous. Clean Common Broken Pekoe, free from stalk, was quoted at 3s. 4½d. per pound. At last week's tea sales the 71,184 packages on offer realised an average price of 3s. 4½d. a pound, against 3s. 7.66d. in the preceding week.

Results obtained by some of the companies are given below:

	No. of packages	Average price per lb.
Amalgamated	523	3/ 6½
Assam Co.	1,404	3/ 7½
Assam Frontier	1,538	3/10½
Attaree Khat	365	3/ 7½
Bagracote	228	3/ 4
Bordub	421	3/ 7½
Budia Beta	607	3/ 7½
Buxa Doora	406	3/ 8
Chargola	240	3/ 8
Cons. Tea and Lands	1,774	3/ 5½
Doora	1,139	3/ 5
Doom Dooma	1,228	3/ 8½
Eastern Assam	671	3/ 8½
Jhanzie	351	3/ 6½
Jokai	1,724	3/ 7½
Jorehaut	1,080	3/ 6½
Majuli	708	3/ 7½
Malayalam	702	3/11
Moabund	721	3/ 7½
Pabbiojan	597	3/ 8
Singlo	384	3/ 5½
Upper Assam	534	3/ 4½

COCHIN TEA SALES

At Sale No. 10 held on 12th May, 1953, there were about 1,330,000 lbs. of tea printed for sale. Quality showed the usual seasonal falling off, which, coupled with the larger quantities available, accounts for the weaker demand noticeable at this time of the year.

The market opened with a fairly strong tone but at an irregular 2 annas below last prices. Medium & low medium types sold freely at the lower values with the commonest sorts firm to occasionally dearer. High grown teas fetched prices a little below last rates but demand for these was limited and followed quality closely. Withdrawals were heavy but most of these have been taken up since the sale.

Fannings grades were the weakest feature but leaf grades were about steady.

	Low Grown Travancore	B. O. P.	Rs. as ps.	Rs. as ps.
Medium	"	B. O. P.	1 11 0	1 11 6
Anamallai	"	B. O. P.	1 12 0	1 14 0
Rest liquoring Nilgiri	"	B. O. P.	1 15 0	2 1 0
Black well made	"	O. P.	2 8 0	2 8 0
		O. P.	1 15 0	1 15 0

Nominal quotation in New Season's export quota this week is 9½ pies but no business has been done. Some business was transacted in Special Licence at 1 pie. No news, up to the time of going to press, has been received regarding the possibility of an extension.

Sale No. 11 will be held on Tuesday, 26th May 1953.

EXCISE ON LOOSE TEA

In our report on Calcutta Tea Auctions in April, which appeared in last week's issue, we inadvertently stated that since the excise duty on tea had been readjusted, dealers in loose tea would have to pay an extra one anna per pound. In fact distributors of loose tea will pay only one anna per pound, compared with the three annas paid hitherto.

COLOMBO RUBBER PRICES

The following prices are issued by the Indian Rubber Board from the weekly rubber market report issued by the Colombo Brokers' Association:

	Closing prices on 9-5-53 (Rs. per lb.)	Average for week (Rs. per lb.)
Sheet:		
No. 1	1.37	1.36½
No. 2	1.34	1.33½
No. 3	1.31	1.30½
No. 4	1.17	1.16½
No. 5	1.12	1.11½
Sheet Cuttings		
No. 1	83	
No. 2	80	
Crape:		
R.M.A. 1X	1.12	1.15½
R.M.A. 1	1.06/12	1.12½
Crape No. 2	1.05½	
Crape No. 3	.98½	
Scrap Crape		
Sc. Crape 1	Cts. .80 Nom.	Cts. 84½
Sc. Crape 2	" .74/78	" 80½
Flat Bark	" .70/73	" 78½
Sc. Crape 3X		78

To arrive at f.o.b. Colombo prices add 20 cents per lb. to the above market prices.

Engineering and Transport

PLANS TO PROMOTE EUROPEAN CONSUMPTION OF FLAT STEEL

STUDY BY E.C.E. SECRETARIAT

THE Secretariat of the United Nations Economic Commission for Europe (ECE) has called for exceptional measures by governments, the steel industry and the principal consuming industries to promote economic production and higher consumption of European flat steel products. In a study entitled "The European Steel Industry and the Wide Strip Mill," the Secretariat point to the "phenomenal" growth in the productive capacity of flat products in Western Europe which will have 15 continuous, semi-continuous or Steckel wide strip mills in operation by 1956 with a theoretical capacity of 17 million metric tons of hot rolled coils. In contrast, before and immediately after the war, the effective capacity of wide strip mills was only about one million tons. The ECE experts stress that a rapid, balanced growth in production and demand requires the modern mills at concerted effort to operate at their full capacity. High levels so that the lowest possible prices may increase the demand for flat steel products.

According to the ECE Secretariat this implies bold policies on the part of European governments and industries to achieve, in particular, a much higher rate of obsolescence of old hand semi-automatic strip mills, an increase in investment in crude steel and slabbing mills and in finishing facilities, expansionist economic policies by governments, better integration of the European market and the promotion of mass production and consumption of flat steel products in Europe and overseas. The major consumers of flat steel are the industries manufacturing automobiles, durable consumer goods, food and other containers and the shipbuilding industry.

The study, which the ECE Secretariat emphasises is published on its own responsibility, discusses the potential returns of the enormous investment in wide strip mills in Europe. It examines past production consumption, price and cost trends for flat steel products in the United States and western Europe and estimates the possible trends of future consumption of European flat steel products by the major industries using them. Special chapters deal with motor vehicle, shipbuilding, containers, capital goods and durable consumer goods, and the export market. An additional chapter presents data on past and expected flat steel products output in the Soviet Union and Eastern Europe.

High Output Essential

The Secretariat underline the great potentialities of the wide strip mill which is the crucial, central and most rapidly mechanism in an enormous production process. If the mills are to make their full contribution to a higher standard of living which results from an increased use of flat-steel products, they must operate at a high level of efficiency. Their potentialities are only fully realised, and radical price reductions obtained, when the mills are operated at, or near, full capacity. Yet, the Secretariat explain, when laying down new strip mills, the eight western European countries including Austria, Belgium, France, the Netherlands, Western Saar, Italy, Luxembourg, and the United Kingdom, did not work to any concerted plan nor, in most cases, was sufficient crude steel and finishing capacity provided to enable these expensive mills to operate at, or near, their potential capacity.

Under present plans, the modern mills in western Europe will be producing just under 10 million tons by 1956. But, the Secretariat point out, even allowing for a lower standard of productivity than in the United States and the difficulties arising in Europe from the placing of relatively small and varied orders, they could readily operate at a level of 12½ million tons if sufficient steel and finishing capacity were provided. If American conditions of productivity, size of orders and mill specialisation applied, this could be raised to 17 million tons.

According to the ECE Secretariat, "it is of major importance to consider as early as possible the installation of new steel capacity to match the capacity of the strip mills being installed. In addition, a sustained effort should be made to raise the productive capacity of the strip mills to higher levels by the provision of additional finishing facilities." The installation of continuous wide strip mills by no means implies that all other strip mills also producing plates, strips and types of mills also producing plates, strips and uncoated and coated sheets would be made redundant. But it does mean that the production of sheets and wide strip which in turn may be subjected to cold reduction and finning should be concentrated on these new mills because of their greater efficiency, lower costs and higher quality, the Secretariat maintains.

Production Plans

In 1951, the production of flat products on mills other than wide strip mills was about 14½ million tons and, under present plans, six million tons of this capacity is to be retired as obsolete by 1956. The plans announced by the western European countries expect flat product output in 1956 to reach nearly 25 million tons, with only 10 million tons of this coming from modern mills (continuous wide-strip, semi-continuous wide-strip and Steckel). More than half of the remaining 15 million tons produced on other types of mills rolling flat products will come from old and partially obsolete plants.

In its plea for an accelerated scrapping programme, increasing the rate of scrapping at least 50 percent higher than at present envisaged, the ECE Secretariat declare: "The full benefits of modern productive processes can be attained more rapidly, and the inevitable social disturbances minimised, if a well-thought-out obsolescence policy, bolder than is at present conceived, is put into operation. The alternative is likely to be a prolonged death struggle of obsolete sections of the industry to survive, which may in the long run be more harmful to the general interests of social as well as economic, of the countries of Europe."

The amount of capacity which will be operated in the western European countries in 1956 is, of course, dependent on the obsolescence policies adopted, but it would appear that the total is unlikely to be less than 24½ million tons and may well be 28½ million. The ECE Secretariat in their study trace probable and possible consumption trends of flat steel products. They suggest that capacity may exceed demand in 1956, even if consumption is greatly stimulated, but that this may be a natural phase in the development of consumption to match the greatly increased capacity of the mills to be installed by 1956. By 1960, on the other hand, production at high capacity levels and consumption "may well be in balance if the right policies are followed."

Policy Measures Advocated

The Secretariat continue: "Efforts must also be made by the consuming industries, by new investment and by changed production policies." The principal policy measures advocated by the ECE Secretariat to promote growing consumption of flat products include:

(1) A new policy for the European motor vehicle industry concentrating on a smaller number of models, the standardisation of parts and in particular the production on a large scale of a much simpler and less expensive car than is at present available on the market. (2) An accelerated ship-scraping policy to encourage orders for modern ships. (3) Increased investment and the application of more modern methods by container manufacturers to cheapen the cost of canning and increase the demand for canned food and for containers for non-food purposes. (4) Policies favouring standardisation, mass-production and increased investment to increase the demand for durable consumer goods, particularly metal furniture and modern labour-saving devices such as washing machines and metal kitchen fittings including refrigerators. Such a policy could be supplemented

by government encouragement of domestic equipment installation as part of housing policies and by a new approach to the concept of landlords' fixtures in housing schemes, making it possible to obtain a number of commonly used domestic articles on a rental basis as part of the house. (5) Modernisation through increased investment in several sectors of the engineering and building industries could do much to increase the demand for flat products, for example in the manufacture of electrical machinery, railway equipment and other engineering products mentioned above.

In addition, Western Europe has been, and should continue to be, a substantial exporter, not only of finished goods of these types, but also of flat-rolled steel, particularly to under-developed countries for housing purposes (especially roofing) irrigation (including water tanks) and the oil industry (for oil tanks and for welded pipes). There is room for more ingenious and comprehensive efforts to develop overseas as well as home consumption of flat steel products.

The ECE Secretariat study warns that "Europe will not retain its position in the world market, particularly in the case of tinplate, unless it uses modern methods of production and operates its modern plant at a high level of capacity." According to the ECE Secretariat, "The most important single element is an expansionist policy on the part of government but of almost equal importance is a confident policy on the part of the steel industry, one designed to allow continuous strip mills to exercise their full effect in reducing costs and demonstrating the as yet unrealised potentialities of modern flat products."

PAKISTAN OIL WELL TO BE CLOSED

Pakistan Petroleum Ltd. announced that it intends to abandon well No. 4 at Patharia, East Pakistan. The Burmah Oil Company Ltd. drilled two wells in this area before the Second World War, of which one gave quite encouraging signs of oil, the other being dry. Pakistan Petroleum Limited renewed the search for oil in 1951 and drilled well No. 3, to a depth of 5,411 feet, but prolonged tests failed to show any worthwhile signs of production.

Pakistan Petroleum's announcement added that from intensive geological mapping it was known that the Patharia structure was greatly compressed and faulted. The results of drilling show that structure to be even more complex than expected and the prospects of finding commercial accumulations of oil are considered to have been disproved. The search for oil in the Patharia forest reserve during the last three years has cost about Rs. 50 lakhs.

For car or truck, tractor or earth-moving vehicle, there's a Firestone Tyre to suit your needs, and to give you the most for your money. Such Firestone extra values as new, tougher tread rubber compounds, better-than-ever Gum-Dipping, and longer

wearing designs mean even more to you today, when tyre economy is so important. Over 50 years of Firestone leadership assures you of the finest in materials, design features, and workmanship to bring you tyres that give more for your money.

THE FIRESTONE TYRE & RUBBER CO. OF INDIA LTD.

RECORD OF PROGRESS IN 1952

Subscribed Capital.....	Rs.	201,00,000
Paid up Capital.....	Rs.	47,52,700
Net Premium.....	Rs.	13,34,372
Reserves.....	Rs.	17,24,823
Total Assets.....	Rs.	81,82,301

The Company's funds ensure a cover of about Five times its net Premium for the year—the highest ever given by any Indian Insurance Company underwriting so much business.

BHARAT FIRE & GENERAL INSURANCE LTD.

Calcutta Markets

FAIR GENERAL DEMAND IN
TEA DUST SALE

AT Internal Sale No. 48 held on 19th May, 1953. Dusts on offer met with a fair general demand at lower rates and as the sale progressed demand became weaker. No Export sale was held this week. The best Assam dusts were mostly of poor quality and these were two annas easier, while good mediums were 1 to 2 annas irregularly lower. Medium Assam dusts were generally one anna easier while the Doonors offerings were a little easier. The commonest sorts valued around Re. 1 were mostly one to two annas cheaper to buy.

A larger quantity than usual—2,130 chests—was offered in the Internal leaf sale this week. These sold a little below last week's rates.

Quotations

Medium Doonors Dust	1 7 6
Medium Assam Grainy Dust	1 6 6 to 1 9
Best Assam C.T.C. Dust	1 12

Approximate Quantity Offered

Internal Leaf	2,130 Packages
Dust	29,800

WEAKER UNDERTONE IN
FREIGHT RATES

TIME CHARTERING ACTIVE

CERTAIN irregularities in freight rates were discernible over the last week and in the Eastern trades the undertone showed weaker tendencies. A feature of the Eastern markets was the fixing of a number of ships for coals from Chinwangtao to Chittagong.

Two further fixtures were concluded in the Calcutta coal section, one being done at the previous rate of 63s while a subsequent vessel accepted 62s and vessels are now believed to be treating at below this figure. A June-July steamer has been chartered for ore from Vizagapatnam to Antwerp or Rotterdam at 60s while a May ship has been fixed for ore from Calcutta to Constantia at 72s 6d. Ore from Dungun to Japan has been fixed at the previous rate of 35s for one vessel.

Grain chartering from Australia has been in abeyance over the past week. Although carriers are still required for grain for India and Pakistan no fixture has been reported. However a fixture from Queensland to U.K. with sugar was done at the previous rate of 117s 6d. Five fixtures have been reported for coals, Chinwangtao to Chittagong, four being done at the previous rate of 55s while one vessel accepted the reduced rate of 53s 9d. Other than this business there have been no further developments in the North China trades. Sugar shippers repeated 72s 6d with a

cargo from Formosa to U.K. for a May loader and zinc concentrates were fixed from Port Pirie to the Bristol Channel at 95s.

In the North American section coals was fixed from Hampton Roads to Japan at 67s and to Rio de Janeiro at \$5.80 for a June loader. 35s 6d was paid for two cargoes for discharge at Hamburg and a cargo to Antwerp was concluded at the rate of 55s. Little interest was shown in grain on the North Pacific section where shippers are adopting a policy of reserve.

The time charter section has been fairly active. A large oil burner accepted \$2.50 for 2-3 months trading delivery U.S. West Coast, re-delivery U.S.N.H. and a small diesel vessel was paid \$22,000 per month for six months trading with delivery U.S.N.H. while a similar vessel accepted \$18,500 lumpsum delivery Rotterdam for one central American round voyage.

SUGAR MARKET EASIER

During the week ended 19th May, the sugar market weakened slightly because of heavy arrivals (7,000 bags a day). The onset of the mango season caused demand to fall but small enquiries were coming from South India. Ready ex-Kantapur delivery rates were Rs. 29-7 a maund for ordinary grain, Rs. 30-14 for big grain and Rs. 28-12 for old ordinary grain. Stocks amounted to 90,000 bags. Sales were 2,500 bags in the local market and 1,000 bags to Assam. Ex-mill delivery rates for Bihar mills ranged between Rs. 27-10 and Rs. 29-4 a maund. Two ships are loading about 50,000 bags of sugar for Tuticorin and Cochin, for which commitments have been made.

LINSEED

Considerable excitement followed the reduction of export duties on linseed oil and there was a disproportionate advance in prices owing to keen activity on the part of speculative elements. Export interests viewed the current situation gloomily, as the advance in price had been far in excess of the reduction allowed on export duty. In effect, shippers found themselves in the same position as before, with overseas buyers showing no interest. Meanwhile, much interest was aroused in the oil market by strong buying activity on the part of certain vantage manufacturers. Large business was reported for ready as well as forward delivery, and plans appeared to be well laid for the mixture of linseed oil with groundnut oil in the manufacture of vanaspati. Government permission for this purpose having been obtained. Supplies of linseed from uncountried appeared fairly plentiful for the time being and there were regular arrivals of new crop goods daily. The daily turnover showed an increase, local merchants stockholders having entered the market in addition to crushers. General conditions were rather unsettled at the moment. Latest quotations were as follows: May Rs. 22/8 per maund, June/July Rs. 23/- per maund.

HIDES AND SKINS

The market ruled steady with narrow fluctuations. Stocks were less than in the previous week.

Bazar Sales

(Between 12th and 18th May, 1953).
Cowhides:—Wet salted (Ord) 4,000 pcs. on the basis of Annas 9-6 to Annas 10; Wet salted (Slaughtered) 16,000 pcs. on the basis of Rs. 14-8 to Rs. 20.

Goatskins:—Wet salted 41,730 pcs. on the basis of Rs. 260 to Rs. 412-8; Assam-Dinaipur-Murshidabad 18,900 pcs. on the basis of Rs. 260 to Rs. 310; Purneah-Kissengani-Malda 11,825 pcs. on the basis of Rs. 280 to Rs. 295; Pakur 1,000 pcs. on the basis of Rs. 230.

SHELLAC PRICES STEADY

During the week ended 19th May the shellac market ruled steady and a moderate business passed. The range of quotations was as follows:—

Standard Pure Buttonlac	Rs. 89 to Rs. 90 value.
Pure Buttonlac	Rs. 85 to Rs. 86 done & buyers.
Lemon No. 1 Shellac	Rs. 85 to Rs. 86 buyers.
Lemon No. 2 Shellac	Rs. 79 to Rs. 81 buyers.
P. O. Std. I Shellac	Rs. 74 to Rs. 76 done & buyers.
Pure TN Shellac	Rs. 70 to Rs. 71 basis done & buyers.
4% I. T. N. Shellac	Rs. 61 to Rs. 62 buyers.
No. 1 Kusmi Seedlac 3%	Rs. 81 to Rs. 82 buyers.
No. 2 Kusmi Seedlac 3%	Rs. 74 to Rs. 75 buyers.
Fine Bysaky Seedlac (Manbhum) 3%	Rs. 70 to Rs. 72 buyers.
Fine Bysaky Seedlac (C. P.) 3%	Rs. 65 to Rs. 67 done & buyers according to quality.
Ordinary Bysaky Seedlac (C. P.) under 5%	Rs. 60 to Rs. 62 buyers.
Ordinary Bysaky Seedlac (C. P.) 5%	Rs. 56 done & buyers.
Kirelac	Rs. 28 buyers.

Shipments during May until the 16th were 14,098 packages.

COMPANY AND PUBLIC NOTICES

THE INDO-BURMA PETROLEUM CO., LTD.
(Originally incorporated in Burma)
Registered in India under Ordinance No. LIV of 1947
Directors' Report and Statement of Accounts for the Year ending 31st December, 1952.

NOTICE is hereby given that the Forty-fifth Ordinary General Meeting of the Company will be held at the Registered Office of the Company at Clive Buildings, Netaji Subhas Road, Calcutta, on Wednesday the 17th June, 1953 at 12 Noon.

- (1) To receive the Directors' Report and Statement of Accounts.
- (2) To sanction the declaration of a dividend.
- (3) To elect three Directors.
- (4) To appoint Auditors for the ensuing year.

The Ordinary Share Transfer Books of the Company will be closed from 3rd June, 1953 to 17th June, 1953 both days inclusive.

By Order of the Board,

JOINT STOCK COMPANIES' PREFERENCE SHARES

Dividends are cumulative and the shares carry a preferential claim on the property for the payment of capital and on the profits for dividend except in case of companies marked otherwise. (For reference see notes below.) Months against names of companies indicate approximately times of payment of dividends.

Year of Issue	NAMES	Amount Issued in Rs.	Rate per cent	Paid-up per Share	Market Quotations		Year of Issue	NAMES	Amount Issued in Rs.	Rate per cent	Paid-up per Share	Market Quotations

COAL COMPANIES

O, P, F and Dd, indicate Ordinary, Preferred Ordinary, Founders' and Deferred shares, respectively. P next to the name of the company indicates that the company also has Preference Shares. Figures in "accounts closed" column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer to the Key (last page) under the numbers indicated.

TEA COMPANIES

O, Po and Dd indicate Ordinary, Preferred Ordinary and Deferred Shares, respectively. P next to the name of the company indicates that the Company also has Preference Shares. Figures in "accounts closed" column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer to the Key (last page) under the numbers indicated.

INDIA'S FOREIGN TRADE POLICY

QUALITY AND PRODUCTION COSTS: IMPORTS AND THE PROTECTIONISTS

THE temperate conspectus of India's foreign trading position that the Commerce and Industry Minister, Mr. T. T. Krishnamachari, gave at the meetings of the Import and Export Advisory Councils last Friday and Saturday was notable for its realism and cautious optimism. Mr. Krishnamachari is not always temperate and realistic. In fact his address to the previous half-yearly meeting of one of the advisory councils was an ill-informed outburst that caused much offence to some of the business men then called together. Explanation of the serenity he displayed last week-end may be found in the announcement made by the Food Minister on Monday, that India had increased her output of foodgrains by four million tons in 1952-53, thereby relieving the trade balance of its heaviest burden. The apparent success of Mr. Kidwai's courageous decontrol policy has given his colleague in the Commerce and Industry Ministry much more room to manoeuvre, so that he can promise continuation of the liberal import policy introduced in the current half-year and can use the feasibility of moderate imports to admonish indigenous producers to improve the quality of their goods. Not that all the credit belongs to Mr. Kidwai. Mr. Krishnamachari's own Ministry has transformed the administration of external trading policy beyond recognition. It is pleasant to be able to congratulate a Minister who evidently feels that he does not always get his due from the Press, on the greater efficiency and stability of the supervision of India's foreign trade. Anticipating the approval that would meet his policy statement, Mr. Krishnamachari was even prepared to hint that his Ministry's work was still far from perfect but that everything possible was being done to improve its efficiency.

Despite the reduction in foodgrain imports because of better stocks and a bigger harvest, the balance of trade has been on the whole unfavourable. The Minister did not volunteer precise figures in this connection but it is known that the trade balance was adverse during 1952 and Mr. Krishnamachari said that there had been deficits in two of the first three months of 1953. There has been a sharp fall in the prices of the country's principal exports, and import prices have on the whole tended upwards, with the result that the terms of trade have not been in India's favour. So far there is no firm evidence that this trend will be reversed, but at the same time there is no reason to suppose that it will deteriorate. The grounds for Mr. Krishnamachari's optimism lie in the healthy condition of the balance of payments which in turn is to be ascribed to what he rather vaguely referred to as "receipts on account of invisibles." The facts are that at the level of the commercial exchange of goods, India has not been paying her way in international trade but nevertheless her sterling balances have risen over the past year because of the receipt of foreign assistance. Taking the figures for the calendar year 1952, which have been published by the Reserve Bank, we find that even when earnings of shipping and insurance are added in, the balance is still unfavourable because gains under those two heads are more than counterbalanced by outgoings on foreign travel and investment payments. But during 1952 India received about Rs. 30 crores in "donations," official and private, and another Rs. 41 crores which is described unhelpfully by the Reserve Bank as "unclassified," these receipts supported the balance of payments and made possible the limited liberalisation of imports which Mr. Krishnamachari announced.

This dual improvement, in the balance of trade because of better food supplies and in the balance of payments because of foreign assistance, is the background to the cheerful picture of external commerce that was put before the advisory councils last week-end. Obviously the situation does not permit of any relaxation of the export effort nor of less careful use of foreign exchange for imports. The Government's decision to press

export promotion with renewed vigour, and to use the easier import position both to meet all essential needs and to spur local manufacturers to better performances, is the wisest that could have been taken. The only sign of complacency that accompanied this decision was Mr. Krishnamachari's statement that there was no need to "cry wolf" every time the monthly export returns for a major industry showed some diminution. It is of course true that policy must be based on the longer-term trends and there is no sense in panicking when temporary slumps occur. But the only two industries about which the Press and trade associations in Eastern India have cried wolf in the last two years were jute and tea—and the Minister admitted that the loss of Rs. 159 crores in export earnings in 1952-53 was due largely to a fall of Rs. 140 crores on jute goods and of Rs. 7 crores on tea. It would seem that those who cried wolf from Calcutta last year have been proven right by the trade returns.

The question of quality was a dominant theme in both the ministerial pronouncements, and this is very proper for it is well known that some manufacturers have taken advantage of the virtually complete protection given by import control to foist shoddy goods on the home market. Others have endangered overseas markets for Indian goods by despatching inferior products which do not answer to specifications. If these latter criticisms concerned only minor export industries, like tiles or mica, the situation would be bad enough, but it is unfortunately the case that some goods for which India is known the world over have suffered a decline in quality in recent years.

pay for its increased imports with increased exports. The picture of an industrialised India which relies on home industries to supply many of the wants now met from imports, and therefore has to worry less about export promotion, is pure fantasy. Even more fantastic is the belief that such an economy could afford to produce at high cost and without care for quality. Those who complain of token imports and present demands for the prohibition of a list of imports should consider the effect of restrictionism on the export industries which will be required to finance much of the industrialisation the protectionists earnestly cry up. The era of free trade might be past beyond recall but one of the great economic truths it discovered has lost none of its force: a progressive economy is a big importer and, if it is to remain solvent, it is also a big exporter. The negative restrictionist approach which promises industrial advance by means of shutting out foreign goods, without thought for the efficiency and quality of domestic industry, is a delusion which leads only to economic stagnation.

EUROPEAN INITIATIVE ON FREER CURRENCIES LONDON CONSULTS CONTINENT ON CONVERTIBILITY

THE resumption of multilateral currency dealing in the main European centres whereby, for instance, a British bank can buy guilders as well as sterling in exchange for francs in Paris, kroner as well as sterling in exchange for guilders in Amsterdam, is not directly associated with the moves towards general convertibility of currencies. Exchange control remains in force; the basis of intra-European payments is not altered. But exchange-rates are now regularly adjustable and are virtually the same in all the main centres (appreciable changes have been made in the adjustment, within the existing parties); and settlement is a continuing process, not confined to the monthly balancing through the European Payments Union. This development, even if it does not profoundly change the monetary system of Europe, is an important step towards normal methods of dealing, and it is understandable that the British authorities are proud of their leading rôle in organising it. Indeed, the recovery of the pound when these multilateral dealings began was attributed in London partly to the recognition that sterling was still gaining the initiative.

There have been other signs that the British authorities are not waiting on developments in Washington to move towards a multilateral system of payments, including convertibility of currencies. There is plenty of evidence that the authorities of the other European countries are ready and willing to co-operate in such a move. Indeed, during the recent Anglo-German discussions it was evidently the Germans who were urging the British to hasten towards convertibility. These Anglo-German talks were a part of a series of exploratory discussions which are being conducted separately between Britain and other European countries. France, Sweden, Norway, Denmark, Germany and Belgium have been consulted so far, and the process will continue with Holland, Switzerland and Italy in the coming weeks.

A few months ago the plan for convertibility was confused, and on the Continent even resented. When the countries of the British Commonwealth had agreed on their own plan late last year, and had presented it to Washington early this year, many people on the Continent felt that this British-American line-up was wrong. It can be assumed that the British did not in fact intend to make sterling convertible without first harmonising Europe with the venture, for if sterling were the only convertible currency in Europe there would be a serious danger, particularly within the framework of the European Payments Union, that the burden of Europe's dollar problem would be imposed on sterling. In any event, the Americans showed no urgent interest in the British plan. Now the sterling area and Continental Europe are working out the problems between them.

There is no clear order of priority. Harmony between sterling and the "hard" European currencies—the Swiss and the Belgian francs, the German mark, and the Dutch guilder—is obviously essential in any plan for convertibility. It is not less necessary to come to terms with Europe's weakest currency, the French franc; or Europe's European-owned sterling to ensure that the European area's dollar accen. shall not upset the sterling area's convertible. What count as soon as sterling is convertible. The British authorities are trying to initiate, indeed, is not convertibility of sterling on its own, but convertibility of all the even with safeguards, but simultaneously. In that main European currencies simultaneously. In that event there would be no serious risk that other currencies would accumulate surpluses of sterling by restricting imports from the sterling area, and

use their sterling to pay for imports from the dollar area.

The response from Continental Europe has been favourable, and, while the Americans procrastinate and argue, solid progress towards the multilateral system of payments is being made in the European area. This contrast has raised in London, and elsewhere, the interesting question whether the initiative towards convertibility—indeed, towards freedom of international economic relations in general—has been transferred from America to Europe. It is certainly true that Europe, less dependent than in recent years on American aid (which is no longer freely available, anyway), is acting more confidently on its own initiative. It is also true that liberalisation of trade has been temporarily halted in America, whereas in Britain it has progressed to a point in advance of America's in various commodities which are truly free to react to supply and demand, not "supported" or "managed". It is true, again, that the Americans, having for years past urged on the British the need to free trade by freeing sterling, are now apparently less interested than the British in convertibility.

Official quarters in Britain, however, make no exaggerated claims. They do not pretend that the European currencies can be made convertible without the full support of the United States, by a more liberal American import policy, or by more liberal American investment abroad, or by a rise in the dollar price of gold. They believe that America will participate more willingly if all Europe is prepared to free trade and payments. Yet, if the Americans are still reluctant next year, Europe, backed by the sterling area, can perhaps take its independent initiative further. The British will certainly be encouraged if, as they expect, the multilateral dealings in European currencies enhance the position of London as a monetary centre.

CURRENT COIN

Relative Commodity Prices.—The London and Cambridge Bulletin recently drew up a table of commodity prices and production before and after the war and, commenting on the conclusions to be drawn from the statistics, Wigglesworth and Co. Ltd. say in their monthly report: "Of the listed commodities rubber is the cheapest with its present price roughly 2½ times pre-war; sisal is the next cheapest at just over 3½ times pre-war. Cotton is relatively very dear at well over 6 times, whilst coffee is by far the most expensive at nearly 9 times pre-war cost. The high cost of some of these commodities can be directly attributed to scarcity and, in the case of coffee a succession of bad crops may be sufficient explanation, production during the last three years having been consistently much under normal. Against this, a key commodity such as wheat was produced last year at 20 percent above pre-war average and yet its price is well over 4 times. Rice which is admittedly in short supply, having only last year shown any worthwhile increase over pre-war, is a particularly important factor in tropical produce, fibres included, since its price bears directly on the cost of all crops; at fully 4½ times pre-war price, rice is dear when compared with say jute; it is even more so when compared with hard fibres. Sugar is likewise relatively dear. It is evident that food in general remains expensive in relation to hard fibre and, to a lesser extent, to jute. These comparisons necessarily depend on what is chosen as a representative pre-war price. The London and Cambridge figures are based principally on 1937 prices which are admittedly well above the average of the 1930's. It may be concluded that the present price structure will discourage hard fibre and jute production. Although it may take time to show itself in the case of hard fibres, where planted areas increased substantially during the last three years of high prices, this trend is likely to persist until either fibre prices rise or food prices fall."

Dye Increases Salt Output.—If trials now being made at the salt experimental station in Bombay on a new dye prove to be satisfactory, Indian production of salt may be increased considerably without new salt fields being established anywhere in the country. So far the tests have shown that with the help of this dye output of salt in salt pans using the solar evaporation method can be increased by 30 percent at an initial cost of about 2 percent of the present retail price. The dye has been manufactured by a leading British firm which, in co-operation with the authorities at the experimental station, proposes to invite all salt producers on the West Coast to a demonstration of the use of this method of production, after which a decision on trials on a larger scale in private salt pans is to be taken. It is claimed that when the dye is mixed with the brine it harnesses more solar energy than ordinary brine, with the result that the evaporation process is accelerated. Untreated brine is said to absorb only about 70 percent of the sun's radiation, the balance being lost by reflection from the brine surface as well as from the layer of the salt at the bottom of the pan. When the

dye is added to the brine it becomes a poor reflector and almost the whole of the sun's heat is absorbed with the result that the time for crystallisation is reduced.

T. U. C. against N. P. V.—There has been a spate of opinions in favour of the proposal for the introduction of shares of no par value in the written evidence submitted to the British Board of Trade committee which is now investigating the subject. These favourable reactions have come from the various accountancy bodies, the Federation of British Industries, the Stock Exchange Council, the Investment Trust Association and several other groups, and reference has been made to some of them in these columns. It is only fair therefore to record the first objection. It comes from the General Council of the Trade Union Congress, and as might have been expected does not mince matters. What they say, in brief, is that they do not want high rates of dividend to be less clearly visible than they are under the present system of nominal par values. "The General Council are in no doubt whatsoever that one of the main purposes of the issue of shares of no par value is to conceal what is happening inside public companies, and in particular to camouflage the payment of excessive dividends."

If a company wishes to pay what appears to be an unusually high dividend, the directors should be prepared to explain their reasons to their employees. The over-simplification is perhaps understandable, but hardly the inaccuracy. It is true, of course, that there is a possibility of abuse in such a system, and this has been recognised by those in favour of the proposal, who have recommended safeguards along the lines of those established in the United States. Canada and other countries where such shares have been in common use for a considerable time. Apart from the convenience of share dealings, the main advantage would be precisely to give a clearer picture of "what is happening inside public companies." When a business expands rapidly, but keeps the nominal value of its ordinary share capital small, dividends may reach high percentage figures without being at all large in relation to the earnings or the current value of the capital. It is to be hoped that the rights and wrongs will be elucidated for the benefit of the uninitiated in the course of the oral evidence which is given before the Committee.

Commonwealth Development.—There will be agreement with the contention of Lord Bruce of Melbourne that schemes for Commonwealth development, which have formed one of the main subjects of discussion at all recent meetings of Commonwealth representatives, are moving much too slowly. Addressing the recent conference of the Institute of Directors, he instanced as before him in his capacity as Chairman of the Finance Corporation for Industry as long ago as September, 1951, in connection with the aluminium project associated with it. To overcome these delays, and to ensure that all these schemes should be economic, he has suggested the setting up of a joint committee representing the British Government, the Colonial Development Corporation and the recently formed Commonwealth Development Finance Company, which in turn would appoint a small working party to sift and examine all Commonwealth development projects and thereafter prepare a comprehensive plan to deal with them. Briefly, the idea is to give priority to schemes which would save dollars and at the same time would be able to pay their way without depending on tariffs, import quotas or subsidies. The planning would be done in conjunction with Commonwealth countries, but Lord Bruce feels it ought to be centralised in Britain to make sure that there is no indiscriminate expansion of production all over the Commonwealth which would inevitably defeat the other objects. However, apart from the objections that would certainly be raised to the centralisation of the planning in Britain, it might be contended that the creation of yet another committee for this purpose would complicate the problem rather than resolve it. Furthermore Lord Bruce's belief that by this means investment from the United States would be attracted is hardly justified by the experience of the Colombo Plan, which has been worked out along similar lines.

U.S. Trade Fairs.—Three trade fairs of interest to India are to be held in the United States next month. The Second Omaha World Trade Fair and Institute will be held at Omaha, Nebraska, from 9th to 14th June under the management of the Omaha Junior Chamber of Commerce, and co-sponsored by the University of Omaha. "Trade Not Aid" is the theme of this international trade fair, whose purpose is to enable exhibitors to show their goods to as many buyers as possible and to test consumer reaction. Exhibits will be confined to consumer goods with no heavy machinery or equipment on display. Invited to participate are manufacturers and direct producers; importers and exporters; general or sole agents; government

agencies, bureaus or departments and transportation companies or agencies concerned with international trade. The First Exposition of Basic Materials for Industry is scheduled for New York between 15th and 19th June in conjunction with the First Basic Materials Conference, under the management of Clapp and Poliak, Inc., founders of this event. Admission is restricted to top management, executives, project engineers, product designers, materials engineers, production experts, research men, and sales and marketing executives. Many industrial experts are expected to be on hand to answer questions for an anticipated 15,000 visitors. Among the basic materials that will be on exhibit are metals, plastics, rubber, other non-metallics, screw machine parts, weldments, finishes, fasteners and laminations. One of the principal functions of the Conference will be to analyse how selection of materials can be co-ordinated with other industrial functions, such as design, production and sales. An effort will be made not only to outline the nature of existing materials but also to study materials now being developed and those of the future. The Exhibit Convention of the Railway Supply Manufacturers' Association will be held at Atlantic City, New Jersey, between 22nd and 27th June in conjunction with the annual meetings of the mechanical, purchases and stores, and electrical section of the engineering and mechanical divisions of the Association of American Railroads. The Railway Supply Manufacturers' Association, a non-profit making organisation is sponsoring the exhibition, and its members will display the products they manufacture for use by railroads. Locomotives, passenger and freight cars with other equipment will be seen and attendance is limited to members of the Association and invited railway guests. Foreign railroad people are welcome.

Loans from the World Bank.—The International Bank for Reconstruction and Development is at work in so many different countries that it is sometimes difficult to get a comprehensive view of its activities. But a speech by Mr. A. S. G. Hoar, of the Bank, in Dusseldorf recently, makes some of the information available. The Bank has lent \$1,600 million since 1946. Of this nearly \$500 million was lent to France, Holland, Luxembourg, and Denmark in 1947 to finance reconstruction. The rest of the money has been lent to 22 member countries and three dependent territories to finance economic development. The largest share, \$374 million, has gone to Latin America. Europe has received \$240 million in addition to the reconstruction loans. The Middle and Far East have received \$182 million, Australia \$150 million, and countries in Africa \$140 million. The Bank has found that its principal task has been to provide finance for basic services. About \$400 million has been spent on electric power, \$200 million on transport and ports, and about \$150 million has gone into agriculture. There are also investments in mining and industry. Mr. Hoar criticised a suggestion occasionally made that the amount of the Bank's lending should be determined by the level of activity in the United States. The principle of "anti-cyclical lending" he said puts the emphasis in the wrong place. It was more important that loans should be judged by the need of the borrower and the soundness of the project than by the state of the United States balance of payments. Otherwise, there would be a danger of making bad loans to "hasty, ill-conceived, half-baked projects."

Improving Productivity.—It will not be the fault of the British Productivity Council if there are no practical results from the effort which went into the work of the 66 teams which visited the United States under the auspices of the Anglo-American Council on Productivity. Some of the reports of these teams are still appearing, and are of course of interest to the particular industries to which they apply, but there has just been published a book, *We Too Can Prosper*, which covers them all and draws expert attention to the basic value of the various findings and shows how they may be put to good use. It is the work of the well-known economist, Mr. Graham Hutton, and he had the collaboration of Mr. Geoffrey Crowther, Editor of *The Economist*. Published by George Allen and Unwin at 12 shillings, it paints a none too bright picture of the human frailties which retard British industry—a picture which some regard as over-drawn on even unfair—but it also gives credit where it is due and suggests how faults can be eradicated. It will provide interesting reading to industrialists everywhere. Mr. Hutton points the way; the British Productivity Council plans to help industry to follow it. The first of its projects is a "circuit scheme" designed to promote a cross-fertilisation of ideas on productivity among industrial firms of all kinds and at all levels. Firms are being invited to form teams of six members drawn equally from management, technical and workshop level, which will then be grouped into "circuits" of ten. Each

month every team will pay one visit to another works on the same circuit and receive one visiting team. The descriptive literature includes a "fixture list" somewhat reminiscent of a football pool coupon. The second project is the formation of local productivity committees throughout the country. The 105 towns and cities which have been provisionally selected as the centres for this local activity are listed in a separate leaflet. Lastly, the B. P. C. is making a series of short films under the general title "There's Always a Better Way". The first of these, one of two screened at the inaugural conference in March, was shown on television recently and attracted favourable comment. The progress of these plans will be followed with considerable interest throughout industry in Britain and will also be closely watched from India.

Instalment Purchase of Shares.—America's vast instalment credit system might soon be extended to help more people acquire a share in American business and industry. The New York Stock Exchange is studying a plan whereby common stock—representing actual ownership of shares in industry—would be available on the instalment plan. Authorities agree that the implications of the proposal are many and sweeping. Mr. Keith Funston, Stock Exchange president, said recently that the immediate target of the exchange is a three-year net gain of 1,500,000 individual owners of shares, carrying out a programme that has been under way for years to spread ownership of America's vast corporate structure as widely as possible. The Stock Exchange, Mr. Funston said, is convinced that "a nation of share-owners is our strongest defence against foreign 'isms'" and widespread ownership of industry by the public "is perhaps the only way by which we can ensure the proper functioning of an enlightened capitalistic society." Despite the fact that a survey by the Brookings Institution last year showed that 6,490,000 individuals in 4,700,000 family units were direct shareholders of publicly owned corporations in America, he was not satisfied. He predicted that an instalment selling plan backed by intensive planning and advertising could spread ownership further in the years ahead.

Workers' Living Costs. The working class cost of living indices issued by the Labour Bureau for March, 1953, with base 1944=100, followed no general pattern. The biggest rise was in Kharagpur where the index number rose five points to 131. In Berhampur the index number rose four points to 145, reversing the downward movement of the previous month. In Ludhiana and Jubbulpore there was a rise of one point to 145. The index rose in Cuttack by one point to 154, and in Dehri-on-Sone at 167 and Silchar at 120 there were fractional rises. In Ajmer the index fell two points to 165, continuing the downward trend first noticed in November of last year. There was a fall of two points in the index in Jamshedpur, and in Gauhati a fall of one point to 131. There was a fall of two points in Tinsukia to 119. The all-India index number for February, 1953, same base, was 141.

CORRESPONDENCE

WORKMEN'S COMPENSATION LAW TO THE EDITOR OF "CAPITAL"

Sir,

It is always with interest that I read your articles under "Without Prejudice." In connection with the article in the issue of 30th April regarding the workmen's compensation case of Chhillu Kahar there is one comment I should like to make. You state that "he had, of course, to show that he had sustained 'an accident.'" The point I wish to make is in connection with the word "an" inserted before "accident." The wording of the Act does not include "an" and reads as follows: "If personal injury is caused to a workman by accident arising out of and in the course of his employment."

This, I am quite sure you will agree, gives an entirely different meaning from that the clause would have with the word "an" inserted before accident. As I read it the clause intends to refer to unexpected personal injuries incurred by a workman: injuries which he could not expect or foresee. As such, the case of Chhillu Kahar quite clearly comes within its jurisdiction. The fact that medical authorities are aware of the possibility of the injuries under such circumstances does not make it any less "accidental", in my opinion, from the workman's point of view, unless he has been specifically warned of the danger.

Yours faithfully,
J. H. W. WARD.

Margharita, Assam.

Without Prejudice

"ACCIDENT" IN WORKMEN'S COMPENSATION LAW

ODDS AGAINST THE RESPONDENT EMPLOYER

(BY OUR LEGAL CORRESPONDENT)

ON another page in this issue of Capital appears an interesting letter from a correspondent raising an important point concerning the word "accident" which was the crux of Chilla Kahar's case on which we commented in this column on 20th April. It will be remembered that Chilla was a workman, employed near a furnace, whose work was to beat heated pieces of iron and steel into shape and in the course of it he had to throw into and draw out from the fire the pieces of iron and steel which he had to beat up. He worked at this job over a period of 20 years. As a result of the gradual absorption of ultra-violet rays through the exposure during this long period to strong artificial light Chilla eventually and gradually contracted retrolubular optic neuritis whereby he lost 50 percent of his eyesight. Chilla made a claim for compensation under the Workmen's Compensation Act and in the introductory part of our note on the case we suggested that the point at issue was "whether Chilla Kahar... sustained an 'accident', arising out of and in the course of his employment."

Mr Ward's point is that the wording of the Act does not include "an" and that our inclusion of it before the word "accident" alters the meaning of the clause the material part of which reads: "If personal injury is caused to a workman by accident arising out of and in the course of his em-

ployment...." "This," says our correspondent, "... gives an entirely different meaning from that the clause would have with the word 'an' inserted before 'accident'."

Now this strikes us as a remarkably ingenious point and one which it is rather surprising was apparently not raised at the trial of the suit. Our own view—given with a due appreciation of its relatively complete unimportance—was and is that the whole series of English decisions on which the decision in Chilla's case was based, was wrong in law, in common sense and in its interpretation of the grammatical and practical meaning of the word "accident", and that the decisions of equally eminent judges, eventually overruled, were right decisions though they cannot now be said to represent the law.

Perhaps here we may be allowed to digress a little. The author and, it has been said, the actual draftsman, of the English Act was the great Mr Joseph Chamberlain, it was his swan-song as Birmingham Mayor of Birmingham, before he emerged as the rising hope of the stern and unbending Tories and he imposed the measure on a reluctant Lord Salisbury. Joe was exceedingly proud of his handiwork and, we read somewhere, came down to the Commons and, flourishing a copy of the Act before the Liberals whose thunder he had stolen, claimed that thenceforth all a British workman had to do was to have his accident and obtain automatically his compensation. In actual fact no measure ever enacted has been the subject of more litigation; and, in particular the clause which has been quoted above has, as to virtually every single word in it, produced a host of conflicting decisions of County Court Judges and the various appellate Courts sitting over them. But one circumstance emerges plainly from this welter of litigation and the

learned Chief Justice in Chilla's case put his finger on it unerringly. That circumstance is that in order to be able to find in favour of the workman judges have stretched the meaning of the statute.

Chakravarti C. J., said that was his opinion in so many words. In addition to his observations quoted in our previous note his lordship said: "Even in the cases where the decision was in favour of the workman the observations of the learned judges make it perfectly clear that they felt the pressure of reason on the other side and perhaps decided in favour of the workman in pursuance of what they conceived to be the policy of the Act." His lordship stated this as an opinion only and with proper deference to eminent judges who have so acted during a period of over half a century qualified a "feeling impossible to avoid" by the word "perhaps." But there is no "perhaps" about it. The opinion is correct without any reservation. The writer, who at one time was engaged almost exclusively on workmen's compensation cases, remembers well the shock he experienced many years ago on hearing one of the members of the County Court Judges, the senior member of the County Court judiciary having charge of the administration of the Act in two English counties and one large city, say openly in a lecture to law students that where he was in any doubt either on the facts or on the law in a case under the Workmen's Compensation Act he invariably found in favour of the workman. His Honor Judge Sir Arthur Gwynne James justified and practice by claiming that that was the intention behind the Act and that legal proceedings under it being arbitrations and not regular suits at law he, sitting as arbitrator and not as judge, was justified in straining the law so long as (in the words of Chakravarti C. J., many years later) "opposed to fundamental principles." The judge insisted on appeals but his decisions were scarcely ever reversed; and he was followed by other County Court Judges and what is more important—upheld by the Court of Appeal and the House of Lords.

Thus we are faced with the astonishing fact that there is a special brand of law administered for the wellbeing of workmen under the Workmen's Compensation Act, in which the juridical dice are loaded against the respondent employer from the start and where ordinary plain English words lose their meaning. Hence, a series of many accidents spread over a period of 20 years becomes "an accident."

And that use of the word an accident brings us back to our correspondent's novel point after a fashion which is not really a digression at all since it emphasises the atmosphere in which such a point—though we think it an unsound one—might well turn the scales in favour of a workman. Mr Ward's point is that "injury... by accident" is not the same thing as "injury... by an accident" and we admit that the distinction raises a doubt which weakens the argument advanced in our original note.

As we understand the new point, it is this: The indefinite article "an" means "one", and if the Act referred to "an accident" it might not be possible to contend reasonably that optic neuritis caused by exposure to glare over a long period of years' tial elements of an accident inasmuch as the essential of the event, suddenness, precise But the Act does nothing of the kind. It does not refer to injury by an accident but to injury by accident and that is a very different thing. "By an accident" is an abstract, a summarised term. "By accident" is a concrete specific term. "By accident" is really an adverb meaning accidentally, unintentionally and may well relate back to a series of incidents whereas "by an accident" must relate back to one single specific event.

Well, this viewpoint has certainly raised a doubt in the writer's mind, and it is quite possible that it is submitted with its soundness. Nevertheless it is submitted that it is unsound. We have counted the number of times the learned Chief Justice used the word "an accident" in his judgment and judges like Lord Birkenhead, and his Halsbury, Henn Collins and Macnaghten and countman to whom all their leaning towards the workman would be of a point such as this, if sustained, the expression "an accident" has consistently used "accident." "By accident" is synonymous with "governed by the proposition 'by.' It has not, we think, precisely the same meaning as the adverb "accidentally." It is more definite, more specific. In short it means "By (an) accident", the indefinite article being understood and implied.

8th GHENT INTERNATIONAL FAIR

The international Fair of Ghent, which will include the quinquennial Exhibition of the Textile Industry and Textile Technique, is to be held from 12th to 27th September 1953. Invitations to participate have been extended to inventors and holders of patents connected with the textile industry. The Fair authorities will be glad to assist those firms manufacturing material or accessories for the textile industry and which will exhibit new developments of mechanical construction and industrial techniques. All inquiries should be addressed to the Administration of the Florales, Ghent, Belgium.

Roomy berths are foam-soft, bigger than on a train! Small surcharge.

ORIENT-TOKYO U.S.A.

Fly in luxurious Round-the-World Clippers

This could be you—enjoying the individual attention of courteous Clipper attendants, savouring the gourmet perfection of cuisine by *Maxim's of Paris* served aloft, your choice of drinks, settling back in a reclining lounge chair in a perfectly air-conditioned and pressurized cabin... as your Round-the-World Clipper sings along over the weather at more than five miles per minute!

Luxurious Super-6 Clippers fly you direct to Rangoon, Bangkok, Hongkong and Tokyo. At Tokyo you connect with double-decked "Strato" Clippers of *The President* service to the U.S.A. At no extra charge, you relax in the world's most comfortable lounge chairs—enjoying *Sleeperette* service. Big foam-soft berths are available at slight surcharge. Liberal stopover privileges en route, including Hawaii!

Finance in India & Abroad

THE CALCUTTA MONEY MARKET

JUTE AND COTTON ADVANCES HIGHER

Wednesday, 27th May.

MONEY was rather more plentiful early in the week but demand has latterly increased also, so conditions are as tight as they were with rates in the interbank market quoting 2½ percent for overnight loans and 3 percent for good money. Jute finance has increased with the rise in the price of raw jute and fears that supplies may be short before the new crop is marketed. Cotton advances, it is reported from Bombay, have also risen and sugar accounts are about steady. On the whole it would appear that the busy season will continue longer than had been expected.

Bills are very scarce in the exchange market and conditions are generally quiet. There has been some increase in remittance. The principal exchange rates are unchanged, the U.S. dollar standing at Rs. 47s.

Tenders for Rs. 1 crore of three-months Government of India treasury bills were opened on Tuesday, 26th May. The total amount offered was Rs. 2,26,25,000. Tenders at Rs. 99-6-6 percent were accepted in full and those at Rs. 99-6-3 percent allotted approximately 28 percent. The total amount accepted was Rs. 1 crore, the average rate of accepted tenders being Rs. 2-6-6 percent per annum. Tenders for Rs. 1 crore of bills will be received up to 11 a.m. on Tuesday, 2nd June, at Bombay and up to the close of business on Monday elsewhere. During the week ended 22nd May treasury bills for Rs. 3,49,00,000 were sold in favour of the Reserve Bank of India.

A fall of Rs. 8.14 crores in notes in circulation to Rs. 11,66.39 crores was the outstanding feature of the return of the Reserve Bank of India for the week ended 22nd May, 1953, although the total note issue was fractionally up by Rs. 46 lakhs to Rs. 11,90.18 crores. Notes held in the Banking Department consequently rose by Rs. 6.60 crores to total Rs. 2,79 crores. In the Banking Department deposits of the Government of India and other Government accounts improved by Rs. 13 lakhs and Rs. 1.44 crores to stand at Rs. 100.84 crores and Rs. 15.72 crores, respectively. Balances of commercial banks dwindled by Rs. 82 lakhs to aggregate Rs. 41.57 crores. Balances held abroad diminished by Rs. 4.43 crores to Rs. 101.92 crores. Other loans and advances fell from Rs. 31.09 crores to Rs. 25.54 crores, of which advances to scheduled banks declined from Rs. 14.64 crores to Rs. 11.59 crores. Ways and means advances were shown at Rs. 3.30 crores (Rs. 3.77 crores).

Irregular fluctuations were seen in silver last week because of speculative activities. There was good uncountry demand, while selling was reported from Bombay. The price rounded off at Rs. 159-14 after Rs. 159 and the ready rate was quoted at a premium of 14 annas. Silver was unchanged at 74d. in London and at 85½ cents in New York.

Gold was comparatively steadier with restricted activity. The price gained fractionally by 6 annas at Rs. 86-6. The sovereign at Rs. 57-10 disclosed a rise of 2 annas.

The statement of the position of Scheduled Banks for the week ended 15th May, 1953, discloses Demand and Time liabilities at Rs. 525.39 crores (Rs. 10.27 crores on account of borrowings from Banks) and Rs. 322.32 crores (Rs. 1.85 crores) compared with Rs. 524.18 crores (Rs. 10.91 crores) and Rs. 321.72 crores (Rs. 1.85 crores), respectively in the previous week. Cash has declined by Rs. 7 lakhs to aggregate Rs. 32.06 crores, while balances with the Reserve Bank have advanced by Rs. 2.24 crores to stand at Rs. 40.58 crores. There is a drop of Rs. 5 lakhs in investments to Rs. 300.68 crores. Advances and bills discounted at Rs. 533.85 crores reveal a fall of Rs. 6.01 crores. The ratios to total liabilities of cash and balances and of advances and discounts are, in consequence, shown at 8.6 percent and 65.0 percent against 8.3 percent and 63.8 percent.

TREASURY BILL MATURITIES

CONSTRUCTION OF INDUSTRIAL SIDINGS

PLEASE DO NOT COMMIT YOURSELF BEFORE
CONSULTING THE RAILWAYS

In your own interest, please consult the
Railway authorities before you decide
to acquire land etc. for the purpose of
building factories, mills, working mines
or such other projects as may require
the construction of special sidings. Please
consult the Railways in advance to find
out if the Railways are in a position to
transport your raw materials and
finished products by rail.

The Railways will extend all possible
help and advice to you in advance
whether or not it will be practicable to
construct a siding on such a site. Each
case will be examined by the Railway
experts. This will save you unnecessary
delay and expenditure.

Issued

IN THE INTEREST OF TRADE AND COMMERCE
by the
PUBLIC RELATIONS OFFICER, CALCUTTA.

Saint Frères Circular Looms installed in Italy.

SAINT FRÈRES CIRCULAR LOOMS

Hundreds of Saint Frères Circular Looms are in
use—in new factories and old, sometimes working
alongside flat looms—in the Belgian Congo, in South
Africa, Sweden, Norway, Italy, Great Britain,
Germany, Belgium and France.

These looms were originally designed for making
tubular cloth from jute. Deliveries of a Saint Frères
Circular Looms for hard fibres are now available.
Saint Frères Circular Looms are manufactured by
Urquhart Lindsay & Robertson Orchar Ltd., Dundee,
Scotland.

FAIRBAIRN LAWSON COMBE BARBOUR LTD.
LEEDS, ENGLAND.

The J.2 loom (2-leaf, 4-shuttle) weaves single and double
warp plain and tubular cloth for sacks and for the manu-
facture of single width cloth woven in tubular form with
a double false selvage for wrappers, etc.

STOCK MARKETS RECOVER FROM BUDGET UPHEAVAL

TRANSACTIONS UNINSPIRED

London, 27th May.

THE pattern in the stock markets during the
past week remained much the same as in the
preceding one, the worthwhile activity coming at
the end of the period. A pleasing feature of the
late improvement, particularly in case of ordin-
ary shares, was that the upheaval which followed
the budget appeared to have been righted—steady
buying which followed revised investment ideas
and in fact led to a shortage of shares. Gilt-edged
showed hardly any decided trend during the
period and movements were mostly narrow either
way, reflecting purely routine business. However
there was a decided firmness in the closing stages
despite the paucity of business.

Mining shares were on the whole good being
kept going by Continental interest in coppers and
diamonds. Professional and Cape enquiries how-
ever helped to enhance Kaffir prices. Foreign
bonds remained quiet. Periodic two-way move-
ments occurred in Chinese bonds following the
course of the Korean talks but were lower on the
week. Japanese drifted down in the early
stages but this movement was checked latterly by
reports indicating that the economic position of
that country was not as bad as was formerly thought.

Nervousness which characterised all commodity
shares following various peace moves seemed to
have disappeared, being replaced by enquiries for
many of the more substantial concerns. Late in
the week tins showed a number of gains includ-
ing a 1s. rise in Siam Syndicate to 21s., while
Rubbers recovered where changed with United
Sua Betong closing the week at 64s 9d after going
ex-dividend at 63s. 6d. Teas were mostly better,
although most of the gains occurred in Ceylon
estates.

Patchy conditions prevailed in London's money
market during the earlier part of the week with
supplies appearing short at one time but proving
adequate at the end enabling banks to be balanced
with ease. But the situation subsequently
became more difficult as banks called in funds
on a substantial scale and moderate help for the
authorities was necessary to balance books. The
Bank of England Return disclosed that note cir-
culation had increased around £4 million to
£1,523.6 million and bankers' deposits advanced
by about £10 million to £273.2 million. Applica-
tions for £250 million of Treasury Bills amounted
to £343,275,000 of which the former amount was
allotted at an average rate of 47s. 7.94d. percent.
This week's offerings are £260 million.

Oilseeds Mission To Europe

The South African Oilseed Control Board is
sending a two-man mission to Europe to try to
expand markets for South African groundnuts.
They are due to leave on 30th May by air and
the tour will include the United Kingdom,
Belgium, Holland, Denmark, Germany, France
and possibly Italy and Norway. The mission will
comprise the Chairman and Manager of the Board.
The Chairman said that since groundnut production
started on a commercial scale in South Africa in
1928 output had risen from 18,000 to 100,000
tons annually. Production has now reached a
stage where it is advisable to seek further markets
overseas. The United States and Holland particu-
larly had shown interest in South African ground-
nuts and even Australia and Canada had bought
groundnuts from the Union last year. South
in the world—India, Indonesia and China being
amongst the large producing countries, the Chair-
man said.

Hong Kong Gold Prices

Hong Kong gold prices dipped around five points
last week, opening at \$280½ and closing at \$274½
per tael. The decline is attributed to lower inter-
national prices, large arrivals in Macao, lower
United States dollar rate locally and a less gloomy
view of the Korean truce talks. Official offtake is
placed at 7,700 taels and unofficial at 13,000.
Arrivals in Macao totalled 40,000 ounces. Unoffi-
cial reports estimated them at 9,000 taels. Forward
contract totalled 14,000 ounces at U.S. \$39.71 c.i.f.
Macao.

Tea Sales and Stocks

There was active demand for the 23,724 pack-
ages of Northern Indian, Pakistan and miscella-
neous teas and prices of descriptions ruled firm,
with any change in sellers favour. Clean Com-
mon Broken Pekoe, free from stalk, was quoted
unchanged at 40½d. Because of the Whitsun holi-
day and the Coronation, the next London tea sale
will be held on Monday, 8th June.

The present United Kingdom stock of tea is
now down from 124 million pounds to 112
million pounds, about ten weeks' supply, and will
almost certainly go lower over the next few
months before the new Indian tea arrives in Sep-
tember. The situation will at least sustain the price
of tea and may well cause it to rise. Stocks of tea
in London and Provincial bonded warehouses on
May 15th stood at 109,699,485 pounds, compared
with 112,292,355 a week earlier. The amount land-
ed during the week ending May 15th totalled
6,850,200 while deliveries totalled 9,443,070.

A DITCHER'S DIARY

mantras at the coronation, which began coyly:
"Really modesty prevents us to trumpet our own
blow..." Someone else recalled how at the last
coronation a field-marshal lost his plumed hat
when his mount played up, and rode most of the
route backwards and bare-headed. A genuine news
story that would cheer anybody up was published
last week about a man who insured against his
wife having triplets, to the tune of £3,000 and, when
it became plain that she was indeed about to have
triplets, he insured against their all being boys.
They were. So you see what the Press can do when
it tries. A little more news of that sort and this
column would be easier to write.

It is agreed apparently that the Eden Gardens
sports stadium is not big enough, metaphorically
at least, to hold both cricket and football, and the
footballers will have to find somewhere else to
stage their major engagements in Calcutta. Un-
fortunately, two of the five sites put forward as
alternatives are also on the Maidan and thus there
is a danger that another shocking eyesore
such as now disfigures the Eden Gardens will be
thrown up on the only respectable stretch of
parkland in the city. This unpleasant possibility
was mentioned in the papers on the same day as
it was reported that the citizens of Melbourne
have got themselves into a frenzy about whether
parkland should be sacrificed for a site for the
1956 Olympic Games. The Victorian Government
has decided that it should not be, and somebody
or other has resigned in protest. I suppose the
city of Melbourne has more parkland than
Calcutta, even without taking account of the vast
difference in population, but its citizens evidently
feel that the worship of organised sport should
not be allowed to despoil its parks. I hope a
sufficient number of influential people feel the
same way about Calcutta's maidan if the proposal
to build another stadium gets any further.

Anglo-Iranian without Abadan seems to be
managing much better than Iran without Anglo-
Iranian. Sir William Fraser's report to stock-
holders, a summary of which is published on
another page of this issue of Capital, shows what
energetic efforts the company is making to com-
pensate for the loss of crude oil production and
refining capacity which it sustained when its
properties in Persia were nationalised on terms
tantamount to confiscation. Last year was the
first full twelve months that the company has had
to operate without its concessions and installations
in Persia, and in that time it expanded its produc-
tion of oil by nine million tons over 1951. A
further ten million tons is expected this year from
Kuwait, Iraq and Qatar but even then the loss of
32 million tons from Persia will be far from made
good. Similarly with refining capacity; great
progress has been made and further additions
are due this year and next, but there will still
be some way to go before the throughput of
Abadan is equalled. This is a story of extra-
ordinary resilience in adversity, which Dr.
Mossadek must contemplate with mixed feelings.
While all development work in Persia has come
to a standstill, and much ordinary economic ac-
tivity too, the Anglo-Iranian Oil Company has been
able to spend £57 million on development last
year and will spend no less than £75 million this
year—while it increases the production of oil in
the Middle East, continues the search for new
deposits in every corner of the globe and builds a
chain of refineries from Kent to Kwinana. The
loss to the miserable people of Persia which this

signifies will give no one pleasure, but Dr.
Mossadek put so much spite, stupidity and stub-
bornness into the conduct of the negotiations with
the company that one cannot forbear from ex-
pressing admiration for its achievement.

Mr. H. T. Ensor of Lloyds Bank naturally had
British banking in mind when he said before the
Institute of Bankers last week: "I feel very strong-
ly that with running expenses and staff costs at
such high levels there is a great danger that...
banking might well become too expensive for the
for the ordinary private customer—a development
which would be most regrettable". But similar
fears might be entertained in India where bank
employees have for years been pressing for wages
and amenities which would inevitably raise the
cost of banking facilities to customers. Actually
the banks have been most conservative in bring-
ing their charges into line with the cost of other
services, which have increased so considerably in
the last decade; but the private customer (as dis-
tinct from the business house, which will always
have to use a bank) can at a pinch do without a
cheque account and if the bank is obliged to charge
him more than he thinks the security and conveni-
ence are worth, he will. Many moneyed people in
this country in fact manage without a bank ac-
count, and the effort to spread the habit of paying
by cheque will be frustrated if the contingency
foreseen by Mr. Ensor arrives. The unions, who
would be responsible for this state of affairs, might
take note of Mr. Ensor's statement that British
banks are now using all available technical aids
to cut costs—mechanical equipment, credit clear-
ings, photography, television and electronics. The
latter in particular had "ever-increasing poten-
tialities", and Mr. Ensor felt that in regard to
such techniques "banks must be receptive of new
ideas even though they may be considered revolu-
tionary".

The following is alleged to be an extract from
the report of a Productivity Team after a visit to
a symphony concert in the Royal Festival Hall:
"For considerable periods the four oboe players
had nothing to do. The numbers should be re-
duced, and the work spread more evenly over the
whole of the concert, thus eliminating peaks of
activity. All the twelve first violins were playing
identical notes. This seems unnecessary duplica-
tion. The staff of this section should be drasti-
cally cut; if a large volume of sound is required
it could be obtained by means of electronic
amplifier apparatus. Much effort was absorbed
in the playing of demi-semi-quavers. This seems
an excessive refinement. It is recommended
that all notes should be rounded off to the nearest
semi-quaver. If this were done it would be
possible to use trainees and lower grade opera-
tives more extensively. There seems to be too
much repetition of some musical passages.
Scores should be drastically pruned. No useful
purpose is served by repeating on the horns a
passage which has already been handled by the
strings. It is estimated that if all redundant pas-
sages were eliminated the whole concert time of
two hours could be reduced to twenty minutes
and there would be no need for an interval. The
Conductor agrees generally with these recom-
mendations but expresses the opinion that there
might be some falling-off in box-office receipts.
In that unlikely event it should be possible to
close sections of the auditorium entirely, with a
consequential saving of the overhead expenses—
lighting, attendance, etc." If the worst came to
the worst the whole thing could be abandoned
and the public could go to the Albert Hall
instead.

Bombay

NATIONAL RAYON TO EXTEND PLANT NEED TO REDUCE TEXTILE INDUSTRY'S COSTS EMPHASISED

(FROM OUR OWN CORRESPONDENT)

24th May.

TWO important company meetings took place in Bombay last week. Even before the annual general meeting of the National Rayon Corporation, which went into full production during the year ended 31st December, 1952, it was known in market circles that the Company had done very well and that it was proposed to pay off all arrears on preference shares. Mr. Kastur-bhai Lalbhai, who presided in the absence of Sir Purshotamdas Thakurdas, Chairman, revealed that the management thought that ordinary shareholders might get a return on their investment next year. He pointed out, however, that before paying a dividend of more than 6 percent on the total paid-up capital, permission would have to be obtained from the Industrial Finance Corporation which had given the Company a big loan. During 1952, the Company increased its production to 5.6 million lbs., which was 10 percent higher than its rated capacity, and it is hoped during the current year to increase it to 7.2 million lbs. The import policy of the Government enabled the Company to dispose of its accumulated stocks at an economic price and Mr. Lalbhai hoped that the Government would continue its policy of permitting imports only to the extent necessary to bridge the gap between

local production and national requirements. To reduce this gap the Company has decided to expand its plant, financed from its own resources without raising further capital. In reply to a question from a shareholder, the acting chairman explained that it was not proposed to start a pulp plant to supply the basic raw material of the industry since the total consumption of pulp in India was not large enough to justify expansion in this direction. Only after the rayon industry had made considerable progress would the question of establishing a pulp plant be considered.

Sreenivas Cotton Mills Ltd. also held its annual general meeting last Thursday. Mr. G. D. Somani, Chairman, who is a prominent leader of the Bombay Millowners' Association and who was its Chairman last year, discussing the outlook for the industry, stated that because of consumer resistance, lack of purchasing power in the internal market and increasing competition abroad, the greatest need of the textile industry at present was to lower production costs. Present high production could be maintained only if the industry was able to bring cloth prices down. Unfortunately, he said, the Government failed to realise this and the industry was being forced to carry increased burdens. Detailing these burdens, Mr. Somani stated that apart from those arising from extensive labour legislation there was the change from the single to multi-point sales tax by the Bombay Government, the levy of additional excise duty on cloth to assist the handloom industry and the drastic upward revision in the excise duty on fine and superfine cloth in the last Finance Bill. Mr. Somani said the industry looked to the Enquiry Commission which was engaged in an elaborate examination of all sectors

of textile production to recommend measures to reduce these burdens and enable the industry to renovate and modernise its plant and machinery, on which the future of the industry depended. Mr. Somani warned the Government that it should not be complacent about the increased production during the first four months of this year as the industry still faced many problems and unless a constant watch was kept and necessary action taken in time the industry might well lose much valuable ground.

Swiss Rail Coach Factory

Switzerland has been supplying coaches for Indian railways and it seems that railway coach builders in Switzerland consider that there will be a permanent demand for Swiss built coaches in this country for some years. It is therefore proposed by the Swiss Car and Elevator Manufacturing Corporation to build a factory to manufacture railway coaches in India, so as to reduce costs. Mr. G. Steiner, a director of the firm, arrived here last week in connection with this project. It is understood that the proposed factory is to be located at Madras where Mr. Steiner will go in a day or so after consultations in Bombay. From Madras, Mr. Steiner will be going to New Delhi to discuss the question with the Railway Board. It is not yet known whether this is going to be an entirely Swiss concern or one in collaboration with Indian capital.

Protection for Pencils

While admitting that the expansion in the productive capacity of the pencil industry from 4.55 lakh gross to 11 lakh gross was gratifying, Dr. B. V. Narayanaswamy Naidu, presiding at the Tariff Commission's enquiry on protection, stated that there had been no corresponding increase in actual production. Dr. Naidu disclosed that production was 117,691 gross in 1950, 242,549 gross in 1951 and 150,589 gross in 1952. Dr. Naidu said that the industry was first granted protection in December, 1950 on the recommendation of the then Tariff Board by converting the revenue duty of 25 percent ad valorem or 1 anna per dozen, whichever was higher, plus a surcharge of 20 percent on black lead pencils, and of 37.5 percent on coloured and copying pencils into equivalent protective duties. Later the rate of pencils was revised to Rs. 0.3-6 per dozen. Though granted for a period of two years, protection was subject to review at the end of the first year and on the recommendation of the Tariff Board protection was extended to December, 1952. As the Tariff Commission could not undertake a further enquiry before the expiry of the period, protection was again extended by the Government up to the end of this year. Dr. Naidu observed that the increase in the capacity of various units without a corresponding rise in actual production was likely to prove detrimental as it would merely inflate costs. The industry's case at the enquiry was that it had to work under certain difficulties such as illicit imports, liberalisation of the Government's import policy and prejudices on the part of the consumers.

U.S. Ambassador's Visit

Mr. George V. Allen, the U. S. Ambassador in India, arrived on his first visit to Bombay last Friday evening. Yesterday, he went to Bulkar, Gujarat to open the new manufacturing plant of Mr. Allen said that Mr. Dulles's visit to New Delhi had been very successful and that the U. S. Secretary of State was able to meet and talk with most members of the Government. This visit had also helped to give Mr. Dulles a better understanding of the problems of this country and was likely to prove the first step toward closer co-operation between India and his country. Mr. Allen will leave for Madras tomorrow morning.

Impending Naval Dockyard Strike

A general strike in the Indian Naval Dockyards by its 5,000 civilian workers now appears to be a certainty. A ballot of the members conducted by the Indian Naval Dockyard Employees' Union to hand in strike notices has resulted in more than 75 percent of the workers voting in favour of a strike. The managing committee of the Union met last Friday to consider the results of the ballot and it was decided to give notice to the authorities of the impending strike which will start on 15th June. In the meantime, the workers will be observing a Demands Day next week. The secretariat of the Union stated after the ballot that even at this late hour the workers were prepared for an honourable settlement. Demands include the recognition of the Union, the implementation of wages as recommended in the Kalyanwala and Gadgil reports and reinstatement of retrenched employees.

OOREGAUM TO CLOSE

The Government of India has decided to permit the Ooregaum Gold Mining Company of India to close down after 31st May, its mine in the Kolar district whose operation has become "uneconomic."

London

LABOUR PARTY DEBATES NEW PROGRAMME NATIONALISATION OF CHEMICAL INDUSTRY SKIRTED

(FROM OUR OWN CORRESPONDENT).

23rd May.

THE National Executive Committee of the Labour Party has completed the drafting of the new policy statement, which is expected to be published shortly after the Coronation. The essential features of this document have already been outlined in a previous despatch. In fact, there was only one point at dispute when the final meeting took place; whether or not nationalisation of the chemical industry should be included. The T.U.C. urged that there should be a public inquiry before any decision was taken on this subject. The Labour Party, on the other hand, favoured the proposal to acquire 51 percent of the shares of half a dozen of the major chemical companies, including I.C.I. The advice of the T.U.C. was finally overridden to the extent that a commitment for "a substantial measure" of nationalisation of the chemical industry has been accepted as being "in the public interest" but has been accepted to the extent of leaving it to the next Labour Government to set up an inquiry to determine the extent and method of acquiring public control.

The Bevanites are apparently very much to the fore, and Mr. Bevan himself is believed to have put forward his own alternative version to the official draft, which was described by some of those present as "brilliant" and "sparkling" while it was also suggested that members of the National Executive who are professional writers should assist in polishing the final draft. Not very surprisingly, seeing that the majority of these are Bevanites, the suggestion was defeated and the task was left to Mr. Morgan Phillips. Subject to any amendments which may be made to the statement at the next annual conference, this policy will represent the basis on which Labour will fight the next General Election.

Parliamentary Business

Once again this week it has been demonstrated in Parliament that it is when things are going most smoothly and quietly that the Whips have to be most vigilant. The programme before the House of Commons provided ample scope for controversy, and yet somehow it proved to be a comparatively quiet week. There were probably three explanations for this. Firstly, there may have been some slight carry-over of the unanimity engendered by last week's foreign affairs debate; secondly, the recess over Whitsun and the Coronation lay just ahead; and thirdly, the Government, aided both by foresight and accident, were enabled to divert attention by a succession of important and useful announcements. Mr. Angus Bevan made the most of his brief, during the debate on the National Health Service last Monday, referring to the Guillebaud Committee that has been appointed to inquire into it as "a deep and calculated manoeuvre," "a subtly laid plot" on the part of the Government to cut the service. The Health Minister, Mr. MacLeod, met these charges and refuted them adequately enough, but he undoubtedly clinched his case by announcing that the Government had decided to appoint a number of investigations into the cost of proprietary medicines, whose prescription under the Service were increasing, where the preparations seem to be particularly expensive. The Opposition motion was easily defeated.

On Tuesday and Wednesday, faced with some 50 or so amendments plus a number of new clauses tabled for consideration, a start was made on the Committee Stage of the Finance Bill. The points were debated rather light-heartedly, which explains why, perhaps, following the defeat of two amendments by majorities of 14 and 19, some 20 or more Conservatives absented themselves without pairs, and it was only after a last-minute round up and not a little anxiety on the part of the Whips that a third was rejected with a majority of no more than four votes—the lowest of this Parliament. It rose to 11 on the final division that day, and subsequently was more or less stabilised. So far, the Treasury has opposed all compromise on its proposals.

Meantime, day by day, Mr. Churchill has found opportunities during question time to carry the House with him in a gradual unfolding of such vexed points in connection with foreign affairs as the truce talks in Korea and the possibilities of high level discussions on the international situation as a whole, culminating in his dramatic announcement on Thursday of a probable meeting next month in Bermuda of President Eisenhower, the French Prime Minister and himself with the prospect of preparing the way for talks with Russia. From the political point of view, it was a good week for the Government, for there was more to come.

Iron and Steel Board

Thursday saw two other announcements made to the House of Commons. The Minister of Supply, Mr. Sandys, gave the names of 11 members of the Iron and Steel Board, including three members of the General Council of the Trades Union Congress, while Mr. Lennox-Boyd, the Minister of Transport, gave the composition of the Road Haulage Disposal Board, with Sir Malcolm Trust-

ram Eve as Chairman. The Opposition was given little scope for criticism. As regards the first, the only point Mr. George Strauss raised was a doubt about the extent to which whole-time members would be allowed to take up other appointments, which Mr. Sandys met by replying that he would follow the precedents set by Mr. Strauss and Lord Wilmot. Labour was rather more critical of the second Board, but much of the sting was removed by the selection of the chairman, whose excellent work on the War Damage Commission and, more recently, on the Distribution Committee of the Floods Relief Fund, leaves no doubt regarding his complete impartiality. The attack was concentrated on the inclusion of Mr. Farmer, who until the day before was a National Vice-Chairman of the Road Haulage Association, as a part-time member, on the ground that it was a departure from tradition to include a representative of interests that might benefit from the Board's activities. On the whole, however, the composition of these Boards has been skilfully devised and they will be widely approved.

For the record, the names are: Iron and Steel Board—Sir Archibald Forbes, Director of Spillers, the millers, and former Chairman of the old Iron and Steel Board from 1946 to 1948, Chairman; Sir Lincoln Evans, General Secretary of the Iron and Steel Trades Confederation, Vice-Chairman; Mr. Robert Shone, Director of the British Iron and Steel Federation (all three whole-time members); Sir Andrew McCance, Joint Managing Director, Colville's Ltd.; Mr. N. Rollason, Managing Director, John Summers and Sons; Mr. J. Owen, General Secretary, National Union of Blast Furnacemen; Mr. W. Beard, General Secretary, United Pattern Makers' Association; Mr. J. Shaw, Chairman, Allied Iron Founders Ltd.; Mr. C. Connell, President, Shipbuilding Conference; Sir Percy Lister, Chairman, R. A. Lister and Co.; and Mr. G. Beharrell, Managing Director, Dunlop Rubber Co. and Past President, Society of Motor Manufacturers and Traders (all part-time members). Road Haulage Disposal Board—Sir Malcolm Trustram Eve, Chairman; Mr. F. J. Orchin, Chief Financial Officer to the Road Haulage Executive, 1948-50, Deputy Chairman (the only full-time member); Lord Rusholme, Member of the British Transport Commission since 1947; Mr. Gordon Graham, former General Manager, Morris Commercial Cars; Mr. R. H. Farmer, Managing Director, Atlas Express Co.; and Mr. J. W. Greenwood, former Transport Manager, Thomas Firth and John Brown.

Wage Demands

It is the present rather than the future intentions of labour which occasion the greatest anxiety at the moment. It is becoming increasingly evident that another spate of wage demands threaten not only relations in industry but the prospects of the export drive. In spite of the warnings of the more responsible leaders for a realistic approach to the question in view of the seriousness of the economic situation and the severe competition in world markets—which, admittedly, they have combined with simultaneous warnings to the Government for the necessity to hold the cost of living—wage demands have already been put forward, or will be put forward in the course of the year, covering a very large section of the working population.

The most serious at the moment are the claims of the engineering and shipbuilding employees for a 15 percent increase, which was finally decided upon last Wednesday, which affects about three million workers and will add some £120 million a year to the industries' costs of production. One and a quarter million workers in the retail and distributive trades have asked for a 15 shillings per week rise; the building workers' claim for an additional 6d. an hour has been sent for arbitration; 162,000 postal workers are asking for increases averaging £1 a week; 280,000 cotton workers want an extra 10 percent; and 700,000 farm workers have put forward a claim for a substantial wage increase. That is a formidable tally in itself, but in addition the question of demanding further wage increases are also under consideration by the railwaymen and the miners.

Arbitrage Operations

Dealings on the new multilateral basis in the leading European currencies started on the exchange market this week. In accordance with expectations, the amount of actual business passing is comparatively modest, though it is thought that in due course it will result in additional foreign exchange business. It has been welcomed most of all, however, as being another step towards a return to more normal conditions.

New Chairman of I. C. I.

When Mr. John Rogers resigns from the Chairmanship of Imperial Chemical Industries on June 30, at the age of 75 and after 54 years' service with the company, he will be succeeded by Dr. Alexander Fleck, a scientist who has been with the group since 1917 and became Deputy-Chairman three years ago.

Company Meeting

ANGLO-IRANIAN OIL COMPANY
LIMITEDFIRST FULL YEAR WITHOUT
SUPPLIES FROM IRANPRODUCTION AND REFINING
DEVELOPMENTS

SIR WILLIAM FRASER ON IRANIAN DISPUTE

The 4th annual general meeting of the Anglo-Iranian Oil Company, Ltd., will be held on June 11 in London. The following is an extract from the statement to stockholders by the Chairman, Sir William Fraser, C.B.E., LL.D., circulated with the report and accounts:

The consolidated trading profit for 1952 was £45,354,732 after provision of £14,198,946 for depreciation on fixed assets, allied companies and other trade investments, and oil exploration interests. The gross trading profit thus totalled £59,553,678, comparing with £71,377,882 for 1951, from which depreciation and other write-offs totalling £23,682,949 were provided. 1952 was the first full year during which we had no oil production from Iran and the effect of this deprivation on our business, despite the greatly increased supplies which we obtained from other sources, is reflected in the reduction in our trading profits.

After providing £22,666,344 for taxation on profits, the amount available for reserves and dividends is £25,165,966, compared with £24,233,030 for 1951. Your Directors have allocated £1,000,000 to Preference stock reserve, bringing the total to £10,000,000, and have placed £16,000,000 to general reserve, which now stands at £97,000,000. They have recommended a final dividend on the Ordinary stock of 25 per cent., and in addition a cash bonus per £1 stock of 1s. both less income tax. The total distribution for the year would approximate 7 per cent. on the Ordinary stock plus general reserve.

The Company's issue of £20,000,000 5 per cent. Debenture Stock in January last was largely oversubscribed. The purpose of this issue was to supplement the Company's existing resources in financing the current programme of capital expenditure, mainly on construction and extension of refineries and building construction. This large programme on which expenditure during 1952 was approximately £57,400,000 and during 1953 is estimated at £75,000,000, is designed to maintain the Company's position in the forefront of the highly competitive and progressive world petroleum industry.

Observance of Contracts a Fundamental Factor

Events regarding the Company's interests in Iran since my last statement have been extensively reported in the Press. There have now been no less than five separate major attempts to settle the dispute. On each occasion the proposals were rejected by the Iranian Government.

The proper observance of contracts is a fundamental factor in international trade, and Her Majesty's Government and the Company have stood on the principle, well established in international law, that compensation for losses resulting from expropriation must be prompt, adequate and effective. While the must be prompt, adequate and effective, while the principle regarding compensation is to be preserved, be free to give unfettered consideration to the Company's claims in respect of the loss of the 1933 Agreement. The Agreement remained the unchallenged legal basis for the Company's operations in Iran for eighteen years, the Company, on the strength of

it, being encouraged to make an investment in a foreign country of unpromising magnitude. The facts speak for themselves and entirely contradict Dr. Musaddiq's contention that the 1933 Agreement was never valid.

The Company is at present dispossessed of its property, rights and interests in Iran, thereby suffering grievous losses. The Iranian Government has neither paid compensation nor agreed to a satisfactory basis and procedure for the future assessment and payment of compensation, and the practical effect of the Iranian Nationalisation Laws of 1951 has thus amounted to confiscation.

The Company, therefore, continues to claim the title to all oil derived from the area of its operations in Iran, and has accordingly published announcements in many countries stating that it will take all such action as may be necessary to protect its rights should any concerns or individuals participate in transactions affecting such oil. Legal proceedings have already been taken in Aden, Italy and Japan.

Production and Refining

Crude-oil production in Kuwait, Iraq and Qatar was largely increased during 1952, the total from these three sources of supply totalled some 25,600,000 tons, compared with 16,600,000 in 1951. During 1953 we expect to have available some 35,000,000 tons from Kuwait, Iraq and Qatar.

The Company's post-war programme for increasing its refinery capacity in the United Kingdom is being brought to fruition. The result will be to have expended this capacity over ten-fold, from under 1,000,000 tons per annum pre-war, to 10,500,000 tons per annum by the end of this year, with a corresponding improvement in the diversity and quality of products. The statement also details the Company's expanding refinery operations in Belgium, France, Germany, Italy, Israel, Kuwait, Australia and Aden.

Sales

The difficulties which we have been facing due to the denial to us of supplies from Iran were accentuated in the earlier part of the year by a world scarcity of tanker tonnage available for prompt chartering. Nevertheless, the A.I.O.C. groups sales of crude oil and refined products in 1952 totalling just over 32 million tons showed a decrease of only 3 million tons, or 8.6 per cent., compared with 1951. Our sales of refined products in the markets supplied through our subsidiary and associated marketing companies were above those for 1951, though only by some 21 per cent.

The commissioning of our Kent refinery early in 1953 has effected an important increase in our availability of products of our own manufacture. But the problem of supplying economically our market outlets east of Suez will remain considerable until we can bring into operation the refineries now being constructed at Aden and Kwinana in Western Australia. These are large undertakings; construction work is being pressed forward as rapidly as possible but we cannot expect these new plants to be on stream before the end of 1954. When they are completed, we shall, in conjunction with the expansion of our other refineries, have a total refining capacity of some 30,000,000 tons per annum. Not only will this allow for an appreciable extension of our Group's sales of products, which in 1952 amounted to just under 33,000,000 tons, but also we shall have a chain of refineries well placed to supply our markets throughout the eastern hemisphere.

The volume of our sales during the early months of 1953 has shown an encouraging expansion. On the other hand, market conditions are more difficult. Selling prices have been reduced as a result of lower freight levels and, in addition, the more ample availability of refined products has led to very competitive conditions. Consequently, profit margins today are smaller than was the case in 1952.

Calcutta Markets

BETTER DEMAND IN TEA
DUST SALE

At Internal Sale No. 49 held on 26th May, 1953, there were 31,400 packages of Dust on offer. There was rather more demand than in last week's sale, but even so the majority of teas were up to one anna easier. The few good liquoring sorts were about steady.

There was a good demand at dearer rates for the rather small quantity of Internal leaf teas offered.

COAL FREIGHT RATES
DECLINE

TIME CHARTERING ACTIVE

A FEATURE of the market this week has been the sharp fall in the freight rate of coal from Chinwangtao to Chittagong. The lowest rate reported last week was 53s 9d and two Japanese vessels have now been fixed at 48s for this business. In other markets rates have also fallen, grain from the St. Lawrence to U.K. being done at the low level of 50s 4d, and a fixture of grain from the River Plate to India was done at the cheaper rate of 80s, a reduction of 10s. on the last fixture concluded for this business a month ago.

Calcutta coals have showed only slight activity due to shippers having mostly slight present orders. One end May loader accepted the reduced rate of 60s. for coals to Japan while subsequently 61s. was paid for a June-July vessel. Scrap has been fixed from two ports India to U.K. at 110s. for a June loader and 76s. 3d. was paid for a similar cargo from Bombay to one safe port West Italy for an end May loader. Ore from Vizagapatam to U.S.N.H. was arranged at \$9.50 for an early July vessel.

Further fixtures of coal from Chinwangtao to Chittagong have been done with rates showing a marked downward tendency. A June vessel accepted 51s. 6d. and this was followed by a similar fixture at 50s. while subsequently two Japanese vessels accepted 48s. Coals from Chinwangtao to Japan was also concluded at \$3 for two prompt Japanese vessels. South African coals were done at 50s. for one ship Lourenco Marques to Chittagong.

There was more interest in the Australian market this week, but what ex silo being fixed from West Australia to India at 57s. 6d. and, in contrast to the present weaker tendencies in Eastern markets, a subsequent fixture was done at the harder rate of 58s. 9d. Bulk wheat from West Australia to Karachi repeated at 60s. and from Victoria or New South Wales to Karachi 70s. was paid. Sorghum in bags from Brisbane or Gladstone to India was fixed at the lower rate of 95s. Sugar from Queensland to U.K. remained quietly steady with a further fixture being done at the previous rate of 117s. 6d.

Several fixtures are reported for coals from Hampton Roads to Japan, freights being paid at the lower rate of \$9 and 65s. 6d. for four July vessels, while more prompt fixtures were done at \$9.15 and \$9.25. There was less interest in American coals to the Continent, Hampton Roads to Bergen paid 37s. and to Zeebrugge 35s. 6d. while Hamburg discharge conceded 3d. on the previous rate of 35s. 6d.

Continued interest was shown in the Time Chartering section and 13s. 6d. was paid for a Japanese oilburner for six months trading in direct continuation of her present charter. Representative fixtures include \$2.20 paid for an oilburner for 3-4 months trading delivery off Bombay redelivery U.K.-Continent and 16s. for a similar sized oilburner one West Indies round voyage, delivery London redelivery U.K.

SUGAR MARKET REVIEW

During the week ended 26th May, prices of ready sugar ex-Kantapur delivery were Rs. 29-12 a maund for ordinary grain. Rs. 31 for big grain, and Rs. 29 for old ordinary grain. Stocks amounted to 60,000 bags. Arrivals were about 3,500 bags a day; sales averaged 3,000 bags in the local market and 1,000 bags to Assam. Ex-mill delivery rates for Bihar mills ranged between Rs. 28 to Rs. 29-4 a maund, and prices in Kanpur were steady. About 50,000 bags were being loaded on three steamers going to Madras State.

LINSEED

Prices showed little change last week and some business was reported on a small scale with the undertone of the market rather easier. Sellers were reserved and arrivals were slightly lower than normal. Crushers were in the market mainly to cover their immediate needs, although local merchants and stockists were buying for both some activity in the oil section although buyers were reserved except at lower prices. Export business was at a standstill with prices still very much out of parity. Latest quotations were as follows: May/June Rs. 22-4 per maund, July/August Rs. 22-12 per maund.

Jute

THE COMPETITIVE POSITION OF INDIAN
JUTE MANUFACTURES

IT is not known how far the views expressed by the Jute Bulletin of the Indian Central Jute Committee represent those of the Government of India, but the leading article in the last issue contains the first explanation, apart from avoidance of retrenchment of labour, from an official source of the Government's reason for refusing to agree to the I.J.M.A. proposal to seal sacking looms. The article says: "Despite sympathies with mills' swelling stocks, Government could not be a party to sealing more looms. Even conceding the I.J.M.A. view of a seeming overproduction, to be hustled into production cut would not be in the country's interests. For there is no guarantee that the gap in Indian production will not be filled up by others in the Indian Continent and the South East Asian countries. Already, they have robbed India of her monopoly world catering of packaging." Up to a point that is correct, but only up to a point because the Dundee and Continental mills do not produce much heavy sacking and the competition from them is mainly in hessian. The few South East Asian mills are mainly producers of sacking and curtailment of production of heavy sacking by Calcutta mills would have helped them.

The article goes on to say: "The British and Continental mills have made the most of the chance given them by high prices of Indian goods during early post-partition years, to expand and modernise their production. The big money from their sale of gunnies has brought them more circular looms and automatic cop winding machines. For about a year latterly, they have also enjoyed a special price advantage in the purchase of Pakistani raw jute. Low production cost due to heavy modernisation, cheap raw materials, fine finishing and easy manoeuvrability to changing fashions in the packaging world have all contributed to making the European products both profitable to their manufacturers and popular to their users." It is satisfactory to note the first official, though still evasive, admission that the huge export duties levied by the Indian Government after partition and currency devaluation gave the British and Continental mills the chance to expand and modernise their plant. In fact, as Capital pointed out at the time, high duties amounted to a subsidy to foreign manufacturers. It cannot, of course, be asserted with certainty that if these extravagant duties had not been levied consumers would have got their goods much cheaper, because at the time there was an actual scarcity of goods which was aggravated by quotas and other restrictions; but a large proportion of the money would have accrued to the Indian mills and they would now have had funds for modernisation. Government could have made sure of this and Indian mills would have been in the same position as the British and Continental mills. But the temptation to rake in extra revenue on the pretext of avoiding inflation was too much for the Government and the industry is suffering in consequence. The reductions in duties came too late and were too little.

With the fall in raw jute prices during the current season, the reduction in export duties and the withdrawal of Pakistan's discrimination against India, Indian manufacturers are again competitive with most other jute goods.

Another aspect of the problem is that, though the prices of Indian manufactures have become competitive, they are not remunerative to the mills. Prices have, moreover, risen considerably in the last week or two and, possibly, Indian goods are losing their competitive advantage again. (It is likely, of course, that prices also, be- petitors will have to raise their prices also, because of the rise in the price of raw jute which cause of the rise in the price of raw jute which the applies to Pakistan as well as to India.) The prices of raw jute have risen more than those of manufactures, so the position of mills in India is, therefore, less favourable than it was a few weeks ago. With short and late crops in India and Pakistan now a certainty, there is less chance of the mills getting cheaper raw material to put their manufacture on a profit-earning basis. Nor does there appear to be a likelihood of a rise in the prices of manufactures without a further rise in the prices of raw jute. Further rises in the prices of manufactures will bring renewed complaints from consumers and place jute goods once more within the competitive range of substitutes. The only solution, again, is the total abolition of the world position of jute has radically changed since the duties were first imposed. They now act as a subsidy to foreign competitors; India cannot afford to subsidise foreign industry, so the slogan must be "off with the duties."

SHARP RISE IN PRICES OF RAW
JUTE AND MANUFACTURES

Since last week's issue of Capital was published, there has been considerable excitement in the markets for both manufactured goods and raw jute and prices have risen sharply. Opinions vary as to whether the rise is the result of continued adverse conditions for the new crop or of bear covering and bull buying of heavy goods in expectation of a shortage. Most people attribute the drastic change in outlook to the likelihood of short crops in both India

and Pakistan; this has induced mills to make large purchases of jute in order to put themselves in a safe position until the new crop is available in quantity, which will be later than usual because of late sowings. The fact that mills have had to pay higher prices for their requirements of raw jute has made them very reserved as regards sales of gunnies, so gunny prices have risen along with those of jute. It is noteworthy, however, that heavy sacking which until recently was the mills' chief worry, has led the way in the rise in prices of manufactures while hessian has dragged along behind. It is said that this is because jute sellers have been buying heavy sacking as a hedge against their sales of jute. It may also be that bazar operators now foresee the possibility of a shortage of sacking whereas it may be difficult for mills to dispose of their hessian output now that the ratio has been so drastically altered. Another point of interest is that whereas when the rise in prices commenced the rise in raw jute values was greater than that in gunnies, in the past week they have just about kept pace.

Manufactured Goods: The market was quiet on Wednesday of last week with some holders trying to liquidate because of rumours of impending devaluation of Pakistani currency and similar conditions prevailed at the opening on Thursday. On Thursday afternoon bear covering in B Twills and cornsacks raised prices and there was also reported to be some enquiry from the U.S.A. for hessian and from Australia for cornsacks. On Friday covering business for B Twills and cornsacks met with considerable reserve on the part of buyers and prices were again higher. Good rates were reported to have been paid for grain sacks, of which there is said to be a shortage. Bull buying on Saturday and a sympathetic movement with raw jute took prices higher on Saturday and the market advanced further over the week-end. Good orders were in the market for B Twills but it was difficult to get sellers. Heavy goods have been the main feature of the market throughout the week.

The U.S.A. market is said to be sceptical of the rise in prices in India and, as spot and afloat goods are still being offered at discounts from Calcutta prices, buyers are inclined to delay purchases. It is said that the spot and afloat stocks which amount to the equivalent of about three months' consumption are regarded as sufficient buffer against the rising prices in Calcutta.

On Wednesday morning the market opened lower on account of mill selling and profit-taking by bulls. Quotations were as under—

	Ready	June	July-Sept.
40" 8 oz.	34-14	35	35-4
40" 10 oz.	43-12	44	44-4
B Twills	104-12	105-8	106-8
Heavy Cees (Plain)	103-8	104-8	105-8
Cornsacks	107-8	107-8	107-8

Raw Jute: On Thursday and Friday of last week the market remained quiet with only small business passing but the undertone was fully steady. Assam Bottoms were quoted at Rs. 25. Continued hot dry weather which was reported to be not only hindering further sowing but damaging the young plants made sellers reserved and inclined to hold for higher prices. On Saturday a large group of mills came into the market for Dhubri/Northern Bengal New Crop at Rs 28 basis Bottoms for Aug-Sept shipment and fair business resulted but there were buyers over at the close. Business was done also in Old Crop at Rs 27 basis Bottoms for Dhubri/Northern Bengal and at 8 annas less for Upper Assam. On Monday there was fairly widespread interest and good business was done in New Crop up to Rs. 29 basis Bottoms for Dhubri/Northern Bengal with Upper Assam at 8 annas less for Aug-Sept shipment. European marks were bought at Rs. 33 and Rs. 34.

basis Bottoms for both Local Packing and Dhubri Old Crop while for Marwari Marks buyers paid up to Rs 29 basis Bottoms for Old Crop. Marwari Old Crop Middles alone were dealt in up to Rs 32 for Dhubri/N. Bengal and Rs 31 for Upper Assam. On Tuesday sellers again raised their prices and there was less business. New Crop was done at Rs 34 and Rs 31 for Dhubri/Northern Bengal and Assam Middles and Bottoms, Pakistani Old Crop was done at Rs 35 and Rs 31 for Jat Middles and Bottoms and Upper Assam Old Crop at Rs 28-8 basis Bottoms for white jute and Rs. 29-8 basis Bottoms for Tossa.

The following business was reported:—

Pakistani Jute:
Jat Rs 34 and Rs 30 to Rs 35 and Rs 31 for Middles and Bottoms May-June.

Indian Jute:

Dubri and/or Northern:—Rs. 27 to Rs. 29 basis Bottoms May-June.
Dubri and/or Northern:—Rs. 30 to Rs. 32 for Middles only May-June.
Dhubri and/or Northern:—Rs. 33 to Rs. 34 basis Bottoms for European.
Assam:—Rs. 25 to Rs. 28-8 basis Bottoms May-June.
Assam:—Rs. 28-8 to Rs. 31 Middles only May-June.
Assam:—Rs. 27 to Rs. 29-8 basis Bottoms for Tossa May-June.

Cuttack Tossa Rs. 26 basis Bottoms May-June.
Karimpur Tossa Rs. 24-8 to Rs. 27 basis Bottoms May-June.
Murshidabad Tossa Rs. 23 to Rs. 26 basis Bottoms May-June.

Daisee Rs. 26 to Rs. 29 basis Bottoms May-June.
Mesta Rs. 23 to Rs. 25 basis Bottoms May-June.
Bimbi Rs. 19-8 to Rs. 23-8 F.A.Q. May-June.
Dundee Daisee S. G. Rs. 165 to Rs. 170 per bale.
Dundee Daisee L. G. Rs. 150 to Rs. 155 per bale.
Cuttings (Pakistani) Rs. 72 to Rs. 78 for N.C's (Jat).
Cuttings (Pakistani) Rs. 68 to Rs. 70 for Northern.
New Crop Dhubri/Northern Bengal Rs. 28 to Rs. 31 basis Bottoms Aug-Sept.

Assam Rs. 27 to Rs. 30 basis Bottoms Aug-Sept.
On Wednesday morning the market opened steady and quotations were as under:

Pakistani Jute:
Jat Rs. 31 basis Bottoms June.
Northern & District Rs. 30 basis Bottoms June.

(In Pakistani jute there is a difference of Rs 4 between Middles and Bottoms.)

Indian Jute:

	Landed at mill	per md. basis Bots.	June
Lower Assam	30	Do.	"
Upper Assam	29	Do.	"
Northern & Purnea	30	Do.	"
Murshidabad Tossa	27	Do.	"
Bihar	24	Do.	"
Daisee	26-8	Do.	"
Mesta	26-8	Do.	"
Bimbi	26-8	F.A.Q.	"
Mill Firsts	175	per bale	"
Mill Lightnings	160	"	"
Dundee Daisee S. G.	175	"	"
" L. G.	160	"	"

Mofussi: The Indian markets have been firm and rates have risen on Calcutta advices. Imports are negligible. It is reported that very little jute remains in the hands of growers except in the Jungli districts. The supplies coming forward are mostly from stockists and even they are meagre. Imports into Cossipore are small and daissee imports are also falling off.

In Pakistan, markets in the big centres have been active and prices are rising. There has been a good deal of covering against contracts for export and fair business with Calcutta has been reported at higher prices. Most of the business has been inter-baler and from kutcha balers to pucca balers because of paucity of fresh imports. Imports into Narayan-ganj have fallen to about 5,000 maunds daily.

Except in the sub-montane areas the weather has been hot and dry. Some districts report that seedlings are being withered up by the dry winds. This lings are being especially to the Murshidabad and daissee districts where sowings are also far behind because of lack of rain.

PROGRESS OF INDIAN CROP

In their tenth crop report of the current season covering the week ended 23rd May, Messrs. Sinclair Murray & Co. Ltd. (India) say that weather conditions in Assam have been very favourable with alternate rain and sunshine. The weather in West Bengal and Orissa has been very hot and dry; this has caused poor seed germination and sowings have been suspended. Rivers in Assam are rising but in West Bengal and Orissa are below normal.

DANPUR: The weather has been very hot and dry and a heavy shower of rain is urgently required to enable cultivators to proceed with sowings. Condition of plants is not satisfactory and they range in height from seedlings to 1'. Sowings to date amount to -13/- as against -6/6 at this time last year. The river is abnormally low.

JALPURI ROAD: The weather has been very hot and dry and a heavy shower of rain is urgently required to enable cultivators to proceed with sowings. Sowings to date amount to -13/- as compared to -13/- at this time last year. Germination of seedlings is not satisfactory and immediate rain is required.

RANAGHAT: The weather has been very hot and dry and sowings have been practically suspended. Sowings to date amount to -14/6 as against completed sowings at this time last year. Seed germination has not been good and condition of plants is not satisfactory. The river is below normal.

COSSIMBAZAR: The weather has been extremely hot and dry and heavy showers are urgently required to enable cultivators to continue with sowings. Sowings to date amount to -12/- as compared to -14/3 at this time last year. The condition of seedlings is not satisfactory and rain is necessary to assist their growth.

NOWGONG: Sowings completed -11/6. The weather has been very favourable with alternate rain and sunshine. Condition of plants is healthy and they range in height up to 3' 6". The river is rising and is slightly higher than normal.

GAUHATI: Sowings completed -13/6 (-1/- damaged). The weather has been favourable. A spell of dry weather would be beneficial to allow cultivators to continue weeding. Condition of plants is satisfactory and they range in height up to 4' 7". The river is rising rapidly and is now 3' 4" higher than at this time last year.

DHUBRI: Sowings completed -12/- . The weather has been very favourable. Plants are healthy and range in height up to 3' 6". Weeding operations are going on where necessary. The river has risen rapidly and is 3' higher than last year at this time.

KHARUPETIA: Sowings completed -12/6. Wet and cloudy weather has been experienced but this has not been unfavourable. A spell of dry, sunny weather would be beneficial to allow cultivators to continue with weeding. Condition of the standing crop is satisfactory and plants range in height up to 4' 9". The river is rising rapidly and is now above normal.

DAISSEE DISTRICTS: The weather has been hot and dry and this has proved very unfavourable for

seed germination and for young plants. Sowings are reported to be completed at -10/- as compared to completed sowings at this time last year, but timely rainfall might allow further sowings. Seed germination has been poor and the condition of young plants is not healthy. First weeding operations have commenced.

WEATHER FAVOURS PAKISTANI CROP

In their twelfth crop report for the current season, covering the week ended 23rd May, Messrs. Sinclair Murray (Pakistan) Ltd. say that the weather has been generally favourable but a spell of bright sunshine is now required to promote growth and to enable cultivators to get on with weeding operations. River levels vary on the eastern side but are generally normal for this time of the year. On the western side rivers are rising.

NARAYANGANJ: Sowings completed -8/- . Continuous wet weather has been experienced and this has prevented the crop from making normal progress in growth. Plants, however, are healthy and range in height from 9" in the highlands to 5' 6" in the lowlands. Weeding operations have been suspended due to wet condition of the fields. The river has fallen and is now 1' 6" lower than last year.

DACCA: Sowings completed -8/- . Wet weather has been experienced and a spell of bright sunshine would now be beneficial. The condition of plants is healthy. Weeding has been suspended due to the wet condition of the ground. The river is slightly higher than last year at this time.

CHANDPUR: Sowings completed -7/- . The weather has been favourable with alternate rain and sunshine. Young plants are healthy and are making satisfactory progress and range in height up to 3' 3". Weeding operations have been completed on the lowlands and are going on as required in the midlands. The river has fallen and is now at the same level as on the corresponding date last year.

HAIJIGANJ: Sowings completed -7/- . The weather has been wet and a spell of bright sunshine is now essential to promote the growth of plants and to allow weeding operations to continue. Plants are healthy and range in height up to 3' 3". The river has risen and is now 2' 8" higher than last year at this date.

AKHAURA: Sowings completed -8/- . The weather has been favourable with moderate rain and sunshine. The condition of the crop is good and plants range in height up to 3'. The river level is 1' 3" higher than at this time last year.

ASHUGANJ: Sowings completed -8/- . The weather has been favourable but a spell of strong sunshine would now be beneficial. Plants are healthy and range in height up to 4'. The river has risen and is now 10" higher than last year at this date.

NIKILAMPARA: Sowings completed -6/3. The weather has been wet and cloudy but this has been good for the crop. A spell of bright sunshine would enable cultivators to resume weeding operations. Condition of plants is good and they range in height up to 3' 9". The river level is normal.

SARISHABARI: Sowings completed -7/- . The weather has been favourable with alternate rain and sunshine but a spell of dry weather is required to promote growth and to allow weeding operations to proceed. The condition of plants has improved and they range in height up to 3' 9". The river has risen and is now 2' 7" higher than last year at this time.

SERAJGANJ: Sowings completed -7/- . The weather has been favourable with alternate rain and sunshine. The condition of the crop is improving and plants range in height up to 5' 9". The river has risen and is about 1' higher than last year at this date.

NAKALIA: Sowings completed -8/- . The weather has been favourable with alternate rain and sunshine. Plants are improving under favourable weather conditions and range in height up to 4' 3". The river is rising and is about 1' higher than last year at this time.

BHANGAORA: Sowings completed -8/- . The weather has been favourable. Condition of plants is satisfactory and they range in height up to 3' 6". Weeding is going on where required. The river has risen but is about the same level as last year.

RANGPUR: Sowings completed -7/- . The condition of plants in this district is reported as satisfactory.

DINAJPUR: Sowings completed -8/6. The condition of plants in this district is reported as satisfactory.

U.S. CONSUMPTION AND STOCKS

U.S. consumption in April was somewhat better than expected. For the first four months of this year, the estimated total industry consumption has been 268 million yds., which is 50 million yds. more than for the same period last year. U.S. stocks on 30th April, at an estimated 209 million yds., increased slightly from March and consisted of an estimated 152 million yds. of spots and 57 million yds. more than a year ago. Appearing below are two tables which include the April figures—(1) based on membership reports to the Textile Bag Manufacturers Association and Burlap and Jute Association, and (2) projected to represent the estimated consumption and stocks for the entire industry.

THE FOREIGN JUTE MARKETS

(FROM OUR OWN CORRESPONDENT).

Dundee, by Air Mail.

MOST jute goods producing countries are reporting an improvement in business, which is probably the result of the considerable advance in raw jute prices in Pakistan. Many buyers had been waiting for still lower prices for jute yarns and cloth, but the quick change to dearer raw jute has at least made certain that the bottom has been touched. The most pessimistic estimates of the next crop are likely to be more nearly correct than has generally been supposed. On many occasions in the past, the short crop scare has proved to have been unwarranted, and even yet drastically reduced sowings could be so. The fibre, which may in some measure be due to the lack of response from buyers, who have shown little inclination to pay the advance of anything from £5 to £15 per ton above the fixed minimum prices in Pakistan.

The Jute Controller has bought nothing since the rise began, and Continental spinners have also shown little or no interest, but it has been reported that the Indian jute mills were ready buyers of the better class qualities.

Plantation Topics

REHABILITATION OF SMALL INDIAN-OWNED TEA GARDENS

ANNUAL MEETING OF I.T.P.A.

WE publish below those extracts from the speech of Mr. S. P. Ray, Chairman, at the annual meeting of the Indian Tea Planters' Association at Jalpaiguri on 10th May, which refer to Indian-owned tea gardens:

"The crisis has had a bitter lesson for the estates under Indian ownership and management, the majority of which are below 500 acres under tea. Though the tea industry of India was 100 percent European originally and had a sprinkling of Indian interests after the late eighties and till the first world war, Indian ownership came to occupy a definite space in the industry during the short period between the first and the second tea crises. There was no scope for a new entrant after the International Tea Agreement of 1933.

"The conditions prevailing before the second tea crisis were favourable for the growth of small tea estates. The prices for the raw materials of the industry were easy and not shackled by controls. There was an assured market for tea, labour was cheap and contented; labour unrest and strikes were practically unknown. Factory and labour legislation was in its infancy, and the employers' responsibilities were few and not onerous. An estate under private ownership with a minimum of 150 acres under tea and having a factory of its own, though equipped with ramshackle machinery, was considered as an economic unit, able to pay its way and give a fair return on the capital invested. The Indian section of the tea industry thrived during this brief period.

"The European section of the industry was already firmly entrenched when Indians came pioneering in the field. During the short period that was allowed for its expansion, Indian portion in the capital structure of the industry did not exceed 25 percent. It is believed that a fraction of the capital has changed hands since our independence, but the extent of it has not been ascertained.

Inadequate Reserves

"Criticism was levelled against the Indian estates for their alleged lack of foresight and business acumen, because at a time of prosperity, they did not build up sufficient reserves to fall back upon during a period of adversity. We have met this point more elaborately elsewhere; the present occasion does not permit me to do more than a short summing up of our answer.

"Barring a few notable exceptions, Indian tea interests were not big capitalist ventures in their inception. Small companies formed out of the savings of middle class families or small private proprietors went in for tea. The plantations were opened with low tea acreage; limitations of finance prevented the estates from purchasing new machinery; they had to be satisfied with old and obsolete machinery discarded by the European planters; they could develop only by implementing their meagre capital with loans from small banks or money-lenders at high rates of interest and by ploughing back their profits into the industry.

"The arrest of further expansion of tea in India by the International Tea Agreement, 1933, imparted a finality to the ratio of the acreage of the two sections as the planted areas could not be materially altered in subsequent years. The following figures relating to the tea industry of North East India give a comparative picture of the two sections at the present moment.

	Indian Management.	European Management.
Estates	366	579
Acreage	74,053 acres	4,21,208 acres
Average area per unit	202.3 acres	727.3 acres

"Of the 112 estates affiliated to our Association only 29 were in existence before the first world war and the other 83 were established after 1918.

"What the position would have been if the Indian section were privileged with a period of three quarters of a century to develop and stabilise itself under the most favourable conditions of industrial tranquillity and State patronage, as was permitted to the European competitor, will be a matter of conjecture. Unfortunately for the Indian section, the majority of them had barely a decade to set their house in order when they were hit by the crisis of 1930, and their expansion was crippled by the International Tea Agreement of 1933.

Changing Industrial Conditions

"The period subsequent to the second tea crisis was marked by a revolutionary change of the industrial conditions. This period culminating in the second world war and our Independence saw the awakening of labour, development of trade unions, inflation of currency to an unprecedented degree, the soaring of prices of raw materials for the industry to more than 400 percent over pre-war level, phenomenal increase of labour wages and management expenses, introduction of a series of labour laws increasing the financial burdens of the employers, disturbance of industrial peace by strikes and lockouts, increased taxation and

increased transport charges and the imposition of controls etc., the cumulative effect of which has been a high and rigid cost structure, deterioration of labour efficiency, and the need for increased finance to keep the industry on its legs. Fortunately the adverse circumstances had been counterbalanced by the tremendous impetus which the war gave to increased production within the capacity of the existing plantations; the high cost structure could be sustained only by enhancing production at the sacrifice of quality. This abnormality could continue so long as tea was favoured with a sellers' market till the middle of 1951.

"Circumstances have radically changed since the latest crisis: production has outstripped consumption and tea is selling in a buyers' market. Purchasers have become selective and estates have been compelled not only to concentrate on quality but also to cut down production to stimulate demand. As many items of cost remain constant irrespective of production, diminishing production means increased incidence of costs per pound of tea. We produced cost figures of estates above and below 500 acres before the Rajaram Rao team, to show that the lower area group suffers by comparison with an enhanced cost of -12/- to -13/- per pound. With fine plucking and regulated production the difference in the cost between high and low producing units will increase, and the latter will be faced with the problem of survival.

"Under the changed conditions, an estate below 500 acres will find it extremely difficult to manu-

TINGAMIRA TEA SEED CO., LTD. ASSAM.

We have pleasure in announcing that New Extensions, of scientifically improved seed-bearers, will be coming into bearing this year, and we are therefore in a position to accept additional orders, from Tea Estates situated anywhere in India, for our unrivalled Tingamira & Goipani Assam Tea Seed.

Price Rs. 300/- per maund.
Freight, and packing charges
Rs. 25/- per maund extra.

Orders should be sent to:-

facture teas which could be sold with a margin of profit in a competitive market; the majority of Indian tea estates will come under this un-economic category.

"It is worthwhile mentioning that even many well-established European estates have been compelled under stress of the crisis to close down; not only have their comfortable reserves, built over a number of years, been completely depleted, but they had to incur huge liabilities, which they saw no prospect of liquidating by continuing to manufacture a commodity which could not be sold at profit. Indian estates had no reserves worth the name and they had to finance their annual manufacturing operations with money borrowed on hypothecation of crops. The altered circumstances under the crop restriction scheme will seriously affect the economic character of the Indian estates and will at the same time make the financiers more cautious than ever to advance monies for the running of these estates.

Memorandum to the Government

"In view of the above lessons of the crisis, we have submitted a Memorandum to the Central Government about the ways and means of rehabilitating such of the Indian estates as must be deemed uneconomic under existing circumstances. The need for State aid for their development into economic units has been particularly stressed, as without such aid, these estates will be consigned presently to a moribund state and later on to extinction. We have proposed a limit of 500 acres for the expansion of these estates either singly or in groups, according to their geographical position and other factors. The rehabilitation of these gardens would necessitate an extension of plantations not exceeding 60,000 acres, which might, in the course of the next 15 years, result in an additional production of 60 million lbs. of tea, or 10 percent over India's current potentiality. India's home consumption can and ought to be advanced by 200 million lbs. and there is no reason why, with efficient propaganda, and the standard of living of our countrymen raised with the materialisation of our planning programmes, we should not look forward with confidence to an increased consumption even up to such a modest limit which would easily absorb the whole of the additional production of our rehabilitated estates. It would be suicidal, nay sacrilegious, to condemn a large number of our Indian estates built up with the toils and tears of our own countrymen, by denying them such facilities of development as they have every right to expect from our National Government.

"The tea industry has been nowhere in the picture in the five year plan, possibly because the experts responsible for the planning had been deluded by the fancied security of the industry before the crisis. Now that the bubble has burst, and the crisis has revealed the instability of the industry, particularly of the Indian section of it, in its nakedness, I do hope that the Government will profit by the experience and will find a definite place for the rehabilitation of uneconomic Indian estates in the five year plan. For obvious reasons, the crisis of the industry has taken so much space of my address. I shall now refer to local matters.

Depreciation of Tea Bushes

"Like all animate objects the tea bush has a limited span of life; but what is important to the planter is that its economic life, depending upon the soil, climatic conditions and other factors, does not normally extend beyond 40-50 years. Therefore, while a tea bush might live up to 80 years, its economic life is lost, say after 40 years. Up-rooting and re-planting and/or replacement is a costly method requiring huge sums of money; therefore suitable provision should be made by every tea estate to build a depreciation fund for replacement of old tea bushes. That is only possible if the tea plantation gets a suitable depreciation allowance from the Indian Income Tax and State Agricultural Income Tax authorities in the assessment of taxes. A 2½ percent depreciation would be a reasonable figure on the basis that the economic life is 40 years, and we would request the Government to amend the law with a view to allowing the depreciation."

MORE TEA SOLD IN COCHIN IN 1952

DEMAND FOR GOOD LEAF MAINTAINED

IN their annual tea review covering 1952 Messrs Forbes, Ewart & Figgis Ltd., South India, say that the Cochin tea market has continued to expand and the weight of tea sold from 1st January to 31st December, 1952 was just under 30 million pounds as compared with approximately 21 million pounds in 1951. Forward contract business was very small, there being no contracts made for export and only a few small contracts for internal consumption.

The review continues: "The first sale of leaf teas was held on 12th January with a strong demand for good teas but for other sorts there was only a limited enquiry. Clean common broken pekoes were selling at Rs. 1-7-6 which was eight annas lower than the opening sale of 1951. The market continued on this level until the end of February when low and medium sorts showed some weakness but all good teas continued to sell well. Early in March rates hardened for low teas but by the end of the month prices again declined with clean common B. P. at Rs. 1-6-0. From here on conditions for low teas became worse and worse until at the end of May the price of low B. P. had fallen to 13½ annas per pound, but all good teas continued to find ready support.

"The market stayed at about this level with some slight fluctuations but in the latter half of the year the market became very depressed, particularly for low descriptions which were often very difficult to sell. In a number of auctions withdrawals were very heavy—up to as much as 30 percent of the offerings remaining unsold—this being most noticeable in the second half of November and December.

"A feature of the year has been the continued demand for all good class teas—these have sold well throughout. Producers of such teas, whilst not making the substantial profits of the previous years following the war, are undoubtedly still able to pay their way.

"For the six months of 1952 whole leaf grades—orange pekoes particularly—were a very poor market and there was only a limited demand for such teas. In mid-June, however, the market recovered and black leaf orange pekoes, which were then selling around Rs. 1-6-0, climbed back nearly to Rs. 2 by the end of the year. With Persia in financial difficulties tippy teas have been a poor market and consequently there has been no inducement to producers to concentrate on teas of showy appearance.

"Except for short periods, all classes of fan-nings have been popular with buyers but on the other hand broken pekoes have been hard to move. The sale average of teas sold with export rights from 1st January, 1952, to the end of the year was Rs. 1-9-9 per lb. The average for the previous year was Rs. 1-15-9 per lb. (These averages are ex warehouse Cochin and do not include excise duty.)

"The dust market has been very irregular. Opening prices in January were around Rs. 1-10-6 for clean common types, which was 5 as. lower

than the previous January. Prices gradually weakened to Rs. 1-6-6 by the end of March and by the middle of May rates were down to 15 as. In the middle of July there was a recovery and prices rose to Rs. 1-6-0 by the end of September and to Rs. 1-7-0 in October which was maintained until mid-November, after which the market weakened to around Rs. 1-2-0 at the close of the year."

The review adds: "On the whole best liquoring teas have been rather above the standard of similar types in the previous year. This was particularly noticeable in the offerings during end September to early November. This was caused by lack of rain in the Nilgiri district during August and September, which meant slow growth and consequently some high class teas were produced.

"Low and medium sorts were average throughout but there are still a large number of stinky teas and teas of undesirable appearance, being sent to the market. We must again emphasise that it is in the producers' interests to make neat, clean teas free from stalk and fibre and of even appearance. The size of leaf is also a very important factor—bold mixed broken orange pekoes are not popular. Quite a number of such teas are consistently offered on this market but although they may have liquors of good quality their realisation price is low comparatively because of their poor appearance. Blenders hesitate to buy such teas because they are difficult to packet, unless cut before blending and cutting does not improve tea.

Increased Shipments

"A further increase is recorded in shipments from South India in 1952. Final figures are 71.5 million pounds against 64.9 million for 1951. These figures are for the period January 1st to December 31st. The largest increase is in shipments to the United Kingdom—46.6 million as compared with 39.2 million in 1951. American and Canadian figures are about steady at 8.2 million and 6.2 million pounds respectively. Australia shows an increase of 1.6 million—3.6 in 1952 as against two million in 1951.

"The 1951 crop of 114 million pounds was a record for South India, 1952 started with the first four months showing increases over the same months of the previous year and by the end of April the crop was six million pounds ahead, 38 million as against 32 million for 1951. May and June showed a fall of just over five million pounds. In July there was a slight increase but August and September were down by some six million pounds. October was ahead by three millions but November produced only 8.3 million pounds as against 10.3 in 1951. December, however, showed an increase of approximately three-quarter million pounds and the final figure for the year 1952 was 112.9 million pounds as compared with 114.9 millions in 1951."

GOOD NEW SEASON TEA PRICES EXPECTED

OUTPUT MAY EXCEED PLANNED RESTRICTION

AT the end of their report on the 1952-53 tea season W. S. Cresswell & Co. Ltd., say that "ignoring the final export sale for 1952-53, since it included many rubbishy teas and coincided with the recent excise 'adjustment' it is only too obvious that the opening sale of the New Season on 1st June will see prices at an appreciably higher level than those obtained for all but the best first flush Doora and Darjeeling last year. So far so good, but how far? Stocks in the U.K., the most important buyer in the world for tea at present, represent barely three months' consumption and that is much less than was ever thought practical in pre-war days. These stocks will be replenished when a weight of this season's teas reach England, but it will not be before August or September; so until that time, a steady demand, at remunerative rates for producers, is likely to be experienced. During this period the quotation for clean common broken pekoe may vary little from the quotation in Calcutta on 13th April which, to be accurate within one anna, was Rs. 1-10-0 to Rs. 1-11-0 per lb.

"Of course there is a 'but' to the preceding paragraph, and a very reasonable 'but' in that both sellers and buyers consider Rs. 1-10-0 to Rs. 1-11-0 per lb. for a sweet liquoring broken pekoe, free from stalk, too high. In London, as at 27th April, the quotation was 3s. 4½d. or approximately Rs. 1-12-3 in Calcutta. The general opinion of all sections of the trade would probably suggest Rs. 1-8-0 per lb., being the rough equivalent of three shillings London Auction, as the most equitable price standard."

The review continues: "In view of the voluntary restriction scheme, there are few reasons why our forecast should not continue in the same strain except that producers may be sorely tempted by the prices obtaining in auction to pluck more freely. Against this possibility the extremely severe lesson of last season is likely to deter even the boldest and we are of the opinion that none—for a year or two at least—will resort to coarse plucking. A word of warning to buyers. If prices in the New Season remain at their present level there may well be some relaxation of the agreed quantity to which crop is to be restricted; in fact we anticipate this. Crop figures need watching too, since last season the crop was 22.5

million lbs. ahead by the end of July, whereas at the close of the year it was some 2½ million lbs. short. That position will not be repeated; in fact the crop may well fall rapidly until August, while we are confident that by the end of this year rather more than the restricted quantity—whatever the final figure agreed upon may be—will be manufactured.

Improvement of Quality

"A very definite improvement was noticed during the latter half of last season in both appearance and cup quality. It is important that this standard be maintained, if not improved. Liquors are being increasingly criticised by buyers who, after all, indicate the taste of the consumer; thus even more attention than in the past must be paid to cup quality.

"Last year we indicated that the range between good and poor tea would be wide. This year, assuming that auction prices will remain within a few annas of present levels, there is likely to be less difference and, as always happens when supplies may be short, the poorer types will receive more support than they deserve. We anticipate a good season for both sellers and buyers and, provided that the tea trade is permitted to settle any problems which may arise without outside interference, there should be fewer headaches than usual. We must, however, qualify this rosy picture by suggesting that the cost of production has now been reduced to a level barely covering essentials, and that if present tea prices are maintained, labour may very soon be issuing fresh demands. We close our report by requesting producers to pluck fine and roll hard."

LONDON TEA SALES

At last week's London tea auctions the 72,202 packages on offer realised an average price of 3s 7.99d a pound, against 3s 7.62d the previous week and 2s 9.82d a year ago. Clean common broken pekoe is quoted at 3s 4½d. Results obtained by some of the companies are given below:—

	No. of packages	Average per lb.
Amalgamated	864	3/ 6
Assam Company	1,594	3/ 8
Assam Frontier	1,487	3/10½
Bagracote	257	3/ 4½

British Indian	150	3/ 6
Budla Beta	681	3/ 8½
Buxa Doora	462	3/ 6½
Chargola	177	3/ 4½
Cons. Tea and Lands	1,801	3/ 5
Doora	1,234	3/ 5
Eastern Assam	676	3/ 9½
Halem	408	3/ 6½
Jhanrie	750	3/ 6½
Jokai	1,608	3/ 7
Jorehaut	1,157	3/ 7
Majuli	870	3/ 7½
Malayalam	701	3/ 8½
Mosboud	425	3/ 8½
Singlo	318	3/ 6½
Tingri	936	3/ 8
Upper Assam	420	3/ 6½

COCHIN TEA SALES

At dust sale 'I' held on 9th May 1953, the offerings amounted to approximately 1,50,000 lbs. There was only a fair general demand and prices were irregularly 2 annas easier. The demand for clean, black, well made dusts was maintained.

COLOMBO RUBBER PRICES

The following prices are issued by the Indian Rubber Board from the weekly rubber market report issued by the Colombo Brokers' Association.

Closing prices on 16-5-53:	Average prices for this period
Sheet:	(Rupees per lb.) (Rupees per lb.)
No. 1	1.37
No. 2	1.24
No. 3	1.31
No. 4	1.17
No. 5	1.12

Sht. Cutts 1	.65
Sht. Cutts 2	.80
Crepe:	
R.M.A. 1X	1.14
R.M.A. 1	1.08/12
Crepe 2	1.02½
Crepe 3	.95

Sc. Crepe 1	cts .78 Nom	cts .80
Sc. Crepe 2	cts .74/76	cts .75½
Flat Bark	cts .70/73	cts .71½
Sc. Crepe 3X		73½

To arrive at f.o.b. Colombo prices add 20 cents per lb to the above market prices.

JOINT STOCK COMPANIES' PREFERENCE SHARES

Dividends are cumulative and the shares carry a preferential claim on the property for the payment of capital and on the profits for dividend except in case of companies marked otherwise. (For reference see notes below.) Months against names of companies indicate approximately times of payment of dividends.

COAL COMPANIES

O, P, F and D, indicate Ordinary, Preferred Ordinary, Founders' and Deferred shares, respectively. P next to the name of the company indicates that the company also has Preference Shares. Figures in "accounts closed" column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer to the Key (last page) under the numbers indicated.

TEA COMPANIES

O, Po and Dd indicate Ordinary, Preferred Ordinary and Deferred Shares, respectively. P next to the name of the company indicates that the Company also has Preference Shares. Figures in "accounts closed" column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer to the Key (last page) under the numbers indicated.

MISCELLANEOUS COMPANIES

O, Po, C and Dd, indicate Ordinary, Preferred Ordinary, Contributory and Deferred Shares, respectively. P next to the name of the company indicates that the company also has Preference Shares. Figures in "accounts closed" column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer to the Key (last page) under the numbers indicated.

DEPRECIATION AND REPLACEMENT IN INDIAN INDUSTRY

HIGH TAXES AND INFLATION RETARDING INDUSTRIAL PROGRESS

THE discussion of depreciation allowances and methods of financing replacement at the meeting of the Central Advisory Council of Industries last Friday in Delhi did not come to much. The Federation of Indian Chambers of Commerce and Industry laid before the Council a definite plan to provide more resources to industries for the purchase of new plant. To this the Finance Minister replied on behalf of the Government that he realised that the problem was a serious one, but he was sorry that governmental assistance was both politically and economically impossible. The representative of labour made the customary references to "exorbitant profits and managing agents' commissions" and, finally, a section of industrialists who were evidently not wholly in favour of the Federation's specific proposals made a general appeal to the Government to give "some positive encouragement" to industry to set aside funds for rehabilitation. There the matter seems to have been left. It is easy to find faults in the scheme put forward by the Federation, and it is just as easy to censure the Finance Minister for his apparent insouciance before a grave matter of national importance. But the case is complex and there is much to be said for various ways of approaching it; last Friday's discussion at least had the merit of defining more clearly the differences between these various approaches.

In general terms and in normal times there can be no doubt that the Finance Minister is right when he says that the problem of rehabilitation is one for industry itself to solve. The replacement of productive assets is in every sense a normal charge on the business itself, and to argue that the State should finance the purchase of new plant is to surrender those principles of free enterprise which business men are accustomed to press when the State wishes to interfere with them in other ways. There are numerous objections, both political and economic, to the State exempting from tax certain profits which will then be used to earn more profits. Government assistance in the creation of new capital assets would inevitably bring the State into uncomfortably intimate association with private enterprise and would in respect of some industries lead on to gradual nationalisation. The experience of the Indian aviation companies and of the British coal industry are two recent examples of this process.

These reflections, we say, apply in general terms and in normal times. But where a Government is itself responsible for creating and perpetuating inflation—which is of course the basic cause of the whole difficulty—when it imposes on industry the rigidity of the welfare state, collects taxation at penal rates and sets limits to the profit-making ability of productive enterprise, then it cannot wash its hands of the matter quite so easily. To tell industry that it must find the funds for rehabilitation when the Government frustrates all efforts to earn those funds, is inconsistent to say the least. And when the Government goes further and calls for a rapid expansion of productive facilities at the same time as it requires industry to finance the welfare state, it is simply guilty of wanting to have its cake and eat it too. It is ironical to hear Messrs. Krishnamachari and Deshmukh exhorting the representatives of Indian industry to shed their restrictionist hesitations and to become bold, brave, adventurous entrepreneurs when the Government of which they are part is erecting an iron framework to contain, even to suppress, any sign of industrial enterprise. In an economy in which the earning of substantial profits is taken as *prima facie* evidence of lack of social conscience, it is idle to suppose that industry can meet all the charges of current business, pay its labour and shareholders, satisfy

the tax-collector and still have enough left over to buy new equipment at prices which have been inflated by decades of global over-spending.

We do not draw from this the conclusion that therefore the Government should agree to some patchwork formula for the financing of rehabilitation, and leave everything else as it is. Such a course would encounter all the objections the Finance Minister put forward last Friday—political allegations of favouritism, anxiety among labour and taxpayers, the long line of Oliver Twists asking for more, and considerable procedural and legal difficulties. The more obvious answer is that if inflation and excessive taxation are hindering the modernisation of productive equipment, then the Government should do something about inflation and excessive taxation. To accept inflation and present rates of taxation and to seek ways of mitigating their incidence on certain sections of industry would be to assume that prices must forever go on rising and that taxes must forever remain at high levels. This is not the case, as the world has been reminded in the last two years. Part of the criticism that orthodox accountants have attracted for their unwillingness to agree to new-fangled accountancy procedures has been endured because of their reluctance to accept as irredeemable the inflationary conditions of recent years. Moreover, makeshift arrangements designed to extenuate the consequences of inflation have a way of worsening the original inflation itself; sliding wage scales and dearness allowances are examples familiar to all employers. The Finance Minister plainly had this danger in mind in connection with "dearness allowances" for capital assets when he said that whatever was done "should be done, so to speak, without any inflationary processes and the resources of the public sector should be utilised for corrective measures only if they were in the general interests of the country".

If the Government's responsibility is limited to suppressing inflation and revising rates of taxation, the Finance Minister would reply that the Government of India has already done as much as can be expected of it: the galloping inflation of the postwar years has been halted, perhaps even reversed, and a commission has been appointed to investigate the whole tax structure. All that needs to be said, Mr. Deshmukh might reply (and in fact did reply last Friday), is that industry must wait until Dr. Mattha's commission has reported the year after next and meantime hope that inflation will be successfully held in check. But this evasive response would only show that the Government has not grasped the size and the urgency of the rehabilitation problems of Indian industry. The memorandum prepared by the Federation of Indian Chambers of Commerce and Industry may have been too sanguine in its prescriptions but there can be no doubt that it was based on a realistic assessment of the degree to which Indian productive capacity has become decre

DEFECTS IN THE WHOLESALE PRICE INDEX

MORE QUOTATIONS AND REVISED WEIGHTS NEEDED

THE wholesale price index prepared by the Economic Adviser to the Government of India is one of the most closely watched products of the official statistical machinery and has in recent years gained increasing importance as an indicator of economic trends. It has been an indicator of the success or failure of efforts to control inflation and the accuracy with which it reflects price movements is therefore a matter of special concern. Although it is not easy to point to actual technical flaws in its construction, it does have several important deficiencies. One of the main criticisms directed against it is that it is not comprehensive enough and unless the number of commodities and quotations used in compiling it is increased it cannot be held to represent price movements in a vast country in which multiple markets are the rule because of poor communications, primitive marketing organisations and defective grading and standardisation of commodities. A recent issue of the *Tata Quarterly* points out that the use of a pre-war year (1938-39) as base also makes the index unrepresentative, even within the limited field it covers. It does not recognise the greater importance manufacturing industry has acquired during and since the war, nor does it make sufficient allowance for the consequences of partition. Considering the fundamental changes which have taken place in the pattern of trade it is necessary to redistribute weights according to the present relative importance of the various commodities. The *Tata Quarterly* makes a shrewd point when it refers to the element of duplication involved in weights for some manufactures being based on gross market value instead of the net addition to value which occurs in the process of production. Raw cotton, for instance, is first entered at its market value and again when cotton yarn and cotton cloth are counted at their full values. By this procedure of "multiple counting" products like jute and cotton textiles influence the index more than they should while commodities appearing in only one group index (such as coal, glass and cement) suffer. In calculating "weight," furthermore, account is not taken of two important factors—exports and imports. Export commodities are weighted in proportion to total production, instead of to the total supply remaining in the home market after export, while the large volume of industrial goods which are imported are not represented in the index.

The distorted picture of general price movements produced by incorrect weightages, says the *Tata Quarterly*, could to some extent be overcome by studying the behaviour of commodity indices rather than of the general index. The reliability of a commodity index depends on the number of quotations taken and their quality (that is, approximation to actual market conditions). The larger the number of quotations, the more the money that has to be spent on collecting them; but the expense is certainly worthwhile, at least in the case of important commodities such as rice, wheat, raw cotton or cotton manufactures. The index for rice, for instance, which has a weight of 11.2 percent in the general index, is based on only three quotations whereas that for shoes, with a weight of 1.2 percent, is made up of eight. Similarly, wheat with a weight of 3.7 percent has three quotations but tyres and tubes with a weight of 0.3 percent have nine. Turning to the qualitative aspect, the *Tata Quarterly* goes on to point out that of the three quotations for rice two represent controlled rates and one ("red rice" in Patna), which is a free market quotation, refers only to a very small area around Patna. In the case of wheat the only open market quotation ("ordinary" wheat at Jubbulpore) again merely has local significance. These "free" quotations have considerable influence on their respective commodity indices but do not necessarily reflect changes in the food economy of the country as a whole.

In the case of raw cotton, which has the largest weight in the Industrial Raw Materials group, five quotations are used but none of these represents Egyptian or American cotton which together account for about one-third of the Indian mills' consumption. It is suggested that the index could be improved by including a quotation for "kapas" or unginned cotton which mainly determines prices outside the controlled sector. The limitations imposed by the fact that India is a vast but undeveloped economy are obvious enough but the official wholesale price index has now attained sufficient importance to deserve greater care, labour and expense in order to make it a more reliable indicator of economic trends. Considerable attention has been given to improving methods of calculation and as new statistical techniques are developed they will no doubt find wider application in this country. More urgent, however, is the need to improve the

collection and communication of primary data, to ensure that such data are accurate and that they are collected from a diversity of sources that is commensurate with the diversity of Indian economic conditions.

CURRENT COIN

Safeguarding Trade Marks.—The formation of the Trade Marks Owners Association of India Ltd is a commendable effort on the part of trade and industry to check the infringement and counterfeiting of trade marks. The Association owes its birth to commercial initiative and official support. As long ago as November 1951 Mr. C. S. Pettit, then President of the Bombay Chamber of Commerce, told representatives of the Chamber and other trade associations that the law had proved inadequate; while its amendment was being considered the Government had suggested that trade marks owners "form an association to assist in co-ordinating the detection of infringements and in undertaking subsequent legal and other measures." A special sub-committee was therefore appointed to prepare a draft constitution and to organise an all-India association. The Association which has now been formed will safeguard the interests of all proprietors of trade marks, trade names and other analogous rights, and will encourage them to co-operate on common problems arising in India and foreign countries. It will support legislation to promote their interests and will provide legal and other assistance to owners of trade marks etc. when the Executive Council of the Association considers this necessary. Applications for the registration of trade marks etc. will be opposed where the Executive Council believes them to be harmful. The Association will help settle disputes between its members on matters relating to trade marks and trade names by appointing arbitrators or assessors and will provide facilities to distribute information and statistics. Full powers of management

and control are vested in the Council which consists of the Chairman and Vice-Chairman of the Association, and 11 to 12 elected persons. Provision is made for the formation of zonal committees, which will be primarily concerned with matters of a zonal nature and will work under the general supervision and control of the Council. Membership of the Association is open to any person, firm or corporation, who or which is the owner of any trade mark, trade name or similar right in India or is carrying on or is interested in any business or industry in India in connection with which the acquisition of any such right may be desirable, or is concerned otherwise in the protection of interests of such individuals, firms or corporations, and is considered eligible by the Council.

Tax Reform.—In a 21-page memorandum to the Taxation Enquiry Commission, the Committee of the Calcutta Stock Exchange point out that while 40 percent of the total tax revenue of the Central Government, both from direct and indirect sources, is derived from income taxes, the main burden is borne by only 0.24 percent of the population. The bulk of income tax payers in this country, the Committee observe, belong to the middle class who at one time ranked as the main builders of capital. Today the middle class taxation and inflation—and is unable to support the memorandum says: "A dynamic economy, in which inflationary pressures are held to a minimum, requires a continuous flow of savings. Savings are the monetary counterpart of physical incentive price is paid for thrift and if people have confidence in the stability of the monetary unit and in the policies of Government. Savings are discouraged if tax rates approach confiscatory levels and the Government pays little heed to the ultimate economic effect of a high rate of taxation". The reforms suggested in the present in-

come tax law are:—in the corporate sector (1) the super-tax on companies should be put back to the former level of one anna in the rupee, (2) companies with incomes below Rs. 25,000 should be exempted wholly from super-tax, (3) a portion of profits used for capital development should not be super-taxed, and (4) to encourage capital formation certain expenditure, like preliminary expenses and the expenses of obtaining additional capital, reconstruction, and legal expenses for the alteration of memorandum or articles, should be allowed for taxation; in the personal sector (1) the maximum average rate of taxation should not exceed 66 2/3 percent in all, and this rate should be applied only to incomes over Rs. 5 lakhs, (2) reliefs like housekeepers' allowance, children's allowance, dependents' allowance, etc. as are granted in the U.K., and the splitting up of a married man's income into two, as in the U.S.A., should be introduced in India, (3) the limit for super-tax on personal incomes should be Rs. 50,000, and (4) the exemption limit for the Hindu joint family should be much higher, as the present limit promotes disintegration of the family. The Committee also examines the incidence of other kinds of taxes, direct and indirect, and concludes that correct policies should aim at: (a) increasing the national income so that the current level of taxation represents a smaller claim on the country's resources, (b) a reduction in Government expenditure, (c) raising revenue in a manner less detrimental to the economy of the country, and (d) a reduction in direct taxation, offset by still greater reliance on indirect taxes.

Record Unemployment.—As expected, the latest official figures reviewing the employment situation in April present a gloomy picture. The number of persons registered with employment exchanges at the end of the month rose to an all-time high (455,417), fewer job opportunities were notified and there was a decline in placings. A total of 126,708 persons registered for employment assistance, as against 110,293 in March, the increases having taken place mainly in Uttar Pradesh, Bombay, Delhi and Madras. Only 23,120 vacancies were notified, as against 23,980 in the previous month, and more than 60 percent of these were in Central and State Government establishments. Placements numbered 16,233, or 1,552 less than in March, the large majority of these again being with the Central and State Governments. Under the Labour Ministry's training schemes 9,772 persons, including 401 women and 2,157 displaced persons, were being given training at various institutes and centres at the end of April. In addition, under the apprenticeship training scheme for displaced persons, 561 persons were being given practical training in production work in Uttar Pradesh and West Bengal.

Coronation Insurance.—It was to be expected that business participants in the Coronation celebrations in Britain would take no risks that might be avoided; they have done so by handing on the risks—which have been willingly accepted, according to our London correspondent—to the insurance companies. Never has there been such a as the rates quoted have been fairly heavy and hundreds of firms have accepted thousands of clients, if all went well the insurance houses would transact this type of business stood to do very well, though if they went awry they stood to lose millions. The biggest risk, of course, was that of rain, and the vagaries of Jupiter Pluvius continued to worry the market right to the end. Insuring against the weather, however, is a well established practice in the contingency insurance market, one section of which is known as the "pluvius" market, and the business has been reduced to what is almost a statistical formula. It has never before, however, achieved the volume that it did on this occasion, and the statisticians' figures and futures would both have suffered severely if the meteorologists' expectations of a bright and sunny day and a reasonably good week or two had failed to be realised. Before Queen Mary died there was a heavy demand for insurance against manufacturers of Coronation souvenirs were the distributors in January or soon after, so their premiums are also safe. The demand has also ceased now, so presumably the public bought well. The contractors' money is also safe, though there was still some doubt on the Friday before the Coronation with regard to the ticket agencies insured against losses on unsold seats, even though the demand for seats at "reasonable" prices was keen.

Quick Progress on Oil Refineries.—Excellent progress is apparently being made with the construction of the new oil refineries at Trombay. The Burma-Shell refinery is expected to start operations during the first quarter of 1955 and not early in 1956 as was announced earlier. Investigations into the design, procurement, delivery and cons-

truction schedules have made it possible to advance the initial operation date. It will be necessary to import crude oil for the refinery during the fourth quarter of 1954. Its capacity will be two million tons of crude oil a year; this increase in capacity has been approved by the Government of India. The bund for the pipeline diversion is practically complete and materials are being assembled on the site. Temporary offices and temporary plant warehouses have already been erected. The Standard-Vacuum refinery is expected to begin operations in July 1954, about six months earlier than was originally thought possible. Site clearing, grading and installation of foundations have been largely finished, and the actual oil processing equipment will now begin to be erected. This first phase had to be completed before the monsoon and work can now continue throughout the rainy season. The project will give India its first modern oil refinery capable of producing a full range of quality fuels. The refinery will have a charging capacity of 25,000 barrels of crude oil a day—sufficient to meet about one-third of India's total needs.

Dial 24.—Last Saturday the long awaited opening of the new Central automatic telephone exchange in Calcutta took place. This is the first of 15 automatic exchanges that are planned for this city under the Posts and Telegraphs Department's five-year development programme. Mr. K. Prasad, Director-General of Posts and Telegraphs, said at the inaugural ceremony that however efficient telephone operators may be, they can never give complete satisfaction to subscribers, particularly in a large business centre. The problem of formulating a plan to convert Calcutta's telephone system to automatic operation was complex; it took a team of experts from the British Post Office two years before they were able to submit a scheme. A step further in the implementation of the scheme is expected in the next few weeks when two more exchanges, Jorasanko and Avenue, will go over to automatic operation. These three exchanges, said Mr. Prasad, will serve nearly a quarter of Calcutta's existing 23,000 telephone subscribers. The automatic equipment in the new exchange was manufactured and installed by the Automatic Telephone & Electric Co. and was subject to rigorous tests both before and during installation. The new telephone instruments which have replaced the old ones have been manufactured by the Indian Telephone Industries Ltd., at their factory in Bangalore. Mr. Jagjivan Ram, Minister for Communications, stressed in his inaugural address the need to maintain the new equipment at its present peak efficiency and expressed satisfaction that adequate provision had been made for the training of staff and engineers. The experience gained in the installation of the Central exchange should stand the Department in good stead in the erection and management of other exchanges. The Minister described the new automatic exchange as the "grafting of a new limb on to the old manual torso". He added that until the process of automation was completed it would not be possible to extend the services but "there is no doubt that when the entire scheme of automation has been completed, it will be possible to meet all the demands for new connections".

Stocks at Sindri.—Only limited success seems to have attended the Food and Agriculture Ministry's efforts to remove the marketing bottlenecks which in the past six months or so periodically threatened to cause the Sindri fertiliser factory to close down. When the first crisis was reported in December, 50,000 tons of ammonium sulphate had accumulated in the storage silo which has a capacity of 90,000 tons. By the end of April 1953 this figure had risen to 74,000 tons, and it was then charged that the railways were responsible because they had diverted wagons from the transport of fertiliser to the transport of foodgrains. The Railway Ministry effectively denied this by pointing out that there was no outstanding registration for wagons to carry fertiliser at the end of February, March or April, in fact right up to 10th May. Apparently, as the accumulation of stocks at the factory reached danger point a call went out to State Governments urging them to take from Sindri as much fertiliser as they could. On 16th May the Railway Ministry reported that "the Eastern Railway was only advised a few days ago that fertilisers in very large quantities were required to be despatched from Sindri to Hyderabad State, Madhya Pradesh, West Bengal and Assam;" special transport arrangements were therefore made. The evidence shows that the railways are not responsible for Sindri's difficulties. The factory has been working at below capacity, production having amounted to 24,638 tons in January, 26,989 tons in February, 22,549 tons in March and 22,957 tons in April. Even so, stocks have increased over this period by about 20,000 tons, or 20 days' output at full capacity. There has obviously been a decline in fertiliser consumption; the decline was noticed many months ago and a leading article in *Capital* on

5th February discussed the probable reasons for it. Chief among these were the high price of fertiliser and inadequacy of marketing arrangements. The ex-factory price has since been reduced to Rs. 290 a ton, though it probably admits of further reduction. Little seems to have been done to improve the marketing practices of official agencies which have only the vaguest notion of how to stimulate the purchase of an expensive novelty like ammonium sulphate by ignorant peasantry.

Urbanisation in Asia.—The May issue of ECAFE's quarterly Economic Bulletin for Asia and the Far East reviews the progress of urbanisation in Asian countries, its principal features and social and economic effects. With the exception of Japan, the ECAFE countries are mainly agricultural and have preponderantly rural populations; on the basis of official definitions of "urban," it is estimated that 18 percent of their total population (1,200 million) live in urban areas. According to data available for India, Pakistan, Burma and Japan, there is indisputable evidence of a growing urbanisation. This is most striking in the case of Japan where, while the total population increased about 15 percent during each decennial period from 1920 to 1950, the urban population increased by 53 percent in 1920-1930, 79 percent in 1930-1940, and 14 percent in 1940-1950; the relatively slow increase in the last decade was due to war and reconstruction. Within a given country, the rate of population growth is generally greater for cities with 100,000 or more inhabitants than for urban areas as a whole; likewise the population living in the urban areas grows faster than the total population. Men predominate in the cities of Asia, as in Africa and some parts of Eastern Europe; women in the cities of Western Europe, America, Australia and New Zealand. This is because, in the East, social and economic factors combine to produce a movement from farm to city that is predominantly male; the rôle of women lies in the family and public attitudes toward the employment of married women outside the home are definitely unfavourable. The employment opportunities in the cities are far greater for men, and wages are considerably higher. As in the West, the fertility of urban populations is lower than that of rural populations in the same countries, and this is a direct result of urbanisation. As economic development proceeds in urban areas increased employment opportunities attract migrants from rural areas and thus generate a redistribution of population between rural and urban areas, but it is not until factors of economic development involve a reallocation of the labour force from lower to higher levels of labour productivity that urbanisation has permanent effects on the redistribution of population. The social effects of urbanisation include the gradual break-up of the large or joint family system and its adaptation to modern industrial conditions, the spread of education and improvement in public health and sanitation. These benefits however are delayed, and in the meantime new city-dwellers endure conditions of considerable squalor.

U.S. Mineral Requirements.—The President of the U.S. National Association of Manufacturers, Mr. Charles Sligh, told the American Chamber of Commerce in London last week that, apart from coal, the United States was self-sufficient in only two industrial minerals—molybdenum and magnesite. She had to obtain her supply of 36 others entirely from abroad and although she produced a large quantity of iron ore and oil herself she had begun to depend increasingly on foreign countries for these two materials. In years to come, he said, American demand for imports was bound to grow and this would encourage raw material development within the Commonwealth. This was something which might be discussed at the Commonwealth conference.

Survey of Mining Industries

CAPITAL'S mid-year industrial survey for 1953 will deal with Indian mining industries and minerals, of which it will provide as complete and authoritative a coverage as the Jute and Plantations Surveys did of those industries in 1951 and 1952. Specially commissioned experts will deal with coal, iron ore, copper, gold, petroleum, mineral fuels, aluminium, gypsum, chromite, kyanite, sillimanite, mica, manganese and other mining products, as well as mining equipment and labour. A feature of particular interest will be an extensive and up-to-date report on research into the beneficiation of Indian coals which includes designs and cost calculations for coal-washing plant and practical instructions on operation and maintenance. This special issue will be supplied free to registered subscribers to the newspaper along with the ordinary issue for 25th June, and will be available to others at a price of Rs. 5. Enquiries regarding advertising, and orders for extra copies, may be addressed to the Manager, CAPITAL, 5, Mission Row, Calcutta-1.

We the undersigned, Accountants Bakker & Co. of Amsterdam (Holland), accountants and auditors, members of the Netherlands Instituut van Accountants, have audited the above consolidated Balance Sheet as per 31st December, 1952 and the Profit and Loss Account for the year 1952 of the branches of Nederlandse Handel-Maatschappij, N.V. (Netherlands Trading Society) in the provinces of India, i.e. at Bombay and Calcutta, drawn up in accordance with the requirements of the Banking Companies Act 1949 of the Republic of India.

We have examined all records and have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit.

In our opinion the said Balance Sheet and Profit and Loss Account are correct

THE CALCUTTA MONEY MARKET

CREDIT A SHADE EASIER: NEW LOAN WELL RECEIVED

Wednesday, 3rd June.

SOME banks report that money has been slightly easier this past week, but the position generally is still fairly tight. Sugar advances have started to decline but there has not been much change on jute or cotton account. Rates in the interbank market still quote 2½ percent for overnight loans and 3 percent for call money.

The bill of exchange market has been very dull, some days being quite blank as far as export bills were concerned. Exchange rates have not varied.

The Government of India's new loan, 3½ percent, 1961 at Rs. 98.4, has been well received in the money market. The higher rate of interest, and consequently higher running yield, make it a more attractive proposition than several existing medium-dated securities. Nevertheless, some holders of the maturing 1953-55 loan might not convert and thus it is possible that there will be more cash about when the old loan is repaid. The prospects for the new loan are discussed more fully in the Stocks and Shares section of this issue, but for the record we publish the official Press Note issued at the week-end: "The Government of India has announced the issue of a new loan for a sum of Rs. 75 crores. The loan, the first to be floated after the finalisation of the five year plan, will be called National Plan Bonds, First Issue and will bear interest at 3½ percent per annum, which will be subject to income-tax. The loan will be issued at Rs. 98-4-0 percent. It will be repaid on 1st June, 1961. Subscriptions will be received from 8th to 10th June, 1953 in the form of cash or the 3 percent loan 1953-55, at the Public Debt Offices of the Reserve Bank of India at Bombay, Calcutta, Delhi and Madras and at the branches of the Imperial Bank at other centres in India. The interest on the new loan is payable half-yearly on 1st June and 1st December."

Tenders for Rs. 1 crore of three-month Government of India treasury bills were opened on Tuesday. The total amount offered was Rs. 2,01,50,000. Tenders at Rs. 99-6-6 percent were accepted in full and those at Rs. 99-6-3 percent allotted approximately 32 percent. The average rate of acceptance was unchanged at Rs. 2-6-6 percent per annum. Tenders for another Rs. 1 crore of treasury bills will be received up to 11 a.m. on Tuesday of next week at Bombay and up to Monday at Calcutta, Madras, Kanpur and Delhi. During the week ended 29th May, treasury bills for Rs. 3,25,00,000 were sold in favour of the Reserve Bank of India.

Early in the week the local silver market was steady on the report that the bull operators had made arrangements to take delivery of about 1,700 bars of Baisakh outstandings in Bombay. In consequence the price advanced from Rs. 160-12-0 to Rs. 161-8-0. Thereafter there was a reaction on heavy arrivals and the price fell to Rs. 160-10-0 quoted to-day. The rate for ready was quoted at a premium of about 8 annas at Rs. 161-2-0. The London silver market was unchanged with rates quoted at 74d. and 73½d. for spot and forward, respectively. The price of foreign silver in New York was also unaltered at 85½ cents.

Gold ruled very steady on keen offtake due to seasonal factors and the price shot up from Rs. 88-6-0 to Rs. 90-8-0, while the sovereign was almost stationary at Rs. 57-10-0.

A further fall of Rs. 7.51 crores in notes in circulation to Rs. 1,158.88 crores featured the return of the Reserve Bank of India for the week ended 29th May, 1953, while the total note issue was fractionally up by Rs. 54 lakhs to total Rs. 31.84 crores. Deposits in the Banking Department consequently rose by Rs. 8.05 crores to total Rs. 31.84 crores. Deposits in the Banking Department showed an all round rise. Deposits of the Government of India and other Government accounts improved by Rs. 2.62 crores and Rs. 1.16 crores to stand at Rs. 103.46 crores and Rs. 16.88 crores, respectively, because of good tax collections. Balances of commercial banks at Rs. 42.71 crores were about Rs. 1.14 crores up on the previous week's figure. Balances held abroad declined by Rs. 4.29 crores to Rs. 97.63 crores. The item of other loans and advances increased slightly from Rs. 25.54 crores to Rs. 25.61 crores, of which advances to scheduled banks against usance bills dropped from Rs. 11.59 crores to Rs. 9.99 crores. Investments at Rs. 88.17 crores disclosed a rise of Rs. 93 lakhs. Ways and means advances were shown at Rs. 3.33 crores (Rs. 3.30 crores).

The statement of the position of Scheduled Banks for the week ended 22nd May, 1953, discloses Demand and Time liabilities at Rs. 530.36 crores (Rs. 11.22 crores on account of borrowings from Banks) and Rs. 322.99 crores (Rs. 1.88 crores) compared with Rs. 525.39 crores (Rs. 10.27 crores) and Rs. 322.32 crores (Rs. 1.85 crores), respectively in the previous week. Cash has decreased by Rs. 20 lakhs to aggregate Rs. 31.86 crores, while balances with the Reserve Bank have increased by Rs. 28 lakhs to stand at Rs. 40.86 crores. There is a drop of Rs. 47 lakhs in investments to Rs. 300.21 crores. Advances and bills discounted at Rs. 530.77 crores reveal a fall of Rs. 3.08 crores. The

ratios to total liabilities of cash and balances and of advances and discounts are, in consequence, shown at 8.5 percent and 62.2 percent against 8.6 percent and 63.0 percent.

The return of the Imperial Bank of India for the week ended 22nd May, 1953, shows a drop of Rs. 28 lakhs in total deposits to Rs. 209.40 crores. Investments in Government Securities are up by Rs. 40 lakhs to Rs. 71.06 crores, while other authorised investments are down by Rs. 19 lakhs to Rs. 10.46 crores. Loans, cash credits and overdrafts, and bills discounted and purchased have declined by Rs. 1.56 crores and Rs. 4 lakhs to aggregate Rs. 106.59 crores and Rs. 26.04 crores, respectively. Cash and balances are, in consequence, shown at Rs. 14.32 crores or Rs. 1.64 crores less.

The provisional figures of foreign Sea and Airborne Trade of India on private and Government accounts during April, 1953 according to data so far available in the Department of Commercial Intelligence and Statistics, Calcutta, are as follows: Merchandise, excluding transit trade of Pakistan but including that of other land frontier countries: Exports Rs. 36.67 lakhs, re-exports Rs. 50 lakhs (transit trade nil), imports Rs. 56.95 lakhs (transit trade Rs. 2 lakhs); total trade Rs. 94.12 lakhs. Treasure: Exports (including re-exports) of currency notes Rs. 2.53 lakhs, others nil. Imports of currency notes Rs. 2.53 lakhs, others nil. The merchandise import figures are exclusive of the value of certain consignments of Government stores awaiting adjustment. Subject to this deficiency in import figures and to the exclusion of figures for transit trade, the total value of exports (including re-exports) of merchandise, gold and silver fell short of imports by Rs. 19.77 lakhs.

TWO PAKISTAN GOVERNMENT LOANS

To finance schemes of industrial and agricultural development, the Central Government of Pakistan has decided to float the following two loans on 15th June: (i) a 3½% loan, 1958; (ii) a 3% loan, 1961. Both loans will be open for subscription for two days only, 15th and 16th June. The 3½% loan, 1958, will be issued at par whereas the 3% loan, 1961 would be issued at Rs. 99-3. Subscriptions may be made in the form of cash or cheques or securities of the 2½% loan 1953-54 for conversion into new loans. Holders of the 2½% loan 1953-54 desiring to convert their holdings can tender their securities immediately accompanied by new loan applications. Information regarding the other terms and conditions of the loans and the Application Forms are available at the offices of the State Bank of Pakistan, all branches of the National Bank of Pakistan, and Government treasuries.

"I HAVE behind me not only the splendid traditions and the annals of more than one thousand years, but the living strength and majesty of the Commonwealth and Empire; of societies old and new; of lands and races different in history and origins but all by God's will united in spirit and in aim. Therefore I am sure that this my coronation is not the symbol of the power and the splendour that are gone but a declaration of our hopes for the future..." Thus the Queen in her broadcast to the world after her coronation on Tuesday, and it was proper that the most significant aspect of that ancient event should have been described by the sovereign herself. The antiquarian interest of the crowning and anointing is so great and the traditions attaching to them so complex that much of writing and talking before the event were done by historians and genealogists, and some of it came near mere admiration of the quaint, mere awe before the old and customary. But the Queen has reminded us that her peoples are celebrating present greatness and future aspiration, and, if they do so according to traditional rites, that is because tradition affords the most solemn and impressive expression of newly taken resolve. It is living significance and lively promise that fill the old forms with renewed grace for millions all around the Commonwealth. "The ceremonies you have seen today," said Queen Elizabeth, "are ancient and some of their origins are veiled in the mists of the past. But their spirit and their meaning shine through the ages, never perhaps more brightly than now".

Indeed this week in the most gorgeous pomp of monarchy, the coronation of a new sovereign, the British have had as equal associates in their loyalty more free people than have ever before acknowledged fealty to one secular leader. The process by which, over 11 centuries, the heirs of the chief of a small Wessex principality came to represent the aspirations of millions of men and women throughout a world that the Saxons did not even know existed, makes up a good part of the story of modern civilisation. And the process by which the conception of that royal family's power came to be modified makes up an even larger part of the story of human liberties. This latter reference is not the aside of an ungracious Whig, for without it we cannot entirely understand the pleasure and sort of secondhand pride with which many who are not the subjects of the Queen have followed the events of the week in London—and we in India know how keen that pleasure has been. The ceremonies of Tuesday, apart from their religious and sentimental import for many of Her Majesty's subjects, meant for all men the latest scene on a stage on which has been transacted the long quest of several nations for the combination of freedom with unity. If Britons have provided the panoplies and the settings of this great drama, that has been not the least of their honours.

The Coronation over, the statesmen gathered in London will already have turned their attention to the other matters that took them abroad, and it would provide early confirmation of the unifying power of the Crown if this were the occasion for new and enduring contacts. The important newcomer to the group of Commonwealth leaders is of course Mr. Mohammad Ali and he now has his first opportunity to meet Mr. Nehru since he succeeded Mr. Nazimuddin. Sir Winston Churchill lately put forward some sensible suggestions on how long-standing and intri-

A DITCHER'S DIARY

cate disagreements can be approached in the hope of a settlement; he then had in mind the much graver friction between Russia and the West, but some of the things he said apply equally well to the differences between India and Pakistan. Particularly is this true of his view that private meetings at the highest level can be fruitful without aiming at an instantaneous, overall resolution of all difficulties. It is pointless to speculate on how far the two Prime Ministers will get in their discussions in London and later in Karachi, but it is very much to the point to recall that at no time in the last five years has the desire for a settlement been entertained more earnestly in India and Pakistan. Conciliatory assurances have been forthcoming from both sides and there is every hope that negotiations will proceed in the spirit of Mr. Ghulam Mohammad's recent assertion that "neighbours should stop frittering away their resources under the impulse of hatred, suspicion and intolerance." There has been some talk of coronation-year gifts to the people of the Commonwealth, but none would be more welcome than this.

Sir William Currie had some eloquent things to say about the fantastic rise in shipbuilding costs at the annual meeting of P & O last week. A standard 9,000-ton cargo vessel such as is employed in the Far Eastern trade now costs no less than £1,400,000, which before the war would have been enough to build a "Strath" class passenger liner. The original book value of a similar cargo boat built 15 years ago would be about £350,000; for seven out of the 15 years of its life the ship would have been requisitioned, because of the war, at strictly regulated rates; the owners would have been paying out more than half the profits they made from it in taxes; and yet when its life is at an end they will have to find almost £1½ million to replace it. The strain this places on shipowners' finances can be gauged from the allocation of P & O's profits in the last four years: out of £70 million operating profits, £47 million has gone to fleet renewal, £17 million in taxes, £2 million on a pension fund and a mere £2 million for shareholders. Considering the huge sums of money involved, Sir William seems very moderate when he says, "There comes a time when one has to consider with special care the pros and cons of this capital cost risk." Sir William also referred to the revival of competition from the Germans, who have come back to the India-Europe trade, and from the Japanese, the full force of whose mercantile sea-power has not yet been felt in the Far East. Evidently the long postwar shortage of passenger berths is now definitely over, for he added that "most passenger ships are now sailing with vacant accommodation in one direction or the other" on the run between Britain and Australasia.

No nationalisation measure that I can remember has aroused as little real opposition as the Air Corporations Act which formally came into force two days ago. This is not surprising in view of the financial difficulties of the majority of Indian airways companies in recent years. What controversy there has been, has centred on the basis of compensation rather than on the principle of nationalisation, and we are likely to hear more of it now that the Government is beginning formal negotiations to buy stock and take over the administration of the companies. The two State corporations—one for domestic and the other

for international services—will be inaugurated by the Prime Minister on 1st July. In a recent statement which was notable for its sympathy and good sense, Sir Miles Thomas, Chairman of the British Overseas Airways Corporation, described the nationalisation of Indian airlines as "a welcome development" and added: "Lots of hard lessons were learned before the air passenger transport business reached present dimensions, and the financial one was that the cost of developing and planning air services on an international scale is normally beyond the resources of an individual company." B.O.A.C., he said, would welcome the "increased competition" resulting from expansion of India's domestic and international air services. "That is no platitude, believe me. Our own experience as a nationalised airline is at the disposal of India, and in fact our files, and whatever other information is required, have been put at the disposal of India's air experts. If we can help at all in this way we shall be only too glad to do so." Sir Miles declared that B.O.A.C. would also give practical assistance in another direction. "Air-India International is taking over Comets and our training facilities for India's future Comet air crews will be made available. It is fair to say that B.O.A.C.'s knowledge of jet airliner operation is completely unrivalled. The data and the experience we have gained in this field has put us quite a way ahead of others." Though not presuming to give advice on how India should run her corporations, Sir Miles said that one good rule was to "keep politics out of it. The running of an airline is a purely commercial undertaking. While reference has to be made, of course, to the broad directives issued by a Government in carrying out nationalisation, any attempt to inject a political bias in the day-to-day running of an airline undertaking can only have a retrogressive effect." One of the major arguments advanced in favour of nationalisation is that air services will be run more economically and this is very necessary because large amounts will soon have to be spent on replacement of aircraft. Economy, however, will not be furthered by political assurances that there will be no retrenchment of surplus staff.

The new film technique of projecting on to a much larger screen than we are accustomed to is used in *Young Bess*, which was very appropriately released in London this week. Evidently it provides what the film exhibitors are forever promising us: "a new experience for moviegoers". I conclude this after reading the following rather intimidating passage from a film review in one of the weeklies: "*Young Bess* is being shown on a screen of such vast proportions that it takes a full ten minutes before one can find one's way about it. Miss Jean Simmons' face, forty-six feet across, her tear-drops twelve feet long, congeal every feeling save that of apprehension. Timidly one waits to be drowned in her eyes, to be crushed against the wall of her forehead, to be swept from one's seat by 'her hair...' The reviewer goes on to speak of 'giant hands', 'rapacious cavernous mouths', and 'eye-strain similar to that acquired at Wimbledon'. Mr. Cecil B. de Mille appears to have had nothing whatever to do with all this. Having dazzled us with false colours, deafened us with gunfire and strident music, dazed us with impenetrable spectacle and bored us very near to death with extravagant stories, the film producers have now apparently determined to overawe us by being literally gigantic where they cannot be metaphorically so. One day they might decide simply to entertain us.

Company Meeting

PENINSULAR AND ORIENTAL
STEAM NAVIGATION COMPANY
SIR WILLIAM CRAWFORD CURRIE'S
REVIEW

The 113th annual meeting of the proprietors of the Peninsular and Oriental Steam Navigation Company was held at the Company's office, 122, Leadenhall Street, London, E.C.3, on Wednesday, 27th May 1953. The following is an abridged version of the speech from the chair by Sir William Crawford Currie.

"Contrary to the view I ventured to express in this room last year, the results for the year to 30th September, 1952, have exceeded those of the previous year which, in their turn, had exceeded those of any year since we began to publish Group Accounts.

In a recent Press commentary on shipping results the name of the P. & O. and its favourable experience was linked with passenger lines, and it was suggested that the fall in freight rates had had no significant consequences. It is important that stockholders and the public at large should clearly understand that the results shown in our Accounts are not those of a passenger ship company, nor indeed those of the P. & O. Company itself. They are the combined result of a great variety of trades and of tonnage which ranges from a small coaster to a large passenger ship.

The cost of new tonnage gives your Board and the Boards of our allied Companies the greatest anxiety. The policy which the Group has followed ever since the War ended, and even during the War period, is that of replacement of lost and obsolescent ships. In normal pre-war times the risk the shipowner ran was a trading one; since the War and today there are other risks—political and economic—not the least of which is that the final capital cost of new ships is unknown when they are ordered and indeed until after they are delivered. The gap in time between order and delivery has been as long as five years.

The rise in cost in five post-war years has been as much as 80 per cent. Nothing that the owner can do will limit this possible increase. It will thus be seen that the normal hazards of a business engaged wholly in the unprotected world markets are immeasurably increased when it is impossible to foretell the cost of the ships whose services we are selling. It is true that ships which were delivered up to last year look cheap compared with similar ships today. But there comes a time when one has to consider with special care the pros and cons of this capital cost risk. If price stability could be achieved, it would be a great encouragement to shipowners to invest in new tonnage. For a 9,000 ton cargo ship of the "S" Class which is expected in the P. & O. Far Eastern trade, we are having to pay today about £1,400,000, a figure which before the War would have been regarded as expensive for a passenger ship. During the seven years since 1946 taxation on company profits has been well above the level of 50%, relieved only by initial allowances.

It is traditional that the shipping companies of this country should be built up by ploughing back profits in good years so that they may be able to weather the storms of the lean years. This policy the Group so far has been able to follow despite the War and the restrictions that accompanied it, and seven years of crippling taxation never before experienced in times of peace. This has only been achieved by a conservative dividend policy and by setting aside cash for the replacement of ships.

The size of the problem which faces us and how we are meeting it can be judged from the figures of the past four years. Out of operating profits of £70 million no less than £47 million has been set aside for renewing the fleets and £2 million for improving staff pension funds, all of which and more has actually been spent. Of the £21 million net profit remaining, £17 million has been absorbed in taxation at home and abroad and £4 million has been paid out as dividends to stockholders of the parent and subsidiary companies.

It must be mentioned in this connection that our cash position has benefited materially by taxation relief flowing from the introduction of initial allowances. The cash benefit to the Group as a whole has been about £12 million which is nearly one half of its invested funds. And yet this sum is nothing more than the receipt of depreciation allowances in advance. The point has been repeatedly stressed that initial allowances are not a form of subsidy from the Exchequer; they represent merely the allowance of depreciation at the beginning of a ship's life instead of at the end. We have recently seen that initial allowances can be withdrawn at comparatively short notice—fortunately they have been reinstated in part, but with no guarantee of permanence. One hesitates to say very much more than has been said already about the taxation burden in the years to come when, through the operation of initial allowances which we are receiving now, there will be no annual wear and tear allowances on ships which will still have one third of their useful lives to run. The Report of the Royal Commission on Taxation is anxiously awaited by the business community and by none more than the shipping industry. It is satisfactory to read in the official Blue Book on the National Income and of the national income requires the income shares should be defined after allowing for the current depreciation of capital at current replacement cost. It is to be hoped that the Royal Commission will appreciate this situation and will recommend its application to the measurement of taxable income. The are nothing more than a stop gap measure which should not reduce future annual wear and tear allowances.

Despite the enormous sums spent on new ships, age last September and was over twenty years of The average age of the passenger ships of the Group is 16 years and of the cargo ships 9 years. A constant programme of shipbuilding is necessary if the fleets of efficiency; the replacement of tonnage of ships building or contracted for is 359,000 tons.

I have said nothing about the development of new interests. No-one who is in business can afford to

stand still. He must either go forward or backward and it is my hope that the P. & O. Company and the other members of the Group will go forward. This envisages that one day or another we may wish to embark on some new project and the present scale of taxation is such that it is difficult to finance worthwhile extensions out of taxed profits. We therefore visualise that we may wish to raise new capital, though I cannot say when. Let me emphasise that at the present time the Board have before them no projects which would necessitate the raising of new capital and, should the need arise, we cannot say whether it will be more appropriate to issue new deferred stock or new debenture stock. We feel, however, that it is in the best interests of the Company and its stockholders that the Board should have unissued Stock available. If we do not increase the authorised capital now but wait until a need actually arises, the resultant delay which would ensue from having to call a Meeting and the consequent publicity which would be given to our intentions, might well be disadvantageous. It is for these reasons that I shall shortly propose a Resolution to increase the authorised capital, of which notice has been given when calling this Meeting.

India, Pakistan and Ceylon

The demand for freight space outwards from this country was generally firm and on the whole the ships were well filled until the end of 1952. Since the beginning of this year cargo has been less plentiful and there is now the competition of German ships which have re-entered the trade.

As regards congestion at Colombo, to which I referred a year ago, some ships have received better despatch but there is still little sign of a permanent improvement in the near future.

Homeward loadings at Calcutta and Colombo were satisfactory during the year covered by the Accounts, but latterly there has been a tendency for Calcutta cargo to fall away a little. Freight through the East Pakistan ports has declined owing to the smaller volume of lute overseas.

From West Coast ports conditions have been steadily declining and ships are now leaving with vacant cargo space.

Far East

Trading conditions to the Far East for the first six months of the financial year were good and the full effect of the recession in world freight rates, the level of gross earnings being well maintained.

The continued restrictions on trade with China and the Korean War have reduced the entrepot trade of Hong Kong. Owing to disturbed conditions the Company made no calls at ports in China during the financial year. This has made difficult the securing of homeward cargo for which in the past we relied on China to a large degree.

ECONOMIC EVENTS IN MAY

- 1st—India-Indonesia friendship treaty ratified.
- 2nd—Comet crashes near Calcutta.
- 4th—Final all-India pepper estimate published.
- 5th—Indian trade envoys discuss export promotion in Far East; Britain ends distribution control on iron and steel products.
- 6th—Japan negotiates trade pact with Sweden.
- 7th—West Bengal Estates Acquisition Bill introduced; import duty on raw flax lifted; report of all-India Bar Committee published; Industrial Finance Corporation Inquiry Committee submits report.
- 8th—Britain's trade deficit for April announced; Japanese-West German pact on industrial priority rights signed.
- 9th—Inquiry committee recommends closure of Oregum mine; Dakota crashes near Delhi; U.S. wheat mission in Pakistan.
- 10th—Setalvad announces Tata ordinary and deferred share conversion ratio; family planning research and programmes committee set up.
- 11th—Palm oil import duty reduced; Indo-U.S. air talks begin.
- 12th—Coal export surcharges abolished; export duty on linseed oil reduced; palm oil removed from G.L.L. Calcutta conference on employment in jute industry; Parliament passes Industries Amendment Bill.
- 13th—Burma's decision to end preferential tariffs reported.
- 14th—Parliament passes Air Corporations Bill.
- 15th—Parliament passes Tea Bill, gets progress report on five year plan; Comet crash inquiry begins.
- 17th—Results of Madras survey of middle class incomes published.
- 18th—U.S. plans to cut atomic energy programme.
- 19th—Air nationalisation reported postponed until 1st July.
- 20th—Bellary taluk to be included in Mysore State; Dulles arrives in Delhi.
- 21st—Kharif cereals final estimate published.
- 22nd—Import Advisory Council meets.
- 23rd—Export Advisory Council meets; refugee compensation plans reported.
- 25th—Kidwai reviews progress of food plans; first atomic shell fired.
- 26th—Indo-Egyptian trade pact signed.
- 27th—Rise in U.S. tea imports reported.
- 29th—British climbers conquer Mt. Everest.
- 30th—Central Government announces new loan; Government accepts Tariff Commission's recommendations on power and distribution transformers industry; Calcutta's first automatic telephone exchange opened.
- 31st—Government announces decision on Tariff Commission's report on automobile industry; U.S.A. relaxes ban on trade with Czechoslovakia.

Stocks and Shares

GOOD RECEPTION FOR FIRST ISSUE OF
NATIONAL PLAN BONDSMATURING ISSUE AT A PREMIUM: OTHER MEDIUM DATED
GILT-EDGED EASIER

Wednesday Evening

THE share market has been dull but the undertone is fully steady. There has been renewed enquiry for selected tea shares, continued demand for selected jute shares and less interest in sugar shares. In restricted trading Indian Irons have moved slightly either way from Rs. 25-9. Hindusthan Motors improved to Rs. 4-9 in view of the Government's policy on automobile manufacture. Shares in the three mill companies managed by Kettlewell Bullen, in which there has been considerable interest in the past two weeks, have been a shade easier but they are still holding the large gains they made after interested buying recently.

The gilt-edged section has of course been dominated by the announcement over the week-end of a new loan, of which the full particulars will be found in an advertisement on this page. The general opinion is that the new issue is so attractive as to be very probably oversubscribed and it is reported that there are buyers of two annas who wish to make certain of obtaining the new security by converting. With this degree of support the new 3½ per cent 1961 loan will possibly go to Rs. 99 when it comes on to the market. Meantime, other medium-dated gilts and longer issues have eased by up to three or four annas, mainly because of substantial offering from Bombay. This is the reaction to the hint of higher interest rates implicit in the terms of the new issue, but it is believed that these loans will recover once the 1961 loan is on the market. Near-dated securities are steady. The table which follows sets out a comparison of the yields on the forthcoming issue and existing medium-dated loans.

	Price	Gross running yield	Gross redemption yield	Net redemption yield
3½% 1961	98-4	3.56	3.74	2.81
2½% 1961	90-11	2.75	3.82	3.10
2½% 1962	91-12	3.00	3.79	3.00
3% 1963/65	92-12	3.23	3.74	2.87
3% 1964	92-15	3.23	3.78	2.93

Gilt-edged were firm during the early part of the week with a small but steady demand for terminable securities and a renewed enquiry for 3% Conversion Loan 1946. The announcement concerning the National Plan Bonds was well received by the market; the terms offered are better than expected. The marking down of prices of existing loans is illustrated by the following table:

	Opening 16-53.	Closing 16-53.
2½% Loan 1961	90-12	90-11
3% " 1958	98-8	98-6
3% " 1957	98-11	98-8
3% " 1959-61	96-13	96-9
3% " 1963-65	92-15 x.v.	92-12 x.v.
3% " 1964	93-0	92-12
3% " 1970-75	86-11	86-9
3% " 1970-75	86-11	86-9

In contrast, both 2½% 1954 and 2½% 1955 met with good enquiry to improve to Rs. 98-8, with buyers over. Three percent Conversion Loan, after improving from Rs. 82-7 to Rs. 82-12, turned sellers to decline to Rs. 82-6, while 3% Non-terminable Paper was also marked down in sympathy to Rs. 82-10.

The demand for selected preference shares continued unabated, though once again the turnover was small because of the absence of sellers. In jute, Belvedere, Budge Budge and Kelvin were marked at Rs. 121-8, and Alexandra were taken at Rs. 100. Anglo-India were quoted at Rs. 119, and Hastings were unchanged at Rs. 104-8. Dalhousie improved from Rs. 116 to Rs. 118, and Northbrook, after being quoted at Rs. 93-12 had buyers at Rs. 95. Among miscellaneous issues, Calcutta Electric were taken higher to Rs. 12-8, while Carew & Company were enquired for at Rs. 94, without attracting sellers. Rohtas 'B' Preference were marked up to Rs. 58, and Martin Burn were crossed at Rs. 105. Hall & Anderson were asked for at Rs. 50, as against the previous quotation of Rs. 35. Other shares in demand were British India Corporation at Rs. 146, Burn & Company 7% at Rs. 133 and Indian Standard Wagon at Rs. 132.

In the banking section, Imperial Bank Fully-Paid were marked up from Rs. 1,840 to Rs. 1,865, to close at Rs. 1,855, and the Contributors were a shade easier at Rs. 451-4. United Banks were fractionally better at Rs. 3-15.

No transactions were reported in railway shares. Among cotton shares, the demand for both Bowreah and Dunbar has died down and prices are more or less unchanged at Rs. 310 and Rs. 205, respectively. Kesornar were marked at Rs. 19-15, and Elgins were taken at Rs. 17-8.

To Rs. 10-6 on the announcement of a lower dividend of annas 4, as against annas 6 for the previous half-year. Bengal were dealt in between Rs. 532 and Rs. 537, and Amalgamated had buyers at Rs. 21. Pench Valley came to hand at Rs. 21-4, and Dhemo Main improved to Rs. 11-4. East Indian were marked up from Rs. 23-8 to Rs. 24-10 and Katras Jheriah were taken at a point higher to Rs. 44. Standard recorded a smart rise from Rs. 18-12 to Rs. 20-5 on the announcement of an increased dividend of Re. 1, as against the previous half-year's distribution of 8 annas. Amongst small-price scrips, Bharats were steady at Rs. 6, and Central India were quoted at Rs. 5. Business was reported in Talcher at Rs. 2-14, and Western Bengal were quoted at Rs. 5-2.

Jute shares were the centre of attention, and this section provided many features. Fort Gloster recorded a further rise of 68 points to Rs. 390 at which rate sellers appeared and the price declined to Rs. 370 at the close. The announcement of dividends by certain mills of the Jardine Henderson Group was well received by the market and there was good enquiry for these particular shares. Reliance were marked up from Rs. 14 to Rs. 16-6, Bally from Rs. 160-8 to Rs. 190, and Howrah from Rs. 24-13 to Rs. 25-5. As a result of profit-taking, Bally however receded to Rs. 185 at the close. Ganges and Nuddea were also supported, and improved from Rs. 75 and Rs. 49-4 to Rs. 82-8 and Rs. 53, respectively, but as a result of persistent selling pressure at the higher levels, declined again to close at Rs. 80-8 and Rs. 50. Other jute shares in demand were Anglo-India at Rs. 235, Budge Budge at Rs. 173, Chitavalah at Rs. 29-12, Delta at 242, Gouperore at Rs. 316, India at Rs. 140, and Nellimarla at Rs. 31-8.

More enquiry was noticeable for electric supply shares, but dealers were unable to complete orders due to the lack of offerings. Bareilly improved to Rs. 14-10, and Patna were quoted at Rs. 10-14. Calcutta Electric were unchanged at Rs. 14-4 while both United Provinces and Agra had buyers at Rs. 155 and Rs. 157, respectively.

There was a shrinkage in the volume of business reported in sugar shares and with the exception of Cawnpore and Darbhanga which had buyers at Rs. 32-12 and Rs. 10-9 respectively, prices were on the whole inclined to be easier. Belsund were lower at Rs. 8 and Carew had sellers at Rs. 6-15. Ramnugger were quoted at Rs. 18-4, and Samastipur

Following the visit to Switzerland of the Director of Railway Finance, Mr. K. Sadagopan the representatives of the Swiss firm Messrs. Schlieren are expected here early in June to discuss their agreement with the Railway Board on establishing a factory for the manufacture of all metal light-weight coaching stock in India. The Public Accounts Committee recently criticised the agreement and Mr. Sadagopan was deputed by the Government to find out whether the firm would be prepared to revise it. He is believed to have reported favourably.

FEAR OF COMPETITION FROM
FOREIGN CAPITALAMENDMENT OF ELECTRICITY
ACT URGED

(FROM OUR OWN CORRESPONDENT)

31st May.

WHILE traders are generally pleased with the outcome of the meetings of the Export and Import Advisory Councils, the reaction of the business community in Western India to the official views expressed by the Finance Minister and the Commerce and Industry Minister of the Government of India at the meeting of the Central Advisory Council of Industries on Friday is not very favourable. It is alleged by some industrialists that foreign capital is being given better terms and treatment by the Government and that competition from this source, even in established industries or in those which industrialists in this country are in a position to develop unaided, is increasing. Mr. Krishnamachari's statement that Indian capital was shy and that the main consideration of the Government was to increase the scope of employment, irrespective of whether the capital was Indian or foreign, has not been well received by these people. They claim that the Government is doing little to help them rehabilitate established industries by replacing old and inefficient machinery and introducing rationalisation, and is at the same time accusing them of not increasing production and the scope for employment. In any case, it is certain that the meeting of the Central Advisory Council has done little to remove industrialists' apprehensions about the Government's policy. It is believed that whatever help the Taxation Enquiry Commission might bring industrialists at the end of their labours, for the present the Commission is being used by the Government as an excuse for not formulating any interim policies on depreciation allowances and tax relief, whether such relief is necessary in the interest of production or the encouragement of exports.

Electricity Charges

Mr. K. G. Milne, of Killick Industries Ltd., Chairman of Surat Electricity Co., once again raised the question of the promised amendments to the Electricity Act. Stressing the urgency of expediting amending legislation he warned the Government that he saw nothing but frustration for the progress of private electrical undertakings, progress which the Government itself had recognised as vital. Mr. Milne dealt also with the important question of the Government charging differential rates to various categories of consumers. He revealed that after the opening of the South Gujarat grid steam generating system at Surat, the Government was selling power from this source to the North Gujarat grid and other consumers at 0.7 annas per unit, while it charged the Surat Electricity Co. and other licensees almost double the price, 1.32 annas per unit. This preferential treatment was expressly prohibited under the Government's own laws governing the marketing of power, and he said that it was contrary to the best tenets of commercial practice and fair dealing. Mr. Milne said that this point had been brought to the notice of the State Finance Minister who had promised to investigate the matter. At the same time he revealed that though the State Government was reluctant to disclose figures on the capital investment on the South Gujarat grid system, it was believed by the business community that the original estimate of Rs. 70 lakhs had been exceeded by as much as Rs. 50 lakhs. The company which had offered to erect and run this plant had estimated the cost originally at Rs. 90 lakhs.

Assessment of Bonuses

In its award in the case of the three oil companies, Standard Vacuum, Burmah-Shell and Caltex, for 1950 and 1951, the Labour Appellate Tribunal in Bombay has again confirmed the principle of calculating workers' bonuses in terms of basic wages and not on wages plus dearness allowance, and has set aside the award of the Industrial Tribunal which had adopted the new basis. Another principle enunciated by the

Tribunal in this appeal was that while the bonus to be awarded should not be altogether unrelated to the workers' efforts, this did not mean that clerks and similar workers should be denied a bonus because they did not participate in the actual work of producing goods, or that labourers in oil companies should not get a bonus because they did not participate in the work of producing oil. The Tribunal's decision to grant bonuses equivalent to basic wages for 4½ months to workmen and 3½ to clerks in these three companies will not affect the quantum of bonus to be distributed, as fixed by the Industrial Tribunal. The decision of the Tribunal was the result of cross-appeals filed by the management and workers over the award for 1951 and the appeals by the companies only over that for 1950.

Welfare Officers

Under the new rules framed by the State Government for the recruitment and conditions of service of welfare officers in all important factories which come into force from tomorrow, every industrial undertaking employing 500 or more workers will be required to appoint at least one welfare officer within six months. Where the numbers of workers exceeds 2,000, an extra welfare officer has to be appointed for every 2,000 additional workers. They will establish contacts and hold consultations to further harmonious relations between management and workers, and will bring individual as well as collective grievances of the workers to the notice of employers for speedy redress. They will also be expected to study and understand the point of view of labour, to help the management formulate labour policies, and to interpret these policies to the workers. In addition they will be required to watch industrial relations and to use their influence to prevent disputes arising.

Partial Decontrol of Wheat

An important step in the decontrol of food-grains taken by the Government of Bombay is the removal of the control on wheat outside the fully rationed areas of 12 cities and 33 towns. Wheat in these areas will be treated in the same way as millets and maize, which were decontrolled some time ago.

Movement of wheat in the non-rationed areas will be free and private trade in this commodity will be allowed under a system of licensing. To check hoarding, the Government proposes to institute periodical checks on stocks held by licensees and producers. At the same time the Government will continue wheat procurement from producers on a voluntary basis until the next harvest at the existing procurement price and, in the event of shortage, it will also requisition stocks of wheat from licensees at a price not more than 10 percent above the procurement price, if the open market price goes beyond a reasonable level or even if such requisitioning becomes imperative for other reasons. To prevent smuggling of wheat into rationed areas from the rest of the State, a three-mile belt round the towns and cities has been created in which free trade in wheat will not be allowed. The Government has also warned producers and the trade to see that prices in the open market do not rise beyond a reasonable level and has said that it will not hesitate to take steps to prevent hoarding, profiteering and other anti-social activities.

Finance Minister's Visit

Mr. C. D. Deshmukh, Central Finance Minister, and Mrs. Durgabai Deshmukh, a member of the Planning Commission, are visiting this State for about a month, with a break of about eight or nine days for a visit to Madras and other centres in that State. Their stay in Bombay city will be limited to the day of arrival and one other before their departure to New Delhi on 26th June. During the earlier part of their visit they will see one of the community project areas near Bombay at Karjat, while they expect to visit Poona for 10 days on completion of their Madras visit.

Consequent on the fall in the price of spelter, the controlled selling prices of galvanised, telegraph, signal and barbed wire produced by the Indian Steel and Wire Products Ltd. have been reduced with effect from 1st June, 1953. The reduction in price is Rs. 80 per ton in the case of telegraph wire and Rs. 30 per ton for untreated wire. A notification on the subject has been published in the Gazette of India Extraordinary, dated 1st June, 1953.

Uttar Pradesh

SET-BACK TO UTTAR PRADESH
JUTE CULTIVATION

SERIOUS DACOIT MENACE

(FROM OUR OWN CORRESPONDENT)

Lucknow, 31st May.

THE Grow-More-Jute Campaign in the State has received a set-back recently. The opening of ten jute production centres contemplated in the five year plan to raise the jute output of the State has been shelved. The five year plan target was 1,35,000 acres, but owing to the unremunerative prices offering lately a tendency for cultivators to reduce even the existing acreage has been reported. In 1948-49 prices offered ranged from Rs. 26 to Rs. 34 per maund; in 1949-50 between Rs. 26 and Rs. 28; in 1950-51 between Rs. 28 and Rs. 80 and in 1951-52 between Rs. 23 and Rs. 60. But in 1952-53 the prices suddenly went down, ranging between Rs. 10 and Rs. 15 per maund. This has discouraged growers. The Jute Development Department has accordingly decided to concentrate on intensive methods of cultivation to increase the yield per acre instead of extending the acreage.

Dacoits' Depredations

For some time the exploits of notorious dacoit gangs operating in the country-side, equipped with modern weapons—and camels to carry loot—have been receiving prominent attention in the daily Press. Pitched battles between the dacoits and the police are frequently reported, with casualties on both sides, but with the dacoits ultimately effecting a get-away. Some of the bigger gangs led by notorious gunmen have affiliations outside the State, particularly in Madhya Bharat, but the ravaging of Agra district are believed to be their headquarters. The Home Ministry recently took a party of Pressmen to Agra to acquaint them with the difficult nature of the terrain which impedes all police operations. The arms and equipment for the dacoits are believed to come from Nepal while one or two arsenals and illegal arms manufacturing units have been unearthed in districts inside the State. While the difficulties in dealing with the dacoit menace are appreciated, public opinion has recently become increasingly critical of the steadily deteriorating situation. It has been alleged in responsible quarters that there is deliberate "under-reporting" by the police to establish that crime is on the decrease. There is also a feeling that the dacoits can only be liquidated with military help, but that the State Government are not eager to ask for it since it would amount to an admission that the situation has got out of control.

U. P. Merchants' Chamber

The Merchants' Chamber of U.P., Kanpur, has submitted a detailed memorandum to the Taxation Inquiry Commission giving its views on current trends in taxation. The memorandum states that Government budgets must be balanced and the pressure of taxation must be on consumption rather than on savings. If deficits cannot be avoided then the gap must be bridged by the issue of long-term bonds. All borrowing, except floating debt and ways and means advances, must be for productive investments only. On the question of sales tax, the memorandum points out a "glaring defect" in the non-liability of sales made by a dealer in a State direct to the consumer of that State. The memorandum, introduces an element of discrimination against similar goods produced in the importing State. "The basic raw materials of the basic industries," the memorandum adds, "need complete exemption" from the sales tax so as to enable the producers and manufacturers to face competition only in the sale of finished products which may be subjected to sales tax. The taxation of the basic raw materials has in most cases proved quite detrimental to the growth of industries, more so when industrial concerns consuming raw materials imported from another State escape tax under the existing law. The memorandum also deals with a number of issues relating to joint family, land revenue, disintegration of the joint family, land revenue, taxes on property and betterment levies.

The seventh annual conference of the U.P. Bank Employees Union has passed a resolution endorsing the proposal of the All-India Bank Employees Association to take a strike ballot throughout the country to get the Shastri Award rejected. The conference thought that the Shastri Award would create a wide gulf between various types of bank employees and appealed to the Centre to resolve the dispute.

Ordnance Workers' Convention

The two-day all-India convention of defence factory employees in Kanpur this week passed a number of resolutions on retrenchment, implementation of the Kalyanwala Committee's recommendations and victimisation of trade union workers. The convention called upon members to observe a strike as a protest against retrenchment in ordnance factories. One resolution urged the Government to form a work load assessment committee, and abolish the contract system to build up a national reserve of skilled artisans.

Community Projects

An official review of the community projects in round progress. It can be confidently asserted that development blocks in community projects within about Rs. 25 crores" besides fostering the spirit of self-help among the people.

London

SPENDING SPREE IN BRITAIN

PRIME MINISTERS TO DISCUSS
INTERNATIONAL SITUATION

(FROM OUR OWN CORRESPONDENT)

30th May.

THE Coronation, which is only three days off, has been the dominant theme of the past week. Indeed, it has proved a good thing that there has been little else to attract, or perhaps distract would be more appropriate, attention from this historic event. People in their thousands, not only from overseas, but from all over these islands as well, have thronged into London to see the sights, try out the stands, go around the route of the procession, admire the Commonwealth troops who have all in turn provided reliefs for the Guards in mounting guard at Buckingham Palace, and generally presented the Metropolitan authorities with a succession of headaches. Traffic jams have been an everyday and almost an all day occurrence—to traverse the few hundred yards of Regent Street by car or bus has taken as long as half an hour, and to get from one side of Trafalgar Square to the other even longer!—and has rendered the keeping of appointments a nightmare. Walking has been a lot quicker than riding, but with pavements packed solid with sightseers by no means comfortable. The Underground has offered the only reasonable solution of the problem of getting from one point to another at either end of the West End, but even there the "rush hour" has extended from early morning till late at night. My function is not to "cover" the Coronation, save where it impinges on economics, but I might perhaps draw attention to a feature which our accounts may overlook, namely, the emphasis which is being given to the Commonwealth as opposed to the purely national aspect of these celebrations.

Turning to the economic repercussions, it is interesting to observe that the normal trend for bank notes to return to the banks after the Whitsun holidays has been reversed this year. The pre-Whitsun week showed a more or less usual increase of notes in circulation of a little under £4 million. Instead of a reduction this week there has been a further increase of almost £9 million. And that is only the start of the spending spree. Decorations alone are estimated to have cost in all something like £10 million; the 200,000 odd overseas visitors here at the moment are expected to be spending around £600,000 a day during their stay; the extended hours being granted to restaurants and public houses will probably result in a doubling of the normal expenditure in Great Britain of just over £2 million a day on alcoholic drink; entertainment generally will be catering for capacity audiences, and bets on the Derby alone are expected to result in the changing hands of about £5 million; and to these comparatively few items must be added the expenditure on travel, on local celebrations of all sorts, or souvenirs, and on other incidentals too numerous to detail here. It is fairly safe to predict that expenditure around the Coronation period will break all records. Surprisingly enough, no-one seems to be worried about the fact that a large part of this extra expenditure, up to 50 percent perhaps, will go back to the Exchequer via beer, spirits and tobacco duties, entertainment tax and purchase tax!

Prime Ministers' Conference

The presence of Ministers in London last Wednesday to attend the luncheon of the Commonwealth Parliamentary Association to the Queen in Westminster Hall was taken advantage of to hold an unexpected Cabinet meeting immediately after, at which the plans for the Commonwealth Prime Ministers' conference are under consideration. In all, the Prime Ministers are expected to meet five or six times, the first meeting being next Wednesday, at 10, Downing Street, with Sir Winston Churchill in the chair. Discussions will continue on Thursday and Friday, and on Monday and Tuesday of the following week, with a final meeting on Wednesday if it is found necessary. In between these meetings all the participants will be fulfilling other engagements connected with the Coronation or in establishing contacts with their own nationals in this country, and if Mr. Nehru's programme is representative none of them is likely to consider this visit as in any way a holiday. The international situation in all its aspects will be the main subject for discussion at the conference, for Sir Winston will no doubt be anxious to have the views of his colleagues so as to be able to present Commonwealth policy to President Eisenhower and the French Prime Minister when they meet at Bermuda. One day, however, will be set aside for consideration of economic questions, either 8th or 9th June, when Mr. Butler, Chancellor of the Exchequer, will review such progress as has been made since the Commonwealth Economic Conference was held last year.

On the whole, the picture he will have to present is a lot more reassuring. The sterling area's gold and dollar reserves are still rising and the deficit with the European Payments Union is slowly but steadily going down. At the same time, with the possible exception of Ceylon and Pakistan, the Commonwealth countries have all managed to fulfil their earlier promise of living within their incomes, and this is a particularly satisfactory development in view of the heavy falls in price of many of the commodities they export. India and New

Zealand have done particularly well, and Australia is fast catching them up. Pakistan has only just managed to restore her trade balance with stringent import restrictions, and Ceylon is now working along the same lines. Meantime, by a variety of means, and more particularly by restoring freedom to markets, the British Government is gradually advancing towards a greater degree of convertibility, and carrying the countries of Western Europe with it. If, as seems likely, the Prime Ministers endorse this policy, and the remaining European countries follow suit when the talks are resumed after the Coronation, the next approach to the United States administration might well be productive of some more tangible contribution towards more liberal international commercial and monetary policies.

Iron and Steel Board Directors

A storm is gathering against the acceptance by trade union leaders of appointments on the new Iron and Steel Board. Pressure by the Executive of the United Patternmakers' Association led to the resignation from the Board of Mr. W. Board within 48 hours of the announcement of his appointment. The vacancy was immediately filled by the appointment of Mr. A. Naesmith, General Secretary of the Amalgamated Weavers' Union, and the T.U.C. General Council, when it met last Wednesday, rather significantly, made no reference whatever to the appointments, though it was generally expected that the acceptances would be questioned and Sir Lincoln Evans, Mr. J. Owen and Mr. Naesmith given an opportunity to explain their reasons. Instead, there have been attacks on the three leaders in speeches, in certain union publications and, of course, in *Tribune*. Mr. Michael Foot and Mr. Ian Mikardo are the contributors to *Tribune*, the former in prose and the latter in verse. Sir Lincoln Evans is the main target for their attacks, but in the end they tend to "write him off" because he is resigning his position as the General Secretary of the Iron and Steel Confederation and therefore his future is less important than the behaviour of his two colleagues, who are retaining their union positions, which "marks a sensational development in relations between the Churchill Government and the trade union movement." Sir Lincoln Evans has made a characteristic reply, which serves to put his critics "on the spot," but the matter will not be allowed to rest there. The Labour Party, officially, maintains complete silence.

Fleet Renewal Costs

Sir William Currie, Chairman of the P. & O. Steam Navigation Co., Ltd., gave some striking figures to shareholders in his annual statement—extracts of which will be found on page 748—to illustrate the difficulty with which shipowners are faced in renewing their fleets under present tax burdens. A 9,000-ton cargo ship now costs £1,400,000 rather more than the purchase cost of a big passenger liner. Of the £70 million profits which the company have earned in the last four years, £47 million has been spent on renewing its fleet and a large part of the balance has gone in taxation. "One day or another," said Sir William, "we may wish to embark on some new project and the present scale of taxation is such that it is difficult to finance worthwhile extensions out of taxed profits. If we do not increase the authorised capital now but wait until the need arises, the resultant delay and the consequent publicity might well prejudice negotiations." Stockholders are being asked to consent to an increase of £5,071,223 to £15 million in the company's authorised deferred capital, though it has been made clear there is no immediate intention of using the new capital for expansion. Shareholders were not entirely happy, however, particularly over the 20 percent dividend, which it was pointed out was no more than 2 percent on the real capital employed. Sir William did not argue. He merely told one of the objectors: "We have got to pay for the ships whatever happens."

Brevities

Lord Reith, Chairman of the Colonial Development Corporation, who was recently given permission to expand his activities, has been elected a Director of Tube Investments.

A £600,000 contract to supply civil engineering equipment for a Burmese irrigation scheme has been placed with Messrs. John Blackwood Hodge and Co., Ltd. of Northampton.

Wage increases in Britain last month totalled £144,000 a week for 792,000 workpeople. This brought the total for the first four months of this year to £1,016,700 a week for 3,704,500 persons. Among those who got increases last month were cinema workers, and workers in licensed hotels and restaurants.

With a final of 2 percent free of tax, Calcutta Electric Supply Corporation is maintaining the dividend for 1952 at 6 percent tax free. Preliminary figures show that gross revenue rose by £423,044 to £1,733,561, while expenditure was £548,807 up at £2,358,645. Special appropriations total £438,540, against £542,087, and £65,744 against £62,845 is added to contingency reserve, carrying forward £161,233 against £170,268.

Fertilisers are to be removed from price control from 1st July according to an announcement by the Ministry of Materials. Manufacturers' associations have welcomed the opportunity this presents for better service, and it is not anticipated there will be any undue increase in prices. Farmers are, of course, subsidised on their consumption.

Without Prejudice

THE DUAL SYSTEM OF COUNSEL & SOLICITOR

UNIFIED NATIONAL BAR FOR INDIA RECOMMENDED

(BY OUR LEGAL CORRESPONDENT)

THE Report of the All-India Bar Committee, established primarily to consider and report on the desirability and feasibility of a completely unified Bar for the whole of India and the continuance or abolition of the dual system of counsel and solicitor (or agent) which obtains in the Supreme Court and in the High Courts at Bombay and Calcutta, is of great interest to the legal profession. It is of still greater interest and importance to the general public, virtually every member of which, in the changes and chances of this mortal life, has sooner or later to depend for his security or honour or liberty on the efficiency and reliability of some member or members of the legal profession. It is therefore proposed here to consider the report mainly, if not solely, from the point of view of the ordinary citizen not one of whom, incidentally, was represented on the Committee. That fact in itself is rather remarkable. The Committee, presided over by the Hon'ble Mr Justice S. R. Das of the Supreme Court and comprising seven other eminent legal personages of the very highest standing, could not but produce, as they have done, a cogent, clear, learned and impressive set of conclusions. Nevertheless, reading page after page of the valuable history, the balanced arguments and the reasoned impartial conclusions, it is impossible not to feel that the presence on the Committee of one leading business man, accustomed to litigation as a client and not as a practitioner, would have been more than helpful. He might have been able to explain what is in fact difficult to explain, why it is that the average man prefers to consult his solicitor on the ordinary everyday legal problems which confront him in his business and domestic life and would not think of going to a barrister's chambers for that purpose; and why, on the other hand, he would feel no confidence at all in his solicitor if that gentleman suddenly announced in a pending law suit that he, the solicitor, was going across to the High Court, there to conduct the client's case in person, as an advocate without employing counsel for that purpose.

Not that there is anything logical about the dual system; and it is the absence of that quality which provides, perhaps, the strongest argument against its continuance. No one in his senses will contend that the average barrister or advocate is not as well equipped intellectually to draw up a lease, or advise a client on the unhappy differences which have arisen between himself and his wife, as the average solicitor; nor that the latter functionary could not, if he made a regular practice of it, adequately plead his client's case in Court. Names like those of the great Sir George Lewis, Sir Charles Russell, Arthur Newton, Freke Palmer, Joynton Hicks and a sprightly young Welsh Police Court solicitor, David Lloyd George, spring to the mind as successful solicitor advocates. Indeed they founded their fortunes as advocates. On the other hand, only a few years ago a Lord Justice of Appeal on retirement from the Bench set up in practice as a family solicitor, and cases are not at all unusual of barristers finding themselves temperamentally unsuited to the rough and tumble of advocacy, abandoning it in favour of the quieter haven of the solicitor's life.

If then the system is illogical why continue it? Why should a man have to employ two lawyers in a case when one, if allowed to do so, could see

the whole matter through from soup to nuts? Why the extra expense?

The answer, in part, is that we are not in the ordinary affairs of life governed by logical but by practical considerations; and one practical consideration is that a system which has endured in Calcutta for at least 178 years and for more than 100 years in Bombay, must have a good deal to be said for it.

If India adopts a completely unified Bar it will be taking a step which, as far as we are aware, no European country has done. That fact—if it is a fact—is, of course, no reason in itself against taking the step. India may be right and the rest wrong. Nevertheless, in a small country like Great Britain and Northern Ireland, though the suggestion of fusion is brought forward as a hardy annual at every seaside conference of jaded lawyers, it is regularly rejected by overwhelming majorities. The lawyers don't want it and the public don't want it. In England you have barristers and solicitors, and so you have throughout both sections of Ireland. In Scotland, advocates and writers to the signet. In the self-governing Channel Islands advocates and notaires. In the Isle of Man advocates and solicitors. And never the twain shall fuse. It is the same on the Continent of Europe, at any rate, in the larger countries. France has its *avocats* (barristers) and *avoués* (solicitors), Italy its *avvocati*, and *procuratori*; Spain, Austria and the other countries outside the Iron Curtain keep the two branches apart. And to quote the Report of the Commission: "Even in the United States where the dual system does not exist there is a feeling that the congestion of work in Court and the sliphish way in which the work is done is due to the absence of the dual system." (ibid, p. 28). Moreover, in the United States, at any rate in all the great cities, the dual system does exist *de facto* though not *de jure*. There are the corporation lawyer, the commercial lawyer and the family solicitor not one of whom would ever dream of appearing as an advocate in Court, though technically qualified to do so.

It is not easy to explain in writing the precise, distinction between a barrister and a solicitor, who are really complementary parts of one whole. Actually, perhaps there is no precise distinction as to where the work of one begins and that of the other ends. They often overlap. But any student of the works of Charles Dickens, who specialised in lawyers, will know instinctively where the difference lies. Mr. Tulkinghorn, solicitor, silent repository of the ugly secrets of high society, would not and could not undertake the work of brilliant, drunken Sidney Carton barrister-at-law, and bullying Mr. Stryver, old Bailey counsel, would not have been a complete failure as a solicitor, if he instead of Uriah Heep had gone into partnership with Mr. Wickfield, Solicitor and Commissioner for Oaths of Canterbury.

The point of all this is that if the dual system were abolished tomorrow the litigant in the High Court would have no expense, for he would still have to employ two lawyers. An advocate's work of pleading orally in open Court is a whole-time job and so is that of a solicitor in advising day by day and hour after hour a succession of clients and drafting intricate documents for them. Neither has time for anything else. And that is the answer to the proposal to fuse the two branches of the profession in Calcutta and Bombay. It was also the answer of the majority of the Committee to the fusion so far as advocates and solicitors in Calcutta and Bombay are concerned is dead, for the present at any rate.

In regard to the Supreme Court, the Commission, rather inconsistently one may think, recommends that the dual system be abolished. As if to atone for its conservatism in advocating the retention in the two great cities of the dual system, the Commission executes a complete volte-face as regards the rest of India and, again by a majority, comes to a startling conclusion. "The psychological moment has definitely arrived," says the Report, "for India..... to take a big step forward and bring into being a unified national bar.... There is no reason why India should not take the lead in this matter." What does such a creation involve? Just as there is probably no country in the world more addicted to litigation than India, so also there is nowhere else such an amazing variety of brands of lawyers. There are advocates subdivided into members of the English Bar and those trained and qualified in India, solicitors and attorneys similarly subdivided, vakils; (all those being of the High Court); pleaders of various grades, mukhtars entitled to practice in the district and other subordinate Courts, with revenue agents and income-tax practitioners who need not necessarily be lawyers at all.

Under the present proposals (*inter alia*) if carried into effect, vakils and pleaders at present entitled only to practise in the lower courts will be automatically eligible for admission as advocates, provided they have secured a law degree. There will be some 1,173 vakils and 38,459 pleaders, at a low estimate, entitled to be thus transformed.

"If the recommendations of the Committee are accepted," says that great lawyer and ex-High Court Judge Dr. Tek Chand, in a dissenting minute with which Mr. V. R. Iyer, Advocate General of Hyderabad, concurs, "the number of advocates eligible to practise in the Supreme Court may be in the neighbourhood of 50,000, of whom many may not have practised at all in a State High Court and some may not hold a law degree. I strongly feel that this will materially affect the quality of work, lower the standard of

Plantation Topics

WORLD TOBACCO CROPS

DESPITE an expected rise in tobacco production this year in exporting countries other than the U.S., says the *Financial Times*, the fall of more than 10 percent in the U.S. crop area means that world output this year will probably be smaller than in 1952. Calculated on 1948-52 average yields per acre, the U.S. crop is estimated at 2,100 million lbs. some 110 million lbs less than in 1952. It will include 1,300 million lbs of flue-cured tobacco, a drop of 70 million lbs on last year. A further increase in Canadian production beyond the peak output of 1952 is expected, and although the Southern Rhodesian crop will not attain the 125 million lbs hoped for, the first official estimate is for a record flue-cured leaf harvest of 108 million lbs.

Northern Rhodesia anticipates a peak crop of 11 million lbs, with leaf of much better quality, while in Nyasaland the crop is put at 33 million lbs. The first Indian estimate is 4 percent less than the outcome in 1951-52, but the final estimate for 1953, says the Commonwealth Economic Committee, may show an increase over last season. Australia's crop of some 7 million lbs will be below that harvested last year, when the Queensland auction prices were low.

COLOMBO RUBBER PRICES

The following prices have been issued by the Indian Rubber Board from the weekly rubber market report issued by the Colombo Brokers' Association:—

Closing prices on 25-5-53	Average prices for this period.
Sheet (Rupees per lb.)	(Rupees per lb.)
No. 1	1.37
No. 2	1.34
No. 3	1.31
No. 4	1.17
No. 5	1.12

Sheet Cuttings	
No. 1	.85
No. 2	.80
No. 3	.75
No. 4	.70
No. 5	.65

Crepe:	
R.M.A. 1X	1.12/13
R.M.A. 1	1.06/10

To arrive at f.o.b. Colombo prices add 20 cents per lb to the above market prices.

COCHIN TEA SALES

At Dust Sale 'J' held on 23rd May 1953, the total offerings amounted to approximately 1,04,000 lbs. There was a good general demand although prices were irregular. Milled dusts and fine dusts met with keen competition and were irregularly two annas dearer. Clean, black, exportable types, were in less demand and inclined easier. Buyers tended to show a preference for teas which had paid only one anna excise duty.

At Sale No. 11 held on 26th May 1953, about 1,60,000 lbs. were printed. Quality was again inferior and the bulk of teas on offer were very available however there was a fairly good general demand which help up well throughout the sale. Low mediums were well supported at about 1 1/2 annas per lb. below last rates but the better drawings in this category were heavy commonest while highgrowns were again weaker and showed an irregular decline in value of about 3 annas per lb.

Leaf grades and fannings were in good demand but prices for these were irregular.

Low Grown Travancore	B.O.P.	Rs. a. p.	Rs. a. p.
Medium	B.O.P.	1 10 6	1 11 6
Anamallai	B.O.P.	1 11 0	1 12 0
Best liquoring Nilgiri	B.O.P.	1 14 6	1 15 6
Well made black leaf	O.P.	2 5 0	2 8 3
		1 15 6	1 15 0

There was a sudden improvement in New Season's quota with buyers at 12 pias. Little business has been done in Special Licence at 1 pie. There otherwise of Special Licence.

Export Sale No. 12 will be held on Tuesday, 9th June 1953.

advocacy in the Supreme Court and otherwise relictant will no doubt have due regard to this ever produced and since members of India has class of advocates will presumably be eligible for the effect on the prestige and quality of the judiciary may also be borne in mind.

As W. G. Gilbert put it, concerning the benevolent monarch who "to the top of every tree body then no one's anybody." In short, except in theory you cannot by a wave of the legislative wand convert a 3rd grade police court pleader into an advocate of the Supreme Court.

Jute

THE FLUCTUATIONS OF JUTE GOODS PRICES

ONE of the complaints often made by users of jute goods is that they are subject to wide and unpredictable variations in price. That complaint is being repeated now because of the rapid rise in prices which has taken place during the past month. Between the end of April and the end of May the price of B Twills for ready delivery has risen by 18 percent and the price of 40" 10 oz. hessian cloth by 10 percent. Between the middle of October and the end of December the prices of B Twills and 10 oz. 40" hessian fell by 24 percent and 22 percent respectively. These are substantial fluctuations and there were also intermediate fluctuations of narrower range in the periods in question. There have, undoubtedly, been cases in the past where markets have been manipulated by speculators through exaggeration of the spreading of false reports but it is justifiable to say that the movements we have just mentioned were unpredictable. Long before October 1952, it was obvious that the 1952 jute crop was much greater than the world could absorb and that raw jute prices would fall. The natural deduction from that was the prices of jute manufactures would also fall and the decline actually began to manifest itself early in the jute season. Temporary influences, such as the placing of the Argentine order for hessian in October, caused partial recoveries but the general tendency was downward. These were the natural circumstances. The "un-natural" ones were the operations of Calcutta speculators who depressed prices further still by persistently underquoting mill selling prices in foreign markets. This placed mills in a difficult position regarding the sale of their manufactures and it also resulted in the price of jute being forced down to levels at which it did not yield a profitable return to the grower. Even at these levels, which were unprofitable to the mills and the growers of jute, foreign consumers were not satisfied and, encouraged by Calcutta speculators, they were looking for still lower prices.

It was apparent to the raw jute trade by December-January that the 1953 jute crop would be much smaller. In Pakistan the fall in prices had been more drastic than in India and the grower in Pakistan, despite the Jute Board's effort to support prices, got less for his jute than the grower in India. The Pakistani Government took the initiative by deciding to enforce reduction of the sowings in 1953 to half of the area sown in 1952. In India the position of the growers was not so bad because, in the districts where good jute is grown, most of the crop had passed from the hands of the growers to those of middlemen before prices had fallen below the economic level. In districts where inferior quality is grown much of the crop remained unsold even when prices reached the bottom. The low prices prevailing at sowing time were also discouraging. In these circumstances it was expected that the 1953 crop would be much reduced in the poor jute areas but that the reduction in the other areas would not be so great. It was clear, therefore, before sowing time came that in both India and Pakistan the 1953 crop would be much less than that of 1952 because of predictable influences and that a rise in the price of jute manufactures might be expected. Moreover, jute prices had fallen much more than those of other fibres or those of substitutes and jute prices could afford to rise without becoming uncompetitive.

It will be seen, therefore, that the main trends in prices of jute manufactures for the past year were predictable and were, indeed, predicted. If the fall and the rise have taken consumers by surprise it must have been because they were not fully apprised of the position. There has of course been one unpredictable factor—the weather—but the adverse weather did not begin to exercise its influence until after it had already become obvious that sowings in any case would be less. There have been other factors, too, such as the transfer of looms from sacking to hessian, which have influenced price movements and it must be admitted that operations by bazaar dealers have also affected prices. But it would seem that Calcutta must be acquitted of any artificial manipulation of prices to the detriment of consumers within the last year. In fact the speculative influence has, rather, been in favour of consumers.

THE JUTE MARKETS

In the case of both raw jute and manufactured goods the general tendency of prices during the past week has been upward and there has been healthy day-to-day business. The main bullish influence has been the lack of rain in the jute districts in India but scarcity of certain classes of manufactures for early deliveries has been a not unimportant factor.

Manufactured Goods: At the time of writing last week, prices had receded from the highest levels on account of mill selling and profit-taking by bulls. It was expected by many that the firmness would continue up to the end of May but that there would be a reaction after the usual end-of-the-month covering. Actually prices continued to decline until 29th May, when B Twills were down to Rs. 102, but thereafter renewed activity carried the quotation up to Rs. 106-12 for a ready position. There has been good enquiry of a diversified nature and interest has been taken by the J.K. the U.S.A. and Australia. Mills have

sold at each rise in prices and selling has been followed on each occasion by a temporary recession. There has been keen demand for cornsacks for early shipments and shippers are offering good premiums.

On Tuesday the market was partially closed because of Coronation festivities but quotations in the speculative market dropped in the afternoon to Rs. 102 for ready B Twills because of reports of rain in some of the jute districts. There was, however, some recovery on Wednesday morning though the tone was quiet.

Quotations on Wednesday morning were as under:

	Ready	June	July-Sept.
Rs.	Rs.	Rs.	Rs.
40" 8 oz.	34-10	34-12	36-0
40" 10 oz.	43-10	43-12	44-0
B Twills	103-8	103-12	104-12
Heavy Cees (Plain)	109-0	108-0	106-0
Cornsacks	102-8	102-12	104-0

Raw Jute: On Wednesday and Thursday of last week the market was quiet and quotations were slightly lower. This was attributed to reports of scattered showers in Orissa and Bihar. Quotations dropped from Rs. 29 for Upper Assam Bottoms on Wednesday morning to Rs. 27-8 on Friday. During these two days only small business was done in bimli, daissee mesta and so on. After normal market hours on Friday one group of mills bought a moderate quantity at Rs. 26-8 basis Bottoms for Upper Assam with the option of delivery ex local godown. On Saturday morning further small business was done, and late on Saturday afternoon another group bought. On Monday the market was firmer with sellers quoting Rs. 28-8 basis Bottoms for Upper Assam and, in the afternoon, business was done at Rs. 29-8 and

Rs. 30 basis Bottoms for Dhubri and/or Northern. Buyers have been showing some interest in New Crop but no actual business has been reported. Sellers have been rather reserved because of the continued drought in Indian districts.

The following business was reported during the week:—

Pakistani Jute:

Jat Rs. 35 for Middles and Rs. 31 for Bottoms, HJ June Rs. 100 to 105 per bale ex Pakistan. Cuttings Rs. 76 to 80 for NC's ex Pakistan.

Indian Jute:

Dhubri and/or Northern Rs. 31-8 to 32-8 for Middles only June.

Rs. 28-8 to 30 basis Bottoms June ex Agency. Rs. 27-8 ex local godown June.

Upper Assam Rs. 30 to 30-8 for Middles only June.

Rs. 27 to 29 basis Bottoms June.

(With option of delivery ex local godown 8 annas to Re. 1 less).

Murshidabad Tossa Rs. 25-8 to 26 basis Bottoms June.

Mesta Rs. 25 to 26-8 basis Bottoms June.

Daissee Mesta Rs. 27 basis Bottoms June.

Bimili Rs. 23 to 24 F.A.Q. June.

Assam Tossa Middles Rs. 32-8 basis Bottoms June.

Karimpur Tossa Bottoms Rs. 27-8 basis Bottoms June.

Jungli Tossa Bottoms Rs. 23-8 basis Bottoms June.

News of rain on Monday and Tuesday in Murshidabad District and in the daissee districts produced an easier feeling with sellers offering

Saint Frères Circular Looms installed in Italy

SAINT FRÈRES CIRCULAR LOOMS

Hundreds of Saint Frères Circular Looms are in use—in new factories and old, sometimes working alongside flat looms—in the Belgian Congo, in South Africa, Sweden, Norway, Italy, Great Britain, Germany, Belgium and France.

These looms were originally designed for making tubular cloth from jute. Deliveries of a Saint Frères Circular Looms for hard fibres are now available. Saint Frères Circular Looms are manufactured by Urquhart Lindsay & Robertson Orchar Ltd., Dundee, Scotland.

The 12 loom (2-leaf, 4-shuttle) weaves single and double warp plain and tubular cloth for sacks and for the manufacture of single width cloth woven in tubular form with a double false selvage for wrappers, etc.

Dundee Daissee	155-0	"
L.G.	155-0	"

Mofussil: In both India and Pakistan there is no change in the supply position. Imports continue small and everything that comes finds a ready market. Most of the business results, however, from sales by stockists or inter-baler transactions. The weather has been generally favourable for the new crop and the rain of the past two days has improved prospects in areas in India where little sowing has been done up to now.

WEATHER FAVOURS ASSAM CROP

In their eleventh crop report of the current season, covering the week ended 30th May, Messrs. Sinclair Murray & Co. Ltd., say that weather conditions in Assam have been very hot and dry and sowings are suspended. The rivers in Assam have been falling and are now normal.

DANPUR: The weather has been very hot and dry and rain is urgently required to enable cultivators to proceed with sowings. The condition of plants is unsatisfactory and they range in height from seedlings to 1 ft. Sowings to date amount to -7/3- as compared to -7/6 at this time last year. The river is abnormally low.

JAJPUR ROAD: The weather has been hot and dry with the exception of a light shower. Rain is urgently required to allow cultivators to continue sowings and for the benefit of the young plants. The condition of seedlings is unsatisfactory. Sowings to date amount to -7/3- as compared to -7/7- at this time last year.

RANAGHAT: The weather has been extremely hot and dry. Sowings have been suspended and the condition of young plants is not good. Sowings to date amount to -7/6 as against completed sowings at this time last year. The river is below normal.

COSSIMBAZAR: The weather has been extremely hot and dry. Rainfall is urgently required to enable cultivators to carry on with sowings and for the benefit of young plants. The condition of young plants is not satisfactory. Sowings to date amount to -7/2- as compared to completed sowings at this time last year.

NOWGONG: Sowings completed -11/16. Weather during the week under review has been favourable with alternate rain and sunshine. The condition of plants is satisfactory and they range in height up to 4 ft. The river has risen during the week and is now higher than last year at this time.

GAUHATI: Sowings completed -13/16. The weather has been favourable with alternate rain and sunshine. Weeding operations are being carried out in the highlands. The condition of plants is satisfactory and they range in height up to 5 ft. The river has fallen during the week and is now about normal.

KHARUPETIA: Sowings completed -12/16. Heavy rainfall has been experienced and a spell of sunshine would now be beneficial. Weeding operations have been suspended. The condition of the standing crop is satisfactory and plants range in height up to 5 ft. The river has fallen during the week and is now normal.

DIHUBRI: Sowings completed -12/17. The weather has been fairly wet and a spell of dry weather would now be beneficial. The condition of plants in general is satisfactory and they range in height up to 4 ft. The river has fallen and is now 6" higher than at the corresponding date last year.

DAISSEE DISTRICTS: The weather has been very hot and dry and rain is now urgently required. Sowings have been completed at -10/0-. The condition of young plants is not satisfactory.

N.B.—Last year's crop has been taken as -16/-.

PAKISTANI CROP'S GOOD PROGRESS

In their thirteenth crop report of the current season, covering the week ended 30th May, Messrs. Sinclair Murray (Pakistan) Ltd., say that the weather conditions have been favourable. The crop is making good progress. River levels on the eastern side are normal to slightly higher than last year but on the western side are very much higher.

NARAYANGANJ: Sowings completed -8/7-. The weather has been favourable with good sunshine. Plants are healthy and range in height up to 6 ft. The river has risen during the week and is now 1' 7" higher than at the corresponding date last year.

DACCA: Sowings completed -8/7-. The weather has been hot and dry and this has been favourable. Condition of plants is satisfactory and they range in height up to 4 ft. The river level is 1' 2" higher than last year at this time.

CHANDPUR: Sowings completed -7/7-. The weather has been hot and dry with exception of one light shower of rain. This has been favourable for the crop and the condition of plants is healthy and they range in height up to 3' 6". The river is normal.

HAJIGANJ: Sowings completed -7/7-. The weather has been favourable with alternate rain and sunshine. The crop is making good progress and plants range in height up to 4 ft. The river level is 1' 4" higher than last year at this time.

AKHAURA: Sowings completed -8/7-. The weather has been hot and dry and this has been favourable. Condition of the crop is satisfactory and plants range in height up to 3' 6". The river is slightly higher than last year at this time.

ASHUGANJ: Sowings completed -8/7-. The weather has been hot and dry. The condition of the standing crop is good and plants range in height up to 4' 6". The river level is normal.

NIKILAMPARA: Sowings completed -8/3. The weather has been hot and dry and this has been favourable for the crop. The condition of plants is satisfactory and they range in height up to 4' 6". The river is 9" lower than this time last year.

SARISHABARI: Sowings completed -7/7-. The weather has been favourable. The condition of plants is improving and they range in height up to 4' 6". The river has been rising and is now 6' 4" higher than last year at this time.

SIRAJGANJ: Sowings completed -7/7-. The weather has been hot and dry and this has been favourable. The condition of plants is improving and they range in height up to 6 ft. Weeding is going on where required. The river has been rising rapidly and is now about 3 ft. higher than last year at this date.

NAKALIA: Sowings completed -8/7-. The weather has been favourable with alternate rain and sunshine. The condition of plants is improving and they range in height up to 4' 6". The river is rising rapidly and is now about 1 1/2 ft. higher than last year at this time.

BHANGORA: Sowings completed -8/7-. The weather has been favourable. The condition of plants is satisfactory. Weeding is going on where required. The river has been rising and is now about 1 ft. higher than at the corresponding date last year.

N.B.—Last year's sowings have been taken as 16 annas.

THE FOREIGN JUTE MARKETS

PRICES TO BE INCREASED
(FROM OUR OWN CORRESPONDENTS.)

Dundee, By Air Mail.

A REPORT from Reuters says "The Ministry of Materials has announced that jute prices in the United Kingdom are being raised following the increases, which vary according to grade, in Pakistan export prices of raw jute. The Jute Control's selling prices of the main grade of long jute are being increased on the average by about £10 per ton. In the case of cuttings, the increase is £3 per ton. The Control's prices of imported hessian and imported heavy goods are also being increased."

Mill firsts have been advanced to £104 per ton and Mill Lightnings to £94, c. and f. U.K. These compare with the issue rates to spinners in December of £91 and £86 respectively, and it is obvious that this state of affairs could not continue. There are still very few offers for shipment material being made. These also include good marks of Daissee 2/3 at £96 and grade Tossa-4 at £95, c. and f. U.K. It is thought that the Jute Controller is fairly comfortably placed with stocks of the fibre, as there has been little or no business done since the advance commenced a few weeks ago.

Spinners are still very reserved about making further sales of jute yarns, but there may be more disposition to do business now that the expected advance is maturing. Common 8 lb. cops and 8 lb. spools have been very firm at 16/10d upwards, less 3 percent for cash, against the Continental yarns which are still being offered at 16/10d upwards, 10 percent duty paid. More interest has been taken in jute cloth and manufacturers have booked business up to several months ahead. Calcutta goods have fluctuated, closing at 78s. 0d. for 10 oz. 40 in. hessians and 58s. 0d. for 7 1/2 oz. June shipment, while "B" yarns are at 172s 6d for June and 174s. 0d. for July-September, all f.o.b. Calcutta.

THE KARACHI STOCK MARKET
IN their report on the Karachi stock market for the week ended 29th May, Messrs. Merwanjee Bomanjee Dalal & Son say that the 23 percent Pakistan loan 1953-54 will be repaid on 25th August. The redemption amount will exceed cent 1956-57 and 23 percent 1958-59 accounted for substantial business. Latest maturities were Trust and Municipal debentures were nominal.

Engineering and Transport

TARIFF COMMISSION'S RECOMMENDATIONS ON THE AUTOMOBILE INDUSTRY

FIVE FIRMS TO UNDERTAKE MANUFACTURE

LAST year the Government of India asked the Tariff Commission to enquire into and recommend suitable measures for the development of the automobile industry in India. The services of a technical expert from Germany were made available to the Commission for this enquiry. The Commission submitted its report on 25th April 1953. The main conclusions and recommendations of the Commission are briefly summarised below:

(1) The chief obstacle in the way of the speedy development of the automobile industry is the comparative smallness of the annual demand which has been, during the last four years, less than 20,000 vehicles of all types and categories. It is, therefore, extremely important to take steps to enlarge the volume of demand and for this there is great scope specially in regard to commercial vehicles. There are far fewer vehicles per 100,000 of the population in India than in most other countries of the world, including countries in south-east Asia. Both to develop the transport system of the country and to encourage the automobile industry it would be desirable to stimulate the demand for vehicles. For this purpose the Commission has suggested that the Government should implement the recommendations of the Motor Vehicles Taxation Enquiry Committee. The Commission has also come to the conclusion that the present high rates of import duty—94 percent on certain components manufactured or expected to be manufactured in the country, 63 percent and 31 percent on other components—far from helping the automobile industry, have had the effect of raising the price of motor vehicles to the consumer. The Commission has, therefore, recommended that the import duty on all components should be reduced to a flat rate of 40 percent ad valorem.

(2) The Commission has recommended that, simultaneously with steps to increase demand, the existing demand should be concentrated on firms with an approved manufacturing programme. There exist at present 12 firms with a total assembly capacity for over 84,000 vehicles. Of these, only five firms have a manufacturing programme and among them only Hindustan Motors Ltd has made "comprehensive and substantial progress" towards the manufacture of major components. The Commission has recommended that future demand should be concentrated on these five firms, and the assembly operations of those without a manufacturing programme should cease within a period of three years.

Plan of Manufacture

(3) To concentrate demand on the five firms with a manufacturing programme and to provide for the progressive manufacture of the types of vehicles required by the country, the Commission has suggested a plan of manufacture of various types by different firms and a programme of progressive manufacture of these types. Briefly, the plan is as follows:—(a) Hindustan Motors, Ltd., will manufacture a light car, a big car and a medium truck. (b) Premier Automobiles, Ltd., will manufacture a big car and a medium truck. (c) Automobile Products of India, Ltd., will manufacture a light car and a medium truck. (d) Standard Motor Products of India, Ltd., will manufacture a medium car only. (e) Ashok Motors, Ltd., will concentrate on a heavy truck and a baby car, if a suitable scheme is put forward by them.

(4) The Commission has suggested a scheme of progressive manufacture of components during the next five years. It has also suggested the actual scale of manufacture of each model from year to year, and the allocation of foreign exchange in accordance with that scale.

(5) The Commission does not consider that any of the five manufacturers is likely to make jeep-type vehicles. It has recommended that, for the present, the requirements of jeeps, both civil and military, should be met by the existing assemblers of jeep-type vehicles.

(6) The Commission has come to the conclusion that, on balance, diesel vehicles are more suitable for heavy transport and that the manufacture of a five-ton diesel vehicle should be encouraged, but that no diesel vehicles of lower tonnage should be manufactured.

Government's Decisions

The Government has, after careful consideration of the report of the Commission, come to the following conclusions:

(1) The Government agrees that for the quick development of the automobile industry it is essential to encourage the greater use of vehicles by bringing prices down. The Government accepts the view that the present high rates of duty have not helped the industry but have, on the other hand, inhibited demand. The Government, therefore, agrees with the Commission that the rate of import duty should be lowered. It considers, however, that a flat rate of duty on all components may not be conducive to the manufacture of new components. After careful consideration the Government has come to the conclusion that the best

approximately 40 percent on a complete CKD pack as recommended by the Commission, but to maintain at a somewhat higher level the rates on components within the manufacturing programme. The necessary notifications giving effect to this decision are being published.

(2) The Government agrees with the Commission that the present system of taxation of road transport by different authorities at different rates—sometimes very high—has been a powerful factor in reducing the demand for vehicles, particularly for transport vehicles. Any change in this requires discussion with the State Governments. The Government of India proposes to examine this question further in consultation with the State Governments and to evolve a system of taxation which will be conducive to the development of motor transport.

Servicing Facilities

(3) The Government of India accepts the conclusion of the Commission that the demand for vehicles in the country should be concentrated on firms with a manufacturing programme. These will, therefore, be no scope for pure assembling work being conducted on an economic scale for any length of time. The Government proposes, after consulting the firms concerned, to formulate a programme for them in the light of these developments and to examine what arrangements should be made to find alternative employment for the labour and, if possible, for the capital equipment, now utilised by the assembling plants. The intention is that within a period of three years these firms should cease their assembly operations and concentrate on the other activities of which is the maintenance and servicing of the vehicles on the road. Indeed the Government draws the attention of the firms with a manufacturing programme to the importance of providing adequate servicing facilities, in the absence of which the Government would find it difficult to continue the help and encouragement which they might otherwise deserve.

(4) The Government accepts in general the recommendations of the Commission regarding the types of vehicles to be manufactured and the firms which should undertake such manufacture. It considers, however, that the manufacture of baby cars need not necessarily be confined to one of the five approved manufacturers. It will be prepared to consider a programme of manufacture from any of the five firms if such a programme is submitted before September 1953.

(5) In regard to diesel vehicles, the Government doubts whether any firm would find it economical to manufacture five-ton vehicles only. It would, therefore, be prepared to consider on merits any concrete plan of manufacture which would include, beside the five-ton diesel trucks, engines for lighter vehicles and, possibly a light or medium vehicle of a type not included in the manufacturing programmes of the five units. This would enable the manufacturers of commercial vehicles to utilise Indian-made diesel engines, should their customers so desire.

(6) The Commission has suggested a detailed programme of progressive manufacture for each of the five firms and has recommended allocations of foreign exchange for specified numbers of vehicles for each of the next five years. While agreeing to the idea of such a programme, the Government considers that there should be some degree of flexibility, both as regards the pace of

progress and as regards the number of vehicles for which components could be imported every year. This is necessary in order to ensure a fair degree of competition among the manufacturers themselves.

Apart from the major recommendations dealt with in the preceding paragraphs, the Commission has made various suggestions on other points such as the need to develop ancillary industries, the establishment of a Development Council for the automobile industry, the importance of greater co-operation between the manufacturing firms, etc. The Government is in general agreement with the basic ideas underlying these recommendations and would take necessary action to implement them as far as possible. The Government also considers it necessary to provide for standing machinery to deal with the problems of this important industry. It has decided to set up an *ad hoc* committee consisting of representatives of the Ministries of Commerce and Industry, Transport, Defence and Finance. The committee will also examine

by the Motor Vehicle Taxation Inquiry Committee in regard to inadequate road development, bad condition of roads, heavy and varying rates of taxation of commercial motor vehicles levied by State Governments and restrictions on State movements of commercial motor vehicles with a view to ensuring an enlarged and steadily expanding volume of demand for motor vehicles.

(11) There should be four types of passenger cars and four types of commercial vehicles for civil requirements in India.

(12) From the point of view of production, it is essential that the army demand should be combined with the civil demand.

(13) The automobile manufacturers should, as far as possible, purchase the products of ancillary industries in India for use as original equipment.

(14) Steps should be taken to prevent haphazard and unregulated growth of ancillary industries. The number of units to be set up and the total capacity of each industry should be correlated to the actual or potential demand for its products.

(15) Ancillary industries requiring protection or assistance should be asked to apply for it according to the usual procedure.

(16) The Government should give encouragement for the establishment of ancillary industries for the manufacture of certain important components such as carburettors, clutches, etc., in technical collaboration with foreign firms.

(17) For reasons given already, the granting of a subsidy to the industry and an increase in the rates of customs duties on automobiles are not recommended.

(18) The present customs classification of components under item numbers 75(9), 75(10), 75(11) and 75(12) of the Indian Customs Tariff Schedule should be abolished and all components and parts should be assessed at a standard rate of 40 percent inclusive of surcharge.

(19) Import arrangements and allocation of foreign exchange for the various types of vehicles should be as suggested in para 15. Their working should, however, be watched closely and reviewed at the end of each year and suitable adjustments made for changes in domestic demand, variations in c.i.f. prices, etc. The position should be reviewed finally at the end of 1956.

"Home Delivery" Cars

(20) The import of "Home delivery" cars should be discouraged as much as possible. A person importing a car under the "Home delivery arrangement" should have owned and used the car abroad for a period of at least one year. The condition regarding resale of cars after import into India should be altered so as to increase the period applicable to cars imported from soft currency area also to two years.

(21) The scope for and extent of integration, mutual assistance and co-operation of manufacturers, assemblers and ancillary industries has so far been very limited. Efforts are, however, likely to be made by all the interests to work in collaboration for the development of the automobile industry when the situation in regard to the future becomes clear and everyone knows his role definitely. The possibility of such collaboration should particularly be explored in the direction firstly, of utilising surplus capacity available with the manufacturing firms by those firms who have not yet made any appreciable progress in implementing their programmes of manufacture and secondly, and utilising capacity or equipment rendered surplus by the curtailment of the operations of the assembling firms.

(22) In the steel expansion schemes which the Government is sponsoring, provision should be made for production of alloy steels required by the automobile industry.

(23) The automobile industry and the ancillary industries should represent to the Government specific cases for relief or assistance required in regard to the import duty on raw materials.

(24) As it is desirable to develop an export market for motor vehicles in Burma and Ceylon, a working arrangement in regard to the import duty on components to be paid by Hindustan Motors Ltd. in respect of motor vehicles exported to these countries should be evolved.

Special Rail Freight

(25) State Road Transport Departments or Corporations should encourage manufacturers of motor vehicles in India by purchasing vehicles from them. They should be given import licences only when the indigenous manufacturers are unable to produce vehicles of the type required by them.

(26) A special railway freight rate not exceeding one-half of the present rate should be fixed for the transport of new motor vehicles produced by the recognised manufacturers in India to the places where they are sold.

(27) Steps should be taken to increase the number of covered wagons so as to meet the full requirements of all the automobile manufacturers.

(28) Import licences for importing tools, machinery, plant equipment and sample vehicles for development purposes should be issued expeditiously to the manufacturers of automobiles subject to the necessary safeguards.

(29) Applications for refund of import duty on tools required for the manufacture of automobiles should be considered sympathetically by the Government.

(30) As the advance payments being made by the Government to Hindustan Motors Ltd. to the extent of 85 percent of the invoice price of imported components for the army trucks are on account basis, they should not be treated as loans on which interest is payable by Hindustan Motors Ltd.

Diesel Engines

(31) For lighter vehicles, whether they are used for goods transport or for passenger service, a diesel engine does not seem to be more economical or more suitable than petrol engine. The use of diesel engines for such vehicles should, therefore, be discouraged. As regards heavy commercial transport trucks and heavy passenger vehicles, it would be desirable to allow both petrol and diesel engines but the choice should be left to the owner of the vehicle. Steps need not, however, be taken to manufacture three-ton diesel vehicles at this stage. For extra heavy commercial trucks and extra heavy passenger vehicles of five-ton and above, it is definitely more advantageous to use diesel engines and if there is a possibility of manufacturing such diesel vehicles in India, it should be explored.

(32) All firms with a manufacturing programme should become independent of their foreign associates within as short a period as possible. They should set up designing and research sections of their own and introduce schemes for the training of apprentices.

(33) A Development Council for the automobile industry should be set up as early as possible under the Industries (Development and Regulation) Act, 1951.

(34) An Association of Manufacturers of Motor Vehicles and Ancillary Industries should be formed to consider the common problems of the industry, secure co-operation among the members and bring their difficulties to the notice of the Government. The Association should set up an Automobile Standards Committee to lay down standards for motor vehicle components.

(35) Research in the production and use of alloys of steel required for the automobile industry should be conducted at the National Metallurgical Laboratory, Jamshedpur.

(36) The Department of Internal Combustion Engineering at the Indian Institute of Science, Bangalore, should be developed as a centre for automobile research.

(37) Central and State Governments should investigate the possibility of utilising surplus capacity available with the automobile manufacturers in India to meet Government requirements other than those for motor vehicles.

(38) In the case of loans advanced by the Central Government as well as State Governments to their officers for purchase of motor cars, a condition should be laid down that a motor car manufactured in India must be purchased.

(39) Manufacturers of motor vehicles should be required to initiate within one year and maintain a proper system of costing.

(40) A special officer possessing high qualifications in automobile engineering and practical experience of work in a large automobile factory should be attached to the Tariff Commission for a period of three years to watch and report on the progress of the industry, the implementation of the manufacturing programme and the quality of the products of the industry.

(41) It would not be advisable to establish a separate unit for the manufacture of jeeps at present. The possibility of combining the manufacture of jeeps with that of motor cars may, however, be explored.

(42) The present practice of issuing import licences for a small number of auto-rickshaws may be continued.

PRODUCTION PLANS FOR BASIC TRAINER PLANE

GOOD progress has been made in the plans to produce aeroplanes in India and the first Indian-designed and developed all-metal basic trainer, H.T.-2, will go into full production before the end of the year. Six planes every month will take off from the assembly line of the Hindustan Aircraft factory at Bangalore. Designed and developed to meet the demands of the Indian Air Force, the trainer will not be put on the market until Air Force requirements have been fully met. The factory plans to demonstrate the performance of the trainer in foreign countries.

Arrangements are now being completed for large-scale production and the assembly line is daily gaining momentum in the new 300-foot long hangar. The shop, when completed, will be self-contained, with the assembly jigs on one side of the hangar feeding the erection line on the other side. Ancillary services are also being located strategically on either side of the hangar, making the shop a complete production unit. The major assembly jigs now being erected are fuselages, wing assembly jigs, and separate assembly jigs. Separate and elevator tabs, cowings, nose cowl, engine mount and canopy.

Since obtaining air-worthiness certificates from the Civil Aviation authorities in India early this year, six trainers have been handed over to the Air Force and five more are on the assembly line.

The trainer, powered by a Blackburn Cirrus major engine of 155 h.p., is entirely constructed with metal, including control surfaces. No fabric or wood is used which will go a long way towards

eliminating deterioration through weather conditions and also does not require frequent replacements. Aviation experts agree that the H.T.-2 is unique in that it is designed for unrestricted aerobatic manoeuvres with an all-up gross weight of 2,240 pounds, and loops, rolls and light turns are possible with extreme ease.

H.T.-2 Mockup

On the other side of the H.T.-2 hangar lies the mockup line of the advanced military trainer, H.T.-10, the mockup of which has now been completed. Senior engineers and technicians of the Indian Air Force are meeting in Bangalore this month to scrutinise the mockup before beginning the manufacture of a prototype which is expected to be completed by the end of 1955. This trainer which is exclusively made for the Air Force will be powered by a 1,200 h.p. engine.

U.K. APRIL CAR PRODUCTION

The Society of Motor Manufacturers and Traders has announced that the output of British cars in April was stepped up to a rate which has not been equalled since November of 1950, the year when the motor industry reached all-time peak levels in production and export. In the four weeks of the April period no less than 44,000 cars were made for the home and world markets—just over 1,000 a week more than the average weekly output during the first quarter of this year.

The percentage of production allocated each month to export orders has now risen from 50 percent in January to 65 percent in April. For commercial vehicles, too, the story is similar, the export percentage having mounted from 39 percent in January to almost 47 percent in April when the total number made stood at nearly 17,000 units. The number of cars actually exported in April numbered 25,600; this was over 3,000 more than the monthly average for the first three months of 1953. Car sales to Canada were an outstanding feature of the month's trading numbering nearly 4,600—almost 2,000 more than in March.

Commenting on these latest figures, Mr. W. R. Black, President of the Society said:—"In today's difficult world situation the figures are indeed gratifying and represent an enormous amount of hard work on the part of all concerned. Inevitably the waiting list on the home market for some models will be lengthened. The industry is still committed to export as large a percentage as possible of its output."

U.K. PETROLEUM CHEMICAL DEVELOPMENT

The publicity campaign on behalf of chemicals from petroleum has died down of late and various conclusions have been drawn from this comparative quietude. Whether the industrial value of these chemicals is as great as was claimed at the outset has been questioned. It would be unwise to make sweeping deductions in the absence of further evidence. There may have been a tendency to overstatement, but this is not unusual in a tendency marketing of new products is undertaken. A certain amount of energy has been absorbed by the appears to have been that the costs of the capital equipment required have far exceeded expectations, and that, by reason of this, it has been difficult so far to market products at competitive prices. But if the cost of petroleum chemicals can be lowered, and this, surely, is only a matter of time, the new industry should become firmly established. What is also wanted is a broadening of the industrial uses contemplated; there is at present a rather undue reliance on outlets for textile auxiliary purposes.

BRITISH AND SWISS CONTRACT FOR U.S. POWER INSTALLATIONS

British and Swiss firms have been awarded U.S. Government contracts to build transformers and hydroelectric generators for power projects in north-west United States, the U.S. Interior Department announced last week. The British firm, Ferranti Electric, Inc., won a \$857,800 contract to build and install six transformers at McNary Dam on the Columbia River in the states of Washington and Oregon. The Swiss company, Pacific Overlark, won a \$1,977,822 contract to manufacture and install four hydroelectric generators at the Palisades Power Project on the Snake River in the state of Idaho. The Interior Department said the number of bids by both domestic and foreign firms had been considered. Those awarded were the lowest submitted.

U. K. AVIATION EXPORTS

The British aircraft industry exported aviation equipment worth nearly £5 million in April, the Society of British Aircraft Constructors announces. This brings the total for the first four months of the year to nearly £19 million—a record figure. The latest figures show that the industry is well on the way to the expected total of £60 million for the year.

Exports of jet and turbo-prop air-liners have only just begun. Two Comets have gone to France and another two are leaving for Canada shortly. The first export Viscount, for Air France, has been handed over to the company and will be flown to France soon. There is a growing demand for general-purpose aircraft, such as the Prince and Heron, and the Dove feeder-liner is earning a steady income from dollar sales. More and more orders are being received for jet fighters and trainers, and exports of jet bombers, the first large jet aircraft to be available to foreign air forces, are beginning.

Our City Cable

GILT-EDGED A SHEET ANCHOR TO MARKET

BROKERS' CARRY-OVER TO BE RESUMED

London, 1st June.

THERE have been too many holiday interruptions to allow the market to get under way during the past week. Following the Whitsun holiday the market was very slow and the only thing stopping a real slide in prices has been the persistent firmness of gilt-edged. At one period conditions became slightly unsettled. Mining sections which lately have rallied, largely on the Continental business, have been brought to near standstill because of the present French political situation. Foreign bonds were generally lifeless until today when disappointment with the Ecuador settlement caused weakness in Quay Quil Quito which were marked sharply lower. Other South American issues gave up some ground in sympathy. German and Japanese have been tied down by lack of news of the ratifications of German treaties and the continued unsatisfactory reports on the Japanese economic situation. Chinese moved lower but later steadied on New York rumours of good progress at the peace talks.

Industrials again have been in the hands of business and latterly uncertainty over the unscrambling of steel nationalisation played its part in unsettling the market. Dividends and chairman's statements have been responsible for quite a lot of activity in shipping issues, while oils also have been moderately active from time to time, but this section more than any other took its lead from Wall Street. Teas have generally been a quiet and irregular market, although the tendency has been more often firm than dull and some interest was stimulated by dividend announcements from two Pakistani companies. The announcements that Chadpore was to resume payments and that New Sylhet was to pay the preference shares came as a surprise. Favourable results were also responsible for some gains among other issues.

Contango to be Restored

The disappointment which was occasioned recently by the decision of the Stock Exchange Council not to permit the resumption of option dealings will be mitigated to a certain extent by the fact that it has now been decided to restore, after 8th June, the contango system whereby bargains can be carried from one Stock Exchange Account to another, to transactions between broker and broker, as opposed to the present practice whereby the facilities are only available through a jobber. This further freedom ought to benefit both the markets as well as the investor. The former will benefit from the greater facility which will be accorded to business generally, while the latter will now be in a much better position to judge if and when a speculative position has been built up. It was more or less general practice for jobbers to charge a fixed percentage rate for contango facilities, and though this was a reasonable enough rate, usually around 4½ percent, it was only too common when speculative pressure developed for the facilities to be withdrawn completely, with the result that speculators were obliged to "put through" their bonds—what is known on Indian stock exchanges as "budia" business—or in other words sell nominally as the close of one Account and buy back at a slightly higher price in the new Account, the difference working out at a money lending rate of as much as 25 to 30 percent. Under the new arrangement contango rates will vary in accordance with demand, thus making the market position more easily distinguishable.

Despite the market holding substantial amounts of maturities and banks being in receipt of the second half of the month's Health Money, short conditions were very difficult at the start of loan conditions were very difficult at the start of the week. This resulted from a heavy bill take-up which needed financing and heavy outside calling. Later, the position eased slightly, but generally conditions remained difficult and the authorities helped out on a number of occasions. The Bank of England Return showed active note circulation £9 million higher at £1,532 million reflecting heavy withdrawals from banks for Coronation spending. This level is the highest reached this year and only £18 million below the all-time record of £1,550 million during Christmas last year. Applications for £260 millions Treasury Bills amounted to £346,945,000 of which the former amount was allotted at an average rate of 4½ to 5½ percent. This week a record amount of £270 million will be offered.

Market Newsletter

The Investor's Chronicle market newsletter writes: The Stock Exchange continues in apathy but is tending more to follow Wall Street than Egypt. After the big decline since the Budget, industrial shares have rallied technically. If gilt-edged can hold as it seems probable, industrials may also hold for the near future since the yield margin between gilt-edged and industrial looks adequate, but the marketing of denationalised steel shares must be a blanketing force. Latest news of Austrian peace treaty implies that Russia's basic policy is unchanged.

U.S. Vegetable Oils

The United States vegetable oil market felt the effects of heavy supplies and low demand as well as the influence of sharply lower grain prices. Values of most oils were cut back sharply especially cottonseed, soyabean and maize oils. A substantial

tantial break in linseed prices brought a immediate reduction in linseed oil. Austria bought 1,000 tons of crude soyabean oil for June shipment on basis around 12 cents a pound. Export interest otherwise was quiet but easier prices made for somewhat higher domestic sales volume in refined oils.

Oilseeds Market

The Whitsun holiday and the Coronation celebrations have influenced the oilseeds market and the only business recorded was in Portuguese West African palm kernels at 5,100 escudos per ton, c.i.f. Canadian linseed was marked up £1 to £15½ and British East African castorseed to £65 from £62½, while Indian nigerseed 3 percent was quoted at £63½ compared with £62, all per ton, c.i.f. The coconut oil situation is still difficult and Ceylon produce is nominally quoted at £124 c.i.f. Some irregularity was noted in American oils with cotton oil at \$341 against \$351, groundnut oil \$525 against \$520 and soyabean oil \$285 against \$305, all per short ton, c.i.f.

Jute Prices Withdrawn

All existing prices for raw jute, yarns and jute goods including imported goods in the United Kingdom have been withdrawn since late on 28th May, it is learned in Dundee. A notice to the industry said that fresh prices would be issued in the near future. The revision of prices was necessitated by the recent stiff advance in raw jute values, the notice added.

Cocoa Sales

Following some sales to the United Kingdom at 207½s. per cwt., the Cocoa Marketing companies announced that they finished selling for shipment, this season's Gold Coast and Nigerian cocoa crop. Their total sales are estimated at around 340,000 tons and it is believed that the remaining stock to be sold afloat later amounts to about 4,000 tons. Meanwhile, United Kingdom buyers continue in the market for superior Bahia after business during the week at 25½s. per cwt, c.i.f. U.K.

Linseed Oil

From 1st July linseed oil consumers will have to take two tons from official British stocks for every one ton imported through private account. At present the ratio is three to one.

Liverpool Cotton Market

Business on the Liverpool cotton market on the week was unimportant and mostly concerned with occasional sales of U.S. cotton for August sailings. United Kingdom arrivals of raw cotton during the past week were only 6,061 bales comprising Egyptian 1,560, Peruvian 1,436, Pakistan 800, United States 792, Argentine 660, West African 199, Brazilian 140, Mexican 16, Syrian and others 458. Quantity at present afloat to the U.K. was 71,225 bales mainly Brazilian, Sudan, Argentine, West African, Egyptian, East African and Pakistan.

Cereal Hedging

The Minister of Food announces that to facilitate the resumption of private imports of cereals, arrangements are being made whereby traders and manufacturers will be assisted to cover themselves against the risks of price fluctuation by hedging their operations. Details of the foreign exchange arrangements regarding these operations are being discussed by the Bank of England with the traders concerned and will be announced later.

Hong Kong Gold Prices

Hong Kong gold prices moved narrowly in featureless trading last week. Opening with a steady undertone, values advanced to \$276½ but then turned easy drifting to \$273½ but rallied one point before the close. The official offshore will be 5,930 taels and unofficial 10,800. Arrivals in Macao were 8,000 tolas and unofficial exports are estimated at about 5,500. There were no forward contracts.

Calcutta Markets

FIRMER UNDERTONE IN FREIGHT MARKETS

BULK WHEAT TO KARACHI

THE freight markets have showed a firmer undertone over the past week though in certain sections rates have moved irregularly within narrow limits, any alterations being usually against shipowners. The Calcutta coal market has been quiet and no fixtures have been reported. Ore, however, has been fixed from Vizagapatam and Madras to Baltimore at \$10.10 and a further fixture from Vizagapatam to U.S.N.H. was done at \$9.25. The Australian market has also been dull and business for Australian wheat is in abeyance after the fixture of wheat in bulk ex silo from West Australia to India at the previous rate of 57s. 6d. Sugar in bags from Queensland to U.K. was done at the lower rate of 115s. for a September loader. No further fixture has been reported for coals from Chinwangtao to Chittagong though tonnage is stated to be actively treating at rates slightly below those last reported. However rice was fixed at 52s. 3d. from Whampoa to Colombo for a late June vessel. Sugar in bags from Formosa to U.K. was concluded at 65s. for one vessel and from Mauritius to St. John or Halifax, 72s. 6d. was paid.

An interesting feature of the North American market has been the demand for bulk wheat from Eastern Canada to Karachi, five ships having so far been fixed. One or two ports St. Lawrence to Karachi paid 72s. 6d. while 71s. 6d. was paid from St. John N. B. or Halifax. Wheat from the North Pacific to Japan was fixed at \$7.25 and four vessels

were fixed for coals from Hampton Roads to Japan at rates varying between \$9 and \$9.30.

In the Time Charter section rates remained fairly constant. An oilburner accepted 16s. for six months trading while 21s. was paid for a motorship delivery Liverpool, redelivery Australia, trip out,

FAIR DEMAND AT FIRST TEA SALE OF NEW SEASON

STYLISH WHOLE LEAF GRADES WELL SUPPORTED

At Sale No. 1 of the new season which was held on 1st and 3rd June, most offerings were comprised of new season's tea. There was a fair demand; flavour Darjeelings and bright liquoring Doars were strongly supported and these sold well. However the rather large quantity of plain liquoring Darjeelings met with little demand and withdrawals of this class of tea were heavy. Stylish whole leaf grades were well supported whilst black fannings were in good demand. There were a few new season's Assam teas on offer which met with fair demand.

The Dust offerings were all Old Season's teas. Demand was irregular, the beginning and the end of the sale being the easiest periods. Black leafy dusts and the few bright liquoring Doars were the strongest features, while medium and good mediums sold at irregularly easier rates. Commonest sorts were firm and sometimes dearer. The small amount of Internal leaf teas offered met with a strong demand at dearer rates.

Quotations		Approximate Quantity Offered	
Clean Common Broken Pekoe	... 1-11-6	1953	1952
Medium Doars Dust	... 1-6-6 to 1-7-0	3,000 Pkgs.	28,100 Pkgs.
Medium Doars Dust (1952)	... 1-5-0	Internal Leaf	660 "
Medium Assam Grains Dust	... 1-7-6 to 1-8-0	Internal Dust	33,850 "
Best Assam C.T.C. Dust	... Not quotable.	Sale No. 2 will be held on 15th and 16th June.	

SUGAR MARKET STEADY

During the week ended 2nd June, the sugar market was steady, prices for ready ex-Kantapukur delivery being Rs. 31 a maund for ordinary grain, Rs. 31-12 for big grain, and Rs. 29-8 for old ordinary grain. Stocks amounted to 30,000 bags and arrivals were about 2,000 bags daily. Sales averaged 3,000 bags in the local markets and 1,200 bags daily for Assam. Ex-mill delivery rates ranged between Rs. 28-12 and Rs. 29-8 a maund for Bihar mills.

LINSEED

Prices moved within narrow limits last week and a generally firm undertone was maintained throughout. After a steady opening, prices gradually declined because of the absence of buyers, but later, towards the close, prices recovered their earlier firmness. The main feature was the shortage of supplies from upcountry and the absence of sellers for ready and forward delivery. The volume of trading was rather small. The oil section was dull and only a feeble interest was shown by local buyers. No fresh business for export was possible as long as prices remained at these levels. Latest quotations were as follows: June Rs. 22¼ per maund; July-August Rs. 22/12 per maund.

HIDES AND SKINS

The market in skins ruled slightly firmer. Stocks were less than in the previous week.

Bazar Sales

(Between 26th May and 1st June, 1953.)
Cowhides:—Wet salted (Slaughtered) 10,300 pcs. on the basis of Rs. 12-8 to Rs. 26.
Goatskins:—Wet salted (Dressed, Killed) 28,370 pcs. on the basis of Rs. 285 to Rs. 425; Assam-Dinajpur-Murshidabad 27,600 pcs. on the basis of Rs. 255 to Rs. 330; Purneah-Kissengani 7,000 pcs. on the basis of Rs. 275 to Rs. 290; Fakur 3,730 pcs. on the basis of Rs. 245 to Rs. 250; Patna (Ord.) 16,450 pcs. on the basis of Rs. 170 to Rs. 250; Muzafferpore-Darbhanga-Silamari 6,140 pcs. on the basis of Rs. 270 to Rs. 285.

WEEKLY SHELLAC MARKET REPORT

The range of quotations in the shellac market during the week ended 1st June was as follows:—

Standard Pure Buttonlac	Pure Buttonlac	Rs. 88 value	Rs. 82 to Rs. 85 done and buyers
Lemon No. 1 Shellac	Rs. 84 to Rs. 86	done and buyers	
Lemon No. 2 Shellac	Rs. 81 to Rs. 82	done and buyers	
F. O. Std. I. Shellac	Rs. 74½ to Rs. 76	done and buyers	
Pure TN Shellac	Rs. 69 to Rs. 72	done and buyers	
4% I.T.N. Shellac	Rs. 60 to Rs. 62	done and buyers	
No. 1 Kusmi Seedlac	3½ Rs. 82 to Rs. 85	done and buyers	
No. 2 Kusmi Seedlac	3½ Rs. 74 to Rs. 78	value	
Fine Bysaky Seedlac (Manbhum)	3½ Rs. 70 to Rs. 73	buyers	
Fine Bysaky (C.P.)	3½ Rs. 65 to Rs. 66	buyers	
Ordinary Bysaky Seedlac (C.P.)	5½ Rs. 60 to Rs. 62	done and buyers	
Ordinary Bysaky Seedlac (C.P.)	5½ Rs. 56 to Rs. 57	buyers	
Kireelac	Rs. 28	buyers	

Shipments during May until the 29th were 27,499 packages.

in Ceylon... they know that

more motorists use
triple-action Mobiloil
than any other motor oil in the world!

There is something for every traveller in beautiful Ceylon, land of ancient civilisations and timeless enchantment. On his travels he sees things of unsurpassed interest, from gem-cutting at Ratnapura to traditional dancing at Kandy ... from the ruined palaces at Polonnaruwa to the glorious 7th-century wall paintings at Sigiriya.

The motorist in Ceylon is equally gratified by a painting of a more modern age, which can be seen everywhere — the sign of the Flying Red Horse. Like motorists all over the world, he knows that Triple-Action Mobiloil is a Heavy-Duty oil, giving greater protection than regular or premium-type oils. He knows, too, that it ...

SAVES ON WEAR by lubricating properly at all temperatures;

SAVES ON REPAIRS by preventing harmful carbon deposits in the engine;

SAVES ON PETROL by preventing acids eating away the metal parts, which causes loss of power.

Stop at the sign of the Flying Red Horse

The Flying Red Horse is the sign of helpful service for your car. Go there for regular Mobilubrication — the complete motor service — and for Standard-Vacuum products backed by 87 years of leadership in the oil industry.

INDUSTRIAL FIBRES

Industrial Fibres. 5s. net. Obtainable from H. M. Stationery Office or from the Secretary, Commonwealth Economic Committee, 2, Queen Anne's Gate Buildings, Dartmouth Street, London, S.W.1.

The Commonwealth Economic Committee's annual review *Industrial Fibres* shows that while in 1951-52 there was a very marked increase in world production of fibres, consumption was slightly reduced; as a result stocks rose considerably during the season. Fibre prices, which began to fall in the second half of 1951, continued to decline throughout the greater part of 1952. The figures given in the Report indicate that in the current season world output may equal that of 1951-52, while consumption is likely to show some improvement on the previous year. Total production of fibres increased by about 20 percent in 1951-52, both apparel and non-apparel fibres rising by much the same proportion. The predominant increase was in cotton, which accounts for three-quarters of the world's supply of apparel fibres and, although the greater part of the improvement was due to the much larger crop in the United States, output also rose in the Commonwealth, particularly in India, Pakistan and British East Africa. Jute, virtually all of which is grown in the Commonwealth, provided the main increase in the non-apparel fibres.

In 1952-53 the cotton crop is again expected to be very high, while wool production will probably expand further, mainly owing to an increase in Australia, which is by far the world's largest producer. Rayon output, which suffered a marked recession in the second quarter of 1952, has since improved. Among the non-apparel fibres, sisal output may show a further increase, particularly in British East Africa, while the 1952-53 jute crops in Pakistan and India should exceed the high level of a year earlier.

A notable development in the world fibre situation has been the entry into commercial production of the newer man-made fibres such as nylon, terylene, aridil and saran. *Industrial Fibres* this year includes a broad survey of these new fibres and summarises details of their manufacture and uses. Output of these fibres has risen sharply in recent years and in 1951 amounted to some 250 million lb., which was 6 percent of world rayon production or one percent of the output of all industrial fibres. Nylon is still the predominant fibre of this group, accounting for two-thirds of the total. As new plants come into operation in different parts of the world, total output of these fibres is likely to become of much greater importance than hitherto.

LABOUR STATISTICS

The Year Book of Labour Statistics 1951-52. (Published by the International Labour Office, Geneva, 360 pages. Price, Rs. 24) This Year Book presents a summary of the principal statistics relating to labour in all parts of the world. The data are based on communications to the International Labour Office or on statistics from official publications. Three languages are used—English, French and Spanish—and in general annual series give figures brought up to and including 1951, with monthly and quarterly figures brought up to June 1952. New tables are presented which give the most recent data for each country on food supplies available at the retail level (in kilograms per head per year) and on the number of calories per person per day available from these food supplies. The tables showing statistics of net intercontinental migration and statistics of industrial disputes according to divisions of economic activity, which appeared in the previous issue, are not included in the present edition. Series which are out of date and for which there is no prospect of current information becoming available have been discontinued. The material is divided into chapters, each opening with an introductory note in which the characteristics of the different types of statistics are discussed.

The International Standard Industrial Classification of All Economic Activities adopted by the U.N. Economic and Social Council has been used as a basis for the arrangement of industries. However, until the different countries have themselves adopted the new classification for their labour statistics, the arrangement of the material in this order will not suffice to unify the data. For the present, not much more can be attempted than to group the items in accordance with the general headings indicated and to arrange them in a uniform order. To a considerable degree, therefore, in the tables on the economically active population, employment, unemployment, hours of work and wages, the industrial categories correspond to the classifications adopted in each particular country. Rather than to any international standard. The industries covered by the various series are shown in the headings. Wherever possible, the numerical scope—the number of wage-earners or number of persons covered by the series—is given.

In compiling, arranging and presenting this mass of material the International Labour Office has tried to bring out as clearly as possible the nature of the statistics available in the different countries. Wherever possible the characteristics of the figures available, their nature, their coverage, the economic and numerical scope and other details are indicated, in order to call attention to the differences in these respects in the figures that are presented together in the tables on the various

topics. Because of the diversity of methods used in the statistics of the different countries, international comparisons are possible only with substantial reservations. In general the fluctuations in time of the various series lend themselves better to international comparison than do the absolute figures for a given date. An important object of the International Labour Organisation in the field of labour statistics is to promote the adoption of standard definitions, classifications, techniques and methods—in short, the international standardisation of labour statistics. By indicating in the Year Book the wide divergencies which exist between the statistics of different countries, as well as the gaps in the information available, it is hoped that the different countries will be given an incentive to produce more comprehensive, adequate and useful statistics on labour.

INTERNATIONAL SALARY DETERMINATION

Retail Price Comparisons for International Salary Determination. (Published by the Statistical Office of the United Nations. Department of Economic Affairs, New York, \$0.40.)

The pamphlet gives interesting details of the plan by which the United Nations Statistical Office has been computing what may be termed "cost of living relatives" applicable to international officials. As employers of staff in several countries, the United Nations and the Specialised Agencies find it necessary to make estimates of the relation between the purchasing power of the salaries paid at United Nations Headquarters in New York with the purchasing power of the salaries paid abroad. The object of these estimates is to provide a guide to ensure that the purchasing power of the emoluments for given grades of work may be made, as far as possible, equivalent for all duty stations.

It has been pointed out that the estimates resulting from such data have a severely restricted application. They measure the approximate relation between the price levels of two places as indicated by a "basket" of goods and services of the kind purchased by international officials. The estimates, therefore, do not cover factors which an individual might weigh in his choice of duty station but which are not subject to statistical measurement or which are not subject to statistical measurement. Moreover, the results refer only to expenditures of international civil servants who have in general been recruited outside the area in which they are stationed and who are nationals of a great many different countries. Calculations made from data for such specialised groups afford no basis for measurement of the general purchasing power. Such data nevertheless are likely to be useful to various governments in determining appropriate allowances to foreign service personnel employed by them.

The basic survey of the plan is for New York City and other surveys in the publication include San Jose, Copenhagen, Cairo, Guatemala City, Rome, Hague, Mexico City, Geneva, Bangkok and London. The highest cost of living was in Manila at 128 as against 100 in New York in September, 1951. Bangkok showed 94, London 70, The Hague 70, Copenhagen 72, Paris 99, Rome 88, Mexico City 84, Geneva 90.5 and Cairo 84.

Handbook of Economic Geography, Vol. II. By S. P. Mookherjee. (Published by the author, Rs. 4, 255 pages.) Intended primarily for students, the revised edition is a simple introduction to the vast field of Indian economic geography. The author does not go into great detail, but has covered every aspect of the subject from soil erosion to irrigation, from a break-down of India's agricultural and mining products to overseas trade. The only defect, though it is one that will prove a nuisance to students, is that the index of contents and maps is incomplete.

The latest annual number of the *Jute and Gunny Review* contains some informative articles on the jute industry and markets abroad. In the

sphere of marketing, special attention is naturally given to the United States, Australia and the Colonies. In the sphere of production, the industries of Britain, France, Austria, Hungary and the Philippines are discussed. There are articles on industrial relations in the Indian jute industry, on research, and on various aspects of development such as modernisation of mills. The statistical section at the end will be found particularly useful. The usual high standards of printing and presentation are maintained. Priced at Rs. 5, the review is published from 271 Chittaranjan Avenue, Calcutta 6.

Sales Tax in West Bengal. By Rai J. M. Ghosh Bahadur. (Published by the author, 19, Aswini Dutt Road, Calcutta 29. 70 pages. Price Rs 3-12.) The author describes this as "a comparative analysis of sales tax laws in India and up-to-date Bengal Finance (Sales Tax) Act, 1941, as amended by West Bengal Act XLVIII of 1950 with comments and recent case-laws." The publication may be useful to the lawyer but it offers little illumination to the ordinary reader. Printing is atrocious.

This year's College Annual published by the Publication Section of the City College, Commerce Department, is an enterprising issue "intended primarily for the students of the College and is directed to acquaint them with current affairs and problems principally in the economic and educational sectors." The late Mr. N. P. Sarker contributes an outstanding article on the economic position of the middle classes. It is followed by a review of developments during 1952 in the fields of food and agriculture, industries, industrial relations and labour welfare, trade and commerce, commodity controls, transport and communications, money, banking and finance, refugee rehabilitation and planning. The remaining articles make a somewhat haphazard assortment. The Annual contains a section on the activities of the College, and articles in Hindi and Bengali on aspects of economic development.

The annual number of *Indian Sugar* contains some useful articles on India's sugar industry, quite the best among these being an adaptation of Mr. R. P. Nevatia's presidential address at the annual general meeting of the Indian Sugar Mills Association in February. Mr. S. P. Jain writes on "Private Enterprise and Industrial Development" while Sir S. S. Majithia makes some useful suggestions regarding the efficiency of the sugar industry. There are sections on sugar technology, sugarcane research, the confectionery and power alcohol industries, and labour problems. Priced at Rs. 2, the annual number is published by the Indian Sugar Mills Association, 23B, Netaji Subhas Road, Calcutta.

Report on a Special United Nations Fund for Economic Development. (Published by the United Nations. Price \$0.50 or 3s 9d, 61 pages.) This report of a nine-member committee, appointed by the U.N. Secretary-General, on a special fund to finance economic development was discussed editorially in *Capital* on 7th May.

WHOLESALE PRICE INDEX
ANOTHER RISE IN INDUSTRIAL
RAW MATERIALS

THE official wholesale price index (year ended August 1939=100) advanced by 0.7 percent to 397.6 during the week ended 16th May, 1953. Compared to the corresponding weeks of last month and a year ago, the index was higher by 2.1 and 8.7 percent respectively. During the week under review, Foodstuffs rose 0.8 percent to 381.7 as a result of increases in the prices of rice at Patna and Jowar (+5 each), wheat at Jabalpur and Bajra (+6 each), gur (+7%), wheat at Hapur (-3%) and at Amritsar (-2%). The index for Industrial Raw Materials rose by 1.4 percent to 479.0 as compared with 472.6 (revised) for the previous week, on account of higher prices of silk (+8%), linseed (+6%), gingellyseed (+5%), groundnuts (+4%), rapeseed, jute and raw hides (+3% each), Karungani cotton at Tirupur (+2%), cottonseed, lac and raw skins (+1% each), Manganes ore (-9%), Umeta cotton at Amravati and Jamilla cotton in Bombay (-3% each), Punjab American cotton in Bombay and wool (-2% each), however, decreased during the week. The index for Semi-Manufactures advanced by 0.5 percent to 359.7. Items which recorded noticeable variations were: linseed oil (+8%), mustard oil (+5%), groundnut oil in Bombay (+3%), sheep skins and Anjengo superior coir yarn (+2% each), zinc and castor oil (-2% each). Despite a fall of 3 percent in rayon and silk manufactures, the Manufactures group moved up by 0.1 percent to 569.8 from 569.3 (revised) for the previous week, owing to an increase of 3 percent in the prices of jute manufactures. Higher prices of vanaspati (+3%), chillies (+9%), betelnuts (+2%) and black pepper (+1%), raised the Miscellaneous group index by 0.7 percent to 620.0. Turmeric, however, moved down by 2 percent during the week.

TECHNICAL ADVANCES IN U.K.
COTTON INDUSTRY

The carrying of machinery and equipment into the cotton industry has been greatly furthered by the British Cotton Research Association (Shirley Institute). That Association is now accepted and acclaimed by most of the cotton textile industry, but in view of the indifference and hostility which the Association experienced over many years, it has been felt desirable to proceed carefully in certain of its expansions, and notably so in promoting the manufacture of new machinery and equipment. However, rather more than 18 months ago the step was taken of forming a subsidiary, Shirley Developments Ltd., to carry on this work, and the diplomatic and strengthening course was taken of appointing as chairman Sir Raymond Street, who is also chairman of the Cotton Board. The name of the subsidiary is Shirley Developments Ltd.; it has a nominal capital of £50 in £1 shares, all of which are held by various sections of the cotton industry or by employees of the Association itself.

Here, as in the case of the Wool Industries Research Association, the procedure will be that after having developed the prototype, manufacture will be done through companies acting as agents. There are already 40 items which will be nearing the agency stage within the next 12 months, and significant technical changes are at hand for the cotton industry. Some of these inventions, although designed for the cotton industry, will be of value to other textile industries. Indeed, the argument that interchangeability will be the keynote of the textile industry in future is now much heard. It is at present the case that some of the Shirley inventions are used in the synthetic fabrics industry; for example, the Radio-Active Static Eliminator. The Shirley Opener for more effective and economical opening and cleaning of raw cotton is near to the marketing stage and full technical data are available.

ASIAN SUGAR PRODUCTION

Asian sugar production is estimated by the U.S. Department of Agriculture at 4.8 million short tons (2,000 lbs. each), an increase of 2.1 percent above the 1950-51 production of 4.7 million tons, and 33.3 percent above the 1950-51 production of 3.6 million tons. Asia is expected to achieve this increase despite an estimated decline of 6.5 percent in world output, from 38.3 million tons in 1951-52 to 35.8 million tons in 1952-53.

India, with a surplus of sugar from the previous crop, reduced acreage for the current season, and India's production of sugar has decreased by nearly 220,000 tons, the department reported. Output from the Republic of Philippines is estimated at 1,165,000 short tons, against 1,077,000 last year; Formosa, 840,000 against 598,000; Indonesia, 505,000 against 472,000; Pakistan, 90,000 against 83,000; Burma, 20,000 against 16,000; and Japan 38,000 against 31,000.

U.S. MARCH FOREIGN TRADE

U.S. exports and imports reached the highest levels for the current year in March, according to the revised report of the U.S. Department of Commerce. March exports totalled \$1,877.8 million, compared with \$1,959.9 million in February, and March imports totalled \$1,004.2 million, compared with \$856.2 million in February. Foreign aid shipments under the U.S. mutual security programme accounted for \$329.3 million of the March export total, compared with \$272.3 million in February. This indicates that commercial exports were \$1,049.5 million in March, bringing the export and import totals more nearly in balance.

Total March exports were about 9 percent above the 1952 monthly average, while imports were about 12 percent above the 1952 monthly average.

Accounting for the export rise in March were increases in shipments of such products as machinery, grains, tobacco and petroleum products. Contributing to the import rise were increased receipts of such products as coffee, sugar, jute, newsprint, sisal, henequin, unmanufactured wool, crude petroleum, meat products, and iron and steel semi-manufactures.

LICENCES FOR IMPORT OF U.S. COTTON

In November, 1952 the Indian Government announced that outstanding licences for the import of U.S.A. cotton would be extended for shipment up to the end of June, 1953. On a further review it has now been decided to allow these licences to be extended for shipment up to the end of December, 1953.

U.S. IMPORTS OF CARPET WOOL

Imports of carpet wool in the United States during 1952 amounted to 140 million lbs. clean or 29 percent more than in 1951, according to figures issued by the Commonwealth statistician. India's share in these imports totalled 18 million lbs. compared with 4.9 million lbs. in the previous year. Imports from Pakistan also rose from 4.5 million lbs. in 1951 to 13 million lbs. in 1952.

LIVERPOOL SALES OF INDIAN AND
PAKISTAN WOOL

At the third series of Liverpool auctions for Indian and Pakistan wools held recently, 9,115 bales were offered of which only 4,458 bales were sold. The Liverpool Wool Brokers' Association states that in comparison with the prices ruling at the previous sale in March, Superior and Medium Whites were 2½ to 5 percent lower, Superior and Medium Yellow in the sellers' favour, Light Greys rather dearer and Black and Dark Greys irregular and occasionally showing a 10 percent decline.

IMPORT POLICY FOR CAUSTIC SODA
AND SODA ASH

Because of the reported shortage of caustic soda and soda ash, the Government of India has announced the following import policy for these commodities for the period July-December 1953. Quota licences for caustic soda at 35 percent will be issued to established importers. These will be calculated on the basis of half of their best year's imports during any one of the five financial years ending 1950-51. Quota licences will not be valid for the import of rayon grade caustic soda. Actual users will be granted licences for half of their users are eligible to apply as established importers by virtue of their direct imports when the O.G.L., the value of their quota licences will be deducted from the value of half of their requirements and actual user licences will be issued for the balance only. If the value of the quota licences is higher than half of their requirements, an actual user licence will not be granted. Actual users should state in their applications whether they are entitled to and are applying for a quota licence.

Licences will be granted to actual users for their full requirements of rayon grade caustic soda. Quota licences for soda ash at 20 percent will be issued to established importers. These will be calculated on the basis of half of their best year's imports during any one of the five financial years ending 1950-51. The quota licences will not be valid for the import of heavy natural soda ash. The licensing authorities have been instructed to entertain applications for these items in advance of the commencement of the ensuing licensing period and to issue import licences on a priority basis. To simplify the licensing procedure the licensing authorities are also being instructed to grant import licences for caustic soda on the basis of import licences for January-June 1953.

U.S. TEA IMPORTS RISE

U.S. tea imports for the first three months of this year were 20 percent above those for the same period a year ago, according to the Tea Council of the U.S.A. Anthony Hyde, executive director of the council, industry-wide organisation of tea packers, said tea imports for the 12 months ended 31st March 1953, were 18 percent higher than during the previous 12 months. "All of the major producing countries participated in this increase," Mr. Hyde said. "Imports from India increased 31 percent; from Ceylon, 33 percent; and from Indonesia, 14 percent."

Imports from India during the 12 months ended 31st March, 1953, totalled 39,666,000 pounds, compared with 30,367,000 pounds during the previous 12 months. The corresponding figures for Ceylon were 44,145,000 lbs. compared with 33,183,000 lbs. and for Indonesia 9,945,000 lbs. compared with 9,713,000 lbs. In the first quarter of 1953 India exported 12,008,000 lbs. of tea to America against 8,103,000 lbs. in the first quarter of 1952, and Ceylon 12,667,000 lbs. against 10,815,000 lbs. According to the latest trade reports, Americans this year will drink more tea than they have in generations, mainly as the result of an advertising campaign jointly sponsored by the tea pro-

The Government of India's resolution on the Tariff Commission's report on the power and distribution transformer industry has been published in the Gazette of India, dated 30th May, 1953. The Government has accepted the Commission's main recommendation that the import duty on power and distribution transformers up to 2500 KVA and 37.5 KV and on the H.T. side (primary voltage being over 220V) excluding the furnace, retines, and flame-proof transformers, should be increased from the present level of 5 percent ad valorem to 10 percent ad valorem exclusive of surcharge and converted into a protective duty which should remain in force up to 31st December, 1955. The Government has also accepted the Commission's recommendation for increasing the rate of import duty leviable on transformer oil imported with protected categories of transformers to 27 percent ad valorem.

THE EASTERN MANUFACTURING CO., LTD.

U.S. BUSINESS ACTIVITY

HIGH LEVEL FORECAST THROUGHOUT 1953

U.S. Government economists expect business activity in the United States to be sustained at a high level throughout 1953, reports the *Financial Times* correspondent in Washington. They believe any movements in national economy during the balance of the year will be relatively small and will more likely be in an upward than downward direction. The most pessimistic forecast advanced by any of the Government experts is for a mild business dip early next year. The preponderant view of analysts is that neither strong expansionary nor recessionary trends are likely to appear in 1953. They believe any downward pressures that develop will be localised by the overall strength of the economy.

It is thought there will be small gains in national output, and that price changes, except for farm products, will be negligible. Farm prices are considered unpredictable because of the prospect that bumper crops will be piled on top of huge surpluses. The international situation is, of course, the most variable in all efforts to appraise future economic trends. It is believed, however, that a truce in Korea has already been discounted by industry and markets, and that a genuinely dampening effect on business activity could result only from a global lessening of existing tensions. American business men had one "peace" scare in March and now that they know the Administration is determined to go ahead with a substantial rearmament programme, the achievement of a truce is expected to have little impact on business or consumer psychology. In gauging the prospects for the remainder of the year economists point out that the U.S. is continuing to enjoy full employment and complete utilisation of resources without price increases or inflation.

Modest Dip in 1954

The question analysts ask themselves as they look ahead is whether the U.S. can make further selective adjustments or whether there is a likelihood that adjustments will pile up and several will hit the economy simultaneously. It is the latter prospect that is envisaged by those more pessimistic economists who anticipate a modest dip early in 1954. The chief potential trouble spots that economists are watching closely are motor-car production, housing, farm prices and income and business investment. The farm sector is the only one of these that is soft now. Others are prospective, but as yet unmanifested. Weaknesses. Farm income declined from \$15,000 million in 1951 to \$14,000 million in 1952 and may go down to \$13,000 million or less this year. The farm decline thus far has been one of the selective adjustments the economy has taken in its stride. Personal incomes have continued to rise, as has national output, and if the farm adjustment proceeds at a sufficiently gradual pace it is hoped that lower prices will encourage consumption to rise to absorb production.

Business investment in plant and equipment remains at a peak rate. Preliminary results at a survey of business investment intentions made after the March peace moves indicate that businessmen still intend to spend about as much in the second six months of this year as in the first. If the intentions are realised, investment will continue to furnish strong support for the economy throughout the year. Motor-car and housing demands are more difficult to evaluate. Motor industry appears headed for a year at least as high as in 1952. But the used car market has become very sticky and economists think it possible that the remarkably high motor-car output of recent months, along with demand softness indicated by the used car situation, may indicate that new car sales will decline more than they customarily do in the last half of the year.

None of the economists actually predicts that this will come about. In fact, many believe that events will show that the recent high production represents the catching up with demands left unsatisfied when motor-car output was curtailed following last summer's steel strike. They declare that if this is true and some price concessions seasonal expectations. Forebodings about home price weakness has developed. Builders are still fast pace. But economists know that most of the post-war housing demand backlog has been wiped out and that the rate of family formation is declining, and that a housing adjustment must come eventually. It is not a soft spot, but it is a sector that could become so very quickly.

Strength of Economy

They believe that even if this does happen the resulting adjustment will have limited impact because of the general strength of the economy. Among counter-balancing and offsetting forces will be Federal spending, which is scheduled to be as high or higher than this year, rising State and local Government outlays, and the Federal deficit.

The expectation that the economy will be hit by several major adjustments at once still is limited to a majority of self-styled pessimists. They are quick to say that the extent of disagreement with their more hopeful colleagues is merely the difference between mild optimism and mild pessimism. There are no marked trends in the U.S. economy today.

"CAPITAL" STOCKS AND SHARES INDEX*

The Capital Stocks and Shares Index (Base: 1939) has now been brought up to April, 1953. Compared with March, the April Indices for Government Securities and Preference shares disclose drops of 0.1 point and 1.3 points, respectively. There were decreases in Bank (0.8 points),

Cotton (0.4 points), Coal (3.6 points), Mining and Oil (1.5 points), Tea (3.8 points), Paper (20.6 points), Sugar (2.0 points) and Miscellaneous (3.1 points), while Engineering increased by 3.4 points. The Indices for Jute and Cement remained unchanged at 144.0 points and 92.1 points, respectively.

Correlating all the factors the Capital variable yield securities index shows that the Index for stock prices in the above classes of shares declined by 1.2 points during April, 1953.

MISCELLANEOUS COMPANIES

O, Po, C and Dd. indicate Ordinary, Preferred Ordinary, Contributory and Deferred Shares, respectively. P next to the name of the company indicates that the company also has Preference Shares. Figures in "accounts closed" column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer to the Key (last page) under the numbers indicated.

Agents refer to the Key (last page) under the numbers indicated										Dividends per cent			Latest Market Quotations available until

CAPITAL FORMATION AND THE TAX STRUCTURE

POLITICAL OBSTACLES TO A PROGRESSIVE TAXATION POLICY

THE first review of the Indian tax structure since 1926 is now being undertaken by the Taxation Enquiry Commission, and in the past few weeks it has received memoranda from leading business associations on the directions its investigations should take. The field is a huge one and the authors of the memoranda have properly confined themselves to general principles, rather than specific suggestions for reform, for which they will have the opportunity to plead when the Commission issues its questionnaire. The opinions put forward by the Federation of Indian Chambers of Commerce and Industry, the Bengal Chamber of Commerce and Industry, the Calcutta Stock Exchange and the President of the Native Share and Stock Brokers' Association in Bombay coincide on a number of important points, so the Commission should not have great difficulty in sifting out the main problems of tax policy which the business community would like to see studied most closely. Briefly, these points of agreement may be summarised as: that the Indian tax structure has become hopelessly complicated and requires simplification and codification; that direct taxation on individuals and corporations has reached the stage where it is restraining enterprise in the production of national wealth; that profitable and politically acceptable avenues of taxation are being neglected for unsound ideological reasons; and that the State Governments are collecting taxes on business activity some of which are inconsistent with the canons of fiscal practice and common sense.

The administrative intricacies of the system, though not the most important from the taxpayer's point of view, are the grievances which the Commission can be expected to do most to remedy. Questions of rates and kinds of taxation raise political issues on which a nominated Commission's views will not be accepted without further examination by the Government; but whatever improvements it can suggest after an enquiry into the administration of the governments' revenue collecting machinery ought to be acted upon expeditiously. The Calcutta Stock Exchange calls for "sweeping change" in the methods of assessment and collection, and describes some sectors of State taxation as "chaos and confusion." The Federation says that the law should be "simple and administered in a proper spirit" and urges that from the present enquiry there should emerge "totally new legislation in simplified form." The Bengal Chamber draws attention to "the growing complexity of the tax system and the complicated methods of computation of assessable profits, involving so much extra work and expense for the assessee and for the taxing authorities. This complexity stems in large measure from the existing high level of taxation and from the complicated provisions of the Act relating to such items as restricted profits, excess dividends, depreciation allowances and the like."

The governments' interest in this matter, apart from their duty to do justice to their taxpayers, is that simplification of the tax laws would result in a reduction of the costs of collecting taxes. The process of assessing and realising tax revenues now absorbs far too high a proportion of those revenues, despite the fact that much Indian taxation has been designed to fall not on those who ought to pay it but on those from whom it could most conveniently be collected. A simpler tax law, in addition to reducing the administrative expenses of the Indian governments, would enable business concerns to devote more energy to their productive vocations and less to the wasteful and endless botheration of keeping out of trouble with the tax collector. Last it be thought that the possible benefits from reform in this field are being exaggerated, reference should be made

to the fantastically complex sales tax regulations which consume so much of the time of trading concerns, and to the needlessly intricate system of reckoning depreciation on buildings and machinery.

A related administrative problem which is taken up by these business associations in their memoranda is the uncompromising and sometimes belligerent attitude of tax officers in charge of assessments. The Calcutta Stock Exchange speaks of "harassing tactics" which are unheard of in countries with more efficient tax systems and which deter the development of frank and honest dealings between taxpayers and the revenue departments. We all know that there are many tax-dodgers in India but the situation will not be improved by "getting tough" with assessee and making the payment of taxes a vexatious ordeal; quite the contrary, for as long as officials have the power to act, as the Stock Exchange says, "vindictively and capriciously" those whose honesty is not well founded will choose to prevaricate rather than take the risk of being annoyed and unfairly treated. It is realised of course that the income tax officer will always have an unpleasant task and we are not suggesting that he will ever be able, as a Deputy Finance Minister once recommended, to collect taxes as the bee takes honey from a flower. But, like the dentist, he can mitigate the horrors of his professional encounters by adopting a more reasonable attitude to honest taxpayers. The importance of this is that assessee, especially firms, can be saved much valuable time and labour without loss to the revenues.

The argument that direct taxation in India has passed the point where business enterprise feels that it is being left an adequate return for its risks is incontrovertible. The Central Finance Minister has in fact admitted that rates of direct taxation cannot profitably be increased, and in the last few years has even offered some concessions in income tax. The Taxation Commission will probably be able to satisfy itself that these concessions have been quite insufficient and that absolute reductions in taxation will be required if the expansion of industry is to be financed by domestic capital or new funds attracted from abroad. The theory of taxation takes account of the phenomenon of "tolerance," the fact that individuals and corporations can adjust themselves to working on a smaller profit margin without loss of output, and no doubt the Indian taxpayer has provided many instances of this tolerance in recent years. But although people are willing, if obliged, to go on doing the same job for less money, they are not at all willing to undertake new risks and put forward greater exertion than is customary for the same small return. More important, they cannot accumulate the savings to put into new ventures, or find the capital goods with which to work harder, if the fund of savings has been depleted by heavy taxation.

The slow progress of capital accumulation under a régime of high taxes is the crux of the Indian tax problem and it is prominent in all the memoranda we have mentioned. The urgent need of greater saving and investment in industry is so universally accepted, and the deterrent effect of high taxation so obvious, that one might wonder that the evident conclusion has not been drawn, and taxes reduced to promote new saving. The notion that the Government has been imposing heavy taxes because it had decided to do the community's saving for it, does not by any means explain the present state of affairs in India. In fact much of the money the Government has taken from taxpayers has not been saved or invested but has been dissipated in current administrative expenditure, the size of which has grown enormously since tax rates be-

gan to rise. In any event, the Government of India and the Planning Commission have agreed that the bulk of new investment in industry must be undertaken by "the private sector", and have disclaimed any intention of monopolising the function of saving and capital formation. The Government's reluctance to accept the inevitable conclusion—that if new private

U.N. TECHNICAL ASSISTANCE

THE "striking increase" in the 1952 volume of technical assistance is the most encouraging aspect of the picture presented in the new report of the U. N. Technical Assistance Administration to the Economic and Social Council. The programme, it appears, is now really "getting into its stride," but a lack of funds threatens to limit growth, at least temporarily. The money issue is the current major difficulty, just as the organisational problems of recruiting qualified experts and making governments aware of the proffered aid characterised the earlier years. Most of the 140-page report itemises U. N. aid to 77 countries and territories during 1952 and early 1953. Comparison with a similar report issued almost exactly a year ago shows that 19 countries and territories have been added. Other figures are an increase in experts from 165 in 1951 to 451 in 1952. Fellowships and scholarships rose from 451 to 729 during the year. Amplifying its remarks on the financial situation, the Technical Assistance Administration points out that it spent a total of £2,504,978 in 1952, separated into £1,940,073 as the U. N. part of the Expanded Technical Assistance Programme and £564,905 from the regular U. N. budget. (Under its specific programme, the U. N. gives aid in three fields: social welfare, economic development and public administration. Requests for aid in other fields are channelled to the seven specialised agencies.) The amount spent in 1952 under the Expanded Programme was more than four times as great as the £427,404 spent by the T. A. A. under that programme during the first period of operations, from July, 1950, to December, 1951. By contrast, the estimated expenditure for 1953 indicates little change from the 1952 figure. This estimate is £2,581,285 with £1,895,714 from the Expanded Programme and the remainder from the regular U. N. budget. Of the 19 countries and territories which were added to the rolls last year, ten received awards of fellowships and scholarships and the others the services of experts or entire missions. The Republic of Korea received both, and U. N. aid there included 16 fellowships and scholarships and special advice on community organisation, for which a field worker is now being recruited. In Singapore, a U. N. expert on welfare of the blind visited the colony to look into existing rehabilitation facilities, in the course of a longer mission through the Far East. Nepal received an expert to survey its unexplored mineral resources, and the U. N. granted a Nicaraguan request for an entire team to help the country's four-year plan for public investment.

Among the major developments in 1952 programmes mentioned in the report is the growing tendency of many relatively under-developed countries, themselves receiving aid, to become active "givers" of technical assistance. The report points out that, in many such cases, "a sympathetic understanding of the cultural backgrounds and specific needs of the countries to be assisted may be more readily met with than in the case of an expert who has never left his own highly-developed country." Moreover, fellowships are often more useful if the fellow students in countries where the level of economic development is not too different from that of his home country, and where similar social and cultural patterns prevail. The report shows that the nationals of 40 countries served as experts during 1952, and more than half of these countries are nominally under-developed. Others, which acted as hosts for U. N. fellows, included Ceylon, Chile, El Salvador, Israel, Mexico, Turkey, Venezuela and Yugoslavia. The report also emphasises a welcome development in the close co-operation being built up between the T. A. A. and the secretariats of the regional Economic Commission for Europe, for Asia and the Far East and for Latin America.

CURRENT COIN

Agitation and Liquidation.—Pressmen who went to hear Mr. A. C. Guha, Deputy Finance Minister in the Government of India, review his West Bengal tour last Friday were surprised to learn that in the Deputy Minister's opinion there had not been enough public "agitation" or "demonstrations" over the liquidation of banking companies. Two criticisms came immediately to mind. Firstly, depositors, who are the chief sufferers and belong largely to the middle class, are not a compact enough body to associate for action of this nature. Secondly, even if they could they would discover that bank liquidation is so complicated a problem that it is better dealt with by the Government or the law courts than by slogan-mongering and flag-waving on the city's streets. Mr Guha pleaded that "if there had been larger public demonstrations it would have enabled the Government to act more effectively," but some of his hearers wondered whether the authorities should wait to count the number of street processions before undertaking important economic reforms. One of Mr. Guha's nobler enthusiasms

in recent years has been to ensure that depositors get a fair deal when banks close their doors. It was this enthusiasm that was so largely responsible for the appointment of the Banking Liquidation Enquiry Committee last year under the chairmanship of Mr. D. N. Mitra. The Committee's report has been before the Government for about five months and is likely to form the basis of the legislative reform that is being considered. The Committee itself underlines the bewildering magnitude of the problem: it points out that 180 banks with liabilities (other than to shareholders) aggregating Rs. 92.63 crores failed between 1947 and 1951. Of these, 84 banks were in West Bengal and their liabilities totalled Rs. 25.52 crores, while 24 were in Punjab and had liabilities amounting to Rs. 61.82 crores. Of the 78 banks in liquidation in Calcutta, only one has so far declared a dividend. Although the Committee has not examined some of the wider social issues involved because they were outside its terms of reference, it has adequately stated the procedural defects, the chief of these being difficulties and delays in recovering debts and high management costs (particularly liquidators' commissions).

Taxes on Stock Brokers.—In his presidential address at the annual general meeting of the Native Share and Stock Brokers' Association in Bombay last week, Mr. K. R. P. Shroff said that stock exchanges, and lately other forward markets, had been singled out for "indiscriminate and discriminatory taxation. From 1947 onwards, members of the Stock Exchange alone have paid approximately Rs. 20 lakhs a year, representing on an average a tax of about Rs. 6,000 a year on each active member over and above the usual income tax and other taxes. A tax on a profession at such a usurious rate, no matter whether a profit has been made or a loss, has jeopardised the financial capacity of brokers and their ability to carry on the business which earns the tax." Criticising the provision in the latest Finance Act which allows the set-off of speculation losses only against speculation gains, he said: "As more than 75 to 80 percent of the transactions in all forward markets are speculative, almost all engaged in this legitimate business have been deprived, in a manner without parallel in any other part of the world, of their elementary right to set off perfectly bona fide trading losses against their other income." The malpractice of "buying speculation losses" could have been prevented by administrative vigilance but, against the advice of stock exchanges, the Government had instead hurriedly enacted a measure which would not affect tax-dodgers but would fall heavily on honest business men.

Mr. Shroff recalled that the fall in profits and effective demand during the past year had caused corporation earnings and dividends to decline. A recession in prices and profits could not "continue for long in a strongly competitive falling market without a reduction in the cost of production." Inflation had caused industrial costs to rise and made India a high-cost producer in relation to world levels. But in the process of disinflation, the prices of primary and essential raw materials like cotton and jute had come down as much as they could. Supplies had expanded sufficiently to meet requirements and controls had been lifted. However, the rigidity of wages, the rising cost of social security and welfare schemes, higher Central, State and local taxes and increased transportation charges had not allowed manufacturing costs to fall to the same extent as selling prices. Profits had contracted but could not be reduced indefinitely and unless there was a substantial improvement in productivity per man-hour or lowering of taxes, "wages must fall or unemployment appear to compel the transition from a high-price to a low price economy." Mr. Shroff said there were already signs that this was happening; he feared that a state of disequilibrium might be reached which "can easily bring in its train a deflationary cycle causing all the mischief of a contracting economy." In that case it might not be possible to stimulate effective demand by deficit financing: "plentiful creation of credit in the public sector last year when Government confronted a shortfall of about Rs. 80 crores in development finance helped comparatively little to augment the volume of money supply in the private sector or to maintain the demand for consumer goods and manpower. The cost structure must ultimately be revised and brought in alignment with that in other parts of the world. Unless we are prepared to endure the inequities of unchecked inflation, the rigours of paralysing controls and the strains of repeated balance of payments crises, the way out does not lie in reckless inflationary finance but in harder work, avoidance of waste and extravagance (particularly in the public sector), increased efficiency and economy and reduced taxes and costs."

No Slackening in the U.S.A.—The National City Bank of New York says in its June monthly letter that the U.S. economy has remained on an even keel at the record peaks of activity attained in the spring. The Bank continues: Trade and in-

dustrial activity during May held at the high rates of preceding months. Despite earlier scepticism, and more recent fears that tightening credit might prove depressing, it is clear that the spring season as a whole has been the most active that the country has ever enjoyed, and that business is still moving along, even at these high rates, under good momentum and with strong supports. Commodity prices are no more than steady, on the average, and buying policy is conservative. Nevertheless, new orders in most industries seem to be running equal or close to shipments, with the result that order books stay well-filled. The index of industrial production has levelled out since its rapid rise during the winter, but chiefly because there is no longer much room for it to go up. Unemployment is subnormal; labour is short in some areas; and a good deal of overtime work is reported. Earlier scepticism about the business outlook centred on consumers' durables, for many people feared that by the end of the spring production of automobiles and household goods would be overdone and dealers overstocked. Thus far, however, evidences of weakness have been confined to a few appliances. Sales of automobiles have held up remarkably. In the main, the record-breaking output of goods appears to be moving steadily into consumption. Retail trade in recent weeks has been excellent. For the month of April, total retail sales were 7 percent above a year ago, with durable goods sales up 15 percent and nondurables up 3 percent. Department store sales recently have shown satisfying increases. The month's news has thrown little light upon a question of major interest, namely, whether tightening credit is beginning to limit either business programmes for plant and equipment expenditures or instalment purchases of consumer goods. So far the evidence is that business investment continues stable, and that the figures for the second half-year will hold current record levels. Active automobile business and high retail sales generally are indications that instalment purchases are probably still expanding. In another area, President Eisenhower's budget speech indicates that government demands for goods and services during the fiscal year 1954 will be at almost exactly the same rate as at present. In short, little significant slackening in business is to be seen, and little evidence of weakening of the forces which have supported trade and industrial activity this spring has appeared. Many suspect, and with good reason in view of consumer credit expansion, that the markets for consumers' durable goods are borrowing from the future, and that a reaction will originate in these industries, perhaps spreading further. But strong supporting influences evidently will be present for months ahead. Not the least of these influences is the extent to which reaction is being anticipated, through cautious buying.

Dhotis Short and Dear.—On the conclusion of his Madras tour last month, Mr. T. T. Krishnamachari, Central Minister for Commerce and Industry, claimed to have persuaded Mr. Rajagopalachari, Chief Minister of Madras, that the policy of assisting handloom weavers at the expense of the mills had "not achieved the expected results." Subsequent statements by Mr. Rajagopalachari suggest that the persuasion has not been as complete as the Central Minister seemed to think. In any case Mr. Krishnamachari himself has done nothing since then to revise a policy which is patently mistaken and of whose failure he admits he has been convinced by shortages and rising prices in cloth markets all over the country. The Calcutta Retail Cloth Shops Association in a representation sent to the Commerce and Industry Minister last week says that the market for mill cloth has deteriorated recently and the price of dhotis has risen by more than Rs. 2 a pair. Supplies are becoming more difficult to obtain. No. 191 Mohini Mill dhotis, for instance, which are regarded as the barometer of the Bengal mill cloth market, have become dearer and scarcer. This situation has arisen because of the cess on millade cloth and the 40 percent cut in mills' dhoti production. The cess and the restriction were imposed in order to help the handloom industry, which has not however been able to offer alternative supplies in adequate quantities and at an economic price. Mills in West Bengal are particularly affected because they do not produce many yardage goods but concentrate primarily on the production of dhotis and sarees. The Association fears that unless the rise in prices is arrested and the supply of mill cloth in West Bengal increased, control might have to be imposed. It suggests that other ways be found to help the handloom industry reduce costs and increase production. "As the purchasing power of the people, especially in the urban areas, has already been much crippled owing to a number of factors, including the recent retrenchment in factories, the need for maintaining a free market in cloth is all the greater."

Reclaim Rubber Plant.—Mr. J. C. Mukherji, president, told the annual general meeting of the Indian Rubber Industries Association in Bombay

recently that negotiations were going on for the establishment of a reclaim rubber plant with a capacity of about 2,000 tons a year. India had a fair-sized tyre industry which consumed about 12,000 to 14,000 tons of raw rubber annually; after they became unserviceable, a large number of these tyres were exported at a nominal price for reclaiming, or went to waste. If a reclaim rubber plant were set up much foreign exchange would be saved. Mr. Mukherji said that supplies of rubber chemicals, accelerators and anti-oxidants and other raw materials had been quite satisfactory during the past year. The Association planned to establish an export sales organisation "to encourage the export of Indian rubber goods on a collective basis;" the scheme was being finalised. He regretted that the proposal to set up a rubber research association had not yet materialised. The Indian Standards Institution had been more active in drafting standards for the rubber goods industry and Mr. Mukherji hoped that in time it would have prepared specifications for all manufactures.

"Dedication" of Oil Refinery.—While the question of the supposed dangers of foreign capital participating in Indian industry and commerce has been raised by a certain section of business organisations, the ceremony of unveiling a commemorative bronze tablet dedicating the Standard-Vacuum oil refinery at Bombay "to the service of the people of India" by Mr. Girja Shankar Bajpai, Governor of Bombay, last week acquires an added significance. The occasion was considered important enough for the U.S. Ambassador, Mr. George V. Allen, to fly specially to Bombay although he had been there only a little while before. With a section of the business community—and an influential section at that—questioning both the entry of foreign capital into the country and the special consideration shown by the Central and State authorities by way of incentives for this purpose, it must have been heartening to many visitors from abroad attending this ceremony to hear Mr. Bajpai express the hope that the establishment of this refinery would encourage the flow of foreign capital into India and thus promote, in friendly and active association with Indian capital, the development of the country's resources. Mr. Bajpai discussed the economic significance to India of the addition of "one of the most modern, most advanced and nationally most useful forms of industry." According to the Governor, not only would the country get the products of the refineries cheaper than present imports, but a number of Indian nationals would have the opportunity to learn the techniques of the most important processes of this industry. Another advantage Mr. Bajpai saw in the existence of these refineries was that they would stimulate the search for oil in India. Rather pertinently, Mr. Allen recalled in his brief speech on the occasion how only a few years ago a \$16 million refinery in a South American country was nationalised on the very day it was scheduled to go "on stream."

Competition from Ordnance Factories.—In a recent note, the Indian Non-Ferrous Metals Manufacturers' Association expresses concern at competition from ordnance factories which, it is complained, are encroaching on the civilian market. The Association says that these factories were expanded beyond the country's normal needs during the war, and their equipment should have been sold to heavy industries in the private or public sector afterwards, as was done in Britain and the United States. Their claim to be able to produce goods cheaper "because they do not make a profit" is questioned on the ground that the Defence audit is not strict enough: "these factories can purchase raw materials at any price; carry large stocks because the money has not to be paid back; distribute their overheads on defence production that even at normal levels is vast; and since it already has a standing charge on the national budget has not to be accounted for strictly." Since there is no elaborate costing system overheads can be made to vary substantially according to the need to underquote. The Association alleges that instead of economy there is waste, and "the vast resources made available for defence go in part to subsidise competition against industries in the civil sector." The attempt to maintain employment in ordnance factories by these means, it says, will have the effect of reducing employment elsewhere; ordnance plant should produce only goods which private industry cannot produce, and a planned programme should be drawn up to absorb their superfluous personnel in new industries or in the Armed Services. The ordnance factories are primarily a defence investment; the potential for their expansion in an emergency must exist in the private sector. "These problems, particularly the effective tie-up of these factories with civil industries so that the latter is its reserve power, and the tackling of frictional unemployment in them, should be studied by an impartial and high-power committee consisting among them of a

distinguished economist and an experienced member of the judiciary."

Indian Exhibitions in London.—According to advances from London, the Indian High Commissioner's office there took full advantage of the influx of Coronation visitors and staged two simultaneous exhibitions. The first, in Cockspur Street, was of Indian village handicrafts. The second, in India House itself, covered commerce and industry with the emphasis on heavy industry although the traditional arts and crafts of the country were also represented by some excellent examples of sarees, jewellery, leatherwork and carpets. The purpose of this display was to educate the British public, or that section of it which is unaware of the progress which the country has made in recent years. Mr. Kher, in his opening speech, said: "Today India ranks as the eighth industrial country of the world. India is one of the most important producers of minerals and other raw materials—manganese, mica, tobacco, shellac, oilseeds and hides and skins. The general index of production in 1952 was higher than in any year since the war. Cotton textiles, jute, iron and steel and cement have all registered an increase." Heavy industry is represented mainly by photographs of the big industrial projects organised under the five year plan. Charts depict developments in mining, aircraft construction, oil refining, jute manufacture and heavy engineering. It is probably true to say that the exhibition serves its main purpose, but it was the silks, brocades, jewellery and other similar exhibits which attracted most attention from visitors.

Asia's Minerals.—The need for international co-operation to overcome a scarcity of fuel in Asian countries was stressed recently at Tokyo during a Conference on Mineral Resources, sponsored by the Economic Commission for Asia and the Far East. The meeting was unique in that it was the first U.N. conference ever held in Japan, the first of its kind in Asia, and it provided an opportunity for geologists to meet and discuss the common problems of the region. There were 21 representatives from Asian and non-Asian countries and their contributions provided a comprehensive picture of the position of Asian mineral resources and enabled an exchange of views on modern techniques of mineral utilisation. Specific recommendations were made for speeding up geological surveys, including aerial surveys and mapping of the region. Delegates urged increased exploration of lower grade deposits with particular attention to lignite and iron ores. They recommended step-by-step development of lignite utilisation, suggesting that lignites be first used for developing power and steam generation. They also urged the use of lignites for domestic purposes and called for a campaign to introduce in the region modern domestic lignite appliances instead of the present uneconomical and wasteful charcoal and firewood household utensils. Most important of all, the Conference recommended that consideration be given to the question of establishing, with assistance from the U.N. Technical Assistance Administration, a pilot plant in the region for investigation of pig iron manufacture with non-coking coals and the production of alloys of iron with other metals.

Coal Statistics for April.—During April, 829 collieries and eight coke plants were reported to have worked. On an average 346,544 persons were employed daily and 8,746,282 man-shifts were worked. The overall percentage of absenteeism was 12.86. The output per man-shift for miners and loaders was 1.05 tons, for all persons employed in underground and open-workings 0.57 tons and for all persons employed 0.37 tons. A total of 3,244,402 tons of coal were produced; 121,417 tons of soft coke, 175,935 tons of hard coke and 13,345 tons of other kinds of coke were also manufactured. Despatches amounted to 2,560,844 tons of coal, 116,012 tons of soft coke, 38,866 tons of hard coke and 3,064 tons of other kinds of coke. Coal stocks at collieries on the last day of the month were reported to be 3,657,726 tons.

MARKET FIRM BECAUSE OF
GILT-EDGED RISELATE DECLINE IN TIN AND RUBBER
SHARES

London, 10th June.

THE main reason for the recent firmness on the London Stock Exchange has been the continuing upward movement of the gilt-edged section despite its comparative quietness. Peace moves in Korea, holiday interruptions and Wall Street uncertainties have in no way undermined the strength of gilt-edged and those sections which usually react against holders when peace moves are on the "front page" have also held their ground. The dominant factor among Far Eastern issues has undoubtedly been moves in the Korean armistice talks. In the first instance major movements were confined to the bond section where there was considerable support for Chinese loans. But while these issues remained steady, the main buying movement suddenly switched to Japanese government stock and have also shown a distinct tendency to purchase all first class equities, both in industrials and oils, when available. Gold mining shares did not figure very prominently in the week's activity though they finished the period on a firm note. The public has once again left the market entirely to finance houses and professional operators.

The fall of 2½ Straits cents per pound in rubber prices at Singapore last Friday came as a surprise to London traders. Most of them had believed that the signs of an approaching Korean truce had already been largely discounted. Values in London were marked down by 1d per pound to the Eastern parity but there was no selling pressure. Some bargain hunting accounted for moderately active trading. At midday values were fairly steady at 20½d bid for spot No. 1 ribbed smoked sheet, compared with 20½d at the close on Thursday. During the afternoon rubber prices improved, further supported by higher New York advances and some trade demand from Europe for lower grades of sheet. Week-end covering orders found sellers reserved and the market closed very steady with the initial decline almost fully wiped out.

Activity in non-ferrous metals slowed down considerably as reports from Washington indicated that the Korean truce might not be far off. Buyers of lead, zinc, copper and tin were willing to wait as the stock and commodity markets eased on the news from Korea and the feeling existed on these factors that metals might be the next to decline. Tin was little higher at £36½ for spot, but business was almost non-existent. Lead sales for the week were put at 9,296 tons while tin production in May at Texas City and Texas Smelter of R.F.C. amounted to 3,100 long tons. April aluminium output continued at the record pace set in March and totalled 102,071 tons of primary aluminium. March set an all-time high at 104,460 tons.

The money market was easy at the start of the week with money in surfeit supply and the authorities operating in reverse. After the one-day holiday, however, conditions became patchy with money useable until the close. Latterly conditions became more difficult until at the close of the week a small amount of official assistance was required on two days to bring books into balance. Applications for £270 million of Treasury Bills totalled

£339,250,000, of which the former amount was allotted at an average rate of 47s 4½d percent. This week £270 million will be offered. Last week's Bank of England Return showed that a growing demand for currency caused active note circulation to rise by a further £11 million to £1,543.6 million. This is within some £27 million of the all time record reached during Christmas season last year. The fiduciary issue was increased by £50 million to a record level of £1,600 million as a result of a depletion of reserves of notes caused by Coronation spending and holiday and seasonal influences.

Market Newsletter

The Investor's Chronicle market newsletter says—The Stock Exchange outlook is for quiet and restrained markets, with gilt-edged remaining firm since almost everything is in their favour for the time being. Industrial shares are likely to be over-shadowed until more is known about the issue of denationalised steel stocks.

U.S. Bond Market

Some U.S. Federal Board officials have said that the weekly balance sheet will show no new acquisition of long term Government bonds for the Reserve's own account. There were rumours in the Bond Market earlier this week that the Federal Reserve had acted to stem price dealings by buying long term Government issues.

Tea Sales

There was very strong and general demand at the first auction following the Whitsun and Coronation recess. Common teas were mostly 1d-1d dearer, particularly better colourings. Best qualities were fully firm on levels ruling on 30th May with any change in favour of sellers. Offerings were 27,643 packages comprising Indian, Pakistan, Nyasaland, Portuguese East African and Indonesians. Clean Common Broken Pekoe, free from stalk, was quoted at 4½d to 4½d per pound.

Linseed Oil Prices Revised

The I.A.P.I. confirmed that a deal of 1,750 tons of linseed oil has been done at 105 pesos per quintal for payment in free dollars. The Institute announced the following revised prices in pesos per 100 kilos for linseed oil: dollars 105; Sterling, Belgian francs, Swiss francs, florins and German, Italian and Japanese trade dollars 110. Danish crowns and French francs 121; Austrian trade dollars 124; Finnish trade dollars 128; Swedish and Norwegian crowns 127; Israeli currency 124. No prices are quoted for Brazilian currency.

Linseed Oil Imports

The British Board of Trade has announced that imports at the rate of one ton of linseed oil (or three tons of linseed) for every two tons of linseed oil bought from the Ministry of Food will be allowed from 1st July next and will continue until further notice. This ration will apply not only to the future purchasers since 7th September 1952. When licensing of private imports of linseed and linseed oil was resumed last September, licensing was at the rate of one ton of linseed oil (or three tons of linseed) for every three tons of oil bought from the Ministry of Food. Imports of linseed and linseed oil can be made from any source and licences will be valid for six months from the date of issue. Importers will be asked to continue submitting monthly returns giving quantities of linseed and linseed oil imported against licences issues.

Oilseeds Market

The London oilseeds market remained very quiet and occasionally easier with Canadian linseed oil at £45 against £52 and Indian pure nigerseed and pure kardsseed at £68 and £49½ against £70 and £53 respectively, all per ton, c.i.f. Trading was on a small scale but included palm kernels at £64 for British West African and 85.00 German francs for Belgian Congo produce, while Belgian East African castorseed was sold at £64. The only quotable change in oils was Uruguayan linseed oil at £88½ against £91 per ton.

Sterling Area Surplus

The sterling area in May earned a surplus of \$48 million compared with a surplus of \$107 million in April. Reserves at the end of May stood at \$2,321 million compared with \$2,273 at the end of April. Provisionally, it is estimated that the United Kingdom E.P.U. surplus in May was £7,100,000 compared with April £15,200,000.

Free Wheat Trading

Discussions between the Government and the grain trade on the resumption of wheat trading are still being held. A number of traders are now operating before next year. The main problem is stock to a level at which it could be absorbed by the trade. While the Government is understood amounts as were requisitioned over the same beginning of this war, traders say this would leave have to sell competitively on the free market. They would like the Government to stop purchases of wheat and allow stocks to run down. But this trading is certain to be delayed beyond the autumn. This would also affect the freight market which at present is being supported by the grain traffic from North America to the United Kingdom.

Finance in India & Abroad

NATIONAL PLAN BONDS FULLY
SUBSCRIBED

MONEY MARKETS SHORT OF CASH

Wednesday, 10th June.

THE lists for the first issue of National Plan Bonds closed yesterday, Tuesday, the loan having been fully subscribed in a day and a half. The mere fact that Rs. 75 crores worth of applications was forthcoming is not surprising since the authorities were known to hold at least that much of the maturing 1953-55 loan, but it is announced that cash subscriptions reached the very satisfactory total of Rs. 22.85 crores. Assuming that rather more than Rs. 30 crores of the old loan, held by the market, was converted, the authorities' own contribution to the success of this cash-cum-conversion operation may have been less than Rs. 20 crores. This satisfactory outcome will not doubt govern the Government's next approach to the loan market later in the year.

The withdrawal of this large sum of cash from the money market has naturally made the position extremely stringent, and the banks report that a new peak of tightness has been reached for this year. It will be a week or two before easier conditions return. Meantime, advances on sugar account continue to fall, large releases and improved supply of railway wagons have enabled the sugar mills to reduce their overdrafts. Advances against grains are seasonally high, especially in Upper India. The jute and tea industries are also gradually increasing their demands for accommodation.

The bill of exchange market has been quiet, with only a few small gunny bills passing. Remittance has been small. The principal exchange rates are unchanged.

Tenders for the offer of Rs. 1 crore of three-month Government of India treasury bills amounted to Rs. 2,09,50,000 this week. Tenders at Rs. 99-6½ percent were accepted in full and those at Rs. 99-6-3 percent allotted approximately 27 percent; the average rate of acceptance fell to Rs. 2-6½ percent per annum. Tenders for another Rs. 1 crore of treasury bills will be received up to 11 a.m. on Tuesday of next week at Bombay and up to Monday at Calcutta, Madras, Kanpur and Delhi. During the week ended 5th June, treasury bills for Rs. 1,82,25,000 were sold in favour of the Reserve Bank of India.

Silver ruled quiet last week on lack of support, followed by short selling. There was also no upcountry buying, so the price fell from the previous week's level of Rs. 160-10 to Rs. 158-12 quoted today. The steady rate, however, rose steeply from Rs. 161-2 to Rs. 161-8 because of scarcity of stocks. The price was unchanged at 74d. in London and at 85½ cents in New York.

Gold moved higher in contrast with silver because of excellent offtake and limited arrivals. The prospect of reduced smuggling with the advent of the monsoon coupled with reports of a power shortage at the Mysore mines also aided sentiment. The price improved from Rs. 90-8 to Rs. 91-14. The sovereign at Rs. 58-6 showed a gain of 8 annas.

A rise of Rs. 10.74 crores in notes in circulation to Rs. 1,169.62 crores was the outstanding feature of the return of the Reserve Bank of India for the week ended 5th June, but the total note issue was fractionally down by Rs. 77 lakhs to Rs. 1,189.95 crores. Notes held in the Banking Department consequently fell by Rs. 11.51 crores to Rs. 20.33 crores. In the Banking Department, deposits of the Government of India and other Government accounts decreased by Rs. 9.40 crores and Rs. 18 lakhs to stand at Rs. 94.06 crores and Rs. 16.70 crores respectively, while bankers' balances at Rs. 42.85 crores showed a minor gain of Rs. 14 lakhs. Balances held abroad rose by Rs. 81 lakhs to Rs. 98.44 crores. The item of other loans and advances fell from Rs. 25.61 crores to Rs. 23.57 crores, of which advances to scheduled banks against usance bills declined from Rs. 9.99 crores to Rs. 8.89 crores. Investments at Rs. 88.93 crores showed a rise of Rs. 76 lakhs. Ways and means advances were shown at Rs. 3.20 crores (Rs. 3.33 crores).

The statement of the position of Scheduled Banks for the week ended 29th May, 1953, discloses Demand and Time liabilities at Rs. 529.01 crores (Rs. 10.71 crores on account of borrowings from Banks) and Rs. 322.89 crores (Rs. 1.88 crores) compared with Rs. 530.26 crores (Rs. 11.22 crores) and Rs. 322.99 crores (Rs. 1.88 crores), respectively in the previous week. Cash and balances with the Reserve Bank have declined by Rs. 19 lakhs and Rs. 1.71 crores to stand at Rs. 31.67 crores and Rs. 39.15 crores, respectively. There is a drop of Rs. 45 lakhs in investments to Rs. 531.32 crores and bills discounted at Rs. 55 lakhs. The ratios to total liabilities of cash and balances, and of advances and discounts are, in consequence, shown at 8.3 percent and 62.4 percent against 8.5 percent and 62.2 percent.

The return of the Imperial Bank of India for the week ended 29th May, 1953, shows a rise of Rs. 28 lakhs in total deposits to Rs. 209.68 crores.

authorised investments are down by Rs. 34 lakhs and Rs. 14 lakhs to Rs. 70.72 crores and Rs. 10.31 crores, respectively. Loans, cash credits and overdrafts, and bills discounted and purchased have declined by Rs. 34 lakhs and Rs. 58 lakhs to aggregate Rs. 106.25 crores and Rs. 25.46 crores, respectively. Cash and balances are, in consequence, shown at Rs. 14.63 crores or Rs. 31 lakhs higher.

According to the land customs trade returns received in the Department of Commercial Intelligence and Statistics the provisional figures of total value of foreign trade of India by land with Pakistan, Afghanistan, Iran and Burma during the month of April 1953, were as follows (in lakhs of rupees):

	Exports to	Imports from
Eastern Pakistan	13	56
Western Pakistan	16	1
Other Countries	8	14
Total	37	71

Total trade amounted to Rs. 108 lakhs. Re-exports were nil and trade in treasure nil. There was an adverse balance of trade amounting to Rs. 34 lakhs.

BUILDING AND MAINTAINING ROADS
with 'CATERPILLAR'
Diesel Motor Graders

There are thousands of miles of unpaved roads in India, the maintenance of which constitutes a major problem to Government and Municipal bodies. Construction, too, is a part of this problem. Widening, realignment, grade improvement and resurfacing must be carried out if roads are to keep pace with changing needs.

"CATERPILLAR" Diesel Motor

Graders are becoming increasingly recognised in India for road building, ditching, bunding and other construction work. They are built not only to perform a wide variety of work but to continue to do that work over extended periods.

"CATERPILLAR" Motor Graders do better work, in less time, at a substantial saving in cost.

CONSTRUCTION OF INDUSTRIAL SIDINGS

PLEASE DO NOT COMMIT YOURSELF BEFORE CONSULTING THE RAILWAYS

In your own interest, please consult the Railway authorities before you decide to acquire land, etc., for the purpose of building factories, mills, working mines or such other projects as may require the construction of special sidings. Please consult the Railways in advance to find out if the Railways are in a position to transport your raw materials and finished products by rail.

The Railways will extend all possible help and advice to you in advance whether or not it will be practicable to construct a siding on such a site. Each case will be examined by the Railway experts. This will save you unnecessary delay and expenditure.

A DITCHER'S DIARY

good taste that could suitably show itself at the beginning of a new reign in an imperial city. As a small example of the sensitivity awakened by the splendid pageantry of last week: the British Railways lion has come off badly by comparison with the older heraldic symbols then displayed, and someone has demanded that the Railways replace "a design which would barely pass muster on the label of a bottle of Old Scotch Whisky distilled in Japan and peddled round Papua in a pearler."

The announcement last week-end that Sir Oliver Franks would be the next chairman of Lloyds Bank marks another stage in an unusual career. It is also probably the first time that a professional philosopher has been chosen to govern the affairs of one of the oldest and largest financial institutions in the world. Sir Oliver became Praelector in Philosophy at Queen's College, Oxford, soon after graduation in 1927 and remained there—with a break as visiting professor at Chicago—until 1937, when he went to Glasgow University as Professor of Moral Philosophy. The war drew him, as many others, from academic pursuits, when he was drafted into the Ministry of Supply as a temporary civil servant. By the end of the war he had risen to be Permanent Secretary but resigned to go back to Queen's as Provost. Ernest Bevin recalled him to public life in 1948, when he was sent to Washington as Britain's Ambassador, in which position he made an outstanding contribution to Anglo-American relations. Last year he declined the offer of the secretaryship of the North Atlantic Treaty Organisation and joined the board of Lloyds. He is still only 48. He has now been appointed deputy chairman—an innovation for Lloyds—with the announcement that he will "in due course succeed to the chairmanship of the bank". The present chairman is Lord Balfour of Burleigh who will be 70 this year and is presumably thinking about retiring, though the bank states that "there is no question of an immediate change in the chairmanship". Sir Jeremy Raisman, formerly Finance Member of the Government of India, has also been appointed to the new post of deputy chairman.

The trouble that President Rhee is giving in Korea, and which the Americans are handling so patiently and firmly as a settlement approaches in the peninsula might be a foretaste of the knotty problems that are bound to arise if a general agreement between Russia and the West were to become a reality. Not only in Korea but elsewhere around the world there are men and parties who owe their special position to the long period of armed unfriendliness that has kept the world tense since 1947. It would be unfair to say that such men have a vested interest in the continuance of hostility and inaccurate to imply that they were all puppets, although I am thinking of minor members of the Soviet alliance as well as those on the other side. They range from mere stooges like the Communist leaders in Albania, through belligerent allies like Chiang Kai-shek, to genuine but peculiarly placed friends like Dr. Adenauer. For all their differences they have this in common, that their present position derives from an unhappy situation which the world—we hope—now wants to see ended, and their status—perhaps their very existence—would be in question if an overall settlement were to be negotiated. If they were men who had simply exploited the political advantages of the cold war, they could be discarded out of hand; but most of them are not. They have filled important breaches that the cold war created, some of them maintaining political stability and

upholding democratic principles under the most difficult conditions. They have had the encouragement and support of their sponsors, often to an extent that would now enable them to hamper or limit by force any attempt at an accord that overlooked what they regard as their due. What, to take an instance, would be the position of Bao Dai if the French decided to treat with Ho Chi Minh tomorrow? When the cold war has come so close to endangering the peace of the whole world, there might be a tendency for leading powers who are desperately anxious for a *détente* to be brusque with these minor figures—as much opinion in the United Nations just now is brusque about President Rhee. I do not say that that might not be the inevitable course of events, though it would be a curious conclusion to a global dispute that began with the cavalier treatment of small nations in East Europe. The question will not arise of course until a total settlement is in sight, which it is far from being yet. But some thought might have to be given before that time to the fate of the bit-players that the cold war has thrown up, and whom Syngman Rhee typifies.

Dr. Girindra Sekhar Bose, who died in Calcutta last week, was a pioneer who achieved fame abroad but had few followers in his own country. Psychiatry seems to be one of the branches of medicine which has least attention in India, although the country has produced many distinguished practitioners of the other medical specialities. The relatively slight interest that Indian medical students have taken in this developing modern science, despite the impressive lead given by Dr. Bose, might be related to the old-fashioned attitudes to mental illness that are still common here, and that in turn to the pitiful spectacles we see on our streets every day of deranged derelicts who evidently have no institution to receive them and no body of public opinion concerned to protect them. Dr. Bose himself founded one of the few mental hospitals in this part of the country and was actively associated with the management of another. As professor of psychology at the University he no doubt had an opportunity of influencing the interests of students, and we may yet see the results of his pioneering efforts.

While waiting for the lights to change at a crossing in central Calcutta the other evening I listened to the police broadcasting from a van advice to passing pedestrians on how to negotiate the terrors of the city's traffic. I wondered whether it would help to broadcast a recording of that horrid "road safety song" that Gracie Fields used to sing to the tune of Percy Grainger's "Country Gardens": "Look to the left and look to the right, And you'll never, never get run oh-oh-ver." (Sing that over to yourself three or four times and you'll see that it has the devastating, monotonous banality that is the secret of all really good advertising.) Gracie, as I remember, had made the recording in the United States where of course one does look to the left before one looks to the right. When it was played in children's radio sessions in Britain it was denounced as "murderous" advice to youngsters who should be taught to look right before they look left on roads where traffic keeps to the left. The safer version could easily be arranged, though even in its present form it would be suitable for playing to that eccentric minority among our pedestrians who insist on walking off pavements backwards. Calcutta motorists would no doubt settle for pedestrians who looked about them in the wrong order, as long as they looked at all.

MARKETS FOR EUROPEAN STEEL BECOME MORE COMPETITIVE

THE DEMAND FROM UNDERDEVELOPED AREAS: LONG-TERM EXPORT AGREEMENTS SUGGESTED

IN the last few months there have been slight indications of a trade revival, not only in Britain but throughout Western Europe. This development has come as a welcome encouragement to industrialists who towards the end of last year, regarded the outlook with comparatively little hope. The present optimism is not unqualified, however, for it is realised that the improvement is still restricted only to certain trades while others are still struggling, and seasonal factors have also played a part. Nevertheless, the available statistical data suggests that 1952 represented the nadir so far as unemployment, output, export levels and other factors common to a recession were concerned. The corner has been turned, and although there is still a long way to go in recovering the ground that has been lost, at least a limited start has been made. In assessing these movements, the regular publications of the Economic Commission for Europe provide a useful yardstick. For instance, the dangers which threatened in 1952 are only too evident from a study of the latest issue of the Economic Bulletin for Europe, while another recent publication, "European Steel Exports and Steel Demand in Non-European Countries," looks both back and forward in surveying what is not only the basis of Europe's economy but the most important factor in its future revival.

The first of these surveys, which admittedly provides somewhat gloomy reading even though it may now be regarded as rather out of date, points out that though consumer goods industries throughout Europe have been recovering from last year's recession, capital goods industries have been declining steadily. Referring to the fall in engineering order books at the end of last year, the Bulletin says: "Such evidence on investment plans as is available suggests that there may be a further slackening in the demand for capital goods." It admits that some weakening in the demand on the capital goods industries was only to be expected as a delayed reaction to the recession in consumer goods production. But it goes on: "Were this the only factor, a revival in the demand for capital goods might be expected to follow, with a similar lag, the resurgence of production in consumer goods industries. There is some evidence, however, that the factors of weakness may be more persistent." It quotes, though with some reserve, the gloomy views of a French study into prospects for capital goods production this year. It points to the findings of the "Manchester Guardian Survey of Industry" that a great deal of new plant has been installed since the war and that a respite is now needed to "digest" and to learn how to use it. And it describes a Swedish survey which suggests a decline of 20 to 30 percent in private investment in plant and machinery this year.

Dwindling Order Books

The Bulletin also presents evidence of dwindling order books. "In all countries the rate of new orders booked in the second half of 1952 fell short of the volume of current production, so that the backlog of orders has steadily been worked off." Details are given of Belgium, Sweden, and Western Germany. In Belgium the value of new orders booked in 1952 was nearly 10 percent lower than in 1951, and orders received in the fourth quarter were less than 80 percent of those taken in the first. This fall has been more apparent in export orders than those from the home market. In Western Germany the volume of new orders in the second half of last year "settled down at approximately the level of the corresponding period of 1951." In January this year, for the first time since the currency reform, industrial production fell below the level of the corresponding month a year earlier. In Sweden also a special engineering industry survey showed that new orders booked in October and November were only 60 percent of those booked in the

same months of 1951. The Bulletin says that similar developments were taking place in the United Kingdom, France and Switzerland. This is all very true, and so far as the thinning-out of order books is concerned is still applicable, but in practically all these countries it is now evident that production is showing a distinct tendency to move upwards. Even orders are increasing, though the return of more competitive conditions is undoubtedly having the effect of making buyers much more selective and demanding better terms.

Crude steel production in Europe as a whole (excluding the U.S.S.R.) showed a continuing tendency to rise during January and February 1953, figures in the latest issue of the E.C.E. Quarterly Bulletin of Steel Statistics indicate. The rise however was not evenly spread over all the countries; France, Belgium, Luxembourg, Italy and the Saar, all showed decreases, particularly in February, a reflection of the fact that European net exports of finished steel to overseas markets fell by over 4 million tons in 1952 as compared to 1951 and that this tendency continues into 1953. The percentage increases in European production of raw materials and crude steel in the production-record year of 1952, compared to the previous record year (1951), were: coke 16 percent, iron ore 10 percent, pig iron 12 percent and crude steel 9 percent.

This changing climate in world trade is brought out in the second survey, which points out that Western European steel exporters, who enjoy from 60 to 80 percent of the world trade in steel, "will have to modify their price and market policies" in order to maintain and increase demand. This valuable publication goes further in that it studies the trends of steel demand in underdeveloped countries, which are of "primary importance to European steel producers." A special section provides data on production, exports, imports and consumption of the main groups of steel products in 37 non-European countries. In addition to the statistical data, information is provided on iron ore, energy resources, the steel industry and production plans in 42 non-European countries. On the basis of these figures, and notwithstanding the leading role of the world level of economic activity in determining steel demand in underdeveloped regions, it finds that "Western European steel exporting countries have a major responsibility if they wish to promote the long-term development of steel consumption in these regions."

Advice to Exporters

The share of Western European exporters in meeting the steel requirements of importing countries "will be affected by the steps they take to improve their competitive position." It is suggested, therefore, that they should: (1) offer stable supply, particularly to regular customers (by being prepared to meet longer and maximum foreign requirements and by offering long-term contracts); (2) reduce production costs by various means (including sound competition and proper use of raw materials); (3) charge reasonable and stable prices based on production costs; (4) discourage speculative stocking and dumping and the disruption of the market by unnecessary intermediaries; (5) provide credit and payment facilities when necessary; (6) improve sales organisations and expand technical help to customers in the utilisation of their products; and (7) foster economic development in the less developed countries.

The study points out that the economies of the underdeveloped countries depend mainly on the level of demand for their primary products by industrialised countries. Thus, in the last resort, the overall level of steel consumption in less developed areas is dependent on the policies of the industrialised countries, both in maintaining high employment and production at home and in carrying out a planned policy of investment to expand the enormous potential demands for steel and steel products in those less developed areas whose purchases depend upon their obtaining means of payment for all types of capital equipment. The past practices of some European steel exporters are criticised, that of selling for exorbitant prices in times of high demand, and that of cutting down supplies to regular customers to meet exceptional demands of irregular customers. These policies, if continued, can kill the goose that laid the golden egg. "The practice of charging what the market will bear in times of high demand is undesirable for a number of reasons. First, the steel importer obviously suffers. Secondly, high steel prices tend to discourage the development of steel consuming industries, on which the steel producer depends for his markets. Thirdly, from the point of view of the steel producer a considerable proportion of the abnormal profits earned is for subsequent losses (from selling below cost when demand is low). Fourthly, an inevitable consequence of high prices is the inducement offered to steel importing countries to set up their own steel works, even if conditions are not favourable and production costs high. In the long

run the steel exporter is liable to suffer as much as the steel importer."

U.S. and British Prices

It would appear from the report that the biggest handicap to securing stability of steel prices on the world market has come from Continental countries, who control 62 percent of it, for it is they who are responsible for the remaining 28 percent, have been kept "in strict relation to production costs" in the case of the former and "reasonably stable" in that of the latter. It is hoped that something concrete towards defining and implementing a long-term policy, in consultation with importing countries, to maintain reasonable and relatively stable export prices, in line with inter-market prices and closely related to production costs, could be strengthened by the conclusion of longer-term agreements or contracts and by the acceptance of firm orders with more than three to four taken to induce the supplies of steel-making raw materials to adopt similar policies. Long-term arrangements are not easy to work out, particularly in the case of steel, but efforts on these points, with adequate safeguards for the interests of exporters and importers, should now prove fruitful.

For their part, "steel importing countries should understand that they would, in the long run, suffer more seriously than they have hitherto, the possibility of entering into long-term agreements with individual suppliers or groups of suppliers." Also stressed is the great influence of governments in the less developed areas in promoting the growth of steel consumption through the mobilisation of as large a share as possible of the national income for investment purposes, to promote sound to attract foreign capital, either public or private. "The growth of steel consumption will similarly be directly influenced by the measures these governments take to ensure the abundant, regular and cheap supply of steel necessary for the economic development of their countries." Specifically, material essential to economic development by imposing custom duties on sales taxes or permitting other excessive distribution costs to be added to the price of steel. A large proportion of steel from Europe passes through the yards of Asia and the merchants, in some countries particularly where mediaries before reaching the consumers and price. Cases are known of steel being re-sold at twice, or more, the landed cost. While this is a problem for consuming countries, it is suggested that "in order to give the governments of importing countries means of judging the reasonableness of steel prices when they issue import licences, average quotations as well as to current freight rates for steel products."

World Steel Market

In the last two years not much competition has been encountered in the world steel market. But this situation is rapidly changing and, in the words of the study, "Europe's ability to maintain or improve its present position on the world steel market will depend essentially on its ability to produce steel of proper quality at low cost." Although a great deal of progress has been made in Europe since the war, much remains to be done, especially in view of the continuing progress of changes in the organisational structure of a large number of the Western European coal and steel industries present at least an opportunity to tackle the problems which international collaboration has so far been powerless to solve. If it is to believe that Europe will again, as before the import requirements of Africa, Asia and Latin America.

According to this survey, domestic requirements in the Soviet Union and Eastern European countries are likely to preclude the export of substantial quantities of steel in the next few years, even the Soviet Union and China. When, however, the Soviet Union and Eastern European countries have fulfilled their steel expansion programmes, which call for 60 million tons by 1960 in the Soviet Union, and well over 20 million tons in Eastern Europe, they may be in a position to divert substantial tonnages for export to the world market. "Owing to the particular structure of their economies these countries should not find it difficult, if they so decide, to compete successfully with other exporters."

Stocks and Shares

WIDESPREAD LOSSES IN GILT-EDGED: NEW LOAN OFFERED AT ISSUE PRICE

TEA AND SUGAR SHARES SUPPORT EQUITIES

Wednesday Evening.

THE share market has been generally steady this week but the volume of business has been restricted. Tea and sugar shares have been much in demand with some useful rises reported by selected companies; the enquiry for tea shares has continued to broaden since the opening of the new auction season. Indian Irons went quiet before the week-end but have since recovered some ground. Jute shares and engineering scrip are steady but dull.

The end of the long strike at the Indian Copper Corporation's works has had no marked effect on the price of the share, probably because of the uncertain outlook for copper; there was an improvement from Rs 2-15 to Rs 3-1. Coal shares are steady but buyers are cautious on reports of deteriorating export prospects and mounting stocks.

There have been widespread losses in gilt-edged in consequence of the flotation of the new 3½ percent 1961 loan. Sellers have appeared for all loans except 1954 and 1970-75. Declines of two or three annas have been suffered, the worst hit being the 3 percent 1959-61 which lost five annas. There have been virtually no buyers. The sharp tightness of credit after the loan subscription took large amounts of cash off the money market probably accounts for the weakness of securities, which is not expected to last if the new loan goes to a premium over the issue price of Rs 98-4. First offers of the loan have actually been at the issue price, but these transactions have been quick profit-taking sales after a complicated slugging operation.

Before the week-end there was good enquiry for 3½ 1953-55 at Rs. 100-2 for conversion purposes and sales of short and medium dated issues were also made to obtain funds for the new loan. Small buyers then appeared at lower levels but the reaction was short-lived and the market reopened on a quiet note on Monday with continued offerings. The major price movements are illustrated by the following table:—

	Opening	Closing
	4-6-53.	10-6-53.
2½% Loan 1961	90-12	90-10
2½% " 1962	91-12	91-10
3% " 1957	98-8	98-4
3% " 1958	98-6	98-3
3% " 1959-61	96-9	96-4
3% " 1963-65	92-12	92-10
3% " 1964	92-15	92-14
3% " 1966-68	90-9	90-7

Three percent conversion loan met with small enquiry to improve to Rs. 82-8, but the demand was satisfied, and the price closed at Rs. 82-6 sellers. Two-and-a-quarter percent 1954 had strong buyers at Rs. 98-8 but no business was reported because of the absence of sellers while 2½ 1955 was marked down to Rs. 98-7. Three percent 1970-75 provided a bright spot in an otherwise dull market with buyers at Rs. 86-9, but it appears that the price has been maintained because sellers were scarce rather than because of good enquiry.

Preference shares continued to be enquired for on investment account. In Jute, Aggarwal Budge Budge, Belvedere and Kelvin were asked for at Rs. 121-8, without attracting sellers. Standard were unchanged at Rs. 104-8, and Anglo-India were crossed at Rs. 120. Shree Ambica were marked at Rs. 110-8, and a small parcel of Kankarrah changed hands at Rs. 104-8. Among miscellaneous issues, Shaw Wallace were dealt in at Rs. 85-8, and Martin Burn and Jardine Henderson were crossed at Rs. 103 and Rs. 86-8 respectively. Burrakur Coal 1st Preference were taken at Rs. 12 and a parcel of Equitable Coal changed hands at Rs. 119. British India Corporation were enquired for at Rs. 146, and Carew were scarce at Rs. 95. Bengal Paper (Rs. 50 paid-up) were marked up to Rs. 73, while Bowreah Cotton 'A' and 'B' were taken higher from Rs. 125 and Rs. 82 to Rs. 134 and Rs. 85 respectively. Dalmia Cement Contributory also improved from Rs. 24 to Rs. 26 as did Rohtas "B" from Rs. 57-4 to Rs. 59. Brooke Bonds were recorded at around Rs. 81, and Birds Investments came to hand at Rs. 76.

Bank shares were steady. Imperial Bank Fully-Paid fluctuated around Rs. 1850 and the Contributories were marked up from Rs. 445 to Rs. 452-8. Hind Bank were quoted at Rs. 19-14, Hindustan Mercantile at Rs. 10-8, while United Commercial were unchanged at Rs. 35-10. Several transactions were reported in United Bank at around Rs. 3-13.

In railway shares a solitary transaction was recorded in Futtwah-Islampur at Rs. 58, though there were buyers for most guaranteed railway scrips.

Cotton shares displayed an easier tendency with the exception of Cawnpore Textiles, which were unchanged at around Rs. 9-1. Bowreah

and Dunbar were marked down to Rs. 285 and Rs. 185 respectively, and Elgins were a turn lower at Rs. 17-4. Kesoram and New Victoria were also easier at Rs. 19-4 and Re. 1-6 respectively.

Rather less business was reported in coal shares, but prices ruled steady. Amalgamated had buyers to improve further to Rs. 21-8, as did Pench Valley at Rs. 21-4, while Bengal were fully steady at Rs. 536. Dhemo Main were in demand at Rs. 11 and Rewa were taken at Rs. 21. East India, after being quoted up to Rs. 24-8, closed easier at Rs. 24-4, and Burrakur also declined further to Rs. 10-1 x.d., while South Karanpura had sellers at Rs. 13-4. Among low-priced shares, Central India and Western Bengal were notably unchanged at Rs. 5, and Talcher were in demand at Rs. 2-15.

A fair volume of business was reported in jute shares with enquiry centred on selected scrips. Aggarwal were turned over freely between Rs. 18-14 and Rs. 19-4, while Anglo-India were dealt in between Rs. 233 and Rs. 238-8. India were active between Rs. 134 and Rs. 142, while Birla and Delta were steady at Rs. 39-8 and Rs. 242 respectively. Fort Gloster were subjected to further profit-taking and were marked down to Rs. 344. Chitavalsh and Nelimaria, after declining to Rs. 28-8 ex-dividend and Rs. 30-8 ex-dividend improved to Rs. 30 and Rs. 32-8 with buyers over. Several transactions were reported in Reliance between Rs. 16 and Rs. 16-6 cum-dividend, to close at Rs. 16-1 ex-dividend, and Howrah were steady at around Rs. 25-7 cum-dividend, to close at Rs. 24-7 ex-dividend.

The demand for Electric shares reported last week was maintained. Bareilly improved further to Rs. 15-4 with buyers over and Benares were taken at Rs. 18. Cuttack were quoted at Rs. 7-4, and Jubbulpore came to hand at Rs. 13-12. United Provinces Electric were the feature of the section and recorded a sharp rise from Rs. 159 to Rs. 168. Calcutta were unchanged at Rs. 14-6, and Sijua (Jheriah) were taken at Rs. 13-6.

Sugar shares were an active market. Darbhanga were taken higher to Rs. 11-3, and Champaran were in demand at Rs. 23. Cawnpore had buyers at Rs. 33 and Ramnagar after declining to Rs. 17-12 recovered to Rs. 18-4. After a considerable lapse, a transaction was reported in Sitalpore at Rs. 6-8. Carew were asked for at Rs. 6-13, and Balrampur were taken at Rs. 7-14.

On weaker advices from Bombay and the prospects of an early armistice in Korea, Indian Iron & Steel shares were subjected to bear pressure and nervous bull liquidation and declined from Rs. 25-11 to Rs. 24-14. Speculative support and short-covering at the lower level saw the price recover to Rs. 25-5, and although the news of the agreement on the prisoner of war issue caused a mild reaction, the price closed steady at Rs. 25-3. Among other engineering scrips, Burn & Company were unchanged at Rs. 280, and Indian Standard Wagon were dealt in between Rs. 88 and Rs. 90. Jessop & Company improved further to Rs. 26, while Britannia Engineering were marked at Rs. 19-12, with buyers over. Kumardhuti were quoted at Rs. 8-4. Marshalls at Rs. 5-11, and Textile Machinery at around Rs. 6-4.

Miscellaneous shares gave a mixed performance, but the undertone was quietly steady. Among paper shares, India Paper Pulp turned easier to be marked down from Rs. 174 to Rs. 169, while Shree Gopal after improving to Rs. 20-2 eased to Rs. 19-6. Titagur were also a shade lower at Rs. 36-4, but Star Paper had buyers at Rs. 8-8. Among cement shares, Assam Bengal were unchanged at Rs. 4-3, but Dalmia and Sone Valley improved to Rs. 6-6 and Rs. 7-12 respectively. Insurance shares were neglected, and a solitary transaction was reported in New Asiatics at Rs. 4-9. There was an enquiry for Shaw Wallace at Rs. 12-14 and Jardine Henderson were turned over freely at around Rs. 128. Martin Burn, however, met with selling pressure to decline to Rs. 18-7. National Tobacco were easier at Rs. 10, and Tide Water Oil were quoted at no better than Rs. 14-4. Ganges Rope were scarce at Rs. 207 and Indian Cables fluctuated around Rs. 18-14. Dunlops came to hand at Rs. 28-12 and Digwarrah were taken higher to Rs. 18-8. On better reports from the shellac market, Angelos improved from Rs. 17-10 to Rs. 18-12, to close easier at Rs. 18-4. Alkali & Chemical had buyers at Rs. 13-14, and Rohtas Industries were in demand to improve from Rs. 9-10 to Rs. 10-1. Assam Saws were done at Rs. 6-9, and Calcutta Tramways were quoted at Rs. 15. British India Corporation were unchanged at Rs. 8-10, but Bararee Coke were a shade lower at Rs. 18. Indo-Burma Petroleum had sellers at Rs. 61 ex-dividend, and Metal Box, after being quoted up to Rs. 20 were marked down again to Rs. 19-12. With the exception of Bengal Assam Steamship, which improved from Rs. 150 to Rs. 155, shipping shares were a dull market. India General Navigation eased to

for the present negotiations is India's demand for the revision of the agreement. Having recently revised its agreements with Britain and the Netherlands, the Government is anxious to bring the Indo-U.S. agreement into line with them and to secure the right to determine the frequency of air services. The global character of U.S. air services, which have no definite termini, is causing the major difficulty. India feels that they violate the Fifth Freedom; the moreover has to face accusations of discriminating against Britain and the Netherlands as long as she maintains the status quo with the U.S.A.

Jet Fighters from France

The Government of India will shortly sign an agreement with a French firm for the purchase of Ouragon aircraft. These jet fighters are considered better than Vampires in range, performance and climbing ability, and are being obtained for the Indian Air Force.

Colombo Plan Consultative Committee

The next meeting of the Colombo Plan Consultative Committee will be held here in the last week of September or at the beginning of October. The countries participating in the Plan are Britain, Canada, Australia, New Zealand, India, Pakistan, Ceylon, Burma, Indonesia and Thailand. India has received Rs. 20.3 crores from the three Commonwealth countries during the last years: Rs. 13.3 crores from Canada, Rs. 6.1 crores from Australia and Rs. 9.0 lakhs from New Zealand. Both Canada and Australia have stated that aid will be in the form of goods from their countries, but New Zealand has given money. In the first year, India received wheat and bus chassis for the Bombay Transport Service from Canada. In the second year, she got wheat and equipment for the Mayurakshi irrigation project in West Bengal. She has been assured that aid will continue on last year's basis from all three Commonwealth countries. In view of the fact that the Indian

Medical Institute, for which the aid from New Zealand was earmarked, has not yet been started, this assurance should be regarded as very generous. As far as Canada is concerned, India has declined to take any wheat this year, but the Government is considering what other commodities to take instead—possibly woodpulp and newsprint.

States' Deviations from the Plan

The Prime Minister will shortly address Chief Ministers of all States and draw their attention to the observations of the Planning Commission on the implementation of the development plan. It is learned. In its progress report, the Planning Commission said that, contrary to their promises, State Governments had not taken effective steps to raise additional revenue for development, that the increase in tax revenues had been more than absorbed by the increase in expenditure of a non-development character; and that several States were spending large sums of money on buildings, roads and development schemes outside their plans. The Prime Minister is expected to insist that no scheme outside the plan should be undertaken until 1956 and the States should raise additional revenues. A meeting of the National Development Council which includes all State Ministers is also being summoned for the same purpose. The All India Congress Committee, meeting in Agra on 6th and 7th July, will be called upon to pass an official resolution with the same object.

A Fiscal Catechism

In order to explain the five year plan to the man in the street, the Planning Commission has issued a booklet containing questions and answers, from which the following are lifted.

Question: Would acceptance of foreign aid politically enslave India?

Answer: Foreign aid without any political strings attached to it cannot politically enslave a country. Indeed, almost every well advanced country in the world at one stage or the other of

its economic development has had recourse to foreign assistance. Thus foreign aid in itself cannot be regarded as an evil. The amount of foreign aid envisaged is small in comparison with the total planned outlay.

Question: If further external assistance does not materialise, would that mean that a greater burden will have to be borne by the people by way of taxation while consumption may have to be reduced?

Answer: Yes, it is true that if we are not able to obtain during the period of the plan the further foreign aid that we envisage, there will be no alternative but to collect more money by way of taxation, borrowing and deficit financing at home, all of which in their turn will inevitably impinge on the consumption standards in the country. If we wish to lay substantial foundations for future progress, the size of the plan cannot be allowed to be curtailed; but the sacrifices of today will bear fruit in later years.

Question: Was it correct to choose economic development with deficit financing rather than steady prices with stagnation?

Answer: If the choice is between economic development with deficit financing and stagnation with steady prices we ought certainly to take the risk of some measure of deficit financing and go in for development.

Question: Are foodgrains expected to become cheaper as the plan progresses?

Answer: There may be a slight decrease in the prices of foodgrains towards the end of the period of the plan if their production increases to the extent envisaged, but no marked decline is expected.

Question: Has the private sector been given a free hand to enrich itself at the expense of the masses?

Answer: No. Though the greater part of the field of industry has been left to private enterprise, there are limitations on its operations. Under sections 15, 16 and 17 of the Industries (Development and Regulation) Act, the Central Government has assumed powers of enquiring into the working of industrial enterprises and, in certain circumstances, of taking them over, with a view to ensuring that private enterprise conducts itself in conformity with the social objectives of the five year plan and in the national interest. In addition, certain amendments to the Indian Companies Act are proposed to be made so that industrial management will conform more and more to the standards of a service playing its legitimate part in the fostering of industrial development.

Question: Why has the flow of foreign capital during the past few years been so meagre and have conditions now been created for a freer flow?

Answer: The political and economic stability of a country, the levels of taxation, the policy in regard to the operation of private enterprise are among the factors which determine the rate of flow of foreign capital into a country. The relatively meagre inflow of foreign capital into India during the past few years may partly be attributable to the uncertainty felt abroad regarding the political and economic future of the country consequent on partition and independence. The recent successful negotiations in regard to the loans for assisting the expansion of iron and steel production by IISCO, and the development of electric power by the Damodar Valley Corporation, producers of the world to invest foreign capital in the establishment of a petroleum refining industry in the country, are indications that the foreign investor is beginning to have confidence in the prospects of this country. The recommendation of the Commission that nationalisation of existing enterprises should have a low priority for the Government is another factor responsible for the creation of a more favourable climate for foreign investment.

Report on Industrial Finance Corporation

The report of Mrs. Sucheta Kripalani's committee on the Industrial Finance Corporation is expected to be published as a parliamentary paper during the autumn session of Parliament. The report was submitted to the Government last month.

AFTER THE CORONATION OUTPUT AND EXPORTS WELL MAINTAINED

(FROM OUR OWN CORRESPONDENT.)

6th June.

THE Coronation is over, but the spirit of that historic occasion will linger long in the memories of our hundreds of thousands of overseas visitors and the millions of the subjects of Her Majesty Queen Elizabeth II. For this the greatest credit must in justice be given to the B.B.C., for through television and sound radio they literally enabled some thirty-odd million people seated in their own homes to participate in the glorious pageantry and the moving solemnity of the event, and even to share, without the attendant discomfort, the trials and tribulations of the harder millions who braved the elements, to line the crowds, the travel and food problems, to line the route of the procession and accord the young Queen and all who participated with a reception whose warmth and spontaneity has probably never been equalled in the long history of this famous city. The B.B.C. did a splendid job. So also did the organisers, for the whole complicated procedure was carried through without a single hitch of any importance and a meticulousness which has been compared with the D-Day operations, and the participants, from the young Queen and the Archbishop of Canterbury, whose dignified yet sincere bearing made of the Abbey ceremonial a thing of beauty and an unforgettable experience, down to the servicemen and women and the policemen who lined the route and dealt with such understanding good humour and with the enthusiasm of the crowds. It was only fitting that in the Coronation Honours List so many who have played important parts in making the Coronation the success it undoubtedly was have found inclusion.

Getting back to normal, however, is proving a rather longer process than might have been expected. The visitors are still with us in large numbers, traffic jams in Central London continue to be common, and the festive spirit is being maintained for the many lesser celebrations connected with the Coronation which are crowded into the next week or two. It will not be until the end of this month or the beginning of next that the more mundane facts of day-to-day events will resume their usual importance and the task of the weekly chronicler of economic, as opposed to social, events be eased.

"The Morning After"

Before leaving the Coronation in search of other items of possible interest, it might be as well to bring up to date my references last week to the repercussions of the event on certain aspects of the economic situation. A friend who has recently returned from the East expressed it best in the query: "Am I wrong, or is there really a more hopeful spirit evident everywhere?" There is, and the Coronation has had not a little to do with it. For instance, the Government's statisticians "as further information has become available," have raised their earlier figures for the index of industrial production this year. The January figure has been revised from 116 to 117, February from 117-118 to 121, March from 120-121 to 123 and the April figure is provisionally estimated at 116-117 (1948=100), which is not only 6 percent higher than in April, 1952, but also slightly higher than in March, 1951, the month which included Easter. There is no denying that preparations for the Coronation did much to stimulate the trade in consumer goods and that in all probability the home trade contributed about half the improvement in production over the last few months. The other half, however, comes from exports, which are being well maintained despite increasing competition, and particularly important—in view of the opinion expressed in the E.C.E. report referred to in an earlier despatch—this applies to capital goods as well.

The spending spree associated with the Coronation—satirised in a cartoon by Low in *The Manchester Guardian* under the title "The Morning After" which has raised a storm of protest from that paper's readers on the score of "bad taste" and earned them in return a gentle chiding in the editorial columns—is reflected in this week's Bank of England return, which shows that the fiduciary issue of £1,600 million is, to quote an official, "the highest ever." It reveals an increase of £50 million over last week's figure, only part of which is due to normal seasonal causes. The value of notes in circulation rose by £11,236,325 to £1,543,647,268. A simple mathematical calculation suggests that Coronation spending to date has been around £30 million, which is the difference between the increases in the last few weeks this year as compared with a comparable period last year for notes in circulation. The actual spending, of course, must be much larger, for not only do notes change hands several times, but cheque payments must also be included.

Fuller Receipts Fall

What of the basic position? The Treasury figures relating to the gold and dollar reserves in May provide a corrective to too much optimism. It is true that they increased again by \$48 million, but this is the smallest monthly surplus recorded so far this year and it included \$13 million from E.P.U. in partial settlement of the

April surplus. This slowing down of progress is likely to continue over the summer months, when dollar purchases of sterling area raw materials are at their lowest. At the same time, the strict restriction of dollar imports which has been in force over the past twelve months cannot be maintained indefinitely. Defence aid, also, is tapering off, while the situation so far as the E.P.U. is concerned is now being stabilised around lower levels and our gold receipts from that source for June, for instance, will be about half what they were in May. For the moment the emphasis will be to hold the position—for it must be remembered that the recent improvement has done no more than to retrieve about one-third of the total loss suffered in the twelve months ended June, 1952—until seasonal factors once again work in our favour later in the year.

The position will be reviewed by the Commonwealth Prime Ministers next Tuesday, but it is unlikely that we will be vouchsafed any indication of their reactions. Complete secrecy has been maintained so far as to what has transpired at the meetings which have taken place this week—much to the chagrin of the Labour Party, who are expected to raise the matter when Parliament reassembles next week. In the absence of a formal agenda, the proceedings have apparently been of an unusually informal character, and all that it has been possible to learn each day has been the main headings under which views have been exchanged. The informality was emphasised when Thursday's meeting was adjourned so as to allow Mr. Nehru to go to Cambridge University to receive in person the Doctorate of Law conferred upon him. Even so, he had to miss the lunch which followed the Convocation in order to get back to London in time.

"Challenge to Britain"

Though stilled for a few days, the storm over the acceptance of appointments on the new Iron and Steel Board by three T. U. C. leaders has far from blown over. Indeed, it has grown more acrimonious. The latest development affects Mr. J. Owen, Secretary of the National Union of Blastfurnacemen, who was to be a part-time member, but who is now reconsidering his acceptance following a meeting of the Union's executive committee which, according to a guarded statement issued later, "had placed before Mr. Owen certain recommendations for his consideration and for discussion at a further meeting of the committee." It is believed that the committee's doubts were with regard to Mr. Owen occupying a dual rôle as union secretary and

board member rather than to a trade union leader joining the Board, but no-one at present is prepared to confirm or deny anything.

Tribune is also on the warpath, and this time it is over the new policy programme devised by the National Executive of the Labour Party, which includes six Bevanites. Mr. Morgan Phillips, General Secretary of the Party, has given a pre-view of the programme in an article in *Fact*. Emphasising the radical nature of the new proposals, he recalls that the last party conference instructed the Executive to "give a Socialist answer" to recurring economic crises, draw up a five-year plan for the extension of the social ownership of industry, and make nationalised industries more democratic. These instructions meant, according to him, that the Executive had to undertake a complete overhaul of the party's views on all major problems of the day, and that is what has been done. The title of the new programme, expected to be published within the next ten days, will be "Challenge to Britain" and it will be "bold and radical." Mr. Phillips continues: "We shall outline drastic Socialist measures which alone can turn our present economic decline towards lasting prosperity. We shall propose a far-reaching reorganisation of some sections of our industry and a rapid continuation of the agricultural expansion which was so successfully begun under the two Labour Governments. These projects are vital to our future as a nation. They will undoubtedly involve a number of material changes in the lives of our people and the sacrifice of some of our cherished habits and traditions. We believe that this aspect of the programme will capture the imagination of the British people inasmuch as it is both a practical plan for prosperity and a rallying call for the economic independence of our nation."

Brevities

Under the monetary agreement between Britain and Western Germany, which came into force this week, it is provided that payments between the sterling area and the deutschmark area may be in either sterling or marks instead of only in sterling. The rate of exchange is 11.76 marks to £1.

To facilitate the resumption of private imports of cereals, British traders and manufacturers will be able to cover themselves against the risks of price fluctuation by hedging their operations, according to a statement by the Ministry of Food. Details of the foreign exchange arrangements relating to these operations will be announced later.

BATTERY SPRAYERS

CHARGE PUMP light yet stable. Three efficient filters. The CONTAINER is tested to twice maximum pressure recommended. INSPECTION PLUG embodies air release and safety device. CONSTANT PRESSURE at jets. COMPREHENSIVE SPRAY LANCE preventing loss of fluid when spraying is suspended. ADAPTOR permitting use of tyre inflating apparatus for initial air charge, etc. PACKING specially designed for permanent use for transport and storage of apparatus.

There is a "MYSTO" sprayer for every purpose.

Ask for details of complete range.

NERVOUS SHAKE-OUT IN COMMODITY MARKETS

COTTON LEADS MODEST RECOVERY

(FROM OUR OWN CORRESPONDENT).

7th June.

NERVOUSNESS spread quickly last week in speculative markets until by last Friday business sentiment experienced something of a crash. Cotton, which had been the first commodity to suffer, was also the first to show signs of a revival with big concerns, capable of taking large-scale delivery if required, coming forward to make purchases after the rates had declined to Rs. 670 per candy. This had a good effect on all the markets and a fair recovery was made by most commodities. The Stock Exchange was the last to succumb to the wave of selling. After a shake-out in most of the over-bought markets, the position is now more healthy. But it is thought that it will be some time before confidence is restored. It has been suggested that the progress of the Korean peace talks contributed in no small measure to the collapse. However, business men had been predicting the fall for sometime and felt that it was bound to come even without recent international developments which had already been discounted by the markets.

The Stock Exchange held its annual general meeting on 3rd June. Mr. K. R. P. Shroff, President of the Native Share and Stock Brokers' Association, reviewed economic and investment trends during the year. He observed that the equity market had followed the customary pattern of disinflation. With the rise in interest rates there was a buyers' market in equities and apart from looking for higher yields, buyers became more exacting

in their demand for safety and liquidity. It was only after January of this year that there was a change in market sentiment; later, the absence of fresh taxation measures in the budget and prospects of deficit financing changed the whole outlook. After tracing the changes in the index for industrial securities in the three important markets, Bombay, Calcutta and Madras, Mr. Shroff repudiated the charge that equity price fluctuations in Bombay were very heavy. According to figures supplied by him, fluctuations were lowest in Bombay.

After a lengthy analysis of the taxation position Mr. Shroff said that revenue and expenditure were two facets of the same problem and while the Taxation Enquiry Commission would examine the tax position, the picture would not be complete unless there was a thorough, exhaustive and impartial enquiry into public expenditure. He suggested that either the terms of reference of the Commission be suitably revised to include this or that another Commission be appointed for the purpose. Mr. Shroff pointed out that deficit financing provided no lasting remedy to economic problems but that the solution lay in resuscitating the domestic capital market and encouraging the flow of capital from abroad by devising a system of incentives to induce new capital formation. Fair treatment, he said, and an adequate return were needed to attract the foreign capital required to supplement domestic outlay and to encourage rapid industrial expansion and development. "After all, deficit financing is not wealth in itself. It only helps to create wealth by mobilising unemployed resources and manpower and setting them to work. Ultimately, our efforts and exertions, the work we do and the product we have and invest are the sole guarantors of progress and advancement and the best pledges for friendly help and support. Till now we have been inclined to worship many false gods. It seems we have yet to learn that work is worship."

An extreme instance of the nervousness of Indian industrialists about foreign capital was evidenced here last week when the soap and toiletries manufacturers met in a conference inaugurated by Mr. D. P. Karmarkar, Central Minister of Commerce. Both Mr. S. C. Ghose, President of the Indian Soap and Toiletries Makers' Association and Mr. S. P. Godrej, Chairman of the Reception Committee, dealt at length with competition from foreign interests in the soap industry. Their complaint centred on the Government having sanctioned the reorganisation scheme of one of the biggest units in this industry, controlled by foreign interests, which was replacing old machinery at its plant in Bombay. Mr. Ghose complained that in the wider interests of the industry and more particularly in the national interest there was no economic justification for this reorganisation scheme. The productive capacity of this plant would increase by 50 percent equivalent to 9,000 tons, and would lead to a corresponding fall in the indigenous sector. Mr. Karmarkar in his reply said that the Government had to view the problem objectively while shaping its policy and that in the present economic position of the country, participation by foreign firms in Indian industry and commerce was justified. While the Government would give careful consideration to any problem of intense competition with which any section of the industry might be faced, it was impossible to discriminate between foreign interests operating in India side by side with purely Indian interests.

New Board of Communications

Goaded by repeated public criticism of its transport development record in the State during the last six years, the State Government has reconstituted the Board of Communications, which met here for the first time last week. Inaugurating the meeting, Mr. M. M. Naik Nimbalkar, Minister for Public Works, expressed the Government's determination to do its utmost to implement the State's road development programme under the five year plan, which was expected to cost about Rs. 17 crores. Mr. Naik Nimbalkar informed the Board that the Government had provided nearly Rs. 5 crores in this year's budget for new roads, exclusive of expenditure on national highways which was to be borne by the Central Government. Apart from road transport, the Government proposes to spend about Rs. 25 lakhs during the next five years on the development of important minor ports. In addition to a loan of Rs. 20 lakhs received from the Centre for the improvement of Port Okha. The Board appointed three sub-committees, one to deal with roads and railways, another with waterways, and another to collect statistics and other data on road transport.

Drive for Exports

At a meeting of the Indian Council for the Promotion of International Trade last week, Mr. D. P. Karmarkar, Central Minister for Commerce, announced that the Government's foreign trade policy would soon be liberalised, as foreign exchange, especially soft currency, required for imports was now more readily available. While India was ready to trade with any country in the world, Mr. Karmarkar pointed out that trade was a two-way traffic and the official policy was not to develop it where such traffic was one-sided, except when absolutely necessary. He assured business men that the Government did not want to place restrictions on commodities for export or import or on their destination. Mr. Karmarkar stated that trade with Russia would be easy, as the necessary financial arrangements could be made through the Bank of England, but because Russia was not explicit about the commodities required from this country, trade between the two countries did not amount to more than .03 percent of India's total annual trade. The Commerce Minister observed that India was obliged to control imports from dollar areas because of limited hard currency resources. It was suggested to the Minister at the meeting that the Central Government should persuade the Bombay Government to revise its sales tax policy, which interfered with the free flow of exports from the country. Mr. Karmarkar replied that he could not do so as sales tax was a State matter. The Council gave an assurance to the Minister that exporters as a body would extend the fullest possible support to the Government's effort to increase exports.

NEW PLANNING BOARD PROPOSED

ADVISORY COUNCILS TO GUIDE ECONOMIC POLICY

(FROM OUR OWN CORRESPONDENT).

Karachi, 5th June.

AT the press conference which he held shortly before his departure for London, the Prime Minister, Mr. Mohammed Ali, had little new to say on the subject of commercial and industrial policy. There has been no change since the budget in the estimate of foreign exchange earnings and revenue receipts during the current year, and there has been no marked improvement in foreign exchange reserves which would enable a more liberal import policy to be pursued. It therefore remains clear that the return to prosperity will be a slow and painful process and that there is no short cut to the goal. Some interest was, however, aroused by his announcement that the Government proposed to set up a Planning Board, consisting of both foreign and Pakistani experts employed on a whole-time basis. It must be said that the business community in general are sceptical about the advantages of this proposal. There is, after all, already a Planning Commission in existence, and the general feeling is that there has been enough of plans and programmes and that what is required is prompt execution within the limits of available finance.

It is not clear how the new board will fit into the existing organisation. As far as can be gathered, the Planning Commission will remain in being and will scrutinise and recommend for approval or rejection, as the case may be, the various projects submitted to it by the provinces and by the various departments of the Central Government. The Economic Council, which deals with such recommendations, will also remain in being; since it is composed of Cabinet ministers its decisions are virtually decisions of the Cabinet. The new Planning Board, it seems, will come in between these two and will devote itself to overhauling the six-year development plan (which forms part of the Colombo Plan) assigning priorities to the various schemes, revised as may be necessary, that are included in that Plan and incorporating such recommendations of the Planning Commission as it approves. In its review of the whole programme it will presumably not merely work on academic lines but will take into consideration the financial resources of the country, including the foreign aid which can be expected under the various aid programmes. It is difficult to avoid feeling that the arrangement, if this is a correct forecast, will be somewhat cumbersome.

Moreover, where are experts of the right calibre to be obtained? Pakistan has had a plethora of experts, not all of the highest grade, supplied by international organisations or by foreign governments under their aid programmes, and it is recognised that for the Planning Board none but experts of the highest level will be required. Even if the cost of obtaining these, which will clearly be considerable, is met from the aid programmes, the difficulty will remain that top-notch financial, economic and industrial experts are not likely to be willing to come to Pakistan on a whole-time basis for a period which presumably must be not less than a year. If they do come, and if they are not familiar with local conditions, they will probably spend the first six months travelling around the country inspecting conditions and the projects already contemplated or in operation.

Standing Advisory Bodies

Mr. Mohammed Ali also announced that his Government proposed to set up standing advisory bodies, on which the provinces and business interests will be represented, to advise the Government on commercial and industrial policy. This would be a very welcome statement if no such bodies already existed, but the first reactions of the business community were to enquire what the Government intended to do with such existing bodies as the Advisory Council for Industries and the Foreign Trade Development Council. These are already representative of provincial and business interests and it is difficult to see what need there can be for further organisations on the same lines: admittedly, the existing bodies could be consulted more frequently and made a good deal more effective, and perhaps this will in the end be the Government's aim rather than the setting up of new councils.

Pakistan Cables Ltd.

In the industrial field, general interest has been aroused by the announcement of the incorporation of a new company, under the style of Pakistan Cables Ltd. in Karachi. This is a British venture, with a minor share of Pakistani participation. British Insulated Callender's Cables Ltd. are, for the present, investing about Rs. 40 lakhs, and Messrs Telcon and Johnson and Phillips are also sharing in the venture. It will be a private company for the present and will probably be converted into a public company once it has got fairly under way. During the first stage of the factory which will be situated on the Sind

Trading Estate, the annual production will be 1,000 tons of bare overhead copper conductor and nine million core yards of rubber insulated cable.

Thal Textile Development

The cotton textile industry continues to develop rapidly and it is understood that the first of the six government-sponsored textile mills in the Punjab is just going into production. It has been set up by the Thal Development Authority at the new town of Liaquatabad and is equipped with 25,000 spindles and 500 looms. It will produce 20,000 yards of cloth, mainly long-cloth, per day. Construction work has started on another textile mill in the Thal area at Bhakkar.

Cotton Quality Warning

Khan Abdul Qayum Khan was in fairly confident mood when inaugurating the ninth meeting of the Pakistan Central Cotton Committee, though he uttered a note of warning regarding the deterioration in the quality and reputation of Pakistan's cotton, resulting from the inexperience of refugee cultivators and allottees of the ginning factories. The deterioration had, he indicated, been checked by the energetic steps taken by the Punjab Government under the Cotton Control Act, but the Governments of Sind and the Khairpur state had not yet enacted similar legislation.

Asian Cotton Research Centre

The Central Cotton Committee has so far approved in principle 34 research and development schemes, involving an annual expenditure of nearly Rs 8 lakhs. Of these as many as 24 schemes, costing annually over Rs 5 lakhs, are already in operation. The Committee has, moreover, drawn up a five-year cotton development plan to cover the several types of problems not dealt with by the schemes now in operation. These problems relate to the breeding of improved varieties, the multiplication of pure seed, the increasing of the oil content of cottonseed, and control of pests and diseases and kindred matters. The Minister also announced the good news that, at the instance of the International Cotton Advisory Committee, the Food and Agriculture Organisation is considering the possibility of establishing a regional centre for cotton research in Asia in Pakistan.

USE OUR EXPERIENCE...

It has long been appreciated by industrialists that the cost of paint per gallon is by no means the best guide to the economics of painting. Production and maintenance costs merit careful study by all who aim to improve quality and efficiency.

I. C. I. have always advocated a realistic approach to this problem and in furthering this aim have recently produced two booklets entitled "Improving Paintshop Productivity" and "Better Housekeeping in the Paintshop"

Interested executives may obtain copies of these publications from the sole selling agents.

THE CASE FOR ABOLITION OF THE EXPORT DUTIES

ONE of the reasons given for the Government of India's new plan for the automobile industry is that it is essential for strategic reasons not to depend on imports. A prosperous automobile industry is also considered necessary for economic reasons. Users of motor vehicles are, therefore, to be put to some inconvenience and, in some cases, are to incur losses until the automobile industry in India gets itself thoroughly established. The industry, in other words, is to be protected against foreign competition. It may be wondered what all this has to do with an article on jute. The reason is that one is tempted to enquire why the jute industry should not receive similar preferential treatment. At present the industry has 12½ percent of its productive capacity idle because, with the growth of foreign competition, Indian mills are unable to find outlets for all the goods they could produce. The output is further restricted by the limitation of mill hours to 42½ per week instead of the full working week permitted under the Factories Acts. Is the Government satisfied that these conditions should continue indefinitely? If the mills were put in a position to work all their machinery full time that would increase employment, not only in the jute industry, but in other industries, such as engineering, which provide the mills with their equipment. The resulting increase in wages distribution would benefit the whole of north-east India. The increased export of jute manufactures would help replace the revenue lost by the port of Calcutta since the stoppage of exports of raw jute. Banking, insurance and many other enterprises would also benefit. What, then, stands in the way of India expanding her output of jute manufactures and finding markets for the larger quantity? We have for long been told that India's jute goods have not been competitive and even now we are told that they are barely so. We know that trade has been lost and is only now being recovered. We have recently seen the prices of jute manufactures fall so low that Indian mills could not afford to pay prices for raw jute which would give the growers an economic return and encourage them to cultivate enough fibre. At the same time India was finding difficulty in competing with foreign manufacturers who were paying higher prices for Pakistani jute than Indian mills could afford to pay. What placed the Indian jute mill industry in this difficult position? The answer is the export duties on jute manufactures. The export duties have, indeed, been reduced. They have probably been reduced so far that they no longer act as a subsidy to foreign manufacturers to enable them to expand and modernise their plant. Nevertheless they are still high enough to afford substantial protection to the foreigners and place the Indian industry under a handicap.

So now we come to the question why one Indian industry should be given protection against its foreign competitors while another is taxed in such a manner as to provide protection for its foreign competitors against Indian competition. We may be told that the Indian jute industry is taxed for revenue purposes but, as we have pointed out before, the position has radically changed since the time India had a virtual monopoly and could impose a tax for revenue purposes without danger to the industry. The export duties now operate to the advantage of foreign competitors and it is time that they were totally abolished so that the Indian industry may regain its lost markets, establish new ones and work to full capacity.

In their latest "Burlap Review," Henry W. Peabody & Co. of Boston say that "a rough and tumble competitive war is in the making between manufacturers in Europe, Pakistan and India. Time passes quickly and Pakistan unquestionably will soon be a tremendous factor. Will India remain apathetic or will she renew consideration of a reduction in her export tariff in an attempt to retain her historic position?"

I.J.M.A. Stocks of Manufactures

Stocks of manufactured goods held by I.J.M.A. mills and mills reporting to the Association were 1,600 tons more at the end of May than at the end of April. Stocks of heavy sacking amounted to 89,200 tons, a decrease of 100 tons. There was a drop of 100 tons in miscellaneous goods but hessian stocks were up by 1,800 tons. It is reported that stocks of sacking have fallen largely because the Government of India has taken delivery of goods purchased last year for delivery in autumn which have been lying in the mills' godowns for eight or nine months. By some people the fact that the Government is now taking delivery is interpreted as an indication that may soon make fresh purchases. Others think that the Government is merely taking delivery so that mills stocks of manufactures may show a fall, or at least no increase, and thus justify the Government's decision against the shutting down of machinery. The increase in hessian stocks is not surprising considering the big increase in output. Indeed, the fact that practically all the increased production is being taken up indicates a very healthy position in regard to hessian.

ARGENTINE ORDER BELIEVED BOOKED

There has been less activity this week in all sections of the market. Rumours of an Argentine order for hessian have sustained bulls while bears have made the most they could of fears of a trade recession after the signing of an armistice in Korea. This

feeling is not of course, confined to Calcutta. In fact, Calcutta seems to have been less affected than some other places. The underlying idea, of course, is that once hostilities cease in Korea there will be a curtailment of production of all classes of goods for war purposes, which will entail a general reduction in industrial activity of all kinds. The U.S.A. has been the biggest supplier of material for the Korean war and the effect of an armistice is likely to be felt more there than elsewhere. On the other hand, President Eisenhower is reported to have said that the rearmament programme must go on in its entirety and that there is no reason to fear a slump. As far as jute goods are concerned the outlook from the statistical position appears to be quite sound. Supplies of raw material for the next 15 months will not be in excess of requirements and might even fall short before the 1954 crop becomes available. It would, therefore, appear improbable that there could be any slump in jute manufactures unless conditions at present unforeseeable should supervene. From the purely statistical point of view it would seem possible that the sellers' market rather than a buyers' market might develop in the jute year 1953-54.

Manufactured Goods: On Wednesday of last week the market recovered from the easiness which had been produced by reports of rain in the jute districts. Buying of hessian on account of the U.K., the U.S.A. and Japan was reported and Cuba was reported to be in the market for sugar bags. Some enquiry for heavy goods from the Continent was also reported. On Thursday the rumour of an order from the Argentine for hessian was revived and higher prices were recorded for both hessian and heavy goods. Rumours of an Indian Government order for sacking were also in circulation. On Friday and Saturday the prospect of an armistice being signed in Korea was the main influence buyers withdrew from the market and prices sagged. There was not much change during the week-end, but on Monday the tone was easier because of reports of rain in Northern Bengal and that an armistice in Korea was imminent. On Tuesday sacking was easier with bears depressing the market, but hessian remained steady on reports that an order for 10,000 tons of hessian for the Argentine had actually been placed with certain shippers and that they would be in the market very soon to buy the goods.

Mills have not been able to sell as much as they would have liked this week but they are not showing any tendency to cut prices. On the contrary, they are inclined to be reserved and unwilling to sell unless they get the prices they want. Good prices have been paid for early shipment goods and for specialities.

At the opening on Wednesday the market was easy for sacking but steady for hessian, in which there was some short covering and quotations were as under:

	June	July	Aug-Sept.
Rs.	Rs.	Rs.	Rs.
40" 8 oz	35	35	35
40" 10	44-4	44-5	44-6
B Twills	102-4	102-10	103-4
Heavy Cees (Plain)	101-6	101-8	103-2
Cornsacks	108	105-8	104

Raw Jute: There has been less business passing during the past week. Prices have fluctuated in sympathy with the market for manufactures and on weather reports. On Wednesday small business was reported on the basis of Rs 27-8 for Assam Bottoms and Rs 28-8 to Rs 28-12 for Northern. On Thursday prices were a little higher in sympathy with a firmer goods market and business was done in Assam Bottoms at Rs 28 and in supervised Dhurbi on the basis of Rs 29-8. Bimil was sold at Rs 24 per md. F.A.Q. The market continued steady on Friday and business was reported in Assam jute on the basis of Rs 28-8 while Pakistani Jat Bottoms were done at Rs 30-8. A fair amount of business was reported done in New Crop at Rs 31 basis Bottoms for half Dhurbi/Northern Bengal and half Upper Assam for August-September shipment. Old crop was also done at Rs 29-9 to Rs 30 basis Bottoms for Dhurbi and Northern.

Easier conditions prevailed on Saturday and not much business was reported though one group bought a small quantity for delivery ex local godown at prices below the general quotations. Bimil was also reported done at Rs 23. On Monday business was reported in pucca bales at Rs 195 for mill Firsts, Rs 175 for Short Group Dundee Daissee, Rs 160 for Long Group Dundee Daissee while cuttings were done at Rs 73 for Indian NC's, Rs 87 and Rs 88 for Pakistani SNC's ex Calcutta godown, Rs 77 to Rs 80 for Pakistani Jat NC's ex Pakistan on sellers' L/C and Rs 74 for Northern on similar conditions. The market was easier on Tuesday because of reports of rain and in sympathy with an easier tone in the goods market. A small amount of business was reported in Assam Bottoms at Rs 26-8. Murshidabad Tossa Bottoms at Rs 25 and Bimil F.A.Q. at Rs 22-8. Fairly large quantities of New Crop were on offer on the basis of Rs 29-8 for Bottoms for half Dhurbi/Northern Bengal and half Upper Assam but no business was reported.

On Wednesday morning quotations were as under:

Pakistani Jute.

Jat Rs. 28 basis Bottoms landed at mill.
District and
Northern Rs. 27 basis Bottoms landed at mill.
(The difference between Middle and Bottoms in Pakistan is Rs. 4.)
Cuttings Rs. 77 for Jat NC.
Rs. 75 for Northern NC.

Indian Jute:

	Landed at Mill	June-July
Rs.	Rs.	Rs.
Lower Assam	28 basis Bottoms	
Upper Assam	27 " "	
Northern & Purnea	28 " "	
Murshidabad Tossa	26 " "	
Bihar	23-8 " "	
Daissee	28 " "	
Mesta (Western)	22-8 " "	
Bimil	23 F.A.Q.	
Mill Firsts	170 per bale	
Mill Lightnings	155 " "	
Dundee Daissee SG.	170 " "	
Dundee Daissee LG.	155 " "	

Mofussil: Conditions are unchanged so far as supplies are concerned. In Indian markets there is little fibre coming forward and good prices are being paid. In Pakistan imports are quite good for this time of the year but there has been less activity this week in the big centres. Assam is having too much rain and there has also been heavy rain in North Bengal. Scattered showers have fallen in other districts but much more rain is needed in central W. Bengal and in the daissee districts to enable cultivation and sowing to proceed. Conditions in Pakistan are favourable but the rivers in western districts are above normal and any further rise may enforce premature cutting of the lowland crop in some places.

RAIN NEEDED FOR INDIAN CROP

In their twelfth crop report of the current season which covers the week ended 6th June, Messrs. Sinclair Murray & Co. Ltd., say that the weather during the week in Assam has been mainly wet. In West Bengal and Orissa scattered showers were experienced. Heavy rainfall is now urgently required to promote sowings and assist the growth of plants.

DANPUR: The weather has been very hot and dry with the exception of a light shower in the middle of the week. Heavy rainfall is now urgently required to enable cultivators to proceed with sowings. Sowings to date amount to -1/3 as compared to -1/6 at this time last year. The condition of plants is not healthy and they range in height up to 1'. The river continues to fall and is now abnormally low.

JAIPUR ROAD: The weather has been very hot and dry with the exception of one light shower of rain during the early part. Sowings have been suspended owing to unfavourable weather and are estimated to be about -3/- compared to -7/- at this time last year. The germination of previous sowings has been very poor and the condition of young plants is far from satisfactory.

RANAGHAT: The weather has been extremely hot and dry. No rain was experienced in this district but we have reports of scattered showers in neighbouring villages. Sowings have been suspended because

of the unsatisfactory weather and the condition of standing plants is bad. Sowings to date amount to -15/- as compared to -16/- at this time last year.

COSSIMBAZAR: The weather was extremely hot and dry with light scattered rainfall. More rain is urgently required to allow cultivators to continue sowing and to benefit young plants. The condition of the standing crop is not good. Sowings to date amount to -13/- compared to completed sowings at this time last year.

NOWGONG: Sowings completed -11/6. The weather has been wet and a spell of sunshine would now be beneficial. Weeding has been completed on midlands but has been suspended on highlands due to excessive rain. Condition of plants is satisfactory and they range in height up to 4'3". The river level is about normal.

CAUHATI: Sowings completed -13/6. The weather has been wet and a spell of sunshine would now be beneficial. Weeding has been completed on low and midlands. The condition of plants is satisfactory and they range in height up to 5'6". The river has been rising during the week and is about the same height as at this time last year.

KHARUPETIA: Sowing completed -12/6. The weather has been favourable with alternate rain and sunshine. The condition of the standing crop is satisfactory and plants range in height up to 6'. Weeding is going on where required. The river level is normal.

DHUBRI: Sowings completed -12/- The weather has been very wet and a spell of sunshine is now required. The condition of plants is fairly satisfactory and they range in height up to 4'3". The river has been rising and is now 5' higher than at this time last year.

DAISSEE DISTRICTS: Sowings completed -10/- The weather during the early part of the week was favourable and one heavy shower of rain was experienced. Further rainfall is still desperately required to assist the growth of young plants. The condition of young plants has improved but is still far from satisfactory.

N.B.—As a basis of comparison last season's crop has been taken as 16 annas.

FAVOURABLE WEATHER FOR PAKISTANI CROP

In their fourteenth crop report for the current season which covers the week ended 6th June, Messrs.

Sinclair Murray (Pakistan) Ltd. say that weather conditions have been favourable. The crop is making good progress. Rivers have generally been rising and it is expected that because of the floods in Assam rivers on the western side will continue to rise.

NARAYANGANJ: Sowings completed -18/-. The weather conditions have been favourable with alternate rain and sunshine. This has enabled cultivators to make steady progress with weeding. The condition of the plants is good and they range in height from 2' on the highlands to 6'6" on the lowlands. The river level is the same as this time last year.

DACCA: Not received.

CHANDPUR: Sowings completed -17/-. The weather has been favourable with alternate rain and sunshine. Plants are healthy and range in height up to 4'. Weeding is going on in the highland areas. The river has been rising and is the same level as last year.

HAJIGANJ: Sowings completed -17/-. Weather conditions have been favourable with alternate rain and sunshine. Weeding is going on where required in the highlands. The condition of plants is healthy and they range in height up to 4'4". The river has risen and is now 10' higher than this time last year.

AKHAURA: Sowings completed -18/-. The weather has been favourable with alternate rain and sunshine. Weeding has almost been completed. Plants are healthy and range in height up to 4'2". The river is slightly higher than this time last year.

ASHUGANJ: Sowings completed -18/-. The weather has been favourable. Weeding operations have almost been completed. The condition of plants is satisfactory and they range in height up to 5'. The river has been rising and is now 7' higher than last year at this time.

NIKILIDAMPARA: Sowings completed -16/3. The weather has been favourable with alternate rain and sunshine. Weeding operations are going on in the highlands. The condition of plants is satisfactory and they range in height up to 5'3". The river has risen and is now about the same level as this time last year.

SARISHABARI: Sowings completed -17/-. The weather has been hot and dry with the exception of a favourable shower. The condition of plants continues to improve and they now range in height up to 5'. The river is about 2'6" higher than this time last year.

SIRAJGANJ: Sowings completed -17/-. The weather has been favourable with alternate rain and

sunshine. The condition of plants in general is satisfactory and they range in height up to 6'3". The river level is about the same as this time last year.

NAKALIA: Sowings completed -18/-. The weather has been very hot and dry with the exception of a light shower of rain. Further rainfall would be beneficial as this would assist the growth of plants. The river is rising slowly and is now the same as last year at this time.

BHANGOORA: Sowings completed -18/-. The weather has been favourable. Weeding is going on where required. The condition of plants is improving and they now range in height up to 5'. The river is rising and is now at the same level as at the corresponding date last year.

As a basis of comparison last year's sowings have been taken as -16/-.

GOODS STOCKS RISE IN MAY

The Indian Jute Mills Association announces that the total reported stocks of manufactured goods exclusive of Government orders at the end of May were as follows:—

Description	30th April 1953 (Lakh Tons) Yds.	31st May 1953 (Lakh Tons) Yds.
Hessian Cloth & Bags	17.90	45.432
Standard Hessian	15.02	37.209
Sacking Cloth & Bags	20.83	86.648
Standard Sacking	16.91	69.905
(included in above)	16.91	69.905
Rope, Rope Twine, etc.	2.942	1.935

THE FOREIGN JUTE MARKETS

MARKETS ABSORB NEW PRICES

(FROM OUR OWN CORRESPONDENTS)

Dundee, By Air Mail.

AS briefly reported last week, revised price-lists for raw jute yarns and jute goods, including imported goods, have been issued to the trade. These became effective from the day after the existing prices had been withdrawn, viz., 20th May. This enabled business to be resumed again immediately after the Coronation holiday break and the advance has been so mild that it is having no effect on the markets.

The issue prices for raw jute, ex-warehouse to spinners have been raised by approximately £10 per ton on the average for long jute and £3 per ton for Cuttings. Mill Firsts are now at £105 per ton and Mill Lightnings at £96, which compare with the shipment rates of £105 and £94 respectively. c. and f. U. K. Good Daissee-1 is fixed at £99 and grade at £91, against £96 and £86 respectively, while grade Tossa-4 are at £96 ex-warehouse and £93 for shipment. Very few offers of the fibre are being received from Pakistan because of the difficulty which shippers are experiencing in securing the necessary material.

Hessian yarns are advanced by about 8 percent to 15.58d per lb. for common 8 lb. cops and 8 lb. spools, compared with 14.40d previously, while sacking yarns are now 11.72d per lb. for 24 lb. and 14.97d. Twist is up to 17.10d per lb. for 3 ply 8 lb. against 15.88d, and rove to £88.10s for 48 lb. and £70 for 200 lb. a rise of £3 and £1.15s respectively. Incidentally, Continental spinners are less anxious to sell yarns to the U.K. for reasonably early delivery and at 16.00d for common cops and spools nett. they are somewhat dearer than local spins. Cloth rates are up by about 5 percent with 10 oz. 40 in. Hessians now at 132.1d (9.55d), 10 oz. 28 in. 20 oz. sacking is raised to 21.79d from 20.66d per yard, and 14 por. 36 in. 18 oz. tarpaulin to 24.68d from 22.97d. With the firmer closing of the Calcutta market shipment rates have been advanced to 80s 9d for ready 81s 0d for June and 81s 3d for July-September 10 oz. 40 in. and to 60s 9d, 61s 0d and 61s 3d respectively for 71 oz. "B" twills are advanced to 176s 0d for ready, 177s 0d for June and 178s 6d for

Saint Frères Circular Looms installed in Italy.

SAINT FRERES CIRCULAR LOOMS

Hundreds of Saint Frères Circular Looms are in use—in new factories and old, sometimes working alongside flat looms—in the Belgian Congo, in South Africa, Sweden, Norway, Italy, Great Britain, Germany, Belgium and France.

These looms were originally designed for making tubular cloth from jute. Deliveries of a Saint Frères Circular Looms for hard fibres are now available. Saint Frères Circular Looms are manufactured by Urquhart Lindsay & Robertson Orchards Ltd., Dundee, Scotland.

The 1.2 Loom (2-leaf, 4-shuttle) weaves single and double warp plain and tubular cloth for socks and for the manufacture of single width cloth woven in tubular form with a double false selvage for wrappers, etc.

IMPORTANCE OF SILK DECLINING

IMPACT OF MODERN SYNTHETIC FIBRES

ALTHOUGH silk has highly-desirable qualities for certain fabrics, its days as an important factor in the apparel and decoration industries are practically over. Silk's place among fibres and in the world economy has been declining over the past 25 years, according to a commodity report issued by the Food and Agriculture Organisation of the United Nations. The report attributes the decline to the increasing supply of man-made fibres, notably rayon and nylon, which have made "great inroads" into the silk market for clothing and decorative purposes.

The report, which will be considered by FAO's Committee on Commodity Problems when it meets in Rome this month, states that the startling rise in the production of rayon after 1920 did not for some time lead to any decline in the output of silk, though it did cause a redistribution of demand. Indeed even throughout the thirties the world's annual supply of silk dropped by less than 10 percent. The war, however, caused a tremendous change. Deprived of markets for their products and in need of food-producing land, the silk-producing nations curtailed output until in 1945 it was little more than one-quarter of that five years earlier. Recovery is a slow process in sericulture and, by 1951, the output of reeled silk was only one-half of what it had been in 1940. In the same period, and in spite of a severe setback in rayon production during the war, the combined output of rayon and nylon had risen by 60 percent.

Influence of Prices

Not only have silk prices increased absolutely, though not relatively, more than those of rayon, and during a period when rayon has become cheaper, but they have fluctuated alarmingly compared with a steadily rising rayon and the almost unnaturally undisturbed nylon. The situation where only a small number of countries, and one, the United States, in particular, buys the bulk of the silk which is exported, where demand is likely to be volatile, as it is for a luxury product competing against a number of developing substitutes, and where supply is so delayed a function of illustrating price instability. To control such unsteadiness, Japan, the predominant supplier in international trade, has operated a maximum and minimum price scheme since January, 1952. The absence of a Government stockpile to cushion the impact of prices as they bumped against the ceiling and the steady rise in the markets of Milan and New York in times of shortage, however, have strained the scheme. Moreover, for most of this time prices have been at the permitted maximum. Japan is thus responding to strong market forces in planning an increase of something like 20 percent in the output of raw silk in the next three years, although if achieved this will still not bring its production to even one half of that before the war.

The hopes of the 900,000 Japanese directly engaged in sericulture or silk processing are based on a rising standard of living in consuming countries. If these are not disappointed the demand for silk may become steady. But it is also more than probable that the wholly synthetic fibres, whose large expansion is at present being planned in North America and Europe will prove themselves increasingly capable of satisfying the need for silk products.

APRIL CANE PRICES

On the basis of returns received from the Central Sugar Factories, the Director, Indian Institute of Sugar Technology, Kanpur, in an abstract statement of cane prices paid during the month of April 1953, figures for:

(a) the total price of cane per maund (including cooperative society's commission, transport charges etc., but excluding cane cess) at the factory as follows:

	Maximum	Minimum	Average
Re. a. p.	Re. a. p.	Re. a. p.	Re. a. p.
Uttar Pradesh	1 9 11	1 3 0	1 5 11
Bihar	1 7 5	1 5 0	1 6 0
Madras	1 5 0	1 5 0	1 5 0
Bombay	1 10 5	1 5 0	1 7 0

Madhya Bharat
All India
(b) The portion of the total price per maund of cane actually received (cash or deferred or both) by the grower as under:

	Maximum	Minimum	Average
Re. a. p.	Re. a. p.	Re. a. p.	Re. a. p.
Uttar Pradesh	1 5 0	1 3 0	1 4 6
Bihar	1 5 0	1 3 0	1 4 3
Madras	1 5 0	1 5 0	1 5 0
Bombay	1 10 5	1 5 0	1 5 10
Madhya Bharat	—	—	—
All India	1 10 5	1 3 0	1 4 7

WHOLESALE PRICE INDEX RISES

The official wholesale price index (base year ended August 1939=100) rose by 0.4 percent to 359.0 during the week ended 23rd May 1953. Compared to the corresponding weeks of the last month and a year ago, the index was higher by 2.5 and 9.1 percent respectively. During the week under review, Foodstuffs advanced further by 0.9 percent to 385.2 owing to higher prices of wheat

and jowar (+4%). Prices of bajra (-2%) and sugar (-1%), however, declined. The Industrial Raw Materials group rose from 479.0 to 479.6. Items which registered noticeable variations were: wool, rapeseed and linseed (+4% each), castor seed and cottonseed (+3% each), jaggery, Punjab, American and Bengal cotton in Bombay, raw hides and copra (+2% each), manganese ore (-12%), Umra cotton at Amravati and jute (-2% each). The index for Semi-Manufactures recorded a further rise of 0.7 percent to 362.3 on account of an all-round advance in the prices of oils, supported by higher prices of groundnut cake (+6%), coir yarn and zinc (+4% each), coconut cake (+3%), buffalo hides (+2%) and brass (+1%). Goat skins (-5%) and sheep skins (-2%), however, decreased. Lower prices of jute manufactures (-2%) and paints (-3%), brought down the Manufactures group index by 0.2 percent to 369.1. The Miscellaneous Group moved up to 621.0 from 620.0 as a result of increases in the prices of turmeric (+3%) and cashewnuts (+1%) despite a fall of one percent in betelnuts during the week.

CALCUTTA TEA SALES IN MAY

ONE "CLEARING UP" EXPORT AUCTION

A PART from one "Clearing up" sale consisting of old and plain liquoring teas, there were no Export sales in May, say Carritt Moran & Co. in their monthly market review. The first sale of the new season was held on 1st June.

In the internal market Sales 46 and 47 consisted of approximately 20,000 packages, and this quantity was readily absorbed at firm rates except for C.T.C. types and residues. About 30,000 packages were offered in Dust Sales 48 and 49, and although withdrawals were few, competition was less and prices eased by 1½ to 2 annas per pound. After Sale 49, there was a balance of approximately 45,000 chests of Old Season's Dust still unsold, and this quantity will be disposed of in Sales 1 and 2.

The small quantities of leaf tea offered in these four internal sales consisted of "end-of-season" residues and some green tea, mostly of poor quality. Demand was only fair and prices showed a sagging tendency until Sale 49 when more interest was shown.

Export sales up to and including Sales Nos. 45 and 46 totalled 1,841,986 chests at an average price of Re. 1-6-6 compared with 2,090,565 chests at an average price of Re. 1-11-9 a year ago. Internal sales at 39,050 chests of leaf and 756,749 chests of dust (Re. 1-9-9 and Re. 1-6-1) go against 104,369 and 665,468 chests (Re. 1-1-11 and Re. 1-10-0) in the corresponding period of last year.

Early in the month a fair quantity of Special Export Licence changed hands at 1½ pies per pound, but latterly the volume of business was negligible owing to uncertainty regarding the expiry date of the validity of Special Export Licence, and the nominal quotation dropped to 1 pie. During the last few days of the month there was some buying by speculators at ¼ a pie per pound. A fair volume of business in 1953-54 Export Quota was done at 11-12 pies per pound and one or two transactions took place at 15 pies. The month closed with strong buyers at 13 pies but there were few sellers at that rate.

The estimated North India crop to the end of April 1953, was 21,828,377 pounds as compared with

25,710,704 pounds to the same date last year. The average figure at this date for the three years 1950-1952 was 20,606,535 pounds.

Arrivals (in chests) in Calcutta warehouses during the period 24th April to 23rd May, with the corresponding period of last year in parentheses, were as follows: by rail 56,952 (26,283); by air 6,818 (9,105); by steamer 39,383 (43,082). Since the beginning of the season, 1st April, 1953, and up to 23rd May, 1953, arrivals have been 66,048 (29,687) by rail; 11,403 (11,866) by air and 56,329 (56,729) by steamer, making a total of 133,780 (98,282) chests.

In its review of the Calcutta market in 1952-53 the review says that "in 1953 if the voluntary restriction in crop is successful, prices should, we hope, remain at a high enough level to cover the cost of production and leave a small margin of profit. Producers have made every effort to cut down their costs but it will be a long up-hill struggle to throw off the effects of the 1952 slump. The very drastic cuts which have been made by producers cannot be continued long without harm to the estates. Recently deliveries in the U.K. have shown a sharp increase and with the low stock position there appears no reason why the 1953 market should not open to a strong and active demand. Prospects for the coming season appear very much brighter."

PROSPECTS SET FAIR FOR NEW TEA SEASON

GOOD DEMAND EXPECTED

IN their North India tea review of the season 1952-53, Messrs. A. W. Figgis & Co. Ltd., say that "six months ago no one could have envisaged the extent of recovery which has been achieved. Looking to the future a fair measure of optimism seems justified, and there are several contributory factors which lend weight to this argument. Firstly, in the light of lessons learned during the past season, a voluntary restriction of crop was decided upon by the industry cutting last year's figures by 6 percent. Provided the temptation to exploit favourable prices can be resisted, this should ensure a satisfactory level, and it is felt that few producers will be willing to incur the risk of a repetition of last year's slump. Secondly, stocks in the U.K. are considerably lower than was considered a normal figure in pre-war days, and the keen enquiry forthcoming from the larger pack-

ing houses in the last sales of the old season, coupled with London warehouse off-take figures which would appear to indicate increased consumption, all point to a strong demand in the early sales which, provided the balance between supply and demand is kept adjusted, should continue throughout the season. Thirdly, some good has come from the evil in that the general standard of plucking and manufacture has shown an undoubted improvement and Northern Indian teas can once again stand up to outside competition on their merits.

Quality Demand

"These points should all contribute to a prosperous year for the industry, but it should be remembered that India's greatest potential market is on her own doorstep and if her internal consumption could be expanded to a figure in the region of only one pound per head of population (9 pounds) the worries of the industry would be largely at an end. Regarding the type of demand it is apparent that buyers are concentrating more and more on cup quality, and it is no longer sufficient to produce a tea which is all appearance. The demand for tippy teas is, only temporarily wanes, in abeyance, owing to the financial difficulties of Iran and other Middle East countries. Ireland may be interested to some extent, but quality in addition to appearance is an essential for this market. The demand for well made whole leaf teas should be maintained, and it is interesting whilst the average quotation for Clean Common Broken Pekoe worked out at Rs. -15/8.73, that grades should be kept small and neat in appearance, and too much apprehension need not be felt if some tip is lost in achieving cup quality. The small broken grades appear to be here to stay, and these will undoubtedly be well supported. Dusts, particularly C.T.C. types, have been fetching very good prices, and there is no reason why this should not be continued.

Coarse Plucking Declines

"The majority of estates are now rapidly overcoming that evil legacy of bulk purchasing days, coarse plucking, but it is a slow and difficult process to get labour out of bad habits, particularly so when fine plucking may affect adversely the amount they can earn. Nevertheless it is undoubtedly essential that great attention is given to this point if India is to be competitive with her rivals. The hope has already been expressed that the Government's interest in the future of the industry will not be of too arbitrary a nature. Given reasonable conditions, the industry has fully capable of overcoming its problems. Unfair burdens and impositions are quite another matter which no industry should be expected to bear, and it is earnestly hoped that this lesson has been learned. Relations within the various sections of the trade and with outmarkets have always been on a friendly and pleasant level, and it is felt that the introduction of too much politics might well disrupt this state of affairs. The greatest service the Government can do the industry, with which is bracketed the welfare of the country, is to assist in the development of overseas markets, possibly with the aid of some system of international reciprocity in the field of Import duties."

The review continues: "It has been stated that more brokers on the Calcutta market would try: this is rather like suggesting that the provision of more stockbrokers would put new life into the share market, and in any case it is felt that buyers would not share this point of view. If Indianisation is the idea behind such suggestions, present engaged in the marketing of tea in Calcutta, and a larger share of operations is progressively undertaken by Indian assistants who, at the same time are receiving a thorough training in all aspects of the trade."

COCHIN TEA SALES

At Internal Sale No. "K" held on 3rd June, 1953, there were 152,714 lbs. printed for sale. Quality was of an average description. Demand was good for Dust "A" and Milled dust types and most of these sold well in the "Room" at an increase of 2 annas per lb. Black Middle out bid but were mostly withdrawn without valuations or higher.

Some business has been done in New Season's quota at 17 pies and there are still buyers at this price.

Dust Sale 'L' will be held on Tuesday, 16th June, 1953.

NO CHANGE IN TEA OUTPUT AND EXPORT RESTRICTIONS

Capital understands that at present no relaxation is contemplated in the restrictions on either the output or exports of Indian tea. It had been thought that some modifications might be made in the existing restrictions but we understand that

Calcutta Markets

FREIGHT RATES FIRMER AT LOWER LEVELS

COAL MARKET DULL

THE recent decline in freight rates appears to have steadied at the lower levels, though in a few directions rates have continued to fall slightly.

The Calcutta coal market continues dull and only one fixture has been reported this week; a handy sized steamer accepting 5256d for coal to Hongkong with July laydays. However, three fixtures have been reported for ore from India, \$9.25 being paid from Vizagapatam to the Northern Range, while a subsequent fixture was done at \$9 for an August loader. Ore from Calcutta with completion at Vizagapatam paid 70s for Hamburg discharge with the option of Polish discharge at 75s. Manganese ore from Mormugao to Baltimore was fixed at \$10.50. In the North China section rice from Whampoa to Colombo was fixed at the lower rate of 49s 6d for a September loader and \$3 was paid for a cargo of coal from Tsingtao to Yawata. In the Australian market one ship accepted 75s for flour in bags from South Australia to India, while another fixture was done at the previous rate of 57s 6d for wheat in bulk from West Australia to India. A cargo of wheat in bags from South Australia to Cyprus was fixed at 100s.

In the North American section there has been a continued demand for tonnage for coal from Hampton Roads to Japan. \$8.85 was paid for a June-July loader from Hampton Roads to Kobe, while six vessels accepted \$9 for one port discharge Japan. A more forward vessel accepted \$8.92 for Osaka discharge, while a cover was arranged at \$8.75 for one ship per month from July to December. From the North Pacific grain was fixed to India for four ships at 77s 6d, while \$11 was paid for a cargo of flour in bags from Vancouver to Pusan.

In the time charter section a handy sized oil-burner delivery Japan accepted \$2.65 for six months trading, while a slightly larger oilburner accepted \$2.32 for six months trading delivery, redelivery U.S.N.H.

SUGAR ARRIVALS POOR

During the week ended 9th June, prices of sugar ready ex-Kantapur delivery were Rs. 32 a maund for ordinary grain and Rs. 33 for big grain. Ex-mill rates ranged between Rs. 29-12 and Rs. 30 a maund. Arrivals were poor at 3,000 bags a day and stocks amounted to 27,000 bags. Sales averaged 2,500 bags a day in the local market and 1,000 bags outside.

LINSEED

Although prices declined slightly, the general undertone of the market remained firm and business was reported on a very small scale. Because of the higher prices prevailing upcountry, despatches to this centre were exceedingly small and local sellers showed very little interest. Millers were in the market daily but they were unable to secure supplies except on a very limited scale. The oil market was very dull and although sellers were fairly keen, buyers were not interested. Export business was at a standstill. Latest quotations were as follows: June Rs. 21-12 per maund; July/August Rs. 22-4 per maund.

SHELLAC MARKET FIRM

During the week ended 9th June, the market was firm throughout and moderate business passed. The range of quotations was as follows:

Standard Pure Buttolac	Rs. 90 buyers
Pure Buttolac	Rs. 86 to 87 done and buyers
Lemon No. 1 Shellac	Rs. 86 to 88 done and buyers
Lemon No. 2 Shellac	Rs. 83 done and buyers
F.O. Std. 1 Shellac	Rs. 77 to 79 done and buyers
Pure TN Shellac	Rs. 73 to 75 basis done and buyers
4% I.T.N. Shellac	Rs. 63 to 65 done and buyers
No. 1 Kusmi Seedlac 3%	Rs. 85 to 87 buyers
No. 2 Kusmi Seedlac 3%	Rs. 78 done and buyers
Fine Bysaky Seedlac (Manbhum)	3% Rs. 74 to 75 done and buyers
Fine Bysaky Seedlac (C.P.)	3% Rs. 67 to 70 done and buyers
Ordinary Bysaky Seedlac (C.P.)	5% Rs. 63 to 65 buyers
Under	
Ordinary Bysaky Seedlac (C.P.)	5% Rs. 58 to 59 done and buyers
Kireelac	Rs. 28 to 28-8 done and buyers

Shipments during June until the 6th were 6,521 packages.

HIDES AND SKINS

The market in skins continued firm and prices showed an upward tendency. Stocks were less than in the preceding week.

Bazar Sales

(Between 2nd June and 8th June, 1953.)
Cowhides—Wet salted (Ord.) 23,880 pcs. on the basis of Rs. 9 to Rs. 10; Wet salted (Slaughtered) 9,000 pcs. on the basis of Rs. 12-8 to Rs. 25-4.
Goatskins—Wet salted (Daisee, Killed) 40,550 pcs. on the basis of Rs. 280 to Rs. 425; Assam-Dinajpur-Murshidabad 17,400 pcs. on the basis of Rs. 280 to Rs. 335; Purneah-Kisanganj 15,200 pcs. on the basis of Rs. 275 to Rs. 305; Patna 4,000 pcs. on the basis of Rs. 157-8; Muzafferpore-Darbhanga-Samastipur 70,200 pcs. on the basis of Rs. 265 to Rs. 290.

CUSTOMS SIMPLIFICATION BILL BEFORE U.S. CONGRESS

ENACTMENT EXPECTED IN THIS SESSION

THE Customs Simplification Bill introduced in Congress recently by Representative Thomas A. Jenkins Republican, of Ohio generally follows the recommendations drafted by the Treasury Department to remove procedural obstacles in U. S. customs regulations that have been impeding imports. It is also somewhat similar to a Customs Simplification Bill that was passed by the House of Representatives in the last session of Congress, but on which the Senate failed to act. The Jenkins measure departs from Administration suggestions in two important aspects, dealing with countervailing duties and antidumping provisions. Because these and other controversial features were removed from the Jenkins Bill, its passage is expected in the present session of Congress. The Secretary of the Treasury, Mr. George M. Humphrey, has expressed the hope that "Congress will be able to develop a workable Bill" in accordance with President Eisenhower's foreign trade programme as announced in his State of the Union message.

Meanwhile, the House Ways and Means Committee has issued a detailed analysis of the Jenkins Bill setting out the ways by which it is expected to reform current customs procedures. The analysis shows that the Bill would:

1. Repeal accounting provisions that are either obsolete or covered by more modern statutes.
2. Clarify the effective dates on which rates of duty become applicable.
3. Make substantial changes to ease marking provisions.
4. Provide that the Secretary of the Treasury may issue new regulations to cover the sampling and analysing of imported lead-bearing and zinc-bearing ores.
5. Repeal obsolete reciprocal provisions with respect to distilled spirit imports and the duty-free entry of advertising materials.
6. Authorise the Secretary of the Treasury to exempt from duties items where the expense and inconvenience to the Government in determining the duty would be disproportionate to its amount.
7. Permit non-residents entering the United States to bring in free of duty automobiles and other means of conveyance when these are only for personal use.

8. Permit residents returning from abroad to make a duty-free exchange of goods brought in with them for one of like value within a period of 60 days.

9. Limit to five years the duration of a bond for the free entry of non-commercial exhibitions.

10. Liberalise provisions for the temporary free entry under bond of samples and other articles.

11. Extend to foreign ships the privilege of importing equipment and repair parts duty-free.

12. Change drawback provisions by extending to three years the period during which substitutes for drawback purposes may be made and to five years the period during which the exportation of imported articles may be made in order to obtain drawback privileges.

13. Increase from \$1 to \$3 the difference between deposited or assessed duties which may be disregarded by the Customs Service.

14. Raise the ceiling from \$1 to \$3 on duty-free single entries of imported goods sent to an individual for personal use and not for resale.

15. Permit duty-free entry of bona fide gifts for personal use up to \$10.

16. Make export value the preferred method of valuation if it can be ascertained.

17. Give the Secretary of the Treasury authority to waive requirements for certified invoices.

18. Repeal provisions for amendment of entry before appraisal and for under-valuation duties.

19. Extend to 30 days the period during which co-mingled merchandise may be segregated in order to avoid subjecting the whole to the highest rate of duty applicable to any part.

20. Repeal the requirement that the Secretary of the Treasury proclaim metallic rates of exchange but would require him to keep a current list of par values maintained by foreign countries. It would also provide for the certification of multiple rates of exchange and permit the application of these rates as they reflect the commercial value of the foreign currency related to the import in question.

21. Provide that in the case of the transfer of goods in bonded warehouses the transferee shall have no right to a separate liquidation on his behalf unless the rate of duty was changed subsequent to the date on which the right to withdraw the merchandise was transferred to him.

The first engine built at Chittaranjan

PROGRESS ON oiled WHEELS

The Locomotive Works of the Government at Chittaranjan and of Tata at Tatanagar, move, as might be expected, with the times.

Both have installed Hollerith machines. At Chittaranjan they handle analysis of wages and stores. At Tatanagar, they handle every aspect of Cost and Stores Accounting. (There are some 12,000 items of stores.) These are but two typical Hollerith installations in a vital industry All over Asia, in industries heavy and light, in commerce, in Government Departments—Hollerith installations are at work, oiling the wheels of progress.

● Publications of greatest interest to key executives are THE TABULATOR, issued periodically, and IN BUSINESS, TOO...describing Hollerith methods. Copies can be obtained by applying to any of the offices below—on your business note-heading, please.

THE PROGRESS OF PRIVATE ENTERPRISE SINCE 1947

INCREASES IN CAPACITY AND OUTPUT: THE AIMS OF INDUSTRIALISATION

THE achievements of private enterprise, complains the Employers' Association in an excellent brochure called *Achievements of Private Enterprise in 1947-52*, "have not been recognised as well as they should be, either by Government or the lay public". Probably they never will be. None but the richest nations can afford to look complacently on their current productive equipment; thought and discussion are inevitably concentrated on present deficiencies rather than past achievement. Even the Americans only took to counting the blessings of private enterprise when the New Deal hamstrung it and international communism threatened to kill it. The "lay public" takes the view that, if enterprise succeeds, its promoters do well enough out of it without having to worry about "recognition." For the rest, the public measures industrial achievement in terms of its effect on the standard of living, and if that standard does not rise in very evident particulars no amount of statistics will convince laymen that private enterprise deserves recognition for its achievements. Nevertheless, after some years in which the conditions for free industrial endeavour in India have been most unfavourable and in which private enterprise has been treated with suspicion and distrust by the people's tribunes, there is a certain interest in a statistical reckoning of the advances that industry has made in the first five years of independence.

Those advances have been very considerable and bear comparison, as national achievements, with the great progress that has been made on the political front and of which we naturally hear more often. The booklet of the Employers' Association gives private enterprise credit for three classes of achievement: it has carried further the growth of major industries which were already firmly established before the war; it has undertaken new lines of manufacture and broadened and diversified industrial capacity; and it has found the money for these developments at a time when the accumulation of fresh capital was dishearteningly slow. Despite partition, extensive civil unrest, persistent labour trouble, restrictive government policies and shortage of funds, Indian industry has become larger, more varied and generally more efficient. It has begun the manufacture of goods previously imported from abroad and has produced exportable surpluses for which markets are now being sought. The most significant conclusion we can draw from these facts is that if such progress could be made in the disturbed quinquennium after independence, even more notable advances can be expected as the five year plan improves the balance of the economy and hastens the rate of capital accumulation.

The Employers' Association recognises that the conditions for expansion had been created long before independence. In fact, the diversification of Indian industry began in the 'thirties and had made good progress by the beginning of the war—which was just as well, for wartime conditions made great demands on industry which it may not otherwise have been able to satisfy. The war itself promoted industrialisation in India, as in several other predominantly agricultural countries such as Canada and Australia; particularly did it favour heavy industries, engineering and power supply which have in turn made possible the growth of consumer goods industries. In the first years of peace came the great postwar boom of 1944-46 when unprecedented numbers of new companies were floated and much new capital (earned during the war) was put to productive use. These developments set the stage. The postwar era of shortages and high prices—which, just when it should have begun to close, was stimulated by the new shortages and higher

prices of the Korean boom—gave Indian industry the opportunity to put its resources to full and profitable use.

The results of this situation, to which was added the initiative and enterprise of Indian business men, were the steep rises in capacity and output of most secondary industry. The cotton textile mills added 1.16 million spindles to their equipment and approached an annual production rate of 5,000 million yards. The cement producers doubled both capacity and actual output. Paper makers added 50 percent to their 1947 output. The collieries raised production from 30 million to 36 million tons. The sugar mills, which have been chronically over-capitalised, succeeded in using almost all their capacity and turned out 148,600 tons. The steel producers, despite the obligation to subsidise imports of foreign steel, increased output by 200,000 tons to 1,100,000 tons, and have undertaken further expansion schemes which will carry that figure much higher in the next few years.

This rate of progress by the established industries outran the expectations of the planners, with the result that several of them have already achieved the targets that were set for 1955-56. Unfortunately, it also appears to have outrun the effective demand from consumers, with the less welcome result that several of these industries are already giving thought to cutting back their production schedules; indeed, one of them—sugar—has this year had to reduce its output. The Employers' Association comments: "If there are indications of an increased offtake and a buoyant export trade, the rate of production can be stepped up even further". No doubt; but many Indian industrialists are making no new plans until they discern some sign of that "increased offtake and buoyant export trade".

Just as important as the progress of the established industries, have been the appearance and rapid growth of many new industries. The list of new manufactures produced in India is a long one; no single entry sounds especially important taken by itself, but taken altogether the picture is one of an economy that has multiplied its resources, increased its resilience and lessened its dependence on foreign assistance and supplies. Some of these new industries have not only grown to the point where they can meet all domestic requirements but they have produced exportable surpluses. This is an important stage in an industry's development, for it marks the stage where tariffs and import controls can no longer be relied upon for protection; henceforth, if export markets are to be found for the surplus, quality and costs have to be framed to endure the competition of overseas markets.

The foundation of new factories and the expansion of the old has been made possible by liberal imports of machinery, millwork, tools and auxiliaries, and the cost of these imports is as good a measure as any of the rate of industrial progress since independence. In the five years from 1947-48 and 1951-52 India imported Rs. 441 crores of machinery and millwork; though this total includes purchases by governments and the railways. In the same period, Rs. 186 crores was spent on imports of machinery for the mining, paper, sugar, tea, textile and jute industries, while imports of machine tools, diesel engines, electrical equipment and boilers have been valued at Rs. 141 crores. Expenditure on machinery imports has been third after food and raw cotton in the import bill. These high figures of course are somewhat misleading, for in the years in question there has occurred a steady rise in the cost of capital goods, and figures in rupees do not indicate to what extent Indian industry was actually obtaining physical producer goods. Furthermore, a good deal of the machinery imported

United States shows, despite the much talked of dollar gap. The argument about saving foreign exchange and displacing imports by industrialising will not stand examination at the economic level; it is often a political argument favoured by entrepreneurs who seek the blanket protection of import controls. It encourages a negative, restrictionist approach to the question of industrialisation—the object of which is not to make countries “self-sufficient” but to raise living standards and promote international commerce. The great progress that Indian industry has made since 1947 has begun to be reflected in a better way of living for the Indian people, and that must be the object of further efforts toward industrialisation. More work, more goods, cheaper manufactures and better quality for the masses of India are the aims of industry; not the sterile and impossible task of “saving foreign exchange”.

BRITAIN REVERTING TO CONSUMER GOODS CHANGING DEPLOYMENT OF INDUSTRIAL RESOURCES

BY a curious freak, it was not until the Coronation and its attendant celebrations were over that the British public and the large number of overseas visitors to Britain began to spend freely on all kinds of goods. (Not quite all kinds, for the radio and television trade had boomed for the Coronation proceedings, and demand was naturally less when they were over; but even in this trade the reduction of sales has evidently not been very sharp.) It might have been assumed that, with annual holidays pending, most people would have tried to save some of the money that they had spent on decorating and celebrating. Instead, they continued to spend money that they would normally have saved and money that they had saved in the past. These are not the only facts which lead to the conclusion that Britain's interest has reverted from producer to consumer goods. Recent figures for production and employment confirm this trend, in general if not in every detail. The Coronation itself caused, as a necessary but unfortunate by-product, a fall in basic production. Output of coal, especially, which had laboriously struggled ahead of the corresponding figures for 1952, has lost all of this year's gains. However, both coal and steel, especially the latter, will evidently achieve in 1953 as a whole a useful increase compared with 1952. It is in the engineering group that the relative weakness of production is most apparent; and the weakening is due not to the Coronation but to basic economic causes.

Generalisations, as usual, are misleading. The recovery of production has been most marked in consumer goods (particularly textiles) because it was in the consumer goods industries that the recession of 1951-52 was most acute. The capital industries (shipbuilding is a conspicuous example) have not been left out of the recovery which has raised Britain's industrial production in the first half of this year a little above the levels of the same period of last year. No British industry has any longer a major problem of unemployment. Some competent observers are well satisfied with the present state of British industry. It is better balanced, they say, not only than a year ago, when consumer trade was in recession, but also than in the years after the war, when resources were heavily concentrated on producer goods. The experience of the capital industry in the inter-war years suggests that there are serious risks in depending mainly on the international demand for capital goods.

This argument is certainly relevant in relation to export trade, where diversity and flexibility are especially needed. Undeniably, however, it is the recovery of demand at home rather than abroad that has restored the consumer trades to their former level of activity, or above it. Export trade, though improved, has played a minor part in the revival of textiles—where the industrial revival is most conspicuous. The biggest change in employment since the rearmament programme got into its stride two years ago is actually the increase in the food and drink industries, whose exports are relatively trifling.

The profound changes in employment initiated after the outbreak of the Korean war have now been largely reversed. It might be assumed that the ending of the Korean war was envisaged in advance and that the pattern of industry gradually reverted to normal. But the pre-Korean pattern has not been restored in detail. There is a permanent increase in the numbers employed, directly or indirectly, in military, naval and air force work. The consumer goods industries, in regaining their labour, have taken workers from general engineering activities, where, doubtless, they could not be profitably employed at the present level of international demand for engineering products. This situation is well enough for British industry as a whole, but it may have serious implications

for the country's financial stability. It suggests that the monetary policy introduced in November 1951 has either served its purpose—or failed. The purpose was to deflate home demand and to force more goods into the export trade, at the same time redistributing labour and other productive resources. When trade went into recession the Government itself was not at all anxious to press this policy further; and even in his budget of April this year, when the recovery was well advanced, Mr Butler allowed important concessions to the consumer trades at home.

It may be that the Government, though perhaps not the Chancellor of the Exchequer himself, is satisfied that the new monetary policy has done all that was required of it. Independent economists take a much less complacent view. The latest quarterly bulletin of the London and Cambridge Economic Service stated: “It is essential to emphasise the fundamental precariousness of our external position, both for the relatively short run and for the years to come. This remains the dominating feature of our position.” The supply of money is increasing again, and the people are spending freely again. Yet production, though revived, is not yet buoyant; and the burden of defence is much heavier than it was when the boom in trade at home prepared the external payments crisis of 1951. The remarkable improvement in the payments position in 1952-53 has not restored the gold and dollar reserve to anything like a safe level. Spending at the current rates is fraught with danger. It may yet be necessary to reimpose monetary discipline as it existed a year ago.

CURRENT COIN

Coal Output Ceilings.—Greater realism has been shown in recent months in implementing the coal conservation policy, mainly because it has increasingly been realised in official circles that the aims of conservation can be achieved better by such methods as beneficiation and sandstowing rather than by the simple restriction of output. The overall ceiling for the production of Selected A and B coking coal during the current year was originally fixed at 7.4 million tons but 37 collieries asked that their individual targets be revised; after consultations the Coal Board has raised the overall ceiling to 7.86 million tons. This compares with the ceiling of 7.9 million tons and an actual production of these grades of 7.752 million tons in 1952. The Board says that in fixing the new individual targets for collieries it has taken into consideration the output obtained with stowing, the labour strength, the cost of production, the record of production in past years, the present level of production, and the economic production capacity. The output of grade I and II coking coals during the current year has been pegged at the level of last year's actual production, but 64 appeals for the revision of individual colliery targets have been received and are being considered. The Board has informed collieries producing grade I and II coking coals that it will consider appeals for the reclassification of their coals as coking coals. Seven collieries have asked that their targets be raised because their coal is of poor coking quality and only three have submitted separate applications for the reclassification of their coals. The Board, however, points out that revision of the target is an issue separate from the reclassification of coal; appeals for the latter should be supported by data such as the proximate analysis of the coals in question and if the Board believes that there is a *prima facie* case samples will be drawn for analysis and a final decision reached. The cost of analysis in such cases will normally have to be deposited by the collieries. The repercussions of the conservation policy on employment have been a matter of considerable concern, but the Board says that since the production ceilings for 1953 are generally higher than the actual production in 1952 the employment of labour in collieries should not be affected. It will not therefore support any proposal to retrench labour which is based on its restriction measures.

Paper Production and Prospects.—In his presidential address at the annual general meeting of the Indian Paper Mills Association in Calcutta on Tuesday, Mr Brij Mohan Thapar said that the production of paper and boards reached a record of 137,504 tons in 1952, as against 131,915 tons in 1951, and was likely to rise further this year. Quality had also improved and new lines and varieties had begun to be manufactured. He was confident the target of 200,000 tons mentioned in the five year plan would be exceeded by 1955-56. Although present production fell short of demand, “this gap exists more in certain special or exclusive lines and varieties than in ordinary writing and printing, Kraft paper and paper boards.” It was estimated that enough of the latter categories would be manufactured by 1953-54. The Government should allow the import of only those special varieties which were in short supply and to an extent just sufficient to cover the gap between

local production and consumption. The term “newsprint” should be defined more strictly, or licensing policy and procedure amended, in order to prevent the “clandestine import” of normal grades of writing and printing papers under this head. Mr Thapar complained that State Governments were ignoring recommendations made by the Planning Commission to ensure that the industry got regular supplies of its main raw materials, bamboo and sabai grass, at a reasonable price. They were interested in the development neither of forests nor of the industry but only in extracting the maximum revenue. State Governments should be made to co-ordinate their policy with the Central Government's, and to lease forests to companies for long periods at reasonable rates of royalty. The Planning Commission had urged the industry to modernise production techniques and bring down costs by reducing the consumption of fuel and raw materials. Modernisation, as well as expansion, would necessitate capital expenditure and Mr Thapar hoped the industry “will continue to experience the reasonably and relatively healthy state it finds itself in, because there are numerous indications of difficulties ahead.” Rail transport facilities, he complained, were inadequate and on some railways booking restrictions had been frequent and prolonged. The industry's products and raw materials deserved higher priority in the preferential traffic list and the freight charged on them was too high. In the case of the straw-board industry, transport costs had risen to 40 percent of the total cost of production after the revised freight rates were introduced in October 1948; a petition on this subject was pending before the Railway Rates Tribunal.

Rationalising Indian Insurance.—Mr. H. K. Sen, president, told the annual general meeting of the Indian Insurance Institute recently that the shortage of trained sales and administrative personnel had been a chronic difficulty with insurance companies and suggested that they finance the establishment of regular study circles or training classes. He thought the system of collective advertisement deserved wider support if scepticism and apathy about insurance were to be overcome. Business had to some extent been hampered by State intervention but “the present grip of the Government is by no means merely an attempt to control the industry on doctrinaire reasons. It is a measure to end certain ills and malpractices which have been threatening to give Indian insurance a bad odour.” Although intentions were good, Mr. Sen felt that remedies had sometimes been too severe. For instance, a simple series of index ratios for expenses with very minor variations due to size, as envisaged in the statute, was unscientific. If two offices charged the same premium but earned different profits that did not reflect their relative efficiency. Profits depended on such factors as the proportion in which different types of risk were distributed and mortality experience; these could justifiably vary between offices. Mr. Sen said that the control over expenses had “practically blocked the way for smaller and middle-sized companies. With the persistence of inflationary trends and a high cost of living it would be impossible for the companies with a comparatively low premium income to keep their expenses within the statutory limits.” In 1951, 45 percent of the Indian companies exceeded these limits; of these 44 percent had shown a surplus in their last valuations, 34 percent showed a deficit covered by paid-up capital and only 22 percent were insolvent. “It would be a pity if these 78 percent of the defaulter companies, which would otherwise be considered solvent and have a reasonable chance of survival, are compelled to close their doors due to non-compliance with the statutory provisions for expenses.” Mr. Sen suggested that small companies with uneconomic premium incomes should be amalgamated into bigger units but pointed out that “until now such rationalisation has not been possible, and also the bigger companies are often reluctant to absorb companies carrying a bad name.” The Government, he said, should therefore establish an Insurance Corporation to which the “business of all defaulting or insolvent insurers may be transferred before their funds are frittered away and the loss increased.” The Corporation, he thought, should also be given a monopoly of reinsurance business. Mr. Sen said that if the Government decided to direct insurance funds into investments ancillary to national development, it should guarantee an interest rate of at least 4 percent. Control over the investment of insurance funds had caused returns to be low, and this was one of the reasons why insurance premiums in India were among the highest in the world.

Fewer Looms, More Textiles.—The latest census conducted by the International Cotton Committee of the International Federation of Master Cotton Spinners and Manufacturers' Associations shows that the number of cotton power looms in the world declined from 3,069,905 in 1936 (when the last census was held) to 2,730,382 on 31st July, 1952. At first glance this reduction

is curious, in view of the increase in the world's population and the general improvement in the standard of living. However, working hours have been increased in most countries during this period, double and treble shifts being quite normal in very many countries, both in the spinning and weaving sections of the industry. That less equipment is now producing sufficient textiles to satisfy the requirements of the world is supported by the fact that in the cotton season ended 31st July, 1952, the world's cotton mills' consumption amounted to 32,662,000 bales as against only 25,389,000 bales for the season ended 31st July, 1936—6,273,000 more bales consumed on fewer spindles and looms, etc. The number of raw cotton spinning spindles in the world during this period was also reduced from 151,745,000 to 127,994,000. The reduction in looms has been proportionately less than the reduction in spindles, viz. 11 percent and 16 percent respectively. Of the total reduction of 339,523 looms, the Continent of Europe lost 236,126 with most of this loss taking place in the United Kingdom; North America lost 167,360 looms; South America, however, increased by 42,949 and Africa by 17,711. Asia only increased by 3,303 but in spite of this total continental increase, Japan lost 42,371 which loss was offset by increases in other countries. Of the total of 27,006 extra looms under erection in 1952, 13,395 were automatic. In addition there were 10,129 being erected to replace older looms and of this total, 7,703 were to be automatic. There are 27,549 extra looms to be erected in 1953-57 and of these 13,298 will be ordinary and 13,668 automatic. More than three-quarters of this in-

crease will take place in Asia and South America, particularly in India, Hongkong, Pakistan and Brazil. The date on which this census was taken unfortunately coincided with the world recession in the textile industry and the return on average hours worked per week showed a lower figure than is generally considered normal working. Idle looms on 31st July last in Europe numbered 231,297, out of a world total of idle looms of 294,776. This last figure is no doubt too low as certain countries were unable to furnish particulars in reply to this question.

Fishery Development.—The development of South India's fishing industry may have entered a new phase with the participation of Norwegian funds and techniques to develop the fishery resources of Travancore-Cochin. The Norwegian Minister to India, Mr. K. Lykes, said at Trivandrum on Sunday that his country's scheme to aid the fishing industry in the State was only “experimental”, and if it went well it might be extended to other areas. Two villages near Quilon, with an area of 10 square miles and a population of 12,000, have been selected. Fifty-three tons of equipment for the development drive were landed in Cochin from Oslo, early this month, comprising fishing tackle, wood slabs, tubes, pumps, water tanks, and other essential material. The project is designed to teach fishermen modern techniques, to ensure efficient distribution and marketing of fresh fish and fish products, and to raise the standard of living in fishing villages. The 400 fishing boats operating in this area will be equipped with motors, and new types of nets; new fishing craft, and shore installations will be introduced, besides methods of storage, speedier transport and co-operative marketing. A plant for the extraction of fish oil will be erected and the possibility of improving curing methods and producing fish meal from waste products will also be explored. Mr. Lykes said that his Government's aid would be continued irrespective of the political changes in Norway following the elections in October. The 20 million kroner (Rs. 134 lakhs) allotted so far was unanimously voted by the Norwegian Parliament; besides this allotment, about 1.7 million kroner (Rs. 12 lakhs) has been collected for the Aid to India Campaign through voluntary contributions, theatre performances, film shows and an exhibition of Indian handicrafts and lotteries. A Norwegian delegation visited Travancore late last year and selected the site. There is already a small export trade in dried fish and prawns, which are

sent to Ceylon, Burma and Malaya and a modest estimate puts this trade at around Rs. 208 lakhs a year. With the new developments and research envisaged, India should be able to expand these export markets.

Inflationary Taxation.—While all aspects of tax policy are being discussed in India, the need for new principles for calculating taxes on industrial profits was the main theme in the address of Mr. S. C. Tyrell, the retiring President of the Institute of Cost and Works Accountants, at the Institute's national cost conference in London the other day. He pleaded for a single tax on business profits to replace the present triple basis of income tax, profits tax and excess profits levy. Such a change, said Mr. Tyrell, may have to be made gradually. It would involve the abolition of income tax on business profits. Income tax was originally a personal tax and it seems illogical for it to be applied to corporations who are merely acting as collectors of tax from shareholders. Mr. Tyrell dealt with the inflationary effects of the present enormous tax burdens which have to be carried by industry. A regular monthly review of a company's “paper profit” experience might point to the conclusion that 80 percent of net profits might have to be retained to meet tax liabilities. The danger today is that directors are tempted to embark on expenditure, not because it is necessary to economic production, but because the rate of tax often offers a subsidy of over 80 percent for any non-capital spending.

Future of the B. I. F.—It is not easy to trace the source of the rumours which were spread soon after the end of this year's British Industries Fair that the question of its discontinuance was under serious consideration. Not unnaturally, they gave rise to considerable apprehension in many quarters. The President of the Board of Trade lost no time in confirming that the 1954 Fair would take place as usual, from the 3rd to the 14th May, but he also announced at the same time that he had set up a Committee to consider the future of the Fair. Possibly it was advance knowledge of this which gave rise to the rumours, or it may have been the apparent decline of interest on the part of both home and overseas buyers which marked the opening days of the 1953 Fair and which received such pointed reference in the Press. Anyhow, the organisers—the Board of Trade—have done well to take the matter seriously and attempt some assessment of the 1953 results. Although it is impossible to measure the value of business done, some idea of the success of the Fair can be gathered from a close examination of the attendance figures. These show that nearly 30 percent more people came to the London sections, at Earls Court and Olympia, than in 1952. There was an increase of 95 percent in public attendance (20,247 to 39,001) and of 3 percent in trade buyers (56,066 to 58,919). Home buyers were responsible for this increase, since the number of overseas buyers was slightly smaller (11,593 to 11,045) although it should be remembered that this is more than twice the average number who came to the pre-war Fairs. The overseas buyer travelled an average of 6,000 miles to the Fair and back to his home. Only 1 percent of them were in England for the Coronation.

CORRESPONDENCE

PETRO-CHEMICAL DEVELOPMENT TO THE EDITOR OF “CAPITAL”

Sir,

Our attention has been drawn to a paragraph headed “U.K. Petroleum Chemical Development” on page 758 of your issue dated June 4th. It seems to us that this paragraph may convey a misleading impression of the industrial value of petroleum chemicals.

While it is true that the cost of petroleum chemical plant, as is the case in other industries, has steadily risen during the post-war years, our Associates' experience does not show that this increase in capital cost has prevented the marketing of these products at competitive prices. In fact the free availability of solvents from the petroleum chemical industry has been largely responsible for a downward trend in certain prices in the U.K. last year and for certain product ranges petroleum chemicals, after only a few years' marketing, have in point of fact obtained a dominant position.

Nor is it, we think, true to say that undue reliance is placed on outlets for textile auxiliary purposes. So far as our own detergent business is concerned, the great majority of sales have been made for purposes other than those needed by the textile trade, although we are of course fully alive to the importance of these textile outlets.

Yours faithfully,

TWO GOVERNMENT LOANS
ANNOUNCED
GILT-EDGED BEST IN AN
APATHETIC MARKET

London, 17th June.
THE Government announced on Monday two new loans, one of £100,000,000 3% 1960 Exchequer Stock, and the other £10,500,000 3½% Treasury 1977-80 as further compensation to colliery owners.

Very little real business has been transacted in the stock markets in the past week. Two principal influences have been the strength of gilt-edged, though these lost some ground latterly, and the conduct of Wall Street. The former had a steadying influence all through and the latter undermined some of the more speculative issues, particularly towards the end of the week when it eased on weakness in the American grain markets. Gilt-edged were active and finished the week higher on balance. Industrials were singularly idle despite annual dividends announced by several principal companies. The undertone however remained reasonably firm, though textiles, stores and provisions looked a little ragged at the close. Among engineering, ship buildings were shaky because of agitation for wage increases by workers. The persistent absence of Continental interest in the mining and oil sections tended to underline the heaviness of these groups but gold shares, in spite of some rather disappointing dividends from the Union Corporation group, closed the week on a firm note through shortcovering by professionals. Talk of an unfavourable Japanese trade balance for May had an adverse effect on Japanese bonds

and this was added to later by the news of continued heavy fighting in Korea and the comment by the American Secretary of State on the Korean situation. These latter factors also served to check the recovery in Chinese.

The distinct rise in tea auction prices, resumed after a fortnight's interlude, was reflected in tea shares in the past week and they have been hardening gradually throughout the period. Also helpful was the news that estate workers in West Bengal were to receive a wage increase, this being taken as an indication that things are looking up for the industry in that area. Dividends announced today, less tax, include Attaree Khat Tea 5%, Borelli 12½%, Borjan 5% and Rupajuli 10%.

Difficult conditions prevailed in London's money market throughout the greater part of the week with money short and outside calling substantial. The market was hard pressed to obtain funds and authorities had to give assistance before books could be balanced. The last session, however, saw a reversal of conditions and though outside calling remained sizeable, one or two outside banks had money to spare and with balances coming in on a fair scale, books were balanced in comfort. The Bank of England Return disclosed that active note circulation decreased around £1 million to £1,542.6 million. Bankers' deposits were slightly higher at £267.4 million. Applications for £270 million Treasury Bills totaled £353,075,000 of which the former amount was allotted at an average rate of 47s. 4.26d. percent. This week's offerings will be £270 million.

Cotton Import Committee
If the Parliamentary timetable goes according to plan, a statement should be made on Thursday on the report of the Cotton Import (Review) Committee, a Ministry of Materials spokesman said on Monday. The Committee was set up last March under the Chairmanship of Sir Richard Hopkins to consider the conditions under which private importing of cotton should be allowed in the 1953-54 season. London observers do not expect the Committee's report to favour an early resumption of dealings on the Liverpool Cotton Exchange as its enquiries are believed to have disclosed a number of difficulties to this step.

U.K. Cotton Arrivals
Raw cotton arrivals in the United Kingdom in the past week totalled 52,281 bales comprising 1,484 Sudan, 10,716 United States, 8,752 Pakistan, 3,022 Brazilian, 3,327 West African, 3,215 East African, 2,421 Peruvian, 608 Indian, 45 Argentine, Syrian and other growths 3,691. The quantity at present afloat is 54,680 bales mainly Brazilian, West African, Sudanese, Pakistani, Argentine and Mexicans.

Tea Stocks
Tea stocks in London and provincial bonded warehouses on 5th June totalled 112,723 pounds compared with 109,558,656 on 29th May and 112,835,756 on 15th May. In the period 13th May to 5th June landings totalled 9,843,012 pounds and deliveries 7,133,940.

Indonesian Export Duties
The exemption of tea from Indonesian general export duty has been prolonged for another six months until the end of this year, according to an Indonesian news agency cable received in The Hague from Jakarta. This move was announced by the Indonesian Finance Ministry. The extra export duty on copra remains unchanged at 10 percent. The cable said that no decisions have been taken on extra duties on rubber, pepper and coffee and they remain unchanged at 10, 15 and 15 percent respectively. The export ban of coffee has been lifted so that exporters will again be able to apply for export permits, the Indonesian Finance Ministry is reported to have said.

Currency Arbitrage Scheme
The currency arbitrage scheme inaugurated among eight European countries on 18th May is being informally extended to forward dealings. Formally, it is still confined to the spot exchange without official permission, but this week it has been possible to do forward deals. In each case, change controls concerned but, in general, approval is readily granted. The present stage could be summed up as an automatic arbitrage for the spot forward and administrative arbitrage for forward.

Rotterdam Fibres Market
In view of the International political situation buyers have withdrawn from the Indian coir yarn market, Rotterdam, this week. Prices, however, fibres continues small with the undertone of the market barely steady.

Copra Market Weaker
To the surprise of some traders in the London copra market, the recent easier trend in prices extended sharply on Friday, with Straits fair merchantable June-July shipment offered and sold at £78-3/4 per ton, c.i.f. compared with bids of up to £81 refused on Thursday and £87 asked three weeks ago. Contributory factors to the decline were freer offers of Indonesian copra, increased availability of Straits copra, virtual clearance of short positions and the apathy of consumers.

Groundnut Oil Market
All offers of groundnut oil have been withdrawn from the London market following the prohibition by the Indian Government, since 5th June, of further H.P.S. groundnut oil shipments.

Tanned Skins
The quantity of tanned skins to be catalogued for public sale on 25th June will be approximately 300,000 goat and 300,000 sheep. The last steamer was Hesperides.

Finance in India & Abroad

CREDIT STRINGENCY PERSISTS
ARGENTINE JUTE ORDER BRINGS
EXCHANGE BUSINESS

Wednesday, 17th June.
MONEY has been extremely tight this week. The cash taken off the market by the recent Government loan has not been replenished, there has been a further call on resources for the Standard Vacuum debenture issue, there have been fairly heavy tax payments, and the demand for accommodation from trade and industry has not slackened. Tea finance is increasing and jute mills' advances are steady. Quite apart from all these causes of credit stringency, there is the fact that is dominating the money markets this year: that the amount of money in the banking system is inadequate for the requirements of business. That this should be the case when the active note circulation as reported by the Reserve Bank is unreasonably high suggests that currency is being held outside the normal credit system, and that the velocity of circulation is notably lower than in recent years. Conditions will probably not become easier for a few weeks. Demand for funds in the interbank market is keen, but rates still quote 2½ percent for overnight money and 3 percent for good money, of which latter there is not a great deal on offer.

There has been more activity in the exchange department over the last seven days. Substantial purchases of jute goods by the Argentine have been reflected in a number of large export bills, and there have been other smaller tea and gunny bills reported. Remittance has been above average. Sterling rates are unchanged and the U.S. dollar stands at Rs. 47s.

The sharp increase in borrowing against trade bills in the week ended 12th June, shown below in the Reserve Bank return, might support the belief that much of the cash that was subscribed to the new loan was raised in this way. Sales of existing securities, to judge from recent weakness in gilt-edged in the stock markets, provided more of the cash subscribed. Though the authorities thus appear to be borrowing their own money (at higher rates of interest), this does not mean that the flotation was any less a success than it seemed, for the Government has established a claim to new money when it becomes available in the slack season. When the supply of money eases, trade bills will be liquidated and loans bought back, and it is then that the authorities will obtain genuinely new funds.

The statement of the Government of India's closing balances at the end of the last financial year, which appears below, shows that the Centre ended the year 1952-53 with more in hand than it expected when the Finance Minister made his budget speech. This is of interest in indicating that "borrowing against treasury bills" during this year need not be as high as Rs. 110 crores in order to ensure that the Finance Minister closes the year with the balances he regards as a necessary minimum—in other words that less of the Government's spending will be inflationary.

The following is a statement of the cash balances of the Central Government on the last day of March 1953:—

(1) At the Reserve Bank of India	Rs.
in India	92,05,04,000
(2) At treasuries in India	27,37,000
(3) In England (Sterling converted at 18d. the Rupee)	3,79,26,000
Total	96,11,67,000

Tenders for the offer of Rs. 1 crore of three-month Government of India treasury bills amounted to Rs. 2,22,50,000 this week. Tenders at Rs. 99-6-6 percent were accepted in full and those at Rs. 99-6-3 percent allotted approximately 28 percent; the average rate of acceptance rose by one pie to Rs. 2-6-6 percent per annum. Tenders for another Rs. 1 crore of treasury bills will be received up to 11 a.m. on Tuesday of next week at Bombay and up to Monday at Calcutta, Madras, Kanpur and Delhi. During the week ended 12th June treasury bills for Rs. 9,44,50,000 were sold in favour of the Reserve Bank of India.

Gold ruled firm last week and the price shot up from the previous week's level of Rs. 91-14 to Rs. 93-4 quoted today. The sovereign at Rs. 59-6 disclosed a gain of one rupee. Sentiment in this section was helped by the suggestion that a 100 percent cut in power would hamper the working of the Mysore gold mines. There was also very good off-take due to seasonal factors.

Silver was also steady, the price rising from Rs. 158-12 to Rs. 159-4. The ready rate was quoted higher at Rs. 161. The price, however, continued unchanged at 74d. in London and at 85½ cents in New York.

The return of the Reserve Bank of India for the week ended 12 June, 1953, showed a fall of Rs. 2.13 crores in notes in circulation to Rs. 1,167.49 crores, while the total note issue was fractionally up to Rs. 1,189.96 crores. Notes held in the Banking Department consequently rose by Rs. 2.14 crores to total Rs. 2,247 crores. In the Banking Department, deposits of the Government of India were sharply up by Rs. 28.03 crores to Rs. 122.09 crores, presumably due to the cash subscription to the First National Plan Bonds, while other Government a... decreased by Rs. 4.19 crores to

Rs. 12.51 crores. Balances of commercial banks at Rs. 41.88 crores were about Rs. 97 lakhs less than in the preceding week. Balances held abroad increased by Rs. 3.42 crores to stand at Rs. 101.86 crores. The sharp rise in other loans and advances from Rs. 23.37 crores to Rs. 37.82 crores, of which advances to scheduled banks against usance bills totalled Rs. 19.19 crores against Rs. 8.69 crores during a week, which experienced no special trade activity was an interesting feature. Investments at Rs. 89.79 crores revealed a rise of Rs. 86 lakhs. Ways and means advances were at Rs. 3.66 crores (Rs. 3.30 crores).

The return of the Imperial Bank of India for the week ended 5th June, 1953, shows a rise of Rs. 34 lakhs in total deposits to Rs. 210.02 crores. Investments in Government Securities and other authorised investments are up by Rs. 1 lakh and Rs. 25 lakhs to Rs. 70.73 crores and Rs. 10.57 crores, respectively. Loans, cash credits and overdrafts, and bills discounted and purchased have decreased by Rs. 12 lakhs and Rs. 63 lakhs to aggregate Rs. 106.13 crores and Rs. 24.83 crores respectively. Cash and balances are, in consequence, shown at Rs. 14.58 crores or Rs. 5 crores less.

TREASURY BILL MATURITIES

Details of 3 months' Bills outstanding with the public on 19-6-53.

Issue Date	Maturity Date	Amount (000's of Rs.)	Average Acceptance Rate
19-6-53	19-9-53	1,00,00	Rs. 2 6 6%
12-6-53	12-9-53	1,00,00	Rs. 2 6 5%

NOT GUILTY!

Oil leaves no thumbprints behind on the many textiles produced in India. This is not so easy as it sounds, for one of our many problems in life is to devise ways and means of keeping oils and greases on textile machinery, and off the yarns they handle.

Shell research has developed special lubricants for the textile industry and many Indian manufacturers have found them more than satisfactory. Their machines run smoothly and their fabrics stay clean.

But this is not a static problem. As textile machinery improves so the demand for special lubricants increases. The distribution of these improved industrial lubricants for specialized purposes is one of the many ways in which we demonstrate our leadership in the Petroleum Industry.

THE PHILIPPINES

The people of the Philippine republic are closely related to the Malays, though the source of much of their culture was China, with whom they traded as far back as the 14th century. Handed over to the U.S.A. under the terms of the armistice following the Spanish-American war, the Philippines were granted their independence on July 4, 1946. They thus pleasantly reflect the influences of the East and West. The Philippine archipelago is very fertile and the rice terraces of Northern Luzon are a marvel of the East. Here also is grown the famous Manila hemp, used for ropes. The Caltex organisation distributes high-quality petroleum products throughout the islands, and their expert information service is readily available to the Philippine nation.

WHEN I quoted here a year ago Sir James Donald's warning that the demand for electricity in 1956 would be in excess of supply, 1956 must have sounded a long way off to some people. Well, it is twelve months nearer now—and Sir James has repeated the warning, in much the same terms, in his chairman's address to the annual meeting of the Calcutta Electric Supply Corporation which is to be held in London next month. Remembering that waste of time and indecision were the main causes of the damaging power famine in Western India, the country's legislators might take careful note of Sir James's statement that, "while there is at the moment sufficient generating capacity to meet present demands and for a few years to come, it will not suffice to meet the anticipated demand from 1956 onwards". Where do our legislators come in? They have many times been requested to take up amendment of the Electricity (Supply) Act of 1948, which, by pegging the return investors in this industry can be offered, presents a formidable obstacle to the creation of new capital for the expansion necessary to avoid repetition of the Bombay and Madras power pickles in other parts of India. Sir James Donald says on this point, "Action in this direction is, I understand, still under consideration, but a year has passed and as nothing has so far seen the light of day it is unlikely that any change in the law will be effected within another twelve months. Meanwhile many companies, particularly the small ones, will be hampered under the existing provisions in obtaining capital sufficient to procure new generating plant, with the result that the areas which they serve are likely to suffer a shortage of supply for some years". The danger could not be more clearly described. Electricity suppliers are not alone of course in suffering lack of capital, though no other industry is virtually prohibited by law from attracting investment funds. But other concerns in a sense pass on their own capital shortage to the electricity companies—lacking funds to build power plant, mills and factories turn to the power suppliers, who must then commission extensions. A law that hinders the raising of money for this vital purpose plainly stands in need of speedy amendment.

We in the area stretching from Budge Budge to Chandernagore, served by the Calcutta Electric Supply Corporation, may expect to have enough power for our needs at least until 1956. We owe this entirely to the Corporation's farsighted decision, taken even before the end of the war, to install new generating plant to the tune of some 170 MW in the years just after the war. To meet the load beyond 1956, the Corporation's plans have included the installation of yet another new station in south Calcutta and it was while the Corporation was waiting for licences to import the plant for this station that the Damodar Valley Corporation came forward with an offer to supply power from Bokaro where, it is understood, there will be generating capacity surplus to initial requirements. Bokaro is 225 miles from Calcutta but the two corporations have negotiated a provisional agreement for the supply of energy for a number of years from 1956. Sir James Donald comments: "The proposal had its attractions since if it could be determined that the transmission of current from Bokaro... would be adequate and uninterrupted, and if the price at which the supply could be delivered within our area was comparable with the cost at which we could generate at our own stations, the construction of a new Southern Station could be deferred". These matters appear to have been satisfactorily resolved, for the provisional agreement has been forwarded for sanction "by higher authority". Sir James concluded with a "warn-

A DITCHER'S DIARY

ing that if there is delay in giving the necessary sanction there is grave danger that Calcutta may suffer a serious shortage of electricity in 1956".

In an article in the Daily Telegraph Lord Asquith of Bishopstone (a Lord Justice of Appeal and the fourth son of the famous Prime Minister) laments the decay of wit which is part of the decline of the art of conversation and that voluminous letter-writing which was practised by educated people half a century ago. It is, of course, also part of that general vulgarisation of modern life which has accompanied, and cannot be entirely unconnected with, the rise of the cinema and allied institutions. Epigrams, says Lord Asquith, are the severest products of wit and he describes them as being as formal as a chess opening or a Dutch garden. Among epigrammatic devices he points to the substitution of the unexpected for the inevitable word. Oscar Wilde greatly overworked this expedient, and whilst "Nothing succeeds like excess" is merely nauseous, "Here am I dying beyond my means" has a certain quality. Lord Asquith picks out for honourable mention Miss Tallulah Bankhead's "My soul is driven slush". He also quotes a good example which was furnished by an interchange between two masters in the senior common room of a famous public school in the early part of this century. One—Mr. X—was a cleric with a large store of anecdotes which, in that age, were considered audacious. The other, Mr. Y, was not. After one of X's sallies, Y remarked: "Spare us X, remember there are laymen present". Political witticisms have always been in good supply and Lord Asquith quotes the famous Harry Cust, a well known wit of an earlier generation, who acknowledged his inability to make up his mind between the respective merits of Free Trade and Protection in the formula: "I have nailed my colours to the fence". It was probably Cust who said of Bonar Law, a compromise choice for the leadership of the Conservative Party which had failed to agree on the respective claims of Austen Chamberlain and Walter Long. "So Bonar Law has risen between two stools". Monsignor Ronald Knox, the eminent Roman Catholic priest, criticising the Liberal Party on the floor of the Oxford Union in the early years of this century referred to it as a party "which first turns its back on the people and then says 'we have the people at our back'".

The Deshbandhu Memorial Society, who are seeking funds to maintain the house "Step Aside" in Darjeeling as a monument to Deshbandhu Chitranjan Das, have published a brief life of the patriot to coincide with the appeal this week by the Governor of West Bengal, Dr. H. C. Mookerjee, for funds for that purpose. As I read it through, having never been either poet or revolutionary myself, I found much of it that lay outside my own (and I suspect, many of my readers') experience. But when I came to the last years of Das's life, when he was working closely with Mahatma Gandhi and Motilal Nehru, one could detect a more modern spirit, a frame of mind that is more familiar to us because it is the mood in which India's present leaders have used their power since the achievement of national independence. The year 1925, when Das died, is a long while ago in terms of the swift movement of Indian history since then, and it betokened more than usual vision that at that time Das was already able to discern the shape of events that were to follow only after years of commotion and distress. For example, we find him saying at Faridpur in that year, "The great Commonwealth

of Nations called the British Empire—a federation of diverse races, each with its distinct life, distinct civilisation, its distinct mental outlook—if properly led by wise statesmen at the helm, is bound to make lasting contributions to the great problem of knitting the world into the greatest federation the mind can conceive, the federation of the human race. I think it is for the good of India, for the good of the world, that India should strive for freedom within the Commonwealth and so serve the cause of humanity." To some ears those words will sound slightly platitudinous today, for we have heard them said recently by all Commonwealth leaders. But that they should have been uttered in India 30 years ago is surely significant. That fact is answer enough to suggestions that India's present position in the Commonwealth is in any sense a break with the liberal traditions of the nationalist movement.

In his latest statement to shareholders of the Burmah Oil Company, Sir Kenneth Harper draws pointed attention to the differing policies pursued by governments in India, Pakistan and Burma in respect of industrial disputes. Whereas in India and Burma there is almost one hundred percent reliance upon compulsory adjudication, in Pakistan it appears that the desire is to avoid adjudication and encourage negotiation. The result is a steady flow of claims upon employers in India and Burma, on which no real attempt has been made to negotiate because there is a better chance of getting something out of the industrial courts which—although Sir Kenneth did not say so—have now established themselves as a permanent wing of the judiciary. It appears that last year the operating subsidiaries of the Burmah Oil Company were almost permanently before tribunals in India and Burma, whilst the one dispute which arose in Pakistan was settled by direct negotiation, since when, says Sir Kenneth, relations with the labour force have been excellent. In industrial production the quality of labour and its relations with the management are every bit as important as the site of the factory, the proximity of raw materials and the availability of power. Recourse to law or semi-legal proceedings is expensive to both parties and psychologically bad, for it tends to separate issues and alienate sympathies which should be mutually shared. All industrial and trading undertakings in Pakistan are feeling the effects of the economic crisis through which that country is passing, but it is good to know that at least these disabilities are not being added to by the unnecessary remission of industrial disputes to tribunals which, whatever their other merits, tend to prolong the process of settlement, to decide the issues in an atmosphere far removed from the practical workaday setting in which they arise and to weaken the natural bond which should exist between employer and employee. If I understand him aright this failure to explore alternative means of settlement before remitting a dispute to a tribunal is the gravamen of Sir Kenneth Harper's criticism of present practice in India and Burma.

During preparations for the coronation procession the Admiralty was worried about sailors fainting while they stood to attention for hours together, fainting being "very contagious once it starts" according to a naval medico. Accordingly written orders went out (probably headed "Fainting, what to do when feeling like") recommending that the affected take one pace backward and put the head between the knees. "This action", the orders emphasised in what *Newsweek* calls a magnificent example of the brass-hat mind at work. "This action is to be taken before losing consciousness".

Company Meetings

BURMAH OIL COMPANY LTD. **SIR KENNETH HARPER'S REPORT** **ON EXPLORATIONS**

The Fifty-first Annual General Meeting of the Burmah Oil Company, Limited will be held on 3rd July in the Merchants Hall, 30 George Square, Glasgow.

The following statement to stockholders by the Chairman, Sir Kenneth B. Harper, has been circulated with the Report and Accounts for the year ended 31st December, 1952:—

Balance Sheet and Profit and Loss Account

The consolidated group trading profit for 1952 was £5,464,672, which compares with the record figure of £7,490,551 in the previous year. 1952 was a year of considerable economic adjustment in the areas where your Company's main trading interests lie. The sharp recession in commodity values which set in during May and June had an adverse effect on trading conditions generally and was felt by our trading Subsidiaries, especially in India, their largest market. This, together with a substantial decrease in world values of wax, extensive development operations in the Digboi Field area in Assam and a comprehensive programme of exploration in India and Pakistan, are the factors contributing to the fall in trading profits of £2,015,879.

The income from interest, dividends and transfer fees during the year amounted to £3,309,861 (£3,228,617 in 1951) making a total of £8,774,533, from which £2.5 to be deducted £36,825 for Directors' emoluments and £1,081,815 for depreciation on the Group's fixed assets. After making full provision of £4,741,422 for U.K. and overseas taxation, and writing off £42,633, the expenses in connection with the increase of capital, the consolidated net revenue of the Group becomes £2,871,838, against £3,360,991 in 1951.

To this net revenue is added £586,981 brought forward from 1951 and out of this sum of £3,458,819 the Board has appropriated £1,018,257 to General Reserve, leaving for disposal £2,440,562.

The Board now recommend a final dividend on the Ordinary Stock of 12½ pence, which, with the interim dividend of 2½ pence, paid on 5th December, 1952, makes a total of 15 pence for the year.

After allowing for the amounts paid and now recommended for net dividends on Preference and Ordinary Stocks the balance to be carried forward to 1953 is £596,047.

No liability in respect of the Excess Profits Levy is likely to arise on the year's results. Taxation in India has increased but the Company has benefited from the increase from 75 to 100 per cent, in unilateral relief now granted in the United Kingdom, under the 1953 Finance Bill, for overseas taxation on Indian and Pakistan profits.

Turning to the Parent Company's Balance Sheet, the main change is the increase of £1,124,937 under the heading of Trade Investments and the realisation of £6,000,000 of Government Securities, with a corresponding increase in Advances to Subsidiary Companies to meet their financial requirements.

The increase in Trade Investments represents your Company's share of the increase in capital of the Burmah-Shell Oil Storage & Distributing Companies of India and Pakistan required to finance the programmes which these Associated Companies have in hand for the expansion of their storage, distributing and marketing facilities. As you are aware your marketing interests in India and Pakistan are in the main taken care of by these Associates.

The employment of Advances to Subsidiary Companies is reflected in the Group's Consolidated Balance Sheet by increase in fixed assets and in the oilfield and refinery stores and equipment, and a considerable reduction in creditors, mainly in respect of outstanding liabilities for overseas taxation now agreed and settled.

Additions to the Tanker Fleet and to the Assam Oil Company's share of the increase in capital of the Burmah-Shell Oil Storage & Distributing Companies of India and Pakistan required to finance the programmes which these Associated Companies have in hand for the expansion of their storage, distributing and marketing facilities. As you are aware your marketing interests in India and Pakistan are in the main taken care of by these Associates.

The increase in Capital Reserve is due to certain capital receipts of which the chief is your Company's share of the £700,000 eventually agreed with His Majesty's Government in settlement of the guarantee, referred to in my statement on the 1949 Accounts, up to the date of its termination on 31st January, 1950.

The excess of the Group's Current Assets over Current Liabilities at 31st December, 1952, remains much the same as at the end of 1951, just over £19,000,000.

Burma

Last year I expressed the opinion that there was little evidence of progress in restoring stability in Burma and I am glad to be able to record a noticeable improvement in the past twelve months. This has taken the form of consolidation of the parts of the country under the control of the Government and a slackening of organised attacks by insurgents elsewhere. Road and rail transport are still liable to frequent interruption and road travel is dangerous even in places quite close to the Chauli Oilfield where our Burma Concessions Company is operating.

Exploration

In these conditions prospecting was still impossible in Burma but in India and Pakistan good progress was made. The test well at Sui in Baluchistan, though finding no oil, was successful in discovering what promises to be a major natural gas field. To seek confirmation of this a second well began drilling just before the end of the year and has since been successfully completed. This gas seems likely to be of great importance to Pakistan's economy and in discussions with the Pakistan authorities on its utilization have begun.

A test well at Chak Naurang in the Punjab found oil but unfortunately of poor quality and in emulsion with water. It is not possible to say yet whether this further discovery will be of value.

At Nahorkatiya a deep well to test the possibility of a big extension westwards of the Digboi Field had reached 7,357 feet by the end of the year. Since then there have been some signs of oil but it is too early yet to say whether this development will be of commercial value.

Pakistan Petroleum Ltd., the public Rupee Company which, as I reported to you two years ago,

was incorporated in Pakistan to qualify for further concessions under the Pakistan Government's Petroleum Rules, and in which we now have a 99 per cent. shareholding, took over, as from 1st July, 1952, the assets and activities of our Pakistan Concessions Company.

Marketing

Production from the Group's oilfields in Burma, Assam and the Punjab contributed 26 per cent. of the total requirements of our Marketing Companies, the balance being imported from the Persian Gulf (although no longer from Abadan) by Indomine-Curacao and other sources. Although our trading increased satisfactorily in Assam and East Pakistan it fell short of expectations in the rest of India and Pakistan for the reason I have mentioned, the overall increase over the previous year being less than 2 per cent. This is a much smaller increase than we have experienced each year since the War ended. Towards the end of 1952 there were signs that the recession earlier in the year was passing. Trading conditions have been settling down and a steady if slight improvement in the volume of our trade during recent months has become apparent.

Industrial Relations

A matter of constant concern to the managements of our operating Companies is their relations with their employees. Burma and India, as I have mentioned in previous years, industrial relations are bedevilled by the existence of compulsory adjudication to which the Governments almost automatically refer any dispute that arises. The inevitable result is a flow of claims on which no real attempt is made to negotiate because there is a better chance of getting something out of the Industrial Courts. In Pakistan it appears to be the policy to avoid adjudication and to encourage negotiation. Our experience in 1952 has been that whereas our operating Companies were hardly ever out of Industrial Courts either in Burma or India or both, in Pakistan the only dispute which arose was settled to both parties' satisfaction by negotiation, since when relations have been excellent.

Joint Venture in Burma

I told you last year that plans for a Joint Venture between the Government and the Oil industry in Burma had progressed to the point where a draft Agreement had been initially subject only to acceptance by the Union Government of the valuation of £15 million which was put on the undertakings concerned. After a survey of the assets by a Commission appointed for the purpose the Government accepted our valuation, but progress was then held up by a reference to the Supreme Court in Burma regarding the validity under the Constitution of Burma of the proposed Joint Venture to proceed. The Supreme Court's ruling was favourable, and we are informed that negotiations to finalise the Joint Venture will soon be resumed.

Tankers

The first of our new tankers, the "Burmah Emerald," was launched in May last year and has now been eight months in service and is proving a fine ship.

An order was placed in December, 1952, for a 31,000 ton tanker which will be employed in supplying the Bombay Refinery with crude oil.

A slackening in the world demand for petroleum products coming at a time when the deadweight tonnage of the world's tanker fleets was being increased by some 9 per cent. resulted, towards the end of the year, in a substantial fall in tanker freights which has continued into the current year. After a period of adjustment, including the scrapping of old vessels, one would expect tanker freights to harden to something above today's levels.

Staff

Once again it is a pleasure to put on record the Board's appreciation of the good work of the Managements and Staffs of your Companies both at home and overseas.

HINDUSTHAN CO-OPERATIVE **INSURANCE SOCIETY LTD.**

KUMAR K. C. MULLICK REVIEWS **A YEAR'S PROGRESS**

At the 46th Annual General Meeting of the Society Kumar K. C. Mullick referred to the death of Sri N. R. Sarker on the 25th January, 1953, on the very day the opening ceremony of his marble statue was performed in the Hindusthan Buildings. The Chairman said, "Sri Sarker truly be called the architect of the Society who guided for over thirty years the affairs of the Society with the highest skill and business acumen. For all these years, in whichever other sphere of life he might be working—the benefit of his wise counsel and mature wisdom was always available to us. It, therefore, leaves a great void in the lives of all of us, who had known him so intimately for so many years as also in the counsels of Hindusthan, which it will be difficult to fill."

Continuing the Chairman said, "The year 1952 has been a very trying year for all who are in the business line and particularly for us, life insurance companies. Our operations are vitally connected with the prosperity of the general masses and anything which affects that adversely must also similarly affect us. In the beginning of the year, when there was a slump in whole-sale prices which started in February and continued unabated till May, from 433 in December 1951 the whole-sale price index fell to 415 in February and to 367 in May. Thenceforward, the index fluctuated around this figure and in December 1952 it stood at 372. The effect on trade and commerce of such drastic fall can easily be imagined and we found that such drastic fall had affected specially those classes of traders and merchants who are good prospects for life insurance. Throughout the year, at different points of time, three major industries of the country—Jute, Textiles and Tea—remained depressed. The Society which does very good business in Bengal and Assam and the neighbouring areas was naturally hard hit by the depression in these areas is largely bound up with the prosperity of these industries. All this had made the task of business procurement much more difficult, but by the grace of Almighty and strenuous efforts of our office and field workers we have been able to maintain its progress.

The new business completed during the year under review amounted to Rs. 16 crores 38 lakhs. Though this means an improvement over the previous year's figure, yet, in our view, the improvement is not in line with the expected usual progressive tradition of Hindusthan. We, however, hope that as economic conditions in the country improve, we shall be able to accelerate the pace of progress as recorded by us in the past.

The total premium-income, during the year under review, in respect of life insurance business amounted to Rs. 3,94,04,504/- which shows an increase of Rs. 2,19,233/- over the 1951 figure. Income from Interest, Dividends and Rents including profits on landed properties in respect of life insurance business amounted to Rs. 61,83,011/- . The rate of interest worked out at 3.37 per cent after deducting income-tax at source. The life assurance fund, at the end of the year, amounted to Rs. 19,72,50,871/- recording an increase over 1951 by Rs. 2,11,33,632/- . The major heads of investments of the fund were: (i) Government & Approved Securities Rs. 12,65,49,465/-; (ii) Debentures, Stocks & Shares Rs. 1,61,65,531/-; (iii) Loans to Policyholders Rs. 1,44,39,922/-; (iv) Mortgage Rs. 2,30,37,791/- and (v) Land & Houses Rs. 2,10,12,659/-.

Government and approved securities represent 62.5 per cent of adjusted liabilities.

During the year under review claims by maturity, inclusive of bonus, amounted to Rs. 37,91,138/- and by death, inclusive of bonus, to Rs. 30,71,708/-.

Since the passing of the Insurance Amendment Act in 1950 providing a ceiling on the expense ratios of life insurers, the question of expense ratio occupies a pre-eminent place in the minds of all who are connected with the insurance business. The situation has been rendered rather difficult for the insurers because of the fact that just when the limit was imposed on them, circumstances have been compelling them to incur substantial larger outlay on many items included in the expenses of management. So far as Hindusthan is concerned, fortunately we have been able to keep our expenses within limits—the renewal expense ratio in respect of the Society's business in India in the year under review worked out at 14.71 per cent as against 14.89 per cent of the year previous. The overall expenses for the year have been 27.60 per cent as against 27.90 per cent of the year previous."

Speaking on the prospect of future growth of Life Insurance, he said, "In our view there is going to be unlimited scope for growth in future for life insurance companies run on sound scientific lines. The Five-Year Plan, when completed, is estimated to effect an increase of 11 per cent in the national income which must surely be of great advantage for us to our clients. Insurance companies have a great part to play in providing finance for the Plan and I may take well-deserved pride in stating that they are already playing their role in a satisfactory manner. As of the life insurers is being invested in Government and approved securities, and, as has been stated by me earlier, this percentage for Hindusthan comes to 62.5%, which is very much higher than the limit prescribed by the Government. Apart from this, the land development schemes under the plan, which are also works of major national importance, in this context, it is really disquieting to us to see references lightly made to nationalisation of insurance on the assumption that if insurance is run by Government that would be conducive to larger national interests. When we consider the question of nationalisation, we must not lose sight of the fact that under State management the degree of initiative and enterprise which is essential in the insurance business, may not be forthcoming. I do not exactly see what would be gained in the way of better safeguarding of the interests of policyholders by putting life insurance under State management. Already the degree and extent of control and supervision, exercised under law, over various aspects of a life insurance company's working, such as, investments, expenses, etc., are so much that we would perhaps be justified in stating that insurance is already semi-nationalised, as Government has taken large control over the life insurance companies' workings.

Difficulties that the insurers have to face are manifold. In respect of many of the difficulties, redress can come about only gradually; but there are some in respect of which Government can come to our help in a more direct manner. I have in mind the question of income-tax of insurance companies which has been a hardy annual for us all. The Income-tax Investigation Committee had recommended that life insurance companies would get an exemption of 80% of the amounts paid to or reserved for or expended on behalf of the policyholders from the surplus. This Income-tax Act, and when given effect to, will, in the sure considerable relief to us. In the Estate Duty Bill, life insurance policies have not been given exemption, which is their due. In a country like India, where insurance habit is still to grow to its fullest extent, would it not be natural for us to expect that the Government should do everything possible to encourage the habit of thrift involved in the taking out of insurance policies instead of making legislations which will have, to say the least, detrimental effect on the growth of insurance habits? In India each man is left to himself to provide for his dependants against destitution and poverty through loss of income on account of his death. Life Insurance, at the present moment, provides the only scope for ensuring the security of the common man. By taxing the proceeds of life insurance policies, Government will be doing something which, in our view, it has not a time as it can provide such schemes of social security as obtain in other countries.

You will be pleased to know that our Jamshedpur Building is complete and last month we performed the opening ceremony. Sir Jehangir Chandy, President of Tata Iron & Steel Company Ltd., presided over the opening ceremony. We have in hand of the country and we expect that at least the Gauhati building will be completed also within this year. Shareholders' Position—The position of Shareholders continues to be satisfactory and a dividend of 10 per cent free of income-tax is being recommended for payment to the holders of Ordinary Shares in proportion to capital paid up."

Stocks and Shares

SOME SMALL LOSSES IN RESTRICTED **SHARE TRADING**

BUYERS APPEAR IN GILT-EDGED: PROFIT-TAKING IN TEA: **IRONS WEAK ON RUMOURS OF LABOUR TROUBLE**

Wednesday Evening.

THE turnover in the Calcutta stock market has been very restricted this week and prices have been steady or a shade easier. Indian Irons moved narrowly around Rs. 25-3 most of the week, until this afternoon, when on rumours (mostly exaggerated) that the prolonged labour trouble at Burnpur had taken an unfavourable turn, Irons dropped from Rs. 25-4 to Rs. 24-14. Tea shares have continued to be in demand but buyers are now more cautious in view of the recent rise. Jute shares have been steady to better in sympathy with the finished goods markets. Coal shares are still neglected. Angelo Brothers have been sought after following the improvement in shellac. There have been rumours of a bonus issue in Chitavalah and Nellimarla jutes, so far without confirmation.

The Standard Vacuum issue of Rs. 4 crores of 5½ percent debentures has been fully subscribed, as was expected.

The gilt-edged market ruled quiet throughout the week and prices were marked down further. Towards the close a slightly better feeling was noticeable and buyers appeared where before there had been only sellers. This was attributed to the re-entry of the Reserve Bank in the market as a buyer of 3½ Loan 1957 and 3½ Loan 1958 against longer dated securities. Three percent Conversion Loan met with selling pressure to decline from Rs. 82-6 to Rs. 81-14, at which rate buyers appeared, and the price recovered at the close to Rs. 82-1. Three percent Old Paper was marked down from Rs. 82-8 to Rs. 82-4.

In short-dated securities, 2½ Loan 1954 was steady at Rs. 98-9, but 2½ Loan 1955 was on offer at Rs. 98-6. Three percent Loan 1957 and 3½ Loan 1958 receded further to Rs. 98-3 and Rs. 98-1, but both loans steadied at these levels on official support. In the medium-dated section, 3½ Loan 1964 recorded a sharp fall from Rs. 92-14 cum-voucher to Rs. 92-5 ex-voucher, while 3½ Loan 1959-61 and 3½ Loan 1963-65 were also easier at Rs. 96-2 and Rs. 92-7 respectively. Four percent 1960-70 was a shade lower at Rs. 102-6 and 2½ 1961 and 2½ 1962 were on offer at Rs. 90-10 and 91-10, without attracting buyers. Among long-dated, 3½ 1968-69 recorded a loss of 5 annas at Rs. 90-2, and 2½ 1970-75 was easier at Rs. 86-8. In the provincial section, 3½ United Provinces 1960 and 3½ United Provinces 1961-66 were enquired for at Rs. 94-4 and Rs. 90-8, but little interest was shown in other State issues.

In the absence of sellers, very little business was reported in preference shares. In jutes, Northbrook were quoted at Rs. 96, and Auckland 2nd were taken at Rs. 76. Soorah were slightly better at Rs. 107 cum-dividend and Reliance were crossed at Rs. 117 ex-dividend. Among miscellaneous scrips, Dalmia Cement Fully-Paid, after being recorded at Rs. 74-4, were asked for up to Rs. 76-8, and the Contributors were steady at Rs. 76. Burn & Company 6½ were done at Rs. 117, and Dunlop 1st were marked at Rs. 130. Indian Aluminium came to hand at Rs. 75, and India General Navigation were a shade better at Rs. 79-8. Bharat Collieries were placed at Rs. 49-4, Karanpura Collieries at Rs. 85, and Burrakur 2nd at Rs. 8-8 ex-dividend. New Victoria were dealt in at Rs. 3-12, and a small parcel of Humayan Properties changed hands at Rs. 11.

In the Banking section, Imperial Bank Fully-Paid and Contributors were quoted at around Rs. 1,845 and Rs. 450 respectively. There were small buyers of United Commercial at Rs. 35-10 and United Banks were steady at Rs. 3-14.

After a considerable lapse of time, business was reported in Arrah-Sasaram at Rs. 76, and Howrah-Amra at Rs. 70-8, at which rates there were further buyers.

Cotton shares were a dull market. Benares were a shade easier at Rs. 2-10, and New Victoria shed an anna at Re. 1-5. Kesoram were steady at Rs. 19-8 and Dunbar recorded a small rise to Rs. 193. Bengal Nagpur and Bowreah were crossed at Rs. 14-10 and Rs. 284 respectively.

Little interest was shown in coal shares, and business in this section was restricted. Bengal met with some support at Rs. 537, and both Amalgamated and Pench Valley had buyers at Rs. 21. Rewa improved to Rs. 21-10, and Standard were marked at Rs. 19-9. New Beerboom changed hands at Rs. 20-1, and Bengal Nagpur were placed at Rs. 14-4. Burrakur were quiet at Rs. 10-2 ex-dividend, and East Indian were a shade easier at Rs. 24. As a result of the announcement that the dividend for the half-year ended 31-12-52 had been passed, Dhemo Main turned sellers and registered a loss of 12 annas at Rs. 10-4. In small-priced scrips, Central India and Western Bengal moved around Rs. 5, while Talcher were taken up to Rs. 2-15. Churulia were marked at Rs. 2-10 and Bharat were placed at Rs. 5-15.

The enquiry for selected jute shares continued throughout the week, and prices have been maintained. Reliance fluctuated narrowly around

Rs. 16-1, and Howrah after being quoted at Rs. 24-8 throughout the week, closed easier at Rs. 24-6. Alliance were marked at Rs. 161-8, Auckland at Rs. 132 and Champdany at Rs. 159-8. Barnagore were taken up to Rs. 163, and Birla were quoted at Rs. 39-6. Bally were dealt in between Rs. 174 and Rs. 176, and Kamarhaty "A" and Kankarnarrah "B" were placed at Rs. 193 and Rs. 147. Megna were done at Rs. 107, and India changed hands at Rs. 135. Orient were placed at Rs. 181, and Nuddea were marked at Rs. 49-8. Empire came to hand at Rs. 20-12, and National were taken at around Rs. 25. Among small-priced scrips, Presidency were recorded at Rs. 5, and Waverley at Rs. 6, and Rameshwara were dealt in between Rs. 5-12 and Rs. 6.

Very little business was recorded in electric supply shares. Shahjahanpur came to hand at Rs. 7-8, and Patna were crossed at Rs. 11. Agras were asked for at around Rs. 159, and there were buyers of Jubulpore at around Rs. 13-12. Calcutta Electrics were dealt in between Rs. 14-5 cum-dividend and Rs. 13-14 ex-dividend.

Steady conditions prevailed in the sugar section throughout the week, but on balance prices finished below the highest. Belsund were steady at around Rs. 8-6, and Balrampur were placed at Rs. 7-15. Darbhanga were quoted unchanged at Rs. 10-15, and Carews moved around Rs. 6-12. Ramguggers were done at Rs. 18-3, but United Provinces were a shade easier at Rs. 17-6 to close at Rs. 16 ex-dividend. Cawnpore were fully steady at Rs. 33-8, while Champaran also had buyers up to Rs. 25-2.

In the absence of any stimulating news, Indian Iron & Steel fluctuated narrowly around Rs. 25-4 most of the week, but at the close bears took advantage of the rumours of a strike at Burnpur, to mark the price down to Rs. 24-14. Among other engineering scrip, Arthur Butler were enquired for at Rs. 5, while Indian Galvanizing New and Old had buyers at around Rs. 14 and Rs. 13-3 respectively. Indian Steel & Wire Ordinary changed hands at Rs. 61, and Jessops were maintained at Rs. 26-2. Kumardhubi Engineering turned sellers and the price was marked down from Rs. 8-2 to Rs. 7-13. Marshalls were also easier at around Rs. 5-8.

There were no special features in the miscellaneous section but the undertone was steady. In paper, Shree Gopal met with investment support at Rs. 19-9, and Star were asked for at Rs. 8-8. Titagur were down to Rs. 35-12, and Orient were on offer at Rs. 34. Cement shares were, on the whole, easier. Assam Bengal Cement were quoted at Rs. 4-2, Dalmia at Rs. 6-4, and Sone Valley at around Rs. 7-10. In insurance, Ruby General were dealt in at Rs. 5, and New Asiatic were marked at Rs. 4-7. Hercules and Triton were also enquired for at Rs. 29 and Rs. 162 respectively, but sellers were reserved in shipping, India General Navigation were unchanged at Rs. 91, but India Steamship were slightly better at Rs. 6-9. Among other industrials, Indian Cables recorded a small rise at Rs. 19-4, and Calcutta Tramways were also taken higher to Rs. 15-12. Birds Investments were

CURES HEADACHE
Manufactured by:

proposed to start a company, known as the Bharat Electronics Industry, the capital for which will be fully provided by the Government of India. The Company will have a Board of Directors consisting of official and non-official members. The factory will be situated at Bangalore in the Talahalli area. The sum of factors after carefully considering a number of factors such as dust-free atmosphere, temperate climate, availability of skilled labour, training, cost of building construction, availability of raw materials, transportation, proximity to other industrial undertakings of which advantage could be taken, availability of essential supplies such as electricity, water, etc., and security. The company will produce radio and radar equipment of all types, including transmitters, receivers (excluding those intended for broadcast and television reception), trans-receivers, amplifiers and ancillary equipment required

The Central Labour Ministry proposes to introduce during the autumn session of Parliament the Industrial Relations Bill and the Fair Wages Bill, both of which lapsed after the last general election. A fair measure of agreement has now been reached on the Industrial Relations Bill. The Minimum Wages Act, it is explained, is intended to cover unorganised industries and lay down wages below which a worker cannot be expected to sustain himself. Under the Fair Wages Bill, labour will have the right to have its wages assessed by an independent tribunal. The Railway Ministry proposes to bring in a Bill to amend the Railways Act, 1925, which will give the Railways the power to order to give legislative sanction to the prevailing conditions of service on railways. Hours of work and periods of rest, for example, are regulated by departmental rules at present. It is proposed to give legislative sanction to these rules. A Bill to implement the recommendations of the Banking Liquidation Inquiry Committee will be sponsored by the Ministry of Finance.

The Government considers that the rise in sugar prices during the past few weeks is unjustified and that the Government should take the following action with immediate effect:— (1) Fooding the important markets such as Bombay, Calcutta, Kanpur and Delhi, with sugar released from factories by arranging special trains for its movement. (2) Allotment of sugar from factories from their reserve stock at a statutory ex-factory price of Rs. 27 per maund to State Governments and other agencies for distribution through fair price shops. (3) As a supplement to the above measures, arrangements to import sugar from abroad to the extent necessary to defeat hoarding, if any, on this part of the trade. It is hoped that these measures will bring about a fall in prices. If they do not, the Government intends to take further measures such as licensing of dealers and stockists and requisitioning of sugar at controlled prices.

	1953	1952
Opening Stocks	894,405	875,696
Production	23,468	47,641
Despatches	61,315	45,736
Closing Stocks	856,558	877,601

The stock position is more comfortable than in 1952. Although production has declined, despatches from factories have risen. The reduction in the price of sugarcane from Re. 1-12 to Re. 1-5 a maund should have brought down the price of sugar by at least Rs. 4-6 a maund. The President of the Indian Sugar Mills' Association claimed some months ago that there was no shortage, which had led to the Government to buy the sugar, were it not for the Government's proposed to make all possible steps, including legislation for the positioning of stocks, in order to prevent the sort of man-made sugar famine that occurred in 1951.

COTTON MARKET COLLAPSES SUGAR ASSOCIATION SUSPENDS FORWARD BUSINESS

(FROM OUR OWN CORRESPONDENT).

14th June.

MORE than any other commodity—even sugar and oilseeds—cotton prices have been behaving in a bewildering manner during the last week. After a steep fall in the two preceding weeks, from about Rs.740 per candy to Rs. 668, they rallied by as much as Rs. 35 per candy at the beginning of last week, on the strength of small purchases by one or two buyers. The attention of the trade was then focussed on the meeting of the Cotton Advisory Board which took place last Friday and at which the whole policy of marketing cotton in the 1953-54 season was reviewed. Curiously enough, after the Advisory Board had arrived at certain conclusions on floors and ceilings for the three important counts for the next year, early permission to allow forward trading in the new crop and the issue of fresh quotas to mills to purchase Indian cotton during the coming months—conclusions which were as favourable as they could possibly have been—the forward market, after first registering its satisfaction at the recommendations by a rise of Rs.5 per candy, collapsed within half an hour and dropped by about 28 points.

The forward market was disturbed by rumours of a reduction in ceiling prices for the next year. It was also keen on securing permission from the Government to commence forward trading in the new crop. In spite of recommendations which favoured the continuance of the present floors and ceilings and suggesting an early opening of hedge trading in the new crop, virtual panic prevailed in the market at Kalbadevi and the lones threw their contracts on to an unwilling market. With the statistical position and the anticipated small carry-over of Indian cotton fully in favour of holders of stocks, this nervousness on the part of the bulls in forward trading only goes to show the complete lack of correlation between spot and forward markets in India. It is feared here that this disharmony between the two sections of the cotton trade in Western India might induce the authorities to reconsider their decision

to allow forward trading, which was permitted last year to aid the industry and spot traders.

The position of sugar is also very curious. The liberal release of 150,000 tons last week, instead of resulting in even a small reduction in prices which had soared previously, actually brought a further increase in spot prices. The reason for this extraordinary behaviour is stated to be the firmness of the forward market and the rush of sellers to buy spot sugar to meet their commitments in the forward market when the time came to deliver sugar against forward sales. For a week, this market has been in the grip of rumours concerning Government policy. The Sugar Association has suspended new forward business and operators are only allowed to square up their outstanding business. The really remarkable thing is that traders who have made large-scale purchases of sugar are disappointed with the Government's decision not to impose sugar control, because they had hoped that, in the face of rising prices, controls on distribution and marketing would open up profitable black markets in which to dispose of their holdings.

Scindia-B.S.N. Co. Merger

Practically all the formalities required by law for the merger of the Scindia Steam Navigation Co. and the Bombay Steam Navigation Co., have now been completed. Scindia debenture holders have agreed to the reorganisation scheme with certain modifications which have been accepted by the Board. The shareholders of B.S.N. Co. have also accepted the merger on condition that instead of 2.75 Scindia shares for one B.S.N. share, they should receive three. This has been accepted by the Board of Directors and the shareholders of Scindia Co. The latter have also approved the issue of additional shares required for this purpose, raising the authorised share capital of the Company from Rs. 6.75 crores to Rs. 7.20 crores by the creation of 300,000 new shares of Rs. 15 each, ranking pari passu with existing shares. It is now believed that the merger scheme will soon be sanctioned by the Bombay High Court.

Stores Purchase Committee

The Stores Purchase Committee, recently appointed by the Government of India, was here for two days last week. At the conclusion of its programme, Mr. S. N. Burghain, Deputy Minister for Works, Housing and Supply, explained at a Press conference that this official committee had been formed by the Government to study weaknesses in the Stores Purchase Department and to suggest ways to increase its efficiency. Mr. Burghain said that the Committee had issued a questionnaire to State Governments and various trade associations. Two regional stores purchasing committees, one for London and the other for Washington had also been formed under the chairmanship of Mr. C. Desai, I.C.S. and they would report to the main committee. Explaining the Government's stores purchase policy, the Deputy Minister stated that it was intended to stimulate the growth and development of indigenous industries and that 60 to 65 percent of such purchases were being made in this country. He added that it was also the policy of the Government to give preference to the products of small-scale and cottage industries. Mr. Burghain announced that in future the local availability of goods required would be ascertained before authorising the Director-General of Supplies to make enquiries abroad.

Maintaining Textile Exports

Mr. Shantilal Mangaldas, an Ahmedabad mill-owner and President of the Saurashtra Millowners Association, thinks that the Indian textile industry can reach and maintain cloth exports of 1,000 million yards a year. He said this at a meeting of the newly formed Indian Council for the Promotion of International Trade. To achieve this target and to maintain exports at that level, he thought it necessary that the Government should assist the cloth export trade by following a steady export policy and by levying the export duty at a reasonable level without frequent alterations. Mr. C. B. Parikh, who presided, asked businessmen to maintain high standards of quality and business integrity.

Textile Workers' Bonus Demand

The Rashtriya Mill Mazdoor Sangh (Congress), as the representative union for textile workers in Bombay, has issued a memorandum to the management of all the cotton mills and to the Millowners' Association asking for an "adequate and unconditional" bonus for the year 1952 for all was very profitable for the owners and demanding that the bonus should be paid soon and in the amount or mentioned any basis for calculating this preliminary step in a long drawn-out struggle which will terminate only with a tribunal's award.

The Government of New Zealand has liberalised its import policy for the year 1954, and 15 commodities will be released from the necessity of obtaining allocations of export licence. Among these the following are of special interest: Tea; Cornsacks; Wouppacks and wool-pockets; tubular woven or knitted cotton cloth specially suited for use as fasteners; handkerchiefs or caps; tobacco, unmanufactured; tobacco, manufactured; tobacco, manufactured for manufacturing purposes only; fresh fruits; (2) into cigars; (3) into cigarettes, or snuff, music, or advertising matter.

London

VALUE OF PRIME MINISTERS' CONFERENCE ANOMALIES OF PURCHASE TAX TO BE INVESTIGATED

(FROM OUR OWN CORRESPONDENT).

11th June.

AS expected, the final communiqué summing up the achievements of the Commonwealth Prime Ministers' discussions was a carefully guarded statement which, although it emphasised the unanimity of opinion reached—which is probably sufficient achievement in itself—gave little or no details of the actual policies which are to be followed in future. Sir Winston Churchill's hand has undoubtedly been strengthened for the Bermuda talks by the support accorded to the idea that the time is ripe for a high-level conference with the Russians, while the possibility of a favourable outcome in the Suez Canal dispute is at least increased by the fact that all the Commonwealth nations, not excluding India and Pakistan whose influence may be decisive, support Britain's case that the "effective maintenance" of the military installations there is a matter of international importance. The economic situation occupied only a part of the last day's discussions, with Mr. Butler in the chair during Sir Winston's absence in the House of Commons where he was answering questions on Korea, and it is understandable that the communiqué says little more than that the long-term plan devised last December for liberating trade and currencies continued to represent the overall policy of the sterling area. It is evident, however, even in the communiqué, that the prospects are less bright than they were last December and that there may well be a long interval before there was a sufficient change in American policy to make the realisation of that plan possible.

Nevertheless, it is possible to disclose that the economic discussions were not quite without value. Mr. Butler's review was cautious, but not without hope. More satisfying was the exchange of information regarding the internal financial policies pursued by each of the countries recently and it was evident that these had gone a long way towards achieving their objectives. Pending the final formulation of American import policies, which it is hoped will be along the lines of liberalisation, and the receipt of some assurance of adequate financial support, the idea of convertibility of sterling has been placed in cold storage. Instead, the emphasis is to be switched to making arrangements for increasing capital investment in the Commonwealth, either through the International Bank or the Commonwealth Finance Corporation, especially for projects which would contribute to the balance of payments problem. Mr. Havenga, the South African Finance Minister, who replaced Mr. Malan when the latter left for Holland, is believed to have raised the question of an increase in the price of gold, and the issue will no doubt be raised with the United States again when opportunity offers, though with the free market and controlled U.S. purchase prices within some 5 percent of each other at the moment, the importance of the matter is less immediate than it was a short while back. No precise decisions were taken, but the general trend of the views held appears to have been that as a sort of preparation of the ground for the long-term plan trade barriers in the non-dollar world should be eased so as to encourage expansion here while continuing to exercise the utmost care until regarding purchases from the dollar area until an adequate reserve has been built up. The progressive removal of the restrictions on trade within the sterling area and Commonwealth which were imposed last year may be expected soon, as well as an expansion of trade with Europe.

As important as the larger discussions, and in many cases, indeed, even more important have been the personal discussions outside the conference which almost all the Prime Ministers have indulged in over the past few weeks. Not the least interesting of these have been the meetings of Pandit Nehru and Mr. Mahomed Ali. To the usefulness of these talks both Prime Ministers have made public acknowledgement. They have certainly advanced the prospects of a comprehensive solution to the many problems which have served to bedevil Indo-Pakistan relations since partition. As Mr. Mahomed Ali pointed out in a broadcast to the British people, friendly accord between the two nations would not only ensure peace in Asia, it would also help towards world peace, and undoubtedly solve their respective economic difficulties.

As an appendage to these discussions comes the news that the Commonwealth Development Finance Company is now ready to start business. The company, which is accommodated for the present at 14, George Street, Mansion House, London, E.C.4, where communications may be addressed, has been incorporated with a nominal capital of £15 million and borrowing powers of double that amount. A call of 10 percent on the nominal amount has been made.

Progress of Finance Bill

The Committee stage of the Finance Bill created less of a stir in the House of Commons than was created by consideration of the affairs of Central Africa in connection with the Federation Bill and a statement by the Colonial Secretary on Kenya, both of which led to what are described as "incidents." The fight over the Finance Bill was expected to be a close thing, seeing that illness had

depleted the ranks of the Government supporters rather more than it had those of the Opposition. The first real test, however, which was on the question of a further reduction in the purchase tax on textiles, a line supported by the Liberals and having at least the sympathetic support of some Conservative backbenchers representing Lancashire constituencies, saw a Government majority of 18. That margin was more or less faithfully maintained thereafter as amendment followed amendment. Mr. Butler is again adopting an air of accommodation while sticking to his guns. He admitted that he was not an admirer of purchase tax, but it produced £300 million in revenue which could not be sacrificed in the interests of defence and the social services. Reform must therefore come by degrees (£60 million had been cut in the Budget) and meantime the Government had decided to look into anomalies created by the tax. One amendment of lesser import was accepted, another in the same category was promised consideration before the Report stage and was withdrawn. The battle will be resumed next week following a holiday on Monday for the Naval Review at Spithead.

National Savings Movement figures over the past few weeks have shown a steep fall in new savings, while the withdrawal of old savings has continued at a high but consistent figure. The deficit over the past fortnight was as much as £11½ million. Whitsuntide and Coronation spending may have accounted for this but some ten million workers have received tax rebates granted in the Budget in their wage packets this week, and though the sums may not be considerable individually, in total they amount to something like £10 million.

Iron and Steel Holding Agency

The names of the six men charged with the task of reselling the iron and steel industry to private investors have been announced, and once again the selection has been a good one. Sir John Morison, a leading chartered accountant who has been advising the Government on this subject for the past year is to be Chairman of the Iron and Steel Holding and Realisation Agency, with Sir John Green, a steel man himself who was chairman of the Iron and Steel Corporation, the nationalised body, as his Vice-Chairman. The four Members are Mr. A. C. Bull, a retired senior official of the Bank of England, Sir Thomas Chadwick, who until a month ago was Accountant of the Treasury, Sir Oliver Franks, recently British Ambassador in Washington and chairman-designate of Lloyds Bank, and Mr. C. P. L. Whishaw, a solicitor. Their task is not going to

be easy and it may well be a protracted one, but they will be assisted by the wealth of experience upon which they can draw as a team as well as by the fact that the industry continues to set up new high levels of production from month to month. In May steel production rose to an annual output rate of 18,236,000 tons and that of pig iron was 11,165,000 tons compared with 16,245,000 tons and 10,456,000 tons in May, 1952.

At the same time, the position of the trades union representatives on the Iron and Steel Board appears to have worked itself out, though the controversy will certainly continue and may have repercussions elsewhere. Sir Lincoln Evans has hit back hard at the critics of his and his colleagues' acceptance of these appointments, while Mr. J. Owen has resigned his general secretaryship of the National Union of Blast Furnacemen to serve on the Board when presented with the necessity of making a choice between the two by the Executive Committee. The hollowness of the criticisms, and the party-political bias of the critics is neatly established by the *Manchester Guardian*, which deplores the Communist-Bevanite inspired "victimisation" of men who are doing a job approved by their own unions and in full accord with T. U. C. policy.

Brevities

Coronation Day cost Britain about a million tons in lost coal output, and for the first 22 weeks of this year total output was 58,000 tons below that of the same period of 1952.

The lending powers of the National Film Finance Corporation, which advances Government money to aid British film production, are to be extended for a further three years from next March, when the present legislation is due to expire.

On 11th July Mr. Attlee is to inaugurate the British-Asian Socialist Fellowship at Beaver Hall, Garlick Hill, London. The decision to form the fellowship—which will aim at promoting contacts between British and Asian Socialists and provide for the exchange of visits and information—was taken by the Labour Party's National Executive Committee.

Although maintaining the usual 10 percent dividend, both trading and net profits of Whiteaway, Laidlaw and Company for last year show declines, the latter one of over 50 percent. Difficult trading conditions in Argentina and the recession in Eastern trade during the second half of the year are given as the reasons. It is announced that it has been decided to close down the Bombay business.

International EXHIBITION ON LOW-COST HOUSING NEW DELHI JANUARY 20 — MARCH 5, 1954

The problem of low-cost housing can be met by developing and utilising indigenous building materials by better designs and specifications and by improving the technique of construction. In order to provide a forum for the demonstration of such attempts an Exhibition on Low-cost Housing will be

held in New Delhi during January-March, 1954, in which foreign countries will also participate. The Exhibition is divided into different sections—Model Houses, Building Materials, Construction Technique, Tools and Light Machinery, Heavy Machinery, Domestic Services, Town Planning, Miscellaneous.

For detailed information, intending Exhibitors and firms who wish to advertise their goods may write to Director, International Housing Exhibition, Ministry of Works, Housing and Supply, 'P' Block, New Delhi, for a copy of the 'Prospectus and Guide'.

Enquiries relating to bookings in the Amusement Park of the Exhibition should be sent in early to the Director.

Issued by the Ministry of Works, Housing and Supply, Govt. of India, New Delhi.

STATE EDUCATION SCHEME
FINANCIAL AID FROM CENTRE
(FROM OUR OWN CORRESPONDENT).

14th June. THE State Government has just introduced in the rural areas a modified scheme of elementary education which has come in for severe criticism. The features of this controversial scheme are: the burden of long hours of work will be reduced; pupils will have one half of each day free to remain with their families and participate in work in and outside the house; for the children of families who do not do manual work arrangements will be made for work for them in the village or in the school; arrangements will be made for organised social work by the pupils; wherever possible a village school committee will be constituted. There will, however, be no reduction in the time allotted for the study of languages, elementary mathematics, history, geography, hygiene, and civics and moral instruction.

In 1951, there were 7,980,000 children of the age group six to 12. Of these only 4,070,000 were at school. There were in all 38,040 schools, of which 6,256 were in urban areas with 1,090,000 pupils and 45,440 teachers. The schools in the rural areas, on the other hand, had just 92,163 teachers. According to a departmental enquiry in 1952-53 there were 26,681 schools in rural areas with 1,680,000 boys and 690,000 girls. For the girls no special arrangements are being made as they will occupy themselves in their houses. Of the boys, 1,490,000 belong to occupational families and only 190,000 to non-occupational families. All the boys in 15,800 schools belong to occupational families and are to work with their families. Arrangements have to be made in 10,870 schools to provide work for a certain number of boys who do not belong to occupational families. For 10,820 schools (out of the above 10,870) there are 26,920 farmers and 18,900 craftsmen available who are willing to help in the successful working of the scheme.

Mr. C. Rajagopalachari, Chief Minister, who has inspired the new system thinks that it will make history. As the schools will work in two shifts of three hours each, it is just possible that more children will be enrolled for elementary education. While the new scheme has the advantage of extending education to a larger number of children with the present resources in men, money and materials, it will undoubtedly subject the poorly-paid teachers to further hardship as they will teach academic subjects alone for six hours a day instead of the present 3½ hours a day. Although there is no guarantee of increased emoluments for the teachers, the Government is likely to consider their case with sympathy.

Andhra Capital

Andhra members of the Madras Assembly recently met in a special session convened by the Speaker and chose Kurnool, a district headquarters town in Rayalaseema, as the temporary capital of the new State. Communists, supported by a few Praja Socialists and Independents wanted Vijayawada: their amendment, however, was rejected by 79 votes to 53. The voting revealed that the Congress, Praja Socialists and Krishak Lok Parties will pull together and form a coalition government when the new State is formed. The choice of Kurnool was ostensibly meant to satisfy the wishes of Rayalaseema. Andhras: the real reason was that the Congress Party had its main support in Rayalaseema and was in a minority in

the Cincir Districts. Kurnool has few large buildings which means that the Government of India will have to give extra financial help.

Mr. Deshmukh's Visit

Mr. C. D. Deshmukh, Union Finance Minister, said here that he was quite satisfied with the result of the first issue of National Plan Bonds. He regarded it as a very good response especially as money was not plentiful this year. In all these cash-cum-conversion operations, he said, the bulk of the amount would naturally be in conversion. But he did not expect that any substantial payment would have to be made by way of cash redemption, although the total of the loan was a very large one. Regarding payment of compensation to the airlines, which have been nationalised, the Finance Minister said that it would have to be paid partly in cash and the rest in five-year bonds. He expected that compensation would be completed in a month or two after nationalisation. The Finance Minister held discussions with the State Government on its financial requirements. The State Government was in difficulty, he said, because a part of its assets was locked up in rice and fertilisers. The aid offered by the Centre, in response to the State's request, up to a maximum of Rs. 10 crores, should be more than sufficient, he said, for any expenditure on relief and the immediate needs for the next five or six months. The Finance Minister gave an assurance that the aid that might be necessary in connection with ways and means would be discussed. He also indicated that possible aid would be considered for schemes including projects under the five year plan by way of short-term advances. But the assistance for famine relief, he said, would be given partly as loan and partly as grants. The State Government has been allotted by the Centre a sum of Rs. 40 lakhs for its local development works under the five year plan—schemes meant to draw forth local initiative and resources.

Tramways Dispute

The Government case against the Receiver and the former Commercial Manager of the Madras Electric Tramways was decided by the Chief Presidency Magistrate last week. According to the judgment, the accused were not guilty of any offence under Section 26 of the Industrial Disputes Act as there was no lock-out; but they were found guilty of offences under Section 31 of the Act for discharging men and thus altering the conditions of service without the permission of the Industrial Tribunal before whom a dispute was pending at the time. They were fined Rs. 500 each. Arguments in the new dispute referred to the Industrial Tribunal after the closure of the Tramways have been concluded, and the award is awaited. Meanwhile, peak-hour traffic in the city deserves to be cleared by more buses and lorry-buses pressed into emergency service.

Housing Scheme

Sardar Swaran Singh, Union Minister for Housing, appealed here to employers and co-operative societies of employees to take full advantage of the Government of India's housing scheme for industrial labour. They would receive, he said, 25 percent of the cost of building by way of subsidy from the Centre and 37½ percent by way of loans. If the State Government undertook to construct tenements, the Central subsidy would be up to 50 percent. The rest of the cost of the scheme would be advanced in the form of a loan repayable over 25 years.

Power Cut Reduction

An improvement in the storages in the hydro-electric reservoirs of the State has led to a reduction in the power cut to 25 percent.

Uttar Pradesh

WARNING TO THE SUGAR TRADE
DIRECTIVE TO TEXTILE MILLS
(FROM OUR OWN CORRESPONDENT).

Lucknow, 13th June. THE upward trend in sugar prices has not yet been halted by the Union Food Minister's warning to sugar traders that the Government proposed to requisition sugar stocks and sell them to consumers at a fixed retail rate. Mr. Kidwai told Pressmen in Naihi Tal that he did not, however, propose to re-introduce controls as in his view it would only benefit hoarders and black-marketeers. The theory of hoarding has been repudiated by the Indian Sugar Mills Association which attributes the rise in prices to the smuggling of stocks to "neighbouring" countries, meaning Pakistan. The rigidity of wagon allotments which prevents the transport of supplies quickly to areas where prices are rising is also blamed by the Association for the present situation. The total figures for the production and despatch of sugar for the season 1952-53 are reported to be 12,73,347 tons and 7,66,323 tons respectively compared with 13,35,755 and 5,74,584 tons for the corresponding period last year. It is thus evident that sugar movements outside the mills have been heavier than last year and the mystery remains as to the real destination of the sugar which has left the factories.

While making allowance for both smuggling and hoarding, Mr. Kidwai does not believe that they could have been large enough to reduce available supplies. Even at the present rate of production and consumption it is estimated that at least 1 lakh tons of sugar will have to be carried over to the next season and Mr. Kidwai has said that unless hoarders release their stocks there is bound to be a collapse of prices. Cane growers to clear off their arrears. A Government spokesman, however, has indicated that these arrears amount to only Rs. 30 lakhs as against Rs. 11.5 crores outstanding at the end of last year's crushing season. The growers allege that a new form of "exploitation" has grown up in several districts where well-to-do people are stated to be purchasing the payment slips of the growers at one-third of their face value.

The Government of Uttar Pradesh has issued a directive to Kanpur textile mills not to close down any machines or discharge any employees without the express permission of the Labour Commissioner. The order states: "No employer of any textile shall close down any of the machines working on rearrangement in any such machines or general mission in writing of Labour Commissioner or an officer authorised by him. No such concern shall, save with the express permission in writing of the Labour Commissioner or an officer nominated by him in this behalf, discharge, dismiss or otherwise remove from service any of its employees whether permanent, substitute or temporary working on effect of any change in the duties of any such employee." Eight mills have been mentioned in the schedule.

State Transport

The State Transport Ministry has announced that it does not propose to complete the nationalisation of road transport in the present phase of development. This decision has been taken on the consideration that the State's resources should not now be invested in projects in which private capital is already functioning or for which it is forthcoming. It is, however, proposed to invest Rs. 1 crore and Rs. 20 lakhs in equipping workshops and increasing the number of buses to 1,800 by 1955. There are at present 250 State-owned motor trucks engaged in goods transport, but no decision has been taken on the question of nationalising goods transport.

Housing Industrial Labour

The State Government has now finalised a Rs.2 crore housing plan for industrial labour and has submitted it to the Central Government for approval and financial aid. The scheme envisages the construction of 7,000 industrial workers' quarters in Kanpur, Agra, Ferozabad, Rampur and Hathras. This year another housing programme for the construction of 2,800 quarters for industrial labour in Kanpur and 600 for sweepers in the big municipal towns.

Grain Crop Competitions

A drive to make Uttar Pradesh the granary of India has been launched by the Government by introducing the Japanese method of cultivation in selected areas and by widening the scope of crop competitions. Already U.P. produces 45 percent of the overall wheat grown in this country. Nearly 70,000 cultivators participated in last year's crop competitions and efforts will now be made to encourage more to enter future competitions. Over 116,000 acres of land have been selected for paddy cultivation by the Japanese method.

Taxation and Profits

A meeting of the executive committee of the U. P. Chamber of Commerce considered a memorandum to the Taxation Inquiry Commission. The Committee thought that taxation should be related to profits only. The Committee also felt that controls have outlived their utility and stood as a positive hindrance to the free flow of trade and commerce. On the question of sales tax, the committee demanded uniformity in its incidence and administration.

HIGHER INTEREST RATES AND
INSURANCE FINANCEVALUATION RESULTS LIKELY TO
IMPROVE FURTHER

(By N. T. Raju)

ONE of the most important financial events of recent times was the increase of Bank Rate to 3½ percent in November 1951. The increase in Bank Rate and the simultaneous withdrawal of official support from the gilt-edged market caused a drop in gilt-edged prices. The abrupt shrinkage in capital values was embarrassing to such large holders of Government and approved securities as banking and life insurance companies. While this depreciation could eventually be recovered through higher interest rates, the preparation of balance sheets on the basis of market values meant that the entire depreciation had to be accepted immediately. Life companies could more or less overcome such a situation by valuing their liabilities, which are of a deferred nature, at a suitably higher rate of interest but the banks had no such advantage. Representations were therefore made to the Government regarding the hardship to which banks and life offices would be put in complying with the statutory requirements in showing assets at market values. Banks as a result were allowed to value their gilt-edged holdings at modified values. In respect of life offices, the Government felt that the increase in Bank Rate did not necessitate any special measures to alter the provisions regarding values of assets in balance sheets; however, regarding the rate of interest to be adopted in the valuations, it was decided that the Controller of Insurance would make a realistic approach consistent with current conditions.

The extent to which life offices suffered depreciation of assets in 1951 is shown in the last Insurance Year Book. The yields realised by the offices and depreciation in the last three years are shown below:

Year	Depreciation or Transfer to Invest- ment Reserve Funds (in lakhs of Rs.)	Percentage of (1) to (2)	Percentage of (1) to (3)	Rate of Interest Rea- lised (in %)
1949	130	0.8	5.7	3.05
1950	188	1.1	8.2	3.16
1951	600	3.3	26.9	3.30

The effect of depreciation in improving the interest yield was not fully reflected in 1951 since it was calculated on the mean Life Fund in which approximately only half the amount of depreciation in the year was allowed for. The other half will be allowed for in 1952 and will, independently of all the other factors, result in an increased yield of about 0.1 percent in that year.

The fall in prices in 1951 was not confined to Government and approved securities. Fixed interest industrial securities and to a lesser extent equities were also affected. Government and approved securities at the beginning of that year amounted to Rs. 128 crores out of the total assets of Rs. 226 crores of all India insurers, and were thus of overwhelming importance to life offices. The decline in industrial securities was further accentuated early in 1952 after the commodity price recession. But, as industrial securities held by Indian offices at the beginning of 1952 were only Rs. 35 crores, their effect on insurance finance may not have been considerable. The following are price indices towards the close of the last three years:

	1950	1951	1952
Govt. Securities	104.0	97.6	98.1
Prof. Shares	103.2	93.9	87.4
Ordinary Shares	214.0	202.9	173.2

The solvency of life offices is judged only by the periodical valuations which are made at least once in three years. Offices which were due to be valued at the end of 1951 had to face immediately the entire depreciation which occurred in the last 1½ months of that year. Others which could be valued later had the advantage of being in a position to recover part of the depreciation through higher interest earnings. In certain quarters, the opinion was expressed that depreciation would affect smaller companies adversely but there was no basis for this view because the amount of depreciation would be roughly in proportion to the assets; the capacity to withstand depreciation never depends on the size of the office.

Valuation Results

The valuations of companies as at the end of 1951 have now been published and it is interesting to examine the results and see how the depreciation has been dealt with. Forty-two offices were valued, of which 39 disclosed surpluses, 21 declared bonuses to policyholders and in the remaining cases the surplus was carried forward. Of the same 42 offices, only 33 had disclosed surpluses at their previous valuations and only 12 had declared bonuses to their policyholders. Twenty of these offices declared higher bonuses than at their preceding valuations and in only two cases where bonuses were declared at their preceding valuations were bonuses passed in 1951. In one case the previous bonuses were maintained. We may next analyse the valuations according to the rate of interest used:

Year	2½%	2½%	3%	3½%
1949	2	3	34	1
1950	6	22	19	5
1951	3	7	40	12

The valuations of the 42 offices as at end of 1951 included in the last Year Book, split up

according to the rate of interest used, compare as follows with their immediately preceding valuations:

	2½%	2½%	3%	3½%
1951 valuations	2	1	3	2
Immediately preceding valuations	7	4	22	1

The trend, though not very marked, is towards a higher rate of interest. Actually, of the 42 offices valued, in 17 cases a higher rate of interest was used than at the preceding valuation and in 20 cases the rate remained unaltered. Of the 17 valuations at a higher rate of interest, ten resulted in larger bonuses to policyholders, and of the 20 valuations at the same rate of interest only eight resulted in larger bonuses.

Again of the 42 offices only six had in force office yearly premiums exceeding Rs. 25 lakhs and all of them showed better financial results than before. Ten offices had office yearly premiums exceeding Rs. 10 lakhs but less than Rs. 25 lakhs and nine of them fared better at their 1951 valuations.

Valuations of the 42 offices classified according to size and rate of interest used are summarised below:

Yearly Office Premiums	No. of Offices	Rate of Interest used at the 1951 valuation relative to that used at the previous valuation			
		Higher	Same	Lower	Results
Over Rs. 25 lakhs	6	4	2	..	..
Rs. 10 to 25 lakhs	10	3	6	..	1
Less than Rs. 10 lakhs	26	10	9	3	2
	42	17	17	3	3

The table below compares the distribution of surplus at the 1951 valuations and at the previous valuations of the same offices.

Yearly Office Premiums	Surplus		To Policyholders		To Shareholders		Carryforward	
	1951	Previous	1951	Previous	1951	Previous	1951	Previous
Largest Office	3,57.89	3,33.39	3,42.10	2,57.07	15.75	11.25	4	65.07
Over Rs. 25 lakhs	1,23.45	63.45	1,12.60	53.94	6.27	5.73	4.58	3.78
Rs. 10 to 25 lakhs	27.47	6.03	23.64	5.01	1.17	24	2.66	78
Less than Rs. 10 lakhs	8.81	1.40	6.14	1.14	21	7	2.46	19

Just a matter of ROAD GRIP!

Even when walking along at no more than 4 m.p.h., a wet pavement may often prove treacherous. How much more so a wet asphalt road for a vehicle travelling at 40 m.p.h. or more! You are best prepared for the monsoon with Dunlop. The wider and flatter tread ensures greater road stability, while the unique non-skid tread pattern wipes away the water, allowing dry rubber to grip the dry road.

WAGE INCREASE FOR SOME TEA GARDEN LABOUR

FOLLOWING on the first tea sales of the new season, which showed that prospects for the industry had definitely improved, has come the decision of the Indian Tea Association to raise the wages paid to garden labour in the Doors and Terai by one anna per day. Last February, although daily wages were raised by 2½ annas, real wages fell as the price of rice was at the same time increased from Rs. 5 to Rs. 15. The latest increase means that daily wages are now 3½ annas more than last year, though rice is dearer. It is expected that wages in Darjeeling and Cachar districts will be reviewed later this year.

NORTH INDIAN TEA CROP

The following summary of crop and weather telegrams has been received from different districts for May 1953.

Upper Assam.—Weather generally seasonable but abnormally wet in Dibrugarh, Tingri and North Lakhimpore; outturn last month poor to good; immediate prospects fair to good.

Central Assam.—Weather generally seasonable but excessive rainfall in Moran; outturn last month about normal; red spider blight severe in Jorhat; second flush quality spoilt by monsoonic conditions in Moran.

Lower Assam.—Weather abnormally wet; outturn last month about normal; red spider blight lifting in Borsola; immediate prospects fair to good.

North Cachar.—Weather generally seasonable; red spider blight prevalent and is severe in some of the districts of Lakhimpore; crop prospects generally are favourable but bad in North Cachar.

South Cachar.—Excepting Chutla Bheel where there has been severe heat during the first half of the month, good rain has now fallen generally; weather abnormally wet, outturn last month about normal; red spider blight prevalent in Chutla Bheel and Hailakandi but lifting in Longai; immediate prospects fair to good.

Sylhet.—Outturn last month good; rain has fallen generally and prospects are now brighter; red spider blight lifting in most districts.

Eastern Doars.—Rainfall below normal but weather favourable; the outturn to-date is considerably under last year; immediate prospects fair; red spider blight lifting.

Western Doars.—Outturn last month poor; dry weather is interfering with outturn; the outturn to-date is slightly under last year; immediate prospects good; there has been severe heat and rain is much

wanted; rainfall for the month has been deficient; crop prospects generally are favourable; helopeltis prevalent in some districts; red spider blight severe.

Darjeeling.—Outturn last month poor; immediate prospects fair; weather unfavourable; blight is generally severe and is checking leaf.

Terai.—Crop prospects generally are favourable; red spider blight lifting; outturn below normal.

LONDON TEA SALES

At last week's London tea sales the 72,626 packages on offer realised an average price of 3s 8.87d a pound, against 3s 7.99d at the last sale and 3s 0.66d a year ago.

There was a good demand for 18,484 packages of Ceylon teas offered on Tuesday, although the quality was often below average. Coloury Medium and Low grown teas were firm to dearer with Fannings a strong feature. Clean Common Broken Pekoes were quoted 42d to 42½d, Low Broken Orange Pekoes at 42d to 45d, Low Broken Orange Pekoe Fannings at 45½d to 49d and High Broken Orange Pekoe Fannings at 52d to 55d.

Results of some of the companies are given below:—

	No of packages	Average price
Amalgamated	1,080	3/7½
Assam Co.	2,004	3/8½
Assam Frontier	1,098	3/11
Budla Beta	777	3/8½
Buxa Doars	912	3/7½
Doors	1,353	3/6
Doom Dooma	1,003	3/9½
Eastern Produce	1,446	4/3
Halem	468	3/7
Jhanzie	559	3/1
Jokai	1,763	3/7½
Jorehaut	1,269	3/8½
Majuli	800	3/7½
Malayalam	1,530	3/8½
Moabund	960	3/8½
Singlo	504	3/7
Standard	804	4/5½
Tingri	838	3/8½
Upper Assam	533	3/6½

CHITTAGONG TEA SALES

Sale No. 1 of 1953-54 was held in Chittagong on 10th June, 1953. Leaf offerings consisted of 2,789 chests and dust offerings 1,449 chests. There was a Supplement of 103 chests.

Leaf. The market opened strongly and very soon prices had reached four to six annas above

Brokers' valuations. As the Sale proceeded the market became exceedingly strong and towards the end practically all broken and fannings grades were selling in the region of Rs. 1-15 per lb. A considerable number of Lots realised Rs. 2 with two parcels fetching Rs. 2-1.

All but 43 chests of leaf were of 1953-54 manufacture and, compared with previous years, all grades were very clean and the absence of stalk was noticeable. Liquors were typically those of early season's teas and buyers generally had no complaints. There were no withdrawals.

Dust. Except for 62 chests, all were of 1953-54 manufacture. The market following immediately after the sale of the leaf section, opened exceedingly strongly and Rs. 1-15 was quickly reached. However, after the first page or two, the market eased and two lines just failed to make valuation but then strengthened again towards the close, ending generally some three to four annas above valuation.

Clean Common Dust can be quoted at an irregular Rs. 1-9-6 to Rs. 1-10 with Churamoni and any small powder types scarcely wanted at Re. 1-4 per lb. Every Lot was sold.

	Quotations	Quotations
	Sale 1-10th June 1953	Sale 19-25th March 1953
	Rs. as p.	Rs. as p.
OP	1 15 0	1 7 6 to 1 8 0
		(Nominal)
Pek	1 13 6	1 4 8
BOP	2 0 0	1 5 0 to 1 5 6
BP	1 15 6	1 5 0 to 1 5 6
EFS	1 15 9	1 5 6 to 1 6 0
OF	1 15 9	1 6 0 to 1 6 6
FF	1 15 6	1 6 0 to 1 6 6

Next Sale, Wednesday, 8th July 1953. The total quantity of Leaf and Dust is not expected to exceed 5,500 chests.

COCHIN TEA SALES

At Sale No. 12 held on 9th June 1953, a little over 2 million pounds of tea was printed for sale. Quality showed a marked falling off in comparison with that of Sale No. 11. Demand however was brisk with outmarket as well as U.K. buyers competing strongly. The best liquoring Nilgiris were again unsupported but as liquidation of this district was barely average for the time of year this was to be expected and withdrawals were fairly frequent. Medium teas which comprised the bulk of the offerings sold freely at rather lower rates, buyers following quality closely and these types can be quoted an irregular 1 to 2 annas per lb. easier to buy. The about two annas per lb. lower but at these rates were sold fairly well. Fannings of all descriptions were in good demand and occasionally registered increased values. Leaf grades, well made Pekoes in particular, were well supported and some good prices were seen for these.

	Last Sale	Rs. as ps.	Rs. as ps.
Low Grown Travancore	B.O.P.	1-9-6	1-10-6
Anamallai	B.O.P.	1-10-6	1-11-0
Best liquoring Nilgiri	B.O.P.	1-13-0	1-14-6
Well made black leaf	B.O.P.	2-2-6	2-5-0
	O.P.	2-1-0	1-15-6

This week the Export Quota showed a rise and at the moment there are buyers at 23 pice, business having been done at this rate.

Export Sale 13 will be held on 23rd June 1953.

U.S. NATIONAL RUBBER CONSUMPTION

Consumption of natural rubber in the United States in April totalled 49,140 long tons, according to preliminary estimates released this week by the U.S. Department of Commerce. Of the total, 43,092 tons were dry natural rubber and 6,048 tons were natural rubber latex. The April consumption level continued the trend toward higher usage of natural rubber this year than in the past two years. Consumption in April 1952 totalled 36,417 tons, and in April 1951 it totalled 39,508 tons. Consumption of natural rubber in every month of 1953 has thus far exceeded consumption in the like periods of 1952 and 1951. Total consumption of natural rubber for the first four months of 1953 came to 192,844 tons, compared with 143,929 tons in the first four months of 1952, and 156,995 tons in the first four months of 1951. Total American consumption of new rubber, natural and synthetic, totalled 126,439 tons in April, 1953, compared with 128,610 tons in March and 104,990 tons in April, 1952.

The Natural Rubber Bureau, trade organisation in Washington, recalled last week a recent statement by American rubber products manufacturers that there would be no surplus of natural rubber in the next year. The manufacturers were quoted as saying that "the current competitive situation between natural rubber and GR-S (U.S. synthetic rubber) in the United States is such that there is every reason to believe that during the next 12 months the United States rubber-consuming industry would buy every pound of natural rubber available to them at prices competitive with GR-S." The bureau noted that the GR-S price is expected to serve as an approximate floor price for natural rubber, and that any substantial decline below the GR-S level should be followed by a recovery within a few weeks. The International Rubber Study Group took note of this situation at its recent meeting in Copenhagen, the bureau observed. The significance of this situation, according to the bureau, is that it establishes on a private enterprise basis what advocates of a buffer stock have wanted—a floor for natural rubber prices.

REPORT OF I.J.M.A. MISSION TO AUSTRALIA AND NEW ZEALAND

NEED TO ASSURE REGULAR AND CHEAP SUPPLIES: LIMITED PUBLICITY CAMPAIGN SUGGESTED

THE report of the I.J.M.A. mission which recently toured Australia and New Zealand to make contacts and gather information on the marketing of jute goods has just been published; extracts from the report are published below.

Regarding the Australian market in jute goods, the report says: "Although damage has been done to our trade by the scarcity and high prices of the past few years, and by competition from other materials and methods, the Australian market, largely because it is an expanding one, has not diminished in importance. Our sales there have been maintained mainly because as one door closed another has opened; in other words, our total trade is still much the same but in fact our sales are not expanding in an expanding market. There are nevertheless reasons for taking a cautiously optimistic view of our prospects in Australia. Not only is it reasonable to expect that as Australia's economy continues to expand so will her demand for packaging materials, but we believe that our losses to competing methods and materials can in some instances be slowed down and in others can be at least partly regained.

"The installation of bulk handling facilities for the movement of wheat constitutes the jute industry's largest and most serious loss in the Australian market. It seems almost certain that, once bulk handling equipment has been installed, there is little or no chance of the market being regained for jute and it would be unrealistic to think otherwise. Although we have argued that the case in favour of bulk handling is not so strong as might appear at first sight, there are nevertheless substantial arguments in its support; and we must record our opinion that, despite the objections which we have noted, the trend, on a long-term basis, will be towards a further extension of the bulk handling system. The Australian wool pack market is one of our most important markets in Australia, it is comparatively steady and reasonably assured, and in all probability it will expand further in the years to come. We must again emphasise that, for the retention of this market, a secure and assured supply of jute goods is the all-important factor. Although experiments are taking place with kenaf, and there has been some talk of Australia growing phormium tenax, there is no immediate or serious threat from substitutes at the present time. The situation should not however be regarded as the price placency. Under present circumstances the price of wool packs is secondary to security of supply. Should there be any substantial decline in international wool prices however, the price of wool packs would become a much more important factor. The threat from substitute materials, mainly paper, is not meantime serious. We believe that it should not only be possible to prevent further losses to these substitutes but that in some instances, notably in the fertiliser industry, there is a reasonable chance of jute winning back some of the ground it has already lost.

Security of Supply

"The primary consideration for the purpose not only of extending our Australian markets but even of maintaining them at all, is the security of supply of jute goods. We have mentioned this subject repeatedly during the course of our report and we are convinced that its importance cannot be overemphasised. The Australian economy is built upon her large-scale production of primary agricultural commodities and these commodities must be packed for their storage, transport and distribution. If packaging resources fail, the commodities are useless and the economy is in very grave danger. In the circumstances, and having regard to Australia's recent experience of danger to her supply lines during the second world war, it is easy to understand the constant fear of a shortage of jute goods and it can be readily appreciated that, if the supply is endangered, no effort will be spared in, and no economic obstacle will be allowed to prevent, a search for substitute methods and materials. Australia must be assured that she will receive all the jute goods she requires and will receive them in ample time for her packaging requirements.

"Generally speaking price is a secondary consideration to security of supply at the present time and in Australia's present economic circumstances. Price however assumes an added importance where there is competition to be met from substitutes; and it will also become much more important if there is any general fall in the commodity prices upon which Australia's economy depends. We consider that, in our competition with substitutes and in our efforts to maintain and extend our Australian markets, it is important that we should be prepared to adapt our products to the requirements of our consumers. We gained the impression that consumers were not always aware of the varieties of bag sizes and constructions that we could make and of the fact that we could introduce special refinements and facilities, such as valves in bags, to meet their particular

needs. It is important that our customers should be made fully aware that we can, and are anxious to, cater for their special requirements.

Marketing in New Zealand

"In New Zealand, as in the case of Australia, the security of supply of jute goods is a vital factor. New Zealand is also a large producer of primary commodities and depends economically on an adequate and timely supply of packaging materials. There is ample evidence that the losses which the jute industry has suffered in New Zealand markets are in many cases attributable to apprehensions about an interruption in the supply of jute goods. If further losses are to be prevented therefore and if jute is to maintain even its present position, New Zealand must not only get all the jute goods she requires but she must be assured that she will get them in ample time for her needs. New Zealand seemed to us to be a country where, partly owing to the desire for industrialisation and partly because of fears about the vagaries of supply from overseas, considerable importance is attached to national self-sufficiency and there is a constant tendency towards the protection of home industries. This means that, in the competition with flax and paper, our product may not always be judged on purely economic grounds and that our efforts to regain or expand our markets may well be vitiated by forces beyond our control. As far as we can see, all that we can do to counteract this tendency is to try to ensure the ready and abundant availability of jute goods upon which we have laid emphasis above.

Threat from Paper

"New Zealand's economy is also very thoroughly State-controlled. It is our opinion that control of this type restricts the scope for ordinary business enterprise; for instance in many fields there is little opportunity of quoting competitive prices and, in industries whose selling prices to the consumer are controlled, there is little encouragement towards close attention to packaging methods and costs. Again, this is a factor which is outside our control; but we mention it because it seems to us to be of considerable importance. In our opinion the greatest threat to the jute industry's prospects arises from New Zealand's huge paper pulp manufacturing project. There are reasons, supported by our experience in the American market, for thinking that if the case is judged purely on its economic merits and if there is no Government intervention or protection for the home industry, jute will in all probability be able to compete successfully with paper. The possibility of non-economic factors entering cannot be ruled out however and the situation will require very careful watching.

"In those parts of the New Zealand market where jute is faced with competition from other materials and methods, we would summarise our views of our prospects by saying that in wool there is a distinct possibility of the indigenous production of packs being reduced, in fertilisers there is a reasonably good chance of winning back lost ground from paper and of halting or retarding the trend towards bulk handling, and in cement the likelihood, it seems to us, of winning back ground from paper is small although we consider that every endeavour should be made to regain this market. Despite the competition we have to meet, the complications which we have described above and the possibility of extraneous intervention which is outside our control, we think that the jute industry has reasonably good prospects in New Zealand. The New Zealand economy is an expanding one and we believe that by producing the right kind of containers adapted to the country's requirements and available in adequate quantities and at competitive prices we can hold our own with our rivals on economic grounds at least. The New Zealand market however undoubtedly requires careful attention and cultivation.

Publicity Campaign

"We believe that a publicity campaign, of a limited nature, is desirable and would assist the prospects of the jute industry in both Australia and New Zealand. Jute goods have undoubtedly suffered a setback in both countries during recent years, owing partly to the shortage and high prices of gunnies and partly to the consequent onset of competition from other methods and materials. We believe that a suitable publicity campaign would be of great service in remedying this state of affairs. The 'message' of the campaign would be that jute, having recovered from the temporary troubles which beset it for a few years, has regained its former advantages as a packaging material and is available again at reasonable price levels and in adequate quantities. As a subsidiary object there would be the endeavour to remind people of the natural advantages of jute as a packaging material.

"A campaign of this kind would be a valuable counter-move in meeting the threat from paper;

and, in addition, it might assist in retarding or slowing down the move to bulk handling by reminding people of the advantages of packaging in jute bags and giving them cause to consider the economics of the question. There is also the potential value which a reinstatement and re-popularisation of jute would have in improving the industry's prospects for new and extended uses in an expanding market. Any campaign which is undertaken should, in our opinion, be of a limited nature. Its object should be the limited one of repairing the damage that has been done and reinstating jute in its popularity. The people to whom the campaign would be directed would in fact be the small ultimate consumer, mainly the farmer, who buys his requirements of commodities in bags or who packs his individual produce in bags.

Controls in Australia

"The situation is rather different in each of the two countries and we think that it may be necessary to adopt a different policy in each case. In Australia there is the complication of Government control over jute goods. One of the main talking points in any publicity campaign would be the cheapness of jute. However, the Australian Government hold large stocks of high-priced goods and their selling prices are at present very much in excess of current Calcutta rates. There is therefore little point in telling the consumer how cheap jute is when he is in fact still having to pay high prices. There is the further important consideration that stocks of high-priced goods which Government are holding are an embarrassment to them and that it would only increase this embarrassment, and perhaps lead to agitation against Government policies, if we publicise the fact that in world markets jute goods are much cheaper than the prices at which the Australian Government are selling to their customers. It seems to us therefore that the initiation of a publicity campaign in Australia depends largely on the liquidation of the Government's current stocks and on the future of the control system; and that the time therefore is not yet ripe for the commencement of a campaign.

"In New Zealand however the situation is different and we believe it is possible to make more positive recommendations. We consider it desirable that a publicity campaign should be launched in New Zealand with the minimum of delay. The New Zealand paper industry has for some time been engaged in an extensive and energetic advertising campaign in the national press; this campaign is also directed very obviously against the jute bag; one sentence in a typical advertisement reads: 'to shroud your product in sack cloth may bring your goodwill to ashes.' Recently, their advertisements have referred to the approaching completion of the pulp manufacturing project and have emphasised the 'national' aspect of the industry and—perhaps most important from our point of view—the fact that 'supplies of packaging material can never again be interrupted by outside events.' We discussed the question of publicity with members of the gunny trade in New Zealand and are assured that we can rely on their help and co-operation in the preparation and implementation of a suitable campaign and in making it a success.

Importance of Personal Contacts

"We wish now to devote attention to the goodwill aspect and, although we have left this subject to the last and although it occupies much less space than the market survey, we would not wish it to be thought that it is of limited importance. We believe that in many respects the personal contacts which we established during our tour have been the most valuable part of our task. It was obvious that people were glad that the Indian Jute Mills Association had taken the trouble to send a mission to Australia and New Zealand, that they appreciated the interest which the manufacturing industry was taking in these markets, and that they were most anxious to discuss our mutual trade and problems. It is our opinion that the value of these personal contacts is incalculable and that the visit of a jute mills mission to Australia and New Zealand will be of great and direct benefit to our trade with those countries. It is our opinion that this tour should have been undertaken earlier; that, having been undertaken now, it has served an invaluable purpose; and that it should be repeated.

Studying Market Trends

"We wish now to conclude by discussing the adoption of suitable public relations methods as a supplement to the publicity campaign. The maintenance of good public relations amounts to the maintenance of close contact with the consumer. As in the case of publicity, we consider that the industry should take measures of a limited nature to preserve good public relations. Firstly, we should make it a point to obtain a continuous flow of market information from Australia and New Zealand, with regard to all kinds of factors and developments affecting these markets, so that our knowledge may be kept up-to-date and that we may adapt ourselves and take whatever measures are necessary from time to time. This, we believe, can be done by keeping in touch with suitable persons in the trade who will, in a sense, be our correspondents in these countries. We do not anticipate any difficulty in making the necessary arrangements with suitable people. Secondly, we consider, as we have already said, that the visit of a mission from the industry should be repeated. The frequency of such missions would of course depend on the development of the market situation and on the circumstances prevailing from time to time; at present we consider that a goodwill mission should be sent to Australia and New

Zealand annually. We are satisfied that during our tour we obtained a great deal of valuable information about the Australian and New Zealand markets and perhaps the most important lesson impressed upon us is that it is essential that our industry should have comprehensive and up-to-date knowledge not only of these markets but of all other important world markets. We must be kept continuously apprised of what is going on in the consuming countries and how the economic pattern is developing. And we are convinced that, if we can achieve this by trying out effective public relations work, our industry will derive continuous and substantial benefits."

CHANGE-OVER FROM SACKING TO HESSIAN CONTINUES

I.J.M.A. PRODUCTION FIGURES FOR MAY

IN May the production of manufactured jute goods by mills reporting to the I.J.M.A. was 72,500 tons, compared with 74,300 tons in April. Of the total, 44 percent was hessian and 53.1 percent sacking. These figures compare with 43.3 percent and 53.6 percent in April, indicating that the switch from sacking to hessian still continues. Taking the five months, January to May this year, the output of hessian has been 42.9 percent of the total compared with 30.6 percent in the corresponding five months of 1952. The output of sacking in January-May, 1953, was 53.7 percent of the total while in January-May, 1952, it was 66.5 percent. Taking the absolute figures, the hessian produced in January-May, 1953, was 155,500 tons compared with 129,400 tons in January-May, 1952 (an increase of 26,100 tons). During this period of 1953 stocks of hessian have increased by 12,800 tons. We are now, however, approaching the months when hessian shipments are normally larger, so it is possible that the extra output may be taken up by consuming markets. In January-May, 1953, the output of sacking was 195,000 tons compared with 280,700 tons in the corresponding five months in 1952 (a reduction of 85,700 tons); stocks of sacking increased by 11,400 tons. There was, therefore, an increase of 24,200 tons in stocks of hessian and sacking between 1st January and 31st May, 1953. In January-May, 1952, stocks of hessian and sacking increased by 20,000 tons but in making any comparison with the

current year it has to be borne in mind that during January-March, 1952, mills worked 48 hours a week compared with 42½ hours a week at present.

From these figures it would appear that while mills have, to some extent, succeeded in adjusting the production of sacking to demand (stocks of sacking having actually declined since the end of February) the overall production is in excess of demand for jute manufactures of Indian origin. The demand from foreign countries for raw jute does not, however, show any decline, from which it would appear that India has still a long way to go to recapture lost markets. It is all the more necessary, therefore, that the handicaps placed by the Indian Government on the Indian jute industry should be removed without delay so that the mills may be able to resume full-time working with all their productive capacity.

Consumption of Raw Jute

During May, mills reporting to the I.J.M.A. consumed 4,32,000 bales compared with 4,44,000 bales in April. The total consumption for the eleven months, July 1952 to May 1953, was 48,83,000 bales. In May 1953 the consumption was 4,91,000 bales and the total for July 1951 to May 1953 was 51,97,000 bales. The smaller consumption in the current season is, of course, because working hours per week are fewer than they were between December 1951 and March 1952.

Jute Mill for Assam

A couple of years ago it was reported that the Government of Assam was considering the promotion of a jute mill in that State. A Press report now states that negotiations are in progress between the Government and an industrialist for the erection of a mill and that the Government will provide the bulk of the capital. Considering that existing mills in India are finding difficulty in earning profits, that they are working only 42½ hours a week and that 12½ percent of their machinery is idle, it does not appear to be an economic proposition to add to the productive capacity. A mill in Assam would, of course, have advantages in that it could obtain raw material at its labour, and, possibly, employ cheaper labour. It would be many disadvantages in regard to power and the need to transport engineering stores and other accessories from Calcutta. With the present poor railway facilities the latter might be quite a problem. It may, of course, be the case that the present scarcity of gunnies, which the railways have created by restricting the transport of jute manufactures to Assam, has decided the State Government to go ahead with the project.

THE JUTE MARKETS

THE ARGENTINE ORDER

One of the main topics of discussion in the markets for some weeks has been the Argentine order for hessian—how it was to be placed, how it was to be financed, how much it was to be and when the goods were to be delivered. The exact details are still not known to the public but it is certain that an order of substantial size has been placed, and it is generally believed that the quantity is about 65,000 tons. If this figure is approximately correct, it means that about two months' output of hessian has been disposed of. On that assumption and, with a prospect of a very healthy position for hessian appears to be assured despite the increased output. At the moment the prospects for heavy sacking do not appear as good but the big reduction in its output should have some effect within the next few months.

Manufactured Goods: The main activity has been on the hessian side. Buying on account of the Argentine order, speculative bull buying, bear covering and domers by shippers on account of other overseas customers have delayed their purchases too long have a substantial rise and, though there have been inter-upted fluctuations, the general tendency has been upward, the gain on the week being about Rs. 100. There is a general feeling that it would be better the prices should not rise further lest Calcutta hessian should again become uncompetitive. It is, however, unlikely that with higher jute prices in India, especially for new crop, and crop prospects quote Calcutta, but a pause in the upward movement enquiry but a fair quantity of business was done. Quotations moved up largely in sympathy with those of hessian. There was enquiry for Cubans, grains business. At the time of writing on Tuesday the ten-market and B Twills quoted at Rs. 102.

On Wednesday morning the market opened steadier and quotations were as under:—

	June	July	Aug./Sept.	Oct./Dec.
40" 8 oz.	35-12	35-14	36-0	35-12
40" 10 oz.	46-8	46-6	46-8	45-12
B Twills	103-12	104-2	104-14	104-10
Heavy Cees	103-0	103-4	104-8	104-0
Corn sacks	109-0	107-0	106-0	105-8

Raw Jute: At the beginning of the week, the market was easy in sympathy with the market for the jute districts. On the afternoon of Wednesday of business in hessian for on reports of further amount of business was reported. Pakistani jute was at Rs. 29 basis Bottoms. Pakistani jute was at Rs. 33-8 for June-July shipments. Pakistani cuttings were bought by mills at Rs. 75 per bale for jute NC's and Rs. 74 for District NC's and Mesta was done at Rs. 24. New Crop for Aug-Sept. Upper Assam and at Rs. 31 basis Bottoms for Nor-

The market continued steady on Thursday but there was less business passing. On Friday there was a renewal of activity and a large business was done. The following prices were reported:—

Assam ex agency Rs. 28 basis Bottoms.
Assam ex local godown Rs. 26 and Rs. 26-8 basis Bottoms.
Cossimbazar Tossa Rs. 27 basis Bottoms.
Laigola Tossa Rs. 26 basis Bottoms.

Karimpur Tossa Rs. 26 basis Bottoms.
Daissee Middles free from samla Rs. 33.
Pakistani jute Middles alone Rs. 32 to Rs. 33.
Northern Bengal ex agencies Rs. 27 to Rs. 28 basis Bottoms.

New Crop Assam Rs. 30 basis Bottoms.
New Crop Dhuri and Northern Rs. 31 basis Bottoms.

Pakistani pseudo-jat and Pakistani district Rs. 28 basis Bottoms.
Pakistani Cuttings Rs. 75 per bale.
Indian Lightnings Rs. 60 per bale.

Saturday saw a quieter market but sellers were steady. Monday was again quiet and only small business was reported. On Tuesday a distinctly easier tendency developed in sympathy with reported weakness in the B Twill market. Sellers showed some keenness for business and were prepared to discount the quoted prices, especially in regard to New Crop for which they had previously been showing some reserve. Small business was reported in mests cuttings at Rs. 62 per bale, in Assam jute on the basis of Rs. 26-8 for Bottoms and Jungli Tossa at Rs. 24-8 basis Bottoms.

On Wednesday morning the market was steadier and prices were quoted as under:

Pakistani Jute:
Jat Rs. 29 basis Bottoms landed at mills.
District and Northern Rs. 28 basis Bottoms landed at mills.
(The difference in price between Middles and Bottoms in Pakistani jute is Rs. 4).
Cuttings Rs. 75 per bale for jat.
Rs. 74 per bale for district and northern.

Indian Jute:

	Rs.	June-July
Lower Assam	27-8	landed at mill.
Upper Assam	26-8	"
Northern & Purnea	27-8	"

Mofussil: There is no change in the supply position in Indian markets but prices are higher in sympathy with Calcutta. Offseason conditions prevail.

There has been rather too much rain in Assam but showery have been welcome in other districts and ploughing and sowing are in progress though it is rather late for both. If, however, the monsoon rainfall is rather below normal to begin with, as the meteorologists forecast, the present sowings might not be too late. In the daissee districts it is reported that about 25 percent of the seedlings from the early sowings perished during the drought. The remaining plants are stunted and are only 6 to 9 inches high.

In Pakistan there has been less demand from overseas and less activity locally. Export. Firsts are quoted at (P) Rs. 118 per bale for Old Crop and (P) Rs. 125 per bale for New Crop. Loose jute is quoted on the basis of (P) Rs. 20 per maund for Old Crop Bottoms for picked marks. S.N.C's are quoted at (P) Rs. 50 per bale and NC's at (P) Rs. 40 per bale. Imports continue good for this time of the year and it is reported that the quality of present arrivals is better. Small imports of New Crop weedings and immature cut jute are coming into the market and prices of (P) Rs. 25 to (P) Rs. 25-4 have been paid for Middle weedings with buyers over. It is reported that nearly one lakh maunds of business has been done in New Crop in Narayanganj. The crop on the Meghna side is reported to be in good condition but some harvesting of immature jute, which was mentioned last week as probable because of rising rivers, is reported to be taking place. This will affect the yield. On the western and northern sides there have been welcome showers and further sowing has been reported. The condition of the standing plants in these areas is not, however, good but the present rain may bring about an improvement. There are said to be large bare patches in the fields where the long drought withered the plants.

PHILIPPINE BAG PRODUCTION

The Linen Trade Circular reports that the Industrial Textile Manufacturing Co., Manila, now have a production of 500,000 bags monthly. They use both Philippine kenaf and Pakistani jute. By working two shifts, it is expected that production will be raised to 1,500,000 bags a month.

INDIAN CROP PROGRESSES

In their thirteenth crop report of the current season, covering the period ended 13th June, Messrs. Sinclair Murray & Co. Ltd., say that the weather in Assam has been wet and a spell of sunshine would now be beneficial. Favourable rainfall has been experienced in West Bengal. In Orissa the weather was hot and dry during the early part of the week but moderate rainfall occurred at the end of the week.

DANPUR: The weather was hot and dry and a moderate shower of rain was experienced at the week-end. Sowings to date amount to -/8/- compared to -/7/3 at the corresponding date last year. The condition of plants is improving but they are still far from satisfactory. The river is steady at an abnormally low level.

JAIPUR ROAD: Report not received.
RANAGHAT: Fairly heavy rainfall was experienced and a spell of dry weather is now required. Sowings to date amount to -/6/8 as against completed sowings at this time last year. Second weedings on early sown ground have been completed. The condition of plants has improved but is still not satisfactory. The river level is normal.

COSSIMBAZAR: The weather has been favourable with alternate rain and sunshine. Sowings to date amount to -/7/- compared to completed sowings at this time last year. The condition of young plants

is improving but they are still not satisfactory. Weeding operations are going on where possible.

NOWGONG: Sowings completed -/11/6. The weather has been wet and a spell of sunshine would now be beneficial. The condition of plants is satisfactory and they range in height from 1' 6" on the highlands to 4' 10" on the lowlands. Weeding has been completed on low and midlands and is going on freely on highlands. The river level is slightly higher than normal.

GAUHATI: Sowings completed -/13/6. The weather has been mainly wet and cloudy and a spell of dry weather would now benefit the crop. Weeding operations have been completed. The condition of plants is good and they range in height up to 6'. The river has fallen during the week and is now normal for this time of the year.

DHUBRI: Sowings completed -/12/6. The weather during the early part of the week was wet but was hot and dry during the latter part. Condition of plants is satisfactory and they range in height from 1' 6" on the highlands to 4' 6" on the lowlands. The river is falling but is 2' 1" higher than last year at this date.

KHARUPETIA: Sowings completed -/12/6. The weather was wet with periods of bright sunshine. Weeding operations have been completed in the midlands and are going on in highland areas. The condition of the standing crop is satisfactory and plants range in height up to 6' 6".

DAISSEE DISTRICTS: Sowings completed -/10/6. The weather has been favourable with general rainfall. The condition of young plants is improving but the growth has been retarded due to previous unfavourable weather, and some loss in output is to be expected.

N.B. As a basis of comparison last season's crop has been taken at -/16/-.

SOME CUTTING OF IMMATURE PAKISTANI CROP

In their fifteenth crop report of the current season covering the week ended 13th June, Messrs. Sinclair Murray (Pakistan) Ltd., say that the weather has been generally favourable with alternate rain and sunshine. Rivers, particularly on the Eastern side, have risen during the week and this has forced cultivators to commence cutting the crop in an immature state on churlands in certain areas.

NARAYANGANJ: Sowings completed -/8/- . The weather has been favourable but a spell of bright sunshine would be beneficial. The condition of the crop is good and plants range in height from 2' 6" on highlands to 7' on lowlands. The level of the river has been fairly steady and is now 9" higher than the corresponding date last year.

DACCA: Sowings completed -/8/- . The weather has been wet and a spell of sunshine would be beneficial to the standing crop. The condition of plants is good and they range in height up to 4' 6". Harvesting has commenced on lowlands areas on a very limited scale. The river is rising and is now 1' 2" higher than the corresponding date last year.

CHANDPUR: Sowings completed -/7/- . The weather has been favourable with alternate rain and sunshine. The condition of plants is good and they range in height up to 4' 2". Harvesting has commenced on churlands. The river is rising slowly and is about 6" higher than last year at this time.

HAIJGANJ: Sowings completed -/17/- . The weather has been favourable with alternate rain and sunshine. The condition of plants is good and they range in height up to 5 ft. The river has risen during the week and is now 10" higher than the corresponding date last year.

AKHAURA: Sowings completed -/8/- . The weather has been favourable with alternate rain and sunshine. The condition of the crop is satisfactory although the height of plants compared with last year is somewhat less. The river has risen during the week and is now 2' 3" higher than last year at this time.

ASHUGANJ: Sowings completed -/8/- . The weather has been favourable with alternate rain and sunshine. The condition of plants is satisfactory but the growth has been retarded due to late sowings. Plants range in height up to 5' 4". The river has risen during the week and is now 2' 3" higher than last year at this time.

NIKILDAMPARA: Sowings completed -/6/3. Wet weather has been experienced with occasional spells of sunshine. The condition of the standing crop is satisfactory and plants range in height up to 5' 6". The river has risen during the week and is now 3' 4" higher than last year at this date. This has caused cultivators to commence cutting the lowland crop and a further rise in the river may cause damage to the midland crop.

SARISHABARI: Sowings completed -/7/- . The weather has been favourable with alternate rain and sunshine. The condition of plants is fairly satisfactory and they range in height up to 5' 3". The river has risen during the week and is now 4' 5" higher than last year at this time.

SIRAJGANJ: Sowings completed -/7/- . The weather has been favourable with good showers of rain. The condition of plants is fairly satisfactory and they range in height from 1' 6" on the highlands to 6' 6" on the lowlands. The river has risen during the week and is now about 6" higher than last year at this date.

NAKALIA: Sowings completed -/8/- . The weather has been favourable with alternate rain and sunshine. The condition of the crop is improving and plants range in height up to 5' 3". The river is rising and is now 1' 6" higher than the corresponding date last year.

BHANGOORA: Sowings completed -/8/- . The weather has been favourable. The condition of plants is satisfactory and they range in height up to 5½ ft. The river has risen during the week and is now about 1½ ft. higher than the corresponding date last year.

U.S. CONSUMPTION AND STOCKS

U.S. consumption in May was somewhat disappointing having declined an estimated 9 million yds. from April. Estimated consumption for the first five months this year, however, is 45 million yds. more than for the same period last year. U.S. stocks at the end of May were estimated at 203 million yds, consisting of an estimated 148 million yds. of spots and 55 million yds. of floats. This decline in stocks, with a decrease in consumption, reflects a domestic market situation whereby several standard constructions have been available in that market at prices lower than for early shipment from Calcutta. Appearing below are two tables which include the May figures—(1) based on member reports to the Textile Bag Manufacturers Association and the Burlap & Jute Association, and (2) projected to represent the estimated Consumption and Stocks for the entire industry:

THE FOREIGN JUTE MARKETS

(FROM OUR OWN CORRESPONDENT)

Dundee, By Air Mail.

UNCERTAINTY is still the dominating factor in the jute industry and the general impression is that there is not much stability in the situation yet. Prices for raw jute have been inclined to weaken from day to day and they are now a bit down from the top points reached a week or two ago. Mill Firsts are now offered at £102 per ton and Mill Lightnings at £91, a drop from £108 and £97 respectively, c and f. U.K. Crack marks of Daissee-2/3 are down to £90 and grade to £80, while grade Tossa-4 is quoted at £90, c and f.

Buyers of jute yarns in the U.K. are still desperately anxious regarding their supplies for delivery to the end of the year. Some spinners have taken orders for delivery in December for hessian descriptions and twists at today's prices of 15.58d per lb. for common 8 lb. cops and 8 lb. spools and at 17.10d per lb. for 3 ply 8 lb. twist. Manufacturers are buying moderate quantities of cops and spools from Belgium and Germany, but the delivery position there is now generally September onwards. The prices quoted are in excess of those ruling in Dundee, being from 16.0d to 16.38d for 8 lb. cops and spools. The position of these firms who only weave is very serious and it has been suggested that an approach should be made to the Government to reduce the import duty of 10 percent on Continental yarns, as local spinners' production is so inadequate to meet requirements. A fairly steady demand continues to be made for jute cloth and manufacturers could increase their output were it not for the scarcity of yarns. Prices remain very firm on the basis of 13.21d for 10 oz. 40 in. and 10.14d for 7½ oz.

Saint Frères Circular Looms installed in Italy.

SAINT FRÈRES CIRCULAR LOOMS

Hundreds of Saint Frères Circular Looms are in use—in new factories and old, sometimes working alongside flat looms—in the Belgian Congo, in South Africa, Sweden, Norway, Italy, Great Britain, Germany, Belgium and France.

These looms were originally designed for making tubular cloth from jute. Deliveries of a Saint Frères Circular Looms for hard fibres are now available. Saint Frères Circular Looms are manufactured by Urquhart Lindsay & Robertson Orchar Ltd., Dundee, Scotland.

NEW PROCESS MAY CUT
U.S. MANGANESE NEEDSMINERAL RECOVERED FROM
OPEN HEARTH SLAG

THE New York Times for 11th June carries the following report: "The country's dependence on imported manganese for making steel would be sharply reduced if a new process for recovering the mineral from open hearth slag proves economical. The American Iron and Steel Institute reported yesterday. The process was developed in a project sponsored jointly by the Institute and the Bureau of Mines, and has been tested in a pilot plant at Pittsburgh.

"An average of about thirteen pounds of manganese is used in the production of one ton of steel, and much of this manganese finds its way into the slag. In the new recovery process, the open hearth slag is treated first in a blast furnace and then in a basic converter.

"While no unusual technical difficulties are involved, the question is whether the cost of the process, as used on a large scale, would exceed the value of the recovered manganese. If the method proves economically feasible, as much as half of the industry's manganese requirements may eventually be recovered from open hearth slag, the Institute estimated."

LARGE U.S. WHEAT CROP FORECAST

This year's U. S. wheat crop has been estimated at 1,132,500,000 bushels by the Agriculture Department. The expected harvest compares

with last year's crop of 1,291,447,000 bushels—the third highest on record. The 1942-51 U. S. average was 1,088 million bushels.

WHOLESALE PRICE INDEX
INDUSTRIAL RAW MATERIALS'
BIG INCREASE

The official wholesale price index (year ended August 1939=100) advanced by 1.0 percent to 407.7 during the week ended 30th May, 1953, as compared with 398.8 (revised) for the previous week. The index was higher by 2.6 percent compared with that of a month ago, and 10.3 percent higher than that of the corresponding week last year. The average for May 1953 stood at 397.4 against 384.9 (revised) for the previous month and 367.1 for May, 1952. During the week under review, Foodstuffs rose further by 1.5 percent to 390.9 owing to the reappearance of the price quotation for tea for internal consumption at a higher level, together with increases in the prices of bajra (+7%), dal arhar and coffee (+2% each) and sugar (+1%). The price of wheat at Amritsar, however, declined by 3 percent. The index for Industrial Raw Materials advanced by 1.6 percent to 487.5 as a result of higher prices of jute (+9%), rapeseed (+7%), groundnuts at Cuddalore and raw skins (+4% each), cottonseed at Amravati (+3%), castorseed and lac (+1% each), despite decreases in groundnuts and cottonseed in Bombay (-3% each), cotton and manganese ore (-2% each), copra and linseed (-1% each). The Semi-Manufactures group remained almost unchanged at 362.3, as the effect of increases in mustard oil (+6%), castor oil (+2%), coconut oil in Calcutta, zinc and gingelly cake (+1% each) was neutralised by a decline in coconut cake (-12%), groundnut cake, gingelly oil and linseed oil (-3% each), buffalo hides and groundnut oil (-2% each), coconut oil at Cochin and cow hides (-1% each). The index for Manufactures moved up by 0.8 percent to 370.8 from 368.7 (revised) for the previous week, as a result of an increase of 5 percent in the prices of jute manufactures during the period under review. Higher prices of chillies (+11%), turmeric (+5%) black pepper in Calcutta (+3%) and betelnuts (-2%), raised the 'Miscellaneous' group index by 1.0 percent to 626.9.

Books and Publications

THE BILL ON LONDON

The Bill on London, or The Finance of Trade by Bills of Exchange, by Gillet Bros. Discount Co. Ltd., (Chapman and Hall, 1952, 96 pp. 15s.)

Messrs. Gillet Bros. Discount Co. Ltd., a member of the London Discount Market Association, have produced a book which should prove valuable in promoting a clearer understanding of the flexibility of the bill of exchange and in showing how with variations in technique bills can be adapted to meet diverse financial problems. The book contains sections addressed to exporters, importers, manufacturers and traders "in the hope that the traditional method of finance by bills may become better known, more easily understood and more widely used". Written by men who have an inside knowledge of the working of the London Discount Market, the book may be commended not only to those to whom its contents are addressed but also to students of finance and banking.

The book is divided into four parts. The first part deals with the history of the bill of exchange, its functions and how the quality of a bill is to be judged. The section dealing with the quality of a bill and the authors' comments on "finance bills" should be of particular interest to bankers. The second part explains the methods by which the exporter, the importer, the manufacturer and the trader can obtain finance through the bill of exchange. Each method is illustrated by a detailed diagram of a bill. Bankers in India, where a bill market is sought to be developed, would find the sections addressed to the manufacturer and the inland trader of particular interest. The third part contains examples of typical letters of credit, accepted bills and relative correspondence. Part four contains a glossary and index of terms. Not the least interesting part of the work is a folder at the end of the book containing replicas of bills made up as a parcel by a discount house for sale to a bank.

The book is practical and fills a much needed want, for although there is no dearth of books on negotiable instruments, these mostly deal with the legal and theoretical aspects of the bill of exchange.

HONOURABLE COMPANY

Honourable Company. By M. Bellasis. (Hollis and Carter, 21s., 285 pages.) Miss Bellasis follows the exciting events of the 18th and 19th centuries in India with the aid of letters and diaries of her kinsfolk, whose connection with India persists to this day. She claims that the English turned "from anxious little shopkeepers into imperial conquerors" by force of circumstance, because "men lived as in a tiger-haunted jungle in daily fear" of the Moghuls and Marathas, and because England's quarrel with France continued on Indian soil. By dwelling upon the plundering activities of Tipu Sahib and Begum Samru, and upon the order-restoring administration of the servants of the Company, she demonstrates that the foreign invaders cleared the rubble left by the dark ages and paved the way for modern India—at the same time of course feathering their nests, or as Miss Bellasis put it, "shaking the pagoda tree." The fortunes, social life and tragedies (one of the chapters is called "They Died Young") of General John, George Bridges, Edward, Major-General John Brownrigg and Augustus Fortunate (the most outstanding member of the Bellasis family) are recounted with unselfconscious circumstantiality and feminine allusiveness, against a background of the campaigns of Wellesley, Cornwallis and Sir John Malcolm. Miss Bellasis is a brilliant gossip-monger and her less "historical" chapters dealing with family scandals are eminently readable.

CO-OPERATIVE BANKING

Standing Advisory Committee on Agricultural Credit. Proceedings of the third meeting. (Published by the Reserve Bank of India.) Considerable progress in the implementation of the recommendations of the Reserve Bank on the reorganisation of the co-operative movement in several States is revealed in the proceedings of the third meeting of the Standing Advisory Committee on Agricultural Credit which has just been published by the Reserve Bank. With the enlargement of the area of operations of the Reserve Bank to include all part "B" States, the whole of the Indian Union came within the purview of the Reserve Bank of India Act in the context of the provisions relating to agricultural credit. In some States, there is no State Co-operative Bank; in others considerable reorganisation of the apex bank is necessary or the intermediate and primary credit structure is weak.

The need in each State for a strong and sound banking structure to take advantage of the facilities for financial accommodation provided by the Reserve Bank of India has been recognised, and it is because of this that the Reserve Bank deputed the officers of its Agricultural Credit Department to tour the States to study the condition and working of the co-operative banking and credit structure and to formulate proposals for its reorganisation and development. In a large number of cases, according to the Report, the implementation of the Reserve Bank's recommendations by the State authorities has already commenced. State Co-operative Banks have been established in Saurashtra and PEPSU and will soon be started in Rajasthan and Himachal Pradesh.

The Standing Advisory Committee, at an earlier meeting, considered the question of liberalising the procedure followed by the Reserve Bank in the provision of financial accommodation to State co-operative banks under Section 17 of the Reserve Bank of India Act. The procedural changes suggested by the Committee were accepted by the Reserve Bank, and have been in operation for some time. The Committee reviewed the position and came to the conclusion that, as the present system had worked smoothly, no change was called for at present.

The Informal Conference on Rural Finance had recommended that to ensure closer co-ordination between the activities of co-operative institutions on the one hand and the policies and operations of the Reserve Bank on the other, the inspection of individual co-operative banks, particularly such of them as borrowed from the Reserve Bank, should be carried out on a voluntary basis by the trained personnel of the Agricultural Credit Department. The Standing Advisory Committee considered the broad lines on which the inspection would be conducted. It was emphasised that these inspections by the Reserve Bank should not be regarded as a substitute for departmental inspection at present conducted by the Registrar of Co-operative Societies. One of the important objects of inspection is also to ascertain how far a co-operative central bank is fulfilling its rôle as the financing agency of the movement in the district and in what manner its utility can be enlarged. A beginning in this direction has already been made and two banks have been inspected by the officers of the Agricultural Credit Department.

India's Balance of Payments 1948-51 (Published by the Reserve Bank of India, Bombay, Price Rs. 14, 42 pages.) The booklet collates the data on India's balance of payments for four years

and has been prepared to meet the frequent demands on the Reserve Bank for a compilation of this kind. It also includes ancillary data relating to gold and foreign exchange reserves and terms of trade. The data have been presented as far as possible on the lines recommended by the International Monetary Fund. Apart from the usual current and capital account and the area-wise breakdown of transactions, tables have been included to show the financing of the transactions and the Uniform Area Classification of India's Balance of Payments. Detailed explanatory notes on each constituent item of the data have also been appended.

Texture. (Published by Messrs. Percy Ripley, Fairfax, Chislehurst, Kent, England, from whom specimen copies are available.) This new British textile quarterly, concerns itself with cultural, as well as with scientific and industrial expressions of the textile industry. The cultural side includes an article on The Influence of Textile Research on Social Customs and a re-examination of Lewis Paul's claims to be the inventor of roller spinning. Among the technical contributions are The Role of Minimum Twist in Spinning, A Mill Manager's Journal and Recent Advances in Rayon. The issue also contains the first instalment of An Encyclopædia of Fabrics.

Industrial
Progress
in India

No observer can fail to note that greater progress has been achieved in India's history in the last 200 years than in the many thousands preceding. In this quickened tempo of development, the advent of the railways has played, perhaps the most significant part. The laying of railway tracks across this vast country was the indispensable factor in linking the life of her people to a rapidly changing world, and thus initiating the series of economic, political and social changes which have transformed the face of India in recent times.

The name Martin Burn has an honoured place in the saga of India's railway construction. Their pioneering contribution has been the development of light railways acting as feeders to main lines, so important in a country of vast distances whose rich hinterland cannot be covered adequately by the main railway network. The Howrah-Amta Light Railway in Bengal was the first such in the country. This was constructed by Martin & Co. who continued their activities by building several others. No less important is the manufacture of rolling stock and C.I. railway sleepers of railway points and crossings—another pioneering venture—of signal equipment and track fastenings such as the Elastic Rail Spike, a recent invention which simplifies track laying. The Martin Burn organisation ably serves one of the busiest railway systems in all Asia.

JAPAN EASES RESTRICTIONS
ON TRADE WITH SOVIET BLOCK

COAL SECTION QUIET

Freights have shown irregular tendencies over the past week and hopes of an impending truce in Korea have caused Eastern and Far Eastern shippers to reduce their ideas of rates. Elsewhere the truce talks have had little effect on freights but while the United States have tightened up their regulations for bunkering vessels that have traded or may trade with China, Japan has eased her trade restrictions with Soviet bloc countries and has already started importing Chinese coal in Japanese vessels.

Quiet conditions continue to prevail in the Calcutta coal section where no orders are circulating at present but earlier in the week a further vessel was reported fixed to Hong Kong at the previous rate of 52s. 6d., while a handy sized ship accepted the lower rate of 58s. 6d. for one sale port discharge Japan. Further fixtures for ore from India were reported. Vizagapatnam to Baltimore being concluded at \$9 for an August loader, while a ship with July readiness accepted \$9.25 and ore from Bombay to Northern Range paid \$9.10 for a July-August ship.

In the China section, a vessel accepted 82s. 6d. for a cargo of mixed cereals from North China to the Continent with full discharging options and 72s. 6d. was paid for a cargo of iron ore from Yulin to Antwerp-Hamburg range. Wheat in bulk from Australia to India was fixed at the previous rate of 57s. 6d. and though additional tonnage is required for wheat to India from Australia, no further fixtures have been reported. In other directions there is no demand for Australian grain, but bagged sugar from Queensland to U.K.

was done at the lower level of 113s. 9d. Grain from the North Pacific to India was fixed at 77s. 6d. for three vessels and 72s. 6d. was paid for fixtures to U.K.-Antwerp-Hamburg range. Coal continues to move from Hampton Roads to Japan, a June vessel accepting \$8.75 and two earlier fixtures were concluded at \$9 for August laydays, while \$8.60 was paid for a September loader. Coal from Hampton Roads to Lavona was done at \$5.10 for three ships and to Buenos Aires \$6 was paid for two vessels and a subsequent fixture was done at \$5.90. Four ships were fixed from Baltimore with coal to Hamburg at 34s.

In the time charter section an oilburner was fixed at 14s. 6d. delivery Mormugao redelivery Northern Range voyage across and a motor vessel accepted 23s. delivery Eastern Australia redelivery Mauritius/Madagascar voyage across. Fourteen shillings was paid for an oilburner delivery July in Calcutta redelivery Bordeaux-Hamburg range.

STRONG ENQUIRY FOR LEAF
GRADES AT TEA AUCTIONS

At Export Sale No. 2, held on 15th & 16th June, fair demand was encountered. Leaf grades met with a very strong enquiry and were the strongest feature of the sale. Prices of one anna and sometimes more above last rates being generally realised. Flavoury Darjeelings were well supported at higher rates, but the plain liquoring sorts were again difficult and the withdrawal of these teas were heavy. Stylish Broken Pekoes Souchongs and Pannings grades were a strong feature, while bright liquoring Doors sold well and were half to one anna dearer. Clean Commons were fully firm and the quotation for Clean Common B.P. remains unchanged.

The old seasons Dusts offered met with only fair demand and were generally one anna easier.

New Seasons Black exportable dusts were well competed for, as were also the few good Assam dusts and flavoury Darjeelings. The rest of the offerings sold irregularly at half an anna below valuations.

There was a fair demand for the Internal leaf teas offered.

The next Export and Dust sales will be held on June 29th and July 1st.

Quotations		1953
Clean Black Pekoe	1-12-6	1-4-0 to 1-5-0
Clean Common Broken Pekoe	1-11-6	1-0-0 to 1-1-0
1953-54 Medium Doors	Dust 1-7-6	
Medium Assam Grains	Dust	
Best Assam C.T.C. Dust		

Approximate quantity offered.	
Export	31,600 Pkgs 21,100 Pkgs.
Internal Leaf	910
Internal Dust	28,100 " 4,800 "

SUGAR STOCKS LOW

During the week ended 16th June, prices for sugar ready ex-Kantapukur delivery were Rs. 31-12 a maund for ordinary grain, Rs. 32-12 for big grain and Rs. 31-8 for coming ordinary grain. Export mill delivery rates ranged from Rs. 28-12 to Rs. 29-8 a maund for Bihar and east U.P. mills. Stocks amounted to 15,000 bags and arrivals were about 2,000 bags a day. Sales averaged 3,000 bags daily in the local markets, and 1,000 bags to markets in Orissa, Assam and Bihar. The Government measures announced on 16th June are expected to bring down prices, which are not so high in Calcutta as they are in Delhi and East Punjab. There is no demand from Madras because stocks here are low.

LINSEED

Easier conditions prevailed last week and a notable decline was registered whilst trading was very dull. Although arrivals from upcountry were poor the local offtake of ready goods fell off and sellers were rather more in evidence but for small quantities only. Crushers were in the turnover daily. The oil market was stagnant and demand. Prices remained entirely out of line for Rs. 20-12 per maund, July/August Rs. 21-4 per maund.

HIDES AND SKINS

The market in skins ruled steady, while that of hides was easier. Stocks were less than in the previous week.

Bazar Sales

(Between 9th June and 15th June, 1953.)
Cowhides:—Wet salted (Slaughtered) 1,500 pcs. on the basis of Rs. 12-8 to Rs. 24.
Goatskins:—Wet salted (Daisee, Killed) 29,000 pcs. on the basis of Rs. 280 to Rs. 425; Assam-Dinajpur-Murshidabad 6,200 pcs. on the basis of Rs. 285 to Rs. 315; Purneah-Kissanganj 3,750 pcs. on the basis of Rs. 280 to Rs. 300; Patna 3,700 pcs. on the basis of Rs. 250 to Rs. 265; Muzafferpore-Darbhanga-Samastipur 25,200 pcs. on the basis of Rs. 270 to Rs. 287-8.

Bazar Stocks

(15th June, 1953.)
Cowhides:—Wet salted 1,08,709.
Goatskins:—Wet salted (Daisee, Killed) 1,06,000, Assam-Dinajpur-Murshidabad 69,000 pcs; Muzafferpore-Pakur-Patna-Purneah-Kissanganj 1,56,000 pcs.

SHELLAC MARKET FIRM

During the week ended 16th June, the market ruled firm and moderate business passed at higher prices. The range of quotations was as follows:

Standard Pure Buttonlac	Rs. 93 to Rs. 85 buyers.
Pure Buttonlac	Rs. 88 to Rs. 96 done and buyers.
Lemon No. 1 Shellac	Rs. 88 to Rs. 96 done and buyers.
Lemon No. 2 Shellac	Rs. 84 to Rs. 95 done and buyers.
F. O. Std. 1 Shellac	Rs. 85 to Rs. 92 done and buyers.
Pure TN Shellac	Rs. 76 to Rs. 88 basis done and buyers.
4% I. T. N. Shellac	Rs. 66 to Rs. 78 buyers.
No. 1 Kusmi Seedlac	Rs. 88 to Rs. 96 buyers.
No. 2 Kusmi Seedlac	Rs. 80 to Rs. 88 done and buyers.
Fine Bysaky Seedlac (Manbhum)	3% Rs. 76 to Rs. 85 done and buyers.
Fine Bysaky Seedlac (C.P.)	3% Rs. 71 to Rs. 80 done and buyers according to quality.
Ordinary Bysaky Seedlac (C.P.) Under	5% Rs. 65 to Rs. 71 done and buyers.
Ordinary Bysaky Seedlac (C.P.)	5% Rs. 60 to Rs. 68 buyers.
Kireelac	5% Rs. 28-8 to Rs. 29 buyers.

Shipments during June until the 13th were 12,044 packages.

COAL COMPANIES

O, Po, F and Dd, indicate Ordinary, Preferred Ordinary, Founders' and Deferred shares, respectively. P next to the name of the company indicates that the company also has Preference Shares. Figures in "accounts closed" column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer to the Key (last page) under the numbers indicated.

TEA COMPANIES

O. Po and Dd indicate Ordinary, Preferred Ordinary and Deferred Shares, respectively. P next to the name of the company indicates that the Company also has Preference Shares. Figures in "accounts closed" column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer to the Key (last page) under the numbers indicated.

THE EPITAPH OF COMMERCIAL AVIATION IN INDIA

MR. TATA ON AIRWAYS NATIONALISATION: THE FUTURE OF TRANSPORT POLICY

THE nationalisation of the Indian airlines has had few critics, at least as regards the principles or the necessity of superseding private enterprise in this industry. Nationalisation proposals usually encounter spirited defence of the rights of private capital, and the repeated conflicting references to the extension of State ownership that have been made by politicians in India in the last few years have uniformly awakened keen and cogent criticism. Yet the one and only major nationalisation measure undertaken by the Government of India since independence has been put through with a minimum of fuss, critics for the most part limiting themselves to dispute about the manifestly unfair terms on which the State is acquiring the assets of the air companies. Many members of the public, observing the apparent willingness with which private enterprise has surrendered its ownership of this major industry, have concluded that airline operators have made such a bundle of the business that they are glad to pass on to the State the responsibility of clearing up the mess. In other words, the nationalisation of the airlines has come to be regarded as a classic example of the anarchic situation brought about by free competition which has then to be rationalised and controlled for the public good by the State. The great debate about the merits of private and public ownership of productive assets would be confused and confounded if this superficial and mistaken view were to pass unchallenged. For it is simply false. The unhappy story of air transport in India is not an example of the dis-abilities of private enterprise, but an object lesson in the damaging consequences of unintelligent Government intervention and crippling taxation.

It is true that there are a number of private airline operators who have burned their fingers and are now quite pleased to get out of the business. But far from representing the best that private enterprise could do in air transport, these are people who, if Government control of the airways had been more realistic, would never have got into the field or who, if Government treatment of the industry had been more progressive, would have developed more vigorous and independent companies. In the event, Government policies were neither realistic nor progressive and the industry has been reduced to a condition where nationalisation is probably the best way out—not necessarily complete nationalisation along the lines that have in fact been followed, but certainly the supersession of the private companies by some form of public or semi-public organisation. This was inevitable because in order to buy new planes the companies would have had to borrow from the Government sums in excess of their total share capital and reserves. Before lending so much public money, the Government was entitled to secure its loan by taking over control of the industry itself. Though this is the long and short of nationalisation of the airlines, it is worth enquiring how the industry came to this pass. Mr. J. R. D. Tata, in his farewell address to the shareholders of Air India Limited in Bombay on Monday, recalled the developments that led to the present situation; his speech is an important and a memorable one, of interest to wider circles than the late airways companies.

"The nationalisation of air transport," said Mr. Tata, "brings to a close an era of 21 years during which from small beginnings the Indian air transport industry grew into the far-flung domestic and international system of today." The two Corporations now set up by the Government of India enter into an inheritance that they could never have created for themselves but which has been built up over the past two decades by investors, staff and managements who despite numerous obstacles, natural and artificial, have established concerns

that, whatever their faults, are no disgrace to the State Corporations that will henceforth manage them. Mr. Tata spoke of the ignorance and misunderstanding that had "grievously distorted" the account of this notable achievement, especially among those who think it fashionable to decry free enterprise. To them he pointed out that the Government of India is today acquiring on the cheap and ready-made an airways system constructed with the brains, labour and capital of those who are held to have bungled and defaulted. In particular he drew attention to "the forgotten man," the investor who is now being dispossessed, without whose support the industry could not have come into being. "Judging from some of the speeches made in Parliament and elsewhere," he said, "there seems to be little awareness that the investing public consists not of a handful of wealthy men but of thousands of simple people of moderate means whose hard-earned savings form the life-blood of private enterprise and have made this industry, among others, possible." Other industrial leaders have called attention to this misunderstanding in recent times; as long as it persists official policies toward private enterprise will be able to exploit envy and the dislike of privilege, in dealing with concerns which in reality are owned jointly by the middle classes.

Mr. Tata divided the history of Indian commercial aviation into two periods: the pioneering years from 1932 to 1940 when the industry enjoyed the freedom to develop slowly but steadily; and the postwar years of "tragic mistakes." The problems of the latter period were dominated by the technological advance of aeronautical engineering: bigger, faster and more expensive aeroplanes were available and, being available, had to be bought by air companies that wished to hold their own in competition. Sir Frederick Tymms at this stage produced a plan for the orderly expansion of commercial aviation, under Government supervision, which required that three or four companies be licensed and each allotted route mileage adequate to enable it to function efficiently. The Transport Ministry rejected this proposal and

BRITISH LABOUR'S NEW POLICY STATEMENT AGREEMENT WITH Tories ON ECONOMIC AIMS

THE British Labour Party has issued a new policy statement. It has, subject to its approval at the party's annual conference in late September, some international significance, for it shows in rough outline how the Opposition's policy-makers view the position of Britain in the world at large and how they would change the economy of this trading nation. If not immediately relevant, because (despite recent rumours to the contrary) no general election is pending, the ideas expressed could take practical effect before long. The Conservative Government's slender parliamentary majority has proved itself quite workable for more than a year and a half, but it remains slender, and there were signs of a leftward tendency among the electorate in the recent municipal elections. Shorn of its incidentals, the new programme presents one remarkable fact, that there is broad agreement between the two big political parties on the general direction of Britain's economic policy. Dependence on American aid, and even on American trade, must be diminished. British industries, especially those which supply goods in worldwide demand, must be speedily re-equipped. The economic development of the Dominions and colonies must be hastened by larger export of British capital and capital goods. The essential of the policy is in the words: "If we are to achieve independence of American aid, it must be through joint planning with the rest of the sterling area and in co-operation with Western Europe." When it is added that imports from the dollar area may have to be further restricted until exports of sterling goods to the dollar area can be substantially increased, and that trade with other non-dollar territories must be encouraged, the programme bears a striking resemblance to that of the Commonwealth Prime Ministers, as brought up to date during their recent meetings in London.

There is another important similarity in the major parties' programmes: neither of them lays down clearly how these objectives can be attained. The problem is to find enough resources for development on the scale required, without either lowering living standards or curtailing expenditure on defence. It cannot be claimed that the present Government has solved this problem. Aided by the general reduction of import prices, it has maintained the standard of living in general and even improved it for the middle classes. But it has not yet provided savings at the rate needed for investment in Britain and the Commonwealth. The Labour Party's executive boldly asserts that improvement in living standards must be "postponed"; but its ambitious capital programme would in fact require a substantial reduction of real spending by the public, effected either by voluntary personal saving or by forced national saving by taxation and budgetary surpluses.

It is in their practical—essentially their financial—application that the two parties' policies must obviously diverge. Financial opinion in London is satisfied that the policy of Mr. Butler as Chancellor of the Exchequer, monetary discipline, is the right policy for the present situation. The question in the City is whether it is being applied sternly enough. But in the Labour Party's promise of "an adequate supply of risk capital at cheap rates" there is an ominous reversal to the "easy-money" policy with which Dr. Hugh Dalton brought the country near to disaster, which Sir Stafford Cripps and Mr. Hugh Gaitskell halted, and which the present Chancellor finally reversed. The old inflationary policy appears again in the Labour Party's attitude towards expenditure, which the present Government has pruned, if not drastically cut: the Labour Party intends to spend more on the health services and on education, to restore the "welfare state" in its old form, in addition to its other formidable commitments.

By comparison, the policy for industry is cautious. On the political plane, the conflict over the Labour Party's policy always revolves round nationalisation, but the difference between the two parties in this respect has narrowed. The Conservatives are returning iron and steel and road transport to private ownership, but they are mainly content with state ownership of the railways, the airways, coal, telecommunications, and the central bank. The Socialists intend to re-nationalise iron and steel and road transport, but in other activities, mainly engineering and chemicals, they envisage competition between the State and private enterprise, or acquisition of inefficient units, rather than total nationalisation. There is also an intriguing reference to control of the resources of the insurance companies, which "dispose of about £3,000 millions and exert great influence on the distribution of investment."

These questions of controlling and allocating the nation's resources are certainly important, but they do not obscure the main problems, how to expand the resources and how to provide from available resources a large surplus for investment. Both parties recognise these problems, but their methods of dealing with them are dissimilar; and it is in the matter of control and allocation that the differences are most pronounced. The Conservatives are confident that free enterprise, duly supervised by the Government, can complete the nation's recovery. The Socialists require more regulation of free enterprise, though the executive, if not all the party's members, accepts private ownership as the economic basis of society. Whatever the methods used, the task is formidable, and it may be impossible for either party to fulfil within the confines of the cold war and rearmament, which the Labour Party explicitly accepts.

CURRENT COIN

Index of Industrial Activity.—Corrected for seasonal fluctuations Capital's Index of Indian Industrial Activity shows a drop of 0.7 points between December, 1952 and January, 1953. Contributing to the fall were declines in the output of cotton, jute, cement, coal and electricity while advances were registered in the production of steel ingots, pig iron and paper. Notes in circulation also showed an increase.

Import Surplus Continues.—In the first two complete months of the new fiscal year, for which provisional figures are now available, it appears that the country is still running a heavily adverse trade balance, at least on sea and air account. The first rough estimate of the deficit in April was Rs. 19.77 crores and in May Rs. 17.05 crores. These figures confirm the impression that exports have been moving very slowly in the last two months, though it is too early to accept the conclusion they seem to point to—that trade results so far this fiscal year are worse than last. India's trade balance during the full fiscal year ended in March 1953 was again adverse but the gap was about half as large as in the previous year. This improvement was accomplished at a reduced level of trade, both imports and exports having fallen sharply from 1951-52. Only part of this decline was due to the fall in prices; there was a decline in the physical volume of goods entering into the country's external trade. Exports fell to Rs. 556.78 crores from Rs. 715.56 crores in 1951-52. Imports fell to Rs. 632.95 crores from Rs. 862.84 crores. The net result was that the balance of trade deficit declined from Rs. 147.28 crores to Rs. 76.17 crores. As announced before, the fall in exports was due largely to the lower value and volume of jute goods and tea shipped. Jute goods exports fell in value from Rs. 269.96 crores to Rs. 129.06 crores; tea exports from Rs. 93.36 crores to Rs. 80.30 crores. Part of the fall in receipts on account of jute goods was the result of the reduction of the export duties which came into effect during 1952. These falls were only slightly compensated for by increases on account of metallic ores and scrap (from Rs. 18.55 crores to Rs. 36.99 crores), raw cotton and cotton waste (from Rs. 21.02 crores to Rs. 28.94 crores) and cotton yarn and manufactures (from Rs. 58.10 crores to Rs. 69.32 crores). Imports were uniformly lower, the heaviest falls occurring, as was expected, in food and raw cotton. Favourable crops at home and the large carry-over from the heavy imports in the previous year enabled expenditure on these two classes of imports to be cut back.

Soap and Synthetics.—The problem of reducing costs in the manufacture of soap in order to face competition—which was discussed at a recent meeting of the Indian Soap and Toilettries Makers' Association—is not confined to the soap industry in India alone. In more advanced countries a new and formidable competitor has arisen in the form of synthetic detergents, whose prospects were discussed by Sir Geoffrey Heyworth, chairman, at the annual general meeting of Unilever Limited in London recently. He said that in a world where living standards were expected to improve, the markets for soap would continue to expand, and it was in this light that the competition between soap and synthetic detergents should be considered. He did not think the latter would come into extensive use in countries where mass purchasing power was low, such as India and West Africa, and where washing habits were so different. Although soap powders had largely superseded hard and soft soaps in Europe and North America during the last 50 years, they had made little or no headway in Asia and Africa. "The reason a utensil such as a kitchen copper or bowl, whereas hard soap can be rubbed directly on the not possess the necessary washing equipment. They do their washing in rivers, and hence soap

has to be rubbed on to the clothes... Powders, either soap or synthetic, are of little use here, and we have yet to discover how to make an effective and cheap synthetic tablet." Although in advanced countries synthetic detergents might become an increasingly powerful competitor with soap, "the growth of blended synthetics had tended to lessen the traditional dependence of the soap industry on oils and fats and this has undoubtedly helped to ease the scarcity of oils and fats which prevailed for some years after the war. The new products have created a demand for important new chemicals. With their new interest in the production of materials for the manufacture of blended washing products, the chemical industries have become potential competitors to the original soap industry, and soap manufacturers have the opportunity to extend into chemical manufacture. Above all, blended synthetic detergents have made the soap industry as a whole more dynamic. They have created new and fundamental problems which require the industry to re-examine its methods. This may well lead to greater possibilities of expansion."

Indo-British Trade Shrinks.—The substantial surpluses India had been showing in her trade with Britain since devaluation contracted to £2.4 million in 1952; the latest figures contained in the U.K. Trade and Navigation Accounts suggest that this trend continues, for between January and April 1953 this country actually had a deficit of £2.85 million (in the corresponding period of last year there was a surplus of £7.34 million). Both exports and imports contributed to the decline in the total value of trade passing between the two countries. Over the two four-month periods, India's exports show a disquieting fall of £14.32 million (from £48.8 million to £34.48 million); this was accompanied by a much smaller contraction of £4.13 in her imports (from £41.47 million to £37.33 million). Mainly responsible for the decline in this country's exports were jute manufactures (from £8.04 million to £1.42 million) and tea (from £20.74 million to £14.55 million); exports of the former in April this year were about half the April 1952 figure. Other notable declines in exports during the first four months of this year as compared with the corresponding period of last year took place in non-metallic mineral products and quarry products excluding coal; manufactures of oils, fats and resins; tobacco; and seeds and nuts for oil, oils, fats, resins and gums. More leather and manufactures were exported, as also was the case with raw cotton and cotton waste; coir mats and matting; non-ferrous metallic ores and scrap (mainly manganese ore); and woollen and worsted yarns and manufactures. Of the 322,391 tons of machinery (to a value of £138,687,000) Britain exported all over the world in the first four months of this year, 30,901 tons—or nearly one-tenth—to a value of £12,166,000, came to India. India got nearly twice as much textile machinery as any of Britain's other customers—6,213 tons to a value of £2,768,000. Electrical machinery is also a big item and during the four months Britain sent India 1,087 tons of generating sets and generators (to a value of £699,000), 594 tons of motors and parts (£266,000), and 3,257 tons of electrical machinery of other descriptions (£1,569,000). Her metal-working machine tool exports to this country amounted to 1,930 tons, worth £749,000, and mechanical handling equipment 1,810 tons worth £457,000. Second on the list, after South Africa, of Britain's customers for electrical goods and apparatus, India took worth of telegraph and telephone equipment. Britain exported to India was over twice the corresponding figure of last year. Her vehicle exports to India were valued at £4,718,000. Among the four months were £2,441,000 worth of chemicals, drugs, dyes and colours, £1,900,000 worth of woollen and worsted yarns and manufactures, and £1,968,000 worth of miscellaneous articles wholly or mainly manufactured.

World Commodity Prices.—The steady fall in international commodity prices, which caused so much anxiety to raw material producers, appears to have been halted, but with the uncertainty has by no means yet been removed. Some interesting comments on the subject are to be found in the latest report of the Bank for International Settlements, which is usually well informed and is, of course in a good position to express fairly authoritative opinions. It points out that the global supply of raw materials would not be able to keep pace with the demands of expanding industrial capacity, have disappeared. "At the present moment," the Bank continues, "when though the rearmament effort is at its height, it is not surprising that people should be beginning to wonder whether there was not after all some

justification for earlier fears of over-production; there has even been a tendency to hark back to the memories of the great economic depression of the 1930s." Looking for reasons, the Bank suggests that the world's resources of substitute materials, both natural and synthetic, have turned out to be much greater than was at one time imagined. Another important development is the reduction in the amount of raw material required per unit of a finished product. However, in the case of agricultural products, the Bank accepts the current view that a great expansion of food output is urgently needed in the world to maintain an adequate food supply for the growing population. The Bank is impressed with the danger that the present price decline might revive what it calls the "slump complex" and lead to attempts to restrict production. "It is important that the need for more raw materials and foodstuffs should be fully appreciated," it is argued. "Several countries have not yet fully rid themselves of the economic malthusianism which took hold of them in the 1930s and which was, if anything, intensified by wartime measures."

Wages Policies.—The Institute of Cost and Works Accountants, meeting recently in London, has done a useful service in surveying, with a critical professional eye, wages policies, incentive payment systems and the mathematical consequences of payment by results. The discussions were concerned mainly with the apparent chaos in the British wage system, but the conclusions reached are disinterested, unprejudiced and frank, and therefore may prove of value to the consideration of allied circumstances in other countries. The Institute finds that a national wages policy is generally desired but it is most unlikely that such a policy would be accepted or would work. One of the most important "underlying principles" which determine wage rates—"the law of supply and demand in a free labour market"—is no longer fully effective because of national wage agreements, wages regulations, and Government restrictions on the transfer of labour from one industry to another. Attempts to "counter the lack of desire to earn above certain levels," a lack of desire which the Institute attributes to "high direct taxation," do not seem to have met with much success. These conclusions are generally unfavourable to the idea of a national wages policy and cast doubt on the theory that the present national call for greater production "will produce results. The Institute records the present tendency towards nation-wide agreements, but wonders whether it is wise. There is "a noticeable striving" to this end. There is "a danger of the danger of despotic authority, and such authority, whether exercised for good or evil, would constitute a threat to individual freedom and privilege." The Institute notes that national agreements are frequently disregarded by the workers and that "no trade union, for all its power" has ever been able to prevent workers from restricting production if that is what they want to do. The Institute has also observed that workers whose wage rates are tied to the cost of living have, on the whole, prospered more than their colleagues whose wages were not so regulated. Because of this, and because of the disparity between the rise in wage rates and the rise in retail prices, the Institute doubts whether the call for higher production can meet with any realistic response. "The Government has asked for increased productivity but has stated that wages must not be allowed to rise unless output increases at the same time. This does not mean that the Government is averse to any form of wage rise but an increase which has the effect of raising the labour cost of the commodity produced would be contrary to present economic policy. Mere exhortation is not enough, however, nor does it appear to be producing any marked results in the way of greater individual production." The Institute believes that incentive schemes, if they are to work, must conform to a number of principles. One of them is that the incentive "should not be affected by matters outside the employee's control." Another is that the incentive should be "reasonably permanent and not just a device to be used by the employer when he is busy and dropped when he is not."

Industrial Disputes in April.—Provisional statistics on labour disputes released by the Labour Bureau show very little overall change in April from March. There were 67 disputes involving 48,218 workers and resulting in a loss of 212,630 man-days. There was a slight fall from March in the number of man-days lost, and the average duration of disputes fell from 5.6 days in March to 4.4 days in April. Four of the disputes resulted in lock-outs, affecting 636 workers and resulting in a time-loss of 8,544 man-days; all these disputes were in West Bengal. There were 12

work stoppages not connected with industrial disputes; these involved 11,510 workers and resulted in a loss of 11,331 man-days. Eight of these stoppages were in Bombay and the rest in Madhya Pradesh. During the month 50 disputes ended, of which 38 had lasted not more than five days each. Wages, allowances and bonuses were the main points of dissension in 18 cases, while grievances relating to personnel accounted for 33 disputes. Sixteen disputes ended in complete or partial success for the workers while in 18 cases the workers were unsuccessful; the results of the other disputes were either indefinite or unknown. Industries recording smaller time-losses included textiles other than cotton, food, drink, tobacco, wood, stone and glass, paper and printing, and transport, including the railways. Mines and plantations recorded no time-loss during the month.

Sindri's Accounts.—There will be general agreement with the view expressed by Mr. A. K. Chanda, chairman, at the annual meeting of Sindri Fertilizers and Chemicals Ltd. in New Delhi last week that the working of the Sindri fertilizer factory has on the whole been satisfactory. From 16th January, 1952, to 31st March, 1953, the company made a net profit of Rs. 95,882 after allowing Rs. 1.60 crores for depreciation and writing off Rs. 26.37 lakhs of development expenditure; nothing has to be paid by way of taxation. Working at the factory is not yet normal by either of the tests Mr. Chanda suggested: the target of full production has not been achieved nor costs brought down to the extent they should be. The shortage of Rs. 27 lakhs' worth of raw materials shown by the stock verification at the end of the financial year is deplorable and deserves fuller explanation. There is a certain imbalance in production facilities, maintenance arrangements are inadequate, and the technical efficiency and productivity of labour have been below expectations. But these, said Mr. Chanda, are "teething difficulties" and "it will not be long before target production is attained and consistently maintained." Costs have been brought down and "will be further reduced." Marketing is not yet the company's responsibility but has caused more worry than anything else; Mr. Chanda's criticisms on this score were far too mild when he said that "drought, financial difficulties in the consuming States and imperfect and unsatisfactory distribution arrangements made by them, all contributed to the off-take in 1952 falling far short of allocations. Heavy opening stocks in the hands of State Governments have also created complications for the marketing of the 1953 production." However, it is reassuring to hear that "we have not allowed the accumulations of stock to interfere in any manner with the growing momentum of production activities." Mr. Chanda hopes that a scheme will be evolved for Sindri to market its own output from the beginning of next year. Meantime there is need to explain India's reported decision to increase her imports of ammonium sulphate under the Indo-U.S. Technical Co-operation Scheme from 88,000 tons to 114,750 tons.

Life Insurance and the Slump.—In his chairman's address at the annual general meeting of the Hindustan Co-operative Insurance Society Ltd., Kumar K. C. Mullick discussed the impact of the business recession on insurance in eastern India, where the Society's interests are centred. He said that "throughout the year, at different points of time, the country's three major industries—jute, textiles and tea—remained depressed," conditions in the first and last of these particularly affected the Society. Business became more difficult to procure and "in the increase in the volume of loans, lapses, surrenders and paid-ups we had evidence of the economic distress among the middle class people on a large scale." The company nevertheless managed to secure more new business, "but in our view the improvement is not in line with the usual progressive tradition set up in the past in this regard by Hindustan." Although the Society has lowered both its renewal expense ratio (from 14.89 percent in 1951 to 14.71 percent) and its overall expense ratio (from 27.9 percent to 27.6 percent), Kumar Kartick Churn mentioned some of the difficulties life offices were facing in this connection. Expenses have tended to rise because business is more difficult to get and also because of higher staff salaries and dearer stationery, printing, etc. In common with the chairman of most insurance companies, he emphasised the need to exempt life policies under the Estate Duty Bill. The Society's results for the year ended last December are satisfactory, the total of new business being Rs. 16.39 crores as against Rs. 16.29 crores in 1951. The premium income rose from Rs. 3.72 crores to Rs. 3.94 crores, and the Life Assurance fund was better at Rs. 19.73 crores as against Rs. 17.61 crores. The distributable income is Rs. 80,597 to which is added Rs. 2,00,677 brought in. Meeting all charges and transferring Rs. 24,250 to the general reserve, there is a balance of Rs. 1,25,879. The dividend has been maintained at 10 percent, leaving a carry-forward of Rs. 57,595.

though dated 20th May, well before the Coronation, also showed inflationary signs. The supply of bank money had increased by about £60 million in three months whereas in the same period of 1952 it remained practically unchanged.

The Coronation statistics that can be neatly disentangled from other economic facts are those of minor importance. Official expenditure (mostly by local authorities) on stunts and decoration probably exceeded £10 million; to which a large but unassessable sum must be added for private efforts. Expenditure on alcoholic drink, normally about £15 million a week, was probably doubled in the week or so around the Coronation; the greater part of the money so spent comes to the Government through the excise duty. Oversea visitors' expenditure attributable to the Coronation is possibly about £10 million. There is a considerable net "invisible" financial benefit included in that figure; and "visible" benefit amounting to some millions of pounds must have accrued from the export of souvenirs of one kind and another.

There would seem, therefore, to be no immediate cause for anxiety in the kind of carefree spending that has characterised the Coronation month. But it has to be observed that the biggest item by far in the whole Coronation reckoning must be the loss of production due to the extended festivities. When the home market is buoyant a short-fall of production cannot be contemplated calmly.

THE CALCUTTA MONEY MARKET

CREDIT STRINGENCY PERSISTS

Wednesday, 24th June. MONEY is still tight in Calcutta, although some banks say that the position has been somewhat less acute in the last three days. R-payments are coming in steadily; sugar advances have fallen satisfactorily and the jute mills do not seem to have been doing any more buying. The upset caused by flotation of the 1961 loan has subsided; stages have liquidated and the loan has passed into the hands of investors. Nevertheless conditions here are not as easy as in Bombay where rates have been reduced. In the Calcutta interbank market overnight money quotes 2½ per cent and call money 3 per cent.

Apart from small gunny bills, there have been few export documents passing in the exchange department. Remittance has been fair. The principal exchange rates are unchanged.

Tenders for the offer of Rs. 1 crore of three-month Government of India treasury bills, which were opened on 23rd June, amounted to Rs. 2,90,25,000. Tenders at Rs. 99-6-6 per cent were accepted in full and those at Rs. 99-6-3 per cent approximately 21 per cent; the average rate of acceptance being unchanged at Rs. 2-6-6 per cent per annum. Tenders for another Rs. 1 crore of treasury bills will be received up to 11 a.m. on Wednesday of next week at Bombay, Calcutta, Madras, Delhi and Kanpur. During the week ended 19th June, treasury bills for Rs. 5,97,25,000 were sold in favour of the Reserve Bank of India.

The bullion market ruled dull and fluctuations were narrow in the absence of activity. Silver was almost unchanged at Rs. 159-8, while the ready rate fetched a premium of Rs. 1-8. The price also continued unchanged at 74d. in London and at 63½ cents in New York.

Gold was also quiet and the price fell from Rs. 92-4 to Rs. 92-12 on profit-taking. The sovereign at Rs. 59-4 showed a loss of 4 annas.

A sharp fall of Rs. 13.12 crores in notes in circulation to Rs. 1,54.37 crores was the outstanding feature of the return of the Reserve Bank of India for the week ended 19th June, 1953, while the total note issue rose by Rs. 3.85 crores to Rs. 1193.81 crores. Notes held in the Banking Department consequently improved by Rs. 16.97 crores to Rs. 39.44 crores. The expansion in the currency was covered by raising rupee coin from Rs. 86.93 crores to Rs. 90.73 crores. In the Banking Department, deposits of the Government of India and other Government accounts increased by Rs. 6.74 crores and Rs. 83 lakhs to stand at Rs. 130.83 crores and Rs. 13.34 crores, respectively, because of good tax collections. Balances of commercial banks were up by Rs. 28 lakhs to Rs. 42.26 crores. Balances held abroad improved by Rs. 21 lakhs to Rs. 102.07 crores. The item of other loans and advances fell from Rs. 37.82 crores to Rs. 32.52 crores of which advances to scheduled banks against usance bills totalled Rs. 17.84 crores against Rs. 19.19 crores. Investments fell fractionally by Rs. 6 lakhs to Rs. 89.70 crores. Ways and means advances were shown at Rs. 3.30 crores (Rs. 3.66 crores).

The return of the Imperial Bank of India for the week ended 12th June, 1953, shows a fall of Rs. 1.38 crores in total deposits to Rs. 208.64 crores. Investments in Government Securities are up by Rs. 4.89 crores to Rs. 75.02 crores, while other authorised investments remain unchanged at Rs. 10.57 crores. Loans, cash credits and overdrafts, and bills discounted and purchased have increased by Rs. 62 lakhs and Rs. 2.44 crores to

aggregate Rs. 106.75 crores and Rs. 27.27 crores, respectively. Cash and balances are, in consequence, shown at Rs. 15.71 crores or Rs. 1.13 crores higher.

The statement of position of Scheduled Banks for the week ended 12th June, 1953, discloses Demand and Time liabilities at Rs. 521.94 crores (Rs. 11.07 crores on account of borrowings from Banks) and Rs. 324.15 crores (Rs. 1.93 crores) compared with Rs. 529.54 crores (Rs. 11.13 crores) and Rs. 323.53 crores (Rs. 1.93 crores), respectively in the previous week. Cash has increased by Rs. 76 lakhs to aggregate Rs. 32.54 crores, while balances with the Reserve Bank have decreased by Rs. 46 lakhs to stand at Rs. 39.83 crores. There is a rise of Rs. 12.17 crores in investments to Rs. 312.40 crores. Advances and bills discounted at Rs. 529.72 crores reveal an increase of Rs. 61 lakhs. The ratios to total liabilities of cash and balances, and of advances and discounts are, in consequence, shown at 8.6 per cent and 62.6 per cent against 8.4 per cent and 62.0 per cent.

The Government of India has decided to discontinue the further issue of 5-Year Post Office National Savings Certificates with effect from the close of business on 30th June, 1953. The Government has also decided that, until further orders, the holders of 5-Year Post Office National Savings Certificates may be allowed, at their option, to hold these certificates after maturity for a further period of seven years.

The provisional figures of foreign Sea and Airborne Trade of India on private and Government accounts during May 1953, according to data so far available in the Department of Commercial Intelligence and Statistics, Calcutta, are as follows: Merchandise, excluding transit trade of Pakistan but including that of other land frontier countries: Exports—Rs. 38.97 lakhs; re-exports—Rs. 69 lakhs (transit trade—Rs. 1 lakh); imports—Rs. 56.70 lakhs (transit trade—Rs. 1 lakh); total trade—Rs. 96.36 lakhs. Treasure: Exports (including re-exports) of currency notes—Rs. 15 lakhs; others—nil; imports of gold and silver—Rs. 1 lakh; of currency notes—Rs. 150 lakhs; others—negligible. Balance of trade: The merchandise import figures are exclusive of the value of certain consignments of Government Stores awaiting adjustment. Subject to this deficiency in import figures and to the exclusion of figures for transit trade, the total value of exports (including re-exports) of merchandise, gold and silver fell short of imports by Rs. 17.05 lakhs.

According to the returns received in the Department of Commercial Intelligence and Statistics, the total gross Sea and Land Customs Revenue collected in India during the month of January 1953, amounted to Rs. 1,238 lakhs as compared with Rs. 2,049 lakhs in the corresponding month of the previous year. The comparisons should be taken to refer to that of the current figures with those of the corresponding period of the preceding year. Of the total customs revenue collections, import duties accounted for Rs. 894 lakhs as against Rs. 1,289 lakhs, export duties for Rs. 320 lakhs as against Rs. 723 lakhs and land customs and miscellaneous for Rs. 24 lakhs as against Rs. 37 lakhs. The total gross collection of Union Excise duties amounted to Rs. 613 lakhs as compared with Rs. 789 lakhs. During the ten months, April 1952 to January 1953, the grand total of gross Customs and Union Excise Revenue realised was Rs. 21,702 lakhs as compared with Rs. 27,065 lakhs during the corresponding period of the preceding year. Of this amount, import duties accounted for Rs. 9,951 lakhs as against Rs. 11,726 lakhs, export duties for Rs. 4,656 lakhs as against Rs. 7,454 lakhs, land customs and miscellaneous for Rs. 331 lakhs as against Rs. 369 lakhs and Union Excise duties for Rs. 6,764 lakhs as against Rs. 7,516 lakhs.

The Government of Pakistan floated two new loans viz., the 3% Loan 1961 on 15th June, 1953. The subscription lists in respect of the loans were closed on 17th June. Preliminary figures indicate that subscriptions to the two loans amount to Rs. 46.62 crores out of which Rs. 17 crores are in cash and the remainder by conversion of the 2½% Loan 1953-54. Of the two loans, subscriptions to the 3% Loan 1958 amount to Rs. 24.56 crores and to the 3% Loan 1961, Rs. 12.06 crores.

"YOUNG Mookerjee", I once wrote in this column (this was in one of my earlier incarnations, in November 1923), "is to qualify as a lawyer, but it would be a pity if he did not cultivate his flair for journalism, which is conspicuous. Mr. S. P. Mookerjee is distinguished by his clarity of style, his fund of information and the logic of his criticism. He is a credit to his father". Shyama Prasad Mookerjee had just taken his M.A., at the age of 22, from the university with which his family was so closely associated, and was casting about for a career. His father Sir Asutosh, then Chief Justice, suggested that he join the staff of Capital, and indeed he did for a short time, until academic work and politics began to exert the influence over him that decided his later career. Even then he continued to write for this newspaper, under the pseudonym "The Chela". Chela means disciple and the reference was to his connection with Pat Lovett, then Editor of Capital, whom he acknowledged as his first guru. The clarity, information and logic which drew notice at that time never deserted him, and as the years passed he acquired another leading quality, which much impressed me when I met him almost three decades later—a gracious good humour which one would have expected in a man who held his political opinions so fervently.

No one man contributed so much to the democratic atmosphere of postwar Indian politics as Shyama Prasad Mookerjee. This was not because he was more brilliant than the men inside the Congress Party, but because he was the only brilliant politician outside the Congress Party and he thus provided the passion and principle in opposition that are as much the life of democratic procedure as governmental integrity. I know I am repeating what has been said many times in the last few days since his death when I say that though one often disagreed strongly with what he stood for, one could seldom with his hold respect and admiration for the man and his methods. This bears repetition, for it is unusual in political life and yet all of Shyama Prasad Mookerjee's adversaries felt it, even on those occasions when he dissociated himself most from policies that had the general support not only of the Congress but of most people outside it. Even those who hold, as I still do, that his most solemn political action in recent years—his resignation in protest against the Nehru-Liaquat pact—was entirely mistaken, might now admit that the country was none the worse off for the critical examination he gave the agreement and its implementation. But he made his deepest impression on Indian national opinion in the last years of his life, when he led the opposition in the House of the People and often gave its proceedings an interest and dignity they might otherwise have lacked. His life, and his death, repeat the lesson that a democracy does not reserve its approbation, nor the people its respect, for members of the governing party alone; there is high honour to be won in opposition too. This is an important lesson for young talents in a country where the traditional leadership sometimes shows signs of age and complacency, and where constitutional political thought tends too easily to a stereotyped party pattern.

The Howards—the late Sir Albert Howard and his first wife Gabrielle Caroline Matthaei—were described in their time as the Webbs (Sidney and Beatrice) of India. Howard was the first Imperial Economic Botanist and his wife, who was a fully

A DITCHER'S DIARY

qualified research chemist, was first appointed his personal assistant and later Second Economic Botanist to the Government of India. In large measure they were responsible for the development of the Agricultural Research Institute at Pusa, now world famous for the breed of its wheats. They planned and founded the Institute of Plant Industry at Indore, though Mrs. Howard (Howard had not then been knighted) did not live to see the project reach full fruition. She died in 1930 and a year later Sir Albert married her younger sister Louise, also a scholar of distinction. Lady Louise Howard has now written a book about the work of her husband and sister in India under the title of *Sir Albert Howard in India* (Faber & Faber 21s.). If unexciting, it is an interesting story of clear thinking and hard work in a scientific field in which results are inevitably slow in maturing. But the Indore process of composting stands as a permanent memorial to Howard's labours, in which he never allowed either himself or his colleagues to forget that the peasant was the living repository of the agricultural wisdom of the ages and that the findings of research could not always be related to the limitations inherent in peasant cultivation. There were, he maintained, good reasons in the Indian soil for preferring shallow cultivation to the deeper tillage in vogue in Europe and he contended that, despite the Indian peasant's lack of formal education, he was receptive to ideas because "he started from a base line of familiarity with the facts". In spite of the great name gained for Pusa wheats, and the immense success of the Pusa work generally, neither Howard nor his wife were fully satisfied that the fundamental question of relations with the agricultural population was being handled in an enlightened or imaginative way, and that is why he went over to Indore where the work was launched entirely on his own lines. He was clearly an individualist but he was also a man with a purpose, in which he succeeded largely because he kept constantly before him the needs of the peasant with his fragment of land and limited equipment.

Though the highest point of Nepal's mountainous terrain has now been trodden, much of the rest of the country remains relatively unknown. This is being put right by a much more modest expedition than the one that scaled Everest; it is led by Toni Hagen, a Swiss scientist assisted by a dozen Nepali sherpas. He is preparing a geological survey of the country by traversing it along north-south lines less than 10 miles apart. So far he has covered a total of nearly 2,000 miles on foot to make 12 such cross-sections of the country, and he expects that it will take him until late in 1956 or early in 1957 to complete his task. Mr. Hagen experiences all the difficulties associated with climbing expeditions, without having their advantages in the matter of organisation and reserves of manpower. Nevertheless, he is optimistic about the work he is doing. Since he started the survey, according to a report he has submitted to the U.N. Technical Assistance Administration by whom he was assigned this mission, "nine mines have been examined and four special reports concerning road construction, hydro-electric dam projects and water supply for the capital have been handed over to the government." "Nepal," he goes on "is a virgin country from the geological standpoint. The production of geological maps, well backed by proper scientific interpretation, will be a first step towards

the development of mineral and other resources." He adds that he has already discovered "some quite new aspects of Himalayan geology" which are "of high scientific interest."

Since referring here some weeks ago to the publication of the *Black Market Year Book* for 1953, I have been able to look into a copy. Look into, not buy. The volume is priced at \$25.00, which seems a very suitable price for a book about black markets but one that will raise dollar-gap problems for readers, whose income is derived from largely legal sources. The author, Dr. Franz Pick, dedicated the work, you may recall, to "the legislators of 60 countries who, in order to maintain the fictional values of paper money, government bonds and gold, are the real promoters of black markets." *The Banker*, rather unkindly, has said: "Whitehall has not had many books dedicated to it, and it should study this one long and hard". I do not suppose our Indian governments have many books dedicated to them either, and before they impose their next set of controls they might spend some time studying Dr. Pick's collection of facts. He shows that black markets thrive in any ideological climate; they flourish as well in Kiev as in Kansas. All they require for sturdy growth is a sufficiency—and preferably an excess—of government controls. The black market in Russian roubles (the official exchange rate is four roubles to the dollar) was moving last year around 22 to the dollar, a slight weakening from the rate of 21.50 in 1951. The most active illegal markets in the United States are in non-ferrous metals and steel, but the favourite metal of the shady dealers and smugglers remains gold. The *auri sacra flamma* at unofficial prices shows no signs of abating, and Dr. Pick estimates that at the end of last October private gold hoards around the world amounted to no less than \$11,900 millions. Of this \$4,000 millions is hidden in the stockings, safes and gardens of thousands of Old Goliaths in France. The rest of Europe has about \$2,100 millions in hoarded gold, while Asia which has been maligned as the "sink of the world's gold" has a mere \$2,000 millions tucked away against a rainy day. Hoarders show a strong preference for gold coins over gold bars and the premium on coins has led some enterprising dealers to cater for this preference by establishing private mints, of which at the end of last year there were two in Northern Italy and one in Damascus producing a combined monthly total of \$6 million in gold coins. Dr. Pick shows that the profits of black marketers are by no means always commensurate with the risks they run, but they do well enough out of it to make it undesirable for governments to subsidise them further by multiplying controls.

The critics of gobbledegook (also known as bafflegab) do not always practise what they preach. The British General Post Office lately sent its staff a leaflet on the virtues of simpler style in official communications, which contained the verse:

"Of clues to writing, well, the chief
Is this: Be clear, polite and brief.
If clear and civil, shorter's better
In word, phrase, sentence, minute, letter."

The reference number of this poetic epic was: E43547 Wt. 63979-44675 45,000 (2) 2/53 Gp.8.

Company Meeting

AIR-INDIA LIMITED

MR. J. R. D. TATA'S FAREWELL ADDRESS TO SHAREHOLDERS

"The nationalisation of air transport brings to a close an era of twenty-one years, during which from small beginnings the Indian air transport industry grew into the far flung domestic and international system of today," observed Mr. J. R. D. Tata, Chairman of Air-India Limited, addressing the last of the Annual General Meetings of the Company in Bombay on 22nd June, 1953. "As it is fashionable in some quarters to decry free enterprise, let it be remembered that the highly developed Indian air transport system which Government are acquiring ready made and at small cost was built up by private enterprise in spite of the many difficulties and restrictions placed in its path."

"While giving full credit to all those who, by their hard and devoted work, sometimes at the cost of their lives, were mainly responsible for the growth and splendid record of Indian aviation, let us also remember the investor, the all too often forgotten man without whose support the industry could not have come into being. Judging from some of the speeches made in Parliament and elsewhere there seems to be little awareness that the investing public consists not of a handful of wealthy men but of thousands of simple people of moderate means whose hard-earned savings form the life-blood of private enterprise and have made this industry, amongst others, possible."

"Ignorance and misunderstanding have so grievously distorted the air transport picture in the post war period, that I feel I must make an effort on this last occasion to correct it."

Chequered History

Mr. Tata then traced the history of Indian air transport which he said could conveniently be divided into two clearly defined periods separated by World War II. "The first, from 1932 until 1940, was a hard but satisfying era of pioneering during which the industry, enjoying freedom of decision and action, grew slowly but steadily. "The second period," said the Chairman, "from 1946 to the present day has been marked by tragic mistakes and presents many valuable lessons for both the private and public sectors of industry."

The post-war period was influenced at the start by two important factors. The availability of larger and more efficient transport aircraft and Sir Frederick Tymms' excellent post-war plan of orderly development under State control, which would have been favourable to the industry were turned into instruments of its ruin. It was also pointed out by Mr. Tata that the fundamental requirements under the Tymms plan, which contemplated the licensing of only three or four airlines each with adequate route mileage, were rejected by the then Minister for Communications, Mr. Abdul Rab Nishtar, and a ruinous scramble for route licenses by a large number of concerns created almost overnight. Instead of three or four strong companies, no less than fourteen companies with capital issues far in excess of requirements were initially licensed and sometimes as many as three companies were given licenses on the same or substantially the same routes.

As an illustration, Mr. Tata recounted what happened on the vital Bombay-Calcutta route. Government began by licensing two operators on this route, one of them being Air-India, and later added a third. When one of these two collapsed, Government went out of its way to revive the defaulting operator and re-licensed him and when he failed again, licensed a third.

Enquiry Committee

Referring to the glimmer of hope engendered by the appointment of the Air Transport Enquiry Committee in 1949, Mr. Tata said that it was short-lived and the authorities' intention to disregard the Committee's criticisms and recommendations and to continue their previous policies soon became evident.

"By the middle of last year," continued Mr. Tata, "it became obvious that drastic measures would have to be taken if the country's air transport system was to be saved from collapse and placed on a sound foot-

ing. It must be said to the credit of Mr. Jagjivan Ram, the present Minister for Communications, that on taking over the portfolio of Communications from his predecessor, he quickly appreciated the need for decisive action. Where Government made a serious mistake, in my opinion, was in deciding upon complete nationalisation—and that too without giving the industry a hearing—and in refusing even to consider an alternative plan prepared by your Company. Based on the Air-India International pattern of joint private and State enterprise, it offered, in my opinion, a better and fairer solution of the problem."

"Although no purpose can now be served by discussing the merits or demerits of Government's decision, I should like once and for all to correct the widely held impression that nationalisation was made inevitable by the airlines' inability to operate at a profit or to raise fresh capital for new equipment."

"First of all, with the possible exception of Australia which enjoys unique geographical and air-traffic advantages, the operating costs of Indian airlines, other than in respect of fuel and spare parts over which they have no control, are amongst the lowest in the world. If they are higher than they could or should be, it is mainly because of the low intensity of operation imposed upon them by Government's licensing and other policies to which I have previously referred. The exceptionally low costs achieved by one Indian company which, as I mentioned last year, has been allowed to operate on a high intensity basis, prove this point."

"Taking the industry as a whole, the main causes of its losses are to be found, not in high operating costs, but in the uneconomically low fares and mail rates and the crushing burden of fuel taxation imposed upon it. The level of first class passenger fares in Europe and America is about a third higher than in India, while the mail rates paid by the Indian postal authorities are about forty percent below those paid by the British Post Office to B. E. A. Furthermore, the abnormally low rates and fares enforced in India have remained substantially the same for five years in spite of mounting costs, while charges to the users of every other form of public service in the country have been substantially increased."

"As regards the petrol tax, the amount which Government have collected from the hard-pressed air transport industry over the last seven years, runs into many crores of rupees and actually exceeds the total price which they will now pay for the assets of the entire industry on nationalisation. The so-called subsidy granted by Government since 1949 has been nothing more than a partial and dwindling rebate on the petrol duty borne by the industry, and the relief so provided was, almost as soon as granted, offset by successive increases in fuel prices exceeding the value of the rebate. Even after deducting this rebate, Government collected Rs. 50 to Rs. 60 lakhs from the industry in 1952. In the face of these facts and figures the claim that the industry has been subsidised is difficult to accept. If the efficient and prosperous American air transport industry had to bear the petrol duty imposed on the Indian industry, it would make a loss overnight."

"If only three or four companies had been licensed as initially provided in Government's post-war plan, reasonable levels and if the industry had been subsidised in its heavy burden of taxation on fuel, it would have been in a flourishing condition and quite capable of raising the finance required to purchase new equipment."

Lessons for the future

"As the dismal chapter closes for ever, I hope that some of its obvious lessons will be appreciated by all concerned and kept in mind for the future: for instance, that the State enterprise should not rush into a new field without making sure that the total probable demand and that the industry will be allowed to function with a reasonable measure of freedom; that a detailed and realistic economic plan, once accepted by Government, should not be changed arbitrarily

without careful consideration at the highest level and without consultation with those concerned; that the appointment of high power commissions does more harm than good if their recommendations are to be disregarded as happened in the case of the Air Transport Enquiry Committee's Report. Finally, that safeguards instituted in the form of statutory authorities for control or license purposes should not be allowed to be destroyed by constant interference by the executive as happened in the case of the Air Transport Licensing Board. From the very date of its establishment, the Board was deprived of its freedom to exercise impartial judgment in its decisions and was subordinated to the wishes and directives of the officials of the Civil Aviation Department when appointed members of the Board. From then on, its proceedings had little meaning."

Valuation

Mr. Tata then turned to discuss the basis of compensation payable by Government to each Company under nationalisation, namely, the method of valuing aircraft. He said, "The use of the 'depreciation compensation' in the debate in Parliament and in the Act has created the wrong impression in some quarters that compensation will be paid to the nationalised companies in addition to a reasonable price for their assets. Such compensation, if payable at all, will be purely nominal, the maximum having fixed at Rs. 10,000, while nothing will be paid towards the heavy devalued expenditure incurred by the operators in the course of opening new routes, etc."

"The principle of paying the market value for assets compulsorily acquired is an old, well-proven and accepted one which has been invariably adopted by Governments in the acquisition of private property and in the disposal of their own. The fact that the purchase of creation by their owners has never upto now been allowed to invalidate this principle, as sale by Governments and public authorities. In the case of the nationalisation of the airlines, however, it is for Aircraft, Government have declined to take into internal price in India. As stated in the Directors Report, the nationalised companies will receive about five-fifths of the world price for their assets. For example, Skymasters and about fifty percent for Constellation Dakotas will be about half the Indian market prices. To that extent, therefore, the Government may legitimately be considered that the terms on which the air transport industry is being taken over contain an element of expropriation."

"Having said this, it is due from me to recognise valuation which the Minister for Communications, who piloted the Bill through Parliament and the Finance Minister resisted the pressure brought to bear on compensation. We are grateful for the stand they took."

Chairmanship of A. I. I.

"Before I leave the subject of nationalisation," observed Mr. Tata, "there is one personal matter to which I should like to refer. As you are aware, I have declined to remain as Chairman of the Air-India International after nationalisation. This in thus agreeing to remain associated with the industry after its nationalisation, I have let down free contentment, as a general proposition, it can hardly in the case of Air-India International as Government already have a dominant participation in its capital and direction. The main consideration, however, in a sense of duty, I refused to continue to make whatever contribution I could to the maintenance of the high standard and prestige which Air-India International has established in India and abroad. This consideration acquired greater force when I found that, in the face of considerable opposition, Government had accepted the recommendation I had made to them, on grounds of efficiency and administrative convenience, to keep the international airline as a separate corporation and to retain intact the name of Air-India International."

"In the circumstances, and having regard to the Minister's assurance that the Board of the Corporation would have the required freedom to manage its activities on business lines and that the interests of the staff would be adequately safeguarded, I believe you will approve of my decision to assume, in an honorary capacity, the somewhat onerous duties of Chairman of the International Corporation."

Bidding farewell to the officers and members of the staff of Air-India, some of whom had been with operations over twenty years ago, the Chairman said he was happy to know that their services would be retained in nationalised corporations whose success would now largely depend on their efforts and those of their fellow-workers from other airlines.

"And now my task is done. If I have dwelt at length on past events and misfortunes and if I have been forthright in directing criticism where I felt it was due, it is in no spirit of bitterness or rancour. I have done so, in laying down the stewardship of this Company's affairs, I consider it a duty to place from them lessons before you and to endeavour to draw Now that Parliament has expressed its will, we must me in wishing success to the two State Corporations which will henceforth carry the flag of Indian aviation."

The Chairman thanked the shareholders of the Company for the support and confidence they had given the management all these years.

"Grieved as I am that this venture to which I devoted so much thought, energy and time and for which Mr. Tata, 'has come to this end, my sorrow is tempered by the thought that our twenty-one years' endeavour has not been in vain, that the work we pioneered is being carried on and that in laying upon them the greater part of the present edifice, your Company and its predecessors, Tata Sons Limited, served the country well."

Stocks and Shares

RENEWED SUPPORT FOR GILT-EDGED

B. I. C. WEAKER ON RUMOURS OF CHANGE IN OWNERSHIP: IRONS AGAIN UNDER PRESSURE

Wednesday Evening.

AFTER a week of dull, restricted trading, the share market found two bearish talking points today in rumours of further labour trouble at the Indian Iron and Steel works, and rumours that the British India Corporation had passed into new hands. The labour position at Burnpur is reported to have deteriorated, with the spread of costly go-slow tactics to other departments. Irons fell back to Rs 24-10 after hours on the strength of this news. The rumour regarding BIC caused selling of that company's shares and of shares in sugar companies managed by its subsidiary Begg, Sutherland, but up to the time of writing could not be confirmed. BIC shares fell from Rs. 8-10 to Rs 8-3; three sugar companies in the group also met selling pressure of which details are given below.

Government securities were very steady in this week's trading. The small enquiry which was noticeable at the close of last week gained further strength and there were buyers of short and medium-dated loans, where previously sellers had predominated. The market ruled steady throughout the period, and at the close prices tended to higher levels. There was a good enquiry for 3% conversion loan 1946, and the price was marked up sharply from Rs. 82-1 to Rs. 83; the rise being assisted by a certain amount of bear-covering. Because of the approach of the interest date, 3% non-terminable loan 1896-97 also improved from Rs. 82 to Rs 82-10.

In short-dated loans, 3% 1957 and 3% 1958 were both better by 2 annas at Rs. 98-5 and Rs. 98-3, while 2½% 1954 and 2½% 1955 met with investment enquiry at their previous quotations of Rs. 98-9 and Rs. 98-6. In the medium-dated group, 3% 1959-61 was better at Rs. 96-3, and the new 3½% 1961 was improved to Rs. 96-6. Three percent 1963-65 and 3% 1964, after declining to Rs. 92-6 and Rs. 92-5 respectively, had buyers at these levels to recover to Rs. 92-8, in both cases. Four percent 1960-70 was unchanged at Rs. 102-6, but 2½% 1961, 2½% 1960, and 2½% 1962 continued to be offered at their previous quotations. In long-dated, 3% 1966-68 was an anna higher at Rs. 90-3, while 3% 1970-75 was dealt in at Rs. 86-8.

The news of fresh borrowing by certain States to the extent of Rs. 20 crores had a depressing effect on the provincial section. Four percent Bombay and Madras 1964 turned sellers to decline from Rs. 101 and Rs. 100-14 to Rs 100-7 and Rs. 100-8 respectively. Four percent U.P. 1954 was also taken lower to Rs. 100-6, while 4½% West Bengal 1964 had sellers at around Rs. 100-8.

Business in preference shares was again on a restricted scale owing to the paucity of sellers. In Jutes, Birla came to hand at Rs. 103, and Soorah were marked at Rs. 100 ex-dividend. Clive 'A' were done at Rs. 97, but Hukumchand were lower at Rs. 113-8. Among miscellaneous scrip, Indian Iron were steady at Rs. 106-8, and Kesoram were taken higher to Rs. 130. Textile Machinery 2nd were marked at Rs. 61-8, while Rohtas 'B' were quoted unchanged at Rs. 59 cum-dividend. Bharat Collieries came to hand at Rs. 49-8, and Karanpura Collieries were taken at Rs. 84. Humayun Properties were a shade lower at Rs. 10-14, and small lot of Bengal Timber were crossed at Rs. 90.

Bank shares ruled steady, with Imperial Bank Fully-Paid and Contributories fluctuating narrowly around Rs. 1350 and Rs. 450 respectively. United Commercial were a turn better at Rs. 36 and United Banks had ready buyers at Rs. 3-13.

In Railways, a solitary transaction was reported in Baraset-Basirhat at Rs. 17.

Little or no interest was taken in cotton shares. Cawnpore Textiles were unchanged at Rs. 9-1, and Kesoram were quoted at Rs. 1-5, and Benares were done at Rs. 2-12. Transactions were recorded in Swadeshi Preferred Ordinary and Ordinary at around Rs. 9-7, and a small lot of Basanti was done at Rs. 4-12.

The turnover in coal shares was moderate, but the undertone was quietly steady. Burrakur were turned over freely at around Rs. 10-2 and both Amalgamated and Pench Valley had buyers at Rs. 21. Standard recorded a small rise at Rs. 20-12, and Bengal were also fractionally better at Rs. 540. East Indian were steady at Rs. 24, and Equitable were done at Rs. 43-4. Ghusick & Muslia were dealt in at Rs. 16-12, with further sellers at this level. South Karanpura were marked between Rs. 13 and Rs. 13-2, and New Manbhoom were quoted down to Rs. 9-4. Nazira had small buyers at around Rs. 6-8, but New Beerboom were easier at Rs. 19-8. Among small-priced scrip, Talcher were enquired for at Rs. 2-15, and Bharats were placed at Rs. 5-14. Central India came to hand at Rs. 5, and Western Bengal were recorded at Rs. 4-15.

Extremely dull conditions prevailed in the tea section and prices, where changed, showed fractional losses. Howrah fluctuated between Rs. 24-3 and Rs. 24-3, to close at Rs. 24-3. Reliance were

marked at Rs. 16 and Agarpura were dealt in at around Rs. 18-12. Champdany came to hand at Rs. 160, and Fort Gloster were placed at Rs. 345. Kelvin were recorded between Rs. 232 and Rs. 234, and Naihati changed hands at Rs. 128. Hooghly recorded a solitary deal at Rs. 30-4, and Nuddea were quoted at Rs. 47-8. Khardah were marked at Rs. 192 cum-dividend and Rs. 183 ex-dividend. Other transactions were Presidency at around Rs. 5, and Waverley at Rs. 6.

Very few transactions were reported in electric supply shares. Calcutta came to hand at Rs. 13-12, and Agra were placed at Rs. 161. Cut-tack were done at Rs. 8, and a small lot of Benares changed hands at Rs. 17-12.

Sugar shares continued to be popular, early in the week, with Balrampur being quoted at Rs. 7-13, Bharats at Rs. 17, and Carew around Rs. 6-10. Cawnpore were taken at Rs. 33-6, but Champaran were slightly easier at Rs. 24-14. Business was reported in New India at Rs. 25, and Darbhanga were placed at Rs. 10-11. Ram-nugger changed hands at Rs. 18-1, but United Provinces were on offer at the lower rate of Rs. 15-4 ex-dividend. At the close the shares of the companies in the Begg, Sutherland Group met with selling pressure on rumours of an impending change in the management. Cawnpore were marked down from Rs. 33-8 to Rs. 30-8, Champaran from Rs. 24-14 to Rs. 23 and Balrampur from Rs. 7-12 to Rs. 7.

Indian Irons opened quiet at Rs. 24-10, but improved slightly to Rs. 24-13 before the weekend on speculative buying. Under the influence of fresh Korean trade uncertainties, the shares were taken higher to Rs. 25-3, but follow-up support was lacking and the price receded again, to close at Rs. 24-14. Britannia Engineering recorded a rise of Re. 1 to Rs. 20, with further buyers at this level, and Burn were also taken higher to Rs. 283. Indian Galvanizing were a shade better at Rs. 13-6, but both Jessops and Kumardhubi declined to Rs. 25-12 and Rs. 7-13 respectively on profit-taking. Sarans were marked at Rs. 10-6, and National Iron & Steel were taken at Rs. 5-1. Both Indian Standard Wagon and Hooghly Docking recorded deals at Rs. 88.

Miscellaneous shares showed little change. In paper, Shree Gopal were steady at around Rs. 19-8, and Star and Tilaghar were asked for at Rs. 8-8 and Rs. 36 respectively. Bengal Paper, however, had sellers at Rs. 44-4. Among cement shares, Assam Bengal were better at Rs. 4-4, and Dalmian were taken at Rs. 6-8. Sone Valley fluctuated around Rs. 7-9. In shipping, Fraser & Company had strong buyers at Rs. 11, without attracting sellers, and India Steamship were steady at Rs. 6-9. India General Navigation, however, were a shade easier at Rs. 88-8. Among other miscellaneous industrials, Angelo Brothers met with renewed support up to Rs. 18-10, while Alkali & Chemical had buyers at Rs. 13-12, and Assam Saws were a shade better at Rs. 6-7. Dunlops were marked at Rs. 28-8, and Indian Rubber came to hand at Rs. 15-4. Indian Cables were steady at around Rs. 19-2, and Godfrey Phillips were crossed at Rs. 30-2. Jardine Henderson were quoted at Rs. 129-8, and Martin Burn were in demand up to

Rs. 18-12. Shaw Wallace were marked at Rs. 11-6 ex-dividend, and Rallis were unchanged at Rs. 75. Rohtas Industries dropped slightly to Rs. 9-11, and Calcutta Tramways were placed at Rs. 15-11. British India Corporation was marked down sharply from Rs. 8-10 to Rs. 8-3 on rumours of a change in the management. National Tobacco were taken between Rs. 9-12 and Rs. 10, and A. Firoos were crossed at Rs. 5-5. Other transactions were Indian National Airways at Rs. 3-14, Walford Transport at Rs. 1-4, and Indo-Burma Petroleum at Rs. 59.

Karanpura Development was the feature in the mining section, improving from Rs. 13-7 to Rs. 15-3, on rumours that the Company had obtained a satisfactory settlement in their case against the Rajah of Ramgarh. It now transpires that there is no truth in these rumours. Orissa Minerals were dealt in at around Rs. 35-6, and Chrestien Mica Deferred came to hand at Rs. 6-12. Indian Copper fluctuated around Rs. 2-15, and Burma Mines were taken at 14 annas. Consolidated Tin were marked at Re. 1-2, and Tavoy were done at 8 annas.

Somewhat less business was reported in tea shares during the past week. There were, however, further buyers of certain scrips and prices generally appear to have been maintained at the previous week's levels. Bishnui were a shade better at Rs. 29, Dhunseri at Rs. 11-12, and Dessai & Parbutia at Rs. 228. Dufflaghar were steady at around Rs. 37-8, as were Dibrugarh at Rs. 6-4, and Gillapukri at Rs. 18. Namburnadi improved to Rs. 8-4, and Teen Ali were also taken higher to Rs. 22. Killikott were marked up to Rs. 12-8, and Hasimara, after easing to Rs. 28-4, closed better at Rs. 28-12. Telapara registered a further rise to Rs. 109, and Dauracherra were done up to Rs. 6-12. Central Cachar were taken at Rs. 60, and Arcuttipore were marked at Rs. 3-4. Tukvar had further buyers at Rs. 6-3, and Seeyok were placed at Rs. 7-4. A parcel of Phaskowa were crossed at the lower level of Rs. 70.

The profit of JESSOP & COMPANY rose sharply from Rs. 10-21 lakhs to Rs. 14-93 lakhs for the year ended 31st October, 1952, after allowing Rs. 2,38,847 (Rs. 2,54,718) for depreciation and Rs. 91 lakhs (Rs. 10,40 lakhs) for taxation. This result was achieved despite a fall in the company's merchant business, following restrictions on imports. Adding Rs. 2,87,549 brought in and paying the usual preference dividends, there remains an available balance of Rs. 17,30,116. The ordinary dividend has been maintained at 15 percent. The dividend has been maintained at 15 percent. The dividend has been maintained at 15 percent.

The working of ROHTAS INDUSTRIES for the year ended 31st October, 1952, has produced satisfactory results. There was an improvement in production in all departments and the profit was consequently up from Rs. 80,64 lakhs to Rs. 99,74 lakhs. After allowing Rs. 39,70 lakhs (Rs. 35,89 lakhs) for depreciation, adding Rs. 33,67,940 brought in and making other adjustments, there remains a balance of Rs. 73,98,936. The ordinary dividend has been raised by 21 percent to 10 percent. General reserve is allocated Rs. 50 lakhs, leaving a carry-forward of Rs. 7,17,486. It has also been reported that production up to the end of April, 1953, has been satisfactory, the output of sugar being 3,61,640 maunds against 3,45,282 maunds in 1952.

HANSQUA TEA COMPANY incurred a loss of Rs. 22,704 for the year ended 31st December, 1952 compared with a profit of Rs. 1,14,941 in the previous year. After all adjustments, a balance of Rs. 12,269 has been carried forward, and the

dividend has been passed over against 71 percent. The crop was 6,554 maunds (7,595 maunds) and the average selling price was Re. 1-4-11 (Re. 1-4-7) per lb. Estimates have been framed for a crop of 7,000 maunds at a cost of Rs. 609 lakhs.

CALCUTTA ELECTRIC SUPPLY COMPANY sold 963,736,963 units for the year ended 31st December, 1952 as against 881,989,720 units in 1951. Gross revenue totalled £4,773,561 (£4,350,517) and net revenue less depreciation £1,233,916 (£1,359,679). Bringing forward £170,268, transferring £198,540 to finance the expansion of the machinery of production, adding £240,000 to net revenue account special appropriation and making other adjustments, a balance of £224,112 remains for distribution. The final dividend has been maintained at 3 percent making 6 percent (same) for the year to leave a carry-forward of £161,223. Arrangements were being made to connect the company's system to the Damodar Valley Corporation supply.

The profit of KIHARADH COMPANY rose from Rs. 15-87 lakhs to Rs. 20-06 lakhs for the half-year ended 30th September, 1952. Sales were, however, lower at Rs. 1,92 crores against Rs. 2,61 crores due to the fall in the prices of jute goods. Bringing in Rs. 2,06,473 and adding Rs. 5,33,375 on account of E.P.T. refund, there is an available balance of Rs. 27,45,967. Taxation absorbs Rs. 8,25 lakhs (same). General reserve receives Rs. 11 lakhs (Rs. 3 lakhs) and the ordinary dividend has been raised by Rs. 5 to Rs. 15 per share, leaving a carry-forward of Rs. 4,00,592.

After providing Rs. 4 lakhs (same) for depreciation and Rs. 6 lakhs (Rs. 9-50 lakhs) for taxation the profit of ANGLO-INDIA JUTE MILLS was lower at Rs. 5,97,399 for the half-year ended 31st March, 1953, as against Rs. 9,68,270 in the previous half-year. Bringing in Rs. 1,44,601, there remains Rs. 7,42,000 of which Machinery Reserve absorbs Rs. 1 lakh (Rs. 3,69,426). The ordinary dividend has been cut by Rs. 2-8 to Rs. 7-8 per share, leaving Rs. 1,32,947 to be carried forward.

THE ALKALI & CHEMICAL CORPORATION OF INDIA reports that it sold its Khewra factory situated in Pakistan at the end of last month. The purchase price was also received.

Although sales of EASTERN MANUFACTURING COMPANY were up from Rs. 97-47 lakhs to Rs. 99-84 lakhs for the year ended 31st December, 1952, profits were reduced from Rs. 326 lakhs to Rs. 59,794 as a result of higher costs. Adding Rs. 16,074 brought forward, there is a balance of Rs. 75,869, of which general reserve absorbs Rs. 30,000 (Rs. 3 lakhs). The ordinary dividend to absorb Rs. 25,500, leaving Rs. 8,368 to be carried forward. Depreciation is allocated Rs. 2 lakhs (Rs. 3-10 lakhs).

CARRON TEA COMPANY made a loss of Rs. 1,58,652 for the year ended 31st December, 1952, which compares with a loss of Rs. 15,130 in the previous year. Rising costs coupled with lower prices contributed to the unsatisfactory result. The purchase price was also received.

of the efforts of the managing agents to increase the efficiency of the mills. The details of the accounts are reproduced below:

Half-year ended	Sales Rs.	Depreciation Rs.	Reserve for Taxation Rs.	Profit including Taxation Rs.	Dividend percent P. O.	Carried forward Rs.

The profit of BENGAL-NAGPUR COAL COMPANY fell from Rs. 118 lakhs to Rs. 33,406 for the half-year ended 31st December, 1952 because of lower sales at Rs. 465 lakhs against Rs. 609 lakhs. Allowing Rs. 31,000 (Rs. 19,000) for depreciation, Rs. 15,000 (Rs. 7,000) for taxation, transferring Rs. 7,332 (Rs. 92,434) to capital reserve and bringing in Rs. 4,230, there remains Rs. 19,345. The ordinary dividend has been maintained at annas 6 per share to absorb Rs. 8,437 leaving a carry-forward of Rs. 6,970.

THE WEEK'S TRANSACTIONS

(In the following list of stocks and shares in which transactions have taken place during the past week, the figures indicate: Opening Quotation—Highest—Quotation for the week—Lowest for the week—Closing Quotation—Quotation for the Corresponding Closing Date a Year Ago, the last named being shown in parenthesis and will not be given where such a quotation is not available).

INDUSTRIAL TRENDS IN THE UNITED KINGDOM

COMPETITION BECOMING A REALITY
(FROM OUR OWN CORRESPONDENT.)

London, By Air Mail.

BUSINESS conditions remain active on the whole, with a maintenance of the more diversified enterprise which became manifest soon after the Budget, as a result of its various financial concessions to industry. Hopes have been also aroused by the Chancellor's further statement that additional reductions of the purchase tax will be forthcoming, although these will have to be gradual, and that the eventual aim is the complete abolition of the tax. There is, however, a gradual insistence among business men that competition is becoming keener, both with regard to home and overseas markets. In the home market this is particularly so in the pharmaceutical chemical industry, where manufacturers of the cheaper—and lower—grades of drugs, etc., are gaining ground at the expense of the more conservative type of manufacturer. The increasing brunt of overseas competition was voiced at the annual meeting of Platt Brothers, the famous textile machinists. Little is said publicly with regard to the sources of this competition but it is well-known that both German and Swiss textile machinists are making inroads into former British consumer markets. Here it is not entirely a question of price, for while German prices are keen, Swiss prices are still relatively high, and in this case success is due to attractive design and superior performance. A number of British industries have derived benefit from the recent festivities in Britain, in spite of appeals not to attempt to "cash in" on the Coronation. These include manufacturers of pottery and fancy goods bearing pictorial emblems of Her Majesty, the sales of which have been very large. But this form of industrial activity is, of course, ephemeral.

U.S. Business Activity in Britain

Britain has not yet made up its mind concerning the extent to which it wishes powerful American undertakings to operate within its borders. The need to come to a decision on this point seemed to have lost some of its one-time urgency, in that there has been little American "penetration" (as some critics would term it) for quite a while. The subject has been revived, however, by the virtual acquisition of the British company Varley Pumps and Engineering by the Californian Food Machinery and Chemical Corporation and the increased activities of the English subsidiary of the American Upjohn Company. The second instance named is not really of major importance, judged by volume of output, since it relates only to a new and simplified method of producing cortisone. But the activities of the Food Machinery and Chemical Corporation are in a more impressive category. The Corporation has announced that the range of products hitherto associated with the English company is to be considerably extended by the manufacture of both food and agricultural machinery. The capacity of the Varley works has been already enlarged for this purpose.

British industrialists are still rather on the defence in a number of directions—not, as formerly, with regard to the respective claims of Capital and Labour, but as to the deleterious effects some of their processes and products are alleged to exercise. The subject of the use of agents in the bleaching of flour has been the occasion of yet another debate, this time in the House of Lords. The Government declined to agree with the contention that bread made from flour so bleached is responsible for the rise in coronary thrombosis and duodenal trouble—so notable a feature of British health returns during the past few years. The point was made by the Government that, as far as the first named disease is concerned, the rise in incidence has been equally remarkable in countries where agents are not used. A good deal was said in the debate upon food adulteration in general. Much that was classified as "adulteration" by the critics would be claimed as harmless conservation by the practisers.

As with the previous debates of this kind, arguments towards the close tended to become less specific in character and to take the form of somewhat general expressions of uneasiness, with much suspected but with little actually pinned down. Nevertheless, it was evident that the Government is not wholly satisfied; for it declared that it was watching the bread situation closely and stated that a difficulty is in finding an unobjectionable alternative to agents.

The Imperial Tobacco Company has taken note of the various medical reports which claim to have established a connection between tobacco smoking and cancer of the lung. There is, wisely, no attempt to refute this possibility, the line taken being that further evidence is desirable. Whatever the truth of this matter, it is probable that the tobacco industry will experience changes as an outcome of the reports; for all the principal tobacco manufacturing companies—American as well as British—have now announced their intention of spending large sums upon research. This research is to be devoted not so much to inquiries into manufacturing methods as into the nature of tobacco itself.

The third defence has been of synthetic detergents, which have entered so largely into domestic and industrial use since the war. Sir Geoffrey Heyworth, the chairman of Unilever Ltd., gave two-thirds of his lengthy annual speech to this matter. Here, also, there was no attempt at evasion. It was admitted that synthetic detergents do sometimes give housewives red hands, and that, at present, these detergents have their industrial limitations. But Sir Geoffrey believes that, on balance, synthetic detergents have conferred great advantages and that their field of employment is certain to be steadily increased. It has to be borne in mind that synthetic detergents are in their infancy, that research is bound to introduce refinements and that the number of raw materials being drawn upon for their manufacture is growing.

Imperial Chemicals and Silicones

There is no lessening of the attention being given to silicones. To the British interests concerned has now to be added the Imperial Chemical

Industries, which is working in conjunction with the General Electric Company of America. The other British companies concerned are Albright and Wilson Ltd. and Monsanto Chemicals Ltd., both of which are also associated with U.S. companies, the first with the Dow Corning Corporation and the second with the U.S. company with a similar name to its own. Silicones, it should be explained for the benefit of new readers of this letter, is the name applied to a large group of organosilicon oxide and related silicon polymers. The proved industrial uses of silicones are many; the essential raw materials are simple—sand, brine, coal and oil. So far, the chief users in Britain are the textile industries (mostly for waterproofing processes), the electrical industry (for insulation), paint manufacturing (as an aid to resistance of corrosion) and food manufacturing (for prevention of adherence to baking tins, etc.) In America, therapeutic uses have been claimed; but these are of an experimental kind.

Multiple Stores Continue Their Advance

New branches of large multiple stores have been opened in Britain and there is every indication that this form of retail trading is suffering no check. Indeed, sales returns continue to show a strong upward movement. It rather looks as though the future must hold keen competition between these stores and the co-operative associations, which cater for a similar type of consumer. The co-operative associations were for long mostly concerned with the selling of foodstuffs and lower grades of clothes, but for some years past they have tended to develop into owners of shops of the "universal" kind, where it is possible to get almost anything. The small retail shopkeeper is stressing the individual nature of the service he renders; but he is finding it difficult to hold his own. Price is with most people the dominant consideration, especially in this period of inflation, and in this connection the small shopkeeper cannot keep pace with either the multiple or the co-operative store. Beyond the fact that the multiple price concessions on an enormous scale, and thus the additional consideration that they are tending to own or control factories themselves, and so be in the position of selling direct from manufacturer to consumer. The extent of the manufacturing interests thus acquired has not been disclosed, nor all of the directions in which this movement has taken place; but it is known that a number of textile mills are so owned. Moreover, the Marks and Spencer group of multiple stores has also established its own textile research department, by means of which it quickly passes on to customers the latest kinds of fabrics and also checks the quality claims of the old. There is no doubt that this store, at least so far as fabrics are concerned, carefully safeguards the consumers' interest on the material side. Some persons complain that their requirements in design are not satisfied. This leaves out of reckoning the fact that the multiple store must meet the needs of the largest possible number of potential customers; for the financial soundness of the whole organisation depends upon this ability.

A New Way to Progress

As a change from the emphasis upon the need to produce more, we are now having a little upon what might perhaps be called progress by means of retardation. This has arisen from the confirmation that has been provided of the power of maleic hydrazide to check the growth of plants. It is possible that this power might be put to good use in the control of weeds, although it is more probable that in this case complete destruction by means of fire or chemicals would be the more likely resort. The conception of progress by this means is a novel one and the direction which it might take is not readily foreseen. Control of grass is one of the few examples that spring to the mind; but here a good deal has been already accomplished by the producing of varieties which will grow only to certain heights. In other directions the hydrazine group of chemicals offers something more positive. It has been long known in industry as a reducing agent and it has recently entered into the manufacture of synthetic fibres.

Timber Research

The timber shortage in Britain was temporarily relieved by the large number of trees brought down in the winter gales; but this was new wood with but limited uses. As is well-known, quick seasoning by chemicals is now the common resort; but it still comes in for much unfavourable comment. New substitutes for timber, mostly of the laminated or "hard-pressed" type continue to be marketed; but while they meet immediate needs in building and furnishing their comparative durability has yet to be ascertained. More interesting is the acceleration of techniques for dealing with the timber that is available. This process is being tried out. It is claimed that these are not only time-saving, but that thinner coatings can be applied that are fully equal to the thicker ones formerly used.

The first session of the Asian Regional Maritime Conference of the International Labour Organisation, the first regional conference of its kind to be organised by the I.L.O., will be held in Newara Eleya Ceylon, from the 5th to the 16th October, 1953. The decision was taken at the recent meeting of the Governing Body of the I.L.O. Commission which is a special body established to advise the Governing Body on maritime questions.

New Delhi

REPORT ON FEDERAL FISCAL RELATIONS

STRICTER CONTROL URGED OVER USE OF CENTRAL LOANS AND GRANTS

(FROM OUR OWN CORRESPONDENT.)

20th June.

THE progress report shows that the Planning Commission is rather perturbed over the lukewarm attitude of States towards implementing the five year plan. As already indicated, the Prime Minister, soon after he returns from Europe, will urge State Governments to accord top priority to this question. It will also be discussed at meetings of the National Development Council and the All-India Congress Committee. But if past experience is any guide, the prospects of gaining the wholehearted co-operation of States are not very bright. State Ministers often are only too willing to make promises which are like cheques on a bank in which they have no account. The main snag has been the Centre's unwillingness to use the power it has to make States fall into line. Mr. O. K. Ghose, till recently a Deputy Secretary in the Ministry of Finance who visited Canada and the United States in 1952 under a U.N. Economic Development Fellowship, has submitted an excellent report on the rôle of the Canadian and U.S. Governments in the promotion and execution of economic development schemes with particular reference to Federal-State relations. According to Mr. Ghose, there are special statutory provisions in the U.S.A. which make grants-in-aid to States conditional upon their compliance with certain Federal standards. "Both in Canada and in the United States each aid programme is secured by law, laying down conditions, ceilings or annual rates of expenditure, etc. There is basic Federal legislation authorising appropriations on a continuing basis. Funds are apportioned among the States in accordance with criteria specified in the basic legislation. A Federal agency is given supervisory powers over the aided programme, including power to issue rules and regulations and to audit expenditure. Certain corresponding State legislation must be enacted. State plans for the operation of aided programmes must be approved by the Federal supervisory agency. Federal grants must be matched by State and local funds. Federal grants are subject to withdrawal if the specified standards and conditions are not met."

The last provision relating to withdrawal of grants is vitally necessary in this country. Many of the present evils might have been prevented if the Central Government had reserved and exercised the right to withdraw a grant in case the Unconditional standards and conditions were not more encouraged. Indian air services will bring greater responsibilities on the Government. At the forthcoming talks there will be a discussion on the full development of the airport in accordance with international standards.

Mr. Ghose has made the following recommendations for India:

1. The need to have a suitable Central executive authority, in charge of all Central Government grants and loans, as a co-ordinating agency. The Planning Division of the Economic Affairs Department now fulfils this function to some extent, but it is too small and inadequately staffed to exercise any effective control over Central disbursements.
2. Central expenditure by way of loans or grants to States should be covered by Federal-State legislation for each programme indicating its broad details, ceiling sums, rates of expenditure, etc.
3. Such expenditure should further be governed by rules and regulations conceived for each particular programme and should then be incurred by the appropriate officers without day-to-day financial control by an outside agency.
4. There will be a concurrent pre-audit of expenditure incurred before actual payment. The pre-audit, however, would not question the propriety of any particular order except when the general rule or order in question is being framed. For this purpose, the general rules should have the approval of the auditing authorities.
5. Once ceilings, etc., have been laid down, authorisations will be issued by the Central executive authority after the model of Canadian Crown Companies in anticipation, where necessary, of annual parliamentary appropriations, if such annual appropriations are held to be inevitable.

These recommendations seem to constitute a desirable executive link between the plans of the Planning Commission, their budgetary correlation, and the proper and effective expenditure of the designated sums fixed for specific programmes without procedural delay. They have been made in the light of U.S. practices governing Federal aid. There is a public administration clearing house in the United States called the Council of State Governments. It is a joint governmental agency, established and supported by the States, which helps improve their legislative, administrative and judicial practices and secure their full co-operation in solving inter-State problems, both regional and national. It also helps to facilitate and improve Federal-State relations.

Two important issues which have faced the Central Government ever since September 1946 are retrenchment and the dispersal of offices from New Delhi. In both cases, the results have so far been unsatisfactory. An official two-man team, appointed by the Finance Minister to suggest economies in expenditure, has made many recommendations which, like their predecessors, now merely adorn Secretariat pigeon-holes. They are being resisted by Ministers and officials. There is a move to set up a Secretaries' committee to recommend reductions in staff by mutual consent. But it is doubtful whether the Secretaries themselves will agree on reductions. Moreover, should any recommendation be made by them, the Ministries will probably reject it. As advocates of the Welfare State, the latter believe in the policy of full employment, even if it is achieved by continuously "digging holes and filling them up." The concentration of offices in New Delhi involves a serious loss. On the one hand, crores of rupees are being spent on building new office and residential accommodation for the ever-increasing staff of the Central Government. On the other, valuable property outside Delhi is running to waste and decaying for want of maintenance. No Minister seems prepared to part with even the attached offices.

Future of Palam Airport

The future of Palam airport, it is expected, will shortly be discussed by top officials in the Ministries of Defence and Communications. Palam airport was opened officially to civil air services and designated by the Government before the I.C.A.O. as the international airport of Delhi, because facilities of Saldarjung airport had become inadequate for aircraft plying on trans-continental services. During the war, it came under the control of the Indian Air Force, which at one stage was prepared to hand it back completely to civil aviation and construct a new airport for itself near Ghaziabad, 12 miles from Delhi. However, there were difficulties relating to finance and unsuitability of the ground. Airline operators thereafter suggested to the Director General of Civil Aviation that a new civil airport be constructed. They said it could also replace Saldarjung airport, which was ideally situated for building plots and by selling which money could be raised for the new international airport. This plan has not met with the approval of the authorities. Meanwhile, dual control over Palam is hampering its development. In its present condition, it is not fit to be the capital's international airport and is not even up to the international standards laid down by the I.C.A.O. Its elevation of 800 feet above sea level and the extreme heat in summer lengthen the take-off run of modern aircraft. Its 6,000 feet of runways are some 2,000 feet less than what is required. The runway lights for night landing are of low power, and there is no approach lighting to guide aircraft to the runways in dusty or cloudy weather. The dual nature of control over Palam means that neither Ministry is prepared to finance its development. Meanwhile, the nationalisation of Indian air services will bring greater responsibilities on the Government. At the forthcoming talks there will be a discussion on the full development of the airport in accordance with international standards.

Government-Industry Consultations

There have been reports here that the Government has accepted a proposal to hold informal discussions with a small group of top-ranking industrialists twice or thrice a year on matters of general industrial policy and development. The origin of these reports is traced to a lunch following the meeting of the Industries Advisory Council where some Indian industrialists, having had a rather uncomfortable time, are believed to have urged the Commerce Minister to let them

meet him informally and place their viewpoint before him. The Commerce Minister, it is learned, said that he was always willing to meet any group of industrialists in order to acquaint himself with their viewpoint. It will be thus evident that there is no question of an ad hoc body meeting regularly. The industrialists concerned, however, are believed to have written to the Government suggesting the names of persons who should be invited to an informal conference. The Government has replied that it has no intention of calling a conference, so the question of issuing invitations does not arise. Some industrialists, it is pointed out, asked the Commerce and Industry Minister if they could meet him in order to place their viewpoint before him. He is willing to receive such representations if prior arrangements are made. The Government regrets that it has been made to appear as though it had arranged a conference to which some persons of their choice would be invited. The complaint is often heard here that the Government does not take Indian industrialists into its confidence, but it is also sometimes asked whether they have shown themselves deserving of this confidence. For instance, the government has recently gone out of its way to protect the automobile industry but has been attacked by the very interests which are the principal beneficiaries of protection. The sugar industry has failed to bring down prices although there are large stocks in the country. Incidentally, the textile industry, according to reports, earned a record profit in 1952. The Government is waiting to see how these profits are utilised, with particular reference to the rehabilitation of machinery and equipment.

Forthcoming Labour Legislation

The Labour Minister, Mr. V. V. Giri, spoke on the legislative programme of his Ministry this week. It includes the Industrial Relations Bill, Payment of Wages Act (Amendment) Bill, Fair Wages Bill, Minimum Wages Act (Amendment) Bill, Factories Act (Amendment) Bill, all-India legislation for shops and establishments, Labour Welfare Fund Bill, and legislation to regulate retrenchment by providing for compensation for involuntary retrenchment and one month's notice pay for other retrenchment. Of particular interest is the Fair Wages Bill. Under the Bill, as long as the cost of living index number exceeds a slab of 185 to 200 (base year 1939 equals 100), the fair wage consists of a basic rate and a cost of living allowance, the latter to be adjusted to such graduated scales as may from time to time be prescribed by the appropriate Government. The Bill also provides for the fixation of wage differentials, calculation of overtime, principle of equal pay for equal work and revision of fair wages. The machinery contemplated consists of tripartite wage boards whose work will be co-ordinated by an all-India body. It is intended in the first instance to apply the Bill to factories and mines, but it can be extended by notification to other classes of establishments where a manufacturing or mining process is carried on. The proposed amendment of the Factories Act seeks to liberalise leave rules. At present the Act provides for one day's leave with wages for 20 days of work on the basis of continuous service. It is proposed to make it one day for 15 days of service and remove the present condition of continuous service. The Payment of Wages Act is to be amended so as to widen its scope of operation. At present it is applicable to people earning less than Rs. 200 per mensem. It is proposed to raise this figure and apply it to all people earning up to Rs. 400 per mensem. Another important amending Bill deals with the question of setting up Labour Welfare Funds in industrial establishments and provides for the appropriation to these funds of all fines collected from workers. The scheme was framed and submitted to State Governments some time ago, but none of them has been able to implement it.

AGREEMENT ON TATA'S
POWER PLANT

SUGAR IMPORT PROSPECTS

(FROM OUR OWN CORRESPONDENT).

21st June.

THE commencement of the monsoon was, as usual, stormy; communications, both within the city and in the hinterland, were interrupted for two days. Normal conditions were restored by Friday and railway and air services have been resumed. Rains were fairly widespread throughout the State, particularly in Maharashtra where the shortage of water and fodder has been acute. The water supply in the hydro-electric lakes and Bombay's water supply areas has improved considerably. Industrialists in the Bombay-Poona area are greatly relieved, because the rains will ensure a continued supply of hydro-electric power in the immediate future.

It is also believed that the difficulty which had arisen between the State authorities and the Tata hydro-electric group over the installation of the 100,000 K.W. thermal plant at Trombay, which is to augment supplies in this area and to work as stand-by even when other sources are developed, is likely to be removed soon. After the whole question had once been settled, the State Government changed its mind and asked the Tata hydro-electric group to reduce the capacity of the proposed installation by half, because the Government hoped to have its Koyna hydro project operating by 1957 and because a small addition was being made to the railways' thermal station at Chola. From past experience the industrial community here had little confidence in the Government's ability to complete a big project like Koyna according to schedule, and it was feared that several industrial projects which await the supply of power might have to wait even longer, or be abandoned altogether, if the capacity of the proposed Tata thermal plant at Trombay was drastically reduced.

The State Government was from the start opposed to the Tata project, because it hoped to undertake a similar one itself one day. Finding that it would never have the requisite finance for this purpose the Government yielded, under

pressure from the Central Government, and ultimately granted a licence to Tatas and extended the licences of the three existing concerns. It was soon after this question had been settled that the Government suggested that the capacity of the thermal station should be reduced to 50,000 K.W. After considerable delay in the construction of the project, the dispute is now likely to be settled—once again by the good offices of the Government of India—and it is expected that a licence, as originally fixed, will be issued soon, so that the necessary orders for machinery can be placed.

Wholesale Sugar Prices Reduced

It is understood that as a part of the Government of India's plan to bring down the price of sugar, the State Government here has received releases of stocks from various sugar factories in the State and in U.P., at the ex-factory price of Rs. 27. The State authorities were making arrangements last Friday to procure these stocks and to distribute them through their ration and fair-price shops and co-operative concerns. This is likely to take some time, however, and the retail price of sugar has, therefore, not yet been affected. The wholesale trade has already felt the impact of the Government's announcement to a moderate degree; prices have come down by about Rs. 2 or Rs. 2-8 a bag. No sugar under the new plan to flood the market has yet reached the city. Importers are already exploring the possibilities of getting supplies from abroad.

The sugar industry in Bombay is not so much worried about its present stocks, a greater part of which will be requisitioned at a fixed rate of Rs. 27 per maund, as about the Government's cane price policy for 1953-54. Unlike the mills in north India, sugar factories in Bombay grow practically the whole of their cane themselves and the cost of cultivation here has actually increased because of wage increases under Industrial Court's awards, the raising of the irrigation charges by the Government, and the requisitioning of groundnut cake which is used extensively as manure in cane cultivation. Any further reduction, therefore, in the price of cane, and consequently in the price of sugar, will put the industry here in a very unfavourable position compared with the factories in U.P. and Bihar, which buy their cane from cultivators. A prominent manufacturer is believed to have brought this point to the notice of the Central Minister for Food and Agriculture.

Cotton Price Control

The latest recommendations of the Cotton Advisory Board to the Government of India have set the cotton trade and textile industry speculating about the price control policy in the coming season. The Board has recommended that the present floors and ceilings should be unchanged if price control is to be continued next year. It is rumoured here that price control on cloth and cotton will be simultaneously removed from October 1953. This has created anxiety among Indian textile shippers because they fear that cotton will tend to find parity with world prices, which are very much higher than the controlled prices of Indian cotton, and that this would make cloth so dear as to render it practically unsaleable in foreign markets. The mills are also worried because, though they want price control on cloth removed, they believe that a large rise in the price of Indian cotton would reduce the already low internal demand for cloth. Among the Board's other important recommendations are an extra quota of 5 percent to the mills to purchase this season's cotton, and an initial quota of 25 percent of new cotton to enable the mills to secure their supplies for the next year in advance.

Council of Foreign Trade

The Indian Council for the Promotion of International Trade, which was formed at the beginning of this year, has now changed its name to the Indian Council of Foreign Trade. According to its President, this alteration was necessary because there were other organisations outside India functioning under the same name, which might create some confusion. Announcing this, Mr. Morarji J. Vaidya, President, disclosed that the Council had selected Egypt as its first field for active operation and that plans were now ready to organise an exhibition of Indian goods there, with the assistance of the Government of India. The Council also proposes to send delegations to Egypt to secure orders for various Indian products.

The Madras Port Trust has decided to increase the existing rates of harbour dues as follows: (1) in the case of etc. from Rs. 2-8 and Rs. 4 per ton, plus surcharge, to Rs. 4 per ton plus surcharge and (2) in the case of spare parts and accessories of motor cars, tractors, motor cycles, cycles, aeroplanes, boats, launches, floating craft etc., from Rs. 2-8 per ton plus surcharge to Rs. 3-4 per ton plus surcharge.

London

COTTON IMPORT COMMITTEE'S
REPORT PUBLISHEDSIGNS OF NEW OUTLOOK
AMONG UNION LEADERS

(FROM OUR OWN CORRESPONDENT).

20th June.

PARLIAMENT'S scheduled business during the past week, not surprisingly, has attracted less attention than the somewhat startling developments which have taken place in international affairs, particularly in Eastern Germany and Korea, with the result that question time has found the major headlines day after day, with the "business" of the House—the Committee stage of the Finance Bill for the most part—occupying a subsidiary rôle and gradually progressing towards its planned conclusion, though there is a threat of later sittings next week to keep within the programme. Mr. Butler has made no more concessions and the Government has maintained its majority without difficulty. This lull enables attention being paid to other economic questions which have received reference to Parliament. For instance, Mr. Peter Thorneycroft, President of the Board of Trade, announced that the Government has accepted the Monopolies Commission's adverse report on the match industry and that action was being devised to end the monopoly and restore competition, but he was not willing at present to be more precise than that although it is believed he has already started discussions with the industry.

It was Mr. Thorneycroft also, who presented to the Commons on Thursday the report of the Cotton Import (Review) Committee. Set up last March under the chairmanship of Sir Richard Hopkins and comprising representatives of both sides of the industry, it has put forward unanimous recommendations which have been accepted by the Government in respect of the Raw Cotton Commission continuing to provide cover to all spinners during the 1953-54 season broadly on the same basis as at present and that "it is intrinsically undesirable that cover for private trade should be provided at the risk of public funds." Therefore the question of what arrangements would be proper and possible after the 1953-54 buying season would be the subject of early discussion with the trade interests concerned. The report was generally welcomed by both sides of the House, and the Liverpool Cotton Association is already visualising the possibility of a Liverpool Futures Market being restored by the beginning of the 1954-55 season, though it points out that it would be dependent upon the maintenance of the present improvement in the national balance-of-payment position, the granting of the necessary freedom of import and remittance, and the broadening of a private supply market before that date. Spinners have been asked to bear this in mind when exercising their option.

May Exports Lower

The appropriateness of this warning is apparent in the provisional trade figures for May. Exports were slightly lower than in April, at £211.7 million against £214.8 million, though still higher than the average for the first quarter of this year. Both April and May were affected by holidays, but it must be remembered that June will be similarly affected. Re-exports in May at £7.2 million were also lower than in April at £8.9 million, against a first quarter average of £10 million. The value of imports, on the other hand, rose from £293.3 million in April to £296.4 million in May, maintaining the steady rise which has been going on since last autumn. As a result of these divergent trends, the trade gap in May jumped to £77.5 million, against £69.5 million in April and a monthly average of £53.9 million in the first quarter of the year. This is the largest monthly gap for a year, and even though the figures are not alarming, it is evident that imports cannot be restricted indefinitely and that the expansion of exports against severe competition is proving more difficult than was anticipated. Some trends are not reassuring, though there is some satisfaction in that exports to North America are being reasonably well maintained. They totalled £25.2 million in May, which though lower than the record figures of £29.8 million in April, was still well above 1952 levels.

There are faint glimmerings, none the less welcome though they are still faint, that the trade unions are at last beginning to appreciate the hard realities of the economic outlook. More than one leader has recently invited attention to them and urged trade unionists to increase the efficiency and productivity of British industry. There is no indication, however, of any new thinking on the question of wage claims—though the drop in companies' profits and, in consequence, of the tax returns thereon is causing some anxiety in Whitehall—save a casual suggestion that a wage halt might be secured if the Government undertook to hold the cost of living stable or brought it down. Retail prices were, in fact, a point lower in May than they were in April, but it is questionable whether that will carry much weight in labour circles. On the other hand, the support accorded by the T.U.C. to those union leaders who have accepted appointments on the Iron and Steel Board is heartening.

State Undertakings' Profits

This limited realism on the part of the trade union leaders contrasts with the airy nature of

Challenge to Britain, the Labour Party's official programme already discussed in earlier despatches and which has now made its appearance. Its lack of realism is most apparent in that it obviously visualises enormous expenditures without indicating where the money is to come from, and takes for granted that the Commonwealth countries will co-operate to the full in maintaining a Welfare State in this country on a much more comprehensive basis than we know it to date. Its re-nationalisation threat lends additional interest to the annual reports of the Iron and Steel Corporation of Great Britain and the British Transport Commission, both of which have been issued this week. At the same time, the proposals for extending nationalisation to other industries has evoked a cold douche from Mr. John Rogers, Chairman of Imperial Chemical Industries, who has queried the factual basis of the arguments applied in the case of the chemical industry, and a fighting rejoinder from Lord Lyle.

The reports of the nationalised undertakings mentioned above have provided material for the making of political points on both sides. Regarded purely objectively, they make fairly satisfactory reading. The combined trading profit for the 300-odd companies grouped under the Corporation amounted to £64.4 million before deducting taxes but after setting aside a special fund of £10 million against the rising cost of replacement. In the previous year (the accounts are to 30th September) the annual rate of profit was only about £54 million. The chairman points out, however, that the 1952 profits contained some temporary windfalls accounting for about half the total, that the companies have been left largely to themselves in matters of production and management, and that future expansion and modernisation plans will not only make heavy demands on the liquid funds of the companies but will entail borrowing, to the extent of some £25 million in the current year. The picture presented by the Commission, which shows a surplus of £8.4 million in 1952, is not so rosy even though that represents the largest surplus since it was formed, for rising costs since then, and the delay in the granting of permission to increase passenger fares, has pushed the industry back into running at a loss. Stabilisation of costs and wages, and increased fares would mean a deficit in 1953, "not frightening in amount."

Wholesale Prices

Seekers after pointers to future economic developments have been keeping an eye on the

commodity markets of late, and some encouragement has been provided by the latest Board of Trade statistics on wholesale prices. In May, despite rising production and therefore increased demand, prices of industrial materials as a whole continued to decline, or in other words the basic materials index was again lower. At 148.4 this index now shows a fall of nearly 9 percent compared with a year ago. Examining the prices of individual commodities, those for raw wool and cotton, jute, silk and rubber—in all of which Commonwealth exporters are particularly interested—increased, but these were more than offset by lower prices for copper, soft wood, palm oil, whale oil and molasses. Even more important is the fact that food prices, which have risen steadily over the past four years, at last appear to be showing some signs of being checked. Wholesale food prices in May were slightly less overall than in April, for although cereal prices, save for wheat, are still on the high side, these have been offset by cheaper meat, fish and eggs. These movements of commodity prices are of vital importance, and future trends will be followed carefully.

While dealing with commodities, it would not be inappropriate to congratulate the Ministry of Materials on its wise approach to the difficult problem of transition from public to private trading in metals. The biggest problem, of course, is the liquidation of Government surplus stocks to strategic stock requirements without producing major disturbances in the market. So far the zinc programme has worked smoothly, and enters on its next phase in July. It is expected that the Ministry will then still have some 70,000 tons of surplus zinc to dispose of, which it is intended to liquidate gradually over a further period with the actual rate to be decided in the light of discussions with the trade. A similar procedure is expected to be adopted in connection with surplus copper stocks, trade in which will be returned to private hands on 5th August. In anticipation, the London Metal Exchange has drawn up draft contracts for standard and electrolytic copper which will be finalised after the reactions of producers and consumers have been examined. At present a one-day settlement for spot metal deliveries is envisaged with a limit of three months on dealings forward. The situation may change between now and August, but metal brokers at the moment think that early dealings may be on the basis of around £230 a ton for spot and slightly above £200 for forward.

West Pakistan

COMMITTEE OF EXPERTS TO
STUDY COTTON TRADE
COTTON-WHEAT BARTER DEAL
WITH AUSTRALIA RUMOURED

(FROM OUR OWN CORRESPONDENT).

Karachi, 19th June.

THE formation of a committee of experts to study the cotton trade of Pakistan has been greatly welcomed. Its terms of reference are wide, and, among other things, include investigation into such vexatious problems as to whether or not there should be a hedge contract in the Karachi cotton market; whether it is necessary to provide additional financing facilities at all or any stage of production; whether insurance facilities are adequate and charges reasonable; and whether any relaxation of the existing conditions under which export of cotton is allowed only against irrevocable letters of credit is necessary. The question whether the control exercised by government through the Cotton Board on the cotton trade is adequate or justified, or whether the functions of the Cotton Board should be enlarged or curtailed, is also to be considered by the committee. This seems to make the announcement made a few days ago that the Cotton Board was to be dissolved and the price support scheme scrapped, a premature one. However, the setting up of this committee of experts provides an excellent opportunity for the straightening out of the cotton trade—from the first sowing of the seed, through the ginner, to the market—and for putting it once more on a firm footing for the future. The committee is a strong one, and in-

cludes Mr. L. Johnson of Ralli Brothers, who has many years' experience of cotton in all its various moods, and Mr. A. Muhajir, Managing Director of the National Bank of Pakistan. The committee has for its Chairman, Dr. Nazir Ahmed, who is Vice-Chairman of the Pakistan Central Cotton Committee.

In the meantime, cotton is moving steadily—though not in large quantities—and the overall position, with several months still to go before the new crop comes into the market, may be considered better than it has been for some time. Of the 6 lakh bales at present lying in the yards, about 250,000 bales are awaiting shipment against commitments abroad, and it is expected that local mills will take up roughly 50,000 bales. The gloomiest possible outlook is therefore a carry-over of 3 lakh bales—nearly one lakh bales less than last year's carry-over. On the other hand, further orders are expected to come from Japan, who is committed to purchase substantial quantities under the current trade agreement, if prices maintain a favourable level, while the United Kingdom, the Continent and the Far East may reasonably be expected to lift between them another one lakh bales. In addition, there are reports of negotiations with Australia for a barter deal of Pakistan cotton against Australian wheat, and if this comes to fruition, the final carry-over has every chance of being reduced to less than one lakh bales. If the Government has been successful in reducing the cotton acreage for next year's crop by 10 percent, as it was stated some time ago it intended to do in order to turn the land to food production, the new season will start on an extremely healthy note.

Jute's Healthy Position

The jute position, too, appears satisfactory. Sowings have been considerably reduced and the new crop, which will start to come into the market in the next few weeks, is not expected to be more than 40 lakh bales. The estimated carry-over from the current crop of about 20 lakh bales, sounds formidable enough, but because of the expected increase in sales to India, under the trade agreement, and the increase in internal consumption as more jute mills go into production, there is no cause at present for any real anxiety. The trade is in fact hopeful that, given reasonable luck during the next jute year, the whole crop, both old and new, will be completely absorbed.

Tea Chest Import Licences

It is also expected that this will prove to have been a good season for the tea gardens. Since the cancellation of the Open General Licence, however, there has been very great anxiety about the import of tea chests. The delay in issue of import licences almost caused a crisis in the market when, a few weeks ago, stocks of tea chests had been exhausted. When licences were at last issued it was found that the industry had been allotted a ceiling of Rs. 10 lakhs for the import of chests, a totally inadequate figure in view of the carry-over from last year's crop and the bumper tea crop this year. Urgent representations have been made to the Government to increase this ceiling to Rs. 30 lakhs, a figure that is even then barely sufficient to cover the industry's entire requirements. It is hoped that the Government will grant this increase in the ceiling without further ado, thereby saving the tea industry from another disastrous trading year and adding at the same time to their own foreign exchange earnings by ensuring the export of the maximum quantity of tea during the season.

Taxation Tribunal

The Taxation Tribunal, constituted under the Taxation Tribunal (Undisclosed Wealth) Act 1953, has started work. It consists of the Honourable Mr. Justice Inamullah, Additional Judge in the Chief Court of Sind, Karachi, as President, and Mr. Zafarullah, Commissioner of Income Tax (Central), Karachi, as Member. The Tribunal will scrutinise all details of previously undisclosed wealth that may be submitted to it and will decide to what extent, if any, it is taxable. The decision of the Tribunal will be binding on the Income Tax Department and the taxes due will be realised, but the persons concerned will not be penalised or prosecuted in any way for having concealed the income in the past. The latest date for acceptance by the Tribunal of declarations of undisclosed wealth is 15th December, 1953, and it is understood that this is intended to be the last chance to be given to people to declare their wealth without penalty or prosecution.

Government Development Loans

The Government has once again been successful in bringing fresh money to investment in their Development Loans. The two new loans—the 3 percent 1958 and the 3 percent 1961—were opened for the three days 15th to 17th June and it was announced today that the preliminary figures indicate an amount of Rs. 46.62 crores as having been subscribed. Of this, about Rs. 17 crores were new investments and the remainder constituted conversion of the 23 percent Government Loan 1953-54, which was due to be repaid on 25th August next.

The Labour Bureau working class cost of living index number (base: 1914=100) for Delhi for April, 1953 compared to the index number for the preceding month, appreciated during December, 1952. The food index recorded a rise of one point due to a slight rise in the prices of milk, mustard oil and potatoes. The index number for the fuel and light group remained stationary. A slight appreciation in the prices of sarees, khadi and coating caused the index number for the clothing group to advance by one point. Due to a slight increase in the price of millet and the miscellaneous group index recorded a rise of one point. The estimated cost of living index number for Delhi on base August 1939=100 was 357 for the month of April, 1953.

Jute

RAW JUTE PRICES AND THE SIZE OF THE CROP

IN these columns in the issue of Capital of 26th June, 1952 the following appeared: "There appears to be a widespread belief that, with big crops in India and Pakistan, Calcutta mills will soon be able to draw on copious supplies of cheap jute and that, therefore, the prices of jute manufactures will fall to very low levels. That belief ignores two important factors. One is that it is unlikely that the Indian Government will allow unlimited supplies of Pakistani jute to come into India because of the effect on India's trade balance with Pakistan. The other is that the Indian Government will have to be on its guard against allowing jute prices to fall to such a low level that the growing of jute will be discouraged, thus bringing the industry back to the position of dependence on Pakistan from which it now appears to be emerging. The whole problem is delicately poised but it is essential for both manufacturers and consumers to realise that uneconomically low prices are as dangerous to the future of the industry as excessively high ones."

The widespread belief that mills would be able to draw on copious supplies of raw jute and that the prices of jute manufactures would fall to very low levels was proved, in the course of events, to be correct. The two important factors which, it was suggested, might be brought in to prevent such an eventuality did not in fact materialise. The Government of India did not take any steps to restrict the import of jute from Pakistan. Pressure was brought on it to do so because it was alleged that the import of jute from Pakistan was depressing the price of Indian jute. No action was taken because the Government was of the opinion that the price of raw jute must be looked on in relation to the prices obtainable for jute manufactures, which were dictated by world conditions. It was felt that any action taken by the Government of India to support raw jute prices would merely make Indian jute manufactures uncompetitive because foreign manufacturers would still be able to get cheap jute from Pakistan. The price of raw jute was, therefore, allowed to take its course following the law of supply and demand, with the result predicted—that the price fell so low that the growing of jute was discouraged. It is true that nature has taken a hand in the curtailment of sowings but the outcome is that India will be more dependent on Pakistan than she was in 1952-53. Prices have also risen and are now, even after the recent decline, nearly as high as they were last year at this time. Mills are complaining that the price of jute is too high and users of jute manufactures are complaining that the price is too low. Could anything, apart from controls which no one likes and which are generally ineffective, have prevented the fall in price which brought about the reduction in sowings and the recent rise in prices?

It is probable that, if mills had supported the price of jute by laying in stocks in January and February, before prices fell to the lowest levels and before sowing time, growers would not have reduced their sowings to such an extent. It is also possible that if mills had done so, the price of manufactures would not have fallen so low, for it was a patent fact that as long as raw jute prices continued to fall consumers of jute manufactures delayed their buying in the hope of still lower prices. It is undoubtedly asking too much to expect that jute manufacturers and users of jute goods should adopt such an altruistic attitude, but if they had done so it would have been to their advantage, for it is practically certain that jute sowings would have been bigger and that prices would not have risen to present levels. Below we give a table showing the value (in rupees per ton) of jute manufactures and raw jute now, as compared with two months ago when raw jute prices were at their lowest and with the position a year ago.

	23-6-53	16-4-53	23-6-52
40" 8 oz.	1,669	1,384	1,705
B Twills	1,010	870	1,150
Average	1,274	1,076	1,372
Assam Bottoms	708	463	762
Margin between manufactures and raw jute	566	613	610

(The average price per ton of manufactures is based on an assumed production of 60 percent sacking and 40 percent hessian).

It will be seen that the mills gained very little by the fall in raw jute prices between June 1952 and April 1953, while they have lost ground by the rise in raw jute prices between April and June 1953. In April both raw jute and manufactures were at the lowest of the year. The question is whether, if the mills had earlier in the year supported the price of raw jute so as to ensure bigger sowings, they would have also kept up the price of manufactures and maintained the margin between the prices of raw jute and manufactures. It is a debatable point.

THE JUTE MARKETS

There has been a marked difference in the tone in all sections of the market in the past week compared with what prevailed recently. The feeling seemed to be that as the Argentine order for hessian had been completed and the U.S.A. was reporting lower consumption than for a long time and there was little

interest being taken in sacking, there was no incentive to maintain the pace. Rumour said that sacking stocks at the end of the month would show a big increase. With the onset of the monsoon there was also a belief that crop prospects had improved and, as the prospect of a short crop had been one of the mainstays of the market, all the props seemed to be gone. Jute prices declined to about the levels of a month ago. Sacking prices showed a substantial drop. The only thing which maintained a semblance of steadiness was hessian, where prices fell though not to the same extent. There was some indication of a steadier feeling late on Tuesday on reports of further buying on account of the Argentine and, at the time of writing, there appears to be a more confident tone.

Manufactured Goods: The easier tendency noted last week has continued throughout the week. The placing of further business on account of the Argentine together with enquiry from the U.S.A. and the U.K. helped to maintain hessian prices though they were below the highest touched recently. The prices at which overseas buyers indicated that they were willing to come to business were, however, below Calcutta quotations. In the absence of enquiry any consequent rise from abroad, speculators dominated the market for sacking. Bear pressure, because of reports of favourable rain together with rumours that I.J.M.A. stocks of sacking would show an increase this month, brought prices down. There were indications that mills were rather keen to sell heavy goods and that also had a weakening effect. B Twills dropped from Rs. 104-12 to Rs. 100-4. From Rs. 46-6 for 40" 10 oz. at the time of writing last week, prices dropped to Rs. 45-3 but subsequently recovered on reports of the purchase of a further 5,500 tons on account of the Argentine. At the close of Tuesday, the quotation was Rs. 46-14. As support for sacking was conspicuous by its absence, recovery in that case was only in sympathy with hessian. The hessian position is now very sound but the sacking position is causing renewed uneasiness. Quotations on Wednesday morning were as under:

	June	July	Aug-Sept.	Oct-Dec.
40" 8 oz.	36-4	36-8	36-12	36
40" 10 oz.	46-14	47	47	46-2
B Twills	101-10	102-4	102-12	102-10
Heavy Cees. (Plain)	101-10	102-4	102-12	102-8
Cansacks	105-4	104-4	103-8	103

Raw Jute: There has been less activity in the market this week than for a long time. With only limited business in hessian and hardly any in sacking, mills have had no encouragement to add to their stocks of raw material. Holders of stocks of old crop have shown some nervousness and small transactions have been reported from day-to-day at declining rates. One group bought a moderate amount at rates below the general level of prices. On Wednesday of last week small lots of Assam Bottoms were done at Rs. 26, Dhulian on the basis of Rs. 23 for Bottoms, and Bimil F.A.Q. at Rs. 22-8. Short Group Dundee Daissee was sold at Rs. 165 and Long Group at Rs. 150. Late in the afternoon, business was reported in Northern at Rs. 25-8, Upper Assam at Rs. 24-8 and Local Packing at Rs. 22 basis Bottoms all ex local godown but sellers were difficult to find at these prices. Not much business was done on Thursday. Sales were reported of mill Reds at Rs. 190 and Long Group Dundee Daissee at Rs. 145. New Crop Tops and Middles for shipment by 15th August were reported done at Rs. 35 and Rs. 33 respectively. On Friday further business was reported in Long Group Dundee Daissee at Rs. 140. Small business was done in Pakistani N.C.'s (jat) at Rs. 75 per bale and in Upper Assam jute on the basis of Rs. 25-8 for Bottoms. On Saturday buyers were offering lower prices but no business resulted. Fresh interest was shown in New Crop on Monday but at lower levels and it was difficult to get sellers at the prices offered. Small business was reported at Rs. 27-8 basis Bottoms for Upper Assam and Rs. 28-8 for Lower Assam and Northern for Aug-Sept shipment. European marks were also reported done at Rs. 34-8 and Rs. 34 basis Bottoms for Pakistani jat for Aug-Sept. Sneoraphul Daissee was sold at Rs. 26-8 basis Bottoms for delivery within one month and Bimil F.A.Q. was done at Rs. 21. On Tuesday further business was re-

ported in New Crop at the same price as on Monday. A transaction was also reported in Northern jute, half Old Crop and half New Crop at an overhead price of Rs. 25-8 basis Bottoms, the Old Crop being for delivery within a month ex local godown and New Crop ex agency during Aug-Sept.

Sellers are inclined to be reserved for New Crop but holders of Old Crop would like to get rid of their stocks because they feel that mills might soon transfer their attentions entirely to New Crop. There are, however, mills which must continue buying Old Crop for a considerable time yet and there are buyers who consider the premium asked for New Crop too much, especially in relation to the prices of manufactures. Quotations on Wednesday morning were as under:

Pakistani Jute:	Old Crop New Crop	Landed at June- July
Jat	Rs. 27-8	32 per maund basis Bottoms
District and Northern	25-8	31 per maund basis Bottoms
Cuttings Jat.	25-8	95 per bale
Cuttings District	74	" "

(The difference in price between Middles and Bottoms in Pakistani jute is Rs. 4 per maund).

Indian Jute: Old Crop New Crop Landed at Mill June- July

	Rs.	Rs.	
Lower Assam	27	29	Basis Bots.
Upper Assam	26	28	Do.
Northern & Purnea	27	29	Do.
Murshidabad Tossa	25-8		Do.
Bihar	23		Do.
Daissee	27		Do.
Mesta (Western)	27		Do.
Bimil	22		F.A.Q.
Mill Firsts	160 per bale		
Mill Lightnings	145		
Dundee Daissee	160		
Dundee Daissee L.G.	145		

(The difference in price between Middles and Bottoms in Indian jute is Rs. 3).

Mofussil: In Assam and Northern and Central Bengal there are hardly any fresh imports of Old Crop and business is almost entirely in sales by stockists. Imports in Bihar are mainly for dispatch to Cossipur and are small. Markets are easier on reports of lower prices in Calcutta. Imports of daissee are dwindling and most of what is being sold in Cossipur and Bagh bazar as daissee is Murshidabad and jungli tossa. The weather on the whole has been favourable for the New Crop but rather too much rain has fallen for the good of the recent sowings in the daissee districts.

In Pakistan imports of old crop are small but exceptionally so for the time of the year. Imports of weavings and immature cut jute are increasing but it is stated that the quantity of weavings will be less this year because the ryots are not weeding so much as usual in the hope of getting a better outturn on the reduced acreage. Since the onset of the rains further sowings have been reported in western and northern districts which are not likely to be affected by rising river levels. There has been less business in the markets during the past week and enquiry from abroad has fallen off. Old Crop quotations show little change but New Crop prices have fallen. Prices offered for New Crop by overseas buyers are said to be below current quotations.

Raw Jute Arrivals

Arrivals in Calcutta and at mills' stations during May 1953 were 3,74,000 bales against 3,02,000 bales in April. The total for July-May, 1952-53, was 50,11,000 bales. Of this total 38,05,000 were of Indian origin, and 12,13,000 were imported from Pakistan. In the eleven months July-May, 1951-52, the total arrivals were 48,24,000 bales of which 30,47,000 were of Indian origin and 17,77,000 were imported from Pakistan.

PROGRESS OF INDIAN CROP

In their fourteenth crop report of the current season, covering the week ended 20th June Messrs. Sinclair Murray & Co. Ltd., say that the weather in Assam has been mainly hot and dry and this has been favourable. Rivers have fallen and a shortage of steeping water may delay the cutting of the low land crop. In West Bengal weather has been favourable. In Orissa the weather has been wet and a spell of sunshine is now required there to promote the growth of plants.

DANPUR: The weather has been very wet and a spell of strong sunshine is now required to pro-

KNOW YOUR INDUSTRIES...

The Indian Jute Industry which a capital of one crore has created a new all-time record. Production in 1952-53 reached the target of a two million yards set by Five-Year Plan. The target for 1953-54 is four million yards, and with the expected increase in the production of cloth this year should not be difficult to reach. The total production of cloth in 1952-53 was over 100 million yards. The production of jute in 1952-53 was 48,000 to 72,000 million yards. The production of jute in 1953-54 is expected to be 100 million yards. The production of jute in 1954-55 is expected to be 150 million yards. The production of jute in 1955-56 is expected to be 200 million yards. The production of jute in 1956-57 is expected to be 250 million yards. The production of jute in 1957-58 is expected to be 300 million yards. The production of jute in 1958-59 is expected to be 350 million yards. The production of jute in 1959-60 is expected to be 400 million yards. The production of jute in 1960-61 is expected to be 450 million yards. The production of jute in 1961-62 is expected to be 500 million yards. The production of jute in 1962-63 is expected to be 550 million yards. The production of jute in 1963-64 is expected to be 600 million yards. The production of jute in 1964-65 is expected to be 650 million yards. The production of jute in 1965-66 is expected to be 700 million yards. The production of jute in 1966-67 is expected to be 750 million yards. The production of jute in 1967-68 is expected to be 800 million yards. The production of jute in 1968-69 is expected to be 850 million yards. The production of jute in 1969-70 is expected to be 900 million yards. The production of jute in 1970-71 is expected to be 950 million yards. The production of jute in 1971-72 is expected to be 1,000 million yards. The production of jute in 1972-73 is expected to be 1,050 million yards. The production of jute in 1973-74 is expected to be 1,100 million yards. The production of jute in 1974-75 is expected to be 1,150 million yards. The production of jute in 1975-76 is expected to be 1,200 million yards. The production of jute in 1976-77 is expected to be 1,250 million yards. The production of jute in 1977-78 is expected to be 1,300 million yards. The production of jute in 1978-79 is expected to be 1,350 million yards. The production of jute in 1979-80 is expected to be 1,400 million yards. The production of jute in 1980-81 is expected to be 1,450 million yards. The production of jute in 1981-82 is expected to be 1,500 million yards. The production of jute in 1982-83 is expected to be 1,550 million yards. The production of jute in 1983-84 is expected to be 1,600 million yards. The production of jute in 1984-85 is expected to be 1,650 million yards. The production of jute in 1985-86 is expected to be 1,700 million yards. The production of jute in 1986-87 is expected to be 1,750 million yards. The production of jute in 1987-88 is expected to be 1,800 million yards. The production of jute in 1988-89 is expected to be 1,850 million yards. The production of jute in 1989-90 is expected to be 1,900 million yards. The production of jute in 1990-91 is expected to be 1,950 million yards. The production of jute in 1991-92 is expected to be 2,000 million yards. The production of jute in 1992-93 is expected to be 2,050 million yards. The production of jute in 1993-94 is expected to be 2,100 million yards. The production of jute in 1994-95 is expected to be 2,150 million yards. The production of jute in 1995-96 is expected to be 2,200 million yards. The production of jute in 1996-97 is expected to be 2,250 million yards. The production of jute in 1997-98 is expected to be 2,300 million yards. The production of jute in 1998-99 is expected to be 2,350 million yards. The production of jute in 1999-00 is expected to be 2,400 million yards. The production of jute in 2000-01 is expected to be 2,450 million yards. The production of jute in 2001-02 is expected to be 2,500 million yards. The production of jute in 2002-03 is expected to be 2,550 million yards. The production of jute in 2003-04 is expected to be 2,600 million yards. The production of jute in 2004-05 is expected to be 2,650 million yards. The production of jute in 2005-06 is expected to be 2,700 million yards. The production of jute in 2006-07 is expected to be 2,750 million yards. The production of jute in 2007-08 is expected to be 2,800 million yards. The production of jute in 2008-09 is expected to be 2,850 million yards. The production of jute in 2009-10 is expected to be 2,900 million yards. The production of jute in 2010-11 is expected to be 2,950 million yards. The production of jute in 2011-12 is expected to be 3,000 million yards. The production of jute in 2012-13 is expected to be 3,050 million yards. The production of jute in 2013-14 is expected to be 3,100 million yards. The production of jute in 2014-15 is expected to be 3,150 million yards. The production of jute in 2015-16 is expected to be 3,200 million yards. The production of jute in 2016-17 is expected to be 3,250 million yards. The production of jute in 2017-18 is expected to be 3,300 million yards. The production of jute in 2018-19 is expected to be 3,350 million yards. The production of jute in 2019-20 is expected to be 3,400 million yards. The production of jute in 2020-21 is expected to be 3,450 million yards. The production of jute in 2021-22 is expected to be 3,500 million yards. The production of jute in 2022-23 is expected to be 3,550 million yards. The production of jute in 2023-24 is expected to be 3,600 million yards. The production of jute in 2024-25 is expected to be 3,650 million yards. The production of jute in 2025-26 is expected to be 3,700 million yards. The production of jute in 2026-27 is expected to be 3,750 million yards. The production of jute in 2027-28 is expected to be 3,800 million yards. The production of jute in 2028-29 is expected to be 3,850 million yards. The production of jute in 2029-30 is expected to be 3,900 million yards. The production of jute in 2030-31 is expected to be 3,950 million yards. The production of jute in 2031-32 is expected to be 4,000 million yards. The production of jute in 2032-33 is expected to be 4,050 million yards. The production of jute in 2033-34 is expected to be 4,100 million yards. The production of jute in 2034-35 is expected to be 4,150 million yards. The production of jute in 2035-36 is expected to be 4,200 million yards. The production of jute in 2036-37 is expected to be 4,250 million yards. The production of jute in 2037-38 is expected to be 4,300 million yards. The production of jute in 2038-39 is expected to be 4,350 million yards. The production of jute in 2039-40 is expected to be 4,400 million yards. The production of jute in 2040-41 is expected to be 4,450 million yards. The production of jute in 2041-42 is expected to be 4,500 million yards. The production of jute in 2042-43 is expected to be 4,550 million yards. The production of jute in 2043-44 is expected to be 4,600 million yards. The production of jute in 2044-45 is expected to be 4,650 million yards. The production of jute in 2045-46 is expected to be 4,700 million yards. The production of jute in 2046-47 is expected to be 4,750 million yards. The production of jute in 2047-48 is expected to be 4,800 million yards. The production of jute in 2048-49 is expected to be 4,850 million yards. The production of jute in 2049-50 is expected to be 4,900 million yards. The production of jute in 2050-51 is expected to be 4,950 million yards. The production of jute in 2051-52 is expected to be 5,000 million yards. The production of jute in 2052-53 is expected to be 5,050 million yards. The production of jute in 2053-54 is expected to be 5,100 million yards. The production of jute in 2054-55 is expected to be 5,150 million yards. The production of jute in 2055-56 is expected to be 5,200 million yards. The production of jute in 2056-57 is expected to be 5,250 million yards. The production of jute in 2057-58 is expected to be 5,300 million yards. The production of jute in 2058-59 is expected to be 5,350 million yards. The production of jute in 2059-60 is expected to be 5,400 million yards. The production of jute in 2060-61 is expected to be 5,450 million yards. The production of jute in 2061-62 is expected to be 5,500 million yards. The production of jute in 2062-63 is expected to be 5,550 million yards. The production of jute in 2063-64 is expected to be 5,600 million yards. The production of jute in 2064-65 is expected to be 5,650 million yards. The production of jute in 2065-66 is expected to be 5,700 million yards. The production of jute in 2066-67 is expected to be 5,750 million yards. The production of jute in 2067-68 is expected to be 5,800 million yards. The production of jute in 2068-69 is expected to be 5,850 million yards. The production of jute in 2069-70 is expected to be 5,900 million yards. The production of jute in 2070-71 is expected to be 5,950 million yards. The production of jute in 2071-72 is expected to be 6,000 million yards. The production of jute in 2072-73 is expected to be 6,050 million yards. The production of jute in 2073-74 is expected to be 6,100 million yards. The production of jute in 2074-75 is expected to be 6,150 million yards. The production of jute in 2075-76 is expected to be 6,200 million yards. The production of jute in 2076-77 is expected to be 6,250 million yards. The production of jute in 2077-78 is expected to be 6,300 million yards. The production of jute in 2078-79 is expected to be 6,350 million yards. The production of jute in 2079-80 is expected to be 6,400 million yards. The production of jute in 2080-81 is expected to be 6,450 million yards. The production of jute in 2081-82 is expected to be 6,500 million yards. The production of jute in 2082-83 is expected to be 6,550 million yards. The production of jute in 2083-84 is expected to be 6,600 million yards. The production of jute in 2084-85 is expected to be 6,650 million yards. The production of jute in 2085-86 is expected to be 6,700 million yards. The production of jute in 2086-87 is expected to be 6,750 million yards. The production of jute in 2087-88 is expected to be 6,800 million yards. The production of jute in 2088-89 is expected to be 6,850 million yards. The production of jute in 2089-90 is expected to be 6,900 million yards. The production of jute in 2090-91 is expected to be 6,950 million yards. The production of jute in 2091-92 is expected to be 7,000 million yards. The production of jute in 2092-93 is expected to be 7,050 million yards. The production of jute in 2093-94 is expected to be 7,100 million yards. The production of jute in 2094-95 is expected to be 7,150 million yards. The production of jute in 2095-96 is expected to be 7,200 million yards. The production of jute in 2096-97 is expected to be 7,250 million yards. The production of jute in 2097-98 is expected to be 7,300 million yards. The production of jute in 2098-99 is expected to be 7,350 million yards. The production of jute in 2099-00 is expected to be 7,400 million yards. The production of jute in 2100-01 is expected to be 7,450 million yards. The production of jute in 2101-02 is expected to be 7,500 million yards. The production of jute in 2102-03 is expected to be 7,550 million yards. The production of jute in 2103-04 is expected to be 7,600 million yards. The production of jute in 2104-05 is expected to be 7,650 million yards. The production of jute in 2105-06 is expected to be 7,700 million yards. The production of jute in 2106-07 is expected to be 7,750 million yards. The production of jute in 2107-08 is expected to be 7,800 million yards. The production of jute in 2108-09 is expected to be 7,850 million yards. The production of jute in 2109-10 is expected to be 7,900 million yards. The production of jute in 2110-11 is expected to be 7,950 million yards. The production of jute in 2111-12 is expected to be 8,000 million yards. The production of jute in 2112-13 is expected to be 8,050 million yards. The production of jute in 2113-14 is expected to be 8,100 million yards. The production of jute in 2114-15 is expected to be 8,150 million yards. The production of jute in 2115-16 is expected to be 8,200 million yards. The production of jute in 2116-17 is expected to be 8,250 million yards. The production of jute in 2117-18 is expected to be 8,300 million yards. The production of jute in 2118-19 is expected to be 8,350 million yards. The production of jute in 2119-20 is expected to be 8,400 million yards. The production of jute in 2120-21 is expected to be 8,450 million yards. The production of jute in 2121-22 is expected to be 8,500 million yards. The production of jute in 2122-23 is expected to be 8,550 million yards. The production of jute in 2123-24 is expected to be 8,600 million yards. The production of jute in 2124-25 is expected to be 8,650 million yards. The production of jute in 2125-26 is expected to be 8,700 million yards. The production of jute in 2126-27 is expected to be 8,750 million yards. The production of jute in 2127-28 is expected to be 8,800 million yards. The production of jute in 2128-29 is expected to be 8,850 million yards. The production of jute in 2129-30 is expected to be 8,900 million yards. The production of jute in 2130-31 is expected to be 8,950 million yards. The production of jute in 2131-32 is expected to be 9,000 million yards. The production of jute in 2132-3

note the growth of plants and to enable cultivators to complete sowings and proceed with weeding operations. Sowings to date amount to -12/- against -11/6 on the corresponding date last year. The condition of plants of early sowing is improving but the seed germination of recent sowings is disappointing because of continuous rain. The river level is abnormally low.

JAIPUR ROAD: The weather has been wet and this has been unfavourable for sowings and the growth of standing plants. Sowings to date amount to -8/- as compared to -12/- at this time last year. The condition of early sowings has improved and plants range in height from seedlings to about 9". Seed germination is so far fairly satisfactory.

RANAGHAT: Moderate rainfall was experienced and this has proved favourable for the standing crop, but a spell of bright sunshine would now be beneficial. Sowings amount to -8/- as compared to completed sowings at this time last year. The condition of plants is improving and they range in height from seedlings to 4' 9". The river level is normal.

COSIMBAZAR: Favourable weather was experienced but further rainfall is still required. Sowings to date amount to -9/- as compared to completed sowings at this time last year. Weeding operations are going on where required. The condition of plants is improving and they range in height from seedlings to 2'.

NOWGONG: The weather has been very hot and dry and rain is required to assist the growth of plants. The condition of plants is satisfactory and they range in height from 1' 9" on the highlands to 5' 3" on the lowlands. Weeding has been completed on the low and midlands, and are nearing completion on the highlands. The river level is normal. Sowings completed -11/6.

GAUHATI: The weather has been unfavourable, further rainfall would be beneficial. The condition of plants is good and lowland plants are almost mature, but a shortage of stepping water may delay the harvesting. The river has fallen 4' during the week and is now lower than the corresponding period last year. Sowings completed -13/6.

DHUBRI: Favourable weather was experienced with alternate rain and sunshine. Weeding operations have been completed and plants range in height from 2' on highlands to 5' on lowlands. The lowland crop is almost mature and harvesting will commence if there is any rise in the river. The river has fallen during the week but is slightly higher than last year. Sowings completed -12/-.

KHARUPETIA: The weather has been hot and dry and this has been favourable. The condition of the standing crop is satisfactory. Harvesting has commenced on a limited scale on lowlands. The river level is normal. Sowings completed -12/6.

DAISSEE DISTRICTS: The weather has been favourable with alternate rain and sunshine. The condition of plants is improving and they are now healthy. First weeding operations have been completed in almost all places. Sowings completed -10/-.

Rainfall	For the Week	Total from 1st January	Rainfall over the week-end
Danpur	3.94"	7.44"	
Jaipur Road	3.29"	9.45"	
Ranaghat	2.68"	8.82"	
Cosimbazar	0.36"	7.94"	
Nowgong	nil	25.77"	
Gauhati	nil	28.39"	0.14"
Dhubri	0.80"	31.99"	1.56"
Kharupetia	0.21"	33.14"	0.20"

N.B. As a basis of comparison last season's crop has been taken as -16/-.

WEATHER FAVOURS PAKISTANI CROP

In their sixteenth crop report of the current season, covering the week ended 20th June, Messrs. Sinclair Murray (Pakistan) Ltd., say that the weather has been favourable with alternate rain and sunshine. The condition of the standing crop is satisfactory. Small scale harvesting has commenced in eastern districts. River levels are generally higher than at this time last year.

NARAYANGANJ: Sowings completed -8/-. The weather has been favourable with alternate rain and sunshine. The condition of the midland and highland crop is very good and there are indications that the quality of the lowland crop will not be too good but plants are stunted and threw out branches as a result of early flowering. The river has been steady and is now 5' higher than the corresponding date last year.

DACCA: Sowings completed -8/-. The weather has been favourable with alternate rain and sunshine. Plants are now making satisfactory progress and range in height up to 5'. Harvesting is going on slowly in lowland areas. The river is rising and is now 1' 6" higher than at this date.

CHANDPUR: Sowings completed -7/-. The weather has been favourable with alternate rain and sunshine. The condition of plants is satisfactory and they range in height up to 4' 6". Weeding operations

have been completed. Harvesting is going on in chur land areas. The river level is normal.

HAJIGANJ: Sowings completed -7/-. Favourable weather conditions have prevailed. The condition of plants is satisfactory and they range in height up to 5' 6". Harvesting has commenced on a very small scale on lowland areas. The river has risen 6' during the week and is now higher than last year at this date.

ASIUGANJ: Sowings completed -8/-. The weather has been favourable with alternate rain and sunshine. The condition of the crop is generally satisfactory although the growth is not as good as last year. Plants range in height up to 5' 3". The river is about 3' 9" higher than at this time last year.

NIKLIDAMPARA: Sowings completed -6/3. Favourable weather conditions have prevailed with alternate rain and sunshine. Condition of the crop is satisfactory and plants range in height up to 5' 9". Limited harvesting is taking place on lowlands. The river has risen and is now about 4' 2" higher than last year at this date.

SARISHABARI: Sowings completed -7/-. The weather has been very favourable with alternate rain and sunshine. Plants in all areas are responding very well. Weeding has been completed in low and midlands and still continues in the highlands. The river has fallen during the week but is still 4' 2" higher than last year.

SERAJGANJ: Sowings completed -7/-. The weather has been favourable with alternate rain and sunshine. The condition of the standing crop is satisfactory and they range in height from 1' 6" on the highlands to 6' 9" on the lowlands. The river has fallen during the week but is slightly lower than last year at this date.

NAKALIA: Sowings completed -8/-. The weather has been favourable. The condition of the standing crop is satisfactory and plants range in height up to 5' 6". The river has fallen and is now slightly lower than last year at this date.

BIANGORA: Sowings completed -8/-. The weather during the week has been favourable. The condition of the standing crop is satisfactory and plants range in height up to 6'. The river has risen and is now about 3' higher than the corresponding date last year.

Rainfall	For the week 1953	For the week 1952	Total from 1st January 1953	Total from 1st January 1952	Rainfall over the week-end

N.B. As a basis of comparison last season's crop has been taken as -16/-.

THE FOREIGN JUTE MARKETS

MORE CONSUMER INTEREST

(FROM OUR OWN CORRESPONDENT).

Dundee, By Air Mail.

WHILE there is an undercurrent of uneasiness in the jute industry regarding the future, producers of jute yarns and cloth at all centres are fairly comfortably placed with business for delivery over the next several months. Led by the Argentine, consumers generally have been displaying more interest, and though there are fluctuations in prices for goods, the level is being more or less maintained at the recent advance. The raw jute market is quieter again at the moment, after fair business having been concluded with the Continent and the U.K. Up-country markets in Pakistan are reported to be firm with supplies coming in slowly, but it is generally agreed that there is a good carry-over from past crops, which is being held back in the hope of higher terms. It would be most unfortunate if prices for raw jute were advanced beyond their present level, caused through any shortage, or even rumours of shortage. To maintain its popularity, jute must be cheap, or comparatively lower than the many substitutes which can come into competition with it. Speakers at the Annual General Meeting of the U.K. Jute Goods Association at Pitlochry last week, at which there was a record attendance of 75 members, all stressed the point of reasonable prices. They said that so long as values were kept down, business would steadily improve. No one wanted to see values at an uneconomic level, but if raw jute advanced, naturally prices for productions would have to go higher.

Continental spinners, after selling a moderate quantity of jute yarns to the U.K. carpet industry, have raised their prices and extended the time of delivery. This has practically stopped U.K. from increasing their production of yarns to meet the additional demand, and it is now quite definitely apparent that there is not enough yarn because of spinners. Weaving has outstripped spinning place in automatic looms and circular looms.

Raw jute offers have been fairly numerous at £102 for Mill Firsts, £91 for Mill Lightnings, £91 4 at £90 for grade, all c. and f. U.K. All these total being fairly substantial. Values of yarn and cloth remain firm and unchanged all round.

Commodity Markets

WORLD WOOL TRADE IN 1952

LACK OF UNIFORM RECOVERY

ONE of the most detailed reviews of the world trade in raw wool and woollen textiles in 1952 is contained in the collection of statistics compiled from the returns made by the principal wool-growing and consuming countries at the request of the Commonwealth Economics Committee and the International Wool Textile Organisation, which was presented to the latter organisation's annual conference in Lisbon recently. The outstanding feature is the lack of uniformity shown by different countries in the extent of their recovery from the recent recession even though practically all showed some improvement by the end of the year.

The improvement in employment in the wool textile industry which was experienced in the United Kingdom last year was shared by Germany, Belgium and Holland. Employment continued to increase in Japan, but there were further declines in the United States, France, Italy, New Zealand, and Ireland. On the other hand, productive capacity decreased. A substantial fall in the numbers in the United States was the principal cause of a decrease in spindle capacity, though there were also decreases in the United Kingdom and Belgium. Spindleage increased, however, in Germany and Portugal. The United States, along with France, was also the principal contributor to a fall in the number of looms installed. The decreases in those two countries were not sufficient to offset increases in Australia, Austria, Norway, Portugal, and Switzerland.

Consumption of virgin wool increased by 2 percent last year, compared with 1951, though it is estimated that the production of tops fell by 4 percent, that of yarn by 6 percent, and that of woven tissues by about 5 percent. There were sharp increases in consumption in Japan, where the post-war recovery again made rapid progress, and in Uruguay, where much of the expansion was in the production of tops for export. (It may be mentioned here that world trade in raw wool and tops increased sharply in 1952, though there was a further decline in trade in yarn and tissues.) There were also increases in consumption in Italy, France, and Germany. The principal declines were in the United States, the United Kingdom, and Australia, though by the end of the year the trend in the United Kingdom had improved greatly.

One point which the figures illustrate is the course of consumption in the wool textile industries of materials other than virgin wool. In 1951, compared with 1950, there were sharp rises in the consumption of these other materials in France, Germany, Italy, Japan, Sweden, and the United Kingdom, but there were sharp declines last year, except in Japan, where consumption in 1952 was only one-twelfth less than in 1951, and one-third greater than in 1950. United States consumption of materials other than wool was smaller in 1951 than in 1950, and it declined further last year.

LIVERPOOL WOOL SALES IN APRIL

The third series of auctions of Indian and Pakistan wools was held from 28th to 30th April. The offerings totalled 9,115 bales of which only 4,458 bales were sold. It is estimated that the United Kingdom bought 3,845 bales and the Continent 613 bales. There was a good attendance of buyers but the opening competition was irregular mainly owing to the excessive number of selling limits. Competition was slightly better on the following day. There was a high proportion of well-prepared White Joria wools; Superior and Medium Yellows were in short supply but Dark Greys were numerous and difficult to sell.

The Liverpool Wool Brokers' Association states that in comparison with the prices ruling at the previous sale in March, Superior and Medium Whites were 2½ to 5 percent lower. Superior and Medium Yellows in the sellers' favour, Light Greys rather dearer and Black and Dark Greys irregular and occasionally showing a 10 percent decline.

WHOLESALE PRICE INDEX RISES

The official wholesale price index (base: year ended August 1939=100) recorded a further rise of 0.5 percent to 405.0 during the week ended 6th June, 1953, as compared with 402.8 (revised) for the previous week. Compared with the corresponding weeks of last month and a year ago, the index was higher by 2.5 and 9.8 percent respectively. During the week under review, Foodstuffs advanced by 1.2 percent to 395.9 from 391.1 (revised) for the previous week, owing to higher prices of wheat (+7%), tea (+3%), gram (+2%), sugar and jowar (+1% each), notwithstanding a decline in the prices of bajra (-5%). Industrial Raw Materials witnessed a fall of 0.9 percent to 483.1 during the week. Items which registered noticeable variations were: Linsed in Bombay (-9%), raw hides (-5%), castorseed (-4%), Groundnuts (-3%), Jarilla and Punjab American cotton in Bombay and cottonseed (-2% each), rapeseed in Calcutta (+10%), linsed in Calcutta and manganese ore (+5% each), lac (+4%) wool (+2%). The index for Semi-Manufactures rose by 0.5 percent to 364.3 as compared with 362.4 (revised) for the previous week, as a result of increases in the prices of coconut cake (+8%), mustard oil (+6%), linsed oil in Calcutta (+5%), Zinc (+2%), coconut oil in Calcutta and brass (+1% each). Prices of linsed oil in Bombay

(-4%), groundnut oil and castor oil (-2% each), coconut oil at Coochin and Bombay (-1% each), however, declined during the week. The Manufacturers group recorded an increase from 370.8 to 371.1 owing to an advance of 2 percent in the prices of jute manufactures, despite declines in glass (-5%), paints (-2%) and rayon and silk manufactures (-1%). The index for the Miscellaneous group also registered a further advance of 5.0 percent to 658.0 on account of increases in the prices of tobacco-leaf (+10%), chillies (+9%), turmeric (+77%) and betelnuts (+2%). The prices of black pepper, however, declined by 2 percent.

POOR BYSAKHI LAC CROP

According to the revised estimates issued by the Indian Lac Cess Committee, the Byssakhi lac

crop in India (excluding Assam) for 1953 is estimated at 456,500 maunds or 19,500 maunds less than the preliminary estimate. The final estimate for 1952 was 890,000 maunds, the normal being 648,000 maunds. As stated at the time of the preliminary report, the low yield is because the 1952 Katki crop was poor, resulting in extreme brood shortage and unfavourable climatic conditions. There was no rain in February, March and the first half of April, it is necessary for the healthy growth of the crop. Arrivals of new lac at the manufacturing centres are poor and quality also is not good.

WORLD OIL PRODUCTION

Free world output of crude oil has continued at a record rate, generally, according to reports released in Washington. Crude oil production averaged 12,785,000 barrels daily in December, establishing a record for the fourth consecutive month, the U.S. Bureau of Mines announced. Incomplete statistics of succeeding months indicate that the high rate of production is being maintained, the bureau noted. Record production in the United States and Venezuela offset declines from the Middle East. During December, the last month for which complete figures are available, oil production dropped 10.7 percent in Kuwait and 4.1 percent in Saudi Arabia. Exports from the Middle East averaged 1,694,000 barrels, compared with 1,749,000 barrels in November.

1953-54 COTTON OUTPUT

The International Cotton Advisory Committee predicted that 1953-54 cotton output would decline substantially in 27 free world countries, particularly in the Middle East and Pakistan where more acreage is being put to food production. Other factors contributing to the decline, the committee said, are increased cotton stocks throughout the world and lower prices for cotton on the world market.

The world cotton crop during the 1952-53 season totalled 28.4 million bales, excluding production in the Soviet Union, Communist China and Eastern Europe. The United States with 14.9 million bales, India with 2.9 million and Egypt with 2 million were the three largest producing nations. The committee estimated that U.S. cotton exports for the current crop season will drop 2.5 million bales from the 5.5 million bales shipped during the 1951-52 crop year.

Saint Frères Circular Looms installed in Italy.

SAINT FRÈRES CIRCULAR LOOMS

Hundreds of Saint Frères Circular Looms are in use—in new factories and old, sometimes working alongside flat looms—in the Belgian Congo, in South Africa, Sweden, Norway, Italy, Great Britain, Germany, Belgium and France.

These looms were originally designed for making tubular cloth from jute. Deliveries of a Saint Frères Circular Looms for hard fibres are now available. Saint Frères Circular Looms are manufactured by Urquhart Lindsay & Robertson Orchar Ltd., Dundee, Scotland.

Sacks made from Tubular Cloth are stronger

They cost less to make

The 1.2 loom (2-leaf, 4-shuttle) weaves single and double warp plain and tubular cloth for sacks and for the manufacture of single width cloth woven in tubular form with a double false selvage for wrappers, etc.

REDUCTION IN SUGAR IMPORT DUTY ANNOUNCED

MARKETS GENERALLY EASIER

THE Government of India's decision on Monday to allow imports of sugar and to reduce the import duty from Rs. 14-14 per cwt. to Rs. 7 per cwt. has had the intended bearish effect in sugar markets. The reduction in duty is estimated to bring down the landed cost of foreign sugar (of which supplies are plentiful) from Rs. 32 to Rs. 28 a maund; present prices in India range up to Rs. 32 a maund but the Government feels the fair ex-factory price would be about Rs. 27 a maund. Importers, large dealers, as well as establishments consuming sugar have been invited to apply for licences to the Chief Controller of Imports, New Delhi. Applications should be accompanied by evidence of past imports, turn-over in internal trade or actual requirements, as the case may be, for different classes of applicants. Licensing will be done on merit and the main test will be the ability of the importer actually to bring in a ship-load (6,000 tons) of sugar within a period of two months for which licences will be valid. For the present, licences will be granted for importation into Bombay and Madras only.

Calcutta Rates Fall

During the week ended 22nd June, the Calcutta sugar market showed a weaker tendency because of official measures to bring down prices. Quotations for ready sugar ex-Kantapukur delivery were: ordinary grain Rs. 30-12 a maund; big grain Rs. 32-4; coming ordinary grain Rs. 30; and

coming big grain Rs. 31-8. Stocks amounted to 15,000 bags, arrivals were 3,500 bags a day and sales averaged 2,500 bags a day. Ex-mill delivery rates ranged from Rs. 27-12 to Rs. 29 a maund.

LINSEED

Generally firmer conditions prevailed last week and a notable advance was recorded, although the actual turnover was rather limited. The main feature was the scarcity of supplies from the producing centres, chiefly owing to transport restrictions upcountry. Ready goods were very scarce and sellers were reserved. A rather meagre interest was shown by crushers and business took place on a much reduced scale. In the oil section prices advanced in sympathy with seeds, but a very poor off-take continued and dull conditions prevailed generally. Latest quotations were as follows: June Rs. 22 per maund, July-August Rs. 22/6 per maund.

HIDES AND SKINS

The market ruled almost unchanged. Stocks were less than in the previous week.

Bazaar Sales

(Between 16th June and 22nd June, 1953.)
Cowhides:—Wet salted (Slaughtered) 2,650 pcs. on the basis of Rs. 13-0-0 to Rs. 24-4.

Cowhides:—Wet salted (Daisee, Killed) 37,050 pcs. on the basis of Rs. 280 to Rs. 425; Assam-Dinajpur-Murshidabad 28,400 pcs. on the basis of Rs. 260 to Rs. 425; Purneah-Kissenganj 8,400 pcs. on the basis of Rs. 280 to Rs. 300; Patna 16,600 pcs. on the basis of Rs. 130 to Rs. 241; Pakur 11,000 pcs. on the basis of Rs. 240 to Rs. 260; Muzafferpore-

Darbhanga-Samastipur 72,500 pcs. on the basis of Rs. 270 to Rs. 280.

Bazar Stocks

(22nd June, 1953.)
Cowhides:—Wet salted 1,03,300 pcs.
Goatskins:—Wet salted (Daisee, Killed) 39,000 pcs.; Assam-Dinajpur-Murshidabad 65,500 pcs.; Muzafferpore-Patna-Pakur-Purneah-Kissenganj 70,500 pcs.

WEEKLY SHELLAC MARKET REPORT

The market was quiet and small business passed at higher prices. Quotations were as follows:—
Standard Pure Buttonlac Rs. 96 to 105 buyers
Pure Buttonlac Rs. 92 to 98 buyers
Lemon No. 1 Shellac Rs. 96 to 103 done & buyers
Lemon No. 2 Shellac Rs. 92 to 95 done
F.O. Std. 1 Shellac Rs. 92 to 95 done & buyers
Pure TN Shellac Rs. 82 to 90 basis done & buyers
4% I.T.N. Shellac Rs. 74 to 80 buyers
No. 1 Kusmi Seedlac 3% Rs. 96 buyers
No. 2 Kusmi Seedlac 3% Rs. 83 to 86 done & buyers
Fine Bysaky Seedlac (Manbhum) 3% Rs. 80 to 85 buyers
Fine Bysaky Seedlac (C.P.) 3% Rs. 72 to 70 done & buyers
Ordinary Bysaky Seedlac (C.P.) 3% Rs. 65 to 68 buyers
Kireelac 3% Rs. 29 to 30 buyers

Shipments during June until the 23rd were 18,200 packages.

FREIGHT MARKETS QUIET

LIMITED DEMAND FOR AVAILABLE TONNAGE

CONDITIONS in the freight markets have recently become quieter and freights have generally moved against the shipowners as there are insufficient demands to meet the tonnage available. Owners are hoping that Charterers will shortly be open for 700,000 tons wheat from America to Pakistan for shipment July-October but at least half of this quantity will be shipped in American bottoms. The fixture of a handy sized July loader for coal from Calcutta to Singapore at the lower rate of 46s was the only fixture reported in the Calcutta coal market last week and two further fixtures have been reported for ore from India: \$9 was paid for a prompt ship from Bombay to U.S.N.H. while a July loader accepted \$9.25. Salt from Bedibunder to Japan was arranged at 47s 6d for an end July vessel and a June loader accepted \$9 for tin slag from Penang to Northern Range.

A further vessel has been fixed from Australia to India with wheat, the previous rate of 87s 6d being paid and in the Australian coal section, a vessel accepted \$8.75 for two consecutive voyages from Newcastle to Pusan. From North China a cargo of mixed cereals to Antwerp-Hamburg range paid 82s 6d and a cargo of rice from Whampoa to Colombo was done at the reduced freight of 49s 6d. While demand for grain from the North Pacific has slackened, some fixtures to India have been reported. Two vessels were fixed at 77s 6d and further two were done at 75s, at the much lower level of 72s 6d. Other fixtures from the North Pacific included one for U.K./Antwerp-Hamburg range at 71s 3d and \$6.50 was paid for a June loader for wheat in bulk to Japan. Coal continues to move in bulk to Japan. Japan, several October to December loaders accepting the rate of \$8.55. Two vessels were fixed from Santo Domingo to Ceylon with sugar, one being done at 86s 3d and the other at 85s.

Quiet conditions prevailed in the Time Charter section and not many fixtures are reported; amongst these is the fixture of an oilburner at 16s delivery Sarawak redelivery U.K.-C-Continent and a handy sized motorship at 22s delivery U.K. redelivery U.S.N.H. 3 to 6 months trading.

JAPANESE SYNTHETIC FIBRES PLAN

Japan has launched a five-year plan to increase the production of synthetic fibres from 10 million to 100 million lbs. annually and so enable drastic savings to be made in the purchase of Australian wool and U.S. cotton. It is estimated that the plan will mean a saving, after 1957, of \$100 million a year in imports of both raw wool and cotton, which combined now cost Japan \$500 million. The approximate cost of the plan, which involves the use of Japanese limestone and expansion of hydro-electric schemes, will be 27,000 million yen (£270 million). The Economic Deliberative Council, top Government planning body, has now recommended that the scope of the plan be doubled to permit the production of 200 million lbs of nylon, vinylon and saran. This increase, it is reckoned, would represent a saving of up to \$240 million in wool and cotton imports. Japan will also increase imports of cheap wood pulp from chemical cellulose. Viscose rayon now has a wide variety of uses in industry, particularly for tyre heating of tyres from road friction strengthens cotton cord is, of course, diminished. Vinylon and distribution will be largely used for domestic needs, through a combination of private enterprise and labour unions and agricultural the latter represented by operatives. Finance will be provided by the Development Bank, supplemented by Government-encouraged loans through private financial organisations.

COMPANY AND PUBLIC NOTICES

THE BURRAKUR COAL COMPANY, LIMITED.

NOTICE is hereby given that the One hundred and fourth Ordinary General Meeting of the Shareholders of The Burrakur Coal Company, Limited, will be held at the Registered Office of the Company, Chartered Bank Buildings, Calcutta, at 11-30 A.M., on Friday, the 26th June, 1953, for the purpose of receiving the Directors' Report, passing the Audited Accounts for the half-year ended 31st December, 1952, declaring the Dividends recommended by the Directors, electing Directors and Auditors, and for transacting any other ordinary business of the Company.

The Share Transfer Registers of the Company will be closed from the 12th to the 26th June, 1953, both days inclusive.

By Order of the Board,

BIRD & CO., LTD.,

Managing Agents.

Calcutta, 28th May, 1953.

SONE VALLEY PORTLAND CEMENT COMPANY LIMITED.

NOTICE is hereby given that an Ordinary General Meeting of the above Company will be held at the Registered Office of the Company, No. 12, Mission Row, Calcutta, on Friday, the 17th July, 1953 at 11 a.m. for the following purposes, namely:—

- (1) To receive and adopt the Directors' Report and Audited Accounts for the year ended 31st December, 1952.
- (2) To declare a Dividend.
- (3) To elect Directors.
- (4) To appoint Auditors for the current year and to fix their remuneration.

The Transfer Books and Register of Members of the Company will be closed from the 6th July, 1953 to the 17th July, 1953, both days inclusive.

By Order of the Board,

MARTIN BURN LTD.,

Managing Agents.

Calcutta,
The 22nd June, 1953.

NOTE:—The Dividend, if declared, will be paid on or after 27th July, 1953 only to those members or their Mandatees whose names appear on the Register of the Company on the 17th July, 1953. No application for Warrants will be necessary.

THE GOUERPORE COMPANY, LIMITED.

NOTICE.

NOTICE is hereby given that the Half-yearly General Meeting of Shareholders of the above Company will be held at the Registered Office of the Company, No. 2, Fairlie Place, Calcutta, on Monday, the 6th July, 1953, at 3 p.m., for the following purposes:—

- (1) To receive and consider the Directors' Report and the Accounts for the half-year ended 31st March, 1953.
- (2) To elect Directors.
- (3) To appoint Auditors and fix their remuneration.
- (4) To transact any other competent business that may be brought forward.

The Share Transfer Books of the Company will be closed from the 30th June to 6th July, 1953, both days inclusive.

1953

Edition of the Calcutta Stock Exchange Official Year Book is endorsed alike by the Press and the Public as the most indispensable work of reference on investment. The very fact that the Central and State Governments, the Reserve Bank of India, all Exchange and Scheduled Banks, Insurance and other financial institutions, and leading business houses use it is a proof positive of its superiority over any other publications of a similar nature.

The work is more comprehensive than others. It presents information not only about all the shares dealt in on the Calcutta market but about the leading scrips of other markets as well. The information given relate to the date of registration, nature of business, managing agents—their names, addresses and remuneration, directors—their names and share qualification, details of capital and shares, share registration fee, names of auditors, periods to which accounts close, date of meetings, summary of balance sheets, and progress statement containing provisions for taxation, depreciation, allocations to reserves, net profit, amount carried forward, dividends, highest and lowest prices, etc. Each section is also prefaced with an informative historical introduction. Besides there are also lots of information relating to such matters of vital importance to shareholders as income-tax and super-tax rates, stamp duty on share transfers, sterling-rupee exchange calculator, interest table, members of the Stock Exchange, Stock Exchange Committee, Stock Exchange holidays, Stock Exchange rules, and regulations and so forth. Price Rs. 12/8/- per copy (Postage Rs. 1/8/- extra). Order from The Secretary, Calcutta Stock Exchange Association Ltd., 7, Lyons Range, Calcutta.

WORKING CLASS COST OF LIVING INDICES

The working class cost of living indices issued by the Labour Bureau for April, 1953, with base year 1944 equals 100, showed a general rise in most towns. The biggest increase was in Silchar where the index rose nine points to 129. In Kharagpur the index rose four points to 135, continuing the rise of the previous month. There was a rise of five points to 115 in Mercara. In Gauhati the index rose three points to 124, in Ludhiana, two points to 147 and in Ajmer one point to 166. In Jamshepur, Jharia and Tinsukia the indices were stationary at 148, 156 and 119 respectively. Only at Monghyr and Dehri-on-Sone did the indices decline. In Monghyr the index receded two points to 147, the lowest level recorded in six years. The index fell one point in Dehri-on-Sone to 166, the lowest figure since February 1950. The provisional all-India index for March was 142 compared with 141 in February.

NEW FINISH FOR NON-WOOL FIBRES

Two new agents for the dyeing and finishing industry of Britain have been announced by Ciba, of Basle. One is Sapamine WP, a finishing agent which imparts a permanent soft finish to all types of fibres, with the exception of wool. It withstands boiling and, in general, has no adverse effect on the fastness to light of dyeing. The agent can be applied alone or in conjunction with thermosetting resin finishes. The second is Neoprinting AN, which is a multi-purpose dyeing and printing agent possessing several outstanding properties. One use in wool-dyeing is for the prevention of "tippy" dyeing and for the covering of dyed areas in garment dyeing. It is used in the dyeing of polyamide fibres and acetate rayon and for many printing purposes, including the production of clearer white effects in discharge printing on nylon and wool-nylon.

"CAPITAL" INDEX OF INDIAN INDUSTRIAL ACTIVITY **

The Capital Index of Indian Industrial Activity (Base: 1935) has now been brought up to January, 1953. Compared with the preceding month there were rises in Steel Ingots (0.9 points), Pig Iron (10.4 points), Paper (1.0 point) and Wagons Loaded

(5.2 points), while decreases occurred in Cotton Consumption (10.6 points), Jute Manufactures (7.2 points) Cement (20.1 points), Coal (5.4 points), and Electricity (5.6 points).

The Index for Cheque Clearances shows a drop

of 1.0 point, while that of Notes in Circulation increased by 2.3 points.

Correlating all the factors the Capital Index of Indian Industrial Activity declined by 0.7 points during January, 1953.

JOINT STOCK COMPANIES' PREFERENCE SHARES

Dividends are cumulative and the shares carry a preferential claim on the property for the payment of capital and on the profits for dividend except in case of companies marked otherwise. (For reference see notes below.) Months against names of companies indicate approximately times of payment of dividends.

COAL COMPANIES

O. P. O. F. and Dd. Indicate Ordinary, Preferred Ordinary, Founders' and Deferred shares, respectively. P next to the name of the company indicates that the company also has Preference Shares. Figures in "accounts closed" column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer to the Key (last page) under the numbers indicated.

TEA COMPANIES

O, Po and Dd indicate Ordinary, Preferred Ordinary and Deferred Shares, respectively. P next to the name of the company indicates that the Company also has Preference Shares. Figures in "accounts closed" column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer to the Key (last page) under the numbers indicated.

Why users choose Caterpillar Motor Graders

**Caterpillar Motor Graders are BUILT!**

Other makes are assembled from many different sources. Caterpillar designs and builds the engine, transmission, final drive, power controls, frame, circle and drawbar and blade mechanism.

Caterpillar Motor Graders are BALANCED!

Each size of Caterpillar Motor Grader is properly designed and balanced between engine horsepower, weight and working speeds. Proper balance results in higher production and lower operating cost.

Caterpillar Motor Graders are LONG LIVED!

99 per cent of all the Caterpillar Motor Graders ever built are still at work. Quality materials, design and manufacture are still paying dividends to owners... in some cases even after 22 years of useful work!

Caterpillar Motor Graders are VERSATILE!

Besides their ability to handle the toughest job expected

of a good motor grader, these machines can also be fitted with the following attachments:

- DoMor Elevating Grader
- DoMor Road Widener
- DoMor Snow Blower
- Scarifier
- Snow Plow and Wings
- Bulldozer Blade

Caterpillar Dealers give good SERVICE!

Your Caterpillar Dealer's most important function is the servicing of Caterpillar equipment in his area.

You can be sure of adequate supplies of replacement parts and expert mechanical service when you buy a Caterpillar Motor Grader.

WILLCOX (BUCKWELL)

the blast that builds...

Man's earliest experiences of explosions were fortuitous and were connected in his mind with the miraculous and the supernatural.

Later he learnt to produce these 'miracles' at will and he used this knowledge first to astonish and then to kill.

Today, these are the lesser uses of explosives—for much of the peaceful development of modern life would be impossible without them.

The great irrigation and land reclamation projects that make possible the planned production of vital food supplies, the winning of coal and important minerals from the earth, the construction of the hydro-electric schemes which increase the world's industrial potential are made possible by the wide range of specialised explosives devised and manufactured by Imperial Chemical Industries. There can be few aspects of our life that have not benefited from the enterprising research, the patient proving trials, the skilfully organised manufacture of

CONTROLS HAMPER EFFORTS TO MARKET INDIAN COAL DISTORTION OF THE INDUSTRY'S COST STRUCTURE

• By A SPECIAL CORRESPONDENT •

INDIA'S production and despatches of coal are today running at all-time record levels; she is producing more coal, and despatching more to consumers, both internal and overseas, than she has ever done before. During 1952 total raisings amounted to 36,180,000 tons and of this 31,077,000 tons were actually despatched from the collieries. The coal mining industry has in fact been pre-eminently successful in achieving its postwar production targets, and the 1952 output represented an increase of approximately 57 percent over that of the worst of the wartime years of shortage, 1943-44, when production was in the region of only 23,000,000 tons. The rapid increase in production during the postwar years has also been accompanied by equally successful results in the export field; in 1952 India exported approximately 2½ million tons of coal to countries other than Pakistan and, including Pakistan, the total export figure reached almost 3,700,000 tons. Taken by themselves, these figures would seem to indicate a prosperous and expanding industry, one which has reached hitherto untouched levels of activity and production, and one which must be economically sound and in a position to face the future with confidence and assurance. Unfortunately, production figures alone tell but a small part of the full story. The industry is in fact beset by problems as grave as any it has ever had to face in its history; the prosperity which might be assumed from its production record is largely illusory and is certainly not generally or uniformly reflected in earnings and balance sheets; and those in the industry who are in the best position to know are deeply concerned over the maintenance of future economic stability.

The Immediate Trading Position

At the outset, the industry's immediate prospects are clouded by the fear of overproduction, of an excess of coal over internal and external demand. Crises caused by overproduction have been a recurrent feature of the coal industry's history and in the prewar years periodic depressions caused by this factor resulted in frequent heavy losses, in widespread closures and, generally, in a harmful and dangerous lack of economic stability. Today, with annual production exceeding the 36,000,000-ton mark, it is widely believed that the industry is producing as much as, if not more than, the country and overseas customers can consume. Production trends cannot be altered quickly or at will and there is therefore a danger that the industry will rapidly run into excess production and find itself in the old unfortunate position of being unable to sell all its output. An industry which is producing to the full absorptive capacity of its markets is also particularly susceptible to the effects of general economic fluctuations; and any general recession in the level of economic activity would therefore find the coal industry notably vulnerable.

Concern over Exports

Exports provide one of the gravest causes for concern in the industry's immediate market prospects. Because of the ever-present threat of overproduction, exports to overseas countries have always had a special value for Indian collieries, for the export of a few million tons has constituted the margin between enough and too much production. Down the years, therefore, India has built up a steady and substantial market for her coal in South-East Asian countries, particularly Burma, Ceylon and the Straits Settlements. In postwar years, with an acute shortage of coal in almost every consuming country, export opportunities abounded. India was able to sell coal to countries which she had not traditionally served — to Australia, the Far East, East Africa, Europe and even to the home of the coal export trade, the United Kingdom. Naturally, therefore, exports increased, and the excellent record of 1952 has already been quoted. The situation which provided these opportunities is however rapidly passing.

The international coal shortage is no longer so acute; America and the U.K. are again important suppliers to overseas countries; Australia, which imported from India during the postwar years, now has an exportable surplus of several million tons annually; and South Africa has ambitious development projects for her collieries which will undoubtedly have repercussions in Eastern markets.

The disappearance of the special circumstances which favoured India and the onset of international competition has been reflected during the past six months in dwindling coal exports and, although the trend has to a certain extent been halted by the recent abandonment of the Indian

Government's export surcharge on coal shipments, there is no doubt that the export prospects of the Indian coal industry are far from bright. Unfortunately, these prospects are, in the industry's opinion, further embarrassed by the Government's policy with regard to the export trade. The quantum of exports can only be maintained by supplying good quality coal at competitive prices. The Government of India however exercises a multiplicity of controls, described more fully below, which severely hamper the Indian shipper in giving his customers what they want and in competing with his overseas rivals. It is the industry's firm opinion that exports will dwindle considerably, and even the traditional

An Indian colliery.

markets in South-East Asia will be endangered, if a greater measure of freedom is not given to the Indian exporter.

Transport Bottlenecks

The market circumstances described above are complicated by India's internal transport difficulties. Although the railways too have succeeded during the past few years in establishing records for the amount of coal they have moved, and although the coal industry undoubtedly has cause to be grateful to the railway administration for their strenuous efforts to improve the supply of wagons, the fact remains that there is a perennial shortage of transport—a shortage which, like the threat of overproduction, has been with the coal industry all its days and has repeatedly produced serious crises and losses. During 1952 the railways established an all-time record by supplying a daily average of 3,163 wagons for the loading of coal in the Bengal and Bihar fields, which produce over 80 percent of India's total coal output. That is an impressive achievement; yet the industry found itself at the end of the year with a stock of over 2,400,000 tons of coal awaiting movement from pitheads in Bengal and Bihar. The supply of wagons is of course subject to seasonal fluctuations and even these massive stocks represented a considerable reduction from the peak pithead figure of 3½ million tons which had accumulated towards the middle of 1952; more recently, stocks have again mounted and in the middle of May amounted to 3,172,000 tons. The consequences of this accumulation can be easily imagined. They involve an enormous immobilisation of capital; they are a constant worry to colliery owners because of their liability to heating and the possibility of spontaneous combustion taking place; and, in particularly bad cases where finance or storage space is limited, they threaten to cause a reduction or even a cessation in raisings.

The inadequacy of transport resources also had its repercussions on exports during 1952 when, towards the middle of the year, a severe cut had to be made in the allocation of wagons to the docks. The result was that steamers calling at Calcutta for coal cargoes found that there was no coal waiting there; serious congestion took place in the port, and vessels were obliged to wait for several weeks at a time in the approaches to the Hooghly. At its worst the situation involved the simultaneous detention of 32 vessels and the waiting time was as long as 50 days. The effects on the coal export trade were serious. The amount exported declined, demurrage accrued, shipping costs went up and Calcutta became less attractive as a port of call. In due course, after wagon supplies to the docks had been stepped up as a result of urgent and repeated representations by the industry and trade, the situation improved and the congestion at the port was remedied over a period of several months. The critical conditions which prevailed at that time, however, are indicative of the serious effects of the constant over-all transport shortage and underline the complications which are added to the coal industry's other difficulties by reason of the fact that it cannot be assured of the necessary transport to take its production of coal where it wants and when it wants.

A shortwall coal cutter working in a British mine.

which leads to the Welfare State, there must inevitably be a wide measure of Government control. The effects on the economics of coal mining however are serious and, as far as the coal industry is concerned, it is frequently difficult to reconcile the results of planning with its ideals.

Price Control

The prices of all grades and qualities of coal are strictly controlled by Government order but in the industry's opinion, they are controlled at uneconomically low levels. As in so many other industries, coal mining has had to face ever increasing costs of production during recent years. In particular labour costs, which account for approximately 70 percent of the cost of production of coal, have increased enormously, as have the cost of stores and the burden of Central and State taxes and cesses. On the other hand, not only have the controlled selling prices for coal not been increased to cover these high costs, but they were actually reduced in the latter part of 1949 as part of the anti-inflationary policy which the Government of India was then following. The price reduction was intended, at the time, to be only temporary and as a matter of fact other industries which also had their prices reduced have since had the cuts restored. Although the circumstances which made the reduction necessary have changed, although costs of production have continued steadily to mount, and although the industry has repeatedly pressed what appears to be an eminently just claim for reimbursement, the selling prices of coal remain fixed at the reduced levels which were introduced in 1949.

The result is that Indian collieries today find it difficult, and in many cases impossible, to earn a profit. Conditions naturally vary from colliery to colliery according to their physical circumstances, but there are undoubtedly many individual units where the margin between costs and earnings has been totally eliminated and the collieries are in fact working at a loss. Obviously, distressing as such a situation is in its immediate effects, the long-term result must be even more dangerous; what it amounts to is that, far from being able to make provision for future development plans, collieries cannot even maintain their capital intact. If the control over coal prices cannot be operated so as to ensure a reasonable margin between costs and earnings, the future of the industry is gloomy indeed.

Labour Costs

The major part (over 70 percent) of the coal industry's expenses of production is in the form of labour costs and these have shown a steadily rising tendency during recent years. The entire management-labour nexus is governed by terms of a Conciliation Board Award which was introduced in 1947 and which has proved increasingly onerous to the industry by reason of overgenerous interpretations and because many of its provisions are not being implemented according to their original design. The award, for instance, provides for the issue of free rice and of rice at concessional rates and for the payment of what is euphemistically called a "production bonus".

(Continued on page 56)

THE BENEFICIATION OF INDIAN COAL INSTALLATION AND MAINTENANCE OF COMMERCIAL WASHERIES

• By ANDREW FARQUHAR, A.R.T.C. •

THE development of industry in India is largely due to the adoption of processes evolved and developed in Western countries. Some have been built up with similar equipment, but success cannot be achieved unless changes are made in design and operational methods to suit climatic conditions and standards of raw materials. The principal raw material for industry is coal and it is in this commodity that the greatest deterioration has been experienced in the last two decades. To reorganise, in order to meet these changed conditions, involves vastly greater capital expenditure and disorganisation than to restore the original quality of the coal. Moreover, it is good business on the part of a coal industry, functioning in a country of free enterprise, to provide suitable raw materials for other industries. As a result of the research work carried out between 1918 and 1940 measures have at last been taken to initiate "beneficiation" on a scale which will meet the demands of the steel industry for consistent and low ash coking coals, and for which the plants were designed. The same results can apply to other industries if the process of "beneficiation" is extended.

The course of the work leading up to these decisions is traced against a background of pessimism and adverse criticism on the part of many, which in other circumstances would have proved fatal to the application of the successful research work carried out by some persistent enquirers. That a successful issue was achieved was due to the Tata Iron & Steel Co., Ltd., and particularly to the confidence and support of Sir Jehangir Ghandy. The formation of coal, its components and impurities are discussed and explanations given for the particular process adopted and its necessary modification in design, not only for Indian coals in general but for the individual local conditions. A warning is sounded to those who may propose duplication without full consideration of the varying conditions, and advice for purchase, erection and operation is also given. Those contemplating similar developments would be well advised to profit from the experience of others in the market preparation of coal by this means. Since the two plants came into successful operation many "experts" have sprung up, who are liable to do more harm than good to the general application of mechanical coal washing in this country.

Initial Research

"Washing" is a process designed to improve, or recover greater quantities of a mineral product from the parent source, and in modern scientific phraseology better known as "beneficiation." Its application in primitive form is very old and assisted in the everlasting search for, and the acquisition of, precious minerals, particularly gold. All at some time or other must have heard of the "prospector's pan" and the "golden fleece," the former being a simple flat pan used on a small scale to separate precious minerals by water from the associated debris, and the latter to trap grains of gold from running streams and rivers. In the course of time, the processes were improved and new ideas improvised for mineral separation, but it was during the middle Victorian age that the greatest advances were made. The great industrial developments of that age in Britain created a demand for more and better raw materials and under this impulse the prototypes of today were created for metallic and non-carbonaceous minerals. During the earlier stages of the industrial developments, coal presented no problems. The country had been endowed with great reserves of very high quality and easily accessible, hence the question of "beneficiation" did not arise.

With the gradual exhaustion of the better grades in Britain and the increasing demands for efficiency, attention was directed to the improvement of inferior coals. It was on this account that the processes of mineral separation were first applied and developed for coal "beneficiation." Where industrial developments lagged behind and good coals were still available little interest was displayed. Other countries, however, at later stages encountered similar difficulties and were gradually compelled to adopt similar processes. This applied particularly to France, Germany and Belgium, and latterly to the U.S.A.,

Holland and South Africa. The original plants were designed for water separation, and were merely the improved application of methods evolved by our ancestors. They were chiefly adaptable for coals with free foreign material, easily separable by water in movement, through taking advantage of the difference in specific gravity between the foreign material and the coal itself. Many are still in operation today and giving good results where the coals are suitable for this design.

The earlier stage of exhaustion of the high grade coals which gave rise to "beneficiation" in Britain has been followed by a further stage of exhaustion in the inferior grades which lent themselves to the original processes. The falling production is more and more being replaced by coals not so amenable to improvement by separation in water alone, by means of gravity difference. The intensification of mechanical mining has also produced difficult problems for coal preparation engineers, since mechanical appliances cannot discriminate in loading out raw coal. These factors have given rise in recent times to the application of revolutionary ideas and successful types of plants are now numerous.

In a country where coal "beneficiation" has been taken up at a comparatively late stage it is possible to take advantage of these new ideas. This particularly applies to the U.S.A., where the difficulties only became apparent after the first World War. The demands of the vast steel industry and the rapid development of the country, have so depleted the reserves of high grade coals that "heavy media beneficiation" has made rapid advances, and plants capable of washing 1,000 tons per hour by these methods are now common. In Britain and in Europe there is also a transition in progress, and in South Africa, where very difficult and high ash coals have been produced for many years, and held to be unwashable, are now being successfully dealt with.

The history of the coal industry in India has followed the pattern of that in other countries. There were in the initial stages of industrialisation fairly large reserves of comparatively good coals, and the demands for inferior grades non-existent. As in South Africa, it was held that Indian coals were not amenable to "beneficiation," in spite of the exposure of the fallacy in the former country. To suggest that Indian coals could be improved in quality by this means led to exposure to ridicule and this attitude still prevails to a great extent. It

is true that the original seams of coal were comparatively low in ash and met the requirements of the country, but as long ago as 1918 warning notes were sounded that these seams were inadequate to meet the increasing demands, and the time would come when consideration would have to be given to the inferior seams. The attention of Government was, on many occasions, drawn to the rapid depletion due to destructive mining and demands for conservation were made.

This resulted in various official, but abortive, committees of enquiry. All these confirmed the seriousness of the position but, with the exception of the 1949-50 Committee, all frowned on the idea of coal "beneficiation." Throughout the period from 1920, increasing deterioration in supplies from the original seams in Jharia gradually forced the steel industry to widen its sources of supply and bring in other coking seams with higher ash content and less reliable consistency. These sources were gradually extended, first to 11 seam, then to 16 seams, then to 16-A and to 10 seam. Since the gradual ash increase and less reliable consistency was of grave concern, the pros and cons of coal washing were the subject of great controversy but the more vocal elements in, and out of, the industry, still held that Indian coals could not be washed.

At the height of the controversy, certain interests brought Randall (an eminent coal preparation expert and chemist) from Britain to investigate the washable properties of Indian coals. He took up research chiefly on the original seams which had so well served the country in the past, and on which warnings had been sounded of approaching exhaustion. In 1918 a small Jig Baum Plant had been tried out at Malkera Colliery by the writer and again in 1924 at Bhowra and in 1938 at Jamadoba with different types. Although the results were not final they were at least encouraging. Dr. Randall's work, although valuable, confused matters since it was within too narrow limits to enable definite conclusions to be drawn. He was obviously under the impression that an improvement of our best seams was desirable to bring them more into line with the low ash coals of Britain. This also appears to have been the motive underlying his limited enquiries into the inferior grades. Naturally, his work failed to establish that Indian coals could be washed economically and few appreciated that the enquiries should have been pursued on the ash

A view of the plant at West Bokaro showing the raw coal bunkers, the main conveyor gantry to the washing plant and the power station on the hilltop.

basis of requirements in India, and not on that of Britain at the time.

With a fuller appreciation of the problems involved, and encouraged by the washing tests carried out from 1918 to 1938, a washing survey was undertaken by Tatas' collieries in 1938-40. This survey was carried out in a more complete manner than any hitherto undertaken. The data acquired, as a result of the tests on the different seams, indicated that the washing characteristics were variable and difficult, but no more so than experienced in some other countries where special processes had been evolved to deal with them. From this it was clear that inferior coal problems could be solved and it was only a question of selection of a suitable process. Although satisfied that coal washing would be successful under certain conditions, the difficulties of convincing the industry were realised on account of Randall's failure to do so in 1924. Hand preparation methods had been prevalent for many years and the adverse attitude of critics could not be explained other than by their opposition to any scientific means of coal preparation which would involve capital expenditure. Before reviving the controversy, it was realised that apart from the free ash, composed of shale, slate and clay bands, it was desirable to ascertain the condition of the combined ash with the coal, (referred to at that time as "inherent" ash) which could not be dissociated from the carbonaceous material. In other words, it was necessary to find out the physical combination of ash with coal, apart from the definite bands of shale and clay. Facilities for such research in India were limited but micro-photographs taken at Jamshedpur enabled a rough estimation of ash distribution to be determined. From this it was concluded that the foreign constituents in combination with the coal were not distributed uniformly but were segregated in patches, or zones, of high and low density which could be separated by floatation. As a result of work at the Indian School of Mines, Dr. Forrester produced similar evidence which supported these theories.

The information obtained from these enquiries indicated that there was no distinct or sharp change in density between the good coal fractions and the bad ones, and that they merged into one another. This would give rise to difficult washing conditions and hence the term "difficult" washing coals. Since similar conditions had been overcome in other countries, it was concluded that, if a definite and

moderate ash limit was fixed for the clean coal, two products could be separated out, one for coking purposes and one for boilers. In other words, the run-of-mine coal could be separated into coking coal at 15% ash, boiler coal at 28% ash and rejection at about 54% ash.

In my Presidential address to the Mining, Geological and Metallurgical Institute in 1939 the data concerning two coal seams were put up and the possibilities of commercial washing discussed. It was indicated that plants could be obtained to meet our conditions and it was only a question of selecting the proper process. It had been demonstrated in other countries that the older types of plant would not meet our conditions but other processes had been evolved for processing difficult coals and were particularly successful in Britain and in South Africa. In view of the opposition of the industry to coal washing and the adverse opinions generally, a wrong selection at this stage had to be avoided, since this would have supported the prevailing assertions that Indian coals could not be washed. In applying these theories to the coals within Tatas' range it was decided that the optimum point for clean coal should be fixed on the range between 14% and 15% ash and 28% to 30% for middlings. On this basis of washing, the operation would be commercially successful for raw coal of first and second grade, and also possibly for inferior grades. In this way, the erroneous deductions arising out of Randall's work were avoided, since it never was expected that washing would produce clean coal on the standard prevalent in Britain in 1924. Moreover, the basis of 14-15% ash in clean coal, produced from inferior seams, would go a long way to supplement supply from selected grade sources. The question was now that of the selection of a plant, which would successfully deal with those conditions.

Meantime, supplies of selected grades of market coal continued to deteriorate in quality and in quantity and the specialised industries were encountering increasing difficulties. Producers' interests were well represented by their Associations but no body had yet been established to safeguard those of consumers. It was realised that if the marketing of coal on specifications was to be achieved, consumers should have some medium to express their united views. With the support of the Tata Iron & Steel Co. Ltd., the Coal Consumers' Association was launched on 17th May, 1945. Under Mr. Driver's presidency, and with a

rapidly increasing membership, support was given to coal beneficiation, which never could have been obtained from producers' associations.

"Drift" Theory of Coal Seam Deposition

If we consider the "drift" theory of coal deposition, it is clear that this was actually a rough form of gravity separation of carbonaceous material from its contaminating elements. When a seam was deposited, the various constituents settled on the bottom of the estuary, lake, or lagoon, according to their specific gravities. If the currents and tides were favourable the lighter carbonaceous material would be carried further out and the silt deposited nearer the entrance of the estuary, lake or lagoon. This process would continue building up the parent materials for a clean coal seam, but interrupted occasionally by high river floods and tides carrying the silt further and thus causing an overlap on the carbonaceous material. Under normal conditions the deposition of carbonaceous material would be resumed comparatively free from contamination and the parent materials for a good coal seam built up with inter-layers of silt, now appearing in the form of free shale, slate or clay. Such seams are amenable to simple processes of "beneficiation," whether by hand, or gravity separation in water and termed "easy" washing coals.

If the estuary, lake or lagoon, was turbulent or shallow, disturbed deposition would take place and there would be intermingling of silt with carbonaceous material. The degree of intermingling would depend on the local variations of depth and turbulence, hence the variation noted in density of the different patches and zones as shown by micro-photographs. Coal from seams of this nature is said to have "difficult" washing properties and these vary in degree according to ash segregation. The former process of nature has provided the good coals now nearing exhaustion, and the latter the inferior coals, which are no longer a problem except from the economic point of view. The intermingling with foreign material has increased the density of certain parts of the coal, thus making gravity separation possible. By reversing the process under which the coal has been formed, and using a media higher in specific gravity than water, a much more rapid and greater recovery of the products can be obtained.

Confirmation from Foreign Sources

From the tests carried out by Tatas in 1938-39, it was realised that great care would have to be

taken in the selection of the washing process, especially since Randall had, in 1924, stated that Jig Buams and Froth Floatation would be uneconomic, and rejected any suggestion that the coals could be washed. Careful consideration and elimination reduced the range of selection to two heavy media plants, one of which had been a recognised success in Britain and in the United States of America, and in South Africa in more recent times. It was confirmed that the South African coals approximated more closely to the washing characteristics of Indian ones and the type of plant adopted was giving results satisfactory to many operators and repeat orders were being placed. On this evidence the Tata Iron & Steel Co. released orders for two plants in 1946, one of which came into operation in April 1951 and the other in September 1952. As a result of continued criticism, it was decided to submit a complete range of samples of Tatas' coking coals to Prof. C. E. Marshall of Nottingham University College for petro-graphic investigation and report. This confirmed conclusions that the foreign constituents in combination with the coal were not uniformly distributed, but segregated in patches or zones of high and low density which could be separated by floatation. The conclusions drawn from this report were as follows:—

(i) It is confirmed that the highest degree of ash concentration is in bands impossible to avoid by selective mining and in the durain concentrations. Although the gravities of the various constituents are very near, it is possible to remove, by heavy liquid washing, such bands and high density durain.

(ii) Too much durain results in high ash and a tendency to weak and incoherent coke. Too little durain may result in low ash but larger discards at the washing plant and danger of increasing the swelling properties. In the interests of conservation of coking coals discards at the plant must be reduced to a minimum and swelling must be safeguarded by the requisite durain factor.

(iii) Fine crushing and washing to produce exceptionally low ash by the further elimination of high ash durain is considered impracticable and in view of (i) and (ii) it is considered to be inexpedient except for specialised requirements, or as a secondary process to a primary plant to deal with natural finer fractions below 1".

Although already committed to the process of heavy-media coal washing, the information derived from Dr. Marshall's report supported the conclusions already arrived at.

Broader Field of Enquiry in India

In 1942 the Fuel Research Committee* was established under the Board of Scientific & Industrial Research. This Committee merely encouraged private research through Government assistance and had no laboratory facilities of its own. The schemes set in hand did not include the washing properties of coals. As a result of the successful enquiry by the Tata Iron & Steel Co. into their inferior coals, Government considered it now desirable to extend the survey, and co-ordinate it with a coking and blending research programme set up at Jamshedpur. The Fuel Research Committee was reconstructed under the writer's chairmanship and the first co-ordinated washing survey undertaken for the Jharia Coalfield. Testing sets were made on the design of the one used by Tatas and arrangements made with Dr. Forrester of the Indian School of Mines to carry out the float and sink tests on the samples collected by Tatas' Coal Department. The errors of Dr. Randall's enquiry in 1924-25 were avoided through the collaboration of the Indian Colliery Owners' Association and the Indian Mining Federation which enabled much valuable information to be obtained regarding the inferior coals of Jharia. The formation of these was in accordance with the "drift" theory and display, more or less, similar washing characteristics; they are amenable to heavy media separation. The recovery of good coal to be expected varies from good to bad according to the degree and distribution of the ash in the coal.

This is clearly shown in the Committee's Report on the "Washability of Indian Coals" and to such an extent that Dr. Forrester was pessimistic of very wide application. My foreword to that Report, and the commercial balance statement on pages 167-170, should have gone a long way to dispel any illusions about the matter, and this has been fully confirmed by the plants now in operation. There is another illusion which has gained currency in the public mind and which is liable to damage the prospects of coal washing in India. This is that the plants can only wash fine coal after being crushed, and are therefore only suitable for the steel industry. Nothing could be farther from the truth. The plants are primary ones, designed to wash steam coal sizes up to 8" and all fractions down to 1/16", although the smaller fractions must be reasonably dry. Satisfactory

A general view of a coal washing installation.

operation can be obtained on large sizes, but for the convenience of certain mechanical conditions at the Steel Works it is desirable to break the coal to a maximum of 4". Heavy-media washing plants are unable to wash fine fractions below 1/16" and for such, and for slurry recovery, secondary plants of different design are necessary. These may be wet or dry processes, and have not yet entered the scheme of washing Indian coals at the present stage, although considerable research work has already been done by the Tata Iron & Steel Co. Ltd., particularly by the cone method which may prove to be a more simple means of dealing with these problems.

Designs to Meet Special Requirements

The Chance Sand Washing Plant was selected out of the two heavy-media plants most likely to meet the requirements of washing "difficult" coals. The reasons for this were that the Chance plant had been fully tried out over a long period of years and had been subjected to a constant process of improvement. This system had been evolved and patented in the U.S.A. by Henry Chance and is still vested in the trustees of the Chance Estate. Royalties are still payable on sections and parts where patents have not expired and new ones for the improvement of the original design, but these are covered in the capital charges of the plant. Licences covering Britain, the Dominions and Colonies had been acquired by Fraser & Chalmers of Erith, England. This concern maintained an office and service organisation in India, and were prepared to tender on a construction, delivery, erection and completion basis excluding civil work, which embraced preparation of site, construction of foundations, etc., etc., and the price was in sterling.

The other plant, although considered suitable for the requirements, was higher in capital costs and operation. Delivery would have been effected in New York and the concern did not maintain an organisation in India. In any case, since this plant had not at that time been placed in commercial operation on a large scale, even in the U.S.A., its selection would only have provided cause for further controversy in India. In the last event the matter was decided by the demands for dollar payments.

Now that the final selection had been determined, the matter of design had to be decided to meet the more difficult washing conditions of Indian coals, the conditions of site, and the particular requirements of the Indian steel industry. Specifications had to be worked out, since requirements differed materially from the plants operating in Britain and in the U.S.A. and even in South Africa, where the coals also had difficult washing propensities. The original Chance plant incorporated two washing cones for a two-cut separation, but a single cone had been developed for difficult conditions. This not only simplified operation, but economised on capital, space, and recurrent charges.

The anticipated quantity of the products from the second cut, namely, the middlings, gave grave cause for concern. From the float and sink tests these were considerable, and marketing conditions were expected to be difficult. With the variability

displayed in all seams in Jharia over very close ranges, both vertically and horizontally, it is difficult to estimate correctly the quantity of each respective product over a prolonged period, as the washing characteristics may not remain constant. The middling product contained a considerable quantity of good coal which could be recovered if crushed and re-washed, and a re-washing section was incorporated in the design. This provided for the middlings to be crushed to minus 1" and returned for re-washing in the same cone with the raw coal. A considerable recovery of good coal was expected with a reduction in the middling product, and this was actually realised in operation, and to such an extent that the problem was practically solved. Any small middling residue could then be disposed of for local boiler requirements or manufactured into domestic coke. With middlings on a 28% ash basis and containing 28% volatiles this would give a domestic coke at 35% ash with 8% volatiles and better than some of the existing grades being placed on the market.

The contingency of washing plant failure due to any cause whatever was taken into account. Should there be a failure of sand, water or other materials or a major break-down on any of the water circulating motors, production from the mine would cease after the raw coal bunkers were loaded. Provision was made in the design to bypass the raw coal in any emergency of this nature.

Rejection disposal had to be decided. If the plants were to be installed at the collieries this would present a very difficult problem. The adverse conditions in the Jharia field with its numerous seam outcrops limited the means of disposal. This was foreseen at a very early stage and experiments were carried out. The rejections from hand preparation at Digwadih Colliery had accumulated to the extent of approximately 40,000 tons and test stowing operations were embarked on in 1944, much to the alarm of the Mines Department at that time. A sand stowing plant was in operation at that colliery, and although it was intended to stow 100% rejections, the sand was always available for mixing with the debris should the tests appear to be dangerous. Another stowing plant was installed with crushing arrangements down to 1". A large underground area was selected in 16 seam and after encircling with substantial stoppings, stowing was commenced and 2" pipes left in for temperature readings. The Mines Department was advised and over a period of six months or so the area was filled and sealed. The stoppings and pipes for temperature readings were accessible on all sides of the area and careful inspection and readings maintained over a long period. No evidence of heating was ever detected and the Mines Department gave their agreement to the disposal of rejections in this way. Unfortunately, for financial reasons, it was not possible to adopt this means of disposal for West Bokaro and Jamadoba right at the outset. Temporary means have been adopted, but it is possible to revert to stowing when conditions are more favourable.

The "Chance" Plant is a primary one and designed to wash large coals and separate them into the various commercial fractions between 8" and

A view of the raw coal loading section at West Bokaro. Beneath the conveyor gantry can be seen part of the take-up and driving gear of the aerial ropeway.

PIONEERS IN COAL WASHING IN INDIA

Coal washing aids materially in conserving the potential reserves of coking coals for metallurgical and industrial purposes. Coals of inferior seams can now be washed and turned into metallurgical coal. Intensive research and washing surveys conducted by the Tata Iron & Steel Company have proved that Indian coals are amenable to washing on a commercial scale.

The pioneer coal washing plant in India, with a capacity of 135 tons per hour, was installed in 1951 at the Tata Iron & Steel Company's Colliery at West Bokaro. The second plant, with a still larger capacity of 300 tons per hour, went into operation at the end of 1952 at the Jamadoba Colliery.

With the increasing need for a rational utilisation of our mineral resources, these plants constitute a significant step towards the conservation of national wealth.

1/16". The washing of fine fractions below 1/16" is a matter which has not yet received sufficient attention in India and a great deal of research has still to be done before final decisions can be made as to the type or process which would be best suited to the conditions. It would appear that in nearly all the Jharia coal seams the good coal is derived from the more friable constituents which are generally low in ash. Even the portions of the seam whose principal constituent is the harder durain, contain patches and bands of vitrain and bright coals (clarain and claro-durain). In the abrasive action of winning, handling and transport, the low ash constituent has a greater tendency to break down and form natural dust. On this account dust coal, from the Jharia seams, is generally lower in ash content than that of larger sizes. There are exceptions to this rule, but very few. Fortunately the fine fractions from West Bokaro and Jamadoba coals obey this rule and the ash content is less than that set as the basis of our clean coal. A secondary washing plant for fine fractions, at the present time, is undesirable, on account of the great capital cost for plants of this nature, the backward state of research in India, and the fact that there is no immediate urgency.

The question of slurry was also a serious problem. Apart from loss of very fine and low ash coal with the effluent, the pollution of streams and rivers had to be considered. As in the case of the small sizes already referred to, sufficient research had not yet been done in India, and it was most desirable to get operational experience on the primary plant in the first instance. Orthodox plants for fine coal washing and slurry recovery cover a very wide range and, ton for ton of washed products, involve very much more capital and operation charges. Many wrong decisions have been made in other countries which have resulted in great financial loss. Pending a thorough investigation into the suitability of the various processes for our conditions, it was decided to make no immediate provision in the plants for slurry recovery beyond the simple means of settlement in ponds, but the designs permitted of reconsideration at a later stage.

The principal considerations for sites were availability of power, water, suitable grade of sand, disposal of rejections and effluent. Installation remote from the collieries had to be avoided. The chief advantage of location at the collieries was the elimination of rail freight, royalty and cess on material foreign to the coal, and ready disposal of rejections and effluent.

All these problems of a two-way separation in a combined cone, basis of quality of clean coal and middlings, continuous operation under emergencies, disposal of rejections and effluent, power supply, water and sand and selection of sites, etc. were finally disposed of and the orders for two plants released at the end of 1946. One was of a capacity of 135 tons and the other 300 tons per hour, the latter being designed for conversion at a later stage to a central plant. All these decisions were arrived at as a result of private research, and experience of Indian coals over a long period of years, and before the publication of the Fuel

Research Committee's report on the "Washability of Indian Coals" in 1947 and also long before the inauguration of the Fuel Research Institute. The work of the former body was merely the extension, to a broader field of enquiry, of the work already accomplished by Tata's Coal Department chiefly, and by a few enthusiastic individuals, from 1918 to 1940. The results have led to the successful demonstration that Indian coals can be washed economically on a commercial scale and this at last repairs the damage done by Dr. Randall's enquiries in 1924-25.

Mine Development—Planning to Suit the Washing Plant Requirements

The Chance Sand Process having been selected to meet the characteristic washing properties of difficult coals, and designed to meet the local conditions and the requirements of the steel industry, mine development had to be planned accordingly. A primary plant, such as selected, will not wash dust coal; the minimum range of size in the final design was 1/16" and sizes below this had to be screened out. Two methods were available, namely wet and dry screening respectively. The former would have involved considerable additional capital expenditure and dry screening was decided on. This was justified by the fact that the seams were comparatively dry and if developments and mine operations were conducted in a proper manner, contamination of the coal by floor or ground water could be avoided. It was also necessary to adopt a method of production which would avoid excessive fractions of small coal. Fortunately, the seams were virgin ones and planning could be arranged accordingly. Provided the main developments were carried sufficiently far ahead before the completion of erection of the plants, production panels could be laid off in directions to give reasonably dry coal. It was realised that water at the development faces could not be entirely avoided but since at least five years would elapse before the plant was fabricated, delivered, and erected, we had every reason to believe that mine development as planned would be completed by that time.

This was fully appreciated when the plants went into operation and any operational troubles encountered, apart from initial teething ones, were due to screening difficulties caused by excessive production of small fractions and moisture and the segregation of dust coal in the raw coal bunkers. These have been temporarily overcome by screening at 1" instead of 1/16" pending completion of mine developments, the adoption of better methods of coal blasting and some modifications on the plant to avoid dust collection in the bunkers. This question of mine operation is one which must be considered carefully and developments and production co-ordinated with the physical requirements of the washing plant operation. Improved mining technique is essential and there should be no relaxation in supervision or methods which would tend to the production of excess small coal fractions, excessive moisture in the coal, and shale, clay or slate should be disposed of in the mine as far as possible whenever free bands appear in the seam. These precautions not only assist the plant but economise in other sections of the mine operation.

This question of mine development and operation must be fully considered in all schemes of mechanisation and applies to coal washing as well as to mechanical coal cutting, loading and transport whether by haulage, locos or conveyors. In a new mine, these matters can be easily planned but in older ones the circumstances are different and the factors more difficult to co-ordinate. The mining conditions should be carefully examined and if there is any doubt about the matter, wet screening should be adopted, even at the increased capital cost of the plant. When an agreement is made to install a plant there are commitments on both sides and the purchaser is no less liable than the supplier. The most important conditions with which the purchaser has to comply is that of supplying the raw coal in accordance with the specifications for the plant.

Operation

The question of sand supply for the gravity mixture had been a cause for concern. This had to be collected from local sources, and adequate quantities stored for a year's requirements since provision had to be made for the monsoon season. Rivers and creeks had to be explored to give sand of the following specifications:

Retained on 30 mesh	...	5% or less
" " 40 mesh	...	15% " "
" " 80 mesh	...	85% or more
" " 100 mesh	...	100%

Difficulties did not materialise to the extent anticipated, since in practice the sand is reconditioned in the washing system and the oversize discarded with the rejections, and the undersize with the slurry. This however results in the excessive use of sand and it was decided to install water classification plants for pre-conditioning. The specified sand consumption is 3 lbs. per ton of coal washed and with water classification, this has been reduced to between 2 and 3 lbs., a figure not yet attained on any other plant. The disposal of slurry had given cause for concern since a recovery plant had not been arranged for. The writer had in view conditions in Britain and the U.S.A. where a stranger could be guided to a colliery with a washing plant by the contamination of rivers and streams. These fears did not materialise and the improvised settlement ponds appear to be adequate, for the time being. The solids in the effluent are about 5%, consisting of sand and fine coal dust.

The quantity produced per day would not justify the large capital expenditure required for recovery by means of an orthodox slurry plant, except possibly by the cone, on which research work is being done at Jamshedpur. When the time is appropriate the recovery of these materials will be worth considering.

The section incorporated in the plant for crushing the middling products and returning them for re-washing has proved very successful. Whereas in the West Bokaro plant it was expected to get about 12% from the first middling separation this has been reduced to about 5% with a corresponding increase in recovery of clean coal. The average operational data for both plants are as follows:

	West Bokaro Washing Plant.	Jamadoba Washing Plant.
*Raw coal ash	18-22%	20-24%.
Capacity per day on 2-shift basis	2,160 tons	4,800 tons.
Present throughput per day	1,200 tons	1,000 tons.
Clean coal & ash 85% at 13%		76% at 15%.
Middlings & ash 5% at 28%		12% at 30%.
**Rejection & ash 10% at 54%		12% at 50%.
***Cost per ton—capital & revenue Re. 0-12-0		Re. 1-0-0.

**On mine samples leaving out bands. Consequently, the raw coal is generally higher in ash than shown.

***Slurry losses included.

***Estimated cost on full capacity is seven annas per ton in respect of West Bokaro Plant and four annas per ton in respect of Jamadoba Plant.

Operation has shown up the necessity for adequate raw coal storage for all such plants, not only to maintain continuous operation, but also to provide for separate washing of different seams with varying washing properties. This applies also in the case of any local variations in the seam for which a plant may have been installed.

Producers' Economics of Coal Preparation

Throughout the long period of discussions and research on the washing properties of Indian coals the general opinion was that these could not be washed. Alternatively, it was contended that if washing should prove possible, the process would be uneconomic. The success achieved with the difficult coals in South Africa, and now in India, but still some critics are reluctant to admit that

it will be economic. In a practical way all are conversant with the financial aspect of hand preparation and despatching, or should be since the costs are exceedingly high. In order to maintain the Coal Commissioner's grading, hand-picking is a destructive method since apart from the high labour costs there is a grave loss through indiscriminate discard of good coal with shale and bad coal. It is doubtful if the opponents of coal washing have estimated the financial loss involved in this alone. Moreover, there are the high costs of housing of the labour force necessary for hand preparation, the rising costs of wages, bonuses, amenities, etc., etc.

All these are factors which must be equated against the estimated cost of mechanical coal washing. Possibly the most important asset to any producer is the security of a market and the goodwill of his customer. This he cannot maintain in a buyers' market unless the most efficient means of coal preparation is adopted. The experience of many depressions has proved that many inferior producers can only function in a sellers' market, unless under some scheme of Government assistance. Immediately before the late War, market conditions were such that consumers could discriminate in meeting their requirements, and naturally the better grades of coal had preference. The mines incorporated in the I. M. A. were the chief producers of these better grades and the I. M. F. and I. C. O. A. the inferior grades, and inefficient hand preparation methods of improvement prevented economic competition. At that time the production and sales from I. M. A. sources were probably in the region of 80% of the total production from Bihar and Bengal and the other two Associations were responsible for 20%. The Coal Control Order of 1944 was promulgated, and prices and specifications fixed for each grade. Due to the serious deficit in national requirements, the first Coal Commissioner, Mr. P. C. Young, was more concerned about increasing total production and since this could be more easily effected from inferior grade sources the question of quality was treated as of secondary importance.

Production figures rapidly became unbalanced and it was with difficulty the specialised industries could obtain the high quality coal necessary for their operations. The controlled rates fixed gave an undue preference to inferior grades of coal and this resulted in a general scramble to take advantage of the high price and the easier conditions of production. Mining of the best grades became largely uneconomic, and producing concerns clearly recognising the value of their dwindling resources could not be held responsible for temporarily conserving their good coals and taking advantage of the Coal Commissioner's policy to encourage inferior coal production. With the end of the War, producers became concerned about their markets. They remembered the depressing years after the first World War, which resulted in a reversion favourable to buyers, and there was a gradual return to the more intensified production of good coal. It was expected that there would be a return to the marketing conditions of supply and demand without statutory control, or alternatively a limited form of control, under which consumers would regain their rights to select the class of coal best suited to their needs.

Controls Distort Market

The conditions however were materially different from those prevailing after the first World War. Production during that period, and after, was voluntary and subject to the laws of supply and demand, and this resulted in the practical liquidation of inferior grade mines. They did not again make any headway until the increasing exhaustion of the better grade mines had given them a limited outlet up to 1944. Subsequent to that year they prospered, and went ahead under the sponsorship of the Coal Commissioner and Government Control. With the return of normal conditions in other directions the inferior grade section of the industry had a claim for consideration on Government, and since the Coal Control Order remains in force, this section will continue to retain consideration at the expense of the other industries of the country, and also at the expense of the better grade producers. The economic conditions are therefore purely artificial and there is no free play of the law of supply and demand. This state of affairs cannot continue indefinitely, since there must come a time when Government will abolish Coal Control or make it conditional upon inferior coal producers taking steps to market their coal in competition with better grades. Government is gradually realising that the remedy is in the hands of the industry and that continued indirect subsidisation at the expense of consumers and good grade producers is not in the best interests of the country.

This aspect is also gradually permeating the industry, and the questions now most often expressed are—Can we get a plant? How long will it take to obtain and erect? What is it going to cost? Who will pay for it? Should the process be

one for individual collieries, or a central one, for a group of collieries, or should consumers or Government take direct action? These questions were considered by the Tata Iron & Steel Co. Ltd. and the decision to install plants was taken on the grounds that the producer was liable and if a washing process was not adopted, the coal could not otherwise be used in the metallurgical industry. Since other producers in like circumstances would not take action in their own interests to preserve their markets the deficit in good grade coal production had to be met by this means. If a business has to function during good and bad times, it must satisfy its clients and this applies to coal as well as to all raw materials and, in fact, to all commerce and industry whatever its nature may be. If the producers of inferior grades do not take the necessary measures to improve the quality of their coals then they are not justified in demanding, at the public expense, assistance in another form, which tends to perpetuate inefficient operation, and at the same time creates precedents. In fact this would be a serious step to the nationalisation of the whole industry.

Central Washing Plant

The real remedy was clearly outlined by Mr. Driver in a presidential address to the Coal Consumers Association—rationalisation of the mines and a central washing plant for each group. An alternative to this for small collieries is central washing by a joint concern in which individual collieries could hold shares in proportion to their interests in the scheme, and group marketing. Another possibility is a public company independent of mining interests. This concern would buy inferior grade coal at fair prices, process on a central plant, and place the products on the market at a favourable price in negotiation with consumers. To encourage such an undertaking Government would no doubt consider favourably any demand for an economic price.

The question of capital requirements and operation charges has in the main been the subject of irresponsible criticism by persons who have failed to investigate the subject in detail. Even if there were fears regarding these factors, it should be realised that drastic diseases require drastic remedies. The figures given in the report of the Conservation of Metallurgical Coal Committee are merely speculative and without adequate enquiry or foundation. It has been shown that considerations of capital and operation cost have not prevented the developments of coal beneficiation in other countries, particularly in South Africa in recent times, where the coals are difficult and capital charges and operating costs equally inflated. People are inclined to ignore that, where this prevails, selling prices are correspondingly inflated. They are also apt to ignore the invisible costs of present methods, which are also very much inflated.

The industry however may be disillusioned when it is stated that both capital and recurrent costs are nowhere near the irresponsible figures quoted by many, but authentic figures cannot be given until the size of a plant has been fixed. Capital requirements and operation charges are not a direct function, but an inverse function (within limits) to the quantity of coal to be washed. In other words the capital cost of a plant to wash 200 tons per hour is not double the cost of one to wash 100 tons per hour, nor is the cost of a 400-ton per hour plant double the cost of a 200-ton per hour one. The same applies to operation charges, but in a still greater degree, since the cost is inversely proportional to the amount of coal washed. A small plant requires the same number of persons for operation and supervision as a large plant and the only additional costs are for increased volumes of water, gravity media and power which are largely counter-balanced by the increased capacity of washing.

It will be seen that the larger the plant the lower the capital and operation

costs. This is the fundamental reason for foreign operation on such a large scale with 1,000 tons per hour washing plants. Even with smaller plants in India the capital and operation costs will be less than the costs of hand preparation. This has been proved by the first plant where the all-in cost is already down to twelve annas per ton at less than three-quarters of the throughput capacity. The all-in costs when full capacity has been achieved will be in the region of seven annas per ton.

This may not satisfy the critics since they will raise the following questions: What about middling production? What about rejections and unsaleable products? It has been shown that a long way has been gone toward solving the former problem, and as regards the latter, attention is drawn to the grave losses by hand preparation methods of selling coal. If producers were compelled to adhere to the system for which grade prices are paid, it would be found that saleable products are reduced by anything up to 30% by hand methods. There are unsaleable products from any mine if honest trading is practised, and by hand methods this loss is very much greater than by washing. For comparative purposes it may be stated that in England and South Africa, both easy and difficult coals are being washed and the unsaleable products are normally 20-25% and in one particular case as high as 40% and yet production is on an economic basis. In such circumstances hand preparation methods would be impossible, and the seams would have been left unworked but for suitable washing plants. Nothing so bad as this is likely to be met with in the Bihar and Bengal coalfields, but compared with honest hand preparation, mechanical coal washing results in less losses.

These remarks are concerned chiefly with the economic aspect of the installation of washing plants as a completely new application of coal preparation and reference has been made to the more primitive methods of hand preparation. For very many years the latter method has been in operation in India and many plants installed, some of them primitive and small and some large, involving a large capital outlay and heavy operation charges. To replace such plants today is a serious consideration and the capital required would go a long way towards meeting the cost of a washing plant. This was one of the decisive considerations at Jamadoba. The hand preparation plant, designed for 2,000 tons per day had been in operation for 30 years. It could no longer be depended on and was due for replacement. The cost of the replacement would have been about 60% of the cost of a washing plant of the type eventually selected but for a much larger capacity.

Washing Cone.

Perhaps it is not realised that a washing plant is primarily a coal preparation plant such as a screening and picking plant with a washing section added. The section is only a part in the total investment. In other words, a washing plant is mainly a coal preparation or screening plant, such as the industry has been accustomed to for many years but with the substitution of mechanical coal washing for the laborious and expensive hand preparation. In considering capital requirements and operation costs for a washing plant it is only reasonable that these matters should be compared with the corresponding costs required to replace an already obsolete screening plant, and the futility of perpetuating such methods. Proper balance sheets should be drawn up for comparative purposes and pages 167 to 170 of the Fuel Research Committee's Report on the "Washability of Indian Coals" can be referred to for guidance.

The logical conclusions on the evidence now available is that washing plants have come to stay in India and that others will follow as and when the capital equipment can be obtained. Moreover, these plants will be economic and not only result in savings to the producer but assure him of a constant outlet for his products.

Consumers' Economics of Coal Washing

It has been contended by interested parties that consumers of coal will benefit more from improved methods of preparation than producers, and that the former should take the necessary steps to do so. It is unfortunate that the first two plants have been installed by large consumers, since this apparently lends support to the contentions. The fact is overlooked that this concern is also a large producer and their production could not be utilised, even in their sheltered market, without improving the grades. Apart from this, the contentions have no basis of support judged by conditions in other free countries where business is governed by the requirements of the consumer and the willingness and ability of the producer to supply. If the consumer benefits at all, he will be prepared to pay for it but strictly in accordance with a competitive market. The producers' attitude may be satisfactory from his point of view in a sellers' market, but what will the position be in a buyers' market when selective buying will automatically return? Producers already have had sufficient experience of such periodic reversions, and except in a few cases, have failed to profit from it.

The benefits to consumers would be chiefly in better and more economical combustion or coking practice, reduction of expenses on rail freight, cesses and other charges on despatches. In the strong pressure now being exercised by the consumers through their association the demands are for better grades of coal to restore production efficiency in their industries and too little attention is directed to the great savings which can be effected by decreased rail charges and cesses due to the elimination of foreign material and worthless qualities of coal by a washing plant. The incidence of these items on industry was clearly shown in my articles published in three instalments in *Capital* of 3rd, 10th and 17th March, 1949 and subsequently in pamphlet form entitled *Defects in India's Present Coal Policy: Beneficiation—The Remedy* published by *Capital Limited*. Those benefits to the consumer will be shared indirectly by the producer and by the State Railways through the improvement in traffic conditions which they will bring, and in fact be distributed over the whole nation.

Advice to Prospective Installers of Washing Plants

From the enquiries being made by producers, they do not seem to be conversant with the facts revealed by research and long experience of Indian coals which has led up to the present position. Neither do they appreciate the implications of the subjects discussed in previous paragraphs. They have undoubtedly been impressed by the successful results being given by the first two plants and as a matter of course take it for granted that similar results can be achieved on their own coal seams. With the introduction of pioneer plants errors are unavoidable and it is to be expected that such will be remedied in later installations through experience. It should also be gathered from previous paragraphs that the plants already in operation were designed for the conditions prevailing at particular collieries, and may not be applicable for others. The same system of washing will apply but modified designs may be necessary to meet the varying conditions met with over very narrow ranges in the coalfields.

The problems of marketing vary, the number of seams to be washed varies, and the washing characteristics of the seams may not only vary, but there may be variabilities in the same seam over very narrow limits. All these require very careful enquiry by a potential purchaser before commit-

ment to a design. These are matters which only the prospective purchaser can decide and no reputable manufacturer will tender until supplied with all such data. The conditions for coal washing in India are undoubtedly difficult and manufacturers are all the more careful in committing themselves to quotations and guarantees until they are satisfied that the data passed over to them are complete and reliable.

This involves a great deal of laborious and expensive preliminary enquiry and planning by a prospective buyer of a plant and, unless he is completely conversant with the washability of Indian coals and conditions of future markets, serious errors are liable to be made. It is a matter of grave concern that the designs incorporated in the Jamadoba and West Bokaro Plants may be copied without consideration of the variabilities of each individual colliery, and this will result in difficulties and a needless waste of capital. The idea is also prevalent that the pioneer plants can be utilised as testing equipment for coals other than those they were designed for. Whilst this is true to a certain extent it will be extremely dangerous to judge results of tests under such conditions. In fact such tests are unnecessary if a complete physical and chemical survey has been made on each of the coals to be washed not only from individual samples but many samples covering a wide range of ground.

From such a survey a plant can be designed to suit the particular conditions of a particular colliery and with the full confidence that the laboratory tests will be closely adhered to in commercial practice. Reputable manufacturers will be prepared to tender and give the necessary guarantees for operation, always provided that mining operations will be conducted in accordance with the conditions revealed by the physical and chemical survey. It has been pointed out that there are commitments on the part of both parties to the installation and operation of a plant, if successful results are to be achieved. Guarantees should be on the basis of mechanical and electrical reliability, washing capacity, and fineness of separation of various products which is generally defined by the percentage float in the sink and percentage sink in the float at definite figures of specific gravity. In other words, the efficiency of a plant, apart from reliability and capacity, is judged from its approach in operation to the data obtained by

The Chance washing cone.

means of the physical and chemical survey of the coals to be washed.

If this survey has been complete and accurate over a wide area, the efficiency should be high and constant. If however these initial precautions have been neglected, or if mine operation is not conducted in accordance with the specified requirements of the design, then low operation figures can be expected and the manufacturers' guarantees will not apply. Apart from a correct estimation of the variability in the washing properties of the coals over a wide area of the mine, the most important factors to be guarded against are excessive production of slack coal, dust and moisture which can only be controlled by the proper development and operation of the mine.

Provision for a well-equipped laboratory must be included in the estimates for the plant and it is most advisable to have this in operation before the plant is ready and in close proximity. This is required to determine the sample results which must be taken frequently in order to check up on the daily routine operations. Without such daily guidance the plant operators are unable to maintain the specific gravity of the washing media in accordance with the nature of the raw coal and the required quality of the washed products. If facilities are not provided for such rapid sampling and analysis, variations in the products will be unknown until attention is drawn to the matter by the consumers and this will be too late to have any effective control on the plant operations. It is also possible that without the guidance given by daily sampling and analysis a serious loss will be incurred by the colliery. These losses may be in the production of clean coal on a lower ash basis than specified and paid for and also an increase in middling, slurry, and rejection losses. Some of these matters discussed are common to all collieries, but many are peculiar to each individual seam or parts of a seam and grave risks and possible waste can only be avoided through proper and timely advice. Coal preparation is now considered to be outside the province of Mining Engineers and in foreign countries is looked on as a specialised branch of engineering.

Coal Components and Associated Minerals

The enquiries leading up to the decisions taken for coal washing were mainly concerned with high and variable ash. This was the principal factor concerning the general utilisation of coal. For the steel industry there were others on which little or no research work had yet been done in India. This was due to the comparatively low sulphur and phosphorus contents of the original coals on which the steel industry was founded. With the gradual exhaustion of the better grade seams and increasing reliance on the inferior ones the adverse effects of swelling properties, sulphur and phosphorus began to appear.

In an earlier section, the drift theory of coal formation was touched on, which explained how free shale, slate, and clay had entered the seams and how ash had accumulated in the coal. There are other forms of impurities which have been derived from the original vegetable matter or accumulated during its transition into coal through infiltration of salt solutions due to earth movements and also due to bacterial action in the vege-

table mass and its associated minerals. Apart from its impurities, coal consists of carbon, hydrogen and oxygen approximately in the proportions of 85%, 6% and 9% respectively for a good British coal and may be taken as approximately the same for a good Indian coal.

Over 40 years ago Dr. Marie Stopes identified four distinct bands in a bituminous coal and gave a great impulse to research in Britain. These bands she termed vitrain, clarain, durain and fusain, but the presence of each varied in degree with different coals. The durain factor is very prominent in our coals and it is this which gives the high ash. The vitrains, clarains and the clarodurains are the low ash components. Since the former is considerably denser than the latter, separation by gravity in a suitable media can be effected to a great extent. It was the acknowledgement of this theory that led to the tenacious enquiries to find a means of improving our inferior grade coal seams and which could not be satisfactorily improved by the elimination of the shale, slate and clay alone. It appeared that the object should be to remove as much of the durain as possible and have a larger concentration of the other constituents in the clean coal. Experience and research in India had shown that each of the components, in its own way, had different effects on the coking properties. The vitrains and clarains, although low in ash, had decided swelling effects on carbonisation, and inclined to give weak coke. The durain component, although high in ash, counteracted the swelling properties of the others and if finely disseminated in the mass gave the hardness to the coke necessary for metallurgical practice. In order to preserve the best properties of each component there was an optimum point for durain elimination and this is the reason why a basis for washing was fixed to give 14 to 15 percent in the clean product.

The minor constituents of coal are sulphur, phosphorus, nitrogen, chlorine, arsenic, zinc, gallium, barium, boron, vanadium, lead, copper, germanium and trace elements. Some of these may be associated with the mineral matter and some with the organic and some with both. The presence of these with the

exception of the first two does not present any problems but sulphur and phosphorus, next to high and variable ash contents, are the most undesirable elements in coal. Although washing had been decided on primarily to give moderately low and consistent ash it was trusted that the process might have a beneficial effect in these problems also, or at least throw further light on them. As a result of enquiries by A. C. Monkhouse, B.Sc., Ph.D., F.R.I.C., Deputy Director, Fuel Research Station, of the British Department of Scientific and Industrial Research, it would appear that sulphur may be present in the coal in either of two forms or both, namely inorganic and organic. The former exists as pyrites and marcasite with some sulphate, usually calcium sulphate, but iron pyrites is the main inorganic sulphur compound and generally appears in layers or nodules or dispersed in particles throughout the coal. He attributes the formation of iron pyrites to the reduction of iron sulphate by organic matter. Another possible mode of formation is by the inter-action of hydrogen sulphide, with iron salts. The former was evolved during the decay of the vegetable mass and its transition into coal and the latter due to percolation. Organic sulphur is derived from the sulphur compounds of the original vegetation and also partly from the action of sulphur bacteria on iron sulphate and organic matter. He also states that there are grounds for belief that organic sulphur, like the nitrogen compounds, are part of the fundamental composition of coals. If the sulphur is present as an inorganic component it should be removable to a large extent by a washing process, but if present in the organic form it cannot be removed.

The source of phosphorus is thought to be largely the associated minerals in the form of phosphates and often in conjunction with other elements. It would appear that these are concentrated in the harder durain component of Indian coals and which is more predominant in the high ash middling fraction. In this event a considerable part of the phosphorus can be removed from the clean coal by washing.

The form in which sulphur and phosphorus were present in our coals was to a great extent unknown. As in other countries the coalfields and seams had been affected by earth movements both during deposition and afterwards. This had given rise to conditions favourable to the formation of the adverse elements as described by Monkhouse. This has been observed in the great sulphur contents of the Assam coals and those from other areas affected by the uplift of the Himalayan range. It has been observed also to a lesser degree in the Jharia and Bokaro coalfields where the presence of sulphur and phosphorus

Where hand preparation has been adopted it is very easy to cover up deficits in coal raisings by attributing larger quantities to discards or rejections than the actuals. The risks of such fraudulent practices are very much reduced with a modern washing plant where the in-coming raw coal from the mine is weighed automatically en route to the plant. If the plant organisation is unskilled or incomplete, then these risks will

Colliers working at the coalface.

THE first mention of coal mining in India records that coal was produced for trial purposes at Raniganj and Chinakuri in the Burdwan district of Bengal in 1774. Through the succeeding decades coal mines were worked but the development of the industry was delayed by lack of adequate transport. Dr. Oldham, visiting Raniganj in 1848, saw lakhs of maunds of coal lying round the colliery pitheads for want of sufficient numbers of bullock carts and country boats—at that time the only means of transport. However, in 1835 an Indian firm, Carr, Tagore & Co., opened the then East Indian Railway line up to Barakar and it is interesting to record that the family of the poet Rabindra Nath Tagore was closely associated with this Company. Then in 1853 the first railway train made its maiden trip from Bombay to Thana. Two years later the railway line reached Raniganj. It was only when the railways largely superseded bullock carts and river boats that it became possible to consider coal mining as an industry. Thereafter there was progressive development which has continued until the present day. The first export shipment of coal—an attempt to open new markets—was recorded in 1873. As regards transport it is believed that the Bengal Coal Co., founded in 1844, continued to maintain and use a fleet of 1,500 boats to carry its coal to Calcutta long after the railways had been established. In this connection it is interesting to note that the Damodar Valley Corporation plans to construct a navigable channel from the vicinity of Raniganj up to Calcutta which will be used for the transport of coal from the Raniganj coalfields as far as the metropolis. As mentioned above, coal was actually shifted in the last half of the 19th century along the Damodar river to Calcutta, and the time taken to reach Calcutta by river was not very much more than the time taken by the railway to do so now.

The First Mines Act

By this time the coal trade was fairly established in Bengal; in the 1870s the Jharia field was

opened in Bihar and by the end of the century was producing a million tons of coal per annum. In 1892 the Indian Mining Association—which now represents almost two-thirds of India's total coal production—was founded in order to develop and safeguard the interests of the industry. The first Indian Mines Act (Act VIII) came into existence in 1901, by which time the total output had risen to six million tons, a figure which had risen to 22½ million tons by 1919. The first world war naturally increased the demand for coal, which was stimulated by the erection of blast furnaces at Tata-nagar. In 1923 a new Mines Act was passed, which was followed by the Indian Coal Grading Board Act shortly after. In 1929, legislation was passed controlling the employment of women underground. By this time sand-stowing had been established in many of the leading collieries, which led to the formation of the Coal Mines Stowing Board in 1939. In the meantime the industry had been severely affected by the great depression of the thirties, which saw a slump in prices until at one period coal was selling below the raising costs. However conditions began to improve and there seemed to be good reason to hope that with the general expansion in trade a substantial export trade in coal would be achieved once more. But it was at this juncture that the second world war broke out. War intervened precisely at a time when the industry had just emerged from a period of depression, but before it had had the time to make up the leeway. Generally speaking 1939 found collieries comparatively ill-equipped in men and machinery to meet the increased demands of the struggle in the East. The impact

of war threw the main problems of the industry into sharp relief, problems relating to equipment, transport and particularly labour.

Links with the Village

Until fairly recently there has never been in India an adequate corps of settled miners on whom the industry could always depend. There has never been a traditional mining caste or community which fitted into the accepted economy of the country; this was due, of course, to the late development of full-scale mining operations. Even today the typical colliery worker is inclined to be an agriculturist at heart and a miner afterwards. He tends to regard mining not as a whole-time career but merely as a useful subsidiary occupation to eke out an extra income. The result is that the supply of labour fluctuates with the seasons. It has been estimated that 30 to 40 percent of the workers return to their homes in June and July for the sowing season, and 25 to 50 percent in November and December for the harvesting months. During the past few years, however, there has been some improvement in this direction. Nevertheless if the crop happens to be a bumper one the worker leaves the mine early and returns late, and acute labour shortage is the result. Conversely a failure of crops slows down the migration to the villages and the labour supply remains fairly constant. In times of famine or marked food scarcity casual workers have been known to flock to the colliery areas, bringing their dependents with them to avail themselves of free housing and concessional food rates.

The matter of establishing a fixed labour force has troubled and perplexed the coal industry for many years, and cannot be said even now to have been satisfactorily solved. At one stage it was thought that the problem might be overcome by arranging the settlement of workers on lands near the mining communities. The results were far from encouraging as it was found that the miners tended to pay more attention to their newly acquired property than to mining. During the last war when labour conditions became acute, the industry took the step of forming a recruiting organisation consisting mainly of Gorakhpuri labourers. This organisation, which is still in existence, has a standing labour force of some 12,000 workers employed in coal mines throughout the country. It is hoped that in course of time they will form the nucleus of a well established mining community, who will have no other profession or interests, and who will be prepared to accept mining as a full time occupation for themselves and their descendants.

Increasing Mechanisation

Indeed mining interests are now fully alive to the paramount importance of a well-trained, disciplined labour force which will be prepared to make mining a permanent career, and not merely a profitable seasonal side-line. This is essential if India is to maintain herself as the leading coal producer of Asia, and if she is to maintain her export markets, and increase the annual production necessary to meet the requirements of internal consumption as well as the development schemes envisaged under the five year plan. The old methods of slow and wasteful pick-and-shovel quarrying, often with surplus and redundant

Women at work.

Wagon loading from conveyor.

labour, are now giving way to highly mechanised streamlined processes which will require skilled and semi-skilled labourers to operate them to the best advantage. The labourer, fresh from the plough or from some remote village community, cannot be expected to adapt himself to mechanised mining without some preliminary instruction. It is evident therefore that in the future some form of elementary practical training will need to be imparted to all new entrants to coal mining. A modest beginning has already been made through the coalfields recruiting organisation, under the ready auspices of one of the leading coal companies in Raniganj.

It is not generally recognised that the coal mining industry is one of the largest employers of labour in the country. Today, for example, there is an average of 350,000 workers (which includes 40,000 women) serving in the main coalfields of Bengal and Bihar and the subsidiary coalfields of Madhya Pradesh and Hyderabad. Of these 130,000 are miners and loaders who are directly concerned with the raising of coal, and the remainder are employed on the surface and on miscellaneous duties underground. Of the total number of workers about 35 percent are permanently settled in the mining areas. In 1952 this labour force raised a total of 36,222,531 tons as compared with 26,892,893 tons five years previously in 1947. The number of mines worked during 1952 was 823. The average attendance of workers in a colliery is reckoned at about 4.5 days per week and the overall output per manshift was 452 tons in 1952 as compared with 357 tons in 1947.

Poor Productivity

This output figure is of course low as compared with that of other countries. Various reasons have been advanced from time to time but it is doubtful if any one specific cause can be assigned. The low general standard of living in India with consequent low demand on the earning capacity of workers, the poor physical condition of the average Indian labourer, adverse climatic conditions, and sometimes the lack of modern mechanical devices used in other countries are all contributory causes. Furthermore it will be appreciated that by its very nature mining is an arduous and hazardous undertaking, and as indicated above very little attempt has been made hitherto to train the ordinary underground miner. He is often left to his own devices and to pick up the rudiments of the job as best he can by copying his colleagues. Unless he can adapt himself to the novel and often bewildering conditions of labour underground, he either absconds or at best becomes an indifferent worker. This leads in its turn inevitably to the problem of absenteeism to which, admittedly, the colliery miner is notoriously prone. Here again the underlying reasons may be attributed to a natural disinclination to go underground, the unattractive working and living conditions, sentimental attachment to his lands and above all to the fact that the average miner's wants are few and are easily satisfied by the earnings of only a few days' work in a week.

During the past decade a considerable volume of Government legislation has been enacted with the main object of bettering the social, economic and physical conditions of colliery workers. This legislative "welfare revolution" bears favourable comparison with any throughout the world. In

1947 the Government of India set up a Board of Conciliation consisting of representatives of both the industry and the workers. The Award which subsequently came into force has up till now been a satisfactory means of maintaining peaceful labour conditions throughout the coalfields. This comprehensive Award fixed the rates of wages of mine workers, and also granted them various other amenities which they did not receive before, and increased the earnings of colliery labour tremendously, so that these increased emoluments and various amenities awarded by the Board to colliery workers compare very favourably with the increases granted to workers in the other industries throughout the country. It may be of interest to examine briefly certain aspects of the Award in question. Firstly, miners and loaders who form the most important class of colliery labour now receive a minimum of Rs. 1-14 per day inclusive of dearness allowance. In addition to this they receive what is known as cash concession paid on the basis of attendance and varying between 3 as 6 ps and 6 as 6 ps per attendance depending upon as to whether the worker is single, has a wife only, or has a wife and children. They also receive foodgrains at concessional rates, which enables them to buy rice at six annas per seer while dhal is sold at six seers to the rupee, and a quarter seer of free rice per attendance. In addition they are entitled to free housing, free medical treatment and free fuel. Among the recommendations made in the Award were the Coal Mines Provident Fund Scheme and Bonus Scheme. The colliery worker is now entitled by virtue of the Award to a bonus which is paid quarterly and which amounts to one-third of his basic earnings, not on the basis of production but on the basis of attendance. Under this Bonus Scheme an underground worker has to put in 54 days' attendance only in the quarter to earn the bonus, and a surface worker becomes entitled to bonus by putting in 66 days only. Certain reasonable conditions are attached, the chief being that any participation in an illegal strike will lose a worker his bonus for that particular quarter. 1948 saw the inauguration of the Coal Mines Provident Fund Scheme which provides for the compulsory membership of all colliery workers on the basis of approximately one anna per rupee on their basic wages, with the employers contributing an equal amount. These funds are remitted to the Coal Mines Provident Fund Office, Dhanbad, for credit to the members' account.

A welfare cess amounting to six annas per ton is levied upon the industry and goes towards the establishment of a Welfare Fund for colliery workers, whose activities cover such items as the building and maintenance of crèches for women workers and their children, pithead baths built on the most modern lines, and the construction of central and regional hospitals. An account of some of these amenities is given below.

Hospitals and First-Aid Centres

The Welfare Organisation which administers the Fund has already built a central hospital for the Jharia field, while one for the Raniganj field is under construction. Each of these central hospitals is equipped with 125 beds and is staffed by fully qualified medical practitioners and trained nurses; modern X-ray plant has been installed. Regional hospitals, subsidiaries to the central hospital, have also been built and treatment at all

these hospitals for colliery workers is free of cost. In addition, colliery companies themselves have had to build and maintain dispensaries and first-aid centres at individual collieries. Certain companies also have their own hospitals which are of an extremely high standard. In 1946 the Central Government issued rules for the construction of coal mines pithead baths. Specifications have been based along the lines of pithead baths provided in the U.K. and these baths are housed in well-constructed buildings, fitted with showers, lockers and sanitary latrines. It is hoped that the Indian miner will, after his work, make full use of these amenities, but at present pithead baths still remain comparatively unpopular, since the miner with his conservative habits has not yet adapted himself to such modern innovations. A fair amount of propaganda and persuasion will be needed before the miners' prejudices are overcome. Legislation has also been passed by the Central Government for the erection of crèches. Considerable numbers of these crèches have been provided, but as with pithead baths they are not as yet being made full use of. Here again it is a matter of the workers not being properly educated and trained in welfare matters, and the Government has incurred a good deal of criticism in legislating for the erection of expensive buildings, and thus somewhat outdistancing the receptivity of those for whom they were made.

Trade Union Movement

The history of the trade union movement in the coalfields is almost a subject in itself, but no account of labour conditions would be complete without a brief reference to it. During war years the labour movement remained largely dormant, but took a new lease of life after 1945, when both the Government and the industry realised that the growing labour consciousness needed to be treated with tact and sympathy. The Conciliation Board Award, described above, was the first official landmark in the recognition of trade unionism. Today trade unions exist in almost all the large colliery companies. The majority are affiliated to the I.N.T.U.C. but left-wing political parties are also represented in certain areas. Although most trade union leaders would be unwilling to admit it, the fact remains that the labour movement in India, as compared with other countries, is still in its infancy. With one or two notable exceptions no outstanding personalities have emerged on the labour front—certainly none from the ranks of the workers themselves. The result is that the trade unionism in the coalfields presents a very doctrinaire and professional aspect. Many of the leading figures are seldom resident in the coalfields and regard themselves primarily as administrators rather than active labour leaders. In consequence they have largely lost touch with colliery workers. Their deputies, petty trade union officials on the spot, are often persons of little ability who are mainly concerned with establishing their position on a purely personal basis.

It is small wonder therefore that hitherto even the most sympathetic colliery employers have regarded trade unionism with suspicion and mistrust and have preferred to deal direct with the workers themselves. In another respect also the labour movement has lamentably failed to give the lead expected of it. The present accepted *modus operandi* is to call large meetings, excite workers with long catalogues of often imaginary grievances, and then threaten a strike. Far too much emphasis is laid on petty complaints, and on recurrent demands for an increase in wages, allowances, additional amenities and so forth. All this has a certain propaganda value since each different trade union organisation is anxious to win new supporters by endeavouring to show that it alone can wring concessions from hesitant and often intimidated employers. But fundamentally this is only a small function of accepted trade union work. Constructive activities on the welfare and education side such as training labour to better habits of personal and domestic cleanliness, urging them to participate in the full use of crèches, pithead baths, schools and social centres—all these aspects of a miner's life are completely ignored and neglected by the present trade union movement in the coalfields. The reasons are not far to seek. Quiet welfare work of this nature seldom commends itself to the average trade union leader, whose only standard of success is judged by the maximum amount of vocal and written publicity which he can acquire. It would be unreasonable, however, to conclude on such a pessimistic note. Trade unionism in the coalfields is admittedly in the early stages of trial and error, but there have been recent indications to show that there is greater awareness abroad on the part of employers as well that trade unionism is a force which has come to stay and that provided it develops along lines of co-operation and mutual understanding and for the good of the industry but for the ultimate benefit of the country as a whole.

UTILISATION OF INDIA'S MINERAL FUELS

THE SEARCH FOR ALTERNATIVE SOURCES OF ENERGY

• By A SPECIAL CORRESPONDENT •

THE energy and fuel position of a country is perhaps best studied in its world setting. In the light of the world energy available from fuels and other sources we obtain a better perspective of the local situation, and of the particular problems to be solved. In the earlier years of this century, Mr. Lloyd George described fuel, and especially coal, as "the blood that flows in the veins of industry". In a half-serious mood he once suggested that the Lord Chancellor of Great Britain should sit on a coal-sack rather than on the traditional and doubtless more comfortable woolsack. Perhaps nowadays the Lord Chancellor ought to sit one day on a coal-sack and the next astride a petroleum barrel. The technically advanced and modern minded will wish to add a chair of electric engineering, preferably hydro-electric; and the still more progressive will doubtless press the claims of a chair of atomic or nuclear energy. The claimants are growing.

For a world which is developing industrially, adequate supplies of power (more truly, energy) are essential. The main sources of such energy today are fuels, chiefly coal and oil, supplemented by, and in certain countries replaced by, natural gas, wood, peat, or brown coal (lignite). These minor fuels are indeed often of major local importance. Wood, for example, in Canada and South America is of great value as a fuel, even in locomotives; and brown coal has achieved unusual importance in Germany and Australia.

The world's rainfall and snow could theoretically give about 100,000 million horse-power, but it is estimated that only one percent of this can be drawn upon as water power for the production of electrical energy. Much rain is naturally disseminated and not canalised in a suitable way. Even so, only about one-tenth of this (one-tenth of one percent) is at present harnessed and utilised. The present capacity of water power plant is some 100 million horse-power, and stations in Europe and North America account for three-fourths of such "hydel" power. The scope for development in Asia and Africa is large, and India has made some progress already. Water power in due course will undoubtedly be a main source of energy, and it could give energy equal to that produced by coal and oil today. But the cost would be enormous and the energy distribution very limited. For India the (potential ultimate) water power resources have been assessed as over 30 million horse-power. This is a high figure. The total capacity of "investigated sites" is about 12 million horse-power and the hydro-electric installations already completed have a capacity of about one-fifteenth of this. For comparison, steam-power stations (public utility) using coal have a capacity of nearly 1.5 million horse-power, or twice the existing hydel capacity. The k.w.h. generated by hydel and by steam are however roughly equal at about 3,000 million per annum each.

With regard to nuclear energy, the economics and potentialities have not yet been even roughly assessed. The problems are formidable, but it is certain that nuclear power plants will be constructed, improved, and developed. Great Britain has already decided to erect one such plant. Possibly, as the world's coal and oil supplies begin to shrink (in a century or two, maybe) nuclear energy will become the chief source of heat and power. But long before that time energy generation in this way may become as economical as the use of coal, oil, or hydro-electricity. In any case we are debtors to the sun. All fuel, all life, all energy on the earth has come from the sun, and even the sun's energy emission comes from a process of nuclear reaction in which hydrogen is converted into helium.

World Energy and Heat Consumption

The energy consumption of the modern world for heating and power purposes (including motor cars) can be calculated from the energy consumption of the U.S.A., which in 1950 was about 14 million million (14×10¹²) h.p.h. The U.S.A. has only 150 million people as against a total world population of 2,100 million; yet for the world as a whole the energy consumption is probably only about three times the above—42×10¹² h.p.h., or 20,000 per head of population. This means a

(continuous) horse-power development of two per head of population. In other words, each person on the average has at his disposal about two horses working continuously; or more truly about one horse to allow for the energy used in space heating, cooking, etc. In the U.S.A. each has the equivalent of five or ten horses; in Asia far less. About one-fourth of the total energy is utilised for transport. As a general picture we may take it that at the present time the world's consumption of fuel and energy for heating and mechanical purposes is roughly as follows: 50 percent from coal and lignite; 25 percent from petroleum; 10 percent from wood and peat; 7 percent from natural gas; 7 percent from water-power, and one percent from miscellaneous sources.

World Fuel Resources

Hence 90 percent of the energy comes from fuels, chiefly coal, petroleum and wood; hydel energy at present constitutes only about 7 percent, and even in the foreseeable future is not likely to supply more than one-quarter of man's requirements because of the cost and reduced scope of action. The question which naturally poses itself is, how long will the coal and oil (and wood) last? The world coal reserves are 7 or 8 million million tons, but perhaps only about half, say, 4 million million tons (4×10¹²) are recoverable. About half of the coal reserves lie in North America. Of the reserves half consists of bituminous coals, and half of other coals such as lignites, sub-bituminous and anthracites. The present output of all coal is

approaching 2,000 million tons per annum; clearly, even if this is doubled, the life is still 1,000 years. But if it is increased four-fold (as is not unlikely within 100 years) the life becomes reduced accordingly—to about 500 years. The prospect is not gloomy for the world as a whole, but the reserves of many countries would be exhausted far earlier.

Regarding petroleum, U.S. reserves are about 28,000 million barrels, or 4,000 million tons. The world's proved oil reserves however are about three times this quantity (12,000 million tons) and the actual reserves may be far greater. If we also include shale oil and take the optimistic figure of 10 times the proved reserves, the total available becomes 120,000 million tons, or 3 percent of the world's coal. The present rate of consumption of oil is about 10 million barrels a day, or 550 million tons per annum. The life of the petroleum reserves is thus about 200 years at the present rate of utilisation, but the figure may be reduced by half with increasing industrialisation.

With regard to wood, supplies of course are perennial and indeed adequate for certain countries; but wood, it is estimated, can yield only the equivalent of about 500 million tons of coal per annum, or one-quarter of the present output of coal. Wood (dried) has only half the heat value of coal, or one-third that of petroleum. Peat (air-dried) has about the same heat value as wood (the reserves are again inadequate), and lignites (25 percent moisture) have only 10 percent more (See

Tables 1 and 2). Incidentally, vegetable oils and coal tar usually have a calorific value of 16,000 to 17,000 B.t.u., that is, intermediate between coal and petroleum. But they are produced in relatively small amounts and are more valuable for purposes other than combustion.

Table 1

Data for Solid Fuels (free from impurities)				
Fuel	Composition			Heat Value (pure fuel) Gross value in calories per gram.
	%C (total)	%H (total)	%O (including N+S)	
Wood	50	6	44	4,500 to 5,000
Peat	35 to 65	6	39 to 29	5,000 to 6,000
Lignite	55 to 75	5	30 to 20	5,000 to 7,000
Coals	75 to 92	5	20 to 3	7,500 to 8,800
Anthracite	92 to 94	3 to 4	5 to 2	8,000 to 8,500
Charcoal	90	1 to 2	0 to 10	7,000 to 8,000
Coke (hard)	97	0.5 to 1	1 to 3	8,000
Coke (soft)	93	2 to 3	3 to 4	8,000

Table 2

Data for Liquid Fuels				
Fuel	Composition			Heat value — gross value in cal. per gram.
	%C (total)	%H (total)	%O (including N+S)	
Petrol	85	14	1	10,500 to 11,500
Kerosene	86	13	1	10,500 to 11,500
Diesel Oil	87	12	1	10,000 to 10,500
Fuel Oil	88	10	2	10,000 to 10,500
Alcohol	51	13	36	6,500
Benzol	91	8	1	10,000

In brief, the world's coal supplies are apparently assured for 500 or 600 years (but only in a few countries); oil is possibly enough for one-quarter of this period. Wood, peat, and brown coal cannot supply the world's needs for fuel, except locally. It has taken 200 million to 500 million years for the earth to store its fossil fuel (coal or oil), and man seems bent on consuming the bulk of it in about one-millionth of the time taken by nature to make and mature it. The industrial era began in earnest only in the last hundred years in most countries. Man is certainly proving a wild spendthrift with the earth's fossil fuel. Nuclear energy may, however, come to his rescue—or to his extinction.

The Main Fuels of Today

The relative composition and calorific value of the main fuels of the day are given in Tables 1 and 2. Coal is derived from ancient vegetation which grew some 200 to 300 million years ago. Brown coal or lignite is usually not so old, though it often has the respectable age of 50 million years or more. Petroleum has sometimes a longer and sometimes a shorter pedigree, as measured by time; most petroleum is now thought to be derived from marine organisms, chiefly micro-organisms, and not from terrestrial vegetation as with coal. Perhaps the chief property of a fuel is its potential energy: this is measured by its heating or calorific value, either in calories per gram or in B.t.u. per lb., the latter value being 1.8 times the former. All commercial fuels derive their heat from the combustion of carbon and hydrogen; their calorific values are given in Table 3. The net values are used in some countries as the basic datum of energy available when measuring thermal plant efficiency. The net value assumes that the latent heat of the steam (yielded by all water and hydrogen present) is not available for actual heating

effect. This is true in boiler plant, internal combustion engines, etc. and even in room heating.

Table 3

Values for Carbon and Hydrogen, the Chief Fuel Constituents.

Constituent	Calorific values			
	Gross Cals./gm.	Gross B.t.u./lb.	Net Cals./gm.	Net B.t.u./lb.
Carbon	8,000	14,400	8,000	14,400
Hydrogen	34,500	62,000	29,300	52,720
Heat Ratio $\frac{H}{C}$	4.31	4.31	3.66	3.66

The net calorific value of a fuel is given by the formula net calories = gross — 52H, where H is the percentage of total hydrogen, including the hydrogen of any moisture present.

Thus, neglecting minor corrections, petrol (85 percent of carbon and 14 percent of hydrogen) will have a gross heat value of about $0.85 \times 8,000$ plus $0.14 \times 34,500 = 11,530$ cals. per gm. or $(11,530 \times 1.8)$ 20,930 B.t.u. per lb. The net values become 10,900 cals. per gm. and 19,620 B.t.u. per lb. One pound of hydrogen has about four times the heat value of 1 lb. of carbon, and on this account petroleum oils have a heat value roughly 50 percent greater than has coal of good quality, the petroleum having about three times as much hydrogen. Impurities in a fuel reduce its calorific value *pro rata* and also interfere in other ways with its efficient use. Many Indian coals contain about 20 percent of impurities (shale, dirt, and moisture together); and, although the calorific value of pure dry coal may be as high as 8,500 cals. per gm. (15,300 B.t.u.), the calorific value of the coal as marketed is some 20 percent lower, or about 6,800 cals. (12,240 B.t.u.). If by washing or other means we could reduce such impurities to 10 percent, such coal would give a heat value of 7,650 cals. (13,770 B.t.u.). Most Indian coals, however, cannot be washed economically to this degree of purity: a more reasonable target would be 15 percent ash or thereabouts. The small amounts of impurities in liquid fuels are usually insufficient to reduce the calorific value, except by a minute fraction. Liquid fuels are thus relatively pure and high-grade fuels. Their price per ton is often 10 to 20 times that of coal. This is no small difference to pay for an increase in calorific value of only 50 percent, but for special purposes (such as internal combustion engines) there is no alternative.

Indian Fuels—(1) Coal

The bulk of the country's coal—about 85 percent—comes from Bihar and Bengal, and is chiefly from the Damodar Valley coalfields. Some 10 percent comes from Madhya Pradesh, Vindhya Pradesh and Orissa, while the remainder is produced in Hyderabad (4 percent) and Assam (1 percent). The present output is about 35 million tons per annum, of which 8 to 10 million is coking coal of medium to good quality.

The country's coal reserves have been estimated at various amounts from 40,000 to 60,000 million tons. Both these figures seem to be excessive as a measure of the recoverable coal; we shall take the more modest value of 20,000 million tons, from which about 2,000 million are obtainable as good coking coal—200 years' supply at the present rate of output and consumption. The Coal Board has "pegged" the output of coking coal (selected grades and grades 1 and 2) at the 1952 output. This is a prudent national measure, especially as the Board take into consideration exceptional cases of mining hardship and difficulty, with a view to preventing complete loss of such coal in abandoned mines. The ruthless and immediate closing down of established mines (occasionally advocated by the thoughtless and irresponsible) would lead to serious labour troubles, injustice, and the breakdown of the country's railway transport and major industries.

Regarding lignite, 2,000 million tons are said to be available in South Arcot, but the mining of it is difficult and may yet prove uneconomic. Nevertheless, the exploitation of such a deposit, if successful, would help greatly in the fuel problems of South India where there is often acute shortage.

Table 4 shows that nearly two-thirds of the country's coal is used for steam raising, about half of this being consumed by locomotives. Is this coal consumed efficiently? The answer to such a question involves not only the efficiency of steam raising in the boiler, but also consideration of steam utilisation in the engine, turbine or the like. For example, the boiler efficiency of steam locomotives

is about 70 percent, but the efficiency of steam utilisation is so low that the overall locomotive efficiency is reduced to 5 percent. This means a loss of 95 percent of the energy in the coal—a heavy and serious sacrifice for reliability, simplicity, and immediate economy. The subject of fuel economy has recently received much attention from the railways.

Table 4

Table showing the general position of the use of coal in India.

	Consumption in million tons coal p.a.	Coal used in steam raising	Percentage used in steam raising
Railways	11.5	10.5	30
Mills and major works	4.5	4.5	13
Electric Utilities	2.5	2.5	7
Cement	1.5	..	..
Iron & Steel	4.0	0.3	1
Brick burning	1.5	..	..
Chemical works	0.5	0.4	1
Miscellaneous glass, and potteries, and refractories etc.	1.0	0.3	1
Bunker & export	3.0	1.5	4
Domestic	3.0	..	..
Collieries	2.0	2.0	6
Total	35.0	22.0	63

In a thermal plant generating electricity the overall efficiency may rise to 30 percent, the boiler efficiency being 90 percent and the utilisation efficiency for the steam approximately 33 percent. Theoretically, 1 lb. of coal of 10,200 B.t.u. ought to give 4 hph. or 3 kwh. If the overall efficiency is 25 percent, we shall obtain 1 hph. per lb. of such coal, that is we shall get 1 hp. by burning 1 lb. of coal per hour. Using coal of 13,400 B.t.u./lb. we can obtain 1-1/3 hph. or 1 kwh. from 1 lb. of coal, with the same overall efficiency of 25 percent; while with 30 percent efficiency, we shall require only 0.85 lb. of coal per kwh. In India the calorific value of grade 1 coal may be taken as averaging 11,000 to 12,000 B.t.u./lb. The average figure for power station coal consumption is about 2 lbs. per kwh. which is twice the value obtainable with good modern plant. Here again, before the electrical energy is consumed we must allow for transmission and other losses, which may well reduce the overall figure by one-third—say, from 30 percent to 20 percent. The main loss of heat at thermal power plant appears in the turbine exhaust and is absorbed by the cooling water. Accordingly, where process heat is required (as at various textile factories for dyeing, etc.) and the heat rejected by the turbine or other prime-mover can be utilised by the subsidiary plant, the overall efficiency of fuel utilisation is often quite high. But in general, it is hardly too much to say that the efficiency of most steam raising plant could be raised by 50 to 100 percent of the existing values. Replacement of plant or modernising would involve expense, and perhaps be unwarranted in some cases; but by and large there is much scope in India, as in other countries, for fuel economy measures. The ruling prices for coal today justify more attention to this issue. If the railways could increase locomotive efficiency from 5 percent to 10 percent, coal consumption would be halved, and the overall fuel bill reduced by some Rs. 15 crores. On existing locomotives only limited improvement is practicable; but may it not be that, by full economy measures, by using diesel locomotives and electrification where practicable (and in due course by employing the coalburning gas turbine) the savings effected in fuel would more than justify the expenditure on new plant?

Regarding factory coal used for steam raising, great economy can be effected in most boiler plant and in steam utilisation. Such economy will not necessarily be followed by an overall reduction in

the coal consumed; it will rather be a precursor of increased output. There may well be no fall in fuel requirements, but the energy or goods produced from the same fuel will be doubled. Management too often neglects the boiler house, the fuel used, and the steam consumption. Where there is no regular check of the fuel and energy losses, extravagance and waste naturally follow.

In the use of coal for cement and brick-burning (together 3 million tons a year) and in factories for glass, refractories, potteries, foodstuffs, chemicals, etc. (1½ million tons a year) the efficiency of consumption in each section can probably be improved. Cement works are often run with high efficiency, but brick-burning often leaves much to be desired, even though only low-grade coal is consumed. For iron and steel works coke is required. In the carbonisation or coking of the coal there is emitted a quantity of valuable gas (10,000 c.f.t. per ton) most of which is used at the works but, much is wasted. Could not the gas be used with greater advantage? A gas grid in the Damodar Valley has been proposed, taking its supplies from the various carbonisation plant there, and supplying Calcutta with gas in large quantities. The coke ovens themselves can be heated satisfactorily with low-grade gas, instead of coal-gas. Such developments are common in Europe and America. Regarding solid domestic fuel, low-grade coking coal is burnt in heaps to give soft coke, a satisfactory fuel for the purpose. But throughout the country cowdung is also consumed in vast quantities as domestic fuel. This certainly ought to be replaced by coal, soft coke, wood, or charcoal. The losses to the food-growing capacity of the soil through lack of natural manure are not easy to assess, but they must be serious, and the effect is cumulative, the nature of the soil being progressively weakened by lack of human and natural manure. There is also room for proper low temperature carbonisation plant which will give soft coke and in addition useful by-products, especially tar, which can easily be converted to petrol.

(2) Mineral Oil

The annual consumption of mineral oil products in India is now about 3.5 million tons, of which only 5 percent is produced in Assam. The estimated import value of such oil products is about Rs. 75 crores. Its retail value (including duty) is probably Rs. 150 crores or more, and is increasing. The coal raised yearly is some 35 million tons, and its pit-head value is about Rs. 50 crores. The actual market or selling value is probably about Rs. 100 crores, the increase arising largely from the transport and handling charges. The monetary value of the country's coal and (imported) oil are thus not even equal, oil costing over 50 percent more than coal, although the consumption of oil is only one-tenth that of coal by weight. One ton of refined oil has thus a value about 15 times that of one ton of coal. To make oil from coal we require roughly 7.5 tons of coal per ton of oil products; in addition, there are the depreciation and interest charges on the plant and also operating charges, and it is problematical whether the venture is financially sound at this stage. The capital cost of plant to produce one million tons of oil products a year from coal has been assessed by experts at about \$250 million (Rs. 120 crores). Accordingly, the Government has arranged to have oil refineries installed as follows:

Table 5
Proposed Oil Refineries

Locality	Company	Approximate capacity per annum.
Trombay Bombay	Standard Vacuum Oil Co.	1.5 million tons.
	Burmah Shell Oil Co. of India	2
Visakhapatnam	Caltex (India) Ltd.	1.0

The capital cost in each case is about Rs. 20 crores.

The policy adopted by the Government seems sound. There is little indication that the world's natural oil supplies are likely to fail for 50 years, and India can draw supplies of crude oil from the Middle East where resources are expanding. The output from these refineries will meet the bulk of India's requirements of petrol, diesel oils, and fuel oils, but substantial quantities of aviation spirit, kerosene, and lubricating oils will still have to be imported. One issue may have been overlooked: the jet and the turbo-jet engines of the aeroplanes of the future will probably consume kerosene as fuel. We hope this has been allowed for in the layout and design of the refineries.

(3) Benzol

Benzol is the source of innumerable chemical derivatives, such as medicines, drugs, dyes, photographic materials, plastics, artificial silk, explosives, and so forth. It is also a fuel, and when blended with petrol to the extent of 20 percent gives a much improved engine fuel performance. Benzol

is obtained chiefly from the gas produced in coal carbonisation (coking), and much, but not all, is recovered by Government plant at the chief carbonisation centres. There is a loss of 5,000 to 10,000 gallons a day. This is serious and preventable. Recovery of benzol at the coke oven plant by the steel and other companies concerned is apparently not attractive monetarily because of the present duty and taxation procedure. The matter should be as capable of "rectification", as is benzol itself. The coal carbonised per annum is about 4 million tons which should yield some 4 million gallons of washed benzol. Some of this is required by the ordnance factories, along with the toluol recovered simultaneously, but available only to the extent of about one-fourth of the benzol. The amounts actually recovered seem to be less than half of those potentially available.

(4) Alcohol as Motor Fuel

Alcohol can also be utilised as a motor fuel in blends of 20 to 80 with petrol, and India is favourably placed for alcohol manufacture as it is easily obtained from molasses. One maund of molasses of good quality can give 2.2 gallons of power alcohol, (99.5 percent ethyl alcohol): however a more usual yield is 1.7 gallons. Petrol imports at present amount to 200 million gallons a year. We should thus require for "universal" blending some 40 million gallons of alcohol (or benzol). This is ten times the present possible benzol production (pending new coking plant), twice the possible alcohol production from molasses, and nearly six times the present power alcohol production of 7 million gallons. Alcohol as rectified spirit for other industries is produced in nearly equal quantities, and may be required to an increasing extent for certain new industrial purposes, such as manufacture of organic chemicals, D.D.T. and acetate rayon. Meanwhile, it is planned to produce annually some 20 million gallons of power alcohol by 1956.

The actual weight of alcohol as with other liquid fuels is small compared with the large tonnages of coal produced. Taking 270 gallons to the ton (2,240 lb.), 20 million gallons is 74,000 tons. And the present petrol imports of 200 million gallons a year are only about two-thirds of 1 million tons, or 67 lakh tons. The main producing State for molasses

and alcohol is U.P. Alcohol production is likely to be most efficient when there is a developed and extensive sugar industry in the area.

Summary of the Position

India's main indigenous fuel is coal, and the present production of 35 million tons per annum is likely to increase at the rate of 1 million tons a year for the coming decade. The attention given by the authorities to the problems of coal washing and coal blending for coking is opportune, but the field for greater coal economy and fuel research is capable of extension. The installation of the new oil refineries should not in any way slow down efforts to produce liquid fuel from coal, whether by variegous forms of carbonisation or by hydro-generation or by Fisher Tropsch synthesis. There are also wide possibilities in extending the use of powdered coal. Indeed for many of India's low-grade coals (including washery rejects) combustion of the material in powdered form would seem to be the way out.

Petroleum oil products are gaining in importance, and with the installation of the new refineries the country's oil consumption (at present 3.5 million tons) is likely to increase by about 10 percent per annum. Imports of certain refined oil products will have to continue. Consideration has been given to increasing the yield of alcohol mainly for blending in motor spirit. In the national interest benzol (and toluol) recovery should be practised at all new coke-oven plant. There is scope for considerable planning and extension in the matter of gaseous fuel, especially for the large towns and industrial areas. Such gas supply could perhaps be supplemented by gas from sewage works producing methane. If the lignite deposits in Madras can be successfully exploited, the prospects of industrialisation in South India will greatly improve.

The continued industrial growth of the country is evidenced by the increased yearly demands for fuel from all quarters. Transport deficiency, however, exists, and to a large degree it acts as a brake on the movement and supplies of solid fuel. That transport should be adequate to the needs of expanding industries is surely obvious, but in the context of five year plans and the like, the issue is too often neglected. Yet is it not vital?

TIME TO EXPAND INDIA'S IRON ORE EXPORT TRADE

INADEQUATE RAIL AND PORT FACILITIES

By B. SEN

Mineral Adviser, Tata Iron & Steel Co., Ltd.*

OF the constituents of the earth's crust, 25 percent of which is metallic, iron forms about 4.5 percent. Human knowledge is yet too meagre to exploit economically a material with only about 4 to 5 percent of iron, but nature has amply provided in her rich pockets iron compounds in various degrees of concentration to form workable ores which are not too difficult of access. Curiously enough, although the iron industry of India is of great antiquity and the famous Damascus steel is claimed to have been of Indian origin, the evidence goes to show that only lean and soft powdery ore was used in the manufacture of iron with charcoal as both the heating and the deoxidising agent. The very large deposits of hard iron ore that India possesses were probably known in those times as iron bearing. The occurrence in India of large deposits of iron ore suitable for the requirements of modern blast furnaces were first reported upon by the late Mr. P. N. Bose of the Geological Survey of India. Later, in the years 1916 to 1920 a number of geologists engaged by industrial concerns made a comprehensive survey of the large deposits of iron ore in Bihar and Orissa. These were surveyed again by officers of the Geological Survey and officially reported upon. Large deposits of iron ore in Bastara State were similarly discovered in 1916 and later resurveyed by the Geological Survey. One can say with certainty that India's iron ore deposits are among the finest and largest in the world.

Nature of the Ore

The chief ore mineral is hematite, an oxide of iron (Fe_2O_3) which when pure carries 70 percent of iron and 30 percent of oxygen. Pure ore, however, is difficult to obtain in nature but by selection very high grade ore may be collected in bulk. The ore of commercial use generally occurs in India in the following categories:

- Massive hard ore, dark grey in colour.
- Laminated ore, rather soft, greyish to brown, often passing into brown lateritic ore.
- Powdery ore, bluish or dark brown in colour.

Although the ore is mostly hematite, lenticles of feebly magnetic ore (Fe_3O_4) are occasionally found. Limonite, or hydrous oxide of iron, exists in moderate quantities.

The massive hard ore is generally a surface occurrence which often passes down to soft laminated ore. Hard ore is actually the cream of the ore giving as much as 68 percent of iron. It is a finely recemented material, often granular in texture. The cap of hard ore varies in places, and may extend to 50 or 60 feet in depth. In borings iron ore has been penetrated to a depth of over 250 feet. The powdery ore is generally a pocket in the soft laminated ore and appears as blue or brown dust. It is very rich in iron (over 65 percent) but unfortunately cannot be smelted under modern practices unless it is briquetted. Laminated and lateritic ores vary in iron content between 50 and 60 percent. The base of the ore is generally a soft brown ferruginous shale. Associated and often interbedded with the ore is banded jaspery hematite, which on leaching gives rise to slumped beds of biscuity ore, silica having been removed by solution. Indian hematitic ores are probably of sedimentary origin, the iron being derived from iron-rich rocks by solution. They have, however, been considerably altered after deposition and even the massive hard ore often shows evidence of crushing and reconsolidation.

Analysis of Hard Ores

The following are typical analyses of selected hard ores from some important localities:

Sasangda Range (Singhbhum)		
Sandur (Medium Hard)		
(Percentage)	(Percentage)	
SiO_2	0.82	—
Fe	68.50	65.75
Al_2O_3	0.46	—

Mn	0.03	Trace
P	0.032	0.044
S	—	0.022
Neamundi (Singhbhum) (Mayurbhanj)		
(Percentage) (Percentage)		
SiO_2	0.96	1.24
FeO	1.81	7.22
Fe_2O_3	95.00	86.60
Al_2O_3	0.85	0.90
TiO_2	Trace	Nil
MnO	0.09	0.64
CaO	Trace	Trace
MgO	Trace	Trace
P_2O_5	0.058	0.091
SO_2	Trace	Trace
Loss on ignition	0.83	3.28
Total iron	67.90	66.20

Because high grade ore is easily available in India, smelting is at present confined to varieties containing not less than 60 percent of iron. This grade is maintained by blending. The other main constituents are silica (about 4 to 5 percent), alumina (about 3 to 4 percent) and phosphorus (0.08 percent). As there is unbalanced phosphorus in the average ore, the pig iron normally obtained from it is unsuitable for the manufacture of steel either by the acid or the basic Bessemer process. The straight basic open hearth or a duplex process has therefore to be adopted. Besides the types of ores described above there are deposits in Bihar and Orissa of vanadium-bearing titaniferous ores which are not amenable to the usual process of smelting in the modern blast furnace. This ore contains about 55 percent of iron, 10 to 20 percent of TiO_2 , 3 percent of SiO_2 and 2 percent V_2O_5 . Several million tons of it lie untouched at the present time. It is claimed, however, that these ores can be treated by the Krupp-Renn process and oxides of titanium and vanadium recovered as by-products. An attempt was made during the last war to recover vanadium from this ore, but the method adopted is uneconomical in peacetime.

Distribution of Deposits

Iron ore deposits in India can be grouped into four main zones:

- Eastern zone, comprising deposits in Keonjhar, Bonai and Mayurbhanj (Orissa), and in Singhbhum (Bihar).
- Central zone, comprising deposits in the districts of Durg, Chanda and Bastar in Madhya Pradesh.
- Southern zone, comprising deposits in Mysore, Sandur and Salem.
- Western zone, comprising Portuguese Goa and Ratnagiri.

The reserves in these places have not been accurately determined but are roughly estimated at 10,000 million tons of mostly high grade ore. As against these large reserves, the three existing steel plants at Jamshedpur, Burnpur and Bhadravati may consume less than 5 million tons of ore a year, and even if the proposed Government steel plant is installed the total consumption of iron ore will hardly exceed 7 million tons a year. Taking the total iron ore reserves into consideration there appears to be almost unlimited scope for expansion for the steel industry, particularly near the coal-fields, but this is not a practicable proposition as

*The views expressed in this article are those of the writer and not of the Tata Iron & Steel Co. Ltd.

India is not metallurgically balanced in regard to her ore and coal supplies. Nature has been niggardly in her gift of coal to India. The question arises: what will India do with her vast resources of iron ore? Will most of her 10,000 million tons of good quality iron ore, capable of being smelted under modern blast furnace practices, languish for dearth of suitable coal?

Other Raw Materials

Some say that it may not be imperative for India to smelt iron ore by means of coking coal when her 2,000 million tons of coking coal are exhausted, and that the distant future might see good quality non-coking coals being used instead under improved techniques. It may be quite possible to do so, but all good quality non-coking coals, of which India may have a reserve of 5,000 million tons, and those beneficiated from low grade coals, cannot possibly be harnessed for one single industry which, along with the engineering industries, consumes only 14 percent of the total requirements. Even if that were done more than half the present reserves of iron ore would remain untouched. Moreover, coal is not the only raw material necessary to convert iron ore into pig iron or steel. Fluxing agents, limestone and dolomite for instance, have to be used to remove impurities from iron ore. But the resources of these fluxes adjacent to the existing steel industries may be of the order of 100 million tons only, and will be exhausted in less than 50 years. Presumably one would then

have to bring limestone at high cost from Assam to flux the ore. Only the future will show whether this would be a practical proposition.

Then consider the most important mineral for making steel—manganese ore for ferro-manganese. Our known resources stand a poor chance of converting even a tenth of our iron ore reserves, as the following figures indicate:

10,000 million tons of iron ore is equivalent to 6,000 million tons of pig iron. This conversion will require:
8,000 million tons of good coal and
3,000 million tons of flux stone.
If out of 6,000 million tons of pig iron
4,000 million tons are reserved for steel making and
2,000 million tons for subsidiary industries, the conversion of 4,000 million tons of pig iron to saleable steel will require:

an additional 4,000 million tons of steam and gas coals,
400 million tons of high grade limestone,
100 million tons of high grade manganese ore and
20 million tons of high grade refractory chrome ore.

India may at the outside have 25 million tons of high grade manganese ore,* and possibly 4 to 5 lakh tons of chrome ore at an exaggerated estimate. But taking into consideration the availability of fluxes and coal, the two major raw materials required to manufacture iron, our available and potential reserves will hardly enable us to convert 1,000 million tons of iron ore into pig iron. Although electric smelting, as at Bhadravati, can be foreseen on a larger scale than now for the utilisation of ores far from the coal fields, the aggregate consumption for several such units cannot be of much consequence. The question arises: how best to deal with the surplus of 9,000 million tons of iron ore?

Exporting Iron Ore

The conversion of 1,000 million tons of iron ore into pig iron, even if practicable, involves a great time factor. The existing steel works, unless multiplied, will take more than 100 years to consume 1,000 million tons of iron ore. Whether at that distant future steel will have the same usefulness as now is difficult to say. With the rapid advances now being made on lighter alloys, steel will no doubt be increasingly replaced and the next 50 years will show which of the two—steel or the lighter alloys—will gain supremacy. To us geologists, it seems that an Aluminium Age will overlap the Iron Age within a measurable distance of time. Aluminium forms 8 percent of the earth's crust, against 4.5 percent of iron; and perhaps nature will try to achieve a balance with aluminium making up the leeway and surpassing steel in industrial application. Obviously, one cannot be dogmatic about the multiple uses of steel for all times but a rational view is needed to change our outlook on the need to conserve iron ore for future use. Probably the best course for India is to expand her iron and steel industries and also to export iron ore.

There is no need to begin a frantic search for ore markets. With the gradual depletion of the Lake Superior reserves and the difficulties caused by the international situation in the Far East, a very wide field lies open for the export of Indian iron ore to America and Japan. Japan's present requirements are at least 5 million tons a year and those of America may be about 100 million tons a year. America is already experiencing difficulties in obtaining ore from indigenous sources and is importing about 10 million tons annually. The time is not distant when India may be able to enter the export trade with America provided favourable freight rates are introduced.

Japan's Potential Suppliers

Japan's cheapest sources of iron ore—China and Manchuria—have been blocked. Only a part of her requirements are met from the Philippines and the Straits Settlements, so she is now looking to India for the balance which amounts to at least 60 percent of her total requirements. About a million tons of iron ore a year is exported to Japan from Portuguese Goa. India's export trade is still in its infancy and it is time the Government formulated plans not only to capture the growing markets in dollar areas, but also to develop new deposits in India. Although at present Japan is an assured market for Indian ore, she may not continue to import large amounts when normal trading conditions return to South-East Asia. Before the second World War most of her ore imports came from China and Malaya, and small quantities from Korea and Manchuria. In 1935 Japan consumed over 9 million tons of iron ore, but it is not clear from where she obtained this huge supply as only about 29 percent of it came from China and Malaya.

Immediately after the war, conditions in Japan were unsettled and during 1946 and 1947 hardly any iron ore was imported. Her blast furnaces resumed operations from 1948 and in the following year 1½ million tons of ore were imported of which 22 percent came from China, 30 percent from the Straits Settlements, 2.83 percent from India, 21.08 percent from the Philippines and 18.31 percent from the United States.

My own reading of the situation is that once the political situation becomes normal in the Far East Japan will negotiate fresh agreements to import a large quantity of iron ore from nearer sources, such as China, the Straits Settlements and the Philippines. She will then be independent of Indian supplies, except perhaps for the quality ores. It is therefore advisable that India should enter into a binding contract with the Japanese for a stipulated number of years and also interest for them in helping to provide her with facilities for transport from the mines and loading at the docks. Western Germany is also showing an increased

* However, W. D. West, late Director of the Geological Survey of India, says (Records of the Geological Survey, Vol. 82, Part 3, p. 408): "In the absence of data derived from drilling it is not possible to estimate the reserves of this mineral. They are undoubtedly considerable, the greater part being of the first grade... the resources of this mineral will be adequate to meet the demands of the future even if the present surplus production is allowed to be exported..." (Editor, Capital).

interest in Indian iron ore and there is a possibility of exporting about 3 million tons there; it is likely that she will offer better prices than the Japanese are paying. It is of interest to note that the Government of India has set up a Mineral Advisory Committee to examine these and other questions relating to export. The results of its labours are keenly awaited.

Transport in the Eastern Zone

The present railway connections to the mineral deposits were planned with a view to meeting the requirements of local steel industries. For the export of ore new sources have to be tapped and suitable transport provided. For instance, to exploit the untouched deposits of the eastern zone it would be advantageous to have an entirely new broad-gauge mineral line from a suitable point between Rourkela and Manharpur, on the Eastern Railway, to the docks, with feeder lines from Manharpur to Gua and from Gua to Rajkharwan. Rourkela is roughly opposite the iron ore belt of Singhbhum known as the Sasangda range, and a branch route served by gravity ropeway systems will enable the huge deposits to be worked, making available for export about 1,000 million tons of high grade ore above ground level. Further, by developing the deposits and extending the track around Joda (Keonjhar) to supplement despatches from Rourkela there is little doubt that about 15,000 tons of ore a day can be despatched to the docks. Unfortunately, dock facilities at Calcutta seriously restrict the shipment of large quantities of ore and unless suitable mechanical handling and loading arrangements are provided, similar to those of the Bethlehem Steel Company's project in Venezuela, it will be difficult to expand the iron ore export trade. Preferably a new dock, a floating one if necessary, should be constructed near the confluence of the rivers Hooghly and Rupnarayan, with all modern devices for mechanical handling of large tonnages of ore. A site near the old port of Tamluk may be suitable for diversion of all mineral traffic for export.

Central and Southern Zones

Iron ore from the central zone, where 2,000 million tons may be available, has to be exported from Vishakapatnam and a broad gauge line requires to be constructed from Drug via Bastar to Vishakapatnam. Transport of ore from this zone is costly and it would be premature to open up this area for export purposes. Relatively, the southern zone offers easier facilities for transport, and export of ore from Sandur should receive as much attention from the Government as the eastern zone. The export of iron ore from Mysore and Salem (southern zone) can hardly assume any importance; the deposits in Mysore have been earmarked for the Bhadravati works, and those in Salem, apart from being scattered and often siliceous, are relatively small.

Financial Considerations

Shortage of finance is stated to be the chief obstacle in providing facilities for the transport of iron ore for export. But this argument does not

bear scrutiny since the amount spent on the provision of transport and rolling stock may be recouped, depending on the volume of export, within a few years. Take, for instance, the average price of iron ore as Rs. 40 per ton f.o.r. Kidderpore Docks for 60 percent grade ore. The Government's gross earnings in the form of freight and port charges may be about 50 percent of this sum. For every ton of ore shipped it will earn Rs. 20, so that if a five-year contract for five million tons annually can be negotiated, the Government will earn a gross revenue of about Rs. 50 crores. It may thus be within the range of economic possibility for a special mineral line to be provided for the transport of ore to the docks for the eastern market. Exports of ore from Sandur should be directed mainly to western markets, particularly Western Germany, and a scheme should be formulated to export about 3 million tons.

Suitability of Hard Ore for Export

Hard ore forms about 20 percent of the total Indian reserves so that out of the 10,000 million tons about 2,000 million tons are of this variety. Considered from the point of view of export, it is the hard massive ore that could be most easily handled and transhipped without loss from the point of origin to the delivery point. Hard ore contains on an average about 66 percent of iron, with silica plus alumina within 3 percent, phosphorus about 0.05 percent and traces of sulphur. It is ideally suited for special use in steel furnaces. Because of its great density it has to be broken to a small size for blast furnace use. The softer variety of iron ore, which is more or less laminated, normally contains 50 to 60 percent of iron, but with a silica-alumina ratio of about 1:2 it is not ideal for blast furnace use unless the alumina is removed by washing or the ratio adjusted either by the addition of high silica fluxes or by blending with high silica iron ore.

Need for Mechanisation

Strictly speaking, iron ore is not mined but surface quarried and everything is done by manual labour right from drilling, breaking the ore, collecting in baskets, to head-loading and sending to the railway wagons for despatch. There was a time when India could boast of cheap labour, but those days are gone; when it is realised that even with the present high wages a miner can raise hardly more than one ton a day, the necessity of introducing mechanical methods becomes all the more imperative. There was also a time when considerable sentiment prevailed against introducing mechanical methods. It was argued that a large proportion of the labour force would be thrown out of employment, but high wages and other incentives have left mining labour almost as indifferent as before. If India has to undertake export on a large scale, mechanical methods must be adopted similar to those introduced in Venezuela in South America and Broken Hill in Australia. It has been reported, probably correctly, that at Iron Monarch, Australia, about 190 men produce as much as 10,000 men at the Indian iron mines, which clearly indicates the benefits of mechanisation.

MINING GOLD IN INDIA

PROBLEMS OF WORKING 8,000 FEET BELOW THE SURFACE

By V. M. SUNDER RAJAN, M. A. M. Sc. (London), A. M. I. M. M., M. A. I. M. E.,
Chief Surveyor, Nundydroog Mines (KGF) Ltd.

GOLD has played a very important part in the economic and cultural history of the human race. Its great influence on human behaviour was primarily because of its physical properties, its scarcity, its suitability as a medium of currency and as a means of personal adornment. Mention of gold in India has been made in the *Rigveda*, the *Sutras* and *Puranas*, in the *Mahabharata* and *Ramayana*, in the Hebrew scriptures and in Greek and Roman literature. From the very earliest times the metal has been produced in this country either by mining the outcrops of gold-bearing quartz veins or by washing sands for sparsely disseminated alluvial gold.

Gold occurs very widely in India. In the north it is mainly of detrital origin and has little commercial importance; but in Mysore, Hyderabad and parts of Madras and Bombay States it is found in quartz veins in ancient schists. There appears to be little doubt that at some unknown period in Indian history (perhaps as far back as 2,000 years ago), a race of people highly skilled in mining and metallurgy explored and prospected thoroughly all the auriferous areas in South India. Ancient workings are so widespread that no reef, vein or even stringers of quartz carrying anything over a quarter of a tola of gold per ton of ore appears to have escaped the attention of the early prospectors. Their method of mining must have been very crude, probably "fire setting" followed by the quenching of the overheated rock, which resulted in fracturing the gold ore. They must have had considerable difficulty with their crude implements and with their lack of equipment to control the monsoon water. It has been recorded by Captain Munn, one-time official of the Hyderabad Government, that at Hutti mine in Raichur district all payable quartz was extracted to a depth of 640 feet—a record not only for India but perhaps for the world. It is noteworthy that practically all modern mines in India have been established on deposits indicated by the existence of ancient workings. The most important of these deposits at the present day is the Kolar Gold Field.

Mines in Hyderabad

In Hyderabad numerous old workings have long been known and prospecting was conducted in the latter part of the last century. Some three or four mines began production, but the principal one was the Hutti mine, which began crushing in 1903 and continued work until 1920, when the workings reached a depth of 3,500 feet. Dividends were paid regularly from 1904 to 1916 and up to the close of operations the total production of gold was 256,474 ounces, worth well over Rs. 1 crore. This mine has been reopened and has been in production since 1949.

In the northern part of Madras State, in Anantapur district, auriferous quartz veins were prospected and worked from 1906 until 1924. The principal mines were the North Anantapur and the Jibuttil, the total production of the district being some 360,000 tons of quartz yielding over Rs. 1 crore worth of gold. The deepest point explored was at the North Anantapur mine where the 1,150-foot horizon was reached.

From 1905 to 1911 the Dharwar field, which lies in Bombay State approximately 100 miles east of the port of Goa, was actively prospected. The Dharwar Reefs mine was explored to a vertical depth of approximately 950 feet but operations proved unprofitable. The total production was 21,657 ozs. In Bihar and Orissa the Dhalbhum mine produced 5,170 ozs. of gold from a quartz vein during the years 1915 to 1919, most of it from a single rich pocket.

The Wynad district, which is on the slope of the Western Ghats in Southern India, had since 1793 been known to contain gold. After the famine of 1877 it was decided to investigate mining possibilities. From 1879 to 1881 numerous companies were floated with an aggregate capital of more than £4 million. The veins exposed, however, were found to be of low grade, although occasional rich

samples could be secured and the actual production of the mines was only some 500 ozs. In 1900 the Geological Survey of India reported that the average tenor of the quartz was only 2 dwt. of gold per ton. A little gold washing of trivial amounts is carried on from time to time in this district.

In Mysore State, old workings are found at many places. At Kudrikonda, south-west of Honnali, old workings were noted and gold is present in the soil. Deeper prospecting revealed a lens of ore five feet wide. About 2,586 tons of ore, averaging 4 dwt. per ton, were milled. At Jalagargundi and neighbouring prospects shafts were sunk near old workings, generally without finding ore rich enough to work under the then existing conditions. In the great belt of schists that extends from near the city of Mysore northwards beyond Chitadrag, gold deposits and old workings are found at many places. Farther south at Ajjanahalli, exploration disclosed a considerable body of chlorite schists with 3 to 4 dwt. of gold per ton. At Bellara, in diabase, a lode was developed which is 2½ feet wide and carries up to 10 dwt. of gold per ton. The Bellara mine has been reopened and the Mysore Government is carrying on mining operations.

The Kolar Gold Field

The Kolar Gold Field is in the State of Mysore and lies about 125 miles west of Madras. It is situated on a plateau 2,800 feet above sea level. There are four mines now operating in this Field—Mysore, Champion Reef, Ooregum (since closed down) and Nundydroog. Since 1882, 750 tons of gold have been mined from the Kolar Gold Field with a value of roughly Rs. 200 crores. The present annual output is 200,000 ounces, which at the prices now ruling in India is worth nearly Rs. 5 crores. The history of the fortunes of the companies operating on the Field reads like a romance; its outstanding feature is the courage, vision and indomitable pluck of Mr. John Taylor, of the firm of John Taylor & Sons, whose strong opposition to the proposed closure of the mines in 1883 ultimately proved a turning point in the economic history of Mysore State.

Working continuously for the past 70 years the four mines now operating have all reached depths in excess of 8,000 feet vertically below the surface. The deepest working on the Field (and incidentally

in the world) is in the Ooregum mine which is now 9,876 feet down. The Kolar Gold Field group of mines is situated on a belt of precambrian hornblende schist which extends to a length of 40 miles in a north-south direction and varies in width from two to four miles. The reef may be visualised as a sheet of paper in a closed book buried in the ground and lying at an angle of 45° near the surface. As the reef extends downwards it steepens and becomes almost vertical. The width of the reef varies from a few inches to 20 feet in places; but the average would be from three to four feet. The gold is not distributed evenly all over the reef; some areas are richer than others, the richer areas usually occurring in lenses or shoots with intervening areas of barren quartz or reef. These shoots are of considerable size and value and are sufficiently numerous as often to permit new discoveries to be made before the old ones are exhausted. The success of the Kolar Gold Field is due to the very extensive exploratory work which is carried on far below the points where ore is being extracted and which permits work to be planned several years ahead of milling requirements.

There are at least 26 gold-bearing quartz lodes on the field, but most of them are of minor economic importance. Most of the gold output of the field so far has come from the Champion lode and its branches. This lode persists through all the mines now at work. The only other lode of known economic importance is the Oriental lode. This is a wide, strongly pyritic lode found in the Nundydroog mine at the northern end of the field, about one-third of a mile west of the Champion lode. The Oriental lode has an average width of about five feet, and in parts attains a width of 20 feet or more. The quartz is frequently nearly black in colour and the sulphide content is from 4 to 5 percent of the ore, principally pyrite, arseno pyrite and pyrrhotite. After the last war, Nundydroog mine put out long crosscuts from its workings on Champion lode in order to explore the Oriental lode at depth. In 1949, crosscuts at the 48th level intersected the Oriental lode. Since then its development has proceeded at an increasing rate and it can be said that what amounts to a new mine has been discovered.

To extract the mineral from the earth's rocky crust and deliver it at the surface on any scale,

Giffords winder which hoists over a vertical range of 6,556 ft.

a large labour force, much machinery and efficient management are necessary. The need for efficient management is particularly great in the mining industry as compared to other producing industries, since penetration below the surface renders the enterprise liable to several hazards such as collapse of ground or inundation by water. In attaining the present depth, many difficulties have been encountered and overcome. These have arisen from the high temperature of the rock at depth; the auto-compression of the ventilating air in descending the mine; heavy rock pressure and the great depth of winding.

The first stage in the mining of gold consists in developing the ore-body and equipping the mine, both underground and on the surface. In order to avoid the decomposed and treacherous ground near the ancient workings at the surface, the early shafts were timbered rectangular shafts, vertical for the first 200 feet and then sunk on the lode, following its dip. Those who look at a map of the mine workings of the Kolar Gold Field will be struck by the large number of small shafts from the surface to 2,000 feet down. One of the reasons for this is that in the early years there were several separate mining companies whose properties have been absorbed into the four large mines in operation today.

Primary development in the early days was carried out by means of incline shafts or compound shafts sunk on the reef, and by means of subsidiary development in the form of drives, rises and winzes the ore deposit was divided up into areas which could be "stoped" out. Primary development opens up the mine and indicates the position of the possible blocks of ore and the subsidiary development provides a series of starting points from which the actual mining of the ore is later carried out. In the early days men climbed to and from the surface by the ladder roads. The small compound shafts were ill-adapted for fast windings and proved to be very expensive in the maintenance of both shaft and winding machinery. They are now obsolete, except for a few old shafts.

By the time the mines reached depths approaching 2,000 feet it became necessary to send men underground by cage instead of relying on ladder-ways. The increasing amount of timber and other supplies which had to be sent underground also demanded a more suitable type of shaft. Vertical timbered shafts were then sunk to depths of about 2,000 feet. Below these vertical shafts mine development was carried on through internal incline shafts placed at some distance from the lode, either in the hanging or foot-wall. This type of lay-out was only intended to carry the mines to depths of 5,000 to 6,000 feet, that is, 2,000 feet of depth by vertical shafts from surface, and the remainder by the second-stage internal inclines.

The Kolar schist belt contains more than one variety of rock. From the fact that rocks of similar type have been observed at the surface on parts of both its eastern and western margins it was at one time inferred that the rocks occur folded in a synclinal trough and that when the lode reached the trough of this syncline the mines might be found to bottom at a shallow depth. But the underground workings give no such indication and instead of becoming flatter the dip of the lode becomes steeper. Plans were then made to reach depths of 8,000 to 10,000 feet by means of vertical shafts from the surface for the first 4,000 feet or 6,000 feet of depth, followed by internal second-stage vertical shafts to serve the next 3,000 feet

to 4,000 feet of depth, these latter shafts being deepened annually as the needs of the mine demanded. The necessity of handling large quantities of rock and material and large numbers of men, the increase in depth and the consequent demand for a more adequate system of ventilation and a more rapid mode of transport to and from the deep levels, led to the general adoption of vertical (circular or elliptical) shafts. From the shafts, through the country rock, crosscuts are driven to the reef, and to open up the ore body tunnels are put out in both directions for subsequent mining operations. Normally the development levels on the reef are spaced 100 feet apart with connecting winzes every 200 to 300 feet in the ore-shoots.

Breaking Ground

The next stage—perhaps the most difficult—in mining operations, following on development, is stoping or excavating the whole or a portion of the ore-body from the surrounding rock. This is done by drilling and blasting holes in the rock and by removing the broken ore to the level below. Stoping is carried on either by the underhand or breast or back stoping methods. Drilling is done by hand or pneumatic machines; there is an increasing tendency to prefer machine drilling to hand labour. Till recently, most of the drilling was done with the old reciprocators or quite heavy mounted drifters. But the development of the tungsten carbide bit with its slow wearing qualities has enabled smaller bits to be used and this, with the retention of a sharp cutting edge, has meant that high penetration speeds can be achieved

even in hard rock with light machines. The slow rate of wear of the tungsten carbide bit has also enabled numerous feet of holes to be drilled without frequent stoppages to change steels.

Further advance towards the objective of lightening the physical labour involved in transporting, setting up and dismantling the paraphernalia associated with the bar and column mounting has been made by the introduction of the "Airleg." The Airleg consists essentially of a cylinder and pneumatically operated piston, the free end of which holds the machine and the other end presses against the ground or other abutment. In practice the rear end of the cylinder contacts the ground by means of a forked sprag and to the top of the piston rod is attached a universally swivelling clamp which grips the side bolts of the rock drill. The introduction of the Airleg combination and tungsten carbide bits has reduced drilling costs by more than 50 percent. In addition output per man-shift and machine-shift has been greatly increased. Considerable savings in labour, capital and maintenance costs have also been attained.

Blasting the Rock

Holes are drilled into the rock in such a way that the maximum amount of rock is broken by each with the minimum amount of explosive. At the end of the shift, cartridges of explosives are placed in those holes and at a carefully fixed time are detonated by means of a cap and fuse. About ten tons of rock are usually broken with each blast. In the early years of the Field blasting gelatine was used almost exclusively. Later, about one-third of the total explosive consumption was gelatine dynamite and gelignite, mainly for stoping purposes. Since 1937, polar ammonium dynamite has been used and has now almost entirely supplanted the nitro-glycerine explosives, with satisfactory results. Lead azide detonators

Steel setted level after a rockburst.

have been in general use for the last 15 years in place of mercury fulminate detonators.

Support of Workings: Rockbursts

Besides drilling and blasting, the miner and his staff have to examine the roof and walls carefully at the beginning of each shift and remove loose pieces or temporarily support such pieces with timber. In addition, it is necessary to erect a permanent support between the walls by means of masonry, timber or packs of granite; otherwise the walls will sag and collapse as the excavations become larger and larger. A serious problem for the mining engineer in a gold mine is rockbursts. Rocks in the mine have always been liable to burst suddenly because of strains in the earth's crust and pressure on the walls. At Kolar, rockbursts may vary from the mere spitting of a few fragments of rock from the face of an underground working to a sudden explosion damaging hundreds of feet of a brick-lined shaft excavated in solid rock half a mile away from the mine itself; or from a mere sudden snap in the wall of a single stope to a sharp earth tremor which may affect underground stopes and levels over an area hundreds of feet long and more than a thousand feet in height.

As the mine workings have gone deeper, various methods of support have been evolved to meet the varying conditions encountered at different depths. In the shallow levels the gold-bearing comparatively sound walls of country rock and simple stulls were sufficient protection. With the increase in depth (as the reef steepened in dip) the stulls were found to be inadequate and they had to be replaced by well-built crib-setts or pigstyes filled with waste rock. Filling with waste or crushed quartz—called cyanide sand—from which the gold had been extracted was also tried, but was not satisfactory. Below 5,000 feet, the reef continued to maintain its steepness and ground pressure rapidly increased with the result that a more rigid form of support was found necessary. Granite is available in abundance in the locality and the present practice is to fill the excavations as soon as possible with granite walling. Sometimes granite walling on top of crib-setts filled with granite is found to give more satisfactory results. The adoption of this system of support and strict adherence to a proper sequence of stoping have to a large extent minimised the effects of rockbursts.

Level Support

The support of levels, particularly in extensive stoping areas, became more important with the increase in the depth of the mine and consequent increase in pressure. Stull pieces and timber setts were found to be insufficient and experiments were made with brick and concrete arches and generally considered that oval shaped steel setts particularly in the case of violent ground movement.

The rock temperature at 9,500 feet depth is 145°F and increases by 1°F every 110 feet. Fortunately the mines are naturally dry, little water being encountered below 3,000 feet. In order that the able limits, wherever water is found, it is immediately collected, enclosed in pipes and pumped

Machine working in a back stope.

to the surface. But 15 years ago, when the mines were approaching a depth of 8,000 feet, temperatures were becoming most uncomfortable and efficiency was suffering. Air-conditioning plants had to be installed on all mines and ventilating air fed into the top of the downcast shafts at 40°F saturated. The quantity of this conditioned air sent underground varies from 120,000 cubic feet a minute in the smallest mine to 250,000 in the largest. The air-conditioning installations on the Kolar Gold Field are situated on the surface. They are refrigerating plants of standard design using ammonia as the refrigerant. A solution of calcium chloride is used as the cooling medium and circulates through air coolers of the coil type. The installations use 400 to 1,000 horse-power each according to size and the season of the year. It is expected that by using them, tolerable working conditions as regards temperature and ventilation can be maintained in vertical depths of more than 10,000 feet. But conditions in one mine are already reaching the stage where the installation of additional air-conditioning units underground is being considered.

At the surface the average barometric pressure is 27 inches of mercury, while at a depth of 9,500 feet it is 36 inches. The effect of this rise in pressure is to compress the downcast air so that its volume is reduced at the bottom by 16 percent—200,000 cubic feet a minute on the surface becomes 168,000 cubic feet at the bottom. Another effect of this auto-compression is to raise the temperature of the air; in descending 9,500 feet an automatic temperature rise of 45°F occurs, quite apart from the rise due to heat picked up from the rock sides of the airways. The actual temperature of the downcast air at 9,500 feet depth is 100°F dry bulb and 75°F wet bulb. Thus the large quantity of air, conditioned at surface, has its volume considerably reduced and its temperature much raised when pushed below. On the other hand its moisture content remains low and conditions in the workings are comparatively good. Below 3,000 feet depth little water is necessary and in order that humidity and wet bulb temperature shall be kept as low as possible very little water is used in mining. The lower levels are practically bone-dry. As a result of this, it is natural that the air is at times somewhat dusty. Nevertheless, the incidence of "pneumokoniosis" has been remarkably low. Recently a separate dust investigation department has been set up in order to carry out routine sampling and investigation of different methods of suppressing dust.

Deep Winding

The major part of the underground work now being done on the Field is below the 8,000 feet horizon. This fact in itself produces major problems of hoisting quite apart from ventilation. On the Champion Reef mine the primary shaft, originally 3,600 feet deep, has been extended to originally 6,560 feet to the 70th level. This is the deepest wind in the world. The winder is driven by two geared motors on the Ward and Leonard system and takes a peak load of 5,200 horse-power. The bi-cylindro-conical drums are 13 to 35 feet in diameter. Flattened strand ropes are used with a diameter of 1½ inches throughout their total length of 7,300 feet. They weigh over 20 tons each. The pay load of 10,000 tons of ore is hoisted in four trucks at a speed of 3,000 feet a minute. In the other mines, however, the many shafts from the surface reach the 4,000 foot mark. The bottom levels are reached by a second shaft to the 7,000 feet or 8,000 feet horizon. Additional internal shafts from this horizon down to the 10,000 feet horizon are being sunk as part of the third-stage development of these mines. All major winding on the mines is carried out electrically, though for some minor shafts compressed air is used. Electricity is supplied from the Mysore State hydro-electric station at Sivasamudram.

Another problem a gold miner has to contend with is the ever-present danger of fire. Elaborate

precautions have to be taken to ensure the protection of lives and property. The ventilation of the mines can be controlled by a system of doors and intersection seals; any outbreak of fire can easily be isolated, and air movement in any particular fire zone can be completely stopped. Fire warning is given by a very simple and ingenious method—by pouring eucalyptus oil into the compressed-air mains. The pungent smell penetrates to all parts of the mine in about 10 to 20 minutes. Fire hydrants are situated at every shaft station in the mine and hose-pipes are located at important places underground and at the shaft tops, along with gas masks and canisters for use in smoke. In addition there is also a well-equipped central rescue station where thorough training in the use of "Proto" self-breathing apparatus is given to selected men. About 150 fully trained men from all the mines are available for fire-fighting.

The next important stage is extraction of gold from the rock. This is effected by crushing the rock, dissolving out the gold by sodium cyanide and precipitating the gold on zinc. The broken ore hoisted to the surface is first of all trammed to the sorting and crushing station. There the fine portion is sieved out in revolving trommels and coarser pieces are tipped on to two 30-foot diameter revolving picking tables, where waste rock is picked out. Usually about 10 percent of the rock coming out of the mine is thus picked out. The larger stones are then crushed in jaw crushers and the small pieces of rock are reduced to a coarse sand by crushing in stamp batteries with water. The stamp mill pulp flows over blankets laid on old amalgamating tables. Any free gold is caught on the blankets which are washed once every hour. The pulp is elevated by pumps to the main distributor from which it proceeds to the classifying cones, consisting of a primary and a secondary cone, where the fine particles are separated from the coarse. The underflow from the classifying cones containing the coarse particles discharges into the tube-mill feeders. The final crushing agent is the tube-mill which consists of a revolving cylinder containing a considerable weight of large rocks or pebbles specially picked for the purpose. As the tube-mill revolves the pulp is ground between the cascading pebbles to about 80 percent minus 200 mesh. There are five tube-mills which are in a closed circuit with the classifying cones. The tube-mill tailings are passed over blankets before being returned to the classifying plant. The gold particles and heavier minerals adhering to the coarse blankets, both in the stamping and grinding operations, form a concentrate containing about 75 percent of the original gold content of the ore. This concentrate is agitated in air-lift cones with strong cyanide solution which dissolves the gold. After 12 hours of agitation the gold-bearing solution is filtered away from the sand and passed through zinc extractor boxes where the gold is precipitated; the sand is returned to the main circuit.

The overflow of secondary cones—termed "slime"—is then pumped to the cyanide works, where it is dewatered and transferred to large agitation tanks to which sodium cyanide is added. Agitation by compressed air follows in order to secure complete solution of the gold and after a period of about 12 hours the remaining recoverable gold is in solution. The mixture is then transferred to the filter plant, which consists of large tanks containing a number of large flat frames covered on both sides with sheets of filter cloth. By suitably connecting each frame to a reservoir in which a fairly high vacuum is maintained, the gold-bearing solution is sucked through the filter

Timber setts in a level.

cloth. The suspended slime forms a cake on the outside of the filter cloth and is washed away to the waste dumps. The pregnant cyanide solution containing the gold is passed through zinc shavings in extractor boxes resulting in the precipitation of the gold as a black sludge. The precipitate is roasted, mixed with fluxes and smelted in oil-fired furnaces to produce bullion which is cast into bars. The recovery of gold amounts to roughly 98 percent, the final tailings which are discarded containing only 3 to 4 grains of gold per ton. The gold bars, containing approximately 910 parts per 1,000 of fine gold, are shipped to the Government of India Mint at Bombay. Here they are refined to approximately 995 parts per 1,000 of fine gold and sold in the Bombay bullion market.

That, briefly, is the story of gold mining. The breaking of the rock, its conveyance to the surface and the extraction of its gold content are the primary functions. For the efficient performance of these functions without loss of life it is essential to have an elaborate organisation consisting of mechanical and electrical engineers, surveyors, metallurgists, accountants and many others. The workmen, often numbering many thousands, have to be housed, their recreation organised and the health of all carefully watched. The underground work, which is, of course, the most important and difficult in a mine, is carried out in small scattered areas by artificial light and supervision must therefore be very good. The mining of gold does not differ from the mining of other metals excepting in matters of detail; experience of mines all over the world is freely exchanged by means of personal visits, correspondence and publications. The success of a mine depends, of course, very largely on the grade of the ore. A drop in the price of gold or an increase in working costs or taxation raises the limit of payability; large tonnage of ore previously considered payable are rendered unpayable and the higher pay limit reduces the life of the mine. On the other hand, a lower pay limit will increase the life of the mine and as a result more money may be spent in capital equipment and development, which in turn will result in greater employment.

since been exceeded. In 1952 Gillanders Arbuthnot & Company Ltd. became the managing agents. The Indian Copper Corporation which to date has produced over 138,000 tons of copper is carrying on operations at three mines—Mosaboni, Badia and Dhobani. Ore at the last of these has been practically exhausted and the mine is being abandoned. The Badia mine gave useful additions to the ore reserves, but development in depth has been disappointing. Energies have therefore now been concentrated on the Mosaboni mine, where operations are being conducted as deep as 2,300 feet vertically below the surface.

New Circular Shaft

In order to accomplish this, it has been

necessary to sink a new circular shaft at a very heavy capital outlay and this is now approaching its final vertical depth of 2,250 feet. From this horizon further sub-incline shafts will have to be sunk in order to continue development in depth, all of which involve further heavy capital expenditure not to increase production but merely to maintain it at its present level. The cost of the circular shaft alone will probably be about Rs. 45,00,000, but this is only a small part of the capital required to extend a mine in depth and which necessitates the ploughing back of the greater part of the Company's net profits year after year. As an instance, it has been found at Mosaboni that the rock temperature increases 1°F for every 95 feet of vertical depth so that at the

mine bottom the rock temperature is even now about 104°F. In future, therefore, it will be necessary to install a plant on the surface to air-condition some 300,000 cubic feet per minute of downcast air to be supplied to the mine workings. The capital and running costs of such a plant will be extremely heavy. It can be fairly stated that as a mine increases in depth, so also do the revenue costs and capital expenditure. After all these years the Indian Copper Corporation is the only operating copper mine in India, and outside of the Kolar Gold Fields in Mysore State there is no other metal mine of any depth. There is, however, a shallow mine at Zewar working on a lead-zinc ore, but its production is comparatively small.

Prices and Mining Activity

Copper, like other non-ferrous metals, has varied considerably in price, and this naturally exerts its influence on the course of mining. High prices stimulate the opening of new mines, while low prices cause closures among high cost producers. In the last quarter of the nineteenth century the price of copper varied from £38 per ton to £105 per ton, and in the first quarter of this century from £45 per ton to £153 per ton. After the outbreak of the Korean war, it is said that transactions on the Continent in the "grey market" took place at up to £450 per ton. The price in that market at the time of writing is £250 per ton and is showing a tendency to weaken. It is expected that in a few months the London Metal Exchange will reopen for dealings in copper and this will no doubt re-establish in due course a correct trading price for the metal.

Silver

Apart from its use in coinage and silverware, silver has an extensive application in photography and recently in certain industrial alloys. More than half the world's production of silver is derived from ores which are primarily worked for lead, zinc, copper and only about one-third from ores in which silver is the principal valuable constituent. In India it is obtained from the treatment of the gold on the Kolar goldfields, Mysore. The output of silver in India amounted to 15,676 ozs. valued at Rs. 67,928 in 1950. India is obviously deficient in this metal and has, of necessity, to depend on its imports from abroad.

DEVELOPING INDIA'S OIL RESOURCES

By

• E. V. CORPS, B.A., F.G.S. •
Geologist, Assam Oil Company Limited.

THE Oil Industry of the Indian Union dates from the year 1865. Some of the oil seepages in Upper Assam had by then been known for many years, having been described by one Lt. Wilcox, who led an expedition through north-east Assam over the border into Burma in 1825. But it was in 1865 that H. B. Medlicott, of the Geological Survey of India, paid a visit to the coal outcrops of Upper Assam, and studied the many oil shows which he found there. He recommended drilling to attempt to develop the oil resources of the region.

The drilling started in 1866, only a few years after the completion of the first oil well in the U.S.A. Four shallow wells near Jaipur (16 miles south-west of Digboi) were unsuccessful, but a small amount of oil was obtained from some wells drilled on the Makum-Namdang structure near Margherita. The lack of transport, however, discouraged further development, and drilling was discontinued for some years.

In 1882 the Assam Railways and Trading Company built a railway from Dibrugarh to the coalfields they were working near Margherita. The following year this Company resumed drilling on the Makum-Namdang structure. Productions were again small and disappointing. During the period up to 1918, only about 12 wells were drilled by the A. R. & T. Company, and the subsequently formed Assam Oil Company. The records for this time are not complete but the production from this area seldom exceeded a few barrels per day.

After the Burmah Oil Company took over control of the Assam Oil Company in 1920, further attempts were made to develop this area. Six more wells were drilled, including a deep test down to 5,545 ft. in 1934, which was quite deep for those days. All the wells showed signs of oil, some of them apparently quite promising. On testing, however, they all proved to be short-lived, and in some cases the oil was accompanied by large quantities of water.

In 1947-48 a geophysical survey was carried out in the area to check certain structural details. The results of this survey, coupled with the earlier unsatisfactory results of drilling, showed that there was little prospect of obtaining remunerative production from the structure, and the Assam Oil Company surrendered its lease.

The Digboi Field

During the construction of the railway from Dibrugarh to the Margherita and Ledo coalfields, engineers noticed oil seepages at Digboi, quite near the track. As a result, the Assam Railways and Trading Company started drilling in the area in September 1869. The first well was completed a year later, and was moderately successful. The

early drilling met with many difficulties and, with the primitive machinery then in use, progress was inevitably very slow by modern standards. Only three wells, each of them less than 1,000 feet deep, were finished during the next three years. By then the A. R. & T. Company had completed its negotiations with Government, and a concession over the area was granted to the Company. At the same time a syndicate known as the Assam Oil Syndicate was granted a similar concession over an adjoining area. These two companies continued to drill more wells, some of which produced useful quantities of oil, some were failures, and some had to be abandoned because of drilling troubles.

To deal with the oil from Digboi and the small production from Makum-Namdang, a small refinery was set up at Margherita. By 1898, fifteen wells had been drilled at Digboi, the wooden derricks, thatched with leaves to protect the drillers from the rain and sun, rising over clearings in the jungle. At this stage the A. R. & T. Company decided to form a separate Company to look after their oil interests. The Assam Oil Company was accordingly launched in 1899 with a nominal capital of £310,000. This Company took over the leases of both the A. R. & T. Company and the Assam Oil Syndicate. Results at Makum-Namdang continued to be poor, and refining operations were transferred to the more successful Digboi area. Here a new and larger refinery was built, having a capacity of about 20,000 gallons per day.

The story of the next 21 years is of the continued and relentless struggle by the Assam Oil Company to develop commercial production. Drilling was difficult and slow, and yields were poor. By 1920, only 80 wells had been drilled and production was only 14,000 gallons (350 barrels) per day. It was then that the Burmah Oil Company, which had achieved considerable success in Burma, became interested and acquired control of the Assam Oil Company. Development began on a larger scale, and new equipment, with the latest rotary drilling machines, was put into use. Drilling was carried deeper, to thicker and more productive sands. Between 1922 and 1934, production was increased to 180,000 gallons per day, and a new, up-to-date, and larger refinery was erected to deal with the greater throughput. The chart on page 34 shows the annual production from the Digboi field since 1900, in barrels of 40 gallons. In 1939 throughput had to be restricted during a strike. In the years 1943, 1944, and 1945 production was stepped up beyond the limit set for satisfactory producing conditions, in order to meet the Armed Forces' extra demands for petroleum products. Excluding these years, production has been

An oil well in Digboi.

maintained since 1934 at a normal level of 180,000 gallons per day, or 250,000 tons per year.

Products on Refining

The crude is of mixed paraffin and asphalt base and is characterised by a high wax content. The refining of 100,000 gallons of crude results in approximately the following major products:—

Motor Spirit	21,000 gallons
Kerosene	31,000 "
Wax	15,000 "
Fuel Oil	17,000 "
Lub Oils	10,000 "
Other Oils etc.	6,000 "

The refinery altogether turns out over 100 different grades of products, the most important of the minor ones being mineral turpentine, bitumen, and coke. The octane number of the motor spirit extracted from the Digboi crude is only 66, so that it requires an addition of tetra ethyl lead to make it suitable for use in cars. The crude contains no suitable base stock for aviation spirit but turbine fuel for jet engines is produced as required. Considerable developments are in hand in the refinery, where a gasoline plant to extract gasoline from the natural gas is almost ready for operation and a modern distillation bench for lub oils is also under construction.

Most of the major products are pumped through pipelines to a storage and dispatching installation at Tinsukia, 22 miles from the refinery. Nearly all the motor spirit and most of the fuel oils are dispatched in railway tankwagons, but about half the kerosene is dispatched in 4-gallon tins which are

Move Materials the Modern Way.

Aerial Ropeways—the modern method of moving materials—deals with the heaviest and most bulky, carrying them over mountain ranges, deep ravines and rivers, and for long distances, even when the needs are 500 tons per hour.

If you have a transportation problem, write to us and our specialised technical staff will, without obligation, see if a solution is to be found in Aerial Ropeways or allied form of transport plants.

made in the installation from tinplate produced by the Tinplate Co. of India. Many products for consumption in Assam are also dispatched in 44-gallon steel drums which are made in a plant at Digboi from drum sheet obtained either from Tatas or the Indian Iron and Steel Company.

Reference has been made above to a limit which is set to the level of production under satisfactory producing conditions. It is perhaps necessary to explain why this is so. The extraction of crude oil from its reservoir rock is controlled by physical factors which do not affect the winning of other minerals, such as coal, iron ore, etc. The expulsion of the oil from the rock into the oil well is largely brought about by a continued decrease in pressure which permits the crude to expand and so flow into the well. All crude oils contain a certain amount of dissolved gas, some more than others. As the pressure decreases, this gas gradually comes out of solution. It is of the utmost importance that this release of gas takes place as slowly as possible. Study of the producing characteristics of various wells and oilpools enables the expert to decide what is a safe rate at which the pressure in the pool can be allowed to decline, and so to fix the maximum rate of offtake of oil.

When production is taken at this rate, or slower, gas comes out of solution more or less evenly throughout the developed part of the reservoir. If, however, a well is allowed to over-produce, there will be an excessive evolution of gas in its vicinity. This gas is at first in the form

of numerous small bubbles in the oil, but these bubbles will soon coalesce into larger gas pockets. These pockets will block the minute, hair-like, channels along which the oil flows to the well. In just the same way as a gas-lock in the fuel system of an internal combustion engine can prevent the flow of fuel to the cylinders, so will excessive release of gas near an oil well prematurely cut off the flow of oil to the well. This must be

avoided at all costs, by restricting offtake to certain limiting amounts.

The amount of restriction necessary depends on the characteristics of the reservoir. Some reservoirs are fringed with water under pressure, which advances as the crude oil is withdrawn and helps to maintain the pressure and keep much of the gas in solution. Others have a large gas-cap which expands and takes over most of the work of pushing the oil along into the wells. Reservoirs of this kind do not need as much restriction as others. Unfortunately, the pools of the Digboi field show very little water advance, and such gas caps as are found are small. Production from these pools, therefore, has to be restricted rather more than usual. Occasional increases in offtake can, of course, be taken for short periods without permanent harmful results. Any sustained over-production, however, could not lead to anything but a marked loss in the amount of oil eventually recovered from the pools. The increased production from the Digboi field during the war was taken for emergency reasons, with the clear realisation that it might result in a slightly diminished total recovery in the long run.

New Wells

The maintenance of controlled production at a level of 180,000 gallons per day has only been made possible by continued drilling of new wells and by the extension of the productive area of the field, mostly towards the east. Not only is oil a wasting asset, but the rate at which it can be extracted from a given pool declines from year to year. The rate of decline varies from field to field, and some fields are fortunate enough to have very slow declines. The Digboi field is about average, and production from oil wells falls off by about 20% each year. This means that to maintain constant production about 36,000 gallons of new daily production must be found by drilling each year. This has been achieved so far, but not by any means easily. The productive limit has now been extended to about 5 miles eastwards beyond the limit in 1930. The sands occur much deeper towards the east, and in the most recent extension wells they have proved much less productive. There are also indications in the latest wells drilled that there are important changes in the underground structure of the field in the vicinity of the present limits of the productive area. All these signs point to the possibility that it may not be long before the resources of the Digboi field are drilled up. When this occurs, production of crude from this field will have to rely solely on the output from existing wells, with their annual decline of 20%. It is important therefore to press on with prospecting operations on other structures, in the hope of finding new sources of oil.

Nearly 8,000 people are directly engaged in the oil industry at Digboi and there are some 35,000 others living in the town which has sprung up on the outskirts of the oilfield. The annual wage bill for 1952 was Rs 117 lakhs. Two-thirds of the employees are housed in solidly built quarters and others who prefer can obtain leases of land on which to build their own houses. All who are not provided with Company housing receive a cash allowance instead.

Living and working conditions have been and are continuously being improved. The health of the workers is looked after by a first class Medical Department headed by a staff of fully qualified doctors and based on an up-to-date and well equipped hospital. The incidence of malaria, once a scourge affecting 60% of the workers, has been reduced to negligible proportions; 3,000 children of employees are given free or almost free education in 13 schools which are run by the Company up to high school standard. For 1952 the fringe benefits, that is to say, benefits provided otherwise than in cash, worked out at the large sum of Rs 35 per month per employee.

Badarpur Field

Attention was first attracted to the possibility of developing an oilfield at Badarpur in 1901, when an oil seepage was observed in ground adjoining the Budderpore Tea Garden. Apart from an initial hand-dug well to 130 feet, which was a failure, no attempt was made to test this structure until 10 years later. In 1911-1912 a test boring showed oil and the Budderpore Oil Company was formed to develop the pool. In 1915 the Burmah Oil Company became associated with the drilling, and took over responsibility for developing the field. The first well found oil and gas but could not be developed as a producer and had to be abandoned, but the next three wells were quite promising. Subsequent wells, however, showed that uniformly good results could not be expected all over the structure. Large volumes of water began to appear with the oil in many wells, and this turned out to be characteristic of the production from this field.

Altogether 60 wells were drilled. The crude was mainly a heavy oil with little motor spirit. The

Conditions favourable to the existence of oilfields occur over only a small fraction of the Indian Union. This is illustrated in the accompanying map. The central part of India is formed of the old land mass known as the Indian Shield. This consists of sediments of great age, igneous rocks and lava flows. The conditions under which it was formed were quite unfavourable for oil formation. Its subsequent history has been inimical to the retention of any small quantities of oil that might have been formed. There are no prospects whatever of any oil being found in this part of India, or in the thin strip of young sediments which fringes it along the western and eastern sea coasts.

Surrounding this old land mass are sediments which may be considered under groups. Firstly there are the alluvial areas of the great rivers—Indus, Ganges, and Brahmaputra. These are the tracts in which the rocks are covered by a blanket of very recently deposited alluvium. They form a wide border around the Indian Shield, in which as a rule only occasional outcrops of the rocks below poke through, to show what occurs underneath. Two of the larger "islands" in this alluvium are the Khasi and Jaintia Hills and the Mikir Hills, which are mainly a prolongation of the Indian Shield itself.

Secondly, beyond the alluvial tracts is an Inner Belt of exposed rocks of Tertiary age. These marine and fresh-water deposits, which also include some older, Cretaceous, sediments are found in Bengal and Assam, and also in Tibet, U.P., and East Punjab to the south of the Himalayan Range. The rocks in this belt are folded to varying degrees.

Thirdly, outside all these, is the Outer Belt of hill ranges which form parts of the borders of the Indian Union; the Himalayas to the North, and the line of the Patkai Bumai, Naga Hills, Chin Hills, and the Arakan Yomas to the East. In these hills the rocks are greatly folded and contorted. Much of the possible oilbearing rock has been eroded away, and what is left is so broken up that it is most unlikely that any oil can have been retained in it. The oil prospects of these tracts are negligible.

In order to appreciate the nature of the search for oil in India it is necessary to understand a little about the geology of petroleum and to know a little also about the geology of India. Oil can only be accumulated in rocks which are porous. Because sandstones and limestones form by far the greater part of the porous rocks of the earth's crust, almost all the world's oilfields are found in these rocks. Oilfields do occur in other kinds of rocks, but they are very rare and invariably small.

The process by which crude oil is formed and accumulates in rocks is still only imperfectly known. It is generally agreed, however, that it comes from the decomposition of the soft parts of organisms buried in sediments deposited in fairly still water, and where there was only a restricted supply of oxygen. Left to decay thus, the organic matter gradually became converted into the hydrocarbons of petroleum. The search for oil, therefore, is limited to those areas where there are rocks in which this process is likely to have gone on. There are no prospects of oil in igneous rocks, such as granites, lavas, etc., or rocks formed under desert conditions, for instance.

The presence of oil-bearing conditions is usually indicated by seepages of oil from the rocks at the surface. Where seepages occur, the oil that was in the rock has been able to escape. Oilfields, however, required that the oil shall not have been able to escape; it must have remained imprisoned in the reservoir rock, under pressure. This is usually brought about by the presence of an overlying cap rock acting as a cover to folded or tilted porous rock, and trapping the oil in them. The figure on page 33 illustrates a porous reservoir rock, arched into what is known as an "anticline." The oil rises on top of its associated water, and reaches the summit of the arch. It can rise no further, being trapped between the cap rock on top, and the water on which it is floating.

It is only in areas where these three conditions (1) porous rocks, (2) oil-forming conditions, (3) traps with suitable cap-rock, occur that there is any hope of finding an oilfield, and it is only in such areas that oil prospecting is carried out. Even so, not all the areas which fulfil these conditions turn out to be satisfactory oilfields. The results of drilling in the U.S.A. show that of prospecting wells located on apparently promising sites, only one in 10 obtains any production of oil, and only one in 243 has found an oilfield capable of producing a total of as much as 10 million barrels of oil.

Fourthly, there is the small area of Jurassic and younger, rocks of the Cutch and Gulf of Cambay region.

Prospecting, therefore, must be confined to the alluvial areas, the Inner Belt of Tertiary sediments, and the Cutch-Cambay region. These occupy about 30% of the surface of the country. It is natural that exploration should at first be concentrated on the exposed Inner Belt. Here the rocks can be examined for signs of oil, and the presence of folds and suitable traps can be seen. Moreover, it is in this belt that the Digboi field itself occurs. Exploration of other structures in this belt has proceeded north-east and south-west of Digboi without success. As well as the unsuccessful fields of Makum-Namdang and Badarpur, tests have been drilled on a score of different structures and altogether about 75 test wells and 190 information borings have been put down, but with no result. The territory explored covers a 300-mile belt from Nampuk within the north-eastern corner of the Upper Assam Valley to Chhatanchura in Cachar. The prospects of such structures in this belt as have not yet been fully tested are not very good, but there is some hope of finding oil at depths greater than those yet reached.

In the north-western part of this belt the conditions are inferior to those of the Upper Assam Valley and Cachar. There are no oilshows as far as is known, and there is only a small proportion of the type of sediments usually associated with oilbearing conditions. In Kangra and Jammu there are gas shows and the folding is not too intense, but the gas is found along cracks in the rocks, and does not necessarily indicate the presence of oil near the gas seepages. However, this is an area which has recently been investigated by the Geological Survey of India, and it may be that the prevailing unfavourable opinion will have to be revised.

In the alluvial areas widespread geophysical exploration is required to investigate the structure below the alluvium. This geophysical work has been going on steadily since 1923, when the then novel torsion balance surveys were carried out for the Burmah Oil Company. The accompanying map shows the progress which has been made to date. The two most promising areas are the Upper Assam Valley area, and the area of the Ganges Delta in West Bengal. A structure indicated by gravity work near Nahorkatiya, Assam, was further outlined by seismic surveys. Drilling started on this structure last year, the first test well in an alluvial area in the Indian Union. As has been already reported, promising signs of oil have been met below 9,000 feet, and the production tests to be carried out in due course will give some idea whether or not an important new field has been found.

BAUXITE MINING AND ALUMINIUM PRODUCTION

• By A SPECIAL CORRESPONDENT •

ALUMINIUM constitutes approximately one-twelfth of the earth's crust and is found in greater abundance than the other metals commonly used by mankind, such as iron, copper, lead, zinc and tin. The extraction of the metal from aluminium-bearing minerals is, however, frequently uneconomic, and the commercial ores are those rich in aluminium oxides known as bauxite. Bauxites vary considerably in composition and appearance, but essentially they are mixtures of hydrated aluminium oxides with impurities in the form of compounds of iron, silicon, titanium and other trace elements. The quality of bauxite is determined by the percentage of alumina (aluminium oxide) it contains, and by the nature and quantity of impurities. In high grade ores, such as those of British Guiana, alumina content is as much as 61 to 62%. Iron oxide (Fe_2O_3), silica (SiO_2) and titania (TiO_2) are found in practically all bauxites; titania and iron oxide are not directly detrimental but if present in large proportions, act as diluents and thus increase the amount of waste matter to be handled throughout the various unit processes required to extract alumina.

The presence of silica, on the other hand, is definitely injurious, since during the extraction process it forms an insoluble sodium aluminium silicate which must be discarded thus involving a loss of roughly one pound of soda ash and one pound of alumina for each pound of silica present. For economic production of alumina this constitutes a serious loss, consequently bauxite suitable for aluminium production should be low in silica.

In India there are extensive deposits of bauxite in Bihar, Madhya Pradesh, Bombay, Madras, Madhya Bharat and Jammu and Kashmir. The reserves are estimated at about 60 million tons, which represent approximately 6% of the world's resources. The bauxite occurs in what are known as "blanket" deposits, i.e. they are located at, or relatively near the surface, as is common in other tropical or semi-tropical regions such as the Guianas, West Africa and South-East Asia. Generally the covering, or overburden consists of humus sand, clay or hard laterite. The quality of Indian bauxite is, however, somewhat inferior to that found in the high grade deposits in other parts of the world. The alumina content of Indian ores varies from 50 to 55% compared to over 60% in the ores used by the North American industry.

Furthermore, in North and South America, Africa and the East Indies nearly all bauxites contain alumina in the form of trihydrate (three molecules of combined water to one molecule of

alumina) which is relatively easy to extract. However, most Indian bauxites contain considerable alumina in the form of monohydrate as well as trihydrate and, since extraction of the monohydrate requires much more rigorous processing, production costs are higher and extraction tends to be lower. This, combined with lower alumina content of Indian ores, results in a requirement of from 4.5 to 5.0 tons of bauxite per ton of metal compared to 4.0 tons in the North American industry. Nevertheless, India possesses, by any standards, suitable and adequate bauxite deposits for the development of a large aluminium industry. The development of this industry acquires special importance in view of the fact that the natural resources of the country for the production of other non-ferrous metals such as copper, zinc and lead are limited, and those for tin are non-existent. The use of aluminium in the building of aircraft makes it indispensable for the defence of the country, and its properties, such as lightness, high thermal and electrical conductivity and resistance to corrosion are valuable for a large variety of domestic and industrial uses. New applications for aluminium are being found in the electrical, transportation, agriculture, building and packaging industries and the magnitude of its rapidly growing acceptance is signified by the fact that world production of the metal in the decade since 1940 has far exceeded the progress made during all its preceding existence since 1889 when commercial production was first started. In 1951 production attained 1,810,000 tons compared to 710,000 tons in 1939.

Indian Aluminium Industry

The Indian aluminium industry was conceived in the years immediately preceding the war, with the formation in 1937-38 of the two companies, the Indian Aluminium Company and the Aluminium Corporation of India, for the production of primary aluminium. The production of aluminium is carried out in two main stages. The first stage involves the processing of bauxite to extract alumina or aluminium oxide and to separate it from the impurities. The second stage accomplishes the separation of aluminium from aluminium oxide by electrolysis. For the intermediate refining of bauxite into alumina, the Bayer process is the method most widely used. The process basically involves four steps:—

(1) *Digestion*—Bauxite is ground and mixed with a hot caustic soda solution. Then, under steam pressure in digester tanks, the alumina dissolves in the solution forming sodium aluminate, while the impurities remain in solid form.

(2) *Clarification*—The solution containing alumina in the form of sodium aluminate is separated from the impurities, known as "red mud", in settling tanks and/or pressure filters. The clarified solution or "liquor" is sent to a holding tank and the red mud residue is sent on through a thickening and washing circuit in order to recover soda and alumina from the small amount of liquor still left with the residue.

(3) *Precipitation*—From the holding tank the clear supersaturated liquor is pumped into large tall tanks called precipitators. After "seeding" with fine crystalline particles of hydrated alumina produced from previous cycles and after circulation is started through central airlift pipes, the liquor starts to cool and new crystals propagated by the nucleus of seed crystals then start to precipitate out of the supersaturated solution. After sufficient alumina has precipitated the crystals are settled and washed free of the mother liquor.

(4) *Calcination*—After precipitation the hydrated alumina contains approximately one-third combined water which is necessary to remove to obtain pure, anhydrous aluminium oxide. This dehydration process is effected in oil-fired, rotary calcining kilns which subject the hydrate to a temperature of about 2,000°F.

In this process, roughly 2.25 to 2.5 tons of bauxite are needed to make one ton of aluminium hydrate; other raw materials required are caustic soda, soda ash and lime, filter cloth for the filter presses, coal for power generation and fuel oil for calcining. These raw materials are available from indigenous sources except for fuel oil, and part of the caustic soda or soda ash of which the production in the country is insufficient for requirements.

The final stage in the production of aluminium ingot is carried out in large electrolytic cells or reduction "pots" which consist of steel shells lined with carbon forming an inner cavity in which the electrolyte, molten cryolite and dissolved alumina is held. A carbon anode partially immersed in the electrolyte introduces the electrical energy which frees the oxygen from the alumina and the molten aluminium falls to the bottom of the pot. The aluminium is withdrawn periodically into a crucible and is poured into ingot moulds. This is primary aluminium and is generally above 99.5% in purity, depending upon the quality of raw materials used and the care exercised in the production process.

Apart from alumina, of which approximately two tons are required per ton of aluminium, other prime factors in this part of the production process are electrical power and pure carbonaceous materials for electrodes. An adequate source of low cost power is of utmost importance and the significance of this factor can be assessed from the fact that 22,400 k.w.h. of electrical energy is required to produce one ton of metal. Soderberg paste for electrodes, which must be made from high quality petroleum coke and soft pitch, is consumed in quantities amounting to about 0.65 tons per ton of metal. Other important raw materials are cryolite and aluminium fluoride but the requirements are small. Soderberg paste is manufactured from indigenous materials. Cryolite and aluminium fluoride must be imported.

The processes described above for the production of aluminium require expensive plant. Integrated facilities for the production of 5,000 tons of aluminium annually, excluding power plant, would require investment in fixed capital of about Rs. 3.5 crores at today's prices, of which roughly 10% would be in bauxite mining, 40% in alumina plant and 50% in the reduction plant. Costs in aluminium production are greatly influenced by the heavy investment required and this emphasises the need for maximum utilisation of the plant and increasing volume of production in order to reduce costs and prices and thereby develop the consumption of aluminium.

Indian Aluminium Company

The Company commenced operations in 1941 with the rolling of imported ingots into sheets and circles at its Belur Works near Calcutta. In 1943, the production of ingots from imported alumina

was started at its reduction plant at Alwaye in Travancore-Cochin, and finally in 1948 integrated production was achieved with the coming into operation of its alumina plant at Muri and bauxite mining facilities at Lohardaga in Bihar. The location of the component units in widely separated parts of the country was due to war-time circumstances. The primary consideration in the selection of Alwaye for the installation of the reduction plant was the availability of electric power; during war-time it was difficult to obtain power generating equipment and the need for speed in starting operations was very great. The rolling mills were established near Calcutta, as it was the largest market for sheets and circles, while Muri was considered suitable for alumina production because of its proximity to the bauxite mines and to coal.

The Company has five leases for mining bauxite; four of them relate to deposits in Ranchi district of Bihar and one in Belgachia district in Bombay. The reserves covered by these leases are estimated at 8.5 million tons. The Company is at present working only two mines at Bagru Hill, Ranchi. An analysis of a typical sample of the ore would be Al_2O_3 52-54%, TiO_2 10%, Fe_2O_3 10%, SiO_2 2-4%, L.O.I. 24%. The ore is mined in open-pits by drilling and subsequent blasting with high explosives. It is transported by an aerial ropeway 61 miles long to Lohardaga, the nearest railway station, from where it is railed 79 miles to the Company's alumina plant at Muri Junction.

The process of integration, which in 1948 had extended the range of the Company's operations to the mining of bauxite and the production of alumina from the earlier activities of aluminium

Loading bauxite from ropeway to wagon.

smelting and rolling of sheets and circles, proceeded further in 1951 with the acquisition of an aluminium paste and powder plant. It is also proposed to install an extrusion plant which would come into operation in the middle of 1954. At the same time, expansion of smelting and rolling facilities at existing locations is in progress and is expected to be completed in the early part of 1954; a decision in principle has also been taken for a major long-term project to establish smelting and rolling facilities at a new location, Hirakud in Orissa.

The aluminium powder and paste plant, which was under construction at the time of purchase, is located at Kalwa, near Bombay. It was completed and put into operation in November 1951. It has a capacity of 600 tons of powder and 300 tons of paste annually; the powder is at present used largely in the manufacture of explosives, while paste forms the base in the manufacture of aluminium paint.

A decision has not yet been taken on the location of the extrusion plant but it is planned to have a capacity of 1,000 tons per annum of extruded products such as bars, tubes and the wide variety of other sections used for structural, architectural and other purposes.

The reduction plant at Alwaye was planned at the outset for a capacity of 5,000 tons of ingot per annum, but only 2,500 tons was installed originally as the Travancore Government was not able to supply sufficient power for greater production. However, the State Government is taking steps to increase generating facilities and the 14,000 kw. required for 5,000 tons production is expected to be available in the early part of 1954. Accordingly, ingot capacity at Alupuram is being expanded to 5,000 tons and completion is scheduled to synchronise with the increased power availability. Increased alumina requirements will be met from the Company's plant at Muri, which already has an installed capacity of 10,000 tons per annum, but which has so far been operated at an average rate of half capacity.

The expansion of the rolling mills at Belur from the present capacity of 4,200 tons to 7,000 tons of rolled products per annum will enable the Company to roll sheet and coil of greater width for a larger range of uses; ingots up to a maximum weight of 500 lbs. will be rolled. It is expected that rolling of heat treatable sheets will also commence during this year. The requirements of ingot for the rolling mills, extrusion plant and the powder and paste plant, in excess of the smelter capacity of 5,000 tons will be imported.

These expansions will permit the Company for the first time to utilise fully its capital investment at Lohardaga, Muri and Alupuram, and by increasing the volume of production, reduce its costs. The Company has also shown its confidence in the future demand for aluminium in the country by undertaking, under the Government's five year plan, a major expansion of aluminium production in the Hirakud area (Orissa) where electric power in quantities and at a cost conducive to smelting operations is likely to be available under the power development schemes of the Hirakud project. The Company has agreed in principle, subject to the necessary power being available by the end of 1955, to: (1) the establishment by early 1956 of a smelter with an initial annual capacity of 10,000 tons per annum and capable of expansion to 20,000 tons; (2) expansion of bauxite mining at Lohardaga to 70-75,000 tons and of alumina production at Muri to 30,000 tons per annum by the end of 1958. During the period between the completion of the smelter at Hirakud and the expansion of Muri Works, viz., 1956-58, the requirements of alumina would be met by imports.

Aluminium Corporation of India

The Aluminium Corporation of India, the only other primary producer of aluminium in the country, has the advantage of all its units of production being located together at Jaykynagar, seven miles from Asansol. The bauxite is brought here from Lohardaga or Tori, a distance of about 150 miles. The Corporation has taken out eight leases for the mining of bauxite. Of these, seven are in Ranchi district, Bihar, and the remaining one is at Unchera, Madhya Pradesh. The estimated reserves of these mines are about one million tons. The Corporation is at present working its mines at Bagru Hill, Khamar, Pakhar and Champi, all within a radius of about 20 miles from Lohardaga railway station. The quality of the bauxite is similar to that mined by the Indian Aluminium Company.

Alumina was first produced on an experimental scale in 1942, and the regular production of aluminium was started in 1944. The Corporation has its alumina plant, reduction plant, sheet rolling mills and plant for utensils fabrication at Jaykynagar; it also generates its own power from coal obtained from its nearby colliery. The capacity of the alumina plant is estimated at 5,000 tons and that of the reduction plant at 1,500 tons per annum. The sheet rolling capacity is 500 tons of rolled products. The Corporation has obtained a loan of 50 lakhs from the I.F.C. and is expanding its facilities to produce 2,000 tons of aluminium ingots and 3,000 tons of rolled products. This expansion is expected to be achieved by the end of 1953.

Part of an alumina plant.

Aerial ropeway.

The Planning Commission have recommended that the Corporation should increase its plant capacity to produce 5,000 tons of aluminium per annum during the period of the five year plan (1951-56). If this recommendation were to be implemented it would require expansion of mining facilities and the alumina and reduction plants; suitable arrangements for electric power would probably also need to be made from the Damodar Valley or Hirakud power plants as the cost of thermal power generation would be uneconomical.

Future Prospects

The onset of the war soon after the formation of the two primary aluminium producing companies had its impact on the development of the industry. In the case of the Indian Aluminium Company, its smelter was built at a distance of about 1,500 miles from the eventual location of its alumina plant, and an equivalent distance away from its rolling mills. Consequently, the Company has to bear considerable freight charges and incur substantial overhead costs on this account. Furthermore, the inadequacy of power at Alupuram has so far made it impossible for the Company to utilise fully its investment in plant and facilities at Lohardaga, Muri and Alupuram.

The activities of the Aluminium Corporation of India also received a setback as a result of the war. Orders for plant and machinery had been placed with the Skoda Works in Czechoslovakia and certain German firms and the full complement had not arrived in India when the war broke out. Consequently, the works could not be developed as originally planned. Its facilities for generating thermal power, apart from being costlier than hydro-electric power, are inadequate for continuous operation of the plant. Its rolling mills at present have a capacity much below its ingot production with the result that a major portion of

SILLIMANITE: ITS EXTRACTION AND USE IN INDIA

By U. B. H. DUNBAR

THE sillimanite group of refractory minerals consists of sillimanite, kyanite and andalusite but up to 1948 only kyanite was produced in commercial quantity. As the name implies, a refractory is a material highly resistant to decomposition by molten glass, metals and the like at high temperatures. It must have resistance to corrosion, it must not expand to any great extent when heated, it must not be friable and must not soften under load at operating temperatures. The three minerals mentioned above have been the subject of numerous laboratory experiments over the last 50 years and for over 25 years a commercial product has been marked under the name sillimanite, consisting of calcined kyanite. Kyanite, on heating to about 1400°C, is converted into the refractory material mullite, the change being accompanied by a considerable expansion which cracks the material. Before use as a refractory, therefore, kyanite has to be calcined. It is then bonded with fire clay or other bond for use in the manufacture of refractory bricks, etc. for building furnaces.

Deposits of natural sillimanite have for the last 30 years been known to occur in Assam, Madhya Pradesh and Rewa, of which those in the Khasi Hills of Assam and Rewa are workable. The Khasi Hills' deposits are in Sonapahar, Nongstoin State, and reserves in the area have been estimated at about 250,000 tons. There is associated corundum which was worked until 1920, but sillimanite as such, except for small scale working in the early 1930s, was not mined seriously until 1948, when 190 tons were produced. In 1949 the output rose to 864 tons and in 1950 there was a further rise to 1,375 tons. The deposits in Rewa are at Pipra in the district of Sidhi. There was a slight fall in the production from this area from 110 tons in 1949 to 100 tons in 1950. Sillimanite was not separately classified in the Seaborne Trading Statistics until April 1951, since when exports for the year ended March 1952 have been published as 3,193 tons valued at Rs. 1,248,514 (approximately £94,126) which went mainly to the United Kingdom (1,625 tons) and Western Germany (841 tons).

Extraction in Assam

Great progress has been made with the extraction of natural sillimanite from Sonapahar, Nongstoin State, in the Khasi and Jaintia Hills of Assam, where Assam Sillimanite Limited, a company registered in Assam, holds several leases. The rock is found mostly in outcrops of these hills and the mean elevation of the deposits is 3,000 feet. The sillimanite is in the form of boulders of varying sizes, and up to 40 tons in weight. This massive sillimanite has to be blasted by gelignite into fragments of a size that can be handled. Drill holes for the explosive are made by tungsten-tipped bits driven by compressed air. About one-quarter of the production is of pieces large enough to afford a fault free sawn block of a cubic foot upwards. The entire production has to be transported over 75 miles by road to Gauhati on the Brahmaputra river. Half of the distance is over the Assam Trunk Road and the remainder runs over ten miles of Forest Department and district board roads, then hill roads with steep gradients which are traversable only in fine weather. The sillimanite is shipped by river steamer to Calcutta for export or by railway wagons to users in India. Sillimanite fragments not large enough for sawing into blocks are crushed at the quarry and graded into three sizes, 1" mesh, 5x5 mesh to the inch, and 11x10 mesh to the inch down to flour. The latter grade is a fine powder suitable for direct use in the manufacture of refractories, fire bricks or certain types of porcelain. The portion of sillimanite production consisting of pieces large enough for sawing into blocks is sent to the sawing shed of Assam Sillimanite Limited at Paharpur in the Kidderpore dock area of Calcutta. This plant, which was started in September 1952, consists of two carbo-saws, motor driven rise and fall model with cross-traverse table. The manufacturers are the Anderson Grice Co., Limited, Taymouth Engineering Works, Carnoustie, Scotland. These saws are usually fitted with carborundum edged blades, but for stone sawing "Never" diamond-impregnated phosphor bronze teeth have been substituted. These blades are manufactured by Impregnated Diamond Products Limited of Tuffley Crescent, Gloucester, England. The blades are of

steel, 48" diameter and 0.299" thick; 68 phosphor bronze segments 1" wide by 3/4" thick are brazed on the rim. Each segment is 3/4" in depth and contains industrial diamonds sintered into the metal.

The speed of this saw in operation is 355 r.p.m. and it is powered by a 17 1/2 h.p. squirrel cage, screen protected, continuously rated motor, wound for 400 volts, 3 phase, 50 cycles. There is a separate 3 h.p. motor for the rise and fall of the saw and a further 7 1/2 h.p. motor for the water pump. The sillimanite rock which is sawn is as close textured as granite, which it exceeds considerably in hardness and toughness. This is why a diamond impregnated blade has to be substituted for the carborundum edge, as the latter would not have any useful life when cutting such hard rock. The inventor of the patented diamond impregnation process was a Belgian and it is interesting to record that he and his process were considered sufficiently important to be evacuated by the British Admiralty at the instance of the Ministry of Supply when Belgium was invaded in 1940. The inventor was provided with accommodation and a new factory in the outskirts of Gloucester. Impregnated Diamonds Products Limited is the post-war successor.

The Process of Sintering

The size of the diamonds is very small—about ten would equal a pinhead—and it should be noted that they are said to be sintered into the metal. Sintering is a process short of complete fusion and loss of identity but beyond the mere embedding of the diamonds in the metal. An everyday example of sintering is available in the confectionery shop window. In Brighton or other seaside "rock" sugar compounds of different colours are sintered together so that although each retains its colour and shape right through the length of the stick it is not possible to separate the colours again, as you could separate the nuts out of nut milk chocolate. The truth of this assertion as regards the diamond impregnated blades is proved by the fact that the saw has to be set before use and reset periodically. This is done by sawing coarse sandstone of a grade calculated to wear the metal and not the diamonds, which after a while protrude from the surface like minute machicolations. These machicolations, being hard, cut a groove in the sandstone while the metal is being worn away. After a time the diamonds are found to protrude sufficiently and the saw is turned on to the hard sillimanite rock. The diamonds cut the hard rock while the metal escapes contact. After about an hour of sawing hard rock the diamond protrusions are worn down so that the rim is a smooth surface and sawing efficiency is lost. If any attempts were to continue sawing, the metal and diamonds would wear down together, but the loss of efficiency in sawing can be detected immediately by the operator, or by the increased load on the ammeter,

so that the saw is put back on to coarse sandstone for a few minutes and the process as above is repeated. When the rim of the blades is examined after cessation of sawing hard material no pits are found from which diamonds have been extruded.

For successful cutting of hard stone—speeds of over 10 square inches per minute are achieved on sillimanite or granite—friction must be reduced to the minimum necessary and the water cooling has to be extremely efficient. Friction is reduced by keeping the 48" blade running to a lateral trueness of 12/10,000ths parts of an inch maximum; 8/10,000ths is expected in practice. The stone that is being cut is held on the cross traverse table by strong metal clamps to eliminate vibration. The water cooling is provided by a high pressure booster pump providing 80/100 lbs. per square inch. Two pipes are lead over the saw blade. One has a single nozzle trained on to the saw rim where it enters the cut and the other has a U-shaped fork in the gap of which the saw blade revolves. Each arm has ten jet holes playing laterally on to the revolving blade which carries the water right down into the saw cut. Cooling at this pressure is efficient and after sawing the blade shows no signs whatever of warmth even to the touch. To obtain a good surface it is necessary to complete a cut in one operation and this at times involves 15 minutes' non-stop sawing.

Cutting the Blocks

The usual size of refractory furnace blocks, such as are cut from sillimanite, is 18" x 12" x 8", equal to one cubic foot. The diamond sawn faces are of marble smoothness and the edges are true. A true edge is obtained by mounting the stone material to be cut on wooden battens 1/2" thick, and if the blade is set to cut 3/4" into the wooden batten a good edge is obtained. There is some crumbling of the edges when sawing sandstone for setting blades, but not on hard material such as sillimanite. These sawn blocks provide a refractory lining for glass tank furnaces and the like that promises a useful life of two years and upwards. A sheet or plate glass tank is not unlike a small swimming bath in general shape and may be designed to hold up to 1,200 tons of molten glass at a temperature of 1430°. The temperature is particularly fierce at the liquid level where the molten glass meets the hot gases and this is known as the corrosion zone, as something not entirely dissimilar to seething takes place, which rapidly eats away anything other than the finest refractory lining.

Natural massive Khasi sillimanite is ideal for the purpose. Its refractoriness is over Cene 36, denoting a melting point of over 1780°C., its hardness is seven on the diamond scale, it has no line of cleavage and negligible expansion at temperature, and it has little or no porosity as it is a natural rock. The saw shed at Paharpur is at present sawing a complete set of 740 furnace

Sillimanite quarry working at Sonapahar, Assam

blocks for a sheet glass tank being built at Asansol for the Hindusthan-Pilkington Glass Works Limited. The blocks are to be fitted in layers, each layer 12" or 18" depth, making 3 feet in all along the corrosion zone or liquid level of the tank. No mortar of any sort is used as the blocks are sawn to a trueness and smoothness to render this unnecessary. A lateral gap of only $\frac{1}{8}$ of an inch between blocks is left for expansion. Pilkington Brothers Limited, the well known glass manufacturers of St. Helens, Lancashire, England, and elsewhere, the founders of Assam Sillimanite Limited, first took an interest in the extraction and marketing of natural Khasi sillimanite shortly after the second World War, and rough hewn or blasted boulders have been shipped to them at St. Helens where they have two saws of their own. They have natural Khasi sillimanite furnace blocks in their own sheet and plate glass tank furnaces, where they have been giving satisfactory service for over two years of continual use. Natural sillimanite in the form of massive blocks is a close grained whitish grey rock with occasional colour variations to light pink or darker grey. It often contains an admixture of corundum in speckles, patches or streaks. It is a heavy rock, having a specific gravity of 3.20 percent, or up to 3.6 percent if there is a large admixture of corundum.

Massive Khasi Sillimanite Blocks

A most interesting paper was read by Mr. C. F. Griffith, B. Sc., A. R. I. C. of the Research Department of Pilkington Brothers Limited, to a well attended session of the Society of Glass Technology at its 281st ordinary general meeting held at St. Helens, Lancashire, England, in the lecture hall of the North Western Gas Board. Mr. Griffith traced the history of the discovery and development of massive sillimanite and corundum-sillimanite in the Khasi Hills of Assam, India, and described their characteristics. He gave details of laboratory experiments started by Pilkington Brothers Limited in 1939 and continued in 1941, the result of which was to convince this large glass-making concern that natural Khasi sillimanite was subject to noticeably less wear in contact with molten glass than that of four other well known high-duty materials. Similar results were obtained in further tests in 1942 and confirmed in the same year in a laboratory glass-making furnace, melting sheet glass batch and sheet glass cullet at 1450°C-1460°C.

Frame-sawing at Sonapahar

The specific gravity of pure sillimanite is 3.23. On heating to temperatures up to 1545°C there is a small reversible expansion, but no permanent change in dimensions or in specific gravity. On prolonged heating above 1545°C, however, the sillimanite is converted to mullite and silica (in the form of cristobalite) according to the following equation:

The theoretical specific gravity of the product (mullite and cristobalite) is 3.05 corresponding to a permanent increase in volume of 5.9 percent or to a permanent linear expansion of 1.96 percent. On heating Khasi sillimanite rock specimens (that is, pieces of the uncrushed rock) to 1500°C there is a completely reversible linear expansion of 0.8 to 0.9 percent. There is usually a loss on ignition of 0.5 to 1.5 percent. Some specimens show a slight peak of about 0.1 percent at 600°C on the expansion curve. On prolonged heating at 1600°C, specimens of natural Khasi sillimanite rock show a permanent linear expansion of about 2.5 to 3.0 percent corresponding to a volume change of 7.5-9.0 percent.

Khasi sillimanite rock usually contains corundum in addition to sillimanite and the specific gravity is on the average appreciably above 3.23, the value for pure sillimanite. This is, of course, an advantage for refractory purposes. An average value for the specific gravity of Khasi sillimanite rock is about 3.3 to 3.4. After prolonged heating at 1600°C the porosity increases from about 0.2 percent to 2.0-4.0 percent and the specific gravity decreases to about 3.0-3.2 percent. The bulk density also changes to correspond with the change in specific gravity and porosity.

Encouraged by the excellent results obtained, Pilkington Brothers Limited centred its interest on the possibility of using blocks of massive Khasi

sillimanite rather than on using blocks of crushed and bonded material. The next step consisted of experiments in full size tanks during the actual manufacture of glass.

A Sheet Glass Tank Furnace

Early in 1944 two panels, each consisting of three unfired sawn Khasi sillimanite blocks, were set opposite each other in the top course of the right hand and left hand side wall respectively in the melting end of a large sheet glass tank with the top of the blocks 1" below glass level. Flux line water boxes two inches in depth were used on top of the panels and the backs of the blocks were cooled by fan air. After 19 months in position each trial panel was cut out of the glass. The six Khasi sillimanite blocks were solid throughout and showed only a few hair cracks, none of which went right through. The adjacent fusion cast blocks were in a cracked condition. The conclusion drawn from the trial was that the Khasi sillimanite blocks had given an excellent performance. They had not become brittle and had resisted cracking in service, being solid throughout. They showed every promise of a much longer life than the neighbouring blocks. In order to organise extraction of Khasi sillimanite rock, Pilkington Brothers Limited decided in 1947 to apply for Government licences to mine sillimanite and corundum in four areas adjacent to Mount Lum Rynkiew, 3,744 feet. Mining leases were duly granted. Referring to the sawing of boulders, Mr. Griffith mentioned two methods—one with frame saw machines fitted with mild steel blades, using chilled steel shot as an abrasive, and the other with stone saw machines using circular saws having teeth consisting of industrial diamonds set in bronze.

Another Sheet Glass Tank Furnace

In 1948 a sawn Khasi sillimanite block, 18" x 12" x 8", was inserted into the top course of a large sheet glass tank furnace. The block was removed after 49 weeks of glass-making and its condition compared with that of its fusion cast neighbours. The latter showed cracks, some of which had evidently been present in service and some of which had occurred in cooling. The Khasi sillimanite block showed only a fine hair crack, which had not opened across the top. The sillimanite block was at least as good in resistance to wear as its fusion cast counterparts.

The first consignment of sillimanite and corundum-sillimanite boulders large enough for sawing was received in St. Helens in 1949. Twenty-one of the first blocks sawn were arranged in five trial panels in the top course at the left hand side of the melting end of a large sheet glass tank furnace. Each block was 18" deep, 8" thick and of random width. After 473 days in production there was a cold repair, but the side blocks were not touched. After the repair the tank continued in production for a further 347 days, making a total production life of 820 days (117 weeks). During the life of the tank the average melting load was 9.5 tons glass/24 hours/100 square feet of melting area. Examination of the Khasi sillimanite blocks showed that they were still good for further service. Neighbouring fusion cast blocks were brittle.

1950-52: Fourcault Process Sheet Glass Tank Furnace

The largest trial mentioned by Mr. Griffith related to the installation of Khasi sillimanite blocks in 1950 in a Fourcault process sheet glass tank furnace. A continuous run of sawn Khasi sillimanite blocks was installed on the right hand side and the front wall. Eighty-nine Khasi sillimanite blocks were used, 21" in depth, 8" in thickness, and of random widths. None had been calcined or heated. They varied from all sillimanite to corundum-sillimanite of high corundum content, but no selection was exercised on this basis. They were set arbitrarily in the order in which they were received from the saw shed. Khasi sillimanite blocks shattered at a temperature of about 650°C. It has been concluded from a few similar failures encountered elsewhere later that the disruption was due to a high kaolin content in the rock from which this particular block had been sawn. At about 600°C the kaolin is decomposed with liberation of water vapour. The type of sillimanite rock which has been found to shatter in the massive state contains upwards of 12 percent of kaolin, sometimes as much as 20 percent. It is detectable by specific gravity measurement. As an added precaution blocks whose production campaign lasted 661 days (94 weeks). The furnace was then put out solely for economic reasons. Over the whole period of production the melting load was 10.4 tons of glass/24 hours/100 Khasi sillimanite blocks in situ showed that they had given a remarkably fine performance. At the

most conservative estimate, they were good for at least another two years of production life. Even in the hottest zone in the furnace there was still at least half the original thickness of block left at the extreme top and much more than half about 6" down.

1952-53: A Sheet Glass Tank Furnace: A Plate Glass Tank Furnace

The Fourcault trial having given such solid results, there was no hesitation in constructing the whole of the melting end sidewalls of a large sheet glass tank furnace, and of a large plate glass tank furnace from sawn Khasi sillimanite blocks. Some of the blocks were sawn completely at St. Helens and others part-sawn in Assam and finished sawn at St. Helens. During eight and six months in production respectively the furnaces have given glass of excellent quality.

1953: A Sheet Glass Tank Furnace in India

Khasi sillimanite being an Indian material whose extraction and preparation represents a valuable addition to the economy of Assam, finding employment for more than 250 persons, it is appropriate that the Fourcault process sheet glass tank furnace being erected at Asansol, in the Bengal coalfield, for the Hindusthan-Pilkington Glass Works Limited, a joint Indo-British concern, will contain the largest number of Khasi sillimanite blocks yet built into a single furnace. This man-made blocks will be built into Assam and India. All these blocks will be sawn in Assam and at Paharpur, Calcutta, by Assam Sillimanite Limited. In Assam, frame-saws are used; at Paharpur, circular saws. The managing agents of Assam Sillimanite Limited are Steel Brothers & Company Limited, Calcutta.

Analyses of Ignited Typical Sillimanite

Mr. Griffith quoted analyses at St. Helens of ignited typical sillimanite and of ignited typical corundum-sillimanite as being:

	Sillimanite, (Percentage)	Corundum-Sillimanite (Percentage)
SiO ₂	36.1	15.4
Al ₂ O ₃	61.5	82.0
Fe ₂ O ₃	0.88	0.73
FeO	1.60	1.80
CaO	0.40	n.d.
MgO	Trace	n.d.
Na ₂ O	Trace	n.d.
K ₂ O	0.05	n.d.
Loss on Ignition	1.40	0.9

He said that ignited run-of-mine crushing analysed at St. Helens during 1952 had been found to be:

	These figures indicate the presence of corundum.
SiO ₂	31.3
Al ₂ O ₃	65.7
Fe ₂ O ₃	0.86
FeO	1.62
TiO ₂	0.25
CoO	0.19
MgO	0.10
Na ₂ O	0.18
K ₂ O	0.22
Loss on Ignition	2.2

The high average alumina and the low average iron content were described as decided advantages from a refractory point of view.

Mr. Griffith concluded by saying that surprisingly little trouble had been found in practice from the use of sawn natural Khasi sillimanite and corundum-sillimanite blocks. He regarded them as approaching the ideal for the flat glass industry. They have long lives. In general they wear smoothly. They resist thermal shock. Their high thermal conductivity and solid structure permit of effective cooling where this is required.

Marketing of Sillimanite

It was gratifying to find Mr. Griffith's report going so far to confirm the advantages claimed for massive sillimanite, namely:

1. Resistance to thermal shock.
2. Low expansion.
3. Resistance to attack by molten glass at high temperatures.
4. Retention of bulk density with a very slight loss of porosity.

These are qualities which render massive Khasi sillimanite particularly adaptable for the most strenuous refractory duties and especially in glass furnaces. The cost of massive Khasi sillimanite blocks is based on the cost of diamond sawn blocks which works out to Rs. 15 per square foot of sawn surface. Massive Khasi sillimanite blocks will, therefore, cost about Rs. 2,000 per ton in sizes of one cubic foot and upwards and considerably more in smaller sizes.

1948-50 experiment: The block in the middle is sawn Khasi sillimanite after 49 weeks' use.

The crystalline structure of natural sillimanite is felted and is not lost when the sillimanite is crushed. There is no large expansion sufficient to cause disruption even on heating above 1550°C. For this reason natural sillimanite can be used in the caustic bonded form without calcining. Resistance to thermal shock and low expansion on heating are unaltered and blocks bonded from crushed natural sillimanite are, therefore, only second to the blocks sawn from massive sillimanite in refractory value. The bulk density and porosity of such bonded blocks depends upon the bonding medium used. Experiments have shown that bonded blocks of crushed natural Khasi sillimanite can be made with as low as 16 percent apparent porosity by using a small proportion of "calgon" (sodium hexameta phosphate) in addition to a small quantity of clay. Excellent results have also been obtained by the use of polyvinyl alcohol as a bonding medium. It has also been demonstrated that artificial "sillimanite" or "mullite" refractories manufactured with calcined kyanite as the principal ingredient will show an increase in volume stability when a substantial portion of crushed natural Khasi sillimanite is added. The addition of natural Khasi sillimanite also enables a sharper mould to be made if this is desired. Bonded natural Khasi sillimanite blocks can be made capable of giving an excellent performance and can be produced to cope with a working temperature of 1650°C. Such bonded blocks are considered suitable for electrical arc furnace or regenerator roofs of up to ten tons capacity, tapping with the roof temperature at 1750°C. Such blocks can be manufactured at less cost than the massive sawn blocks and can of course be moulded to any desired shape, including curves or tubes. As only a quarter of the natural Khasi sillimanite mined is found in pieces large enough for sawing it is apparent that the crushed natural sillimanite will be in much freer supply and that the cost will be very considerably less.

Use of Sillimanite in India

According to the Overseas Economic Survey dealing with Economic and Commercial Conditions in India, published in Britain in March this year, Indian industry in 1948 consumed some 200,000 tons of refractories, most of which were produced by Indian manufacturers whose total rated production capacity was in the region of 225,000 tons per annum. At the time plans were afoot for a considerable increase in the production of iron and steel, and in addition there were schemes for expansion in other refractory-consuming industries; in a Panel Report issued by the Ministry of Industry and Supply,

the Government of India felt justified in recommending a 100 percent increase in the production of refractories by 1953. Although there has been some expansion in the refractories industry it has not been as rapid as was then visualised and, indeed, actual production of refractories today is of the order of 238,000 tons per annum. The plants of the main manufacturers are located in the coalfield areas of Bengal and Bihar within a radius of 30 miles of Asansol. Raw materials for the principal refractories—fire bricks and silica bricks—are found near this area; coal is plentiful, and the largest consumer of refractories, the steel industry, is not more than 100 miles away. The industry is established less extensively in other parts of the country, particularly in Madhya Pradesh, and primarily to meet local demands. Today the rated productive capacity of the industry is around 290,000 to 295,000 tons per annum with a production level of some 235,000 to 237,000 tons each year, and is meeting an increasing proportion of the demands of Indian industry; imports of firebricks and graphite crucibles have shown a progressive decrease.

Specialised refractories which are normally imported include chrome magnesite bricks, graphite refractories, silicon carbide products, high-temperature cement, glass pots, crucibles, pyrometer tubes etc. It is thought that crushed natural sillimanite will be found especially suitable for the manufacture of very high temperature refractories and substitutes for other high duty refractories normally imported into India. Samples of natural sillimanite were exhibited to the trade at the annual exhibition of the Indian Ceramic Society held on 26th, 27th and 28th December, 1952.

1950-52 Trial: The deep blocks in the centre are natural sawn sillimanite, the darker blocks below are fusion cast.

MARION EXCAVATOR AND EUCLID REAR DUMP

One of the main delays and causes of high transportation costs in open pit mining is rigidity of transport. Blackwood Hodge can supply the solution to this problem with MARION Shovels and EUCLID Rear Dumps. No more frustrating delays relaying rails and Dumps can operate with equal ease in any part of the mine. Due to the manoeuvrability of this equipment, no damage is caused when blasting takes place, for Marion's and Euclids can move in under their own power and start removing the ore immediately. Manoeuvrability is essential for increased output and reduced costs per ton.

CHROMITE REQUIREMENTS EXPECTED TO EXPAND

• By Dr. M. S. KRISHNAN •
Director of the Geological Survey of India.

THE mineral chromite is commercially the most important source, and for all practical purposes the only source, of the metal chromium. The theoretically pure mineral should contain 68% of chromic oxide and the rest iron oxide but material of this composition is rare. The ores from commercial deposits generally contain 45 to 55% of chromic oxide. From chromite is obtained chromium which is an important constituent of some types of steel, particularly stainless steel. A well known composition of stainless steel is 18% chromium and 8% nickel but many other proportions of chromium are also used. Chromium steels of a great range of composition are used for various purposes, especially where resistance to chemical corrosion and to oxidation is required, as in the case of equipment used in the manufacture of chemicals, food, dairy and fruit products. Some steels containing chromium are also used where high electrical resistance is needed, while others which contain cobalt in addition find application in the manufacture of tool steels. Chromium metal is extensively used for electroplating over other metals. Even a very thin film of chromium, of the order of one ten-thousandth of an inch in thickness, is very effective as a protective layer.

The next important use of chromite is as a refractory lining in smelting furnaces. Since the material is neutral to most slags, it resists corrosion and also withstands high temperature and sudden changes of temperature. It is used mainly in the form of chromite bricks and chrome-magnesite bricks, and also as blocks or as a chrome-base cement. Chromite is the basic raw material for the manufacture of chrome chemicals, of which the alkali bichromate (sodium or potassium) is the most common. The bichromates find use in the dyeing industry, in chrome tanning of leather, the dyeing industry, in chrome alum and in the batteries, in making chrome-alum and in the manufacture of certain yellow and green pigments for paints. Lead chromate is one of the main constituents of chromium paints. These pigments are used in oil and water colours and in glass and ceramic manufacture. Some chrome chemicals are also used in medicines for external application.

Grading of Commercial Ores

Commercial chrome ores are graded into metallurgical, refractory and chemical ores. For metallurgical purposes a minimum of 48% of chromic oxide is stipulated, with a chromium to iron ratio of not less than 3 to 1; the silica content should also be low. For chemical purposes the chromite may have a high proportion of iron but the ore should have comparatively low silica and magnesia and should also be easily disintegrated during treatment. Chromite for refractories should have comparatively low iron and silica and fairly high chromic oxide with a fair amount of alumina; the total quantity of chromic oxide and alumina should amount to a minimum of 57 or 58%. The prices of commercial grades vary according to the proportion of the various constituents and the suitability of the ore for the different uses mentioned above; 48% metallurgical chromite is generally taken as the standard grade.

India has figured as a fairly important producer of chromite since 1903 and the annual output has varied from 20,000 to 50,000 tons. Before partition, the most important deposits were those of Hindi Bagh in the Zhoib valley in Baluchistan, which produced, on an average, about 15,000 tons of high grade metallurgical ore per year. Smaller deposits occurred in the Quetta-Pishin district and in the region near Fort Sandeman. Next in importance were the deposits in Southern Mysore in the districts of Hasan, Mysore and Kadur. Several of them have been worked since 1907 and the annual production has averaged 15,000 tons, though fluctuating from year to year. The chief deposits are at Sindhuvali, Byrapur, Nuggihalli, Tagadur, etc.

Production at Singhbhum

The Singhbhum district in Bihar has been a steady but comparatively small producer since 1913. The deposits occur in three groups on hills near Jojohatu, some 15 miles from Chaibassa, the headquarters of the district. The maximum production from the Singhbhum deposits was about 11,000 tons in 1935 but the average production taken over the last three decades is only a little over 3,000 tons a year. Some small deposits occur near Kankauli in the Ratnagiri district and in the

neighbouring area of Savantvadi State, but these have not been regularly worked because of the rather poor grade. Chromite has been recorded as occurring in the valley of Hanlechu in Spiti and in the Puga valley in Ladakh. Some deposits are known to occur near Dras in Kashmir though, because of the inaccessibility of the region, information on them is scanty. It is known that a belt of ultra-basic igneous rocks stretches from Ladakh in a south-easterly direction into Kumaon and possibly further down into Nepal. Since such rocks are the usual associates of chromite, it is probable that this belt contains some useful deposits.

Madras and Orissa Deposits

During the last 10 to 15 years, four groups of deposits have come to light, two in Madras and two in Orissa. In the Salem district of Madras, the corundum bearing area of Sittampundi, just north of the Kaveri river, was found to contain lenses of chromite which is high in alumina and iron. It was estimated by the Geological Survey that these deposits contain about one-quarter million tons within a depth of 20 feet from the surface. But the deposits undoubtedly extend to a depth of 50 feet or more. This material is expected to be suitable for the manufacture of refractories. The Kondapalle hills, some 10 miles north-east of Bezvada in Krishna district, have revealed several small deposits capable of producing a good grade of metallurgical chromite. These hills, which extend into the adjoining parts of Hyderabad, are covered with dense thorny shrubs which make prospecting difficult. The deposits were discovered only about 1936 and have since been producing a small tonnage every year. During the war, some deposits of high grade metallurgical ore were discovered in the Baula hills in Keon-

tion is probably of the order of 5,000 tons for refractories and between 4,000 and 4,500 tons for chemicals. The chief consumers are the iron and steel smelters and the textile and tanning industries. As there has been very little import of chrome chemicals into India during the last few years, it is thought that at present the internal demand is fully met by local manufacture. Small quantities of ferro-chrome were manufactured for war purposes during the second world war. There was a proposal to produce ferro-chrome in an electric furnace in Mysore but it has not fructified. However, it is expected that with the development of the iron and steel industry of India, the consumption of chromite for metallurgical purposes will increase in the near future.

The known deposits of chromite in India are of limited extent but will meet requirements for some years. It is, however, necessary to know what possibilities there are of discovering new deposits and where one should look for them. Since chromite is found generally associated with beds of magnesia-rich ultra-basic igneous rocks, it would be worth surveying the known and possible areas of occurrence of such rocks for new deposits. These are mainly along the mountain belts of the Himalayas, the Aravallis, the Eastern Ghats and possibly the Patkoi, Naga, and other hill ranges between Assam and Burma. However, they lie in the least accessible parts of the country but exploration should be directed to them for locating new deposits of chromite. The prospects are not discouraging, for the discoveries which have come to light during recent years are all in the Eastern Ghats and there is yet a great deal to be learnt about the details of the geology of the areas on the border of Assam and Burma.

FERTILISER PRODUCTION INCREASES GYPSUM OUTPUT

• By A SPECIAL CORRESPONDENT •

GYPSUM is a hydrous calcium sulphate, represented by the formula $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$, and containing 46.5 percent sulphur trioxide (SO_3), 32.6 percent lime (CaO) and 20.9 percent water. It crystallises in the Monoclinic System, has a perfect cleavage in one direction, a hardness of 2 in the Moh's scale, and specific gravity 2.3 to 2.4 (about 145 lbs. per cubic foot). It is transparent to opaque, and white, grey, brown or pink in colour. It is slightly soluble in water, but dissolves readily in dilute hydrochloric acid without effervescence. It is not soluble in sulphuric acid. The only other form in which calcium sulphate occurs in nature is as anhydrite, with the composition CaSO_4 . When occurring in transparent translucent crystals gypsum is known as selenite; a fibrous variety is known as "satin spar", and in massive form, with a finely crystalline texture, it is known as alabaster. Another variety of gypsum occurring as an earthy material on or near the surface in dry regions, is known as gypsum, of which large workable deposits occur in Rajasthan. Gypsum is formed in nature in a variety of ways. Usually it occurs in thick layers interbedded with limestone, shale and sandstone, etc., and is formed by precipitation on the evaporation of marine waters in enclosed basins. The Salt Range (Pakistan) deposits are examples of this type. In other cases gypsum is formed as a result of the interaction of sulphuric acid, or other sulphate compounds carried in solution, with calcium carbonate, or limestone. The deposits of Sirmur, Naini Tal, Dehra Dun and in some other parts of the Himalayas are replacement deposits of this nature.

Gypsum is used both in crude and in calcined state in many industries. An addition of 2 to 4 percent of gypsum to cement-clinker, while it is finally ground, acts as a retarder and helps in controlling the setting properties of Portland cement. Application of ground gypsum to alkali soils improves the texture and the permeability of such soils. Ground gypsum is also used as a filler and extender in the paint industry. Heated to about 350°F, gypsum loses a part of the water and turns into demihydrate, $\text{CaSO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$, commonly known as "plaster of Paris", and when heated further to 400°F it loses practically all its water. The most common use of gypsum is as plaster of Paris in the building industry, pottery, moulds, blackboard chalk and surgery etc., the building industry consuming the largest proportion of world output in the form of plasters, lath, boards etc. In comparatively recent years gypsum has come to be employed on a large scale in the manufacture of ammonium sulphate and sulphuric acid in countries deficient in other sources of sulphur.

The Cement Industry

In India, until recently, the largest consumption of gypsum was in the cement industry, but with the establishment of the fertiliser plant at Sindri the tonnage of gypsum that goes into the manufacture of ammonium sulphate far surpasses the consumption in all the other industries put together. In 1951, out of a total Indian production of over 200,000 tons, approximately 126,000 tons were consumed by the cement industry. Complete figures of production for 1952 are not yet available but it is estimated that when the manufacture of ammonium sulphate was started at Sindri, 282,000 tons of gypsum were consumed for this purpose and 140,000 tons were consumed by the cement industry. At the time the ammonium sulphate factory at Sindri was first conceived it was intended to use gypsum from the Salt Range, but as that area fell in Pakistan after partition the Geological Survey took up an intensive programme immediately for a systematic assessment of all the known occurrences of gypsum in the country, so as to locate domestic sources for the industries in India, particularly for the Sindri fertiliser factory. As a result of this programme a number of deposits in Rajasthan, Kutch, Uttar Pradesh and Trichinopoly have been examined in detail in recent years, and a few others in Kashmir, Spiti, Bhutan and one or two in Rajasthan remain to be explored.

The most important producing deposits of gypsum in India lie in Rajasthan and in Trichinopoly, Madras. In Rajasthan, gypsum occurs mostly in the form of gypsite in Bikaner and Jodhpur, and to a lesser extent in Jaisalmer. These deposits occur in horizontal beds, in shallow depressions amidst sand dunes, the most important of these being the one next to Jamsar railway station, about 19 miles north of Bikaner City. Here, the deposit consists of three horizontal layers placed one above the other in an area approximately 1½ square miles. Top layer is white powdery gypsite, about 7 feet thick, containing 72 to 89 percent gypsum. This is underlain by a 10 to 15 foot thick bed of gypsum composed entirely of small crystals loosely held together, averaging 80 to 95 percent $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$. Below this bed, separated by an 8-foot thick layer of sand, is another layer composed of larger crystals.

The major portion of the output from Jamsar is sent by rail to Sindri and the balance is distributed to other industries. This deposit is estimated to have a reserve of over 25 million tons and is at present the largest source of it in India. In 1951, production from this deposit was 1,14,601 tons as against the total Indian production of 207,120, and in 1952 it rose to 1,84,481 tons. The deposit is under lease to Messrs. Bikaner Gypsum Ltd. In the adjoining Jodhpur State there are two producing centres located at Badwasi and Kavas. Badwasi has been in production for a number of years, chiefly by Messrs. Associated Cement Co., and the Kavas deposit has come into production in 1952, and is worked by Sindri Fertilisers & Chemicals Ltd. to meet a part of their requirements at Sindri. Besides, fairly large deposits of gypsum occur at Manglod, Utarlai, Khutani and Phalsund etc. which are not yet worked on a large scale. The total reserve of gypsum in Jodhpur is estimated to be over 21 million tons, not taking into account the deposits associated with the Vindhyan rock formations.

which are known to occur a few hundred feet below the surface at Nagaur and Badwasi.

In Trichinopoly district, Madras, gypsum occurs in irregular beds in an area of about 22½ square miles around Nambakkurichhi, Garudamangalam, Sirukanbur and Karai. The predominant variety of gypsum here is fibrous, but large crystals of transparent gypsum also occur in a few places. The reserves are estimated at about 15 million tons to a depth of 50 feet. Near Sulurpet in Nellore, another million tons of gypsum have been estimated in the marine silts north of the Pulicat lake. In Saurashtra and Kutch several deposits occur in the form of selenite crystals in bluish plastic clays and marls, and also in some of the creeks. The largest of these is near Ran, where about 3,776,000 tons have been estimated. Usually, the individual deposits are rather small, but the total reserve of gypsum in these is about 6,500,000 tons. In the Himalayan ranges in Northern India, gypsum is formed by a partial or total replacement of limestone. Relatively small deposits occur in Sirmur, Himachal Pradesh, in Dehra Dun, Naini Tal and Tehri Garhwal districts of U.P., with a total estimated reserve of about 589,000 tons. Large deposits are, however, known to exist in Kashmir, Spiti and Bhutan, where they still await detailed exploration.

Figures of reserves in the more important areas which have been examined recently are summarised below:—

Rajputana*	(Tons)
Bikaner	28,341,000
Jodhpur	21,320,786
Jaisalmer	1,341,000
	50,902,766
Madras	
Trichinopoly	15,300,000 (to 50 ft. depth)
Nellore	1,000,000 (to 2 ft. depth)
	16,300,000
Saurashtra	
Halar Dist.	4,441,000
Bhavnagar	25,000
Porbandar	4,466,000
	2,071,000
Kutch	
Himachal Pradesh	
Sirmur	383,000
Uttar Pradesh	
Lachmanjhula	156,000
Dehra Dun	13,000
Naini Tal	37,000
	206,000

The production figures tabulated at the end show the rapid rise in the production of gypsum in India in recent years. None of it is exported; in fact small quantities are imported from Pakistan and Cyprus. The growing rate of production is related to the rapid growth of the cement industry and the establishment of the ammonium sulphate factory at Sindri.

Working to rated capacity the Sindri fertiliser factory requires approximately 600,000 tons of gypsum per year for the production of 350,000 tons of ammonium sulphate. Practically the entire supply comes from Jamsar (Bikaner) and Kavas (Jodhpur) deposits. The 32,000 tons of gypsum required by the other ammonium sulphate factory at Alwaye (Travancore) for the production of 50,000 tons of ammonium sulphate per year are derived from the Trichinopoly deposits. Thus, about 632,000 tons are currently required per annum for the working of the two fertiliser factories to their rated capacity, and an additional 15,000 tons for the cement industry.

Plaster of Paris

Only a small portion of the production is calcined for plaster of Paris; little is used in the building industry, and less for agricultural purposes. Recently, the manufacture of sulphuric acid from gypsum has been under consideration by the Muller-Kuhne process, in which ground gypsum is roasted with clay, sand and coke to yield cement and sulphur dioxide, according to the reaction:

The clay and sand combine with CaO to form Portland cement, and the SO₂ is scrubbed and purified for the manufacture of sulphuric acid. As it is necessary to use CaSO₄ for this reaction, gypsum is first roasted in a separate kiln to drive out all water. This process is well established in Germany and is also in use in the United Kingdom. It is estimated that 500,000 tons of gypsum will yield 75,000 tons of sulphur (equivalent to 225,000 tons of H₂SO₄) and 300,000 tons of cement.

There is, thus, vast scope for the development of gypsum-consuming industries in India, but this development depends largely on the success of efforts to locate new and easily accessible deposits.

Production of Gypsum in Undivided India during the years 1941-1946 (in tons.)

Ilmenite

This is a titanium-bearing iron-ore which may have up to 32 percent titanium. It is used for the extraction of titanium dioxide which is a valuable pigment. Titanium metal is an important alloying element in high speed steel. India is the largest producer of ilmenite in the world. About 75 percent of the average annual production of the world comes from India. The material is obtained from the beach sands of Travancore and along the east coast of India. The reserves of ilmenite are roughly estimated to be of the order of 200 million tons. The ilmenite bearing beach sands of Travancore are concentrated on wet tables to remove quartz sand, and then after drying the ilmenite is removed by magnetic separators, leaving monazite, zircon, sillimanite, etc. Output in 1950 was 212,663 tons valued at Rs. 33,09,968. The quantity produced is entirely exported out of India. There was no consumption of ilmenite in India until the establishment of a factory for the manufacture of titanium dioxide in Travancore. India enjoys an exportable surplus of this mineral and will continue to do so for several years to come after meeting the requirements of her domestic market.

INCREASING USES OF KYANITE

STEADY RISE IN OUTPUT AND VALUE

• By V. P. SONDHI •

KYANITE, with andalusite and sillimanite, belongs to the group of aluminium silicate minerals, all of which possess the same chemical composition, Al₂O₃.SiO₂ (corresponding to 63.2% alumina and 36.8% silica), but differ from one another in optical, physical and crystallographical properties. Kyanite crystallises in the Triclinic System, usually in long-bladed crystals of light blue or light green colour, and also in fine grained massive variety, which is preferred for refractories. Its specific gravity is 3.6-3.7, and hardness 4 and 7 according to the crystal face. Other minerals of this group crystallise in the Orthorhombic System. On heating, all the members of this group break down at different temperatures to mullite, 3Al₂O₃.2SiO₂, and silica. Kyanite begins to decompose into mullite and free silica at about 1325°C, andalusite at 1550°C and sillimanite at 1530°C. At 1545°C mullitisation is complete. The decomposition temperatures are, however, related to the rate of heating and to the grain size of the material. Above 1545°C mullite remains unchanged until 1810°C is reached. At this temperature it decomposes to corundum, Al₂O₃, and siliceous glass.

Similarly, when artificial mixtures of alumina and silica are heated, the reaction is the same as in natural aluminium silicate minerals, that is, the mixture produces mullite and silica at 1545°C. This reaction to heat is not reversible. Mullite, 3Al₂O₃.2SiO₂, is thus the only stable aluminium silicate at high temperatures. The decomposition temperatures quoted above are for materials when in pure state. In the presence of impurities and fluxes, as in ceramic bodies, the decomposition actually takes place at much lower temperatures. To the above group of minerals may be added dumortierite and topaz, represented by the chemical formulae 4 (AlB)₂O₃.3 SiO₂ and (AlF)₂SiO₂ respectively, which also break down to mullite and silica after boron and fluorine are largely driven off on heating.

Use in Ceramics

The optical and crystallographic properties of mullite being very similar to those of sillimanite, for a long time mullite in fired ceramic products was mistaken for sillimanite; to this day, kyanite is known in the trade as "sillimanite" because on heating it produces mullite. Equally long has it been known that the development of this compound imparts strength and other desirable qualities to the ceramic products. But it was not until 1924, when mullite was proved to be the only stable phase in the Al₂O₃.SiO₂ system, that the utility of the various natural aluminium silicate minerals to the ceramic industry was fully appreciated. The use of these minerals in ceramics is, thus, meant to increase the mullite content of the body, and the choice of the mineral for this purpose is largely determined by the availability of a regular supply and by the firing characteristics of the material. Deposits of kyanite being more widely spread in different parts of the world, and being more easily obtainable, this mineral is in more common use, although other minerals of this group have also been used commercially.

All the above aluminium silicate minerals change in volume when heated, with consequent change in density and porosity. In this respect andalusite is affected least and kyanite the most. It is usually possible to use andalusite, sillimanite and dumortierite direct in their raw state, but kyanite has to be pre-heated to stabilise its volume-change at industrial temperatures, and topaz has to be calcined for the removal of fluorine before it is used. Volume-change in commercial grades of kyanite is stabilised by calcining it, before actual use, at temperatures between 1400°C and 1500°C. Average commercial samples of Indian kyanite reach maximum volume-expansion and porosity when heated to 1400°C, except when the sample is unusually high in corundum content. Subsequent firing to 1500°C slightly reduces the volume expansion and apparent porosity, which, in the ordinary Indian kyanite, varies from 18.4% to 19.4%. In high-corundum kyanite the apparent porosity is much lower.

This article is published with the permission of the Director of the Geological Survey of India.

In India, Bihar possesses the most important occurrences of kyanite, which are found along a narrow belt, about 80 miles long, in the Singhbhum and Manbhum districts. For its greater length, the belt runs parallel to the copper belt. Generally, segregations of kyanite occur in kyanite-quartz rock or granulites which are associated with mica-schist and hornblende-schists, and the mineral is believed to have been formed under high temperature hydrothermal conditions, through the influence of magmatic emanations from intrusions of soda-granite, close to which the segregations are found. Alumina is believed to have been derived from the neighbouring schists, which are inherently rich in alumina. Within this belt lie the famous deposits at Lapsa Buru in the former Kharsawan State. Massive kyanite occurs here as segregations in the kyanite-quartz rock, which on denudation has given rise to abundant debris of kyanite in the soil. Kharsawan, which has since merged into the Singhbhum district of Bihar, was the first in the world to produce high-grade kyanite commercially in 1924, soon after the value of aluminium silicate minerals began to be recognised by the ceramic industry, and today it continues to maintain its position as the leading supplier of high grade kyanite to the world markets. In the same belt, massive kyanite is also produced in Saraikela, at Ghadidih, Rakha Mines, Mohanpur, Badia and Kalyanuluka. Minor occurrences have been noted in a number of other places in Bihar, and small quantities are also produced in the adjoining Orissa State.

Estimate of Reserves

In South India, Hassan district in Mysore has produced about 7,000 tons of kyanite in the last few years, but the mineral here suffers from an excess of titania in its composition. It has been produced in Nellore, Madras, for the last few years in a small way, and deposits also occur in Rajputana. The kyanite-schists which occur in large quantities in several parts of India are not yet regarded as deposits of kyanite, since it is not certain how far attempts at the recovery of the mineral through beneficiating processes will be successful. Such beneficiating is, however, being successfully practised in America.

Most of the production of kyanite in India is obtained from debris on the surface or in the soil which has been derived by the weathering of less resistant underlying rocks. Only in a few places, like Lapsa Buru and Ghadidih, is the material quarried direct from the country-rock. Concentration of debris in the soil is very capricious and sporadic, and it is, therefore, difficult to make even an approximate estimate of the reserves without undertaking an elaborate and costly system of pitting and trenching. An estimate of the reserves of kyanite at Lapsa Buru made many years ago, in 1927, was 200,000 tons of

the material *in situ* to a depth of three feet. It was pointed out at the time that actually the reserves will probably be found to be many times larger. Actually, from this area over 300,000 tons of the material have been produced up to end of 1951, and there is no noticeable sign of exhaustion of the deposits.

As regards the occurrence of other aluminium silicate and allied minerals in India, deposits of massive sillimanite, associated with small deposits of corundum, occur at Nangstoin in Assam, where a minimum of over 230,000 tons has been estimated. At Pipra, in the Rewa district of Vindhya Pradesh, a minimum of 100,000 tons each of high grade massive sillimanite and corundum occurs, associated with dumortierite. Deposits of topaz occur in Singhbhum, close to kyanite, and those of andalusite occur in phyllites in the Yellandu Taluka of Hyderabad. Several varieties of Indian kyanite are put on the market, varying in texture and in composition. In texture, the samples are coarse to fine-bladed, with either radiating or parallel blades, or they are fibrous, granular or massive. The massive variety is the most highly prized.

Influence of Corundum

In composition, the commercial samples contain generally 56 to 80% Al₂O₃. Theoretically, kyanite contains 63.2% Al₂O₃, and any Al₂O₃ above this percentage indicates the presence of corundum in the sample. Corundum actually improves kyanite, since it tends to take up the excess silica released in mullitisation. Eighty percent Al₂O₃ in the composition will indicate approximately 40% corundum in the sample. Generally, however, the percentage of corundum in the commercial grades of kyanite ranges from 5 to 15. Pure kyanite contains 36.8% SiO₂, and in commercial samples it may be anything from about 20% upwards. Excess of silica over its theoretical content in kyanite is deleterious, as it means the presence of free silica which tends to soften the refractory at high temperatures. Iron oxide and titania put together are usually less than 1%. The presence of calcium, magnesium and alkalis is harmful, as these elements act as fluxes and lower the melting point. Only a small amount of mica is tolerated.

Indian kyanite is much superior to the kyanite from other sources available in the international market. The chief characteristics for which Indian kyanite is valued are its high refractoriness (P.C.E. cones 37 to 39), and high alumina content (56 to nearly 80%), with free corundum. It calcines to a hard white mass suitable for a coarse grog, with minimum of fines. The grog obtained from the better quality Indian kyanite is volume-constant when reheated to temperatures between 1400°C and 1700°C.

It can be manufactured into large complicated shapes with a small amount (15%) of plastic clay, and with normal firing it produces products with 15 to 20% apparent porosity which gives them resistance to penetration. Indian kyanite has excellent load-resistance at high temperatures; samples tried under standard A.S.T.M. test at 2650°F with 50 lbs. per square inch showed no deformation.

Uses of Calcined Kyanite

Calcined kyanite finds wide use in metallurgical glass, ceramic, chemical and electrical industries. In America, about 50% of the total consumption of kyanite goes into metallurgical industry, about 40% into glass industry and the balance into other miscellaneous products. In metallurgical industries, it is used as lining for induction and indirect arc furnaces for melting and refining high-copper brasses and bronzes. In electrical steel furnaces and other direct arc electrical furnaces, a mullite roof gives a long life to the furnace. It is used in glass tanks and in making glass-house refractories, saggars, high-temperature kilns, kiln furniture, special refractory shapes and electric porcelain. It is also employed in oil burner ports and blocks in slag-hole blocks, and in a variety of other uses. Andalusite and dumortierite have been used in the manufacture of spark-plug insulators, many millions of which have been made with this material in the last 30 years or so. Topaz has been used with good results as a substitute for Indian kyanite in heavy-duty refractories, and as a suitable bond for low-grade kyanite.

Mullite Refractories

Mullite refractories are also successfully produced synthetically. The Corhart Refractories Co. of America has been producing electro-cast mullite-corundum for a number of years by fusing in an electric-arc resistance furnace a mixture of fireclay, bauxite and diaspore clay. The melt is cast into shapes, and the small percentage of waste material yielded in the process is crushed for use in bonded refractories. The Vitrefrax Corporation, similarly, produced synthetic mullite by fusing a mixture of

kyanite and pure alumina. The Malinite process for synthetic mullite involves partial reduction of silica in clays and other aluminous materials by smelting with coke in a cupole furnace, and a similar result has been obtained by volatilising silica from pure kaoline in an arc-furnace. In the Thermit process, the aluminium metal is heated with clay to about 930°C, near which temperature an exothermic reaction takes place raising the temperature to 1650°C. During the second world war, Germany developed a synthetic mullite in which a mixture of clay, aluminium trihydrate, fused alumina, feldspar and water was cast into small blocks, dried and then fired for about five days at 1600°C. The calcined blocks were crushed for use in refractories. In recent years there has been a very rapid increase in the production of synthetic mullite in America, the present production being estimated at about 18,000 tons.

Contribution to Export Trade

India is fortunate in possessing large resources of raw materials for the manufacture of mullite refractories. Indeed, it occupies a unique position in possessing the largest known deposits in the world of high-grade kyanite in Kharsawan and in possessing, at the same time, the only known deposits of massive sillimanite in Assam and in Rewa. But for the relatively small quantities used by Messrs. Refractory and Ceramic Works and by Messrs.

Kumardhubi Fireclay and Silica Works since 1938, the entire annual production of kyanite has been exported to foreign countries since 1924. Since 1951, however, the export has been on quota basis, the quota being fixed by the Government of India each year. Britain and the United States have been the largest importers of Indian kyanite, together taking up nearly half the total exports. Belgium is the next important consumer, followed by Germany, Japan, Sweden, Holland, France, Italy, and Canada.

Prices are fixed according to the alumina content of the consignment and have registered a steady increase, especially in recent years. For the period, 1934 to 1939, the average pit-mouth value was Rs. 19.65 per ton; for 1939-43, it was Rs. 18.83 per ton, and for 1944-46, Rs. 24.13 per ton. From 1947 onwards, Messrs. Eastern Mineral Ltd. have supplied the following price figures as received by them:

59-61% Alumina	66-70% Alumina
Price per ton f.o.b. Calcutta	Price per ton f.o.b. Calcutta
1947 £ 4 16 to £ 5 14	£ 7 to £10
1948 £ 7 5 6 to £ 8 5	£ 8 5 to £10
1949 £ 8 to £ 9 12	£10 9 to £14 9
1950 £ 9 12 to £13 11 6	£14 19 to £18 9 6
1951 £14 5	£20 to £24 14
1952 No sale of low grade	£26 15 to £30

The production figures and pits-mouth value of kyanite produced in India from 1947 to 1951 are given in the table below:

Quantity and value of kyanite produced in India during 1947-1951

the quality of **COAL** you buy

These facts are of vital interest to the industrial Coal Consumer:

- Ash in coal is waste matter.
- The ash content in coal is as follows:-

Selected A	15%
Selected B	17%
Grade I	20%
Grade II	24%
Grade IIIA	28%
Grade IIIB	35%

Coal consumers should insist on obtaining supplies most suitable to their requirements.

There is no shortage of high grade coal either in production or reserves for ordinary industrial uses.

DODGE ELEVATING AND CONVEYING EQUIPMENT

ELEVATORS

CENTRIFUGAL, CONTINUOUS, PERFECT DISCHARGE, GRAVITY DISCHARGE, GRAB TYPES, SUPER-CAPACITY, UNI-FLO, TRAY TYPE, BARREL TYPE, MARINE LEGS.

CONVEYORS

BELT, CHAIN, UNI-FLO, FLIGHT, PAN, SLAT, OVERHEAD, WIRE MESH, SHUTTLE, SPIRAL (ALL TYPES), PIVOTED BUCKET, APRON FEEDERS, STACKERS.

Belt Conveyor handling ore at a northern Ontario mine.

Heavy Duty Dodge Belt Conveyor handling ore Underground under severe dust and abrasive conditions.

Speed, efficiency and economy are essential in today's production methods and DODGE engineers have these considerations fully in mind in the designing of materials handling equipment to meet modern requirements. In mines, mills and plants of all types producing a wide variety of lines, DODGE equipment has established a sound reputation for long and faithful performance and smooth-running, trouble-free operation. No attempt can be made here to illustrate the complete line, but if you are confronted with any problem relating to the efficient handling of materials, we invite your enquiries.

HISTORY OF THE INDIAN MANGANESE ORE INDUSTRY

ITS IMPORTANCE IN THE EXPORT TRADE

• By A SPECIAL CORRESPONDENT •

IN his monumental work on manganese ore deposits in India, published in 1909, L. Leigh Fermor gave a brief but interesting account of the fluctuations of prices ruling in Europe before and after the use of this important mineral ore in metallurgical industry. He mentioned that before the start of the manufacture of ferro-manganese in Europe, a little later than the middle of the nineteenth century, manganese ore was chiefly used as a decolouriser in glass-making and for the manufacture of bleaching powder. The chief sources of supply for English glass factories and chemical works were Tavistock in Devon and Launceston in Cornwall, but some ore also came from the Harz in Germany and Piedmont in Italy. Prices were high. Later the discovery of manganese ore deposits in Germany caused the English mines to close. After the cessation of mining in Britain, prices rose steeply. The discovery of extensive deposits in Spain brought down the price and all but three of the British and German mines were closed. The Spanish ores, being pockety, were exhausted in time, whilst there was a reduced supply from Germany. At about this time the demand for manganese for steel-making began to grow. As the mines then working could not meet the increased demand, the search for deposits of manganese ore was extended all over the world and the price rose once again. In course of time new deposits were found and new economies introduced.

The quest for manganese ore in distant lands, to meet the increasing requirements of the steel industry in Europe as well as in America, helped Russia to advance the rate of production from 182,467 tons in 1890 to 802,234 tons in 1900. During the same period Spain increased her production from 9,572 tons to 112,897 tons. Turkey started mining in 1893 and increased her production to 48,689 tons a year by 1899. Brazil started production a year later and was raising 108,244 tons per annum by 1900. France also increased production but most of the resources in Western Europe were exhausted by the time India began exporting manganese ore in small quantities in 1892. Russia and Turkey still dominated the world market at the time; America obtained some of her supplies from Chile and Cuba, but production there was somewhat erratic.

The First Indian Exports

India's manganese ore industry was born almost by chance. Although manganese deposits had been known for over half a century and although in the ancient days manganese had been used as an agent to decolourise glass and to stiffen iron, no one thought of it as a commercial possibility till a Collector of Vizagapatam district in Madras saw some railway contractors using high-grade ore as ballast in 1891 and formed a syndicate to raise and market the ore. As a result of his efforts a small quantity (695 tons) was exported in 1892. The industry developed rapidly after 1895 when the ex-civil servant and his friends converted their syndicate into the Vizianagaram Mining Co. Ltd., and started working one of the two most interesting deposits in India—Kodur and Garbham. Subsequently two geologists from the same company visited the Central Provinces and discovered fresh areas. Almost simultaneously with these discoveries an extensive ore-bearing area in the Sandur Hills (Bellary district) of Madras was discovered by a different team of geologists. Further rich concentrations were also found in the districts of Nagpur, Chhindwara, Bhandara and Balaghat in the Central Provinces, Jabua State in Central India; and in the Panchmahal district of Bombay. Deposits were also located in the Tumkur, Shimoga and Chitradurga districts of Mysore, as well as in the Singhbhum district of Bihar.

The progress of mining during the short period from 1892 to 1907 was astonishing. In Vizagapatam district alone 843,025 tons were raised between 1892 and 1906. Between 1901 and 1906, Balaghat, Bhandara, Chhindwara and Nagpur districts produced a total quantity of 901,072 tons. The output of the Central Indian mines between 1903 and 1905 was 98,688 tons. Production in Mysore amounted to 46,312 tons.

By 1906, India had raised as much as 1,898,257 tons of ore, an output second only to Russia's. During this period there were two slumps in prices extending over five years at a stretch each time but the progress of mining was not arrested. There was a vigorous search for new deposits around 1916 when the inaccessible and most difficult forest regions in the interior of Orissa were invaded by enterprising prospectors and investors. About this time, the geologists employed by some of the associates of Bird & Co. and the Tata Iron & Steel Co. Ltd., discovered extensive manganese ore deposits in Keonjhar State (Orissa). The discoveries were made simultaneously by the employees of the two companies and by 1918 the former obtained a prospecting licence for manganese and iron ore over an area of 93 square miles and the latter applied for an area of 137 square miles. After intensive investigations leases were obtained over much smaller areas. Development was delayed by the lack of railway facilities till 1924 when the newly laid railway between

1919-23 and 953,039 tons in the following quinquennium, 1924-28.

Liquidation and Closure

The remarkable increase in production during the five years ended 1928 was because of the unprecedented expansion of the world's iron and steel industry. Unfortunately for Indian producers there was also a corresponding increase in the output of ore in other countries, surpassing the requirements of the market, and a drastic fall in the price ensued. The slump hit the metallurgical industry as a whole and the effect was disastrous for India. A great number of mines were closed down and some well known companies went into liquidation. The average total output of ore for the whole of India dropped to 559,596 tons during the period 1929-33. The statistics in terms of tonnages cannot explain the effect of the rapid fall in demand. Almost all the surviving mines had to struggle hard to keep going. Even the Central Provinces Manganese Ore Company Ltd., one of

Unloading shipments of Indian manganese ore in Baltimore, U.S.A. The arrows indicate the electric crane at the end of the pier, a transfer station and the storage hopper. A rubber conveyor belt, one-third of a mile long, connects these three installations.

the best organised producing concerns in India, had to suspend operations for four years. The price of manganese ore c.i.f. U.K. ports fell from 22.9d per unit in 1924 to 17d in 1928, 14d in 1929, 9.5d in 1933, and 9d in 1934. This was accompanied by an increase in wages, railway freights etc. During the five years ended 1933 the average sea freight from Calcutta and Bombay to U.K. ports fell from 19s 2d in 1929 to 14s 3d per ton in 1933. The average price f.o.b. Indian ports dropped from 8.8d in 1929 to 5.24d in 1932.

Exports Through Vizagapatam

During this period of five years, iron and steel companies in India consumed 204,157 tons of manganese ore, of which 21,715 tons represented stocks carried over. In other words, out of a total quantity of 558,596 tons produced in the country only 182,442 tons were consumed locally and the rest was disposed of at a price slightly above cost in the case of high-grade, and at a loss in the case of low-grade ore. The new port of Vizagapatam, opened during this period, reduced the lead from the Central Provinces to the sea and thereby enabled a certain amount of second-grade ore to be exported, but this did not materially improve the situation. The only country unaffected by this period of depression was Russia. Having usurped the concession held by W. A. Harriman & Co. of New York over Georgian manganese ore, Soviet Russia increased her output by large-scale improvements in transport facilities and mining methods in order to fulfil successive five year plans. Some of the ore, produced by an economy which ignored considerations of cost, ousted Indian ore from the market, although it was well established that Indian manganese ore, particularly from the Central Provinces, on account of its hard lump form was more suitable for blast furnaces than the softer and more friable ores of the Caucasus.

Recovery Begins

The worst of the depression in 1933 passed quickly and the manganese industry showed definite signs of recovery from 1934. Prices f.o.b. Indian ports moved up slowly from Rs. 10.12 per ton for 32 percent and Rs. 21.8 per ton for 43 percent grade in 1934 to Rs. 15 and Rs. 30 per ton respectively in 1940. India's annual production of manganese ore during the two quinquennia 1934-38 and 1939-46 is shown below to illustrate the sharpness of recovery, and the subsequent decline.

1934	4,06,306 tons
1935	6,41,483 "
1936	8,13,442 "
1937	10,51,594 "
1938	9,67,929 "
1939	9,44,663 "
1940	8,68,918 "
1941	7,85,541 "
1942	7,57,269 "
1943	5,95,366 "
1944	3,79,980 "
1945	2,10,583 "
1946	2,52,916 "

The drastic fall in production after 1943, in spite of the increasing consumption of India's own steel works, shows a deplorable state of affairs, particularly in comparison with competing countries. Apart from Soviet Russia and Czechoslovakia, India had to contend with competition from the Gold Coast, South Africa, Brazil, Egypt and Cuba. All these sources of supply for the world market, except Egypt (whose production suddenly declined in 1941), maintained or improved transport facilities in order to get the raw material to the consumers. Prices began to rise sharply, but India was unable to take advantage of this mainly because of the shortage of railway wagons and of petrol to carry ore from mines to railheads. Some mine-owners in Orissa were also prevented from developing their properties by the State Government, which had taken over the former princely states. Furthermore, considerable misgiving was caused early in 1948 by the Central Government imposing a duty of Rs. 20 per ton on all grades of ore exported from India. There was a countrywide protest, particularly from producers of cheap, low-grade ore and the Government was persuaded to fix the duty on an ad valorem basis.

Middlemen Adventurers

About this time rising prices, as illustrated below, brought into the field scores of middlemen adventurers who did not know anything about how to mine or market the ore but had money to spare. Some of them managed to obtain plots of

land at Calcutta Port and were thus entitled to a proportionate share in the supply of wagons. Others hired plots from those of the parties who merely traded in the plots and earned a profit as absentee landlords. Consequently the large mine-owners who had many years of established connections with the consumers and had survived repeated periods of depression were now more seriously handicapped than ever by the shortage of wagons.

Prices f. o. b. Indian Ports

	48%	38%
1933	Rs. 25	Rs. 14
1937	Rs. 35	Rs. 20
1942	Rs. 40	Rs. 23
1947	Rs. 65	Rs. 25
1952	Rs. 170	Rs. 110

This phenomenal increase in prices in the last two or three years attracted speculators from other fields of activity, particularly jute and hessian, who bought over the interests of small mineowners by advancing money and shipped the ore as expeditiously as possible without arranging for proper dressing and grading. Some of the reject dumps of the old mining concerns in liquidation offered an additional source of supply. By washing and hand-jigging of the spoil dumps a fairly large quantity of saleable ore was recovered and blended with freshly mined ore. This was all to the good as far as additional foreign currency was coming into the country but the profits earned were not put back into the industry. In addition serious complaints were received by the Ministry of Commerce from various Trade Commissioners to the effect that foreign buyers were being let down as the quality of ore supplied by certain shippers was not up to specifications and the reputation of Indian ore was being jeopardised. The Ministry sought the help of the Indian Standards Institute. A committee of experts was set up and after several meetings the following grades were declared as standard. Methods of sampling and analysis were also clearly defined.

METALLURGICAL GRADE.

Region	Grade	Chemical Analysis.			
		Manganese as Mn%	Iron as Fe%	Silica as SiO ₂	Phosphorus as P%
Madhya Pradesh	Dameri Buzurg	51 Min.	5.0 Max.	5.0	0.3
	First	45 to less than 48	7.5	9.0	0.5
	Second	40 to less than 45	9.0	11.0	0.15 to 0.30
Orissa and Smt. Orissa	First	48 Min.	4 to 8	3 to 8	0.15 to 0.20
	Second	45 to less than 48	8 to 12	5 to 9	0.15 to 0.20
	Third	38 to 40	11 to 19	5 to 13	0.15 to 0.20
Saurashtra	First	30 to 35	19 to 25	5 to 13	0.15 to 0.20
	Second	35 to 42	16 max.	2 max.	0.02 to 0.05
	Third	48 min.	5 max.	6 max.	0.24 max.
Gujarat	First	46 to less than 49	5 to 6	6 to 10	0.24 to 0.26
	Second	46 to less than 49	5 to 6	6 to 10	0.24 to 0.26
	Third	Below 46	6 to 7	10 to 11	0.25 to 0.27

BATTERY GRADE.

Region	Grade	Chemical Analysis.			
		Manganese as Mn%	Silicon Dioxide	Iron	
Madhya Pradesh	Dameri Buzurg	88 to 89	1.5	Max. 1.0	Max.
	Low Ferruginous	85 to 86	3.0	..	..
	Standard Peroxide	84	Min. 3.0	..	..
Keshwar & Bani-Orissa	1st	90	Min. 0.7 to 1.0	0.30 to 0.75	
	2nd	88	Min. 0.7 to 1.0	0.75 to 1.03	
	3rd	87	Min. 1.0	Max. 1.00	Max.
4th	84	Min.	2.50	..	..

Only those of the large mine-owners who are equipped with laboratories, the National Metallurgical Institute and the Geological Survey of India have investigated the possibilities of beneficiating low-grade manganese ore. The ores from Orissa, where different grades occur more or less in the same area, sometimes in the same deposit, were found suitable for experiments and one of the largest mine-owners operating in the area tried out various processes to improve quality by beneficiation. They found that by heating the ground ore to 1,200°C and subjecting the product to magnetic separation, its manganese content could be improved by 5 to 10 percent, due partly to the removal of its water content and partly to the reduction of manganese dioxide to a lower oxide. This, however, rendered the material useless for sale as dioxide because at the temperature to which the material has to be heated the dioxide is converted into either sesqui-oxide or monoxide. The main problem still to be investigated is whether there is a sufficient supply of low quality ore of a uniform grade in any particular area to warrant the cost of powdering, incineration, magnetic separation and finally sintering into sufficiently large lumps to be useable in a blast furnace and

if the resultant product can be economically marketed. An additional problem is whether there would remain a local market for the product if the foreign market disappears. There is a great demand for the higher grades of manganese dioxide with low impurities. Few companies, however, are in a position to process such ore and it is generally used for blending and improving the manganese content of low-grade metallurgical ore.

Prevention of Wastage

It is hoped that the expansion of the Indian Bureau of Mines and greater control from the Centre will prevent wastage of such ore by unscientific working. The Government has realised the urgency of the question and has moved expeditiously in taking over increased control but what is necessary is removal of duplication of control exercised by the State Government and the Central Government, resulting in multiplicity of policies and duplication of taxation as well as unnecessary harassment in duplicating returns. State Governments do not have the personnel capable of handling the problems confronting the mining industry and therefore it is most essential that the authority should be vested with the Central Government and that a co-ordinating agency should be set up, with members nominated by the trade, to give expert advice. This agency should be empowered to deal with all mining matters and to advise the Indian Bureau of Mines as well as the Customs authorities in different Indian ports, as the latter's methods of assessing duty on ore shipments have been far from satisfactory.

The experience gained by the Central Government between 1948 (when the duty was levied on the export of manganese ore) and 1952 (when the maximum value was obtained for the ore) resulted in the easing of various restrictions previously contemplated. It is hoped that there will be increasing co-operation between the Government and the trade. India's output and exports of manganese ore as shown below will illustrate its importance to the Government Exchequer. Production from 252,916 in 1946 rose to 451,034 in 1947, 525, 876 tons in 1948, 645,825 tons in 1949, 882,929 tons in 1950 and 1,233,939 tons in 1951. The value of the ore exported to various countries (in order of importance—the U.S.A., Japan, the U.K., Western Germany, etc.) during 1951-52 was Rs. 15,81,10,417. This amount undoubtedly provided the Exchequer with a very handsome return in taxation and duty at a time when the country was sorely in need of funds for development schemes.

Domestic consumption of ore, which amounts to about 15 percent of the total output, also steadily increased, having been 69,325 tons in 1950, 88,807 tons in 1951 and 1,07,533 tons in 1952. Exports through various ports during 1951-52 were: Bombay 367,596 tons; Calcutta 165,448 tons; Vizagapatam 610,312 tons; and Mormugao 56,465 tons (exporter is the Central Provinces Manganese Ore Co., whose output amounted to nearly 30 percent of the total in 1951. The figures given above indicate the importance of the manganese ore industry and emphasise the fact that it deserves very careful handling by all concerned.

Magnesite

Mineral magnesite is a carbonate of magnesium. There are two varieties of natural magnesite. One is amorphous, compact and often snow-white. The other is crystalline, and sometimes a little reddish due to the presence of iron as an impurity. Magnesite deposits are known in India in the States of Bihar, Kashmir, Madras, Mysore, Rajasthan and Uttar Pradesh. The deposits in Ajmer-Merwara are not of economic value. The same they occur only seven miles from a large industrial centre, Jamshedpur. The average annual production at Dodkanya in Mysore is about 3,000 tons. The reserves in the Almora District of Uttar Pradesh appear to be large and of India. By far the largest and the best magnesite deposits in India occur in the Salem District of Madras. The total potential reserves of Indian magnesite are estimated to be of the order of At present about 55,000 tons of magnesite are produced annually in India of which about 10,000 tons are utilised locally in refractory and other industries.

MICA AS A DOLLAR EARNER

INDIA THE CHIEF EXPORTER, USA THE CHIEF IMPORTER

MICA is one of the chief dollar earners for India and 60 percent of the world's supply is met from Indian sources. The two important industrial micas are (1) muscovite (potassium aluminium silicate) and (2) phlogopite (magnesium aluminium silicate). Most of the world's production consists of muscovite, but phlogopite is more resistant to heat and is preferred for certain purposes.

World production of mica is divided into two main categories: (1) Waste and scrap mica, which comprises the greater part of the total quantity produced in the world and (2) sheet mica which comprises blocks, films and splittings. These two classes of mica differ widely in the forms in which they are marketed as well as in their use. Waste mica is always ground and used in composites, roofing paper, paints and rubber products. These paratively large tonnages in the manufacture of such mica account for approximately 75 percent of the consumption of such mica, the remaining 25 percent being accounted for in oil-well drilling mud, house insulation, axle greases and oil products, pipe-line enamel and others. In contrast to the bulk tonnage distribution and use of ground mica, sheet mica is marketed in smaller quantities and is costlier. It is used predominantly in the manufacture of electrical and electronic equipment.

The trimmed mica, commonly known as uncut or unmanufactured sheet mica, is further processed into punch mica, circle mica, blocks, films or splittings. Punch and circle mica are terms employed in the U.S.A. and refer to thumb-trimmed pieces not larger than 2 in. in diameter from which circular discs of 1 1/2 to 2 in. diameter may be punched. Block mica consists of sheets ranging in thickness

from 0.007 to 0.040 in. with a minimum usable area of 1 1/2 by 2 in. Film mica is the best-quality trimmed sheet mica split to thickness ranging from 0.00125 to 0.007 in. Splittings are mica sheet which do not exceed 0.0012 in. in thickness.

Grading

Unmanufactured sheet mica is marketed by grades. Although no international standards have been established, most countries follow the Indian standards of grading. The United States mica industry has developed its own standards for domestically produced mica, but follows the American system for imported muscovite. The American Society for Testing Materials has prepared a quality classification for muscovite block mica and film that reflects the visual quality designations used in the trade. For muscovite block mica the classification covers 10 quality classes which range from "clear" to "black stained" mica. Muscovite film is classified under three quality designations.

For muscovite and phlogopite splittings the National Electrical Manufacturers' Association (NEMA), U.S.A., has approved a list of standards and specifications. For muscovite splittings this classification provides seven grades based on form, size and quality; for phlogopite splittings it provides four grades.

Block mica and film mica (derived from high-grade block) are essential in the manufacture of many items, among which are electrical commutators, armatures, radio tubes, radio condensers, and radar tubes. Other items in which these types of mica are essential, though less important in terms of the quantity used, are mica diaphragms for oxygen-breathing apparatus, gage-glass gaskets

for high-temperature boiler gases, marker dials for navigation compasses, and quarter-wave plates for optical instruments. The higher quality blocks and films are generally required for the uses just described.

Mica is also used as a component, but not an indispensable part, of many other articles, such as electric flat-irons, toasters, water heaters and other electrical appliances and equipment. A large part of the mica thus used is lower quality block, punch and circle mica.

Mica splittings are used almost entirely in making built-up mica board or "micanite." This board, a combination of alternate layers of insulating cement (shellac or alkyd resin) and irregularly arranged and shaped mica splittings, may be of any thickness desired, the usual maximum being 0.03 to 0.04 in. After heating, pressing and trimming, this built-up board constitutes a raw material from which numerous shapes used for electrical insulation are stamped or cut. Mica board is the most important insulating medium in the electrical industry, except for certain film mica used as condenser shapes. Electric motors, generators and transformers either could not operate or could operate only with greatly reduced efficiency without suitable splittings for the manufacture of accurately sized built-up mica. The consumption of mica splittings in the form of built-up mica is larger than the aggregate consumption of all other unmanufactured mica, except scrap.

Substitutes and Conservation

A number of materials have been developed to replace sheet mica in certain specific fields, but no acceptable substitutes have been developed for most

For MINING DIAL, SUSPENSION THEODOLITE, HANGING MINERS' COMPASS AND CLINOMETER

of its principal uses. The more prominent materials developed to replace built-up mica are (1) glass melamine, a glass and ground-mica compound; (2) teflon, a plastic; and (3) glass cloth. A number of other materials, such as glass, paper, ceramics and plastics, are being used instead of sheet mica and plastics, are being used instead of sheet mica for some purposes. These materials will probably become more important if the supply of mica becomes increasingly inadequate and if its price increases materially, but it is unlikely that any of these materials will replace mica in the essential uses discussed above.

It is possible that synthetic mica might become an adequate substitute for natural mica, but work on the production of the synthetic material is still in the research stage and there are no indications when, or whether, commercial manufacture will be possible. Research on synthetic mica is currently being carried on by the National Bureau of Standards, the United States Bureau of Mines and the Colorado School of Mines. Considerable progress has been reported, but it appears that there are a number of difficulties still to be overcome before commercial production is feasible.

Many consumers in the U.S.A. today are specifying lower quality mica than they specified before World War II. As the lower quality mica has always been more plentiful than the higher quality, this change represents an important step in the conservation of mica.

World Production

Between two-thirds and three-fourths of the total world production of mica consists of waste and scrap mica. The production of sheet mica is estimated to have averaged about 22 million pounds a year during 1937-39. Output increased substantially during the early part of World War II, amounting to an estimated 34 million pounds in 1943. It subsequently declined and during 1944-47 was at about the 1937-39 rate. Since 1948, output has again increased; in 1949 it is believed to have amounted to about 32 million pounds.

Mica is produced in many countries, but sheet mica is produced in significant quantities in only a few of them. India, which has always been the world's foremost source of sheet mica, usually accounts for more than 60 percent of total world supply on the basis of quantity and for an even larger percentage of the better qualities. Other principal producing countries, in the order of importance, are Brazil, Madagascar, Canada, the United States and Tanganyika Territory. India and other countries named account for over 90 percent of total world production of sheet mica.

The United States is the world's largest consumer of sheet mica, but generally produces only 10 percent of its requirements. It imports well over half of its supplies of block mica and virtually all of its supplies of splittings.

The estimated consumption in the U.S.A. averaged about 5.6 million pounds a year during 1937-39; it increased sharply during the war and in 1943 amounted to over 25.5 million pounds. Post-war consumption in most years has been more than twice the pre-war average, averaging about 12.1 million pounds a year in the period 1946-49; consumption in 1950 and 1951 is estimated at about 15.5 and 17.0 million pounds respectively.

In the period 1937-39 aggregate annual imports of unmanufactured sheet mica into the U.S.A. averaged about 4.9 million pounds, valued at 1.1 million dollars. Imports increased sharply during the war in response to the strong demand for high quality sheet mica in all forms and in 1943 reached the high level of about 22 million pounds, valued at 14.6 million dollars. Post-war imports have been in greatly above the level of pre-war years and in 1950 exceeded even the war-time peak, amounting to over 27 million pounds, valued at 23 million dollars.

By far the larger part of the mica imported into the U.S.A. consists of films and splittings. In recent years 88 percent of total imports, both in quantity and in value, consisted of sheet mica of these forms. During 1937-39, annual imports of films and splittings averaged about 4.2 million pounds, valued at \$900,000; in 1943 they rose close to 17 million pounds, valued at 8.3 million dollars. After a decline during subsequent years imports have again increased sharply in recent years, amounting in 1950 to about 24.2 million pounds, valued at 19.9 million dollars. Splittings (not above 12/10,000 in. in thickness), which constitute the bulk of U.S. consumption of sheet mica, are the most important class of mica imported on the basis of quantity and value, ordinarily accounting for over 80 percent of total imports of all sheet mica. Imports of block mica ordinarily account for less than 15 percent of total imports of mica. During 1950, 3.2 million pounds were imported, valued at over 3 million dollars.

India Leads Exporters

India, the world's leading producer of high-grade mica, has supplied the major portion of the United States imports of sheet mica. On the basis

of quantity, India ordinarily accounts for over 80 percent of total imports. Before World War II Madagascar ranked a distant second in importance, but since 1941 Brazil has been the second largest source. Other important supplying countries are Argentina and Canada. Mica from India, Brazil and Argentina is of the muscovite variety, whereas that from Madagascar and Canada consists predominantly of phlogopite.

India has been almost the sole source of mica splittings; before the war, India also supplied nearly all the United States imports of mica film. On the other hand, the proportion of higher priced block mica supplied by India declined from an average of 57 percent in 1937-39 to 13 percent in 1948, and it was 34 percent in 1950. The decline in the relative importance of India as a source of mica film and higher priced block mica is due to greatly increased shipments from other countries, chiefly from Brazil and Argentina. However, the imports of mica film and block mica from India are somewhat higher in average quality than those from Brazil and much higher than those from Argentina. Brazil supplied an average of about one-half of the mica films and higher priced block mica imported during 1948-50, but its share in the imports of lower priced block mica has declined notably in recent years. Argentina has become the major source of lower priced block mica and also a regular supplier of fairly substantial amounts of higher priced block mica.

India accounts for three-fourths of the total quantity of sheet mica entering world trade. Exports of sheet mica from India have generally been equivalent to production, as relatively little of the output is consumed within the country. They reached their highest volume in 1937, amounting to about 33.3 million pounds. During the war, exports reached 41 million pounds in 1942, but declined thereafter. Since 1945 they have shown a strong upward trend and in 1950 amounted to 27.8 million pounds.

Indian sheet mica exports consist predominantly of splittings. Before the war splittings accounted for 80 to 85 percent of total exports, but in recent years the ratio has been above 90 percent, and it was 94 percent in 1950. The decline in exports of block mica is probably due in part to the increasing importance of Brazil as a source of high-grade block mica. However, it is doubtful whether any other country can become an important source of mica splittings, or surpass India as a source of high-grade block mica.

The United States is by far the most important market for Indian splittings, having taken on the average about 60 percent of total exports in recent years. Indian block mica has been shipped chiefly to the United Kingdom and the United States, the two countries often taking three-fourths or more of the total exports of block.

Brazil has become the second largest source of sheet mica entering world trade. The production amounted to 3 million pounds in 1949. In recent years an increasing proportion of the mica produced in Brazil has been consumed at home. Exports of Brazilian block mica compare favourably in quality with the Indian product.

Madagascar occupies the same commanding position as a supplier of phlogopite mica that India holds as a supplier of muscovite, although production in Madagascar is small compared with that in India. Madagascar has extensive deposits of both phlogopite and muscovite, but current production is confined almost exclusively to phlogopite. The output of phlogopite splittings in 1951 was about 2 million pounds. Canada produced 287,000 lb. of phlogopite mica—mostly sheet—in 1950. Argentina produces muscovite sheet and is not an im-

portant source of high-grade material. The output is estimated to be 600,000 lb. annually.

Deposits of muscovite of good commercial quality are widely distributed throughout Tanganyika Territory. The production of block mica averages 144,000 lb. a year. Small shipments from this area were made to the U.S.A., and it is expected that a substantial part of Tanganyika's production in future may be exported to the U.S.A.

Rutile

This is a natural oxide of titanium and is thus far richer in titanium (60% TiO₂) than ilmenite, and more suitable for the preparation of titanium dioxide paints than ilmenite. It nowadays finds a special use in electric welding. It occurs in considerable quantities in ilmenite-monzonite sands of the Travancore coast from which it is recovered in the zircon fraction. After magnetic separation the zircon is said to contain about 12 percent of rutile. It is also known to be plentiful in the kyanite rocks of Lapsa Buru, Singbhum, but its separation is difficult. Output in 1950 was 36 tons valued at Rs. 6,987. The whole of the output is exported abroad, mostly to the U.S.A. and U.K.

Bentonite

Bentonite is a variety of clay which consists mainly of a hydrated magnesium alumina silicate. It is used in foundry sands, in soap-making, in ceramics, for thickening mud in oil-well drilling, for filtering and decolorising oils, for roofing, etc. The U.S.A. is the largest producer of bentonite. In India, it is available mostly from Jodhpur and Kashmir in small quantities.

Corundum

Corundum powder is used as an abrasive either in the loose form or bonded into grinding wheels. In India corundum deposits are known in Khasi hills in Assam, Rewa, the South Kanara and Salem districts of Madras, Mysore and Kashmir. Supplies are obtained chiefly from the Salem district of Madras, Rewa and Mysore. Output is now largely exported abroad. Corundum is a natural abrasive, but in recent years artificial products have been replacing the natural abrasives. However, the raw materials being readily available, there are possibilities of developing this industry, should cheap electrical power be obtained in the near future.

CONTROLS HAMPER EFFORTS TO MARKET INDIAN COAL

(Continued from page 6)

Unfortunately, contrary to the original intention, both foodgrain concessions and bonus (now paid quarterly although it was intended to have been an annual bonus) are based merely on attendance and have no relation to actual production. A worker merely requires to put in an appearance at his work in order to qualify for cheap food and for his bonus payment. There is no condition as to the amount of work he does, and the net result has been a lowering of productive efficiency and more pay for less work. The issue of free and cheap foodgrains—a rationing responsibility which employers contend should properly be that of the State and not of the individual employer—is in itself the greatest single burden which the industry has to bear. It has been calculated that at the present time it is costing the industry between six and seven lakhs of rupees per week to subsidise these food issues. The ultimate solution is that the industry should be freed from this responsibility for feeding its labour force. As a half-way step towards that end it should be assured of foodgrain supplies at fixed and reasonable prices. In the meantime, there should be a direct link between foodgrain issues and production rather than mere attendance.

The distribution of coal from the collieries to the actual consumers is also strictly controlled. Not only does the Government prescribe the grades which may be utilised by particular consumers but, before any consumer can actually obtain his requirements, he must first establish his need and obtain a quota; even so, before he can get coal against his quota, the supplying colliery must obtain a sanction for despatching it to him. Having regard to the many thousands of consumers and the massive production of coal which is involved, the laborious toil, trouble and harassment involved in operating so strict a control as this hardly needs further emphasis. Undoubtedly, the control served an invaluable purpose in its earlier days when, during the war years, there was an acute physical scarcity of coal and of transport for its distribution, coupled with an overriding need to ensure that important war industries received priority of supply. Today, those circumstances have passed; there is an abundance of coal of all qualities and grades and indeed an everpresent fear of excess production. The only limiting factor is the inadequacy of the transport system and that, in the industry's opinion, can best be dealt with by the transport authorities themselves. The distribution control, however, with all the complicated administrative machinery which it involves, remains. But it is now an anachronism, which on the one hand has stultified the efforts of colliery owners to run their industry efficiently and on the other is preventing important industrial consumers from obtaining coal in the quantities and qualities best suited to their individual needs.

Distribution control extends also to the export trade and the Government prescribes minutely the percentages of the various grades which must constitute each export shipment. Mention has already been made of the difficulties which India is likely to encounter in retaining her export markets and of the need to allow Indian shippers to use their expert knowledge of the trade and to supply coal of the types and qualities which their

customers require. In so far as distribution control hampers exporters in their efforts to this end, it undoubtedly seriously prejudices India's export capabilities.

The foregoing paragraphs deal, in wide and general terms, with only a few of the more important features of the Indian coal industry's current situation. Nothing has been said of the place which coal mining finds in India's five year plan and of the aims which the Government has set before itself for the opening up of outlying coalfields and for planned development and utilisation of the national coal resources. The most significant feature of those plans has been the Government's decision to implement a scheme for the conservation of metallurgical coal and its action in pursuance of that object, in limiting the output of metallurgical coal, encouraging stowing for conservation and investigating the possibility of erecting washeries for the beneficiation of Indian coals. Whatever may be the rights and wrongs of the controversial conservation issue, one thing is clear: the development of the coal industry on the lines envisaged by the Government—the planned opening up of new fields, the mechanisation of mines, an increased resort to stowing, the erection of washeries and, combined with all of these things, the achievement of higher living standards and improved terms of service for the coal mines' labour force—will involve huge capital expenditure and investment which, under present conditions, is beyond the resources of the industry itself. The Government's plans are directed towards improving the efficiency and the standards of the industry. Even, the maintenance of its existing capabilities, however, is a task which, in the context of the many difficulties already described, presents the industry with very great problems.

Coal is a wasting asset; once a mine has been opened up its life is limited by the physical existence of the coal which it is designed to extract. A colliery's assets therefore steadily and continuously diminish, and unless provision is made to build reserves during the colliery's life which will in due course enable fresh development work to be undertaken and new workings to commence elsewhere, the company's original capital investment will have completely disappeared by the time the colliery is worked out. The coal industry's present economic circumstances do not permit of a reasonable day-to-day return, far less a rate of earning which would enable capital to be maintained intact and provision to be made for the future. Coal mining, with all its attendant hazards, is essentially a risky venture and, to attract fresh capital, the return which it gets must be appreciably higher than in most other businesses where the risks and dangers are not so great. The prospect of the industry's future development being financed by the attraction of new capital is, under the present circumstances, remote: it is equally difficult to see large amounts of finance being found from the industry's own resources. These circumstances and the relatively unpromising prospect to which they give rise, call for a very thorough and urgent review of the conditions under which the industry is working and of the policies which the Government is pursuing with regard to it.

BAUXITE MINING AND ALUMINIUM PRODUCTION

(Continued from page 37)

its ingot is sold in distant markets with consequent freight charges.

The expansion currently being undertaken by both the Company and the Corporation will remedy to some extent the disadvantages resulting from the establishment of the industry during war-time. Further expansion of smelter capacity based on power from the Damodar Valley or Hirakud projects at favourable rates would place the industry on a sound economic foundation. It should then be in a position to dispense to some extent with the need for tariff protection it has so far enjoyed.

The industry recognises that development cannot be based entirely on the expansion of production facilities. If production is to be increased from the present level of 4,000 tons to 20,000 tons per annum, markets will have to be developed. The principal consumer of aluminium has been the utensil and hollow-ware industry; aluminium has so far made little headway in the industrial markets, except for its use in electrical transmission lines. Emphasis is, therefore, needed on the promotion of the use of aluminium in the electrical, transportation, agriculture, building and packaging industries.

As the country's installed electric power capacity expands and the country-side is electrified, all-aluminium cables and aluminium steel-reinforced cables will be needed for overhead transmission lines. In view of the limited production of copper in India, it would appear that aluminium can obtain practically the whole of the overhead transmission line field within a short time. It has been demonstrated in the U.K. that aluminium can be used satisfactorily as a conductor (replacing copper), as a sheathing material (replacing lead), and for armour wire (replacing galvanised steel), in the manufacture of cables.

In transportation, agriculture and building industries, aluminium has a market where its special properties, namely, light weight combined with strength and resistance to corrosion are sufficiently significant to overcome the initial adverse price differential. In aircraft manufacture, in railway coaches and bus bodies, road tankers for gasoline transportation, grain storage bins, milk cans, door and window frames, railings and grills, roofing material, pipes and low cost or mobile housing and structures, aluminium can be used to advantage. With growing production facilities, equipped to serve a variety of consumer needs, the industry can face the future with confidence.

Asia's Mineral Resources

ECAFE estimates that the known coal reserves of Asia and the Far East total some 557,000 million tons, of which 445,000 million tons are in China, 68,000 million tons in India, and 20,000 million tons each in Indo-China and Japan. Of the total known iron ore reserves of the region, estimated to be almost 11,000 million tons, over 78% are in India and China (5,387 and 4,168 million tons respectively), with the Philippines (1,019) and Indonesia (899) being next in importance. Japan ranks as a rather poor fifth with some 170,000 million tons.

The Commission has commented on the inadequacy of mineral resource surveys. In India, for instance, 300,000 square miles of the accessible parts of the country remain to be geologically mapped on the one inch to one mile scale, the smallest scale with practical use. In China, it has been estimated that with the present strength of technicians, it would take at least fifteen years to complete a geological survey of the country on a scale of 1:200,000. In Indonesia, only 8 percent of Java has been geologically surveyed on a scale of 1:100,000 and 8 percent of Sumatra on a scale of 1:200,000. In the Federation of Malaya, geological maps on a scale of one inch to one mile are available only for 3.5 percent of the whole country. Only 5 percent of Korea and less than 10 percent of the Philippines have been surveyed on a scale of 1:50,000. In Thailand, though a general geological map on a scale of 1:2,500,000 is now available, no detailed surveys have so far been made.

U.N. staff members, who have been working with governmental and non-governmental experts from Asian countries for the past two years express the view that although the development of coal and iron ore resources has made considerable advance in recent years, there cannot be economic planning for industrial development so long as the mineral wealth of the various countries is inadequately surveyed. They point out that the pace of development should be increased by better and fuller use of the known resources but point out that mineral resources are completely inadequate.

SYNTRON

SOLVES YOUR VARIOUS MINING PROBLEMS

For feeding heavy tonnages of coal, rock, etc.

Vibrators for hoppers, bins and chutes.

To compact a fine powder or keep a stream of quarried stone flowing freely—call in Syntrol. This wide range of electrically-operated vibrators, feeders and packers meets the needs of every kind of industry. There are vibrators for feather-light duty or hard-labour tasks, feeders varying in capacity from 2 to 500 tons per hour—and packers dealing with 5 or 500 lbs according to their platform size.

Having no mechanical moving parts, all Syntrol equipment can claim an exceptionally low maintenance cost.

Controlled feeding to processing plant of every kind.

For compacting materials in drums, shaking moulds or joggling paper.

the building of a NEW ERA

India's Five Year Plan is a blueprint of future national prosperity. Its implementation demands the solid and material output of a myriad of industries. Foremost among these are, of course, the "Heavy Industries"—the producers of iron and steel.

The BIRD/HEILGERS group of operations have, in the past, supplied iron ore, coal, limestone and the many kindred minerals required for steel production.

We now look forward with confidence to a continued era of service to the nation in the years which lie ahead, when the blueprint will become a reality; and today's dream will be rendered into true, solid and sound national prosperity.
