The year 1952 was one of disillusionment and disappointment to lead/zinc producers. Scarcely had the exhortations of both US and UK governments to increase production become less intense than high prices and restrictions of use began to affect consumption. Current production was already in excess of current requirements at the time when the UK government decided to return these metals to private trading. This step presented a number of difficult problems particularly as it involved the question of government stock disposal. Unhappily it would seem that the measures to solve these problems were not as well contrived as they might have been. The price of lead, which in the UK was £131 on September 30, 1952, fell rapidly on the open market until it reached £73 5s. on April 23, 1953. In the case of zinc a similar picture can be shown; the price on December 31, prior to the opening of the market, was £110, and a low of £63 15s. was reached by April 23, 1953. The resultant losses have been shared by producers throughout the world and must have totalled many millions of pounds.

A SPLENDID ORGANISATION

Our position has changed with much rapidity from one of great prosperity as a result of very high metal prices, to one where profits are greatly reduced and, indeed, can only be achieved with the utmost energy and efficiency on the part of all. None of you, I know, will accuse us of having been lavish in our distribution of dividends during our four years of existence, but equally do I believe we have had your full approval to the retention in the business of comparatively large sums of money; these I can assure you have been—and will be—fully required, especially in view of the difficult times which appear to lie ahead.

I do not wish to conclude this statement on too gloomy a note, so let me add one word of a happier nature—we have built up a splendid organisation both in the United Kingdom and in Australia, our properties are in first-class order and every opportunity is being taken both in exploration for minerals and in the development of new processes which we consider will be of benefit to your company

PRESSED STEEL COMPANY, LIMITED

INCREASED SALES, PROFIT AND TAXATION

BUDGET RELIEF WELCOMED

MAJOR ALBERT PAM ON THE PROSPECTS

The twenty-sixth annual general meeting of the Pressed Steel Company, Limited, was held on May 29th at Winchester House, Old Broad Street, London, E.C., Major Albert Pam, OBE, the chairman, presiding.

The secretary, Mr F. E. Cairns, CA, read the notice convening the meeting and Mr T. Howorth, FCA, of Messrs Price, Waterhouse and Company, the auditors, read the report of his firm.

The following is the chairman's speech, which was circulated with the report and accounts:

Ladies and gentlemen—From the report of the directors and from the accounts for the year ending December 31, 1952, you will have seen that the results of your company have again been satisfactory. Our total sales have increased by over 10 per cent and our profit by £76,000; however, taxation has absorbed £112,000 more than last year and our charge for depreciation and obsolescence is higher by £87,000. Thus our net profit is lower by £123,000, but is still £802,849, after again providing £250,000 for the increased replacement cost of plant, machinery and equipment.

Your board have decided to recommend to you, out of the profits for 1952, a transfer of £500,000 to the general reserve, and together with the usual final dividend of 12½ per cent, less tax, on the ordinary stock, a Coronation year bonus of 5 per cent, less tax. This bonus will absorb £45,574, and, in addition, your directors have decided to mark the occasion by distributing a sum of £50,000 among the employees of the company, based on their years of service. I feel sure that the stockholders will be pleased that the employees, too, should benefit by a special distribution.

THE FACTORIES

As you know, our main activity continues to be the manufacture of motor-car bodies and parts, and nearly all this work is carried out in our Cowley factory, where over 9,000 men and women are employed. We manufacture at our Theale works all the compressor units for Prestcold refrigeration, and these units are assembled into the cabinets at our Cowley factory. The refrigeration business has been very difficult during the year, owing to the many import restrictions in several countries and the heavy purchase tax in the home market. Fortunately, the latter was reduced in the Budget and the export trade also is better; so I am glad to say that our refrigerator sales are again improving.

Our Linwood factory, where we employ about 1,650 people, is working to full capacity on the manufacture of railway wagons and agricultural machinery. We are also carrying out there some important Government contracts. Our total labour force is now over 11,500.

The buildings, plant and machinery of the company in all three factories have again been well maintained, and we have this year added to these works fixed assets to the value of £1,100,000. This represents profits of past years which were not distributed.

MONEY PLOUGHED BACK

In my speech on the accounts of your company for 1947 I gave you some figures to show how much money we had ploughed back into the business. At that date these sums amounted to about £2 million, and, in addition, approximately £1,600,000 had been provided for depreciation and obsolescence, making £3,600,000 in the aggregate. The corresponding figures at the end of 1952 are as follows: £6 million ploughed back and represented by assets such as power presses, machine tools, new buildings at Cowley, the factory and machinery at Theale and the equipment of the factory at Linwood; £2,700,000 has been provided for depreciation and obsolescence and, in addition, £1,500,000 for the increased cost of replacement of plant, machinery and equipment. These figures in the aggregate come to £10,200,000.

In previous years I have given you figures to show how your company's gross profits have been spent. This year, after paying out £5,987,000 in wages, salaries, pensions and National Insurance Fund Contributions, the profit before taxation amounted to £2,493,000. Of this, 67.80 per cent went in taxation, 19.69 per cent was retained in the business and 12.51 per cent was paid in dividends.

LONDON AND PROVINCIAL STORES

Our London showrooms in Regent Street have been well patronised, and we have had good displays at the Motor Show, the Ideal Homes Exhibition and many other London and provincial shows.

On April 25th I had the pleasure of declaring open the sports ground, which we have built for the benefit of our employees on land belonging to the company and adjacent to our works at Cowley. The total area is 32 acres, but we are as yet only using 24 acres; facilities exist for almost every kind of outdoor game. The ground was levelled and resown for us by Sutton and Sons of Reading, who appear to have provided an excellent sports ground, including a large bowling green, all of which will be managed in future by the company's Social and Athletic Club.

On April 11th was held the second annual dinner of the Company's 25-year Club, when 139 new members were given their badges, making a total membership of 230.

Your board were greatly encouraged by the Budget, which was introduced by the Chancellor of the Exchequer on April 14th. As to the future, we are hopeful but not too enthusiastic, because in this country we are still very much under the influence of happenings all over the world. Although we have had much more experience than most nations in international affairs, we are not yet strong enough financially to move independently, or to give the lead to others in what we consider to be the best and safest directions.

FREER INTERNATIONAL TRADE NEEDED

Our scientists and engineers have proved that we can produce aircraft and other apparatus of astounding merit; our workpeople are second to none in their ability to manufacture high grade products and to handle difficult and complicated machinery. The management of our industries is efficient and constructive, otherwise we should not be able to pay heavy import duties on our

exports and still compete with the local manufacturer, and beat him at the game. We have little to be ashamed of in the industrial and commercial world, but we are told much too often how much better others are at the job—this is simply not true. But it does seem that freer international trade, which was the fixed policy of this country when we were the great creditor nation, is still a long way off. I should much like to see a quickening in the plans for Dominion and Colonial development, particularly in the schemes for the production of those commodities and foodstuffs which we must still purchase from the dollar area. Recent events have proved how necessary it is for us to be able to buy goods from countries which will accept our exports in exchange.

Before I close, I would ask you to allow me to pass on to the management, the staff and all the employees of the company, wherever they may be serving, your thanks for the efficient way their work has been conducted in 1952 and for the satisfactory results shown in the profit and loss account of the company.

The report and accounts were unanimously adopted; the proposed dividend was approved, and the retiring directors, Dr G. L. Kelley, BSc, MA, Mr R. T. Pemberton and Mr Henry F. Tiarks, were re-elected.

THE BURY FELT MANUFACTURING COMPANY

NEW ACQUISITIONS

INCREASING HOME AND OVERSEAS COMPETITION

The forty-eighth annual general meeting of The Bury Felt Manufacturing Company, Limited, was held on June 4th in Manchester, Lt Col A. Buckley, CBE, DSO, JP (the chairman), presiding.

The following is his circulated statement:

The accounts for the year ended December 31, 1952, disclose material alterations to those of the preceding year. These arise principally from the acquisition of two subsidiary companies during 1952.

The consolidated trading profit is £313,913, as against last year's figure (for the parent company only) of £280,274. After adding investment and other income of £6,880 and deducting directors' and auditors' remuneration, appropriations to depreciation and development reserve and the amount written off motor vehicles, there is a profit (subject to taxation) of £290,884, compared with £254,741 for 1951. Income tax and profits tax are provided for at £160,496, being £14,829 more than the previous year's figure.

From the remaining balance of £130,388 your directors have utilised the sum of £28,648 in revaluation of the fixed assets of subsidiary companies. Notwithstanding the higher trading profit, this capitalisation leaves the available profit for the year at £101,740, some £7,000 less than last year. A further transfer of £50,000 increases the general reserve to £250,000.

In order to clarify the balance sheets, £40,000 of the £43,055 depreciation previously shown as a deduction from fixed assets has been transferred to depreciation and development reserve, the remainder being utilised to write down motor vehicles. Depreciation and development reserve now appears at £100,000.

The liquid position remains satisfactory. During the year, approximately £100,000 has been invested in fixed-term government securities and loans to building societies, and a further £70,000 of tax reserve certificates purchased. In addition, cash resources are £448,548 compared with £503,909 in 1951. Current liabilities, including provision for the recommended dividends, are £337,481. Revenue reserves and available balance of profit carried forward total £642,115.

ACQUISITION OF SUBSIDIARIES

All the issued share capital of the two subsidiary companies has been acquired. One is an important producer of felts similar to those manufactured in one of your company's factories, the other a merchanting business. Messrs Peat, Marwick, Mitchell and Company, our consulting accountants, investigated the position and examined the accounts of both these companies prior to acquisition.

The depreciated figure at which the manufacturing company's modern factory, plant and machinery appeared in its balance-sheet prior to the date of completion of purchase, was very much below the valuation made on our behalf by Messrs F. S. Airey, Entwistle and Company. In negotiating the purchase, recognition had to be paid to the current value of fixed assets and it has been decided to increase the book value of land and buildings to the valuation figure. Plant and machinery remains at a figure substantially less than valuation. Your directors believe that this manufacturing subsidiary will be a valuable asset to your company. The factory is strategically situated and the management has been very successful for many years. The services of the directors have been retained under service agreements.

The whole of the assets of the merchanting subsidiary are liquid.

No proportion of the cost of acquiring either company is attributable to goodwill. Of the composite purchase price appearing in the parent company's balance sheet at £230,456, no less than £185,162 is represented by the excess of cash and liquid assets over current liabilities.

DIVIDEND INCREASED

Since 1948, when your company became a public company, the annual ordinary dividend has remained at 3s. per share. During the intervening years, £706,651 has been provided for taxation, £327,781 placed to reserves and £211,525 distributed in dividends. From reserves, £50,000 has been consolidated into preference shares.

Your directors have decided this year to recommend an increase in the annual ordinary dividend to 3s. 3d. per share. They also intend to seek the permission of the Capital Issues Committee to consolidate a further portion of the reserves into fixed capital.

The past year has been somewhat difficult, and although your factories have been fully employed far less overtime has been worked. So far during 1953, similar circumstances have been operative. Competition, which was mentioned in the previous report, has continued to increase both at home and overseas. Fortunately, we are well equipped to meet this competition, but care and economy in management are of greater importance than ever before. Our efforts are strenuously directed to this objective, but there are many essential items of expenditure over which, unfortunately, we have little control under present conditions.

Your directors are appreciative of the efforts of the staff and employees to maintain and enhance the company's position and reputation.

The report and accounts were adopted.

WILMOT-BREEDEN (HOLDINGS)

CONTINUED HIGH LEVEL OF DEMAND

The fourth annual general meeting of Wilmot-Breeden (Holdings) Limited was held on May 29th at Birmingham, Mr D. L. Breeden (chairman and joint managing director) presiding.

The following are extracts from his circulated review:

Changes in trading conditions affecting the motor industry in 1952 have already been reviewed by the chairmen of the car manufacturing companies. Reference, however, should be made to the two main factors. The output of the industry declined; and it was necessary to reduce selling prices to meet increasing competition. It is considered that under these circumstances the results for the year under review are satisfactory, and that your company has been able to adapt itself quickly to the changing conditions.

The year saw the completion of a large postwar expansion programme, in which no less than £1 million has been spent in new plant and buildings.

It is not easy to make a long-term forecast of future prospects, but the demand for our products continues at a high level. Furthermore, there are signs that the decline in activity in the motor industry, which was a feature of the year under review, has been halted. Indeed, there is definite evidence that output is rising. Against this must be set the continual pressure for lower prices at a time when there is no corresponding fall in those basic costs over which we have no control.

FINANCIAL REVIEW

The consolidated profit and loss account shows a net income from all sources for the year of £575,378, after making the deductions shown therein.

After taking off £406,023 for taxation, the amount available for distribution is £169,355.

Dividends of £63,000 have been paid after deducting income tax at 9s. 6d. in the £. These represent, first, a full year's dividend of £21,000 on the 5 per cent cumulative preference shares and of £16,800 on the 20 per cent second cumulative preference shares, and, secondly, £25,200 for an interim dividend of 16⅔ per cent on the ordinary shares. In addition, the directors recommend a final dividend of 25 per cent, less income tax at 9s. in the £, on the ordinary shares, which will absorb £39,600. After making these dividend distributions of £102,600, the balance unappropriated in the consolidated profit and loss account is £498,371.

BONUS ISSUE

The consolidated balance sheet shows an increase of £48,000 in the amount of £1,248,000 for issued capital, this increase being represented by the issue of bonus shares made to the holders of the ordinary shares during the year. It was intended in making this bonus issue of ordinary shares that it would result in the issued capital more representative of the re[illegible] carry of the assets employed in the busin[illegible] further pursuance of this policy the d[illegible] are recommending that another bo[illegible]ce sheet of ordinary shares be made. remain[illegible]

The report was adopted. [illegible]k cost is [illegible]arch 31st

At the subsequent extraordinary meeting resolutions were passed [illegible]ciation of £48,000 by the creation of 192,[illegible]a, 3.5 per shares of 5s. each to be allotted[illegible]s, 17.4 per proportions as the existing 1,152 and other shares of 5s. each held.

TAYLOR WOODROW LIMITED

A SATISFACTORY YEAR'S TRADING

The annual general meeting of Taylor Woodrow Limited was held on May 29th in London, Mr Francis Taylor (chairman and managing director) presiding.

The following is an extract from his circulated review:

The accounts for the year ended December 31, 1952, show an improved trading profit. In 1951 we suffered from the exceptionally inclement weather experienced during the winter months; this, coupled with the effect of devaluation of the £ sterling and a spiral of rising costs, adversely affected many items not heretofore covered by rise and fall clauses in building and civil engineering contracts.

In the year now under review we enjoyed in the main what may be regarded as good contractors' weather. It is important to stress the effect of climatic conditions in our business.

This year the profit on trading before taxation, depreciation, etc, is £490,095, compared with £291,805 in 1951. After depreciation, etc, but before taxation, the comparable figures of net profit are £241,191 against £90,958. The improved results are most gratifying, and present indications encourage your directors to hope that the profit recorded for 1952 will be maintained in 1953. Taxation on the profits has been charged at £177,500.

BUILDING AND CIVIL ENGINEERING

Our Construction Company had a successful year, many important works of a specialist nature were completed to the satisfaction of our employers. The tunnel contract at London Airport is approaching completion and several additional important works on this site have been secured in competition, including the contract for the control tower and the passenger handling building, two important contracts in value exceeding £2 million. This company is also engaged in the construction of power stations, factories, airfields, pipelines, bridges and opencast coal production.

Housing.—Relaxation of many of the restrictions placed on house building for sale has enabled us to enter this market; many of the important sites we held were requisitioned by local authorities, but we are urgently seeking new and suitable land and efforts will be made to play our full part in this important sphere.

Ballast Pits.—Our ballast pits have again operated to capacity and due to careful selection of these sites, and the good quality of the products, should continue in full production until worked out.

After reviewing the company's widespread overseas interests, the statement continues: Our export company experienced a year of satisfactory trading. "Arcon" structures were exported in considerable quantities over fo[illegible]ide areas overseas and are meeting a much belie[illegible]led demand. Naturally competitors are the rei[illegible] into the markets, but every effort large sum[illegible] made to meet competition as and have bee[illegible] especially arises.

appear to[illegible]ill, I hope, have noticed our adver-

I do n[illegible]s—"Building for the Future." This on too glo[illegible] only mean erecting buildings for word of a h[illegible] but that we are endeavouring to a splendid o[illegible]uild our personnel. We have a Kingdom an[illegible]me for young people. We are are in first-cl[illegible] organisation and finances on a is being taken[illegible] "Building for the Future" and in the d[illegible] be Taylor Woodrow's motto which we con[illegible]e to come.

company [illegible] was adopted.

POWER SECURITIES CORPORATION LIMITED

SATISFACTORY RESULTS

The thirtieth annual general meeting of this company will be held on June 24th in London.

The following is an extract from the statement of the chairman and managing director, Sir Andrew M. MacTaggart, circulated with the report and accounts for 1952:

The accounts show satisfactory results. Although the gross profit at £438,333 is £97,003 less, in 1951 it was enlarged by final adjustments in respect of certain completed contracts. Provisions required for depreciation and taxation are £101,356 less while interest on loans is higher by £10,294.

The consolidated net profit is £136,492 as compared with £140,485. The proposed dividend is 7 per cent on the ordinary shares.

Current assets at £6,226,800 show a substantial increase of £2,141,892 due to the larger volume of construction work on hand, chiefly on civil engineering work overseas and transmission line contracts in this country. This increased volume of work in hand is also reflected in the figure of £4,563,653 in respect of current liabilities.

The main source of income of this Corporation is derived from the engineering and construction side of the organisation through Balfour Beatty and Company, Limited. They continued to be fully occupied during the year in handling a large volume of civil and electrical engineering work in this country and overseas. The results of the year under review, together with the amount of work in hand at the moment, compare favourably with anything we have achieved in the past. The two principal electrical engineering contracts on hand in the United Kingdom are those for the British Electricity Authority for construction of the Staythorpe and Carmarthen Bay power stations. Both these contracts continue to show good progress.

THE FUTURE

As regards the future, I am not going to attempt to prophesy what will happen in the Middle East. Our principal interest in that area is in Iraq, in which we have maintained the fullest confidence during the past twenty years, and I see no reason to change our views.

East Africa continues to develop and apart from the Mau Mau troubles in Kenya, the future looks good. We can only hope that those responsible for the ending of the present trouble will act quickly and effectively and re-establish confidence among the various races affected. Malaya appears to be weathering the storm, and with the continued pluck and confidence of those in charge of our interests there we look forward, with a feeling of hope, to better times.

I would add my voice to those of the many other chairmen of public companies who have protested against the heavy burden of taxation. Higher taxation is not the real answer to this country's problems. The answer is a simple one: economy in Government administration and increased output in industry. Both of these answers, in my opinion, can be achieved; the first by a rigid overhaul and the second by incentives in industry which will not be penalised by taxation.

You will welcome the modest increase in the dividend recommended on this occasion. This, in effect, is a return to the rate paid prewar, and, encouraged by the results achieved, and by the nature and volume of our work in hand, the directors feel fully justified in recommending this increase.

SILVRO MANUFACTURING

(Makers of "Bonsoir" Shirts and Pyjamas)

The seventeenth annual general meeting of Silvro Manufacturing Company, Limited, was held on May 29th in London, Mr Manley Cooper (chairman) presiding.

The following are extracts from his circulated statement:

Although a larger turnover was achieved, the margins of profit were on a reduced scale, thus accounting for the small reduction in profits of £4,250 as compared with last year.

The net worth of your business has appreciated from £217,764 to £225,853.

With the expanding demand for your company's products, there has been an increasing strain on its manufacturing capacity. When an opportunity occurred of obtaining at a very favourable price larger premises at Crewkerne, where you already have a small unit, your board seized it, and it is hoped that by mid-summer we shall be in occupation of approximately 22,000 sq ft of space, which will give us the necessary elbow room for any further expansion.

The order book is full and, indeed, we are hard put to fill the demand which your company's new shirt with patented collar has created. Other new products are also showing satisfactory results. Our dollar earnings are steadily growing, as, indeed, is the whole of our export trade.

Our stock position is good.

While conditions are still full of difficulties, prospects for the current year appear favourable.

The report was adopted.

AUTOMATIC TELEPHONE & ELECTRIC COMPANY

The annual general meeting of the Automatic Telephone & Electric Company Limited will be held on June 19th in London.

The following is an extract from the statement circulated by the chairman, Sir Alexander Roger, KCIE:

The profit of the parent company at £850,570 shows a reduction of £321,411 compared with 1951. Although the volume of our sales and production was even higher than 1951 the profit on our trading operations was reduced by rising costs and more intensive competition abroad. On the whole we consider that the trading results of the year are satisfactory.

Dividends at the same rate as last year are proposed. The consolidated profit of the group amounts to £1,137,917 against £1,545,399. Consolidated reserves total £4,776,036.

During the past year production was maintained at a high level. Due to the continued Government restrictions on the Post Office's capital investment programme, supplies of telephone switching equipment to this customer were again severely limited, and consequently the emphasis has continued to be on export business.

After dealing with the progress of the subsidiary companies, the statement continues: We have a good order book; but increasing intense competition from foreign manufacturers in the export field will call for greater effort and reduced costs on the part of industry in this country if it is to maintain its position in world markets.

BRITISH ENKA LIMITED

EFFECT OF SEVERE RECESSION

The twenty-eighth annual general meeting of British Enka Limited was held on May 28th in London, Mr A. D. Carmichael, CBE (the chairman), presiding.

The following is an extract from his circulated statement:

The group working profit of £289,966 compares with £1,259,582 for 1951. After adding £882 profit on fixed assets sold and charging £1,106 interest paid, £268,877 for depreciation of buildings, plant and machinery and £10,378 for directors' fees and emoluments, the operating profit is £10,487; after writing down stocks of raw materials by £103,743 to market value and providing £2,238 for taxation, the loss for the year is £95,494, which compares with a profit of £419,415 for the previous year.

The directors have given very careful consideration to the question of a dividend. In view of the recovery of business which has taken place in 1953, and the fact that in the previous two years the company placed £750,000 from profits to general reserve and the carry forward was increased by approximately £70,000, the directors have decided to take £50,000 from general reserve and to recommend a dividend of 6 per cent for the year 1952.

Capital and revenue reserves, including the carry forward, now amount to £976,598, against the issued capital of £1,875,000.

TRADING CONDITIONS

In my statement twelve months ago, I drew your attention to the severe recession which had spread from the USA and the Continent and was already at that time affecting this country seriously. This recession hit all sections of the United Kingdom rayon trade and became very marked during the summer months of 1952.

In the extremely difficult conditions, involving a low rate of production, the company during the year as a whole made an operating profit, but it was necessary to write down the stock of raw materials by £103,743 at the end of 1952.

Some slight recovery in trade began in September and continued to develop steadily to the end of the financial year. The improvement has made further progress in 1953 and in March, with the exception of the Breda Visada Factory, the company was back on to full production, and this despite the fact that the formerly important crepe trade was still practically dormant. It has always been the policy of this company to spread its deliveries over all the important sections of the various trades using rayon yarn, and we have taken full advantage of new developments in other directions to make up for the present slackness in the crepe trade.

THE FUTURE

With regard to the future, it would be unwise to prophesy, but it is worth emphasising that British rayon yarn is still the least expensive raw material available in the textile industry of this country or anywhere else in the world, and consequently the industries using rayon yarn are able to produce attractive and well-wearing articles which sell at a low price. Rayon has put luxury, lightness, colour and serviceability within the reach of everyone. Given reasonably stable conditions in this country and overseas, we believe the company will be able to maintain full production and a satisfactory measure of prosperity.

The report was adopted.

E. POLLARD & COMPANY

The forty-first annual general meeting of E. Pollard & Company, Limited, was held on May 28th, in London.

Mr H. Edward Pollard, chairman and managing director, who presided, said:

The trading profit was £183,322, as compared with £180,889 for the previous year, and we have increased this by an amount of £9,977 received from a Continental subsidiary company. After providing £97,918 for taxation and transferring £60,000 to reserve, your directors recommend a capital dividend at the rate of 15 per cent, free of income tax, on the ordinary shares.

Taking the year as a whole, I feel that in results at any rate it has not proved unsatisfactory, and that at present we can look to the future with a little more confidence than in the past few years.

The lead we maintain in the design of first-class shopfitting and the service we are able to give by having our own departments for building construction, electrical installations, signwriting, sun blinds and shutters, is well appreciated in the fact that we avoid the embarrassing and annoying delays on contracts that occur when outside contractors have to be employed.

In the Haskins factories, which cover 130,000 sq ft, we have the substantial business of electrical lifts under the title of Hammond and Champness. Our research and development with the fully automatic lift design has brought us to the forefront of the lift industry. We have a substantial contract book for the future.

There has been a steady demand from the Morris Singer Company for steel doorframes, casements and other iron work.

The report was adopted.

LISBON ELECTRIC TRAMWAYS

The annual general meeting of Lisbon Electric Tramways, Limited, will be held on June 24th in London.

The following is an extract from the circulated statement of the chairman, The Rt Hon The Lord Rathcaven:

The number of passengers carried by the company increased during 1952 by 14 million, or 4.5 per cent, compared with 1951, the total number being 328,193,891. Of this figure trams accounted for 278,153,405, an increase of 5,421,840, or 2.0 per cent, and buses 50,040,486, an increase of 8,638,530, or 20.9 per cent. The mileage run by all our vehicles amounted to 25,232,835, an increase of 1,916,837 miles, or 8.2 per cent.

These increases in both the number of passengers carried and the mileage run have been made possible by the net addition during the year of 22 new closed trailers to our tram fleet and 22 new double-deck buses.

Although the increased number of passengers carried has resulted in an increase of revenue, the cost of operation has also gone up, especially in the case of trams. This is due to the additional mileage run and to the increased cost of electric power, track maintenance and repairs.

After providing for all charges, including general and depreciation reserve, the year's operations show a net profit of £69,739, an increase of £6,219 compared with 1951. This profit, together with the balance of £52,555, brought forward from last year, gives a total of £122,294. The preference dividend and the ordinary dividend of 5 per cent net for the year absorb £60,957, leaving to carry forward to 1953 a balance of £61,337.

HALL TELEPHONE ACCESSORIES

INCREASED OUTPUT

The twenty-fifth annual general meeting of Hall Telephone Accessories Limited, was held on May 29th in London, Major The Hon Oscar M. Guest (chairman and managing director) presiding.

The accounts for 1952 now submitted to you, show a net trading profit of £63,261, which compares with £46,237 for the previous year. Your directors recommend a dividend of 10 per cent, less tax, for 1952.

We have been able to increase our finished work, with the result that our output for the year was considerably greater than was the case for the previous year. We have also been engaged in widening the basis of our business by undertaking a considerable amount of instrument work of high-grade character, both for Government departments and private customers. We have received an important order of this nature from one Government department. We have received continuing orders from the Post Office, which are keeping us fully occupied, during 1953.

Our rentals department has again been active and shown expansion, a new activity being the hiring out of prescription stamp-machines to the hospitals in connection with the National Health Scheme.

It is more difficult than usual to forecast the future in view of increasing competition, but at the present we have our fair share of business, which should enable us to maintain a satisfactory production during 1953. Our development department has been very active during the past year.

The report and accounts were adopted.

RUBBER PLANTATIONS INVESTMENT TRUST

SIR ERIC MACFADYEN'S ADDRESS

The forty-fourth annual general meeting of the Rubber Plantations Investment Trust, Limited, will be held on June 24th in London.

The following is an extract from the circulated address of the chairman, Sir Eric Macfadyen:

The accounts give effect to the changes in the capital structure of the Trust approved by the stockholders at the extraordinary general meeting on October 17th last and subsequently sanctioned by the Court with the object of eliminating from the assets the shares held by the Trust in Sumatra Tea Estates, Limited—which company has since been placed in liquidation—and writing down the book cost of certain other Indonesian investments.

Gross revenue is £182,156, compared with £307,431 in the last accounts, which, you will remember, covered fifteen months' operations. Taxation requires £74,033 and the allocation to general reserve £22,078. We recommend a dividend of 8 per cent, which will take £76,057. The amount brought in from the last accounts was £149,313 and the carry forward will be £142,491.

The investments figure in the balance sheet at £1,903,644; deducting the surplus remaining on realisation account, the book cost is £1,822,280. The value at March 31st was £1,333,892, showing depreciation of £488,388; 48.4 per cent of our investments are in rubber, 30.7 per cent in tea, 3.5 per cent in other plantation products, 17.4 per cent in British Government and other securities.

At the moment American industry is using 3 tons of synthetic to 2 tons of rubber. This will not last. Once the US Government divests itself of the ownership of the synthetic plants, and these pass into the hands of commercial operators, the real cost of producing synthetic will for the first time be established.

UNITED SERDANG (SUMATRA) RUBBER PLANTATIONS, LIMITED

SIR ERIC MILLER'S SPEECH

The forty-fifth annual general meeting of this company was held on May 28th in London.

Sir Eric Miller (chairman of the company), in the course of his speech, said: The labour shortage in Sumatra eased somewhat during the year under review, making it possible to bring further areas of rubber into the tapping round. As a result, the crop rose to 12,357,131 lb, the highest figure recorded since the war.

The sharp fall in the price of rubber and greater activity on the part of the police led for a time to a decline in the highly organised traffic in stolen rubber, but this nefarious trade has not yet been stamped out and there has been a serious recrudescence of illicit tapping on several of our estates in recent months. A lot of valuable young trees have been permanently ruined.

Several of the states continue to suffer from illegal occupation. This difficult problem has political implications, but that is all the more reason why the prolonged study which the Indonesian Government have been giving to a general settlement of agrarian problems in the territory should be translated into firm action.

HIGHER GROUP PROFIT

It is gratifying to see that the group profit for the year before taxation was some 30 per cent higher than that for 1950-51. The fact that a fairly satisfactory margin was maintained despite the sharp fall in world rubber prices is largely attributable to favourable forward contracts which I reported to you at our last meeting, and to the fact that an otherwise very serious increase in production costs was mitigated by the spread of overhead expenses over larger crops

The weight of total taxation remains extremely heavy. Adding export duties and other levies which are not apparent in the published accounts, to the amount we have had to provide for company tax in Indonesia and profits and income tax in the UK, we arrive at a figure of just under £1 million as this company's contribution to national funds, almost the same as the corresponding figure in the previous year. This is no mean achievement.

Subject to any unfavourable developments of retroactive effect such as we have suffered under in the past, the current year, of which almost three-quarters have now elapsed, should show a reasonable margin of profit. Output and sales of palm oil and kernels this year have also been satisfactory.

It is not generally appreciated that employers in Sumatra by general agreement provide, free of charge, the basic foods not only for the workman but for his wife and children and issue textiles to them at well below cost. Thus any and every increase in the cost of subsistence is borne entirely by the estate owner. The workpeople have a 40-hour week, and the holidays with pay now total 27 days per annum. Yet the trade unions are constantly raising their demands for higher and ever higher cash wages and cash bonuses, probably hoping that the Department of Labour is not strong enough to call a halt to a process which is rapidly undermining the competitive power of Indonesian estate enterprise.

The report was adopted.

JOHN HOLT & COMPANY (LIVERPOOL) LIMITED

TURNOVER EXPANSION OFFSET BY TEXTILE LOSSES

The fifty-sixth annual general meeting of John Holt & Company (Liverpool) Limited, was held on May 29th in Liverpool, Mr John A. Holt, the chairman, presiding.

The following is an extract from his circulated statement:

The sharp fall in net profits for the year is an indication of the very difficult trading conditions in which we have been operating in West Africa during the last fifteen months. Gross turnover continues to increase and exceeded £23 million for the year, but heavy losses were incurred on sales of all classes of textiles, and an over-supplied market reduced margins on other types of goods to low levels.

For most of the year the tendency was for world produce prices to continue the fall which began in May, 1951, and it was not until towards the end of the year under review that a steadier tone became evident. Our purchases represented a satisfactory proportion of the total crop marketed.

John Holt Line Limited had a reasonably satisfactory year, although the fleet consisted of three ships only, so to provide the tonnage required by the trade we chartered vessels from time to time.

The trading results for the current year to date have shown some improvement, and we can, I think, look forward to a more favourable picture at the end of August. Profit margins continue to be very low, but I hope to be able to report we have achieved some modest expansion of our business.

The report was adopted.

NEW BROKEN HILL CONSOLIDATED

LOWER METAL PRICES AFFECT RESULTS

The seventeenth annual general meeting of New Broken Hill Consolidated Limited will be held on June 25th in London.

The following are extracts from the circulated statement of the chairman, Mr John R. Govett :

The profit for the year 1952, before taxation, amounted to £818,780, compared with £1,338,884 for 1951. This reduction results from lower prices having been realised for lead, zinc and silver than in the previous year and from an increase in costs generally and particularly of wages. The charge for taxation amounts to £260,760, leaving a net profit of £558,020, a reduction of £61,004 on the result for 1951. The board recommend a total distribution of 1s. 6d. per share for the year.

Ore production from the company's leases in 1952 totalled 239,922 tons, compared with 212,178 tons in 1951—making a total since production first commenced of just over a million tons. The expansion of ore reserves continues satisfactorily with an inclusion of a greater amount of the richer lead lode. The total ore reserves as at December 31, 1952, amounted to 2,400,000 tons, assaying 10.6 per cent lead, 2.6 ounces silver, and 10.9 per cent zinc.

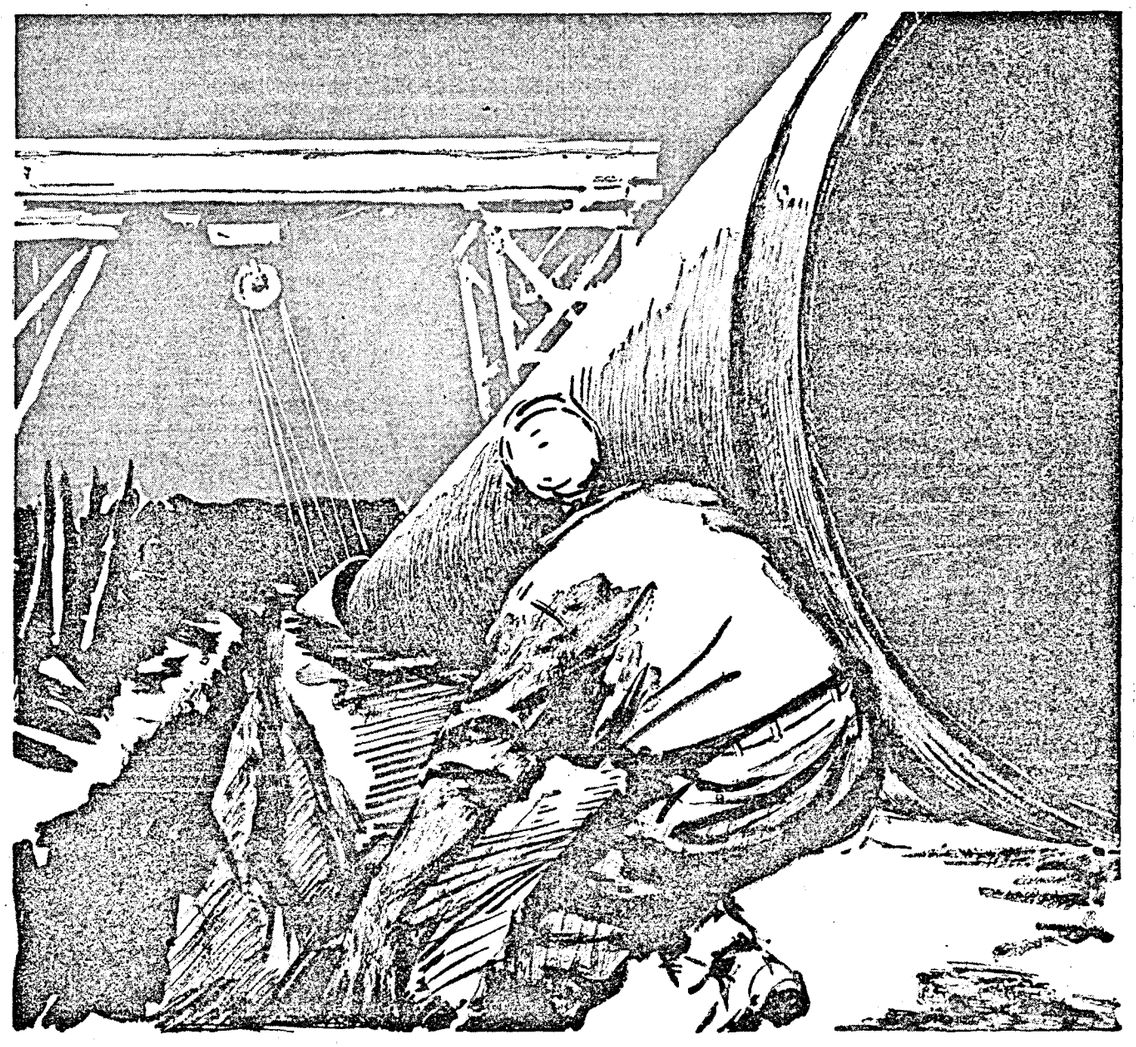
The year 1952 marks an important stage towards the completion of the ten-year programme commenced in 1945 for developing and equipping the mine. Towards the close of the year under review the hoisting of a substantial proportion of the company's ore through the new haulage shaft and its subsequent treatment in the company's own mill were commenced. We remain confident that the mine will be among the lowest cost producers in the world. While it is hoped that the completion of our programme may be achieved without having recourse to further permanent financing, some additional finance of a temporary nature will be required until we see some turn in the trend of metal markets and prices once again become more remunerative.

THE UNIVERSITY COLLEGE OF THE WEST INDIES

Applications are invited for the following appointments in the Department of Extra Mural Studies.
(1) Staff Tutor in Industrial Relations;
(2) Resident Tutor.
Salary for (1) on scale £1,200 to £1,350 per annum, and for (2) on scale £750 x £50 to £900 x £50 to £1,100 per annum. Point of entry in scale according to qualifications and experience. Child allowance £80 per annum per child (maximum £240 per annum). F.S.S.U.
Applications (six copies), giving full particulars of qualifications and experience and the names of three referees, should be sent to the Secretary, Inter-University Council for Higher Education in the Colonies, 1 Gordon Square, W.C.1, from whom further particulars may be obtained. Closing date June 30, 1953.

PLANT ENGINEER required for large, light electrical engineering factory in London area. Must be capable of taking charge of steam, bulk electricity, generation and main supplies and of organising all maintenance work with staff of approximately 125. Age: 30-40 years. Full membership of Institution of Mechanical or Electrical Engineers or equivalent qualification. Not less than five years' experience in responsible position. This is a senior post and will carry a four-figure salary, according to qualifications and experience.—Apply to Central Personnel Department, Philips Electrical Industries, Ltd., Century House, Shaftesbury Avenue, London, W.C.2.

UNIVERSITY OF SYDNEY



Applications are invited for the position of LECTURER IN MORAL AND POLITICAL PHILOSOPHY. The salary will be within the range of £650-£1,000 (Australian) per annum, plus cost of living adjustment (at May 1, 1953, £247 males and £187 females), with annual increments of £50. The salary is subject to deductions under the State Superannuation Act. The commencing salary will be fixed according to the qualifications and experience of the successful candidate. Applications, supported by copies of testimonials and giving the names of three referees should be forwarded to reach the undersigned not later than June 27, 1953. In addition, overseas candidates are requested to forward a copy of the application to the Secretary of the Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1, from whom further information may be obtained.

W. H. MAZE, Registrar.

YOUNG EXECUTIVE (35) requires responsible general management post with good potentiality. Qualified accountant, cost accountant, secretary, economist with extensive knowledge and experience of general industrial problems. Salary £1,500.—Box 256.

ADAPTABLE MAN (34), Chartered Librarian, completing B.Sc. (Economics) June, wide knowledge economic literature, requires post with prospects.—Box 257.

ECONOMIST with indexes, July 31, 1948, to date. Offers.—Box 261.

WATER - ESSENTIAL FOR CIVILIZATION From the very beginning of civilization, the well-being of all peoples has depended upon the availability of clean, fresh water. Today adequate quantities of drinkable water are of increasing importance for domestic, industrial and agricultural activities. As this basic condition cannot always be met on the spot, the necessity often arises to build water plants at a distance from towns and villages for the provision of a piped supply.

Here again, the unique features of the Mannesmann Steel Tube have opened up new opportunities. That is why extended piping systems made up of Mannesmann steel tubes are being operated in so many areas throughout the world.

Mannesmann design, manufacture and install:
Long-Distance Water Transmission Lines, made up of
Seamless or Welded Steel Spigot & Faucet Tubes
Service Connections and Plumbing Systems
Hydraulic Pipes and Penstocks, made up of Seamless or Welded Steel Tubes

What are silicones, Mr. Sims, Sir?

The silicones are a most interesting group of materials based on organic compounds of silicon. To industry the most outstanding merit of silicones is their marked resistance to the effects of intense heat and cold. They are used, for example, in jointing and insulating materials for jet engines and electric motors. They have other special applications in heat-resistant paints, car polishes, and the shower-proofing of textiles. Midland Silicones Ltd. are the marketing organisation for the full range of silicone rubbers, resins, varnishes and fluids, some of which are already being manufactured by Albright & Wilson Ltd.

Armistice?

IS this, then, the way the war ends—with neither a bang nor a whimper, but to an accompaniment of sighs of relief mingling with discords in the West, defiant cries from Seoul, and seductive airs wafted from Moscow? If the firing that has now lasted for nearly three years ceases and the casualty lists come to a full stop, there will be sincere thankfulness in every heart throughout the sixteen countries that have helped to resist the aggressors in Korea. But this thankfulness must not obscure the grave problems that remain to be solved—problems which, indeed, will become more unavoidable and more urgent the instant the armistice is signed.

There are, first, the problems of Korea itself. Even if the complex machinery for disposal of prisoners of war can be operated without new difficulties appearing, other aspects of the armistice arrangements bristle with potential frictions. The presence, for example, of Communist representatives at ports in South Korea will not be accepted very calmly either by the local authorities or by the population. All such difficulties could be ironed out, given goodwill; but the armistice is not being concluded in an atmosphere of goodwill. The United Nations Command and the Indian, Swiss and Swedish truce teams will need to draw on all their reserves of patience, tact and self-control if they are to treat successfully with Communist officials, alternately sullen and sly, and with South Korean politicians who are likely to be, at best, consistently sullen.

The conflicting statements of President Rhee and his assistants make it impossible, as yet, to judge how far they will carry their repudiation of the whole armistice project. Their position is strong, in that the Republic of Korea's forces now outnumber those of all its allies in South Korea; it is weak, in that the ROK divisions—like the whole Korean economy—depend on American supplies, and, despite their personal loyalty to their ageing president, it is very doubtful whether in the last resort they would undertake to "go it alone." But if Mr Rhee continues to sulk in his tent, how can the allies guarantee that South Korean troops will not at some stage violate the armistice? If they cannot give such a guarantee, the Communists will have a new pretext for recalcitrance, and the "neutrals" will hesitate to get involved. But it would be both politically and militarily impossible for the allies to disarm or neutralise the ROK army, which now holds over half of the line; and even to apply economic pressure to South Korea, which the United Nations are solemnly pledged to aid in its task of reconstruction, would be a most invidious business.

Nor is this all. Even if the Seoul government and its army are induced to accept the continued division of their country, on what basis will that division rest? Theoretically, the armistice should produce a return to the situation in 1948-50, when the UN had proclaimed a united Korea as its ultimate objective, but relied on purely peaceful processes to bring it about. But in those days the tension was heightened by the fact that each of the two rival governments claimed

jurisdiction over the whole of Korea, and each was recognised as the government of Korea by certain other nations, which refused recognition to its rival. Is this dangerous relationship to be re-established? It is abundantly clear that any early reunion of Korea can be achieved only by war, and the risks of war will surely be lessened if it is agreed to reduce the gap between theory and reality.

★

This principle may, indeed, prove useful when the time comes to turn to the wider issues that remain to be settled in the Far East. Immediately after a Korean armistice, it can be taken for granted that Peking will redouble its claims to the Chinese seat at Uno; and in doing so, it will not merely be pressing for an obvious objective, but also seeking to open up a rift between the allies. But, although allied disagreement on this issue is real, and the need for agreement urgent, no good is done by exaggerating the scale of the rift or of its significance. In both Britain and America, at present, there is a tendency to assume that the other country's position as regards the Chinese seat is more absolute than is the fact; it is all too often argued that the gap is unbridgeable. In fact, since the recognition by Uno of Peking's credentials in place of those of the Taipeh government would be a procedural act, the matter is largely one of simple mathematics. If and when a majority of the sixty member nations come to feel that Mao has lived down his crime of aggression in Korea, he will receive his seat; and although groups of member nations are free to agree among themselves how and when they will vote on this issue, no one power or group of great powers could prevent the change being made if the due majority were found in favour.

No one loyal to the ideal of collective security can be happy at the prospect of an unrepentant aggressor being ushered to a seat at Uno after defying that very body. Yet it should be pointed out that, far from "shooting its way into the UN," Communist China effectively delayed its appearance there by invading Korea. It has failed to buy its way in at the price of a Korean cease-fire; its application will now be considered on its merits, not under duress. More important, in reality, is the other half of the Chinese problem—the question of Formosa. It is sometimes argued that the Peking Government, once seated at Uno, could demand not merely a free hand, but international support, in dealing with Formosa. But if the UN is to recognise reality by seating Peking and by tolerating Pyongyang, is it unreasonable to ask Peking in turn to accept Formosa as a fact? As things stand, Formosa can no more be reunited with mainland China without war than can North Korea with South Korea. Why should not the side that began the war now make some concession in the cause of peace?

Other demands, too, might well be made on Peking before it is received into the international society which it has injured. But it is doubtful whether the most obvious of these—a demand for some reassurance to China's southern neighbours—is worth making. Peking, like Moscow, disclaims all responsibility for Communist violence in Indo-China and Malaya, and its machinations in those areas cannot be exposed as easily as an attack across the Formosa Strait or the 38th parallel. The security of South-East Asia must continue to rest not on promises but on what resistance can be provided there to Communist pressures. Yet, while it is to be feared that an armistice may now free Peking's hands for new adventures in the south, it is certain that failure to check aggression in Korea would have led many of the southern peoples to accept the coming of Communist rule as inevitable. In effect, the Korean campaign itself has been of more service to South-East Asia than any new negotiation can be.

★

Here, indeed, one arrives at the true meaning of the Korean war. In fighting it, the United States and its allies have kept alight the faith in collective security that was so often allowed to die in the days of the League of Nations. In the 1930s, Abyssinia, Austria, Czechoslovakia and China itself were left alone at the mercy of the aggressor; in 1950, South Korea was not. History may record this as a unique turning point. It is true that the Korean war will leave behind it a sorry mess of unsolved problems and unaverted dangers. Let it be remembered, however, that this was true in 1918 and 1945, too. It is, after all, the fate of the peace-loving nations, which thrice in this century have been forced into wars, to fight them not for tangible gain but solely to prevent things from getting much worse.

Yet there is a difference of great meaning. The Korean war, unlike its greater predecessors, is ending without final victory, with the original aggressor cowering under the skirts of his backers but spitting unrepentantly from that refuge. The nations that have given their blood in the struggle are robbed of the emotional satisfaction of triumph; small wonder that their prevailing mood is one of frustration, doubt and anger. But would it, in fact, be better if the atmosphere now reflected the jubilant relaxation, the deceptive finality, of 1918 and 1945?

This time at least, it is painfully clear that although the war may have been fought, it has not yet been won. By relaxing their vigilance, by failing to counter the political offensives which the Communists will now launch, and above all by failing to keep the ranks closed, the allies may yet yield up in peace the victory they denied the enemy in war. Their differences of opinion on the issues that now arise, and especially as regards the international status of the Peking government, are well known and well aired. The present need is to find an accommodation between them. No more urgent task will lie before the statesmen who meet at Bermuda.

Malenkov's Hundred Days

TO speak of Malenkov's hundred days is, of course, inaccurate. For if one thing is clear about the events in Soviet Russia since Stalin's death on March 5th it is that a dictator has been succeeded by a group, by a committee in which Malenkov is only *primus inter pares* with such men as the head of the Security Services, Beria, the political head of the armed forces, Bulganin, and Molotov in charge of foreign affairs. It is convenient to simplify the state of affairs in the Kremlin by pretending that Malenkov has simply taken Stalin's place; but it is this desire to simplify that has caused so much wishful judgment about what has actually happened in Moscow. As the statesmen of the West prepare for the Bermuda conference, now postponed until the end of the month, it is vital that public opinion should distinguish between what is known about events in the Soviet Union and what is reasonable deduction or sheer guesswork.

There is a quite impressive number of known facts that can be briefly recalled. Stalin's death brought about, with remarkable speed, a relaxation in the Kremlin's attitude to the Russian people and to the world outside. The amnesty for hundreds of thousands of prisoners, the denial that there had been a doctors' plot, the persistent warnings that police and officials must respect the rights of the Soviet citizen, the lowering of prices, the novelty of sales in the shops—all these events showed a desire to assure the ordinary man and woman that life was to be easier. There was to be a break—just how sharp and deep we cannot tell—with the austerity and brutality of Stalin's rigid methods. Here, on the home front, was the really significant change. At the same time steps were taken to reduce tension with the outside world. It was as if his colleagues had said to Molotov on March 6th: "Lower the international temperature ten degrees by the end of the month." Gestures, acts of conciliation, assurances of peaceful intent, friendly advances in diplomatic circles, followed in quick succession all around the world. None was negligible but none cost the Kremlin much, not even the intervention to get a truce in Korea. Then came a spell of strikingly restrained controversy. *Pravda's* comments on President Eisenhower's statement of peace aims were firm and critical but courteous; the same tone, somewhat warmer, was used towards Sir Winston Churchill's speech in the House of Commons on the same theme. The Russian people were allowed to follow in detail the great debate and to judge for themselves the intentions of men they had long been told to regard as warmongers; indeed, it seemed at times that they were being taken into the confidence of their rulers.

Then, too, it became apparent that the fires of the Stalin cult were being damped down. His name appeared less and less in the Soviet press, though it remained in its old position in the slogans of the satellite countries. Some of the things that the Generalissimo had said about economics—not by any means all—were quietly corrected, and there was a suggestion that his authority in matters of doctrine might have been not infallible in his last months. Changes in the party structure approved by him in October were reversed overnight in March; men who had risen surprisingly sank back suddenly. Malenkov put his friends and pupils back where he wanted them. Things were said, too, which showed a new trend of thinking at the top. Public statements emphasised the paramount task of industrialising China, the new Communist ally in Asia. They seem to point the way ahead to a renewed industrial effort, designed not only to make the Soviet Union stronger and richer but also to make the best of the new Communist empire stretching from the Elbe to the China Sea. For Soviet Russia the aim must still be to create Communism—all in good time—but there is now added to it the task of consolidating revolution in eastern Europe and creating power in China.

★

There is one further fact which merits prominence all on its own as a sign of changing attitudes. Moscow's desire for increased east-west trade is now unmistakable. In Stalin's day the demand that western restrictions on such trade should be lifted seemed designed to cause friction between the United States and its allies rather than to promote genuine business. The deals that were arranged over governments' heads never came up to the expectations roused by propaganda. Now the signs are different. At Geneva, in the Economic Commission for Europe, the Communist representatives have said that they will buy from the West consumer goods as well as capital equipment, provided that the restrictions on the supply of the latter are dropped. Never before have they shown such real interest in the consumer goods offered to them. The picture that now presents itself is of a Soviet government eager to get some help in meeting the enormous demands on its resources made by its own forces, by the critical shortages in the satellite states, by the Russian people's suppressed demands for consumer goods, by the technical needs of Soviet industrialisation and, above all, by China's demands.

This, and nothing more, is certain. There remain, it is true, the things that have been promised or that are due to happen. The budget is three months overdue. The Five-Year plan approved by Stalin in 1952, with its emphasis on the development of heavy industry

people prefer Danish bacon; they know they can rely on a standard product of high quality. How then can English bacon compete? As things are, the Government would have to stand the loss that the British producer would suffer in a free market.

The meat problem has points of similarity. Supplies are very nearly adequate—for mutton and lamb they are back to the prewar level—and they are more than enough in the summer months. Next week's increase of the ration to 2s. 4d. is a seasonal one reflecting home killings; not for the first time, it brings the butchers' supplies to the point where less than the ration is bought, at least by the people entitled to it. As much as possible is put into cold storage during the summer, but not enough can be stored to prevent shortages from recurring during the winter. Private trade, however, would prevent it, by raising prices in the winter; this would not put meat out of reach of the poor, because the freeing of the price would undoubtedly mean a return to something like the prewar price structure, with the better cuts dearer and the inferior cuts cheaper. Moreover, private traders would be far better placed than the Ministry of Food to secure a more even flow of supplies over the year. If Argentina could send another 150,000 tons of beef between November and April the problem would be solved. Individual traders, by insisting on suitable delivery dates, could probably go far to secure this quantity.

There remains the difficulty, however, of the British farmer's guaranteed price; the margin between prices of home and imported meat is considerable. Another question is whether all the prospective supply of pork could be rammed down the throat of the British public. The effort to increase home meat production as rapidly as possible has succeeded so well that by next year some British farms will be overrun with pigs. The amount of pork in the shops is far greater than it was before the war. It is very fat, and would be hard to sell if the ration did not sometimes offer pork or nothing.

The derationing of meat therefore waits on a new policy for agricultural marketing. So far two solutions are offered, one at the expense of the consumer and one at the expense of the government. The National Farmers' Union wants livestock marketing boards which would keep up prices by regulating supplies; the butchers suggest a deficiency payments scheme by which the gap between market prices and the guaranteed prices would be filled by the Exchequer. Of the two, there is little doubt that this would be better than the farmers' marketing scheme, which would perpetuate all the rigidities of the annual price review. Worse still, it would enable the producers to control imports.

The government's problem is to devise an agricultural policy that is both good in itself and consistent with freedom for the consumer. The task should not be underrated. After thirteen years of scarcity it is not easy for producers and distributors to adjust themselves to the prospect of freedom. But the government—and the opposition—should be on notice that these are not difficulties about which public opinion will be patient. The experience of the past year shows that consumers prefer freedom of choice even if it means paying higher prices. Rationing and subsidies have no place once the free demand can be met at prices close to the procurement costs of either home or imported food. The man and woman in the street may not think of it in those terms, but they are certainly not going to put up with their ration books while the government hesitates over difficulties that no longer reflect "real" shortages. That point has not yet been reached, but it is in sight. By next spring food supplies may be sufficient for the ration book to be scrapped. The government's administrative and agricultural arrangements certainly ought to be ready then to take the opportunity if it comes.

Britain and Luxemburg

THE common market in coal and steel has now been in operation in the six countries of Western Europe for several weeks; for this large range of products a customs union is in existence. The Schuman Plan and the Coal-Steel Community that sprang from it is therefore in functioning order. By itself, this is a triumph for the spirit of European unity—one of the few it has had—and a surprise for the "realists." When M. Schuman first propounded his plan, anyone would have given odds against its being embodied in a Treaty. When the Treaty was drawn up, its ratification did not seem certain. And even when the High Authority came into existence on paper, there were still plenty of sceptics who thought that was where it would remain. But it has begun to act; the tariff duties have been removed; and further decisions are impending. The policies that the Coal-Steel Community will actually follow are still obscure—or it would be more strictly accurate to say that the determination and effectiveness with which it will pursue its declared policies are still unknown. It is still too soon to say exactly what difference it will make to the heavy industry of Western Europe. But that it will make some difference is no longer in doubt.

The powers conferred upon the Community by its founding charter fall principally under three heads: the freeing of trade in coal and steel within the six countries; the stimulation of production in the most economic locations; and the guidance of new investment in the interests of both the foregoing objectives. On these and related topics the Treaty lays down a set of rules for the behaviour of the six national industries; the High Authority is less an operative body than a policeman supervising the performance of the obligations accepted by the members. What the Community has done so far is to open its common market by abolishing all tariffs and quota restrictions on the coal, iron ore, scrap and steel circulating within the six nations. A large number of impediments to free trade and competition nevertheless still exist, and the High Authority will do well if it succeeds in removing them during the five years of so-called "transition" envisaged by the Treaty.

One obstacle is the thicket of subsidies and monopolistic selling or purchasing agencies that disguise the true picture of costs and obstruct the natural pattern of trade in all six countries. If past behaviour is any guide, the High Authority's policy will not be to act hastily and out of dogmatic attachment to pure principle. Instead it will examine distortions one by one. First it will consult at length with its two sister bodies, the Council of Ministers and the Committee of producers, consumers and labour; and then, if necessary, it will hold an inquiry by independent experts, whose opinions are subsequently published. In this way it can justify publicly the case for or against each and every departure from competition.

Price policy in the Community is not yet firmly set, and it cannot be said with certainty whether the final outcome will be a level of prices that shows more stability than hitherto. The intention is that price determination shall rest largely with the producers themselves, and that the High Authority shall intervene only in periods of acute shortage or surplus, or if producers seem to be forming private agreements to maintain unduly high prices. Where investment policy is concerned, the Authority has hardly begun to formulate a programme or to augment its own resources by seeking to attract foreign capital. There are signs, however, that the essential point has been grasped: there can be no expanding production without an expanding market, and the market will not expand unless costs of production, and prices, are kept low. But to lower costs and prices, as the Authority in the long run aims to do, may not be enough, and it is now belatedly recognised that the consuming industries should have been given a direct voice in the Community rather than loosely attached in their present consultative capacity. In practice the Authority now strives to remedy the defect by consulting with consumers, formally and informally, on every conceivable occasion.

★

Ever since the Authority began its operations Britain has had a delegation at Luxemburg watching all developments. The time is approaching when Britain's relationship to the Community will need sharper definition. It is true that, even apart from the general British love of empirical methods (which seems to rise to the dignity of a sacred principle where experiments in European integration are concerned), there are some specific and practical reasons that can be urged for leaving things undefined for the present. It will be easier later on than it is now to see what sort of policy the High Authority is going to adopt, and how effective it will be. It will be easier to tell whether the world market in coal and particularly in steel in the next few years is going to be a buyers' market, as now seems probable. But the matter cannot be decided simply on British wishes and cautionary instincts. M. Monnet would like to see a formal agreement drawn up, which would specify in some detail not only Britain's rights in relation to the Community, but also Britain's duties. Firm as is the condemnation of cartel practices within the six-country common market, there seems to be no such objection to the whole Community acting as a single cartel in its external relationships. In certain eventualities, that might be a prospect that the British coal and steel industries might well be willing to make concessions to avoid. At any time it is worth something to them to be admitted far enough into the charmed circle at Luxemburg to know what is going on there. And if they wait until the eventualities occur they might find the price steeper than it is at present.

There is no great reason for the British steel industry to be afraid of the Community. It is in good fettle technologically and its present costs are fully competitive. There is little direct and continuing commercial contact between the British and European steel industries. Semi-manufactured products are sometimes imported from Belgium and scrap from Germany, and there is a small export trade, which the industry would be sorry to lose, in heavy products such as plates and rails to the ports of Holland and North Germany. But none of these is vital to the British industry's prosperity—nor, of course, does it follow that the High Authority would wish to interfere with them. Of much greater importance are the third-party markets in which British and European producers appear as competitors, and it is here that the major questions arise. Would the High Authority, for example, wish the British industry to surrender any of the preferences it enjoys in British countries overseas—and if so, against what compensation? Or again, if in some future period the world demand for steel should slump well below the exporting capacity of European producers, are British interests likely to be best served by co-operation with the Community or by competition? Price policy is another matter on which British and Continental policy has differed, the British industry apparently having a much greater preference for stability of prices. Would there be any suggestion that the British Steel Board and the High Authority should have a voice in each other's investment programmes? None of these matters could perhaps be resolved with ease; but none of them reveals an inevitable clash of interest between the British industry and the High Authority. There is no reason to suppose that a bargain could not be struck.

Coal is a different, and a more difficult, matter. The Community, unless the principles it seeks to apply outside the six countries are wholly different from those it is to enforce inside, has certain things to ask of the National Coal Board which the Board would find it very

difficult to concede. Possibly the most difficult would be the "double pricing"—that is, the charging of a much higher price for exported coal than is charged within the country—in which the NCB, despite all condemnations in principle, continues to indulge. The High Authority permits its members to charge more for exports to markets outside the Community than within it. But it rejects all "double pricing" within the Community and if Britain were to become a sort of "semi-member" there might well be pressure on it to adopt this part of the rules. British coal is already among the cheapest offered in Europe, and if the NCB reduced its export prices to the domestic level, not only would it lose revenue that it cannot afford to do without, but there would be a strong Continental demand for British coal which could not be met without reducing supplies to the home consumer, who is already limited and rationed. A uniform price could, of course, be secured by raising the internal price to the export level, but though economists might argue in favour of such a course, an all-round increase in the costs of all coal-using industries in Britain is not a policy that is likely to appeal to the political controllers of British coal. It is true that the long-term objectives of British coal policy are very similar to those of the Community: the concentration of production at the most efficient mines; the reduction of costs; and the charging of prices sufficient, but no more than sufficient, to cover average costs of production. But it has become apparent that this is a very long-term programme, and if the pressures of British domestic politics and economics do not suffice to speed it up, it is unlikely that anything further would be promised to the High Authority. Some of the Community's own members have been given a five-year period of grace to prepare themselves for free competitive conditions. They would hardly take kindly to a longer period for the British coal mines; but in the timetable of British coal policy five years begins to look like a very short time indeed.

★

An agreement on coal would therefore be more difficult than on steel. Even as a matter of industrial tactics alone, however, this is no reason for refusing to enter the negotiating room. On coal as on steel, there is surely every advantage in finding out what is in M. Monnet's mind and in drawing up a balance sheet of the advantages and dangers of substituting a set of defined mutual obligations for the present very loose relationship. Moreover, it cannot be treated as a matter of industrial tactics alone; there are two considerations of wider import. First, the British public, which owns the coal industry and is still to control the steel industry, has a right to know exactly what are the pros and cons of a closer relationship to the Community. It might be that some of the British industries' reasons for hesitation derive more from their own narrow concerns than from the public interest of the British nation as a whole. Secondly, the international politics of the matter cannot be forgotten. Over and over again, in explaining the reasons why Britain was unwilling to become a full member of European federal institutions, British representatives have pledged the closest practical collaboration with them. It will not, in Continental eyes, be a redemption of these pledges simply to station a delegation at Luxemburg, if it is not empowered to do more than to observe, to discuss and to report. The coal-steel community is the first achievement of a movement behind which European public opinion has placed considerable emotional force. Britain's attitude is already suspect, and an attitude of distant politeness towards the Community, though it might reflect no more than industrial considerations, would have far wider political repercussions. This does not mean, of course, that the British steel and coal industries need to be asked to make damaging concessions for political reasons; M. Monnet is accustomed to hard bargaining, and there should be no definite commitments on the one side without equivalent commitments on the other. But it would be a mistake to refuse to enter upon any negotiations at all or to reject in principle the objective of a precise agreement before any attempt has been made to discover what might be in it.

Plunge into War?

The dispute between Russia and Turkey, though nothing very decisive has occurred since last Saturday, bears a less favourable aspect than at that period. The Russian fleet is said, indeed, to have sailed from Sebastopol, and the English and French fleets have gone to the Dardanelles. . . . At such unfortunate prospects we can only express our deep regret. We have witnessed for the last five years, with equal surprise and admiration, the steady and inflexible determination of the bulk of the people of Europe to have peace preserved at almost any price, which has made them resist all the allurements of demagogues, and prefer certain quiet and prosperity to the doubtful and seductive charms of liberty. They have rallied round authority, because authority preserved peace. The case will be entirely altered if authority make the preservation of peace impossible, and be the means of bringing war on Europe. If the people cannot have peace with submission to the ruling powers—if they must be exposed to all the evils and horrors of war—they will fight for liberty as a means of guaranteeing peace in future, not for the preservation of despotism, on which no reliance can be placed, or the maintenance of old authority. The present relation between the industrious, the trading, the peace-loving multitude, and the thrones of Europe, which is the sole strength of the latter, will be entirely reversed by the ruling powers involving Europe in war; and neither generals nor statesmen, neither emperors nor kings, can answer for the result. Never before was the desire for wealth, and for an abundance of superior food, better clothing, and greater comforts and luxuries, equal to that desire at present, and never before was the conviction so earnest and so general that to gratify this desire the preservation of peace is indispensable. For the Sovereigns of Europe to plunge into war is nothing less than to run counter to the stream of society, which we can only dread may overwhelm them.

Notes of the Week

Commonwealth Accord

THE Prime Ministers of the Commonwealth countries completed their conference in London during the seven days following the Coronation. The discussions seem to have run very much on the expected lines. Economic affairs played relatively little part, and the detailed content of the diplomatic discussions has been kept unusually secret. It has to be remembered that Commonwealth conferences in plenary session are designed to discuss points of general interest rather than issues between two or three members. On the steps to be taken to ease world tension it is fully possible for Sir Winston Churchill, Mr Nehru and Dr Malan to find almost everything in common. Their sources of intelligence and information do, after all, overlap to a considerable extent. Certainly the official communique issued on Tuesday could hardly contain more expressions of accord and unanimity; if the content of information was correspondingly slight, that should not be taken as detracting from the agreement.

The generalities have considerable significance. It is not without importance that the Asian Prime Ministers agreed to the declaration that, while seeking peace, "the democracies must maintain their strength and exercise unceasing vigilance to preserve their rights and liberties." It is more significant still, particularly after Mr Nehru's meeting with General Neguib, that they put their names to a statement that "the Prime Ministers recognised the international importance of the Suez Canal and of the effective maintenance of the military installations in the Canal Zone." The Commonwealth countries alike of the Western hemisphere, of Africa, of Asia and of Oceania have thus forthrightly backed Britain's determination not to surrender to Egypt's present demands. Their unanimity on this point contrasts with the emphasis that it is those members "associated with or interested in the North Atlantic Treaty Organisation" who want to see the European Defence Community functioning soon. The discussions on economic policy probably could not have been much more than a review of the reasons why the "plan" of the last conference could not now be carried out in the form then envisaged. The sense of the meeting seems to have amounted to an agreement that the Commonwealth must go on as it has been going on, building up its gold reserves and its mutual trade as far as possible, until the United States adopts a good creditor policy. Convertibility will not become a serious possibility in the meantime.

The conference met at a good moment for agreement on all these matters, with the Coronation atmosphere still strong, the gold and dollar reserves rising, the agreement on prisoners achieved in Korea, and the Bermuda meeting ahead. Whatever doubts the United States may raise, there can be little question that the Commonwealth premiers support Sir Winston's idea of big power talks in its original form. On broad issues the Commonwealth is solid (though not the Commonwealth alone); the details are matters for day-to-day negotiation.

Amity and Television

PARLIAMENT reassembled on Tuesday in a good temper. The agreement on the Korean prisoners of war had been completed the same morning, which would have ensured amity even if nothing of the Coronation spirit had survived. Labour members tossed bouquets at Sir Winston Churchill in recognition of his influence on the negotiations, and for good measure he returned one to Mr Attlee. At first sight, the Government should be hopeful of sustaining this basically amicable atmosphere until Parliament adjourns for the long recess in seven weeks' time. The Opposition will presumably follow the custom of not embarrassing a Prime Minister while he is actually engaged on negotiations abroad. In any event, the main business before the House of Commons will be the Finance Bill and, whatever differences there may be over general economic policy, the specific Budget proposals offer little scope for deeply felt divisions. If only minor issues were otherwise in prospect, there would be every chance of a continued respite from serious party warfare during the summer. The majority of MPs would probably like this to be so, and it is the height of irony that the issue which at present seems most likely to break the harmony stems directly from the Coronation itself.

The BBC's dignified televising of the Abbey ceremony, contrasting with the questionable taste of the American companies handling the telefilms, shows every sign of reviving political controversy over the Government's decision to allow commercial television to be started in this country. The White Paper embracing this proposal was approved by the House of Commons just a year ago. But even then one Conservative member admitted that he voted for it only from fear of bringing down the Government and it was generally believed at the time that on a free vote the White Paper would have been rejected. This is not to say that the Government was under any obligation to leave the matter to a free vote. But there was certainly a case for doing so, particularly as the Government decided in favour of commercial TV after a small but active group of backbench Conservatives had campaigned vigorously for it. Those who were doubtful about the idea a year ago must have been impressed by the announcement last week that Lady Violet Bonham-Carter, Lord Halifax, Lord Waverley, Lord Brand and Mr Tom O'Brien are sponsoring a council to oppose the introduction of commercial

television. The list of sponsors might almost have been drawn up with a special eye to their influence on Sir Winston Churchill.

No irrevocable step has yet been taken. The Government will shortly publish the report of the advisory committee on the technical problems of commercial television and will at the same time announce its own policy in greater detail. If it decides to go ahead, it will certainly be landed in sharp and uncertain controversy in both Houses. The nature of the opposition to commercial television prevents this from being a strictly party battle, however, and if some tempers at Westminster are strained relations between the two front benches may be none the worse for it.

M. Bidault Tries in Vain

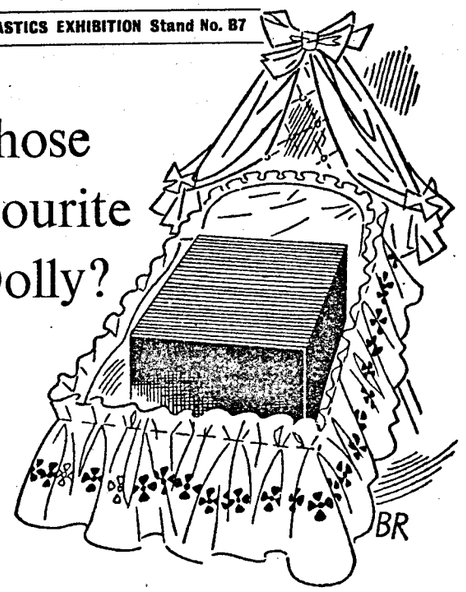
ONE vote prevented France from having a government after three weeks of interregnum. Following on M. Reynaud in the role of Jeremiah and M. Mendès-France with his brilliant programme of Bevanism, M. Bidault tried to secure from the Assembly the necessary absolute majority. His proposals were a series of compromises tempered with hope: M. Bidault spoke of arriving at some form of truce in Indo-China without French withdrawal, and urged conciliation in North Africa without saying specifically what France was prepared to concede. Although M. Bidault admitted that his government would make the ratification of the EDC treaty a matter of confidence, he reassured the deputies that it would not come up for debate until the additional protocols had been signed, until negotiations with Britain were concluded, and until a settlement of the Saar problem was in sight. Only with regard to decree laws needed to meet the French budgetary crisis did M. Bidault venture beyond generalities. His speech was calculated to evoke support from a coalition very similar to that which existed during M. Mayer's tenure of office. M. Bidault can have had no illusions about the longevity of his government, but the trip to Bermuda was a prize worth trying for.

His defeat, by an absurdly narrow margin, came as a surprise and was probably due to the pique of several Radical deputies who wished to avenge M. Bidault's opposition to M. Mendès-France a few days before. Whatever its motive, the Assembly's rejection of M. Bidault creates a grave situation. M. Pleven is the obvious candidate for one more attempt, but it is difficult to see how he could rally a more substantial majority than that hoped for by his predecessors. If M. Pleven fails, and if M. Pinay remains in the justifiable attitude of a republican Coriolanus and refuses his services until the repentant Assembly meets his terms, to whom could President Auriol then turn?

General Ridgway Reports

GENERAL RIDGWAY'S report on the state of Europe's defences under Nato is typical of the retiring Supreme Commander: honest, dogged and narrow-eyed. Indeed, it reflects so little the economic and political difficulties into which rearmament has run during his short term at Shape that the document can hardly have been approved by the Standing Group in Washington or by the Atlantic Council in Paris. That General Ridgway should have been left to plead alone for more and better forces, adequate ammunition and supplies, and a steady understanding of the Russians' ability to use against Europe surprise and overwhelming superiority reflects no credit on the Nato governments. Where is the "increasingly firm top-level direction" from Lord Ismay's Council to which the report pays homage? It is a pity that General Ridgway should be joining the American Chiefs of Staff with a feeling that Nato did not back him up.

On the other hand there is another kind of realism that is entirely lacking in General Ridgway's argument. He will not face the fact that rearmament is near its peak and will soon level off. He has nothing to say about how the Atlantic powers are to maintain readiness in a state of peaceful or tense co-existence; yet that is Nato's military problem from now on. The crying need for a new system of training and mobilising reserves is treated so cursorily that yawning gaps in readiness behind the front line remain concealed. The report would have done good, though it would have caused explosions in Washington and London, if it had said flatly that the American Army has not begun to produce adequate reserve divisions, and that the British Territorial system—excellent in principle—could not produce reserves fast enough to reinforce the regular divisions in Germany. General Ridgway, like most of his service colleagues in Shape, has not begun to think how democracies can keep effective forces in being for a long time. He is still obsessed—not unnaturally—with the problem of holding off at any moment the 30 Russian and 60 satellite divisions in Europe.



The report deals some good buffets at complacency. "Air power is still today the weakest link in our defence"; there is a "grave shortage of operational reserves"; stocks have not been built up as promised; Northern Europe has no troops worth speaking of. General Gruenther will find it hard to get even a quarter of the divisions that General Ridgway wanted; but he will probably plead for them with more subtlety and patience.

Pointers from Panmunjom

IN the House of Commons on Tuesday the Prime Minister paid a spontaneous tribute to the United Nations negotiators at Panmunjom, and stressed the difficulties with which they had had to contend. He might have added that the recent course of the negotiations has suggested the advantages of using two specific techniques in dealing with Communist representatives. The first is silence. Since May 25th, the Panmunjom talks have been held in true secrecy; neither party has published, each from its own corner, the former blow-by-blow account of each exchange. Is it mere coincidence that the prisoner-of-war problem, which had defied solution for so many months, was settled so rapidly once this technique was adopted? Admittedly, there are limits to the usefulness of secrecy. If the Communists had not got to the point of needing a truce, or if they had seen a chance of dividing the allied ranks by judicious

BRITISH PLASTICS EXHIBITION Stand No. B7

Whose Favourite Dolly?

Far from being pampered, this BAKELITE Laminated pile driving dolly has to stand up to forty-five blows from a 4-ton hammer every minute. Yet it is certainly the constructional engineer's favourite, for it outlasts the elm and oak dollies formerly used. The unusual toughness of the fabric-based BAKELITE Laminated Materials is one result of the continuous process of experiment and development that goes on from day to day. The story of plastics is already a long one, but new pages are being written every day — by the organisation whose pioneering efforts were mainly responsible for the general adoption of these versatile materials.

man and tree

If nature is kind, a man may live in health to a hundred years, a tree to a thousand. Man's knowledge of the chemistry of health is increasing. Through science man is gradually making nature kinder and more predictable. Fisons are in the business of chemicals. Their main manufacture over the last hundred years has been chemical fertilizers to enrich the soil. But they make chemicals for medicine and industry, too. Fisons contribute to Britain's harvests, health and wealth.

"leaks," they might well have broken the silence. Clearly, neither open nor secret negotiation will yield results when one party is merely playing out time, but when both parties genuinely want a settlement secrecy has great advantages. The press has a duty to recognise this fact.

The second lesson from Panmunjom is the value of a degree of toughness. General Harrison, the chief UN delegate, has more than once been criticised in this country for an apparently unyielding attitude on certain points; but twice in recent weeks events have seemed to justify him. Essential Communist concessions, without which no truce based on humane principles could have been achieved, have followed his stubborn stands. It is important here to distinguish between talking tough and talking big. In dealing with totalitarian governments, experience has shown that it is fatal to talk big, to demand or threaten what is clearly beyond one's power; for the antagonist, free from the impatient hopes and criticisms that beset democratic negotiators, is happy to sit back and await the inevitable climb down. On the other hand, experience also shows the danger of underplaying one's hand. The Communists haggle in the manner of an Asiatic bazaar, and if they find their opponent stating at the outset only minimum terms, they either conclude that he is weak or suspect a trap. There is, therefore, something to be said for making quite clear in advance of negotiation what interests are considered vital; the Russians themselves do so.

Federation in Committee

It was hardly to be expected that the Government would accept the Opposition's amendments to the Rhodesia and Nyasaland Federation Bill, which was considered in committee this week. For the most part these sought either to delay the coming into force of federation or to change the draft constitution that had already been agreed between the British Government and the Governments of the three territories concerned. In both cases, acceptance would be interpreted as hesitation and drawing back from the federal scheme; it would thus encourage African extremists to persist in their campaign of intimidation and European extremists in their propaganda that the yoke of the United Kingdom Government should be shaken off as soon as possible.

It was, however, the manner rather than the fact of the Government's rejection of the amendments that was in doubt. By turning them down out of hand, Mr Lyttelton could himself have done considerable harm to the cause of federation. On the whole, he showed himself conciliatory and patient. But if he said nothing to intensify the Africans' fears he also said nothing to help dispel them. It is, for instance, a pity that the Government did not accept the amendment that would in effect have made the two Secretaries of State—for the Colonies and for Commonwealth Relations—jointly responsible for the activities of the federal government. There are difficulties in the way, because this arrangement would imply that the status of the federal government was less than that of the Southern Rhodesian. But, as Mr Lyttelton said, the constitution itself is illogical; and the Africans would have more faith in the efficacy of the Colonial Secretary if he were clearly and constitutionally responsible. The present intention is that he should be called into consultation and either agree with his colleague or take the matter to the Cabinet. The amendment would have made little practical difference, but it would have made the safeguard for the Africans more visible to them.

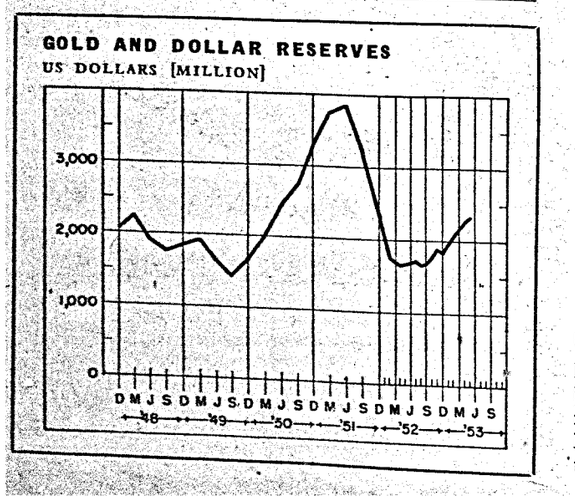
In the meantime, the most effective gesture of conciliation towards the Africans has come from Salisbury. The inaugural board of the proposed Rhodesia university has decided that the university should be completely inter-racial on the academic side and that admission should be dependent solely on educational attainments and character, regardless of race or colour. This decision does not meet all the objections to the Salisbury project raised in the Carr-Saunders report (discussed in *The Economist* of May 30). One of these objections involved the site, which the inaugural board is unwilling to abandon. But its declaration of racial policy is a big step forward—provided that it can now be backed up by the necessary funds.

Proscribing a Party

The Kenya Government has now proscribed the Kenya African Union, taken over its property and made membership of it a serious offence. It has always been clear that the organisation, some of whose officials were implicated in Mau Mau, must itself be suspect, but for a considerable time the Government rightly tried to maintain a distinction between the seditious activities of individual members of the union and the organisation's own legitimate purposes. The detention of Mr Odede, successor to Jomo Kenyatta as its head, on the ground that he was involved in Mau Mau, obviously made it increasingly hard to give the union the benefit of the doubt, though Mr Odede has not yet been brought to trial. No doubt more evidence has accumulated, and the Government—itself under great and increasing pressure from the settlers—has felt compelled to take drastic action. But it is action with the wholly regrettable effect, which will depress the spirits of everyone but the extremist settlers, of leaving the Africans of Kenya with no political organisation through which to voice, or indeed define, their grievances and legitimate aspirations. This is still true, even if it be admitted that the union was almost wholly an expression of Kikuyu politics.

It should surprise nobody that African political organisation fails to follow the models provided by British parliamentary parties. Even West African nationalist parties made use on occasion of local methods, in which witchcraft and secret societies have a big place, in their struggle for power. In Kenya, the impulse towards the conspiratorial in political organisation is inevitably greater, because the opportunity for legitimate and effective African self-expression through nominated (and generally distrusted) African representatives on the Legislative Council is less; moreover, the racial situation is more frustrating. What was begun in the Kikuyu independent schools was naturally consummated in the Kenya African Union.

The settlers will see in the proscription of the union a further reason for pressing for increased power for themselves, and for the indefinite postponement of securing



African representation by election, even after the emergency is over. But the problem of making African aspirations articulate and legitimate will remain. The Mau Mau insurrection was possible only because of culpable ignorance by settlers and officials alike about developments in Kikuyuland. Such insularity has to be overcome, and the Europeans have somehow to work politically with the Africans, if any constructive approach to race relations is to be made.

Sex Inequality at School

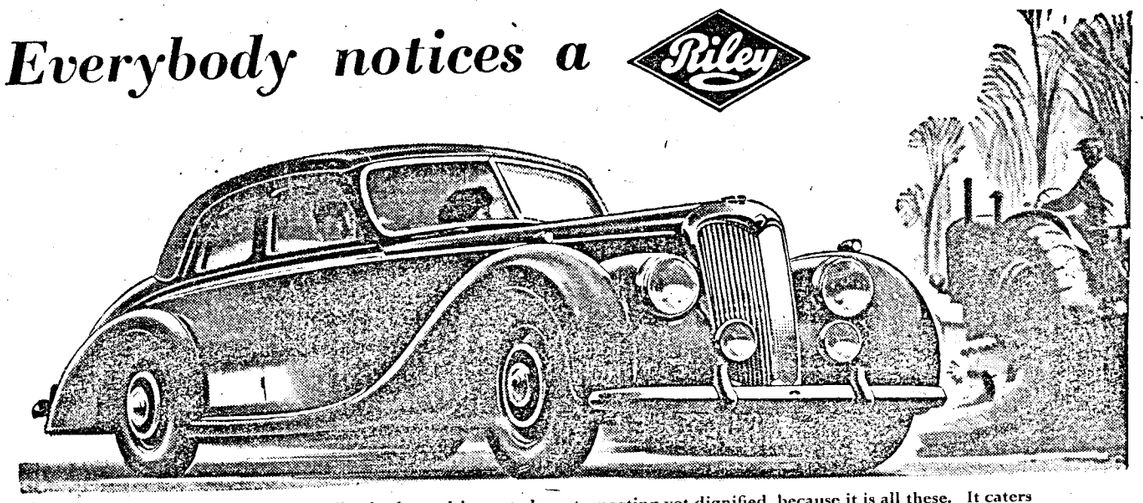
FROM the Minister of Education's Report for 1952, published this week, some comparisons can be made between the educational careers of boys and girls. The proportion of boys who get a grammar school education in England and Wales is about the same as the proportion of girls who do so—about 30 per cent of the children of each sex in maintained secondary schools. Neither the boys nor the girls took full advantage of their opportunities, for the commonest age of leaving grammar schools was sixteen for each sex. This means that the education continued for only a year longer than the minimum. Two-thirds of the pupils leaving grammar schools in 1952 were under seventeen; the proportion was much the same for both boys and girls.

Girls did better in the General Certificate of Education. In the individual subjects at ordinary level the girls could show 63 per cent of successes against the boys' 57 per cent. The girls' lead, in this respect, was maintained at advanced level, where 74 per cent of their entries were successful, compared with 71 per cent for the boys. But this lead was in proportion to entries only, not in absolute terms. Although as many girls as boys completed the grammar school course, less than half as many girls entered for the certificate at advanced level. The girls' schools evidently play safe and are content to enter even relatively mature pupils for an ordinary certificate. One reason is, no doubt, that fewer girls seek the advanced qualification because more than twice as many boys go on to universities. State scholarships were won by 1,800 boys and 600 girls, but this represented an equal proportion of successes for the women candidates. At the university stage, however, the men come to the fore. Of 1,250 male state scholars who took their final examinations in 1952, one-fifth got first-class honours, compared with one-eighth of the 400 women.

At the other end of the scale, there were 26,000 boys in schools for handicapped children, compared with 19,000 girls. Male preponderance was heaviest among the maladjusted and educationally subnormal. The broad conclusion seems to be that, educationally speaking, a bigger proportion of girls are mediocre and the boys produce more of both the best and the worst.

Taftism Explained

BEFORE announcing his temporary retirement from the leadership of the Senate, Mr Taft sought to clarify his controversial speech in Cincinnati, which was discussed in the last issue of *The Economist*. The general understanding of this speech was that the Senator advocated a forthright go-it-alone policy for the United States. So cautious an authority as President Eisenhower himself read it in this sense and took the opportunity to say so at a press conference.



In an apparent attempt to soften the impression he had made, Mr Taft has now published an elucidation. So far from bringing comfort to his critics, his new statement merely reinforces their original fears. "If we are to disentangle ourselves from the United Nations," he said, "we already have treaties with Australia and New Zealand, with Japan and the Philippines. . . . I think we should have a free hand to form an alliance with the British, if we possibly can do so, as to how Far Eastern affairs should be conducted. An alliance has this advantage over the United Nations, that each member can express his views and no other member can veto his action, as the United Nations . . . vetoed the hot pursuit by our aeroplanes in Manchuria."

In other words, Senator Taft's concept seems to leave no room for a concerted policy with America's allies. Either they agree with Washington or they are ignored. President Eisenhower, for one, does not seem to have been reassured. Again this week, in a speech at Minneapolis, he has spoken out against the "fortress theory of American defence" and has reminded the American public that compromise is the essence of democracy and of unity with allies.

Dr Adenauer Fears a Soviet Trap

ONE unfortunate result of Sir Winston Churchill's public support for a Four-Power meeting has been to increase Dr Adenauer's difficulties. The Federal Chancellor has been unable to hide his fears that talks with the Russians might wreck the already precarious chances of forming a European Defence Community; and he has been forced this week to defend himself before the Foreign Affairs Com-

Everybody notices a Riley

The Riley looks exciting yet elegant, sporting yet dignified, because it is all these. It caters for the enthusiast by providing a race-proved engine which though rather more costly is infinitely more efficient. And it offers a particularly happy marriage of positive steering and sure road-holding. The Riley is in fact a car with a very pronounced character. That's why it stands right out wherever it goes.

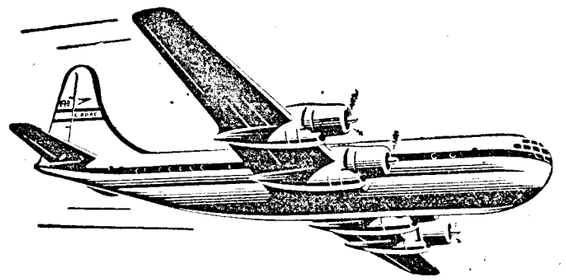
An interesting experiment



WE SUGGEST that you try this experiment upon yourself. For the space of one month, change your newspaper. Take the Manchester Guardian.

You will at first be disconcerted. All change of habit disconcerts. But within a week—when once you have accepted the fact that the Manchester Guardian will neither pander to your lower instincts nor yet pose as an infallible organ—you will find your heart warming to this outspoken newspaper.

You will find that good writing has its own savour, a delicious one. You will welcome the candour and clarity of the reporting. You will sense that the Manchester Guardian is a true part of the true England. You will see why the Manchester Guardian is everywhere known as a 'national' newspaper.

An interesting experiment! It can do you nothing but good to try it out this very week.

If you have any difficulty in getting your Manchester Guardian regularly, please write to: The Manchester Guardian, Manchester.

Across the Atlantic 27 times a week!

This summer B.O.A.C. is operating 27 North Atlantic services a week to the U.S.A., Canada and the Caribbean. This schedule includes seven low-fare Tourist Class services to New York by *Constellation*, and five to Montreal.

London to New York *direct* — THE Monarch

London to Montreal *direct* — THE CANADIAN Monarch

De luxe "Monarch" *Stratocruiser* services to New York or Montreal direct. Additional services to New York via Prestwick and Boston; to Montreal via Prestwick. Enjoy transatlantic air travel at its best — with breakfast in bed, if you wish!

mittee of the *Bundestag* against the Social-Democrats' charge that he lacks proper enthusiasm for German unity.

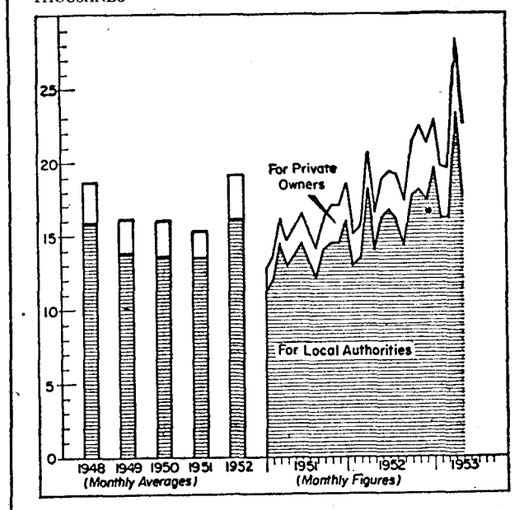
Dr Adenauer's fears are well-founded in previous experience of Soviet methods. It is quite possible that Moscow will propose talks on free all-German elections simply in order to confuse the issues in the campaign that has now begun for the Federal Republic's elections. Dr Adenauer's hopes of re-election might be seriously weakened if the Germans were to believe that there was a chance of regaining the Soviet Zone in peace and freedom at the price of abandoning the western alliance. The Soviet negotiators could easily drag out talks on free elections for as long as the marathon conference at Panmunjom, unless the western side itself broke the sessions off. In a number of earlier fruitless conferences with the Russians the western negotiators have gained an insight into their technique which should now stand them in good stead. They know that if Molotov finds agreement beginning to look unavoidable, he throws some extraneous demand into the discussion. Nobody can forget the occasions when the Soviet side, in the middle of negotiating on Germany or Austria, suddenly proposed to talk on China or Trieste. The same trick might well be tried again; and in the meantime, Molotov would perhaps have tried to re-establish four-power control over Germany, with a Russian exercising a veto on affairs in the Federal Republic. That this is what the Soviet Government intends is suggested by its insistence on a return to Potsdam, and by the recent administrative changes in the Soviet Zone, which have brought Semionov's position into line with that of the High Commissioners in the West.

In view of this possible Soviet trap, it was sensible of Dr Adenauer to send a representative post-haste to Washington when the Bermuda conference was announced. He has now secured from President Eisenhower a fresh assurance that no decisions concerning Germany will be taken at Bermuda or at four-power talks without consulting the German government. Sir Winston Churchill gave a similar promise to the Chancellor when he was in London last May. That is all to the good. But the Western statesman apart from consulting Dr Adenauer would do well to avoid starting a chase for agreement with Moscow on Germany until the Federal elections are over.

Goodbye to Famine in India?

MR NEHRU'S recent statement that India expects to be self-sufficient in food next year is heartening; but it is also surprising. The major deficiencies in India's domestic food production are in grain and rice. In both instances the five-year development programme envisages a substantial increase in production by 1955-56; but no remarkable increase is planned or likely by next year. Imports of food for 1953 are expected to reach 2.5 million tons and it is hard to see how this gap will be bridged by local production. A good harvest and a steady increase in productivity, still below prewar levels, might help; but no permanent or immediate solution appears likely. Mr Nehru cannot, of course, be contemplating any reduction in standards of food consumption which, even now average only about 80 per cent of the prewar daily calorific intake per head. His government is committed to a programme of improving living standards for a rapidly increasing population. How this is to be squared with self-sufficiency by 1954 is not clear.

There was until recently no suggestion that the Indian government had such hopes, for there were reports of negotiations with the Russians for a five-year agreement by which India would receive a million tons of grain annually. Furthermore, the Indian representatives at the international wheat meeting seemed only too willing to sign the agreement. A permanent improvement in the Indian food situation would be universally acclaimed, for no one wants to see a return of the famine years of recent and bitter memory; but one would like to see concrete evidence of Mr Nehru's claim.



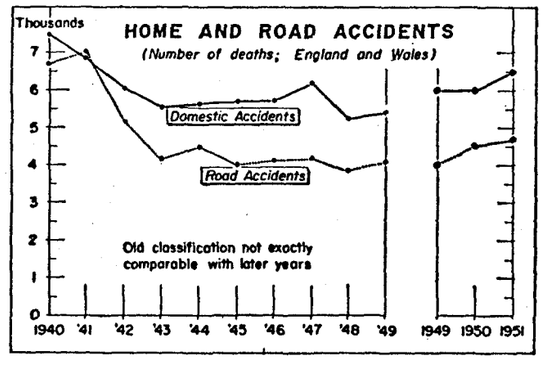
Preserving England

ANYONE who is inclined to think that the Council for the Preservation of Rural England is solely concerned with thatched cottages and village greens is advised to read its annual report. He will then see that its activities range far and wide, from coasts, moors and mountains to housing schemes and refuse pits. With so wide a sphere, it naturally encroaches on the work of other bodies, for instance, the National Parks Committees, the National Trust and local preservation trusts. It also comes up against authority, in one form or another, all over the country: the Service Departments, which have excluded the public from so many open spaces; the Ministry of Housing; the electricity authorities; the National Coal Board; the local authorities; the prison commissioners. Private enterprise is another enemy; the council is concerned with the pollution of the sea by tankers, and with

HOUSING PROGRESS

Permanent Houses Completed in Great Britain

THOUSANDS



outdoor advertising, including, indirectly, the advertisements in that non-rural area, Trafalgar Square.

In its many battles, the council fights in a good cause. But it is a cause that sometimes has to give way in the face of the inexorable pressure of population and a modern standard of living on a restricted space. People cannot always expect to have amenities both inside and outside their homes. If in a particular case they prefer electricity to a view unbroken by pylons, the council will have to defer to their choice. But the value of its activities, apart from its prevention of some unnecessary horrors, lies in making authority—and private enterprise—think again about some projects. Small modifications and a very little extra expense will often enable the thing to be done without spoiling a beauty spot. What is surprising is that the council can do so much with so small an income. Last year its income was only £5,800, to meet expenditure of £6,370. It certainly deserves more support from the public than it gets.

The Unsafe Home

It will come as a shock to most people to learn that the modern home, with its labour-saving equipment and amenities, is a dangerous place to live in. Yet the report of the Interdepartmental Committee on Accidents in the Home (HMSO, 6d.) shows that annual deaths from domestic accidents far outnumber road deaths. (The comparative figures are shown in the accompanying chart.) No national figures about injuries in the home have been compiled, but they are certainly very large. The report states that in 1946 in a congested Birmingham area 9 per cent of the children under 10 and 13 per cent of all adults were treated at the Birmingham Accidents Hospital for accidents in the home. It has been estimated, from the experience of this hospital, that the hospital treatment of home accidents in the country as a whole costs about £4-£5 million a year.

The very young and the elderly and old are, as one would expect, most prone to accidents at home. Twenty-five per cent of the deaths are accounted for by children under 15, and 50 per cent by persons over 65. According to the report, the commonest kinds of fatal accidents are as follows: falls, 58 per cent; burns and scalds, 13 per cent; suffocation, 12 per cent; coal-gas poisoning, 8 per cent. The proportion attributed to suffocation should, however, be treated with some reserve. There is a widely held belief that many babies found dead in cot or pram, and subsequently said to have been suffocated, may actually have died from natural causes.

Like road accidents, accidents in the home can be dealt with partly by legislation. It is an offence, for instance, to leave a child in a room with an unguarded fire; and last year an Act was passed preventing the sale of gas, electric and oil fires without adequate protection. But as with road accidents, the main remedies must be propaganda and education. The worthy purpose of the committee's report is to provide material on which campaigns for prevention can be based.

Storm Signals in Soviet Germany

The penalty of failure has begun to fall on Herr Ulbricht, whose loudly vaunted process of "building socialism" in the Soviet Zone of Germany has led to an economic crisis and the flight of hundreds of thousands of valuable citizens to the west. It is no longer possible to hide the effects of terrorism, the collectivisation of farms and galloping inflation even in Czechoslovakia, where serious unrest has admittedly followed the government's currency reform (dealt with on page 745). In Eastern Germany, the Communist system is laid bare to western eyes, as the stream of refugees pour over with their tales of misery and oppression; yet the Soviet Zone was intended to be the model and magnet for Western Germans.

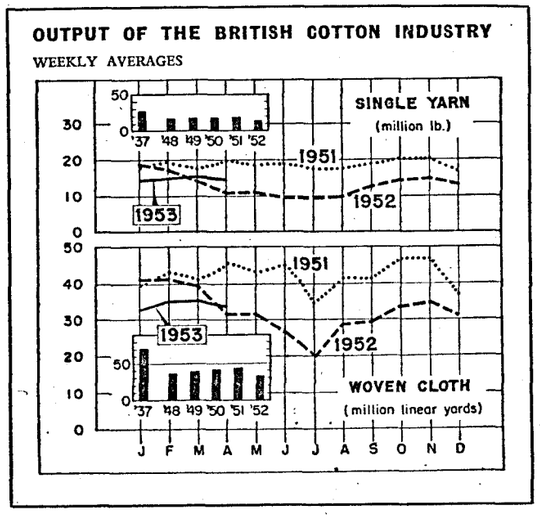
The concessions that were announced on Wednesday by the Socialist Unity Party in Eastern Germany are, therefore, in the first place a forced admission of weakness. They are intended to plug the flow of refugees, and to lure back the producers—particularly the farmers and technicians—who have already sought sanctuary in the west. By halting the drive towards Communism, sources of food supplies and consumer goods are to be unfrozen. In addition, the concessions are probably intended to counteract anti-Communist and anti-Russian feelings in Western Germany during the election campaign. This new moderation—which includes an agreement to stop persecution of the Evangelical Church—may have some effect in appeasing the Germans, to judge by the tributes which the Austrians are now paying to the Russians for concessions made in that country. It is a mournful fact that the very brutality of the Russians' normal behaviour means that everyone tends to be delighted with them when they show signs of civilisation, while the freedom long granted by Western governments is taken for granted.

The concessions made in the Soviet Zone include credits for the private traders and abandonment of what are now called "errors" in "coercive tax collection methods." Returning farmers will get their land back, or receive compensation. There will be an amnesty for peasants who had been sentenced for failure to deliver the quotas imposed on them, and on all prisoners serving sentences of up to three years for crimes against State property. It is confirmed that the decree which in May deprived well over a million people of ration cards will be reversed. As this move had originally been made as part of an attempt to mop up surplus purchasing power, the latest decision indicates that the Soviet German leaders will now have to find some other way to combat the serious inflation in their Zone. They may try currency reform, though the unprecedented resistance roused by the Czech government's reform suggests that this is a solution which will not be lightly adopted.

Prince Akihito's Visit

The visit of the Japanese Crown Prince to this country on the occasion of the Coronation has been a significant event, not only as a symbol of the restoration of friendly relations between Britain and Japan since the peace treaty, but also because Japan is now the most important country outside the Commonwealth to retain the institution of hereditary monarchy as part of its political system. Prince Akihito has followed in his father's footsteps; for the present Emperor visited Britain in 1921, when he was himself Crown Prince, and some years ago, according to Mrs Vining, the American Quaker who was tutor in English to Prince Akihito during the occupation period in Japan, the latter declared that Britain was the foreign country he most wanted to visit—a preference surprising to his teacher, who expected him to put America first.

He has now made his first tour abroad at the impressionable age of nineteen, he has been a welcome guest in this country, and he has had an opportunity of observing at first hand those British institutions which have long been admired in Japan, but have hitherto been prevented by adverse conditions from having a decisive influence. The Meiji Constitution of 1889, under which Japan was governed until 1945, was modelled, not on the British, but on the German, political system of the time, and was designed to reserve far-reaching executive powers for the monarchy, while granting to an elected parliament rights similar to those of Bismarck's Reichstag. But the eclipse of Imperial Germany in 1918 left Britain as the principal example of successful monarchy in the west, and Hirohito, both as Emperor and, for a period previous to his accession as Regent, favoured the trend towards a parliamentary monarchy of the British type which was marked during the twenties. This was shown particularly in the Emperor's refusal to replace the Genro or Elder Statesmen—the body which nominated Prime Ministers—as they gradually died off. It was expected that after their final extinction cabinets would be formed according to a usage similar to the British. But a constitutionally autonomous and politically minded army seized the powers which might have passed to the Diet, and the Court was not strong enough to prevent their political ascendancy.



Since the war Japan has adopted under American prompting a complete parliamentary democratic constitution, but the monarchy remains a factor of great influence, if no longer legal power. It can be an essential element of stability in the new liberal Japan or it can become a centre of reactionary intrigue. Much depends on the conception which the young Crown Prince forms of the functions to which he is destined to succeed. It may be hoped that he has taken away from this country some impressions and observations which may be helpful to him in the increasing responsibilities that lie ahead of him.

Freedom of an Editor

That political and civil liberties in Switzerland should be in serious danger seems incredible. Over the centuries political freedom has not only been a Swiss habit, but it has also been extended to a series of stormy exiles, from Rousseau to Lenin. Last week, however, the country found itself in a crisis of opinion over the problem of whether or not the direction of a newspaper is a public trust, independent of the will of its board of directors. The crisis arose over the resignation of M. Pierre Béguin, the editor of the liberal *Gazette de Lausanne*. The *Gazette*, which was founded in the revolutionary year of 1798, has prestige and influence far exceeding its circulation of 20,000 copies. M. Béguin's resignation was the result of seven years of mounting conflict between his own liberal editorial policies and the wishes of a small group of conservative Vaudois financiers who have acquired a controlling interest in the paper.

M. Béguin felt that the *Gazette* could no longer carry on as an independent paper and his stand has been supported by a number of other trustees and many of his regular contributors. It has, moreover, received wide backing from the public and the rest of the press. It even seems likely that the Federal Council, at the request of the National Council at Berne, will give a public ruling, especially as it is preparing to revise the article on the freedom of the press in the Swiss Federal Constitution.

As long as the conflict is *sub judice* it would be improper to do more than recognise that the problem is one of great complexity. On the one hand, a newspaper such as the *Gazette* is far more than a private business and stands in a relationship of responsible independence towards the community. On the other hand, so long as a newspaper represents the private investment and consequent risk of its trustees, the latter have a case for making their opinions felt. A settlement of the dispute between the parties now seems likely, as the opponents of M. Béguin have unstiffened. The details will be interesting to newspapers far beyond Switzerland, for the principle involved is vital.

Books & Publications

Controls and Controllers

THE CONTROL OF RAW MATERIALS. *The history of the Second World War: United Kingdom Civil Series.*
By J. Hurstfield.
H.M. Stationery Office. 530 pages. 35s.

WHETHER in war or peace, this country must import its raw materials, and the basic problem in the last war was again the physical one of getting them in. Until the advent of Lend-Lease, indeed, there was a serious financial problem; and all through there were problems of procurement that increased with the loss of the Pacific and the entry of the United States, until the whole allied and neutral world was being combed for various scarce materials required for the combined war effort. But for Great Britain shipping was the overriding problem in the case of staple materials.

In this volume of the official history of the war, Mr. Hurstfield traces with accuracy and fairness the development of the estimating and programming of requirements in relation to needs and to shipping space—from the prewar days, when no estimates could be made at all, until both the British authorities and the Combined Raw Materials Board were serving up programmes in profusion. Estimating is an art as much as a science, and practice improved greatly on the early days of "We must put down a figure" and "We mustn't leave ourselves short" tempered by "What's the use of your asking for all that?" But how far even agreed programmes can fall short of achievement is indicated by the comparison given on page 216 between the shipping programmes for 1942 and the actual imports. Mr Hurstfield is perhaps inclined to overrate the importance of estimating in totals, essential as it was. He quotes a dictum that "in a planned economy statistics assume the role played by competition under private enterprise." But while statistics of the future may provide an aim, an assumption, or an argument, the result has still to be struggled for.

Mr Hurstfield justly emphasises the lack of prewar preparation, and how gradual was the approach to full civilian austerity. Three things might have been done in the prewar period. Preparations might have been made to curtail civilian consumption drastically on the outbreak of war, in the expectation that the resources released would sooner or later be taken up in the war effort. This course was hardly conceivable in the climate of the time, and it may be doubted whether it would, in fact, have shortened the war or rendered it less costly. Secondly, stocks of raw materials might have been gathered, in the confident expectation that they would in due course be required. This was done only to a very limited extent, but the "phoney war" gave something of a second chance. Thirdly, apparatus might have been established to enable the control of raw materials to be undertaken without delay. Under the stimulus of Munich this was done effectively, and on the day war broke out fully staffed controls came into force for the more important materials. They were staffed from the trade; the controller himself was usually drawn therefrom; and in all matters of detail they had to think and act pretty much for themselves. The controls were even physically scattered over the country. A small headquarters, staffed by civil servants with an admixture mainly of dons, was responsible for their co-ordination and guidance and for transmitting instructions on policy. It was also responsible for looking after the many lesser materials for which no separate control for the time being existed, but which might at any moment become a critical point in the war effort.

This organisation was by no means the only possible one—the Ministry of Food indeed chose rather differently—but it worked remarkably well. The golden rule for headquarters was to give help freely where needed, and to interfere as little as possible when the control was strong and fortunate enough to do its job effectively and without getting into trouble. The allocation of a number of materials for which departments were in acute competition was in due course undertaken by an inter-departmental committee with a ministerial chairman. A heavy burden, however, fell upon the controllers, who plunged into the unknown with courage and determination and carried their trades with them. Too little recognition has been given to their resourcefulness, flexibility and impartiality. Mr Hurstfield deals with them in no more than very general terms, but it is to be hoped that before recollection fades and records disappear the adventures of some of them at any rate may be written down.

Warm-hearted Believer

BORN TO BELIEVE.
By Lord Pakenham.
Jonathan Cape. 254 pages. 18s.

LORD PAKENHAM'S autobiography provides an attractive and reliable self-portrait—none the worse for being partly unconscious—and a chain of amusing stories about his various acquaintances and political adversaries to all of whom he is a little more than generous. But his approach is too emotional and subjective to offer a convincing or coherent account either of his policy as a Socialist Minister or of his successive changes of front towards politics and religion. Odd as it may seem in one who has chosen an academic career, Lord Pakenham, despite considerable intellectual brilliance, appears from this book to be ruled by his heart rather than his head. His main attitudes are to be explained on an emotional rather than intellectual basis.

Lord Pakenham has become successively a supporter of Mr de Valera, a Socialist and a Roman Catholic. The first decision he justifies on the grounds that partition is "against nature" whatever this may mean; the second, by the dogmatic assertion that there is a "superior morality" in the Socialist case "above all in its demand for an equalitarian distribution of wealth." This view, if accepted, would justify any policy of confiscation and runs clean counter to the philosophy of the Roman Catholic Church on the subject of property, but Lord Pakenham endeavours to support it by the proposition "because I believe that each one of us is of equal and infinite importance in the sight of God"—a premise which hardly seems to justify in itself the compulsory redistribution of material things on an arbitrarily egalitarian basis.

His conversion to Roman Catholicism is explained as an urgent necessity occasioned by the need to salvage his genuine piety from philosophic agnosticism. Comparatively late for one of his generation he came to doubt the existence of God, and, some thirteen years afterwards, he tells us that he flew in to Father D'Arcy at Brewer Street "like a homing pigeon." "It was not a choice between Catholicism and any other form of religion. It was a belief in Catholicism or no belief at all." Faced with these stark alternatives, no doubt Lord Pakenham made the right choice; but it is precisely the question why life should have presented itself to him in this somewhat simplified form to which he never really gives any sort of answer.

The same unintellectual and subjective approach colours his account of his principal ministerial decisions. One may approve the courage and warmth of heart with which he entered into his duties to the defeated Germans, but he never explains why he should discount the opinions of those who regard them a little more suspiciously than he does himself. The debate on his rejection, perhaps a little hasty, of the results of the judicial inquiry into the Prestwick air disaster is reduced to "nothing but a Prep School Court Martial . . . kick, pinch, slap, punch." And the relations between the races in Africa suggest to Lord Pakenham nothing more complicated than the picture of the Irish tenantry assembled before Lord Aberdeen at a Pakenham horse show.

The title "Born to Believe" is drawn from Disraeli's famous speech at the Sheldonian in which he proclaimed himself as "on the side of the angels." No one who reads this book will doubt the reality of Lord Pakenham's faith or his desire to serve on the side of the angels; but those who are less concerned with the achievement than with the content and grounds of belief will find little to satisfy them in his account of the matter.

Germany's Generals

THE GERMAN GENERAL STAFF.
By Walter Görlitz.
Hollis and Carter. 508 pages. 30s.
SWORD AND SWASTIKA.
By Telford Taylor.
Victor Gollancz. 413 pages. 21s.

THE sinister characteristics of the German General Staff were for long an article of simple democratic faith—no institution in German history has enjoyed such authority as the army, none so completely embodied the continuity of national purpose. The General Staff were the high priests of this tradition, which they were trained to serve with an impersonal devotion. Their description of themselves as unpolitical is naïve and misleading; under its ablest leaders, from Scharnhorst to Seeckt and Schleicher, the High Command played, and sought to play, a major role in the development of the German state and its policy. The plea that German generals were not concerned with politics was the excuse with which the army's leaders sought to evade obligations (as under Weimar) or responsibilities (as under Hitler) which they found it convenient not to recognise. Hitler was the first German ruler who refused to accept the pretensions of the General Staff, and their exclusion from politics after 1938 marked the end of their power—without regard to what they may regain in the future.

No history of this remarkable institution has hitherto been available in English. The first of these two volumes is an abridged translation of the work which was first published in Germany in 1950. Herr Görlitz, who is also the author of a history of the Second World War and a biography of Hitler, tells his story plainly and clearly. Beginning briefly with the work of the founding fathers, Gneisenau, Scharnhorst, and Clausewitz, he really gets into his stride with Moltke, who became Chief of the Prussian General Staff in 1857. Only Seeckt ranks with Moltke in the influence he exerted on the character of the German General Staff, but a series of well-drawn portraits fill the gap between, from Schlieffen, combing history to find a parallel in Cannae for his own plan of encirclement, to Hindenburg and the magic formula of the "stab in the back."

More than half the volume is devoted to the years after 1918, and the chapter on the Weimar period is the best in the book. The years that followed began with brilliant hopes of what Hitler would do for the German army and ended with the ignominy of a double humiliation, at the hands of Hitler and in the loss of the war. It is a shabby record, which illustrates the limitations not only of the men who then led the German army but of the tradition in which they had been bred. Herr Görlitz is content to tell his story with few comments. But most English readers will feel bound to ask whether the moral decline that stands out so sharply from his pages does not go back to the methods of chicanery and deceit with which the German High Command sought to conceal its responsibility for the loss of the war and its intention to rebuild German military power after 1918.

It is also true, as Brigadier Telford Taylor insists in the second of these two books, that the German generals were in far more substantial agreement with Hitler's objectives than they or Herr Görlitz are prepared to admit. Brigadier Taylor's book is substantially an expansion of the brief he presented as one of the American prosecutors at the Nuremberg Trials, and it makes effective use of the evidence then brought to light. The narrative stops short with the occupation of Poland in 1939, but its analysis of the social and moral shortcomings of the German Officer Corps and its traditions is far more critical than Herr Görlitz's account. Indeed, a comparison of the two books reveals the wide gap that still separates American and British views of the place and purpose of the army in the state from those of even postwar German opinion.

Twice before, after Jena and after 1918, Germany's military leaders succeeded in evading the terms of a dictated peace with momentous consequences for Germany and for Europe. The decision to rearm Germany again may be inescapable, but these two books leave one in little doubt of the dangers that can arise from pursuing such a course without adequate safeguards.

Matters Great and Small

OUR TIMES: *A Social History, 1912-1952.*
By Vivian Ogilvie.
Batsford. 224 pages. 21s.

THIS book consists of a series of chapters recording forty years' change in food, agriculture, health, clothing, building, transport, communications, power, machinery, materials, industry and leisure. Thus it is not, perhaps, quite a social history; but it assembles in a convenient and readable form an immense amount of the material which a social historian would use. Much of the information is familiar but there are surprising items. Did the reader know, for example, that one of the patent medicines from which we are now protected by a watchful government was a slimming pill containing the maggots of intestinal worms? Any further selection, after that, must suffer from anticlimax. But it is interesting to know that a slot machine existed at Bridgewater in 1750; that aluminium was such a rarity a hundred years later that Napoleon III had a set of aluminium spoons and forks to supersede the silver at very special banquets; that the percentage of labourers to farmers has fallen in sixty years from 5:1 to 2:1; that an increasing number of people pronounce the d in Wednesday; that the last country bank issuing its own notes lasted until 1921; that the BBC orchestra in December, 1922, contained only eight performers.

Great matters and small alternate with a charming inconsequence. Having disposed of the atom bomb we confront the fountain pen. Among the most fascinating pages are those describing how things are run at a Butlin camp. It is obviously rather like Eton, only better. This would be an excellent book for a school library. It is, of course, as the publisher's name suggests, profusely illustrated.

Compleat Holiday-maker

OXFORD TRAVEL ATLAS OF BRITAIN.
Edited by D. P. Bitkmore.
Oxford University Press. 34 maps and 253 pages. 10s. 6d.

THE publishers describe this book, with excessive modesty, as an atlas. Certainly it contains a number of maps, but there is also much information of a kind that does not normally find a place in an atlas. The atlas is well planned and is therefore an easy reference book.

The book opens with a list of "100 country eating-places" and continues with lists of notable gardens and country houses. Then follow road maps (showing traffic density), railway and physical maps, maps of scenery (the legends are of doubtful legibility and the colour-printing of poor registration), maps of sunshine and rainfall, and sports. The United Kingdom is covered by a series of maps at about 12 miles to the inch. The gazetteer, perhaps the most important section of the book, occupies the rest of the volume.

Every reviewer records his protest when one of his favourite objects of interest is omitted. Let it therefore be stated that the charming Byland abbey goes unnoticed, whereas other Yorkshire abbeys are all recorded; also the probably unequalled parish church of Whitby has no reference made to it. In fact these two omissions typify the principal ground of criticism of this atlas: the recording of objects of historical and architectural interest is very incomplete. These matters are of interest to people planning a holiday and should receive more attention in a second edition.

It is right, however, to keep a sense of proportion and to emphasise that this holiday atlas contains an enormous mass of information within a very small compass and at a modest price. The gazetteer is undoubtedly the most impressive feature of the atlas and it is effectively linked with the maps by cross references based on the national grid system. The book should become a standard work of reference on everybody's bookshelves and a most useful handbook for any visitor proposing to spend a wide-ranging holiday in Britain.

Text and Reference Books

WORLD PRODUCTION OF RAW MATERIALS.
Royal Institute of International Affairs.
104 pages. 7s. 6d.

This little book is divided into three parts. In the first, it discusses the problems that affect raw materials today, and describes experiments in international co-operation. Then it gives notes on sources and uses and, thirdly, tables of world production of about fifty commodities, agricultural and mineral. One section deals with synthetic materials. Information, including statistics, not usually obtainable in one book are here brought together.

★

STATISTICAL YEARBOOK 1952.
United Nations. Her Majesty's Stationery Office. 554 pages. Clothbound 55s.; Paperbound 45s.

The latest issue of this yearbook continues to provide a valuable service in international statistics. A few new tables have been added since the previous issue while a few others have been omitted; but improvements have mainly taken the form of extending the scope of some of the series and introducing new countries.

★

IRON AND STEEL WORKS OF THE WORLD.
Edited by M. G. Cordero.
Quin Press. 651 pages. 50s.

Details are given of more than a thousand works in fifty countries, mainly those producing pig iron, raw steel rolled sections, flat steel and tinplate; independent fabricating works and small re-rollers are not generally included. For most of the larger works, these include descriptions of the steel plant and equipment installed, the products made, the total issued capital, and some indications about capacity or output in a recent year. This is the first publication of its kind; it constitutes a very useful assembly of data, including some upon steelworks in Communist-controlled countries.

★

ENCYCLOPÆDIA BRITANNICA BOOK OF THE YEAR, 1953.
663 pages. £3 3s.

This annual deals mainly with the events of 1952, and follows the general pattern of its predecessors with the addition of some new subjects. The European Defence Community and the Mutual Security Programme are included for the first time. Historical reviews covering a longer period than 1952 are given of some important items at home and abroad. Nearly all the articles are illustrated, many of them by photographs of a high quality.

★

THE PRACTICE OF LIFE ASSURANCE.
By N. E. Coe and M. E. Ogborn.
Cambridge University Press. 440 *pages.* 32*s.*

This addition to the series of new textbooks that is being published jointly by the Institute of Actuaries and the Faculty of Actuaries in Scotland is intended for students studying for an advanced part of the examinations. The scope of the subject is so wide that it has been necessary to condense greatly the treatment of each individual topic; the book is, nevertheless, far from heavy going and there is an adequate bibliography at the end of each chapter.

Readers are assumed to possess a thorough knowledge of the theory of compound interest and of life contingencies, and the book has, therefore, only a limited appeal to the non-actuary. It does, however, give a useful insight into the intricacies of the administration of life assurance, and instils a healthy respect for the mathematical dexterity and breadth of knowledge that is required of the present-day actuary. In addition to a mastery of more mysterious crafts, such as the calculation of premiums and the valuation of the liabilities of life offices and pension funds, the actuary must possess a sound working knowledge of many other things, including income taxation, the interpretation of medical reports and the theory and practice of investment. The extent to which the authors have kept their feet firmly on the ground is illustrated by their remark that "when the proposed life is stated to be a total abstainer we need to know for how long he has been an abstainer. If he has previously suffered from alcoholism the risk is one of a return to alcoholic excess."

The two actuarial professional bodies are showing considerable enterprise and energy in the production of their new textbooks and skill in the selection of authors who possess the facility of presenting highly technical subjects in a readable manner. This book maintains the already established high standard of the series.

★

THE YEARBOOK OF THE UNIVERSITIES OF THE COMMONWEALTH, 1953.
G. Bell & Sons.
1805 pages. 3 gns.

This yearbook, published for the Association of Universities of the British Commonwealth, is now in its thirtieth issue. It gives information, revised up to last September, about each Commonwealth university and university college; it lists its teaching staff, the degrees, diplomas, and postgraduate awards that it offers, and states the income that it commands. It also gives a brief summary of the history of each institution. It is a useful book of reference, especially for those interested in higher education in the Commonwealth.

Letters to the Editor

A Natural Phenomenon

SIR—Reluctance to spoil the innocent wonder of the credulous and destroy a good tourist attraction has hitherto kept me silent on the subject of the Loch Ness monster. But now that, as noted in your issue of May 30th, the Gas Council is about to make a large-scale search for natural gas in this country, poor Nessie's demise cannot be far off. For Nessie is not phenomenal but merely a phenomenon. She is created by the periodical rising to the surface of the loch of a series of huge bubbles of natural gas coming from a geological fault that passes under Loch Ness.—Yours faithfully, A. W. MORRISON
Glasgow

Mink to Beaver Lamb

SIR,—The article in your issue of May 9th contains some misleading statistics relating to the use and export of the home-produced rabbit skin crop. The British crop of rabbit skins is used for the manufacture of fur felt hats, and the bulk of the crop is exported to the United States and Continental manufacturers. The quantity of British rabbit skins used for the manufacture of garments is negligible. The manufacturer of rabbit skin coats relies primarily on imported merchandise, as the indigenous article is unsuitable. Total home produce skin exports during 1950-51-52 was £3,078,000, and of this £2,772,000 were raw undressed rabbit skins for the hatting industry, primarily exported to the United States.

This industry does not come under the purview of the London fur market, but is carried on by old-established merchants in the United Kingdom, and these houses are not to be found "in the little side streets behind the dignified headquarters of the Hudson Bay Company." The British rabbit skin crop is neither collected nor merchandised by the fur trade. It is not supplied to nor manufactured by the fur trade. It is essentially the raw material of the hatters' fur and fur felt hat industries.—Yours faithfully,
S.E.1 J. BARRY DE JONGH

Who Rules in Africa?

SIR—In the article published in *The Economist* of May 16th, it is stated that the Executive Council of Uganda is "entirely official." This is not so. The council, under the presidency of the Governor, consists of six *ex-officio* members, three official members and six unofficials. The unofficials are two Africans, two Europeans and two Asians.

I think it should be made clear, too, that there is an African preponderance on the unofficial side of Legislative Council, though not, as you rightly point out, on Legislative Council as a whole. At present, the council is balanced between sixteen *ex-officio* and official members, all of whom are heads of Government Departments, and sixteen unofficials. The unofficials are eight Africans (two representing each of the four provinces), four Europeans and four Asians.—Yours faithfully,
Kampala HORACE WHITE

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Crusade Meets Congress

Washington, D.C.

THE early part of last week provided a stimulating diet for American television and radio audiences. On Monday, June 1st, they listened to Mr John Foster Dulles reporting on his visit to India and the Middle East. On Tuesday they were tuned all day to the great and gorgeous happenings in London, and on Wednesday they had the privilege of a "folksy" television interview with the President and four members of his cabinet. This last, although it attracted nothing like the attention accorded to the generally disappointing and unsuccessful presentation of the Coronation, represents a new and serious attempt to build a bridge between the President and the American public along the lines of the Roosevelt "fireside talks." It was not altogether successful; the slick hand of the New York advertising agency which had turned many stomachs during the Republican election campaign was again in evidence. The President made an unfortunate reference to the scare word "Munich" in referring to the possibility of compromise in international negotiations and certain aspects of policy, such as agricultural exports, were discussed too glibly.

The key to the importance of this new political use of television lay in the extent to which its general tone belied its brave title "The Crusade Up to Now," for this had little of the ruthless vigour of a crusade about it. It was a highly defensive attempt to explain to the American people that despite appearances the Administration has in fact got policies for agriculture, national security, welfare, and the economy which it does not need the help of Congress to formulate or administer. That a President who was elected with by far the largest popular vote in American political history should find himself, after five months in office, obliged to give such an explanation is not, however, as remarkable as it seems.

President Eisenhower is not a politician and, as a professional soldier, has been living outside the United States for a great part of the past forty years. To him, as to many other Americans who have never had the opportunity or the curiosity to study the workings of their own political system at first hand, the duels and conflicts between Congress and the Presidency over the past twenty years have seemed largely unnecessary, the work of factious and fractious men which could be avoided with a little common courtesy and common sense. The view that the President must either lead his party from the day of his inauguration or be led by them, that he must rule through a coalition of like-minded people in both parties and not depend solely on his own party, was thought by many to be purely an invention of the high-handed Roosevelt and Truman regimes.

Mr Eisenhower has now found out that this is not so, that there are basic rules in American politics which govern his own presidency as much as those of his predecessors. Within the space of a week he was forced to dissent vigorously in public from Senator Taft's notions on Far Eastern policy, to intervene directly to dissuade the Senate from tacking a rider to an Appropriation Bill which would have cut off the United States contribution to the United Nations if Communist China were admitted, and to use his influence to persuade the House Ways and Means Committee to report out a Bill for the continuation of the Reciprocal Trade Agreements Act without crippling riders or amendments.

★

Unfortunately this resumption of presidential initiative has come so late upon the scene that a substantial price has had to be paid for it. To convert the rider on the admission of Communist China to the United Nations into a Senate resolution, the President has had to give an undertaking—or at least it is construed in that sense by Senators Knowland and Bridges—that he will provide an active lead in preventing that admission. This clearly implies a much more dogmatic attitude to the question than the President or the State Department would like to take. Many people feel that this piece of senatorial folly should have been headed off before it had begun to gather serious momentum by the kind of discreet State Department pressure and explanation which could generally be managed even in the bad old days of Mr Truman's difficulties with Congress. This feeling was reinforced by the President's admission at his press conference two weeks ago that he was unaware of this development in Congress, although it had been in the press for at least a day and a half.

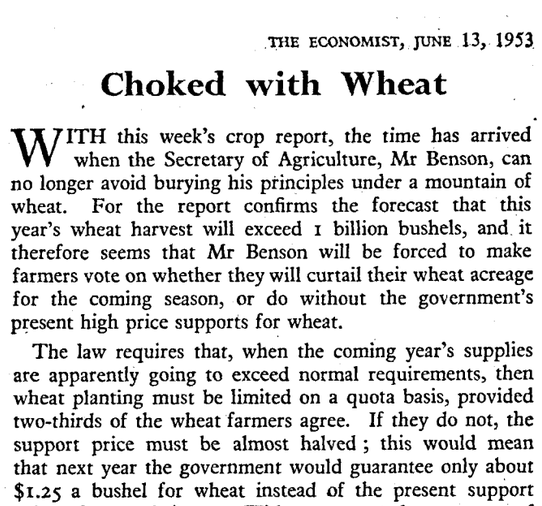
Equally, in order to persuade the Bourbons of the House of Representatives, Mr Reed and Mr Simpson, to accept an unrestricted renewal of the Reciprocal Trade Agreements Act, the Administration has had to agree to enlarge the Tariff Commission from a six to a seven member board. The Act which set up the commission forty years ago was intended to establish an impartial fact-finding board, leaving considerations of policy to the President. This was clearly set out in the stipulation that not more than three members were to be of the same political party. Now it

seems certain that there is to be a Republican majority on the commission. The President has got the breathing space of a year which he considers necessary to reconsider American foreign trade policy but, as the *Washington Post* says, "it is unfortunate that the extension has been sullied with a measure reminiscent of President Roosevelt's attempt to pack the Supreme Court."

What is unfortunate, from his own point of view, is not that President Eisenhower has tried the experiment of treating the Republican committee chairmen in Congress as if they were capable of pursuing the national interest until they proved themselves unable to meet this standard, but that he has allowed the experiment to continue for so long. On the expenditure side his fiscal policy, which for sound administrative reasons could not be presented until a few weeks ago, will probably be accepted, and the current row over the cuts in the Air Force budget will blow down river like a Potomac thunder shower. On the revenue side the President and Mr Humphrey, the Secretary of the Treasury, face a gathering storm over the extension of the excess profits tax, on which they have failed to gain the backing from the National Association of Manufacturers and other business organisations whose support they had—somewhat naïvely—hoped to enlist. This augurs badly for the rest of the untidy tax structure which has grown up to meet the needs of rearmament and forced the President to take his case directly to the people, not only over the head of Mr Reed but also over the leaders of business opinion.

★

It is foolish to try to judge President Eisenhower, a man without direct political experience who heads a party ignorant of contemporary administrative responsibility, as if he were an experienced politician. Nevertheless, it seems justifiable to record two sources of regret. The first is that there was not a better understanding in the White House of the time element in the American legislative machine. As a result of the gentle hand which Mr Eisenhower has laid upon Congress, a great many of the sensible constructive measures which formed part of his "Crusade" will have to be abandoned for this year. Although frantic efforts are being made to prepare revisions of the Taft-Hartley Act to conform to the President's promises to labour, it is doubtful if they will see the statute book at this session. Similarly statehood for Hawaii, the St Lawrence Seaway and the admission of a quarter of a million refugees and immigrants will probably go by the board for this year.



The other source of regret is that the likelihood of a Korean truce finds the President without that clear ascendancy over Congress and his own party which he will need to guide them through the complicated and unpalatable decisions which will flow from an armistice agreement. This is going to open a Pandora's box of views and prejudices on the future of American relations with Communist China, and the most extreme ones, on this as on economic and fiscal questions, exist within the President's own party. The danger is that the President, and American foreign policy, may become imprisoned by the passions which the Republican Senators can stir up on Far Eastern questions. As Mr Ernest Lindley has expressed it in *Newsweek*: "In a real sense, the major question may be, not whether the President can win control of Congress, but whether he can escape the control of Congress sufficiently to perform the highest functions of his office."

Choked with Wheat

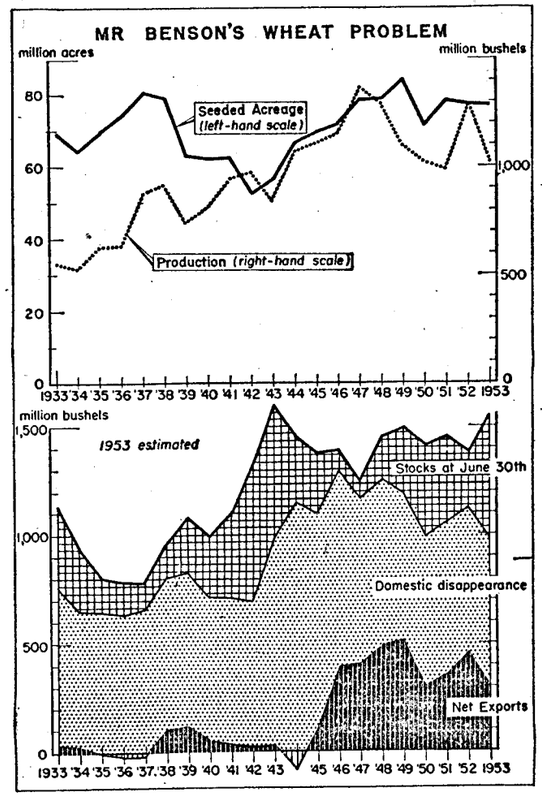
WITH this week's crop report, the time has arrived when the Secretary of Agriculture, Mr Benson, can no longer avoid burying his principles under a mountain of wheat. For the report confirms the forecast that this year's wheat harvest will exceed 1 billion bushels, and it therefore seems that Mr Benson will be forced to make farmers vote on whether they will curtail their wheat acreage for the coming season, or do without the government's present high price supports for wheat.

The law requires that, when the coming year's supplies are apparently going to exceed normal requirements, then wheat planting must be limited on a quota basis, provided two-thirds of the wheat farmers agree. If they do not, the support price must be almost halved; this would mean that next year the government would guarantee only about $1.25 a bushel for wheat instead of the present support price of around $2.20. With an expected carry-over of nearly 600 million bushels when the crop year ends this month, to add to the new crop which is already being harvested, there can be little doubt that next year's normal requirements will be exceeded. And with the Korean armistice so near, Mr Benson can hardly take shelter behind the national emergency that saved his predecessor from having to impose quotas last year.

That some restrictions are necessary in order to limit the government's financial commitment is shown by the present position of the Commodity Credit Corporation, the agency responsible for price-supporting operations. Wheat, actually

owned by the corporation or held as collateral for loans to farmers, represents the largest single item by value in the CCC's investment. As a result of the favourable harvest prospect, future prices of wheat are well below the support price at which loans are made, and have been falling sharply. It is therefore expected that in the next few weeks farmers will relinquish much of this wheat to the corporation in preference to repaying their loans. In consequence, most of this year's wheat surplus will be owned by the government. In addition farmers are likely to put a higher proportion than usual of the new crop under loan because of the low market price for wheat. Cotton and possibly maize are also candidates for acreage restrictions this year, but this will not be decided until the autumn.

Various proposals are being considered in Congress for softening the impact of wheat quotas on farmers. It is being suggested that the present conception of "normal reserves," based on a period when the population of the United States was smaller and the danger of supplies being disrupted by war was less, is outdated and that stocks of as much as 500 million bushels of wheat are now desirable. If this idea gains legal acceptance, quota restrictions on wheat might not be required for next season. The House Agriculture Committee has approved a Bill which would fix the minimum acreage to be planted to wheat at 66 million acres; the Department of Agriculture had proposed 62 million acres for next year, which would mean that each farmer's quota would be only about 80 per cent of his wheat plantings in the current crop year.



But even if this higher figure is accepted Mr Benson, who only a week ago was telling the country that agricultural programmes would give the farmer freedom of operation and should not price American products out of world markets, will have to spend the next month trying to induce farmers to vote for restrictions on their output in order that their prices may stay high. For if the farmers reject the quotas (they approved them when last asked to do so in the early nineteen-forties), the price of wheat seems certain to fall disastrously next summer, if not before, just as the congressional election campaign begins. And in that case the Republicans, who cannot afford to lose a seat, would have little hope of holding the votes of the farmers who were prosperous under the Democrats but whose prices and incomes have been falling steadily ever since the Republicans took office. It is not surprising that President Eisenhower's first speaking tour since the election is taking him through the northern wheat states, or that the House of Representatives has insisted on giving the Secretary of Agriculture more money than he requested for the soil conservation programme; under it payments are made to farmers who improve the fertility of their soil, something which any good farmer would do in any case.

★

It is not only the Republican principles of economy and freedom from government regulation that are being choked by the wheat surplus, but also the principle of getting the government out of business. For the most immediate problem is that of finding storage space for the new crop, and for the maize that will be harvested in the late summer. The Department of Agriculture has already arranged for emergency warehouses, such as a hundred laid-up cargo vessels belonging to the Maritime Commission, and farmers are being urged to expand their own storage capacity. But there is little doubt that, as last year's grain crops now under loan are taken over by the CCC, the government will be obliged, however reluctantly, to build new storage facilities and thus to compete with private enterprise. Political considerations enter into this question, too, for the Democratic victory in the agricultural states in 1948 was widely credited to the failure of the Republican Congress to allow the government to add to its storage space for maize; the large crop of that year then flooded the market and drove the price down.

The fall in export demand during the past year is the main reason for the present surpluses of wheat and cotton. Last March agricultural exports made up only 18 per cent of the total for the month, compared with 26 per cent of a rather higher total a year earlier; wheat and wheat flour, valued at $74 million for the month, were, as usual, the leading farm exports, but had fallen in value by almost 40 per cent since March, 1952, while cotton was down by over 50 per cent.

It is admitted that this fall is due in part to the restrictions that have been imposed on agricultural imports, especially dairy products. Dairy products benefit from government price support programmes which keep prices high enough to attract competition from foreign sources. The much criticised section of the Defence Production Act, which requires that imports of these products should be controlled and has resulted in complete embargoes in several cases, is about to expire, but President Eisenhower has only been able to prevent Congress from renewing it by establishing new import quotas and tariff schedules for dairy products and certain types of fats and oils. However he has at

least succeeded in lifting the complete ban on imports of butter and dried milk and has increased quotas for most types of cheese. The President has also asked Congress to lighten the wheat surplus directly, if only slightly, by giving 37·5 million bushels (1 million tons) of government owned wheat to relieve the famine in Pakistan, and there are other proposals before Congress for moving farm surpluses "not into storage but into stomachs" in other countries.

American Notes

Time for Economic Advice

PRESIDENT EISENHOWER has at last produced his scheme for the re-establishment of his Council of Economic Advisers, a decision which could hardly have been postponed much longer. Even now, it will be the end of July, unless Congress can be induced to approve the new scheme more quickly, before the council can function formally. And the Korean armistice gives an urgency to the council's official duty, that of making plans to counter a possible economic recession, which has not been felt since Congress set up the agency in 1946, immediately after the last war. The recession forecast then failed to materialise, but President Eisenhower dare not trust to luck that the same thing will happen again. For if a fall in economic activity does bring serious unemployment, then the Republican party, last in power in the early nineteen-thirties, would be forever associated in the public mind with depression. Therefore the new Administration ought to be, and apparently intends to be, prepared to answer any signs of an impending recession with even more speed than might have been expected from the Democrats.

It would have made a bad impression if the President had begun by killing off the agency which is supposed to do his economic planning for him; but in fact his delay in making up his mind allowed Congress to cut off the council's funds and thus drive it out of business for the time being. Distrust of the old council arose from the political flavour given to it by its close association with Mr Truman's Fair Deal policies; the members, Mr Leon Keyserling in particular, had often been outspoken defendants of the more extreme of these policies, both to Congress and the public, although they did not always speak with the same voice. Paradoxically, another criticism was that Mr Truman did not in fact take the council's advice, or even bother to consult it, as much as he should have done. Moreover, other government agencies, with long-established interests in economic matters, regarded the economic advisers as upstarts and avoided them as much as possible.

President Eisenhower's reorganisation scheme sets up an advisory board on economic growth and stability, which would act as a co-ordinating body between the council and other government offices. The chairman of the board would be the chairman of the council, who is also given authority over the other two members. The chairman's prestige is further strengthened by the provision which makes it clear that only he is to deal directly with the President. The new chairman is to be Dr Arthur F. Burns, an economics professor and an expert on business cycles, who has been acting as the President's economic adviser while the Council has been in abeyance; President Eisenhower is known to rely heavily on his advisers; and Dr Burns is respected in Congress and believes that the council should keep out of both political controversy and the public eye. For all these reasons the Council's new lease on life may be more successful, and perhaps more useful, than its old one.

Another Round for States' Rights

THE Senate Judiciary Committee has decided to forward to the Senate the proposed Bricker amendment to the Constitution, which would give Congress and the states greater control over the President's treaty-making powers. It is unlikely that this amendment, which is accompanied by a trenchant minority report, will be considered by Congress this year. And the resolution would have to be approved by two-thirds of the membership "present" in the Senate and House, and then by three-fourths of the 48 State Legislatures within seven years, before it could become an effective amendment to the Constitution. In spite of the fact that Senator Bricker and his supporters still have a long way to go, however, the favourable vote of the Judiciary Committee marks yet another round in the bout between Congress and the Eisenhower Administration.

The legal aspects of Senator Bricker's case, which is based on the fear that treaties drafted and submitted by agencies of the United Nations would over-rule the Constitution and cut across domestic legislation, are extremely complex. Backed by part of the American Bar Association, Senator Bricker has been able to generate a good deal of heat and even a little light. It is possible to conceive of instances of conflict between the United Nations Charter and state laws. But whereas the perils invoked by the Bricker resolution are, at this time, imaginary, the motives behind it are a real and present danger to the Administration.

Senator Bricker and his sixty-three colleagues who have endorsed the proposed amendment—a fact which does not commit them to voting for it—represent a general movement to take power away from the White House and give it back to Congress and the individual states. Senator Bricker has made it plain that he wants to protect the "basic beliefs" of the people of the United States against the possibility of such disasters as another spell of Democratic foreign policy. The Tenth Amendment declares that powers not specifically delegated to the federal government remain vested in the states. Thus the states should have the right to ratify or reject treaties which affect matters not directly within federal purview. But, while the assertion of states' rights represented by the tidelands oil decision would affect the government only in case of emergency or secession, the Bricker amendment could hamstring President Eisenhower's executive role in foreign policy.

After a slow start, the Administration tried to stop the resolution at the committee stage. Mr Dulles reversed his earlier opinion, expressed at Louisville in April, 1952, that treaty law can over-ride the Constitution. But this, together with the compliments heaped on Senator Bricker for his vigilance and red-blooded Americanism, has clearly not been enough to do more than, at the most, slow down the progress of the Amendment.

More Academic than Free

AFTER much soul-searching, Harvard University has decided that former membership in the Communist party or a refusal to answer congressional investigators are not *prima facie* causes for dismissal from its teaching staff. This decision is an improvement over the policy of many other universities where principles of academic freedom have been partially sacrificed to fear of McCarthyism. It is not, however, that formulation of an honest doctrine and of a rallying point for liberalism which might have been expected from the most revered and financially independent of American universities. Not only has Harvard decided that present (as distinct from past) membership in the Communist party would justify dismissals, but it has preferred not to discuss the vital case for allowing Communism to be taught and studied openly. It is absurd to treat Communism as if it did not exist or as if it were an occult mental disease, and it is one of the primary functions of a free education to present alternative views. This interpretation of academic freedom, already put forward by Justice Holmes, has been courageously supported by Professor Harper of Yale in front of a hissing audience of the General Federation of Women's Clubs.

The Harvard formula, moreover, deplores the use of the Fifth Amendment—that no one "shall be compelled to be a witness against himself"—as a shield against congressional harrying, because such a defence is inconsistent with "the candour to be expected of one devoted to the pursuit of truth." It is true that the Fifth Amendment safeguard has been abused. Harvard's disapproval, however, overlooks the present political atmosphere, in which a man who is under investigation may feel compelled to seek refuge in complete silence, since a qualified answer or a refusal to turn informer give immediate rise to the gravest suspicions. Not only a man's job is at stake, but his whole place in the community, the admission of his children to schools and his freedom to leave the country and return at will.

As successor to Mr Conant, as President of Harvard, the Corporation has chosen Mr Nathan Marsh Pusey, head of a small college in Wisconsin. Mr Pusey is a distinguished humanist and the author of a study on Athenian law. One can only hope that humanism and justice will stand him in good stead. American universities, particularly those that are independent of state financial aid, will have to remember that freedom of thought is, and always has been, a dangerous doctrine, but that without it there comes the safety of totalitarianism.

Open Back Door

WHILE in Washington Congress is holding hearings on the President's emergency proposal to admit 240,000 immigrants during the next two years, to help solve Europe's refugee and population problems, a stream of three to six thousand immigrants a day is pouring over the southern boundary of the United States without benefit of quotas, loyalty tests, or permission. So far this year over 300,000 "wetbacks," illegal immigrants who swim (or wade) the Rio Grande to evade border patrols, have been caught and returned to Mexico; the year's total may come to almost 900,000, and at least an equal number will probably escape detection and deportation. The ironic spectacle of these hundreds of thousands of uneducated, unskilled workers flooding in through the southern door, while immigration officials screen aliens carefully one by one in east and west coast ports, does not seem to worry Congress, which has repeatedly refused to provide enough money to pay adequate border patrols.

Congress has indeed given little attention to any of the problems of migratory labour; migrant farm workers, whether foreign or domestic, are unorganised and have no votes and therefore no political power—but their employers have and use it to discourage Washington from interfering. No minimum wage laws or welfare legislation cover these migrants and employers of wetbacks are not liable to prosecution for harbouring illegal immigrants. The only recent congressional action on migrant labour has been a three-year extension, so far by the House alone, of the agreement between the United States and Mexico under which a number of Mexican workers—200,000 last year—receive contracts, guaranteed by the government, from individual employers. It was argued when this legislation was first passed that the institution of contract agreements would end illegal entries, but in fact the number of wetbacks has grown steadily. In 1952 over 635,000 were apprehended and sent back, and at least as many more were not caught; one estimate is that 1.5 million wetbacks worked in the United States last year. Five consecutive years of drought in northern Mexico have driven more and more Mexican labourers over the border to a country where wage levels and standards of living are far higher.

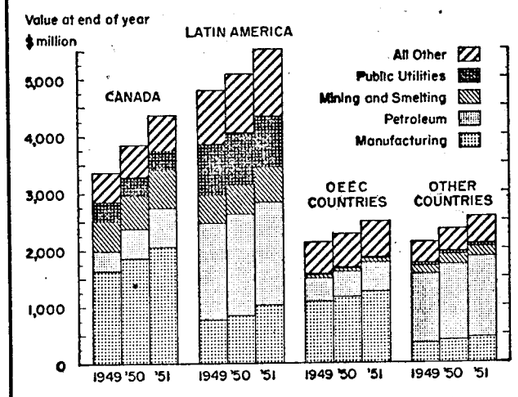
But when they get to the United States, the wetbacks are forced by their desperate need and lack of protection to accept sub-standard wages and to work under conditions which depress the standards of all farm workers. The changing pattern of American agriculture, in which larger and more fully mechanised farms require fewer steady workers than they used to do, but more temporary harvest labour, has forced the big farmers to rely increasingly on migrant workers. The urgent need of the farms for labour, and of the Mexicans for jobs, have set up pressures that cannot be held back by the 600-man patrol which is at present all that guards the 1,600 miles of southern frontier.

Segregation Fading Away

THE Supreme Court has been unable to reach a decision on what was probably the most important issue to come before it at its present session, the question of whether racial segregation in primary and secondary schools is constitutional. The five cases dealing with this matter, which were first argued before the court last December, are to be argued again next autumn and, from the specific points which counsel have been asked to discuss, it is clear that the justices could not make up their minds on either the law or the public policy involved in these cases. They have forced the court to reconsider the whole doctrine of "separate but equal" facilities for Negroes on which has been based the previous decisions that have done so much to undermine racial discrimination in higher education.

The court did, however, rule that it was illegal for restaurants in Washington to refuse to serve Negroes. The decision had little constitutional importance, for it turned upon a technical aspect of the peculiar way in which the District of Columbia is governed, but nevertheless it weakens that racial segregation which has so long disgraced the national capital and which President Eisenhower has promised to abolish. The local housing authority is also making its contribution, by opening up its public housing facilities to all races; whites are to be allowed to move into Negro

units as well as Negroes into white units. There is still a long way to go in Washington, but the line of attack proposed by a Negro member of Congress, Representative Adam Powell, seems too sharp ; he tried unsuccessfully to cut off all funds from district agencies, such as schools, which practice segregation.



There have recently been encouraging signs from the South that racial prejudice will gradually fade away, even in its homeland, if left to itself. It was probably the unconcealed disapproval of the national leaders of the Episcopal Church which induced that church's seminary in Tennessee to abandon its refusal to admit Negro students. But in North Carolina five Negroes have just been elected to city councils ; in four of the places concerned this had not happened since the " reconstruction " period immediately after the Civil War. Even more striking, in Atlanta, Georgia, a Negro has been chosen for a public administrative office, also for the first time since reconstruction days. Dr Rufus Clement, president of the Negro University in the town, won election to the Board of Education over a white candidate who had held the office for 25 years ; and Dr Clement's majority came from white as well as Negro voters. As he himself said there could be no better evidence that " the white population is ready to try to work constructively with the Negro population."

Investment, not Aid

CLOSING the dollar gap in world trade by increasing American investment abroad is a solution that is arousing more and more interest in Washington as the appropriations for economic aid become less and less. Two different congressional groups have recently dealt with aspects of this problem. The Mutual Security Agency has been advised by a Senate committee not to make any more attempts to promote foreign industrial developments unless specific funds are voted for this purpose. The committee feels, in spite of much evidence to the contrary, that there is a " serious question as to the soundness " of such attempts and points out that the foreign aid programme is now concerned with defence rather than with general economic assistance. This admonition has given added significance to a report by a Foreign Affairs subcommittee of the House, summarising the views held by business and government leaders, who urged that private investment overseas should be encouraged by a series of measures, including the concentration into a single new agency of the government's many activities in connection with such investment.

Both the direction and the amount of American investment abroad at present offer indications of the conditions likely to affect it in the future. An annual figure of $2 billion is the usual assessment of the dollar gap ; when economic aid ends, it may well be larger, but the outflow of private capital from the United States is well under $1 billion a year. Furthermore, it is largely drawn to areas like Canada and Latin America, where the " investment climate " is propitious both to profits and to provision of the raw materials—especially petroleum and metals—that the United States needs. Investment in the countries which have the greatest need for dollars is held back by currency and exchange controls, by tax regulations that favour investment in the western hemisphere, by political and economic instability, and by the fact that there are still ample opportunities for investment within the United States. The House report suggests that private investors might venture farther afield if they received incentives such as government insurance, protection by special treaties, opportunities for joint investment with nationals of the countries concerned, and tax reductions, including amortisation of the cost of overseas factories in five years for tax purposes. Few of these recommendations are new, but little or no practical attention has been devoted to them in Washington recently.

SHORTER NOTE

In his broadcast three weeks ago, President Eisenhower announced that a complete revision of the tax laws was being undertaken by the Treasury for presentation to Congress next January. Although no details have been given of the measures under consideration, it is believed they include the possibility of a national sales tax, changes in the rates and structure of personal and corporate income tax, and in the treatment of undistributed profits, increases in surtax exemption and in allowances for depreciation, more liberal recognition of capital losses, and modification of double taxation on profits. It is hoped that it will be possible to put the emphasis on relief for the taxpayer rather than on more revenue for the government.

WORDS ROUND THE WORLD

For Decisions and Opportunities

Transmitting telephone conversations by radio between places thousands of miles apart is one of the many ways in which Cable & Wireless Ltd. carry words round the world. When personal contact is vital, to ask for an urgent decision on policy or to acquaint a business colleague of an opportunity, a man in the Far East, for instance, can talk to Britain or America on the radiotelephone.

His voice, carried on radio waves, is " scrambled ", the various tones being ingeniously transposed, and at the receiving end it is converted back again. Cable & Wireless Ltd. operate more than 80 such radiotelephone circuits at the distant ends, putting Accra, Athens, Barbados, Bermuda, Hong Kong and Malta, to name just a few of the terminal points, directly in touch with London. Radiotelephony is an example of the way Cable & Wireless Ltd. try to provide the most convenient method of communication to suit particular occasions.

In its telegraphic system, the Company can use both the submarine cable and wireless to link places far apart, either directly or, if there is any interference, by alternative routes.

Maintaining and developing these arteries of communication entails heavy expenditure, and with rising costs of labour and materials, it is not easy. The Company's efforts and resources will be resolutely exerted to earn currency abroad, to link the Commonwealth and to retain Britain's dominance in international communications.

It's no illusion!

higher mileage

is a REALITY!

HIGHER MILEAGE Avon's thicker and deeper tread gives many thousands of extra miles.

GREATER GRIP The wider Avon tread *gives more* road contact, extra bite.

BETTER BRAKING Centre traction bars and multiple slots give extra stopping power.

Nothing could be more certain than Avon higher mileage! It was proved on the most modern test machine in Europe—and over 1¼ million miles of road trials—long before the first H.M. tyre was sold. NOW thousands of motorists confirm the great money-saving qualities of this remarkable tyre. It can save *you* pounds every year.

THE UNITED STEEL COMPANIES LTD

THE LARGEST STEEL PRODUCERS IN THE BRITISH COMMONWEALTH

The United Steel Companies Limited is the largest producer of steel and allied products in the British Commonwealth, and makes *one ton in eight* of the steel production of Great Britain.

The United Steel Company is a combination of individual producing units, giving employment to about 30,000 workers, and operating iron ore mines, quarries, coke plants, blast furnaces, steel works, rolling mills.

The integration of these units into a group provides centralised resources and services for *finance, selling, research,* recruitment and training and other functions which best respond to large-scale organisation. Each producing unit of the group, however, has a considerable degree of practical autonomy, giving it the flexibility of an independent concern of manageable size.

Italy's Scylla and Charybdis

FROM OUR SPECIAL CORRESPONDENT

THE Italian people has spent the last few weeks wrestling with its conscience. The failure this week to re-elect Signor De Gasperi with a clear and positive lead over his extremist rivals unfortunately shows that it has not been entirely successful. The appeal of the demagogue, the nationalist and the Communist has been strong enough to prejudice the future of the young republic. The battle, however, is not yet entirely lost. The fact that the elections went off in such quiet good order would do credit to a country far more experienced than Italy in the workings of the parliamentary system. And, despite the rejoicing of Signor De Gasperi's opponents at his relative setback, he has in fact been given another, albeit very grudging, lease of power.

How slender is the margin may be judged from the fact that his central coalition has done something which no one expected. Although just failing to win 50 per cent of the votes and thereby to gain a premium of seats under the recent hotly disputed electoral law, it has nevertheless achieved a tiny absolute majority in the lower chamber : 303 seats out of 590. In the Senate it has, against expectations, done slightly better with 125 out of 237 seats.

No Sense of Urgency

The issue which hung on the nation's decision was the future of democracy in Italy ; it requires at least another decade to throw out firm roots—a decade which, it now seems, may not be granted. If too many votes had fallen away from the centre to either extreme, the least of the dangers this week was that Italy would become another France. Effective government might be paralysed by the failure of parliament to give its confidence to any particular administration. And this, as many Italians have lately been saying, is something that an inherently rich country like France may be able to afford for a time but that a poor one like Italy certainly cannot. As things stand, although it is questionable whether any administration in the new parliament will be able to pass contentious legislation, the situation has partly been saved by a strange quirk of the old electoral law. The chance play of inequality in the size of constituencies has provided the centre bloc with a small *bonus of seats in the chamber ; Signor* De Gasperi's majority of 16 will presumably make it just possible for him to continue in office with essentially the same team. He will not be immediately dependent either on the Monarchists to the right or the Nenni Socialists to the left.

The calm of the last few days in the country has been due in part to the confusion of the electorate. The number of parties rendered it difficult for many people to make up their minds how to vote. There was of course the disciplined core of Communists and the increasingly self-confident neo-Fascist right wing. But there was not, as there had been in 1948, a strong sense of the urgent need to block the Communist drive for power. Signor Togliatti might be able to address, as he did, the largest of the eve of election crowds in the great Piazza di Porta San Giovanni, with flood lights directed in Nazi fashion on the row of alternate Russian and Italian flags fluttering in the warm night breeze. Neither he nor anyone else, however, really thought that even the combined Communist and Socialist Left could emerge as the largest group in the new parliament. And this very fact made the election a trifle dull—perhaps too dull.

Dullness is sometimes a feature, however, both of economic prosperity and practical democracy. Part of the government's difficulty in appealing to the people sprang from its own achievement in creating a greater sense of *economic stability and moderate political progress than at* any time since the war. This, indeed, was the first election for a generation in which Italians had felt free to sit back and examine each party dispassionately before casting their votes. It is true that on any such rational approach the government's centre bloc, consisting of the Christian Democrats, the right-wing Socialists, the Liberals and Republicans, should have won the support of the great majority of the electors ; for even if they disliked the taint of clericalism about Christian Democracy or felt that it merely represented an ideological umbrella covering widely divergent political opinions, they could have voted for one of the other three smaller parties. But, for one thing, the Italians are a strongly emotional people, and as they recover their poise their support goes out increasingly to those who appeal to such fundamental instincts as patriotism and class consciousness. For another, the complexity of the electoral machinery undoubtedly prevented some of the less intelligent voters from grasping how to express a coherent choice even if they had made it ; voting was primarily by party symbol and there were no less than eighteen different symbols—ivy leaves, shields, rising suns and so forth—from which to choose when marking the ballot paper. This *accounts in part for the huge figure of 1,300,000 votes so* far provisionally ruled as "spoiled."

The excitement in the closing stages of the vote counting lay in the hair's-breadth failure of Signor De Gasperi's supporters to win the 50 per cent of the votes which would bring the new electoral law into operation. This gives a premium of some 80 seats, and therefore a clear working majority in the chamber, to any bloc securing more than half the total votes. In a poll of 27 million, the centre has missed this premium by a mere 57,000—a handful of votes which has stood between Italy and another five years of good government. There is still just a chance, however, that the situation will be reversed; the "spoiled" ballot papers are being re-examined and according to a government statement, they are to some extent the result of Communist instructions to their followers among the electoral officials to cavil at everything possible.

Success of the Communists

The main lesson of the voting is the striking fact that the extreme left has added 1½ million to the 8 million votes it secured in 1948, while the little parties of the centre, other than the Christian Democrats, have lost a million; the Christian Democrat vote itself has held up surprisingly well. The Communist increase must admittedly be read in the light of an electorate some 2 million larger than last time, but the hope that a heavy poll would favour the centre has proved unfounded; in spite of the incredible storms and torrential rain all over Italy, the poll was even heavier than in 1948.

This resurgence in Communist strength, after all that happened in Italy, is an ugly thing, particularly in view of the virtual eclipse of the non-confessional centre parties. The left centre, which for a moment after the war seemed to dominate the country under the premiership of Signor Parri, has almost vanished from the scene; the right-wing Socialists (*Saragattiani*) polled no more than a third of the Nenni vote and the Republican party has come out smaller than ever. Even the much heralded recovery of the Liberals failed to materialise. Ominous as is the rise of the extreme right, its 3½ million votes, won largely from the Christian Democrats, can hardly be considered a great success even though it trebles the 1948 figures; surprisingly the Monarchists have turned out stronger than the Fascists (MSI). The best that can be said is that the Christian Democrats taken alone still remain by far the largest single party, with well over a million votes more than the Communists and their fellow-travelling Socialists combined. Although Signor Nenni, standing separately this time from the Communists, made gains which re-established his party's national position, it was perhaps too soon to forget that he himself was among those who mounted guard over Stalin's bier.

The Truce Through Chinese Eyes

NOW that the truce in Korea at last appears to be imminent, the question of China's attitude towards the forthcoming political conference claims attention. As in any totalitarian state, a veil of secrecy surrounds the purposes and intentions of the government, yet certain inferences may be drawn from the press publicity by which the government seeks to mould public opinion; although this publicity is propaganda and not self-revelation, it is meant to prepare the Chinese people for the courses to be pursued, and the scale of reticence and emphasis on different themes is not without significance.

Over the future of Korea there has been a marked absence of commitment. Whether Korea is to be unified, and if so on what terms, or whether the two Korean states are to remain as separate entities does not appear to be a matter on which the Chinese People's Government wishes the public to expect or to desire strongly any particular outcome. This implies that the government is keeping its hands free for the conference to negotiate whatever settlement of the Korean question may seem attainable and expedient at the conference. This is quite in accord with the general attitude which has been cultivated in China throughout the war. Although it has always been held that the North Korean government alone represents the Korean people and that the South Korean regime is merely a puppet administration of the American imperialists, the emphasis for the Chinese public has been, not on the liberation of Korea, but on the defence of the approaches to China's own frontiers.

This latter aim has in fact been accomplished by the military victory in November, 1950, and by the subsequent maintenance of a fighting front approximately half-way down the Korean peninsula. It is a long time since there has been any talk of driving the Allies into the sea, and any settlement ensuring that there would be neither a hostile nor an unreliably neutral state on the Yalu would probably be regarded in China as a successful outcome to the war. Unless the unification of Korea can be achieved on terms which would guarantee Communist ascendancy, this would imply preserving North Korea as it is and perpetuating the division of the country. The links between China and North Korea have been continually strengthened and are by no means confined to the military partnership; much publicity is given in the Chinese press to fraternal gatherings of Chinese and North Korean soldiers and to the recent tour of the Chinese Peace Committee, which gave performances of "singing, dancing, acrobatics, conjuring and Peking opera" in Pyongyang. In North Korea, at any rate, it seems that this kind of thing is intended to be permanent.

America's "Satellites" Hold Back

Apart from the question of Korea itself, the main theme recently presented to the Chinese people has been the moral and political isolation of America. In their home front publicity the Chinese Communists have always avoided speaking of United Nations forces or of a United Nations command in Korea; the enemy has always been represented as simply American imperialism with additional contingents from "satellite" countries which have unwillingly taken part in the war because of their economic dependence on America. This contrast between American policy and the interests of America's allies has now been carried to the point at which the Chinese people is shown a picture of America being held back from further aggression by the refusal of its allies to co-operate. Thus a Peking radio commentary declared on May 24th:

> The American warmongers are opposed not only by the peace-loving people of the world, but also by their own allies.... The British bourgeois press assailed the American policy of arbitrary actions. India, Canada and many other capitalistic countries from South East Asia to Northern Europe also expressed their dissatisfaction in varying degree over the American policy of perpetuating the Korean war.... This situation has placed the warlike USA, which is bent on aggression, in a state of dismay.

The truce is represented as having been held up for so long, not by any obstruction on the Communist side, but by the desire of the United States to prolong the war, which has now been overcome by the revolt of America's allies, who refuse to follow Washington's lead any longer. Credit is also given to the "people's peace movement in the capitalist countries," which, inspired by the example set by the "world camp of peace and democracy" [i.e. the Soviet bloc] has compelled the "ruling cliques in the capitalist nations" to heed the demands of the masses and agree to an armistice in Korea. All this emphasis on dissensions among the enemy may be confidence-promoting propaganda to the Chinese people rather than a factor affecting policy, but it suggests that Chinese diplomacy at the conference may aim to exploit to the utmost American-European differences on Far Eastern policy and at magnifying them by suitable publicity.

Future of Communist Prisoners

On one point at least the Chinese Communists appear to have nailed their colours to the mast. This is the question of prisoners refusing repatriation, which, although now overcome as an obstacle to the truce, remains as a hurdle for the diplomats when they assemble. The Chinese have now agreed to a procedure which the Allies think sufficient to ensure that no prisoners will be sent back against their will. But the Chinese official contention, endlessly reiterated and emphasised in their internal propaganda, is that there are no prisoners who do not want to return, that it has all been a matter of American trickery and coercion. Thus a Peking broadcast late in May told China:

> Common sense and all evidence showed that all prisoners of war would want to return home to their families if the influence and coercion of the detaining side were removed and proper explanations made. ... Sick and wounded Korean and Chinese prisoners of war who recently returned were living witnesses of the untold terror and force used to make them afraid to return home.

After public attention has been so much concentrated on this question, and Chinese propaganda has so confidently claimed that no prisoners at all will refuse to return when "explanations" have been given them, it will hardly be possible to conceal it from the Chinese if in the end there is still a considerable number refusing repatriation. The only way to avert the loss of prestige which such an outcome would involve would be for Peking to claim that the armistice terms have not been properly carried out and that coercion is still somehow being applied to the prisoners. The armistice provides that after the five-power neutral commission has been supervising "explanations" for two months, the disposal of any prisoners who still refuse to go back will be referred to the political conference, and that if the latter does not decide within a month, the prisoners are to go free. China cannot in the end prevent the release of the prisoners, but if it becomes clear that the blandishments before the five-power commission are not bringing them all home, Peking may well revive the dispute at the political conference.

Drastic Medicine for the Czech Economy

THE recent currency reform and abolition of rationing in Czechoslovakia was only the latest and clearest sign of the difficulties brought in its wake by the rapid industrialisation of Eastern Europe. The heavy rate of investment, the emphasis on basic industry to the detriment of consumer goods, the time-lag in agricultural production—all these exercise a strong inflationary pressure on the economies of these countries. Yet the planners cannot allow this to affect directly the structure of production, since the rapid tempo of industrialisation is the main objective of their plans. Production of consumer goods is not allowed to increase in response to the pulls of demand. On the margin, however, in the so-called free market, prices of unrationed foodstuffs and of the products of light industry soar. A stage is reached when the scarcity or dearness of these goods affects the performance of industrial workers and threatens to jeopardise the fulfilment of the plans. It is then that the government steps in to tackle radically the problem of inflation.

In Czechoslovakia the illness was particularly grave and the remedy, if belated, exceptionally drastic. The government has proceeded, not to increase the supply of consumer goods, but to cut substantially the quantity of money chasing after them. With a stroke of the pen it has slashed the value of the money hoarded, wiped out the bulk of the population's savings, written off all state bonds issued after 1945 and annulled all blocked deposits.

How Planners Discriminate

These were the main results of the currency reform. The Czechoslovak crown is now valued at 0.1234 grams of gold or 1.8 crowns to the rouble, compared with the previous rate of 12 crowns to the rouble before the reform. This "revaluation," however, is not likely to have any appreciable effect on Czechoslovakia's trade relations. Neither its trade with the Soviet bloc—now accounting for three-quarters of Czechoslovakia's turnover—nor its exchanges with the West are based on the nominal value of the crown. The reform is aimed at the home market and the important results sketched above are to be obtained by the application of differentiated rates for the exchange of the old crown for the new. While wages, allowances, prices, taxes and other levies are in principle converted at the rate of 5 old crowns for one new, the bulk of the existing currency is being exchanged at the rate of 50 to 1. This is the rate applied to all the hoarded cash with the exception of the first 300 crowns held by each member of the working class. For deposits in state Savings Banks the terms of exchange are less unfavourable and there are more gradations between the ratio of 5 to 1 for the first 5,000 crowns and of 50 to 1 for amounts over 50,000 crowns. The elaborate system of discrimination at the disposal of the planners is well illustrated by the application of various rates of exchange for different kinds of collective farms according to their degree of integration.

The "remnants of the bourgeoisie and kulaks" who deposited only a very small proportion of their savings in the banks are obviously worst hit by the reform. The simultaneous abolition of rationing, on the other hand, will probably hurt the workers most of all, since they were the main

beneficiaries of the rationing system. It is cryptically stated that the new price level will be one-third lower than the pre-reform one. This presumably means lower than the level prevailing hitherto on the free market. But hitherto the workers bought a large part of their essentials with ration cards at incomparably lower prices. The small increase in wages which they are now offered seems insufficient to offset the rise in prices and it looks as if on balance the workers have had their real wages substantially cut. They may find it easier to get the goods on the market, but they will have to work harder to obtain the same real income.

Turning the Screw on the Workers

To increase all-round productivity is indeed the avowed aim of the whole reform. Rationing could not be abolished as long as there was much surplus money about, but once this has been mopped up the government will be able to apply a system of differential payments on the Soviet model. Under rationing, each worker in a given category was receiving the same benefits of cheaper prices. This—the Czech premier complained—has led to a levelling of wages and smacked of "egalitarianism." Now, with uniform prices, piece rates and wage differentials will be used as incentives to higher production. At the same time it is hoped that small peasants unable to stand the strain will be forced to join collective farms, while the kulaks—deprived of their savings—will be more dependent on the market.

Czechoslovak spokesmen, faced with serious popular discontent, try to reassure the public with the example of the Soviet currency reform of 1947, which was followed by a steady improvement of the standard of life. This was due to the fact that the Russians allowed a certain proportion of the rising national income to be used for raising the appallingly low postwar levels of consumption. This is indeed the crucial issue. No financial reform, however elaborate, drastic and risky, can by itself solve the problem of consumption. Even if productivity were to increase as a result there is no guarantee that the benefits will be passed on to the consumers. Judging by the precedent of other East European countries which underwent a similar process the increment is likely to be ploughed back as soon as it is produced. In such an event, the Czech planners may soon find themselves again grappling with inflationary forces and no doctor in his senses would apply a second dose of such potent medicine to an unwilling patient. Eastern Europe in general, and Czechoslovakia in particular, are in need of the new remedy now promised by Malenkov to the Russians—namely, a better satisfaction of the needs of the consumer.

Danish Dilemmas

AT a time such as this, it is hardly surprising that most reports of the Danish constitutional reform have stressed the fact that it provides for female succession to the throne, and makes the young Princess Margrethe heiress-presumptive in place of King Frederik's brother. In fact, however, the reform has more far-reaching implications. These are due less to its content than to the circumstances of its execution. The reform, which embraces the abolition of the upper house of parliament, the incorporation of Greenland into the kingdom, and the lowering of the voting age from 25 to 23, had the support of all the major political parties, and last week its main provisions were endorsed in a national referendum by 1,181,173 votes to 318,075. But under Danish law a reform of this kind necessitates not only a referendum but also two general elections. The first was held on April 21st, but the second will not take place before the autumn; until then the political situation will probably remain precarious. Denmark's role as a partner in the Atlantic Pact, while not directly affected, is involved in these uncertainties, and its allies can hardly afford to ignore them.

Paradoxically, the April elections strengthened the forces that support the Atlantic Pact, but at the same time placed its critics in a key position. The right-wing coalition government lost no seats, but the chief opposition party, the Social Democrats, gained two and thus came to hold 61 seats to the government's 59. The Prime Minister, Hr Eriksen, offered the resignation of his government, but withdrew it on May 2nd after the opposition parties had agreed that he should remain in office until after the referendum. The smaller opposition parties, the Radicals and the "single-tax" *Retsforbund*, went further and indicated that they would support the government even after that. The Social Democrats declared that this was unacceptable, and moved a vote of no confidence, which the government survived thanks to Radical and *Retsforbund* support. Last week Hr Eriksen announced that the government proposed that the next elections should be held on September 22nd, and that until then it would seek to avoid controversy. As a result, the Social Democrats now feel robbed of the fruits of victory; and the Radicals, who are almost as critical of the Atlantic alliance as the Communists, are in a position to demand terms for their support of the government. If they should succeed in securing the removal of the Foreign Minister, Hr Kraft, they would have struck a real blow at Danish partnership in Nato.

New Zealand's Criticisms of Britain

FROM OUR WELLINGTON CORRESPONDENT

THERE is no doubt that the very great majority of New Zealanders of all political persuasions—except possibly the very small number of New Zealand Communists—would agree with Mr Holland when he wrote in a Coronation message for a popular newspaper; "Whatever successes and adversities may lie ahead, Britain will always be able to depend upon the friendship and support of New Zealand." Labour leaders, the late Mr Fraser, and his successor, Mr Walter Nash, have several times expressed the same conviction.

Nevertheless, both Mr Holland and Mr Nash would probably agree that the relationships between New Zealand and the mother country require rather more careful consideration than repeated assertions of loyalty to the Monarchy and to British traditions. New Zealand, at a more sedate pace than Australia, is marching towards adult nationhood and it is conscious of the fact. Complacent assumptions, either in Britain or New Zealand, that the Dominion will automatically follow British leadership and support British policies are dangerous and many loyal New Zealanders would like to see this danger more clearly recognised in Whitehall. To put it bluntly, New Zealand is extremely loyal and extremely pro-British, but it does not like this to be taken for granted.

There is, for instance, a strong conviction in New Zealand that British political leaders could pay it more personal attention. Their visits have been rare and hurried and it is safe to say that there are very few British politicians in either camp who have any first-hand knowledge of New Zealand conditions. Many New Zealanders were unfavourably impressed when the Minister of Food, Major Lloyd George, responded to an invitation to visit the Dominion by saying that he was too busy and sent a Food Ministry delegation instead. And they remember that the only Secretary of State for Commonwealth Relations who has visited New Zealand since the war was Mr Patrick Gordon Walker.

Well Worth a Visit

The same criticism could be applied to leaders of British industry. Last year there was strong criticism in the New Zealand House of Representatives of the shoddy standards of some British imported goods. The complaints were well documented and were not presented in any factious spirit. Behind the scenes some of the members concerned suggested that leaders of the affected industries or possibly the President of the Federation of British Industries, might investigate the complaints on the spot. They are well aware that British industrial leaders keep closely in touch with Continental and North American markets. They recognise that New Zealand is comparatively remote, but it is still one of Britain's most important markets, and they would like to see some evidence that British industrial leaders are conscious of the fact. There are exceptions, of course, and leading British industrialists, such as Viscount Nuffield, who have made a practice of paying regular visits to New Zealand, have found that the policy has paid handsomely both in profits and goodwill.

British industrialists should recognise that their postwar trade with New Zealand has been fortuitously assisted by the dollar shortage and that New Zealand's restrictions on hard currency imports have virtually protected the market for the United Kingdom. If these restrictions were lifted, they might well be surprised and depressed at the move there would be towards the United States. Since the present major objective of the Commonwealth is to remove these restrictions, British leaders should give some thought to maintaining their goodwill in the Dominion.

Although most New Zealand farmers recognise the great value of their guaranteed British markets, they are far from satisfied with some of the deals they have had from the British Ministry of Food. They fail to see why New Zealand's ability to produce butter and meat more cheaply than Britain's foreign food suppliers should be used as an excuse to pay it lower prices than Denmark and Argentina. They are also inclined to point out that the postwar prices of British imported goods show no differentiation in favour of New Zealand—on the contrary, Mr Holland himself has asserted that some British manufacturers load their export prices to New Zealand in order to cut their prices at home and in more difficult markets. If this is not checked, sympathy and support for Britain will deteriorate.

There is also some suppressed irritation in New Zealand over the assumption in certain British circles that New Zealand necessarily agrees with the British preoccupation with Middle East defence. There is a growing feeling that New Zealand's position as a Pacific country is not adequately recognised in London. New Zealanders as a whole are not prepared to go as far as are Australians in emphasising this, but the belief that it should be more clearly recognised is there. Though it came as a surprise to the New Zealand public to learn that the Anzus pact excluded the United Kingdom, this was counterbalanced to some extent by the opinion that the realities force New Zealand to look more to the United States for protection in the Pacific and that New Zealand, like Australia, must be prepared to accept the transfer of obligations which this entails.

Tactless Immigrants

On the whole, the American "invasion" of New Zealand, when it was used as a base for Pacific operations during the war, has left little lasting impression. It did, however, destroy a number of New Zealand prejudices about Americans, just as it exacerbated some antipathies. Most New Zealanders, however, found that their American guests spoke very much the same language as themselves—some of them will assert very roundly that they found more in common with the Americans than they do with some British tourists and immigrants. On the whole New Zealanders are much more favourably disposed towards immigration from Britain than from anywhere else, but a section of the British immigrants arriving in this country arouse hostility and resentment. They are the type of people who spend most of their time in criticising the manners and customs of New Zealanders and in comparing them invidiously with those in Britain. They are a small minority, but they do not help.

There is no reason why these feelings should cause any unease. If it is recognised that they exist, and why they exist, they can contribute a very great deal to the consolidation of general Anglo-American relations. It would assist relations between the United Kingdom and New Zealand if some of the irritations, real and imagined, were brought to the surface and given an airing instead of being smothered, as they so often are, beneath the cottonwool of laudatory speeches. It would help Whitehall to understand New Zealand attitudes and New Zealand problems if more could be done to encourage the appointment of New Zealanders to posts in the Commonwealth Relations service. It would help them even more if British political, industrial and scientific leaders would do something to obtain first-hand knowledge of the Dominion. At the moment the pilgrimage of New Zealanders to Britain is too much of a one-way traffic.

QUARTERLY ECONOMIC REPORTS are now available on nearly seventy countries. These reports give information and opinion on matters of concern to exporters and investors; they are concise and have comprehensive statistical sections. A descriptive leaflet may be obtained from The Economist Intelligence Unit, 22 Ryder Street, London, S.W.1.

The Rumanian "Amnesty"

BY A CORRESPONDENT

THE proclamation of an amnesty in the Soviet Union shortly after the death of Stalin was quickly followed by a similar announcement in Rumania and later in Czechoslovakia. These moves were eagerly welcomed in the West as further indications of a change of attitude in the Communist world.

It would appear, however, that the Rumanian decree was not an amnesty at all, but a "pardon for certain sentences." From the text, dated April 4th, it was not possible to obtain a precise appreciation of the scope of the decree. The "crimes and offences" to be pardoned were defined only by reference to "Annexes I, II and III," which, it was stated, "are published in the *Official Bulletin.*" Since this Bulletin is a highly confidential document, those most closely concerned are not in a position to know whether or not a pardon is applicable in their case, and consequently are obliged to rely on the goodwill of the authorities. Moreover, Article 10 of the decree precisely states that it will be "applied by the president of the tribunal that passed the sentences concerned," and if he is unable to come to a decision he is to "send the dossier to the tribunal, which will decide the case." Finally, "appeals by the Prosecutor and the interested parties against the decisions of the president lie within the competence of the same tribunal."

With the text of the Annexes at hand, it is clear that the decree is not the far-reaching act of clemency which it was made out to be. It grants three different degrees of pardon: a total pardon, a conditional one, and a reduction of sentence. The total pardon is accorded to the cases listed in Annexe I, under sixteen headings, which all concern offences against the common law, such as assault, threats, swearing, petty thefts and other minor violations of private property rights. All charges listed in Annexe I which are pending at the time of proclamation of the decree are to be dropped. A total pardon is also granted to expectant mothers, mothers with children under seven years of age, and all people over sixty, even if they are in prison for offences listed under Annexes II and III.

Conditional Pardons

The conditional pardon, that is, release for a probationary period of three years, is extended to all crimes listed under Annexe III, and to those under Annexe II which involve a sentence of up to two years. If during the probationary period those concerned are again punished with more than six months' imprisonment, they will then have to serve their full sentence. The offences listed under Annexe III include theft of communal property, negligence at work, and infractions of laws relating to agriculture and forestry and the delivery or sale of agricultural products. Annexe II contains twenty-two categories of offences against the penal code, such as negligence at work, refusal of obligatory service, abortion, larceny and robbery; nine categories dealing with infractions of special laws, such as the use of agricultural credits (under 2,500 lei) for other purposes, evasion of taxes, and individual and collective violation of the labour contract; and lastly, the large and special category of offences concerning economic sabotage.

The interesting point about Annexe II, however, is not the great number of prisoners affected by it, but the fact that only a small number of those charged with various kinds of "economic sabotage" have been punished with less than two years' imprisonment—and can thereby benefit from the conditional pardon. Most of these prisoners—many of whom are serving eight years and over—should, however, get their sentences reduced by a little over one half for sentences of 4 years and more; even so, in Western eyes they will still seem excessive.

Miscarriages of Justice Admitted

The comments of the Rumanian press on the decree are illuminating. *Scanteia*, the Workers' (i.e. Communist) Party paper wrote on April 8th that the decree will pardon a certain number of minor offences.

> At the same time, the decree is intended to rectify certain errors, excesses, injustices and abuses committed in some places by elements of the local authorities and the judicial apparatus, which in applying certain laws have interpreted them in an unjust and partial manner.

Both *Scanteia* and *Romania Libera* (the organ of the People's Councils) in an article on the same day, admitted that some of these representatives of the new order have shown a tendency to resort to penal or administrative measures "instead of resolving difficulties by political and educational work." The result has often been "imprisonment for minor infractions," and both papers went on to state that

> it must be emphasised that there have been cases where local bodies have interfered in judicial matters and have brought pressure to bear on some responsible elements of the judicial apparatus, amounting to a violation of the Constitution of the Rumanian People's Republic which provides that "the judges are independent and responsible only to the law."

But how many judges will be prepared to admit that they have interpreted the law "in an unjust and partial manner" or that they have acted under "pressure" from outside? And how many will dare to "rectify" their "errors"? Indeed, what is to be thought of a régime which admits that innocent men and women have been imprisoned, proposes to pardon rather than amnesty them, and then for the final decision in their case leaves them at the mercy of the very person who sent them to prison?

But perhaps the explanation, as information from a usually reliable source suggests, is that the decree was never meant to be put into practice at all. Indeed, the latest reports concerning its application show that there is little or no connection between law and practice. For instance, two categories of prisoners falling within the provisions of the decree have been excluded from its benefits: all the peasants considered as kulaks and all those workers who were members of the former Social Democratic Party have been excluded as "dangerous to the security of the state." And the manner in which it is proposed to liberate peasants not considered kulaks shows up the Rumanian "amnesty" for what it is worth, since only those who sign a declaration of their willingness "voluntarily" to join a kolhoz are to be released from prisons and forced labour camps.

GROWING MORE FOOD

Australia needs more fertilisers in order to grow more wheat—and in the manufacture of superphosphate fertilisers sulphuric acid plays an important part. Simon-Carves (Australia) Pty are building two large plants in South Australia and New South Wales to make sulphuric acid from Australian pyrites. These two plants—one of which will be the biggest single-unit sulphuric acid plant in the Commonwealth—will together produce nearly 150,000 tons of acid a year and will make a valuable contribution to Australian superphosphate production.

THE BUSINESS WORLD

Television Space for Sale

THE somewhat heated controversy about commercial television that has erupted in the correspondence columns of the press in the past fortnight is a soufflé of high principles and politics—given extra flavour by wider misgivings about the American television stations' handling of the Coronation broadcasts. The Postmaster-General had been expected to make a statement this week on the technical aspects of the problem, notably upon the number of channels available for commercial stations, but apparently decided to defer it for a few days until tempers are cooler. The coming statement will presumably be based on the technical report prepared by the Television Advisory Committee, which was given the task of determining how many programmes—in other words, the number of "competitive" television services—that the British air could accommodate at any one time. The committee's report has not yet been published; but certain of its technical conclusions seem fairly clear.

In a strictly technical sense, there are probably 80 to 90 different channels that could be allotted to competitive television stations, but some of these are on frequencies that are unlikely to be attractive, for commercial reasons. It seems improbable, therefore, that enough workable channels could be found to provide anything in the nature of a national network for each of the dozen or more organisations that have applied for licences. What seems more likely is that the government will be in a position to offer each of them a partial network; the degree of over-lapping and if so of inter-station competition, remains to be decided. Opinion in government circles is believed to favour the building up of separate regional, rather than national, networks in commercial television, a policy that may not commend itself to advertisers accustomed to organising their sales campaigns on a national scale. The publication of the Television Advisory Committee's report may well prove, therefore, to be the signal for a spate of negotiations between the groups that have applied for commercial television licences.

Only two of these applicants have so far come out in the open, the *Daily Mirror* group and the Associated Broadcasting Development Company Limited; the latter might be said to represent a co-operative venture by a portion of the radio industry. But all the big newspapers, with the exception of *The Times* and the *Manchester Guardian*, and certain magazine groups are believed to have applied. These applications do not necessarily denote any great enthusiasm in the newspaper world for television as an advertising medium, but newspaper proprietors realise that television is likely to channel off, at least temporarily, some of the £50 million odd spent annually by advertisers in London and provincial papers, and they have taken the view that the wisest way of insuring against this loss would be to get in on the ground floor of the new commercial services. Only one of these applicants, the Associated Broadcasting Development Company, has publicly defined its attitude to the technical questions concerned; and it is only this group, too, that has given any indication of the principles upon which it would plan to run its television service. Its readiness to explain, indeed, has been a piece of shrewd salesmanship that may succeed in cutting the ground from under those competitors and advertisers who disapprove of the policy to which it is committed.

The Associated group is a private company, set up last year with a nominal capital of £100; the list of its directors gives a fair impression of its backing. This includes Sir Alexander Aikman, chairman of Electric

and Musical Industries Ltd, one of the major producers of transmission equipment. Another director is Mr C. O. Stanley, chairman of Pye Radio, a company which on most other occasions engages in open and bitter competition with EMI. In recent years, Pye has come to the forefront as possibly this country's leading producer of television studio equipment, in which it has a considerable export business to the United States as well as to Europe. A third director is Sir Robert Renwick, who is among other things President of the Radio and Electronic Component Manufacturers Federation and of the Television Society. These three represent technical support from established radio manufacturers, each of which has an interest in the marketing of sets to receive the programmes as well as the transmission and studio equipment necessary to send them out. On the entertainment side, the company includes Sir Alexander Korda, who can arrange for spare film studio space, talent and technicians to be placed at the company's disposal. Also on the board is Mr Norman Collins, one-time controller of the BBC television services. Until American experts are imported, Mr Collins can boast of being the only person in this country, outside the BBC, who has first-hand experience of running a television service (Mr Maurice Gorham being in Dublin). Financial weight is provided by the presence of Viscount Duncannon from the bankers, Robert Benson, Lonsdale and Co.

This company has applied for a licence to set up a television network of either medium or low-powered transmitters that could cover roughly 65 per cent of the country's population (the BBC's services will shortly cover 80 per cent of the country). The capital cost of such a network would probably not exceed £4 to £5 million. But since, if a licence is eventually granted, the company seems unlikely to be permitted a network so extensive as this, the sum eventually needed may be smaller.

The *Daily Mirror* has said nothing of its plans beyond confirming that the company has applied for a licence and "is in active communication with various people who may participate with us in this new development." Alone among British newspapers, the *Daily Mirror* has some previous experience of commercial broadcasting. It has a considerable interest in one of the Australian stations, which will almost certainly develop commercial television as well when transmission begins in that country.

The commercial policy upon which the associated company hopes to operate departs from the usual "American" pattern of commercial broadcasting in one important respect. The company has said that it intends not only to operate the transmitters, but also to provide the programmes for them. It intends to sell time for advertising announcements between, and possibly in the course of, the individual programmes. Under this system advertisers would not be required (or even allowed ?) to provide their own programmes, as they are accustomed to do in other countries. Once they had agreed with the television company over the timing of their own televised advertisement the advertisers would have no control over the programmes—though presumably the television fare the station planned to offer would be a part of the bargain.

This method of operation would have some resemblance to the principles of ordinary newspaper publishing, applied to the sale of space on the air. The advertiser would in the first instance receive a guarantee that the programme carrying his commercials was within range of a given number of television receivers. Later, obviously, some form of viewer research organisation could provide periods and programmes with a popularity rating somewhat comparable to the assurance given to a newspaper advertiser about the paper's circulation, and the advertising rates would be fixed on this basis.

A formula of this kind might be politically more acceptable in principle here than the American type of commercial station, that would simply sell time and technical services, leaving the responsibility for advertising programmes, and the type of advertising that each carries, to the sponsors ; though in practice, and to the viewer, the distinction might not be so evident. This formula has recently been endorsed by two advertising societies, the Incorporated Society of British Advertisers and the Institute of Incorporated Practitioners in Advertising, in a memorandum to the Postmaster-General. But support from this quarter for such a moderated version of commercial television may be influenced as much by economic considerations as by the exalted argument about the cultural heritage of the BBC that has figured largely in recent discussion (and might well surprise the devotees of that service's lighter programmes). Only a handful of British advertising agencies have had any experience of commercial broadcasting, and in competing for business all others would find themselves at an acute disadvantage if they had to provide television programmes.

The proposal is less attractive to those companies, and especially to some of the bigger advertising agencies, who do not want to leave the responsibility for attracting audiences to the transmitting station, and who want to integrate their advertising message with the programme—and perhaps the product with the television personality—in a way that may not be possible when they neither provide nor control the programme. Believing that the power of television as an advertising medium would be greatly weakened by such a "half way" system, these bodies constitute potential support for any commercial television company prepared to set up a station on the American—or Australian—pattern.

The capital cost of setting up a transmission network, and the heavy annual expense of running programmes good enough to attract a sufficient audience to make advertising pay, may together discourage many of those who have applied for commercial licences. The British advertising agencies, in their memorandum to the Postmaster-General, mentioned that the BBC spent more

than £2 million in 1952 on its television services, half of it on the programmes themselves. This year, according to the report, BBC television licence revenue is likely to reach £3 million, and if the present 2,202,000 licences in existence have risen to 3 million by the end of the year, the BBC will have a potential television licence revenue of £5 million. This, of course, overlooks the fact that the BBC is free to divide its combined licence revenue (now £13 million) as it chooses. It now spends probably a fifth of its revenue on television. The advertising agencies hazarded the guess that a commercial station, to attract audiences away from the BBC, would have to spend more than this on its programmes, and suggested a figure of between £6 and £8 million a year. Press advertising is at present running at more than £50 million a year. The agencies estimated that the amount of money that might be diverted to commercial television services, as the audiences were built up, would be between £5 and £10 million a year. This sum—on their showing—might provide barely sufficient income for one large-scale commercial network.

★

These estimates may at once underestimate the revenue that might be available, and over-estimate the costs of programmes. Certain types of television programmes are extremely costly to put on, and the existence of alternative employers may push up salaries and fees. But other types of programme are not costly, whilst the rapid development of films specially tailored for television and of the international distribution of recorded programmes, of which the Coronation broadcasts were a most successful example, suggest that annual programme costs could be pegged at a reasonable levy. A commercial station may also be able to avoid the heavy overheads that beset the BBC. Nor does it seem likely that newspaper and magazine groups would have taken serious steps to enter upon commercial television if they, too, expect a sum no higher than £5 to £10 million to be liable to go to the new television stations from the total advertising budget.

There is likewise great uncertainty about the number of families who will be prepared to adapt their receivers so that they can tune into the new transmitters and provide the potential audience to attract advertisers. All of the two million or so receivers sold in Britain since the war are one-channel sets; the cost of adapting them ought not to exceed £5-£10 each. This is small compared with the initial cost of the receiver, but nevertheless high to the many working-class television owners who find difficulty in paying for the cost of valve and cathode tube replacements. If the commercial programmes are of high enough quality at the outset, this extra outlay is likely to be made. Some such vicious circle often exists at the beginning of a commercial venture ; but ways to break it are nearly always found.

If the government can offer each licence applicant only an incomplete and regional network, the next move may seem to be towards some form of collaboration among them. The liabilities incurred in financing a service and its programme resources may be so high as to deter at least some of the newspapers from pressing ahead with applications to set up their own separate stations—if, indeed, all these applications were serious ones. The difficulty is, however, for so competitive an industry, with its national and regional rivalries, to find some way of working together. One or more of the newspapers may eventually join up with Associated Broadcasting Development group. Certain of the London papers are likely to maintain their traditional independence in this new medium, while a number of regional groupings may emerge from the fevered negotiations now in progress.

★

The delay in publishing the Television Advisory Committee's report, the early appearance of which was intended to give the receiver manufacturers advance notice of the number of channels for which they would need to design their sets, may have upset the government's time-table and shortened the time left for discussion. A statement crystallising the government's views on commercial television, and outlining the type of control it favours, seems now likely to be produced in a few days' time, and will be followed by a White Paper laying down the conditions under which licences will be granted. These are likely to be stringent ; and if they include a proviso that a minimum number of programme hours must be provided by the licensee, the stimulus to amalgamate among applicants unwilling to take large risks alone may become even greater.

If the scheme is approved by the summer or early autumn, transmitters working on very high frequencies could be operating within six months of the granting of licences ; those for ultra-high frequencies might take six months longer to complete. It is therefore reasonable to reckon that the first of the new transmitters might be working within twelve to eighteen months from now. The first company in the field will have the unenviable task of building up an audience out of nothing and of selling that audience to advertisers even before its exists ; presumably this may mean at first a large outlay upon unsponsored "sustaining" programmes. It is by no means clear whether, on an economic basis, there is room in this country for several small, and probably local, rivals for the BBC. Events may prove that what emerges from the present traffic behind the scenes is not a number of independent regional groups, but one, or at the most a handful, of commercial networks offering only a few alternative programmes at any one time. Without some means of offering national coverage to its advertisers, a commercial station in the restricted area of Britain may simply not be an economic proposition.

Shell Cornucopia

WITH a gross income of £1,616 million and net assets worth £1,018 million, the Royal Dutch-Shell group towers head and shoulders over all other business concerns domiciled in Europe. The broad trading results of this group in 1952—a small fall in gross profits, but a small increase in net profits and in the dividends paid by its two constituents—were discussed in these columns on May 16th, when the preliminary profits statement was published. The publication of the group's full report now makes it possible to look at its complicated accounts, and their import for the international oil industry, in more detail.

The main complication about the group's annual accounts springs from the fact that it is the Gog and Magog, not the Goliath, of the oil industry. In fact, as a legal entity, the "group" does not exist. What does exist is a close partnership between two separate companies—Shell Transport and Trading, and Royal Dutch Petroleum—that have invested jointly in a wide number of oil producing or marketing ventures all over the world, in each case in such a way that the capital put up by Royal Dutch has been one and a half times as large as the capital put up by Shell Transport.

These two companies (henceforward called the "group") participate in this ratio of 60 to 40 in the whole of the capital and income of three major operating companies—Shell Petroleum, Anglo-Saxon Petroleum and Bataafsche Petroleum—which, in their turn, control subsidiary companies engaged in all branches of activity in the oil industry. In addition, the group has a controlling interest in the Shell Oil Company in the United States, in Shell Francaise SA and in the United British Oilfields of Trinidad Company; the remainder of the shares in these companies are held by private and institutional investors, but this year—and for the first time—the group has included the assets, liabilities and income of these companies in its own consolidated accounts (with an offsetting entry in these accounts against minority interests). Among the other important companies in which the group has made an investment (but has not secured a controlling interest) are the Iraq Petroleum Company, the Shell-Mex and BP marketing organisation in this country, and joint marketing companies in Africa, Asia and South America. In all, the group controlled the production (and, in the main, probably also the distribution) of some 597 million barrels of crude oil last year, or about one-eighth of the world's total production.

This colossus, then, straddles the world; but it is a colossus in the giants' homeland of Brobdingnag. In his report to shareholders for 1952, Sir Frederick Godber, the chairman of Shell, estimates the cost of capital outlays in the whole of the international oil industry since the end of the war and in the foreseeable future at £6,500 million; it is sobering to recall that this is not much less than the whole of Britain's domestic outlay on fixed investment in the last four and a half years.

Indeed, one of the major questions at the moment must be whether this pace of development in oil production has not been too hot. Oil consumption throughout the world is still rising, but the curve of expansion is flattening out. Last year consumption of oil products (at 635 million tons) was 7 per cent higher than consumption in 1951, but this compared with an increase of 10 per cent in 1951 and of 12 per cent in 1950. This slackening of the rate of increase in consumption has been particularly marked in the consumption of fuel oils, of which, Sir Frederick reports, "a surplus . . . (has) emerged, with a depressing effect on the returns for this product and, although there has been a slight improvement in the basic price since the end of the year, it is still below that ruling a year ago." To some extent high petrol taxes have contributed to this result; in Britain, for example, in response to Mr Butler's budget of 1952, there was no increase in total consumption of petrol last year and average consumption per vehicle fell. An exception to the general trend is the steadily rising demand for aviation petrol; although the throughput of aviation petrol in the Royal Dutch-Shell refineries was stepped up by 60 per cent last year, this type of fuel remained in short supply.

★

Yet Sir Frederick's outlook on the future is by no means a gloomy one. After a year of "uncertainty and consequent hesitation," he appears to be willing to accept the reappearance of freer supplies and stronger competition as a "return to normal conditions"; and he regards the recent weakening in tanker freight rates as nothing more than "a healthy readjustment of a position which had got out of hand." Much of his confidence, however, may spring from the fact that the Royal Dutch-Shell group more than held its own in world markets last year; while world consumption of oil products rose by 7 per cent, the volume of the group's own sales rose by 11 per cent. This increase was primarily responsible for the rise in the group's sale proceeds and other income by £192 million to £1,616 million. In normal circumstances this would have been a very satisfactory increase, but last year it was more than offset by a rise of £206 million (to £1,383 million) in total costs. As a result, the group's gross trading profits fell from £247 million to £234 million; the increase in its net trading profits, by £5 million to

Responsible advice

ON INVESTMENT

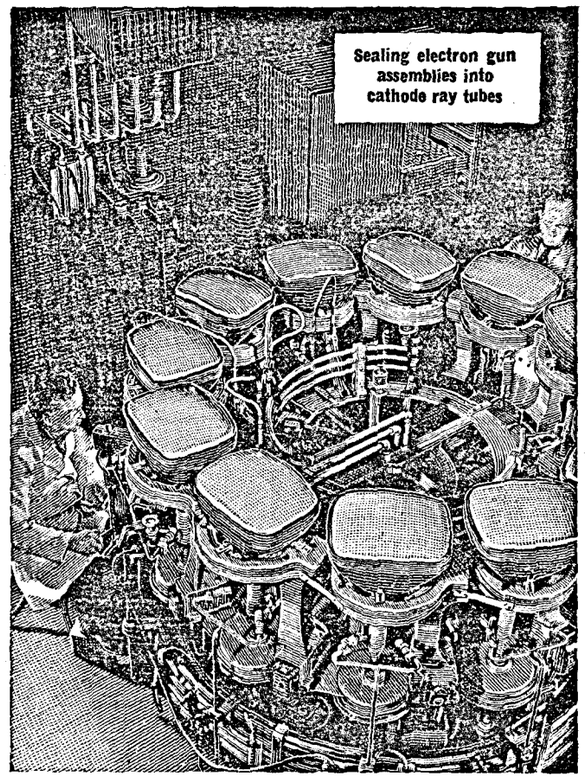
AS AN EXECUTOR | AS A TRUSTEE

AS A SOLICITOR | AS AN ACCOUNTANT

Professional men, business men, even private individuals are often asked for advice on the safe investment of substantial sums of money, whether arising from a will, a maturing policy, the sale of property or other sources.

The investments offered by the Co-operative Permanent provide an ideal answer to such problems. Money so invested enjoys the security assured by a large financial institution with interests throughout the country. Moreover, capital is free from fluctuation. Interest at 2½% is paid with unfailing regularity and income tax is paid by the Society making the return equivalent to more than 4½% where there is liability to income tax at 9/- in the £. Invested money is always at call on short notice and can be realised without loss or expense.

Full details of the complete financial service made available by the Society will be forwarded on request.



Everything points to the advantages of investment in the—

PROGRESS IN ELECTRONICS

BEFORE the advent of television as a home entertainment for the millions, an electronic device known as a cathode ray tube found limited applications in scientific measuring instruments. Today, this device is the heart of every television receiver, and it is being mass-produced to remarkably high standards of performance and reliability.

In the operation of the cathode ray tube in a television receiver, a beam of electrons, modulated by the signals received from the transmitter, impinges on a luminescent screen. The scanning action of the electron beam reconstructs the transmitted picture, while the varying intensity of the beam provides the light and shade.

In direct-viewing receivers the picture is seen on the actual face of the tube. In projection receivers a picture of high brilliance, produced on the face of a tiny cathode ray tube, is magnified, and is then projected on to a viewing screen.

The manufacture of cathode ray tubes is a major activity of the Mullard organisation, and hundreds of thousands are produced annually for the British radio and television industry.

YOU'LL *FOLLOW THE TRACKS*

Of The BIG Yellow 'CATS'

Many people on the east coast of England have been astounded at the speed with which Caterpillar earthmovers have helped to rebuild the shattered sea defences.

One day—perhaps soon—you'll be travelling the new roads which such Caterpillar equipment as this has helped to build. They'll be fine roads, a credit to Britain; the ultra-powerful, fast-working 'Cats' (world-recognised nickname for world-famous machines) will have done an incomparable job, going a long way towards solving the country's transport problems.

DIESEL TRACTORS AND EARTHMOVING EQUIPMENT

£126 million, can therefore be attributed directly to the fall in the provision for taxation from £112 million to £99 million.

From these profits slightly bigger dividends were paid to the two partners and, in turn, both Shell and Royal Dutch effectively increased payments to their equity shareholders (Shell repeated its dividend of 15 per cent tax-free despite last year's one for four bonus issue, and Royal Dutch paid a cash dividend of 16 per cent against a cash dividend of 13 per cent and a stock dividend of 2 per cent in 1951). Inevitably, however, these higher dividends meant that less was ploughed back into the business; although it is a sign of economic health that the latest appropriations (at £106 million) are shown as available for all purposes in contrast to the decision in 1951 to reserve £123½ million against specific contingencies. Largely because of this, the group's liquid resources have been strengthened despite sizeable increases in its material stocks (from £92 million to £103 million) and in oil stocks (from £188 million to £206 million).

The group's basic problem, however, is that it needs large ploughed-back profits if it is to continue with its huge programme of development and exploration. Last year, for instance, the group spent about £188 million on capital account and added another £9 million to its portfolio investments; as the sums available through depreciation and amortisation provisions amounted to only £136 million, a further £61 million had to be drawn from ploughed back profits to support this programme. About one half of this total sum of £188 million was spent upon exploration and production, just over another quarter on oil refineries and chemical plants, and the remainder upon ocean-going fleets of ships and upon marketing and miscellaneous facilities. In financing this programme, the group has come up against the general problem of the lack of risk capital in the new issue market; Sir Frederick devotes part of his address to emphasising this familiar problem, and draws the obvious—and for shareholders ominous—conclusion that "international industry must look to the retention of a large proportion of its earnings for its main finance."

To sum up. The massive march of development in the oil industry, having already stepped in almost derisory style across the gap hacked into world supplies by Dr Mossadegh, is now faced by signs that the rate of increase in world oil consumption is flagging and could soon come to a halt. Even if this does not happen the need of finance for development purposes may tend to prevent dividends from rising much further; while if the world's consumption of oil ever turns down, prices and profits could be quickly affected—and it remains to be seen what the various foreign governments that draw their oil royalties on a profit-sharing basis would say to that.

Business Notes

Commonwealth Contradictions

NOBODY expected this week's Commonwealth conference to do more in the economic field than to shake its head sadly over the plight that has befallen the highest hopes of last December, and to clear up some of the patient bewilderment with which most of the Commonwealth Prime Ministers are looking out on their countries' trade policies today. But it is perhaps a little unfortunate, for clarity's sake, that the draftsmen of the eventual communique, while striving for the traditional platitudes, should have proclaimed the sterling area's firm intention to run in two diametrically opposite directions at the same time. The principal economic passage of the communique declared that:

> Particular attention was given to the need for stimulating economic development, for expanding exports and, consistently with the maintenance of adequate reserves, for removing progressively restrictions on trade over as wide an area as possible and especially within the Commonwealth and the sterling area.

Since the extent to which the sterling area will have resources to spare for the expansion of exports to the outside world will depend, at least partly, on the extent to which they are not using those resources for the production of goods for sale to one another, the last nine words of this declaration are completely incompatible with the precepts that precedes them. The policy enunciated in this communique is that of striking out against restrictionism and discrimination in the whole wide world, but at the same time paying especial attention to whipping up trade within one particular restrictive and discriminatory bloc. In the tradition of Animal Farm, the doctrine is that all payments should be multilateral, but some should be more multilateral than others.

It is, however, unfair to blame the sterling area governments for this peculiar state of affairs. The object of their trade policy now is to move towards something that is rather vaguely called "freer trade," when and how they can; steps towards this freedom in one direction will make steps towards it in another direction impossible, but the policy now is not to bear in mind any clear order of priorities about which steps would eventually be the most desirable but simply to take those that are immediately most practical. This certainly seems to be in contradiction to the policy that the Prime Ministers enunciated last December; although there are some who allege that it is not contradictory to the policy that they actually always had in mind.

In terms of hard policy, the most likely outcome of last week's conference is that some pressure has been put upon Australia and certain other dominions to ease their import restrictions, especially against sterling area goods and perhaps against European goods as well. One other policy decision towards which Britain was believed to be moving must now, however, be contradicted. It was reported in *The Economist* last week that the British Government was believed to have veered in favour of a higher proportion of gold payments, and a lower proportion of credit, in the monthly settlements at EPU; since the plan for a "harder EPU" that the Belgians are now trying (unsuccessfully) to foist upon OEEC would apparently call for large once-for-all gold settlements by those in debt to the union from past transactions, however, anybody in the British Government who was veering in this direction has now veered smartly away again. Of course, opposition to a scheme for elevating payments within EPU towards the same system as that now used for payments with the dollar area is flatly inconsistent with propositions for convertibility; for less discrimination and all that. But practicability, not consistency, is the touchstone by which decisions on trade are now being, and should be, judged.

Markets and Peace

THE week-end news of the Korean negotiations, and the subsequent spreading of hopes of an early peace, have been a dominant influence upon world markets this week, but except on Wall Street—which took a hard knock to the lowest levels of the year—it has not been a heavily oppressive one. In London, as was perhaps to be expected, the effects were more pronounced on the metal exchanges than upon Stock Exchange. The general tone in the stock markets, indeed, remain refreshingly bright (though not unduly optimistic) until the opening dealings on Wednesday. Then, industrial equities were marked down, bringing to an end the steady advance achieved since May 20th, when the *Financial Times* ordinary share index touched its lowest point for the year, at 113.9. Between this date and Tuesday last the index had climbed to 118.1, but Wednesday's dealings brought it down to 117.6 —which was still 0.7 above its level of a week earlier. The mood of uncertainty has, however, ensured a sustained focus upon the gilt-edged market. The advance in prices there continued apace, with War Loan rising from 81 9/16 to 82 3/16 and 4 per cent Consols making the biggest gain of all—from 92 1/16 to 92¾. This strength of the funds carried the new Tanganyika issue home on a tide of success; when dealings began in the new loan on Wednesday it was immediately quoted at a premium of 3/16, which widened by the close to 9/16. Indeed, the only sector of the market that was really depressed by the news from Korea was that dealing in base-metal shares—and here, of course, dealers were following the lead of the metal exchange.

Metal prices took their first sharp tumble on the Friday before the weekend. Spot price tin then slumped £21 5s. to £711 5s. a ton, lead dropped £1 7s. 6d. to £86 15s. a ton and zinc £1 8s. 9d. to £71 6s. 3d. a ton. These markets remained weak on Monday—as did the rubber market, where the price fell from 20 7/16d. to 20¼d. a lb; this compares with the year's highest price of 26½d. recorded in January and the year's lowest of 19¾d. recorded in April. Tin lost a further £20, lead £2, and zinc £1 4s. 3d. At these points the markets paused for breath, and prices hardened slightly, with tin recovering to £693 15s. a ton, lead to £85 15s. a ton and zinc to £70 7s. 6d. a ton by Wednesday's close.

Very Full Employment

THE number of people unemployed in Britain in mid-May was down to 340,300, the lowest since December 1951. This represents only 1.6 per cent of the estimated number of employees in the country, and may be compared with the percentage of 2.2 per cent in May last year—about the nadir of the depression in textile manufacture. The continued and steady recovery in textiles is indeed the main factor in the return to very full employment. Civil employment in textiles in July, 1952, was down to 878,000; at the end of April it had recovered to 978,000—still, however, nearly 60,000 less than it was two years ago. Recovery was more marked in the woollen and worsted industries than in Lancashire; employment in the wool textile industries was up to 219,000, against 190,000 a year ago and 214,000 in June, their lowest point. But employment in cotton, 282,000 at the end of April, was still 52,000 lower than in June, 1951, though 17,000 higher than in August last year. In textiles as a whole, employment rose by 15,000 during April this year.

Employment rises seasonally in the spring: during April 82,000 extra people entered civil employment, including a substantial number of young people leaving school. The seasonal activity in agriculture and fishing took in 15,000 extra workers, and employment in services rose considerably—with 13,000 extra in the distributive trades and 10,000 extra in catering and hotels. The manufacturing labour force rose by 29,000, the main increase being that in textiles noted above. The clothing industry, too, gained 9,000 people on the month. The main movement of labour in recent months, even discounting seasonal influences, thus appears to have been firmly back into the consumer goods industries.

Labour in Engineering

SINCE 1951, during which the labour force of the metals and engineering industries grew by nearly 120,000 workpeople, or 3 per cent, there has been little change in the total. During 1952, the labour force in metal manufacture grew by 1,000, and the vehicle industries gained 28,000 workers; but other "engineering, metal goods and precision instrument" industries lost 29,000, so the total remained stable. Clearly, the large-scale move of workers into the engineering industries from outside was replaced during the winter by a flow into consumer goods manufacture. But there have been significant shifts between some of the heterogeneous industries that make up this broad category of "engineering." The following table, comparing the changes in numbers employed recorded for certain industries in 1951 and 1952 (without reconciling the totals for "end-1951" that were revised during the year) gives some indications of the main changes during each year. It records those industries within which a change, up or down, of more than 5 per cent in numbers employed (which are not comparable with the broad figures of "civil employment") took place in 1951 or 1952.

MAJOR SHIFTS WITHIN ENGINEERING EMPLOYMENT 1951 AND 1952

	1951 Increase or decrease		1952 Increase or decrease	
	'000	%	'000	%
"Expanding"				
Aircraft	+23·4	+15·2	+29·7	+16·8
Ordnance	+ 6·5	+16·8	+ 5·3	+ 9·8
Machine tools	+ 5·0	+ 5·7	+ 6·5	+ 6·9
Telegraph equipment, etc.	+ 2·8	+ 5·8	+ 3·4	+ 6·5
Accessories for motors and aircraft	+ 8·6	+ 7·5	+ 7·0	+ 5·2
Electrical machinery	+ 9·6	+ 5·6	+ 3·1	+ 1·8
Boilers	+ 1·4	+ 5·1	+ 0·4	+ 1·3
Wireless & gramophones	+ 6·8	+ 7·4	+ 0·9	+ 0·9
"Contracting"				
Carts & perambulators	− 0·5	− 5·3	− 1·1	−12·5
Textile machinery	− 0·9	− 1·2	− 7·0	− 9·1
Railway rolling stock	− 4·5	− 5·3	− 1·5	− 1·8
"Altered Development"				
Constructional engineering	− 4·8	− 5·7	+ 0·7	+ 0·9
Tools & cutlery	+ 1·9	+ 3·5	− 7·8	−14·2
Musical instruments	+ 0·2	+ 2·4	− 0·8	− 8·8
Stationary engines	+ 1·0	+ 3·8	− 2·3	− 8·6
Radio valves & lamps	+ 5·5	+14·6	− 3·4	− 8·0
Hollow-ware	+ 0·3	+ 0·5	− 4·3	− 7·3
Electrical goods	+ 7·9	+ 6·2	− 9·5	− 6·3
Batteries & accumulators	+ 0·7	+ 3·6	− 1·2	− 5·9
Brass manufactures	+ 0·8	+ 1·7	− 2·5	− 5·1

More detailed analysis, therefore, emphasises the limitations of the monthly figures of civil employment in broad groups of industries as a guide to significant movements of manpower in the economy. With this reservation, it is worth noting that in the first quarter of 1953 the total engineering labour force tended to shrink more sharply: by the end of April metal manufacture had 12,000 fewer workers than at the end of December, employment in the vehicle industries was almost unchanged, and the "engineering, metal goods and precision instruments" industries had lost another 19,000 people. Sections of engineering still recording increases in numbers employed were aircraft, wireless and gramophones, shipbuilding and marine engineering, and railway rolling stock—plus carts and perambulators and hollow-ware. All other industries in the group had stable employment or showed declines.

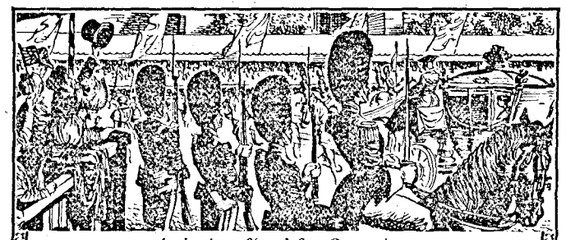
Salesmen for Steel Shares

THE cast is now fully assembled for the opening scenes of steel denationalisation. This week the Treasury announced the membership of the new Iron and Steel Holding and Realisation Agency, which, as was already known, will be headed by Sir John Morison, who has been advising on the question of resale for some time. His colleagues include Sir John Green, chairman of the moribund Iron and Steel Corporation of Great Britain. This organisation seems likely to present its second and last report, for the year ending in September last year, very shortly ; this will have some general interest if only because it may give more indications of the broad course of profitability of the industry than have yet appeared in individual steel company reports. The corporation, having dutifully presented this report to the Minister of Supply, will then presumably commit *hara-kiri* amid much politeness ; there does not seem to be any intention to produce any further report or accounts for the period since September. But indications of commercial experience to date will presumably appear in the prospectuses that are presumably already in preparation. The agency's intention seems to be to float off a number of the larger companies before the holidays, Stewarts and Lloyds having been rumoured as perhaps the first. This selection might be a good one, and would probably be well received ; but the City is saying nothing until it sees the first prospectus—and some surprise has been expressed at the silence of the steelmasters themselves upon the virtues of the operation.

The agency will have the duty of acting as a passive controlling shareholder as well as of selling its shares, and Sir John Green's experience at the head of the corporation will obviously be of value here. It will share some of its responsibilities with the recently appointed Steel Board—particularly if any questions should arise of regrouping some of the now nationalised companies.

No Concessions on Purchase Tax

IN the Finance Bill debate the Chancellor of the Exchequer has this year presented a firmer front to the renewed pressure for concessions on purchase tax. Last year, it will be recalled, he felt obliged to concede relief to the textile industry, and during the debate introduced two new tax rates for textiles only, of 25 and 50 per cent (instead of 33⅓ and 66⅔ per cent). This year, having given concessions in the budget itself—mainly by extending these changes to all the other products still attracting tax at the relevant rates, as well as by reducing the 100 per cent category to 75 per cent—he has refused any concessions for textiles at all. In this he was certainly justified, for, as he pointed out, the textile recovery has gone far enough to make any such measures unnecessary. In spite of the constant criticisms levelled against them, the special "D" schemes for textiles constitute a tax advantage that other industries subject to purchase tax, with the exception of furniture, do not enjoy. During Wednesday's debate, Mr Maudling estimated that the amount of tax paid on textiles was equivalent to 5 per cent of the wholesale turnover, compared with 34 per cent for other industries.



On the question of the future of purchase tax as a whole, Mr Butler made it plain that he hoped to continue the policy of general reduction that he started last April. The Budget changes, he recalled, reduced each of the old rates by one-quarter and will cost £45 million this year and £60 million in a full year, compared with the previous year's purchase tax yield of around £300 million. The Government's answer to those who would have liked to see an even larger reduction is that a bigger drop in revenue could not be afforded. Moreover, any sharper reduction would aggravate the burden thrown upon retail traders in the form of losses on tax-paid stocks. The Chancellor put this year's loss by retailers at about £13 million, which roughly confirms the estimate of £15 million made in these columns at the time of the budget.

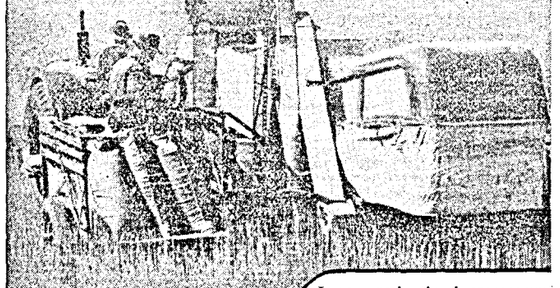
Textiles in April

THE trend of textile production this spring certainly bears out the Chancellor's confidence in the industry's recovery. Production and sales now seem to have reverted to their normal seasonal pattern—with Easter marking the customary decline. Rayon output, though still running at a very high level, dropped in April by 3.6 million pounds to 32.7 million ; similarly, production of cotton cloth fell from an average of 35 to 33 million linear yards a week and rayon and mixture cloth production from 15 to 14 million yards over the same period. In Bradford, consumption of wool declined from 46 million pounds to 42 million. In the wholesale trade, the index of textile sales (1950 = 100) dropped from 115 in March to 95 in April. In each of these cases, however, the figures were above their level at the corresponding date last year. Textile sales by value are nearly 9 per cent up on the year, in spite of the sharp fall that has occurred in textile prices, while the value of stocks on the wholesalers' shelves, which was one point lower in April than in March, was 28 per cent lower than it was a year ago—at 86, compared with 121. Combined cotton and rayon cloth production in Lancashire was on

BRITISH BANKING
1952

A series of articles surveying developments in British banking in 1952 will appear in *The Economist* next week and an associated selection of banking statistics will appear simultaneously in the *Records and Statistics* Supplement.

At the time of 'our' first Coronation . . .



The People Cheer

Probably there were few customers of the Westminster Bank among the crowds who, in 1838, watched the Coronation Procession of Queen Victoria; the Bank had then been in existence only two years. In this present Coronation year the position is very different. For now the Westminster Bank looks back upon 117 years of continuous growth and service. Its branches are a familiar sight in the towns and villages of England. Its customers are found in all occupations and all walks of life. For all of them the Bank provides an efficient and friendly service which combines modern practice with all that is best from the past. And, in thus honouring its own traditions, it has created another—the family tradition of 'banking with the Westminster'

PLASTICS
inspire new ideas

It can hardly have escaped your notice that a great number of out-of-the-ordinary problems are being solved to-day by the use of Plastics. For Plastics possess *combinations* of qualities not to be found in other materials. This bottle-filling machine illustrates the

point. Metal must not come in contact with the liquid directly or indirectly because it will produce a chemical change, and for this reason it must also be possible to inspect during the filling operation All the major parts of the machine are made from plastics materials Transparent BX Acrylic rods have been machined to make non-return valves, and filler heads resiliently mounted. These are connected up by flexible BX P.V.C. tubing which is also transparent, allowing constant inspection throughout

A visitor from the States recently told our customer he had been unable to find an American or Continental manufacturer producing a machine for this purpose

Illustration by courtesy of Gravifil Machines Ltd.

INDUSTRIAL AND COMMERCIAL FINANCE CORPORATION LIMITED

Subscribers:

THE ENGLISH AND SCOTTISH BANKS

In the eight years since it was established by the Joint Stock Banks, the Corporation has become one of the principal sources of long-term finance for the private company. In this period it has invested in over 500 concerns, of which 450 are private companies. It has invested some £34 million since its formation, of which £26,286,355 was outstanding at March 31st, 1953.

The growth of the Corporation during the eight years of its existence is shown by the following table of net advances and investments.

	Loans £	*Share Investments* £	*Total Net Advances and Investments* £
1946	178,380	—	178,380
1947	1,836,646	1,233,399	3,070,045
1948	4,701,959	3,058,180	7,760,139
1949	7,976,449	4,422,044	12,398,493
1950	9,922,907	5,745,172	15,668,079

average 6 million yards a week above last year's level; wool consumption was up from 28 to 42 million pounds, but the most striking evidence of recovery is that afforded by the figures for rayon yarn. Here the total has doubled—from 16.6 million pounds in April, 1952, to 32.7 million in April this year.

The accompanying chart shows that the general level of production, in both continuous filament and rayon staple, is back to the high levels reached at the end of 1951, with the disastrous summer of 1952 representing a trough between the two peaks. Production of rayon staple is, indeed, now running at an even higher rate than in 1951. In several months of that year it exceeded 15.5 million pounds; whereas both in January and March this year it exceeded 17 million, dropping to 14.8 million in April because of the Easter holiday. This section of the industry was the most severely hit by last year's slump, when staple production at one point declined to little more than 2 million pounds a month. The recovery in rayon seems, however, to be largely supported by the home market. Deliveries of continuous filament yarn to home consumers averaged 16 million pounds a month in the first quarter of the year, compared with a monthly average of only 11.5 million in 1952. The total value of rayon exports has declined; during the first four months of this year, it amounted to only £13 million, compared with more than £17 million in 1952. As the figures show only a slight rise in volume, the decline cannot have been wholly due to a more competitive price policy.

New Funds for the Comet

THE £6,100,000 that de Havilland hopes to raise from its two new issues is expected to satisfy about half of the additional finance that the group will need in the next three or four years. The other £6 million odd, which will be needed as additional working capital to finance the building and development programme of the Comet and other aircraft and engines, will come partly from ploughed back profits but also partly (and probably largely) from borrowings from the banks. The new issues announced this week are designed to satisfy all tastes, for de Havilland proposes to raise £1,200,000 from an issue of 5¼ per cent redeemable cumulative £1 preference shares at par and about £4,900,000 from an issue of 4,385,459 £1 ordinary shares at 22s. 6d. each. These new ordinary shares are offered by way of renounceable letters of rights to the company's existing equity shareholders, in the ratio of one new share for every share now in issue. At a price of 22s. 6d. the new shares offer a yield of 6⅔ on the assumption that the company will do nothing more than to maintain the equity dividend at the current rate of 7½ per cent; these terms offer a sufficient turn on the current price of the ordinary shares of 27s. to ensure full subscription lists. But although the new shares are an attractive investment, and although the directors expect that profits in the year to September 30th next will exceed the gross profits of £1,575,989 in 1951-52, shareholders should not nurse extravagant hopes that, in conditions of possibly cooler war, the company's earnings will necessarily soar as high as the Comet itself.

Equilibrium in Rubber

WORLD production and consumption of natural rubber during April were the same, 132,500 tons. From the producers' point of view this was not as satisfactory as the balance in the two previous months, when consumption exceeded production (by 17,500 tons in February and by 5,000 tons in March). But it was still a great deal better than the monthly surplus of rubber production throughout 1952 and in January this year, when it amounted to 27,500 tons. This recent approach to a balance of production and consumption, however, has only slightly relieved the gloomy outlook for natural rubber, and the new situation is maintained precariously.

According to the figures published by the Rubber Study Group Secretariat, production in April was 2,500 tons lower than in March, but consumption was 7,500 tons lower. For the first four months of this year production of natural rubber amounted to about 545,000 tons and consumption to 537,500 tons, an excess of production of only about 7,500 tons; for the corresponding period last year production was 587,500 tons and consumption 502,500 tons, resulting in an excess production of 85,000 tons. Production has thus been 42,500 tons less and consumption 35,000 tons more than up to the end of April last year. Production of synthetic rubber for the first four months of the year amounted to 329,500 tons, about 6,000 tons less than in the corresponding period a year ago and consumption, at 327,500 tons, was about 3,000 tons down. The excess production of synthetic rubber up to the end of April was about 35,000 tons last year, but it was only about 2,000 tons this year.

It is too early to say whether this approach to equilibrium in the production of rubber will continue; but it has fortified those who hold the view that a buffer stock for natural rubber is unnecessary as an answer to the planters' difficulties. At this week's meeting of shareholders of United Sua Betong, Sir John Hay came out very strongly against a buffer stock scheme. Sir John and many other rubber experts believe that a reduction in the production, or a rise in the price, of synthetic rubber would be the most helpful single thing for the natural rubber industry. Any important change in synthetic prices is, however, unlikely before next year, when it is expected that the government-owned United States synthetic plants will pass into private ownership. Meanwhile the remainder of this year must remain a crucial period for rubber planters.

Branded Margarine Again?

RECENT statements from two leading manufacturers of margarine, Unilevers Limited, and Van den Berghs and Jurgens Limited, lifted the veil only very slightly on the question of when the British housewife will be offered a choice between different brands of margarine, instead of being restricted to the single "national" variety. As long ago as last October, the Ministry of Food propounded a plan to make this choice possible. Some of the private manufacturing companies are believed to have been willing to accept this plan after only minor amendment; but, despite this, negotiations are still proceeding between the Ministry and a committee representative of the whole trade, and it now appears that branded qualities may not come on the market until next January.

The main difficulty is that the manufacturers—and presumably especially the high quality manufacturers—are reluctant to accept any scheme that does not guarantee adequate and regular supplies of good quality raw material. At the moment practically all the raw material that the sterling area has to offer is being taken up; and, to achieve complete freedom, the industry would like additional supplies that would cost about £22 million a year, of which £10 million would be in dollars. The government, for its part, is inclined to try a return to branded qualities while still retaining rationing; although this would be administratively irksome many producers would be willing to give this a trial. Finally, however, the government wants to remove the present subsidy of about 2d. a lb on margarine (which costs it £13 million a year), but at the same time to make reasonably certain that retail prices would not rise by more than that amount. The introduction of branded qualities would no doubt stimulate competition, which might be very keen at the start, but the government cannot overlook the fact that about 50 per cent of production is in the hands of one group of makers.

Coal Budgeting

THE Coronation holiday cost the coal industry about a million tons of coal, and may have had some effect upon output during the days before and after. Output last week amounted to 3,058,000 tons from the mines and 131,200 tons from the opencast sites; this compares with 3,360,000 tons and 231,400 tons respectively the week before (which was Whit week) and with 4,339,400 tons and 247,200 tons respectively in the week ended May 23rd. It was only slightly lower than the corresponding week last year, which was again Whit week. So comparisons are necessarily blurred; and the industry is looking at the picture of cumulative production this year and last, from which it can draw a certain amount more comfort. The loss of production during the extra day in 1952, which was a leap year, and during the Coronation are past; and the industry has still produced more than last year—about 5,000 tons more. It may already be beginning to experience the more important of the handicaps with which the coal mines have to cope in 1953—the miners' second week's holiday. At the present moment, it may be losing perhaps 40,000 tons a week through the longer holidays miners are beginning to take; by the end of the months the weekly loss of coal may be five or six times as much as that, to be continued throughout the summer. The eventual loss of coal through this extra holiday has always been put at about 3½ million tons—a summer week's output; to offset it, miners at work will have to continue to increase production.

During the last two months, they have indeed achieved a certain increase; the National Coal Board estimates that the extra million tons of coal that has offset the losses in working time so far was obtained during this period, a substantial amount of it coming from the newcomers who have now been upgraded into productive work. Inland consumption, it is however worth noting, is already 1,600,000 tons higher than it was by this time last year, and the board has managed to send so far about 1,300,000 tons more overseas. Distributed stocks ten days ago were 13,857,000 tons, which is more than a million tons lower than a year before; and in their own stocks at collieries and opencast sites or stocking grounds the board has now only about 700,000 tons more saleable coal than it had then. The building of stocks continues, though the loss of coal through holidays may slow it down; those responsible for the board's coal budgeting must still be fairly anxious about the winter.

Select Committee in the Clouds

THE latest report on rearmament from the Select Committee on Estimates devotes particular attention to the difficulties of aircraft production. Two points caused the Committee most concern. These were the disconcertingly long time-lag that seemed to exist between the design and the delivery of military aircraft, and the apparent multiplicity of designs in production. In consequence, the recommendations attached to the report were somewhat critical of the size of initial orders placed by the Ministry of Supply and of the timing of those placed by the Admiralty for naval aircraft. The Committee also suggested that the services and the Ministries "should examine the possibility of greater co-operation between the Western Allies so that each country can produce at a reduced cost per aircraft a more limited range but greater number of specialised aircraft for the benefit of all the Allies."

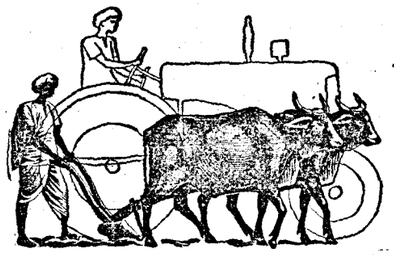
These suggestions overlook one vital point: no country can afford in peacetime to keep all branches of its services equipped with the most modern weapons all the time. Weapons are under continuous development; and aircraft design, in particular, is in the throes of a technical revolution brought about by the sudden opportunities for supersonic and near-sonic flight. When an aircraft goes into service it has to remain standard equipment for several years, towards the end of which it will certainly be technically inferior to newer designs in service here or elsewhere. It is therefore important—and this is a prime test of judgment—to order a design that holds out the prospect of having the longest effective service life. When the Select Committee contrasted the Ministry of Supply's recent practice of ordering designs from the drawing board with the Admiralty's practice of testing prototypes before ordering, it was not in fact comparing like with like. The Swift and Hunter fighters have been both evolved from a long succession of prototypes dating back to the early postwar years. Four-engined jet bombers have been ordered off the drawing board—in very limited numbers—because the alternative was to leave the Air Force without any such machines in its armoury, and nobody wanted that. In the case of the Navy, it is fair to say that no really satisfactory designs were put up to it until the arrival of the twin-engined Vickers fighter which, although it has been ordered off the drawing board, is itself an evolution from an earlier prototype. Those aircraft that the Navy has ordered have had to be modified again and again to bring their performance and that of their equipment closer to service specifications.

This constant evolution of design also justifies the placing of initial orders that appear small and expensive to the aircraft manufacturer, but that are in fact an insurance against the danger of burdening the Air Force with large numbers of obsolescent machines. The cutting of the very big orders placed in 1950 and 1951 for Meteors, Vampires and Canberras was a clear illustration of this danger that the Government has rightly taken to heart. For much the same reasons, it is unrealistic to suggest that in a time of technical evolution, the industries and the air forces of different countries should all standardise on one design of one type. British and American designers have approached the problem of jet bomber design in totally different ways, and, until the aircraft concerned have had several years of testing in squadron service, no one can say which approach has been the correct one. The requirements of aircraft production in cold war are very different from those in hot war. Of course they do give some scope for waste, against which the Parliamentary watchdog must always be on guard; but it should also have a clearer definition of what waste is.

Cost of Defence Tools

THE Government's decision nearly two years ago to obtain the machine tools they required for the rearmament programme partly from overseas, in order to moderate the load on the British machine tool manufacturers, seemed then and since, on balance, the right one. But it was also, necessarily, expensive; and in a memorandum that the Select Committee on Estimates has reproduced in its latest report, the Ministry of Supply has now set down some of the cost.

Broadly, the Government in 1951 decided it would require about 35,000 machine tools, and to get about 18,000 of these from overseas. It ordered in fact about 20,000 tools from abroad, but later cut these orders to 18,500, to cost about £104 million. At the end of February this year, some 14,000 tools had been delivered, costing £76.5 million. The orders on the British machine tool industry, for about 16,500 machines, were later slightly increased; the bulk of these have been delivered, and except for certain specialised producers the industry is now becoming less heavily engaged upon defence work. A small number of the tools delivered from both sources, as a result of changes in the programme, are now surplus.



The machines ordered abroad were partly of types that Britain does not produce or of which production here, based upon normal demand, was small. About 8,000 of the total ordered from overseas—costing roughly £70 million, since these are generally more complex and specialised machine tools—fell into this category. Half of them had to be bought from the United States, and half were available from European tool manufacturers. The remaining 10,000 were of types that British makers do produce in substantial quantities, but had largely earmarked for the home and domestic markets. The extra cost was thus £15 million for these tools:—

	Cost of foreign machines obtainable in Britain	UK Cost
USA	£11 million	£4 million
Continental	£23 million	£15 million
	£34 million	£19 million

The American tools cost on the average 145 per cent more than equivalent British types, and in some cases as much as 191 per cent more; Italian machines cost on average 57 per cent more, French 25 per cent more, and German and Belgian 17 per cent more. During last year, when the British industry was left partly free to serve its home and export markets, it increased its output to some 60,000 tools, worth about £60 million; of these, it exported about £22 million worth. Inevitably, the experience has led the Select Committee, like many earlier investigators, to ask why Britain fails to produce types of tool obtainable from other countries; and this question has some force by comparison with European manufacturers, though America is the only country with a steady market large enough to justify production of certain of the more specialised equipment. The extra price paid for foreign tools, again, may seem an expensive way of maintaining the power to export and re-equip British civil industries. It may, too, have assisted European manufacture to expand and generated future competition for engineering exports. But that competition was already increasing markedly. To have pulled the British industry out of its export markets to equip British rearmament might have pulled it out for good.

Ceylon's Deficit

LAST year saw an abrupt change for the worse in Ceylon's balance of payments, which had for several years past been in a more consistently healthy condition than that of any other independent sterling country. In the four years to the end of 1951, Ceylon's external assets rose from Rs. 947 million to Rs. 1,185 million, and throughout this period Ceylon was unique among the independent members of the sterling area dollar pool in consistently running a dollar surplus. But during 1952 the fall in the prices (though not the volume) of Ceylon's exports, coupled with a rise of 38 per cent in the price of imported rice and with a continued high level of total imports, led to a serious deficit. External assets dropped during 1952 by nearly a third, to Rs. 837 million—the equivalent of about six months' imports at the 1951/52 rate—and by March, 1953, they were down to only Rs. 750 million. Moreover, the dollar account is now only precariously in balance—and the long-term agreement to sell rubber to China (in return for badly needed rice)

will certainly reduce Ceylon's dollar earnings in future. As Ceylon is believed to have a flexible and informal agreement with the United Kingdom whereby it retains part of its own dollar earnings, the possibility of its swinging into dollar deficit raises the question of how far it should be allowed to draw upon the sterling area's dollar pool without incurring the full obligations accepted by other members.

This dramatic reversal in Ceylon's external finances is fully documented in the third annual report of its central bank—the youngest in the Commonwealth. This document, which has recently become available in London, maintains its refreshingly independent view of government policy. It points out, in particular, that the large-scale extension of bank credit to finance the government's budget deficit—occasioned largely by the continued high level of food subsidies (amounting to Rs. 245 million)—has been the main reason why the drastic fall in export receipts has not been accompanied by contractionary influences that would have tended to buttress the balance of payments. In this and other outspoken comments, Ceylon's central bank sets a good example for some of its older sisters. It is to be hoped that the government will show no less decisiveness in putting the advice into effect in the difficult situation facing the country. And perhaps the bank, too, should suit deeds to words in the matter of disinflationary policy—by exercising rather more influence towards the raising of interest rates, which are generally lower in Ceylon than elsewhere in the sterling area.

Soap and Synthetics

SIR GEOFFREY HEYWORTH'S address at the annual general meeting of Unilever was devoted almost wholly to an appraisal of the role of synthetic detergents in the soap market. The group has shown itself reluctant to back synthetic detergents up to the hilt with the vigour shown by its major rival, Proctor and Gamble (who control Thomas Hedley in this country); and this reluctance cost it a portion of its American and British markets in the early days. Although, in the past year or so, the company has devoted more energy to the production and marketing of Surf and other synthetics, Sir Geoffrey's speech shows that the change has been one of expediency rather than choice. He emphasises that the synthetic detergents are less *versatile than soap*, except for dishwashing and surface cleaning. This is a verdict that would be confirmed by most detergent chemists; for, of themselves, synthetics have not the ability to hold dirt in suspension in the way that soap can do. Even after blending with various compounds to improve this property, the synthetic still suffers from the handicap that some people find it hard on the hands. Finally, the costs of production (and so the price) are higher than for the equivalent weight of soap powder. When all these factors are combined, they appear to add up to a formidable case against the detergent.

In spite of this, Sir Geoffrey admits that the synthetic detergent powders sell. Last year they accounted for 43 per cent of the household detergents sold in the United States (where they have been on the market longest), for 22 per cent of the household detergents sold in Britain and 23 per cent of those in Holland. The bulk of these sales have been made at the expense of soap, and the synthetics are still gaining ground. This suggests that the detergents must have some stronger appeal over soap, other than their efficiency in hard water, than the Unilever chemists are yet prepared to concede to them. Unilever is expecting the drop in the price of soap-making oils and fats, due to lower soap production, to make soap powders even more competitive with synthetic detergents than they are today. But evidence so far would seem to suggest that prices are not the whole answer. Sir Geoffrey admits that the "tempo of marketing the new blended synthetic detergents is faster than it used to be with soap," because the market must be captured with the minimum delay if the chemical plants producing the basic materials are to operate on an economic scale. Unilever's share in this capital cost in Europe and North America has amounted to date to nearly £8 million, to which must presumably be added some underemployed soap plant.

But whether or not the company's more vigorous selling policy enables it to capture the share of the detergent market that its size suggests it should command, Unilever's first love—and main interest—may still lie in oils and fats. The company is now negotiating to buy a shareholding in East Africa Industries Limited from the Colonial Development Corporation and to assume technical and managerial responsibility for the production of oils and fats there. From the tenor of Sir Geoffrey's speech, which was a remarkably comprehensive analysis of detergent economics, it seems plain that Unilever is by no means convinced that the market for oils for soap will go on shrinking; it is therefore still adopting the cautious attitude of backing detergents both ways.

Finance for Gold Mining

AGAINST the expected background of cuts in many Kaffir dividends for June (but also of some hopes among investors in London, though apparently not yet in the Cape, that gold mining would be one of the few industries that should gain if disinflation gathers pace after a truce in Korea), three chairmen of major mining finance houses have delivered their annual addresses to shareholders this week. Lord Baillieu, at the meeting of the Central Mining and Investment Corporation, spoke for a corporation that is interested in deeper—and therefore at the moment less

profitable—mines than those of most of its competitors ; but as the Blyvooruitsicht and Harmony mines are in the group, he was able to wax reasonably, though necessarily guardedly, optimistic about the " important milestone " represented by the new emphasis on uranium production. Sir George Albu, at the meeting of the General Mining and Finance Corporation, was largely concerned with explaining the group's somewhat finely drawn offer for the absorption of two smaller investment houses, " Crits " and " Trams " (neither of which has paid any dividend for some years) ; but as General Mining administers West Rand, he too was able to derive encouragement from the uranium prospect (and to make the important point, which can be misunderstood by those who read West Rand's operating results, that the mine is now able to send to the mill ore with a much lower gold content because the uranium makes it profitable).

The third address, and in many ways the most interesting, was that by Sir Ernest Oppenheimer at the general meeting of the Anglo-American Corporation in South Africa. Sir Ernest devoted much of his speech to the familiar problem of the shortage of risk capital. The task of finding the torrent of new money needed to finance the development of the gold mines in the Orange Free State and of uranium production throughout the Union has been exacerbated by the fact that the " state of the financial and share markets " has made new issues by the mining finance houses to the public virtually impossible. The Anglo-American Corporation has found a short run solution by providing loans out of its own resources to a large number of developing mines under its patronage ; last year, loans by the corporation to affiliated and other companies more than doubled—from £7,411,891 to £15,436,208. These loans will be repayable when the developing companies have reached the stage when an issue can be made to the public or when they are earning big enough profits to pay off the loans from their own resources.

Further relief has come from another—and a rather unexpected—direction. Recently, the National Finance Corporation of South Africa has agreed to take up short-term debentures from two companies in the Anglo-American group. Although the Act under which the National Finance Corporation was set up expressly empowered it to make such loans, this is the first time that such arrangements have been made. Naturally enough Sir Ernest gives these pioneering loans a warm welcome and hopes that they will become more common in South Africa. But it is a frightening comment on the decline of the capital market that the risks of development in such speculative ventures as mining on the Rand should have to be borne in part by a quasi-governmental institution.

Gas from the Coal Seam

EXPERIMENTS in the underground gasification of coal have been going on, since the war, in Britain, the United States, France, Belgium and Italy. A conference in Alabama last year pooled their results ; and a report recently issued by a technical mission from the European countries concerned shows that the results are encouraging, though the economic possibilities of underground gasification are not yet established. Russia, the best-publicised pioneer of the technique, is presumably operating underground gasification plants on an industrial scale ; but the West knows nothing of experience there since 1942.

Various methods have been tried, mainly in the United States and this country. A coal face extending between parallel galleries, across a seam, may be ignited and a stream of air passed across it ; boreholes of small diameter may be driven along a coal seam and gas produced by combustion in them as air is passed through ; or in suitable rock formations separate vertical boreholes may be joined by a horizontal tunnel in the coal seam driven to join the bottoms of both. But the method that requires least underground work, and on which most hopes are being pinned, is " percolation." Holes are bored down to the coal seam at some distance from one another, and the gas is circulated between them by the natural porosity of the coal or through cracks produced by the injection of air or liquid under high pressure (or by the passing of an electric current through the seam). Hot gas is produced, of a calorific value suitable for use in local power plant but not worth transport over long distances, when the combustion is carried out with air ; but a richer " synthesis gas " might be produced using oxygen and steam or by blowing alternative blasts of air and steam. It should, the European team conclude, be possible to extract 60-90 per cent of the latent heat in the underground coal, in the form of the warmth and the combustible quality of the gas. Oxygen would increase the cost of gasification, but the richer gas obtained could be distributed as a fuel as widely as coal and perhaps more cheaply, apart from its possible use in chemical processes.

Rhodesian Tobacco Prospects

FOR the first time since the war the area under tobacco for the current season in Southern Rhodesia shows a reduction, being 179,000 acres, or 14,000 acres less than in 1951-52. But the estimate of a good yield this season, giving a total crop of 108 million lb, 11 million lb more than was sold at auction last season, may yet be fulfilled. The target crop of 125 million lb, which means a yield of 700 lb per acre, will not be reached, but the present estimated yield of about 603 lb is nevertheless already about 20 per cent better than last year.

Sales so far on the auction floor at Salisbury have amounted to about 40 million lb, realising approximately £7.6 million, an average price of about 45.5d per lb, which is a fraction higher than for the same period last year. Buyers for the United Kingdom have bought about 57 per cent of this year's crop of Southern Rhodesian tobacco and Australia has bought about 7 per cent. It seems doubtful, however, if the proposed purchase of 80 million lb by Britain will be fully carried out. Southern Rhodesia remains an important source of sterling tobacco for Britain. In the calendar year 1952, of total tobacco imports into Britain, which amounted to 223.7 million lb, valued at £51 million, no less than 58.3 million lb, to the value of £14.8 million, came from there.

SHORTER NOTE

In last week's issue of *The Economist* it was stated that Brazil's commercial arrears " to the major New York banks alone stood at $208.3 million at the end of April." Actually, of course, although this was the figure of arrears reported by fifteen leading banks, the debt was owed not to the banks but to their customers, the United States exporters. It is believed that total commercial arrears owed by Brazil to all American exporters are about twice as large as this.

Company Notes

J. LYONS. The published report of J. Lyons is a disappointingly colourless document for a company whose name is familiar to all and whose record in recent years has been one of remarkable development and expansion. The directors issued no preliminary statement and, as in the past, they are content to let the published figures speak for themselves in the full accounts for the year to March 31st last. Yet the accounts, which record another advance in trading profits (this time from £3,512,812 to £4,162,805), provide no reason for canny secrecy ; it seems probable that the company, which has spent a lot of money on brightening up its restaurants recently, is still efficiently and successfully taking some of the trade away from competing caterers. In any case, the rate of advance has been so rapid

£1 'A' ordinary share at 95s. 0d. yields £4 15s. per cent.

that the company is clearly one that has been hit hard by EPL—although, of course, its business has nothing to do with rearmament. In the accounts the specific charge for EPL is not shown but the total provision for taxation has risen from £906,548 to £1,676,674 ; and this, together with a higher charge for depreciation, has limited the advance in net profits to a mere £88,685. It is, perhaps, because of this stickiness in net profits that the directors have again been content to recommend the same rate of dividend—22½ per cent—that has been paid in each year since the end of the war. Although the £1 ordinary shares are recognised as " blue-chip " equities, the patience of shareholders will be severely tested if the directors fail to break away from this ultra conservative policy when EPL is removed.

★

METAL BOX. Although Metal Box's total income from sales and investments in the year to March 31st last rose from £36,423,000 to £40,165,000, its trading profits fell from £3,720,000 to £3,300,000. Within this total, profits at home declined from £2,545,000 to £2,255,000 and profits earned overseas from £1,175,000 to £1,045,000. These lower margins of profits suggest that, while the group's production benefited from the freer supplies of tinplate, keen competition in the industry forced it to keep prices down while costs were rising.

The fall in profits has been balanced by a decline in taxation (from £2,205,000 to £1,997,000), but, even so, the group's net profits are £202,000 lower at £1,113,000. This decline in earnings, however, has not prevented the directors from recommending the same rate of dividend (15 per cent) on the ordinary capital of £4,515,962, as increased by the " rights " issue of 902,192 ordinary shares at £2 each last June.

The bigger cash distribution to equity shareholders has, of course, had to be accompanied by a reduction in the amounts ploughed back into the business. The whole burden of this has fallen on the companies trading at home ; the holding company's appropriations have been reduced from £752,000 to £576,000, while those of the overseas subsidiaries have actually been increased slightly, from £212,000 to £226,000. As the immediate well-being of the company depends in some measure on a reasonable stability in tin and other raw material prices, the yield of 5⅞ per cent on the £1 ordinary stock units (at the current price of 58s. 6d.) does not appear to be an over-generous one.

★

J. AND P. COATS. The full accounts of J. and P. Coats do nothing to dissipate the gloom engendered by the group's preliminary profits statement (which was discussed in these columns a fortnight ago). The accounts confirm that it was the heavy fall in the price of Egyptian cotton and other raw materials that forced the group to write £5,652,289 off its stocks, and that this, in turn, was largely responsible for the slump in trading profits from £16,172,694 to £5,631,544. At the same time the group was able to reduce the volume of its stocks ; as a result of this, and of the fall in prices, the book value of the group's stocks is down from £53,496,310 to £45,907,132. Nevertheless, as the directors point out, cotton prices are still falling ; if this goes on further stock losses must be expected at the end of this year. Gloomy forebodings do not end there, for the directors also reveal that recent depreciations in rates of exchange in certain overseas countries may involve the group in an exchange loss of £3,400,000 by the end of the year.

Some shareholders had hoped that, as a single ray of light through these clouds, the fall in stock values would be accompanied by a strengthening of the group's liquid resources. Unfortunately, this hope has been disappointed. The group's cash balances

* Including £500,000 written back from general reserve.

have, indeed, risen from £4,247,450 to £6,444,037, but these additions to cash balances were accompanied by a rise in bank overdrafts from £5,196,006 to £6,088,979 and by the appearance of an acceptance credit of £1 million. Shareholders will also note that the maintained ordinary dividend of 12½ per cent was effectively made possible only by the writing back of £500,000 from the general reserve ; in this context the directors emphasise that the undistributed profits of certain overseas subsidiaries cannot be assumed to be available for distribution by the parent company. All that shareholders can hope is that the directors will stick to their conservative dividend policy in times of adversity as well as in times of boom.

Statistical Summary

EXCHEQUER RETURNS

For the week ended June 6, 1953, total ordinary revenue was £42,882,000, against ordinary expenditure of £81,104,000 and issues to sinking funds £760,000. Thus, including sinking fund allocations of £4,852,000 the deficit accrued since April 1, 1953, was £84,853,000 compared with a deficit of £128,775,000 for the corresponding period of the previous financial year.

	Estimate, 1953-54 £'000	April 1, 1952 to June 7, 1952	April 1, 1953 to June 6, 1953	Week ended June 7, 1952	Week ended June 6, 1953

June 5	270·0	339·3	270·0	47 4·52	74

On June 5th applications for 91 day bills to be paid from June 8 to June 13, 1953, were accepted dated Monday to Saturday as to about 74 per cent at £99 8s. 2d., and applications at higher prices were accepted in full. Treasury Bills to a maximum of £270 million were offered on June 12th. For the week ended June 13th the banks were not asked for Treasury deposits.

PRINCIPAL POINTS OF INTEREST IN THE ANNUAL REPORT ON 1952

During 1952 activities in the different phases of operations of the Royal Dutch-Shell Group and associated companies again were higher than before.

The production of crude oil and natural gasoline, including amounts received under long-term contracts, amounted to 597 million barrels as against 549 million barrels in 1951.

The average rate of throughput in its refineries of 1.6 million barrels daily (595 million barrels per annum) was more than 6 per cent higher than the year before. The production of aviation gasoline showed an increase of about 60 per cent as compared with the previous year.

The total tanker tonnage owned by group and associated companies amounted to 2.5 million tons deadweight, while the total tonnage controlled, including period-chartered vessels, amounted to 6.8 million tons. These figures include 29 vessels with carrying capacities varying betwen 23,000 and 30,000 tons.

The total length of trunk pipelines, including pipelines partly owned, amounted to some 14,500 miles, more than half the circumference of the earth.

Group and associated companies achieved an increase in total sales during 1952 of some 11 per cent, and well maintained their position in the markets of the world.

The net profit of the Royal Dutch Petroleum Company for 1952 of fls. 165,612,349.80 (as against fls. 127,034,126.61 for 1951) makes it possible to pay a dividend of 4 per cent on the preference share capital of fls. 1,500,000 and of 16 per cent on the ordinary share capital of fls. 959,388,000 outstanding on December 31, 1952, 4 per cent of which was made payable as an interim dividend on February 5, 1953.

The annual report of the Royal Dutch Petroleum Company will include as previously financial statements of companies comprising the Royal Dutch/Shell Group of oil companies, compiled on the new basis of consolidation.

The net income for the year was £125 million (£120 million in 1951).

Sales proceeds and other income in 1952 amounted to some £1,616 million as compared with some £1,424 million in 1951. Most of the increased revenue, however, was absorbed by higher operating costs, depreciation and taxes.

Total taxes, both on products and income, charged against the year's operations were £402 million (£364 million in 1951).

Capital expenditure amounted to £188 million (£164 million in 1951).

From the net income of £125 million dividends have been or will be paid to the parent companies, viz., Royal Dutch Petroleum Company and The "Shell" Transport and Trading Company, Limited, of £22,168,883 (for 1951 £19,057,327). The balance of nearly £103 million has been retained in the business.

Copies of the full report and accounts can be obtained free of charge from N. M. Rothschild and Sons, New Court, St. Swithin's Lane, London, E.C.4.

COMPANY MEETINGS

UNILEVER LIMITED

IMPACT OF SYNTHETIC DETERGENTS

EASEMENT OF OIL AND FATS PROBLEM

DEMAND CREATED FOR IMPORTANT NEW CHEMICALS

SIR GEOFFREY HEYWORTH ON A MAJOR TECHNOLOGICAL DEVELOPMENT

The annual general meeting of the members of Unilever Limited was held on June 10th at the Hall of the Chartered Insurance Institute, 20 Aldermanbury, London, EC2. Sir Geoffrey Heyworth presided.

Addressing the meeting, the chairman said:

My lords, ladies and gentlemen:

On former occasions I have spoken to you about subjects which were related to our own business and at the same time had a certain public interest. Today I shall deal with synthetic detergents. Whilst there are some wider aspects to the recent technical changes in the soap industry, my main reason for dealing with synthetic detergents here is the impact they have on the operations of Unilever—a subject about which the shareholders are entitled to get information now that we can make an interim evaluation of the position.

VARIATION OF SOAP CONSUMPTION

The use of soap is universal. It is manufactured in every country where the market is large enough. In those places where there is no local manufacture, soap invariably figures in the list of imports.

The *per capita* consumption of soap does, however, vary considerably from place to place. There are a number of reasons for this variation—the climate, the availability of water for washing or local customs as to the kind and quantity of clothes worn. Above all, the consumption of soap is bound up with the general standard of living. Clearly then, the consumption per head of population and therefore the size of the trade in any locality, depends primarily on the economic circumstances of the people.

To illustrate the extent of the variation I have analysed soap consumption in 28 of the principal countries of the world and the result is broadly as follows:

(1) Four countries with a total population of 533 million and a national income of under $100 *per capita* have a soap consumption averaging 1 lb per head per annum.

(2) Four countries with a population of 67 million whose income per head lies between $100-200 have a soap consumption averaging around 5 lb per head per annum.

(3) Five countries with a population of 142 million with an income between $200-400 *per capita* have a soap consumption averaging around 10 lb per head per annum.

(4) Finally, fifteen countries, with a population of 382 million, and with a *per capita* income of over $400, have an average soap consumption around 25 lb per head per annum; a variation in consumption from 1 lb to 25 lb over a range of income from $100 and under to $400 and over.

This influence of purchasing power on the consumption of soap has always been known to the soapmaker. Quite a small increase in purchasing power in a typical eastern market may permit a substantial expansion in that market. In the wealthier markets, too, any increase in the standard of living has generally led to an increased use of soap.

DEVELOPMENT OF SYNTHETIC DETERGENTS

A world which is universally seeking to improve its standard of living provides an expanding market for the soap trade, and the discovery of new types of detergents which appear to compete with soap for the consumer's favour should be viewed in this light. The point is that they are not competing for a share of a static market. I believe that both soap and synthetic detergents will each have their place in this expanding market, although as I will show, synthetics may tend to replace soap in some parts of the world, while soap is likely to continue as the principal washing medium in other parts.

Until the turn of the present century most soap was produced in the form of hard soap, soft soap or toilet soap.

At that time, hard or soft soap accounted for most of the trade, hard predominating in some countries, soft in others. Toilet soap was somewhat of a luxury in those days.

Hard and soft soaps were used everywhere for nearly all domestic washing, much personal washing and for a number of industrial processes as well.

They give good results, but when used for domestic laundry purposes a certain amount of physical effort is required from the housewife. The scrubbing board, which used to be a familiar feature in the home laundry, is still remembered by many people.

During the last fifty years, in North America and Europe, hard and soft soaps have been largely superseded by soap powders which are a blend of soap and various chemical substances, generally of an alkaline nature.

These powders which have become so important in the last fifty years are more efficient than hard or soft soap, and their ready solubility goes a long way to eliminate the physical effort of wash day. By the beginning of the last war, these soap powders had already captured a substantial proportion of the soap market in North America and Europe.

In the less highly developed countries of Asia and Africa, soap powders have made little or no headway and hard soaps still account for the bulk of the trade. The reason is obvious. Soap powders need to be dissolved in a utensil such as a kitchen copper or bowl, whereas hard soap can be rubbed directly on the clothes. In these countries most housewives do not possess the necessary washing equipment. They do their washing in rivers, and hence soap has to be rubbed on to the clothes.

This, then, was the general picture of the soap trade against which we can consider the development of synthetic detergents.

SYNTHETIC SUBSTANCES LESS VERSATILE THAN SOAP

Within limits, the new synthetic substances resemble soap in that they will do a washing job, but they are, however, less versatile as dirt removers than straight soap. They are excellent for washing woollens and fine fabrics. They are also efficient for washing dishes and for cleaning surfaces. Speaking more generally, they are good emulsifying agents and therefore are good for removing grease. For all these purposes they need only to be diluted to become saleable household products.

All synthetic substances are, however, relatively ineffective when used for the more heavily soiled fabrics in the domestic weekly wash. Their performance in removing dirt from fabrics is poor. It is, therefore, necessary to blend them with certain types of phosphates and other chemicals to produce a detergent suitable for general household use, and today it is in this blended form that most of the synthetic detergents for household purposes are sold. In other words, synthetic substances are best understood as ingredients in the make-up of domestic washing products rather than as complete, universal washers in themselves. Their commonest form is the blended synthetic powder.

For washing clothes the performance of these blended synthetic powders is comparable with that of the blended soap powders, and they are somewhat better than soaps for dish washing and for cleaning surfaces. The housewife therefore tends to regard them as general household cleaners; with soap she is more likely to buy a different specialised product for each washing or household task.

BENEFICIAL PROPERTIES

The main reason for their popularity is the fact that they do not form insoluble precipitates with the salts responsible for the hardness of water, in contrast to soap which forms an insoluble scum tending to adhere to the washing utensils and make a lot of rinsing necessary. Moreover, this very reaction uses up soap. In other words, when washing in hard water an extra amount of soap is required to soften the water over and above what is required for the purposes of washing. Although modern soap powders have gone a long way to suppress this nuisance of scum, the advantage in favour of blended synthetics remains real to all who cannot escape the use of hard water.

One disadvantage of the blended synthetic products is that they are somewhat more expensive to produce than a corresponding soap washing product and this means that a packet of the synthetic product is retailed at a higher price. The fact that the synthetic product goes further when used in hard water may compensate for this higher price, but to some consumers the initial outlay is an important factor in determining a purchase.

In soapmaking, the principal item of cost is the price of oils and fats. Blended synthetic products, on the other hand, are made from materials derived from various branches of the chemical industry where the cost of manufacturing may be as important as the cost of the initial raw material which is put into the process.

Costs of the blended synthetics are, therefore, less likely than soap to be affected by rises and falls in material prices. The relationship between soap and synthetic prices varies from country to country, but in all countries soap costs less and may continue to do so.

In the United States a packet of a blended synthetic product now retails for some 7 per cent more than a soap product. Elsewhere the differential is a little higher: from 12 per cent to 15 per cent in Canada and some European countries including the United Kingdom and Holland, and up to as much as 20 per cent in others.

Although the synthetic products are seen to best advantage when compared with soap in hard water, they are extensively used in soft water areas as well. The fact that many consumers are prepared to pay a higher price for the new products for use in soft water is indicative of their beneficial properties.

POSITION IN LOW PURCHASING POWER COUNTRIES

The position is quite different in countries where mass purchasing power is low such as India and West Africa and where, as I have explained, washing habits are so different. Powders, either soap or synthetic, are of little use here, and we have yet to discover how to make an effective and cheap synthetic tablet.

While I have already shown that the consumption of detergents in these countries can be expected to increase as the standard of living improves, it appears to me that even with a somewhat higher living standard, blended synthetic products are still unlikely to participate in these markets to any great extent. It may be rash to prophesy because new discoveries may alter the picture at any time, but for the time being I think they will be confined in the main to the more highly developed countries.

Apart from the question of price and cost there is a further factor which may have a limiting effect on the acceptance of blended synthetic products, even in markets with a high purchasing power; and that is the prevailing impression that they are hard on the hands.

There is no question but that a number of housewives have found their hands affected by blended synthetic detergents, but it is also true that blended soap products tend to irritate skins which have been softened by prolonged soaking. I imagine that most reputable manufacturers will have satisfied themselves by practical tests as we have done that the synthetic products do not involve greater risks than are incurred with blended soap products. Nevertheless more clinical research as to the effect of detergents on the skin is necessary, and this has been planned by ourselves and other manufacturers on a substantial scale.

WIDE RANGE OF FORMULATIONS

As a factor in the soap industry usable synthetic materials first became available commercially in Germany about 1930. Chemical industries in other countries which, from the beginning, had shown great interest in the new development, produced comparable products very shortly afterwards.

Up-to-date a very large number of different materials have evolved, all of which broadly possess the same detergent characteristics, but which differ in chemical composition and in behaviour in use. Many of these have never gone beyond the research laboratory, but there are several hundred different formulations now in commercial production either in North America or Europe. A particularly wide range is available in North America. In Europe the selection is more limited. Some of these synthetic materials are produced from natural vegetable or animal oils and fats. Others are derived from a petroleum base. Thus, they are manufactured wherever the chemical and petroleum industries have assumed important dimensions.

UNILEVER PROMINENT IN EARLY PIONEERING

Equally with the chemical and petroleum industries, the soap trade showed a practical interest in the new form of detergency from the outset, and while the earliest application of the new products was in industry—particularly the woollen trades—they were quickly tried out for household and personal uses. Soapless shampoos were on sale both in Europe and North America in the early 1930's, and the first domestic washing product appeared in the United States in 1933.

Along with others, Unilever played a prominent part in the early pioneering. We first marketed synthetic shampoos in Germany in 1934 and in Great Britain and Holland in 1935. We followed with light-duty household washing products in Germany and Great Britain in 1936.

The first blended synthetic product suitable for the heavy domestic laundry appeared on the market in the United States in 1946. That the United States manufacturers took the lead in applying the discovery of combining phosphates with synthetic materials was due principally to the war, which, besides leading to the suspension of most research work of this kind in Europe, also delayed the establishment of production facilities both for the manufacture of the chemical ingredients and of the blended washing product. It was three or four years before Europe could follow the American lead.

The domestic use of blended synthetics in the United States and Canada has therefore developed far beyond the point now reached in Great Britain and Europe.

In 1952 they accounted for as much as 43 per cent of the sales by weight of all domestic detergents in the United States compared with 22 per cent in Great Britain and 23 per cent in Holland. (Toilet soaps are excluded from the calculation, and allowance has been made for the low synthetic content of some products.)

PROCESS OF CHANGE

The blended synthetic detergents have, to a limited extent, increased the total domestic consumption of washing products, but in the main they have replaced soap. It is, moreover, clear that the process of change is not yet completed. Even in the United States the share of the market held by the synthetic products continues to increase.

It is at present impossible to say when, or at what point, equilibrium will be reached. It is felt by some authorities, particularly in North America, that the sale of soap will be reduced to a small residual figure. Others consider that soap will continue to hold a significant share of the market, although smaller than today. It is pointed out that a reduction in soap output is likely to lead to lower prices of oils and fats from which soap is made. This would make soap still more competitive in price. To some extent this has already happened in some countries, particularly in the United States. Certainly national habits and preferences, as well as economic circumstances, differ sufficiently to make it inadvisable to suggest that Europe will follow the American trend all the way.

In any case, new discoveries in the laboratories may change the position yet again. They may swing the balance back in favour of soap or still more in favour of synthetics. In the meantime, the fact that some consumers prefer blended synthetic products and others soap makes it clear that the soap industry must continue to back both. It is the consumer who will have the final say.

SOAP ADVERTISING A LIVELY AFFAIR

Although the housewife's acceptance of blended synthetic detergents is based on her appreciation of the advantages they offer her when she uses them, her acceptance has certainly been accelerated in all countries by the heavy advertising by which their merits have been made known.

The soap trade is by nature a highly competitive business, in which advertising has long played an important part. This is due mainly to the very individual nature of the housewife's home washing problems. There are so many factors which make each person's weekly wash different from next door—the presence or absence of children, the size of the family and, of course, differing tastes in clothes. Each housewife, in consequence, views her washing from a highly individual standpoint and likes to suit herself in what she buys. It is difficult to convince her that a change to a new brand would be to her advantage.

As a result, soap advertising has always been a lively affair. The advertising of a new product caused as much furore fifty years ago as it does today.

The tempo of marketing the new blended synthetic detergents is, however, faster than it used to be with soap. This is partly due to the normal forces of competition and partly to the fact that manufacturers can see there is much to be gained by establishing the new trade as quickly as possible. A considerable capital investment is required in the chemical industry to produce the synthetic and chemical ingredients which go to make the new domestic detergents and the full advantage of low production costs is not achieved until the new equipment is fully utilised.

Moreover, the new products call for considerable readjustment in the soap factories and it is desirable, in order to prevent waste, to determine the extent of the new market as quickly as possible.

Introductory advertising, the cost of which is undoubtedly heavy, has to be regarded as a kind of capital investment which will have a beneficial effect on manufacturing costs in the long run, because the blenders and suppliers of ingredients can plan with greater certainty the required outputs.

The effect on the soap factories has not been so much a matter of building completely new plants as adapting and partially reconstructing existing ones. Some parts of a soap factory, however, cannot be used for blended synthetic products. Completely new equipment is generally required for mixing the ingredients and drying the finished powder. On the other hand, the very expensive packing machinery requires little or no adaptation.

SUBSTANTIAL CAPITAL EXPENDITURE

Unilever's capital expenditure for making the new products has been substantial. It has amounted to nearly £8 million by the end of 1952, in Europe and North America. It would, however, be quite unreal to regard this figure as an additional capital cost to the business which would not have been incurred had the new products never been discovered. In such a case, the normal development of

the soap trade would obviously have required additional capital expenditure—although not quite on the same scale.

In the long run, the capital cost of establishing and maintaining factories for producing blended synthetic detergents should be no greater than for soap factories of comparable output.

In the long run, too, I do not expect the return on investment in our industry to be affected either favourably or adversely by the development of synthetic detergents, although for the time being advertising expenditures involved in pioneering the new products will continue to be heavy.

STIMULATION OF SCIENTIFIC THOUGHT

To turn now to the technical side, the new detergents, as might be expected, have stimulated scientific thought on detergency and the washing process. There has been a marked re-emphasis of the more fundamental chemical aspects of the industry. The work involved in determining new analytical procedures is considerable. Soap analysis has been a subject for the text book for many years; now each new synthetic substance presents a fresh problem that has to be dealt with on its own merits.

The change in emphasis in the laboratory is of special importance to the industry. The chemistry of washing products seemed to have been so thoroughly explored that the scientist appeared to have relatively little future scope. It was the salesmen and the advertising experts who seemed to play the decisive roles. While the marketing people are no less important today, the new products have introduced a more balanced perspective to the industry and the scientist can look forward to a future as absorbing and exciting as can be found anywhere in the chemical trade.

It will be clear from what I have said that the pioneering of the new developments is being undertaken by a number of separate industries working in parallel. Various chemical manufacturers have discovered a whole series of synthetic detergent substances and are engaged in solving the intricate problems connected with producing them at a cost which will make them saleable. The soap industry has applied its knowledge of washing problems, and more particularly of the requirements of the housewife, to putting the new synthetic substances to practical use in the preparation of domestic and other washing products that meet the user's needs.

But in making this distinction between the chemical and soap industries, I would emphasise that no hard and fast line can be drawn between them.

The manufacture of synthetic substances is not confined to the chemical industries, nor is the creation of blended synthetic detergents a matter only for the soap industry. There are chemical manufacturers who produce blended synthetic products for retail sale and some soap manufacturers now produce part of their own requirements of the synthetic substances.

This means that a new competitive element has been introduced into the detergent industry. If the soap manufacturer loses efficiency, the chemical manufacturer can and will step into the breach and *vice versa*.

Both in the chemical and soap industries the pioneering has, in the main, been in the hands of the larger manufacturers, primarily because the expenses of pioneering have tended to be beyond the means of the smaller firms. This is particularly true in the case of the soap industry, because of the heavy cost of persuading the housewife to change her habits.

This may tend to create the impression that synthetic detergents involve a larger scale of operation than was the case with soap and will lead in time to the disappearance of the small soapmaker. This will not necessarily be so; in fact a number of smaller companies have already successfully taken up the manufacture of blended synthetic detergents both in America and Europe. While pioneering may be expensive, the cost of introducing new brands need be no higher than that of soap, once the housewife's taste for the new products is established. Moreover, some household synthetic products can be produced with modest expenditure on plant.

The supply of skilled technical knowledge is, however, still relatively scarce. It is difficult for a manufacturer to engage management with experience and knowledge of the production of blended synthetic detergents. But the supply of this knowledge will grow, and, as it does, the demand on the part of the housewife for variety of choice will offer a market for the enterprising new manufacturer, large or small.

EFFECT UPON WORLD DEMAND FOR FATS AND OILS

One of the wider implications which the development in the synthetic detergent field has is its effect upon the world demand and market for oils and fats. I estimate that the total world sales (excluding Russia) of blended synthetic products in 1952 was rather more than 1 million tons—about 800,000 tons in North America and 300,000 in Europe. Sales elsewhere were of relatively minor proportions.

I estimate that in the same year sales of soap were rather more than 5 million tons.

It might be assumed that, had synthetic detergents never been discovered, the world consumption of soap would have been commensurately greater. Whether this would have been so cannot be proved. All that can be said is that most of the consumption of blended synthetic products has been for purposes for which soap would previously have been used. But if this demand had had to be met entirely by soap, it would have required an additional world production of oils and fats of about half a million tons.

World production of oils and fats other than butter reached a figure of about 19½ million tons in 1952. An extra half million tons, or 2½ per cent, could possibly have been achieved, but probably a somewhat higher level of world prices would have been necessary to bring it into being.

Without blended synthetic detergents it is probable that the prices of both soap and margarine might have been rather higher than they are now. It is also probable that some of the additional oils and fats could only have been obtained from the United States—at the expense of a wider dollar gap or a reduced expenditure of dollars on other commodities.

It is possible that the de-rationing of margarine—which is now complete everywhere except in Britain, Finland, Israel and Austria—might have taken longer and so might the de-rationing of soap.

Whatever might have happened we can certainly say that blended synthetic products have eased the postwar problem of meeting the world demand for oils and fats at a more reasonable level of prices.

FUTURE DEMAND

I do not know whether the future demand for oils and fats for soap-making purposes will increase or decrease. One would expect a further decrease in North America and Europe but, as I suggested earlier, the increase in the tropical countries might be very great if the standard of living there were to rise by even a small amount.

If demand for soap contracts it will, of course, have an important effect on the world production of glycerine, a by-product of soap-making.

Between 1950 and 1952, world glycerine production (again excluding Russia) has already been reduced from about 230,000 tons to 210,000 tons, although not all this reduction can be attributed to a lower soap production. This has not so far led to a glycerine shortage, as the demand has not been maintained at the high level which prevailed in 1950. But it is clear that there is now little margin of safety. A further reduction in supply, coupled with an increase in demand, could easily result in quite a serious shortage.

A shortage might, in fact, have developed by now but for the fact that a new plant was established a few years ago in the United States for synthesising glycerine from a petroleum base. This plant has recently contributed some 10 per cent towards total world production.

So far I have dealt with the oils and fats position in general and have shown that the growth of blended synthetic detergents has eased the postwar shortage of oils and fats. It has, however, resulted in special local difficulties.

The soapmaker can use a wide variety of materials, some of which, like technical tallow, are not suitable for edible purposes, while others, like palm oil, coconut oil and palm kernel oil, are equally suitable for edible use.

In the United States, where there is a very large indigenous production of technical tallow which depended largely on the local soap trade to absorb it, the reduced demand has led to a serious decline in market prices, which today are, in fact, below the prewar level.

In Europe something similar is happening to the fatty acids which arise as residues from the refining of oils for edible purposes. These residues are inedible, but they make admirable soap-making material, provided they do not exceed a certain percentage of the total. The rapid rise in margarine production has led to an increasing supply of these fatty acids, at a time when soap-making demand is contracting. The result has been a superabundance of refinery fatty acids in Europe and a fall in their market prices.

SUMMARY OF POSITION

I have now outlined the more important aspects of what is a major technological change in the detergent industry. They can be summarised as follows:

(1) The new blended synthetic detergents have achieved a wide acceptance in North America and Europe.

The new products have not, however, become a serious factor in those countries where standards of living are still low.

(2) The growth of blended synthetics tends to lessen the traditional dependence of the soap industry on oils and fats and this has undoubtedly helped to ease the scarcity of oils and fats which prevailed for some years after the war.

(3) The new products have created a demand for important new chemicals.

(4) With their new interest in the production of materials for the manufacture of blended washing products the chemical industries have become potential competitors to the original soap industry, and soap manufacturers have the opportunity to extend into chemical manufacture.

(5) Above all, blended synthetic detergents have made the soap industry as a whole more dynamic. They have created new and fundamental problems which require the industry to re-examine its methods. This may well lead to greater possibilities of expansion.

The chairman concluded by moving the adoption of the report and accounts.

Sir Herbert Davis, CBE, vice-chairman, seconded the resolution and it was carried unanimously.

The proposed final dividend of 8½ per cent on the ordinary stock and a dividend of 6 per cent on the deferred stock payable on June 22, 1953, were approved, the retiring directors (except Dr C. H. Clarke who had reached retiring age and did not seek re-appointment) were re-appointed and the remuneration of the auditors, Messrs Cooper Brothers and Company and Messrs Price Waterhouse and Company, who had been re-appointed under the provisions of the Companies Act, 1948, was fixed.

The proceedings terminated with a vote of thanks to the chairman, directors and all the employees.

UNILEVER NV

The annual general meeting of the members of Unilever NV was held on June 10th at Museumpark, Rotterdam, Mr P. Rykens presided and made a speech in similar terms to that delivered by Sir Geoffrey Heyworth at the annual meeting of Unilever Limited, reported above.

The report and accounts for the year 1952 were adopted. The proposed final dividend of 7½ per cent (being the equivalent of the final dividend for the same year to be paid by Unilever Limited to its ordinary stockholders calculated in accordance with the provisions of the Equalisation Agreement) was approved, the retiring directors, except Dr C. H. Clarke, were re-appointed, Mr A. D. Bonham-Carter and Mr J. F. van Moorsel were appointed directors and the auditors, Messrs Price Waterhouse and Company and Messrs Cooper Brothers and Company, were re-appointed.

THE LICENSES & GENERAL INSURANCE

MR RONALD GILBEY'S ADDRESS

The sixty-third ordinary general meeting of The Licenses & General Insurance Company, Limited, was held on June 10th in London.

Mr Ronald Gilbey (the chairman), who presided, said:

It will be seen that 1952 closely follows preceding years in showing a continuity of progress, with £190,652 increase in premium income to a figure of £2,325,116; with interest earnings higher at £90,180.

The achievement of a new high level of total assets at over 5 million pounds must not pass unnoticed.

In the Life department the year has added to the inherent strength of this section of our business, the funds improving to a figure of £1,157,928.

On the general side of the business, the Fire department has benefited by an income increase of £82,904. Claims cost has not varied much from the previous year with a percentage of 43.3.

It will be appreciated that each successive advance in premium in every department requires an adjustment in the reserve for unexpired risk, so that in these present accounts the Fire revenue contributes with an addition of £33,161. This reserve, as well as the sum required for outstanding claims, having been comfortably provided, enables a transfer to profit and loss of £60,128. This compares with £60,366 in the previous year.

The report was adopted and a final dividend of 25 per cent, making 40 per cent for the year, was approved.

CONSTRUCTORS LIMITED

PROFITS FORECAST EXCEEDED

MR R. S. DYBALL ON THE CONTINUED DEMAND

The thirty-first annual general meeting of Constructors Limited was held on June 11th at Nickel Works, Tyburn Road, Erdington, Birmingham.

Mr R. S. Dyball, chairman and joint managing director, presided.

The following is his statement, which had been circulated with the report and accounts for the year ended December 31, 1952:

Ladies and gentlemen,—When permission to deal in the ordinary shares of the company was obtained in October of last year, the directors gave a forecast to the effect that in the absence of unforeseen circumstances the group profits for 1952 would exceed the average of the group profits for the four years 1948 to 1951 of £122,141 before taxation. I am pleased to report that the actual profit for 1952, after all charges, including a further transfer of £6,000 to plant replacement reserve, was £126,072, compared with £111,497 in 1951.

The charge for taxation is £75,465, and after sundry appropriations, which are shown clearly in the directors' report, there is a disposable balance on the group profit and loss account of £146,296.

The preference dividends were paid on the due dates and an interim dividend of 5 per cent, less income tax, was paid during the year on the ordinary shares. The board recommends a final dividend of 20 per cent, less income tax, which leaves a balance on the group profit and loss account to carry forward to next year of £121,527, against £100,480 brought in.

THE ACCOUNTS

Before I leave the profit and loss account there are two unusual items to which I should refer. First, in the profit and loss appropriation account of the parent company you will see credited an amount of £35,000, being net dividends from subsidiary companies declared out of profits of earlier years. This has no special significance and has been done simply to pass over to the parent company profits of some of the subsidiaries which have accumulated over previous years to an amount far in excess of the amount required to finance the companies concerned.

To explain the second unusual item I shall have to refer back to the report of the auditors given with the particulars attached to the offer for sale of the ordinary shares. The auditors stated that the profits certified were after making adjustments for, *inter alia*, "overhead expenses relative to valuations of work-in-progress at accounting dates on the basis agreed subsequently for taxation purposes."

This adjustment was necessary as the company had, in the past, always valued its work-in-progress at cost of materials and labour only although overhead expenses relative thereto had been included for taxation purposes. In preparing the accounts now submitted the directors have followed the procedure adopted in the statement of particulars and have included overheads in the valuation of work-in-progress at December 31, 1952. In order that the profit for 1952 is not distorted by this change in the basis of valuation the work-in-progress at the commencement of 1952 has been adjusted by the amount of overhead expenses attributable thereto, and you will see that the resultant surplus has been transferred on the balance sheet to general reserve—£21,528 in the balance sheet of the parent company and £25,228 in the consolidated balance sheet of the group. I should add that this adjustment was taken into account when making the forecast of the profits above referred to.

Turning to the consolidated balance sheet you will see that the fixed assets have, after depreciation, risen from £267,386 to £292,822, and the net current assets have increased from £216,019 to £276,098.

I must report that during the current year, owing to the increase in steel deliveries in stocks and work-in-progress, due largely to unbalanced supplies for certain government contracts, it has been necessary to increase the company's bank facilities.

NEW ACQUISITION

You will have read from the statement circulated recently that your company has acquired the whole of the share capital of Pratt Brothers, Limited. For some time it has been the wish of your directors to undertake the galvanising of certain of the company's products instead of placing this work out, and the erection of a galvanising plant on the company's premises had been considered. Fortunately, the opportunity arose for the purchase of Pratt Brothers, Limited, who have a modern galvanising plant, and your directors decided this was technically and financially a better proposition than the installation of its own plant.

The demand for the group's products remains satisfactory, and the orders in hand at this date are in excess of last year, as is also the output, though I feel it right to mention that profit margins are somewhat keener. There has been some setback in A. W. Chapman, Limited, manufacturers of sliding seat mechanisms, owing to the deferment of deliveries to the motor trade.

I am pleased to be able to report that in spite of the political upheavals which have occurred in the steel trade, deliveries have considerably improved, which position I sincerely hope will be assisted by the recent derationing of steel.

The group is still obtaining a fair share of overseas trade, especially through Poles, Limited.

TAXATION

I referred last year to the various burdens placed on industry by taxation, and it is very pleasing to note that there has been a slight reduction in tax, and the termination of the excess profits levy will, I am sure, be welcomed by all. The restoration of initial allowances will also help industry to instal new and modern machinery which is so essential to compete with our foreign competitors.

Before closing I should like to thank the directors, the staff, and employees for the excellent work they have done and the very special efforts made to keep the works running at full capacity under the difficulties of supply to which I have already referred.

The report and accounts were adopted and the final dividend of 20 per cent, making 25 per cent for the year, was approved.

The retiring director, Mr J. A. Pinches, was re-elected, and, the other formal business having been duly transacted, the proceedings terminated.

UNION CORPORATION, LIMITED

MR P. M. ANDERSON'S SPEECH

The annual general meeting of Union Corporation, Limited, was held in Johannesburg on May 26, 1953, Mr P. M. Anderson presiding.

In moving the adoption of the report and accounts for the year ended December 31, 1952, the chairman said:

Our gross profit for the year was £2,045,254, or £253,446 less than for 1951. Dividends and interest received rose by £142,452 to £1,848,328, but net realised profit on shareholdings, fees and sundry receipts, after charging expenses, fell by £395,898 to £196,926. The amount provided for taxes on the profits for the year is £818,300, which is substantially less than the amount of £1,153,000 provided in the previous year. Even this reduced provision is likely to be somewhat in excess of requirements as a result of the favourable changes in the United Kingdom 1953 Budget which was introduced after the accounts were closed. The net profit after taxation increased by £75,431 to £1,058,145. Out of this profit your directors have considered it desirable to appropriate £400,000 to Exploration Reserve which, after deducting £281,050 expended during the year, now stands at £597,888. This increase in the reserve is desirable in view of the Corporation's heavy exploration programmes.

In July, 1952, each of the Corporation's Ordinary shares of 12s. 6d. was sub-divided into five Ordinary shares of 2s. 6d. each. Dividends declared thereon for the year amounted to 1s. 4d. per share, free of United Kingdom income-tax, compared with 1s. 3.6d. per share (6s. 6d. per 12s. 6d. share) for 1951. These dividends absorbed £620,000, leaving £351,686 to be carried forward to the new account, against £313,541 brought forward from 1951.

As usual, before turning to the affairs of the companies under our administration, I would like to review briefly the results of operations during the past year by the South African gold-mining industry, in which the Corporation's chief interests continue to be centred.

The average price received by the industry for the output of gold during the year was 255s. 5d. per ounce fine, or 5s. 6d. less than in 1951. Owing to fluctuations in the dollar/sterling exchange rate, the standard price actually rose slightly, but the benefit from this was more than offset by the substantial reduction in the premium on gold sold for industrial and artistic purposes.

The tonnage milled by the Witwatersrand and O.F.S. gold mines in 1952 increased by 2.3 per cent to 60,000,500 tons, and the output by 2.5 per cent to 11,299,986 ounces fine, as compared with the previous year. The increase in tonnage milled and in output is due to the production of four new mines, which more than offset the fall in production of the older mines of the Witwatersrand. Notwithstanding the lower price received for gold, the working revenue rose slightly as a result of the greater output to the record figure of £144,970,434. On the other hand, total working costs rose by more than £9 million to £102,525,003, so that the working profit declined by more than £8 million to £42,445,431, which includes £3,646,865 premium received on gold sold for industrial and artistic purposes. From this profit, a little over £7 million was appropriated for capital expenditure and miscellaneous items, which is about £3 million higher than in the previous year. Provision for taxation and the government's share of profits is estimated at £15,337,000. Net dividends distributed to shareholders decreased by just under £3 million to £19,804,928.

The industry has had to contend during the year under review with the problems of higher working costs, and of shortages of European and native labour and electric power. Working costs for the whole industry rose during 1952 by 2s. 4d. per ton milled to 34s. 2d., the increase being primarily due to the higher costs of stores and materials and to a rise in the cost-of-living allowances paid to European employees. A small part of the increase results from the effect on the average figure for the industry of the present high working costs of the four new producing mines. The increase in costs rendered unpayable further large quantities of marginal ore previously included in ore reserves, so that although the total development footage accomplished by the industry in 1952 was almost 7 per cent higher than in 1951, this was insufficient to maintain the former level of ore reserves which decreased by approximately 8 million tons to 176,205,355 tons. In keeping with the higher pay limit, the average grade of ore reserves was slightly higher at 4.96 dwt per ton.

Although the number of natives in service during 1952 showed a small increase over the previous year, the native labour supply was still much below the requirements of the industry which is at present operating, in terms of tonnage milled, at only about 85 per cent of capacity. The shortage of native labour in the established producing mines is being accentuated by the increasing demands being made on the available supply by the new mines of the Orange Free State and the Far West Rand. The opening up of a number of new mining properties has now reached an advanced stage—at least five further mines are expected to commence milling during the course of this year—and their requirements of native labour, particularly for work underground, are now increasing rapidly. If this results in the existing producing mines milling a lower tonnage, the costs per ton on these mines must inevitably increase, due to the incidence of standing charges. With the industry today milling only 85 per cent of its capacity, the cost per ton of standing charges is already inflated, and this factor, though frequently overlooked, is one of the underlying causes of the present high level of unit costs in the industry.

The shortage of native labour from which the industry has been suffering ever since the latter part of the war has been due in large measure to the rapid expansion of other activities in South Africa during these years, and the consequent increased demand on the available native labour supply. The effect of this development can perhaps best be illustrated by a comparison of the position today and in 1941, which was a peak year for the gold mining industry. In 1941, when there were 45 producing and two developing mines, the average number of natives at work was just over 356,000. In 1952, with 46 producing mines and no less than 15 developing mines, the average number was just over 293,000. The number of natives available for work underground, on which production depends, dropped even more sharply, from 279,000 to 209,000, or a decrease of just over 25 per cent. On the other hand, according to figures published by the Union of South Africa Bureau of Census and Statistics, the number of natives employed in the manufacturing and building industries, and by the South African Railways and Harbours, in 1940-41 totalled only 197,000, or about half the number employed in the gold mining industry. By 1949-50 this had more than doubled, and had reached the high figure of 411,000, or nearly one and a half times the gold mining industry's native labour force at the time. This represents an increase in demand by these activities of over 100 per cent, or an average of about 12 per cent per annum. More recently the rate of increase, while still appreciable, has been somewhat reduced. Today, it appears that the manufacturing industries are no longer expanding at their former rapid rate, but are entering a quieter period and one of consolidation.

Much of this industrial expansion took place during a period of inflation and sharply rising world commodity prices. During such a period many manufacturing industries were able, unlike the gold mining industry, to offer increasingly higher cash wages, since a large proportion of the cost could be passed on to the consumer. There are signs that this period is now ending, and consequently it is possible that a greater proportion of the native labour available may gradually come into the gold mining industry. It is hoped, too, that measures being taken within the gold mining industry to increase its native labour supply, including certain increases in remuneration which took effect from the beginning of this month, will help to ease the problem in time.

In passing, it is worth noting that, notwithstanding the drop of over 25 per cent in the underground native labour force which I have already mentioned, and the increased number of developing mines, the tonnage milled in 1952 was only about 11 per cent less than in 1941. This speaks well for the work done to effect economies in the use of the available labour and to increase efficiencies all round.

In my address last year I referred to the arrangements made by the industry to meet the shortage of electric power. These arrangements were continued in 1952, and enabled the industry to maintain production, but the disruption of normal operations has contributed in some small measure to the increase in working costs.

I will now touch briefly on the affairs of the gold mining companies under our administration and of some other companies in which we are interested.

GOLD INTERESTS

East Geduld Mines, Limited.—The ore milled in 1952 was 1,725,000 tons, and the net profit was £2,029,231. Dividends totalling 4s. 1d. per unit of stock were declared, and £573,494 was carried forward.

Geduld Proprietary Mines, Limited.—The ore milled was 1,253,000 tons, and the working profit therefrom £468,733. Income from investments, principally from holdings in East Geduld Mines and Grootvlei Proprietary Mines, was £726,005. The net profit was £1,054,735. Dividends declared totalled 12s. 6d. per share, and £376,948 was carried forward.

The Grootvlei Proprietary Mines, Limited.—The tonnage milled was 2,316,000 tons, and the net profit was £1,621,425. Dividends totalling 2s. 6d. per unit of stock were declared and £663,210 was carried forward.

Marievale Consolidated Mines, Limited.—The tonnage milled was 723,000 tons, and the net profit was £506,819. Dividends declared totalled 1s. 8d. per share, and £469,234 was carried forward. The capacity of the reduction plant has been increased by about 9,000 tons per month.

St. Helena Gold Mines, Limited.—The tonnage milled in 1952, the first full year of production, was 598,000 tons, and the working profit therefrom £123,287. Working results have been adversely affected by a number of factors common to the industry and also by the continued need to carry out extensive cementation work in order to seal off water-bearing fissures. In the light of these difficulties the gradual but steady improvement in the mine's position and in the operating results is encouraging for the future.

Van Dyk Consolidated Mines, Limited.—The ore milled was 1,246,000 tons, and the working profit was £188,746. The amount carried forward was £162,268. In the No. 5 shaft area development work done to date, which is small in relation to the area to be explored, has disclosed some payable ore, but so far values have been sporadic with little in the way of continuous payable stretches. Until more is known about this area, on which the future of the mine depends, it is not possible to forecast to what extent it can contribute to the replacement of low-grade ore coming from the old mine. Owing to the slender ore reserve and the inadequate native labour supply the mine is passing through a difficult time.

OTHER MINING INTERESTS

San Francisco Mines of Mexico Limited.—During the year ended September 30, 1952, this company milled 657,000 metric tons of ore—an increase of 60,000 tons over the previous year. This was achieved despite serious cuts in the supply of electric power during the first three months of the year, and a fire in the South shaft, which curtailed production during January, 1952. The accounts for the year ended September 30, 1952, have not yet been published. On February 4, 1953, the sections of the Miners' Union at the company's mines in Mexico submitted a demand for a large increase in pay and benefits. Similar demands were made on all other mining companies in Mexico. After prolonged negotiations a substantial increase was agreed with the delegates of the union, but the workmen refused to ratify the agreement and went on strike. All operations at this company's mines, except essential services, ceased for a fortnight this month, after which the workmen agreed to resume work in return for a slight increase in the terms previously agreed by their delegates.

OTHER INTERESTS

Bay Hall Trust, Limited, declared a dividend of 7 per cent, free of United Kingdom income tax, in respect of the year 1952. At the end of the year the appreciation of its holdings over book cost amounted to £422,412.

British Enka, Limited, in common with other rayon producers in the United Kingdom, was forced to reduce its production in 1952 as a result of a severe recession in trade. After providing approximately £269,000 for depreciation and £104,000 for writing down stocks of raw materials to market value it made a net loss for the year of £95,494, compared with a net profit in 1951 of £419,415. In view of the recovery of business which has taken place in 1953, and the fact that in the previous two years £750,000 was placed to general reserve and the carry-forward increased by approximately £70,000, the directors have transferred £50,000 from general reserve and recommended a dividend of 6 per cent, with a consequent reduction in the carry forward of approximately £110,000.

South African Pulp and Paper Industries, Limited, again increased its production and sales from its Enstra mill. The net profit was £424,149, and dividends declared for the year amounted to 2s. per share. The major part of the large-scale expansion programme at the Enstra mill is now virtually complete, and good progress has been made on the erection of the Tugela mill. It is expected that trial runs of the plant at this latter mill should take place early next year.

EXPLORATION

Exploration work in Tanganyika and in the Bethal and adjoining districts of the Transvaal is being continued, but there is nothing I can usefully add to the information contained in the directors' report.

In conclusion, I should like to take this opportunity of expressing our thanks to the staff of the Corporation, both in London and in Johannesburg, and to the managers, staff and employees of the companies under our administration, for their loyal and efficient services during the past year.

The report and accounts were adopted, and the retiring directors re-elected.

NATIONAL BANK OF NEW ZEALAND

BUSINESS WELL MAINTAINED

The annual general meeting of the National Bank of New Zealand, Limited, will be held on July 2nd in London.

The following are extracts from the circulated statement of the chairman, Sir Sydney Parkes, CBE: Last year I explained that a number of special influences had swollen the totals of our balance-sheet. It is satisfactory to be able to report that the effects of these exceptional factors have largely disappeared and that the bank's figures this year reflect a return to more normal conditions in the Dominion. It is a great tribute to the fundamental soundness of New Zealand's economy that this change has been brought about so smoothly and so quickly. At the same time it could not have been accomplished without the co-operation of all concerned in carrying out the wise measures taken under the guidance of the Government to meet the situation.

The net profit brought in after providing for taxation is £219,066, being a small increase on the comparable figure of £214,015 last year. The directors recommend a final dividend of 5 per cent, less UK income tax at 9s. in the £, making a total of 8 per cent, leaving an increased amount of £132,393 to be carried forward to next year's accounts.

The bank's business has been well maintained during the year, and there has been a satisfactory increase in the number of new accounts on our books.

When I addressed you last year the economic conditions of the Dominion and the figures of the banking system had been affected to a marked degree by the exceptionally heavy flow of imports during the previous nine months. I am pleased to be able to say that the position now presents a much more satisfactory picture. The policy of the trading banks, which was supported by the Reserve Bank, of allowing time for last year's surplus stocks to be liquidated in an orderly manner, has been fully justified by the results since achieved. Although the period of adjustment has been a difficult one in most sectors of the economy, the experience has provided a valuable lesson to everyone and business now appears to be working on a sounder basis.

Competition has been keen throughout the retail trade. Sales for the calendar year 1952 were about the same in value as in the previous year, but as retail prices rose during the past year it is evident that the volume of sales was lower than for 1951. There have been no labour disputes of consequence, and the supply of labour is now more satisfactory, although there is still a shortage of skilled workers.

UNION INSURANCE SOCIETY OF CANTON

ASSETS EXCEED £14,300,000

The annual meeting of the Union Insurance Society of Canton, Limited, was held on May 21st in Hong Kong, Mr J. D. Alexander, the chairman, presiding.

The following are extracts from the report and accounts and his circulated statement:

Marine.—The net premiums for the year amounted to £3,398,309. After releasing £150,000 to profit and loss account, the marine fund stands at £4,447,225.

Fire.—The net premiums for the year amounted to £2,702,452; £195,310 has been transferred to profit and loss account. The fire fund stands at £1,483,665.

Accident and General.—The net premiums for the year amounted to £1,493,714; £147,819 has been transferred to profit and loss account. The additional reserve has been increased by £25,000 by the transfer of £15,000 from the society's profit and loss appropriation account and £10,000 from the profit and loss account of a subsidiary company. The accident and general fund now stands at £722,485.

Dividend.—The directors recommend the payment of a dividend of £2 per share, free of Hong Kong Corporation profits tax.

Profit and Loss Account.—Interest and dividends amounted to £329,345 and transfers from underwriting accounts to £493,129. After charging outgoings not brought into account elsewhere, making provision for taxation, and allowing for the minority interests of the outside shareholders of the subsidiary companies, the profit for the year appertaining to the society is £486,581.

Consolidated Balance-sheet.—Total assets amount to £14,394,535.

CHAIRMAN'S STATEMENT

In many parts of the world where we operate, economic conditions were more stable for our business during 1952, and I am happy to be able to report a satisfactory advance in our premium income, which expanded by £743,000 to £7,594,000.

National production in Canada reached a peak level and the wheat crop was a record; our organisation in that progressive country is fully capable of taking advantage of the phenomenal growth which continues to manifest itself there.

Our marine business has continued to expand, although the rate of progress has been retarded considerably, compared with the previous year. This circumstance is attributed to a decline in commodity values, and in a lesser degree to a general recession of business in the world markets.

The marine fund of nearly four and a half million pounds, representing 130.86 per cent of our 1952 premium, is considered fully adequate to meet all contingencies under our marine portfolios.

The fire department has again had a successful year. The account shows a notable increase in the net premium income with a satisfactory profit, although not as high as for 1951.

I should here mention that our interest in the storm and flood disaster which overtook the eastern counties of England in January was not heavy, but in any case the resulting losses will fall for inclusion in 1953 accounts.

The net income in the accident and general account has increased by more than 32 per cent, and the experience in all the main areas where we operate has been very satisfactory.

The report and accounts were adopted.

THE UNITED SUA BETONG RUBBER ESTATES, LIMITED

SIR JOHN HAY ON THE BUFFER STOCK PROPOSALS

The forty-fourth annual general meeting of The United Sua Betong Rubber Estates, Limited, was held on June 10, 1953, at 19, Fenchurch Street, London, E.C.3. The following are extracts from the address by the chairman, Sir John Hay:

The accounts now presented show a fall of over one million pounds as compared with 1951. The primary cause was, of course, a radical change in the price of rubber. For 1951 the average realised price was over 43 pence per lb; the 1952 crop averaged 26.84 pence. No saving could offset such a loss in revenue. Despite many difficulties, however, we succeeded in effecting a reduction of over £70,000 in estate expenditure, while at the same time increasing our rubber and tea crops. The secondary causes were a loss in tea of over £40,000 and the difficulties in operating on certain of our estates in continuing conditions of insecurity.

TAXATION AND DISTRIBUTION OF PROFIT

Dealing with taxation and distribution of profit Sir John Hay said:

In the twelve months under review the Company has operated for 8½ months to earn Government revenue. Two months' earnings are ploughed back into the business, and only one and a half months' profit goes to the stockholder in dividends. Thus is enterprise rewarded and encouraged. Although the rate of UK income tax has been reduced from 9s. 6d. to 9s., the proportion of our profits payable in tax and duty is higher than last year. This is due to the incidence of Malayan export duty which is a tax on output. It is not allowed as a payment on account of income tax. The intention underlying the provision for relief from double taxation is thus frustrated and the rubber industry singled out for discriminatory and oppressive treatment. The ascertainment of such facts need not wait an official enquiry. They are writ so large that he who runs may read. If, for its own reasons, the government of Malaya must retain an export tax, then some arrangement with the government of the United Kingdom should quickly be made, under which payment of export tax is made allowable in the calculations for relief from double taxation. It is unrealistic to expect the rubber producing industry to carry its present crushing burdens and at the same time compete with USA synthetic which receives such strongly contrasting treatment. Appeals to the USA for fair trading conditions have little moral sanction as long as our governments, by confiscatory taxation, seriously impair the competitive powers of the very industry for which that appeal is specifically made.

To the foregoing it may be objected that we succeed in paying a dividend at the rate of 20 per cent. That figure in this instance is particularly illusory. Much of our capital was issued at a time of prosperity at a premium. On the real capital engaged in the business this 20 per cent dividend is equal to 5½ per cent gross and less than 3 per cent net.

THE RUBBER INDUSTRY'S PROBLEMS AND OUTLOOK

Rubber supplies have been in surplus over consumption for more than two years, but happily this surplus for the time being was readily absorbed by purchases for government stockpiles. This abnormal buying is now tailing off to termination and producers become dependent on consumption demand. According to the statistical forecast made by the Rubber Study Group there is in prospect for 1953 an excess of supply over trade's demand of 270,000 tons. It would appear, therefore, that the rubber producing industry is again faced with another of these recurring problems which have been such a disturbing feature of its chequered career. But the problem on this occasion is more complex. Formerly, we had to deal with a surplus of one product and natural rubber producers were free collectively to consider and, if deemed advisable, to adopt unilateral measures for the adjustment of supply to demand. In this instance the surplus consists of two products, natural and synthetic, each conducting its operations on totally different systems. The natural rubber producer operates under free enterprise, paying his heavy taxes, accountable to his stockholders for a profit without which the source of capital would dry up. The synthetic product in its greater part is a USA Government monopoly, free from the taxation to which commercial enterprises are subject and not obliged to trade at a profit. It is worked as a fully integrated monopoly, selling its product at a price which covers the expenses of all, the profits of one unit being set off against the losses of another. The first consequence of competition under such contrasting systems is to throw the weight of any surplus supplies on to the natural rubber producer, whereas under equally competitive conditions for each product supply would be adjusted to demand by a reduction in the output of the marginal producer on either side.

COSTS

From the high level of 73 pence in March, 1951, the price of natural rubber has fallen to 20 pence, a decline of over 70 per cent. Against this there has been a very insignificant fall in the prices of items which enter into the cost of living of the worker on a rubber estate. Rice, still an important item in his diet, was in short supply in 1952 compared with 1951. Although the greater part of this supply was subsidised at considerable expense by the Government of the Malayan Federation, the cost to the worker was approximately five to six times greater than what he had to pay in 1939. The removal of squatters from their cultivated patches to new villages, a necessary measure to combat banditry, interrupted the supply of vegetables and other foodstuffs. Although there has been some adjustment of wages from the levels prevailing in 1951, new rates must necessarily take account of the factors I have mentioned, as well as the legitimate desire for a better standard of living. The adjusted scale of cash wages is now at rates approximately the equivalent of five times the rates prevailing in 1939. Cash wages are supplemented by payment in kind in the form of housing, medical services, maternity benefits, educational and recreational facilities, etc., the cost of all of which has increased very substantially in the post-war period. Wages are further augmented by employers' contributions to a provident fund. The cost of estate equipment shows some decline, but is still, under inflationary influences, whilst overhead charges, never raised to the level of other items of cost, offer as yet no scope for reduction. Higher yields from improved stock and changes in the technique of cultivation and production help in some degree to counter increased expenditure on labour and equipment, but only a limited number of producers enjoy the benefits of high yields. Replanting is a long-term policy and cannot minister to the present, except in its first incidental result of reducing production from areas in the process of replacement. From this brief recital of salient facts, it is evident that the natural rubber producer is now about to undergo a crucial test.

PROPOSALS FOR A BUFFER STOCK

In these circumstances, it is not unnatural that the Malayan Government should regard with concern the outlook for its main industry, which forms the backbone of the country's economy and upon which it has leant so heavily and, as some of us think, excessively and imprudently, for revenue. Nor can the UK Government afford to be indifferent. Its dollar earnings from rubber in 1951 were over $300 million. This year they are not likely to exceed $100 million. It is no doubt these considerations and the demand for Government to do "something" that has led to the promotion of two expedients, the suitability and efficacy of which there is reason to doubt. The two expedients are the establishment of a buffer stock and an officially sponsored enquiry into the Malayan rubber producing industry.

The first is based on a simple faith in the long-term statistical forecast which predicates a period of excess supply to be followed by a shortage. Unlike the classic case of the first successful buffer stock, which was based on a forecast derived from an infallible source, the present statistical exercise is a fallible effort, subject to all the uncertainties of an uncertain future. The forecast of a surplus of 270,000 tons for 1953, to which I have referred, is no sooner made than it is highly qualified if not invalidated by a statement issued by US manufacturing industry representatives at the last Rubber Study Group meeting. That statement has been published, but since it may have escaped notice I quote the following sentences:

"United States of America rubber products manufacturers believe that there can be no surplus of natural rubber during the next twelve months.

"The current competitive situation between natural rubber and GRS in the United States is such that there is every reason to believe that, during the next twelve months, the United States rubber-consuming industry will buy every pound of natural rubber available to them at prices competitive with GRS.

"Even a relatively slight decline from presently prevailing prices may be expected to provide an incentive to a substantial increase in the usage of natural rubber in the United States.

"In summary, we believe that normal market forces will ensure a market during the next twelve months for all of the natural rubber which will be produced and at prices which will not be substantially lower than present prices."

This prediction of "no surplus" for the next twelve months is, of course, conditional on the price of natural being competitive with synthetic; but that condition is inherent in any competitive trade and could not be evaded by the operations of a buffer stock without pursuing the disastrous course of pricing natural rubber out of its major consuming market. Those of us who have entertained doubts regarding the advisability of a buffer stock have based our views on the belief that "normal market forces" must bring natural and synthetic into close price relationship. It is difficult to reject that view except on the assumption that consumers would elect to buy the higher priced product and refuse the cheaper, an assumption which is hardly in accord with business acumen of manufacturers engaged in a highly competitive business.

It may be objected that the condition of no surplus relates only to the next twelve months, and the question may be posed: "What of subsequent years?" Before the elapse of that period it is expected that the synthetic industry in USA will have been transferred to private enterprise. There is good reason for believing that the initial result of this transfer will be a reduction in the volume of synthetic output and a consequent wider scope for the use of natural. In these circumstances, it is difficult to believe that the main producing and consuming countries can be brought to agree on the necessity or desirability of a buffer stock involving a total financial commitment of something in the region of one hundred million pounds and subject to the remote and rigid control of an international body with conflicting interests and widely varying views.

RUBBER ENQUIRY

With regard to the second expedient, since all the facts relating to the operations of the industry can easily be made available at any time to Government, it would seem that a formal enquiry is an unnecessary and untimely diversion of energy. None the less, I am sure that producers will respect the decision made and will co-operate and submit to a properly constituted authority for objective examination such information as may be required. These two dissimilar proposals have this in common: they derive their main support from an attitude of mind which, in disregard of normal experience, looks for some dramatic intervention to provide a swift escape from harsh economic realities, or, alternatively, expects that an enquiry, if officially sponsored, must be productive of some startling diagnosis revealing a new and painless remedy. To minister to such illusions can only lead to disappointment and tend to weaken the will to greater endeavour along practical lines.

GOVERNMENTAL OBLIGATIONS

The chief beneficiaries from such transient prosperity as the rubber-producing industry may enjoy are the Governments of Malaya and the UK, neither of which shares in its risks or its losses. On them rest corresponding obligations to all sections of that industry, not least to the part which, domiciled in the UK has to bear the burdensome exactions of both Governments. The main function of Governments is to provide conditions favourable to economic production. Earlier in this statement I have made suggestions for relief from excessive and unfair taxation. An increase in Malaya's food production would do much to lessen the high cost of living in that country. The execution of plans for expanding the production of rice has suffered a setback and domestic supplies in 1952 were 100,000 tons less than in 1951. Here there is urgent need for improvement, otherwise Malaya will continue to be dependent on uncertain and costly imports. The assistance now being given to the smallholder in the processing and marketing of his produce is a well-conceived measure which wins general approval, but it might be more widely and quickly applied if simple and readily available equipment was chosen in preference to waiting for more elaborate appliances. In this instance there is a tendency to allow the better to become the enemy of the good.

Internationally, Governments should be vigilant to win and to preserve free and fair trading conditions for the sale of South-East Asia's main product. It is in the energetic and intelligent discharge of such obligations that Governments can help to strengthen the industry's competitive power and thus promote the workers' welfare by the assurance of continued employment in profitable and productive work.

RIO TINTO COMPANY, LIMITED

TAXATION OFFSETS IMPROVED RESULTS

PROGRAMME OF OVERSEAS EXPLORATION

THE EARL OF BESSBOROUGH'S SPEECH

The eightieth annual general meeting of Rio Tinto Company, Limited, was held on June 11th in London, The Rt Hon the Earl of Bessborough, GCMG (the chairman), presiding.

The Chairman, in the course of his speech, said:

Turning to the accounts for the year 1952, you will have observed that the profit carried to appropriation account of £705,108 is a decrease over 1951 of £238,907. Briefly stated, the simple explanation for this is taxation. You company's trading profit increased from £144,164 to £291,730, but the confiscatory scale of taxation imposed upon us reduced our trade investment income to £377,884, as compared with £758,170.

This year's Finance Bill contains some palliatives and temporary reliefs which are welcome. They do not, however, represent more than a first short step in the right direction, and I consider that early relief of a more fundamental nature is of imperative importance. Exhortations to private enterprise to carry out large-scale mineral development in the Commonwealth cannot be implemented by mining companies, bereft by taxation of an overwhelming proportion of their revenue. Nor has any attempt yet been made to put us on a level footing with the mining industry elsewhere, as in Canada, for example, as regards treatment of capital outlays and other taxation concessions necessary in an industry in which are involved such high risks as that of mining. Your company is carrying out a modest programme of exploration overseas, but it cannot be expected that under present conditions this country will play its proper and, as I believe, essential part in the development of our Commonwealth resources.

PROFIT REMITTANCES FROM SPAIN

You will recall that in my speech last year I was able to indicate that arrangements had been concluded for the resumption of sterling remittances of profits and that certain sums had already been received. I regret that I have to record an almost complete cessation of these remittances during the last few months. We continue to make representations with a view to obtaining a resumption of them.

MINES IN SPAIN

The mines in Spain maintained full production during the year and sales of pyrites were 943,731 tons as opposed to 951,173 tons for 1951. Once again production costs have risen and, notwithstanding frequent representations, the prices being paid to the company for internal sales of copper, sulphur and pyrites are below cost. There are indications, however, that attention is being given to this matter, and I hope that before long the position will improve. In the meantime there has been some reduction in the sale of export pyrites, and though I think that this is of a temporary nature it is all the more important that internal prices should be readjusted quickly, for the higher price obtained for pyrites exported will not secure an adequate profit under present conditions.

I paid a visit to Spain in October, 1952, accompanied by the managing director, during which we were received in Madrid by the Minister of Industry and by the Minister of Commerce. We also paid a visit to the mines where we found work proceeding satisfactorily under the direction of our general manager in Spain.

BALANCE SHEET

Turning for a moment to the balance sheet, your company's investments in Rhokana and Nchanga, which as you know are our principal investments in Rhodesia, remain unchanged. In spite of a certain downward tendency in copper prices I am confident that these investments will continue to be, as in the past, one of the most valuable assets of the company. The market value of the company's quoted investments at the end of 1952 stood at £11,607,524.

EXPLORATION AND DEVELOPMENT

As stated in the directors' report, exploration of a long-term nature is being started in Africa, notably in Northern Rhodesia. It is not expected that there will be anything of interest to report for some time to come.

Your company has also formed a Canadian company with the object of carrying out exploration activities in that country as well.

In Scotland work has been started, in association with Siamese Tin and Bangrin Tin, on dewatering the old lead workings at Wanlockhead and Leadhills.

In addition, we have taken a small participation in the Commonwealth Development Finance Company, Ltd., and also in the British Newfoundland Corporation, Limited.

ADMINISTRATION

No changes in the board have occurred since our last meeting.

You will have taken notice of the extraordinary general meeting which is to follow this meeting. The "Objects" clauses of the Memorandum of Association have not been altered since the formation of the company 80 years ago, and your directors consider that it would be advisable for the scope of these "objects" to be widened so as to bring them more into line with the present-day needs of this company.

DIVIDENDS

As stated in the report, the board recommend that the dividend on ordinary shares should be maintained as in 1951 at the rate of 15 per cent, free of tax. On account of the heavy load of taxation they have only been able to recommend a bonus on this occasion of 5 per cent, making a total payment of 20 per cent, free of tax, on the ordinary shares.

We have ever been fortunate in this company in the service we have received from our staff at home and overseas. Once more I express to them all on your behalf our appreciation of their loyalty and devotion to the company's interest.

The report and accounts were adopted.

At the subsequent extraordinary general meeting a resolution regarding the "Objects" clauses of the Memorandum of Association was approved.

THE BURMAH OIL COMPANY, LIMITED

YEAR OF ECONOMIC ADJUSTMENT

IMPROVEMENT IN LOCAL CONDITIONS

DIVIDEND 15 PER CENT

SIR KENNETH B. HARPER'S STATEMENT

The fifty-first annual general meeting of The Burmah Oil Company, Limited, will be held on July 3rd in the Merchants Hall, 30, George Square, Glasgow.

The following statement to stockholders by the chairman, Sir Kenneth B. Harper, has been circulated with the report and accounts for the year ended December 31, 1952:

BALANCE SHEET AND PROFIT AND LOSS ACCOUNT

The consolidated Group trading profit for 1952 was £5,464,672, which compares with the record figure of £7,480,551 in the previous year. 1952 was a year of considerable economic adjustment in the areas where your company's main trading interests lie. The sharp recession in commodity values which set in during May and June had an adverse effect on trading conditions generally and was felt by our trading subsidiaries, especially in India, their largest market. This, together with a substantial decrease in world values of wax, extensive development operations in the Digboi Field area in Assam and a comprehensive programme of exploration in India and Pakistan, are the factors contributing to the fall in trading profits of £2,015,879.

The income from interest, dividends and transfer fees during the year amounted to £3,309,861 (£3,228,617 in 1951) making a total income of £8,774,533, from which falls to be deducted £36,825 for directors' emoluments and £1,081,815 for depreciation on the Group's fixed assets. After making full provision of £4,741,422 for UK and overseas taxation, and writing off £42,633, the expenses in connection with the increase of capital, the consolidated net revenue of the Group becomes £2,871,838, against £3,360,991 in 1951.

To this net revenue is added £586,981 brought forward from 1951 and out of this sum of £3,458,819 the board has appropriated £1,018,257 to general reserve, leaving for disposal £2,440,562.

The board now recommend a final dividend on the ordinary stock of 12½ per cent, which, with the interim dividend of 2½ per cent paid on December 5, 1952, makes a total of 15 per cent for the year.

After allowing for the amounts paid and now recommended for net dividends on preference and ordinary stocks the balance to be carried forward to 1953 is £596,047.

No liability in respect of the excess profits levy is likely to arise on the year's results. Taxation in India has increased but the company has benefited from the increase from 75 to 100 per cent in unilateral relief now granted in the United Kingdom, under the 1953 Finance Bill, for overseas taxation on Indian and Pakistan profits.

Turning to the parent company's balance sheet, the main changes are the increase of £1,124,937, under the heading of Trade Investments, and the realisation of £6 million of Government securities, with a corresponding increase in advances to subsidiary companies to meet their financial requirements.

The increase in trade investments represents your company's share of the increase in capital of the Burmah-Shell Oil Storage and Distributing Companies of India and Pakistan required to finance the programmes which these associated companies have in hand for the expansion of their storage, distributing and marketing facilities. As you are aware, your marketing interests in India and Pakistan are in the main taken care of by these associates.

The employment of advances to subsidiary companies is reflected in the Group's consolidated balance sheet by increased investment in fixed assets and in oilfield and refinery stores and equipment, and a considerable reduction in creditors, mainly in respect of outstanding liabilities for overseas taxation now agreed and settled.

Additions to the tanker fleet and to the Assam Oil Company's refinery in Assam are responsible for the increase under fixed assets, while the expansion and development operations referred to above have required the maintenance of higher inventories.

The increase in capital reserve is due to certain capital receipts, of which the chief is your company's share of the £700,000 eventually agreed with Her Majesty's Government in settlement of the guarantee, referred to in my statement on the 1949 accounts, up to the date of its termination on January 31, 1950.

The excess of the Group's current assets over current liabilities at December 31, 1952, remains much the same as at the end of 1951, just over £19 million.

BURMA

Last year I expressed the opinion that there was little evidence of progress in restoring stability in Burma, and I am glad to be able to record a noticeable improvement in the past twelve months. This has taken the form of consolidation of the parts of the country under the control of the Government and a slackening of organised attacks by insurgents elsewhere. Road and rail transport are still liable to frequent interruption, and road travel is dangerous even in places quite close to the Chauk Oilfield, where our Burma concessions company is operating.

EXPLORATION

In these conditions, prospecting was still impossible in Burma, but in India and Pakistan good progress was made. The test well at Sui, in Baluchistan, though finding no oil, was successful in discovering what promises to be a major natural gas field. To seek confirmation of this, a second well began drilling just before the end of the year, and has since been successfully completed. This gas seems likely to be of great importance to Pakistan's economy and discussions with the Pakistan authorities on its utilisation have begun.

A test well at Chak Naurang in the Punjab found oil but, unfortunately, of poor quality, and in emulsion with water. It is not possible to say yet whether this further discovery will be of value.

At Nahorkatiya, a deep well, to test the possibility of a big extension westwards of the Digboi Field, had reached 7,357 feet by the end of the year. Since then there have been some signs of oil, but it is too early yet to say whether this development will be of commercial value.

Pakistan Petroleum Limited, the public Rupee Company, which, as I reported to you two years ago, was incorporated in Pakistan to qualify for further concessions under the Pakistan Government's Petroleum Rules, and in which we now have a 99 per cent shareholding, took over, as from July 1, 1952, the assets and activities of our Pakistan concessions company.

MARKETING

Production from the Group's oilfields in Burma, Assam and the Punjab contributed 26 per cent of the total requirements of our marketing companies, the balance being imported from the Persian Gulf (although no longer from Abadan), Indonesia, Curacao and other sources. Although our trading increased satisfactorily in Assam and East Pakistan, it fell short of expectations in the rest of India and Pakistan for the reason I have mentioned, the overall increase over the previous year being less than 2 per cent. This is a much smaller increase than we have experienced each year since the war ended. Towards the end of 1952 there were signs that the recession earlier in the year was passing. Trading conditions have been settling down and a steady if slight improvement in the volume of our trade during recent months has become apparent.

INDUSTRIAL RELATIONS

A matter of constant concern to the managements of our operating companies is their relations with their employees. In Burma and India, as I have mentioned in previous years, industrial relations are bedevilled by the existence of compulstory adjudication to which the Governments almost automatically refer any dispute that arises. The inevitable result is a flow of claims on which no real attempt is made to negotiate because there is a better chance of getting something out of the Industrial Courts. In Pakistan it appears to be the policy to avoid adjudication and to encourage negotiation. Our experience in 1952 has been that whereas our operating companies were hardly ever out of Industrial Courts either in Burma or India or both, in Pakistan the only dispute which arose was settled to both parties' satisfaction by negotiation, since when relations have been excellent.

JOINT VENTURE IN BURMA

I told you last year that plans for a joint venture between the Government and the oil industry in Burma had progressed to the point where a draft agreement had been initialled subject only to acceptance by the Union Government of the valuation of £15 million which was put on the undertakings concerned. After a survey of the assets by a Commission appointed for the purpose the Government accepted our valuation, but progress was then held up by a reference to the Supreme Court in Burma regarding the validity under the Constitution of Burma of the proposed joint venture procedure. The Supreme Court's ruling was favourable and we are informed that negotiations to finalise the joint venture will soon be resumed.

TANKERS

The first of our new tankers, the *Burmah Emerald*, was launched in May last year and has now been eight months in service and is proving a fine ship.

An order was placed in December, 1952, for a 31,000-ton tanker which will be employed in supplying the Bombay refinery with crude oil.

A slackening in the world demand for petroleum products, coming at a time when the deadweight tonnage of the world's tanker fleets was being increased by some 9 per cent, resulted, towards the end of the year, in a substantial fall in tanker freights, which has continued into the current year. After a period of adjustment, including the scrapping of old vessels, one would expect tanker freights to harden to something above today's levels.

STAFF

Once again it is a pleasure to put on record the board's appreciation of the good work of the managements and staffs of your companies both at home and overseas.

UNITED DRAPERY STORES

A NOTABLE ACHIEVEMENT

SIR BRIAN MOUNTAIN ON GROUP'S PROGRESS

The twenty-sixth annual general meeting of United Drapery Stores, Limited, was held on June 9th in London, Sir Brian E. S. Mountain, Bart. (the chairman), presiding.

The following are extracts from his circulated statement:

The accounts show a satisfactory picture of the continued growth in the affairs of your group of companies for the past year.

Our turnover, after making appropriate adjustments for new acquisitions, showed a substantial increase and again constituted a new high record for the group.

The group profit before taxation exceeds two and a quarter million pounds, being an increase of more than half a million pounds in the year, and I am sure you will consider this to be a notable achievement, particularly having regard to the changing trading conditions in the year. Unfortunately, nearly 80 per cent of any increased profit has to be paid away in taxation, and this year's charge of over one and a half million pounds now exceeds our ordinary share capital. The effect of Excess Profits Levy has been particularly heavy, and this year costs £272,400. This tax was undoubtedly having a disheartening effect on progressive businesses, and we are very pleased that the Chancellor of the Exchequer has announced that it will be discontinued at the end of 1953.

The net profit of the group is £667,814, and after very careful consideration, taking into account the outlook for the current year, your board decided to increase the ordinary share distribution by 10 per cent, making a total of 40 per cent for the year.

I am very pleased to report that our total reserves now exceed three million pounds, which is more than double our ordinary share capital.

EIGHT YEARS' REVIEW

Your board decided this year to follow a current trend in company reports, and include in our accounts a summary of the results for the past eight years. The review shows that year by year there has been a substantial increase both in profits and reserves. The group profits have increased almost tenfold, and in the last two years alone there has been an increase of over one million pounds, which is largely the result of plans laid down in earlier years.

Even after extremely heavy taxation the net profits have risen from £98,889 to the present level of £667,814. The payments to the shareholders have steadily increased from 10 per cent in the year 1945-46 to the present rate of 40 per cent. At the same time, the reserves have increased substantially and the sums set aside annually have in total exceeded the dividends paid. The asset position has grown with the increased profits and it is particularly satisfactory to observe the increase in the net current assets from three-quarters of a million pounds to just under four million pounds. The fixed assets have increased by over two million pounds and stand in the books at a conservative figure.

As regards our prospects for the current year, the retail sales of our present businesses for the first 12 weeks as compared with the same period last year show the satisfactory increase of 12 per cent and in total the group sales this year, excluding Heelas, are larger than last year's sales including Heelas. Against this expenses tend to rise and, in the interests of increased efficiency, this cannot be altogether avoided but subject to this we are constantly watching our overhead expenses.

I do not like making forecasts, but your business has always continued to prosper, and with a certain saving in taxation your board believes that the net profit attributable to the holding company in the current year should again prove satisfactory.

The report was adopted.

LANADRON RUBBER ESTATES

SIR ERIC MACFADYEN'S STATEMENT

The forty-fifth annual general meeting of Lanadron Rubber Estates, Limited, will be held on June 29th in London.

The following are extracts from the statement by the chairman, Sir Eric Macfadyen, circulated with the report and accounts for 1952:

Output last year amounted to 3,738,210 lb. compared with 3,833,632 lb for 1951, the reduction being due to the adoption of lighter tapping in some of the younger areas. Gross profit was £123,596; taxation on balance £40,092 (additional to £46,559, practically 3d. per lb for export duty and cesses treated as a cost of production). After taxation the remaining profit is £83,504. The 7½ per cent dividend will require £25,061, and we shall carry forward undistributed £29,871, or £181 more than the balance brought in.

In 1953 we can look forward to seeing some reduction in cost of production, and I hope at least to paying our way; but at current prices there is no prospect of being able to make allocations to reserves on the scale of those of the past few years.

We are suffering from the after effects of a period of excess prices. Now the world outlook is quieter and the scare buying has died down, we find we have lost half our American market. We shall only recover it by offering well-prepared and well-graded rubber at attractive prices. We have a better article to sell than the chemists, and we can turn out our product at a lower cost than they can theirs. In the long run the two will settle down together and both earn a living. And meanwhile a company such as Lanadron will remain competitive.

ANGLO-AMERICAN CORPORATION OF SOUTH AFRICA, LIMITED

(Incorporated in the Union of South Africa)

SUCCESSFUL YEAR'S OPERATIONS

The following is an extract from a statement by the chairman, Sir Ernest Oppenheimer, on the affairs of the Corporation for the year ended December 31, 1952:

The profit for the year 1952, after providing for taxation, was £3,015,426, which compares with £2,894,345 for the year 1951. Once again, as for some years past, the dividend distribution for the year on the ordinary shares totalled 6s. per share.

The general reserve has been strengthened by an appropriation of £4,400,000, and now stands at the substantial figure of £17,900,000. The bulk of the appropriation for the year to the general reserve represents the premium on the share issue made during the year, which is, in effect, additional permanent capital in the business. The book value of the Corporation's shareholdings and other interests once again increased substantially by £2,332,793 to £19,257,500. The market value of these investments at the end of the year was £31,988,095. Current assets at £32,248,607 exceeded current liabilities by £3,658,306, and the holding of notes and debentures was increased to £4,134,083. There was a substantial increase in the amount of loans to affiliated companies and others; at the end of 1952 this amount stood at £15,436,208, compared with £7,411,891 at the end of the previous year. This figure indicates the substantial part which the Corporation is playing in financing the operations of its affiliated companies.

PRODUCTION OF URANIUM

It is of interest to note that two of the Corporation's producing gold mines are this year commencing the production of uranium. Production of uranium by these two mines will be not only of benefit to them by furnishing additional profits, but also of great assistance to the United States and British Governments by furnishing them with a supply of this valuable metal.

The Corporation has acquired an interest in several new developing gold mines and the Corporation is assisting materially in the provision of finance for these companies. We have reason to expect that these interests will be of considerable profit to the Corporation in due course. In regard to our interests in the Orange Free State, we are looking forward to satisfactory results in the relatively near future.

The Rhodesian companies of our group have had a most succesful year. This year is the centenary of the birth of Cecil Rhodes and it is most fitting that the event should be celebrated by the establishment of the Federation of the two Rhodesias and Nyasaland, which, I have no doubt, will inaugurate a great period of progress in the territories of our northern neighbours.

You will have seen from a recent press announcement that Rhodesian Anglo American, Limited, has recently acquired a large shareholding in the Wankie Colliery Company. At the same time your Corporation is taking over the duties and responsibilities of managers consulting engineers and buyers to the Wankie Company. The full financial and technical strength of the Corporation and its associates will be available to ensure that the Wankie Colliery will, within two or three years, be brought to a position where it can meet the full requirements of the territories which it serves.

DE BEERS CONSOLIDATED MINES, LIMITED

(Incorporated in the Union of South Africa)

GROUP'S STRONG FINANCIAL POSITION

SIR ERNEST OPPENHEIMER ON INDUSTRY'S DEVELOPMENT

The sixty-fifth ordinary general meeting of De Beers Consolidated Mines, Limited, was held on June 10th in Kimberley.

Sir Ernest Oppenheimer, the chairman, who presided, in the course of his speech said: The consolidated profit and loss account shows that the group profit for the year, after providing £7,840,000 for taxation, was £19,076,000, to which has been added the sum of £6,614,000 in respect of adjustments in diamond stocks from the nominal value of £1, at which they were previously shown in the respective companies' accounts, to cost of production in the case of the producing companies and in the case of the Diamond Corporation, to cost of purchase, making a total net profit for the year of £25,690,000, in which the outside or minority shareholders have an interest to the extent of £2,368,000, including their proportion of dividends declared by subsidiary companies, the balance of £23,322,000 being attributable to your company. To this sum has been added an amount of £19,038,000, being the unappropriated balance at December 31, 1951, after deduction of the initial contribution to De Beers pension fund and an adjustment in respect of minority interests, and this together with the credit in respect of the reserve for allowances to retired employees gives a total available for appropriation and distribution applicable to the company of £42,632,000. Out of this amount £15,782,000 has been transferred to reserves, £750,000 provided for depreciation of Government and local authority securities, and £8,964,000 has been declared in dividends to the shareholders of your company, leaving an unappropriated balance of £17,136,000, of which £7,465,000 is in your company's own accounts and £9,671,000 is your company's interest in the unappropriated balances in the accounts of its subsidiary companies.

BALANCE SHEET FEATURES

The consolidated balance sheet shows total assets at £105,038,000, which includes the sum of £13,832,000, being the net excess of cost of investments in subsidiary companies over their nominal value, less amounts written off, and after adjustments on consolidation. This sum is covered by capital reserves on the liability side of the consolidated balance sheet, of which share premium account amounts to £10,053,000 and other capital reserves to £22,182,000.

Current assets, loans to other companies and investments total £66,722,000 and exceed all liabilities to the public, including minority shareholders' interests, by £34,927,000.

I am sure shareholders will agree that our group is in a very strong financial position. The adjustment of diamond stocks in the accounts from a nominal value of £1 to cost of production in respect of our stocks and those of our associated producing companies and to cost of purchase in the case of the Diamond Corporation is a change in procedure which was decided on in the light of advice from our auditors. Your directors hope that the disclosure of this information will remove the erroneous impression that the diamond producers hold huge stocks of diamonds (whole bags full) and could, at will, double or treble the supply, but do not do so in order to maintain an artificial shortage and keep prices at an excessively high level.

It will be illuminating to shareholders to know that at the end of 1952 the total stock held by the De Beers company was only £311,947, at cost of production; by the Consolidated Diamond Mines of South West Africa, Limited, only £414,055 at cost of production; while the Diamond Corporation stock amounted to £5,782,832, valued at cost of purchase.

I would add that the stocks of all other producers have also been reduced to a bare minimum.

CONTINUITY OF DIAMOND PRODUCTION

Another erroneous impression that exists in some quarters is that even though we may not have large stocks we mine in such a way as to restrict production to a level calculated to cause an artificial shortage and keep the price of diamonds at unreasonably high levels. This view is contradicted by two important principles which operate in the diamond trade. The first is that the selling arrangements in force contain provisions by which each producer is guaranteed, over a period of years, that, however bad the general trade conditions are, his sales will not fall below an agreed minimum. As a result, there is always continuity of production, and diamond mines are kept in operation through bad times as well as good. The second is that the industry has always equipped its mines to operate at their optimum capacity. When the trend of prices and demand has warranted it, considerable sums have immediately been spent in reopening old mines which previously could not be exploited economically.

Finally, I can state that we have no agreement with any producer providing for a restriction of output. On the contrary, being represented on the boards of the most important producers, I can say that their mining operations are conducted on a scale dictated by the nature of their deposits and the full capacity of their equipment.

CECIL RHODES CENTENARY

We celebrate this year, the centenary of the birth of the founder of our company, and it is therefore appropriate that today's address should contain a fuller account of the development of the diamond trade and of your company than is customary on these occasions. The chairman, in a lengthy survey, then reviewed the period from the discovery of diamonds in the area until the death of Cecil John Rhodes, and the 50 years thereafter. He continued:

The momentous events of the last 50 years; the two World Wars, and the unprecedentedly severe and prolonged depression of the '30s, combined with our special difficulties, had of necessity important repercussions on the fortunes of your company. During the depression we had to cease operations intermittently and postpone the payment of preference dividends.

When times improved, your directors remaining ever conscious of these serious setbacks, followed a conservative dividend policy and built up substantial reserves.

The accounts presented today will have shown you that the De Beers Company has accumulated £7,400,000 in excess of liabilities, and the Consolidated Diamond Mines of South West Africa, Limited, in which De Beers has a 96 per cent interest, £7 million. The Premier Company will be able to repay its outstanding loans this year, and if the Government approves, we propose to accumulate reserve funds of £1 million, before declaring any dividends. Shareholders will observe that we now possess the funds necessary to assure continuity of operations.

However, we have achieved more as during recent years we have considerably strengthened and re-modelled the selling organisation.

CO-OPERATIVE SELLING ARRANGEMENTS

The marketing of the gem diamonds is now conducted by the Diamond Purchasing and Trading Company, Limited, and its associated company, The Diamond Trading Company, Limited. The marketing of industrial diamonds is done through Industrial Distributors (1946), Limited, and its 100 per cent subsidiary, Industrial Distributors (Sales), Limited. The great majority of selling companies' share capital is, however, held by the important diamond producing companies, not only those of this group, but also those operating outside the Union and South West Africa. In effect we have, therefore, placed the selling of gem and industrial diamonds on a co-operative and, therefore, more permanent basis. The selling companies have cash resources of:

Gem companies	£7,404,000
Industrial companies	£6,605,000
Making a total of	£14,009,000

They are thus amply financed for all contingencies. To my mind this is of special importance and significance because in this manner the risk of being compelled to force diamonds on an unwilling market is removed and the maintenance of prices greatly facilitated. The surplus funds in the hands of producers, together with the resources of the trading companies, assure continued mining operations in quiet times and will enable us to face temporary trade depressions without financial worry.

We decided on the establishment of a separate selling organisation for industrial diamonds so as to ensure that the maximum quantity of industrial diamonds should always be available, irrespective of the demand for gem diamonds. Continuity of operations, of which I have just spoken, is of greatest importance for the industrial section of our business and, of course, for industry generally.

PRESENT PROSPECTS

The chairman outlined the functions of the company's subsidiary, the Diamond Corporation, the history of which he described as an uninterrupted endeavour to preserve and cement co-operation between all producers, and referred to the formation of De Beers Investment Trust, Limited. He continued:

The boom times have come to an end, and both sections of the diamond trade, gem and industrial, are adjusting themselves to normal business conditions. Our customers are wisely following a cautious policy, and regulate their purchases with a view to reducing their stocks to ordinary trade requirements. Under these circumstances, some reduction in sales of both classes of diamonds was to be expected.

It is gratifying to be able to tell you that gem sales for the first five months of 1953 amounted to £21 million, which is approximately the same as for the first five months of 1952. We anticipate some reduction in the demand for the remaining months of the year, but all-in-all 1953 will be a satisfactory year for the gem section of our business.

Sales of industrial diamonds for the first five months of 1953 amounted to £6,700,000, against £11,800,000 for the similar period last year, a reduction of £5 million.

This drop in sales must not be attributed to a reduction in the actual consumption of industrial diamonds, but to other causes.

We estimate that total sales of industrial diamonds for 1953 will be approximately £13 million. Moreover, until there is a further expansion in the use of industrial diamonds, annual sales are likely to be within £2 million or £3 million of that figure for some years to come.

The report and accounts were adopted.

CENTRAL PROVINCES MANGANESE ORE

RESULTS CONSTITUTE A NEW RECORD

CONTINUED WORLD DEMAND

MR H. R. HOLMES ON THE SATISFACTORY PROSPECTS

The forty-fifth annual general meeting of the Central Provinces Manganese Ore Company, Limited, was held on June 8th in London, Mr H. R. Holmes, chairman and managing director, presiding.

Mr A. Linton, MC (director and secretary), read the notice convening the meeting and the report of the auditors.

The chairman said: Ladies and gentlemen, the report and accounts for the year ended December 31, 1952, have been in your hands for some time and I propose, with your permission, to take them as read. (Agreed.)

Before asking for your approval of the accounts, I would like to make a few comments on the figures which appear in the balance sheet and profit and loss account.

Last year I expressed the opinion that the prospects for 1952 were satisfactory, subject to there being an improvement in railings during the second half of the year. I am glad to say that this opinion has been justified, as the balance on trading account of £2,887,767 constitutes a new record for the company.

This result has been possible owing to the continued demand for our ore in the world's markets and to the prices at present prevailing.

TAXATION BURDEN

Of this balance, taxation takes the enormous sum of £2,041,000, and included in this figure is £425,000 excess profits levy. Taxation is a very serious matter for us, because, as I said last year, our company is subject to the full rate of tax obtaining in India. If the proposals contained in the Finance Bill, 1953, become law, the unilateral relief, which at present is limited to 75 per cent of United Kingdom taxes, will be increased to 100 per cent, but no substantial benefit from this can accrue to your company until the expiration of the incidence of excess profits levy, which, under the Bill, will continue for the year 1953.

Of the total taxation, Indian taxes amount to £1,512,000, and, in addition, we paid about £800,000 in India by way of export duty on the ore we shipped during 1952, while royalty on the ore railed was over £200,000, making altogether a total of more than £2,500,000. Furthermore, we give employment to many thousands of Indians, whose wages and bonuses, and the many amenities provided for them, amount to a very large sum annually.

Income from investments is higher at £44,001, as compared with £30,500, although the total holding of securities is the same. This is because some of the stock was bought in the second half of 1951 and consequently did not attract the full year's interest for that year.

On the debit side of the profit and loss account, depreciation of fixed assets at £38,996 is only a little higher than the previous year's figures at £37,896, in spite of the fact that the fixed assets in the balance sheet have risen from £444,046 to £641,936. This is because the depreciation on the buildings erected and machinery bought in 1952 is not charged until 1953.

APPROPRIATIONS

Your directors recomend that, out of the net profit available, the following appropriations should be made: To staff benefit fund, £30,000; to workers' welfare fund, £10,000; to general reserve, £100,000; to contingencies reserve, £75,000. An interim dividend of 1s. 3d. per unit, free of tax, has already been paid, and it is proposed that a final dividend of 2s. 3d. per unit, free of tax, plus a bonus of 2s. 6d. per unit, free of tax, should be paid, together absorbing £600,000. This will leave £192,604 to be carried forward, as compared with £185,066 brought in.

LABOUR RELATIONS

As regards the staff benefit fund, as I said last year, it is essential that this fund be built up whenever we can afford to do so, in order to provide something for both our European and Indian staff when the time comes for them to retire. With taxation at its present level it is impossible for anyone to save sufficiently for retirement, as you no doubt well know, and I feel sure that this allocation will have your approval.

As regards the workers' welfare fund, you are probably aware that the Government of India are very keenly interested in the welfare of all workpeople employed in industry. As you will see from the balance sheet, we spent £9,984 during the year on this welfare work. The £10,000 which we propose to appropriate to this fund is to replace this expenditure.

The health of our labour force in India continues to be good, and constant attention is being given to housing, sanitation, water supply, and the control of disease, particularly malaria. In the accounts we have again provided for a sum sufficient to give those of our workpeople who qualify for it by service during the year a bonus on similar lines to that drawn by the staff. The contributory provident Fund for our workpeople, which came into operation on January 1, 1952, is working satisfactorily.

We have always had the welfare of our labour at heart, and have in the past, without pressure from the Government, done much to improve the conditions under which they work and live. We hope that, with the co-operation of the Government and the trade union, labour relations will remain on the same satisfactory footing as they have been for many years past.

BALANCE SHEET FEATURES

Turning to the balance sheet, you will notice on the assets side that the value of the manganese ore stocks has risen from £530,828 to £617,003. This does not mean that the total tonnage is higher, because the contrary is the case; but there were more stocks at the ports awaiting shipment, and these stocks, having borne the cost of railway freight, are valued on a higher basis.

Proceeds outstanding on ore sales were £913,784 as compared with £440,564 for the previous year, the increase being due to the larger number of shipments afloat on December 31, 1952, than in the previous year.

There is no change in our holding of British Government securities, but during the current year the market value has appreciated by about £90,000.

The cash at bank and in hand at December 31, 1952, is approximately equal to the total of cash and tax reserve certificates shown in our previous accounts. The £200,000 tax reserve certificates were used during the year in payment of taxation.

On the liabilities side of the balance sheet, the figure of £1,472,699 appearing under reserve for future taxation represents Indian and United Kingdom income tax on the profits for the year under review less amounts already paid on account in India. The item £456,276 shown under current liabilities for accrued taxation comprises the balances of taxation for previous years.

DIRECTORS' VISIT TO MINES

Earlier this year two of your directors—Mr Bartlett and myself—visited the mines in India when we made a thorough examination of our properties, and in consultation with your general manager, and the several mine managers, came to decisions about many outstanding matters. We still cannot get all the labour we require, though there has been an improvement in this respect, and it is therefore important that we proceed with our programme of mechanisation, which so far has proved to be very successful.

Generally speaking, we found the mines in very good condition with development work ahead of ore extraction. This position will be still further improved when we get more machinery installed.

Last year I referred to the heavy media separation plant which we are installing at our Dongri Buzurg Mine. This has taken longer to complete than I estimated, but the work is now well advanced and I hope that it will be started up later this year.

CURRENT YEAR'S PROSPECTS

The demand for our ore in the world's market continues and prices remain firm.

The usual improvement in our railings during the second half of the year took place as I anticipated in my speech last year, and we were able to implement all our contracts. I think I may say that the prospects for the current year's trading are satisfactory.

As no doubt you are aware, we have had for many years now excellent relations with the largest buyers of manganese ore in the world and it has taken many years to build up these very desirable connections. It is unfortunate, therefore, that these large buyers have expressed dissatisfaction with the varying methods adopted at the ports in India in assessing the export duty on manganese ore. We are doing what we can to minimise this irritation to our buyers, with a view to retaining their good will. We feel that it is of primary importance to aim at maintaining a market of a lasting nature for Indian manganese ore in these important countries, particularly as in course of time we may have to meet severe competition from other sources of supply which are in process of being developed.

TRIBUTE TO STAFF AND AGENTS

Again I wish to emphasise the excellent work of the staff both in India and in London, and also of our shipping agents in India, Messrs James Finlay and Company, Limited. I am sure that they will appreciate the thanks of the stockholders which, with your approval, I propose to convey to them.

I am glad to say that our relations with the government authorities in Delhi and with the State Government of Madhya Pradesh continue on a satisfactory basis.

I now beg to move: "That the report of the directors and statement of accounts as at December 31, 1952, be and are hereby approved and adopted, and that the profits be appropriated as recommended by the directors." I will ask Major Herring to second the motion, and before putting it to the meeting I shall be glad to deal with any question which stockholders may wish to ask.

Major A. C. Herring, VC, ACA, seconded the resolution which was carried unanimously.

The Board's proposal of a final dividend of 2s. 3d. per unit, free of tax, and a bonus of 2s. 6d. per unit, free of tax, was also approved.

The retiring director, Major A. C. Herring, VC, ACA, was re-elected, and the remuneration of the auditors, Messrs W. A. Browne and Company, having been fixed, the proceedings terminated with a vote of thanks to the chairman, directors and the staff, both at home and abroad.

GENERAL MINING AND FINANCE CORPORATION, LIMITED

(Incorporated in the Union of South Africa)

SIR GEORGE W. ALBU'S SPEECH

The ordinary general meeting of shareholders of the General Mining and Finance Corporation, Limited, was held on June 9th in Johannesburg.

Sir George W. Albu presided and, in the course of his speech, said:

Since the last annual general meeting of the Corporation, your directors decided to increase the capital of the Corporation in view of the many calls which were being made on its funds through its direct and indirect interests in the Orange Free State and on the Far West Rand. In September, 1952, an invitation was made to shareholders and to the public to subscribe at par for 750,000 newly created 6 per cent cumulative convertible redeemable "A" preference shares of the nominal value of £1 each. The issue was heavily oversubscribed.

This increase of capital has necessitated the appearance of two new items in the accounts for the year under review, viz. a provision for the first dividend on the "A" preference shares totalling £11,094, in respect of the period from the date of allotment to December 31, 1952, and an appropriation out of profits of £11,581 for the redemption, in due course, of the *pro rata* proportion up to December 31, 1952, of those shares.

THE YEAR'S RESULTS

Although your Corporation again earned additional revenue for technical services rendered in respect of abnormal capital expenditure incurred by associated companies during the year, the profit of £611,400 was some £115,100 less than for the previous year, due partly to reduced dividend income but mainly to a small loss as compared with a substantial profit on share dealing in the previous year. Owing to adverse market conditions which characterised the greater portion of the year under review it was necessary to write off an amount of £240,300 from stocks and shares and other securities.

This item was absorbed by an appropriation of £115,300 from profits and by taking £125,000 from investment reserve account. In addition, normal appropriations totalling £64,200 were made for the writing down of land, buildings and mining properties, for exploration provision, for directors' remuneration, and including £15,000 for taxation. Dividends totalling 5s. per share on the ordinary shares were declared in respect of the year under review and absorbed £419,300, with the result that the unappropriated balance carried forward to the current year was £156,600, as compared with £166,700 at the end of the preceding year.

In accordance with the provisions of the Union Companies Act of 1926, as amended, a consolidated balance sheet and profit and loss account showing the position of the Corporation and its several subsidiary companies is attached to the directors' report. In comparison with the figures I have just quoted these accounts reflect a consolidated profit of £629,000 for the year ended December 31, 1952, and an unappropriated balance of £188,200 carried forward to the current year.

As shareholders are aware, the Corporation derives the major portion of its revenue from dividends from mining companies, so that its position has been affected by reason of declining dividends declared by those companies as the result of the present adverse conditions through which the industry is passing. The decrease in the industry's profit in 1952 as compared with 1951 totalled £8,400,000 of which £2,994,000 was due to the lower average price received for gold sold for artistic and industrial purposes at enhanced prices. Working costs increased from 31s. 10d. per ton milled in 1951 to 34s. 2d. per ton milled in 1952, mainly accounted for by increases in the cost of stores and materials and the higher cost of living allowances paid to European employees, while the total dividends declared by the producing companies of the industry at £19,805,000 was £2,983,000 less than in 1951.

URANIUM PRODUCTION

The commencement of the production of uranium, to which I referred at the recent meeting of West Rand Consolidated Mines Limited, is the beginning of a most important era for the gold mining industry in South Africa. Some disappointment has been expressed in that in the case in which we are particularly interested, i.e. West Rand Consolidated Mines, the advent of uranium production has caused a drop in the grade of gold mined. In certain cases, of which that mine is one, the effect must be to enhance the value of low-grade ore reefs substantially above their level when mined for gold alone, and on a long-term basis will have the immeasurably beneficial effect of counteracting the increasing pay limit for ore reserves, thus reducing the tonnage of ore to be excluded from reserves by reason of its being rendered unpayable through increased mining costs.

BROADENING OF INVESTMENT FIELD

Shareholders will have noticed from the announcements in the Press yesterday morning, that your directors have made an offer to absorb the undertakings of Consolidated Rand Investment and Trust Company Limited and Transvaal Mining and Finance Company Limited. You will remember that in February, 1950, the Corporation purchased a large shareholding in the former company, which carried with it a substantial interest in Transvaal Mining and Finance Company Limited. From the information published in the circulars by these two companies, it is apparent that there is little likelihood of the payment by them of ordinary dividends for some years, and it is considered that by merging the interests, with the consequent broadening in the field of investment, the amalgamation will be of benefit to shareholders of all three companies.

It has been decided to place before shareholders of the two companies concerned proposals that your Corporation should absorb them in exchange, mainly, for the issue of ordinary and preference shares where respectively applicable, based on an issue price of £4 10s. for ordinary shares of your Corporation and at par for the 6 per cent cumulative "B" preference shares, which, unlike the "A" preference shares, carry no rights of redemption or conversion. Should shareholders of those two companies approve the scheme, the Corporation will be under an obligation to issue as fully paid, from its reserve capital, 274,440 ordinary shares of £1 each at £4 10s. per share and 250,000 6 per cent cumulative "B" preference shares of £1 each, and to pay in cash a total of £188,486.

As the Corporation cannot receive its own shares for the shares it holds in Consolidated Rand Investment and Trust Company Limited in the same way as proposed for other shareholders of that company, the Corporation will receive an equivalent value in cash, namely £126,000, in respect of 400,000 of the shares held by it in Consolidated Rand and will retain 161,466 shares in that company and also the 31,000 shares it holds in Transvaal Mining, which, after the various steps have been completed, will represent the entire issued capital of the two companies. These companies will then have a total of £62,486 cash available, from which will be paid the Consolidated Rand preference dividend, taxation and all other expenses of both these companies in connection with the offer.

The report and accounts were adopted.

Copies of the full report of proceedings can be obtained on application to the London office.

THE INSTITUTE OF COST AND WORKS ACCOUNTANTS

The thirty-fourth annual general meeting of The Institute of Cost and Works Accountants was held at the Royal Festival Hall, London, S.E.1, on May 30, 1953, when Mr S. C. Tyrrell, FCWA, FIIA, the President of the Institute, was in the chair.

Mr Stanley J. D. Berger, MC, FCIS, the Director-Secretary, read the notice convening the meeting and also the auditors' report.

The annual report disclosed that at the end of the year there were nearly 4,000 members and over 11,000 registered students in various stages of qualifying. Nearly 6,000 students presented themselves for the Institute's Examinations in 1952. The three regional conferences, the National Conference at Buxton, the Third Summer School at St. Catharine's College, Cambridge, and the Sixth International Congress on Accounting, in London, had been outstanding successes. During the year the Institute Library had issued 5,000 books on loan, and the monthly journal, *The Cost Accountant*, had a steadily increasing circulation. The Institute research work had continued to flourish, and the publications of the Research Committee had been well received. The Appointments Bureau had successfully handled many hundreds of vacancies, and the Council had approved regulations for the guidance of members in practice as Consulting Cost Accountants. The report recorded the grant of Letters Patent for Supporters to the Institute's Armorial Bearings.

After the report and accounts had been adopted and the other business of the meeting transacted, the president invested Mr F. W. H. Saunders, FCWA, the new President, with the Badge of Office.

FELLOWSHIP IN MANAGEMENT ACCOUNTANCY

At the 24th National Cost Conference, held on the previous day, the President, Mr S. C. Tyrrell, stated that the recent inauguration of the Institute's Fellowship in Management Accountancy had attracted the attention of many accountants, industrialists, financiers, and Government officials. He felt that boards of directors of public companies would be vulnerable to criticism in the future if full advantage were not taken of the aids to efficiency and economical management available to them through the services of trained, experienced and qualified accountants.

INFLATION AND CAPITAL EROSION

Speaking on inflation and capital erosion, Mr Tyrrell said that "an important duty of a board of directors is to ensure that the original capital assets of a company shall not be distributed to shareholders or to its customers unless and until the undertaking winds itself up or restricts its activities below those for which the capital was first subscribed. Directors, therefore, must look to someone to provide them with the means to carry out this duty, and that service can only be rendered by the accountant who, by building up and operating an integrated accounting system, is able to ensure that the correct amount of 'anti-capital erosion preventive' is included in the cost of every production, selling or distribution process which makes use of assets which have to be replaced at any other than relatively short intervals.

"The management accountant and the cost accountant have as a *daily* pre-occupation the major task of indicating to boards of directors the proper basis for the fixing of selling prices so as to preserve intact the capital of the undertaking: they carry at the same time the added responsibility of seeking without cessation the means for reducing the cost of production, distribution and selling operations. I am satisfied that members of this Institute will make a signal contribution to the well-being of their country by a conscientious and efficient pursuit of these two objectives."

BRITISH TIMKEN LIMITED

MR JOHN PASCOE ON DEMAND AND CAPACITY

FURTHER BONUS ISSUE

Mr John Pascoe, chairman, at the annual general meeting of British Timken Limited, after referring to the death of Mr A. J. M. Duncan, a director since 1928, said:

For the third year in succession we recommend an increase in the ordinary dividend. We propose 10 per cent on the increased capital, equivalent to 30 per cent on the capital at date of the last accounts.

The ordinary shareholder who provides the capital to establish manufacturing facilities and who runs the greater part of the risk of loss and is therefore surely entitled to his reward, cannot do other than reflect ruefully on the fact that over the past five years we have paid out as net ordinary dividends £226,500, while the total set aside for taxation by the Group amounted to over £2,500,000.

We are paying as ordinary dividend a small proportion of our profits. At the end of 1951 our accounts showed capital commitments outstanding for the Group of £675,000, of which £630,000 became effective during 1952. At the end of 1952 our capital commitments were still £410,000. We have entered into further commitments since the close of the year.

This high rate of capital expenditure is likely to continue as, apart from certain directions in which we are undertaking further expansion, the replacement of obsolete equipment is still a heavy burden, and cannot be fully met from our depreciation allowances. Obsolescence is a great problem. Equipment purchased during the last seven or eight years on which we used to reflect with pride as being as up-to-date as that in any bearing factory in the world is now, due to technical development, rapidly falling to be replaced.

BONUS ISSUE

As we believe the share capital of the company should represent more accurately its total net assets, we have obtained permission from the Capital Issues Committee to capitalise a further £800,000 of British Timken Limited revenue reserves, and propose issuing two new fully paid ordinary shares for every three now held. Notices convening the necessary meetings will be posted during the next week or two.

We are transferring to the holding company's accounts £150,000 of the reserves of our main subsidiary. After this, the revenue reserves of British Timken Limited will stand at £421,379, and we hope to add to this from our results of the current year.

During the year our increased productive capacity in all our factories was very fully occupied. Turnover for the year of every operating company very considerably exceeded that for 1951.

Our direct exports also showed a most satisfactory increase, but it must be remembered that our main contribution to export trade must necessarily lie in bearings incorporated in completed equipment.

DEMAND AND CAPACITY

The year under review opened at the peak of the "sellers' market," and for the first six months we found difficulty in meeting demand. During the second six months, there was a certain falling off in trade, although all our factories were, generally speaking, fully engaged to the end of the year on both day and night shifts. The lessened demand affected only the smaller type of bearings. Demand for the larger types remained as high as ever in the company's history.

When we found difficulty in meeting demand, undoubtedly some of our European competitors were able to sell their products in this country. Part of the heightened demand was due to users, wishing to be certain of their supplies, building up stocks in the belief that the capacity for manufacture of anti-friction bearings might not meet demand. In my opinion, this country's capacity for manufacture, certainly of the smaller types of bearing, is sufficient to meet any likely demand.

All our factories are still working a day and night shift, and apart from an unexpected deterioration in the trade situation, we should be well occupied for the remainder of the year. At present our profits are rather lower than for the corresponding period of last year, but they are still running at a satisfactory rate.

Orders in hand have decreased considerably, but the orders on our books do now constitute a very real demand, and our view of the trade situation as a whole is such that we are still proceeding with our re-equipment and expansion programmes. The continued prosperity of the British Timken Group is bound up with that of the engineering industry generally, but your board take the view that we must in catering for the future assume that the trade of this country will remain at the high level necesary to support our population.

COSTS AND PRICES

We again faced increases in costs of our raw material, but we can still claim that the prices of our products have risen proportionately far less than the cost of our purchased raw material and capital equipment. Our research and development departments are unremitting in their efforts to evolve improved methods of manufacture and handling in our works.

An interesting feature during the year has been the development by Fischer Bearings Limited of what are known as miniature bearings. One of these bearings consisting of an outer race, inner race, cage and seven balls, weighs but 1/100 oz. The heaviest bearing we make weighs 3½ tons. Our manufacture covers every conceivable size of anti-friction bearing.

TAXATION

I fully share opinions expressed by industry that the taxation burden is too great a handicap for British industry to carry in its competition with the rest of the world. We welcome the crack in the ice which was slowly crushing the life out of industry, and although that ill-conceived tax known as excess profits levy is not yet dead, we are delighted to see it incarcerated in the condemned cell.

MR W. R. TIMKEN

It was with great pleasure that your directors received acceptance from Mr W. R. Timken of an invitation to join the board of directors.

The accounts were adopted. Mr W. R. Timken was re-elected to the board, and votes of thanks on the excellent results were passed to the board and the staff.

FINANCIAL TIMES LIMITED

LORD BRACKEN'S SPEECH

The annual general meeting of the Financial Times Limited was held on June 9th at Winchester House, London, E.C.

The chairman, Viscount Bracken, in presenting the accounts, said: Our earnings as newspaper proprietors are surprisingly good. Despite a sharp decline in revenue from new issue advertisements, which is usually a considerable part of our income, profits earned by the *Financial Times* are approximately equal to those reported to you last year.

WELCOME MEDICINE

Far from complaining about a temporary decline in this source of revenue, we should accept and even acclaim a development which is the inevitable consequence of a rather inadequate but altogether desirable effort made by the Government to restore some of the purchasing power of the pound which was lost by years of inflation and the crowning folly of devaluation. There is no painless remedy for inflation and as the *Financial Times* has long pressed for a return to honest money we gladly take the medicine we have prescribed and would welcome a bigger dose.

A GREAT BUSINESS NEWSPAPER

Our revenue from industrial and trade advertising steadily increases. The *Financial Times* is now as much an industrial as a financial newspaper: we can in truth claim that we publish more industrial news than any daily newspaper in the British Commonwealth. The easement in supplies of newsprint has enabled us to make numerous improvements in the services we provide to industrialists and investors. The fact that our total revenues from advertising and circulation have increased during a rather difficult year proves the wisdom of a policy which has transformed the *Financial Times* into a great business newspaper which serves almost every trade and industry in the British Commonwealth.

PLANT MODERNISATION

Revenues from our printing interests have not unexpectedly declined. This is partly due to an increase in competition, which is, of course, a healthy development. The fall in profit is almost entirely attributable to a subsidiary, the St. Clements Press Limited. This company has been engaged in a considerable modernisation of plant, and during the year took delivery of new plant and machinery to the value of £130,000. There was therefore a fairly large increase in depreciation provisions, while it was not possible during the year to bring the new plant into full productive use. Like most other British businesses we have to record a monotonous increase in the cost of wages and the cost of materials.

MERGER OF PRINTING INTERESTS

We have been considering the desirability of more closely integrating the resources of St. Clements Press and W. Speaight and Sons, and as a result a holding company is in process of formation which will take over the assets and businesses of both. To preserve the long established and distinguished names of these two businesses, so well-known in the sphere of newspaper, periodical and commercial printing, it is intended that they shall continue to trade as separate departments under their existing names. We believe, however, that the proposed financial reorganisation will be of value in the future economical deployment of their respective resources, and that the services they can offer to customers will be enhanced.

CURRENT ASSETS

You will see that the current assets of the group at £1,249,609 exceed current liabilities by £840,507. Capital commitments for the purchase of new plant and machinery amount to £62,120, against £191,850 a year ago. The liquid position therefore continues to be satisfactory.

NEW DIRECTOR

Since our last meeting, Mr Herbert C. Tingay has joined the board of the company, and you will be asked to confirm his election before the close of our proceedings. Mr Tingay is vice-chairman and managing director of George Newnes Limited, with which company we have for some years participated in the control of W. Speaight and Sons. He brings to our counsels a wide knowledge of all branches of the publishing and printing industries.

I feel sure you would wish me to thank members of our editorial and business departments for the good results recorded in these accounts.

The report and accounts were adopted.

J. H. VAVASSEUR & CO., LIMITED

(East India Merchants)

A YEAR OF READJUSTMENT

DIVIDEND OF 30 PER CENT

The forty-ninth ordinary general meeting of J. H. Vavasseur & Company, Limited, will be held on Wednesday, June 24th, at the Registered Office, 15-16, America Square, London, E.C.3.

The statement of the chairman, Mr E. J. Mackenzie Hay, which has been circulated with the report and accounts for the year ended December 31, 1952, reports:

Broadly speaking, all markets throughout the year were seeking to adjust themselves to the values and conditions of a more selective and competitive world, and having regard to the difficulties inherent in this process of readjustment, we consider the results achieved in 1952 as very satisfactory.

PROFITS AND APPROPRIATIONS

The combined profit of the group amounting to £412,524, compared with £601,624 in 1951, and after all deductions, including provision for taxation and making adjustments relating to previous years, the available balance is £155,279, compared with £195,800 in 1951. The company's net profit comes out at £75,774, against £107,160 the year before. With £81,421 brought forward, and after taking credit for £25,000 tax provision no longer required—a similar sum to that credited in 1951—there is an available balance of £182,195.

The directors recommend the transfer of £25,000 to the general revenue reserve, £15,000 to the dividend equalisation reserve and the payment of a final dividend of 25 per cent on the ordinary stock (making a total of 30 per cent for the year). After these appropriations there will be an amount of £82,258 to carry forward into the current year. The general revenue reserve now totals £260,000, the dividend equalisation reserve amounts to £75,000, and there are in addition the capital reserves and undistributed profits. The consolidated net assets total £1,676,828, against £1,645,641 a year ago.

DEVELOPMENTS

It has been our policy for some years to broaden our activities and we have several new projects in hand. A new plant has been set up in Colombo, in conjunction with associates, for the production of carbon dioxide gas, for which there is a considerable demand in the island. We are also planning, in conjunction with Ceylonese interests, the erection of a factory for the manufacture and distribution of "Schweppes" minerals, for which we have been granted a franchise for Ceylon, including the important international shipping trade calling at Colombo.

Both in Malaya and Ceylon we have secured additional agencies for important shipping lines.

In Malaya we have concentrated our rubber business into a partnership in a new company, Stanley Ward, Vavasseur and Waterhouse, Limited, the object of this company being to grade, pack and ship rubber of its own selection, and thus be able to guarantee quality standards to consumers—a long-felt want.

THE OUTLOOK

All the indications are that the terms of trade between primary products and manufactured goods will continue to move in favour of the latter, and in this event produce and commodity trading and markets may have a further period of readjustment before them. I may remind you, however, that we are not particularly affected by the fluctuations of the markets, for the reason that we do not speculate in stocks. Our main business is the purchase day by day from the producer or manufacturer to sell to the consumer or to ourselves as processors, and our profits arise from the margins we are able to earn from these activities. We do not expect a return to the abnormal profits made in 1950 and 1951, which were largely owing to the rocketing prices which followed the outbreak of hostilities in Korea. Our turnover and earnings to date this year are well up to the average of the years preceding the recent spectacular period, and we look to the future with confidence.

SELANGOR RIVER RUBBER ESTATES LIMITED

TAXATION'S HEAVY TOLL

The twenty-first annual general meeting of Selangor River Rubber Estates Limited, was held on June 9th in London, Mr J. Bligh Orr (the chairman) presiding.

The following is an extract from his circulated statement: The decline over the year in the price of rubber naturally is reflected in the accounts now presented, and we show a profit of £59,295, as against £84,838 for the previous year. The profit represents almost 20 per cent on our issued capital, but, as usual, tax takes its heavy toll and this year, at £40,178, absorbs two-thirds of the profit. We were assisted to some degree by a favourable forward sale, but, nevertheless, our net average price for sales fell by 3.09d. to 26.25d. per lb. Our cost of production, including replanting, export duty and all head office expenditure, was almost the same as for the previous year, the respective figures being 18.75d. and 18.82d.

Excluding our trade and subsidiary company investments, our net liquid assets stand at £32,278, against £31,616 a year ago. While this figure is not particularly high in relation to our issued capital, we must remember that we have considerably improved our main asset, our estate, by replanting over 55 per cent of the acreage with high yielding stock, and this we have financed from revenue while continuing to make a reasonable return to stockholders.

The report and accounts were adopted and a final dividend of 6 per cent, making 10 per cent for the year, was declared.

HUMPHREYS LIMITED

(Building and Civil Engineering Contractors)

IMPROVED RESULTS DESPITE DIFFICULTIES

MR A. V. BRIDGLAND'S STATEMENT

The sixty-first annual general meeting of Humphreys Limited was held on June 9th in London, Mr A. V. Bridgland (the chairman) presiding.

The following is an extract from his circulated statement:

The profit for the year is £24,495 after tax, as against £23,748 last year. This profit has been achieved despite the many difficulties that contractors have to overcome in their business, not the least of which is the continued and highly contentious issue in regard to controls and licences.

Since I last addressed you the issued capital of the company has been increased by the bonus issue of £100,000. After providing for our dividend requirements, the profit and loss carry-forward drops from £67,791 to £51,335, but this drop is obviously due to the transfer of £75,000 to general reserve.

SOUTH AFRICAN INTERESTS

Shareholders will see that the company has acquired interests in two South African companies. In R. H. Morris, Limited, we own 76 per cent of the ordinary shares and between that company and ourselves we possess 51 per cent of the issued capital of National Quarries (Pty.), Limited.

Originally it was the intention of the board to form a subsidiary company in South Africa, in order to participate in the development of that country. The opportunity occurred, however, of purchasing an interest in R. H. Morris, Limited, a contracting and building concern of good repute and long established in the Cape (75 years). Through this company, the board felt that we had a solution more satisfactory than starting a subsidiary *de novo* for our purposes.

We have sent out in all £70,000 to date by way of loan to R. H. Morris, Limited, to steady its finances, a substantial portion of which we propose to convert into ordinary shares in that company, leaving a balance on loan which will gradually be redeemed. This sum is in addition to the cost of the shares purchased in the two subsidiary companies totalling £55,742. At the time we acquired our shareholding in R. H. Morris, Limited, that company held about one-third of the capital of National Quarries (Pty.), Limited.

The business of National Quarries (Pty.), Limited, is a prosperous one and there seems little doubt that good dividends can be got from the investment in this company, whose reserves should also increase substantially each year.

Statements are often made in the press about the need of improvement in building methods so that costs can be reduced. But one of the most potent factors causing increasing costs is the present licensing system. I suggest that the system has long outlasted its usefulness, and is a cancer upon the industry. Eliminated, it would save a great deal of Government costs as well as our own. The number of men employed in the industry today approximates the number prewar, when we built 350,000 houses per annum, apart from all our other normal requirements, and there is no reason to suppose that that effort cannot be repeated at far lower cost to all if freedom to the industry were granted. The report was adopted.

MANCHESTER OIL REFINERY, LIMITED

REASONS FOR REDUCED GROUP PROFIT

MR H. STUART EBBEN ON THE OUTLOOK

The fifth annual general meeting of Manchester Oil Refinery, Limited, will be held on June 29th at the registered office of the company, 170, Piccadilly, London, W.

The following are extracts from the statement by the chairman, Mr H. Stuart Ebben, OBE, circulated with the report and accounts for the year 1952:

The group profit for the period before taxation amounts to £29,382, as compared with £345,373 of the previous year. Stockholders will wish to know the causes which have brought about such a material reduction in profit.

Mention was made in my statement last year of a special refining operation which had then been brought to a conclusion: the 1951 results were in consequence thereof improved to the extent of approximately £50,000 by this non-recurring income, while on the other hand the provision for depreciation, which was exceptionally increased in this connection last year, now reverts to normal.

FOUR PRINCIPAL CAUSES

Otherwise there are four principal causes of the reduction in profits. The full effect of substantial wage increases which took place near the close of 1951 was felt during 1952, together with further additions which were made during the latter year. The cost of charge stock was higher, due to the exceptionally high freight rates which prevailed during the first four or five months of 1952, despite the partial long-term cover to which I shall refer later.

The restriction of credit and the general reduction of stocks held by consumers severely affected sales of certain specialised products during part of the year, necessitating adjustments in the refinery programme which entailed the diversion of charge stocks into less remunerative channels in order to avoid the undue building up of stocks of finished products. I am glad to be able to report that, although there has been some reduction in the prices of these specialised products, sales in recent months have risen materially from the low point touched in 1952.

WRITING DOWN OF STOCKS

Lastly, it has been necessary to make a substantial provision of no less than £58,000 for writing down the value of our stocks of containers. In recent years, due to shortages in this country which should not recur, we have had to supplement domestic supplies by imports of drums from abroad, which have cost considerably more than their British counterparts.

As a result of import restrictions in certain overseas markets our usage of them contracted materially during the year and our long position was accentuated by contracts for future delivery which had to be entered into during the period of shortage. The stock of drums as at the close of the year has been written down to market value and based on current utilisation no further losses should be incurred; by the end of this year the physical volume of drums on hand should not be excessive. The burden of these additional costs was in part offset by economies in the organisation as a whole, the full benefits of which should be realised during this year.

Reference must also be made to the collapse in tanker freights which took place during the year. Whereas the spot rate for charter tankers in January, 1952, was 162s. per ton for a journey from a representative port on the US Gulf to Manchester, in December this rate had fallen to 57s. 3d. per ton and currently it is 33s. 6d. per ton.

The new distillation unit was completed early this year and has started routine operations. It has given every satisfaction both as regards its capacity and the quality of its products. The work on this installation was completed on schedule and its cost was within 4 per cent of the original estimate.

DIVIDEND 10 PER CENT

Your directors recommend the payment of an ordinary dividend of 10 per cent, less tax, which will require £21,450, and it is proposed to transfer the sum of £100,000 to a reserve for contingencies. If these appropriations are approved, there will remain balances to be carried forward of £68,330, as compared with £38,979 brought forward from the previous year.

While the trading results of the group for the year under review were disappointing, it is my opinion that the company has surmounted satisfactorily the great difficulties with which it was faced during that year. Although your company is only a small independent unit in an industry which is dominated by a number of large individual companies representing vast investments of capital, it has two assets which enable it to look forward to the future with confidence; these are a first-class team of senior executives and a good plant, which stands in our books at very much less than its replacement value.

BARTON & SONS

The ordinary general meeting of Barton & Sons, Limited, was held on June 9th in London, Mr A. H. Redfern (the chairman) presiding.

The following is an extract from his circulated statement:

The change in trading conditions is reflected to a small extent in the accounts before you which show a decline in profits, but I think that you will consider the results to be satisfactory.

The group trading profit is £690,509 compared with £772,766 for 1951, and after providing for all normal charges including depreciation there remains a profit of £560,657 from which taxation of £337,307 is to be deducted, leaving a net profit for the year of £223,350 compared with £292,742 for 1951.

The 10 per cent final dividend recommended on the ordinary stock is, of course, payable on the stock increased by the bonus distribution in December, 1952, and would be equal to a 12½ per cent dividend on the holding prior to that date.

Our overseas interests, I am pleased to say, are contributing their fair share towards the profits of your company, and these should be augmented during the present year through our interests in a Canadian company, which commenced production of welded tube in August, 1952.

Regarding our prospects for 1953, although order books in some of our companies are full, in others the position remains unchanged. You will see from the accounts that, after deducting preference dividend from the net profit, the ordinary dividend provided in these accounts is covered more than 5½ times.

The report was adopted.

BRIGGS MOTOR BODIES

FUSION OF INTERESTS WITH FORD MOTOR COMPANY

The eighteenth annual ordinary general meeting of Briggs Motor Bodies, Limited, was held on June 9th at The May Fair Hotel, Berkeley Street, London, W.1, Mr S. W. Cochran (deputy chairman and managing director) presiding.

The following is an extract from the circulated statement of the chairman, Mr W. D. Robinson:

The report and accounts for the year 1952 again disclose a position which I feel sure can be considered satisfactory. 1952 was a year of great achievement for your company. Our volume of business again broke all previous records, and I am pleased to report that levels of production called for by our customers were successfully met, despite the difficulties which were encountered during the year.

Production for the motor industry alone reached an all-time high and production of jet engine components for the aircraft industry made rapid progress during 1952.

TRADING RESULTS

The net profit (after taxation) for the year amounted to £769,617 and compares with a corresponding figure of £754,721 for 1951.

The results to date this year have been satisfactory. During the first four months of this year our sales have substantially exceeded those of 1952, but the future, particularly as regards production for the motor industry, is too uncertain to derive any reliable indication for the rest of the year.

I would now like to turn to the already announced important acquisition by Ford Motor Company, Limited, of the controlling shareholdings in your company and of the offer made to acquire the remaining shares. This offer, if fully accepted, will result in the complete fusion of interests of the two companies.

As you are no doubt aware, since the inception of our company, Ford Motor Company, Limited, has been our largest customer. The chairman of Ford Motor Company, Limited, in his statement accompanying that company's report and accounts for the year 1952 sets out information relating to that company's negotiations with Briggs Manufacturing Company for the acquisition of their controlling interest in Briggs Motor Bodies, Limited, the reason for purchase underlying these negotiations, the circumstances surrounding the Ford Company offer now made for the remaining shares and their proposals thereunder.

Your directors affirm their unanimous opinion that having regard to all the circumstances the terms are fair and proper, and they therefore recommend the offer for acceptance.

Briggs Manufacturing Company has informed us and I am authorised by that company to state that, at the time the terms of purchase of their controlling interest was arranged, an assurance was given to that company by Ford Motor Company, Limited, that it was not their intention that the change in control should result in Briggs Motor Bodies, Limited, failing to carry out any current or planned production programmes which have been mutually agreed with existing customers, or in the disturbance without fair and reasonable notice of the present course of business with those customers, nor in the present terms and conditions of service enjoyed by our staff and personnel being adversely affected.

The report was adopted.

THE CENTRAL MINING & INVESTMENT CORPORATION

DIVIDEND INCOME WELL MAINTAINED

The forty-eighth annual general meeting of The Central Mining & Investment Corporation, Limited, was held on June 8th in London, the Rt Hon Lord Baillieu, KBE, CMG (the chairman), presiding.

In the course of his speech the chairman said: From the profit and loss account it will be seen that our dividend income was well maintained. There are only two respects in which the figures for the year vary substantially from those of the preceding year—namely, in the profits from realisation of shares and in the taxation provision. As to the former, the profit of £27,893 was barely one-tenth of that in 1951 and clearly indicates how unfavourable conditions on the stock markets were for us last year. As a result of these conditions we have had to make very substantial provision for diminution in the value of shares in our portfolio at December 31st. £263,699 have been debited in the profit and loss account and the balance required — namely, £302,252 — has been charged to investment reserve.

GOLD-MINING INDUSTRY

During 1952 the gold-mining industry as a whole was able to report an increase in both tonnage and grade of ore milled, but in spite of the fairly substantial increase in the number of ounces produced, the profit fell by more than £8 million, or 3s. 2d. per ton milled. Of this fall approximately 10d. per ton can be attributed to the reduction in the premium revenue received for sales of gold for non-monetary purposes and the remainder to the increase in costs which was the most striking aspect of the year's operations.

Shortages of African labour and of power hampered the mines during the year in their endeavour to attain full milling capacity. The situation is one causing concern and special steps are being taken by the industry in the hope of improving the supply.

The results for the Group, even allowing for the influence of the Blyvooruitzicht mine —which, indeed, affects considerably the figures for the industry as a whole—are less favourable than those of the average of all producing mines. In view of the remarks I have already made on the subject of increasing costs and decreasing labour and in the light of my comments on deep level mining at last year's meeting this will not cause you surprise.

During the year under review, a total of approximately £36 million was expended upon the equipment and development of the 19 new gold mines which have started shaft-sinking since the war between West Driefontein and Virginia. Four of these mines are now producing and, on seven others, first-stage mill construction is either complete or so far advanced as to be ready for service at short notice.

An important milestone in the history of mining in the Union and in the economy of the country was reached in October, when the first uranium extraction plant at the West Rand Consolidated Mines was started up.

Two gold-mining companies of the group —Blyvooruitzicht and Harmony—are among the potential producers of uranium. The big installation at Blyvooruitzicht, upon which capital expenditure of approximately £3,500,000, financed by Government loans, has been incurred, is expected to come into production in the near future.

The report was adopted.

SHEFFIELD TWIST DRILL AND STEEL

HEALTHIER TRADING POSITION

The sixth annual general meeting of the Sheffield Twist Drill and Steel Company, Limited, was held on June 11th at Sheffield, Mr Alexander Dormer (chairman and managing director) presiding.

The following is an extract from the circulated statement by the chairman for 1952:

We have special reason to congratulate ourselves on the trading results of the year 1952. The profit of £768,073 shows a small increase over that of the previous year. Last year I warned you that the profits of 1951 would not necessarily be repeated. Happily, our order book was such that we were able to continue at the same rate of production throughout the year. By the end of 1952 we had satisfied all accumulated orders and had reached the position of increasing the stock of finished goods.

MORE NORMAL CONDITIONS

The abnormal demand has abated and we are now back to a much more normal, stable and healthier trading position. As a result, we are now able to make deliveries of all standard tools ex stock, which we were always able to do before the war. Stocks have now been, or are being, established in London, Glasgow and Manchester.

The intention of your board is to make the company's products more readily available throughout the country, thus improving the prospects of obtaining as large a share as possible of the engineering industry's requirements. Our long-established policy of distribution through our merchant friends will not be affected.

Quality engineers' cutting tools, as made by your company, have always enjoyed a good export trade. In 1952 we achieved a very satisfactory export figure, since then it has become more difficult for our agents to obtain good import quotas in the countries where they represent us. This country's main export is the labour content of the goods we sell, and we earnestly commend to Her Majesty's Government this simple fact.

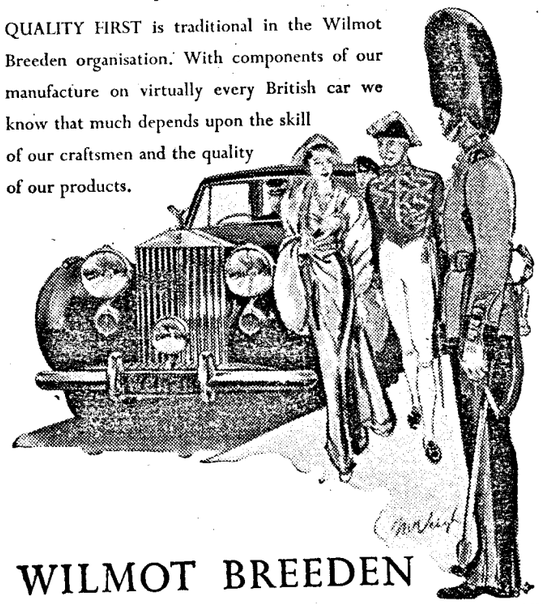
When reciprocal trade negotiations are under discussion it is the practice of other nations to fix quotas for individual export items and, until universal liberalisation of trade is achieved, our negotiators should, and must, adopt the same policy.

The surplus of assets over liabilities has increased by £159,512 to £1,622,186. The net current assets contribute £139,804 of this increase and both the items of sundry debtors at £270,081, and of stock at £278,422, on comparison with the year 1951, are indicative of my earlier remarks on the subject of sales and stock.

FINANCIAL STRENGTH

Our financial position goes from strength to strength.

Taxation continues to be an excessive call on our resources. This year £125,000 alone has had to be provided for excess profits levy and we are relieved to learn that this heavy charge on our business will be discontinued from January 1, 1954.

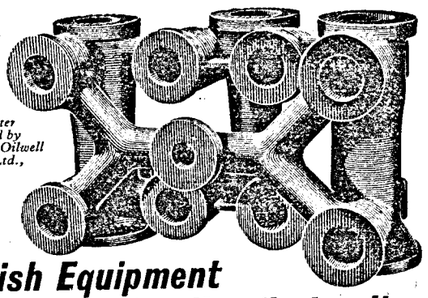


From present indications sales are improving, and whilst it is reasonably clear that our turnover will be less than last year, there is no cause for pessimism.

Your directors have maintained the proposed final dividend of 1s. 4d. per unit and in addition, as a special distribution, a Coronation bonus of 5 per cent has been proposed.

The report and accounts were adopted.

On virtually every British car —



QUALITY FIRST is traditional in the Wilmot Breeden organisation. With components of our manufacture on virtually every British car we know that much depends upon the skill of our craftsmen and the quality of our products.

British Equipment for 700-mile oil pipe-line

Until quite recently the supplying of highly specialised castings for the world's oilfields and refineries was confined to the United States. Aware that no British company made this equipment, the David Brown Organisation saw its opportunity, and took it. The exceptionally advanced techniques and high degree of skill of the David Brown foundries were concentrated upon entering this hitherto exclusive market. The result of this aggresive attitude towards foreign business is exemplified in the David Brown contribution to the Iraq Petroleum Company's new 30-inch pipeline, which will run 700 miles from the great Kirkuk oilfield to a terminal under construction north of Tripoli, in the Lebanon. For this construction, David Brown supplied a quantity of 16-inch oil pipeline valves — the largest ever made outside the United States. Today, David Brown foundries devote one-third of their entire output of alloy steel to the manufacture of specialised components for the world's oil industry. In doing so, they are winning new dollar markets for Britain.

ask the typist

Of all the tests a typewriter undergoes the typist's test is the final and most important one. On its result depends the assessment of the typewriter's value. To pass it, the typewriter must produce work of a very high standard, quickly, quietly and easily; the touch must be light; the carriage movement firm and precise; every one of the 2,400 parts working faultlessly.

Careful planning and precision engineering ensure that every Imperial typewriter is, above all else, a typist's typewriter. As a result, Imperial typewriters have been passing the typist's test all over the world for more than fifty years.

Socialism in Dilution

THE Labour party's new statement of policy, which was published on Wednesday, has some important merits. It rests, at least in appearance, on a reasoned assessment of Britain's economic needs. It is sparing of the extravagant promises to which politicians in opposition are prone. Its Socialist prescriptions are more restrained than the left-wing victories at the party's conference at Morecambe last autumn might have indicated.

These are the document's principal virtues. Inevitably, the policy as a whole makes sense only in its setting—the setting of party tension that has fashioned it. The result is confidently proclaimed as "a programme of action for the next Labour government," offered to meet the "Challenge to Britain"; but everyone knows that it is also the outcome of a desperate struggle to find the highest common factor of opinion within a party deeply divided and confused. It is salutary for the critic to think how different the programme might have been, if the Left of the party had been allowed to have all its own way and the Right had made no recovery at all from its demoralisation last autumn.

In fact, the Right's recovery—its uphill fight against the doctrinal and emotional pressures of the Labour movement—is considerable. A charitable judge might say that, considering the strength of those pressures, the Labour policy-makers should be congratulated for achieving as much realism and moderation as they have. A bad policy may be understandable because it is the least that will fob off the Socialist zealots who are the constituency delegates at a Labour conference. But it does not on that account become a good policy, and it is difficult to find in "Challenge to Britain" much more than the negative virtues of compromise. The main proposals are mostly of a familiar kind. Controls on foreign trade and payments will be tightened, and the sterling area will become a closer association. Steel and road transport will be renationalised; undefined parts of the machine tool, mining, machinery and chemical industries will be, in some sense, nationalised (the circumlocution "brought into public ownership" is studiously preferred); powers of nationalisation will be held over some other industries; and various sorts of government control, supervision and aid to industry will be intensified. More aid to agriculture will be combined with more vigorous dispossession of farmers judged to be inefficient; price controls will be renewed; companies will in some way be forced to plough back their profits into the business. Health service charges will be abolished; schools are to become "comprehensive" and there will be more technical education; some private landlords will have their houses taken into municipal ownership.

All this, and particularly the economic policy, does not indicate much more than a new gloss on the inadequate improvisations of Mr Attlee's governments. Discussion, both inside and outside the Labour party, will inevitably concentrate on the proposals for public

ownership, which are at least distinctive in that they break with the previous pattern of large, industry-wide public corporations. They are also closely tied, in the policy statement, to a recognition of Britain's continuing economic difficulties, to an appeal to the public based on "the harsh facts of life." That stands in welcome contrast to the Labour complacency of 1950, to the ostrich-like ignoring of the crisis in 1951. It is a frankness that comes more easily to a party in opposition. The actual relation between the country's economic needs and the Labour programme is probably as far as ever from being a relation of cause and effect. On the contrary, it would be more true to say that if the economic outlook had not in fact been highly uncertain the Labour policy-makers would have been compelled to imagine the country into difficulties. For the economic problem becomes, in the new policy statement, the means by which the Labour party's own conflicts can be resolved. For internal consumption within the party, it is presented as the reason for moderation, the reason why the social services cannot quickly be further expanded and why the programme of nationalisation is limited:

> Though the general case for nationalisation is compelling, we advocate nationalisation here only for those industries where the immediate national need makes the case overwhelming.

At the same time, for general public consumption outside the Labour party, economic stringency is presented as the reason why men so sound and moderate as Labour's leaders advocate "the drastic Socialist measures which alone can prevent catastrophe."

★

The needs of economic policy are thus made a basis for compromise between the right and left wings of the Labour movement. That is convenient for the writers of policy. Indeed, it is a very neat trick. But do they really believe that the result can be convincing? Within the party, the friends of Mr Bevan have already made their dissatisfaction public. When the programme is put to the Labour conference in the autumn, they will press for the nationalisation of some land, for a more precise commitment about nationalising the chemical industry, and no doubt for other leftward variations of the policy. They may well succeed, for the programme falls somewhat short of the list of major nationalisation measures on which last year's conference insisted. At present, however, the proposals deserve to be judged as they stand, and the question is whether the comparative moderation of their Socialism will be accepted by the non-Socialist voter as evidence of Labour's competence to solve the national economic problem.

"Challenge to Britain" offers little argument except a general principle: an industry should, it seems, be nationalised if its expansion can play an important part in increasing exports. But this, if it is proved at all, surely proves too much: it would justify a nationalisation programme extending far beyond the undefined parts of three industries. They seem to be arbitrary choices, and no particular reasons are brought forward to explain them. It may be agreed that the machine tool industry, for example, has an obvious opportunity both to save dollars at present spent on imports of machinery and to earn more foreign exchange by exports. But how will nationalisation (precise form unknown) help the industry to do so? Will the nationalised firms be more inventive, more flexible? Will they take more risks? Will they be more untiring in the search for markets? Will they achieve a higher productive efficiency? Will they cut costs more finely below those of overseas competitors? Will they inspire more confidence in foreign firms buying machinery? Will they be more prompt to expand their plant to the limit of the demands for its products? All these advantages of public over private enterprise are conceivable. But most of them are hardly likely, and they certainly are not proven. On the whole, both argument and experience point very strongly the other way.

★

There is, indeed, a fundamentally false ring in this new doctrine of state ownership as the instrument of export expansion. If the underlying idea has any validity, it should lead to very different proposals. If there are gaps in Britain's industrial effort, where state enterprise would economically expand capacity, the natural area to search for them is surely not in well-established industries such as chemicals and machine tools—industries well placed to obtain the capital for any expansion that the managements think worth while. The most likely field for state enterprise in an expanding economy is where private enterprise is undeveloped: in new industries and new products, where the risks are great and the private entrepreneur—in an age of capital scarcity and high taxation of profits—may well hang back. Even in this field, the case for state ownership (as distinct from state encouragement) is highly questionable, but at least it would follow logically from the idea of nationalisation as a means of economic expansion. The present proposals do not.

The real point of these proposals is therefore open to little doubt. They do not express a new approach to nationalisation, a response to the economic problems of postwar Britain. There are Labour politicians and theorists who like to imagine themselves offering a new, entirely practical form of industrial organisation to plug the gaps of an inefficient capitalism. But there is nothing of this in the programme. Its proposals are to take over what capitalism has already established; indeed, they make nationalisation the penalty of success for the private firm, and they indicate almost nothing about the changes in organisation that would follow on public ownership. Though the form is different, the motive remains the same as that which inspired the giant nationalisation schemes of 1945-48. It is the wish to "transfer the keys of economic power from private to public hands." That is not done for the sake of economic expansion. On the contrary, it is done for the sake of Socialist doctrine; it is done the more stubbornly because experience has shown that there is no real content whatever in the doctrine; and it is done regardless of the disturbance to industrial management. That disturbance is likely to inhibit expansion in the short run, and the short run may well be decisive.

All this is greatly disappointing. A new Labour programme, a new enthusiasm on the Left, was the need not of the party alone but of a healthy British politics. "Challenge to Britain" is a poor outcome of all the "rethinking" that has been going on. The more cautious politicians and more inventive minds of the Labour movement may put a new gloss on the old doctrine; they may give it some apparent relation to the immediate economic tasks on which these islands depend for their future livelihood. But if the relation is difficult to establish, it is, apparently, the doctrine that must still be served. There can be no complaint about this, if it is what the active membership of the Labour party really wants. But if so the conclusion for the general public to draw is that a vote for Labour at the next election will be a vote for blindness.

France's Crisis of Conscience

IN the present crisis, which began on May 21 with the fall of the Mayer government, France is passing through a "moment of truth." No one, in the past weeks, has been more critical of France's unworkable constitution and apparent helplessness than the French themselves. M. Reynaud's speech to the National Assembly, when seeking in vain for a vote of confidence, will stand as a classical indictment of the Fourth Republic. M. Herriot, France's elder statesman, has described the present interregnum and sense of stagnation as more anguishing than anything he had previously experienced in his long career. Thundering from his Olympus, General de Gaulle has stated flatly that no link now exists between the will of the nation and the practices of its wayward representatives. Even the steady patience of President Auriol has been wearing thin as candidate after candidate for the premiership has been prevented from solving this eighteenth cabinet crisis in postwar France.

This crisis, however, has brought far more than criticism and exasperation. It has liberated a great many ideas and political conceptions hitherto disguised for reasons of party expediency or from a wish to avoid a showdown with France's allies. Things have been said about Indo-China, the European Defence Community, North Africa, and France's share in the burden of western defence, which cannot be unsaid. Whoever finally succeeds in obtaining the mandate of the Assembly, he will have to take into account the programmes put forward by M. Mendès-France and M. Bidault, both of whom received a wide measure of support. During these weeks of controlled anarchy, the French ship of state has subtly altered course and it is an important question what course it will steer for Bermuda.

Indo-China offers the clearest instance of a problem on which ideas, cautiously hinted at by statesmen, have captured the attention and hopes of the French public. Any future prime minister knows that he will have to build with the difficult material left by M. Mendès-France, who, though he refused to give details, promised the Assembly that he would end the bitter war. He let it be known, moreover, that what he had in mind was some form of negotiation with the enemy, either directly with Ho-Chi-Minh, or within the framework of more general talks with Peking. M. Bidault, though he did not go quite so far, agreed that the burden of Indo-China was the central fact in France's continuous economic and political disequilibrium and insisted that there must be a solution. Psychologically, moreover, Indo-China dominates French thinking about European integration and Atlantic defence, and it will come first on the agenda of any future government.

★

All too frequently the rest of the free world forgets the extent of the French sacrifices in Indo-China. The French regular forces have suffered well over 80,000 casualties in the Indo-Chinese war and the number of French officers put out of action equals the total number of graduates from Saint-Cyr for the past four years. France has spent in Indo-China an average of $1,250 million a year, or twice as much as it has received under Marshall aid. In proportion to national income per head and to manpower, France's burden in Indo-China has far exceeded that of the United States in Korea or that of the United Kingdom in Malaya. More important, this seemingly endless struggle, which France's allies tend to regard as a matter of course, has been solidifying Communism in France itself. Up to the present, no coalition government has succeeded in convincing the nation that the open wound in the Far East is either beyond curing or necessary to the safety of France. The Communists have branded it "this dirty war" and the one solution in which almost no Frenchman now believes is a clear-cut military victory. Everyone knows that whereas Indo-China is 7,500 miles from France, Hanoi is only 90 miles from the armies of Mao Tse Tung.

What, however, is the real solution in Indo-China?

Clearly, it is the creation and maintenance of an independent Viet Nam—preferably one that would freely choose to remain within the framework of the French Union, but in any case fully independent. The responsibility would then no longer be that of one country alone and France's burden would be shared by the rest of the free world on whose behalf the war has been fought. This, moreover, is the kind of programme for which France might expect to receive the fullest support from America, where the stigma of "imperialism" has kept many people from seeing clearly what was involved in Indo-China. Unfortunately, however, relations between France and the Associated States have been deteriorating steadily and it now seems as if some French statesmen would find it easier to negotiate with the Viet Minh than with their own allies in Viet Nam, Laos, and Cambodia. More is involved than the potential loss of vital supplies of natural rubber and tin: what is at stake is a joint venture in democracy between the West and an Asian country of some twenty-five million people.

★

The feeling that France is being bled white in the Far East while Germany regains its former strength has been one of the main factors in the mounting French hostility towards the treaty for a European Defence Community. M. Bidault promised in his programme that EDC would not come up for debate until the Saar problem had been solved, until all the additional protocols to the treaty had been signed, and until France could persuade the United Kingdom to draw closer to the European Community. M. Bidault was actually saying, in a polite and neutral manner, that the issue of EDC would, at best, be shelved until late autumn or winter. No other candidate before the Assembly will call for an earlier date or more pressing schedule. As a result, whoever represents France at Bermuda will have to admit either that the prospects for EDC are hopeless, or that the only hope is to wait.

French statesmen feel that they do not wish to go further with EDC before the outcome of the West German elections is known or until it becomes much clearer than it is today what lies behind the flock of doves released from Moscow. The fact that their hesitations may contribute to Dr Adenauer's defeat and create a stalemate on the Saar, or that the Russian tune may revert to its old menacing key once it is clear that the European Defence Community is dead, has not impressed them. No one in France has offered any practical alternative to the EDC, and most people in Paris are now ready to admit that its collapse will not prevent the rearmament of Germany. Nevertheless, so strong is the mood of pure negation that there is very little prospect of a government that could afford to be any more realistic on this issue than its predecessors. The present French mood is founded on the hope of a *détente* with Russia and of an arrangement over Germany which will leave the latter unarmed and, at the same time, politely silence the voice of conscience, with its American accent. This is not a political programme so much as the libretto of a day dream. But it will play an increasing role in French political life and will have to be reckoned with at Bermuda.

These conceptions, moreover, are convincing many Frenchmen that a cut in the defence programme is an essential part of any cure for France's economic ailments. Admittedly, the French military expenditures, which represent nearly eleven per cent of the national income, have created a financial strain. Moreover, as is pointed out in the recent report of the French Commission on the Nation's Economic Accounts and Budgets, the rearmament programme has hampered French export industries. It has retarded retooling and made it more difficult for them to respond to changes in world demand. The report also underscores the deep-rooted fact that behind France's economic difficulties there lie thirty years of almost continuous inflation. France has been willing to accept neither the discipline of economic planning, nor that of a really free competitive system. As a result, the economy has become rigid; during inflationary periods production has not increased swiftly enough and during periods of falling demand prices have hardly declined, and what price decreases there have been do not find their way to the public. In France, moreover, inflation and recession are simultaneous rather than alternative perils. Underemployment is spreading, in spite of a budgetary deficit of 800 milliard francs—that is, of £800 million in a national income much smaller than the British.

★

That this state of affairs is as unfortunate for France's friends and allies as it is irritating to them goes without saying. It does not follow, however, that they can do anything about it. External pressure and advice can often produce the opposite of the result intended, particularly where wounded pride is concerned. Even the repetition of what seems, outside France, to be the obvious truth that many of the problems of the French people would be solved, and the rest mitigated, if only they would give themselves an effective form of government—even this truism may act as an incitement to obstinacy. Nobody can help the French until they are at last ready to help themselves—indeed, the key to the whole problem lies in finding means to break through the present apathy of the average Frenchman. There are observers both inside and outside France who, for this reason, want the crisis to get worse and worse, in the hope that, as has happened before, at the fifty-ninth minute of the eleventh hour, a statesman will appear (it might this time be M. Vincent Auriol himself), who will form a government strong and broad enough to carry out the necessary reforms. This can be no more than a hope, and a rather desperate one. But if the moment of redemption comes, others must be ready to help. The plans of the free nations may for a time have to be drawn up without counting very much on the French. But they cannot get very far without France.

Trading With Mao and Malenkov

EAST-WEST trade is in the air. It will be a focus of interest in coming weeks, whether peace is made in Korea or not. Nor will this be wholly due to the Communists' intensive propaganda. They, no doubt, will claim the West's growing attention to the subject as the fruit of last year's Moscow economic conference and of the subsequent tireless campaigning by Moscow-sponsored bodies. They could hardly be more in error. In point of fact, the free world was deterred rather than attracted by the propagandist ballyhoo staged at Moscow by Mr Nesterov and his team, who blew monstrous bubbles of fantasy that were all too easily pricked (one was an offer of 3,000 million roubles' worth of Soviet capital equipment for South-East Asia). If western businessmen are now ready to take east-west trade more seriously, it is precisely because the Communists have dropped their "Nesterov figures."

When, earlier this year, the Communists took up a long ignored invitation to trade talks at Geneva under the auspices of the UN Economic Commission for Europe, they still demanded strategic goods as the price of broader trade; but they eschewed propaganda and gave the impression of men genuinely, if uncomfortably, in search of straightforward deals. Their behaviour reinforced the growing belief that the Communist world, faced with the task of industrialising China, with economic strains and stresses in eastern Europe and, perhaps, with the need to relieve the Soviet citizen's austere living conditions, now at last wants trade with the free nations for other than strategic reasons. Appreciation of this fact is of great importance at a moment when the news from Korea is turning many in the West to thoughts of freer trade with China and, indeed, with the whole Communist world; while the news from Moscow makes others wonder what cards the West can play to induce Stalin's heirs to come to reasonable terms.

What is now the right course to take as regards trade with the Communists? Should the apparatus of controls which the free world has built up, largely under the pressure of the Korean war, be dismantled if that war now ends? Should it remain intact even if peace comes in the Far East and the Communists continue to make conciliatory moves elsewhere? Or is there a third course to be followed? Before these questions can be answered, it is essential to establish the truth about east-west trade. Few subjects are veiled by more illusions carefully fostered by interested parties.

To begin with a crude but surprisingly widespread error, it is not true that current restrictions amount to the virtual strangulation of east-west trade. Between 1950, when the Korean war began, and 1952, the first full year of the operation of the Battle Act, western Europe's exports to Russia and its European satellites fell by only 13 per cent. In Europe alone, east-west exchanges in 1952 totalled over £555 million. Even the United States bought $28 million worth of goods from Communist China in 1952.

It need scarcely be said that this trade in non-strategic commodities in no way endangers the free world. But, since many people have the impression that the United States, while maintaining its own tariff barriers, constantly presses its allies to reduce all their trade with the Communists, it must be recalled that both Mr Dulles and Mr Stassen have recently defended the right of other western countries to deal in non-strategic goods with Communist nations. Moreover, the administrators of the Battle Act, which requires the suspension of American aid to any country that supplies the Communist bloc with strategic goods, have shown a remarkable understanding of their allies' difficulties in operating their admittedly cumbrous mechanism. It is not so easy as some pretend to find here a clear-cut divergence between the United States and its allies.

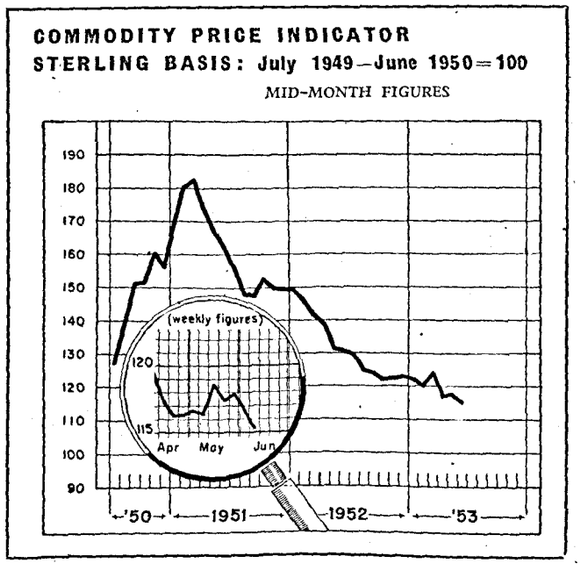
More dangerous than mistaken ideas of the current condition of east-west trade are illusions about its potentialities. It is often argued, and not only by Communists, that by trading more actively with the East the free nations can rid themselves of unemployment, raise their standards of living, and have done with their dollar problems. This is to ignore the most obvious limitations to the possible scope of east-west trade, namely, the hard facts.

★

Let us first consider the Communist bloc as a source of supplies. In the past, Britain has been among Soviet Russia's best customers. Yet the highest percentage of total British imports ever supplied by the USSR was 3.75 per cent in 1931; and the average for 1935-38 was only 2.2 per cent. The five countries which are now Russia's European satellites—Poland, Czechoslovakia, Rumania, Bulgaria and Hungary—provided only 2.5 per cent of British imports in 1935-39. The postwar picture is even less encouraging. Although, under the Marshall plan, the western countries made great efforts to revive trade with eastern Europe, their success was limited; in 1949 the satellites could provide Britain with only 1.14 per cent of its needs, while Russia provided 0.7 per cent. A similar sharp fall took place in the Soviet bloc's total shipments to western Europe, and the reason is not far to seek. Before the war the pattern of trade was mainly an exchange of eastern primary products—timber, grain, foodstuffs, and coal—for western manufactures. But as soon as the Communists gained control over the satellites, they hastened to free them from this "exploitation" by expanding industry. Meanwhile, industrialisation was also pressed forward in Russia. Inevitably, the East

now has less to export of precisely those few commodities of which it was once a useful source for the West. Thus Russia, which before the war provided 14.5 per cent of Britain's imports of wood and timber, provided in 1948-52 only 5.5 per cent of a much smaller total. Grain shipments from the satellites to western Europe fell from an average of 2.6 million tons in 1934-38 to 0.3 million in 1951-52.

It is clear that the trend to industrialisation, and with it the decline in exportable surpluses of primary products, will continue. Yet it is inconceivable that the Communist bloc, in ceasing to export primary products, can become at any early date a major exporter of the products of industry. Its own needs for such products are enormous, now that it has engulfed China ; and there is still no sign of the machinery and equipment that it has promised to Asiatic countries.



If we turn to consider the Communist bloc as a market for western products, a somewhat similar picture appears. The USSR has never been a major market, and since the war it has proved an even smaller one. In 1935-38 only 3 per cent of British exports went to Russia, in 1948-52 only 0.8 per cent. The satellites, which before the war took 2.1 per cent of Britain's exports, took only 1.34 per cent in 1949. Yet Britain is western Europe's largest exporter to the Soviet bloc. It is true that the bloc also buys wool, rubber, cotton and jute from the oversea sterling area, but except in the case of rubber, of which Russia bought about ten per cent of the sterling area's exports in 1952, it is not an important market for these commodities. The Soviet bloc buys virtually no consumer goods ; and although at Geneva in April the eastern delegates hinted at a less rigid policy in this matter, it was noticed that, while precise about their demand for sponges and ping-pong balls, they retreated into vagueness when offered cotton textiles. In China, prospects for western consumer goods are even less promising ; if and when the Peking government is in a position to buy such goods, it will hardly look further afield for them than Japan, where it can pay its way with coal and soya.

★

There is no doubt that China, and to a lesser extent other Communist countries, urgently need quantities of capital equipment. That, however, does not oblige the West to provide them. Three difficulties arise. First, given the Communists' limited exportable surpluses, how do they propose to pay for such purchases ? The fact that they have been able to pay for the modest purchases they have hitherto made gives no assurance that they could finance a much expanded import list. Second, the equipment they seek most urgently is also needed by other countries. Is it wise to disappoint a friendly and reliable customer in order to sell to a country whose intentions are veiled in darkness ? No prudent businessman would commit himself deeply to a firm that hid its affairs from the world as rigorously as do the Communist states. Indeed, the third difficulty is that to the Communists trade has become a political weapon, to be wielded ruthlessly and without warning. Can the West afford dependence on eastern supplies or markets that, at a critical moment, could be subjected to sharp economic pressure for political ends ?

From all this it is clear that, even if there were no question of restricting east-west trade in order to limit the striking power of a potential aggressor, the visions of vast eastern markets and sources that are now dangled before the West's nose would remain just as unreal. The West has far less to gain from this trade than the East, and it has every reason to approach it with caution. It is surely time that this was made clear to the Communists. As long as they remain unyielding and uncooperative on the major issues that divide the world, the West can hardly be blamed if it declines to help them out of their economic difficulties at small gain to itself. If it did so without naming terms, it would be throwing away one of the few cards it now holds.

But if that card is to be played in such a way as to extract the maximum of reasonableness from the Communist bloc, it must be played by a single hand. For individual nations in the free world to break away and seek private deals with the bloc at this moment of *détente* would be fatal not only for their partners but also for themselves. The Communists are doing all they can to tempt free nations into such short-sighted ventures, and there is probably only one way of ensuring that they do not succeed. That is to continue to operate the international mechanism through which the free world has been restricting east-west trade in strategic goods, but to extend its present purely negative functions so that it can hold out to the Communists positive propositions of expanded trade in return for clear acts of political co-operation. In this way, and in this way only, east-west trade might now be of great service in helping to free the world from its present fears and dangers.

Tugs and Towage

WHENEVER a big liner is plucked out from the dockside by a tug, manœuvred past the dock gate against wind and current and guided, helpless, through a crowded anchorage to the open sea, the tugmaster, casting off the towrope, may well feel contempt for the job of the skipper on the bridge high above him who has little to do but set a straight course for the next harbour. For the majority of tug masters have never gone to sea, any more than their fathers or grandfathers who were " tuggies " before them ; have never, in fact, save for the exigencies of war, served in any but their home port. Towing is a highly specialised skill, learnt from boyhood on the deck of a tug and nowhere else. It depends on knowing a particular port blindfold, and on having a long experience in manipulating at the end of a rope a ship of up to a hundred times the tug's own tonnage. As ships have grown bigger their elbowroom in docks and crowded waterways has grown less, while they are almost impossible to steer at low speeds.

Wherever there are docks there are tugs. They number about three hundred in the United Kingdom. Although tugs have increased in power over the years, their size is strictly limited. Seldom over a hundred feet in length, their horsepower is anything up to 1,200, which means that their hull-space holds mostly engine.

Besides the familiar tugs that help vessels to their berths in harbour, there are two other kinds of tug: little craft tugs for handling lighters, and big coastal or ocean-going tugs for long-distance work. London is pre-eminently a lighterage port ; that is, ships unload some 80 to 90 per cent of their cargoes, not on to quays, but directly into barges for distribution by water up and down the river. There are upwards of 7,000 lighters, or " dumb barges," on the Thames, and the 300 Thames craft tugs, which tow up to six of them at a time, are built especially small to turn closely in congested docks, to work at tidal wharves and to pass bridges at high tide. These tough little ships shoot round bends and through arches on a three-knot tide, swinging behind them craft with no independent control, strung out to three times their own length. They may work from Brentford to Tilbury, picking up and dropping dozens of lighters in the course of a single trip, shouldering their way among moored craft to single out the ones they want. Some of them are confined to specialist work ; but many of them are " seekers " hailed at the dock gates for casual work, and doing a little ship towage for smaller vessels on the side.

Ocean-going tugs are much rarer. Before the war the Dutch monopolised long-distance towage, which they had developed as a means of transporting their floating docks and dredgers to the Far East. France, and later England, were only preparing to challenge the Dutch position when war broke out. Today the United Kingdom has thirteen ocean-going tugs capable of working in any part of the world, and they have shared with the French and Dutch vessels a postwar boom in long-distance salvaging for breaking-up, and in towing dock units and dredgers to newly developing areas. Obtaining this kind of work depends not only on tendering competitive prices, but on establishing with underwriters such a reputation for success in these risky undertakings as will keep insurance premiums down.

Tug owning is a self-contained and rather conservative little industry of its own. Most of the forty-odd ship tug firms are family businesses with local roots in their own ports; only one firm has extended its operations to cover two rivers, and very few have financial interests outside towage. Half a dozen of the leading firms have fleets of twenty-odd vessels, and the rest are owned by small concerns in threes and fours. Outside the commercial field there are two large corporations owning tugs, neither important competitively, the Port of London Authority and the Docks and Inland Waterways Executive. The latter acquired a number of tugs from the railways, but these are not operated as one fleet ; they are not numerous, and compete locally for business, usually at local prices. An attempt to establish a monopoly for the Executive's tugs at Immingham was successfully challenged last year, but such strident competitiveness is decidedly rare. Elsewhere, agreed scales of charges and a peaceful division of labour between rival owners suggest a state of affairs that, in any other industry, would be called monopolistic. In London, for example, all the ship-towing in the long stretch of river between London and Gravesend is shared between three firms whose charges are agreed.

★

The case of the little craft tugs on the Thames is somewhat different. All but forty of them are owned as an adjunct to other businesses, mainly by lighterage firms or wharfingers. The dozen owners whose craft tugs go " seeking " for work are inevitably competitive, in the tradition of the old tug industry of pre-1914 days, when ship tugs themselves were all seekers, and ruthlessly competitive seekers, too, according to the colourful stories. Different again is the ownership of the ocean-going tugs. These thirteen vessels are divided between four owners, only one of which is a specialist ; of the others, two are ship-tug firms, and the fourth is Metal Industries Ltd., which entered the business chiefly to bring home ships for scrap.

Although the three branches of the towing industry never encroach upon each other's work—cannot in fact do so, since the small tugs lack the power and big tugs the manœuvrability—and although their organisation is so different, yet they all have one major problem in common: utilisation. Towage by its very nature is a

Parliament resumed was to be the announcement of the Government's policy on commercial television, have put Ministers into a hole. For it has become quite clear that, if they go ahead and announce the policy that it is believed they intended to announce, they will run into a great deal of opposition. Several of the most reputed names in their own party—led by Lord Waverley, Lord Halifax and Lord Brand—have been put to a manifesto deploring any commercial element in broadcasting. And Mr Attlee and Mr Morrison, who can recognise a good thing when they see it, have made it clear that there will be firm opposition from the Labour party, with a promise of reversal when they get back into power.

The discussion is being conducted in black-and-white terms to a degree that is surprising even in politics. It is the BBC *versus* vulgarity, or liberty *versus* tyranny, perfection *versus* infamy. In point of fact there are at least four ways of organising a broadcasting service, with any number of combinations and sub-divisions. The four are:—

1. A complete monopoly for the BBC.
2. Competition between two or more public service corporations, sharing the licence revenue between them.
3. Programmes provided and controlled by the BBC (or by more than one publicly appointed and publicly responsible corporation), but financed in whole or in part by permitting advertisers' announcements between items of the programme.
4. Programmes provided by advertisers or by a private company dependent for its revenue on advertisements.

The argument is being conducted as if Nos. 1 and 4 were the only conceivable alternatives. But an impartial observer might well conclude that both these extremes were objectionable, the monopoly of the one being no less dangerous than the commercialism of the other. Ideally, No. 2 might well be the best, but those who appreciate the very heavy costs of television would hesitate to exclude No. 3, which might in practice be quite acceptable, no less so than a newspaper which is conducted as a public trust but is prepared to print advertisements alongside the articles the editor provides for his readers.

Hitherto almost nobody in this country has been willing to give any serious consideration to any of these more moderate solutions. Now that the Government has lightheartedly got itself into a real difficulty, committed to doing something but forewarned of the storm it will arouse if it plumps for full "sponsoring," it would be very well advised to explore the possibilities between the two extremes.

The Three "Guilty Men"

LABOUR'S left wing has maintained its attack on the three trade unionists who have agreed to serve on the new Steel Board. The alliance between *Tribune* and the *Daily Worker* in the campaign of abuse has been backed up by resolutions passed by the Scottish miners, the South Wales miners and some other unions calling for the removal of the three officials from the General Council of the TUC. Mr Owen's union, the blast furnacemen, has been equivocal. Its executive committee could not condemn his willingness to serve on the Steel Board because last December it had decided that the union should take part in such a board if invited to do so and provided that no conflict with the TUC would thereby be involved. But it declared that Mr Owen could not combine the duties of a part-time member of the board with those of the secretaryship of the union. He was therefore asked to choose between the two posts—and he resigned the secretaryship.

It would be interesting to know whether, in putting pressure upon Mr Owen in this way, the executive committee of the union was reflecting the wishes of its rank and file, who do not appear to have been consulted before they were deprived of their secretary's services. The committee's action flatly contradicts the accepted principle that trade union office can be—in the opinion of the TUC should be—combined with part-time membership of public boards, whether for the coal industry or for hospitals, and, indeed, with any part-time activity in the public service.

Fortunately, other union leaders have not been so scared as the blast furnacemen by the attacks from the Labour left. The Iron and Steel Trades Confederation has given its full approval to Sir Lincoln Evans's acceptance of the vice-chairmanship of the board, and resents the attacks made on him. A similar protest at the campaign has been made from outside the industry by the National Union of General and Municipal Workers. The assertion that trade unionists are overwhelmingly in agreement with the campaign would be difficult to maintain. It would be truer to say that the incident merely emphasises again the cleavage in the Labour movement. Mr Morrison accepts the view that trade unionism should be represented on Government bodies—whichever the Government in power—and that, in any case, it is a matter for the unions concerned and the TUC to decide for themselves. For the Bevanites any co-operation with the present Government in the case of steel is pure treachery to the Labour party.

Naval Occasion

THE Coronation Review of the Fleet at Spithead on Monday provided a splendid spectacle and another example of the excellent organisation and lavish hospitality that can always be expected from the Navy. Some 190 ships of the Royal Navy were assembled, consisting of most of the Home Fleet and a large part of the Mediterranean Fleet. These represented about half the total number of ships in the Fleet—many being on duty in stations from which no ships could be recalled, such as the Far East, the East Indies and the South Atlantic. With the representatives of the Commonwealth navies, Spithead could show about a third of the combined Commonwealth fleets. But behind the ships in commission are a vast number laid up in reserve, in varying degrees of readiness. When these are included the British Navy is outnumbered only by the United States Navy, although the Russian Navy keeps a larger number of ships ready manned. Allied superiority at sea is overwhelming.

There is small reassurance nowadays, however, in mere numbers of ships. Progress in the fields of equipment and new methods of propulsion have lately been so rapid that ships are quickly obsolete. Most of the ships in the review date from the war years, although much of their equipment is of later date. The public knows something of what is going on—of new anti-submarine weapons and powerful radar equipment, of the change in emphasis from guns to carrier-based aircraft and from battleships to lighter and smaller ships, reflecting the prime need to clear the seas of mines and submarines. It is known that much construction is in progress, including 8 new aircraft carriers, 13 frigates, 3 cruisers, 3 ships of the Daring class and 95 minesweepers—as well as the new naval aircraft. But the requirements of security are such that a great deal of what is being done must be taken on trust. Confidence is justified only if it is certain that speed in technical development is not being sacrificed to maintain—within the framework of Nato—an unnecessarily large number of obsolescent ships.

A Gesture to Turkey

IT was to be expected that Soviet diplomacy would turn on to the country that is Nato's hinge between Europe and the Middle East and controls the passage between the Mediterranean and the Black Sea. For nowhere has the bold containment policy devised by the predecessors of Mr Dulles and Mr Eden come closer to the Soviet Union than in Turkey. Since 1946, when the Russians put forward in the flush of victory their claims to Kars and Ardahan and proposed revision of the Montreux Convention controlling the use of the Straits, Turkey has gone through a diplomatic, industrial and strategic transformation. It has given up isolation for Nato membership; it has received $1,000 million of American aid for military and economic development; Nato air bases have been constructed on its soil within easy range of the Donbas, and at Izmir there is an important allied command headquarters. Moreover, it has developed with Greece and Jugoslavia close and cordial relations which may eventually produce a full military alliance. In Russian eyes Turkey is a challenging nucleus for military and political groupings both in Europe and the Middle East.

It must in all fairness be said, therefore, that serious overtures to Ankara would cost Moscow a good deal in pride. For it is no small matter for a great totalitarian power to accept restraints on its use of a vital sea passage, or to accept the presence of other Great Powers on territory adjacent to its own. Whether the overtures made this week are of a far-reaching kind is uncertain. That the Russians have abandoned claims to Kars and Ardahan is clear; that they are ready to agree to a revision of the Montreux Convention acceptable to Turkey and other powers is not clear. The text of their proposals has not been published; but it is reliably reported that they do not go beyond the suggestion that it should be possible to work out with Turkey a mutually satisfactory arrangement for the defence of the Straits. This may or may not imply abandonment of the previous demand for Soviet bases on the Dardanelles.

Turkey and its allies will find it difficult to decide what kind of international agreement on the control of the Straits they now want. In 1946 they were ready to go a long way towards meeting Soviet wishes. Since then times have changed; but here, at any rate, is one issue between the Kremlin and the West on which arguments and tempers have not been exhausted during recent years. In the list of gestures to the outside world so far made from Moscow this is one of the very few to be labelled "promising."

Last-minute Grab

THE public has become accustomed to repeated disappointments in the Korean truce talks; it was, nevertheless, generally believed that the question of the repatriation of prisoners of war had been for a long time the only obstacle to the conclusion of an armistice. It was, therefore, a shock to discover that new difficulties over the demarcation line had apparently appeared, and an even greater shock when the Chinese launched their heaviest offensive for eighteen months. The most obvious intention of this attack is to gain ground so as to improve the strategic and territorial position in favour of the Communists before the fighting stops; a less obvious, but perhaps even more compelling, motive for the "peace-loving" Chinese leadership in thus incurring heavy casualties on the eve of the truce which they apparently want, is to gain prestige by a last-minute advance which will enable the Peking government to claim that it has compelled an unwilling United Nations command to agree to a cessation of the fighting. If there is to be a truce, it is important for the Communists that it should not give the Chinese people any impression of having been forced on the invincible People's Government by military deadlock and exhaustion, but should appear to have been conceded from victorious strength owing to Peking's devotion to peace.

Communist loud-speakers at the front are reported to have been announcing that an armistice will be signed on June 25. There is so far no sign that the American government intends to break off the truce negotiations because of the Chinese offensive, though, if there were to be a serious cracking of the Allied front, it would be necessary to take a grave decision—whether to accept military defeat on the eve of the armistice or mount a counter-offensive to restore the line. One advantage, at any rate, there may be from this eleventh-hour offensive: it should teach the South Koreans better than any argument that they cannot possibly carry on the war by themselves against the power of China.

President Syngman Rhee's action in ordering, on his own responsibility, the release of all anti-Communist North Korean prisoners is yet another sign of the reckless obstinacy with which the Americans have to cope. On the face of it, the reported escape of 25,000 prisoners is a grave matter that might jeopardise the truce; in fact, however, many of these men have been prisoners only in name and would not find escape difficult.

Anxious Days in Prague

THE Communist bosses of Czechoslovakia are getting into very deep water; and they give the impression that they have little idea of how to get out of it. They have to deal with workers who "lack discipline" and indulge in constant and deliberate absenteeism, as well as with farmers who refuse to sow and plant as they are told. This must be bad enough. But it must be even worse to find that their request for "criticism from below" has been accepted at its face value, that they can no longer

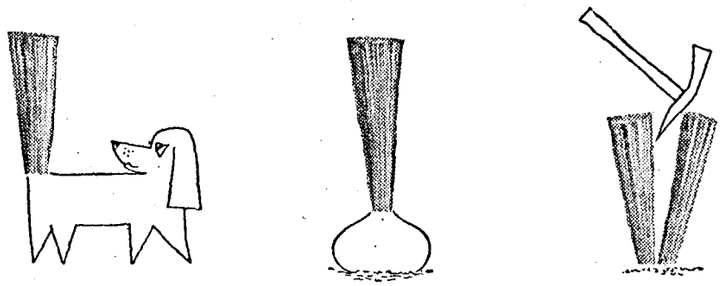
count on the unquestioning support of all their own followers, and that many party members have become fainthearted and even downright insubordinate. This is not the first time that the Czech Communist leaders have made this painful discovery; but the refusal of some party members to "sell" the new currency reform to the workers, and the apparently active hostility of others, are clearly causing Messrs. Zapotocky and Siroky the gravest anxiety.

Their anxiety seems amply justified. They are caught in a cleft stick between the demands of Russian planning and the opposition of their own countrymen. Their latest measures are unlikely to be effective in keeping the workers' noses down to the grindstone; and the cost, measured in terms of political instability and increasingly vocal discontent, is certain to be formidable. But this resort to desperate remedies is by no means surprising; industrial production, especially in the heavy industries, is continually falling behind the plan, while the Russians—it has been admitted—are deliberately withholding supplies because Czech deliveries of finished products are falling behind schedule.

Yet if Moscow wishes to avoid serious trouble in Czechoslovakia, it will surely have to intervene in a more constructive way: by lowering its demands on Czech industry, by supplying the Czechs with consumer goods and foodstuffs on credit, and by allowing them, like the East Germans, to abandon temporarily the headlong race towards socialism. In a fully fledged "people's democracy," however, it is not so easy to put the clock back; and it might prove difficult to prevent a dangerous chain reaction from spreading throughout the Soviet empire. In any case, the Russians might not be willing either to forgo the industrial tribute from their most advanced satellite or to supply it with consumer goods just when they have promised to make things easier and pleasanter for their own people. In that case, it is not wishful thinking to suggest that the situation may become gradually more explosive.

Nigerian Leaders Reply

THE leaders of the two main southern Nigerian parties, Dr Azikiwe, president of the National Council of Nigeria and the Cameroons, and Mr Awolowo, leader of the Action Group in the Western region, have now replied—in identical letters—to Mr Lyttelton's invitation to a conference to discuss the crisis. His first announcement that there would be a conference was not adroitly phrased, and it looked as if the Nigerian response would be a factious refusal. Evidently wiser counsels have prevailed, but the sending of identical letters to the Governor, and the conditions upon which they insist, are not auspicious for the success of the talks.



The Secretary of State will find it difficult to overlook the unpleasant threat of direct action to achieve independence, even though force is not mentioned and the threat is wrapped up in promises of co-operation and friendship with Britain after Dominion status has been achieved. The achievement of Dominion status, indeed, is in effect to be the subject of any conference which the southern Nigerian leaders express themselves as ready to attend. They state that they will attend only if the purpose of the discussions is to put right the defects in the present constitution, and that this constitution is the last under colonial conditions which they are prepared to work. Should it break down, and in any case by 1956, power must be transferred to them unconditionally.

This is, of course, a political move designed to exclude from discussion any looser form of confederation such as the northern province demands as the price of its remaining in a Nigerian union at all; and in effect it means that Dr Azikiwe and Mr Awolowo are united in their determination to ignore the claims of the Northern Peoples' Congress to represent the north. They are staking out their claim to control the north through the masses, who, they assume, are ready to follow their line. In these circumstances, it will still be worth while to hold a conference, but it will require a great deal of careful handling; for the prospects of agreement between the Nigerians themselves seem remote, and the conditions set forth in the southern leaders' letters would imply that, in the event of failure, the British must withdraw from Nigeria and allow the Nigerians to sort matters out whatever the state of government at that time. Such an unrealistic attitude may perhaps be modified in the course of talks between all the parties represented.

Progress Report on Kenya

ALTHOUGH Mr Lyttelton had encouraging news for the House of Commons last week of the campaign against Mau Mau, he hardly satisfied his critics. Opposition members showed themselves punctilious in their determination not to allow statements to be made which might in any way prejudice the trial of an accused person, and fought the Secretary of State's observations on the Kenya African Union word by word; and his suggestion that more and more Kikuyu were coming over to the side of law and order was received by Labour members with scepticism. In a sense it is no doubt true that the vigorous assertion of the Government's power to put down revolt does not convert African opinion to friendship towards the European, but it is unquestionably the indispensable first step to any settlement of racial and economic problems in Kenya. The staunchness and successes of the Kikuyu Home Guard, the growing flow of information, and the inexorable trial and conviction of those guilty of terrorism, are substantial victories for law and order. There is, however, as Mr Lyttelton emphasised, a long way yet to go. The extent to which the forests are infested with Mau Mau gangs and armouries has come as a shock to the authorities, and a protracted struggle with bandits probably lies ahead.

Mr Lyttelton was a little naif in insisting that because Mau Mau has murdered so many more Africans than Europeans, the struggle is not one between white and black. The prime Mau Mau objective is the expulsion of the white settlers and government, for which purpose complete power over the Kikuyu, enforceable by terror, was the necessary first step. The anti-European element in the struggle ought not to be played down, although it is true that the Mau Mau drive for power has produced solid African resistance—a resistance largely inspired by the missions. But it does

animal, vegetable or mineral?

When you think of thousands of tiny fibres which can be teased away in the fingers, you don't usually think of a rock. With asbestos rock it's different. Asbestos is one of nature's freaks: a mineral, yet made up of gossamer-light fibres. These fibres, which never burn, can be spun, woven or moulded into a variety of materials. Hardly an industry, today, is not using Asbestos in one form or another. For the fullest information on its possibilities in your own branch of industry, consult

THE FINEST SERVICE FOR ALL CLASSES OF INSURANCE

The "Alliance" has representatives throughout the United Kingdom, British Commonwealth and elsewhere abroad.

THE UNITED STEEL COMPANIES LTD

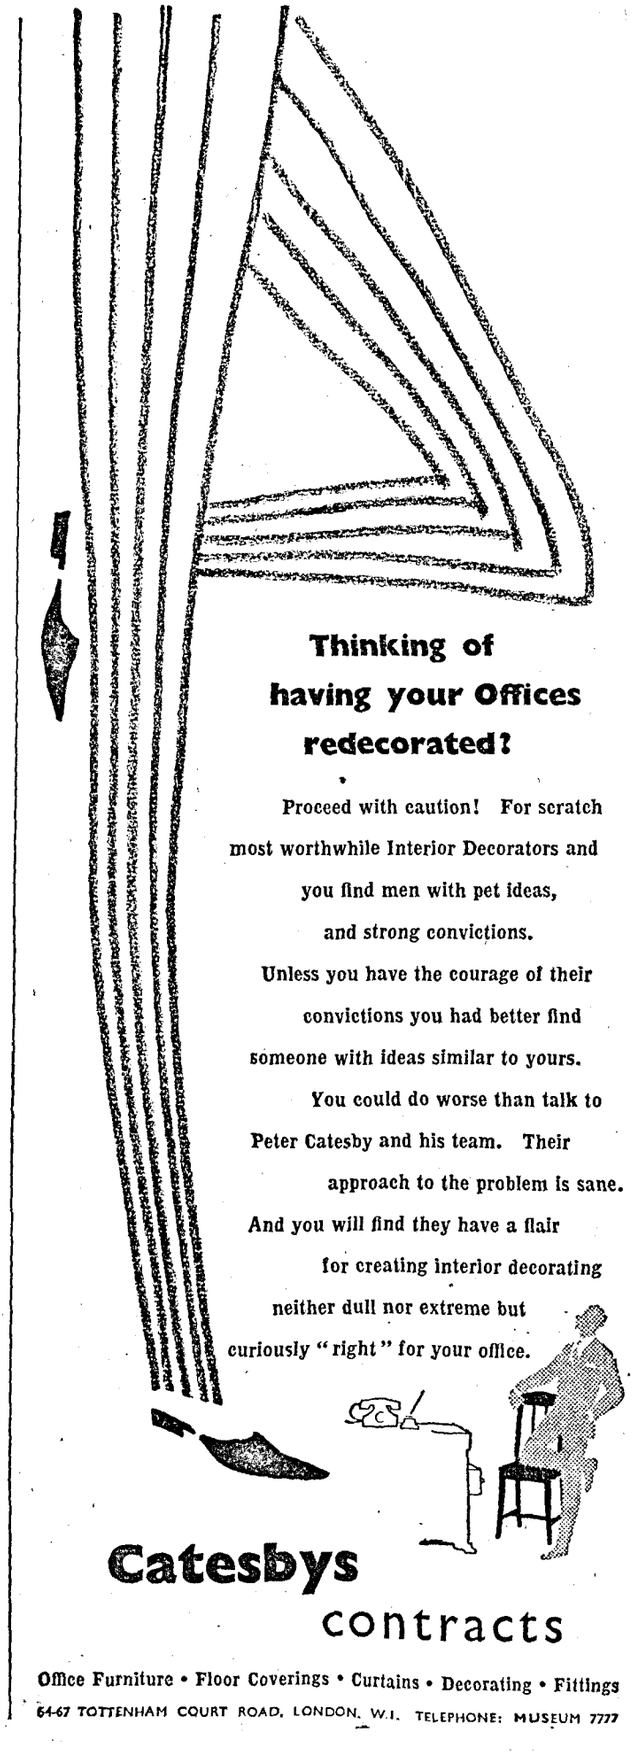
THE LARGEST STEEL PRODUCERS IN THE BRITISH COMMONWEALTH

The range of steel products of the United Steel company is easily the most comprehensive in the country. Engineering, mining, constructional work, shipbuilding, electrical and other primary industries, railway, motor vehicles, aircraft, hardware and domestic, textile and other trades depend upon steel in all its forms. This widespread demand is touched at almost every point by the United Steel company's production.

The practical and economic advantages of such a range of output are manifest. All needs of large and small individual consumers can be supplied through a single selling organisation, securing from one product goodwill and contacts for another.

Of prime importance is the ability to adjust production to variations in demand, giving widespread stability and security to the whole organisation.

SOME FIGURES



The total sales during the year ending September 1952 were £67,000,000 supplying these industries:

Railways and Rolling Stock	11.5%
Shipbuilding and Marine Engineering	8.9%
Constructional Engineering and Building	8.6%
Drop Forgings and Laminated Springs	6.8%
Motors, Cycles and Aircraft	4.9%
General Engineering	13.1%
Mining and Quarrying	6.6%
Miscellaneous	10.2%
For further conversion to finished products	19.0%
Direct Export	10.4%

APPLEBY-FRODINGHAM STEEL COMPANY
SAMUEL FOX & CO. LTD.
STEEL PEECH & TOZER
UNITED STRIP & BAR MILLS
WORKINGTON IRON & STEEL COMPANY
UNITED COKE & CHEMICALS COMPANY LIMITED
UNITED STEEL STRUCTURAL CO. LTD.
DISTINGTON ENGINEERING CO. LTD.
YORKSHIRE ENGINE CO. LTD.

not follow that the loyal Kikuyu are pro-settler or even uncritically pro-government. Indeed, it is from their ranks that the legitimate political pressure from African opinion in Kenya may ultimately develop. Meanwhile, there is much to be done to bring the races closer in the emergency, and it is to be hoped that Asians and Africans will before long serve on the Emergency Council. The schemes for Kenya's economic and social progress, which Mr Lyttelton promised in due course, will also be awaited with the greatest interest.

Labour and the Schools

THE Labour party executive shows a certain astuteness in giving an important place in its policy statement to its plans for educational reform. These will appeal not only to the out-and-out egalitarians, but also to many who are justifiably uneasy about the educational system as it is.

The most revolutionary proposal would end the present division of schools and pupils into three categories—grammar (for the clever), technical (for the handy) and modern (for the dull); and, as a corollary, would abolish the examination which sorts the children out into these schools—and so to a great extent determines their subsequent careers—at the age of eleven. Instead, all children would go to the same kind of secondary school from the age of eleven until the school leaving age. Those who stayed on at school after fifteen would go on to high schools, and ultimately the "best of the 'public' schools and independent day schools" would be taken over and converted into these high schools.

There is some sense in these proposals. The comprehensive school up to the age of fifteen would allow more time to select those best fitted for further education, and would give a chance to the child who develops late. The high schools would allow a better use of scarce teaching ability, for the ablest teachers could be concentrated there, leaving younger pupils to the less well qualified. Theoretically, too, it would be a good thing to bring the public schools into a unified system. But everything would depend on how these ideas were put into practice. Unfortunately the motivating force behind most Labour thinking about education seems—in spite of official protestation—to be envy. The educational ideas of the LCC, as well as the speeches of prominent socialists, give every reason for misgiving. An experiment on the lines suggested by the Labour party would be valuable; but to throw good grammar and public schools into the melting pot in a spirit of doctrinaire destruction would be madness.

Complications for President Tito

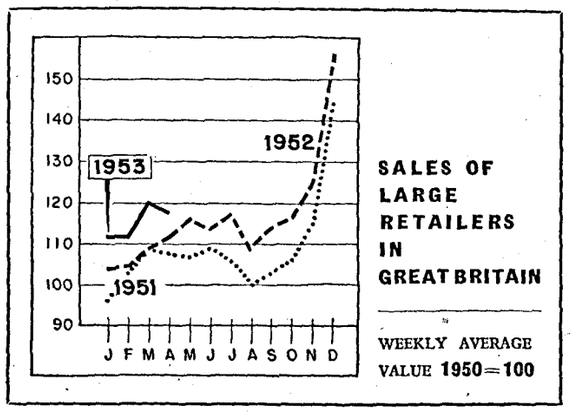
ALTHOUGH diplomatic relations between Jugoslavia and the Soviet Union have never been completely broken off, President Tito must have felt some sense of achievement in announcing that the Russians had taken the initiative in asking for an exchange of ambassadors for the first time since 1948. At the same time he made it quite clear that this gesture had not gone to his head. He pointed out that frontier incidents with the satellites were double what they had been under the Stalin regime: "While the Russians smile on us they direct their satellites against us." He might have added that at the latest meeting of the Danube Commission the Jugoslavs have had no success in their attempts to break the Soviet monopoly of the key posts on the Commission.

There is no reason to doubt that President Tito meant what he said. The quarrel with Stalin and, above all, the Communist economic blockade that followed drove Jugoslavia deep into economic and military connection with the West. To re-join the Soviet camp would be costly and difficult, as well as dangerous. But to devout and fanatical party members these things may not be so obvious. Many must be bewildered and unsettled by the sweeping administrative and economic changes now being carried out; and a good many are clearly resentful of the new and less dominant role allotted to the Communist party at the sixth party conference last year. *Borba* has spoken of the "persistence of a fractious spirit" among party members, and President Tito has complained that many have failed to orientate themselves to the new system. It is reported that the Central Committee of the Union of Communists has been meeting this week largely to discuss means of allaying the present confusion and discontent among party members. The extent of its task should not be exaggerated; but it will certainly not be reduced by Moscow's latest conciliatory gesture. Disgruntled Communists may leap to the conclusion that the Russians are ready to forgive and forget, and to ask why in Jugoslavia the clock cannot be put back to the *status quo ante* 1948. It has been assumed that President Tito's assertion that he would not be blinded by Russian smiles was designed for western consumption; but it may well have been aimed at some of his own followers as well.

Genius Takes a Back Seat

WHEN the death of Stalin brought personal dictatorship to an end his successors immediately took pains to emphasise that they were speaking and acting in a collective capacity. Since then they have always spoken in the name of the party and the state, the Central Committee or the government. The cult of Stalin has been played down in order to stress that the days of hero worship and personal rule are over. The new leaders, as if frightened that the Russian people, after over a quarter of a century of iconography and autocracy, may not believe the change to be real, drive the point home on every possible occasion. Thus, *Pravda* last week, in a lengthy article intended to guide party propagandists, devoted much space to an attack on pernicious ideas about the role of the individual in history. Marxists, it recalled, have always condemned "subjectivist emphasis" on the importance of personality. Nevertheless, remnants of such anti-Marxist views have persisted "until very recent days in propaganda work . . . in books, journals and newspapers." The history of the party, says *Pravda*, must not be written around personalities and biographies.

This will sound strange to masses of Soviet citizens who for years have been given Stalin's biography as the best



introduction to "Marxism." Yet it has been found possible to pay skilful lip service to Stalin by quoting something he said in 1930. Then, when struggling against the opposition and fearing the sympathy of the rank and file for the old Bolsheviks, he dubbed such "devotion to personalities" as "vain shibboleths of the intelligentsia." The propagandists are now told that perfect leadership does not depend on individual genius. The new rulers are presented merely as the first men of the Central Committee to which the party sends its most experienced members. Their strength is not their own, but merely represents "the party's wisdom . . . and its experience of collective leadership." This is a strong antidote to past panegyrics of "humanity's leader of genius."

Flight from Cambodia

FRENCH policy towards Indo-China has been reeling under the impact of renewed doubt and difficulty in France, the recent invasion of Laos, the protracted deadlock in Vietnam, and the King of Cambodia's complaints—made public during a visit to New York—about his lack of independence. King Norodom Sihanouk's entirely unexpected and sudden flight to Bangkok this week has been a specially rude shock, because negotiations between him and the French High Commissioner appeared to be going moderately well.

It is easy for the outsider to point to what the British did in India, but the political and human factors in the Indo-Chinese situation are terribly complex. In France a number of people maintain that the Indo-Chinese, dependent on French arms as they are, have already received the fullest independence possible. In Indo-China itself this attitude is flatly rejected by national feeling. Immense anger was caused recently, for example, when the French devalued the Indo-Chinese piastre virtually without consultation. Likewise one can reject on practical grounds the diehard attitude of those who would fight for Indo-China to the last ditch without accepting the view that France should now say to the Indo-Chinese people: We will go as soon as the war is over and, when we do, you may have complete independence. That is, in fact, what will happen—if the war is not lost meanwhile—but to say so emphatically in public at this stage is to risk undermining the morale of France's troops at the front. They are the forgotten heroes in this grim campaign, and on them rests what possibility there is of ultimate success. If Indo-China is to be given up anyhow, what, they might ask, are they fighting for?

For anti-Communist leaders like the King of Cambodia, however, the grant or promise of an independence comparable to that of India in the Commonwealth is essential if they are to hold their own against Communist pressure. Whatever the demands of the military situation this is the primary political fact. The young king's flight may prove a shrewd move not only in his tussle with the French but also in his fight against the Communists.

Egalitarian Anomalies

THE committee stage of the Finance Bill provided, last week, some clarification of the different qualities connoted by that blessed word "equity." There was, indeed, nothing fresh about Labour's indignation against the cut in the standard rate of income tax. It made somewhat more explicit the underlying assumption that a man's right to an income derives not from his having rendered that income's worth of services but from the state's assessment of his needs, deserts and reactions to incentive, which alone, therefore, should determine distribution. It is just as well that this argument should be brought into the open; but the committee stage can only underline, in this respect, the budget debate itself.

There was more profitable debate on the Opposition amendments relating to allowances for children and other dependants. It is, as Mr Douglas Jay pointed out, a curious thing that the notion of equity should have attached itself so exclusively to the distribution of incomes as such and so very imperfectly to the standards yielded by those incomes to the larger or smaller family groups which live on them. Mr Jay (declaring his interest as father of a larger-than-average family) demonstrated that, all the way through the income tax scale, fiscal concessions to the family man with three children leave him with only a quarter the net income per head enjoyed by a bachelor at the same gross income level. A philoprogenitive surtax payer may, indeed, easily be worse off than the single man with ten pounds a week. The complacency with which even enthusiasts for redistributive taxation generally regard this wide inequality between people getting the same gross income probably owes its origin partly to the lack of class significance, partly to an ingrained Malthusianism which has persisted in the teeth of all demographic evidence and expertise.

Other anomalies were debated on amendments aimed at raising earned income reliefs—a proposal supported from all parts of the House—at extending the widower's housekeeper allowance to cover non-resident housekeepers, at improving the position of single householders, at bringing paid apprentices within the scope of the child allowances, and at raising the resident daughter's allowance conceded to the old and infirm. Only this last was accepted; Mr Butler has held to the principle that the lightening of the general burden should, this year, take clear precedence over any nice adjustment to personal circumstances. It is arguable that for some time to come the same priority will hold; but the debate established the claim of at least some of these rectifications to a high place on the agenda of fiscal equity.

A Voice for Italy

SIGNOR DE GASPERI'S visit to England on Monday seems a curious mixture of the awkward and the opportune. It must be inconvenient for him to squeeze in a trip abroad at this juncture, with the future of his coalition still none too certain and with the strain of the election campaign only just behind him. But the visit does have positive political advantages, in that an invitation given some time ago to receive an honorary degree at Oxford brings the Italian Prime Minister to this country at a useful moment. It will enable him to discuss at first hand with Sir Winston Churchill the topics that will appear on the agenda of the Bermuda conference, and thus to make it clear as well as certain that Italy's voice has been heard.

Much harm has lately been done by ignoring the Italians. Resentment against the British and, to a lesser extent, the American attitude probably swung a few votes away from the government in the elections. Considering how narrow is the margin by which Signor De Gasperi's coalition scraped through, these votes could be ill afforded. Italians say, and with no little justification, that if France is to go on being treated at all big international conferences as if it were still a great power, their country at least deserves a seat. The fact that Sir Winston Churchill did not even mention Italy in his recent notable review of foreign affairs was the type of blunder that should not recur.

The established lines of Italian foreign policy, active support of the Atlantic alliance and of Western European union, have been seriously prejudiced by the electoral results. It remains to be seen whether, with one Italian in three voting Communist and with a firm government majority only possible by compromise either to the left or to the right, Signor De Gasperi can effectively maintain his previous policy. What is clear is that Italians feel their country's recovery from the war now entitles them to resume a more active role in the conduct of western affairs, and that to neglect this fact may prove dangerously unwise.

Caribbean Federation

THE details of the agreement reached by the West Indian delegates to the conference on Caribbean federation in April have now been published as a White Paper (Cmd 8837). As was indicated in advance, these diverge only slightly from the proposed federal constitution drafted by the Rance committee and published in 1950. The scheme has been adjusted to the refusal of British Guiana and British Honduras to join by a reduction in the total membership of the federal houses. For five years, moreover, members of the island legislatures can be elected to the federal legislature, unless they hold executive offices locally—a modification made to meet the (no doubt temporary) shortage of seasoned parliamentarians.

Most of the other changes show a tendency to weaken federal authority, though less than might have been expected. Thus the power of raising loans for federal and for "unit" purposes has been transferred to the concurrent list, that is, the list on which both the federal and unit governments can legislate; and instead of 25 per cent of customs revenue being allocated to federal use, a maximum of 15 per cent has been fixed, with a provision that the federal government's needs shall be re-examined by an independent commission, and that it shall get even less if the commission finds further economies consistent with its functions. Migration, on the other hand, has been put on the exclusive list, on which only the federal government can legislate. This may reflect the refusal of British Guiana to join the federation. As the potential main recipient of migrants, British Guiana would presumably have insisted on migration being a subject for unit governments if it had agreed to join.

The Governor-General's powers are not curtailed significantly, though three senators are to be chosen by the "Governor-General in-council"; these replace in the Council of State (the federal executive council) three of the six members nominated by the Governor-General. It is also to be specified in the constitution that the Council of State is to be regarded as the instrument of federal policy. If the Rance constitution, with these changes, in due course wins the acceptance of the individual island legislatures, the West Indies will at last find themselves with a workable central government which with good will, experience and a sense of responsibility on the part of federal politicians can develop into the instrument of independent statehood within the Commonwealth. This objective would, however, be reached more easily if British Guiana and British Honduras see the wisdom of joining the federation.

Dutch Talks with Mr Butler

THE sixth meeting in the current series of bilateral discussions with OEEC countries brings Mr J. W. Beyen, the Netherlands Foreign Minister, and Mr J. van de Kieft, the Finance Minister, to London for talks with Mr Butler and the Treasury. There can be little fresh news for Mr Butler to impart: progress towards convertibility has slackened; there is no evidence yet of new American economic policies, and the Commonwealth Plan has, temporarily at any rate, been put into cold storage. The meeting may, nevertheless, turn out to be quite lively. On the British side a possible bone of contention could be the Dutch system of export incentives—especially the dollar retention device—which the British and German governments have firmly condemned. The Dutch will want clarification of Britain's intentions about the future of EPU, which the Dutch, along with other European countries, regard as a valuable mechanism worth retaining. Mr Beyen will no doubt use the opportunity to press his own plan for a European tariff union. No startling developments are likely to emerge from the meeting.

The inclusion of the Foreign Minister in the Dutch team indicates that the discussions will range over a wide field. The Netherlands parliament has recently discussed ratification of the EDC treaty. Though there are misgivings in some quarters and an understandable perplexity at the French attitude, there is every chance that the treaty will be ratified before the summer recess. As it is still British policy to see the defence community formed, the Dutch will be encouraged in their resolute stand.

Books & Publications

Malthus *versus* Micawber

THE MALTHUSIAN POPULATION THEORY.
By G. F. McCleary.
Faber. 191 pages, 21s.
INTRODUCTION TO MALTHUS.
Edited by D. V. Glass.
Watts. 205 pages. 10s. 6d.

IS it, perhaps, a pity that Malthus ever wrote on population? The thesis may well appeal to others beside those who, ever since the publication of the "Essay," have furiously rejected the idea that there might be anything conditional about the injunction to increase and multiply. Hindsight reveals Malthus as wildly wrong about dates and quantities; and he drew such erroneous practical conclusions, and provided support for so repulsive a set of social attitudes, as to strengthen the hand of every Micawber who, in the very different circumstances of today, complacently relies on something "turning up."

What Malthus actually said is, of course, often very different from what he is quoted as saying. Dr McCleary's book is a fascinating analysis of these discrepancies. Malthus did not assert, in the teeth of the evidence, that population always increased in a particular geometrical ratio; he said that it would probably do so if unchecked, and added that checks had always been operative. He did not regard population increase, or a dense population as such, as an evil; he explicitly noted that an "unfavourable proportion" between population and food is "more frequently found in countries which are very thinly peopled, than in those which are populous." He did not maintain that technical progress must necessarily lead to mere multiplication at subsistence level; he held the very different view that it could produce permanently higher standards only if, having once experienced these, people exercised the prudential restraints needed to maintain them. If his final impression was gloomy, it was because his notion of restraint—excluding as it did, with tersely expressed abhorrence, the contraceptive practices so inappropriately associated with his name—was so obviously hard for normal human nature. Dr. McCleary's analysis should be an eye-opener for those who have hitherto judged Malthus at tenth-hand.

The "Introduction to Malthus" contains Malthus's own final *Précis* of his demographic views—the "Summary View of the Principle of Population," published in 1830—and his "Letter to Samuel Whitbread, Esq., MP," on the amendment of the poor laws; critical essays by Mr Alan Peacock, Dr D. V. Glass (who edits the whole) and Professor H. L. Beales; and a thirty-page bibliography. Less closely analytical than Dr McCleary's book, it gives an enlightening picture both of the historical and social background against which Malthus wrote and of the impact of his ideas at home and abroad. (What the lunatic fringe of German sociological thinkers made of the "Essay" is something remarkable.)

The commentators find Malthus less sympathetic, and his theory less satisfying, than does Dr McCleary; and indeed a close comparison of the two books is likely to lead the reader to agree with them. When a writer is as consistently misread and misunderstood as Malthus he has probably to blame not only the perversity and obtuseness of his opponents but also a certain disingenuousness and confusion in his own thought. One can hardly blame him for failing to foresee the revolutionary effect of steam transport on the world's supply of foodstuffs. The fact that something did turn up to justify the Micawbers of his day is no warrant that history will obligingly repeat itself for the benefit of successive Micawbers in every generation. Nor can one condemn him for not having evolved, far in advance of his time, the concept of an optimum population. The fact remains, however, that his "theory"—as distinct from the general rational approach which was his prime contribution to contemporary thought—was conceptually lopsided and inductively insecure; one of those half-truths which can bar the way to enlightenment more effectively than much plain error. The two books under review, despite differences of emphasis and assessment, are alike in the objective of rescuing Malthus's name from its ironical role as a weapon in the arsenal of obscurantism.

The Pen and the Bayonet

THE CHRONICLE OF PRIVATE HENRY METCALFE.
Edited by Lieut-General Sir Francis Tuker.
Cassell. 117 pages. 10s. 6d.

THE Sepoy Mutiny was the ugliest of all the ugly campaigns that the British Army fought in India. Its ferocity was matched by its brutality. Perhaps the best illustration of this is a drawing by an officer showing an officer and a sepoy below the Lucknow Residency wall, to the sound of a spade, each trying to shoot the Sepoy sapper who is wielding a pickaxe and has pierced the wall of the counter sap. It was not one of the jobs of Private Henry Metcalfe, weary after a long guard, to dig these tunnels. His was the commoner task of burying the swollen carcases of horses.

Private Metcalfe joined the 32nd Foot (then a normal regiment of the line but turned into a light infantry regiment for its services in the Mutiny and now known as the 1st Batallion of the Duke of Cornwall's Light Infantry) when he was thirteen years old. He served nine years later throughout the Siege of Lucknow; then after his retirement he set down his artless account of the siege and the mopping up campaigns in which he had served. History in his narrative, as in that of Private Wheeler, is fragmented. A siege becomes the bullet that killed Chatter-Box Tomlinson; a battle a bayonet scuffle in Johannes Bungalow. But through his undiscriminating eyes the shaded oblongs on the military historian's maps come alive. They become peopled with men like Metcalfe, turning out "sick, lame and lazy" to repel an assault, sharing a puny ration with a dog with the absurd name of Bustle, or finding fun in a pair of boots that were too tight. The private soldier does not change from army to army, or from age to age. Metcalfe, for instance, races with two others to capture a gun, scratches an unanswered claim for a Victoria Cross in the dust where the gun had stood, and then, with an eye for plunder, carries off two chickens, which he then gives away.

This casual sidelight on the Mutiny would have been left unnoticed in a regimental museum had it not been for the persistent enquiries of Sir Francis Tuker, who accidentally came across part of the chronicle. One wonders how many more forgotten manuscripts of this sort are waiting for someone with the interest and patience of Sir Francis to ferret them out.

Active Octogenarian

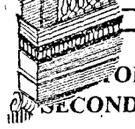
MY POLITICAL LIFE. *Volume I. England before the Storm,* 1896-1914.
By L. S. Amery.
Hutchinson. 492 pages. 25s.

MR AMERY, who is eighty this year, has led an active life, and though he plans to write his autobiography in three large volumes, to judge by the present volume the reader will not find it too long. After Harrow (where masters long afterwards spoke of him as the ablest boy they had ever taught) and Oxford, he began to prepare himself for the career of a diplomatist by going to the Balkans, learning all the languages, and making acquaintance, in palaces or pubs, with everyone that mattered. Hearing that, on the strength of this, the Foreign Office would very likely send him to South America he thought he might do better in journalism, joined the staff of *The Times,* went to South Africa as chief war correspondent and found himself charged with writing *The Times* History of the War. Designed by Moberley Bell as a journalistic best seller it developed into six volumes, lost money (for author as well as publisher) and made history. His devastating exposure of Buller and his like supplied ammunition for the army reform movement. Mr Amery considers that Arnold-Forster's scheme (in essentials Amery's), which foundered with Balfour's government, was better than that afterwards adopted by Haldane.

Although he has never been as conspicuous in the public eye as his sheer ability would warrant, Mr Amery had a knack of being in at the beginnings of things behind the scenes. Asked to join Milner's kindergarten he refused, but appears to have picked most of its members. He suggested to his friend Fred Oliver that he should write about Alexander Hamilton, and the result was the famous book which inspired Lionel Curtis to propose the federation of the British Empire and Clarence Streit to propose the federation of the free world.

The book is rich in pen portraits: Roberts, whom he admired and loved; Kitchener, so unlike the popular idea of him; Milner and Chamberlain, his political heroes, and all the other politicians; also men such as Mackinder who were greatly superior to many who passed them on the road to fame. After five attempts Mr Amery reached the House of Commons in 1911 where the Home Rule crisis gave [illegible] his natural pugnacity. [illegible] lower opinion of poor Asquith, and Mr Churchill gets some hard knocks in these pages.

But the parliamentary story of 1911-14 has been told a great many times before. The most interesting and valuable part of the book is that dealing with its author's multifarious activities behind the scenes in the first ten years of the century. There is much close argument and plenty of fun. We hear of the author enlivening a by-election by punching the head of an insulting opponent, and encouraging Mr and Mrs Sidney Webb to roll down the slope of Hampstead Heath. It is altogether a readable and valuable book.



Personal View

DIPLOMATIC TWILIGHT: 1930-1940.
By Sir Walford Selby.
John Murray. 210 pages. 16s.

THIS book is an attack on a system, and an attack is always refreshing to read. Sir Walford Selby goes so far as to assert that it was the faulty organisation of the Foreign Office to which he will "continue to attribute the greatest share of the responsibility for the disaster of 1939." Hitler's war, he says, was largely the fault of British indecision, and that indecision was due to two things. The Foreign Office had lost its proper power in Whitehall owing to the misguided interventions of Sir Warren Fisher, as head of the civil service. And under Lord Vansittart the Foreign Office itself was so mismanaged that reports from heads of missions abroad were filed away without ever receiving proper attention.

Sir Walford gives chapter and verse to support his contentions from his experience as Minister in the "key" post of Vienna; he was later "promoted," he feels, to the less important ambassadorship of Lisbon to get him out of the way. While also attacking certain other appointments—"I had had opportunity of ascertaining Sir Nevile's [Henderson] disastrous views about Germany when he had been our Minister in Belgrade"—the author bestows unexpected and welcome praise on Austen Chamberlain, Arthur Henderson and Ramsay MacDonald.

This is a book which will interest anyone seriously concerned with the conduct as well as the aims of foreign policy. Captain Norman Warren Fisher has already sprung to his father's defence in the press and Lord Vansittart was never one to suffer in silence. The pity is that, in dealing with such an important subject, the author has allowed so much personal feeling to filter into his pages, and he is not always so clear as he might be because he assumes too much on the part of the reader. But as one man's account of what happened before the war and why, Sir Walford's standing will ensure a place for his book in the archives from which history is written.

STORIES OF THE SECOND WORLD WAR

(Published in conjunction with Longmans, Green and Co., Ltd.)

The Control of Raw Materials
by J. Hurstfield
A study of raw materials policy during the Second World War. The author reviews the pre-war scene and shows how changes in principle and policy became necessary at the outbreak, and during the various phases, of hostilities.
Price 35*s.* 0*d.* By post 36*s.* 2*d.*

British War Production
by M. M. Postan
An account of the growth of the munition industry from the beginning of British rearmament in the mid-thirties to the end of the war.
Price 32*s.* 6*d.* By post 33*s.* 7*d.*

Contracts and Finance
by W. Ashworth
This volume is concerned with wartime financial and contractual policy in the procurement of supplies for the fighting services.
Price 22*s.* 6*d.* By post 23*s.* 2*d.*

H.M. STATIONERY OFFICE
P.O. Box No. 569, London S.E.1, and Sale Offices in London, Edinburgh, Manchester, Birmingham, Cardiff, Bristol and Belfast or through any bookseller.

"I Flew for the Führer"
by HEINZ KNOKE

The frank, revealing and absorbing story of a German fighter-pilot's war — as it has never been told before. Illustrated with the author's own photographs.
From all Booksellers.

Letters to the Editor

Malenkov's Hundred Days

SIR—The Prime Minister is right to hope for "a profound movement of Russian feeling" and you are right to ask for patience and caution in our policy towards the USSR. But the West in its own camp should not merely sit cautiously wondering just how ogre-like the new Kremlin committee is. Now that Stalin's death has made the world more malleable (that much we may at any rate suppose), we must make up our minds about a new map of Europe whereon the Iron Curtain hangs a good deal further east. The British at least cannot reconcile themselves to a Poland and Czechoslovakia ruled by the Kremlin. The problem is to invent a system whereby central Europe remains militarily allied to the Soviet Union but recovers its traditional relationship to the West. The trouble will be that the weaker the Kremlin's grip on the Russian population, the harder its empire's shell will tend to be. Thus a temporary decrease in internal brutality, deemed expedient in Russia, is most unlikely to lead of itself to freedom in Poland or Czechoslovakia. Our business is to negotiate that freedom. So long as we wonder, vaguely and globally, whether the Soviet government has accepted "coexistence in our time" we shall promote slavery in our time in Berlin, Warsaw and Prague.

The British public and Press even more than the experts must, therefore, examine the whole European question. We should, for instance, try to decide whether the two main Soviet objectives in Europe, recognition of the Oder-Neisse frontier and withdrawal of occupation forces from Germany, are not acceptable in return for genuine changes in the regimes of central Europe. The Kremlin will accept our terms, if accept it does, not because Malenkov and his colleagues are "men more humane and enlightened than Stalin could ever be" (a suggestion rich in unconscious humour) but because it believes that all Germany is within its grasp. Risk is inevitable. But the way to defeat Soviet expansion is not to abandon territory that the West has already lost but to try to regain it. Surely the West can best further "a profound movement of Russian feeling" by actually meeting the Soviet Union in a common sphere of interest. Central Europe is the natural place of meeting, where Russian interests might eventually be regarded as mainly military and western ones as mainly commercial. Need the Soviet Union for ever reject the idea of a Balkan Federation which Dimitrov launched soon after the war? We cannot plan the remote future; but we can help to shape events by thinking far harder about Europe's lost people now.—Yours faithfully,

CHARLES JANSON

Sutherland

Television Space for Sale?

SIR—May I raise a matter not touched on in your summary of prospects of television. Should not this form of entertainment be called on to pay its share of entertainments tax?

It is a well established principle that when a tax is imposed purely to raise revenue then similar and competing things should be equitably taxed. Thus both matches and automatic lighters are taxed and when one tax is increased the tax on the other goes up proportionately. Television, as an art and an entertainment, competes with the cinemas and it is of similar form. The cinema industry pays nearly £40 million a year in entertainment duty. It would hardly seem equitable to leave the cinema bearing alone this burden of taxation.

There are some four million cinema seats in Great Britain—and each seat pays nearly ten pounds a year in tax. Counting each television set as say four potential seats, there are already probably ten million television seats in competition with the cinema. Assuming that the Chancellor does not seek to increase his cut from these visual entertainments, there is a case for television viewers bearing at least half of the tax burden—to the extent of say £20 million or £30 million a year—to the relief of the long-suffering cinemagoer. — Yours faithfully,

London, S.W.1. RALPH COX

[Possibly. But viewers already pay purchase tax.—EDITOR.]

The Unsafe Home

SIR—In your note of June 13th dealing with accidents in the home, you state that "as with road accidents, the main remedies must be propaganda and education." The value of education, together with law enforcement, is not disputed. But engineering, in the form of improving existing roads and building new ones, can make an invaluable contribution to road safety.

Whilst, in the last analysis, almost every accident is caused by human error the surest way to avoid its tragic effect on the roads is to remove the hazards which allow such errors to be made. The great advantage of engineering is that its effects are permanent.—Yours faithfully,

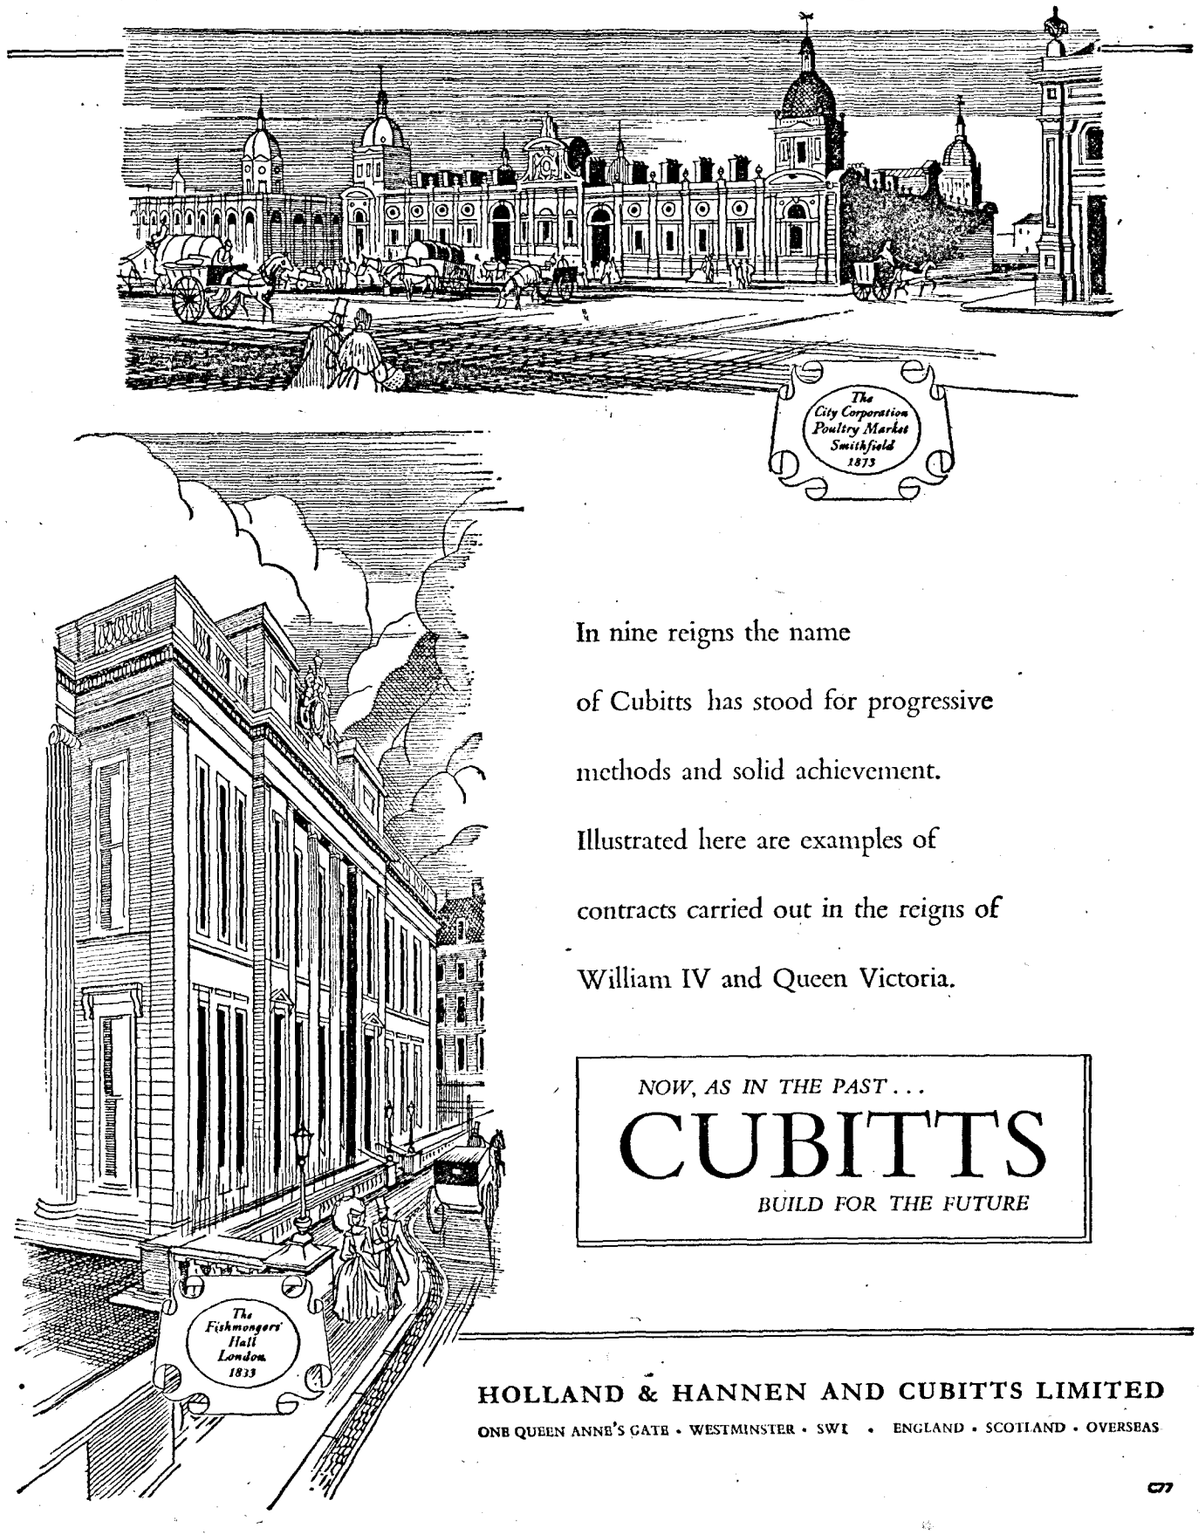
M. FRANCIS

London, W.C.1

Proscribing a Party

SIR—You state in your issue of June 13th that "The Mau Mau insurrection was possible only because of the culpable ignorance of settlers and officials alike about developments in Kikuyuland."

This charge of incompetence levelled at members of the Colonial Service shows a lack of appreciation of the problems which beset them. It would help to correct some of the illusions about conditions in Africa which are so common in this country if it were realised to what degree the colonial administrations are skeleton services. In East Africa an average District Commissioner may be responsible for all aspects of the administration of a district having a population of about 250,000 people of three or four races, spread over several thousand square miles of territory ill-served with communications. To assist him, he may have one or two District Officers, but, unlike the Higher Civil Service in this country, he is not buttressed by several grades of competent subordinates. He is fortunate if his three or four African junior staff can cope with the filing, typing and despatch of letters, and doubly fortunate if he has a trustworthy Asian cashier to whom he may delegate some accountancy routine. Unlike the Higher Civil Servants to captur[e] this country, his office door is covered [with] day to the public of all [sorts] dust where the works in an atmosphere [of] with an eye petty interruption. [Two] chickens, w[ife] European staff of other [officers] adds to his work, for their [assistants] be co-ordinated though [not] unnoticed i directly controlled by him. [has] not been



"Culpable ignorance" is [a] language to use of such people. If more thought and money were devoted to strengthening the administrative services so that full use could be made of their knowledge of political problems, and of the unique confidence with which they are regarded by Africans, such developments as Mau Mau could be forestalled. If financial resources dictate that such strengthening be made at the sacrifice of expenditure on the Welfare State type of service, let that be accepted. It is cheaper than bearing the cost of maintaining armed services to cope with a breakdown. And a strengthened administration would give scope to the educated African who, not being attracted by the prospects of a typing and filing clerk, devotes himself to subversive political activity.—Yours faithfully,

M. M. P.

London, N.12

[No charge of general incompetence was levelled at the DCs, who are certainly thin on the ground, but—outside the missions—knowledge of the Kikuyu language remains rare and direct contact with the people restricted. The scale of Mau Mau organisation, built up over years, came as a complete surprise to the authorities, though they had been warned to investigate matters by the undermanned police force. The starvation of administrative and welfare services may be laid in part at the door of organised settler opinion.—EDITOR.]

In Nine Reigns

In nine reigns the name

of Cubitts has stood for progressive

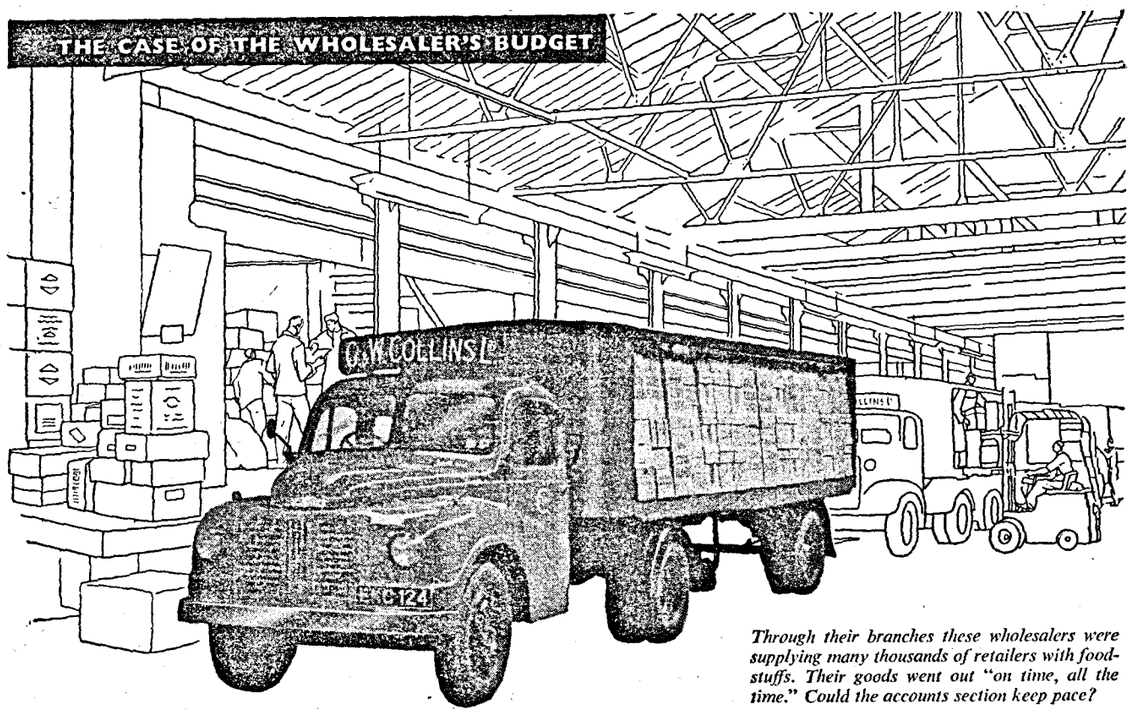
methods and solid achievement.

Illustrated here are examples of

contracts carried out in the reigns of

William IV and Queen Victoria.

NOW, AS IN THE PAST . . .



CUBITTS

BUILD FOR THE FUTURE

HOLLAND & HANNEN AND CUBITTS LIMITED

ONE QUEEN ANNE'S GATE • WESTMINSTER • SW1 • ENGLAND • SCOTLAND • OVERSEAS

C77

Through their branches these wholesalers were supplying many thousands of retailers with foodstuffs. Their goods went out "on time, all the time." Could the accounts section keep pace?

Canned figs or canned figures . . . which did the branches need first?

G. & W. COLLINS LIMITED, large wholesale food distributors, operate through branches in the North West. When they decided to concentrate buying and accounting operations in the Liverpool office they realized that more detailed and prompt information would be needed by their branches. Could they establish a more effective system of management-control now that the accounts were centralized?

With this problem Collins called for advice from machine accounting specialists of Burroughs Adding Machine Limited.

After investigation, Burroughs suggested the installation, in Collins' Liverpool office, of a Burroughs Typewriter Accounting machine for all Purchase and General Ledger work, with detailed posting of assets, revenues, liabilities and expenses.

Result: Apart from the great saving in time and labour in the office (one girl, in fact, does all recording) Collins now get a *monthly analysis* of all expenditure in time for branch managers to keep within their individual budgets. Collins installed their first Burroughs machine twenty years ago, since then every accounting department of the business has been mechanized. The installation of the general-purpose accounting machine is the culminating factor in the preparation of speedy monthly accounts.

What about you? If your business could benefit from faster figuring, call in Burroughs. They can offer advice on all the latest systems, for Burroughs make the world's broadest line of modern record-keeping machines: Adding, Calculating, Accounting, Billing and Statistical Machines, and Microfilm Equipment. Remember, once you have any Burroughs machine installed in your office, Burroughs Service *guarantees* its continuous efficiency in operation.

The "Burroughs Man" is a trusted visitor to thousands of business houses. Call him at any time. Head Office: Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1. Sales and Service offices in principal cities.

Photographed here is Miss P. L. Langford, at work on the Purchase Ledger for G. & W. Collins Limited. She is operating the Burroughs Typewriter Accounting Machine, which helped to solve the Case of The Wholesaler's Budget.

For expert advice on business figures

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Atom of Discord

Washington, D.C.

WITHIN the space of a few weeks four separate developments concerning atomic energy and atomic weapons have forced themselves upon public attention, suggesting that a fundamental recasting of American atomic policy may become necessary. Two were concerned with the warlike and two with the peaceful application of atomic energy. On the warlike side, the Kelly Committee, set up under the last Administration to study certain aspects of the problem of "defence of the North American continent against atomic attack," presented its report with a grave warning about the inadequacies of American air defences. Within the same week a military official of the Atomic Energy Commission calmly informed a House Appropriations subcommittee that the AEC needed $30 million to build new storage sites, as there would soon not be enough room to store the output of atomic bombs.

On the peaceful side, the thorny and complicated problem of whether private industry can now be allowed to participate in the production of nuclear power for industrial purposes is more intensively discussed before the Joint Congressional Committee on Atomic Energy with each passing week. Finally, Mr Gordon Dean, the outgoing chairman of the Atomic Energy Commission, announced at the beginning of June that fissionable material can now be "bred." In a "breeder reactor" it can be made to produce—to use an Irish sort of definition—more of itself than it consumes of itself, supplementing, instead of diminishing, the world's limited stocks of uranium.

All these developments are related. For some time past it has been clear that the Atomic Energy Commission has been fulfilling with growing ease its task of providing the United States with a stockpile of atomic weapons and bombs. Mr Dean has spoken of the coming year as one of increasingly rapid physical production and has admitted that the Savannah River plant, built to make hydrogen bombs, is already operating in part. The scale of this year's "spring meeting" at the proving grounds in Nevada shows that there is no shortage of bombs for experimental purposes. Although the Kelly Committee's report emphasised the increased importance of an American atomic striking force as a deterrent to the Soviet Union, it seems that the AEC no longer has any real problem in meeting the demands of the services for atomic weapons.

Consequently for the past few months the AEC has had less and less reason to resist the growing pressure both from Congress and from industry for a reconsideration of the Atomic Energy Act of 1946. They wish to permit some form of participation by private business in the building of atomic plants to produce electrical power. This pressure has been formidable and has come not only from the Joint Congressional Committee on Atomic Energy but from industrial sources outside Congress. Among other suggestions is that of the Monsanto Chemical Company, which has advocated government construction of an atomic power plant with private industry having a share in the design and operation; this would act as a guide to the construction of further commercial plants. The Dow Chemical Company and the Detroit Edison Company have offered a joint suggestion: that while further study and research on atomic power plants should continue to be partly financed by the government, the two companies should put up an operating plant out of their own resources. And two groups in Nevada and New England, where ordinary electric power is expensive, have suggested that the AEC build them reactors.

The powerful voice of Mr David Lilienthal, who in his TVA days used frequently to be accused in Congress of being a socialist, has demanded a complete rethinking of American policy to enable the production of atomic energy to become a commercial venture. His argument is that although some big private firms such as the General Electric Company and the Westinghouse Corporation are associated with the AEC in the construction and running of reactor units, the present system of cost-plus financing removes all incentive to lower costs. What is needed, in his opinion, is the healthy spur of competition and cost accounting to enable atomic energy to enter into its rightful inheritance as a major source of civilian fuel and power. The Administration may also reasonably hope that private work on atomic reactors will contribute to the projects for an atom-powered aircraft and aircraft carrier, which have been postponed for reasons of economy.

★

The Atomic Energy Commission has submitted to the committee the revisions in the 1946 Act which it considers would enable private industry to make a start in planning for atomic power plants, and it is probable that these will be argued about for the next few weeks. They include the enactment of legislation to enable groups other than the AEC to own, rent, buy and sell fissionable material, a liberalisation of patent rights, a freer flow of information and new safety codes. It is appreciated that these are only interim amendments, but a more fundamental revision of the government's monopoly of all fissionable material, which was granted to it by the 1946 Act, must wait until next year. So must any formal recognition of the present unofficial

arrangements whereby a certain amount of information on atomic subjects can now be exchanged with Britain and the other North Atlantic Treaty partners.

The willingness of the AEC to foster the commercial use of atomic energy for electrical power does meet with several forms of resistance. One is from the trade unions concerned with production of conventional fuels, such as the mineworkers and the United Gas, Coke and Chemical Workers. Another is from those who consider it wrong that private industry should fall heir to a development in which the people of the United States have invested $8 billion since the war. Even by those who deny the force of this argument, it is admitted that the question of patent rights, by which a private firm can protect a new discovery or process without at the same time patenting for itself a whole chain of processes of which it is merely the beneficiary, is one of the thorniest the lawyers have ever had to face. Another doubt is whether competitive industry could or would take the elaborate safety precautions which the AEC has enforced for its own workers.

But there is also an economic objection which explains why private industry as a whole has not rushed forward to embrace the possibility of atomic power for electricity except under a heavy government guarantee or subsidy. The United States has more alternative resources of fuel than almost any other country, and, in particular, many ways of producing electricity. It is believed that in the next five or ten years the cheapest atom-produced electricity will match only the most expensive electricity produced by conventional means; therefore any firm contemplating building a reactor plant for this purpose must expect to offset its losses on sales of electricity by selling plutonium—the by-product of the reactor process—to the AEC for warlike purposes. But if the AEC has now discovered the means of "breeding" plutonium while at the same time it is beginning to taper off production for the military stockpile of bombs, will it remain a constant and faithful customer?

It is this line of reasoning which has prompted some whose business it is to look many years ahead to suggest that it is not in the United States, but in the underdeveloped or desert countries where there is no water or other means of producing electricity available, that the great fields for American enterprise in the use of atomic fuel may lie.

American Notes

Reprieve for the Rosenbergs?

THE day before that set for their execution for betraying atomic secrets, when every hope of clemency or further stay seemed exhausted, Julius and Ethel Rosenberg won a respite, though it may prove an illusory one, from Justice Douglas of the Supreme Court. The resources of American legal procedure traditionally permit delays that would be impossible in this country; it is now three years since the Rosenbergs were indicted. This eleventh hour reprieve was made possible because, when the court is not sitting, a single Justice is empowered to grant a stay of execution if he finds that there are new considerations in a case. What moved Justice Douglas to act was the contention, submitted by lawyers new to the arguments, that the provisions of the Atomic Energy Act of 1946, rather than those of the Espionage Act of 1917, should have been applied. The later Act permits the death sentence only on the recommendation of the jury, and only in cases where the intent was to injure the United States. Mr Douglas concluded that the validity of this new argument should be tested because, although the crime the Rosenbergs are alleged to have committed took place in 1944 and 1945, they were not indicted until 1951.

Justice Douglas's position is that

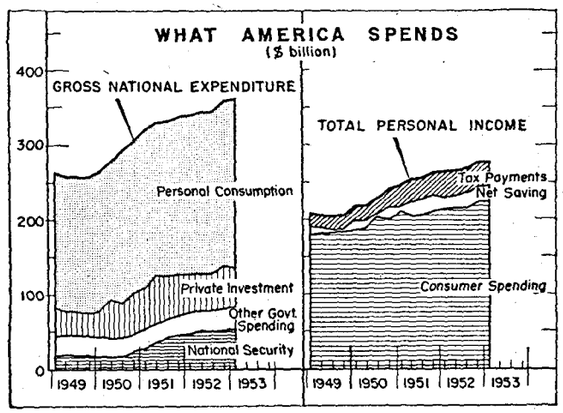
> it is important that the country be protected. . . It is also important that before we allow human lives to be snuffed out, we be sure, emphatically sure, that we act within the law. If we are not sure, there will be lingering doubts to plague the conscience after the event.

Justice Douglas took a highly contentious, as well as courageous, step in granting a respite which the Supreme Court as a whole had refused four times, the latest two days before, and there is no certainty that he will not be over-ruled at once by the court, which was recalled at the request of the Attorney-General. Wild demands for the impeachment of Mr Douglas are already being heard in Congress. What seems certain after Mr Douglas's intervention is that, if the execution is not postponed, there will be the "lingering doubts" of which he spoke.

Presidential Leadership

IN his first long trip outside Washington since his inauguration the President has discovered that there has been no falling off in the affection in which he is held, and, perhaps, a new resolve to mobilise some of this good will. It is still his view that there should be no "destructive cross-fire" between the Executive and Congress. Yet he chose to preach collective security in the Middle West, the region where the Taftite thesis that America is strong enough to do without allies and without the United Nations is most deeply rooted. And on his return through New Hampshire, he delivered at Dartmouth College a wholehearted denunciation of book-burning and appealed to the students to try to discover for themselves why Communism held such attractions for so many peoples. This had every appearance of a long overdue challenge to Senator McCarthy, although apparently this was not intended; but caught in the crossfire was Mr Dulles, the President's own Secretary of State. Mr Dulles has allowed the State Department to appease the Senator by ordering the removal from its foreign information libraries of books not only by Communists and fellow-travellers, but even those by reputable authors, whose sin consists of criticising the Chinese Nationalists.

Such attempts by the President to lead and shape public opinion by going over the heads of Congress, as Mr Roosevelt used to do, are certain to become increasingly necessary. Impressed by the demand for peace in Korea, the Republicans in Congress have swallowed the prospect of a truce which many of them privately dislike. But this has been only a foretaste of the disagreeable draughts which may be served up at the peace conference; and with the illness of Senator Taft the unruly Republican flock in the Senate may easily get out of hand.



Senator Taft was capable, as he showed only a short time ago, of completely misunderstanding both the realities and the President's foreign policy. But much more often he has been the President's right hand. As far as he is able, he will continue to attend the weekly conferences at the White House between the President and Congressional leaders, and the meetings of the Republican Policy Committee. But the day-to-day floor leadership will be exercised by Senator Knowland. Once as strong a supporter of President Rhee as of General Chiang Kai-shek, responsibility is already altering Mr Knowland. But even the greatest loyalty to President Eisenhower cannot make him overnight the equal, in prestige and experience, of Senator Taft. The signs that the President is beginning to find his own political feet have come none too soon.

Peaceful Economy

THE Korean truce is coming just at the time when, according to last January's forecasts, the American economy was in any case expected to be moving towards a decline. Yet businessmen in general are refusing to succumb to the jitters of the security and commodity markets and are facing the prospect of peace with optimistic equanimity. Partly this is because they have discounted in advance the effects of the much-discussed armistice; partly it is because they have been warned about the wolf of recession so often that they no longer believe that it is a genuine threat; but mainly it seems that many of them have convinced themselves that recession nowadays would be no more than a sheep in wolf's clothing. Certainly the economy has appeared most amenable during the past six months, following a peaceful course with almost all the indices holding steady at very high levels, and with only the rise in consumer credit and the fall in farm incomes to cause concern. And, as government spokesmen have been emphasising, there is little reason to suppose that a truce, or even a real peace, in Korea would of itself bring any marked change in this situation, unless it set off a psychological reaction of which there is so far no indication.

Any government spending, on ammunition and uniforms, for example, that can be saved if hostilities end in Korea will probably be offset by increased expenditure on relief and reconstruction there. And in spite of the Eisenhower Administration's attempts to economise on armaments, the immediate outlook is for an increase, rather than a decline, in spending on national security, since deliveries of military supplies are to be speeded up. Spending on another important component of the present prosperity—private investment—is also expected to rise for the remainder of the year. Nothing could better demonstrate the growing optimism of businessmen than the recent report of the Department of Commerce that outlays for new plant and equipment are to be higher than last year, instead of lower, as was earlier forecast, during the coming months.

Less reassuring is the contraseasonal fall in new housing starts in May, and also the contention of credit agencies and used car dealers that the automobile industry is overproducing. Makers of some other consumers' durable goods, notably television sets, have been curtailing production for several months and the size of inventories is beginning to cause some concern. There are also those who believe that capacity output in the steel industry will cease now that the price of steel has gone up. Whether all these factors combined would be enough to bring about any serious drop in employment is doubtful, but some decline in overtime earnings is probable before long. The resultant fall in earned incomes might, perhaps, affect

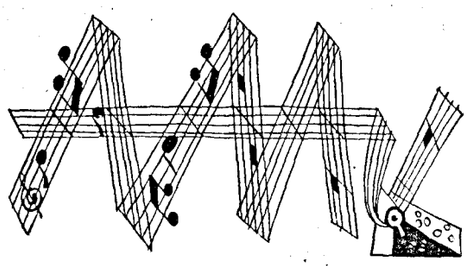
MUSIC AND THE COMMON MAN



Schweppshire shows the Way

4. SPONTANEOUS COLLECTIVE SELF-EXPRESSION

Once more, Schweppshire anticipates the era of progress—the century of the common, or fairly common, man. The making of music is not left to the individual freak, the isolated and probably introverted and ego-bound "composer", standing or wishing to stand apart from his fellow men. Musical creation is a spontaneous act evolved from the group-will, by the group-will, for the group-will.

In this simplified illustration of the poly-omni-panhorn, musical group-creation is seen at work. Mass extemporising is co-ordinated, not by the domineering baton of the conductor (tawdry effigy of the old slave habit or leader-and-led mentality) but by the "unanimity of the common spout"

The effect of omnipolyphonic music is difficult to describe to those whose ear, brought up to the "tum-ti-tum" of Hindemith or Berg, is not trained to receive four-dimensional sound: nor is its scripting easy. The scribe or *Ubereinstimmung schreibgerätsmann* (right-hand corner) must be specially trained. For his three-dimensional notation (see insct) he uses a three-dimensional typewriter.

Designed by Lewitt-Him, written by Stephen Potter

SCHWEPPERVESCENCE LASTS THE WHOLE DRINK THROUGH

savings rather than the demand for goods and services. Moreover, unearned incomes are likely to go up soon, for the Korean truce has strengthened the already powerful resistance in Congress to the President's request for a continuation of the excess profits tax.

Chief Joseph Transformed

THE controversy caused by the initial rejection of British bids for the electrical equipment for the Chief Joseph Dam on the Columbia River has now not only been settled by what appears a satisfactory compromise, but has also served to clarify the entire question of the Buy American Act. This Act was intended as an emergency measure against depression and dates from President Hoover's final days in office in March, 1933. It is a vague law and was generally interpreted as meaning that government contracts should be awarded to American bidders unless foreign offers were 25 per cent lower. Last June, however, President Truman's Administration ruled that foreign and domestic bids for defence contracts exceeding $25,000 in value should be considered on an equal competitive cost basis.

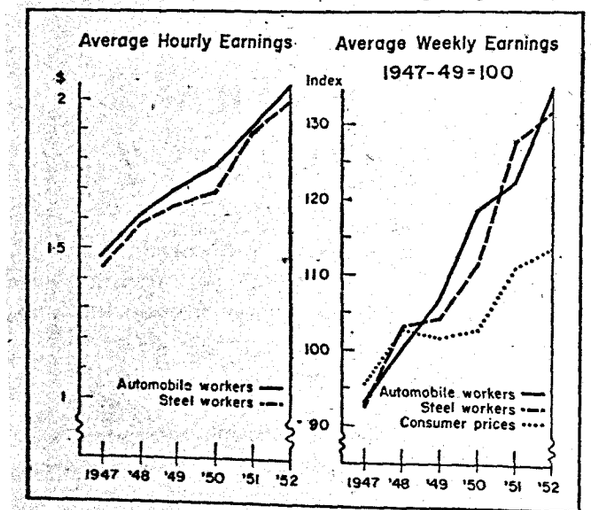
It was in fact to make such consideration possible, as is explained in a Business Note on page 835, that the original tenders for the Chief Joseph equipment were rejected last April and new bids were invited. Much misapprehension might have been avoided had these technical details been clearly explained at the time, for the American press was as convinced as was the British, and not without reason, that the rejection of the original bids was an attempt by the Republican Administration to give new life to an Act which seems an inexcusable anachronism at a time when it is vital to narrow the free world's dollar gap.

Since this initial rejection, however, a number of developments have suggested that President Eisenhower and his Cabinet have realised that the Buy American Act presents a serious obstacle to the economic salvation of Europe through the "trade not aid" formula in which the President has frequently expressed his belief. While the Chief Joseph Dam project was under discussion several other important contracts were won by foreign bidders. The Swiss Oerliken Company has been awarded a contract of nearly $2 million for generators for the Palisades power plant in Idaho. Another Swiss company has landed a $3.5 million contract for heavy duty electrical equipment for an atomic plant being built in Ohio. The British Ferranti firm has won the bidding for the installation of six transformers at the McNary Dam in Oregon. And now the English Electric Company is to be responsible for the transformers at the Chief Joseph project, although the more costly generators are to be provided by the Westinghouse Corporation, which underbid the British firm on the second attempt.

This American firm has been encouraging demonstrations among its workers against the award of contracts for electrical equipment to foreign firms which, it is alleged, are able to compete only because they pay such low wages. It is protests of this kind that so often induce Congress to try to frustrate the Administration's attempts to foster foreign trade.

Defending the Defence Budget

MR WILSON, the Secretary of Defence, making a second appearance before the Senate committee considering the Administration's $5 billion cut in the funds requested for the Air Force, has had a chance to redeem his own mistakes and to bring Congress back to earth after its exhilarating climb into the stratosphere with General Vandenberg, the Air Chief of Staff. General Vandenberg, who is expected to retire soon and will not have to work under Mr Wilson much longer, was outspoken: to abandon the goal of 143 wings would leave America with a "one-shot, second-best" Air Force and deprive its allies in Europe of American air support. Already, he asserted, the penny-pinching of the new Administration had reduced the efficiency of the Air Force.



Mr Wilson, in his rebuttal, was as cocksure as ever, and guilty of stretching the meaning of words in, for instance, his statement that, despite the cut, there would be 143 air wings in existence by June, 1955; this figure can be reached only by including the Air National Guard, the "weekend warriors" who were excluded from earlier calculations. But Mr Wilson was on firmer ground in pointing out that the Air Force had built bases and recruited personnel much faster than it had been able to secure new aircraft; that the production schedules had not been met since the Korean war began, and that under the new plan there is to be no reduction in deliveries of combat aircraft during

the next twelve months. Effort is to be concentrated on keeping manufacturers up to the schedules. This is what President Eisenhower meant when he said there would be "fewer planes on order, more in the air." The cuts will fall on training, bases, manpower, and future orders, particularly of new types where technical difficulties still make mass production impossible.

It is idle, as Mr Hanson Baldwin, the military critic of the *New York Times*, says, to pretend that this is not a cut and Mr Wilson's scorn for any research which does not promise immediate practical results is disturbing. But both Mr Wilson and Mr Talbott, the Secretary for Air, have promised that their interim goals may be revised after the new Joint Chiefs of Staff complete their appraisal of military needs in November. Doubts in Congress, particularly among the Democrats, are unlikely to be fully satisfied. But President Eisenhower's conviction that the budget is adequate for national security is likely to carry the day; few Congressmen would set themselves up as greater military experts.

Labour Agreements

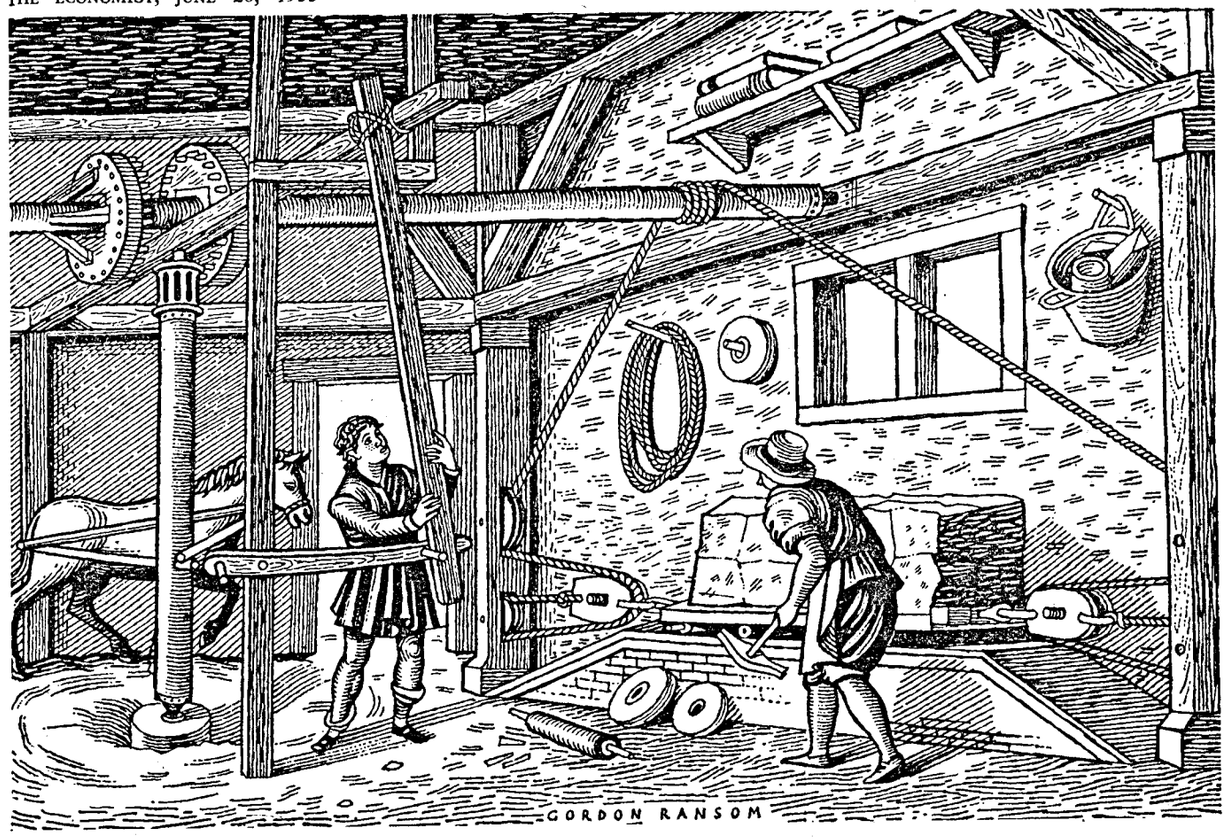
PROBABLY never before has a labour contract in the steel industry been agreed so quietly or so quickly as it was this year. This friendly negotiation, conducted with no need for interference from the government, in marked contrast to last year's long strike and bitter legal arguments, is

Source: US DEPT. OF LABOUR

a bright feather in the cap of Mr MacDonald, the new head of the steel workers' union. From the point of view of his prestige within the Congress of Industrial Organisations, it is of even more consequence that the wage increase he won for his members, a straight 8½ cents an hour, was more than any other union had gained this year and far more than Mr Reuther, the new president of the CIO, achieved for his automobile workers three weeks ago.

What the new automobile contract actually amounts to in wages increases has never been revealed officially, if indeed it has been calculated, but it certainly does not come to more than 5 cents an hour. Its importance lies much more in the decreases it avoided: under the formula by which automobile wages are tied to the cost of living, the workers could have lost up to 24 cents an hour had the consumers' price index fallen far enough; now they can lose only 5 cents. And by agreeing to base the calculation on the new instead of the old index, Mr Reuther avoided a fall of 2 cents an hour which would otherwise have come this month. He also won pension gains for his members, something which Mr MacDonald could not discuss this year, since the steel contract was open only for wage negotiations. But already a study is being conducted jointly with the industry on pensions in preparation for next year's new steel contract.

An important feature of the steel agreement was that it provided for the gradual elimination of the wage differential of 5 cents an hour between steel plants in the North and South, something which the union has always wanted to get rid of. The lower wages in the South in many industries have encouraged a steady flow of firms away from the North and in recent years one of the chief sources of conflict between the CIO and the American Federation of Labour has been the question of which group should bring the benefits of trade unionism to these new southern factories.



These rivalries between members of the two groups are found both between national unions covering the same industry and local branches attempting to organise the same factory. An essential preliminary to any hope of a successful union between the two branches of the labour movement is the removal of this constant source of friction. A draft of such a "no raiding" pact has now been tentatively agreed by the CIO and AFL and has also been given practical meaning by a more specific agreement between the CIO's automobile workers and the AFL's machinists. These two large trade unions, which compete chiefly in the aircraft industry, will now not only refrain from trying to steal each other's members but will also co-operate in bargaining with employers in industries or plants where both have members.

SHORTER NOTES

A special committee, headed by Senator Margaret Chase Smith, has been investigating General Van Fleet's charges that his operations in Korea were seriously hampered by shortages of ammunition. It has now reported that deficiencies in five types of ammunition resulted in "a needless loss of American lives." The miscalculation and bad planning that caused this tragedy are blamed on President Truman and his leading defence officials by the committee, whose members were too responsible and too respected to have been influenced by purely political considerations in forming their judgment. The only dissenting member, Senator Kefauver, a Democrat, drew attention, however, to the conflicting testimony on which the report was based.

★

In 1951 over 700,000 hours were flown by small aircraft which were helping farmers with a variety of tasks, ranging from blasting leaves off cotton plants to picking fruit. The Civil Aeronautics Administration also reports that 13,000 flying hours were spent in aerial advertising and 227,000 hours in specialised operations such as rain-making.

WOULD YOU EXPECT EXTRA OUTPUT FROM THIS FACTORY?

We do not expect high production or low costs from a ramshackle factory equipped with antiquated machinery turned by animal power or by hand, lacking electricity and piped water, and with no housing available for half its workers.

Yet that is precisely the condition of fully half our farms. Two-thirds of our farms are without electricity. About half our regular farm-workers are without cottages, fewer than half our farm-houses and cottages are supplied with piped water. The standard of farm roads and access to fields is much lower than it should be.

It is not surprising that food production is lower than we want, that costs are high, that many farmers and farm-workers find life a hard struggle for bare existence and that there is a dangerous drift from the land. Yet what is done to help? Farmers farming good land are crippled by super-tax. Those needing capital for expansion are subjected to loans at interest as high as 5½%! Is this really the sensible way to get that vital extra food?

The taxation system must be altered. Long-term loans at low interest must be offered. The land is our finest investment. Let us not forget it!

GROW MORE FOOD IN BRITAIN

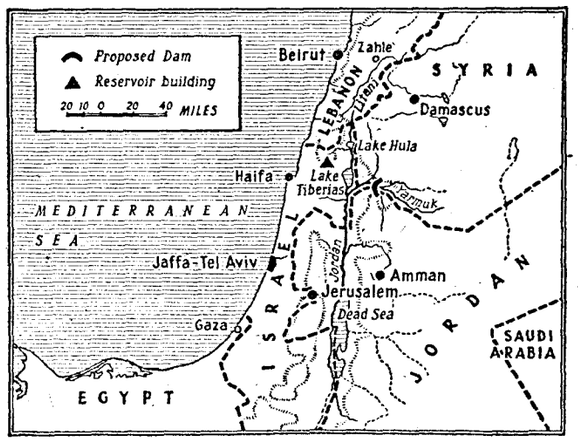
The World Overseas

Dilemma Over the Jordan



BY OUR SPECIAL CORRESPONDENT IN THE MIDDLE EAST

"EVERYWHERE throughout the area the cry is for water, water for irrigation," said Mr Dulles immediately on his return from the Middle East; likewise he said "Mr Stassen and I came back with the impression that the funds available can well be spent on a co-ordinated use of the rivers which run through the Arab countries and Israel." Almost immediately he had spoken, Tel Aviv chimed in with a reiteration of willingness to discuss a joint river plan for the Jordan and Yarmuk rivers with the Jordanian, Syrian and Lebanese governments. Most experts agree that to use both these rivers in order to turn Lake Tiberias into a storage reservoir of use to three states, Israel, Jordan and Syria, would (in terms of money) be much the cheapest way in which to use two rivers of almost equal size. (The annual flow at their junction is 52 per cent Jordan and 48 per cent Yarmuk water.) But the political experiences of the last few years, and the uncertainty which dogs all Israel-Arab relations, have convinced some of the scheme's champions that its running costs might be prohibitive in terms of tempers and politics. Separate plans for national Israeli and national Arab schemes have therefore been evolved and are both at the final blue print stage. Now both these schemes hang in the balance while Americans ponder, and Israelis make willing noises, and only the Arab states look churlish.

The main political snag to co-ordinated use is that the Jordan-Yarmuk waters are of concern to four countries, but of major importance only to two—the Kingdoms of the Jordan and Israel. A relief map at once shows that the Syrian escarpment lies for the most part high above the river basins and that Syria's great development areas are farther north, round the Orontes and Euphrates rivers. The two scantier users, backed of course by the rest of the Arab League could, as Arab states have often done before now, baulk a plan for Jordan's salvation without much loss to themselves, acting simply in order to obstruct Israel's advancement. The first point that has to be weighed, therefore, in considering the merits of the unitary versus the separate national schemes is not technical but psychological. Is harmony worth waiting for while lands lie arid, refugees linger unsettled, and blue prints fade?

The trouble about deciding in favour of the two national schemes that could be executed tomorrow is that the step is irrevocable; that a joint plan virtually becomes a dead letter, once they are in operation, is evident from a description of each of them. But before giving it, a word must be said about salinity. Lake Tiberias is fed by springs and rivers of which some are fresh and some saline. The Jordan, for instance, when it enters Tiberias contains 20 milligrams of salt per litre and, when it leaves it, 280. (Not till it contains 700 milligrams of salt is water unusable for irrigation.) The Yarmuk inflow of fresh water greatly improves the proportion, but saltness increases as the joint stream flows southward to the wholly salt Dead Sea.

The Israel plan is described first because it is the older in date. Originally many Jewish authorities were in favour of the obvious economy of storing both rivers for all users. But as political relations worsened they modified their plans so as to keep them within Israel's boundaries. They therefore conceived Israel's present long-term countrywide

water plan which, though it proceeds by stages, is designed as a well knit whole. Its two early stages—a three to six year venture of which much is under way—chiefly concern the waters of the coastal plain and affect this article only where they include the draining of the Hula marshes and Lake Hula at the head of the Jordan. This local scheme is providing, inside Israel, much fertile land for settlement, and has increased the flow of the river southwards by reducing evaporation.

The third stage of the all-Israel water plan—to be executed over ten to fifteen years—is the one that worries the Arabs. It is to pump 400 million cubic metres per annum of the headwaters of the Jordan by pipe to a reservoir already started in the Galilean Hills, and thence out of the Jordan basin and down the coastal plain to the Negev. What this scheme, if completed, will do to the level of Lake Tiberias is apparent from the fact that the Jordan flow into it is 597 million cubic metres per annum (though out of it, owing to evaporation, only 511 million). It will leave a shrunken and salty sea. The total capital cost of the all-Israel plan is roughly $1,000 million in order to irrigate 400 million dunums (one million acres).

Because of the problematic future of a joint scheme, the Jordanian's latest plan is likewise an independent operation. Conceived by an American adviser, it is to dam the Yarmuk just below a point where three wadis meet on the Jordan-Syria frontier, and just as it enters the frontier canyon through which it flows almost until its junction with the Jordan. The advantage of the dam to Syria would be a raising of the water table beneath the plateau and the provision of some local power from a station immediately below the dam. The much greater advantage to Jordan would be the conduction of some of the water downstream through a concrete canal built at a high level along the Jordanian hillsides to a second and much larger power station at the far end of the canyon. The plan is, thereafter to use the rest of the canal water for irrigating 210,000 dunums (52,000 acres) of the wide eastern side of the valley floor by gravity flow. The second and larger power house would serve to pump water up on to the west bank. The additional water which flows into the Yarmuk bed below the dam site would be sufficient to service a Syrian spa and the six Jewish colonies on its north bank just above the confluence. The rough first estimate of the cost of the scheme is £13.5 million sterling, without power. The two national schemes are completely independent.

Two Schemes or One?

Each party criticises the other's scheme. The Jews say that whereas Lake Tiberias would serve to hold the Yarmuk's entire annual flow, the "costly artificial Yarmuk reservoir" would only hold part of it. They add that if diversion of the Yarmuk into Lake Tiberias were to give less fresh water than is necessary to render it fresh after their prior removal of 400 million cubic metres of the head waters of Jordan, a balance could be made up from the Hula area. The Jordanians view as laughable any proposition to divert the whole of the Yarmuk into Tiberias unless the whole of the Jordan is going in too. Why should they, they ask, divert their best asset into a lake of which they are not even a border state and where they would be infinitely vulnerable if the Israelis, having built a pipe big enough to carry four-fifths of the Jordan's headwaters over to the coastal plain, were in a position to alter the balance in the lake at the mere turn of a cock. If part of Jordan water is removable, they say, then no Yarmuk water can be contributed.

Whether there is to be one multinational scheme, or two national ones, the Americans will in one form or another do most of the paying. They have therefore a right to call the tune. Their dilemma is the old one between an imperfect decision today (leading to quite a measure of Arab refugee settlement) and a much better one that might be reached in a none too promising future. In making up their minds, they need to weigh the following additional facts. The first is that Syria, which has repeatedly kept them waiting for decisions, is so violently anti-Israel that it has never yet touched their money. (It is unneighbourly even to Arabs; its dilatoriness in putting the seal on the Yarmuk dam agreement is one reason why that project is not already under way.) The second is that quite a good and cheap pilot scheme for an open channel south from the Yarmuk to irrigate the east bank was all ready three years ago, but was dropped because bigger things were on the way. The failure of these last to materialise makes the advantage of doing something at once look very great. The third and far the most weighty consideration is that no economic proposition involving both Jew and Arab has ever worked unless forced upon them. Is Mr Dulles prepared to force an international Jordan Valley Authority on sovereign states, some of which will be unwilling to participate? Is he prepared to apply some screw to forestall their refusal? If so, the unitary scheme is the best. If not, best go ahead with the two others. The bad policy is to haver.

New Deal for the Ukrainians

UNDER the inconspicuous title—"A Plenary Meeting of the Central Committee of the Ukrainian Communist Party"—the Soviet press has reported one of the most important political events in the Soviet Union since Stalin's departure. At that meeting, it is reported, the Committee decided to relieve its first secretary, G. L. Melnikov, of his duties and remove him from the Party's Bureau chiefly because of the errors in his national policy. Mr Melnikov is not merely a local figure. He has been up to now—and has not yet been officially expelled—a candidate to the highest organ of the Party, the All-Union Praesidium (formerly the Politbureau). Even more significant than the downfall of a man so highly placed is the cause of his disgrace. Hitherto, regional leaders have been attacked or dismissed only for local "nationalism" and anti-Russian bias. Nationalism in the outlying republics has been a deviation, while in Russia proper it has been praiseworthy patriotism. Indeed, in recent times russification has been openly encouraged. But Mr Melnikov is now downgraded for having, among other things, imposed the Russian language in the schools of the Western Ukraine. Implicitly therefore he is accused of russification. Thus his case appears to mark a complete reversal of the former Soviet policy towards the nationalities.

Such a change has been foreshadowed by other moves in the post-Stalin era. The doctors, when released, were exonerated from accusations of Jewish nationalism. In the Georgian affair, which followed, Party members previously branded as nationalists were also rehabilitated. Yet, the real test of Russia's policy towards its minorities lies in the Ukraine. With some 40 million inhabitants this is by far the biggest non-Russian group. In the economic and social life of the country it is also most important. It produces about one third of the Soviet Union's coal and steel; and it has a substantially larger *intelligentsia*, a stronger national culture and tradition than any other minority group. Moreover, throughout the history of the Soviet Union it has provided the Kremlin with its most difficult national problem.

At first the revolution seemed to many Ukrainians to herald an era of freedom. The Bolsheviks had always been the most outspoken critics of Tsarist oppression. True, they soon limited their promise of self-determination by the major clause "in the interests of the working class." In the cultural field, however, they were willing to grant a large degree of autonomy. The Ukrainian language was used by

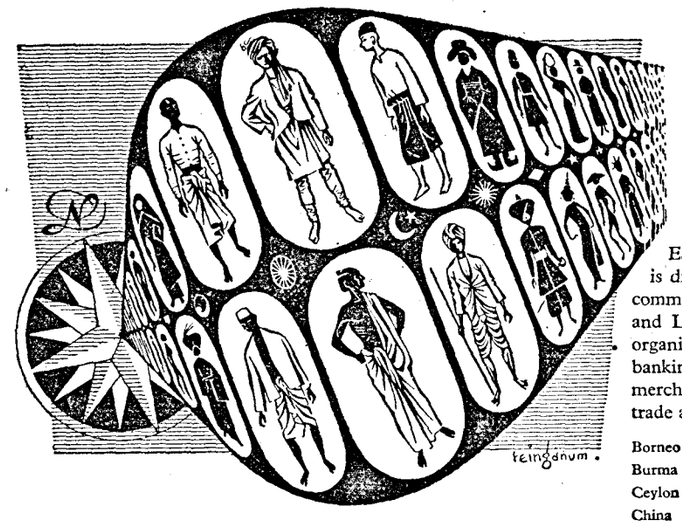
the provincial administration. In all the universities—in Kiev, Kharkov or Odessa—Ukrainian was the main language even though there were many Russian students. Ukrainian nationalists could only complain that they had no right of secession. This liberal policy was inaugurated when the commissar for nationalities was Stalin, the man who a few years later was to provoke the bloodiest social upheaval in the history of the Soviet Ukraine.

With Donbass coal and Krivoy Rog ore the Ukraine was the key to Russia's industrialisation. It was also its granary and there the fiercest battles of collectivisation were fought. This ruthless struggle devastated the country like a major war. The conviction that such bitter memories are not quickly forgotten must have formed the basis of Stalin's subsequent mistrust of Ukrainian nationalism which in the years before the last world war was steadily increasing, partly in reaction to the Great Russian nationalism which was then the official fashion. The régime, however, could not tolerate any centrifugal forces, particularly on its western flank. Yet through its purges of devoted Communist workers and intellectuals in the late 'thirties it only strengthened the hand of the nationalists.

Thus, when the war broke out the Ukraine seemed the best breeding ground for collaborators. The Nazis' unwillingness to redistribute collective land together with their barbarity helped to rally the Ukrainian people to the Soviet cause. There were, however, many defections. Lazar Kaganovich was sent for a year as party chief to the Ukraine to get the difficult postwar situation under control. The gangs of nationalists were exterminated ruthlessly, while the energies of the country were directed to the gigantic task of reconstruction. At first the question of economic survival dominated all other issues. Soon, however, the national problem re-emerged in roughly the same form as before the war. Under the impact of the cold war Great Russian nationalism once again raised its head. The wave naturally swept through the country. What, however, was a virtue in Moscow was considered a vice in Tiflis, Riga or Kiev. In 1951 the Ukrainian poets were strongly attacked for echoing in their own idiom the patriotic notes which were being sounded in Russia. Writers, historians and even Party officials were censured for nationalist deviations.

Thus, politically the growth of the Ukrainian intelligentsia was judged to be dangerous; but economically it was indispensable. There are apparently 158 establishments of higher education in the Ukraine, from which 40,000 students graduate every year. The technicians and bureaucrats sent from Russia must have been submerged in this mass. As long as a nationalist climate was prevailing throughout the country the task imposed by Stalin on his emissaries—to quell Ukrainian nationalism—seemed superhuman. It was not, however, the only task in the postwar period. The Party had also to assimilate and adapt to the Soviet pattern the so-called Western Ukraine, that is, the territories acquired since 1939, chiefly from Poland. It is now admitted that collectivisation was imposed on these lands with an excess of zeal and that attempts were made to russify an unwilling population.

M. Melnikov is certainly taking the blame for much that was not his own doing. He became first secretary of the Ukrainian Party only in 1949 and up to then played second fiddle to Nikita Khrushchev, who is now first secretary of the All-Union Party. Besides, the policy of russification had the Kremlin's blessing until Stalin's death. On the other hand, he may have belonged, together with the disgraced men from the Ministry of Security (Ignatiev and Ryumin), to the "tough" group which hoped to rise to power on the wave of the vigilance campaign. Whether he is a scapegoat or a culprit, however, his departure marks a change of policy. He is replaced as first secretary by a Ukrainian—A. I. Kirychenko—and his place in the Bureau is taken over by the writer Korneychuk who was criticised in 1951. These decisions of the Ukrainian Central Committee are bound to find an echo in the other republics, from neighbouring Byelorussia to distant Uzbekistan. On the issue of nationalities, as on others, Russia's new leaders seem to hold that conciliation pays better than coercion.



•

Economic Integration in Eastern Europe—II

Soviet Economic Stranglehold

RUSSIAN control of the economies of eastern Europe is exercised through the Council of Mutual Economic Aid (Comecon), which was founded in January, 1949, with its headquarters in Moscow. The six original members were joined by Albania in August, 1949, and by Eastern Germany in September of the same year. It is also reasonable to assume that Communist China has now joined the Council; it has participated with the satellites in several triangular deals and the office of the China Export-Import Corporation in east Berlin appears to be largely staffed by east Germans. The closest secrecy has been observed about the details of the Comecon; but from the scattered fragments of information available there emerges the picture of a large and complicated organisation with a big secretariat and many inter-related committees. There is some evidence that a representative of the Council in each satellite capital transmits the directives from Moscow.

After the war the east European states which had fought against the Soviet Union were naturally in no position to withstand the Russians' determination to dominate and exploit; this they carried out principally through their confiscation of all German assets and the formation of mixed companies. In Bulgaria very little is known of these companies, but in Rumania over a dozen, known as Sovroms, have been set up and between them they control the greater part of the country's economic activity. Ostensibly they were formed on a 50-50 basis, but in fact the Russians valued the assets which they contributed at an arbitrary and inflated figure while insisting that the actual value of the Rumanian contribution should be equal

The Peoples of the East

Branches of The Chartered Bank of India, Australia and China, under British management directed from London, are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East and the Bank's clientele is drawn from all the peoples of the East who engage in commerce and industry. The offices in London, Manchester and Liverpool are linked directly to the Bank's overseas organisation and they are fully equipped to provide the banking facilities and information services required by merchants and manufacturers in the United Kingdom who trade as exporters or importers with:—

Borneo	Hong Kong Colony	Japan	Sarawak
Burma		Malayan Federation	Siam
Ceylon	India	Pakistan	Singapore Colony
China	Indonesia	Philippine Republic	Viet Nam

IF YOU BUY MAN HOURS—*read this factual schedule:*

Internal Telephones	*Staff Location & Broadcasting*	*Time Control*
❶ By freeing G.P.O. switchboard from inter-office calls, we've saved 50% of operating cost. Quick access to personnel and information has reduced our G.P.O. account 5% and we save £300 p.a. on other messengers' wages.	10% saving of executives' time increases efficiency. Quick reporting and repair of breakdowns reduces time wastage by 2%, adds 1% to production... regular broadcasting of music increases keenness, alertness and output.	Time recording system in departments and automatic break and pre-resumption signals system made 36,500 extra man hours per annum available for production—equalling 2% of total wage bill and 2% of output.
❷ ...we would certainly be lost without them . . . extending our system to cover all departments has much increased administrative efficiency.	Our staff are happier and more contented. Broadcasting for locating staff is of immense assistance.	Departmental time recording saves 5 hours 40 minutes paid man hours per day . . . break time signals system saves 10 hours 40 minutes man time per day. £1,950 extra man hours value thus made available per annum.
❸ Specific cash savings are 5% on G.P.O. telephone charges and £150 p.a. wages of messenger... switchboard operator is able to do other work.	. . . we consider that speedy broadcasting of information and quick location of breakdown personnel increased production efficiency by over 5%.	Recording of time in departments instead of at the gate adds 3% to productive value of wages paid. T.R. Attendance Cards save 2½% of salaries of wages department.

It is compiled from information supplied by users of T.R. Service who, like more than 20,000 other subscribers, find T.R. Internal Telephones, Broadcasting and Staff Location and Time Control essential to the smooth and efficient running of their businesses. The cases quoted below are as follows:

❶ Plastic Manufacturers—448 employees ❷ Metal Stampers—160 employees ❸ Ironfounders—550 employees.

Originals of these users' reports and many others from widely differing industries are available for inspection.

to the inflated value of their own contribution. Like the similar companies formed in other ex-enemy satellites, they are controlled by Russians, are exempt from local taxation and enjoy what amount to extra-territorial privileges.

In Hungary, the Russians' seizure of German assets gave them a firm foothold in important sectors of industry as well as in banking and insurance ; in some enterprises they acquired an exclusive or dominating interest in this way and in others a smaller share. In addition about half-a-dozen mixed companies, known as Maszovs, have been formed ; the most important of these have between them come to control the extraction of bauxite, coal and oil, and have thereby a strong hold over Hungarian heavy industry as a whole. Secret protocols signed in Moscow in December, 1947, gave these Maszovs, and other Soviet-dominated companies, various privileges which included the right to conclude private barter agreements with the Soviet Union, to receive profits and dividends tax-free and to transfer these to the Soviet Union in the form of goods.

Even the Hungarian Communist leaders seem to have been taken aback by the creeping stranglehold exerted by the Russians over their economy in the postwar years ; it is said that in December, 1947, Rakosi himself intervened to prevent the Russians from acquiring a 50 per cent interest in the Manfred Weiss (M. Rakosi) combine. Last September the Russians made a gesture by agreeing to sell back to the Hungarians 69 Soviet enterprises ; but these concessions do not affect the industries of major importance to the Russians. In eastern Germany, where joint-stock companies (SAGs) were formed from assets originally scheduled for dismantling, some similar gestures were also more apparent than real ; the SAGs now control only about one-tenth of total production, but this includes a quarter of electric power production and two-fifths of the chemical industry.

In enterprises where the Soviet Union has a dominating or partial financial interest, Russians in key positions usually follow as a matter of course. Elsewhere the presence of Soviet technical experts must provide a useful measure of control—a control, moreover, that it is particularly difficult for the satellites to reject since it is presented to them in the guise of brotherly assistance for which they should be deeply grateful. In the more backward satellites, Soviet technicians and blueprints may indeed be an asset ; but Czechs and Poles must feel only very modified enthusiasm for technicians from a country which they commonly regard as less advanced than their own.

Russian help to its satellites is not, of course, confined to technicians and blueprints. The satellites' press contains frequent grateful references to the raw materials, machinery and even whole industrial installations which they are receiving from the Soviet Union. Whether or not these reports are exaggerated, it would be idle to deny that the rapid expansion of heavy industry in eastern Europe must owe a good deal to Soviet deliveries. All the same, from the scanty evidence available, it is reasonably clear that the satellites pay heavily for whatever benefits they derive from their forcible connection with the Russians. It is not only that their economies are heavily strained by the deliveries that they themselves must make to the Russians—and the strain may become even more intolerable if they are called upon to supply a large proportion of the goods needed by China for its industrialisation programme. Soviet orders also spoil the satellites' chances of more attractive markets elsewhere, as well as delaying the equipment of their own industries ; in 1948, for instance, the conclusion of the six-year Soviet-Hungarian trade agreement forced the Hungarians to cancel an important agreement just concluded with Argentina.

Dependence on Soviet Supplies

Moreover, the compulsion of concentrating as much as possible of their trade within the Soviet bloc, not only makes the satellites heavily dependent on Soviet supplies, but also hampers their industrial production by forcing them to make use of inferior materials. It appears that they can only buy abroad those materials which the Comecon is satisfied cannot be obtained within the bloc ; whether they are of the right kind and quality seems to be largely immaterial. Thus the low Hungarian textile production is thought to be largely due to the enforced use of inferior Russian cotton ; while the Czechoslovak chemical industry which formerly used to manufacture end-products from materials obtained from Germany, has now been forced to reorganise itself so as to be independent of these outside resources. The Czech iron and steel industry, which used to use Swedish ore, is now forced to supply its supplies of Soviet ore by opening up its own low-grade deposits—an operation which appears to have been only a partial success.

The central control exercised by the Comecon over the economic affairs of the Soviet bloc also renders the satellites, whose currencies are closely tied to the rouble, vulnerable to various forms of price exploitation by the Russians. If in their trade negotiations with, say, the Hungarians, the Russians insist on delaying a settlement of prices until after the Hungarians have committed themselves to making certain deliveries, then the latter are in a poor position to argue about prices. It is known, for instance, that the Russians paid only $480,000 for Hungarian rolling stock that cost $550,000 to make, and only $6,000 for steel pipes that cost $10,000 to produce. The Russians also play the lucrative role of middlemen in inter-satellite exchanges of raw materials. The Hungarians get Polish coke ; the Czechs get Hungarian wheat ; the Poles get Rumanian oil—but the coke, wheat and oil all come from the Soviet Union as Soviet imports.

(Concluded.)

Markets Overseas

If you are seeking new markets abroad or want to know more about your present ones, the quarterly reports by The Economist Intelligence Unit will help you. These reports give concise and up-to-date analyses of economic and business conditions and prospects in other countries, and they contain a wealth of information of value to the exporter and investor. Each report is prefaced by a summary of the main facts and conclusions, and contains a comprehensive statistical appendix supplemented by maps and diagrams.

This service of reports was started by the Unit last year. From the outset the demand was large and came from many parts of the world, and in response to requests from subscribers the list of countries included in the service has been extended. Fifty reports are now published every quarter on a total of seventy territories.

Descriptive leaflets and a specimen copy of the reports may be obtained from:

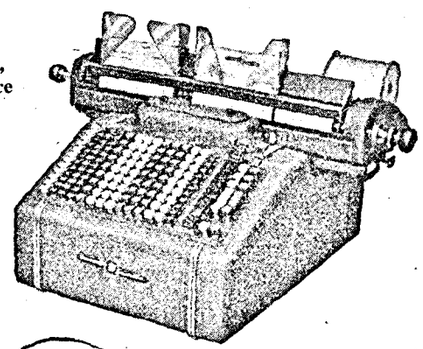
THE PURPOSE AND RESULT OF SENSIMATIC CONTROL



Here's the secret of the Sensimatic's astonishing versatility. Each panel (or sense-plate) like this guides the machine through any four different *accounting jobs in any combination. There is no limit to the number of panels you can use.*

From *one* accounting machine— *countless* applications

NOW THERE ARE FIVE VERSIONS of the Burroughs Sensimatic Accounting Machine, giving you the registers or combinations of registers you need for the jobs you have on hand. All are based on the completely new principle of Sensimatic Control, which directs the machine automatically through every mathematical function and carriage movement during a posting operation. Just as there is no practical limit to the number of different accounting applications the Sensimatic will handle —switching instantaneously from one to another at a turn of the selector knob—so there is no limit to the economies in time and labour which its use will effect in your office.

Call Burroughs about the Sensimatic today. You'll be surprised at the low cost of this multi-purpose accounting machine.

Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1. Sales and Service offices in principal cities.

THE BUSINESS WORLD

Steel Shopwindow

A NUMBER of points of significance to prospective investors in steel shares emerge from the second, and final, report of the Iron and Steel Corporation. The Corporation (which will shortly be passing its steel shareholdings to the new Realisation Agency for disposal to private investors) has computed the profits of its steel subsidiaries at £75 million in the year to September last year, compared with an annual rate of £64 million in the preceding period. Of this total profit, a quarter was earned from exports of steel at a premium over home prices; these export premiums on British steel have been running down, and for certain products (including tinplate) they have virtually disappeared.

The second consideration for investors is the impact of the steel "Industry Fund" upon individual companies; at the end of last September, this fund was £9 million in deficit. The Fund is, in fact, a device for spreading certain costs of steel making across the whole industry and is fed by a levy on crude steel produced and by a special levy on steel made from scrap. These levies cover the cost of importing iron ore, scrap, and iron and steel at world prices, and selling them more cheaply here. In effect, they also reduce the cost of making steel from pig iron and increase the cost of making steel from scrap. Figures published elsewhere support the guess that the spreading of costs (or, in other words, the reallocation of profits) through the Fund was at the rate of £80 million last year. The profits of the Corporation's subsidiaries (before additional provision for depreciation) amounted to practically £75 million. This is a formidable reshuffle, involving the whole net profit of the industry; the amounts by which the costs of a works using imported scrap and iron ore may have been mitigated and those of a works using home ore increased are unknowns that cannot be weighed by the prospective investor. In these financial gymnastics, many who are penalised on the swings also have an agile foothold on the roundabouts. Moreover, the levy has been somewhat reduced since last September, and the Fund should now be self-balancing. But so long as the fund operates it will pose certain questions: What does the Steel Act mean when it talks of "competitive conditions" in the supply of Steel? And what is the investor buying when he acquires a particular steel share?

These are important considerations in the assessment of individual steel companies. Nor does the Corporation's report, with its compendium of the results of its subsidiary companies to last September make more than a beginning in dressing the shopwindow in steel. For that, the investor must still await the appearance of the separate offers for sale. The results of past years have been influenced by the keeping down of prices and profit margins on semi-finished steel and making money out of finished products. Most of the large integrated works thus gain at the finishing end what they might otherwise lose on semi-finished steel. Most of the re-rollers, buying in their billets, have made a comfortable living at the finishing end of the trade. But now a period is opening in which further huge investment in pig iron and crude steel capacity is planned; if, to attract the money for these projects, the price structure in steel was modified, and if imported ore was no longer made artificially cheap, as at present, the whole order of profitability that the steel industry has known in recent years might be radically changed. Such alterations in price policy may not be likely. Imports of iron and steel are being reduced, and in the long run the price of imported ore should come down. But this emphasises the degree to which a steel company's profits

will depend upon prices controlled from the centre—*mainly* by the Supervisory Board.

In these circumstances, it would be vain to look for a perfect standard of comparison of profits between the different steel companies that are likely to be on offer shortly to the investor. Conditions are changing in the export markets ; the intra-industry levies and subsidies may be modified ; and the price relations between different steel products that have subsisted for so long may not necessarily be permanent. Even if the investor proceeds by what is known of the past, he will not be able, at this stage, to push comparisons too far. In the accompanying table, some 25 out of the 80 subsidiaries of the Steel Corporation are ranked in accordance with a simple standard of profit-earning capacity—in some respects, a deceptively simple standard. This standard is based on a comparison of a company's net income after tax with the book value of its net assets. The appearance of a high percentage return is not, in itself, an invitation to go in and buy—though it may be for certain companies. Book values are notoriously defective measures of assets ; they may have been heavily written down—for examples, there are the smaller and older tinplate companies and some of the re-rollers whose plant now appears at an almost nominal sum, and whose profits would show impressive percentages. But for some of these, good trading conditions may not necessarily be maintained, and the day may be close when profits make a poor showing even by reference to asset values that are far below replacement cost. Any inference from such a comparison about the strength of a particular company must therefore be most carefully qualified. But when applied to the major companies it does afford the general conclusion that the apparent return on many finishing operations is comfortably high compared with the return that an integrated plant—particularly a plant that has been completed in recent years at high cost—can generally show by this standard.

Some indications of future development costs—far from complete—are given in the table. Sanction has been given to the expenditure of £60 million this year and next year by the companies now publicly-owned. The second steel development scheme for these companies was put at £250 million on prices ruling early in 1952. With other subsidiary schemes, the Corporation estimates, the companies' total commitments may approach £350 million " in the next few years." This is a large sum. No doubt the companies would wish to find a good part of it—say, a half—from their revenues. But already this year the Corporation has been borrowing steadily to finance part of the cost of development—its bank loans had reached £16½ million by the end of March. If premiums on exported steel continue to narrow, the prospect for profits will be less secure ; the Corporation declares that it would be " unsafe to rely on finding more than £30 million per annum from depreciation provisions and profits retained within the group." The present level of steel profits retained is partly determined by the fact that only £9 million a year has to be found in interest on steel stock ; more liberal distributions on the ordinary capital of an industry restored to private ownership would reduce the amount of net revenues that could be retained. The Corporation adds:

> It will be noted that should trading profits of the group fall substantially, the amount payable in taxation in the years of declining profits could well absorb all the funds arising. In this event the whole of the estimated capital investment of £60 million per annum would require to be financed by external borrowing.

That is the worst contingency and it may never happen ; moreover, the Corporation may be over conservative. But the provision of further money to finance development in steel under private ownership must be a weighty consideration for the prospective investor.

Engines for Ships

CHOICE of the type of marine engine to propel a new ship is no easy matter for the shipowner ; and today the variety of equipment he has to choose from is widening rapidly. Many variables have to be weighed, such as the conditions of service, the speed or power needed, first cost, reliability and maintenance costs, and fuel costs and availability ; one or other of these considerations may on occasion be decisive. Until recently the main choice has usually been between the steam turbine and the diesel engine, in various forms. But already a new form of propulsion, the gas turbine, is on the scene ; and the use of nuclear energy for marine propulsion may not be far distant.

The marine gas turbine is still in an advanced stage of experiment, particularly for commercial, as against naval, operation. But its advent has already called out considerable advances in technique and performance from the more conventional forms of marine engine. From the point of view of prime cost, reliability and ease of maintenance, the reciprocating steam engine still remains a suitable choice for many types of ship, but the principal rivals for the favour of shipowners today are the steam turbine and the diesel engine. From the table, which gives an analysis of the world merchant fleet according to propulsion, for 1939, 1948 and 1952, it can be seen that the triple-expansion steam engine, including engines that incorporate a low-pressure exhaust turbine, has lost ground in terms of its share of total tonnage since before the war. Steam turbine propulsion, by this yardstick, has increased its share rather more than the diesel in comparison with 1939 ; but since 1948 the motorship has increased rapidly.

These figures illustrate the fleet in being, and must be considered in the light of intervening events. Enemy bombs and torpedoes sank steamships and motorships indiscriminately during the war, but the huge wartime replacement programme, undertaken mainly in the United States, gave precedence, inevitably in the circumstances, to steam reciprocating and turbine machinery. Since the end of the war, economic considerations have dictated the choice of machinery to a greater degree once more, and there has been much more variety in the types of ships built and the services for which they have been designed. During 1952, for instance, of the 1,074 vessels, totalling 4.4 million tons gross, which were launched, 838 vessels of 2.9 million tons were motorships, 110 vessels of 1.3 million tons were turbine ships and only 126 vessels of 259,000 tons had steam reciprocating machinery.

Diesel propulsion is generally preferred for medium-sized ships, but larger ships are mainly turbine steamships. For the higher powers and faster speeds required in passenger ships or large tankers, for example, steam turbines so far have been the only possible answer. Using the higher temperatures and steam pressures that metallurgical advances have now made possible, as much as 20,000 shaft horsepower can be developed by a turbine installation driving a single propeller shaft. The general postwar tendency for the size and speed of merchant ships to increase has thus favoured the adoption of steam turbine machinery, but turbine engineers have by no means been neglecting the other end of the scale.

Marine diesel engineers, on the other hand, have made considerable progress recently in their endeavours to overcome drawbacks of size and weight in competition with steam turbines for the higher powered ships. This has been achieved through the application of turbo-charging systems to the two-stroke engine of high horsepower. The effect of this development, pioneered by the Danish firm of Burmeister and Wain, is a considerable saving in engine weights and sizes for the power developed. The recently completed cargo liner *Songkhla*, for example, a vessel of about 10,000 tons deadweight with a loaded speed of nearly 17 knots, is powered by a " supercharged " 7-cylinder engine capable of developing 8,750 brake horsepower in normal continuous service. Without turbo-chargers, it would take at least 9 or 10 cylinders in a normally aspirated engine to give this power, and the new system can provide a saving of about 30 per cent in weight and 20 per cent in length of engine ; alternatively, an increase of about 35 per cent of horsepower can be provided for the same weight and size of engine. By adopting the new system, therefore, a shipowner can increase his carrying capacity or his speed, or take the advantage of any combination of the two that suits him best. Although the *Songkhla* has only recently completed its trials, orders for no fewer than 50 sets of these diesel engines

have already been placed with the manufacturers and their licensees, including British marine engineers.

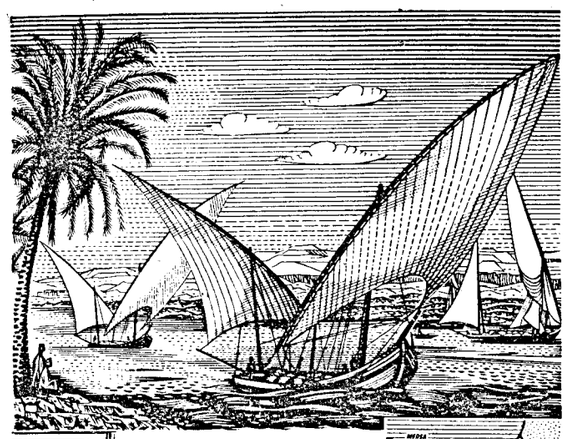
It has thus become possible for marine diesel engines to provide much higher powers without the necessity of duplicating the machinery and providing twin screws. Another method of obtaining a similar result from diesels, that has been finding increasing favour, is by the installation of two or more diesel engines in a ship, coupled to a single shaft through gearing, or hydraulic or electro-magnetic couplings. By using two diesel engines " in parallel," as it were, a considerable saving in the length and height of the engineroom can be achieved, which can be used for increasing passenger or cargo accommodation. There is also the advantage that if one breaks down the ship can still run on the other. In fact, when two engines are coupled to one shaft a breakdown in one engine may reduce the ship's speed by only about 15 per cent. This means an even greater saving in fuel consumption and may in some cases be adopted deliberately. Some owners have found, for example, that it is profitable to instal twin geared diesels but to use the extra power of the second diesel only when circumstances require it.

The gear diesel installation, therefore, combines single-screw efficiency with multi-engine reliability, and in it the use of hydraulic or electro-magnetic couplings has revealed certain further advantages. The loss of power through propeller " slip " has been reduced from about 8 per cent in the case of direct drive to as little as 2 or 3 per cent with hydraulic and less than 2 per cent with electro-magnetic drive. Flexibility and manœuvrability have been greatly increased. Since the two coupled diesels will be smaller than a single slow-running engine of higher power, the cost of spares and replacements is lower, although this is offset to some extent by the larger number of cylinders. Nevertheless, it means that more running repairs and overhaul can be carried out by engineers on board ship, and the amount of shore work correspondingly reduced.

Similar flexibility of engineroom arrangement and manœuvrability can be achieved by the use of electric propulsion motors, to which current can be supplied by alternators, actuated either by diesel engines or turbines (steam or gas). This system has notable advantages in certain conditions of service, but its high prime cost and complications of maintenance still militate against its more general adoption.

Fuel consumption is an important factor, not only because of the cost but also because of the space and carrying capacity that must be used for its storage over a long voyage. In this connection, the existing economy of the diesel engine over the steam turbine has been increased by the development of equipment that enables diesel engines to burn ordinary boiler fuel instead of the more expensive diesel fuel. On the other hand, diesel engines generally require considerably more maintenance than turbine machinery. Maintenance can be an expensive item over the lifetime of a ship, involving losses of earnings through delays as well as expenditure on spare parts and repairs—and it is often argued that the lower maintenance costs of turbines more than compensate for their higher fuel costs.

★



Really full comparisons of operating costs seldom become generally available, and the trend of shipowning opinion is often influenced by indications of policy from large groups operating vessels with propulsion equipment of all types. Since the war the lead has often been given by the tanker companies; apart from being very large fleet operators, they are experts in fuel economy. The Shell group's marine research department, for example, was primarily responsible for the adaptation of diesels to use residual fuels. But the impression that this development made upon shipowners in general was somewhat tempered by the subsequent decision of the group to make all but one of the 50 " general purpose " tankers of about 18,000 tons dw that it has recently ordered turbine steamships. Most of the largest tankers now being built have turbine power, though some motor tankers of up to 32,000 tons dw are in service or under construction; but the Shell group's new programme provides an example of turbines invading a field that the diesel engineer might have reckoned as his own special preserve. It is true that in tankers there are special demands for steam to heat the cargo for handling purposes, and steam is also used for the cargo pumps though these may be electrically driven.

For a preliminary verdict on the economics of the marine gas turbine, shipowners have again to look to Shell. Experience with one gas turbine unit in the tanker *Auris* (the balance of its power is diesel-electric) has shown that repair and maintenance costs may be almost negligible on a gas turbine. One of the 50 new tankers for the Shell group is now to be powered entirely by two gas turbines, driving a single propeller shaft through electric motors and reduction gearing. Since all the other tankers in the new Shell programme will use turbine or turbo-electric systems, and all will have the same horsepower of 8,300 shp, it should be possible by 1956 to obtain a direct comparison of the operating and maintenance costs at least of these three types of propulsion.

PROPULSION OF THE WORLD MERCHANT FLEET
('000 tons gross)

THE GIYASSA: The Nile was the national highway of Egypt long before oxen drew carts or men went on horseback and even to-day in the face of competition from all forms of modern transport, the great river is still the cheapest means of transporting goods to and from the coast. The giyassa, the boat most commonly used for this purpose, varies in size but averages seventy-five feet in length. Like some ninety per cent of the craft in usé on the Nile to-day it is a sailing vessel and carries a crew of two or three, the captain being frequently the owner as well. The cargo is stowed in the bottom of the boat and often rises above the bulwarks: a familiar sight is a giyassa piled high with earthenware jars, another typical load might include cotton, sugar cane and fertilizers. Our branches in Egypt are particularly well placed to answer your questions on market conditions, or local commercial undertakings. Please address your initial enquiries to our Intelligence Department, 54 Lombard Street, London, E.C.3.

More Modest Funding

THE recent rumours of a new government loan were confirmed last Monday more promptly than had been expected, but the operation proved to be a less ambitious one than the pundits of the gilt-edged market were envisaging last week. It took the unpretentious form of another issue for cash of a further tranche of the 3 per cent Exchequer stock, 1960, first issued early last March ; the lists were opened last Thursday, and closed at 10.15 a.m. As on the previous occasion, the amount offered was £100 million, but this time the issue price was par, instead of 99½, a difference equivalent to the greater part of the advance that had occurred in the stock during the preceding three months. The gross redemption yield offered by the original tranche was £3 1s. 7d. per cent at the issue price, whereas at one time last week the corresponding yield offered at the market price was down to £2 19s. 2d. per cent. The yield offered by the new stock of a level 3 per cent was only a shade above the market basis at the time of the announcement, since the effect of the rumours current in the market had been to force the price slightly below its peak.

The issue had been heralded by the recent success of the authorities in disposing of departmental holdings, a success clearly indicated last week by the raising of the prices for the supply of stock through the unofficial "taps" and then by the closing of the tap in the 1960 stock. This clearly implied that the departments had sold as much of their portfolio as they were prepared to relinquish ; but the market generally expected that the new operation would be designed not only to provide the authorities with a further supply for tap sales of this kind, but also to make a first attack upon the maturities that lie ahead—£577 million of 1¾ per cent Serial Funding stock falls due in mid-November and £810 million of National War Bonds are finally repayable three and a half months later. The market is assuming that this problem is now not likely to be tackled before the autumn. The new issue therefore seems to have been designed to enable the authorities to capitalise, in a small way, the recent advance in the market and simultaneously to restrict the rise in the liquidity ratios of the banks during the summer season of Exchequer borrowings. Some of the banks and other institutional investors were undoubtedly interested in the new stock, but it is too long to be suitable for the discount market, and some of the institutions had probably already filled their immediate requirements through the market. It seems probable, therefore, that departmental participation has been substantial ; if so, the immediate effect upon the banks' ratios will be slight. In short, the tactics fit in neatly with the principles of the budget and with the Chancellor's indication that monetary policy would probably be kept for some time on an even keel.

Counsel from Basle

FROM the undefiled air of Basle comes the annual dose of orthodox exhortation that can be depended upon in the report of the Bank for International Settlements. This year the sermon is addressed to a seemingly more receptive and sympathetic audience and is, therefore, couched in less aggrieved tones than those of some earlier reports. Two themes dominate this year's report. The first is the question of the financing of investment. On this the report points out that countries which have been most successful in solving the problem of non-inflationary investment are those which have sought to achieve both physical reconstruction and monetary rehabilitation at one and the same time. In these countries "the maintenance of monetary confidence has created the conditions for a flow of genuine domestic savings." The report throws liberal doses of cold water on the policies of those countries that have laid the main stress on savings achieved by means of budget surpluses and self financing by companies. It argues that substantial savings out of a budget surplus demands heavy taxation which, in turn, may cause a reduction in private savings greater than the amount of the attempted budget surplus. Experience, says the BIS, has revealed the uncertain nature of official contributions to capital formation and has shown that capital markets can provide substantial funds for investment provided three conditions are satisfied: that monetary stability is maintained ; that the level of taxation is not so high as to make private savings impossible ; and that no attempt is made to impose unnaturally low rates of interest rates.

The second theme of the BIS report almost chose itself: convertibility. The objectives should be complete convertibility, avoiding all flirtations with insulation and permanent discrimination against any one currency. "Europe's whole history shows that the periods when it has been cut off from other regions of the world have been its dark ages." Moreover, "convertibility is a flexible bond which constitutes the most effective and the least rigid form of integration." Therefore "the movement which is at present carrying most of the countries of Europe towards genuine convertibility should not be allowed to lose its momentum." But even the BIS does not suggest that an immediate jump into complete convertibility and non-discrimination in international trade is practical politics. It envisages the plan of action in a series of stages including a period of transition during which "a wider margin of (exchange) fluctuation should be permitted than would be acceptable in the long run." It is quite evident that within the walls of the Bank for International Settlements the discussion of the problem of convertibility has ranged beyond the realm of principles and generalities and has progressed well into questions of technique.

British Transport's Surplus in 1952

IN all the circumstances of 1952, the achievement of a net revenue surplus of £8.4 million by the British Transport Commission was meritorious ; to mark its fifth year, it shows the first significant net balance, of £4½ million, after meeting its obligation to redeem its capital. To sum up the five years, the Commission carries forward a deficit of £31½ million, after providing £17½ million for capital redemption ; this deficit was largely incurred in 1949 and 1950 and it represents little over one per cent of the revenue receipts (£2,860 million) over the five years. For a year which saw a distinct recession in trade in the early months and was loaded by increases in costs of various kinds—including coal and steel, £7½ million a year and increased fuel tax, £5½ million a year—the results are good. They would have been better if the Transport Commission had not been denied the benefit of increased charges for which it had applied, and in London had actually been awarded, worth about £6 million.

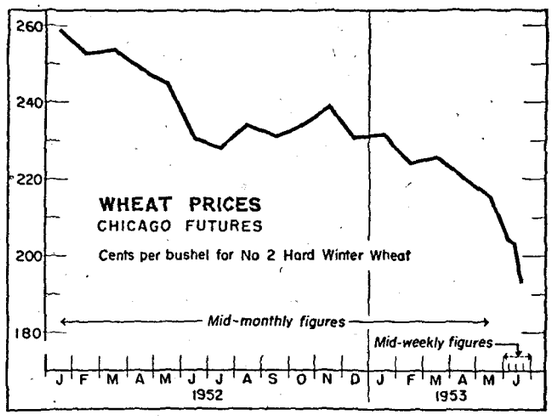
Throughout the five years, the Transport Commission's charges have followed in the wake of rising costs for steel, coal and wages. The new Act promises a rather more rapid adjusting of charges to costs which should protect the Commission from being left hopelessly behind in the inflationary race of costs. Towards the end of 1952 costs were again rising steeply, and although the Commission obtained an increase in freight charges last December and is awaiting the result of an application to the Transport Tribunal for an increase in London fares which if granted would bring in £6 million a year, its finances are most unsatisfactorily balanced on a knife edge. The railways earned net traffic receipts of £39.6 million, but at the high operating ratio of 90 per cent ; London Transport "made no reasonable contribution" to the Commission's results ; and the road haulage services, hit by recession, increased fuel duties, and by "the prevailing uncertainty about the future of these services" provided a meagre return.

Beyond the particular complications of last year lie the tasks of disposing of the road services and reorganising the railways ; the provision of a reserve fund and means for the replacement of assets at current prices ; the effective starting on the job of renewing old locomotives and railway coaches which has been sharply—and even unreasonably—curtailed on the ground that steel was scarce. In this new and more competitive phase, the Commission will enjoy real opportunities ; the more quickly it can proceed with effective reorganisation and the reinforcing of a vigorous commercial spirit in its operations the greater will be its chances of success.

Consolation Prize for English Electric

THE second set of bids submitted by competing companies for electric generators and transformers for the American Government's Chief Joseph power project has produced a solution that satisfies honour all round. The first set of tenders put the engineers in charge of the project in a difficult technical dilemma and their efforts to extricate themselves from it evoked a political storm out of all proportion to the points in dispute. British and American power engineering practice differs in detail, and unless the specifications for a project put out to international tender are precise, the bids submitted are apt to reflect these differences of practice. This appears to have been true when English Electric submitted a tender of $6 million for four generators and ten transformers, nearly $1 million lower than the next tenders put in by American manufacturers. The English Electric tender appears to have followed British rather than American practice on certain points where the specifications were not precise, and this made it unacceptable by American engineering standards. But since the engineers in charge of the Chief Joseph project could hardly have justified a decision to accept instead the far higher American tenders, they decided to reject all bids and ask the competitors to tender again to more detailed specifications.

The fact that the earlier tenders were known clearly put the British company at a disadvantage, but since the engineers had made the initial mistake of giving the competitors insufficient guidance, the damage was done. As it turned out, English Electric's second tender for the ten transformers, of $1.8 million, was the lowest received and was accepted ; its bid of $4.4 million for the generators was $97,701 higher than that submitted by Westinghouse and was rejected.



Most engineers—British or American—would prefer to buy plant when they can from local suppliers rather than from suppliers several thousands of miles away. But this natural preference has not prevented contracts being given by American authorities to foreign suppliers when their bids are sufficiently low. Last year the Ferranti company was awarded an Army Engineers' contract for nine transformers, and at the end of May its bid of $857,600 for six transformers for the McNary Dam in Oregon was also accepted by the Army Engineers. Swiss manufacturers were given a $2 million contract by the Interior Department for four hydro-electric generators at the same time. None of these is as big or as important as the generator contract that English Electric has just lost by so narrow a margin (and would have won on its earlier bid), but they are at least indicative of a fair measure of good will among technicians who are being asked to change the habits, and the suppliers, of a lifetime.

Falling Wheat

THE price of wheat sold outside the International Wheat Agreement has been moving slowly downward for the past eighteen months ; in the past week, the Chicago market has taken a sharper plunge downward, from which only a slight recovery has occurred. July futures, which ten days ago were quoted around $2.03 a bushel, dropped to $1.89 early this week, and rallied later to $1.93. When the new International Wheat Agreement was signed on April 13th, with its stipulated maximum price of $2.05 a bushel, Chicago July futures were quoted around $2.25.

The recent fall in wheat has been encouraged by the American government's latest crop forecast. The total crop of winter and spring wheat is estimated at 1,133 million

bushels, against 1,292 million bushels in 1952, but the estimate for spring wheat is 363 million bushels compared with only 239 million bushels last season. But the basic

reasons for the fall are the steady decline in exports of American wheat this year and the apprehension of "bursting granaries" in the United States.

Rolls-Royce and Westinghouse Agreement

A WEEK ago Rolls-Royce signed a ten-year agreement with Westinghouse Electric Corporation. This agreement, for which Westinghouse is to pay an initial, and considerable, capital sum, to be followed by later instalments, provides not only for technical co-operation but also for direct help from Rolls-Royce in the development of current Westinghouse engines. For many years Rolls-Royce has been licensing engines to one of the major American engine companies, Pratt and Whitney, who built first the Rolls Merlin piston engine and then the first Rolls jet engines. Pratt and Whitney, however, took no steps to license the Avon engine, the newest in the Rolls-Royce series, but began to develop a similar engine of its own design. The Curtiss Wright Company, in an attempt to make up for lost time, three years ago bought the designs of Armstrong-Siddeley's turbo-prop Mamba and pure jet Sapphire, an engine of about the same power as the Avon. Last year, also, the Curtiss Wright Company acquired the American rights for the Bristol Olympus engine that recently set up a new height record. During the summer, the General Electric Company reached an agreement with de Havilland for technical collaboration on engine design.

It seems probable that these companies would have seen distinct attraction in collaborating with Rolls-Royce, for it has the Avon in production as the standard engine for the RAF and a good proportion of the Nato fighters; and it has the future promise of the by-pass Conway engine which may revolutionise jet engine design.

The agreement with Westinghouse is a tribute to the ability of Rolls-Royce as designers and builders of engines. Suggestions that cuts in the defence programme might leave Rolls-Royce with some idle capacity by 1954, especially in the Glasgow factory, have been denied by the chairman, Lord Hives. The company knew of the defence cuts last autumn, but since the beginning of this year it has booked £8 million worth of new commercial business for aero engines alone. This almost certainly excludes the sum that Westinghouse will pay under its agreement; there is every indication that Rolls-Royce is likely to work to capacity for some time to come.

Power for Industry

IN 1948 British industry generated in its own factories something over 8,560 million units of electricity, which was just under a third of all the power it used. The total number of units privately generated had not altered greatly since 1935, the date of the previous census of production, when industry was making more than half its own power. In other words, the great bulk of the extra power that industry is now taking—and consumption between 1935 and 1948 rose by 84 per cent—comes from the public electricity supply.

This "absence of development of industrial electricity production in Great Britain" puzzled the Economic Commission for Europe recently; although industrial power generation as a percentage of industrial and transport consumption has fallen throughout Europe since before the war, Britain comes particularly low on the list, comparing with countries such as Italy and Denmark. The lack of expansion in private power generation here, however, is a matter for self-congratulation to the British electricity supply industry; and at the British Electrical Power Convention last week spokesmen of the British Electricity Authority took due credit from the fact. Their broad conclusion, naturally enough, was that the growth of consumption of power from the public supply, by making possible more economic use of the growing supply system, had enabled its owners to offer extra power more cheaply than consumers would generate it themselves. And broadly, no doubt, this is true. In 1948, of course, industrial tariffs had changed little in form since before the war, though most prices had moved steadily upwards in accordance with a coal clause. The latest array of two-part tariffs being offered by the Area Boards to industry are designed upon unexceptionable principles. But some industrialists would question whether the actual tariffs offered, despite these principles, are in practice fair between consumers—and in particular to the industrial consumer with a high load-factor, who should be so desirable a customer.

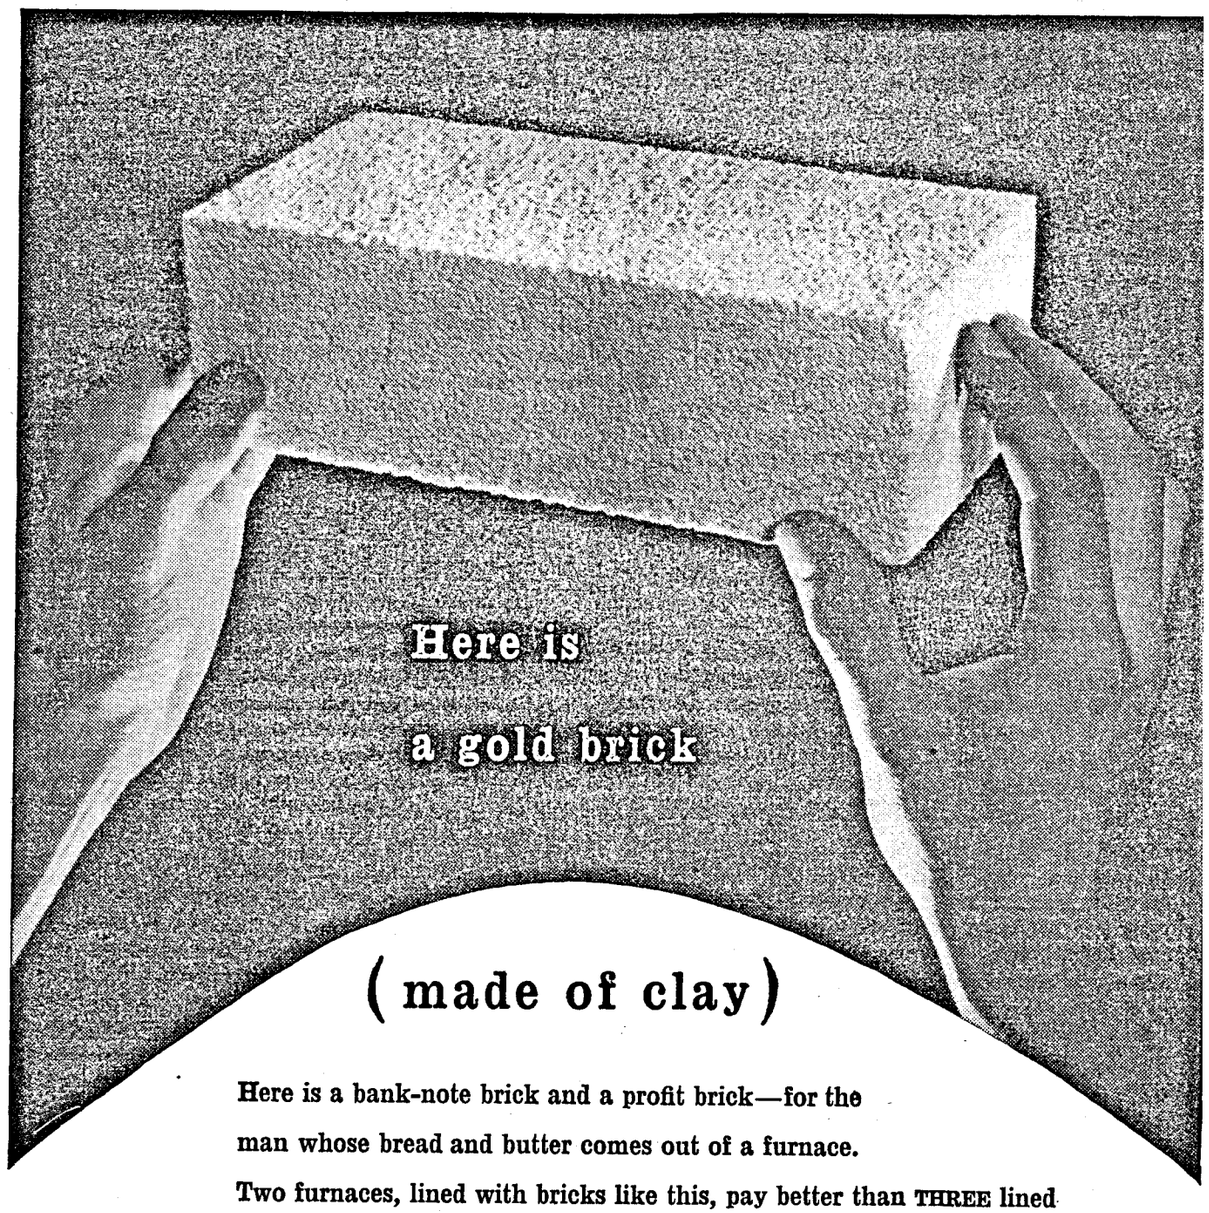
Electricity at the Plant

THE form of private generation of electric power most favoured for reasons of fuel economy today is one combining the supply of heat and power. Many factories generate steam in their own boilers for process work and for space-heating, and at the same time buy electricity from coal-fired power stations where most of the heat generated is dissipated in cooling towers. The introduction of a back-pressure turbine into the factory's steam system, in theory, would often enable all or part of its electricity requirements to be met without calling upon the public supply, with a considerable saving in coal owing to the higher thermal efficiency of a combined heat-and-power system.

At last week's Electrical Power Convention, Mr H. S. Prosser of the British Electricity Authority and Mr A. W. Pedder of Merz and McLellan, in a joint paper, examined the economics of such combined systems. They regretfully set aside the idea of district heating systems, in which communities would draw hot water warmed by heat bled from BEA heat-electric power stations; they concluded that practicable systems would hardly save coal and would give the householder more expensive hot water (though much more of it). After a detailed examination of back-pressure generation inside factories, they concluded that this would not generally be profitable for a factory with a steam demand of less than 25,000 lb. an hour. In all cases, the economics of it depend upon the balance between the factory's steam and power requirements. But in larger installations they hold that back-pressure generation may be reasonably worth while and can become highly profitable, by comparison with the purchase of power from the public supply; while the saving in coal is very considerable. Group schemes, by which a combined heat-electric station could serve a number of factories, seemed to them unlikely to show much greater savings, though these offer the possibility of obtaining a national saving in fuel through the association of companies that alone could not find the money to instal such equipment.

Some industrialists using factory generation would put the size of steam installation at which back-pressure generation becomes worth while, given suitable conditions, considerably lower than these speakers. Even so, the slow progress in the installation of fuel-saving equipment in this country has arisen perhaps less from the sheer economics of its operation than from the general shortage of capital, and the fact that industrialists to whom fuel costs matter little can usually find productive equipment that would be more immediately profitable to spend their money on. This has probably been the reason for the lack of response to the Treasury's offers of loans to instal fuel-saving equipment. This week, in an attempt to ginger up the scheme, the Chancellor of the Exchequer announced that the loans would be available for a wider range of equipment, would be repayable over a longer period, and would become interest-free for the first two years.

The Comet Crash



THE report of the Indian Government's investigation into the disaster that overtook a British Overseas Airways Corporation Comet airliner on a flight from Calcutta to Delhi last month has been published with commendable speed. It attributes the accident to the thunderstorm into which the aircraft flew as it left Calcutta airport, but leaves unanswered the major question whether this type of aircraft was more vulnerable than any other to such weather conditions. The investigators admit that with the facilities at their disposal they could not determine the sequence of events with any precision. The aircraft broke up while it was still in the air (earlier reports of the evidence showed that the engines were still running when the main part of the fuselage hit the ground) and the break-up was caused either by the severe turbulence of the thunderstorm or by the effect of the storm on the Comet's handling under controls. The report records that the controls were set as they would have been for normal flight, and that no radio alarm was sent out nor had any emergency precautions, manual or automatic, come into operation; all these points suggest that the destruction of the aircraft took place with great rapidity.

This much could be learned by examining the wreckage on the ground, but the only way of determining precisely what happened, and where and how the structure failed in a storm that local observers described as "unusually violent" would entail, the report suggests, detailed examination of the wreckage in this country. This will be done at the Royal Aircraft Establishment, where some of the parts have already arrived. It is generally believed that enough wreckage can be found to present a reliable picture, so a second more detailed report on the accident may be published. This should resolve the question whether there was any structural weakness in the aircraft, or whether it met with forces in the highly localised vortex of the storm of a kind that no aircraft is stressed to withstand, any more than buildings can survive in the path of a hurricane.

In an appendix to the report, one of the investigators puts forward an ingenious hypothesis—which the report firmly describes as a hypothesis only, without supporting evidence—suggesting that the handling of the Comet under power-operated controls had placed it at the mercy of the storm. He then suggests that these controls should be modified to give the pilot some of the "feel" characteristic of manually operated controls. Neither BOAC nor de Havilland appear to think this a profitable line to follow, in view of experience in flying other Comets through storms, and attention is being concentrated on perfecting a form of radar storm warning which will tell the pilot when he is approaching conditions that are downright dangerous. The Comet, built to withstand the pressures of high speeds, is in many ways structurally stronger than slower aircraft; even if further investigation proves beyond doubt that it was a victim of circumstance, future travellers may yet benefit from the lessons learned at Calcutta at such tragically high cost.

Rayon Dividends with a Flourish

THE maintained equity dividend from Courtaulds and the higher dividend from British Celanese owe as much to the remarkable recovery in the rayon trade in the last few months as to the actual profits earned by these two companies in their financial periods to March 31st last. In the year to this date Courtaulds' consolidated gross profits slumped from £19 million to £10½ million and its net profits from £8.5 million to £5.2 million. In the nine months to the same date British Celanese (which has changed its accounting date, to coincide with the fiscal year) earned a net consolidated profit before taxation of £1,841,346; recalculated on an annual basis this profit would be £90,000 lower than the net profit of £2,546,233

(made of clay)

Here is a bank-note brick and a profit brick—for the man whose bread and butter comes out of a furnace.
Two furnaces, lined with bricks like this, pay better than THREE lined with standard refractories, because they cool quicker and reload quicker.
This is no place to go into wearisome technicalities.
Just make a note of the M.I.28 (one of the new Morgan Refractories) . . . and consult your Maintenance Engineer . . . and tell your Accountant that

MORGAN Refractories

ARE WORTH FAR MORE THAN THEY COST

N.E. 28

The Morgan Crucible Company Ltd. (Refractories Group), Neston, Wirral, Cheshire. (Tel : Neston 1406)

(after writing about £900,000 off stocks) earned in the year to June 30, 1952, and it is barely a third of the profit of nearly £7.3 million earned in 1950-51—the period of inflation and automatic gains upon stocks. In spite of the decline of 45 per cent in gross profits the directors of Courtaulds had no qualms in maintaining the ordinary dividend at 11¼ per cent (so that at the current price of 39s. 6d. xd. the £1 ordinary stock units offer a yield of 5¾ per cent) ; and the directors of British Celanese have decided in effect to increase the distribution on equity capital by declaring a dividend for the nine months of 12 per cent. This dividend is equivalent to 16 per cent for a full year and compares with the payment of a 11 per cent dividend in 1951-52 ; on the assumption of a full year's dividend of 16 per cent British Celanese 10s. ordinary stock units offer a yield of 6½ per cent at the current price of 24s. 6d. xd.

By detailing the course of the recovery in the rayon trade in the last few months, the directors of both these companies implicitly justify these dividend payments. The directors of Courtaulds report that the recovery in domestic sales of rayon goods began in October, and that "activity was at a high level in the home market" in the first quarter of this calendar year. They add, however, that "conditions in export markets, though improved, are still difficult," and they are obviously worried about the level of their prices in these markets. There seems to be less worry about the course of trade in the board room of British Celanese, but this company did not receive so hard a knock as did Courtaulds last year, for it is far less concerned with the production of rayon staple fibre. The directors heave a sigh of satisfaction rather than of relief about the improvement in trade in the last six months of the financial year (when almost all the group's profits were earned) ; they report that turnover in the first quarter of 1953 was considerably higher than in the corresponding quarter of 1952 and that since the end of the financial year earnings have improved still more. There is, in short, a flourish of hope as well as of expectation in the trade's current advertisement slogan that "This is rayon year." But it remains to be seen whether the hope can be completely fulfilled until the price of viscose rayon yarn at home has been adjusted to the fall in the price of the industry's basic raw materials.

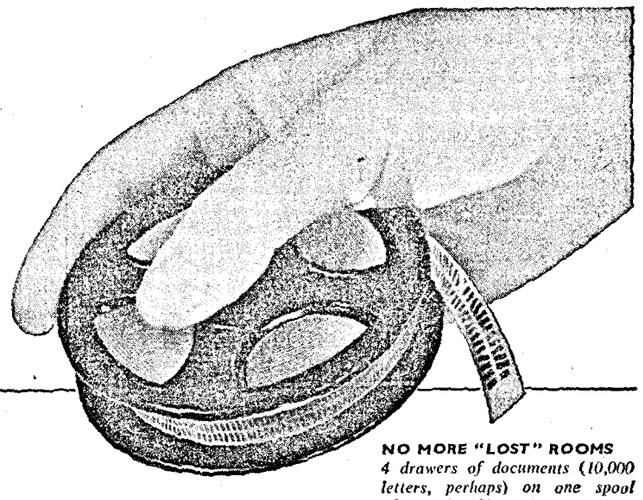
Trade Gap Grows

PRELIMINARY trade figures for May show, as in April, an increase in imports, little buoyancy in total exports, but a continued high level of exports to North America. Hence the May figures also reveal a further slight widening of the trade "gap." The cif value of imports during May is provisionally estimated at £296.4 million, or approximately £3 million more than in April and £24 million more than the monthly average of imports for the first quarter of this year. Total exports for May, valued fob, are estimated at £218.9 million, being approximately £5 million less than for April and almost unchanged compared with the monthly average in the first quarter of the year. Figures for May are for 25 working days, those for April for 24 working days, and both months were affected by holidays. The excess of imports valued cif over total exports valued fob for May is £77.5 million, or £8 million more than in April and £23.6 million greater than for the average over the first quarter of the year.

Exports to North America amounted to £28.2 million, £1.6 million less than for April, but £4.1 million better than the monthly average for the first three months of the year and £5.3 million better than the monthly average for the whole of 1952. As in April, exports to Canada in May, at £14.8 million, were slightly higher than exports to the USA at £13.4 million.

Blame for the *Princess Victoria*

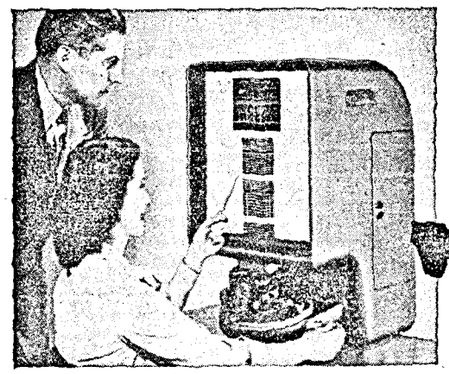
THE motor vessel *Princess Victoria,* which sank in the Irish Sea on January 31st with the loss of 133 lives, was unseaworthy, and "the loss of life in the disaster was caused or contributed to by the default of the owners and managers"—the British Transport Commission. Full copies of the 30,000-word report by the Ministry of Transport court of inquiry issued in Belfast last week have still to be studied in London. But this main finding of the court is measured, categorical and shocking.



The court found that the vessel was not seaworthy because the stern door to the car space on the freeboard deck, and the water-clearing arrangements on that deck were inadequate. An incident causing damage to the stern doors in November, 1951, had not been reported (as is required by the Merchant Shipping Act), and precautionary steps had not been taken following this damage. It appeared, according to the court, that it was beyond the comprehension of the designers, owners and managers of the *Princess Victoria* that sea water could ever be shipped aft in appreciable quantities. Yet there is no evidence that the following sea that broke open the stern doors was an exceptional one: "if the owners and managers of the ship had given the matter careful consideration they would have known that sooner or later seas would have been encountered which would subject those doors to severe trial."

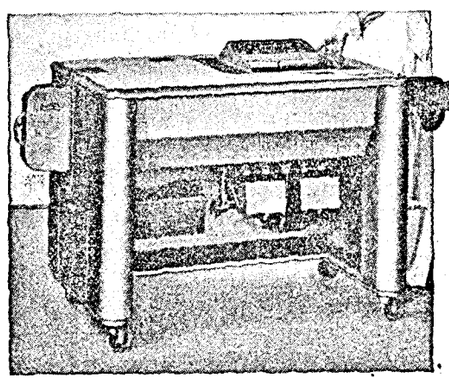
The court spoke of "the evils of remote control" in this case. When the master of the ship required advice or assistance from a higher authority it was necessary for him to telephone his head office at Euston, 400 miles away. One of the managers of the ship told the court that there was no one in the whole organisation whose sole duty it was to look after the well-being of the structure of the ships. Suggestions were made in 1949 and again in August, 1952, to the ship's managers by its officers that larger scuppers were required to clear the possible flooding of the car deck ; but no action was taken. No extra scuppers were installed, and the owners and managers were content with repaired doors ; after the 1951 incident, indeed, the ship was allowed to make three passages with the stern doors in a damaged condition. "There are, 'the court observes,' no exculpatory circumstances disclosed in the evidence."

Tin Truce Talks Open



REPRESENTATIVES of tin producing and consuming countries who compose the Tin Study Group Working Party now assembled in Brussels were thrown into opposing

Microfilm those records and save . . .



NO MORE "LOST" ROOMS
4 drawers of documents (10,000 letters, perhaps) on one spool of . . . microfilm.

space Today, finding floor-space is an office-manager's headache. He knows that document-storage on the old plan eats up costly square feet that could be put to better use. The saving in space alone that microfilm gives is over 99%. Astonishing? No: simple mathematics; because thousands of business documents (approximately 2 cwt.) can be recorded with photographic accuracy on just one roll of microfilm very little larger than a 20-cigarette packet. This is less than one per cent of their normal filing space!

NO MORE PAPER-CHASES
Hours of search saved! The Reader throws up the document you want in a few seconds on . . . microfilm.

time Do your employees know what "record-control" really means? Think, for example, of the time they must waste in tracking down one document to a particular transfer-box and then returning it to its right place after use. Stored on microfilm, every record that you need is on hand, clearly identified. In a few seconds it can be projected as a clear, original-size image on the screen of the Burroughs Reader. No photographic skill is required to make prints of an image to its original size.

NO LOSSES—NO FIRE-HAZARDS
The Recorder can photograph documents back and front simultaneously or one side only on . . . microfilm.

money The eventual economies made possible by installing Burroughs Microfilm Equipment are practically limitless. The three compact units—Recorder, Processor, and Reader—give you a complete storage system for all your documents; a system that will help and accelerate the work of everyone concerned with your business—management, office staff, auditors, etc.

Like all Burroughs Equipment, its operating efficiency is guaranteed by Burroughs Service. For users who do not wish to process their own film, Burroughs maintain, in addition, a speedy Processing Service.

CALL IN Burroughs ON *microfilming*

camps when war in Korea in 1950 upset the commodity markets. In the new international political atmosphere, they may feel more disposed towards agreement on long term marketing arrangements—if it is to be a more settled world. At the International Tin Study Group meeting in London last March the Americans agreed to participate in the working party—in itself a sign of co-operation. The meeting in Brussels will re-examine the proposals that failed to win acceptance at the United Nations Tin Conference in Paris in 1950—proposals which included the formation of a tin council representing both producers and consumers and the creation of a buffer stock.

The continuing excess of production of tin over consumption is the main reason that is prompting producers to seek an international agreement, and they are particularly fearful of what may happen when stockpiling comes to an end. A year ago, the London cash price for tin was around £975 a ton. When the study group met in March the price had already fallen to £930, and it is now about £677 a ton. Commodity agreements, according to the now fashionable conception, should not aim at a rigid stabilisation of prices, but rather at preventing sudden and drastic price movements. If this is to be the guiding principle in tin, the nearer its price appears to approach rock bottom, the more receptive should the consumer countries in Brussels be to join proposals for an international agreement. If so, there may be work for a new United Nations Tin Conference in the autumn.

Lower Kaffir Dividends

THIS summer's array of Kaffir dividends—including for the first time a uranium dividend—were roughly in line with recent forecasts in the market. In general, as the table at the bottom of this page shows, they were lower than those paid last December; in the last six months Kaffir profits have inevitably been squeezed between the decline in revenue from premium gold sales and the rise in operating costs associated with the shortages of native labour and of electric power. Since some of the mines will ultimately hope to make good this loss in revenue from the sale of uranium, the market was particularly pleased to welcome the first uranium dividend—from West Rand Consolidated. This company raised its dividend from 1s. 6d. to 1s. 9d. on each 10s. share, despite the fact that its earnings from gold-mining in the last six months must have been falling; the extra 3d. on the half year's dividend accords fairly well with the director's previous estimate that the annual net profits from uranium should be at least equivalent to between 9d. and 1s. on each share.

Investors were also well pleased with the maiden dividend (of 6d. on each 10s. share) from West Driefontein, particularly in view of the chairman's warning last November that it might not be possible to declare a dividend in the current year owing to the heavy cost of the company's development programme; this early dividend must reflect a rapid increase in profits from a mine that produces the highest grade ore on the Rand. There were, of course, some nasty shocks as well as pleasant surprises in the dividend list. The market was especially disappointed with the reductions in the dividends of City Deep and Vlakfontein as well as with the absence from the list of payments of Rose Deep, an old mine where there is little hope that the grade of milled ore can be raised.

Sales after the Budget

THE effect of this year's budget on retail sales has been slight; only a small proportion of the goods that go to make up the monthly returns now attract a large burden of tax, so there was little inducement to delay purchases before the budget in the hope of considerable concessions. The general level of retail sales therefore shows no special change between April and May. Sales of food did not move at all, the index staying at 132 (1950=100), ten points above its level in April, 1952. Sales of all other types of goods showed a slight variation according to the type of shop, the only noticeable movement being in the sales of goods other than food by the co-operatives, which dropped from 106 in March to 100. But in no case did any of the shops record a substantial difference between the value of their sales this April and the level twelve months before. The value of stocks was 7 per cent lower than in April, 1952, the same difference that was reported in March.

. Sales in fact followed an established seasonal pattern ; and the only major departure from it was in returns for the type of goods grouped together in the hardware, radio and electrical class. While saucepans and cookers are tax free, the majority of other household capital goods attracted tax before the budget at the rate of 66⅔ per cent, which made an appreciable addition to their already substantial selling price. It is these categories that feel the most heavily any tendency to postpone purchases of highly taxed goods until after the budget. The budget cut the rate of tax on these goods to 50 per cent, and sales rose in response. The increase recorded between March and April, from 109 to 112 for big shops, does not at first sight appear very significant, but the index is 21 points above the level for April, 1952. Most of this improvement in trade seems to have gone to the department stores ; the independent shops reported a drop of two points in their hardware sales which, at 105, are only two points higher than in April, 1952. These independent shops are the only ones to send in separate returns for radio and electrical goods, and while their April sales, at 133, are 3 points lower than those for March, and 26 points lower than in February, they are 28 points higher than in April, 1952. The combined value of radio and television receivers sold by the manufacturers to retailers has risen from £5 million in March to £8 million in April, compared with little more than half that sum in April, 1952. This suggests that the full post-budget recovery in radio and television sales may not be felt until May. Whether such heavily taxed items as refrigerators, fires and washing machines have shared in this recovery seems more doubtful. Sales of " motor and cycle accessories, cycles, petrol, etc.," reached a figure of 142 in April, 13 points higher than the year before.

Cotton Imports as Before

THE report of the Cotton Import (Review) Committee, the second cotton committee over which Sir Richard Hopkins has presided, was published this week. Its main conclusions, unanimous notwithstanding the various industrial interests represented, including the trade unions, are that the present method of importing raw cotton into this country, with minor modifications, must continue for another twelve-month season. Over that period the Raw Cotton Commission should continue to provide cover for all importers and users of cotton to be consumed in this country, though the merchanting and cover accounts of the Commission should be separated. But, finally, the committee finds that " it is intrinsically undesirable that cover for private trade should be provided at the risk of public funds, and that the time has now come for this issue to be faced."

Like the earlier Cotton Import Committee in 1952, the committee had to examine import arrangements in the light of the foreign exchange position. It welcomes the fact that raw cotton from all non-dollar sources can now be imported without restriction, but admits the necessity that dollar cotton for some time to come will be subject to foreign exchange limitation. The committee recommends that importers shall again—for a second year—be free to choose whether to import privately or through the Raw Cotton Commission. At present about 30 per cent of imports are on private account, but if the percentage were to increase considerably the Raw Cotton Commission might not find it easy to continue its functions, and in that case the committee recommends that those who " contract in " to buy through the Commission should have a second choice to " contract out " completely or partly in respect of any type of cotton. Contractors-in could not ask for fairer treatment.

The committee regards cover arrangements as necessary for the cotton industry, but does not think there is time enough between now and the opening of the next buying season in September to reconstitute a cotton futures market. It therefore proposes that for the next season the Cotton Commission should continue to give cover equally for importers using its facilities or buying privately, provided there is an insurable interest and that the cotton covered is for consumption within this country. Certain proposals are made for improving the cover system, and for protecting the Commission. Various methods of private cover were brought to the notice of the committee which recommends that they should be examined with a view to finding an alternative to cover from public funds within the next twelve months.

Disposing of Government Zinc

TALKS have now begun between the Ministry of Materials and the trade to arrange the second round of the orderly disposal of the Government's stocks of zinc. Before private trading in zinc was resumed at the beginning of this year, the Ministry disclosed that Government stocks amounted to 135,000 tons and that 24,000 tons would be sold back to United Kingdom and other Commonwealth producers of the metal ; it also announced a scheme for selling Government zinc through the London Metal Market at a rate of not more than 4,000 tons in any one month.

These arrangements were to be examined after six months. They have worked smoothly and the Ministry states that after placing an undisclosed amount of zinc to strategic reserves it will have 70,000 tons remaining for sale. World production is now running at the rate of about 2 million tons a year and the gradual disposal of 70,000 tons should not disturb the market. Disposal could continue as at present, at a rate of not more than 4,000 tons a month, through the London Metal Market ; but the Government, aware that the London market and European demand are at present sluggish, would no doubt welcome suggestions from the trade for disposing of some qualities of the metal through other channels and at better prices. This may not be easy to contrive.

SHORTER NOTE

The word " sound " was omitted from a statement on page 753 in *The Economist* last week that the BBC spends probably a fifth of its licence revenue on television services. In 1951-52, the last year for which figures are available, the BBC had a net revenue of £13 million after deducting 7½ per cent of the gross licence revenue to cover Post Office expenses. The number of licences current at the end of April suggests that the present figure may be nearer £14 million, but 15 per cent of this is taken by the government. This leaves the BBC with a probable net income of £3.5 million from television licences and £8.4 million from sound radio licences. About a fifth of this latter sum, it is believed, is spent on the television programmes in addition to the revenue from television licences themselves.

BRITISH CELANESE LIMITED

Owing to the change of Accounting date to the end of March, the Accounts cover a period of nine months only and the Directors have, therefore, decided not to pay an interim dividend on the Ordinary Stock on this occasion. The Report and Accounts for the nine months ended 28th March, 1953, contain the Directors' recommendation for the payment on 25th July, 1953, of the following dividends to Stockholders registered at the close of business on 17th June, 1953 :—

A Participation dividend of 2½% actual (less Income Tax) on 7½% Participating Second Cumulative Preference Stock in respect of the year ending 30th April, 1953, and

A First and Final dividend of 12% actual (less Income Tax) on Ordinary Stock in respect of the nine months ended 28th March, 1953.

The proposed dividend on the Ordinary Stock is equivalent to a rate of 16% for a full year.

The following details are extracted from the Report of the Directors and audited Accounts for the nine months ended 28th March, 1953, which will be posted to Stockholders on or about 23rd June, 1953.

** Includes dividend £81,267 paid on £2,211,333/10s. Stock in compensation for restricted dividend in previous year.*

Turnover for the six months to 31st December, 1952, was substantially lower than that for the corresponding period of the previous year. Turnover for January to March, 1953, however, was considerably in excess of that for the corresponding three months of the previous year and the monthly average was much higher than that for the six months ended 31st December, 1952, reflecting the improvement in trading conditions to which the Chairman referred at the last Annual General Meeting.

As intimated by the Chairman at the last Annual General Meeting only a small profit was made in the first three months of the period now under review. Earnings improved progressively during the last six months of the period and, therefore, practically the whole of the consolidated net profit of £1,841,346 before taxation was earned during these last six months. Earnings have further improved in respect of the period which has elapsed since 28th March, 1953.

Profits earned after 28th March, 1953, will be relieved of any charge in respect of redemption of Funding Certificates as full provision at that date has been made for the redemption of the balance of Certificates then outstanding.

LONDON, W.1. *12th June*, 1953.

Company Notes

FINE SPINNERS AND DOUBLERS. At the end of last December, when the interim ordinary dividend of Fine Spinners and Doublers was reduced from 5 to 2½ per cent, the directors referred to the "dire effects of particularly adverse trading conditions." Just how dire these effects were is now revealed in some detail in the company's preliminary profits statement for the year to March 31st last. The group's gross income fell by nearly two-thirds—from £4,387,337 to £1,586,318—and it is quite clear from this statement that the slight improvement in trade towards the end of the calendar year (to which the directors referred in their interim report) has failed to heal the scars of the earlier recession. The parent company's profits slumped from £3,572,069 to £1,053,074, and the company's subsidiaries certainly fared no better; their profits are returned at £533,244, compared with £815,268 in 1951-52, but these profits are shown after the transfer of £458,508 (compared with a mere £19,417 in 1951-52) from reserves provided for stock depreciation.

These reductions in gross profits have, of course, been offset to some extent by a fall in the provision for taxation—from £2,274,567 to £407,414. Even so, net profits at £337,094 are not much more than a quarter of the net profits of £1,205,058 that were available for appropriation at the end of March, 1952. In these circumstances it comes as something of a surprise (though, for shareholders, a pleasant one) that the directors have decided to recommend the same final equity dividend of 7½ per cent. This means that the full year's distribution has been reduced only from 12½ per cent to 10 per cent. But the payment of over £300,000 in equity dividends has meant that nothing could be ploughed back into the business; in fact, the consolidated carry forward has been reduced by nearly £69,000, compared with an addition to

	Years to March 31, 1952	1953

this carry forward of £48,000 and an appropriation of £700,000 to a general reserve in 1951-52. Although the company's trade should now be improving, it remains to be seen whether the directors will consider it their duty to reinforce these reserves again before restoring the equity dividend to 12½ per cent.

★

ENGLISH SEWING COTTON. Last year was just as gloomy and testing a time for English Sewing Cotton as it was for Fine Spinners, but its shareholders have escaped with the same dividend as before. The preliminary profits statement for the calendar year 1952 shows that the group's revenue was virtually whittled away last year—from £1,474,658 in 1951 to a mere £65,177; this profit is returned after including the receipt of £213,093 (compared with £314,050 in 1951) from the American Thread Company, but also after providing £564,215 (compared with £132,109) against the fall in stock values. The recession in trade and the collapse in profits has not been confined to this country for the net earnings of the American Thread Company are shown to have fallen from $2,253,049 to $92,137.

At home, the English Sewing Cotton Company has not had to pay any taxes (compared with a provision of £749,582 in 1951) and, in fact, £11,771 has been written back into the profit and loss account as "United Kingdom taxation recoverable." The parent company's share of the group's revenue is shown to be £34,005 (against £624,001) and once net dividends from subsidiary companies of £49,267 (against £46,090) have been included the total revenue of the parent company is returned at £83,272, compared with £670,091 in the previous year. In addition, £250,000 is written back from the stock reserve (against an appropriation of £500,000 to this reserve in 1951), but effectively the directors have merely transferred this sum to a general reserve by making an appropriation of exactly the same amount—£250,000—from the company's net income.

The decision to pay out £135,000 in maintaining the dividend of 12½ per cent to equity shareholders has therefore been made possible only by reducing the carry forward from £189,645 to £95,502. On the assumption—and, as trade is improving, it seems a fairly safe assumption—that the dividend of 12½ per cent will be repeated again this year, the yield on the £1 ordinary stock units at the current price of 38s. 6d. xd is 6½ per cent.

★

NCHANGA. The benefits that have accrued to shareholders from the migration of the copper companies to Rhodesia are made very apparent in the preliminary report of Nchanga for the year to March 31st. This company, which is effectively controlled by the Anglo-American Corporation (Rhokana holds £2,355,000 and Rhodesian Anglo-American £1,490,581 of its equity capital of £7 million), has again raised its ordinary dividend—this time from 50 to 75 per cent. The company's normal gross profits have risen from £8.8 million to £14.0 million; taxation (although £1.6 million higher than a year before) has taken only £5.3 million of this and net profits have risen by £2.5 million to £8.7 million. If these profits had had to bear British taxation the company, in view of its heavy development programme, would probably have had to have kept dividends on a tighter rein than this.

As it is, the increase in net profits has enabled the directors not only to step up dividend payments from £3,500,000 to

	Years to March 31, 1952	1953

£1 ordinary stock at 122s. 6d. yields £12 5s. per cent.		

£5,250,000 but also to raise total profit appropriations from £2,750,000 to £3,100,000. The whole of this sum has been appropriated to a general reserve; in 1951-52, £2 million was transferred to this reserve and £750,000 to a sales equalisation reserve. The directors add that the appropriation to the general reserve provides a further instalment of the finance needed to meet the capital expenditure programme that is now being carried out. So far, the need to finance this programme has not prevented dividends from rising, but if the freeing of the copper market in Britain is followed by a new fall in copper prices, it is a factor that will have to be kept closely in-mind.

COMPANY MEETINGS

MARKS AND SPENCER, LIMITED

CONTINUED INCREASE IN TURNOVER

IMPROVEMENTS IN MERCHANDISE

MODERNISATION OF STORES

The twenty-seventh annual general meeting of Marks and Spencer, Limited, was held on June 11th at 82, Baker Street, London, W.1.

Sir Simon Marks, DSc (chairman and joint managing director), who presided, said:

Ladies and Gentlemen,—May I take it that in accordance with customary practice the directors' report and the accounts as circulated be taken as read?

PROFIT AND LOSS ACCOUNT

I am glad to report that our profits for the year, after taxation, have amounted to £2,466,000 compared with £2,206,000 for the preceding year.

The sum of £4,275,000 has been provided for taxation compared with £2,790,000 a year ago.

With the amount of £4,506,000 brought forward from last year there is available for distribution £6,972,000.

Your board propose a final dividend of 35 per cent, making 50 per cent, less tax, for the year on the ordinary and "A" ordinary capital, requiring in total the sum of £1,227,000.

After the transfer to the general reserve of £1,500,000 and approval of the dividends and other appropriations recommended, the carry forward to next year will be £4,051,000.

RESERVES

Following the capitalisation of reserves which was made in June of last year, the reserve funds of the company amounted to £8,793,000. With the addition of £1,143,000 from the profits of the year they now amount to £9,936,000.

PROPERTIES AND EQUIPMENT

During the year we continued modernising our stores and rebuilding those destroyed during the war.

Properties stand in the balance sheet at £8,940,000 after capital expenditure of over £500,000 and have been depreciated at the usual rates. This figure is obviously substantially below their present-day value as most of our properties were acquired before 1939. They represent, therefore, a considerable capital reserve. Our rental charges are based on the original cost, and thus our profits benefit accordingly.

Fixtures and equipment stand in the balance sheet at £2,652,000 after providing £569,000 for depreciation—an increase of over £300,000 on last year. This is part of the investment in our programme of modernisation.

SUBSIDIARY COMPANIES

Advances made to our subsidiary companies have fallen from £4,249,000 to £1,990,000.

The stocks of the subsidiary companies form the pipe-line for a large part of the cloth used in our business. They now amount to £1,148,000 compared with £2,915,000 a year ago.

CASH AND SECURITIES

Cash balances and investments in Government securities and in tax reserve certificates amount to £7 million—an increase of £5,500,000.

GENERAL SURVEY

I am pleased to record the continuing progress of the affairs of our company. Our turnover for the past year was £85 million—an increase of 16 per cent over the previous year.

It was the first full year of the operation of the "D" Scheme, which gave us freedom to transform our merchandise values by the creation and utilisation of better and finer quality materials. After a period of thirteen years of control by Government regulation we were in a position, at long last, to exercise our initiative and accumulated experience in presenting our customers with a wide range of well-styled, well-finished, attractive garments at prices they could afford to pay. The expansion of our business reflects the increasing goodwill of our public—an asset which we cherish and greatly value.

It is our aim to satisfy the growing needs of our customers with moderate and lower levels of income for inexpensive goods of quality.

Our customers are quality and style conscious. They understand values, for they are most discerning in their purchases.

MERCHANDISE DEVELOPMENT

There have been some quite remarkable improvements in our goods, which stem directly from the fact that we are now increasingly able to use better, finer, and newly developed materials.

Our merchandise development section concentrates on the development and production of a wide range of suitable woven and knitted materials for our garment manufacturers. Before the war we had found it essential to centralise the purchase of our basic cloths in order to standardise quality and to organise the production of the great volume of grey cloth needed. Satisfactory standards were achieved, but that important activity was halted by the war, when a general decline in quality set in throughout the industry. As soon as conditions permitted, we took up this work again and have already effected considerable improvements in the construction and quality of our basic materials. We have added many new and interesting cloths.

The printing department, which is responsible for the conversion of the grey cloth into the finished fabrics by printing and dyeing, has made much progress. They study and apply new technical processes for colour-fastness, shrink-resisting treatments, and anti-crease finishes, features which add much to the appearance and durability of our fabrics.

The styling and design centre has been built up to deal with the styling of the garments which serve as production models for our manufacturers. They take into account the trends of fashion which are adapted to meet the tastes of our customers. The grading of sizes is an important part of their functions. This has meant a considerable study, over a long period, to determine the range of sizes required to satisfy our public with ready-to-wear apparel.

Qualified scientists, technicians, and stylists deal specifically and systematically with the various tasks I have indicated. They work in conjunction with our executives, selectors, and merchandisers who are responsible for the organisation and progressing of the production of the vast quantities of goods needed for our stores. The success of these activities depends on the team spirit which, I am happy to say, animates the whole of our organisation.

This preparatory work simplifies and facilitates the task of our manufacturers as it enables them to concentrate their efforts on the orderly production of our goods. These special services are much appreciated by our friends as they supplement their own skills, techniques, and experience.

In our food section we have continued to develop specialised lines of quality and value. A growing proportion of our foodstuffs is sold in attractive hygienic packs which conserve freshness and facilitate handling and speed of service. Important ingredients such as fats and sugar are now more freely available. Our suppliers will be able progressively to utilise these basic raw materials at reasonable prices instead of expensive—and not always satisfactory—substitutes which have had to be used hitherto. In co-operation with our friends, we are now engaged in improving our values and in bringing down the selling prices of many items for which there is a wide demand.

TRIBUTE TO MANUFACTURERS

It is interesting to observe that 90 per cent of our goods are sold at less than 30s. per article, and 43 per cent are still sold under 5s., which price before the war constituted our appeal to the public.

So varied a range of inexpensive goods of quality could not have been evolved without the understanding collaboration of our suppliers, with whom we enjoy a partnership of minds and ideals. Just as we have invested large sums in modernising our stores, so have our friends invested considerable monies in new factory buildings, new machinery and new equipment. They have devoted much effort to the training of specialised labour forces, for we attach the greatest importance to the workmanship and finish for which the brand name of "St. Michael" is a guarantee.

Our friends have a deep understanding of the consumer problem and know that it is the public who are the final judges of value. By introducing new techniques and planned and careful production, they enable us to present a wide range of desirable merchandise. Our market is an assured and growing outlet for their goods, and continuity of production for them is as essential as continuity of supplies to us. This harmony of interests is responsible for the success of our joint efforts. We thank them for their most helpful collaboration which we value most highly.

MODERNISATION OF STORES

We had always taken pride in the appearance of our stores and had tried to make them attractive to our customers. We had maintained our properties in first class condition, but the war years forced us to neglect this aspect of our business.

It has been a major task to make up the leeway. As licences to repair and build became available and building materials freer in supply we set out to restore our properties and modernise our stores.

Modernisation means a radical conversion which has given many of our stores a new look and a new character more in keeping with the specialised goods we are selling. We have spent much on equipment and on specially designed display fixtures and counters. We have introduced modern decorative and lighting schemes, for we seek to create a worthy setting for our goods and to give to our customers the convenience of shopping in attractive surroundings. Our customers have so readily responded to these new amenities that we are encouraged to extend this transformation to the rest of our stores.

It is with pleasure that we can report the rebuilding, since the war, of our bombed stores at Bristol, Clacton, Exeter, Plymouth, Southampton, Sheffield and Yarmouth. New stores have been opened at Leeds, Norwich, Sheffield and Swansea. All our latest conceptions and ideas have been incorporated in these buildings, which are an impressive addition to our chain. Important extensions have been made at 36 stores.

Since the end of the war we have invested some £11 million on the whole of this programme, and further substantial sums will have to be appropriated.

In addition, the sum of £1,250,000 has been invested in new sites for future development and in the enfranchisement of some leasehold properties. The whole of the expansion I have outlined has been met from the company's own resources.

TRIBUTE TO THE STAFF

Our staff now exceeds 26,000. I am sure that you will join with me in thanking them for their services during the year. The board is most appreciative of their loyalty and devotion. Our thanks are due to one and all, whether engaged on the administrative side of our business, or brought by their duties into direct contact with our customers.

I have paid tribute to the team spirit which animates all at head office. It animates equally all employed in our stores. The sales staff take pride in the attractive goods they sell, for they know the detailed care which has gone into their manufacture. By their knowledge of the goods, and their courteous and helpful approach to our customers, they add to our good name and the goodwill we enjoy with the public, as so many spontaneous appreciations from all over the country testify.

We are concerned with the education and training of our staff, for the expanding requirements of our business offer many and varied careers, and organised courses are arranged to advance their skills and prepare them for higher positions.

The ambition of so many to make their career in the business, and the increasing length of service of our staff, is a noteworthy feature. The number who have attained a service of twenty-five years grows from year to year. This is the occasion for an appropriate ceremony at head office marking this important event in their lives.

Our welfare department is devoted to the well-being of our staff, and the amenities which it creates are designed to make their working hours pleasant and congenial. After business hours there are social and other activities for those who care to participate in them. All this adds to their sense of belonging to our organisation and creates an *esprit-de-corps* so important to the success of the company.

Our staff are aware that provision is made, through our pension and benevolent funds, for an appropriate pension to be paid to those who, on retirement, have qualified by their record and length of service. The position of our pensioners is reviewed annually, and any special needs which they may have are taken care of by the company. We regard them still as members of the firm, and in their retirement they enjoy many of the amenities which were available to them during their active careers.

It is because of these growing needs that we propose to increase to £100,000 our allocation this year to the benevolent trust.

The report and accounts were unanimously adopted.

UNITED CANNERS

DIFFICULT CONDITIONS AFFECT PROFITS

MR J. B. DRING'S SPEECH

The twenty-first annual general meeting of United Canners, Limited, was held on June 11th at Boston, Lincs.

Mr J. B. Dring, the chairman, in the course of his remarks said:

In the combined accounts the profit before taxation is £170,489, and after reserve for taxation £69,703. The amount brought forward from last year was £72,577, making a total of £142,280. The final dividend of 20 per cent, together with the interim dividend of 10 per cent, making 30 per cent for the year, takes £34,125 and, after placing £35,000 to reserve, there is a balance of £73,156 to be carried forward to next year.

Without taking goodwill into account, combined assets exceed liabilities by more than three times the issued capital of the company. Current assets exceed current liabilities by £275,000. In our balance sheet, freehold land and buildings at £155,000 stand at a figure which is much less than half their current value. Stocks are considerably in excess of stocks held at the end of the previous year, but are conservatively valued and the higher figure is largely due to shipments of imported canned goods held by your company at that time.

SALES WELL MAINTAINED

During the year 1952 sales were well maintained and were within 2 per cent of sales for the year 1951. As compared with the previous year, there was a reduction of £60,000 in the profit made by the group, and, in explanation of that, I wish to say that the conditions of trade for processed peas during the latter half of last year were difficult, and during that period the company and its subsidiaries did not earn as much profit as could reasonably have been anticipated. The board also found it necessary to increase the allocation for advertising expenditure and the increased cost of advertising accounts for nearly half the reduction in profit.

POSITION OF SOUTH AFRICAN BUSINESS

I have referred to stocks of imported canned goods and perhaps at this point I might make some reference to United Enterprises, the South African company which was founded by ourselves on behalf of the shareholders of United Canners. The main business of canners in South Africa as well as in Great Britain is the canning of fresh fruits and vegetables, and for South Africa this means chiefly the canning of apricots, peaches, pears and pineapples.

Since United Enterprises commenced business in South Africa in 1948, we have acted as their selling agents in Great Britain, but we are not permitted to distribute their pack of canned fruits, although packed under the trade mark "Benedict" registered by ourselves in Great Britain. The Ministry of Food buys the whole pack of South African canned fruits and hands over the pack for distribution to a selected list of firms who were in their view importers in 1939, and whom they describe as first-hand distributors. We ourselves were large importers of canned fruits from South Africa and California before the war, but we are not included in the list. But even if we had never imported canned fruits before the war, the extraordinary position would arise that we could not be permitted to distribute fruits packed by United Enterprises because we had not been distributing them nine years before that company was established in 1948. It appears to me that this is not only an injustice but that the Ministry of Food hold themselves up to ridicule.

TRIBUTE TO LATE MR DAWBARN

Before I conclude my remarks I desire to pay a tribute to our late colleague, Mr J. R. Dawbarn, whose unfortunate death by accident last March was a great blow to us. He had co-operated with us in the development of the business of the company since its formation in 1932, and his services had been at all times greatly valued by the board. During the past year he was also acting as joint managing director of the company. It is with great sorrow that we have to record his death at a comparatively early age when we had hoped that the company would have the benefit of his services for many years in the future.

Mr R. C. Scott, who became a director of the company last August, had also been acting as joint managing director and has now been appointed managing director of the company, and in moving the adoption of the report and accounts I shall ask him in seconding the resolution to give you some further report on the current progress of the company during the present year.

MR R. C. SCOTT'S REMARKS

Mr R. C. Scott, the managing director of the company, in seconding the resolution for the adoption of the accounts, said: It is with great regret that the board has had to accept the decision of Mr Dring to resign as managing director of your company, but he continues to act as chairman, and the company will have the benefit of his knowledge and experience of the trade.

We have now very largely overcome the difficulties which arose in connection with the trade towards the end of last year and sales are running at the same level as in 1951. I feel there is no doubt that when the new season starts in the autumn our sales will be well in excess of last year's figures.

RENEWED DEMAND

The advertising campaign referred to in the directors' report has resulted in a renewed demand for your company's products. There have been excellent sales of the South African produce, which increased our stock figures at the end of last year and, in fact, further orders have been placed and shipments received.

I look forward with confidence to further expansion of your company's business, to which the energy and enthusiasm of our staff contributes so greatly. I would like to add that I greatly appreciate that the same loyalty and ready co-operation from the staff has been given to me as was given to Mr Dring.

The report and accounts were unanimously adopted.

THE BUTTERLEY COMPANY, LIMITED

RETURN OF CAPITAL TO ORDINARY SHAREHOLDERS

GROUND FOR REASONABLE OPTIMISM

MR E. FITZWALTER WRIGHT'S REVIEW

The sixty-sixth annual general meeting of The Butterley Company, Limited, was held on June 16th at the registered office of the company, Butterley Iron Works, near Derby.

Mr E. Fitzwalter Wright (chairman of the board of directors) presided.

The secretary (Mr P. Elliott) read the notice convening the meeting, and the report of the auditors.

The chairman said: Ladies and Gentlemen,—Since I last addressed you we have appointed Mr M. F. M. Wright vice-chairman of the board and deputy managing director. We have done this for two reasons. Firstly in appreciation of the long and outstanding service he has rendered to the company, and secondly, to emphasise the fact that he bears the responsibility of the company's chief executive when I may be absent for any reason. I am sure you will welcome these appointments which give official sanction to a situation which has in fact been recognised in the company for a good many years.

CAPITAL PROPOSALS

When this meeting has been completed, we shall as you know be having extraordinary general meetings to consider, and if thought fit to approve, the scheme put forward by the board for a return of capital to the ordinary shareholders, for the raising of the preference dividend from 4½ per cent to 6 per cent, and for certain alterations in the company's articles of association. I am sorry that even now we cannot complete the matter, and that the return of capital must be regarded as a payment on account of what will eventually be forthcoming. The houses, the land and farms, and certain stocks of small coal known as slurry, still remain to be valued, and until their value is known we cannot put final proposals before you. But you will have noted that we ask for powers to pay back to the ordinary shareholders a further sum not exceeding £810,000, or 9s. per share. What the actual figure will be I cannot tell you. It entirely depends on the amount of the valuations still to be made. We are in negotiation with the National Coal Board in regard to the land and farms, and the slurry. I think it reasonable to hope that we shall come to agreement about the land and farms reasonably quickly, but so far we are very far from agreement about the slurry, and shall almost certainly, I fear, have to seek a valuation from the District Valuation Board and possibly in the event go to a referee.

So far as colliery houses generally are concerned, it became clear that important issues of principle separated the NCB and the claimants, and in order to get guidance the NCB and the Mining Association have agreed to put their cases before an independent Tribunal. The Tribunal has completed the hearings, and its report should be available quite shortly. I am hopeful that thereafter it should be possible to reach agreement with the NCB on the lines laid down by the Tribunal without too much difficulty or delay.

SUCCESS OF COMPENSATION NEGOTIATIONS

That we are able to take the first step in our capital reduction scheme is of course largely due to the success of the negotiations with other Notts coalowners in regard to TS compensation, to which I referred last year. A Tribunal under the chairmanship of Mr John Sparrow was set up, and issued its award in December. Our share was £996,545, which, while it is totally inadequate as compensation for the assets taken over, was I think a reasonably fair share for us to get out of the Notts District sum awarded at Stage II.

Now that the valuations of our TS assets are completed, I should like to say a word in praise of the ungrudging help given to us in the preparation of our cases by former servants of ours who joined the NCB. The only reason for them to have spent the time and trouble they did on our behalf was loyalty to their old company, and I would like to put on record our deep gratitude to them.

INCREASED TRADING PROFIT

Turning now to the accounts and the consolidated profit and loss account, the trading profit shows an increase from £394,670 to £426,056. There is also brought in a figure of £45,141 before deducting tax, representing interest for the year on agreed amounts of compensation, and a further figure of £53,875 after deducting tax, representing interest on compensation for earlier years and the contribution towards the costs of prosecuting our claim made by the Ministry. These figures will, of course, tend to decrease as further amounts of compensation are paid. The balance available after all charges is increased from £136,540 to £175,892, and after providing for dividends either already paid or now recommended, and adding the balance brought forward from last year, we carry forward £299,788 compared with £222,802 a year ago.

I hope you will think this satisfactory. While all departments have been busy, the one which has made the greatest contribution to the increase in the trading profit is the civil engineering department, which has had a very much more successful year. The building section has secured several important contracts for the erection of non-traditional type houses and schools, and others are in course of negotiation. Altogether the value of work done in 1952 was more than double the work done in 1951, and our programme for this year is considerably higher even than last year. I should like to offer my congratulations to Mr Fletcher, not only on the results his department has achieved, but also on his recovery from a severe illness which I am happy to say appears to be complete, and to say that we hope confidently for further improvement in his results this year.

IRONWORKS

All sections of the ironworks worked to capacity, and sales amounting to just under 2¼ million pounds constituted a new high record. We had our moments of anxiety over steel supplies, but the difficulties were overcome, and the position has certainly improved considerably over the past few months. Our overhead cranes and sheet metal presses and guillotines are winning new friends both at home and abroad, and orders continue to come in steadily.

The wagon works produced nearly 1,100 railway vehicles of many varying types during the year, and we secured a contract from the Railway Executive for 5,000 16-ton steel mineral wagons, delivery of which will be spread over the next five years. We are very glad that the Railway Executive decided on this long-term policy, as it enables us to plan production much more confidently and efficiently than is possible with comparatively short-term contracts.

OXYGEN DIVISION

Our oxygen division has made good progress. We have installed a generator in Butterley Works, which will not only produce a considerable saving in costs, but will be useful as a demonstration model. Interest in the plants is widespread, and I feel sure that we have only to put ourselves into the position of being able to offer reasonably early deliveries for orders to flow in. This we are doing by making available additional space at our Codnor Park Works, and by trying to make arrangements with the manufacturers for special deliveries of compressors.

We have done our best to make our full contribution towards the easing of the shortage of bricks which has been widespread throughout the country. All our plants except one have been turned over to the manufacture of facing bricks, and record outputs have been achieved. The new plant at Blaby has been an unqualified success.

EFFECT OF OPENCAST MINING ON FARMS

Turning to the farms, we are becoming increasingly anxious about the effect of opencast coal mining. Nearly half our acreage at Butterley has either been opencast, is now being opencast, or is likely to be opencast in the next year or so. We have considerable experience now of so-called restored land, and even though we do our very best for the land by copious application of farmyard manure and fertilisers, the recovery to reasonable fertility is painfully slow. I have the greatest sympathy for our farms manager, Mr E. B. Jackson, in what must be at times almost a heartbreaking job. And I must tell you that the restoration of this land to full fertility will not only be slow but very expensive, and it may well be that next year we shall be wise to make special provision for it in the accounts.

I must now say a word about the other companies in our group. The Kelvin Company has had another very successful year, and the easing in steel supplies should be of great benefit to it. Hughes and Lancaster has continued to improve, and we now only need a comparatively small increase in the labour force to make these works into a highly efficient producer. In order to help towards this we have applied for and have received a licence to build ten blocks of flats, and we are assured that by having homes to offer them we shall be in a much better position to attract suitable workmen, skilled in the trades we need. Our sand and gravel quarries have had a good year, and we have acquired through our Mugginton subsidiary a neighbouring quarry at Hulland. The two should constitute a very efficient working unit.

THE OUTLOOK

Taking the group as a whole, I believe there is ground for reasonable optimism. But we must realise that the outlook today is very different from what it was even a few years ago. Foreign competition in world markets is becoming more and more marked, and we have to be increasingly on our guard to meet it. Only by offering to our customers terms and conditions at least as good as our competitors can we hope to get business. It is for this reason that we, in company with many other engineering firms, view with the greatest apprehension the continued demands for wage increases and many other concessions which are being made so regularly.

We are often called upon to quote for large contracts which may not be completed for two or three years, and the uncertainty about wage rates and raw material prices makes it very difficult to be prudent as well as competitive. The sooner everybody realises that in this country today rises in wages can only be justified by increases in productivity, the better will be our chances of maintaining our position in the export markets of the world.

THANKS TO STAFF AND WORKPEOPLE

In conclusion I would like to add our thanks to our staff and workpeople for another year of loyal efficient service.

I now have pleasure in moving that the directors' report and balance sheet, which carries with it the directors' recommendation of the payment on July 11, 1953, of a final dividend on the ordinary capital of 6 per cent, less income tax (making 9 per cent, less income tax, for the year), which will absorb £59,400, and the carrying forward of the balance of £299,788, be received, approved and adopted. After it has been seconded, any shareholder can ask any questions before the motion is put.

The report and accounts were adopted; the retiring directors, Mr M. F. M. Wright and Mr P. N. Wright, were re-elected; the auditors, Messrs Price Waterhouse and Company, were reappointed, and the proceedings terminated with a vote of thanks to the chairman.

At the subsequent extraordinary general meeting, following meetings of each class of shareholders, resolutions to repay 10s. per share on the ordinary capital and increase the rate of dividend on the preference capital from 4½ per cent to 6 per cent were carried unanimously.

HARLAND AND WOLFF, LIMITED

LAUNCHINGS TOTAL 162,000 GROSS TONS

PROBLEM OF CONSTRUCTION COSTS

SIR FREDERICK E. REBBECK'S REVIEW OF WIDESPREAD ACTIVITIES

The sixty-eighth annual general meeting of Harland and Wolff, Limited, was held on June 11th at the registered offices of the company, Queen's Island, Belfast, Sir Frederick E. Rebbeck, KBE, DSc, DL (chairman and managing director), presiding.

The secretary, Mr F. V. Spark, CBE, ACA, read the notice convening the meeting and the report of the auditors.

The chairman said: As the statement of accounts and the directors' report have already been in your hands for some time, I propose with your permission to take them as read. (Agreed.)

From the figures before you it will be seen that the consolidated net profit after depreciation and taxation is £363,355. To this figure there is added a sum of £55,000 arising on settlement of claims under War Damage Act Part II. The resulting figure of £418,355 enables the directors to make the same dividend payment on the ordinary stock as for the last few years and add to the reserves and the carry forward on profit and loss account a sum of £106,709 in the accounts of the parent company and £39,389 in the accounts of the subsidiary companies.

The consolidated total of reserves and undistributed profits now amounts to £4,724,012.

GREATER VOLUME OF WORK EXECUTED

The amount of work carried out during the year was in excess of 1951, but the reduction in profit is entirely due to the fixed price contracts taken in the early months of 1950 to which reference was made last year. Owing to the impossibility of obtaining our normal supplies of steel, more particularly steel plates, and to the difficulty of securing delivery from sub-contractors of auxiliary equipment, in the manufacture of which steel is incorporated, the completion of these vessels was delayed, with the result that their construction was thrown into periods when higher costs were in operation. They have now all been completed, and provision has been made in the accounts submitted for those completed in 1953.

WORK IN HAND

This is the thirteenth successive year in which the vessels launched from the company's works have exceeded 100,000 gross tons, the total gross tonnage being 162,000, the largest in the United Kingdom. More than 70 ships are at present under construction, fitting-out, or on order and these include large passenger vessels, six large tankers of between 30,000 and 32,000 tons deadweight for British and Norwegian owners, a large number of smaller tankers, Diesel passenger ferries and other small craft.

Naval work includes the light fleet carriers *Centaur* and *Bulwark*, frigates and coastal minesweepers for HM Navy and the light fleet carrier *Bonaventure* for the Royal Canadian Navy.

As mentioned in the directors' report, the Admiralty entrusted the company last year with the planning, building and management of a works for the construction of small naval craft. This establishment, located on a site near the Queen's Island and comprising three covered slipways, has been completed and the building of the first three vessels is proceeding satisfactorily.

DIVISIONAL OPERATIONS

The marine engineering division, which manufactures both propelling and auxiliary engines, has been fully occupied during the year. Our latest type of Diesel engine is giving complete satisfaction in service, and is being supplied in increasing numbers. Our latest orders also include several important turbo-charged Diesel engine installations.

The land engine division is engaged in the manufacture of a wide range of engines, including gas and air compressors for oil refineries at home and abroad. There is also in hand a gas turbine plant for the large sewage station at Mogden, which for the last seventeen years has been operated by an installation of seventeen Diesel engines made by us.

The Steel Constructional Division at Belfast has been fully employed during the year and the orders in hand will keep the division well occupied for some time to come.

The electrical division has also been well employed on electrical installations of both naval and merchant vessels. Generators for direct and alternating current, motors, control gear, switchboards, etc., have been manufactured for all classes of vessels, and also for export to Australia, India, South Africa and other parts of the world.

Once again I am able to report that our Scotstoun Works have been employed up to the capacity of the limited amount of labour available on the manufacture of turbines, etc., for hydro-electric installations at home and abroad. This machinery is being built to the designs of The English Electric Company under a working arrangement made some time ago between the two companies.

The repair works at London, Liverpool and Southampton have been well employed throughout the year. Of particular interest is the extensive refit and conversion of HMS *Wrangler*, which was completed by the company at Liverpool. As usual a certain amount of ship repair work was also undertaken at the company's shipbuilding and engineering establishments on the Clyde, whilst the repair division at Belfast was well employed throughout the year.

THE OUTLOOK

While it is satisfactory to know that the company has an extensive programme of work in hand, there is not in the order book a sufficient number of passenger ships to enable the finishing trades to be fully employed. No new shipbuilding orders of any magnitude have been placed in British shipyards for some time, and no doubt you will have seen in the press recently the statements made by the chairman of some of the leading shipowning companies calling attention to the high costs of new construction, and stating their intention to defer the placing of further orders, and even to seek cancellation of outstanding shipbuilding contracts, should costs rise further. This question has been giving the industry the greatest possible concern, and it is of the utmost importance that every effort should be made not only to avoid further increases, but to reduce present costs. This requires the co-operation of managements, suppliers of materials, and every employee, and such co-operation is the only way to ensure the continuance of a full order book.

As indicated in the report, since the close of the year under review, Dr Denis Rebbeck, CBE, MA, MSc, JP, has been appointed deputy managing director.

The company's property and plant have been well maintained during the year.

I take the opportunity to thank the members of the staff and workmen who worked well throughout the year.

The report and accounts were adopted; the proposed dividend was approved; the retiring directors, viz., Mr H. C. MacEwan, Mr W. H. Park, Mr J. S. Baillie, Mr H. R. Humphreys and Mr N. McCallum, were re-elected. Messrs Price Waterhouse & Company were re-appointed auditors and their remuneration was fixed.

The meeting terminated with a unanimous vote of thanks to the chair.

DUNLOP RUBBER COMPANY, LIMITED

FACTORS AFFECTING TURNOVER

LORD BAILLIEU'S REVIEW

The fifty-fourth annual general meeting of the Dunlop Rubber Company, Limited, was held on June 15th in London.

The Rt Hon Lord Baillieu, KBE, CMG, the chairman, in the course of his speech said:

Two events of great significance for the future of the country and of its industry occurred during 1952 and in the early part of this year. First, the built up demand for most products which was in evidence during the greater part of the war and since has been largely satisfied. Second, the trend of the steady increases in the taxation burden of industry which also persisted throughout and since the war was at last reversed.

CHANGE TO BUYERS' MARKET

The change to a buyers' market in this country and abroad has been directly reflected in the report and accounts for 1952 in the following ways:

The volume and value of our trading was reduced, reflecting a reduction of approximately 27 per cent in our net balances from trading; the investment in inventories was substantially reduced; there was a considerable reduction in our working capital requirements, notably in the form of bills and overdrafts; the margin of profits on which our group operated in 1952 was lower.

As you will have seen from the directors' report, the group turnover for 1952 at £250 million was £34 million less than in 1951. It was, however, £53 million greater than the turnover for 1950 at £197 million. I think it is important in considering those movements to remember that the years 1950 and 1951 were the years of peak inflation when prices of our main raw materials were abnormally high and that in 1952 those prices fell sharply. It is in that setting that we have to view the results and, as I will indicate later, these changed conditions created many difficulties and problems for the management of your company's affairs.

PRICE FLUCTUATIONS

The reduction in turnover was due to lower selling prices of many of our products and also to a slight reduction in the volume of goods sold. The lower volume reflected the two-fold effect first, of the advance buying in 1951 which occurred after the outbreak of the Korean war and, second, the buying resistance in a period of falling prices such as occurred in 1952. Industry is always confronted with difficult operational and financial problems in a period of rapidly fluctuating and falling prices.

The magnitude of the problem facing our company is simply illustrated by the course of prices for raw materials throughout the year. At the end of 1951 the price of rubber was 41d. per lb and a year later, in December, 1952, it was 27d., i.e., a fall of 34 per cent. In other words a ton of rubber worth £383 in 1951 had dropped in value to £252 at the end of 1952. Such a severe and rapid price decrease disturbs the normal buying habits of the public, but manufacturers' inventories of raw materials and of finished goods are at the higher cost levels previously ruling.

INDUSTRY'S PROBLEM

The problem of maintaining sales volume and at the same time avoiding excessive inventory losses is not easily resolved, but it is one which must be faced by every manufacturing industry in such a period.

You will see that in the directors' report we state that full provision has been made in the results for the year for the adjustment of inventories necessary in such a period of falling prices. These adjustments were absorbed in the profit and loss account and we did not require to draw upon our reserves.

You will see, too, that as a result of the reduction in inventories our working capital requirements were considerably reduced. We enjoyed the full support of banks and financial houses during 1951, when large sums had temporarily to be provided. At no time have we approached the limit of the borrowing powers with which you entrusted your board. The lower prices of our principal raw materials have enabled us to reduce the capital employed and thus to regain greater financial flexibility.

LOWER PROFIT MARGIN

The lower margin of profit again directly reflects the conditions existing in 1952 both here and abroad. Profit for the year was at 4.7 per cent of turnover before charging tax and 1.9 per cent after tax. This is lower than the margins earned in 1951 and considerably lower than the figures for 1950, namely, 9.2 per cent and 3.4 per cent respectively. Out of this margin we have to provide a reasonable return to shareholders and a sufficient allocation to reserve to maintain our productive capacity and volume of business. In 1952 tax provision was £5,275,000 and the reserve allocation was £520,000. This latter we consider insufficient to provide for the proper maintenance of our productive facilities and for the normal expansion of our business.

In my reviews of recent years I have mentioned the grave concern with which industry viewed the continued high level of taxation. Now for the first time since the war the tax burdens have been eased and we trust the trend of recent years has been finally reversed. The actual relief, present and prospective, provided in the Budget is still small, but it is a first and important step towards stopping the progressive erosion of the resources of industry. Whilst much remains to be done to strengthen the financial and productive basis of industry, we welcome the accumulating evidence of an important change of direction in Government policy towards industry.

We seem at last to be shaking ourselves free from the controls and restrictions and the negative thinking which is so often generated by a long war. Controls and licences are being progressively removed; shortages over a wide field of raw materials and of consumer and capital goods seem to be slowly disappearing; industry and the individual are being thrown more upon their own resources; and incentives are being revived to call forth the latent resources and energies of the nation. We trust the Government will not weary of well doing. I am confident that industry itself will recognise the continuing challenge of this change of direction in Government policy.

CHALLENGE OF GROWING FREEDOM

The growing freedom we enjoy and the incentives now appearing just above the horizon are a further call to industry to continue in its task of increasing its own efficiency and of making its full contribution to the national need.

As we have consistently done since the close of the war, we must continue to seek every opportunity of increasing turnover and exports, of raising productivity, of achieving greater efficiency and lower costs and of re-awakening in its widest interpretation the arts of salesmanship. These constitute a grave and weighty challenge to the whole of industry.

If we succeed we shall be putting real value into the pound sterling; we shall be increasing the net worth of every pay packet; and we shall be helping to re-create a stable and solvent Britain.

We all know that the governments of the free world are faced with the dilemma of providing finance for essential defence needs and for the minimum requirements of the modern state without levying too heavy a toll on productive effort. We may continue to hope that a supreme act of statesmanship will relieve the world of its growing tensions and financial burdens. Meanwhile, there lies upon government and industry alike the inescapable duty, by wise and prudent husbandry, of nourishing and sustaining our national resources. This devolves upon each of us a rigorous control of all expenditures, linked to a courageous policy of developing present and of opening up new sources of national wealth. Only then can we hope to maintain the living standards and the level of employment we now enjoy.

EXPORTS AND OVERSEAS BUSINESS

The contribution to our results for the year by our export and overseas business has again been substantial. You will see from the reports on individual territories, which are included in the review of divisions and subsidiary companies, that our trading abroad was at a slightly lower level than in 1951. In the majority of markets there was a heavy stock carry-over from the previous year and a general tendency to reduce stocks. Sterling became scarce in some territories and in others an adverse trade balance resulted in the imposition of import controls. Competition became sharper and prices and delivery keener.

Shipments in the early part of the year, mainly against outstanding orders, were extremely heavy, with the result that markets were quickly over-stocked. During the second half of the year, therefore, there was a considerable drop in the export rate of the industry as a whole. Nevertheless, we were able to maintain our share of exports from this country.

Last year I mentioned many of the difficulties which were imposed on export business by bi-lateral agreements, import quota restrictions, and currency regulations in particular. These conditions, together with the desire of many overseas territories to set up secondary industries, inevitably give rise to a position where the company, which has for years exported to a country and has built up a considerable goodwill, is faced with losing those British exports and goodwill and being completely shut out of that territory. As you know, for some years our policy has been in such cases to face up to this situation and set up a factory in the territory.

The report and accounts were adopted.

W. J. BUSH AND COMPANY, LIMITED

AN IMPROVING TREND

The fifty-sixth annual general meeting of W. J. Bush and Company, Limited, was held on June 18th in London, Dr Percy C. C. Isherwood, OBE, FRIC (chairman and managing director), presiding.

The following are extracts from his circulated statement on the year 1952:

The trading profit of the group has decreased from £855,404 to £532,760, and after providing for interest on loan capital, depreciation and estimated sums for taxation, the net profit recorded shows a decline from £340,722 to £196,395.

Last year I referred to the recession in business due to a reluctance on the part of buyers to add to existing stocks under the more competitive conditions then obtaining. Unfortunately these adverse conditions were accentuated during the balance of the year, particularly in the chemical section of the company's business, and, as a result, our plants, which prior to 1952 had been operating at full capacity, had to be geared down.

It was under these conditions and with the prospect of considerably reduced profits for the year under review, that in January, 1953, as has been the custom for many years, your directors gave consideration to an interim dividend. At that time the recession in business was still going on; also, it was not known how far our always substantial inventories would have to be written down. It was therefore deemed prudent at that stage to give an indication to shareholders, by reducing the interim dividend, that profits were likely to fall, as indeed they have. In view of the final profit achieved, however, in spite of these adverse factors, your directors are recommending a final dividend of 8 per cent, making, with the interim dividend already paid, a total of 10 per cent, the same as for 1951.

INDICATIONS FOR 1953

I can say that for the first quarter of 1953 our turnover is less than for the corresponding period of 1952. It does, however, show an increase over the last three months of 1952, which indicates an improving trend. It must be borne in mind, however, that under the existing more competitive conditions the gross margins are lower than for a number of years past. Nevertheless, although I hesitate to assume the role of prophet, particularly in such uncertain times, I feel that we can look to the future with sober confidence.

There is an increase in fixed assets of approximately £353,000, the bulk of which is attributable to developments in our factories in the United Kingdom, and also in Canada, where we have recently completed the erection of up-to-date factory and office premises on the new industrial site at Ville LaSalle, near Montreal.

Provision is also being made to cater for an expanding business in the Union of South Africa by the erection of premises on a new industrial site at Isando, about 14 miles from Johannesburg. Work is now in progress and the capital commitments figure in the notes to the balance sheet is largely attributable to this project.

The excess of current assets over current liabilities and provisions has increased during the year by £216,000, which is mainly due to the acquisition of the unsecured loan capital. Taxation, both past and current, does, however, constitute a burden, and is demonstrated by the provision and the reserve of £620,595 and £127,640 respectively.

The report was adopted.

UNITED BRITISH OILFIELDS OF TRINIDAD

INCREASED SALES

The fortieth annual general meeting of the United British Oilfields of Trinidad Limited was held on June 16th in London, Sir Frederick Godber (the chairman) presiding.

The following is an extract from his circulated statement:

The profit for the year 1952 was £202,202 after £325,000 had been appropriated to general reserve. The corresponding figure for 1951 was £202,038 after £875,000 had been appropriated to general reserve.

VALUE OF OIL SALES

The value of oil sales for the year at £9,207,000 is higher by £288,000 than in the previous year, in spite of reduced fuel oil prices during the second half of the year. This improvement is due to an increase in sales of all products of 102,174 tons. On the other hand, the higher income has been more than offset by the rising trend of operating costs.

As regards capital outlays in 1952, our expenditure on exploration amounted to the considerable sum of £593,373, which is £262,318 higher than in 1951. This increase in exploration expenditure is mainly accounted for by work in the Ortoire Basin.

As regards field developments, our production in 1952 was somewhat less than in 1951. So far this year there has been some improvement owing to the completion of several good wells within the main field area at Point Fortin, but it is, of course, too early yet to say whether this higher production rate will be maintained. The ratio between our remaining crude oil reserves and our rate of output continues to be most inadequate, and from this point of view the company's future cannot be viewed with complacency. It is therefore still essential to continue with active exploration to find new sources of production. This search is bound to be costly.

EXPLORATION RESULTS

Exploration results, however, have recently been a little more encouraging. In the Ortoire Basin an accumulation of oil has been discovered at Balata, but as yet it is not known whether it is of sufficient size to justify commercial development. A certain amount of production is being obtained and transported by road tank cars to Penal, whence it is pumped through to Point Fortin. The amount of this production was not significant in 1952, but so far this year some 22,000 barrels of crude have been produced from this area. Well Balata E-3, mentioned in the directors' report, has since been completed as a producer as have two more wells. Drilling on other sites continues. Similarly, small quantities of oil are being obtained from two wells in Catshill. Tests in Catshill CO-4 have so far failed to yield any production.

While these results justify continuing with two drilling strings in the Ortoire Basin, it is to be emphasised that the fundamental question as to whether we have discovered a new commercial oil field must remain in doubt for some time yet. As regards the Ortoire Basin as a whole, we have already spent some £1.9 million in exploration surveys and test wells and it is evident that something very substantial in the way of oil reserves must be discovered before there is any solid prospect of recovering our investment.

As regards Trinidad Northern Areas Limited, a company in which we hold a one-third interest, important progress is being made in preparation for testing the company's extensive marine holdings in the Gulf of Paria.

The report and accounts were adopted.

F. FRANCIS & SONS LIMITED

FUTURE VIEWED WITH CONFIDENCE

The fifty-second annual general meeting of F. Francis & Sons Limited was held on June 15th in London, Mr John Ismay, the chairman, presiding.

The following is an extract from his circulated statement:

You will observe from the parent company's accounts that the balance of profit for the year, including dividends receivable from subsidiary companies, amounts to £175,729, and after providing £70,500 for taxation we are left with a disbursable sum of £105,229. Your directors have transferred £50,000 to general reserve and recommend payment of a final dividend of 15 per cent on the ordinary share capital, making a total of 20 per cent for the year.

The net profits of the group, after providing for taxation and bringing in certain tax adjustments relating to previous years, amount to £122,697, a decrease of £10,574 on the corresponding figure for 1951. Current assets at £823,553 show an excess over current liabilities and provisions of £555,213, an increase over the previous year of £36,731.

The continued shortage in the supply of steel and tinplate persisted until early December, 1952, when a distinct improvement took place and adequate supplies are now available.

We feel that the trading conditions now developing will prove to be healthier for industry generally, and your directors view the future with every confidence.

The report was adopted.

ENGINEERING COMPONENTS

The eighteenth annual general meeting of Engineering Components, Limited, was held on June 11th in London, Mr C. C. Griffith, MC (the chairman), presiding.

The following is an extract from his circulated statement:

The net profit amounts to £187,059, as against £320,482 for 1951. Although the profit margin had been reduced, the actual group profit for the first six months of 1952 was roughly equivalent to that for the first half of 1951. From July onwards, however, there was a progressive decline in sales and production, and not until December did production become stabilised, and then at a figure approximating to 50 per cent of the previous year, and with this reduced output profits must suffer.

The causes of this sudden falling off we believe to be due to tighter monetary conditions and to an awakening of the fact that there had been a too generous stocking by most of our customers in the past against spares requirements. The actual turnover for the year 1952 was a record in spite of the last six months.

In spite of falling off in the latter part of the year, export sales were a record, and we are making every endeavour to extend this very important side of our business.

It remains as difficult as ever to forecast the future. The continued demand for lower prices (when there is no corresponding fall in basic costs—over which we have no control) must have its effect on profits.

The report was adopted and a total distribution of 25 per cent was approved.

THRELFALL'S BREWERY

SALES WELL MAINTAINED

The sixty-sixth annual general meeting of Threlfall's Brewery was held on June 18th in London.

Mr Frederick Cornwall, chairman and managing director, in the course of his speech, said:

Once more it is my pleasure to announce that we have had a good year. Our sales of beers and other commodities have been well maintained, and your board are in the happy position of being able to recommend an increase in the dividend to the ordinary stockholders.

We have now practically completed the re-equipment of the Liverpool bottling stores with the latest type of machinery, and have also re-organised its lay-out with beneficial results.

Your board have under consideration the erection of a new residential hotel near to the Liverpool pier head, as we are convinced that such an hotel, similar to our other high-class residential hotels on Merseyside and in North Wales, is very much required. This proposal has received the approval in principle of the local authority, and it is presently before the appropriate Ministry as we are desirous of proceeding with the erection of the building at the earliest opportunity.

The company has always attached great importance to the question of happy relations with its employees and their well-being. We appreciate their loyalty and the willing and efficient services rendered by all, irrespective of position, but I particularly take this opportunity of expressing our thanks to the licensees and staffs in the hotels.

The report was adopted.

LUNUVA (CEYLON) TEA AND RUBBER ESTATES

A TRYING YEAR

The forty-sixth annual general meeting of the Lunuva (Ceylon) Tea and Rubber Estates, Limited, was held on June 11th in London, Mr H. W. Horner (chairman) presiding.

The following are extracts from the chairman's circulated address for the year 1952:

Producers of tea, our main product, found the year 1952 a trying one. Early in the year a decline in the tea market set in which continued with one or two minor temporary improvements until about the middle of December, when prices began to rise, and have now regained a less unsatisfactory level. Throughout, the better teas were in strong demand and realised satisfactory prices. The lowest average price at any of the London auctions during the year was only a fraction under 3s. 6d. a lb for Ceylon, as compared with 2s. 5d., the lowest average in any week, for North India, and 2s. 2d. for South India.

Crops for 1953 are estimated at 8,674,000 lb tea and 1,628,000 lb rubber. Costs unfortunately are not stabilised even yet. All economies are being effected commensurate with the maintenance of the estates in their present first-class order, but by far the greater part of our costs is for labour, over whose wages and general conditions we can now exercise little direct control. At present market levels for our tea and rubber, and if crops come up to expectations, it is possible to foresee moderately profitable results for 1953. Much of our rubber is manufactured in the form of sole crepe, a grade which commands a substantial premium over ordinary crepe and sheet.

The report was adopted.

NOTICES

FINANCIAL CONTROLLER required for exceptionally well-founded and growing company with two new factories and headquarters near south coast. Very good conditions and terms of employment will be offered to the right man. Only fully qualified accountants already holding good positions and under 40 should apply. The man appointed will be directly responsible to the Managing Director for efficiency of his department, for completing and improving partly developed systems of budgetary and cost control and for securing that the Management is promptly informed on the current financial position, the financial trends and the financial implications of policy decisions.

Please send full particulars of your education and qualifications, your own responsibility in past and present posts held, with salaries and names of employers. References will be required and it will be useful to submit two to whom immediate reference may be made. Box 269.

SENIOR OFFICIAL required by International Tin Study Group (an intergovernmental body) in The Hague. Duties include control over small staff, committee work, conference organisation and preparation of minutes and memoranda; direct responsibility to Secretary General. Some administrative experience necessary. Knowledge of the tin industry or international commodity problems an advantage. Very good knowledge of French essential. Minimum age 30. Salary 10,000 guilders (about £940) per annum (free of tax in the Netherlands for non-Netherlands citizens) with pension fund. —Applications (in English or French), with names of three references, should reach the Secretary, International Tin Study Group, 7 Carel van Bylandtlaan, The Hague, Netherlands, before August 7th.

TOP-LEVEL PRODUCTION EXECUTIVE of exceptional experience and calibre is required by a progressive group of Companies in the light engineering field, accepted as one of the most advanced in its production methods in Britain today. The post demands professional engineering qualifications, practical experience of current production techniques, and administrative ability above the average. The proposed appointment will entail complete responsibility for one of the Group's manufacturing units employing up to 2,000 people. Recent experience in the instrument or electronic industry would be an advantage. A salary of up to £5,000 per annum will be offered, commensurate with ability. Production Executives who consider their engineering and administrative qualifications equal to this important appointment are invited to write, quoting reference TE/R, in strict confidence (and with the assurance of careful consideration at the highest level), to Box 272.

INDUSTRIAL CONSULTANT (39), with highest qualifications in accounting and general management and wide practical experience seeks a settled position in top management of a medium sized concern where the planning and control of Sales, Production, Costs and Finance are required in order to increase productivity and profits. Full information to be exchanged in strict confidence after preliminary interview with principals.—Box 263.

A SMALL London firm of Industrial Consultants, established 12 years, offers Partnership to a young man, not over 35, of outstanding qualifications, who has had sufficient experience in Management, including Management Accountancy, Production and Sales, to advise on current problems in industry.

Some capital required, possibly later, to acquire interest, but the main emphasis would be on experience, reputation and ability to make a significant contribution to the expansion of the clientele of the organisation, as well as to carrying out of some of its activities in consultancy.—Box 275.

RESEARCH OFFICER (Woman).—A Company in the North of England manufacturing nationally known consumer goods has a vacancy in its Market Research Department for a woman graduate in mathematics. The position involves responsibility for the analysis and interpretation of a wide range of market information, and candidates should be capable of pursuing a line of investigation independently. Good commencing salary and prospects are offered.—Write, stating age, experience and qualifications, to Box 276.

BUSINESSMAN (37), at present in London, having valuable experience of present-day marketing conditions in SOUTH AND CENTRAL AMERICAN REPUBLICS, extensive connections, and fluent knowledge of the languages, seeks appointment as Resident Representative of British firm making heavy or light engineering products and/or general merchandise.—Box 278.

THE UNIVERSITY OF LEEDS

DEPARTMENT OF GEOGRAPHY

The Council invites applications for a Lectureship and an Assistant Lectureship in Geography. Salary on appointment will be according to qualifications and experience on the scale £550 x £50–£1,100 a year for a lecturer, £500 x £25–£550 a year for an assistant lecturer. Applications (three copies), together with the names of three referees, should reach the Registrar, The University, Leeds, 2 (from whom further particulars may be obtained) not later than July 15, 1953.

SCHOOL OF ECONOMICS, DUNDEE

Courses of study are offered for:
B.SC. ECON DEGREE OF LONDON UNIVERSITY.
A four-year course for an Honours Degree.
GENERAL CERTIFICATE OF EDUCATION ADVANCED LEVEL OF LONDON UNIVERSITY.
A one-year course in Economics, Economic History, Geography and British Constitution.

Copies of the Calendar of the School can be obtained from the Secretary, 17 Bell Street, Dundee.

STATISTICIANS in the HOME CIVIL SERVICE.—The Civil Service Commissioners invite applications for posts of Assistant Statistician in Government Departments. Selection will be by interview in London in late July. Age at least 21 and under 24 on August 1, 1953, with extension for service in H.M. Forces and approved post-graduate experience. Candidates may be mathematical or economic statisticians; they must have a First or Second Class Honours Degree (II(i) where the Second Class is divided) with statistics as a main subject, or a post-graduate University Diploma or higher Degree in Statistics. Those so qualifying this summer will be eligible. Starting emoluments in London between £475 and £640 (men) or £570 (women), according to periods of National Service and post-graduate experience, rising to £877 (men) and £763 (women). Promotion prospects to £1,550 (men) and £1,350 (women), with possibility of later increases to £2,100 (men) and £1,950 (women).—Particulars and application forms from the Secretary, Civil Service Commission, Burlington Gardens, London, W.1, quoting No. 96/53. Completed application forms must reach him by July 4, 1953.

IMPORTANT old-established industrial company in Malaya invites applications for Executive position. Applicants should be aged 35-40 years, of good presence and education. General experience commerce and finance desirable. Commencing salary equivalent to £1,750 per annum with annual increments, cost of living allowance and free housing. Excellent prospects for advancement to managerial position within a short period.—Apply with fullest details age, education, experience, etc., to Box No. 6843, c/o Charles Barker and Sons, Ltd., 31 Budge Row, London, E.C.4.

APPLICATIONS are invited for the post of AGRICULTURAL ECONOMIST, tenable at Bristol, and for four posts of ASSISTANT AGRICULTURAL ECONOMIST, two tenable at Bristol and two tenable at Newton Abbot, Devon. Candidates must be graduates in Economics and/or Agriculture, and for the Agricultural Economist post experience is essential. Salaries in accordance with the Ministry's scales. Further particulars may be obtained from the Registrar, The University, Bristol, 8, to whom applications should be sent to arrive not later than July 6th.

RESPONSIBLE ADMINISTRATOR (42), widely travelled and with first-hand knowledge of many overseas markets, seeks post providing greater scope for his energy and ability to develop export markets. Experience of negotiating to highest governmental level. He has previously held important overseas position connected with British trade and is now London director of foreign company. Prepared to travel. Salary £2,000.—Box 274.

STATISTICIAN required for Market Research Statistics by a firm of Manufacturing Chemists in West London. Ability to interpret figures after compilation essential, with particular reference to export markets. Salary £600/£650. Pension Scheme, Profit Participation.—Write, giving fullest details, age and experience, to Box 265.

EXPORT.—PROFESSIONAL ENGINEER, aged 42, commercially trained, fluent French and German, knowledge Spanish and Slavonic languages, residential experience European countries, war service as officer R.N.V.R., seeks appointment to promote markets on the Continent and in Canada.—Write Box 271.

OTHER NOTICES APPEAR ON PAGE iii OF COVER.

BRITISH BANKING 1953

This series of articles comprises the editorial section of THE ECONOMIST'S annual survey of banking trends in Britain and the British Commonwealth, which on this occasion relates to the first complete year of Britain's "new" monetary policy and the disinflationary trends that developed simultaneously in the overseas sterling area. The articles are intended to be read in conjunction with the 16-page selection of British Banking Statistics that appears in this week's issue of the RECORDS AND STATISTICS Supplement.

Twelve Months of Credit Expansion

THE monetary trends of the past twelve months have presented some odd contrasts—both with the expectations of bankers when the "new" monetary policy was launched and with the trends of the first six months of that policy. On the one hand, it is now almost generally acknowledged that the revival of Bank rate and the associated moves towards monetary orthodoxy played a major part both in extricating Britain's economy from the crisis and in promoting the climate of disinflation that was especially noticeable during the summer and autumn of 1952. On the other hand, this phase of disinflation that monetary weapons have helped to bring about has actually witnessed a renewal of credit expansion.

Early in 1952, when the new credit squeeze had stopped the expansion of bank advances and the Government was enjoying its seasonal surplus of revenue, it was widely believed that the long phase of credit expansion had at last been brought to an end. And, indeed, the year 1952 as a whole was the first since 1939 to show a decline in the average level of deposits. But this change of trend was almost wholly due to the steep fall during the first half of the year. The latest deposit figures quoted in the Banking Survey published at this time last year—those for May, 1952—marked the limit of the improvement. At that point, net deposits were running fully £150 million below their level of the previous year. Now, in these past twelve months to May, 1953, they have risen by no less than £168 million, to £5,865 million, the highest figure ever recorded at this season of the year. The deterioration has been somewhat more marked in the past six months of seasonal contraction than in the previous six months. Since last November deposits have fallen by £167 million less, whereas in the previous six months they rose by £153 million more, than in the corresponding period of 1951-52.

It is instructive to examine the sources not only of this deterioration as a whole but of its recent accentuation. If the twelve months are surveyed as a whole, the change of trend from that of 1951-52 has to be attributed solely to the remarkable expansion of governmental demands for bank credit. In the twelve months to May, 1953, clearing bank advances—the greater part of which represent credit extended to the private sector of the economy—declined by £118 million,

whereas in the twelve months to May, 1952, they rose by £97 million. Similarly, bank portfolios of commercial bills have contracted during these past twelve months by £34 million; the amounts of these portfolios were disclosed for only part of the previous year, but on balance they were probably not much changed. Bank portfolios of investments increased substantially in both years, in consequence of the special funding operations of November, 1951, and October, 1952; but if the funding stocks taken up by the banks are excluded, their portfolios show declines of £34 million in 1952-53 and £123 million in 1951-52. Most of the 1952-53 movement may be presumed to represent actual sales rather than writing-down, but the reverse is true of the movement recorded for 1951-52.

If rough allowance is made for these and other complications, it appears that in the twelve months to May, 1952, the private sector of the economy, including those nationalised industries that borrow from the clearing banks, increased its absorption of bank credit by rather more than £80 million. During the past twelve months, on the same basis of estimation, the private sector appears to have reduced its requirements for bank credit by not much short of £180 million. In other words, if the demands upon the banking system from the central government had remained constant as between the two years, bank deposits would have fallen in 1952-53 by some £250 million more than they fell in 1951-52.

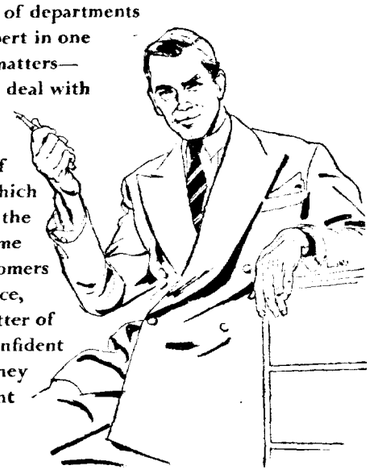
This comparison, which indicates broad magnitudes rather than exact quantities, brings out very clearly the way in which government finance has dominated the credit trends; for bank deposits, instead of falling faster, have risen sharply in response to governmental borrowings. The same process of estimation suggests that in 1951-52 the central government reduced its indebtedness to the banking system by nearly £170 million, whereas in the past twelve months it appears to have increased its indebtedness by fully £350 million.

★

This massive change in the credit needs of the central government does not, however, reflect any corresponding deterioration in its purely domestic finances. The "overall" Exchequer deficit, though abnormally large in the first nine months of the fiscal year 1952-53, was not very much larger in the twelve months to last May than in the previous twelve months; and, indeed, the excess was approximately offset by a diminution in the strain upon the Exchequer for net repayments of tax reserve certificates and an increase in the finance it secured via the Bank of England against the expansion of the note circulation.

The whole explanation of the striking change in the Government's financial needs has, therefore, to be sought in the strain put upon it from external sources through the dramatic transformation in Britain's external balance of payments—in the fact that, whereas in 1951-52 the Treasury was in effect borrowing from overseas the sterling counterpart of Britain's large external deficit, in the past year it has had to furnish banks and persons overseas with the sterling counterpart of Britain's considerable external surplus. The strain resulting from this big change does indeed appear to have been fully sufficient to explain the Treasury's swing from repayer of debt to the banks to heavy borrower from them. The banking swing, as estimated above, was perhaps of the order of £520 million; while the swing in the current external balance of payments, from deficit to surplus, may have been in the region of £600 million, or even more.

These calculations, made by the method of comparing differences between the two years, thus yield a logically satisfying result; but it should be noted that similar calculations made by direct reckoning of the two years separately do not explain how the whole requirements of the Treasury were financed in either year. For both years there is a considerable unexplained margin, representing, apart from errors and omissions, finance obtained from domestic sources other than the clearing banks. One of the principal omissions that cannot readily be made good by any dependable estimates is the effect of trends in overseas speculation in sterling. Purely financial transactions arising from the desire of foreigners to "go short" of sterling, or the converse movement when short positions are covered, do not directly impinge upon Britain's domestic finances, because in most instances—so far from representing a real "outflow" or "inflow" of money—they merely involve transfers of sterling to or from overseas monetary authorities from or to the nationals of the countries they represent. But the change of ownership of these sterling funds may increase or diminish the proportion of overseas funds that is placed, directly or indirectly, at the disposal of the Treasury.



Any attempt to estimate, from an analysis on the above lines, what the tactics of the British authorities have been in the gilt-edged market, has to make some precarious guesses of influences such as these. For what it is worth, the impression conveyed by the figures cited is that both in 1952-53 the Treasury and the "departments" have been substantial net sellers of government securities. This basis of estimation does not, of course, draw any distinction between securities sold by overt public issue (much of which are in any case usually subscribed by the "departments" in the first instance)

OUT OF YOUR GROUND

There are so many occasions when one realises how difficult it is to be well-informed on all the financial problems which arise in these complicated days. That is why our organisation includes a number of departments which are each expert in one or other of these matters—departments which deal with Foreign Exchange, which understand the complexities of Wills and Trusts, which will not get lost in the labyrinths of Income Tax and so on. Customers may, in consequence, bring to us any matter of this kind, in the confident expectation that they will receive efficient attention and sound advice.

and the net sales (or net purchases) of the government broker in market operations. But the analysis suggests that the total net sales in the past year have appreciably exceeded the amount of net cash nominally secured from public issues. This net cash comprised £64 million from the operations of last October (after allowing for the unconverted residuals that were due to be repaid last December and March) and £100 million from the stock issued last March. The similar issue made this week does not, of course, figure in this analysis.

It appears, therefore, that the monetary authorities have made some effort to follow the orthodox principle of trying to curtail their demands upon the banking system by borrowing instead from the public; and this effort has probably been particularly successful in recent months. Policy may have been rather more orthodox, therefore, than might be judged from the short-dated nature of the public issues as such. It has not, however, been vigorous enough either to prevent the unexpectedly large expansion of bank deposits or to avoid a rise in the banks' ratio of liquid assets. Last autumn the excessive liquidity ratio had once again to be cut back by the surgery of a special funding operation, in which the banks were expected to participate—necessarily by running down their bill holdings—to the extent required to reduce their liquidity ratios to more reasonable levels. There is little doubt, however, that the easy policy pursued by the authorities last summer, combined with the indications that the autumn operation was not intended to reduce the banking system to a position of real stringency, played a contributory part

in promoting the more liberal tendencies that have since been observable in the banks' attitude towards advances.

The downswing in advances reached its limit in the first half of the period under review: the low point was reached last November, at £1,744 million, more than £200 million below the peak reached in the previous April. But since then the total has risen by £28 million, despite the repayment of probably more than £50 million out of the first proceeds of the £125 million issue of the British Electricity Authority; in the similar period a year earlier there was a decline of £35 million (and BEA repayments then, out of the previous issue, were only slightly larger than this year's). At the same time there has been a re-expansion of bank portfolios of commercial bills, which likewise touched their lowest point last November, at £57 million; they are now £9 million above that level, whereas in the comparable period last year they declined by £50 million. The fact that the deterioration in the trend of bank deposits in these past six months has been even more marked than in the previous six months cannot, therefore, be laid at the door of governmental finance as such; the public sector's repayments to the banks have, it is true, been appreciably smaller than they were a year previously, but the deterioration in the position of the private sector has been much more marked. It should not, however, be attributed wholly—or even mainly—to relaxation of lending standards. It is mainly a reflection of the fact that commercial borrowers, having run down their stocks and work-in-progress, have lately faced the need for some replenishment, made in some instances at appreciably higher prices.

★

The year's credit trends are, therefore, readily explicable in terms of statistical analysis. But such explanations do not similarly explain how it has happened that a credit trend that most bankers would regard as the reverse of disinflationary has none the less coincided with a phase of undoubted disinflation in the national economy, and has not, apparently, had any untoward results. The explanation of this has to be sought in the non-monetary sources of disinflation, and in the momentum of the disinflationary impulse imparted to the private sector in the early phase of the credit squeeze (and also maintained at considerable strength in some branches, such as personal advances, ever since). The non-monetary influences were, of course, the recession of certain types of consumer buying that began even before the new monetary policy was launched, and the steep curtailment of sterling area demand for British exports. If these influences had not produced a climate of uncertainty that was reducing willingness to spend, the government's deficit-financing through the banking system last year, as well as the consequential easing of liquidity ratios, would certainly have generated a renewal of the inflationary impulse. Had that happened, the fact that the government was having to put up a large amount of sterling for the finance of the external deficit would not have been a sufficient excuse for its heavy reliance upon bank credit. And, had it sought to moderate such borrowings in circumstances of rising inflationary demand, the pressure upon interest rates and the degree of the credit squeeze might have been severe. The new monetary policy has most of the time had the great advantage of pulling with the tide. Only if and when it has to work against the tide for some time will the techniques and courage of the authorities be put to the full test.

Preparing for Convertibility

THE "plan" for convertibility tabled at the Commonwealth conference of last December has now become little more than an assembly of good intentions to move towards freer payments and trade when and if circumstances permit. But the good intentions have been spread widely across Europe and are not confined to the sterling area alone. Without entering into analysis of the implications—and complications—involved in these shifts in policy, this seems to be an opportune moment at which to summarise the technical steps of special interest to international bankers that have taken place in recent months, and to discuss some of those that may be in prospect.

In the field of payments—as distinct from trade—the most important of these technical moves in recent weeks has been the freeing of the exchange markets in eight European currencies for arbitrage between the centres concerned. Whilst the mechanism of the European Payments Union itself had provided for the operation of multilateral payments within Europe at the level of the central banks (so that the French franc has been just as "hard" a currency to the Bank of England as the Belgian franc), the opening of arbitrage facilities has meant that the principle of multilateral payments has been extended to the authorised banks in the eight countries for which the scheme operates. So far the experiment has proved eminently successful. It has not, admittedly, led to a substantial expansion of foreign exchange business, although London bankers have been able to attract a certain amount of three-cornered business that in the previous postwar years had been the virtual monopoly of Swiss banks. But the return of arbitrage is beginning to recreate a technique of dealing and a habit of intra-European banking collaboration that had fallen into desuetude in the preceding years. These techniques will be put to greater use when the structure of exchange controls of the countries concerned can be further dismantled, and also when the arbitrage facilities are extended to forward markets instead of being restricted to spot transactions as at present—which seems likely to be the next step.

Meanwhile, within the Managing Board of EPU and the appropriate committees of OEEC, a considerable amount of preparatory work is being done on the problem of translating EPU itself into wider multilateral terms. That work is at present handicapped by the fact that the Union includes some very weak members, especially France, and only a few fairly strong ones; but this obstacle is giving greater incentive to a detailed study of the possibility of operating the Union in a setting of more freely fluctuating rates of exchange. This particular issue goes far beyond the bounds of technique and involves questions of high policy—not least that of the degree of tolerance of exchange fluctuations allowed under the Articles of the International Monetary Fund. It is probable, nevertheless, that a greater freedom for movement is under consideration, not only in Paris, but in Washington. The wider problem of relations between EPU and the Fund is also receiving some attention; and some consideration is being given to the help that the IMF could give to EPU, by way of standby credits and other facilities, in the event of any future joint move by a substantial group of West European currencies to convertibility with the dollar.

★

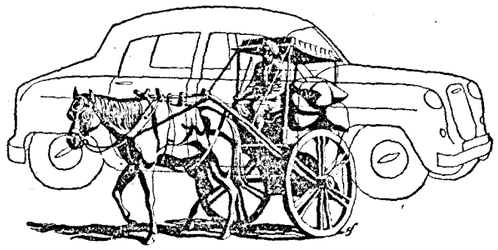
Significant technical strides towards convertibility are also taking place in the realm of commodity dealing. In Britain, an increasing number of commodities have been freed from state trading and restored to private markets in the past few months, and in many cases freedom has been provided for arbitrage in such commodities between dollar and non-dollar countries. The dealings that have been freed can be divided into two main groups. The first comprises those commodities in which re-exports have been freed as well as imports. These are the commodities in which genuine arbitrage is possible. They include tin, lead, zinc, rubber, tea and cocoa; there are also opportunities for re-exporting dollar coffee to EPU countries, though there is no complete freedom to import dollar coffee for domestic consumption. It is intended that copper should be included in this group of commodities eligible for free arbitrage, when private dealings in it begin next August. To the extent that arbitrage dealings do in fact take place in these commodities, the sterling that enters into the operations is wholly convertible, even though the privilege of such convertibility applies only to transactions that are put through members of the appropriate and recognised markets.

In a second group of commodities, Britain has freed imports, but has retained control of re-exports. Timber, pulp and paper are typical examples of the commodities in which British exporters are now entitled to secure their requirements in the cheapest markets even though those requirements have to be paid for in hard and not in soft currencies; cotton also belongs to this group, for although licences are required for the import of dollar cotton (but not of non-dollar cotton), the licences do not seem stern enough to hold many such purchasers back. Sugar is a special case, partly because of the Commonwealth Sugar Agreement; but the recent decision to make a bulk purchase of dollar Cuban sugar and the announced intention to deration the commodity and to open the way for freer imports suggest that it is now moving towards, if not right into, this category. Most important of all, when dealings in grain are freed later in the year they will probably be treated similarly—British importers will be able to secure their requirements in the cheapest markets, but for some time at least they will be unable to re-export dollar grain to non-dollar countries.

Yours faithfully

FAITHFUL service to the needs of agriculture, commerce, industry and the people of Britain is the objective of the Bank, in which all the advantages of intimate local knowledge of people and affairs are used to the benefit of customers and prospective customers.

Local Boards of Directors in important centres in association with resident District General Managers have, for many years, contributed much to the successful achievement of this objective in providing a distinctive banking service for everybody.



Enquiries will be welcomed and will meet with immediate and courteous attention at the local District Office or through any branch.

FRUITFUL ENQUIRY

One of our clients received from Spain a Peseta quotation for citrus fruit. Knowing that multiple rates for sterling were involved, he at once telephoned us to ask exactly what this quotation represented in British currency. Within a matter of minutes we rang him back with the answer. Part of the exchange earned from this export was negotiable at the special rate of about 61 Pesetas to the £ and the balance at the free rate of about 110, making a composite rate that could easily be calculated.

It is unlikely that our client could have obtained this information so quickly from any other source.

The advantages of being here and there

As the only British Bank with branches in Spain and Portugal as well as throughout Latin America, we can offer you special services—either direct or through your own bank. These services are set out clearly and concisely in our leaflet "The advantages of being here and there." We shall be glad to send you a copy on application to:—

The technique that is being increasingly used by the British authorities in dealing with commodities bought for domestic consumption is that of the "global" quota. This is a quota for total imports, based on the amount bought in an earlier year, and the potential suppliers have to compete for a share of it. In timber, pulp and paper, for example, these quotas are actively competed for by suppliers in both soft and hard currency countries. As a result, Swedish timber and paper suppliers have had to come down to the prices quoted by their dollar competitors. By the use of a global quota and by abandoning discrimination against hard currency imports, differential prices have been abolished, to the considerable benefit of Britain's terms of trade. These developments in commodity dealings can be regarded as a real contribution to the cause of convertibility—the first group because they represent a form of genuine though localised convertibility, the second because they banish the differential price systems that are the main symptoms of the co-existence of convertible and inconvertible currency groups. The price mechanism is being allowed to work. That is the best and most testing preparation for convertibility.

Another essential preparation for convertibility is the reinforcement of the gold and dollar reserves outside the dollar area. The progress that has been made on this score over the past year has been strictly limited. It is true that the United Kingdom has increased its gold and dollar reserve by $636 million in the eight months to the end of May, 1953 ; but no less than $340 million of this was gold clawed back from EPU. Nevertheless, in 1952 as a whole, Western Europe's gold and dollar reserves rose from $9,880 million to $10,320 million. The movement is in the right direction, but it has a desperately long way to go before any serious consideration can be given to a genuine measure of convertibility. As the IMF pointed out this week in a report prepared for the Economic and Social Council of the United Nations, gold and dollar reserves held outside the United States at the close of 1951 were equal to only 39 per cent of the annual imports of the countries concerned—compared with a ratio of 69 per cent in 1938. The inadequacy of these reserves is heightened by the fact that as the report says "world trade must be considered more volatile now than before the war mainly because the United States has increased the ratio of its imports to total world imports from 10 per cent in 1938 to 15 per cent in 1951."

It seems obvious from these figures that it would take the countries of the non-dollar world many years of stringent internal policies and of discriminatory import restrictions before they could build up their reserves to a level from which a real plunge into convertibility would have sober chances of success. Perhaps the only step that would make genuine convertibility possible in the lifetime of most of those now busying themselves with the "plan" would be a once-for-all revaluation of existing reserves by an increase in the dollar price of gold. Among the many measures now being urged on the American Government—lower tariffs, simpler customs procedure and the rest—this question of the gold price may increasingly be seen as the most important. But meanwhile, although technical measures for some degree of freer payments and trade are going forward, the immediate outlook for this all-important issue does not seem bright.

The Demand for Advances

THERE are many snares and delusions in talking about, and still more in trying to measure, the demand for bank advances. One of the difficulties is that the analyst has only very dubious figures to work with, another is that the demand for advances is by no means independent of the price of advances (that is, of the rate of interest), and yet another is that any analysis in this very tricky field is liable to be misunderstood. But provided one guards against these dangers—both by emphasis at the very outset and by a running commentary as the analysis unfolds—it seems worth while to make the attempt. The main objects of the exercise are to see how closely the movement in bank advances can be correlated with the movement in the estimated value of stocks and work-in-progress in the country ; and to form some idea of the effect of changes in such basic factors as wholesale prices and industrial production upon the queue of would-be borrowers at the banks.

According to last year's national income blue book the total value of stocks and work-in-progress (other than central government trading or strategic stocks) was £6,900 million at the end of 1951. By jobbing backwards and forwards from this figure and applying to it the estimates of stock changes shown in the latest national income white paper (Cmd. 8803), rough estimates can be made of the equivalent figures for stockholdings at the end of each year from 1947 to 1952. These estimates are shown in the first line of Table I. The second line of that table shows the total of bank advances in Great Britain in November of each year ; these figures are drawn from the quarterly classifications of advances published by all members of the British Bankers' Association.

It will be seen that between 1947 and 1951 the ratio between bank advances and the value of stocks and work-in-progress outstanding remained remarkably stable, at between 28.5 and 29.9 per cent ; then, in 1952, as the monetary squeeze developed, it fell fairly sharply to 26.8 per cent. It would be interesting to know how these ratios compare with the pre-war position ; if the ratio now is significantly larger than it was before the war, that might seem to give some support to the often heard (but, by the banks, often denied)

allegation that part of British banks' loans in recent years have gone towards financing things that would formerly have been regarded as requiring something more permanent than floating capital.

In the absence of reliable prewar figures, all that can be said is that there is no evidence from Table I that the increase in Bank advances in the last five years has indeed been greater than the increase in industry's working capital commitments would seem to have demanded. Of course this is not to say that the government should not have used the monetary weapon earlier to ensure that these working capital commitments did not soar out of hand; but that is another story. It is also worth drawing attention to the absolute level of the figures involved. Since some bank advances (for example, in the personal, professional and financial groups, which accounted for some £550 million of the £1,815 million of advances outstanding at the end of 1952) obviously do not finance transactions that are connected with stockholdings or work-in-progress,

TABLE I—STOCKS AND BANK ADVANCES
(£ million)

	1947	1948	1949	1950	1951	1952
Stocks and work-in-progress outside central government sector (end year)	4,285	4,779	5,122	5,699	6,900	6,763
Bank advances in Great Britain (end November)	1,219	1,380	1,533	1,683	2,016	1,815
Ratio of advances to total stocks	*28·5*	*28·9*	*29·9*	*29·6*	*29·2*	*26·8*

the proportion of industry's working capital commitments that is financed by bank advances must be considerably less than one quarter.

What, however, of the effect of changes in working capital commitments on changes in advances? In the first, fourth and fifth lines of Tables II the figures derived from Table I are shown in a different way. It will be seen that in four of the last five years the ratio between the increase in bank advances and the increase in stockholdings has lain between one quarter and one half. The exception was 1952 when, thanks partly to the new monetary policy, the fall in bank advances was actually some 47 per cent greater than the total fall in working capital commitments. Moreover, in 1952, the clearing banks' holdings of commercial bills fell by £116 million; in other years they probably rose.

The working capital commitments that were not financed by bank advances or bills had, of course, generally to be met out of retained profits. The second line in Table II shows the excess of new savings in the private sector (this time, excluding the local authorities) over the fixed investment outlays in that sector; the figures, incidentally, include as part of industry's floating capital the sums that had to be held in reserve for future tax and dividend payments. There are considerable pitfalls in the way of any analysis based on this figure. There is, for example, a temptation to add in the sums that industry raised by new issues on the long-term capital market to the total of available resources; that, of course, would be wrong, for new issues were mainly a way of transferring funds within the private sector—from those who had liquid funds to spare to those who had not. In the same way, there is some element of double counting between the sums available to the private sector (line 2 of the table) and the sums used for bank advances (line 4). A simple way of looking at this is that some of the available funds in the private sector were held in bank deposits and these funds were utilised by the banks in making their advances; a more sophisticated way of looking at it is that some of the spending made possible by bank advances swelled the incomes (and thus the available funds) of suppliers in the private sector. But there is no need here for nice verbal distinctions about which chicken came before which egg. In any case, in three of the five years in the table, some of the increases in bank advances were "paid for" by some repayment of central government debt to the

TABLE II—CHANGES IN STOCKS AND BANK ADVANCES
(£ million)

	1948	1949	1950	1951	1952

* Year to November.

banks; the banks in those years became a mechanism for passing on the surplus savings in the central government sector to the finance-hungry private sector, and in other years (when there were no surplus savings to spare) there was some inflationary creation of finance.

It will be seen from the third line of Table II that there is a reasonably close correlation between the funds that the private sector needed to borrow and the increase in bank advances. Thus, in 1948 the private sector was in apparent need of £273 million of new funds and it got £161 million in bank advances; in 1949 it was in apparent need of £203 million and got £150 million, and so on. The correlation between these separate sets of figures cannot be complete; to make it so, it would have to be possible to strike out of the table the elements of double-counting described in the previous paragraph, to make allowances for bank advances that do not finance stockholdings, to make allowances for the government and foreign funds that became available for finance of the private sector through media other than the banking

The oldest inhabitant

Somehow, he seems always to have been part of the village. None can remember it without recalling him, for his wise advice and local knowledge have helped both young and old.

For many businessmen, it is equally hard to think of Australia and New Zealand without recalling the Bank of New South Wales. For, as the oldest public company in the South-West Pacific, its experience and knowledge of local conditions are unrivalled. And as the largest commercial bank there, with over 850 branches and agencies, it can give every assistance to its customers.

For your ventures in Australia and New Zealand, consult and use—

system, and then to take account of the sums raised by the private sector's sales to other sectors of stock exchange securities and so forth. But as we cannot undertake this arithmetic with the figures available, Table II will have to do. Its interest lies, not so much in the obvious and expected fact that there is a statistical connection between the movement in bank advances on the one hand and the movement of stockholdings and of the private sector's excess of savings over fixed investment outlays on the other, as in the light that it throws on the quantitative importance of the different factors involved.

The most important factor is the huge swing in working capital requirements that can be caused by a relatively small increase in prices. With stocks at their present level, a 2 per cent increase in prices can lead eventually to a demand for some £135 million of working capital, of which between one quarter and one third might "normally" be provided by the banks. In fact, however, the rise in wholesale prices was no less than 61 per cent between the end of 1947 and the end of 1951; as Table III shows, wholesale prices rose by about 8 or 9 per cent in 1948 and 1949, but by considerably more in 1950 and 1951. Then, in 1952, wholesale prices showed their first fall for many years. The second line of Table III shows the effect that these price changes should have tended to exert on working capital commitments when they had worked themselves through—that is to say, when all the stocks that had been bought at old prices had to be replaced at new ones. The third line of the table shows the estimates of stock appreciation in each year that are set down in the latest national income white paper.

TABLE III—INCREASE IN WHOLESALE PRICES

	1948	1949	1950	1951	1952
Per cent increase in index of wholesale prices during year	+ 8½	+ 9	+ 21	+ 13	− 1
Potential increase in need for stock finance (£ mn.)	+340	+430	+1075	+740	− 69
Actual stock appreciation (£ mn.)*	+300	+250	+700	+900	*Nil*

* Including appreciation in central government's stocks.

There are, of course, important differences—including a difference of time lag—between the estimates shown in the second line of Table III and the estimates in the national income white paper (shown in the third line of the table). The national income figures for stock appreciation show changes (between the beginning and end of the year) not of current wholesale prices but of the prices at which stocks are valued for balance sheet purposes. But, since all stocks are not being replaced all the time, there is also an important time lag between the published movements in wholesale price indices and the movement in demand for bank advances; with one eye on the wholesale price index and the other on the effects of this time lag, it is possible to go some way towards forecasting the trend in demand for advances. As an indication of current trends, it should be remarked here that the Board of Trade's index of wholesale prices has risen by just under one-half per cent in the first five months of 1953.

The second major factor that has an effect on the demand for stock finance is the physical increase or decrease in stock volumes. The biggest movements in the physical volume of stocks in the past five years were the increases of 7½ and 3½ per cent in 1951 and 1948, and the fall of 4 per cent in 1950; in both 1949 and 1952 there was very little movement in the volume of stocks at all. At first sight it might be expected that changes in the volume of stocks and work-in-progress would accord closely with changes in the current index of industrial production. In fact, however, there is no real evidence of such correlation (except in 1952); the effect of changed expectations about prices on industrialists' purchasing policy has seen to that. Moreover, the net increase of approximately 7 per cent in the volume of stocks and work-in-progress between the end of 1947 and the end of 1952 is significantly less than the concurrent increase in the index of industrial production, although it does seem to correlate fairly closely with the concurrent increase in the real value of gross domestic product. Because of the maldistribution of stocks during the period of Daltonian (and even of neutral) monetary policy, it is therefore difficult to regard these earlier figures as conclusive evidence that the absolute level of stocks in Britain today is too low. But there seems little reason to suppose that it is still too high. For the immediate future, therefore, it should probably be expected that if industrial production rises (as the Treasury hopes and expects it will do) then demand for stock finance is likely to increase broadly in line with it.

This analysis has taken no account of the seasonal pattern in demand for bank advances; nor of the distortions caused by the habit of certain nationalised and other industries of running up their indebtedness to the banks and then repaying it at one fell swoop out of the proceeds of a periodical new issue; nor of the effects (very marked at the moment) of such things as the return of commodity markets from governmental to private hands. But these are ephemeral influences. The main object of the article has been to draw attention to the huge volume of stocks and work-in-progress in the British economy at present day prices and in conditions of full employment; and (given that) of the effect that can be wrought on the demand for bank advances by changes in wholesale prices that are by no means abnormal by either prewar or postwar standards. The level of wholesale prices is, of course, considerably affected by the nature of monetary policy and of the banks' lending opportunities; there are, therefore, some elements of a vicious circle in analysis here. But the sort of arithmetic that has been set down in this article seems to deserve closer analysis by British bankers nevertheless.

Monetary Policy in the Dominions

THE violent fluctuations in the balance of payments of all the sterling area dominions during the past eighteen months have posed problems of domestic monetary policy for each of them. On the one hand, monetary policy had clearly to play its part in reducing domestic demand, and thereby their imports. On the other hand, the large deficits incurred by several of them, especially in the first half of 1952—when export proceeds had fallen sharply from their post-Korea peak, but when imports were still running at high levels—so depleted their international reserves as to impose a considerable strain upon the liquidity of their banking systems. This depletion of reserves represented, of course, the "natural" means of curtailing the excessive level of domestic demand. But in certain cases, despite the need for this curtailment, steps were taken to cushion the impact upon the banks' lending policies of the drastic fall in their liquidity.

This strain upon the liquidity of the banking system was especially marked in Australia. The drain there reached its peak in August, 1952, by which time the deposits of the trading banks had fallen by no less than £A183 million in the space of eight months, whereas advances had risen simultaneously by £A66 million, thereby raising their ratio to deposits from 50 per cent to 65 per cent. Even by December, 1952, deposits were still £A95 million down on the year, at £A1,147 million. This severe deflation of credit was, of course, the direct result of the drain upon London funds. During the twelve months to June, 1952, Australia's international reserves fell from £A843 million to £A362 million. As this deflation proceeded the Commonwealth Bank intervened to prevent too great a fall in the banks' liquidity, and released considerable sums from the trading banks' Special Accounts. These had reached a peak of £A570 million, at the equivalent of 46 per cent of total deposits, in June, 1951; but by November, 1952, they had been reduced to the low point of £A156 million, or 13.5 per cent of total deposits. These releases from the "frozen" part of the banks' assets enabled them to avoid a drastic reduction in their advances during the period of large deficits on the balance of payments. At the same time the trading division of the Commonwealth Bank seems to have shaped its own advances policy so as to give a lead to the other banks in avoiding too swift a contraction.

The wisdom and orthodoxy of this cushioning operation have inevitably been called into question. It is only fair to note, however, that two features of the Australian banking legislation passed last August seem likely to force the Commonwealth Bank to rely more on orthodox monetary weapons and less on direct control of the trading banks in the future. One was the separation of the daily administration of the Commonwealth trading bank from the central bank; the other was a limitation of the Commonwealth Bank's power of calling the trading banks' assets into special accounts. The special account balances have, in any event, now been reduced to a fairly low level—despite their recovery during the 1952-53 export season, a movement that had raised them to £A276 million by the end of April. This recovery was of course associated with the recovery in Australia's international reserves; by May, 1953, these had risen by some £A160 million from their low point in June, 1952. At the same time there has been a notable upswing in deposits combined with a decline in advances. Hence, by March, 1953, the ratio of advances to deposits had fallen to the more normal level of 47 per cent.

Meanwhile, the drift towards orthodoxy in Australia has also been discernible during the year in other aspects of monetary policy—notably in the abandonment of qualitative credit controls (except where these were necessary for purposes of capital issues control). There was also some increase in long-term interest rates. The long-term Government loans floated in November, 1952, and in March, 1953, were at 4½ per cent—compared with the 3¾ per cent of basis of the loan placed in November, 1951; and there has been a corresponding increase in the rates offered by recent semi-governmental loans. Rates paid on savings bank deposits and allowances on time deposits at the commercial banks were raised in August, 1952, and in that month also the Treasury bill rate was raised from ¾ to 1 per cent. The maximum rate charged on advances was raised from 4½ to 5 per cent in August, 1952—though this is no longer a legally enforceable maximum, but is now fixed voluntarily by the trading banks. The short-term money rates, it will be seen, are still below the levels ruling in the United Kingdom and in several other sterling countries. The revival of monetary policy in Australia seems to have progressed so far as the gilt-edged market but to have taken only tentative steps beyond it.

★

In New Zealand, as in Australia, the balance of payments continued in heavy deficit up to the middle of 1952. But fluctuations in the incomes of primary exporters—and thus in their demand for imports—were less severe than in Australia, thanks to the operation of marketing boards and the wool retention scheme. The total deposits at the trading banks fell from £262 million at the end of 1951 to £250 million at the end of 1952, while advances declined from £154 to £142 million as stocks of imported goods fell to a more normal level. At their peak in March, 1952, advances had touched £195 million. The decline in bank liquidity became serious only in March, 1952, after which the banks' cash balances were benefiting from the recovery in the balance of payments. The New Zealand banks' cash reserves

have remained substantially in excess of their statutory obligations; but the raising of the statutory reserve ratios for the first time in August, 1952, and again in May, 1953—together with the banks' brief experience of severe stringency in early 1952, and the informal control exercised by the monetary authorities by means of "consultations" with the trading banks—have contributed towards the cautious attitude to advances shown in recent months. Only slight reliance, however, was put upon the interest weapon. The maximum rate payable on deposits by building societies was raised to 3½ per cent (for the longest-term deposits), and by the end of 1952 the yields on New Zealand Government securities had come into line with those of other sterling area Governments—after being as much as ½ per cent lower than those of comparable stocks in other sterling countries a year earlier. But the New Zealand authorities showed evident reluctance in this upward adjustment of rates on governmental and other public loans. Their hesitancy in this respect—beside which the tactics of the Australian authorities appear almost bold and unequivocal—not unnaturally resulted in the undersubscription of several such loans.

★

In South Africa, too, the first half of 1952 saw a large external current deficit, followed by an improvement in the second half of the year; and here, likewise, there were sympathetic—though much less violent—fluctuations in the domestic supply of money. Bank deposits fell from £379 million in December, 1951, to £362 million in May, 1952, and then recovered to £394 million in December, 1952. Advances fell almost continuously during the period, from £205 million in December, 1951, to £184 million in December, 1952. This contraction in advances was associated with a rise in interest rates to relatively high levels. The rediscount rate of the Reserve Bank was raised from 3½ to 4 per cent in March, 1952, involving a simultaneous increase in the commercial banks' overdraft rates from 5 to 5½ per cent and appropriate increases in the rest of the interest rate structure; whilst in August, 1952, the rates paid on fixed deposits by the commercial banks, and the rate on six-month and twelve-month Treasury bills were raised further. Bill rates were again increased in May, 1953.

These changes represented a more definite step towards monetary orthodoxy than anything that occurred in the other Southern Dominions. Nevertheless, in South Africa as in Australia and New Zealand, some cushioning of the impact of the external deficit upon the liquidity of the banking system was felt to be necessary during the first half of 1952. One way in which this relief was secured was by means of substantial rediscounting of commercial and Treasury bills at the Reserve Bank. This resort to such an orthodox method of relieving a credit stringency is worth noting, as rediscounts at the South African Reserve Bank have not often reached any substantial scale. Another—though later—point of interest in South African banking technique is that the improvement in the balance of payments in the second half of 1952, and the simultaneous re-expansion of the deposits of the commercial banks, led these banks substantially to increase the volume of their funds held with the National Finance Corporation—a reflection, presumably, of the check administered to demands for advances. Bank funds deposited with the Corporation reached a peak of £20½ million in August, 1952, in which month the interest paid on such balances was raised from 1⅛ to 1⅜ per cent. This experience seems to indicate that the Union is having some success in developing a rudimentary call loan market.

In India, the movement towards monetary orthodoxy was at least as marked as in South Africa. During 1952 interest rates in India were stiffened considerably. The issue of Treasury bills was revived in September, 1952 (after a lapse since December, 1949), and the average rate of discount on them rose subsequently from just over 2 per cent to nearly 2.35 per cent by the end of January, 1953. The effects of the stiffer monetary policy, which began with the raising of Bank rate to 3½ per cent in November, 1951, were having their full impact upon the Indian economy at the same time as it was feeling the force of the fall in export receipts. Total deposits of the scheduled banks fell from Rs. 872 crores in December, 1951, to Rs. 848 crores in May, 1952, but they recovered slightly to Rs. 853 crores by December, 1952. As in other dominions, however, some relief was given from the pressure upon domestic liquidity occasioned by the overseas deficit. This was achieved by the rediscounting by the Reserve Bank of usance promissory notes or bills drawn and payable in India. This departure has proved to be an outstanding success in its first year of operation. During this period Rs. 81½ crores were advanced by the Reserve Bank by discounts at ½ per cent below Bank rate. The granting of these rediscount facilities (made available for a much wider range of bills than had previously been accepted) not only provided an effective way of relieving the strain on liquidity caused by the external deficit, and especially the seasonal strain, but constituted a means whereby

INTEREST RATES IN CERTAIN STERLING COUNTRIES

India	3½	4	3½	3½	–	2½	2	2	2	2½
New Zealand	3½*	4½*	1½	1½	1	1	2½	2½	½	½
Australia	3½†	4½†	–	–	½	1	2	2½	½	1
Ceylon	2½	3	2½	2½	½	1	1§	1§	½§	½§

* In New Zealand. † In Australia. ‡ Rate for six-month bills; no rate issued for three-month bills until May, 1953, when it was fixed at 1⅛ per cent and rate for six-month bills raised to 2 per cent. § Minimum.

the Reserve Bank could effectively make its policy known and felt through the short-term money market.

It is interesting to note that during 1952 such a financially undeveloped country as Pakistan followed India's example in providing wider rediscounting facilities ; by the end of the year some Rs. 17 crores of advances upon commercial bills had been sanctioned by the central bank. The decline in export proceeds in 1952 was even more serious in Pakistan than in India, partly because of the overvaluation of Pakistan's rupee at present export prices. Despite the maintenance (that is, the subsidisation) of the prices paid to primary producers by the Government of Pakistan, bank deposits in Pakistan declined from Rs. 150 crores at the end of 1951 to Rs. 140 crores at the end of 1952 and there was considerable stringency in the money market. The scheduled banks' borrowings from the central bank rose to Rs. 13 crores at the end of June, 1952, and then declined up to November, 1952, after which they increased again with the onset of the busy season. In the early months of 1953 the drain on Pakistan's foreign reserves had become so severe that the government resorted to the highly unusual step of ceasing to publish figures for them.

In Ceylon, the drastic fall in export receipts led to a decline of Rs. 375 million to Rs. 837 million in external assets during 1952, but an expansion of Rs. 217 million in bank credit extended to the government sector went far towards offsetting the effects of this decline upon the domestic credit situation. Even so, bank deposits fell from Rs. 817 million to Rs. 725 million during the year. The cheap money policy was maintained, and the very low yields on long-term Government securities (at 3 per cent) and on Treasury bills (at just under 1 per cent) rose only fractionally in 1952.

★

In sum, there have been signs that many of the Commonwealth countries have, in different ways, and with varying degrees of conviction, been feeling their way towards techniques suitable for their particular environments. Now that the period of general "cheap money" policies seems to have passed, conditions in these countries—in view especially of the wider markets for government securities and the growing diversification of their economies—may be more favourable than ever before to the growth of central banking control by rediscounting and open market operations. At the very least, there can be no excuse for their being lulled into any easy and complacent scepticism about the usefulness of monetary weapons based upon misreading of their experience in the very different situation in the 1930s—or even of the very special conditions of the late war and immediate postwar periods.

WATER - ESSENTIAL FOR CIVILIZATION From the very beginning of civilization, the well-being of all peoples has depended upon the availability of clean, fresh water. Today adequate quantities of drinkable water are of increasing importance for domestic, industrial and agricultural activities. As this basic condition cannot always be met on the spot, the necessity often arises to build water plants at a distance from towns and villages for the provision of a piped supply.
Here again, the unique features of the Mannesmann Steel Tube have opened up new opportunities. That is why extended piping systems made up of Mannesmann steel tubes are being operated in so many areas throughout the world.
Mannesmann design, manufacture and install:
Long-Distance Water Transmission Lines, made up of
Seamless or Welded Steel Spigot & Faucet Tubes
Service Connections and Plumbing Systems
Hydraulic Pipes and Penstocks, made up of Seamless or Welded Steel Tubes

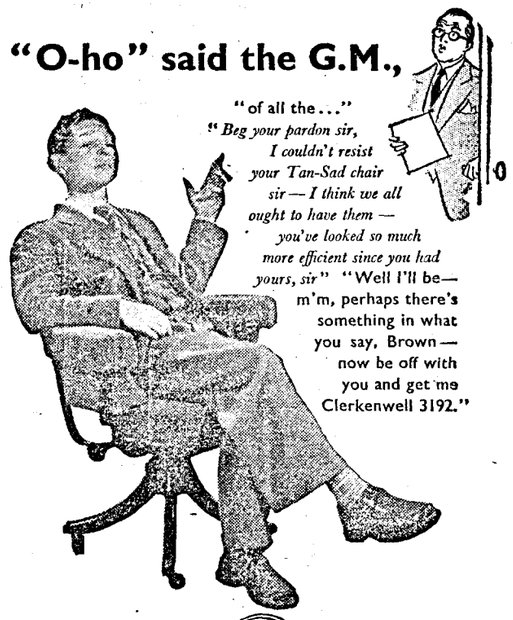
MANNESMANN-EXPORT GMBH DÜSSELDORF

How would you start to pack 200 bagpipes?

What a performance you would find it—a task to make any man puff! But Remploy's group known as P.I.P. (Preservation, Identification, Packaging) can tackle the most difficult pieces with the verve of virtuosi.

Apart from their mastery of the bagpipes, they have packed thousands of items as various as road rollers, needles, radar equipment, knives and forks, sponges.

Identification is carried through every stage of the successive packings. Where necessary, packings are tested for resistance to heat, moisture, vibration, dropping—and even dropping from the air. If you have a problem of this sort, *put it to P.I.P.* From the design of a prototype pack to the final packing for dispatch, P.I.P. knows the answers.



Remploy's P.I.P. organisation, the largest of its kind in the U.K., has 13 factories throughout the country. These provide everything for a complete packaging service—bag liners and cartons to giant packing cases.

PRIVATE TREATMENT *in* ILLNESS

NO FINANCIAL WORRY

In the event of serious illness or operation many people want private advice and treatment for themselves and their families, but are afraid of the cost. B.U.P.A. offers an inexpensive solution. For a very reasonable annual subscription, the Association pays all or a major part of the cost of private nursing home, hospital, and specialist treatment, members being entirely free to make their own arrangements.

The Association's sole aim is to assist its members; it is entirely **non-profit-making.**

Attractive special schemes are available for Staff Groups.

The Reconstruction of Policy

THE diplomacy of the western powers has fallen behind the march of events. To say this is not to imply that any disasters have occurred or that any are impending. But it is clearly no longer the case that the free and allied powers are working together on an agreed plan and bending events to their purpose. They rather seem to be proceeding by expedient on divergent courses to a goal that is in doubt. Their own initiatives—whether it be in "trade not aid" or in organising collective defence—are, at best, limping. When the initiative is taken by the sudden shifts of Soviet policy, or when something just happens, western policy is taken by surprise. Whether the event be a point scored or a point lost, whether it be revolt in East Berlin or treachery by Dr Rhee, it is scored or lost by accident. There have always been critics in the western countries—critics of the policy and critics of the allies with whom that policy is pursued—but in recent months the governments in Washington, in London and in Paris have seemed more concerned to concede points to their disruptive critics than to carry them along. The Bermuda meeting was originally proposed for domestic reasons by a desperate French Prime Minister; but it has grown into something more. It is, or ought to be, an attempt to reconstruct a policy.

Perhaps the best way of seeing clearly what has gone wrong is to go back to the last time the western powers can be said to have had a consistent policy which they were pursuing in unison. That was in the days of Mr Acheson and Mr Bevin. For all their difficulties and their mistakes, they were operating an effective alliance with a working agreement on the policy of containment. The name has, for inevitable reasons of domestic politics, been much abused. But there can be even less doubt now than there was at the start that it was the right policy or that it has been on balance successful. Revolutionary aggressive Communism has been contained, without a world war.

The weakening of the policy since those days is partly a reflection of its success. There is no cement of alliance to compare with fear, and as the tidal wave of panic retreated, differences in national psychology and national preoccupations began to reappear. These were worked on and enlarged by party politics. In America, the Republicans attacked the Democrats for being weak and gullible in their handling of Communism, with the result that they took away from Mr Acheson all his freedom of movement and that Mr Eisenhower must at all costs prove himself to be firm and incredulous. In Britain, Sir Winston Churchill was attacked as a warmonger, with the result that the Conservatives are determined to prove themselves the peace party. The gap thus opened up has been enlarged by the impact of the "new look" in Moscow. The reaction has not been unanimous on either side of the Atlantic, but American opinion has tended to regard the change of tone in the Kremlin as a trick, or alternatively as a response to Allied pressure, while European opinion, whatever it may logically believe, cannot resist the temptation to see in it a real change of heart.

The result is that there are two distinct attitudes in western public opinion today. Europeans are encouraged to believe that there is a hand outstretched from Moscow which has only to be grasped for the cold war to be over. Americans are encouraged to believe that, with firmness producing such results, the obvious need is for more firmness. In these circumstances, the major task of statesmanship is in the field of psychology. To work out an agreed policy may not be too difficult, for the governments are still acting together and the practical views that the statesmen express in private are very much closer together than the generalities that they think it prudent to utter in public. What is more urgently needed is to rebuild for the agreed policy the necessary foundation of public support. This will be much more difficult, if only because it requires each leader to swim against the present tide of opinion in his own country, to plead with his own people the cause of his allies' views.

★

The line that any agreed policy takes must depend on the view that is held of the eventual way out of the *impasse* of the cold war. The tactics cannot be concerted until the strategy is accepted. In point of fact, this is not likely to be as difficult a requirement as it might appear. For on a sober and realistic analysis, both of what might be called the two extreme policies for ending the cold war will be found to disappear. One of these is the "showdown" thesis—the doctrine that the Russians should be confronted with something like an ultimatum and bidden mend their ways or else. The main difficulty about this thesis is that it would not work. If a challenge is thrown down to the Kremlin, it will be picked up, leaving the West with the choice between humiliation and war. The second defect of the policy is that, even if it would work, it could not be carried out by a loose alliance of democratic governments. Throwing down challenges is dictators' stuff. He who plays the game must not only have iron nerves himself, he must be able to rely on an absolutely solid, or completely controlled, public opinion. Certainly we cannot play it.

The other extreme of strategy for ending the cold war is to sit down at a table with the rulers of Russia and haggle out a final and comprehensive settlement with them of all outstanding difficulties. It is an attractive idea. But unfortunately it, too, is a daydream of the impatient. There are, in fact, two separate hurdles on the way to accomplishing it. First, is there any reason to believe that the Communist rulers are prepared to sit down to an honest attempt to strike a real bargain? The list of the "concessions" they have made since Stalin's death is now long enough to be quite impressive. But so far none of them affect the substance of Soviet external policy—that is to say, the changes that are substantial are internal, and those that are directed towards the outside world are no more than gestures.

Suppose, however, that we try it out and find that they are ready to sit down at the bargaining table. The second hurdle still remains: what are we to bargain about? There is absolutely nothing whatever in the events in Russia since Stalin's death to suggest that his successors are prepared to give away any of their vital positions except in return for something that they consider of equal value. To make the West feel really secure, they would have to give away a very great deal—their control over their satellites, their machinery of propaganda and agitation, the bulk of their armaments. Does anybody seriously think that they would go so far? Does anybody seriously think that we could be satisfied and secure with anything less? And what concessions do we have it in mind to offer as the price of all this, or even of one-tenth as much?

The plain fact is that neither of these extreme policies—neither the one that can be caricatured as sabre-rattling nor the one that can be caricatured as appeasement—stands any chance of working. The one would run a grave risk of immediate war. The other cannot be expected to work until mutual confidence has been slowly rebuilt by a long period in which both sides in fact refrain from aggression, open or covert, against the other. In the meantime the only possible policy is to go on as we have been going, or rather as we set out to go four or five years ago, doing nothing to provoke a conflict, ready to explore every genuine prospect of agreement, but actively preparing to deter any attack on the present borders of the free world.

The task of Bermuda, in short, is to reconstruct the Acheson-Bevin policy—though Mr Eisenhower and Sir Winston Churchill may perhaps be excused from describing it in those words. Both the Americans and the British have something to contribute to such an endeavour. If the President were to argue that American policy is right in *substance*, it would be difficult to quarrel with him. Firmness has worked. On the other hand, if the Prime Minister were to argue that a much greater suppleness is needed in *presentation* of the policy to the world, it would again be impossible to gainsay him. On Capitol Hill, Mr Eisenhower may be attacked for being too weak; but everywhere else in the free world, American policy has been losing friends because it is thought to be too stiff, too rigid, too inhuman, incapable of conceiving of any issue to the struggle save the unconditional surrender of the enemy. This, of course, is a travesty; but it is a misrepresentation that the Americans themselves have abetted by the need to appear uncompromising in what they say at home. If what is needed of the Europeans to keep the alliance alive is a reaffirmation of their willingness to stand firm and resist the siren voices that call for appeasement and an easy life, then what is required of the Americans is that they should pay more attention to the desperate longing of the ordinary man for peace and quiet, that they should take more trouble to make it clear to all the world that they do not want to smash the Russians if there is any other honourable and

enduring way of making the world secure and free.

The basic strategy, then, should continue to be that of containment, the middle course between provocative challenge on the one hand and weak appeasement on the other. It is perhaps worth giving some indication of how it could be applied in the two areas of greatest immediate concern, in the Far East and in Europe.

In the Far East, until the moment of Synghman Rhee's criminal treachery, the middle course has in recent weeks at last shown signs of working out. In any event, the lines of a workable policy are henceforward clear. The policy of the truce, of accepting things as they are, has been accepted by both sides in Korea and the next step should clearly be to extend the principle to the rest of the Far East. That involves no final commitment to acquiesce in the permanent disappearance of China behind the iron curtain; but it clearly implies that abandonment of any thought of trying to unseat Mao Tse-tung by war. Similarly, it implies nothing about the permanent status of Formosa, but an agreement that its present status shall not be disturbed by force. Save for the large question-mark hanging over Indo-China, there is now reason to believe that the Communists would accept a *modus vivendi* on these lines. And profoundly unsatisfactory as it is in many ways, it should also be agreeable to the United Nations. The chief obstructions in the way are the stubborn refusal of American opinion to admit that the Communists do effectively rule China and the no less stubborn refusal of the rest of the free world to admit that they do not rule Formosa. As was suggested in these columns two weeks ago, the obvious solution is to make these obstinacies cancel each other out.

★

The problem of Europe is virtually identical with the problem of Germany, and if it is less immediately dangerous than the Far East, it is likely to be far more stubborn. It is here that the policy of the middle course meets its severest test. Both the extremer policies have their advocates. For example, there are those who preach the doctrine of liberation of the satellites. But the impossibility of carrying a policy of liberation beyond the stage of talk has been sharply illumined by the events of the last ten days in the Soviet zone of Germany. For the first time, there has been open revolt in a Soviet satellite. Moreover, it has happened in full view of western observers, with American, British and French troops close at hand. If there is anything in "liberation," was not this the golden opportunity for action? But what action? And the answer surely is that no action was possible. The Berlin riots are a propagandist's godsend; they should be exploited to the full in what is *said*. But it is clear that nothing could have been *done* without running the real risk of immediate war. The moral is clear. We can refuse to accept the enslavement of the peoples of Eastern Europe or the arbitrary re-drawing of their frontiers by Moscow. We can make it clear that a condition of any general settlement is the holding of free elections. But we must equally make it clear that we shall not be the first to send our forces across the truce line.

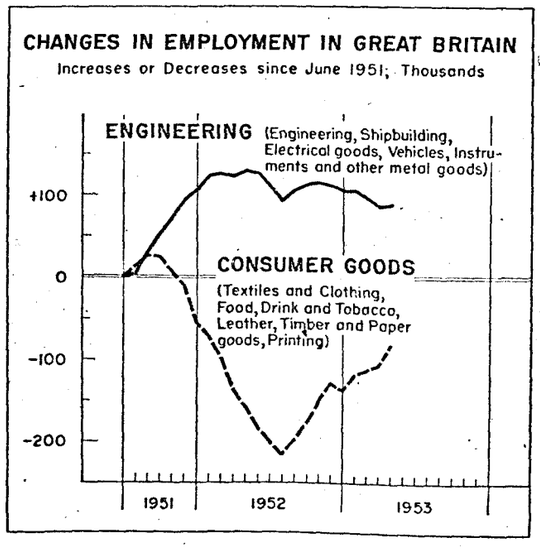
The other extreme also has its advocates and its attractions. A great many problems would be solved if only it were decided to give up the attempt to fit a democratic Germany into the western alliance and to abandon Dr Adenauer. But what would happen if we did? Those who think that Germany could simply retreat into a neutral vacuum are deceiving themselves. Ever since the days of Potsdam it has been perfectly clear that, if Western Germany is not on our side of the fence it will sooner or later (and probably sooner) be on the other. The temptations that an unscrupulous Russian diplomacy could offer would be irresistible—history is full of examples of Russian-German bargains at the expense of other people. The only real choice is between having the iron curtain on the Elbe and having it on the Rhine. It is possible that, in office, the German Social Democrats would face up to this awkward fact; but nothing in their record encourages confidence that they would. The Russians have made it clear that their primary objective for 1953 is to get Dr Adenauer defeated in the coming election. That should be enough to convince the western powers that their interest lies in supporting him. For the next few months, every step in western diplomacy ought to be carefully considered for the impact that it is likely to have on German politics, for it is there that this year's chief threat to the policy of the western alliance lies.

★

Nobody would pretend that the policy here sketched out is complete or watertight. It has, as it always has had, gaping holes in the Middle East and in South-East Asia. Nor is it easy to arouse enthusiasm for a middle-of-the-road policy—particularly for one that is familiar enough to have become tedious. It would be much more exciting to strike out on a new line and to promise, by some brilliant stroke of diplomacy, a speedy and a happy issue out of all our afflictions. But there are no patent medicines in politics and a very little quiet thought is enough to discover how much danger, and how little prospect of success, there is either in defiance or in appeasement, either in the "open challenge" policy towards which domestic political pressure is constantly pushing the American Government, or in the "negotiated settlement" policy towards which so much wishful thinking in Britain and Western Europe is inclining. Imperfect and incomplete though it may be, the policy of containment is more practical than these. Its successes have not, indeed, been sensational. From its nature, they have been largely negative; they have consisted in the wars that did not break out, the lines that have not been attacked. The very *détente* that enables the public to

enjoy the luxury of resenting its burdens is the chief proof of success.

The task of Bermuda, then, is one of reaffirmation. The less difficult part will be to agree on the detailed measures to be taken in furtherance of the policy. The more difficult part will be for the President and the Prime Minister to take counsel together how they can rekindle in the peoples of the West the confidence in the policy that domestic politics—in each country, though in different directions—has so largely undermined. For a task of that sort, fortunately, no two men in the world are better equipped.



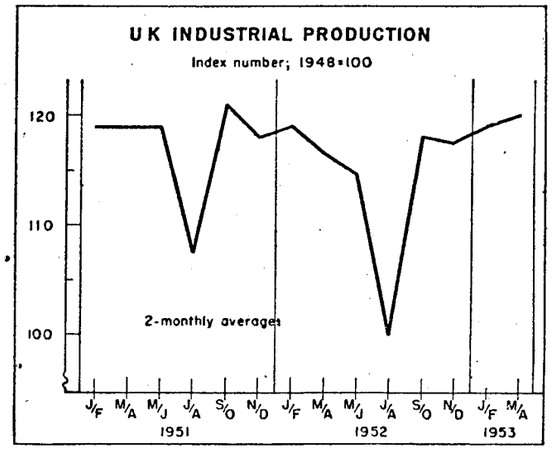
Reflation at Work

THE committee stage of the Finance Bill was quietly completed on Wednesday morning, and the Chancellor has good reason for satisfaction with the case that has been made from the Treasury bench. He was able to assert—modestly but convincingly—that, in relation to the purposes of the Budget, "things are certainly developing in a way which is not entirely unsatisfactory." With this, he was probably understating his case: the case, that is, against his Labour critics who say that the economy is being repressed by too tight a monetary and fiscal policy. In reply, the Chancellor had redefined the purposes of his Budget as being "to increase investment in productive industry and to moderate any deflationary tendency that might militate against the proper and full employment of our people." It is, of course, too soon to dogmatise about the state that the economy is assuming under the influence of the Budget. Changes that began only in the middle of April do not yet have much reflection in statistics. One thing, however, is evident. Before the Budget unemployment was falling by more than is usual at the beginning of the year, and this went on in the month after the Budget.

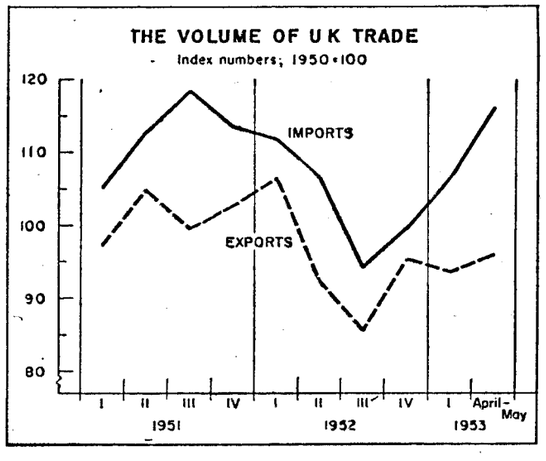
Employment is now full enough to satisfy even those Labour politicians who think that anything short of the postwar boom is a national disaster. Last month there were, indeed, rather fewer men out of work than at the same time in 1950. The total of men and women unemployed was 340,000 last month and 315,000 in May, 1950. The latter figure coincided exactly with the average for the year 1950. It was, that is to say, typical of the period that Labour apologists have since proudly pointed to as the summit of their achievement, the time of economic stability that was rudely disturbed by the Korean war and rearmament. Mr Butler has already got within 25,000—one worker in a thousand—of the same low level of unemployment, and even these few extra unemployed are women (and therefore not, in most cases, the main breadwinners of their families). No Socialist critic can make a large black mark out of that.

The fall in unemployment is illustrated in one of the accompanying charts. Mr Butler's success in increasing "investment in productive industry" cannot yet be given any such statistical demonstration, but the general impression is undoubtedly favourable. There is evidence that many firms are launching new schemes of investment in plant, equipment and factory-building. How much this has to do with the stimulus of the Budget is open to argument. Certainly there never was anything like the industrial stagnation that the Chancellor's more doctrinaire critics regarded as the inevitable penalty of a 4 per cent Bank Rate. Outside a few industries, with special reasons for depression, last year brought only a little more caution. British industry was not made to flop crippled by the roadside; it was induced to pause to look at the map. There are many signs that it is now going ahead the more confidently.

★



In these matters, stimulating investment and avoiding unemployment, Mr Butler is entitled to his satisfaction. But they are hardly the whole point. He rested his Budget proposals less on the need to reduce unemployment, or even to stimulate investment, than on the scope for raising production—which meant, primarily, improving output per man. Here this year's statistics as yet do no more than confirm the diagnosis. In the accompanying chart, they are plotted as two-monthly averages, in order to eliminate the most casual of the fluctuations in the monthly production figures. An encouraging upward trend at the beginning of the year is clearly indicated. Nevertheless, the volume of production during the first four months of 1953 was only slightly greater than in the same period of 1952; it was almost identical with the production of two years ago, before the disruptions of rearmament took effect.



This is disappointing. Some temporary fall in productivity was an almost inevitable consequence of last year's industry readjustments. But by now smooth working should have been restored, and Mr Butler's fiscal stimulus to production ought, therefore, to be showing results soon. The success of his policy can now be seen to depend more clearly than ever on the degree to which production expands. Consumers' demand is undoubtedly buoyant. In this, again, it is too early to try to judge the effects of the Budget; and it is impossible to know how far the Coronation is responsible for a purely temporary buying spree. But the reports of good trade in the shops are widespread. It is at least possible that the country is once again launching itself on a higher level of consumer spending than the economy can support. With investment outlays also rising, a revived inflationary pressure is a clear danger unless production rises to meet the extra demand.

The margin of extra demand that can be met without damage to the economy is certainly slight. When Mr Butler talked about the "proper," as well as the full, "employment of our people" he was presumably thinking of the need to have more labour working on exports and on productive investment at home. But, as another of the charts shows, manufacturers of consumer goods have taken on another 135,000 workers in nine months. Meanwhile, the industry that should have been the beneficiary of expansion—engineering—has lost 41,000 workers since the peak of rearmament recruitment in the spring of 1952. Consumer demand certainly cannot now be allowed to strengthen its pull on the labour force.

★

If demand does continue to rise, without extra production to match it, exports will quickly suffer. Their volume has in recent months declined, as the chart shows, while more imports have been coming in. The balance of payments seems, nevertheless, to be remaining at present in surplus; exports have done quite as well as the more realistic forcasts indicated. This situation could, however, change considerably for purely domestic reasons; it could be changed fundamentally by any slackening of activity on the other side of the Atlantic. On that, however, speculation at present serves little purpose. The first task of the economic policy-makers is to keep a close watch on the domestic front. In April the Chancellor believed that a certain reflation of demand, by means of tax reductions, was necessary to stimulate employment, production and investment. The signs are that the reflation is working. They also suggest that it may be going, if anything, too far; the danger is that inflation will revive. It is in a spirit of vigilance against renewed inflation that the Chancellor ought to stand ready to change course if required.

Opportunity for Adenauer

EVERYTHING that can and should be thought in praise of the workers' revolt in Soviet Germany has now been exultantly said. It will be long remembered as a gallant and astonishingly effective demonstration against despised politicians held in power only by Russian troops and Communist police. It has been made clear to the Russians and to the Communist governments of Eastern Europe, by disorders in Czechoslovakia as well as in Soviet Germany, that the dictatorship of the proletariat can be challenged by the workers it claims to represent if they find their conditions of life and work getting more and more intolerable. Nothing more damaging to Communist prestige has happened since the war. The fact that German workers, only eight years after Hitler's death, are being hailed as the champions of freedom, must have consequences for the future that are unpredictable. What is important for the moment is that the events of last week are already having potent effects in Western as well as Eastern Germany.

Firstly, the East German Communists have been forced into public repentance for their own terrorist methods. They must now pursue a more moderate policy and it can be only a matter of time before Christian Democrats, Liberals and representatives of other non-Communist parties appear in a reconstructed government. The first moves in this direction had been taken by the Russians before the demonstrations, and the sense of impending changes in Communist rule must have strengthened the determination of the workers to make their claims heard. It seems likely that the Russians decided some weeks ago that Ulbricht or Grotewohl, or both, must be called to heel before any attempt to reopen four-power negotiations was made. They doubtless hoped to take a little time over this correction of their protégés; instead they find themselves overtaken by events. Secondly, it is clear that the Russians will not be easily deterred from their policy of appeasing the Germans. The behaviour of their troops in Berlin suggested that Moscow had ordered the utmost possible restraint. Thirdly, the Russians and the Communists of Eastern Germany must now approach the business of getting German unity—if that is what they have in mind—with much reduced confidence and prestige. What they had boasted they could bring about in Western Germany—a revolt against Dr Adenauer and his western policy—has happened to them in Eastern Germany.

This turning of the tables has had a lightning effect on the politicians—not so much on the people—of Western Germany. Here, suddenly, in the opening stages of the election campaign which is to decide in September for or against Dr Adenauer, comes the evidence that things which seemed impossible may now be possible. The process of Sovietising Eastern Germany has been not merely checked but in some respects reversed, and the Russians may yet throw over their German allies in order to pursue new tactics towards Germany and the West. It even seems possible, after what has happened in Austria, that free movement between the western and the Soviet zones will be allowed. If so, the western powers could claim that party activity on an all-German basis should become possible and one of the main obstacles to free elections would be removed. That, at any rate, is the way some politicians in Bonn see the future. To the Social-Democrats the East German revolt must seem a heaven-sent election opportunity. Were they not right, they can now say to Dr Adenauer, to stand firm for German unity against his policy of integration with the West? (They do not admit that this policy is a main reason for the present Russian tactics.) Herr Ollenhauer can now claim that men of all parties are behind the demand for a return to four-power consultation on German affairs.

These are revolutionary developments, which could gravely embarrass Dr Adenauer if they were mishandled by his colleagues and allies in the West. At a moment when the cause of Western European integration is already sagging, the news from the East could be used to deflate still further the Chancellor's policy. When it seemed certain, as it did last year, that Eastern Germany would be sovietised root and branch, he and his followers could show a patient scepticism about the prospects of German unity held out by his political opponents. They cannot now maintain that attitude without endangering their prospects in the September elections. At this very moment the parties in the coalition must be wondering how they can use the Russian predicament in the East to maintain the government's position and to rally waverers behind it. For they hear the Social Democrats claiming that the workers' revolt behind the iron curtain means that leadership in Germany now lies with the non-Communist left.

In this situation it is to the United States and Britain that the Chancellor and his colleagues will look. Already he has appealed to President Eisenhower, Sir Winston Churchill and M. René Mayer to support a five-point plan for the unification of Germany in peace and freedom which reasserts the terms put forward by the western powers last year. It demands free elections throughout Germany, an all-German government free to make whatever alliances it wishes, a peace treaty to be negotiated with—not dictated to—that government, and the fixing of Germany's frontiers in the peace treaty. Dr Adenauer, in other words, is asking that the West should stand by the terms that it presented to Moscow in Stalin's day, and that the Germans should take a full and equal part in the settlement of their future. It is only on this programme that the Chancellor can challenge his opponents with the questions: Would you settle with the Russians for less? Would you be content to see a united Germany given no more freedom than Austria has? Would you exchange the virtual independence offered to Western Germany in the Bonn Conventions for an Austrian solution? And Dr Adenauer puts it forward with all the more conviction because he feels that last week's events have shown the Russian bargaining position to be weaker than anyone had dared to hope.

Two courses now lie open to the Russians. One is to take up negotiations on unity and free elections at the point where they were left last October. That would mean discussing the whole German problem with the three western powers and the Federal Republic solidly aligned against them. Or they can proceed step by step, making piecemeal concessions, seeking direct contact with the politicians of Western Germany and the Allied High Commissioners, hoping that their tactics may divide the western team. That, so far, has been the method of their diplomacy, notably in Austria; and that seems to be the more likely course for them to take. If these are, indeed, to be the Russian tactics, then allied policy will face a task of great difficulty and delicacy. The problem is essentially what it was a year ago, but with this difference: that Dr Adenauer can now appeal to Germans to insist on freedom as the condition of unity, knowing that the rising behind the iron curtain has brought home to their hearts what freedom means. That should steal his opponents' thunder.

The Rhodes Scholars

CECIL RHODES, the centenary of whose birth is being celebrated next month, created two monuments for himself. The one is the empire he carved in South Africa, and it is symbolised by his proud grave in the Matopo Hills. The other, and perhaps more enduring, is the commonwealth of heart and mind formed by the Rhodes Trust. Some 2,500 Rhodes scholars now live scattered throughout the world, but next week seven hundred of them will be gathered at Oxford in memory of the founder.

Neither of Rhodes's two principal dreams has been realised altogether in the way he intended. The relationship between the Union of South Africa and the rest of the British Commonwealth is full of strain and potential difficulty, while the Rhodesias are at present struggling with the bitter problem of Central African Federation. The Rhodes scholars, on the other hand, have not constituted the closely-knit and militant vanguard of imperialism that Rhodes may have imagined. Despite the fears of the *Chicago Tribune*, they have not indulged in a vast conspiracy to bring the United States back into the Commonwealth. Instead, they are a world-wide confederacy of individuals, often opposed to one another in beliefs and politics, but none the less joined by the common experience of Oxford.

Essentially, Rhodes conceived of his scholars as future statesmen and politicians; they might form a diplomatic free masonry in which leaders of various nations could meet and pursue common ideals. In fact, however, no very large proportion of Rhodes scholars has gone into politics and diplomacy. One of the most distinguished of that number, Senator Fulbright, is famous less for his politics than for his initiation of an annual exodus of American students to Europe. Nevertheless, there were more than a hundred Rhodes scholars in important posts in Washington during the last war.

So far, law and education have taken the largest share of Rhodes scholars; nearly half of the 2,831 scholars elected since the foundation of the scholarships fifty years ago have been active in these two fields. The Chief Justices of South Africa, Southern Rhodesia, Victoria, the Sudan, and Sierra Leone are all Rhodes scholars, fifty-two of whom are Queen's Counsel. It is in education, however, that Rhodes scholars have had their most decisive impact; 33 have been vice-chancellors or presidents of universities and colleges. In scholarship and research, the catalogue of Rhodes scholars can boast the Nobel prize of Sir Howard Florey, the Order of Merit of Dr. Penfield and the fame of Sir Hugh Cairns.

If it is difficult to detect an influence of Rhodes scholars on world opinion and events of the kind envisaged by Cecil Rhodes, such scholars as, for example, the head of the Mutual Security Administration in England and the editor of the *Christian Science Monitor* have, each in his distinct way, fulfilled the intention of leadership and public service. The fact that so many have chosen more academic and indirect means of contributing to the public good is perhaps a mark of the impression Oxford has made on them. Those who have combined the college quadrangle with active politics are, after all, the most direct reminder that Rhodes himself rarely crossed the veld without a Plato in his saddle bag.

What is striking and instructive about the double heritage of Rhodes is that it embodies a conflict of visions. On the one hand, there is the nineteenth-century dream of empire, with its affinities to Kipling and its disturbing note of racial preference. Although the changes in Rhodes's successive wills make his intentions difficult to interpret, there is little doubt that the Rhodes scholarships were supposed to be an empirical part of this imperial dream. Instead, they are playing

a complex and important role in a very different kind of imperialism: that extended by an ancient civilisation to lands often more powerful than itself. Rhodes himself would no doubt have rejected any analogy suggesting that the third British Empire might have much in common with the heritage offered by a new Greece to a modern Rome. And yet, it is in this context of moral influence and example rather than of political alliance and expansion that the Rhodes Trust is acquiring its authentic character.

It is a truism, but one worth considering, that in these times Anglo-American relations and the problem of keeping a changing Commonwealth united are matters above and beyond the domain of traditional diplomacy. An increasing burden will lie on sheer personal contact and mutual comprehension by individuals. Nearly every Rhodes scholar or Fulbright student who has spent a number of formative years in England will go home either as an active friend or at least as a tolerant observer of this country. The fact that Rhodes scholars may help represent Indian and Pakistan at future Commonwealth conferences, or that an increasing number of American Rhodes scholars are representing the United States abroad, may prove to be a force of cohesion far stronger than that originally conceived by Rhodes. The British Government's decision to create a number of Marshall scholarships in order to increase yet further the flow of American students to this country is a welcome recent sign that the importance of this form of intellectual and moral export is understood.

Nor is this a one-way traffic. The Commonwealth Fund Fellowships for British students to attend American universities were not founded in imitation of the Rhodes scholarships. But they serve much the same purpose in reverse; they have now been in existence for nearly thirty years and the 600 or so returned Fellows are playing their part in this country in the same design of international comprehension. The English-Speaking Unions both of Britain and of the United States have been active in sending students from this country to America; recently the English-Speaking Union of the United States has raised a King George VI Memorial Fund that is to be entirely devoted to this purpose. British students also share in the grants made both by the great charitable foundations and by the United States Government under the Smith-Mundt Act, and the fact that Rhodes scholars are to be found at the head of the Rockefeller, the Guggenheim and the Carnegie foundations helps to ensure that the British claims are not overlooked. But even the concept of Rhodes, closely tied as it was to British imperialism, was never intended to be exclusive. On the war memorial in Rhodes House the names of those who fell in defence of their native land are recorded impartially, whether they gave their lives for Britain, for America or for Germany.

Notes of the Week

The Problem of Rhee

No one in the world at the moment is in so strong a bargaining position in relation to the United States as President Syngman Rhee. Circumstances have involved American prestige in the fate of little South Korea to an extent which is possible only in war. President Eisenhower, moreover, was elected largely in the popular belief that he would find a solution to a problem that had come to dominate the political scene. Mr Syngman Rhee's temptation is great, therefore, to stake his life's aim of a Korea united under his leadership on the belief that he can force the United States and the rest of the United Nations into a course of action which their own interests would cause them to reject.

Those who normally support the cause of nationalism have an obligation to understand how critical this moment is for a man as fanatically nationalist as Mr Syngman Rhee; but nothing can excuse his carrying his aims beyond a certain point. Even if he himself cannot see beyond Korea, the struggle in his country has assumed for everyone else a character far beyond that of a local war. It has become not only a symbol of the free world's determination to resist Communist aggression but possibly a means of avoiding a world war. In the attempt of the United Nations command to bring it to an end on honourable terms by hard bargaining at Panmunjom is involved not merely the success or failure of Korean nationalism but the future of countless millions everywhere.

These considerations now justify President Eisenhower in almost any steps that he can take to counter Mr Syngman Rhee's ruthless and cynical act of sabotage in releasing prisoners of war on his own responsibility. In order to save the truce and save South Korea it may prove necessary to remove Mr Syngman Rhee from office. Any proposal that allied support for him should be withdrawn has hitherto broken down on the grounds that there is no other Korean leader who could take his place and rally and organise his people. But the fact that he still finds it necessary to indulge in acts of terrorism against political opponents suggests that neither he nor his implacable

intransigence are as popular in South Korea as he makes out. If he died, someone else would have to be found anyway. The war, moreover, has thrown up new leaders, both military and political, whose standing in the country today bears little relation to the political situation that existed before this intense phase of national struggle began. Does President Synghman Rhee want to be removed like Napoleon to a remote place—St. Helena not Elba—where he could end his days peacefully and not without honour? If the Communists want a truce, as they still appear to do, it should not prove impossible for the United Nations to give effective support to a new and co-operative regime in Seoul. It should be possible to explain to the South Korean people that their President is jeopardising not only peace but also the reconstruction of their devastated land by the United Nations.

Labour with a Policy

Officially, there is now an Opposition policy for home affairs; on foreign policy, the Labour party's executive committee wisely decided this week to postpone its intended statement until the international situation is somewhat clearer. It is doubtful whether in fact the state of Labour's domestic policy is any more settled. Few members of the party, of either wing, are talking as if it were. A week after the publication of "Challenge to Britain" it seems to have ceased to be a challenge to Labour; it has been relegated in the minds of most of the party to a rough draft on which a coherent policy might be built later.

In this it has suffered the fate of so many compromises; it has failed to give real satisfaction to any of the groups whose opinions it was supposed to cover. As usual, the left wing has reacted promptly and with precision. Even before the document was published the Bevanites announced that they would campaign for the nationalisation of rented farm land. Now they are urging that the party should sweep aside the equivocal references to a capital gains tax and to public ownership for industrial assurance, and declare boldly for both. Nor have they missed the opportunity presented by the omission of any reference to equal pay, apparently due to sheer forgetfulness. It is a sign of the propaganda dominance of the Bevan group that it is allowed with impunity to chide the party executive for the omission, although that body contains five members of the group, one of them a woman. This is typical of the aggressive opportunism by which the Left keeps the party leaders in a consistently unheroic posture of defence.

One of the leaders' difficulties is illustrated by the current controversy over school building. It seems that ex-ministers had to point out to their own party that their own record was also involved and to suggest that, with Miss Horsbrugh a sitting target, it would be a pity to attack her with boomerangs. Similarly, ex-ministers have been pained to find that at several points—notably over agriculture—the policy statement promises great improvements with really no more powers than they enjoyed when in office. Where positive policy changes are offered, the right wing carries an even greater encumbrance: experience of what is practical makes many ex-ministers dubious about the education proposals and about the ideas for a tightly organised sterling area. Above all, they distrust the industrial proposals. With something near an empirical approach to public ownership, the right wing accepts some of the schemes of "Challenge to Britain" but has grave doubts about others—notably about nationalisation in the chemical and aircraft industries, for both of which the national executive barely attempted to go beyond a doctrinaire justification. The feasibility of re-introducing many industrial controls is also doubted. This empirical approach is naturally anathema to the Left, and the gulf between the two views is so wide that it is hardly possible for Labour to produce a coherent industrial policy until one or the other, not a compromise, prevails.

The State of the Schools

The condemnation of Britain's schools which issued last week from the Select Committee on Estimates has given the Opposition a useful stick to beat the Government with. The committee's report was unusual in that instead of detecting extravagance it expressed concern that more money had not been spent on providing school places and on improving the many slum schools that are still in use. In doing so it not only lends powerful support to the Opposition's campaign against cuts in education expenditure; it also provides a long-sought political counter to the Conservatives' housing programme. The Government's success in this field has hitherto had to be attributed to the building of "rabbit hutches"; now the select committee can be cited as proof that it is building houses at the expense of schools.

This particular criticism is fairer than some of the report's strictures. It is no doubt true that a stronger Minister of Education would have been able to secure a larger allocation of resources. But the Labour party, as well as the present Government, was guilty of spending too much on subsidised housing. The Opposition lays great stress on the fact that school building was held up by the moratorium early in 1951; a principal reason for this moratorium was, however, the shortage of steel, which hardly enters into housing. The shortage of school places and the continued use of "black-listed" schools cannot be laid at Miss Horsbrugh's door. It is a deep-rooted problem, openly referred to in the Ministry of Education's annual reports. It was inherent in the introduction of universal secondary education at a time when the national resources were at a low ebb; and it has been particularly acute because of the "bulge" in the school population (shown in the chart on page 895) due to the high postwar birthrate. Whether the Ministry's estimate of the number of places needed was or was not 100,000 too low is beside the point. There is no evidence that schools have been built less quickly than the Ministry's share of money and materials, and the productivity of building labour, allowed. The architects' department is certainly to be congratulated on its excellent work, particularly in the design of prefabricated buildings, though the local authorities are slow to adopt them. Miss Horsbrugh should be able to put up a good defence of her own part in school-building policy, even though the Government as a whole shares with its predecessor responsibility for giving education a low priority.

Not Even M. Pinay

M. PINAY'S refusal to attempt to form a government in the face of MRP reluctance and Gaullist indecision brings the French crisis yet another lap nearer to absurdity. Two facts militated against M. Pinay: his popularity with the country, which the Assembly has always feared and resented, and his association with the "right" at a time when France has moved several points leftward. M. Mendès-France's programme of retrenchment in armaments and in France's colonial commitments, although it failed to secure the necessary majority in the Assembly, has made its mark on French public opinion. M. Bidault and M. Marie failed, even though they tried to take the new mood into account and it seems unlikely that M. Pinay could have succeeded.

After his refusal, it was expected that President Auriol would turn to M. Faure, the young radical, who was thought to have the best chance of constituting a centre-left coalition. Instead, the President has called on M. Laniel, an independent whose views are not dissimilar from those of M. Pinay, but who has the added advantage of a close association with the Resistance. A point has been reached, moreover, where all the traditional cards have been played and when the very fact of relative obscurity may help a candidate before the Assembly. Whoever does succeed in solving this crisis, however, will do so by virtue of the growing political weariness rather than owing to a real national sense of urgency. This, in spite of the fact that public finances are in a precarious state and that the question of France's representation at Bermuda is unanswered.

As the crisis prolonged itself, it had been hoped that some dramatic method could be found to end it, or at least to explain its importance to a sceptical and often amused public. When all the parties except the Communists met, however, the Socialists baulked and M. Reynaud was left prophesying doom. As long as the French constitution is not reformed so as to embody an effective right of dissolution, one crisis will merely be solved by preparing the next.

No Concessions for the Czechs

THE Czechoslovak workers whose economic hardships drove them to demonstrate against the Communist regime are not, it appears, to receive the same conciliatory treatment as their comrades in eastern Germany. The predicament in which they now find themselves after the recent drastic currency reform can be easily illustrated. Their wages have been cut to a fifth of what they were; but the new fixed prices of all the things that they need are far above the old rationed prices, although they are below the former "free" market prices. Before the reform a man had enough ration tickets to buy rationed bread at eight crowns a kilo for about 18 days each month; for the rest of the month he had to buy unrationed bread at 16 crowns a kilo. Now he pays for all his bread in the new currency at 2.80 crowns a kilo; this is equivalent to an increase of 75 per cent over the old price of rationed bread and a decrease of 12.5 per cent below the old price of unrationed bread. Similarly, the new price of butter is 175 per cent above the old rationed price and 50 per cent below the old unrationed price. To add insult to injury, rationing has not really been abolished; there is still a strict limit on the amount of bread, butter, etc., that each person can buy.

The Czechoslovak Communist leaders, however, have made it clear that they will not—or cannot—retreat, and they have now handed over to the trade unions the task of dealing with recalcitrant workers and keeping the rest of them up to the mark. A meeting last week of the executive committee of the trade union organisation, which was attended by President Zapotocky, agreed that all workers who violated the labour discipline code in the recent demonstrations should be punished and expelled from their trade union, and that the trade unions would support all disciplinary decrees imposed by the government on the workers and oppose all "unjustified" wage demands.

The trade unions have also accepted responsibility for fulfilment of the five-year plan and of the orders placed by the Soviet Union and other "people's democracies." Here, in fact, lies the chief reason for the government's stubbornness; it is gravely and increasingly worried by the failure of industry, especially heavy industry, to fulfil its targets. The regime's persistence in its present course is more likely to provoke further disorders than to secure increased production; but it is unlikely to venture a change of course unless it receives a new directive from Moscow.

Europe Debates and Dithers

THIS has been another of those weeks during which so many European gatherings are held simultaneously that the eye is confused. In Strasbourg two assemblies—that of the six-nation coal-steel community and that of the fifteen-nation Council of Europe—have met separately and jointly; in Paris the foreign ministers of the Six have conferred briefly and agreed, "in view of the need for haste," to meet again in August. At Strasbourg progress, if not made, was at least registered. The High Authority of the Coal-Steel Community presented a first report on active operations, and received what amounted to a clear vote of confidence. M. Monnet and his eight colleagues were confirmed in office for a further year amid deserved applause. Yet there was some discrepancy between M. Monnet's claim that the High Authority had been able "to give Europeans the sense of their own dignity," and the decision, taken by the bureau of the Consultative Assembly, to postpone general discussion of current problems until September owing to the "fluidity" of the situation. The successful launching of Europe's first working community may indeed have added to the continent's dignity, but it has not lessened its ability to dither.

However, the fact that the six foreign ministers must now foregather at Baden-Baden in August for the discussion on common political institutions that should have been held on June 12th in Rome is due primarily to the French ministerial crisis. Dr Adenauer, at least, will not welcome the delay. But the short Paris meeting provided a useful opportunity for the foreign ministers to exchange ideas on broad international issues before the Bermuda conference. In this respect it was, perhaps, as happy an accident as the gathering of Commonwealth prime ministers at the time of the Coronation. If the project for a European political community never matures, it will at least have proved a valuable pretext for the kind of periodic, informal meetings of ministers that have proved their usefulness to the Commonwealth but are still a novelty in Europe.

The BBC's Alternative

THE BBC's development plans, announced by its Director-General on Tuesday, are plainly a bid against commercial television. After completing and extending the existing service, the corporation intends to start a second television programme.

These plans, however, all hinge on Government sanction. In order to give almost everyone in the country the chance to see television, five medium-power and eight low-power stations must be built; that will require capital expenditure some 50 per cent above the present rate. The corporation can probably look forward to an early relaxation of the present limitations on its investment programme, which were imposed when inflation was stronger and steel scarcer; permission to complete the BBC's national coverage can certainly be expected to precede permission to build commercial television stations. The starting of an alternative programme, however, depends on whether the Government will allocate enough frequencies to the BBC. The Television Advisory Council's report on frequencies, expected last week, had still not appeared when this issue of *The Economist* went to press. But if enough frequencies are allocated to the BBC to form a second national network, it seems more than ever likely that commercial broadcasters will have to be content with very limited regional services.

Sir Ian Jacob said nothing definite about the character of the proposed new programme, but thought that the two services might correspond to the national and regional sound services before the war. A television service of higher intellectual quality than the present one is certainly desirable. On the other hand, if commercial television does come to provide light entertainment, the need for the BBC to do so will be a good deal less obvious; a single service, embodying the high standards about which more is at present heard than seen, might then be enough.

Records and Statistics

Since 1947 *The Economist* has published a weekly Supplement, entitled *Records and Statistics*, whose contents have closely corresponded with its title. This Supplement was started, at a time of strict paper rationing, as a means whereby the size of *The Economist* itself could be reduced to a minimum without wholly abandoning the duty that, from its earliest days, the paper has always accepted to provide for its readers a service of factual information. The Supplement has been produced at a heavy loss; latterly the subscription charged has covered barely one-third of the cost of production.

Now that paper is available, it has been decided to reverse the measures of 1947. Publication of the Supplement will be suspended after the present week. From next week, *The Economist* itself will include an average of four statistical pages instead of the one that has appeared hitherto.

The Burden of Pensions

THE first statutory review of the national insurance scheme is due to take place next year, and it is bound to be dominated by the growing cost of old age pensions. This cost is the theme of the Government actuary's interim report on the scheme for 1951-52 (HMSO. 6d.), just as it was the theme of his memoranda on the National Insurance Bills of 1951 and 1952, which increased the rate of pensions.

In other respects, the national insurance accounts are satisfactory. Partly because the average rate of unemployment for the whole year was lower, expenditure on unemployment benefit was £1,300,000 less than in 1950-51. Another reason for the smaller expenditure was that, while the numbers unemployed increased in the later part of the year, a large proportion of them were women, for whom the rate of benefit is lower. It is also reassuring to note from the actuary's report that, contrary to a widely held view, there has been no increase in absence from work because of sickness. The influenza epidemic of January, 1951, was responsible for an exceptional increase in that quarter; 1,500,000 insured persons were absent at the height of the epidemic. But since then absence in each quarter has been lower than in the corresponding quarter of the previous year, except in the period October to December, 1952, when the great fog was responsible for a sudden increase in sickness.

There remains the cost of pensions. In a few years' time the insurance fund income from contributions, including the Exchequer's supplement to those contributions, will not meet its expenditure. This is not a new discovery. It was fully realised in 1946 when, by making the higher rates of pension applicable to all existing and future pensioners, Parliament imposed a huge liability on the country. The prospective deficit has since been added to by the increase in pensions made in 1951 and 1952. At the present time, according to the actuary, only 5 per cent of the current expenditure of £275 million on retirement pensions may be said to be covered by the payment of insurance contributions in the past. In 1946 the day of reckoning seemed far enough away. What is the attitude of the parties now that it is approaching? Labour, which was responsible for placing the burden on the country in 1946, expresses the pious hope that old people will be able to postpone retirement, but it proposes also to increase pensions periodically if the cost of living demands it. The Conservatives' attitude has yet to be defined; but as the signs are that the present government will be in power when the review of national insurance takes place, it will sooner or later have to show whether it can be more realistic than Labour.

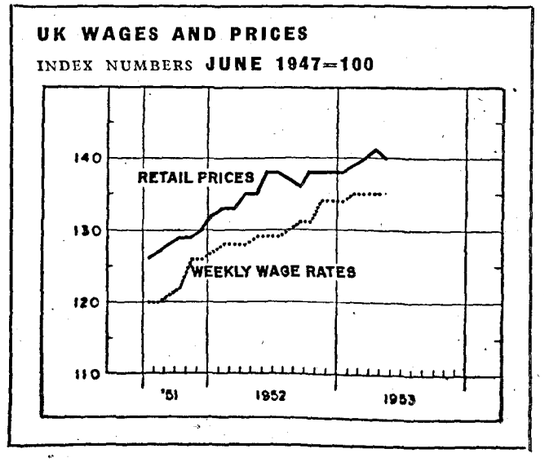
Towards Gold Coast Independence

WHILE a constitutional impasse has been de[veloped] Nigeria, in the Gold Coast provin[ce] political groups have been discuss[ing] of moderation, the next ste[p] Proposals to this end published as a [White Paper] debated in

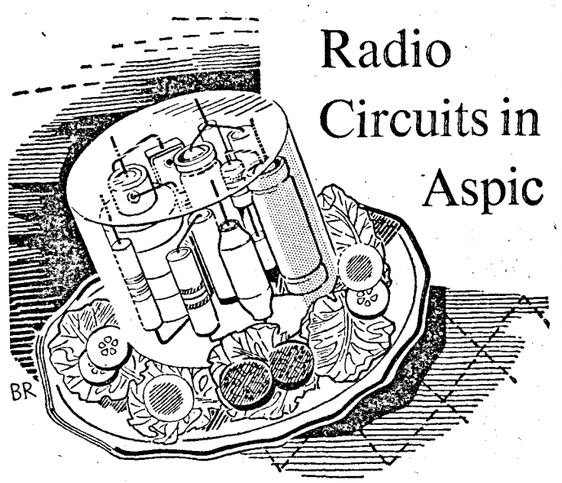
in London in the hope of making an agreement with the Gold Coast Government and political parties. The educationally backward Northern territories, like those in Nigeria, are opposed to a degree of self government that would substitute Africans from the south for Europeans as their rulers ; but there is in the Gold Coast a wide measure of agreement on the proposals now put forward.

These are intended to cover a "limited transitional period" before independence is granted by Act of Parliament. The three European officials in the Executive Council are to be replaced by African ministers, thus rounding off cabinet responsibility. But the Attorney-General is to remain an official apart from the new Minister of Justice, while the new Minister of Finance will have an economic adviser, presumably also a European official or officer on special duty. The Governor is to remain responsible for external affairs and defence, and is to share responsibility for police, security and public services with an African minister. There would be a deputy Governor, and the Governor would have reserved powers, as at present ; they have never been exercised. Finally, indirect elections would disappear ; all elections would be by single-member constituencies, which would further curtail the power of tribal authorities.

This scheme would make the Gold Coast almost a dominion, and would probably justify the transference of its relations with Britain to the Commonwealth Relations Office, as is suggested. The only remaining checks on sovereignty would be those of the Governor and those imposed by the continued presence of European officials. These checks would in practice diminish, and though no date is set for final independence, the transitional period would almost certainly be short. Put forward in moderate language after a period of fairly smooth administration, the proposals will be hard to resist in principle, even though in some particulars they may need modification. But it will be important to look forward to the wider implications of bringing a negro country for the first time into the Commonwealth family as a full member.



Generals into Presidents



DESIRE for legitimacy has this week produced new declarations by both of the Middle East's military dictators. In Egypt, General Neguib has cut the few remaining strands which bound the country to King Farouk's child, has declared himself President "for a transition period" and has promised that at some unspecified date, when a republican constitution is ready, "the people will have the final say in defining the form of the republic." In Syria, where since 1949 Brigadier Shishakly's army dictatorship has run affairs first from a back room and, since last year, openly, constitutional developments are farther advanced. A constitution "on American lines" is ready and will be put to the vote on July 10th, when, by means of a referendum, all Syrians over 18 can accept or reject it. Simultaneously, they will elect a President who will enjoy full executive power. Elections for a legislature will follow when the President has settled into his stride.

Superficially the two dictatorships have points in common and look as if they are merely at different stages of the same development. In fact they are rather differently based. General Neguib enjoyed the flying start of a popular victory ; everyone approved his liquidation of the Palace and the corruption for which it stood. Therefore, though he has enemies, he has been able to harness the support of many Egyptians of worth—of men who applaud his selfless reasons for starting a revolution. It is worth noting that he feels strong enough to hand over the job of commander-in-chief to a colleague ; General Amer, the new C-in-C, has for years been a close associate of the vice-premier, Colonel Gamal Abdel Nasser, whose authority is increasing steadily. Brigadier Shishakly is, by contrast, merely the third of a series of colonels who lost patience with the political parties, and seized power. He is tolerated rather than admired, has few supporters of note, and must retain the army command if he is to make sure or his election as president next month. He holds his position thanks, chiefly, to nationwide exasperation with the quarrelsome ineffectiveness of his civilian predecessors. In one important respect, however, a dictator of Syria is at an immense advantage over any Egyptian counterpart: the economic and social problems he has to solve are much simpler than Egypt's. Brigadier Shishakly's reasonably good prospects of improving his country's lot are described in a special article on page 913.

India Takes a Hand in Cairo

THIS week's meeting in Cairo between General Neguib, Mr Nehru and the Prime Minister of Pakistan, Mr Mahomed Ali, represents a striking new combination of interests and policies. Both India and Pakistan recognise that they are directly concerned with the security of the Middle East. Having just come, moreover, from the Coronation and the Commonwealth Conference in London, both Mr Nehru and Mr Mahomed Ali are keenly aware of British views on the subject ; both acknowledge in principle that, while Egypt is certainly entitled to the full

Radio Circuits in Aspic

—but instead of a jelly, a hard plastic resin, proof against extremes of temperature and humidity, preserving the circuit—however delicate—under all conditions. This is typical of the technical advances made possible by the products of Bakelite Limited—just one side-line from the continuous main stream of development that goes on day after day. The polyester resins used for 'potted' circuits, in association with glass fibre, also make plastic boat hulls and have already been used experimentally for car bodies. The story of plastics is already a long one, but new pages are being written every day—by the organisation whose pioneering efforts were mainly responsible for the general adoption of these wonderful man-made materials.

EQUITY & LAW
LIFE ASSURANCE SOCIETY
HEAD OFFICE: 20, LINCOLN'S INN FIELDS, LONDON, W.C.2

IF YOU LIVE . . .
to age 65, you will receive £1,000 together with bonuses which, *if maintained at present rates,* would then amount to a further £836.

IF YOU DIE . . .
before age 65, your family will receive £1,000 with accrued bonuses immediately and, in addition, £200 a year until you would have been 65.

These figures relate to a life aged 35 next birthday and represent a Family Provision Scheme for the maximum term of 30 years at a premium of approximately £60 a year.

To: The General Manager,
Equity & Law Life Assurance Society,
20, Lincoln's Inn Fields, London, W.C.2.

Please forward, without obligation, an illustration of this Family Provision Scheme with full details.

Not enough trout?

Not enough cash. Business is terrible. So few people can afford products like mine these days.

Oh, I don't know. We make things in the same price range and we're on the up and up, especially after the budget. Mind you, we're doing a lot of advertising.

So are we. Spending a lot of money, too.

In mass market papers?

Well, no. Ours is hardly a mass market product.

And that's just where you're wrong. Whether we like it or not, times have changed and you and I make mass market products. The ordinary man is buying the sort of things which were once exclusive to the executive classes. Go round any working class estate and see for yourself.

What papers are you using?

The Mirror principally. It has the biggest daily net sale on earth.

Pretty expensive then?

No. On a square inch per thousand basis it's the cheapest in the market.

Daily Mirror

THE BIGGEST DAILY NET SALE ON EARTH

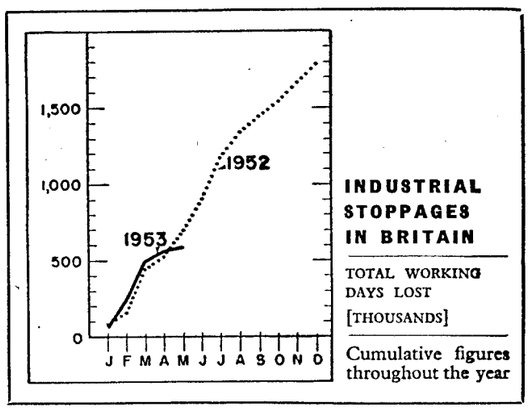
sovereignty which it claims over the Suez Canal Zone, the total withdrawal of British support is undesirable. But they do not see entirely eye to eye on how this problem is to be solved.

During the past few weeks the Indian Ambassador in Egypt, Sardar Panikkar, has been putting some aspects of his government's thinking to General Neguib. He has done what he can to widen rather than bridge the gap between Cairo and London in order to secure the evacuation of British troops. While recognising the need for concerted measures to defend the Middle East, he argues that they can be taken only on a basis of Arab unity ; that this is impossible so long as the British remain in Egypt ; and that it is against India's interest either to have the western powers press on with their present unpopular plan for a Middle East Defence Organisation (MEDO) or to see Pakistan encouraged as a leader of Islamic opinion. His aim is to push Egypt into full co-operation with other Arab states, to compel the British and Americans to stake everything on Arab unity, and to make Pakistan lean on India rather than Islam. Thus India's policy of backing the Arabs but opposing an Islamic bloc is, he emphasises, essentially realistic.

Whether either Mr Nehru or General Neguib fully agrees with Sardar Pannikar is another matter ; but there is certainly much to be said for any policy which could lead to the positive exercise of joint Indian and Pakistani influence on Middle East affairs. Apart from the question of Suez, the critical weakness in the Persian Gulf springs from the fact that since the disappearance of the old Indian Army, there is no effective force within reasonable distance for use in an emergency.

Savings from the Russians

THE new Soviet regime has made yet another move that will please the public. Having increased the purchasing power of the population by an unusually large cut in retail prices, it has now halved the annual dose of disinflation which helps to absorb this excess purchasing power. The State loan launched on Wednesday by the Minister of Finance, A. Zverev, is for only 15,000 million roubles compared with 30,000 million roubles in the previous years. Once again 65 per cent of the bonds will be redeemable at par after 20 years, but the payments to be made on the remaining 35 per cent by lottery drawings will now yield the equivalent of an interest rate of three—as compared with the previous four—per cent.



The Russians, particularly the industrial workers, will welcome the cut in forced saving more than they deplore the reduction in the interest rate. State loans are normally regarded by them as one of the better forms of taxation, for the holder does get something in return, even if it is usually in depreciated currency. They are thought of as taxation because of their semi-compulsory character. The trade union advises its members to buy bonds for an amount equal to four weeks' pay, and for a factory worker it is difficult to " contract out." This time, however, the unions recommend a purchase costing only two weeks' pay and the minister, significantly enough, insisted that the operation must be on a purely " voluntary " basis.

In a country where there are no inducements for the *rentier,* state loans have been the principal form of saving. In last year's estimates they accounted for over eight per cent of budgetary revenue. Now this disinflationary weapon is likely to fall into disuse. On the other hand, the burdens of the Soviet exchequer are rising. Mr Zverev confirmed reports that a supplementary plan for the production of consumer goods has been put into operation this year. Indeed, he claimed that the new loan will be used primarily for this purpose. Yet this begs the question. One item of revenue has been cut and an item of expenditure has been raised. But we do not know by how much. If the sum is large, how will Mr Zverev strike his balance ? The budget, now months overdue, should provide some clues. There is no doubt that the new regime is trying to grant concessions to the consumers. Yet the outside world does not know, and the Soviet leaders may themselves be not quite certain, how big a shift towards the production of consumer goods they can afford.

Peace Meeting in Budapest

AT its latest session in Budapest, the World Peace Council seemed to have lost some of its old militancy. This may have been because some of the stalwarts, such as M. Joliot-Curie and Signor Nenni, were not present. Or it may have been because it had nothing new or exciting to get its teeth into. At the meeting in Berlin nearly a year ago members were able to work themselves up into a frenzy of indignation over alleged germ warfare in Korea. This time they evidently assumed that a Korean truce was as good as in the bag, and they had to make what they could out of the old story of the encroachments of American imperialism. But the theme of national independence, which was trumpeted so loud at the big Vienna Peace Congress last December, was played with notable restraint ; and one delegate stressed that the Council should guide and co-ordinate—not direct—national movements.

As usual, an agreement between the Great Powers was said to be the Council's aim. But it may be significant that there were a number of approving references to limited talks on specific problems, and that no reference was made to the five-power peace pact that figured so prominently at the Vienna Congress. The Council meeting, in fact, did nothing to resolve prevailing doubts on whether the Russians themselves really want a four-power meeting.

The meeting was the first session of the Council to be held since the death of Stalin, and this fact may be the principal cause of its muted tones. If the new men in the Kremlin should be perplexed by uncertainties, these would be reflected at Budapest. Alternatively, if they should have decided to attempt a genuine lowering of international tension, they may well feel that the peace movement should be allowed to slip somewhat into the background. The cause of peace would be improved if it never met again.

Costs of Rural Electricity

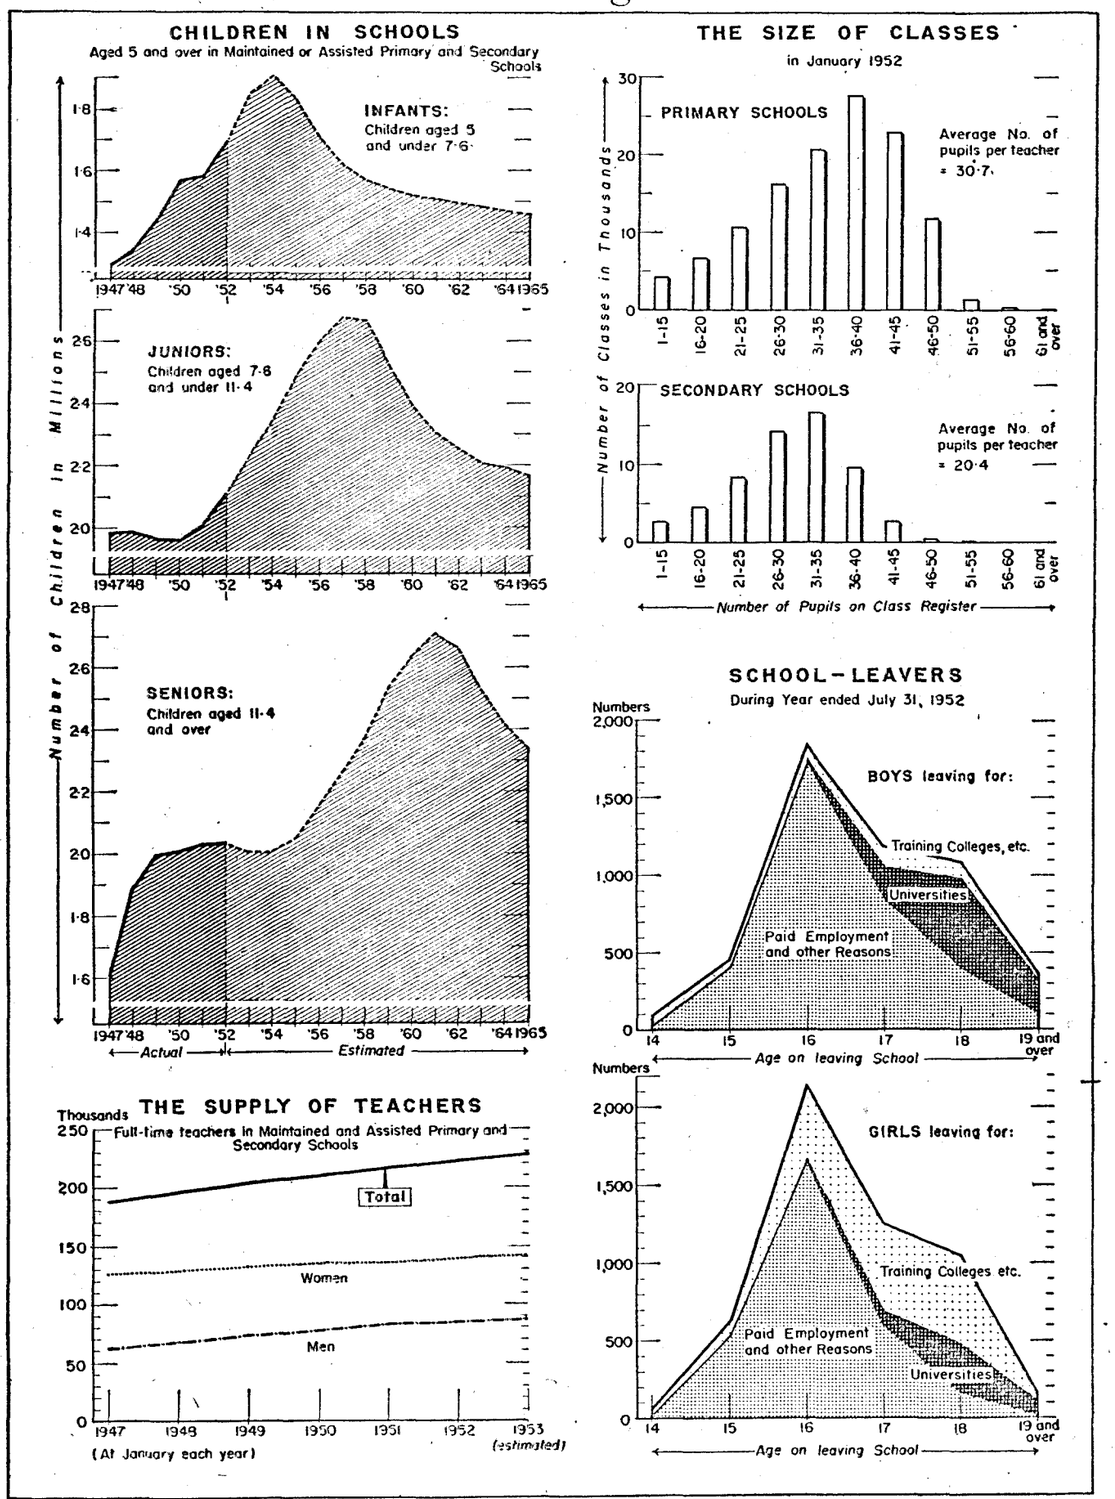
THE Minister of Fuel and Power announced last week that "a very extensive effort" is now to be made in rural electrification. The capital investment approved for this purpose has been raised to £7,500,000 for next year, compared with only £3 million in 1951. This policy was greeted with general satisfaction in the House of Commons, and a plausible case can indeed be made out for it. It is a commonplace that farming manpower is short and getting shorter, which makes it all the more important to give the attenuated labour force all the productive aids that electricity can bring; it is also a commonplace that a main reason for this decline in manpower is that the farm worker's cottage lacks amenities, which electricity could do much to remedy. Electrification should, therefore, help food production. It is, the argument goes on, of major importance even if it is "uneconomic." If the costs of supplying the countryside are higher than the countryside can bear, then costs should be averaged; the cheaply supplied town consumer should accept the burden, by way of his own electricity bills, and take the benefit indirectly through a fuller larder.

No voice was raised in the House of Commons against this dubious thesis; it takes a good deal of economic sophistication nowadays to see anything wrong with the principle of "postalisation"—the principle of the postal service, that the consumers in thickly populated areas who can be served cheaply should subsidise the high-cost consumers elsewhere. It would, of course, be absurd to regard postalisation as a wicked expedient to be shunned in all circumstances. There is, in private as well as in public industry, some degree of postalisation wherever there is a uniform delivered price. Moreover, the line between economic and uneconomic developments may be drawn very differently according to the method of charging the consumer for the initial connection to the electricity supply, which may reflect anything from the most short-sighted insistence on quick full return to the most starry-eyed faith in the farm labourer's willingness to use stoves, refrigerators, immersion heaters and washing machines.

There are, therefore, two separate problems, one for the Area Electricity Boards and one for Parliament. The first is to establish a reasonable time within which to judge whether an electrification scheme will be self-supporting; the second is to decide, on wider grounds of national policy, what schemes that are not self-supporting, by this general test, shall nevertheless be carried out. If the first question is settled, decisions about subsidies can at least be made with knowledge of the real cost. If it is not settled, such a programme as the Government has approved leads straight to the arbitrary priorities and eccentric alternations of stop-and-go that plague capital development in the pseudo-planned economy.

Legal Aid and Divorce

THE Civil Judicial Statistics for 1952 (Cmd. 8867), published this week, have an added interest. They give, for the first time, a reasonably full picture of the effect of the legal aid scheme on litigation and on the litigious propensities of the country as a whole. The result is not alarming. Proceedings in the High Court, where litigation may be assisted, increased in volume in 1952 by no more than 6 per cent over the 1951 figure, from 159,781 to 169,544. In the County Courts, where litigation is not assisted, the rise in the volume of work was even greater, one of 16 per cent, from 535,374 proceedings in 1951 to 622,867 last year.



The records also show that the first wave of divorce proceedings that was almost certain to follow the granting of wider legal aid is already subsiding. The following figures, of the totals of all divorce petitions, show the development: 1950, 29,096; 1951, 37,637; 1952, 33,770. The importance of the scheme in assisting women to obtain relief is indicated in the rise in the number of petitions presented by wives. In 1947, for example, when the first wave of postwar divorces reached its peak, 61 per cent of all petitions came from husbands. Last year, 57 per cent of all petitions came from wives. In assisted cases themselves, the preponderance of petitions by wives was even greater.

The statistics as a whole are full of useful miscellaneous information. For example, the average costs, as settled by the Court, of an action in the Queen's Bench Division are £141. The slight worsening of trading conditions in 1952 is shown by the rise in the number of petitions to wind up companies, from 535 in 1951 to 612 in 1952, and in the rise in the numbers of receiving orders in bankruptcy, from 2,028 to 2,149. But it is surely time that the Lord Chancellor's Department, responsible for this publication, and the Law Society, responsible for the administration of the legal aid scheme, co-ordinated their statistical records. The Law Society publishes its figures for a twelve month period which ends on March 31st. The Lord Chancellor sticks to the calendar year, with the result that it is impossible accurately to collate the fuller details given by the Law Society with the records of the Courts as a whole.

Tension over Tensing

TO the British onlooker, the display of nationalist passion over Sherpa Tensing is a distasteful pettiness beside the achievement of climbing Everest. His exact national status—Nepalese or Indian—seems irrelevant to the pride that both countries can take in him as an Asian who has stood on the top of the mountain. The fact that Hillary stood there before Tensing is insignificant; the two men were roped together and neither could have reached it alone

State Education in England and Wales

Source: "Education in 1952." [*HMSO.*]

or, indeed, without the co-operation of the whole Everest team.

The sad fact, however, is that the Everest achievement has now become entangled in Asian nationalism and Nepalese politics. The ascent of Everest "by an Asian" has an obvious symbolic importance for people endlessly resentful of the assumption of western superiority and of its assertion on a mere technological basis. Any suggestion that the British are trying to belittle or to appropriate Tensing's achievement touches off nationalist anger; on balance, less offence might have been caused if Tensing had—however improperly—been given a knighthood, instead of the award of the George Medal. But the mingled feelings of aggression and resentment, pride and envy, have been deliberately used by Nepalese political rivals. The divided Congress party is ready to make trouble, and the Communists, who are growing in power, have seized the chance to rouse feeling both against Indian influence—which supports the Nepalese Congress—and against the British, who are represented as Delhi's backers.

The unfortunate Tensing thus finds himself at once honoured, promised a pension and under police guard, signing statements that he cannot read, and perhaps debarred from enjoying the reception which the British and Indian Governments are preparing for the whole expedition in their respective capitals. Clearly every effort must be made to satisfy the Nepalese that no political motives underlie the desire to honour the man and his achievement, and that there is no cause for a dispute that would lower the world's opinion of all the countries involved.

Who Owns Television Sets?

A POPULAR belief has grown up, fostered by the crop of aerials to be seen on housing estates, that television is more favoured by the working classes than by the middle classes. A survey of the ownership of television sets and certain other durable goods, reported in the current issue of the *Bulletin* of the Oxford Institute of Statistics, does not, however, substantiate this view. This inquiry, made during April and May of last year, shows that the higher the income, the larger is the proportion of people who own a television set. This does not mean, of course, that the majority of owners are well-to-do; in absolute numbers most of them have only medium-sized incomes. But, according to this survey, television sets are like other durable goods and somebody who earns over £1,000 a year is more likely to possess one than somebody who earns less.

Television sets appeared to be just about as popular as washing machines or cars at the time of the survey—each was owned by 7 or 8 per cent of income-holders. Since any single person over eighteen was counted separately, the proportion of households with these goods was rather higher. Some 10 per cent of households possessed television sets, while only 5 per cent of them had refrigerators, for which demand is the most influenced by income. The tenth of the population with the highest incomes owned only one-third of the television sets but two-thirds of the refrigerators.

Among managers and self-employed persons, about one out of six own a television set, compared with a proportion of one out of three who own a car. One reason for this is, no doubt, that such occupations predominate in the London area where television has been established longest. Also to be expected is the fact that owners of houses are more likely to possess television sets than those who pay rent. Perhaps, too, it is not surprising to find that, among people who rent their houses, television sets and washing machines are more often owned by tenants of council houses than of others.

OWNERSHIP OF DURABLE GOODS

Income group	Percentage in each group who own a: Television set	Refrigerator	Washing machine	Car	Motor-cycle
Under £200	2	1	3	1	...

Order and Bearer

In accordance with a Bill now before Parliament, an important change will be made, "from and after the 5th of July," in the law affecting stamps for receipts and drafts, or bills payable *on demand* to *bearer* or to *order*. This arrangement will prove to be of far greater importance to the public at large, as well as to bankers and the trading community generally, than at first sight is apparent. . . . Thus, in point of fact, a banker's cheque with a penny stamp, and payable *to order*, will have every privilege and advantage which a bill at sight has at the present time, including that of furnishing a valid and legal receipt for the amount, no matter how great. . . . As regards bankers, the high stamp duties chargeable upon bills at sight may be said to have led to their entire disuse, and to have introduced a system as clumsy and inconvenient as it is possible to conceive. The plan resorted to in order to evade the stamps at present is the use of letters of credit not transferable, and which entail both upon the issuers of them, and especially upon those on whom they are drawn, great trouble and inconvenience. In future these will be entirely discontinued, and bills *on demand* drawn instead, upon a uniform penny stamp, when the amount is above £2. By this means a bill payable to order, and transferable by endorsement from hand to hand, will be furnished at the low cost of a penny stamp. This advantage will be felt as much, if not more, in the trade between the various inland towns of the kingdom, between which remittances are made, as in their direct intercourse with London. A shopkeeper in any village or market town, wishing to make a remittance to some other distant local town, will obtain a draft *to order* from his banker upon London on *a penny stamp*, and the person to whom he remits it, in however remote a town in England, Scotland or Ireland, will be able to endorse it and receive the amount at once from his own banker, who will remit it to London to his agent for collection. At present this cannot be done except by the use of expensive stamps.

Letters to the Editor

Proscribing a Party

SIR—I have noticed in various articles in your paper that there has been a distinct tendency to attribute the blame for the present situation in Kenya as much to the settlers as to the administration.

As someone with some small knowledge of Kenya conditions, may I attempt to correct that impression and point out that in this present instance the settlers should be absolved of all blame. It must be accepted that the present disturbances emanated from, and still in the main persist inside, the Kikuyu Reserve itself—an area which has been, since its inception, a complete preserve of the administration so far as planning and management are concerned. No settler at any time has been afforded the opportunity of assisting in the management of this particular area. This closed-shop policy has led to a great deal of the difficulties that Kenya is going through at the moment.

I, like my father before me, have been for many years a large employer of Kikuyu labour, most of whom were resident on the farm. They had their own council, schools for their children and clubs under their own management for their recreation, and not only gave loyal service but appeared a happy and contented community. However, owing to the fact that we settlers were not able to be in touch with events in Kikuyuland, and indeed were constantly assured by high-level Government spokesmen that all was well there, our resident Kikuyus became most vulnerable to the agitators that came out from the Reserve to spread their nauseous doctrine. Thus when the troubles started, we were suddenly faced with enemies in our midst and it became impossible to rely on any of our farm Kikuyu as it could not be ascertained who had been corrupted and who remained the same as before. This state of affairs not only caused some of the dreadful incidents which have occurred, but also did much to destroy the confidence between employer and employed.

I venture to say that had the Administration paid the same attention as the settlers to continuity of management and a personal knowledge of those they were dealing with, the present state of affairs in Kenya could never have occurred. One thing is certain and that is this: that in the future the administration and the settlers must work together in the planning of the natives' welfare and advancement wheresoever he may be resident. Both sides can help each other, for I know that, with a few exceptions, both settler and official are striving for the same object — sensible native advancement—which only co-operation between the two can achieve.—Yours faithfully,

DELAMERE

London, W.1

Armistice?

SIR—There should be general agreement with your excellent leading article of June 13th save on the major issue. You accept a divided Korea as inevitable, regardless of whether it can provide the basis of a durable settlement. The alternative to a united Korea is the re-creation of the conditions which provoked the war—two rival governments. Most pertinently you ask: "Is this dangerous relationship to be re-established?", well knowing that if your attitude prevails the answer must be yes, but carefully refraining from answering your own question.

Your implied conclusion is unnecessarily defeatist. It is premature to assert that "any early reunion of Korea can be achieved only by war." To most it must seem the other way round, that war *cannot* achieve the desired unity. It is untried and therefore unproven that "it would be both politically and militarily impossible for the allies to disarm or neutralise the ROK army."

A compromise solution might well prove acceptable to all parties on the basis of a neutralised unified Korea. The ROK might be persuaded to disband its army and turn the attention of its young ex-soldiers to rebuilding their country in exchange for the unity and independence of Korea, unobtainable by war, a seat in the United Nations and promises of continued large-scale economic and financial assistance. The Chinese might accept a solution which brought China into the United Nations and ensured that a united Korea was disarmed and neutralised. Japan, also, might be admitted to the UN as part of the agreement. The American and other UN governments, glad of a solution which offered the prospect of a genuine settlement, might agree to China's membership of the UN and the neutralisation of Korea.

A solution on these lines, if accepted in principle, would require the phased withdrawal of all non-Korean forces and their replacement by "neutral" UN security forces under a UN commission responsible, *inter alia*, for convening an all-Korean constituent assembly to draft a constitution for an all-Korean Government, maintaining law and order in the meantime and supervising the elections, and the reduction of the ROK army to police dimensions.—Yours faithfully,

GORDON EVANS

Sharperton, Northumberland

Revolt in Stalin Allee

SIR—Present international news shows up very clearly, I think, the strategy in the USSR's policy of "economic aggression." To see it clearly it is necessary only to look briefly at the course of events since the outbreak of the Korean war.

In 1950 the economies of all the non-Soviet-bloc countries suffered the shock of a Soviet-induced "war-boom," calculated to extend further the inflationary forces in them. Stock-piling in the US, and the general demand for raw materials for war and defence use whipped up to greater heights the postwar inflation, which was at that time showing some signs of abating. No doubt it was part of the strategy of the Kremlin to experiment with the economy of the free world, and to ensure that the amplitude of the boom would be as great as possible, in the hope that a following depression also would be a severe one.

When, in about mid-1951, the boom had reached the highest peak that might be expected, it was time to practise with a down swing—or so the Soviet considered. Perhaps impatience impaired their timing. However, with the opening of peace talks in Korea the recession duly started. We had a recurrence of dollar difficulties, and unemployment began to manifest itself. The Russians have probably been disappointed, first that no serious political ruptures between America and the sterling countries has ensued; and secondly that the neo-Keynesian world has been able to "contain" the onset of unemployment.

But success in promoting a free-world depression as a step in the post-World War II phase of the plan to discredit its economic and political systems was perhaps not really to be hoped for in one round. They would in any case have expected further rounds—although the first might, with luck for the Soviet, have been more successful. So, now that round one is clearly over, here we go again. Martial law is proclaimed in Eastern Germany and President Syngman Rhee seems to be playing into the Soviet's hand by raising (already!) the threat of a revival in the Korean war. Just how far it will be necessary to go this time in reviving the boom is yet to be seen. However, the sharper and more frequent they are, the greater the impression of instability they will convey to the free-world worker.

These thoughts suggest a reconsideration of the policy of "containment." Who is "containing" whom (or what), and at whose behest? It seems that the free world, in addition to pressing on with its work of developing its less-developed economies in the interests of higher living standards and basic economic stability, will have to extend its experiments in building up organisations like NATO in order to have, as far as possible, "built-in" stability in defence expenditure.—Yours faithfully,

R. J. WALKER

Books & Publications

A Hammer of the Slavs

THE RUSSIAN MENACE TO EUROPE.
By Karl Marx and Friedrich Engels; edited by Paul W. Blackstock and Bert F. Hoselitz.
Allen and Unwin. 288 pages. 20s.

THE editors of this book have perhaps been led astray by the ironic possibilities of linking such a title with two such authors. Had it appeared soon after the war, it might have served a real purpose. For Marx and Engels say, in brief, that Tsarist Russia wanted to control the whole of eastern Europe up to a line from Stettin to Trieste. One wonders why Messrs Blackstock and Hoselitz now think it necessary to point the moral that Soviet Russia shares these ambitions, which would indeed have been achieved already but for the Turks, the Greeks, and the Southern Slavs whom Engels called "ethnic trash."

The editors appear to belong to the now popular school of commentators who, hypnotised by the parallels often found between Tsarist and Soviet policy, assume that every Soviet action must have a Tsarist precedent. This is to look at Russia through dust-covered spectacles. Russia did not, for example, celebrate the five-hundredth anniversary of the capture of Constantinople, as it did the four-hundredth, by making war on Turkey. Its old obsessions may remain, but they take their place among new ones—particularly Russian interests in Asia, which take up exactly two sentences in the present book.

Its real value is incidental to the editors' purpose. It brings together some of the writings of Marx and Engels on Russia which have hitherto been hard to come by, and it adds the quarrel between Stalin and Engels over the causes of the first World War, Stalin urging that Alsace-Lorraine had as much to do with it as Constantinople.

The contributions of Marx and Engels are also seen to be most uneven, both in quantity and quality. Marx, apart from a talk on Poland and two items on Russian peasant farming, is quoted only for the two years 1853-55; Engels's contributions range from 1848 to 1894, and essentially the book is by him. Marx is not seen to best advantage as a prophet. He ridiculed the Tsar for bluffing in threatening war; when it was seen to be no bluff he attacked him for not doing it on a grand enough scale. He thought Palmerston a traitor in collusion with the Russians; Napoleon III "already tottering" in 1854; Austria and Prussia certain to join Russia in the Crimean War. He was sure that the Tsar would not allow his fleet to be blockaded in Sevastopol — which is exactly what did happen.

Marx was a young man of 35, wanting to get home from exile to a position of leadership in Germany, and calling for war against Russia because he believed that reaction would remain master in Europe as long as the armies of the Tsar were intact and ready to stamp out national movements, as in Kossuth's Hungary, let alone revolution. Short of general war, the European workers must encourage the Polish nationalists to keep the Russian armies busy and give the Revolution time to mature.

Impatient as he was, however, Marx appears to have had an inkling that some counterpoise to an otherwise inevitable German ascendancy must be found if the powers were to be induced to drive Russian influence from eastern Europe. Engels, with longer to reflect, neither saw nor cared. For him, the Czechs and Southern Slavs were "dwarfs of peoples" with no future, which was an error of judgment; and no past, which was an error of fact. He hated Panslavism, but failed to see that it originated in fear of Pangermanism, and that a Germany which despises the western Slavs instead of making allies of them must always drive them into the arms of Russia. His flatulent hectoring culminates in the threat that "we shall some day take bloody revenge on the Slavs."

The editors probably did not wish to present Engels as the precursor of beer-cellar Nazism and racial selectivity by the death camp. But they have been so infatuated by Russian parallels that others equally relevant appear to have escaped them. Even historical materialists can be the victims of temperamental and national bias in weighing evidence: this, rather than the too evident nature of Russian ambitions in Europe, is the real lesson of the book.

Shakespeare as Moralist

THE PHILOSOPHY OF SHAKESPEARE.
By K. J. Spalding.
George Ronald. 191 pages. 12s. 6d.

SHAKESPEARE'S traffic is with moral notions from first to last, and he seldom writes a speech or even a song which does not draw upon the vocabulary of ethics. Even the swallows are courageous, enterprising, hardy—only less so, indeed, than the daffodils—and his villains are almost as free with improving observations as are his senior statesmen. In the theatre Shakespeare owes his success not more to his poetry than to his ability to show with supreme force and clarity men and women as acting and suffering in a universe of good and evil. Mr Spalding, however, convinced that a spectacle thus farced with morals must be the creation of a moralist with a definable system, ignores too much: the formidable difficulty presented by the dramatic and personative form through which alone Shakespeare has communicated with us; the place, if any, of philosophical distinction in the achieving of artistic excellence; above all, the playwright's instinct always to argue both sides. Shakespeare's "philosophy" may be elusive because it consists largely in an indisposition to subscribe to one.

Nevertheless there is a sense in which Shakespeare, if he has any character as an artist, must evince some system of ethical predispositions—since, as Aristotle says, character gives us qualities and is shown in what men seek and avoid. Shakespeare vividly exhibits some spectacles and ignores others. The plays, studied against the background of their sources, prove him—in Professor Harbage's brilliant summary—"almost as determined an expurgator as Bowdler." But there is a difference. Bowdler's was a somewhat morbid activity. Shakespeare's impulse in choosing materials for his drama which shall both represent man's predicaments and reflect his dignity is consistently consonant with what we may think of as simple moral health. His sense of good and evil is acute and sharpens ours, but nothing is made easy.

Perhaps, seeking a verdict, we may say that Shakespeare is for life in its fullness, and that he rejoices in human passion and aspiration as these are controlled and sanctioned by the traditional wisdom of the race. Mr Spalding indeed does not himself proceed much farther than this. But his essay is independent—to the point even of ignoring a whole professional scholarship of its subject—and of much interest as a contemporary philosopher's reading of Shakespeare.

The Period of Scepticism

THE EUROPEAN MIND (1680-1715).
By Paul Hazard.
Hollis and Carter. 454 pages. 35s.

THIS book is a translation of an original and ambitious study by an eminent French scholar of the varied and changing intellectual climate of Europe during a brief but decisive period. Professor Hazard takes the whole of western Europe for his province and examines every aspect of its culture from moral and political philosophy to Italian opera and French fairy-tales. His chief interest lies naturally in France, where the defeats of the latter half of Louis XIV's reign provided a fertile breeding-ground for doubts and questions. "We had our contemporaries as far back as Louis XIV's time," Diderot wrote, and Professor Hazard shows how deeply and

on how broad a front the lines held by the defenders of tradition had been penetrated by the end of the seventeenth century.

The growth of scepticism is traced from a number of roots. Travel books extolling the virtues of the savage and the refinements of China made western standards appear both parochial and relative. History was discredited as prejudiced and untrustworthy, its scheme of world chronology shattered by its inability to accommodate the long tale of the dynasties of Egypt and China. Biblical exegesis undermined the old certainties, and members of the Catholic hierarchy were driven both to learn Hebrew and to make damaging admissions. Spinoza trained his guns upon the superstition and credulity that led men to accept tyranny from the State and persecution from the Church. Bayle savagely attacked religious myths and inexorably exposed the delusions, follies and crimes of mankind. The formal disciplines of mathematics and geometry were regarded as providing the only sure guides to truth. Algebra could be the subject of an ode.

M. Hazard's range of illustration is impressive and his manner agreeably informal. He has given us not a critical study of ideas but a crowded and impressionistic canvas on which he catches the swiftly changing and complex intellectual and moral tones of the period. Interested in exploring what Bagehot called the emotion of conviction, he examines ideas in their context of personality and describes polemical controversies in the form of conversation pieces. He opens his chapter on Bossuet with a description of Rigaud's majestic portrait and goes on to give the other and more accurate picture of a man embittered and worn down by his ceaseless war on scepticism, "a harassed workman, hurrying away to patch up cracks in the edifice that every day grow more and more alarming." And if he makes us hear again the firm voices raised in the debate between authority and reason, he is also able to catch the other notes of sentiment and enthusiasm. For if Diderot had his contemporaries in this period, so too had Rousseau. M. Hazard's impressionistic method is a dangerous one, but the range and firmness of his scholarship preserve him from the pitfalls. His use of metaphor, of the rhetorical question and the exclamatory comment belong to an established French tradition but often ring oddly in this translation, which tends to sacrifice English idiom to literal fidelity.

Chartists in Scotland

SCOTTISH CHARTISM.
By Leslie C. Wright.
Oliver and Boyd: Edinburgh. 242 pages. 21s.

DR WRIGHT has culled progressive periodicals—*The True Scotsman*, the *Scottish Patriot* and the *Chartist Circular*—national and local newspapers, parliamentary reports, contemporary pamphlets and secondary works, to produce what is no mere amplification of a story already familiar in outline, but an entirely new chapter in modern political and economic history. The standard works on Chartism will be searched in vain for anything more than passing allusions to events in Scotland; the assiduous reader of them would not suspect that there was a distinctive Scottish brand of Chartism.

The origins of the People's Charter and the first wave of agitation were essentially English, while from about 1843 until the final fiasco of 1848 Irish influence was dominant; but, as Dr Wright shows, there was a middle phase (1839-1842), when Chartism, moribund elsewhere, was kept alive and flourishing in Scotland. Here it inclined to constitutionalism rather than physical force, and the establishment of Chartist Christian churches and Chartist schools was typical—and typically Scottish. The demand for franchise reform interlocked with other reformist activities, so that Chartists were generally free traders, advocates of factory legislation and opponents of capital punishment; often dissenters, pacifists and teetotallers; sometimes republicans and even mercantilists—for the "movement" brought together strange bedfellows.

There are a few minor blemishes—for instance, the name of the inventor of the steam hammer was Nasmyth, not Naismyth. More seriously, one misses cross-references to the recent cognate studies of Professors Ferguson (1948) and Saunders (1950). In most respects, however, "Scottish Chartism" is a balanced and judicious survey, with the economic background skilfully portrayed. Dr Wright does well to challenge the facile fallacy about the "failure" to Chartism, and to stress the enduring value of its work of enlightenment.

Killers of Kenya

WHO KILLED KENYA?
By Colin Wills.
Dennis Dobson. 111 pages. 9s. 6d.

A PERSONAL but dispassionate survey of Kenya's problems, Mr Wills's analysis also has the advantages of compactness and readability. The Kenya that has been killed is the old Kenya in which the partnership of black and white, with the Asian as a useful member of the firm but with no status, was based upon a patriarchal and feudal order—an order which temporarily freed the black from war and want, and temporarily preserved for the white, in a world of revolution, a spacious eighteenth-century culture with more space than culture. But it nevertheless transformed and modernised the country. The killer of the old Kenya, however, was not the Mau Mau outbreak alone, but all the forces which

THE RT. HON.
SIR WINSTON CHURCHILL
K.G., O.M., C.H., M.P.
STEMMING THE TIDE
SPEECHES 1951 and 1952
This collection of Sir Winston Churchill's speeches, edited by Randolph Churchill, covers the end of his period in Opposition, and his return to Westminster as Prime Minister. The volume includes his speeches on Tory Policy for the Iron and Steel Industry, Transport, Rearmament and Defence. It also includes his brilliant address to the U.S. Congress in Washington and his magnificent tribute to King George VI, broadcast to the nation.

GATHERINGS FROM CATALONIA
by JOHN LANGDON-DAVIES
John Langdon-Davies, who has lived in this corner of Spain for more than thirty years, lays before your eyes a detailed picture of the towns, villages and countryside of Catalonia. He introduces you to the Catalan people, whom he knows so well, and tells of their daily life, their homes, their food and their attitude to their bodies and souls. Ending with a picture of the great port of Barcelona with its million citizens, this is a book to delight all travellers, armchair and actual. 256 *pp. Demy* 8*vo.*
16 *pp. half-tone illustrations and frontis.* 21*s. net.*
JUST PUBLISHED BY CASSELL

are disrupting Africa—pressure of population, transport, soil erosion, industrialisation, town values, education (of all kinds), and the more intimate knowledge by black and white alike of each other's strengths and weaknesses.

Mr Wills gives due emphasis to each element in a complex situation, though the limits of space which he has imposed upon himself prevent any profound study of them—or of the possible solutions to the problems of a multiracial society such as he hopes the new Kenya will be. But these will form the substance of the Royal Commission's report, and meanwhile it is important to build up an informed and balanced public opinion upon the issues in Kenya, so that the action to be taken upon that report, and indeed as soon as the emergency permits, will carry public support. To its creation, this informed and sympathetic study of the conflicts in Kenya should make a useful contribution.

Evolution of Chinese Currency

MONEY AND CREDIT IN CHINA: A SHORT HISTORY.
By Lien-sheng Yang.
Harvard University Press. (London: *Geoffrey Cumberlege.*) 143 pages. 25s.

LIKE almost any other aspect of early Chinese history, early Chinese monetary history makes fascinating reading. The monetary system of Ancient China presented a strange combination of the use of very primitive currencies and the pursuance of remarkably advanced monetary policies. Professor Lien-sheng Yang, in his brief historical survey, appears to be more concerned with providing factual material about the various monetary systems that followed each other in close succession in China over a period of some thirty centuries than with the analysis of the various monetary policies. From this point of view his work compares unfavourably with Nancy Lee Swann's translation of "Food and Money in Ancient China"; this at least contains extensive quotations from early texts indicating various early monetary policies.

It is a pity that the author does not attempt, for instance, to interpret in detail the advice given to King Ching in the sixth century BC by his minister about balancing light and heavy coins according to the prevailing condition in the country. The Memorandum containing the advice has been quoted by a number of authors, Chinese and foreign. What we need is some authoritative interpretation of the suggested policy, based on a thorough knowledge of contemporary conditions in China.

However, the Western student owes a debt of gratitude to Mr Lien-sheng Yang for having made accessible in readable form the essential facts relating to the evolution of Chinese currency and credit throughout the ages. In particular the early Chinese experiments in paper currency between the eleventh and sixteenth centuries are described with a wealth of detail. The way in which various Chinese rulers drifted into inflation, notwithstanding frequently repeated resolutions to limit the issue of paper money, must appear familiar to present-day readers. Military expenses were the most frequent but not the only cause.

In early paper currency experiments the notes were secured by reserves consisting of silk or precious metals, but their convertibility was always suspended sooner or later. Subsequently notes were issued without any pretence of maintaining reserves and with no intention of ever making them convertible. Indeed in 1262 the use of gold and silver as media of exchange was forbidden. A little later all private trading in these metals was forbidden in an attempt to attract precious metals into the Treasury. As a result of advanced depreciation of the various note issues paper money became utterly discredited before it made its first appearance in the West, and its issue was suspended for several centuries. It was not until the establishment of foreign banks in China during the second half of the nineteenth century that the issue of notes was resumed.

The author does not devote much space to the difficulties of Chinese silver currency during the modern period. That subject has, however, a fairly extensive literature and Mr Lien-sheng Yang was wise in devoting the greater part of his space to less known chapters of Chinese monetary history.

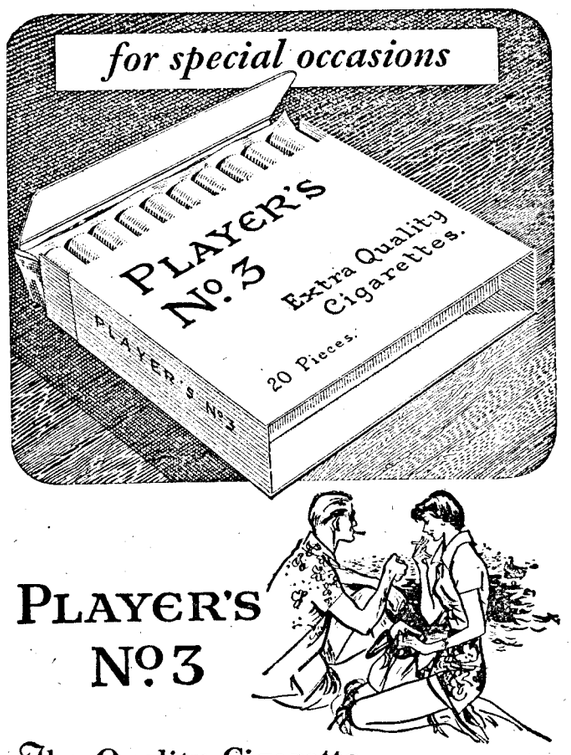
German Geography

GERMANY. A GENERAL AND REGIONAL GEOGRAPHY.
By Robert E. Dickinson.
Methuen. 700 pages. 50s.

THE lack of a standard work on Germany has long left a gap in geographical literature in English, which has only partially been filled by Professor Dickinson's earlier and more specialised writings. The appearance of this book is therefore to be welcomed; the more so as it is obviously a work of major importance in geographical scholarship, valuable not only for the information it contains but also because of the insight it gives into the ideas and methods of the German school of geographers, little known in this country.

The book is divided into two halves, the first treating German geography systematically, the second regionally. As might be expected, it is in the social and political aspects of geography that the writer excels. The section on the regional variations in the political attitudes of the German people, for example, forms a most illuminating introduction to the detailed regional geography that follows. Here, and in many similar passages, is the kind of scholarly background to the facts of human geography that so many more superficial works lack. Similarly the geography of the human habitat, of the patterns of fields, farms, villages and towns, is exhaustively, often stimulatingly, treated. If by contrast some chapters, such as those on the physical geography of Germany and on industrial geography, are somewhat weaker, this does not prevent the first half of the book from providing a solid and sometimes brilliant foundation for the regional geography to follow. This second section is based on a carefully prepared series of detailed maps of terrain regions of all Germany, and is excellently illustrated.

If one has any reservation, it is that Professor Dickinson continues to give too much material, in too unbalanced a form. It is admirable to draw attention to the studies and controversies of German geographers that lie behind the book. But is it really necessary to describe them in such detail and number, to give, for example, two alternative and quite lengthy classifications of village types without any indication about which is considered the more perfect? Such discussions are surely more appropriate to a scientific paper, especially where, as often happens, their results do not materially contribute to the elucidation of the general and regional geography of Germany, which is, after all, the writer's intention. Although this is probably Professor Dickinson's most important book, which will long remain the standard work in this field, it would have been even more welcome had it been more drastically pruned.



Save yourself . . .

Almost certainly, you will be able to save yourself a great deal of time and trouble if you apply *first* to us for books on economics and on the political and social sciences. We make no claim to infallibility. Yet, inevitably, a bookshop reflects the interests of its clients. Our clients include Universities, Government Departments, libraries, banks, learned bodies—and learned men. Their discriminating custom has enabled us to build up a stock, and a service, that we are told is unrivalled in its field.

UNITED NATIONS

NEW ECONOMIC STUDIES AND REPORTS

Economic Survey of Asia and the Far East, 1952
104 Pages. 7/6 (7/11 incl. postage).

This *Survey* presents a comprehensive picture of the economy of Asia and the Far East during a crucial period in the life of the region. During the months under review there was a collapse in the raw material boom of 1950-51 and a world recession in textiles. These events immediately influenced the market for the principal export commodities of the region and led to a worsening in the terms of trade and a decline in foreign exchange reserves. Prepared by the Secretariat of the Economic Commission for Asia and the Far East.

Review of Economic Conditions in the Middle East, 1951-52
161 pages. 12/6 (13/- incl. postage).

This volume surveys recent economic developments in the Middle East, paying particular attention to production and to prospects for economic development in the area. Separate chapters are devoted to Agriculture, Industry and Petroleum in the region. A review is provided of the aid to Palestine refugees by the United Nations and further chapters discuss foreign investments and the contributions made to the economic development of the area in recent years by international organisations. There is also a discussion of public finances in the Middle East.

The European Steel Industry and the Wide-Strip Mill
108 pages. 7/6 (7/11 incl. postage).

This is a study of European steel production in the light of the introduction of continuous wide-strip mills in the area. Among the subjects treated are: Past Production and Consumption Trends in the United States and Western Europe; The Trend of Future Production; Production in the U.S.S.R. and Eastern Europe; Prices and Costs: Western Europe compared with the United States; The Distribution of Flat Products by End-Using Industries; The Motor Vehicle Industry; The Shipbuilding Industry; Containers; Capital Goods and Durable Consumer Goods; Exports of Flat Products to Overseas Markets; A Tentative Evaluation of the Future and Some Conclusions.

Report on a Special United Nations Fund for Economic Development
59 pages. 3/9 (4/- incl. postage).

Prepared by a committee of 9 independent experts appointed by the Secretary-General, this *Report* presents a detailed plan for the establishment, operation, management and control of a Special Fund for grants-in-aid and low-interest, long-term loans to underdeveloped countries for the acceleration of their economic development.

or through any bookseller.

THE QUEEN'S PLAYERS

THE names of Shakespeare, Marlowe, Burbage typify the first Elizabethan stage.

Who are the Queen's Players of this age? Are there among them names that will still be remembered 400 years from now — in a London as far removed from the second Elizabeth as we are from the first?

Kenneth Tynan, Evening Standard theatre critic, gives a provocative answer.

He puts the Queen's Players of 1953 under the microscope of his own brilliant mind.

Who are they? Their names — and Tynan's assessment of their merit — will be given day by day in the EVENING STANDARD.

KENNETH TYNAN is the most-talked-of theatre critic in London. There has been nobody like him since the youthful Bernard Shaw opened fire 60 years ago. He is the voice of youth in the London playhouse.

THE QUEEN'S PLAYERS begins on Monday next, exclusively in the

EVENING STANDARD

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Due Process

Washington, D.C.

FOR the nine Justices of the United States Supreme Court, the hectic turn of events in the last week of the Rosenberg case served to illustrate once more how difficult it is to determine the famous separation of powers upon which the American Constitution rests. As has often happened in the past, the Court found itself forced to deal with matters which, being of the most immediate political consequence, were the subject of acute and widespread controversy far beyond the judicial sphere.

Much of the fascination of the Rosenberg case in its final stages was due, in fact, to the way in which it lived several lives concurrently—as both a domestic and an international political issue, a human tragedy, and an intricate legal problem. The Court, of course, had to ignore the political repercussions, no matter how world-shaking, and confine itself to such technicalities as whether or not the Rosenbergs should have been tried under the Atomic Energy Act of 1946, instead of the Espionage Act of 1917.

Inevitably, there were many outside the Court who found this insistence upon the technicalities exasperating and irrelevant. To Representative Wheeler of Georgia, Mr Justice Douglas's grant of a stay of execution, so that the question of the applicability of the Atomic Energy Act could be further investigated, was grounds for impeachment for "high crimes and misdemeanours." The impeachment resolution, applauded in the House of Representatives, is not likely to emerge from the congested obscurity of a committee docket. But it is a powerful example of a pattern of congressional behaviour which seems obsolete in an age in which, as Congressmen never tire of telling each other, the eyes of the world are upon the United States and its rulers. Many members of Congress are not yet willing to forgo their ancient privilege of making gestures which are devoid of any purpose more serious than that of impressing constituents at home, but which are often frightening to people in other parts of the world who are not familiar with the rules of this game.

As for the Court, its recent duties have not been pleasant ones. There was no doubt that Justice Douglas acted within his rights in granting the short-lived stay. The Chief Justice, Mr Vinson, emphasised this in his announcement of the decision to vacate that stay order. Six Justices, with Mr Douglas and Mr Black dissenting, concluded that the death sentence was legal, on the grounds that the Atomic Energy Act did not limit the Espionage Act, and that the Rosenbergs' crimes were committed during wartime and before the Atomic Energy Act was passed. But the hurried calling of a special session after the Court had recessed for the summer, and the necessity, felt by a majority of the justices, of overruling a colleague's judgment were unfortunate, and the public clamour on both sides could not but becloud the legal points at issue and create confusion about the meaning of the Court's actions.

The Rosenberg case may be said to have provided a reaffirmation of the durability of American due process; in fact, the chief objection from a British point of view may be that there has been an undue amount of process: it is almost three years since the Rosenbergs were arrested, and over two years since they were first sentenced to death (Sacco and Vanzetti were executed six and a half years after they were arrested). The Supreme Court alone has acted on nine occasions in the case, six of them in the compass of the last week. The tenacity of the defence was able to exploit the very liberal rights of appeal which the American judicial system affords, on points of procedure as well as substance.

But whatever value the parade of judicial process may have had—by contrast, for example, with the technique of summary execution used by the Soviet rulers of East Berlin—it has been lost in the maze of complexity which has left many laymen puzzled and troubled, unsure of the technical rights and wrongs and perhaps all the more sure that such technicalities obscure the moral and political issues. This may be said of people whose views conflict sharply. Whether one wishes that Justice Douglas had been sustained in defending sacred human rights or that he had been ignominiously dismissed for befriending traitors, one can feel that the law and its processes have not, in this case, been especially clear or reassuring to the average citizen. This is not altered by the fact that the complexities of the law are in a sense merely consequences of its superiority over Soviet "people's justice," which is swift, unequivocal and unjust.

★

The Court was not the sole repository of responsibility in the Rosenberg case. Only the President could have granted clemency to the condemned pair. Despite the mournful picket lines around the White House, it is safe to say that the movement on behalf of clemency was weaker in the United States than elsewhere in the world. On the other hand, perhaps opinion in other countries fails to appreciate the fact that Americans, too, have been made sick at heart by the Rosenbergs' protracted ordeal, and have been troubled by the fact that never before have American civilians been executed for treason in time of peace. But, since the case (unlike that of Sacco and

Vanzetti) lacked, in the eyes of the overwhelming majority of Americans, the one basic ingredient of a judicial tragedy —any real doubt about the guilt of the accused—the campaign for clemency had little chance of success, despite the skilful Communist attempts to exploit the pathos of the case to its full.

There was little indication, from the limited reports of Mr Eisenhower's discussion of the subject with a group of clergymen a few days before the execution, that the President was himself at all ready to see in the granting of clemency a wise political move that would prevent the creation of martyrs valuable to the Communist cause in the world. Even if he had been of a different opinion, however, and had therefore saved the Rosenbergs, it is all too easy to imagine the domestic uproar that would have ensued. Those who saw in so innocent a speech as that at Dartmouth College condemning "book-burning" a sign that the President was insufficiently sensitive to the threat of subversion would surely have found a host of allies.

When the Rosenberg case has faded into the limbo of *causes* once *célèbres*, some other landmarks of the Supreme Court term which has just ended may still be standing. The Justices postponed a final decision on the momentous issue of racial segregation in the elementary schools in the South, by referring the case back for reargument. Among the questions which seem particularly to have troubled the Court was the problem of what the practical effects of a decision against segregation might be. The *Washington Post* has commented that

> before drawing conclusions it [the Court] wishes to make certain also that it does not step out of its judicial role and get over into the field of policy-making.

But nothing could better illustrate the extreme difficulty of doing this very job of self-limitation than the fact that the Court feels it necessary to consider practical consequences in this matter. For example, the Governors of South Carolina and Georgia, backed by their respective State Legislatures, have threatened to close down the state school systems rather than accept unsegregated classes. As has been suggested on several sides, the Court may well have it in mind that the "great mistake" of the Supreme Court of the eighteen-fifties, the Dred Scott decision, in which the practical consequences of judicial action were notably ignored, played no small part in bringing about the Civil War. While no second "War Between the States" would ensue from the abolition of segregation—few believe even that southern schools would really close, whatever Governors Byrnes and Talmadge may threaten now—it is still important, for the sake of the Negroes themselves, that the Court avoid what Dr Frank Graham, a very liberal southerner, has called "unwise compulsions." Its members, all of whom were appointed by Democratic Presidents, must provide both an element of continuity in the changing political atmosphere and an agency for social and political change at the highest level of statesmanship.

In the meantime, a much smaller but nevertheless worthwhile advance was made this term in the decision forbidding segregation in the restaurants and cafés of Washington, D.C. Perhaps one small hint of the practical consequences to be expected from moves in this direction was afforded to the Justices—and other Americans, for that matter—by the complete lack of untoward incidents which accompanied this change in the nation's capital, which is, among many other things, a southern city.

Research—Servant or Master?

FROM A SPECIAL CORRESPONDENT

THE choice of Dr Nathan Pusey, a student of the humanities and Greek civilisation, to succeed Dr James Conant, a physical scientist, as President of Harvard University seems to many Americans a reminder of the dilemma which the colleges and universities now face. In this instance, those who made the choice insist vehemently that it was the man, not his field of study, that attracted them, and they deny that they turned deliberately away from science to the classics. Yet in the mood which prevails among people interested in education the choice continues to attract comment. Those who, having watched with alarm the social sleep-walking of such scientists as Dr Karl Fuchs, deplore the narrow rut in which scientific training sometimes confines its students, now talk hopefully of a swing back to more general education and to spiritual values. (They forget that it was the scientist Dr Conant who set up Harvard's "general education plan" for undergraduates some two years ago.) Those who, like Dr Vannevar Bush, have long been urging that America needs all the scientific training her young people can be given, fear for the future if this choice does indeed represent a return to older ideals.

The struggle between science and the humanities for the attention of educators is, of course, not new, but in the United States it has sharpened as both government and industry have for a decade poured more and more money into organised research. The United States now spends a billion and a half dollars a year on higher education in colleges and universities, both public and private. This money comes from student dues, private endowments and gifts, local and state tax money, corporate generosity, and grants from the federal government. Depending on whether the institution is large or small, privately established and endowed, or financed by the state, the pattern of support, and its effect, varies widely.

In 1950 some $200 million, or 14.2 per cent of the total spent, was allotted to organised research, almost treble the amount in 1930. Even in 1940 the proportion devoted to research was only 5.6 per cent. Most of this expansion must be charged to war and the fear of war, which drove home the importance of scientific research to industrial and military power. Much of the increase in research funds comes from the federal government, which is supporting atomic research on a scale only to be described as gigantic.

★

Of the $196 million in federal money which went to higher education in 1950 (this does not include help for ex-servicemen) two-thirds, or $131.5 million, was for definite research done according to contract specifications. Thus the University of California was paid $25 million for work at the atomic centre at Los Alamos; the University of Chicago operated the Argonne National Laboratory on a similar basis; the Jet Propulsion Laboratory is manned by the California Institute of Technology; and so on. Half the federal money spent on research under contract goes to eleven large projects serving the cause of national defence. At the same time a third of all private benefactions to higher education is also earmarked for research, while half of the funds granted by business corporations and foundations, some $35 million in 1950, is for the same purpose.

Obviously, the weight of all this money is considerable in college budgets, and so is that of the pressures which go with it. In 1947, when the President's Scientific Research Board declared that the rapid extension of scientific knowledge had become a factor in the national survival, those pressures were resented chiefly by classical scholars who found their departmental budgets cut for the sake of a new laboratory; by now the cries of pain have become louder and more varied. It is doubted whether educational institutions can turn themselves into research factories and still educate. And there is a danger that the small liberal colleges which have played so large a part in training American leaders will go bankrupt because their traditional courses attract neither the government nor the corporate giver.

The American Council on Education has appointed a committee on institutional research, to study the problems posed by what has come to be known as "sponsored research," most of it, of course, in scientific fields. This report, available only in preliminary form, sums up charges which are made in many quarters. First, sponsored research has brought welcome income to many colleges, "but it is threatening the present financial stability and future independence of some professional schools and entire universities." Secondly, it keeps too many people occupied on research, and thus deprives the educational world of too many potential teachers. Thirdly, it lays too much emphasis on the value of group research and gives too little consideration to the fruitful by-ways of the individual scholarly mind. Fourthly, it subordinates the humanities to the work of materialistic, and frequently destructive, scientific inquiry.

Few college presidents with a sense of public duty and a budget to be met can work their way out of these dangers by refusing government or corporate funds, or by repelling the pressures which go with them. Cash sets up its own demands, and neither government nor corporation is likely to give without a specific end in view. Scientific research can no longer be brushed aside as irrelevant to an institution's main purpose in a period when, as the Carnegie Corporation says,

> the intellectual climate in which we live has been fashioned in no small part by the physical and biological sciences, and no educated man can ignore their contributions, nor indeed frame a philosophy without them.

Yet at the same time the American Council on Education finds that

> the concentration of support on the physical sciences, to the virtual exclusion of the humanities and social sciences, may distort existing relationships among the various disciplines, with regard to undergraduate and graduate instruction as well as to research. . . . The situation has created a new problem of great importance to the nation.

What can be done about this problem, without risking a weakening of the nation's scientific strength and hence its industrial and military prowess, is a growing question.

So far the nettle has only been grasped with padded tongs. A report made for the Social Research Council asks "some freedom for independent scholarly research" on the apparently heretical ground that there is "no effective substitute for the individual human mind as an instrument for making fundamentally new discoveries." The American Council on Education has before it a list of suggestions related respectively to the various elements in the problem. It is proposed, for example, that there should be no restriction placed by the government on the publication of the results of research done under its contracts; that industry should pay the overhead cost of the research which it orders as well as the mere direct costs; that research aimed primarily at the production of weapons should be avoided; that the federal government should not demand short-term research on specific problems, but "give greater recognition to the crucial importance of fundamental research as the essential basis for long-range programmes of scientific and cultural development." The word "culture" occurs so seldom in these discussions as to cause almost a shock. Timid as such proposals may seem, their phrasing represents to some extent a recognition of the great tides of change which, for good or ill, are sweeping the American academic world.

American Notes

EDC or Else

THE sharp battle which was fought in the House of Representatives, and which the Republican Administration could not have won without the staunch support of the Democrats, over the first big foreign policy issue to come before the new Congress, the authorisation for foreign aid in the coming 1954 fiscal year, is certain to be repeated when the actual appropriation of funds is debated. The result then is likely to be less favourable to the Administration, and to America's allies. For Senator Taft has promised to look at the appropriation more severely than he has at the authorisation. The version of the Bill which is before the Senate would permit $5.3 billion to be spent, while the House has authorised just under $5 billion. This compares with Mr Truman's request for $7.6 billion last January and is almost half a billion less than even the present Administration thought it needed.

A compromise between the House and the Senate Bills will probably mean, however, that the final authorisation will come to over $5 billion. This would apparently be enough to satisfy the Administration, especially if President Eisenhower is given greater freedom to transfer funds from one area to another to meet changing conditions, something which Republican Senators think he should have. The House cuts fell entirely on Europe and the Middle East, leaving the amounts requested for the Far East intact. The feature of the House Bill to which the Administration does take serious exception is the provision, first proposed by a Democrat, Mr Richards, that half the $2 billion allotted to Europe should not be made available until the European Defence Community has been established.

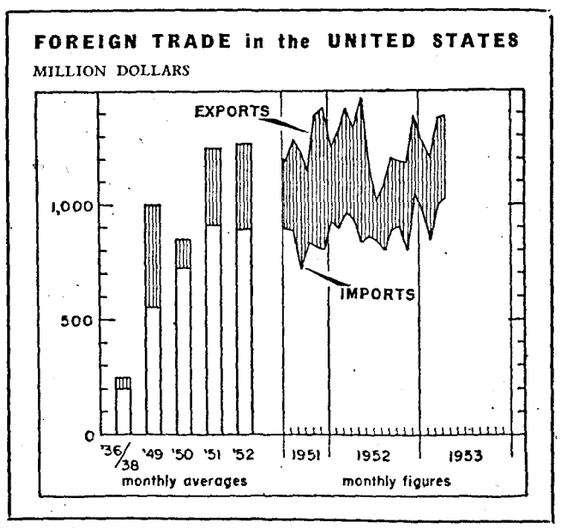
This latest attempt to drive Europe into uniting would not affect arms shipments immediately, for they are being paid for with funds already appropriated, but it would mean that no new contracts for military deliveries to Europe

could be made before the EDC pact was ratified, which can hardly be before the late autumn. Furthermore, the effect of putting such a pistol at Europe's head would almost certainly be the opposite of that which Mr Richards intended. Instead of helping to get the treaty through European legislatures, as he hoped, it would make the situation much more difficult for the advocates of the measure. The Senate Bill, so far at least, does not contain any such restriction and the Administration is working to ensure that the clause will be eliminated in conference, and that the House will agree to the elimination.

Goodbye to Controls

THE Defence Production Act, which for the purposes of headline writers has been the "Controls Act" ever since it was passed nearly three years ago, no longer justifies the abbreviation. The House and Senate conferees who agreed to extend the Act for two years have cut out even the feeble Senate proposal for a 90-day freeze of wages and prices and control of credit in an emergency. This is no great loss. Senator Capehart's original intention had been to enable the President to act alone in circumstances, such as an atomic attack, which might make it difficult to convene Congress. But, impressed by Senator Taft's argument that controls should have no place in a Republican Bill, and that the President should not be given too much power, the Senate in the end insisted that the freeze could only be put into effect by a Congressional resolution. The Administration itself, which is more worried about a post-Korean slump than about the risk of another bout of inflation, showed little interest in the proposal.

The conference Bill extends for two years, to June 30, 1955, the present powers to allocate scarce materials and impose priorities, and continues the loan and purchase programmes established to encourage certain types of defence production, particularly of metals. A new and narrower definition of national defence limits the scope of allocations and priorities, but the Administration had already decided that after July 1st, when the Controlled Materials Plan vanishes, only defence industries proper would continue to enjoy allocations of steel, copper and aluminium.



Shorn of controls and of the notorious "cheese amendment," the Defence Production Act, formerly a legislative catch-all, becomes exactly what the name implies, with one exception—and it is an exception which the Senate is refusing to approve. This is the proposal to create a Small Business Administration to make loans of $100,000 and under to small firms and to see that they receive a fair share of defence contracts. Loans, hitherto, have been available from the Reconstruction Finance Corporation, which is under sentence of death; battling for contracts has been the work of the Small Defence Plants Administration, which expires this month. The House wants both these functions to be concentrated in one permanent agency. But in the Senate irritation that a proposal on which there have been no Senate hearings should be offered as part of a conference Bill which is not open to amendment has led to a rejection of the measure. It has been returned to the conference committee, with the suggestion that, instead, the Small Defence Plants Administration should be continued.

Stranded Shipping

THE shipping companies have as usual given the seamen's union all that it demanded, after little more than a token strike. The wage rises which the men have won, ranging from 2 to 6 per cent according to grade, are, again as usual, better than any other union seems to have achieved this year and the seamen have increased still further their already substantial advantage both over workers in American industry and over seamen in other countries. This explains why American ships are unable to compete now that freight rates are falling with the revival of European shipping, and the slackening of the pressure that arose out of the Korean war. The proportion of the country's foreign commerce transported in American bottoms has been halved since 1950, and in January this year only some 25 per cent of cargoes coming to and leaving United States ports were in American ships. The tramp shipping companies maintain that the regular lines give in too easily to the seamen's union, and thus make the whole industry suffer, because, when their costs rise above foreign costs, the difference is made up by an operating subsidy from the government. The tramp and other unsubsidised owners therefore argue that government aid should be available for all shipping companies.

The new Administration, which is studying every aspect of the maritime question in an effort to work out a long-term policy, is meanwhile trying to speed up the payment of outstanding operating subsidies, at a cost of $65 million for the coming year. But it has held up all new subsidies for shipbuilding, thus saving $118.5 million, and moreover after some difficulty it has managed to induce Congress to agree to this measure. This means that American shipyards, which have had no new orders for ocean-going vessels this year, will continue to be left high and dry, while American companies turn to other less expensive yards, notably in Japan.

The case for shipbuilding subsidies is based largely on defence needs; not only is a skilled shipyard labour force desirable in time of war, but also a large up-to-date merchant fleet of freight vessels and oil tankers. Much of the present

American cargo fleet is obsolescent, and furthermore a spokesman for the Defence Department has told Congress that an addition of 165 cargo ships, 43 tankers and 6 passenger liners, or troop carriers, is needed for security reasons. But the special features which he said were wanted would make the ships unprofitable to operate under normal conditions, and in any case there is no commercial demand for such an expansion of the merchant fleet. It therefore seems that the new Administration will have some difficulty in achieving one of its aims, which is to induce private firms to take a greater interest in the financing of new shipping projects.

McCarran's Veto at Uno

SENATOR MCCARRAN evidently means to be numbered among the great powers exercising the veto over United Nations affairs. When the new Secretary General, Mr Hammerskjold, returned to the United States he was greeted with the news that the Senate, without a dissenting voice, had passed the Senator's Bill making it a criminal offence, punishable by a $10,000 fine or five years in jail, for an American to take a job with the United Nations unless his loyalty to the United States had first been attested by the Attorney General.

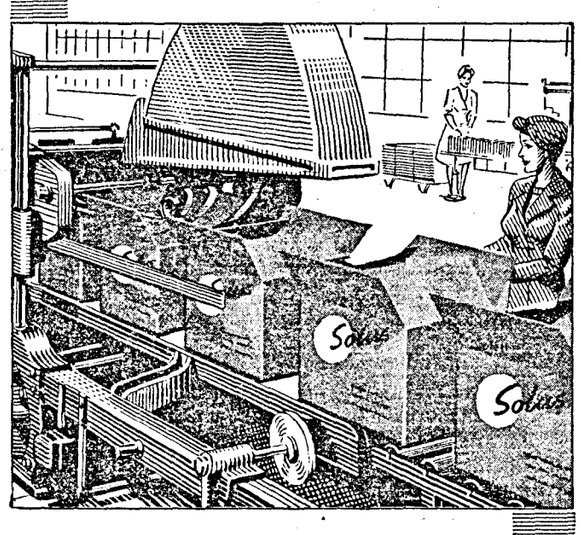
The principle that the United Nations will not employ Americans disloyal to their own country has already been accepted. Mr Lie discharged forty Americans after receiving adverse reports on them, and Mr Hammerskjold, by ending the employment of Mrs Glaser, of the reference library, has made it clear that he will take action against Americans who refuse to answer the questions of Congressional committees about possible Communist affiliations. Machinery to screen American employees of the United Nations was created by Mr Truman last January after the Senate Internal Security Committee's investigations, and has been continued, in a somewhat different form, by President Eisenhower. The broader standard of security replaces that of loyalty, but the right to a hearing, with legal aid, is assured to those under investigation. Both Administrations have respected the authority of the Secretary General to choose his own staff, which was granted by the Charter. The conclusions of the screening authorities are forwarded to the Secretary General, but the decision whether to act on them remains his.

It is this freedom Senator McCarran would end. Even the existing loyalty programme may, it is feared, encourage other countries to demand a similar right to screen their own nationals. But if the McCarran Bill becomes law, Mr Hammerskjold's technical freedom to employ any American he likes will be meaningless if the only result is to send the employee to jail. The State Department opposes the Bill as a violation of the Charter, and the Department of Justice as an unnecessary duplication of the existing machinery. Whether the President will veto it is another matter, but he has had ample warning this time of the intention of Congress to dictate to the United Nations, as he apparently did not when Congress was considering the rider to cut off United Nations funds if the Chinese Communists were admitted.

Undermining the Interior Department

THIS Republican Senate may be about to see a repetition of the deadlock which arose in the last one, in 1947 and 1948, over the appointment of a new director for the Bureau of Mines. For the nominally Republican president of the United Mine Workers, Mr John L. Lewis, is no more favourably disposed towards the man, Mr Tom Lyon, whom the Republican President of the United States has nominated to head the bureau than he was towards Dr James Boyd whom President Truman nominated in 1947. It took two years, an election and a coal strike, which put senatorial backs up, to get Dr Boyd confirmed and President Eisenhower is courting a similar clash by sending Mr Lyon's name to the Senate, after delaying the nomination for two months while he considered Mr Lewis's protest.

Mr Lewis's opposition has been stimulated by the new Administration's wish to economise on the bureau's plans for making synthetic fuel from coal, a project which Mr Lewis had hoped would provide a much-needed new market for his miners' output. His official reasons for objecting to the new appointment are two: that Mr Lyon is not qualified, since his experience has been in metal mining, not in coal mining (with which only about 20 per cent of his duties are actually concerned); and that Mr Lyon is an anti-labour man who was chosen for political reasons (by which Mr Lewis really means that he, not local Republican officials, should have been consulted first).



★

There seems in fact less reason to object to Mr Lyon's nomination than to those of other new bureau heads who were chosen for the Department of the Interior at the same time. The directorship of the Bureau of Mines has been the subject of political patronage before, but this is not so in the case of the far more influential Bureau of Land Management responsible for grazing, afforestation and mineral rights on nearly half a billion acres of federally owned land. Yet Mr Clawson, the career civil servant who held the post, was replaced by a Republican outsider who had been state land commissioner in Idaho. The appointment to this position of a man who had such a special interest has encouraged the suspicion that the Eisenhower Administration may be preparing to hand public property over to state authorities.

But at least Mr Clawson does not seem to have been an entirely satisfactory administrator while there have been no such charges against Mr Day, of the Fish and Wildlife Service, another civil servant who was demoted to make room for a political appointee. It was argued that this change was made not so much to reward a Republican as to punish Mr Day for having offended Republican salmon canners and duck hunters, by insisting on strict game preservation practices.

The Department of the Interior was perhaps more closely associated than any other with the development of the New and Fair Deals and it is therefore only natural that a Republican Secretary of the Interior should want to select men on whose sympathies he is sure he can rely for policy-making jobs. But for the same reason it is also only natural that appointments at the department should be closely watched by those who fear that Republican reactionaries will undermine the civil service and sacrifice the interests of the people to the claims of big business.

Packed right in "Fiberite"!

If goods are worth making and worth advertising, they are worthy of good packing! Manufacturers whose trade-marks are household words realise this and pack their products in "FIBERITE" cases. Thus they increase their prestige, but packing costs stay low. Yes, it pays to let the "FIBERITE" trade-mark give your goods the hall-mark of good packing.

The World Overseas

Malaya's Road to Independence

FROM A CORRESPONDENT IN MALAYA

IT is just five years since the emergency began in Malaya. General Sir Gerald Templer's reported remark this week, that it will go on until the Malayan Communist party is convinced that the Communist world revolution will not succeed, reflects not an admission of government defeat but the triumphant fact that, so far as the struggle in Malaya is concerned, the Communist rebellion has been crushed. There will continue to be a running fight between the security forces and any terrorists who remain in the boundless jungle. But the scale of that fight has been so reduced—and General Templer, as High Commissioner, estimated that it could still be reduced by 15 or 20 per cent—that conditions of something approaching normality have been restored in most parts of the country.

This anniversary marks in fact a clear switch of priority from the military to the political field. The struggle now is to build a new and self-governing Malaya, and two events lately shed light on the difficulties which still remain to be overcome on this road to freedom. What is described as a national conference to plan Malayan unity and independence has recently set up, at Kuala Lumpur, a working committee to further these aims. The sponsors considered that all interests, races, creeds and colours should discuss together and compose any differences between them. One of the leaders of the movement stated that

> We want the Templer type of protection, the type which plans and creates the Federation army, navy and air force, not the protection of the prewar type which had one foot lightly in this country and the other in the Indian Ocean so as to make a quick getaway in time of trouble. We want the Malay rulers because they are symbols of authority which can combine the heterogeneous population that lives in this land.

These remarks are illuminating. They are commonsense in that they face the fact that Malaya's greatest need now, and for years to come, is protection, which is both Britain's excuse for continuing to rule Malaya and its justification for doing so. The point has been made that it should be a real protection; without Britain's power Malaya would be blown about like a withered leaf. It would grow again, but if Britain let the catastrophe of rebirth happen in this way it would be throwing aside a very real trust.

Commonsense is not, however, the strongest suit in Malayan politics, and right though they may be, these ideas are unlikely to bring the nation together at this stage. It is more probable that they will result in yet further disunity. The immediate outcome was a boycott of the conference and the working party by three of the leading political organisations—the United Malays National Organisation (UMNO), the Malayan Chinese Association (MCA)—recently allied with UMNO—and the Pan Malayan Labour Party. General opposition flows from the idea that only political bodies should have the right to discuss and vote on such matters. The national conference has been attacked as being "one-sided and undemocratic," which on the face of it seems hard to justify, since the meeting was open to all.

The second instance of internal differences and rivalries comes from a speech delivered by Dato Onn bin Ja'afar at a meeting of the Independence of Malaya Party when he accused the leaders of the Malayan Chinese Association and the Associated Chinese Chambers of Commerce of plotting for political power and seeking to turn Malaya into China's 20th province. Dato Onn is the Chairman of the Independence of Malaya Party, but he claims to have spoken on this occasion as a private member of that body. He is also Member for Home Affairs in the Legislative Council and is thus a member of the Government. In the Legislative Council a Chinese member, Mr Tan Siew Sin, brought against him what amounted to a motion of censure, and the business of governing Malaya was set aside for two days in favour of a protracted and at times heated debate over a political wrangle. A European member pleaded that "We should cease bleating glibly about a united Malayan nation until there is more evidence that such is a practical possibility." Pointing to the evidence that Malay and Chinese leaders were at loggerheads, he added, "One can only conclude that this state of affairs seeps down through all the layers of society and that we are far from being truly united." The truth of his remarks was only too evident from several of the irresponsible contributions to the debate. The outcome was a vindication for Dato Onn. In a Legislature numbering 75 only nine were found to support the motion, with 40 against. Those abstaining were chiefly official members, who probably took this line mainly in order to avoid becoming embroiled in local politics.

To the impartial onlooker the whole pattern of the picture is unrealistic and immature, and there is clearly a need to get back to thinking on first principles. Ever since the war the people of Malaya have been encouraged to think about self-government, and under Labour rule in Britain those who undertook the task of ruling Malaya were frustrated by a blind adherence to the theory that self government was right and anything else necessarily wrong. For any sort

of government to be right it must be truly in the interests of those governed, who should be the best judges of where their interests lie. This, however, assumes that they have the understanding to judge and the ability to give expression to their opinions. We are disgusted with the humbug of the Communists when they stifle public opinion for party purposes, and yet we are doing much to expose the people of Malaya to these same conditions.

Under British rule, before the war, large numbers of Chinese and Indians were sufficiently attracted to the conditions in Malaya to want to make their homes there ; it was possible to live at peace and with reasonable prosperity. The war shattered former expectations of security and it severely damaged Britain's reputation as a protector, but it also showed what could happen when the British were not there. There can be little doubt that a very great many of the ordinary folk in Malaya would prefer conditions of peace and security to a theoretical freedom which provided very little in the way of tangible day-to-day benefits. The demand for self government, such as it is, comes from the local politician, who is attracted by the prospect of power and eminence that lures politicians all the world over. The present trend in Malaya is for those seeking such power to found their own political parties as preparatory schools, as it were, for the parliament to come.

These parties, however, reveal a clash of interests. Not only are there differences, varying from left to right according to the normal political pattern ; there are also dangerous communal differences. Here is the core of the problem. Malaya contains Malays who are Malays, Chinese who are Chinese and Indians who are Indians. The search for power cannot be divorced from the idea of communal domination.

General Templer, a man who has not been afraid to govern, has led the way in his insistence on a common Malayan nationality though not necessarily a common culture. Given time the idea will gain ground, but at present the human factor stands in the way of any rapid racial adjustment. It may be a generation before a common nationality is instinctively and sincerely accepted. Britain, therefore, can best serve Malaya by allowing its people time to reach the goal of self government in their own way. To force the pace will throw the whole problem out of proportion and accentuate local rivalries.

The Balkan Alliance

BY A CORRESPONDENT

IN the gloomy political landscape of postwar Eastern Europe the one bright feature is the growing community of purpose between the three states of the Balkan Peninsula which have escaped the Stalinist yoke—Greece, Jugoslavia and Turkey. Ever since the expulsion of Jugoslavia from the Cominform, their relations have improved. During 1952 the three governments began to negotiate for a closer and permanent association. In February, 1953, a Treaty of Friendship and Collaboration was signed by the three Foreign Ministers in Ankara. This is not a full military alliance ; it obliges the signatories to consult on matters of common interest, and provides both that the three Foreign Ministers should meet at least once a year and that the General Staffs should jointly examine problems of common security. The first General Staff discussions were completed the other week. The fact that Jugoslavia is not in Nato sets limits to military co-operation, since Nato plans cannot be disclosed to non-members. But already an atmosphere of trust and even of cordiality has been achieved. The Balkan treaty has transformed the basis of defensive strategy in the Eastern Mediterranean.

Between Jugoslavia and Greece there has seldom been enmity, and often mutual respect and friendship, marked at times by warmth of feeling. Since the 14th century there has been no serious conflict between Serbs and Greeks. In the present century the two nations fought together in the First Balkan War against the Turks, and in the Second against the Bulgarians. Since then they have been united by common fear on the one hand of Italian expansion, and on the other hand of Bulgaria, the tool in turn of Hitlerian and Stalinist imperialism. The exception was the period 1944-1948, when the ideological conflict placed Jugoslavia on the side of its old Danubian enemies, against its old allies in the south and the west. But today there is no conflict of interests between Jugoslavia and Greece : the most that can be said is that there are differences of outlook on certain problems.

Misunderstandings about Macedonia

Fifty years ago the whole of Macedonia, then under Turkish rule, had a mixed population, in which Slavs predominated and Greeks were a minority, largely though not wholly consisting of scattered urban communities. The partitions of 1913 and 1918 gave Greece a large part of Macedonia, in which the Slav element was still extremely strong. When after the Turkish victory over the Greeks in 1922, a million and a half Greeks were expelled from Asia Minor, many of these were settled in Macedonia, and most of the Slavs and Moslems were in turn sent to Bulgaria or Turkey. Thereby Greek Macedonia became a land of compact Greek population. Today Slav-speaking inhabitants in Greek territory are an insignificant minority. But these facts have not been fully recognised outside Greece. Bulgarian imperialists continued to claim all Macedonia, and in the years 1941-44 their German masters partly gratified their wish. The Macedonians of Jugoslavia, who since 1913 had fought the Serbian nationalist policies pursued by successive Belgrade governments, received the status of a constituent republic under Marshal Tito's new Constitution of 1946. In the exuberance of their new-found autonomy, they began to talk of "liberating" Aegean Macedonia from the Greek yoke. The Belgrade government, eager to humour the Macedonians, would have found it hard to restrain their firebrands even if it had wished : in the ideological conflict of the first postwar years, with civil war raging in Greece, it did not even wish it.

Since 1949, however, there has been no more such talk. There can be no doubt that Jugoslavia has now abandoned aims of expansion at the expense of Greece. It may be hoped that the Jugoslav leaders will lose no chance of informing their subjects of the fact that Greek Macedonia is not Slav territory, or even mixed territory, but a purely Greek land. The point needs to be made, for until recently there were many Serbs, and even Croats, including persons of both left and right and persons who had no ill feeling for Greece, who still believed the view which has so long been spread by the propaganda of Bulgarian imperialism.

Jugoslav and Greek views of Bulgaria certainly differ. To most Greeks, hatred of Bulgars is a dogma. In fact it is possible that more Greeks hate Stalinism because they imagine it to be Bulgarian than because they really understand the nature of its menace. The Jugoslav view is more sober than the Greek but also more complex. It has varied, during the last fifty years, between a belief in South Slav brotherhood, verging on Panslav sentimentalism, and a hatred which is the more intense because it is based on intimate knowledge of its object. Today the differences between the Greek and Jugoslav view matter little. Tomorrow, when Bulgaria is no longer Stalinist, the Jugoslavs may have an important part to play in helping Greeks and Bulgarians to live in the same world.

There is also a difference in attitudes to Albania. Greece claims "Northern Epirus," which has traditional associations with Greece but whose population is Albanian, Jugoslavia includes a province (Kosovo-Metohija) inhabited by 700,000 Albanians, about half the population of the whole Albanian state. Jugoslavia would perhaps prefer a united Albanian state closely associated with itself, assuring by its friendship easy access to the Adriatic at its narrowest point. This would not threaten Greek interests, nor are Greek claims incompatible with Jugoslav aims. But Italy, bitterly hostile to Jugoslavia as a result of the Trieste question, is suspicious of any Jugoslav influence in Albania. Greece, wanting the friendship of both Jugoslavia and Italy, is naturally keen not to be embroiled in their quarrel.

Greco-Turkish Reconciliation

Greeks and Turks have a long tradition of enmity to live down. Since 1930, when the statesmanship of Venizelos and Ataturk made the first step towards reconciliation, Greco-Turkish relations have entered a new phase. But the expulsion of the Greeks from Asia Minor, which deprived Turkey of many of its most able citizens, increased the population of Greece by a quarter, and permanently disorganised the Greek economy, was a catastrophe for the whole Levant, and its effects could not be quickly forgotten. The Turkish attitude to Greece during the Second World War left much to be desired, and the treatment of Turkish subjects of Greek origin under the provisions of the Turkish capital levy of 1942 was bitterly resented by their kinsmen.

Since the war, however, there has been a remarkable improvement. The common danger from Soviet imperialism is, of course, the main reason, but the Democratic administration of President Celal Bayar also deserves great credit. The Greek community in Turkey are no longer made to feel second-class citizens. Greater religious toleration has benefited not only Moslems but also Orthodox. In Greece it is believed that the Oecumenical Patriarch of Constantinople, Athenagoras, has done much since his election in 1949 for Greco-Turkish friendship. In short, a quite different atmosphere is being created.

Of Jugoslav-Turkish relations there is much less to say. Enemies in the past, they were associated in the Balkan Pact of 1934. In the first postwar years Jugoslavia's adhesion to the Soviet camp, and Soviet threats to Turkey, estranged them. Today they have a common interest in resisting the same danger. They also have much to gain from mutual trade. Jugoslavia needs Turkish cotton, and to some extent Turkish cereals. Turkey needs Jugoslav timber products, and as Jugoslav industry develops it will find Turkey a valuable market.

The Balkan Entente of 1934 was a failure for three reasons. Memories of enmity were too recent ; German diplomacy and trade was able to drive wedges between the partners ; and, above all, the members of the Entente feared different great Powers, and could not combine against them all. Today things are simpler ; and for all the differences of regime and ideology, the three Balkan states are bound by a firmer solidarity than in the past. If their human and material resources can be rationally organised, they can prove a powerful bastion of the free world.

"Operation Nenni"?

FROM OUR ROME CORRESPONDENT

THE political uncertainties bequeathed by the election results of June 8th have now crystallised into the dual question: Can an "Operation Nenni" be shirked ? Can it be risked ? By "Operation Nenni" is meant Christian Democracy, in the person of Signor De Gasperi (or his as yet quite invisible successor), compounding with Signor Nenni, leader of those Socialists who have hitherto qualified as fellow travellers, in order to obtain the co-operation of the latter in a future government.

"Operation Nenni" was implicitly suggested by the party of Nenni himself when, on June 7th, he led it to the polls no longer officially linked, as in 1948, to the Communists, and having for its slogan the ambiguous words "Socialist Alternative." It was an ambiguous phrase because the Italian elector was allowed to suppose that the alternative to the sterile deadlock between a Christian Democracy wielding the political power and a Communism controlling the trade unions could be resolved by a Socialist Middle Way and that Nenni's party could lead Italy along it. The first to denounce the disingenuousness of this appeal were the Saragattian Social Democrats, more or less reliable allies of Christian Democracy these last six years, who told the electorate not to be so foolish as to imagine that Signor Nenni had any other possible line of conduct but subservience to the Communists.

Some part of the electorate undoubtedly voted for Signor Nenni in the hope or expectation that Christian Democracy, missing an absolute majority in Parliament, would have to come to terms with somebody else besides, or instead of, its usual allies, the three small "lay" parties. Their vote meant that they wanted this somebody to be Signor Nenni on the left instead of the Monarchists on the right. The election results have, however, been what nobody could expect: a narrow defeat of Christian Democracy and its traditional allies in the national poll, which deprived them of the automatic large parliamentary majority ensured to the winner by the 1953 electoral law, combined with a fortuitous success in the single constituencies. This enabled Christian Democracy, provided it remains fully backed by its "lay" allies, to maintain a marginal control over the Parliament. The conditions in which either an "Operation Nenni" or an "Operation Lauro" (Lauro is the Neapolitan millionaire who leads the Monarchists) would have been absolutely necessary, have not come about. Neither Nenni nor Lauro finds himself in a position to exact conditions from the Christian Democrats.

Nenni has therefore limited himself to demanding, like the Communists, in a quite general way, that the Government should take heed of the growth of the extreme Left's share in the poll—from eight million to nine and a half million, or from 31 per cent to 35 per cent of the whole.

Signor Nenni himself has not explicitly raised the question of the Socialist Alternative and the "Operation Nenni." But Signor Saragat, finding himself with a sharply reduced poll and parliamentary representation and yet, with his remaining little band of nineteen deputies, in a position to make or unmake majorities, has plunged in to raise it, producing strong reactions in all directions. Saragat's argument, expressed in a commentary on the election results, has been as follows: "I have lost half a million out of my two million votes. They were captured by Nenni by his slogan of Socialist Alternative which was understood by the electors to betoken a Socialist detachment from Communist policy. Therefore Nenni's party is now full of anti-Communist Socialists, who feel as I do. Therefore Nenni could be detached from the Communists, and only by bringing him too into the Government coalition would the electorate's mandate be honestly fulfilled. For the switch of votes to the extreme Left shows that the Italian people is determined now to secure much more vigorous social reforms."

If Saragat Turned Sour

The response, in various quarters, to Saragat's emotion-laden utterance, reflects the great difference, felt by everybody, between an "Operation Nenni" which effectively detached Nenni from the Communists before bringing him in, and one which brought him into the Government still tied by invisible apron strings to the Communist Togliatti. Christian Democracy is vexed with Signor Saragat for making, by his initiative, the beginnings of a rift in the small centre majority which the elections—though going so badly—had provided. If Saragat turned sour, they would have no assured majority at all. Yet Christian Democracy has come out of the elections itself a good deal more tilted to the left than it went in. (Only 30 "Vespisti" or right-wingers have been returned—about half the previous number.) And the party's strongly leftist elements feel that a suspicion of social indifference will cling to the Christian Democrats unless—but not necessarily at once—an opening is offered to Nenni, if only to prove to the nation once and for all that he is too tied up with Communism to be able to accept any reasonable conditions.

Among the Communists the reaction against Signor Saragat's suggestion has been so bitter, violent and abusive as to suggest a real fear that Signor Nenni might prove a second "traitor." Yet Signor Togliatti himself said publicly, before the elections, that the pact of unity of action of the two parties need not preclude the Nenni party from joining the Government and leaving the Communists outside. And the reports of his present private conversations suggest that he is still not averse from Signor Nenni's finding a subtle formula (such as accepting the "defensive" aspect of the Atlantic Pact while repudiating "Atlanticism"), which would enable him to climb into the Government. Glancing finally, across the centre, to the Right Opposition in the new chamber, it looks as though a "moderate" wing of Signor Lauro's Monarchists might give enough support to Christian Democracy to reduce the temptation of "Operation Nenni." This in any case is most unlikely to be attempted before the winter. Meanwhile, Signor De Gasperi may go ahead with a "one colour" Cabinet of Christian Democrats only.

Travelling in Russia

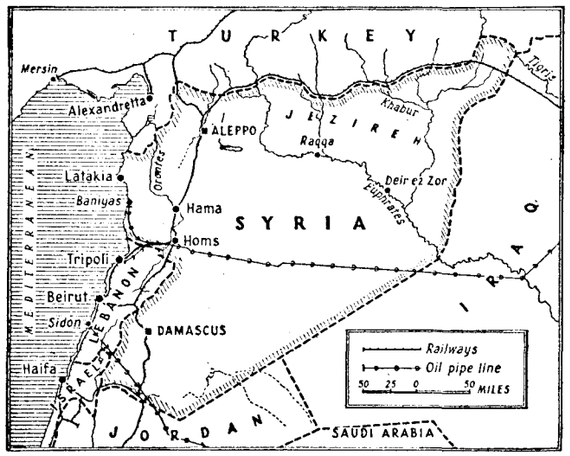
ONLY the test of actual experience will reveal the precise extent to which restrictions on foreigners' movements inside Russia have been eased by this week's announcement in Moscow. Non-Communist diplomats and journalists are now, it seems, made theoretically free of the greater part of European Russia and large tracts of the greater part of Soviet Central Asia and Siberia. They may now, for instance, visit the eastern Ukraine and Byelorussia, and some of the ancient Asian cities. But the industrial areas of the Urals and Siberia, and bases such as Molotovsk in the north and Sevastopol and Kerch in the Crime remain prohibited areas. So do the Baltic States, the frontier regions where Russia borders upon non-Communist states such as Finland and Turkey, and even such regions as the western Ukraine, which does not front upon the free world but may still be somewhat unsettled.

This easing of a system which has virtually confined

diplomatic and press representatives to a tiny area round Moscow is obviously to be welcomed, especially if Russia's example is followed by its satellites. But its significance could easily be overrated. It will hardly be possible—as it is in other countries—for a diplomat who wishes to learn about the Russian way of life to take a car and simply drive out from the capital wherever fancy guides him. To begin with, he may not go more than 25 miles along the roads out of Moscow without permission. Even if he confines himself to visiting one of the places now specifically declared open, past experience suggests that he may have trouble over tickets and hotel reservations if his journey is not favourably viewed by the authorities. Between the little Moscow enclave and the formally "prohibited" areas, all, for the time being, remains grey.

Moreover, the new concessions apply only to the small band of diplomats and correspondents already inside the Soviet Union. As yet, the slow Russian process of "leaving off doing what they should never have done" has not made it easier for the average person to obtain an entry visa. Approaches made by various organisations on the subject of restoring the prewar tourist facilities in Russia have not achieved results. Yet it may be assumed that, with some exceptions, postwar reconstruction has now got to the stage where the Russians need neither be short of accommodation nor feel ashamed of their living conditions. Strategic reasons no doubt account for the exclusion even of diplomats from certain military areas and industrial centres. But no obvious reason suggests itself for the continued closing to the ordinary foreign tourist of the spas and seaside resorts to which Stalin permitted access before the war.

Prospects for Syria



"I HAVE no authority except in my capacity of Chief of Staff," said Brigadier Shishakly of Syria to some foreign correspondents in April. If ever there was a pose, this is it. A note on page 890 explains that the fiction is likely to come to an end on July 10th, when he plans to be elected President of the Republic on American lines—that is, with full executive powers.

Briefly, the political history of his four years of leadership in Syria is that, though the former political parties remained in being, and nominally in power, until December, 1951, no cabinet could wield authority unless it had the sense to square him and his army informers of the Deuxième Bureau. Towards the end of 1951, he quarrelled first with one and then with another of these parties; finally he disbanded them all and put a puppet fellow-colonel, Fawzi Selo, into power "until the country could return to normal parliamentary life." Since then, no decision—political or economic, has been taken unless the papers have crossed his desk. Administration has suffered considerably from this bottleneck. Dissatisfaction with his methods has been sufficiently widespread to push him to conduct successive army purges—the last in December, 1952; in the same month he unmasked a civilian plot against him, and in the process arrested the boldest and most outspoken of the remaining party leaders and put three others to flight into Lebanon.

Meantime, Brigadier Shishakly, modelling himself on the Kemalist pattern, has set about founding a single national party, the Arab Liberation Movement; so far, few men of distinction have joined it, and those who belong hasten to explain how they were forced into doing so. Apart from the tiny handful of competent senior civil servants who have kept the state going through the vicissitudes of these years, he is served by curiously few men of note. Syrians are carping by habit and he is the butt of steady censure from a majority of educated men. It is difficult to put a finger on the secret of his survival.

The emotions that work for him are strongest among common people, who—without much tangible proof of it as yet—are sure that he means to build them a welfare state; he also stands well with the section of the business world that has derived benefits from his decrees that all business with foreign firms shall be conducted through Syrian (as opposed to Lebanese) agents. Among women, too, approval of his rule is fairly widespread; even if critical, they admit gratitude for the strides he has made towards their emancipation. The public also feels warmly enough towards his armament policy, and enjoys itself when the armaments he has bought and the shirt movements he has organised take three hours to roll by. The only wry faces on these occasions are those of the business men from whom, for lack of a proper system of direct taxation, money for armaments has been extorted by unorthodox forms of army pressure. Lastly, he strikes a popular attitude as the arch-irredentist over Palestine and as the Saladin who will liberate it once his hands are free of internal problems.

This day is not yet, for his home programme is enormous. Yet if he counts his blessings, he is better endowed with the means ultimately to execute it than are many of his neighbours. For one thing, he starts from the basis of a relatively well-balanced economy: given better organisation of internal transport and of irrigation on the Euphrates and Orontes rivers, Syria could annually produce considerable export surpluses of valuable raw materials—notably cotton, wheat and wool.

Any excess of imports over exports is easily offset by a series of lucrative invisible earnings, notably dues for the pipelines for oil from Iraq and Arabia, emigrant remittances, and local payments made in dollars by the United Nations organisation (UNRWA) for succouring Palestinian refugees.

A second blessing, patent to all Arab eyes, is that Syria is more truly independent of great power influence than any of its neighbours. It is bound by no defence treaties with alleged imperialists. By the establishment, upon the efficient advice of a Belgian banker, of an *office des changes*, it has severed its currency from the handicap of fluctuations in accordance with the chancy Beirut market; by making arrangements to found its own Central Bank it is about to rid itself of a link with the Paris bank rate that has not always worked out to its advantage. This freedom from complexes about great power pressure has left the Syrian entrepreneur free to get on with modernisation on a private scale, and his enterprise is reflected in concerns such as the Aleppo cement factory, and in a considerable development of the textile industry at both Aleppo and Damascus.

A crowning blessing that Syria enjoys is a healthier social climate than that which prevails in Iraq, Iran or Egypt; its rich are not so rich, nor its poor quite so poor, and the ironing out of inequalities will be a less painful and upsetting

process than that which is taking place in more feudal countries. In sum, Shishakly's Syria is its own master and enjoys almost every boon save that of capital for development of its promising agricultural resources. It eyes with envy the oil royalties that are pouring into its neighbours' laps, and would like to secure a share of the bounty either by exacting higher dues for the passage of pipelines or else by inducing its friends among oil-bearing states to relieve it of the horrid need for turning to infidel capital. Saudi Arabia has fulfilled part of a $6 million loan agreement, but does not seem to be keen to do more.

Yet it does not relish the thought of borrowing from the west. So far, it has refused Point IV aid, and has not touched a $30 million grant that has been earmarked for it by UNRWA in connection with the settlement of Palestine refugees. Its motive for holding back is reluctance to accept anything from hands that helped to found Israel. Apparently it does not include United Nations technical experts in this category, for it is using them freely ; the World Bank, by contrast, seems to carry the slur, for though its missions have been consulted and though it is ready to lend for Latakia port, for drainage and land reclamation, and for the much needed roads that would link the rich Jezireh wheat and cotton lands with Aleppo and Latakia, its services have not so far been accepted.

Snail's Pace Progress

Syria's capital works programme is therefore proceeding only at a snail's pace, and a number of valuable projects hang fire except in so far as they can be financed out of current revenue. (There are no savings to spare from the exchequer on account of fairly heavy expenditure on armaments.) On this hand-to-mouth basis a beginning has been made with the port of Latakia, and with a Dutch contract for drainage on the Orontes ; a long-planned irrigation scheme on the Khabur river has also been completed. But little or no start has been made with the vital bridges and roads that are needed to bring the rich produce of the Jezireh to world markets, or with the railways that must be built if Aleppo and Damascus are to make full use of Latakia.

Maybe the forthcoming plebiscite will provide Brigadier Shishakly with the fillip that he seems to need before he decides whether to borrow and be damned or whether to fulfil his development plans only as a poor but proud country can afford. He does not disguise that he would be ready enough to accept foreign aid if it were proffered on a scale that he could claim as a personal triumph. When studying his policy, either political or financial, it must never be forgotten that he moves from weakness more often than from strength.

Breaking Colombia's Deadlock

THE recent *coup d'etat* in Bogota was by no means just another of the seizures of power by army officers that are still sadly frequent in Latin America. It was a bold breach with tradition ; and it revived hopes of an early end to the bitter and pointless struggle that has plagued Colombia for five years.

Indeed, no Latin American country is less military-minded than Colombia. Although, paradoxically, it has been alone among the twenty republics in sending troops to Korea, Colombia retains a strong tradition of respect for civilian authority, springing from the doctrines of its particular founding father, Santander, " the man of laws." The officer class, which in neighbouring Venezuela and Peru holds high social status and dominates political life, in Colombia is accustomed to a more modest place.

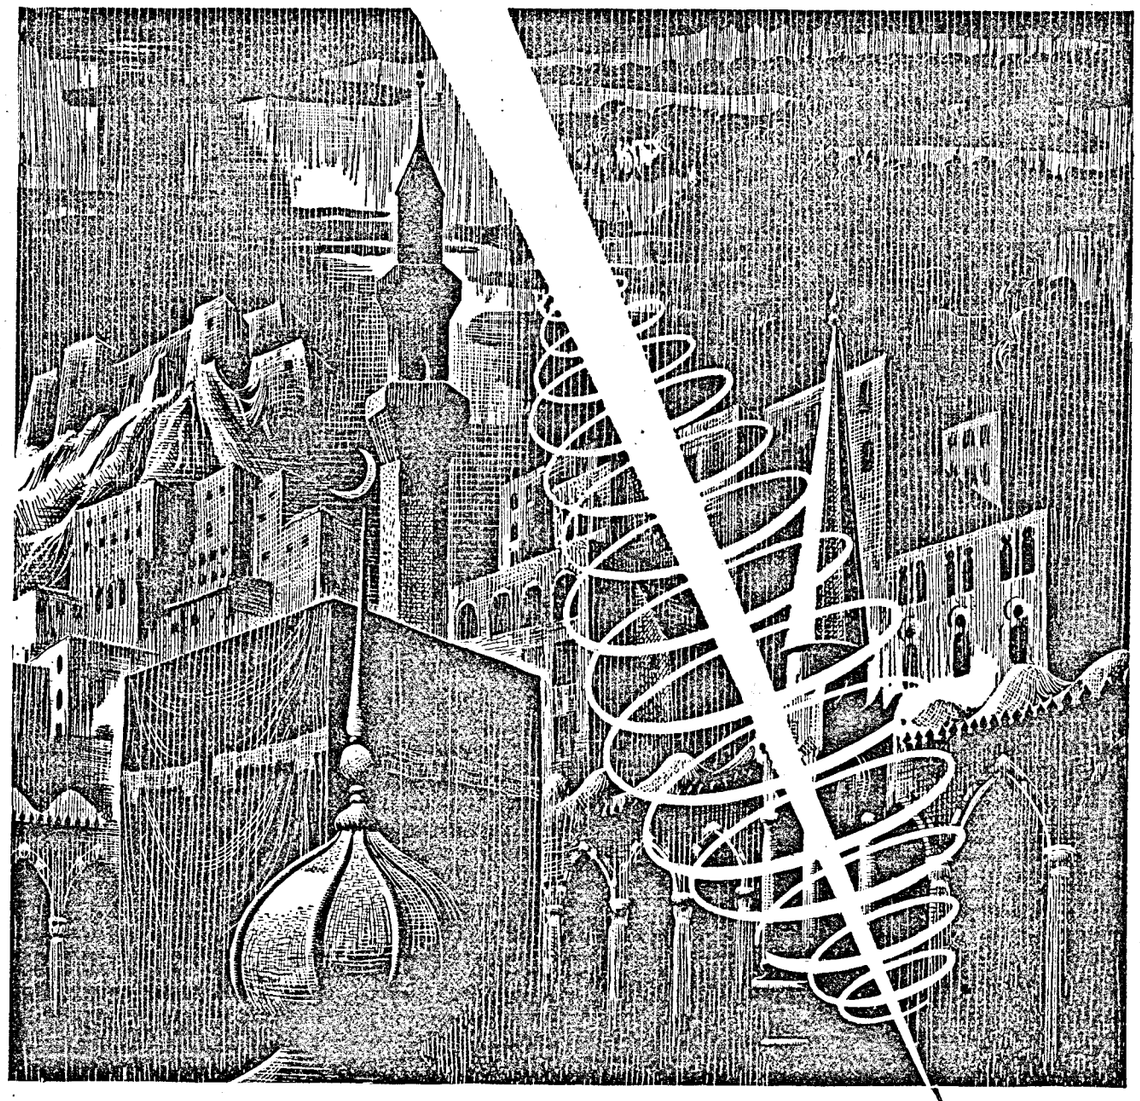
Yet when General Rojas Pinilla, the head of the armed forces, seized the presidency on June 13th in a bloodless *coup*, he was cheered by a surprisingly calm capital and offered the support of both government and opposition leaders ; and on Monday he was acclaimed by a national convention which had only just been called into being by the deposed president, Sr Laureano Gomez. However, it is not difficult to explain why a civilian nation should give such a warm welcome to a military ruler. Since the notorious rioting in Bogota in 1948, the political situation in Colombia had deteriorated to such a point that the legal opposition was silenced, and the army was permanently engaged in bloody clashes with desperate rebel groups in many parts of this sprawling, inchoate country. To the bitter hatred of the opposition, Sr Gomez had added the disillusion of his own supporters ; and not a hand was raised to defend him when the moment of crisis arrived.

Revulsion Against Autocracy

The deposed president seemed, however, to have little idea of the extent of the revulsion against his authoritarian methods. Although Sr Gomez had only been president for three years, he had dominated the Conservative party for a decade, and his strongly reactionary beliefs had done much to widen the gulf between his party and the Liberals. The present crisis was touched off by his resumption of personal power after a long period of ill health during which a more moderate Conservative, Sr Urdaneta Arbelaez, had sought, as acting president, to modify some of Sr Gomez's more rigorous policies ; by his proposal to reform the constitution so as to increase the already wide powers of the presidency and to introduce some features of the corporate state ; and by his attempt to dismiss General Rojas, whom he suspected of leanings towards the moderates.

General Rojas has already received the support of Sr Urdaneta and many other members of the former government, and he is also backed by Sr Ospina Perez, the Conservative president who preceded Sr Gomez, who has lately been seeking to conciliate the opposition. Many Liberals have also declared for General Rojas, but he has not as yet taken any of them into his government. Liberals both in Bogota and in exile have, however, been encouraged by the General's announcement that he would not carry through Sr Gomez's plans for a more authoritarian constitution ; and several reports from the provinces indicate that rebel groups are beginning to accept the new government's offer of amnesty on condition that illegal arms are surrendered. It is too early to assume that the feud between the two main parties can now be brought to a conclusion satisfactory to both. But the army's intervention has at least broken the deadlock that had paralysed Colombia's political life, and in the new situation that General Rojas has created there are obvious possibilities of a settlement, if the moderate men on all sides can prevail over the irreconcilables at both extremes and the many individuals with personal vendettas.

THE TAX COLLECTORS There is little of their modern successors' ruthless urbanity in these 16th century Dutch tax collectors—from a painting by Marinus van Reymerswaele known as "The Excisemen". Ruthlessness, yes; for the gathering in of hard cash was apt to be a dangerous proceeding. Urbanity was to come with anonymity.



A hatful of coins on authority's table reminds us nowadays more of a bank counter and of those little brown paper bags in which coins are packed. And paper bags—be they carrier bags, vegetable bags, or specially constructed bags for hygienic food handling—are as much part of modern life as the aloof manner of modern taxation. Many millions of paper bags are sold every year by Bowaters and this is just one of the ways in which their Packaging Division makes paper serve modern life. Paper for commerce, art or industry is the business of The Bowater Paper Corporation.

There is a power barrier even in Mecca. A barrier between darkness and light—between old-fashioned power methods and modern power with all its benefits. But the city of Mecca will soon stand also as a symbol of the progress in temporal matters—in industry and agricultural reform. For once again, *power* is bursting through the barrier. The Brush Electrical Engineering Co. Ltd., a member of THE BRUSH GROUP, is carrying out the electrification of Mecca. Power is being supplied for lighting and for industry—from a power station situated outside the walls of Mecca and fifteen sub-stations in the city itself.

BRUSH *through the Power Barrier*

Wherever *power* is exported—throughout the world—The Brush Group is helping to extend the frontiers of progress, bringing the plant and the experience that burst through the power barrier.

THE BRUSH GROUP

Manufacturers of diesel engines and electrical equipment for agricultural, traction, industrial and marine purposes.

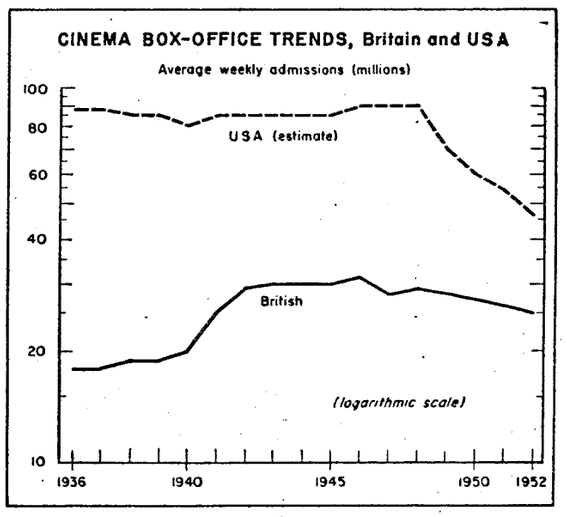
THE BUSINESS WORLD

What Future for Films? —I.

Vision at the Box-Office



THE cinema business needed no polarised spectacles on Coronation Day to visualise the huge potential audience that television can grasp in Britain once it shows something that people really want to see. That prospect, coupled with the box-office statistics for 1952 published a few days before, may indeed have been enough to drive the industry considerably faster towards third-dementia. Whether it has done that or not, it has perhaps reminded all sections of the British film industry rather sharply that the real problem confronting them, which quite overshadows their seasonal sparring around one another and the Government, is the size of the audience they can attract into British cinemas, now and in the future. This problem, incidentally, also concerns the Government—if only because Entertainments Duty seems near the point of diminishing returns.

A glance across the Atlantic offers no cheer: on the contrary, a horrid example. Records of cinema attendance in the United States are vaguer than the official statistics compiled here; but estimates show graphically how the cinema trade there has sagged under the body-blows of an aggressively expanding television industry. From an estimated 90 million admissions a week in 1948, attendance slumped by 22 per cent in 1949 and kept on downward; the latest estimate suggests that in four years it has been cut in half. American exhibitors, engaged in the international activity of asking for a remission of entertainments tax, said recently that the number of cinemas there has dwindled by a fifth since 1946; over 5,000, or more cinemas than exist in Britain, have been closed.

As yet, of course, it is far too early to assume that British cinemas need fear as large—or at any rate as steep—a decline. In some urban areas of the United States, nearly as many homes have television as have radio, thus approaching a degree of saturation in viewership. In the USA as a whole, however, only about 20 million homes have television, against about 45 million with radio (about three sets, incidentally, per home). In Britain, television licences number only about a fifth as many as radio licences. The high initial and replacement costs of a television receiver, and the lower level of consumer incomes in this country will delay any comparable approach to saturation, and thus delay its impact upon the cinema. Moreover, the BBC now puts out only five programme hours a day, against 12 hours (often with a choice of several stations) in America; nor does the average British television owner yet spend "fully one-third of his non-sleeping hours" in front of the set. But coverage here is sure to expand—the BBC guessed this week that 7 million sets might be in use in ten years time—and so, if sponsorship comes, will the variety and duration of television programmes and their light entertainment value. Cinema box-office statistics for Britain as yet give no hint of any such precipitate decline as in the United States. But they are not inconsistent with the possibility that a similar consequent decline, differing mainly in the steepness with which television takes its toll, may have begun.

Here, in the last four years, cinema admissions have declined by about 4 per cent per year, and this from an apparent level of stability after the wartime boom. These have been the first years in which television has become available over a widening area of the country; and it is probably significant that particularly large declines in cinema admissions have been recorded in London and the South-East, in the Midlands, the

North-West and Yorkshire, and last year in Scotland. This loss of patronage has not affected only the smaller cinemas that tend to show the older films; those seating over 1,250 people, along with the tiniest halls seating 250 or fewer, have suffered proportionately more. Sampling of the cinema's potential audiences, made yearly in the Hulton Readership Survey, throws up the pattern of the decline. In 1947, some 44 per cent of men and women over 16 were regular cinema-goers, attending "once a week or more"; in 1952, only 35 per cent were, though the proportion who went twice a week or more often, the trade's best customers, had been stable since 1950 at about 14-15 per cent

(against 19 per cent in 1947). Last year 22 per cent of adults, as against 13 per cent in 1947, said they never went to the cinema at all. The hard core of patronage, though shrunken, may thus still be faithful; but the occasional patrons have become increasingly fickle.

Television, almost certainly, is not the only reason for this. Alternative explanations, indeed, are profuse in Wardour Street. Other things upon which people can spend their spare money have gradually returned after postwar shortages . . . in the last year or two, people have had less to spend . . . the British public is getting older, while the cinema tends to draw its core of regular patrons mainly from the 16-34 age group . . . films are not as good since Hollywood as well as British producers have been watching pennies . . . with postwar stars and growing public sophistication, the star system is becoming a less effective assurance of box-office stability . . . and so on. Most important of all, the argument runs, patrons are now being priced out of the cinema: the average price paid for admission, which varied between 1s. 5d. and 1s. 6d. from 1945 to 1949, has risen since to about 1s. 8d., and this last twopence-ha'penny has turned people away from the cinema.

Most of these explanations—and particularly the last—probably contain some truth. No clear assessment of the importance of price could be made without details of the numbers of seats sold in every range of price; and these are not published. Patrons can usually take a cheaper seat, though not necessarily at the peak evening performances of the week when cinemas do most of their business. Even so, the rise in the average price paid, which has been sufficient financially to offset the loss of patrons, suggests that some have thus been deterred. But in recent years, it is perhaps fair to say, exhibitors as well as producers may have felt better able to improve their income by putting pressure on the government than by offering patrons more for their money. There is not much evidence that in the last few years many exhibitors have been increasing the number of seats at lower prices in their cinemas to avoid losing patronage. The patterns of price at which a cinema could break even, of course, may not allow much room for manœuvre; and cinemas that vary their prices often may become unpopular. The argument about people being priced out of the cinema should not be over-played, though substantial cuts in seat prices would probably bring back some of the lost patrons.

Moreover, cinema admissions today are still about 56 per cent higher than in 1939, when exhibitors at least seemed to make a comfortable living. The seating capacity of cinemas has probably not altered much; at the end of last year 4,575 cinemas were operating with about 4,209,000 seats, compared with about 4,800 cinemas in 1939 with probably rather more seats than today. Before the war, in fact, cinemas were worth operating when every seat was taken only about once in perhaps five performances; today, the exhibitors manage to fill each seat during one performance in three, and complain that they cannot cover costs from admissions alone. But in 1939 entertainments duty took only 11 per cent of gross takings; last year, out of takings two and a-half times as large, duty took 34.7 per cent and a further 2½ per cent went into a special fund for poor British film producers. Net takings—the amount accruing through normal commercial channels to the trade—had thus grown by only 90 per cent during 13 years in which the amount paid by the public grew by 150 per cent; the average price paid at the box-office for each seat had risen from 10d. to 1s. 8d., but the net price had risen only from 9d. to 1s. 1d. It is perhaps understandable, therefore, that the box-office problem should present itself to the various sections of industry primarily as a problem of their share in the cake of box-office takings. Nevertheless, in the long run, the size of the cake is what really matters, and that depends primarily upon the number of people who go to the cinema.

If television is mainly responsible, and sponsored television arrives, even cuts in seat prices may not make much difference to the slide in cinema admissions. To the cinema patron who has once made the initial outlay on a television set, sponsored programmes would offer a large volume of broadly comparable visual entertainment, seemingly free. So far, the British film industry has seemed too pre-occupied with politics to face this threat squarely. It brandishes certain arguments about

large-screen television; a few cinemas are equipped for this, and some groups have applied for television licences that would enable them to broadcast at least some news programmes. But these arguments often sound largely rhetorical; the industry has generally used them in arguing with the BBC about the television of films or the sharing of news events between television and newsreels, and it seemed to be taken off guard some weeks ago when the Television Advisory Committee asked it just what its intentions were regarding transmission by television. Rightly or wrongly, most people in the business think of this as no more than a counter to use in bargaining with state-owned or commercial television. Film distribution through today's celluloid channels is not cheap, but any notion of distribution of films in general over television channels—at least to cinemas—still appears impracticable or so costly as to be out of the question.

How well is the film business placed to defend itself? It needs ideas, more than money. It has borrowed one—the three-dimensional film, a showman's "gimmick" that Hollywood has exalted into a talisman. But "Three-D"—and probably any other idea shaped so as to impress the film business—will mean spending a good deal of money in the hope of earning more, or perhaps, in the long run, of just losing less. And the financial resources of the British film business, as of the American's, are today somewhat strained. Some indications of the capital and running charges that this technical transition now impending in the cinema may imply will be given in a second article. But the questions remain whether in the present state of profitability of the film business this extra money can be found, whether it is worth ploughing in, and whether what it buys will serve as an effective defence against television.

Organising the Railways

A CERTAIN diffidence is evident in the report of the British Transport Commission when it turns from the five years of its past history to contemplate the future. It is clear enough from the report that the Commission in 1952 was in sympathy neither with the manner nor with much of the matter of the Government's proposals for inland transport. The Commission remains rootedly opposed to the breaking up of its road haulage undertaking, and it declares that the gains in efficiency that were becoming apparent after four years spent in acquiring 3,774 undertakings and 42,000 vehicles were gravely disturbed by the Government's proposals, now enacted, to dispose of the road haulage undertaking "as quickly as is reasonably practicable." The conceptions of integrated public transport on which the 1947 Transport Act was based have been discarded before they had been tested beyond doubt, but after they had ceased to hold out conspicuous hopes of success. What lies ahead is full of uncertainty. Neither history nor public opinion (so far as it is informed on transport matters) suggest that radical competition between publicly owned railways and privately owned road haulage would endure for very long. What the Government have provided in the new Act is a framework in which the railways may be more competitive than they were before nationalisation or have been since, leaving road haulage as free as ever to fix its rates and as protected as before against new road competition.

Whatever may be said about the disposal of road haulage, there is a wide measure of agreement that greater commercial freedom for the railways is desirable, and that a considerable reorganisation of the railways is necessary. The new Transport Act imposes on the Transport Commission the duty of preparing a scheme of reorganisation of the railways within a year from May 6th, or longer, if the Minister of Transport agrees. The intention is to decentralise the management, but the terms of reference within which the Commission has to work are distinctly vague. It must get rid of the Railway Executive if that has not already been done; but it leaves the choice of areas, the kind of management authorities that will be responsible for them, and the division of powers between them and the Commission (save that the latter will be responsible for general financial control and general control of charges) all to be worked out. After the scheme has been drafted, the Minister will consider it, consult such railway users as he thinks fit, approve the scheme or amend it or throw it back to the Commission for revision. When all this has been done, the scheme will require an affirmative resolution of both Houses of Parliament before it becomes effective.

Whether the Commission is in sympathy with all the objects of such a scheme is difficult to guess; it is known that in 1951 the Commission recommended the disbanding of the Railway Executive, but this proposal seems to have been intended to get rid of the clash of two organs of central control—both appointed by the Minister, but one formally the servant of the other—rather than to promote decentralisation. It is, indeed, never easy for the controlling centre of a vast business to relinquish power to its subordinates. In a commercial concern, the plain evidence of loss or inadequate profit may lead to the loosening of ties that are strangling efficiency; but in the case of a nationalised industry, which is told to take "one year with another" and which is accountable to a Minister, the impediments to effective devolution of power are bound to be large. But there are other complications. Four of the five full-time members of the Commission, including the

chairman and deputy chairman, terminate their appointments at the end of August. The majority of the members of the Railway Executive hold appointments that were extended for a year from October, 1952, and thus come to an end in September. Some members of both bodies are likely to retire ; others await re-appointment, if the Minister should so decide. But it is by no means certain who the Minister may be by the time that decisions have to be taken ; there might be a government re-shuffle in which Mr Lennox Boyd would gain the reward for his skill in steering the Transport Bill by a translation to higher responsibilities.

Thus the Commission and the Minister are charged with important decisions about the future organisation of the railways at a time when for each the future is uncertain. So far as government policy on the railways has emerged—and little enough has been disclosed—it has been the thinking aloud of Mr Lennox Boyd ; and there is no evidence that he has been anxious to point the way that the Commission should take in drafting the scheme. He may know what he wants, but again he may not be responsible, when the time comes, for examining the new Commission's scheme. That is the justification for considering, once again in these columns, some of the basic principles that ought to find their place in the scheme.

★

Since the railways were nationalised in 1947, two divergent concepts have confused the question of how best to organise them. The first was an excessive degree of centralised technical control exercised through the functional system of direction in the Railway Executive—a system that despite a real degree of modification still survives in large measure. The second was the assertion of central control by the Commission over its Executives—the concentration of power at the top of a pyramid rather than the guiding force of a central sun over its satellites. What could be said in favour of a concentration of power in the hands of the Commission when it was charged with the task of providing an integrated system of public transport will obviously need much modification when its duties are reduced largely to providing railway services for Great Britain and to running London transport. The scheme for which it has to provide is on the scale of the Railway Executive, not on the scale of the Commission as it has been known.

There emerges from these considerations the need for a middle course, steering a line of administrative common sense between the extremes that have been pursued by both the Commission and the Railway Executive in the past. Moreover, it is important that another mistake made in 1947 should not be repeated—namely, the setting up of a form of organisation that was impossible to adapt to changing circumstances and the lessons of experience without a new Act of Parliament. It is essential that an experiment in decentralisation, if it is to have any hope of success, must be capable of evolution and adaptation. The first need in an effective scheme of decentralisation is a paradoxical one—it is to allow once more for general management to take effective control in railway policy. General management has been exerted only by the chairman of the Railway Executive himself, sitting *primus inter pares* with the several functional officers who were entitled—or at least inclined—to claim that their decisions on their own special subjects should be treated as final by their colleagues. The converse of this tight system of centralised technical control should, on the face of it, be a return to the general management of the separate railway systems coupled with the effective general management of them all, under a new Commission. Thus the first task in any satisfactory scheme for decentralisation is to devise workable units of general management ; in some respects these would have to be different from the existing geographical "regions," some of which are too big for efficient management. Over each of them would need to be placed a general manager with effective power, not a mere Chief Regional Officer with undermined authority.

It does not follow that these new "systems" need behave in all respects like the old railway companies did. Valuable economies have been obtained from standardisation imposed from the top by the functional Executive ; there may be costs on the other side in the longer run through lack of competitive technical advance, but the better working of locomotives and wagons and economies in maintenance through the standardisation of various technical factors cannot be gainsaid. It is difficult to conceive of fully autonomous railway systems akin to the former railway companies when such an evident degree of economy can be obtained from common technical standards ; the opportunities for such standardisation have not yet been exhausted.

But they can be secured by a common management of all railway systems ; they do not require the exercise of functional direction from the very top of the railways' organisation. Nor is it necessary to make the new railway units financially autonomous, with their comparative efficiencies judged by the appearance of their revenue accounts. There would be many arbitrary and even spurious factors in such a comparison ; the real tests of comparative efficiency would have to be sought in other directions—notably, operating performance and commercial enterprise. The true conception of the task of general management is to run railway systems as businesses, competing vigorously in every area for passengers and freight, and concentrating on the task of finding customers and satisfying their needs. Obviously, the changes in the organisation of the railways which have been under discussion for the past two years have had a severe reaction on their commercial activity. No time must be lost in reversing this dangerous trend.

The middle view would see another danger—that of a radical and excessive degree of decentralisation. It is one thing to argue that power should be pushed out from the centre and made more effective throughout the railway systems. But in the reaction against excessive concentration of power, it is sometimes suggested that commercial and operating functions can be devolved over different areas and in units of different size to be determined by empirical considerations of the volume of railway transport required in different localities. But if the boundaries and forms of organisation of the different departments differ widely themselves, it will follow that only a strong central authority will be capable of co-ordinating them. To constitute small, technical authorities—for engineering or operating or commercial purposes—in areas that bear no resemblance to railway systems of reasonably manageable size is bound to lead to a continuation, and perhaps an intensification, of centralised control under a new guise. It is important to get the new systems right in size for the efficient exercise of general management ; when that is done, the distribution of technical functions within each system and their co-ordination between the different systems can be controlled by recognisable chains of authority from the headquarters to the several systems and—more important for the efficient day-to-day working of the railways—within each system itself. Decentralisation should mean the handing down of effective managerial power to manageable units ; it should not mean the fragmentation of the different phases of railway operation into *ad hoc* local units which could only be brought together under yet another form of strongly centralised control.

Business Notes

Shakeout in Gilt-edged

THE shakeout that began in the gilt-edged market just under a fortnight ago became more sharply pronounced towards the end of last week, and since then prices have sagged further. Except on Friday, when the declines ranged up to ⅛, the losses on any one day have been small, with the result that the extent of the adjustment over the whole period has not, perhaps, been generally recognised. Between June 10th, when most stocks reached their best levels, and Wednesday last 3½ per Cent War Loan has lost 1⅜ and 2½ per cent Consols 1⅝, while losses in the dated stocks have ranged from ½ for the 1956-61 stock to 1⅜ for Savings Bonds, 1965-75, and roughly a full point for the long Transport and Gas stocks. This not inconsiderable movement has added fully ⅛ per cent to the redemption yields of long-dated stocks—Transport, 1978-88, now yields 4⅛ per cent, and Gas, 1990-95, 4 per cent to the latest date—and slightly more than that to the flat yield from 2½ per cent Consols (which offers just over 4⅛ per cent, at 60⅞).

Obviously, the authorities prove to have seized the last possible moment for the advantageous launching of their £100 million issue of Exchequer Stock, 1960. And, despite the softening of the market at and immediately after its announcement, the issue is generally believed to have secured a somewhat better support from the public—necessarily, almost wholly the institutional public—than did the first tranche offered last March. This belief was reinforced by the terms of the allotment : applicants for £5 million or less secured a full allotment, and larger applicants received 75 per cent, whereas last March the full allotment was confined to £1 million or less, but the proportion for bigger applicants was 80 per cent. The "departments" have obviously taken a large slice ; but that was, equally obviously, what they expected and intended to do. In these circumstances the new stock has held its own in the market—at a token premium of ⅛ or ⅛. Lesser borrowers have, perforce, been less fortunate. The two small issues for South Africa—Cape Town and Durban—have both had to be carried to a substantial extent by the underwriters, and both are quoted at perceptible discounts.

This new mood in the gilt-edged market reflects caution in the face of uncertainty rather than any general conviction that the best has been seen. The dominant influences have quite plainly been the antics of President Syngman Rhee and the troubles in East Berlin ; these disturbances, and the resultant uncertainties, have cut off (though perhaps only temporarily) the principal source of the market's recent strength. This was the belief that a cooling of the war would reinforce the disinflationary tendencies still visible in many world markets and apprehended in the United States.

More Credit for Industry

BANK finance for private trade and industry rose faster in March, April and May than in any quarterly period since the introduction of the new monetary policy in November, 1951. That is the most striking aspect of the latest quarterly classification of bank advances in Great Britain, which confirms the impression of mounting industrial borrowing already held by analysts of the monthly clearing bank returns. Total bank advances in the three months to May actually fell by £3.7 million, but—as the latter half of the period saw substantial repayments of bank overdrafts by the British Electricity Authority from the proceeds of its April loan—this small drop in the

aggregate was more than accounted for by a fall in advances to public utilities by £41.3 million. And as the net borrowings of the "personal and professional" category continued to fall (though by only £2 million, their smallest quarterly decline since the closer scrutiny began in November, 1951), advances to "the rest"—which, very broadly, consists of the private business sector—rose by £39.5 million to a total of £1,397 million. This is still fully £91 million below the level of a year ago, but it is £56 million up on last November's figure.

Especially when viewed in contrast with experience at this time last year—when the decline in loans to public utilities and personal borrowers was accompanied by some contraction of bank finance to private trade and industry—these figures leave no doubt about the marked change that has occurred in the trend of bank advances. In the equivalent returns for May, 1952, eleven of the twenty-five items into which advances are classified showed increases, while fourteen showed decreases; this year there were sixteen increases and only nine decreases—and only one category, engineering, records any substantial decline. As this particular fall followed a steady expansion of bank finance to the engineering industry in previous quarters, the group's total is still above last year's. The wool group's advances have increased by almost a quarter since February, and they have now passed last year's figure; the shipbuilding and non-ferrous metals industries both increased their bank loans by almost 20 per cent during the quarter—the former's advances now stand at £16.6 million, more than 60 per cent above last year's figure. The iron and steel group's advances rose again, but by less than in previous quarters. Loans to the cotton industry rose for the first time for over a year, but at £15.5 million they are still well below last year's figure. The food, drink and tobacco and the retail trade group's advances rose substantially in the quarter, in both cases reversing the previous quarter's experience, but both still stand below their level of May, 1952. The demand for bank credit has clearly now spread well beyond the so-called priority categories that were formerly the principal new borrowers; but this may be due as much to the need to replenish stocks (in some instances at higher prices) as to an easing in the standards of bank lending.

EPU Extended

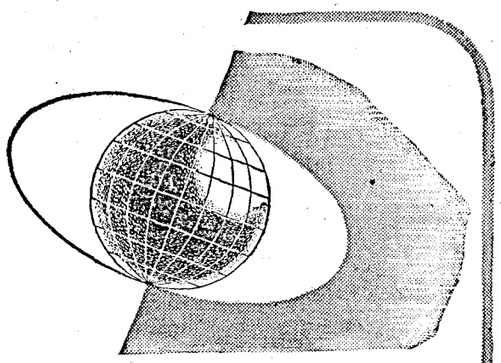
FORMAL provisions for the extension of the European Payments Union for one year from the end of this month have recently been approved by the Council of the Organisation for European Economic Co-operation. The extension agreement, contrary to some earlier expectations, makes few changes in the arrangements that have operated in the past year. In particular, there is no alteration in the scales that determine the rate at which gold and dollar payments are made by debtors. The considerable debate that has taken place on the question of "hardening" EPU by increasing the ratio of gold payments to drafts on credit in the settlement of deficits has been lost by the hard currency school, led by Belgium. This school has, however, gained a more limited victory in the agreement to increase interest rates applying to both creditors and debtors. The interest rate paid to creditors is to go up from 2¼ to 2¾ per cent. The rates charged to debtors will remain at 2½ per cent for positions outstanding up to twelve months, but for longer-term overdrafts the charge will rise from 2¾ to 3 per cent for periods of twelve to twenty-four months and from 3 to 3¼ per cent for periods over 24 months. The Council has also decided that the interest rate on loans granted by creditors in excess of their quota should continue to be ¼ per cent higher than that for loans granted within the quotas, and will therefore be increased from 2½ to 3 per cent. These increases in interest rates are explained and justified as a reflection of the rise in current market rates and as making some allowance for their future trend; but they are only a pale shadow of the movement that has occurred in open market rates.

The other important change in the renewal arrangements has been to adopt rules that will apply to those extreme creditor countries whose quotas have been exceeded. Extensions of quotas have been agreed upon for Belgium, Germany, the Netherlands, Portugal and Switzerland. Within the limits of the extensions decided upon for each of these countries, surpluses in excess of their normal quotas will be settled as to one half in gold and the other half in credit granted by that country to the Union. The Council has also decided that Austria's debtor quota will cease to be frozen as from July 1 next. Austria will be able from that date to use its credit facilities in EPU, but will at the same time assume the obligation to make corresponding payments in gold. Hitherto, Austria has been one of the EPU "wards" whose deficits have been met by the US Government.

Franco-German Contrasts

WHILE Austria has ceased to be an EPU "ward," France has in each of the last two months qualified for that doubtful privilege. The detailed statement of EPU operations for May reveals that in that month France incurred a further deficit of $37,400,000. The whole of this deficit was met by the US Government out of special resources and has not gone to swell France's cumulative accounting deficit with EPU. For this purpose the French Government used amounts due from the United States in respect of MSA grants, just as in the previous month the deficit was discharged by an anticipation of military aid from the United States to France in respect of operations in Indo-China. France is indeed living from hand to mouth.

While France dominated the debtor side of the EPU account last month, Germany was equally dominant on the creditor side. With a surplus of $39,900,000, of which half was paid in gold and half in credit, Germany has now achieved a cumulative net position that is $13,300,000 in excess of its quota of $500 million. This German credit with EPU is only one facet of the creditor position that Germany had acquired vis-à-vis the greater part of the world. The D-mark gap is, in fact, now second only to the dollar gap. Its growth is beginning to cause serious concern to the German authorities, who are fearful of the domestic inflationary effect of the substantial surpluses on the balance of payments. Further steps have therefore been taken by Germany to liberalise imports, a move that may help to



"Hullo Susan! I don't suppose you've seen me before! I'm one of the chemical family by the name of Hydrosulphite. No, no, not doll-fight . . . look, you'd better call me by my trade name, *Formosul*. What am I? Well, I'm the chemical that's put in the Paste that makes it possible to print the Spots that cover the Frock that YOU wear. There's a *tremendous* lot of me made these days . . . and mostly by a firm called Brotherton. They make enough of me every hour to print simply thousands of frocks. More than all the other Chemical companies in this country put together. Why, Brotherton's are one of the biggest manufacturers of certain chemicals in the whole world!"

A BIG NAME IN THE CHEMICAL WORLD

Brotherton

One of the world's largest manufacturers of hydrosulphites, liquid sulphur dioxide and hexamine. Makers of an extensive range of Metachrome dyes for dyeing wool in all its forms.

Brotherton & Co. Ltd., City Chambers, Leeds, 1. Also at Manchester, Glasgow, Wakefield, Birmingham and Birkenhead.

Plans for **DEVELOPMENT**

Business men who have plans for development in overseas and colonial territories which call for medium or long term finance should write for our new booklet. It explains what the Corporation can do for you and gives details of the countries in which we operate. Please write to the Manager at the address given below.

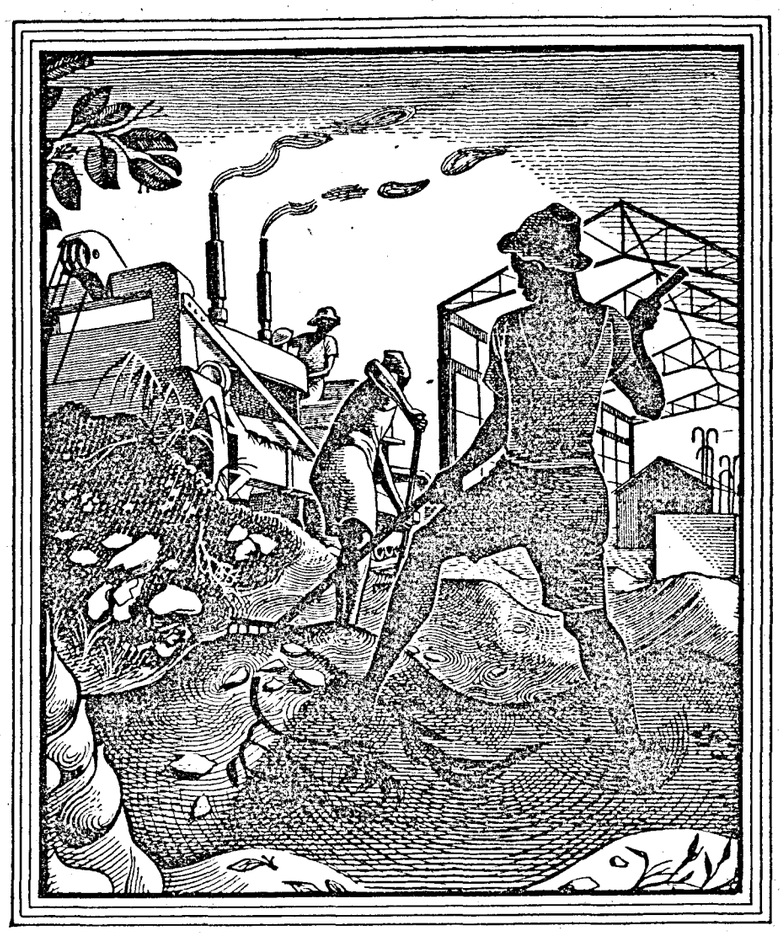
BARCLAYS OVERSEAS DEVELOPMENT CORPORATION LIMITED

54, Lombard Street, London, E.C.3

WORKERS IN THE TEAM
Number 2 in a series

At eighteen, Robert Halsey has his foot on the bottom rung of the ladder and likes the feel of it. He is half way through his apprenticeship.

He sees all sides of construction work on the site and learns how everyone, himself included, fits into a team. His foreman and the others, are as pleased as he is when he does well. Head Office too takes a practical interest, so there is really a great organisation behind Bob's training.



One day and an evening every week he works for the next examination in bricklaying, and after that he intends to tackle costing and measurement.

In the future he wants responsibility. There is plenty of that, for all who are fit, in the very big team to which Bob belongs. He would like to move around, to take a job overseas, but, he says, it must be a job with the firm. No reason why not. Bob is on a road that can lead far and high.

LAING

John Laing and Son Limited
Building and Civil Engineering Contractors

Established in 1848

There's a future in STEEL

FIVE YEARS AGO, to meet the future needs of the steel industry's first post-war development plan, B.I.S.C. (Ore) Limited, the buying organisation for the steel firms, sent their mining engineers to French West Africa. Along with their French colleagues they proved the existence of vast deposits of worthwhile iron ore near Conakry.

Since then a huge new mine has come into operation; it is potentially capable of producing many millions of tons of this vital mineral each year and already shipments from it have reached Britain.

To bring this enterprise to fruition has meant clearing hundreds of acres of bush, laying miles of roads and rail tracks, installing a hydro-electric power plant and creating a complete modern town. In addition a new deep water wharf has been built at the port of Conakry with a modern loading installation which has a capacity of 1,500 tons *per hour*.

This is only one of the ways steel firms are providing the raw materials to meet the future needs of modern industry, science and engineering.

'What about my future?' says JACK SCRAP

The steel industry still needs all the scrap which engineering firms and other steel-users can send back. Search out every ton of scrap on your premises. Your local scrap merchant will help with dismantling and collection.

● Issued by the BRITISH IRON AND STEEL FEDERATION, Steel House, Tothill Street, London, S.W.1

limit the German surpluses in the near future. The effect of the resumption of external debt repayments should also make itself felt, but it should be noted that the first full year's repayment, amounting to DM. 470 million is equivalent to no more than about three months of Germany's surplus with EPU alone, at its current rate.

No Change of Speed

THE Minister of Transport's statement in the House of Commons on Monday about the future of the heavy vehicle limit is a sharp disappointment to most of those who felt that the arguments in favour of raising it had been proved beyond all possible doubt. There is no longer any technical reason why the speed of heavy vehicles should be artificially held down to a level as low as 20 miles an hour, and few lorries on the roads ever appear to be travelling as slowly as this. Yet the schedules on which the lorries operate have to be drawn up on the assumption that the vehicle is driven within the legal limit, which probably means an average speed of 16 miles an hour. The lighter vehicles, from 3 tons unladen weight downwards, are not so severely restricted; in their case the speed limit is 30 mph and their average speed is probably about 22 mph. This suggests that if the limit for heavy lorries was also raised to the more realistic figure of 30 mph, they could be expected to cover, on the basis of an 8-hour day, nearly 50 miles a day more than they are at present permitted to do. For long-distance drivers, who may drive up to eleven hours in twenty-four, the extra 70 miles could mean the difference between a round trip and an enforced over-night stop.

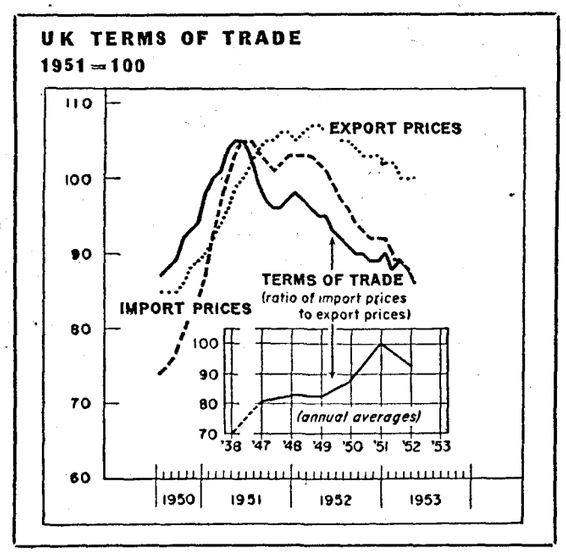
The waste involved in under-employing men and equipment in this way has been widely recognised, and there were grounds for expecting that the government might at last have been prepared to make a move in the matter. The way in which the Minister phrased his refusal on Monday suggested that the government has accepted in principle the need for a change but will make no move until "there is agreement in the industry as to the changes in existing arrangements which might follow." The attitude of the unions appears to be the deciding factor in reaching an agreement. The drivers are aware that a tightening up of schedules would lead to a reduction in road haulage costs, and many of them clearly feel that this entitles them to some increase in wages. About half the heavy lorries on the roads today are "C" licence vehicles whose owners are probably quite prepared, individually, to meet their drivers' claims. The position is less clear in the case of those lorries that form part of a road haulage business. A big company transporting goods by road for its own convenience is likely to have a different attitude to small savings in transport costs from a company that makes a living out of road haulage alone. So long as it is uncertain about the attitude of the lorry owners on this point, the union is unlikely to commit itself to accepting an increase in the speed limit. That the government should feel compelled to allow the need for agreement in all sections of the industry to govern its own regulation of road traffic, however, is less easy to accept.

Opening the Matchbox

IT is easier to accept the view of the Monopoly Commission that the present organisation of the match industry in Britain "operates, and is likely to operate, against the public interest" than to decide how to safeguard the public interest in getting good and cheap matches. The President of the Board of Trade, who last week told the Commons that he accepted the conclusion of the Monopoly Commission, though doubting the efficacy of the price control system suggested in its majority recommendation, was forthright but not forthcoming about his own remedy:

> I propose to explore without delay the possibility of removing some of the obstacles to competition in the match industry. Some of the steps I am contemplating call for consultation with the British Match Corporation and I am already in touch with them.

Mr Thorneycroft is not to be envied this task of exploration.



A majority of the Commission decided that any radical modification of the elaborate "trading agreements" by which companies associated with the British Match Company share British and overseas markets with the Swedish Match Combine might have such repercussions that on balance it would not be justified. Two of its members disagreed. Whatever the virtues of the monopoly purchasing agency—or simply importing agency—that these members proposed, their feeling that the risk of ending the quota arrangements ought to be taken may seem more in accord with the feeling in all parties that led to the setting up of the Monopoly Commission. But the match report did not perhaps completely explain the BMC group's position here. The group argued to the Commission that if forced to compete with Swedish Match, it would be unlikely to "stand in any stronger position today than it did in 1927." Inside Britain, this attitude may sound too timorous. The group is now well-established, and though it depends for machinery largely on manufacturers controlled by Swedish Match, it could no doubt, if separated from these, obtain equipment from the independent machinery manufacturers of whom it supplied a list to the Commission. The group's wish for the protection afforded by the quota agreements in Britain, therefore, may under-estimate its own strength. But abroad, clearly, it is more vulnerable.

Direct exports of matches by the BMC group, in 1949, amounted to only £225,000 out of a total turnover of nearly £5 million. But the average of £330,000 in dividends declared on holdings in overseas subsidiary and associated companies during the years 1945-49 is much more significant beside the BMC subsidiaries' profits, which in 1949, according to the Commission, would have amounted to about £900,000 from home and direct export sales or BMC's own published income as a holding company, which was £602,257 in the year ended March 31, 1949. Abolition of the quota arrangements held to operate against the public interest in Britain might well expose the group to severe competition in its trading in the world market, which contributes perhaps more than a third of its total profits; and BMC would be much less strongly entrenched to combat Swedish Match overseas than at home. It is easy to see, therefore, that the prospect of competition with its Swedish partner (and part-owner) may well alarm the group. Mr Thorneycroft, however, considers it "most desirable that there should be a measure of competition in the industry." How much is a measure?

More Imports at Lower Prices

DETAILED trade figures published by the Board of Trade show that a major factor in the slight increase in imports of £3 million in May, compared with April, was an increase of £7 million in imports of food and drink. These rose to £116 million, the increase being mainly spent on grains, flour, meat and fresh vegetables; but this rise in the food import bill was offset by a fall in imports of tobacco from the exceptional figure of £11 million for April to the more normal amount of £5 million in May. The two other main categories of imports, raw materials and mainly unmanufactured goods (at £115 million) and manufactured goods (at £58 million) were practically unchanged on the month. Total imports for the month amounted to £296 million.

Total exports in May, valued at £219 million, were nearly £5 million less than in April. Among goods of United Kingdom origin, there was an increase in exports of food, drink and tobacco by about £300,000 to £11.7 million and of raw materials by £600,000 to £10.9 million. But exports of manufactured goods fell by £3.4 million to £182.8 million, with vehicles at £40.1 million (down by £770,000). The number of cars shipped abroad, it should be noted, continues to rise; nearly 31,000 were sent out in May—according to the motor industry—compared with 26,000 in April, but this may prove to be the industry's seasonal peak. Machinery exports at £34 million, were

down by £2.3 million, while cotton goods exports at £10.9 million and woollen and worsted at £11 million were each lower by over £300,000. The reduction of £1.7 million in re-exports during May, to £7.2 million, was due mainly to a falling off in the re-export of raw and waste wool and rubber. The decline in total exports in May was nearly all in exports to the non-sterling area. The increase in imports was also nearly all from non-sterling area countries; total imports from the sterling area decreased.

The increase in imports by volume in May was again proportionately greater than is shown by the increase in value, because prices continue to fall. The Board of Trade price index number for imported food in May (1952 = 100) was 98, the same as in April, but the index for raw materials was down two points at 82 and the index for manufactured goods down four points at 85; the index for all imports was 88 in May, a fall of two points on the month. Export price indices are unchanged for textiles and other manufactures (91 and 93 respectively), and down by only one point for engineering products at 100, resulting in an unchanged index of 97 for all exports. The fall in import prices and the steadiness of export prices during May produced a further welcome improvement in the terms of trade; the index fell by two points to 91, continuing a gradual trend that has now lasted nearly two years.

Bulk Buying in the Cotton Slump

ANY monopoly buying agency that is directed to secure full supplies of a commodity at all times is inherently vulnerable to fluctuations in trade, and the Raw Cotton Commission provides a sorry but instructive example of this in its fifth annual report. During the 13 months ended August 31, 1952, the Commission incurred a loss of £22 million on its trading, in contrast with the trading profit of £2.6 million that it made in the previous year. During those 13 months the Governments of Pakistan, Brazil, and Egypt had to come to the rescue of their raw cotton industries, while the weekly consumption of raw cotton and the spindle activity in Lancashire dropped at one time to half the 1951 level. Moreover, during the period of disorders in Egypt the Commission decided that "it was more important to forestall any danger of a serious shortage of long staple cotton for Lancashire's fine spinning mills than to avoid the financial risk of carrying heavy stocks." Accordingly, it bought about 60 per cent of the 1952 Sudan crop. The shortage feared did not develop; heavy stocks of long staple cotton were accumulated, and had to be sold at prices substantially cheaper than those at which they had been bought.

The fall in price levels during the year was in some cases very severe. Egyptian top grade Karnak and Sudan high grade both fell from a high of about 123d. a lb to 70.8d., and even the steadier American middling 1" fell from around 48d. to 39d. In view of the losses that the Commission incurred upon its "political" purchases of Sudan cotton and upon its stocks of Egyptian cotton, it is perhaps not surprising that in the subsequent period spinners opted to buy privately 64 per cent of their American cotton but only 15 per cent of their Egyptian cotton.

The Commission's trading losses, together with the necessity to provide for losses on its large open position, brought about the operating deficit of £22 million. To this it had to add a loss of £1.9 million under the price cover scheme for spinners; after paying £2.2 million in interest on advances from the Ministry of Materials, its deficit was increased to £27.8 million. After sundry adjustments, including the setting off of £3 million no longer required to meet tax, the Commission had to transfer £25 million from the reserves accumulated in earlier years. The Act creating the commission laid down that it should trade on the basis of setting bad years against good; in the good years the Commission had built up a reserve of £35 million. The

1951-52 loss, however, brought this down to £9.8 million; in view of the further fall in cotton prices since last August the remaining surplus and reserves of £11.3 million will presumably have been run down much further.

Aluminium Returns to Private Trade

AFTER 13 years the responsibility for importing aluminium into this country is to be transferred back from public to private trading on July 1st—a month before copper too reverts to private trade. The supply of aluminium to Britain has been largely determined by the arrangement made between the British Government and the Aluminium Company of Canada, which in recent years has been supplying about 80 per cent of Britain's aluminium imports. Under agreements made in 1950 and 1951 between the company and the Government, substantial supplies were secured for this country by firm contracts until the end of 1955 and by yearly options to the Government thereafter. Sir Arthur Salter, Minister of Materials, has stated in the House of Commons that "the substantial benefit to this country of these arrangements will be retained under private trading." In 1952 Britain's imports of aluminium amounted to 4.7 million cwt valued at £36.4 million, of which 4.6 million cwt valued at £35.8 million came from Canada; the other main sources of supply were Norway and France. Imports for the first five months of this year amounted to 1,096,000 cwt of which Canada supplied 1,070,000 cwt valued at £8.6 million.

In obtaining release from its contract with the Canadian company, the Government has made arrangements which it apparently considers satisfactory. After July 1st, private traders will, subject to import licence, make their own arrangements for importing aluminium, but the Government, until its contracts expire at the end of 1955, will take up from the Aluminium Company of Canada as much of the contract quantities as is not bought by private importers. For five years after 1955 the Government will buy from the company up to 20,000 tons a year of unsold metal within the option; moreover, to assist the company to finance and supply this country with aluminium, during the period covered by the original contracts, the Ministry of Materials is transferring to Alcan trading stocks of the metal valued at about £5 million, for which, subject to payment of interest, the company need not pay until the end of 1955. On the other hand, the Government has secured from the Canadian company a reduction in the contract price of ¾ cents a lb, about £6 a ton, as from July 1st, so that the Ministry could reduce its present selling price in this country of £161 to £155, and has secured from the company an undertaking not to charge British importers more than the Ministry would have charged, which means that the price can be increased only if costs rise.

Premium Petrol and Fuel Tax

ONE not generally expected consequence of the higher level of taxation on motor spirit in this country has been to make the new premium grades of fuel a considerably better proposition for the motorist than if the tax were lower. Whatever the increased mileage per gallon a motorist can obtain from the new fuels, it obviously looks better value for 3d. extra on petrol costing already 4s. 2d. a gallon than it would if the tax—and hence the total price—were less. Indeed, according to Mr A. L. King, of Shell-Mex and B.P., speaking to the Institute of Petroleum this week

> had the tax been 9d. per gallon or even 1s. 6d. per gallon, the cost-per-mile factor could not, in most cases, have been shown actually to be in favour of the premier grades, and the primary reasons for the purchase of the better products would have been superior performance, smoother acceleration, easier starting and such features.

With fuel tax at 2s. 6d. a gallon, the question of mileage has been the key factor for the car driver—and even more so for the commercial consumer, who watches the economics of vehicle operation more closely. So far this year, the purchases of premium grades of petrol have steadily exceeded the percentage that they bore to total sales of motor spirit in prewar years, particularly the sales to commercial consumers (even when only direct commercial sales are measured).

DELIVERIES OF PREMIUM GRADE MOTOR SPIRIT

	1938	1952		
		Feb.	March	April
Dealers	%	%	%	%
Premium grades	52·0	55·4	57·8	60·6
Second grades	48·0	44·6	42·2	39·4
Total deliveries to dealers	100·0	100·0	100·0	100·0
Commercial consumers*				
Premium grades	7·0	13·3	13·0	13·6
Second grades	93·0	86·7	87·0	86·4
Total deliveries to commercial consumers	100·0	100·0	100·0	100·0

* Direct sales only, ignoring dealers' sales to commercial vehicles.

Mr King was not, naturally, putting this point forward as a justification of motor spirit taxation at its present

Binding Cases

Binding cases for THE ECONOMIST *can now be supplied. These cases, made by Messrs.* EASIBIND LTD., *are in stiff, dark blue cloth covers, and are gilt-lettered on the spine; they provide an extremely effective and firm binding and will hold 13 issues with the quarterly Index. The year can be stamped on the spine. The cost per case, post free throughout the world, is* 11/-.

Orders, stating requirements clearly and enclosing a remittance, should be sent, **not** *to* THE ECONOMIST, *but to—*

EASIBIND Ltd.

(Dept. E), 84 Newman St., London, W.1

A binding case can be sent on approval if required.

level, but as an anomaly arising from it. His paper, examining the effects of taxation upon demand for petroleum products in this country, included calculations of the way in which existing trends of petroleum consumption have from time to time been sharply modified by alterations in taxation here and in other countries, and touched upon the distorting effects that taxation of motor fuels has had upon tractor engine design in this country and upon the use of light hydrocarbon oils in industry. He instanced also a second recent example of the effects of the present rate of tax upon motor transport operation. Since roughly seven miles per gallon can be obtained from a diesel-engined road vehicle for four per gallon from a petrol engine, taxation has accelerated the switch towards diesels in large commercial vehicles—and more recently in the smaller types too. This lower fuel consumption has to be set against higher initial costs ; but the increase of taxation upon both "derv fuel" and motor spirit has greatly widened the range over which diesel operation becomes economic.

Export Premiums in Steel

THE cuts announced this week in the export prices of a few British steel products reflect the growing difficulty of obtaining export premiums in a softening world market for steel. This development, as the Iron and Steel Corporation commented in its farewell report last week, has a direct and somewhat ominous bearing upon the future profitability of the British steel industry. But its effect upon steel prices inside Britain may not be so direct as some Continental steel manufacturers and consumers have recently been arguing that it should be.

ANALYSIS OF STEEL PROFITS, PUBLICLY-OWNED COMPANIES, 1951 AND 1952

	Year ended Sept. 30, 1952	Period ended Sept. 30, 1951, adjusted to annual rate
On activities within the iron and steel industry, both home and export sales being valued at UK controlled prices	37·3	34·7
On activities outside the iron and steel industry	8·9	6·0
From overseas establishments	2·9	2·3

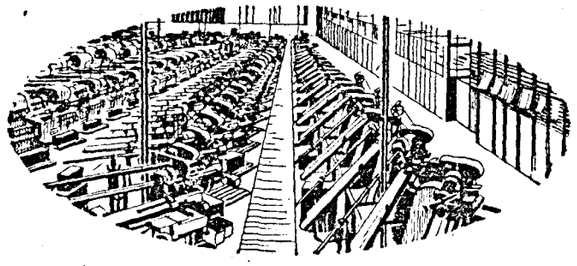
TOTAL PROFITS	74·7	63·8

All the European countries that export steel have generally charged more for it overseas than at home whenever they have been able since the war. Over most of the period Britain has charged customers overseas rather less than its Continental competitors have charged, but because the home price in Britain has also been lower than home prices on the Continent, Britain has generally obtained larger export premiums. These have also been more stable, because both the home and the export prices of British steel products have been governed by a policy of fairly stable prices. Continental prices have fluctuated more widely and more often in response to world demand. During the boom after the Korean war began, export prices of steel from Belgium and Luxemburg nearly trebled in a year ; and they were already coming down again by the time last year that British prices, moving up more slowly, had reached about twice the level of mid-1950. From that time, Continental steel export prices continued to fall, until early this year, after a sharp drop in Belgian export prices, the Belgian, French and German producers in concert agreed to fix a level of export prices below which none of them would compete. British prices, more sedately, have followed downwards ; for certain products such as tinplate and sheet, export premiums have disappeared or are disappearing.

Realism and Steel Prices

SINCE the war steel prices inside most European countries have been controlled, and for the most part held low. Inevitably, export premiums have some bearing upon the settling of domestic steel prices, whether or not they are explicitly taken into account in pricing every product ; and this is true in Britain, though since 1949 home prices have formally been set to allow a reasonable margin from home production alone. On some products, particularly in the semi-finished and heavy ranges, British steel producers have been hard put to it to earn the permitted margin ; certain types of billets, for example, became not worth producing. The different levels of export premiums that could be earned, therefore, have a considerable effect on the profitability of different products—and different steelworks.

During the year ended September 30, 1952, the publicly-owned companies as a whole earned nearly £19 million from export premiums. But during the calendar year 1952 Britain imported about 2½ million tons of steel and scrap at prices averaging probably £20 a ton more than British prices. This imported steel was sold at home prices, which had to be raised to cover the loss on importing ; during most of last year the price of steel sold in Britain included a levy of some £3 an ingot ton for this purpose. Any "subsidy" from export premiums, therefore, was probably more than offset. Export premiums earned by other steel exporters, it may be noted, did not have to be set against a loss on imported steel, so that their home prices may indeed have been subsidised to some extent. There are, of course, two elements in the cost of British steel from which home consumers do gain an exceptional benefit. One is the low controlled price of scrap in this country ; this, the British Iron and Steel Federation has calculated, would account for less than £2 a ton of steel, which would still leave British home prices well below Continental. The other is the low price of British coal. Whatever the pricing policy adopted, this price must be counted as artificially cheap when the National Coal Board is in deficit after earning export premiums on the coal it sells abroad—even though the board has to pay £14½ million in interest in good years or



I know how . . .

WROTE LEONARDO

. . . but theories are not sufficient. Realisation must depend upon the techniques of PRODUCTION.

Today, men of ideas can call upon the immense store of engineering and production "know-how" of Plessey—whose main occupation is to apply tomorrow's methods of quantity production to the day-to-day needs of the aircraft, electronic and light engineering industries.

Managements in these industries are invited to call in Plessey to clear production bottlenecks.

THE UNITED
STEEL
COMPANIES LTD

THE LARGEST
STEEL PRODUCERS IN THE
BRITISH COMMONWEALTH

During the last years the United Steel company, by research and full-scale experiment, has introduced and sponsored many completely new products, improvements in existing products and opened up new markets.

Amongst these are: Fortiweld, a new high-tensile weldable low-alloy steel; advanced techniques in the production of stainless steel; developments in precision cold-rolling of razor blade strip and clock springs formerly imported from abroad; for the structural engineer low alloy steels and castellated beams have conserved steel in building.

Such developments and innovations, ranging from the heaviest products to the lightest, are typical of contributions made to every steel-consuming industry and are tangible evidence that a basic industry such as the United Steel company is as live and progressive as any in the country.

SOME FIGURES

On a turnover of £67,000,000, the United Steel company has been spending almost three times as much on research and development as it pays in dividends. The 180 scientific workers engaged in the new Research & Development Department are additional to the research staffs at the individual producing units.

THE COST
OF DRYING THINGS

Millions of tons of fuel are used in Britain every year in drying processes, many of which are inefficient and wasteful.

When coal was cheap no one worried unduly, but today the cost of fuel used in drying is a serious expense item which tends to get buried in general overhead without receiving the close control given to economy of raw materials. Furthermore, many drying processes are as ineffective as they are extravagant.

Eight years ago, we started a specialised service to the Metal Goods Industries by providing Gas Infra-Red Tunnels for drying paints and varnishes. Today our techniques have wide application as varied as those employed in fish curing and textiles.

We are ever looking for new drying problems to solve. Nearly every industry has one. Send yours to:

bad, a steady burden that Continental coal industries may not have to bear. These two elements, rightly or wrongly, seem likely to remain. Moreover, it is perhaps doubtful whether British prices for heavy steel fully cover adequate provision for the replacement of the country's steel plant: but that may equally be true for Continental steel industries.

One Way to Save Fuel

THE idea of an advisory service on fuel efficiency for industry, independent of the Ministry of Fuel and Power, was recommended by the Ridley Committee nine months ago. The Minister accepted it, believing moreover —as the committee did not—that his own official fuel efficiency service should be brought to an end as the new body took over responsibility. A committee under Sir Harry Pilkington, set up to consider what kind of organisation would be needed, has now recommended that it should be a non-profit-making company limited by guarantee, sponsored by the British Productivity Council and assured of a regular income of at least £500,000 a year over and above anything it may earn from providing advice or services. The Minister agrees, and the company is to be set up; its basic income, for five years at least, is to be provided by annual grants of £250,000 a year from the National Coal Board, £100,000 from the British Electricity Authority and £100,000 from the Gas Council. It is also to receive free of charge the testing equipment no longer required when the Ministry closes down its own service. The company is designed to provide advisory services on a scale at least comparable with the Ministry services, with hopes of expanding in the future.

The Ridley Committee, it may be remembered, thought that this service should be financed from a levy on industrial coal sold, and most of the Pilkington Committee agreed; but they were told that "there are objections to this course." Why the cost of providing this service to industry should be paid for by the taxpayer or the general consumer of coal—the same man in another hat—rather than by industry is not explained. The cost is small, and the point unimportant—unless it suggests that industry would rather not bother with the service than pay its full costs. However, whether or not an enthusiastic demand for fuel advice exists, the company's job will be to drum it up, and it deserves good wishes in this task. Its formation coincides with the easing of conditions for the Treasury loans for fuel-saving equipment, which so far industry has generally failed to take up. Both will face the same difficulty—that an industrialist with capital to spend today, considering the very small item that fuel costs constitute in most industries, can usually find productive capital equipment to offer a far better return on his investment. But then, both are part of the same larger policy—that of keeping coal artificially cheap at the same time as rationing it and offering inducements or special financial assistance in order to induce consumers to use less of it.

The Best Shells—or the Most?

INSPECTION is a key factor in the production of ammunition; the type and the degree of inspection employed, and the authorities that control the inspectors, have a considerable influence upon the rate of output, quite apart from the intended control of quality. Late last year, in studying the Royal Ordnance Factories, the Select Committee on Estimates was struck by the duplication that arises from the direct control of inspectors in certain ammunition factories by the service departments concerned. This week, one of the published departmental replies to the Select Committee's recommendations reveals that the Admiralty and the Ministry of Supply have set up a committee to consider steps to reduce this duplication and thus to avoid the unnecessary disturbance of factories' production programmes that it may involve.

The same question of inspection occupies a prominent place in the productivity team report upon ammunition production in America that was published this week. This team, drawn largely from the Ministry of Supply and the ordnance factories, encountered some difficulties arising from the fact that before its departure nobody had decided quite what it was supposed to do; but it has provided a very clear summary of the general organisation of ammunition manufacture in the United States and detailed studies of certain arsenals and factories. In spite of the elaborate attention given in the American plants to planning for quality control, the team felt that

> in practice the quality of workmanship was often so intimately associated with the rate of production that the quality of the end product might not meet the uniform standards of quality assurance at which we aim in the United Kingdom.

The American rates of production in ammunition factories were generally higher, largely perhaps because the orders, many times higher than in Britain, justified a very much higher degree of mechanisation. Moreover, ammunition in the United States seems on balance to be designed with rather more consideration of the requirements for quantity production, as against user niceties, than ammunition in Britain. These observations of the team, it will be noted, are all of a piece, consistent with the rather different American and British approaches to rearmament and indeed to production in general. They do not, in the case of so highly expendable a product, suggest that on balance the British practice is necessarily the better, though a balance between production efficiency and quality in any item of war equipment is not an easy one to strike.

The Price of Zinc

WITH business rather quiet of late the zinc market has had time to ponder the criticism that has been growing of the London Metal Exchange's method of pricing zinc, which does not, so it is said, necessarily reflect the general supply and demand for the metal. The metal exchange price is related to an ordinary commercial grade of zinc. About 50 per cent of the zinc used by industry—or by certain industries—is of this quality, while the other 50 per cent is of a higher quality and used by other manufacturers. Metal market quotations may give a fair current price for the quoted ordinary quality, but it does not follow that the supply and demand for the other higher qualities move in the same way; yet the higher quality prices are fixed by adding an agreed premium to the quoted ordinary price. There may, at any one time, be a shortage of ordinary quality and an abundance of, say, electrolytic zinc, but because its price is tied to that of the ordinary quality it is dealt in at an unreasonably high price—or not sold at all. That is the burden of the argument.

Because zinc, unlike certain other metals, cannot be bought in the lower grades and transformed into higher qualities simply on payment of a refining premium, the different brands are bought by different industries and, critics maintain, the different qualities should be quoted independently. The varying development of demand for different qualities of an industrial material is an inevitable consequence of technical change; and markets that treat it as a single commodity run the risk of losing a sensitivity to the patchwork pattern of individual demand that is one of the traditional virtues of free dealings in commodities. Should the disproportion widen between the state of supply and demand for special qualities and the prices based on the commonest grades, pressure upon the market to segregate different qualities may come from the consumers as well as the producers of zinc.

Exchange Control and Grain Dealings

THE Bank of England has this week circulated details of the exchange control arrangements under which members of the grain trade will have to operate as they march towards their new-found freedom. A large measure of freedom has already been restored to this trade, for since May 1st last open individual licences have been granted for the import of wheat and flour, coarse grains and feeding stuffs. But the private grain merchant's real opportunity—and real test—will come when the terminal markets in grain are re-opened and when Britain's membership of the International Wheat Agreement runs out and with it the rigidity characteristic of bulk government trading.

The Bank's notice lays down that dealings with buyers and sellers in any part of the world will be permitted only to persons and firms "having a continuing interest in the import and marketing of grain and recommended to the Bank of England by the National Federation of Corn Trade Associations." The broad understanding is that these elect will have complete freedom to buy grain in any country in the world, provided it is intended for consumption in the United Kingdom or any other part of the sterling area. But exports and re-exports of grain from this country will still have to go through the normal export licensing procedure; and although there will be some freedom to engage in third party trade—that is, to buy grain in one country and sell it to another—this will be subject to the important reservation that grain of American, Canadian or other "dollar" origin, may be resold outside the sterling area only against payment in US or Canadian dollars or in sterling from an American or Canadian account. The authorities are evidently determined therefore that Britain cannot yet afford the very real step towards sterling convertibility that would result from any decision to allow European and other countries to buy their dollar wheat against ordinary sterling payments in London; this determination must be influenced by the memory that when dollar-EPU arbitrage was restored for a short while last August, it was in grain that the bulk of the business was done. Nevertheless, the supremely important fact remains that henceforth importers into Britain itself will be able to secure their wheat from the cheapest sources, irrespective of the currency in which payments have to be made. Moreover, the facilities for third party trading and arbitrage should prove considerable, despite the restrictions regarding resales of dollar wheat.

As in other commodity schemes operating in the United Kingdom, the participants will be called upon to make monthly returns to the Bank of England. The usual pledge of secrecy will apply to these but the Bank will have the right to reveal the global figures to the responsible authority in each market and to make representations to them if an undesirably extended position appears to be developing. On all counts—commercial and payments—this new freedom for grain dealings can be regarded as the most important commodity freeing operation that has yet taken place in Britain. Its importance will become even greater when the terminal markets in grain are reopened. It has already been announced that non-residents will be allowed to operate in these markets and to receive payment of any differences that fall due in respect of their transactions.

SHORTER NOTES

Car production in May rose sharply to nearly 50,600 cars and 19,700 commercial vehicles, compared with 44,193 cars and 16,810 commercial vehicles in April. The output of cars was the highest monthly figure to be reached for nearly three years; an important factor in the high rate of production achieved in May compared with earlier months must be the resumption of work at the Austin Motor Company's factory that was paralysed by a strike that lasted from mid-February to April. Exports are also rising, but although the figure of nearly 31,000 cars exported is the highest for a year, it is well below the monthly figures that the industry was recording in 1951 and the beginning of 1952.

★

In a table showing steel profits and capital on page 830 of last week's issue of *The Economist* the net income, after tax, of Dorman Long was wrongly shown as £4,160,000. This figure should have been £2,244,000, and the profits ratio to the net assets of this company should be 9.1 per cent, not 16.9 per cent as given in the table. In the profit ranking of 25 major steel companies shown in this table, Dorman Long should rank eleventh, between Lancashire Steel and the Steel Company of Wales.

Company Notes

BRITISH CELANESE. Although Mr G. H. Whigham, in his statement accompanying the full accounts of British Celanese for the nine months to March 28th last, refuses to venture on a forecast of future earnings, he does suggest that the "outlook for the immediate future is reassuring." To some extent he bases this judgment on "the general indication that stocks of textiles in the hands of the trade at all levels have been reduced materially and no longer represent a barrier between the manufacturer and the demand exercised by the public." The British Celanese group has reduced the book value of its own stocks from £7,371,746 to £5,614,618. Mr Whigham finds further reasons for confidence in the current trends of sales and profits. In the nine months to March 28th, profits were running at the same rate as in the previous twelve months, and since then they have shown a further improvement. Indeed, in the last few months of the financial period the group was unable to meet in full the demand for acetate yarn. The main worries of the industry today seem to be not the level of demand but the continuing rise in operating costs and the shortage of highly skilled labour.

Even with these qualifications, Mr Whigham's statement may serve to invigorate the hopes of shareholders. For the nine months to March 28th shareholders have received an equity dividend of 12 per cent; this is equivalent to a full year's dividend of 16 per cent and is thus a sizeable increase in the dividend of 11 per cent in the previous

financial year. Another heartening sign is that the company's funding certificates (issued to make good the dividend arrears on the second preference stocks) have at long last been paid off.

★

ROLLS ROYCE. As the recent success of the de Havilland issue proved, investors in this country are very willing to venture their capital in financing the growth of the aircraft industry. But, equally clearly, the need for their support has not yet entirely disappeared. As one reflection of this, Rolls Royce is to increase its authorised capital by £2 million to £6 million. Its old authorised capital of £4 million was exhausted when an issue of 933,334 ordinary shares (at 50s. each) was made last November. The directors do not intend to issue any part of this additional authorised capital at the moment, but cannot rule out the possibility of further permanent capital being required in the future.

The company's recent record of expanding profits and sales was continued in 1952—when trading profits rose from £2,210,943 to £2,572,215—but this rise in profits must be read in conjunction with the need to finance extensive additions to fixed capital equipment and with the further growth of investment in working capital. Only part of the proceeds of last November's issue were incorporated in the balance sheet drawn up at the end of last year, and the receipt of another 30s. on each share at the beginning of the current year will presumably have already wiped out the bank overdraft of £986,071 that was then outstanding. Nevertheless, this overdraft and the fall of nearly £300,000 in cash balances are eloquent reminders of the current cost of growth, and the company's task last year cannot have been made any easier by the need to revise its plans for expansion to conform with the Government's changes in the rearmament programme. Fortunately for the group, the problem of redeploying resources in recent months has been made easier by off-shore purchases for Nato countries, by orders for marine gas-turbine engines for the American Navy, by the growth of the business in oil engines and by the general increase in demands from overseas customers. This year it should not therefore have any difficulty in repeating the dividend of 15 per cent.

★

METAL BOX. In the face of stiffer competition, rising costs and a rather unsteady demand, the Metal Box group last year adopted a deliberate policy of expanding production and accepting lower profit margins. The result, as was pointed out in these columns a fortnight ago, was that the value of the group's sales rose from £36.4 million to nearly £40.2 million, but that its profits fell from £3.7 million to £3.3 million. The full accounts and balance sheet now show that stocks also fell, by some £200,000 to £10,439,185—but thanks wholly to a fall of £400,000 in the stocks of overseas subsidiaries. Currently, the chairman, Sir Robert Barlow, reports that "the home trade demand is strong" and that many of the industries that were most affected by last year's recession in trade are now pressing for delivery. Of export markets, Sir Robert says only that they "have begun to open up again." But Sir Robert also reveals that the company has based its plans this year on what it can hope to sell and not, as in past years (when tinplate was short), on what it could produce; he adds that it is still too early to gauge the full effects upon demand of the removal of the restrictions on packaging. In these circumstances it is not surprising that the market appears to expect nothing more than the repetition of an ordinary dividend of 15 per cent; at their current price of 56s. xd., the £1 ordinary stock units offer a yield of 5.35 per cent.

Statistical Summary

EXCHEQUER RETURNS

For the week ended June 20, 1953, total ordinary revenue was £42,884,000, against ordinary expenditure of £69,000,000 and issues to sinking funds £600,000. Thus, including sinking fund allocations of £6,262,000 the deficit accrued since April 1, 1953, was £144,691,000 compared with a deficit of £192,719,000 for the corresponding period of the previous financial year.

COMPANY MEETINGS

BRITISH CELANESE LIMITED

MR G. H. WHIGHAM'S STATEMENT

The thirty-fourth annual general meeting will be held at the Great Hall, Winchester House, 100 Old Broad Street, London, E.C.2, on Thursday, July 16, 1953, at 12 noon.

The following statement to stockholders by the chairman, Mr G. H. Whigham, has been circulated with the full report and accounts for the nine months ended March 28, 1953:

The accounts presented deal with a period of nine months only instead of the usual twelve months due to the change of the accounting date to which I referred in my statement last year.

The net profit of the group for the nine months, before taxation, of £1,841,346 is at a rate broadly equivalent to that earned in the previous year.

There have been added to the net profit of £744,341, after tax, provisions from previous years no longer required of £804,689, of which £160,938 is to be applied in the purchase or redemption of funding certificates—a net addition of £643,751.

General reserve has been increased to £3 million, and reserve towards increased cost of replacement of property and plant to £2 million, an increase in the aggregate of £700,000.

After providing for fixed dividends on preference stocks, interest on and redemption of funding certificates, dividends recommended, and after transfers to reserves, the carry forward of the group at £766,792 shows an increase of £35,666.

You will see from the directors' report that future profits will be relieved of any charge for repayment of funding certificates. You may remember that in 1942 £1,700,000 of these certificates were issued to second preference stockholders in satisfaction of arrears of fixed dividends on second preference stock.

Under the conditions of issue the profits of each financial period were subject to a deduction for interest on the certificates and to the setting aside of a proportion of the profits for redemption of the certificates in priority to the payment of dividends on the ordinary stock. As provision sufficient to redeem the whole of the outstanding certificates has now been made, the position of ordinary stockholders in the future, in relation to distributable profits, will be substantially improved. It is very satisfactory to be able to report this position after a period of just over ten years, as this is a very much shorter period than was visualised in 1942 when the certificates were issued. It should also be appreciated that the whole of the £1,700,000 and the net interest paid relevant thereto has been provided out of profits which have already been subject to taxation at very high rates.

During the nine months, £46,133 of debenture stocks were purchased and cancelled.

DIVIDENDS AND TAXATION

In my statement which accompanied last year's accounts, I referred to the recession in our industry during the last half of the year ended June 28, 1952. At the annual general meeting I informed you that business during the three months July to September, 1952, had improved and that we had made a small profit.

This improvement continued progressively throughout the remaining six months of the period and the net profit of British Celanese, Limited, of £744,341 (after tax) was practically all earned during the six months ended March 28, 1953; over the whole period of nine months this profit represents earnings of approximately 16.5 per cent (actual) on the ordinary stock. On a *pro rata* basis this is equivalent to 22 per cent for 12 months.

Earnings, so far as the current financial year has progressed, have further improved.

As will be seen from the report, your board have recommended a dividend on the ordinary stock of 12 per cent (actual) for the nine months, which is equivalent to a rate of 16 per cent for twelve months.

As regards the concessions proposed by the Chancellor in his recent budget, the reduction of 6d. in the £ in the income tax is of course welcome as a step in the right direction. Let us hope that it is only a beginning towards easing the heavy burden of taxation on industry.

The reintroduction of initial allowances is also welcome, although the immediate taxation benefit on these allowances can only really be considered as representing an interest-free loan. This loan will have to be repaid by reduction in wear and tear allowances in subsequent years unless of course the rate of tax should be materially reduced during the life of the plant or buildings in question.

This company has not so far been subject to excess profits levy, but we welcome its abolition in view of the benefit to industry in general.

Much has been said in the press and in the House of Commons regarding purchase tax on textiles and, while we appreciate the Chancellor's difficulties, we cannot but be disappointed that he has found himself unable to make further adjustments in this tax, and we hope that next year will see the complete removal of purchase tax on British manufactured rayon goods.

TRADING

The demand for our acetate yarn during the latter part of the trading period has been in excess of our ability to supply, despite the steady increase in output as new labour has been trained and become efficient. The monthly rate of turnover in the home market during the last six months of the financial period under review shows considerable improvement over the comparable months of the previous year.

The company's export turnover during the whole period under review was about the same in total as in the corresponding period of the previous financial year but the last six months show a sharp improvement. A much higher proportion than previously was contributed by shipments of yarn and a lower proportion by the shipments of fabrics. In general, yarn exports enjoy freer access to overseas markets than do fabrics, since many countries which hitherto imported fabrics are now seeking to weave and knit them.

The export market is always subject to keen competition, but the sudden imposition of import bans or high tariffs and other obstructions to trade makes it impossible to conduct export business on a normal basis.

RAW MATERIALS AND STOCKS

Raw materials during the period under review were in good supply and prices have been falling, but other important factors in production costs, such as labour, fuel, power and freight, have continued to rise. Our cellulose and other stocks are at a satisfactory volume and valuation.

PLANT EXPANSION AND MODERNISATION

Although the execution of our plans for plant expansion and modernisation was slowed down somewhat during the recent textile recession, substantial progress has been made in this respect and further expenditure has since been approved.

At Wrexham, building construction is proceeding and plant is being ordered.

The factories at Wigan, Jarrow and Blyth are again operating satisfactorily.

RIVER POLLUTION

Much work has been devoted to the problem of complying with the order made against us in the pollution action last year. It was never anticipated, and the court was so informed, that the period of two years for which the injunction was suspended would be sufficient to enable us or our co-defendants to provide a remedy against the complaints. Much research work has, however, been done and a good deal of progress has been made.

Cooling units are in course of construction which, when they come into operation early next year, should remove the complaint of overheating the river. We have also been able to reduce our trade waste pollution figure by something like 35 per cent.

I have previously indicated that the problem of full compliance with the injunction is a difficult one which will necessitate the construction of extensive and expensive new works. Further research is necessary before the best methods of treatment of the waste can be established. We have been advised, however, by our consultants that the most efficient method of dealing with it is most probably by treatment in combination with domestic sewage. We have accordingly continued negotiations with Derby Corporation and with the Ministry of Housing and Local Government with a view to arranging for the treatment of our waste by the corporation in their own sewage works. The corporation have pointed out their difficulties in this matter which arise because they are themselves under injunction against polluting the river and so have their own urgent problems. I am able to report that a good deal of experimental work has, however, been carried out by the company and the corporation in collaboration, and discussions have taken place between the advisers of the two bodies whereby it is hoped that the negotiations will result in a mutually satisfactory solution.

It will be impossible to put the matter wholly right before the expiration of the period of suspension next April, and it will be necessary for us to apply for a further suspension. We expect, however, to be able to show a real improvement by that time and, meanwhile, every effort is being made to cope with the problem.

RESEARCH AND DEVELOPMENT

Your board is well satisfied with the progress arising from research. The very nature of research, however, precludes my being explicit on the specific lines being followed, but I may say that the maintenance of our commercial position is in no small measure due not only to the day to day application of developments arising out of research but also

from time to time to major developments attributable to it. Because of our awareness of the expected outcome of our researches you may be assured that a close watch is kept upon the probable trend of our future activities when planning modifications and extensions of plant and buildings so that these preserve the maximum interchangeability of productive use.

The position with regard to personnel for the rapid technological development of new processes is not, however, so satisfactory. This is mainly due to the fact that as a nation we have by comparison with other industrial countries so far neglected to afford adequate educational facilities for training in the practical technologies other than engineering. In these circumstances, the company therefore has itself to take active steps to provide the facilities for technical training to suitable scientifically qualified staff.

FUTURE OUTLOOK

Under the constantly changing world conditions, there are many unknown and unpredictable factors, and it would be imprudent for me to venture an estimate of future earnings, but I may say that the outlook for the immediate future is reassuring. The general indication is that stocks of textiles in the hands of the trade at all levels have been reduced materially and no longer represent a barrier between the manufacturer and the demand exercised by the public.

Acetate yarns maintain their prominent position in the textile industry. More new man-made fibres will undoubtedly emerge from the research stage into the commercial stage as the years go by. Each of them may have certain special qualities which in many cases can be most usefully absorbed in the making of mixture fabrics in which, no doubt, acetate will be very largely used. In this connection your company is spending considerable sums on research in order that it may keep abreast of the times.

A feature of our industry is the stability in price both of rayon yarn and staple compared with natural fibres and this must have been of immeasurable value to all sections of the textile industry, particularly during the recent difficult period. This stability we hope will continue, bearing in mind that the cost of certain elements, such as raw materials and wages, is outside our control.

The element of wages in our costs can be decisive as to whether we remain competitive or not, and I look to the good sense of the workers and their representatives in this matter. Any increase in wages must be coupled with increased productivity if we are to remain competitive.

PERSONNEL

You will see from the directors' report that, during the year under review, Mr G. H. Spilman was appointed vice-chairman and Mr W. A. Dickie and Mr C. H. Colton assistant managing directors.

Mr Spilman has served the company from its very early days and has been a member of the board of directors since 1927 and a managing director since 1945. His knowledge and long experience of the company's business and of the rayon industry as a whole make him eminently suitable to hold the office of vice-chairman.

Mr Dickie and Mr Colton have both served the company for many years, Mr Dickie mainly on the technical and development side and Mr Colton on the sales side. They have both been members of the board of directors since 1945.

Mr W. H. Poxon has relinquished his duties as secretary of the company, which position he has held for over 25 years. He has been a member of the board of directors since 1945, and he will continue to act as director concerned chiefly with finance; his long experience of the secretarial, legal and financial matters of the company will continue to be of great benefit to the company.

I am glad to say that a large proportion of the skilled and valued workers of long-standing, whose services we were compelled to lose on account of the trade recession, have gradually returned to employment with us.

Since my statement last year, the improvement in trading conditions has called for great efforts not only by our factory operatives but also by the whole staff of the company owing to the increased demands on their services, and they have responded with the most commendable energy; and I take this opportunity of thanking all employees for their loyalty and hard work. We are still in need of additional well-qualified technical staff, and contacts to this end have been made with the principal universities and technical colleges in this country.

The company is completing a large new sports field at Spondon where a variety of sporting activities can be carried on. It is hoped that these activities will further cement the excellent spirit of comradeship existing amongst our operatives and staff.

THE CAPE ASBESTOS COMPANY

DIAMOND JUBILEE

POSITION OF FINANCIAL STRENGTH

MR ROBERT WALKER ON MAJOR DEVELOPMENTS

The sixtieth ordinary general meeting of The Cape Asbestos Company, Limited, was held on June 24th, in London, Mr Robert Walker, MBE (the chairman), presiding.

The following is an extract from his circulated statement:

Your company was incorporated on December 28, 1893, and this year we therefore celebrate our diamond jubilee. The initial issued capital was £45,000 and the assets then acquired were asbestos-bearing properties in South Africa and a factory at Turin. From this modest beginning we have grown in stature. Our capital and reserves today amount to £4,634,111.

The trading profit of the group at £1,407,058 just exceeds the 1951 total of £1,381,659.

The net profit of the parent company alone is down at £506,645 compared with £528,327. In explanation, I may say that we earned a smaller margin of profit on trading in the home market as a result of continuing increases in wages, and in overhead expenses such, in particular, as fuel and power. In the latter part of the year, also, there was a falling off in the volume of business, resulting, of course, in keener competition. But, as I have said on more than one occasion, we welcome competition. Our products sell because we make them, so far as is in our power, the highest quality goods obtainable in the trade, and I know this policy will sustain us in the future as it has done in the past. Our overseas interests, on the other hand, provided us with greater income, which went a considerable way to compensating for the shortfall in profit at home.

The year's profit, together with £141,171 brought forward from 1951, leaves available for disposal the sum of £647,816, out of which it is necessary to provide £283,213 for taxation. Of this £57,000 is for profits tax, £181,213 goes in income tax, and £45,000 is provided for excess profits levy.

Your directors recommend that £75,000 should be placed to general reserve and that a final dividend on the ordinary shares of 20 per cent be declared, making with the interim of 5 per cent a total of 25 per cent for the year, compared with 22½ per cent last year. The payment of this dividend, together with the preference dividend, requires £141,277, and leaves £148,326 to be carried forward.

The consolidated balance sheet shows a further accretion of strength. Current assets are up at £3,778,721 compared with £3,385,739 last year and in spite of an increase of over £200,000 in the value of stocks and stores, I am particularly glad that we are able to disclose a healthy liquid position, cash and realisable securities showing a total of £1,277,784. Current liabilities at £1,336,735 continue to remain well below current assets. Revenue reserves, including undistributed profits, amount to £2,332,561 compared with £1,969,673 last year.

FACTORIES

This has been a difficult year for our established factories. Our Barking factory, the mainstay at home, has in the circumstances, done well and the Acre Mill factory has weathered a trying period of reconstruction with far less disturbance to production than might have been expected. The results of Uxbridge board factory have shown an improvement and the sales division is to be complimented for their efforts. The Kentmere works have had a year of full production with gratifying results.

SUBSIDIARIES

Mining operations in South Africa have again brought results which are a most satisfying harvest from the policy of reinvestment and expansion which your board has pursued at a cost of over £1 million in the past three years.

We cannot, however, regard the South African scene with complacency. The pressure from consumers for increased production has left us little time to devote to methods of improved treatment of the fibre. Buyers of crude asbestos are more critical in their demands, and every effort is being made to improve production methods and the quality of the milled fibre.

Cape Asbestos Insulations (Pty.), Limited, has had a satisfactory year.

Capamianto, S.p.A., has had a good year's volume of trading.

The Uxbridge Flint Brick Company, Limited, has had another successful year, and production is now very near the maximum of which the present installation is capable, while the Weaver Manufacturing and Engineering Company, Limited, has broken all previous records.

DEVELOPMENT

I will now refer to two new major developments which have taken place since I last addressed you.

Firstly, a new subsidiary called Marinite, Limited, has been formed jointly with the Johns-Manville Corporation to manufacture in the United Kingdom an incombustible board mainly for marine use. The past year has been spent equipping a large factory, acquired in Glasgow, with the costly and heavy machinery necessary to make this unique board.

A second venture, more recent still, is the purchase of a site at Stirling for the purpose of manufacturing a form of insulation produced from inorganic fibres made from rock and clay found in Scotland.

This is marketed under the registered name of Rocksil and will be distributed by our old friends William Kenyon and Sons, Limited, of Dukinfield. All the necessary formalities have been completed and the erection of buildings and machinery is being urgently pressed forward.

The report was adopted.

SPILLERS, LIMITED

FURTHER IMPROVEMENT IN RESULTS

PROPOSED DECONTROL WELCOMED

MR WILFRED D. VERNON'S STATEMENT

The sixty-sixth annual general meeting of Spillers, Limited, was held on June 19th at the Great Eastern Hotel, London, E.C., Mr Wilfred D. Vernon, chairman of the company, presiding.

The secretary (Mr Cyril Harvey, FCIS) read the report of the auditors.

The following is the chairman's statement which had been circulated with the report and accounts for the year to January 31, 1953, and was taken as read:

I am most grateful to the directors for the confidence which they have shown in me by electing me as chairman of the board. It is a privilege to hold this office, and I can assure the stockholders that I shall do all in my power to further the interests of the company.

The directors in their report have expressed their high appreciation of the work done for the company by my predecessor, Mr Arthur Whittaker. I should like to add a personal tribute as I have worked closely with Mr Whittaker for the major part of my business career. His ability and strength of character enabled him to rise from the most junior to the most senior office in the company, and he played a most important part in building up the business to its present level. His wise counsel and leadership have been of great value to his colleagues and we are sure that the stockholders will join with us in wishing him a long and happy retirement.

NEW EXECUTIVE DIRECTORS

We welcome to the board two new executive directors in Mr R. A. Twomey and Mr C. P. Rishworth. Both have a wide experience of the company's business and previously occupied senior managerial posts in our service—Mr Twomey as general manager in the North East area, and Mr Rishworth as manager of the Central Technical Department. I warmly commend the confirmation of their appointment to the stockholders.

It is with great pleasure that we congratulate Mr Humphrey Vernon, one of the joint managing directors, upon his nomination by the Council of the National Association of British and Irish Millers as their next president. We wish him every success in his tenure of that important and exacting office.

Two new area general managers have been appointed. Mr Hugh Potter has succeeded Mr Twomey in the North East Area and Mr A. P. W. Baker has succeeded Mr W. H. Clark in the North West Area. Mr Clark has retired after 46 years' valuable service with the company and its predecessors and he has our best wishes for a complete recovery from his recent illness.

THE YEAR'S RESULTS

I need not make any detailed comments on the accounts since this has been done in the directors' report. I am glad, however, that we are able to show a further improvement in results, the profit after making adequate provision for depreciation and obsolescence being £2,256,000 as compared with £1,980,000 in the previous year. But taxation absorbs £1,520,000 so that the net profit available of £736,000 is only £106,000 greater than last year. The relief afforded by the small reduction in the rates of income tax and profits tax has been largely offset by the charge for the excess profits levy. Nevertheless it is satisfactory that in this year's Budget the Government have recognised the need to make a start in lightening the burden of taxation on industry to enable it to increase its savings for the carrying out of modernisation and development upon which so much depends.

Your directors are very sensible of the facts that the development of this company's operations has been made possible by the ploughing back of profits over a long period and that the present level of distribution represents only about 4 per cent gross on the total capital and surplus applicable to the stockholders of the parent company. We recognise, too, that the distribution to the equity stockholders should reflect the development of the business to such extent as the results and prudent policy allow. But while the trading results for the early months of the current year indicate that last year's improvement has been at least maintained, the major consideration is the Government's declared policy to decontrol cereals and feeding stuffs during the course of this year. This involves a number of factors the effect of which cannot be assessed at present and accordingly, although I look to the future with confidence, we consider that for the time being it is necessary to conserve our resources until there has been experience of working under the new conditions.

GOVERNMENT'S PROPOSALS FOR DECONTROL

The Government's proposals for decontrol are far reaching in their effect. Summarised very briefly they are designed—

(i) to enable the buying of wheat and course grains to be undertaken by trading interests in place of the Ministry of Food;

(ii) to afford freedom of grist to flour millers;

(iii) to remove any subsidy on flour and price control over flour and feeding stuffs;

(iv) to permit the manufacture of short-extraction—that is, white—flour subject to its conforming with certain nutritional standards, and

(v) to provide for the manufacture of such quantity of longer extraction flour as public demand may require. Bread made wholly from this flour would continue to be subsidised; other bread would not.

UNDERLYING PRINCIPLE WELCOMED

We welcome the underlying principle of this policy which would restore a very large measure of freedom of commercial operation to the industries concerned and freedom of choice to the public as regards the nature of the product which they wish to buy. For nearly fourteen years the milling industry has been compelled to work under the tightest form of restriction—technically, commercially and financially. There has been virtually no incentive to enterprise or initiative and the return has been inadequate in relation to the volume of business and capital employed.

But while the principle of decontrol is welcome, much still remains to be settled before the transition can be effected with any reasonable smoothness or equity to the trading interests concerned. Since these matters are at present the subject of negotiation with the Government I do not propose to review them here. Nevertheless, I feel it right to touch upon what is perhaps the principal problem from the standpoint of the milling industry, namely, the transfer from the Government to the millers of the risk involved in the carrying of stocks.

THE MAIN PROBLEM

To take wheat alone, its price is now about six times that at which it stood at the outbreak of war in September, 1939. Unlike most other commodities, it has not been subject to any fall in price, though some decline, and possibly a considerable one, appears inevitable at some stage. The whole of the benefit of the rise in price since 1939 has accrued to the Government as they requisitioned the industry's stocks at the outbreak of war and have effectively carried the risk on stocks since that time. No part of this benefit has been received by the industry. Moreover, since the margin of profit on flour has, under the control arrangements, been virtually frozen for most of the intervening period below the prewar level and only raised to that point in the last two years, there has been no opportunity to build up from that source adequate reserves against future stock losses.

I am sure that it is right in the national interest that the buying of grain should be undertaken by trading interests. It is also true that risk taking is inherent in free enterprise. Under normal conditions we should have no hesitation in accepting the legitimate risk associated with the carrying of the necessary stocks because the results of the previous fourteen years would have reflected the inflationary conditions of that period and we should also have been able to adapt and develop commercial machinery and methods for the minimising of the risk involved. But the conditions are far from normal and it is clear that it would be unreasonable for the industry to have to take over the risk at the peak level of a market which has shown a dramatic rise over the period of control without some measure of protection against a future fall.

WORKING CAPITAL NEEDS

It is appropriate that I should remark upon the working capital needed in the business. Although the risk of fluctuation in the value of stocks has lain with the Government during control, we have nevertheless had to find the capital required to carry working stocks of raw materials and finished products. The amount required for this purpose and for the financing of debtors has steadily risen as the Government have advanced prices to take account of the increasing costs of raw materials and production, and this has led to a reduction in our liquid balances.

The last increase in prices took place after January 31, 1953, and its effect on the working capital required is not, therefore, reflected in the balance sheet at that date. Some

further adjustment of prices may still be necessary to bring these to a true commercial level. It is too early to make any accurate forecast of the additional amount which may be required, but we are reasonably satisfied that we shall not have to obtain any further permanent capital for this purpose.

BOARD'S CONFIDENCE

After such a lengthy period of rigid control a reversion to full commercial operation on the milling side is bound to present a number of problems. I am convinced, however, that the management throughout the organisation will face these with all the effort and ingenuity necessary. We have continued our policy of keeping all our mills and factories in the highest state of efficiency and capable of producing products of the finest quality. This will enable us when control is lifted to enter the field of competition with confidence. Considerable progress has been made during the year in replacing capacity destroyed during the war, particularly in London and Hull. The recently rebuilt Millennium Mills at Victoria Dock, London, came into operation in January. Every modern device has been incorporated into this mill which, in our opinion, is the most up-to-date milling plant in the world. At Hull substantial progress towards the completion of the new mill has been made and we hope that it will come into production before the end of the summer.

The conservation of resources over many years has enabled us up till now to finance internally the requirements for increased working capital and those of the capital programme of modernisation and development. It is true that this has not yet produced an adequate return, but I hope that under freer conditions it will begin to bear fruit. The real anxiety is that to which I have referred concerning an equitable arrangement for protection against any heavy loss on the taking over of the Government's risk on stocks.

STAFF AND WORKPEOPLE

On your behalf, and that of the board, I should like to convey to the management, staff and workpeople of the parent and subsidiary companies how much we appreciate the efforts which they have made during the past year and their contribution to its results. I know that we can count on their wholehearted co-operation in meeting the transitional difficulties which lie ahead.

The report and accounts were adopted and a final dividend on the ordinary stock of 7½ per cent, less income tax, making 10 per cent for the year, was approved.

The retiring directors, Sir Archibald F. Forbes, Mr Humphrey B. Vernon, MC, Mr C. Paslew Rishworth and Mr Richard A. Twomey, were re-elected. In connection with the re-election of Sir Archibald Forbes the chairman made reference to his appointment as chairman of the Iron and Steel Board, which took place after the printing of the report and accounts. Sir Archibald's decision to accept that position had followed close consultation with his colleagues on the board, who were unanimous in their concurrence that he should do so. Sir Archibald's expert advice and assistance which his colleagues valued so highly would remain available.

The remuneration of the auditors, Messrs Impey Cudworth and Co. and Messrs Deloitte Plender Griffiths and Co., was fixed.

A special resolution was passed altering the articles of association with regard to the signing of stock certificates.

The proceedings terminated with a vote of thanks to the chairman, directors, staff and employees throughout the organisation.

SUEZ CANAL COMPANY

TRADITIONAL POLICY OF INTERNATIONAL USEFULNESS

The annual general meeting of the Suez Canal Company was held on June 9th in Paris.

M. Francois Charles-Roux, the president, in the course of his speech, said: The financial year 1952 has not belied the favourable forecasts I made at your last annual general meeting. Your company's receipts for 1952 rose by a round figure of 720 million francs, and as expenses increased by 726 million francs—and this came as no surprise to us—the available profit comes out at approximately the same as for 1951. This is a figure which certainly gives no grounds for dissatisfaction.

It seemed to us that the close similarity between financial results called for similar proposals for distribution as regards both dividend and allotment to extraordinary reserve.

The information which has been given to you regarding the volume and composition of the traffic contains nothing to weaken confidence in the future, much the contrary, provided that peace, on which naturally the economic future of the world depends, is maintained.

It is no part of the annual report to predict the results of the current year, of which scarcely more than five months have elapsed, but the results of these five months show a slight increase in receipts.

Your company, being responsible for an international public service of primary importance, owes it to those who make use of that service to place at their disposal a waterway kept in perfect condition, constantly adapted to the latest requirements of shipping and to developments in shipbuilding; provided with up-to-date and perfected equipment and, lastly, affording speedy and regular passage under the best possible conditions.

These are the reasons why you do not find your company putting forward the plea of advancing years to avoid embarking on necessary works, or making useful purchases, or facing financial sacrifices to maintain its personnel on the high standard of efficiency which has always proved its worth.

Your company is rewarded by the confidence placed in it by shipowners and the high reputation it enjoys amongst them. A confidence and reputation in which your company quite rightly sees the most valuable component of its strength. You will certainly approve that your company should persevere along this path where its conscientiousness and competence have met with general appreciation.

Another guiding principle of the policy traditionally pursued by your company is to be useful and of service to Egypt. It is, I believe, to the services rendered by your company to Egypt that the lasting nature of its trustful relations with the Egyptian Government is due. A long tradition, older even that the opening of the Canal to shipping, carries these relations over, so to speak, at the close of every reign and government. We were given a further proof of this continuation of good relations after General Neguib came into power and at the dawn of the far-reaching revolution embarked on under his leadership.

DIRECTORS' REPORT

The following are extracts from the directors' report: The disturbing events which took place in the Isthmus of Suez during the winter of 1951-52 and which at times could not but cause serious interference with the smooth working of the Canal, did not last more than a few months, so that the Canal services and the living conditions of the staff returned to normal from the first quarter of the year under review.

The year 1952 has been marked by further progress in traffic both of ships and of cargoes.

The former, with 12,168 transits and a net aggregate of 86,137,000 tons, shows an increase of 7.2 per cent as compared with the previous year. Approximately 90 per cent of this increase is accounted for by tanker traffic. Cargo traffic reveals a new record figure of 83,448,000 tons weight, an advance of 8.7 per cent over 1951. Southbound cargo traffic, reaching 22 million tons, accounts for two-thirds of the overall improvement, with an increase of 4,581,000 tons, due almost entirely to the new southward flow of petroleum.

Northbound cargo traffic reached a new record figure of 61,447,000 tons, showing an increase of 3.6 per cent. This progress is due entirely to shipments of petroleum, whilst the traffic in other commodities, sluggish throughout the first nine months, shows a drop of 5.7 per cent as compared with 1951.

Total receipts in 1952 amounted to 28,379,481,562 francs, an increase of 745,857,756 francs, while expenditure, at 13,542,892,209 francs, rose by 726,438,407 francs. After deducting interest on and redemption of capital, and expenditure in respect of past financial periods, the surplus comes out at 13,651,097,228 francs. Transit receipts have improved by 2 per cent in spite of the reduction in dues which became effective on September 15, 1951.

Social charges have been reduced by 1,196,763,868 francs, or 26 per cent from one year to the other.

Working expenses increased by 1,925,497,886 francs, that is to say 23 per cent.

Interest on and redemption of share capital, which amounted to 1,152,620,691 francs, shows scarcely any change from one year to the other.

To the surplus of 13,651,097,228 francs is to be added 81,248,647 francs brought forward from the previous year so that the total sum, on the distribution of which you will have to decide, amounts to 13,732,345,875 francs.

We propose that the following amounts be deducted from this sum for the endowment of the various reserve funds: depreciation and renewal of plant 1,200 million francs, an increase of 300 million francs on last year, in view of the important purchases in progress; depreciation of buildings 100 million francs as against 300 million last year.

We propose the allotment of a sum of 200 million francs to the insurance and contingency fund and finally, as last year, 2,000 million francs to extraordinary reserve, your company's total reserves not having yet reached, in the opinion of your board, a level in keeping with the magnitude of its transactions.

After these various allotments, a sum of Frs. 10,232,345,875 will remain available.

The distribution proposed to you amounting to Frs. 10,140,845,070 would leave a balance of Frs. 91,500,805 which we again invite you to carry forward.

The proposed distribution would correspond to a gross dividend of Frs. 9,000, to which will be added, in the case of capital shares, the statutory interest for 1952 amounting to Frs. 1,429.

The full report, in French, will be sent on application to the company at 6, Bishopsgate, London, E.C.2.

STEEL BROTHERS AND COMPANY

DIFFICULT TRADING CONDITIONS

MR J. K. MICHIE REVIEWS WORLD-WIDE ACTIVITIES

The sixty-second annual general meeting of Steel Brothers and Company, Limited, was held on June 19th at the offices of the company, 24-28, Lombard Street, E.C.3, Mr J. K. Michie (chairman and managing director) presiding.

The secretary (Mr E. A. H. John, FCIS) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended December 31, 1952:

The accounts for the year 1952 in so far as trading results are concerned are even more disappointing than I expected when writing my last report, but fortunately other sources of revenue, together with the provision for possible losses on stocks made ex 1951 profits, have to some extent restored the situation and we are left with a profit available for distribution of £139,825 as compared with £238,475 a year ago.

Due to lack of purchasing power in certain consuming countries rather than to dear stocks, trading remained very difficult throughout the year and at December 31, 1952, in many cases stocks had to be written down to well below replacing costs.

As usual I give below a short review of our main activities under geographical headings. During the past winter I was able to visit our branches in Pakistan, India, Burma, Siam, Hongkong and Ceylon, roughly in that order, and so was able to appreciate at first hand the problems set our local managements by the varying monetary conditions and policies with their corollaries of import and export restrictions, government monopolies and/or marketing boards and such like which the different governments decide from time to time are either essential to meet their economic difficulties or are in their best interests as free and independent nations.

BURMA

Burma continues to prosper in a monetary sense by reason of the very high prices being realised for her rice surplus, but there are signs that her policy of doling out supplies on a scarcity basis has its dangers. There is insufficient storage to carry the stocks now being held and the monsoon waits for no man.

We have every sympathy with Burma's attempt to get the best possible prices for her rice, especially in view of her well-known internal difficulties—sporadic attacks by insurgents on towns and railways and water transport and the new menace of the Kuo Min Tang's, all of which are very costly directly and more costly indirectly, causing as they do a heavy drop in production of Burma's valuable exports. Nevertheless, I think it would have been in Burma's best interests to have followed the well-known system of selling the bulk of the rice crop for shipment in the early months of the year, so ensuring the condition of the rice on arrival at destination. Where there is dubiety about quality there is bound to be resistance to price and this is becoming evident in many rice-consuming countries.

Last year our rice business was again largely confined to agencies for Colonial governments, and although this year controls will be removed from imports of rice and all rice products into the United Kingdom, so far we see no firm prospect of doing business from Burma on any large scale, largely for the reasons I have named. We have no rice mills at work in Burma or in a condition to operate.

Timber business in Burma is increasingly being done through the State Marketing Board, while supplies of teak are running at about 20 per cent of prewar level.

Cotton is another export which is now being channelled through a government-sponsored agency and we invariably find this method means a restriction of our business.

In common with other markets, Burma was a poor one for imported goods last year, textiles in particular, but this year probably partly due to a considerable building programme financed by government the volume of business has markedly increased. One of our two main rubber estates still remains in the hands of an insurgent group.

The negotiations by the mineral oil-producing companies for a joint venture with government have not advanced materially during the past year, although we understand the intentions of government are unchanged; the same remark applies to the government's negotiations for a share in the Burma Cement Company, Limited, whose plant worked steadily throughout the year.

Our subsidiary, Strand Hotels, Limited, again had a successful year and its increased accommodation is being fully used.

INDIA AND PAKISTAN

1952 was a very difficult trading period, particularly in jute goods, which suffered heavy falls in price. Some recovery has since happened and with it a return of confidence in price levels.

Our managing and selling agencies for the Indo-Burma Petroleum Company, Limited, and Assam Sillimanite, Limited, and our food procurement agency for the Indian Tea Association represent our principal activities in India and their turnover was maintained. We expect a diminution in the volume of procurement for tea this year, due to easier food conditions locally.

During the year there was a steady decline in purchasing power in Pakistan with a consequential fall in prices to levels well below either costs or replacing costs and a severe drop in turnover. These factors coupled with liabilities in respect of staff and overheads, which nowadays cannot be adjusted at will, resulted in considerable losses. The reduction in turnover continues, but price levels have risen because of a drastic reduction in imports necessitated by the economic situation of the country. We hope to get our due share of the available import licences based on our past performance.

HONGKONG

As expected, the world situation caused a severe drop in the volume of the trade of the colony, particularly her intrepôt business. The Uno policy of restricting trade with China has also affected Hongkong considerably and until the Korean situation is cleared this restriction will continue. At the moment our turnover is much curtailed and prospects are obscure, but Hongkong has great resilience.

JAPAN

World conditions also affected this part of our business adversely.

SIAM

Siam is a country which on the basis of her rice sales should be prosperous and a good market, but it does not seem to work out that way and our trading departments had a difficult year.

The Siam Rice Agency, Limited, in which we are a partner, continues its work on behalf of Colonial governments.

CEYLON

Our subsidiary, Messrs E. B. Creasey and Company, Limited, had in the circumstances a satisfactory year, but in common with many other countries Ceylon found she had overspent her income and is now going through a period of adjustment.

MIDDLE EAST

Our associate company, Messrs Spinney's (1948), Limited, have extended their activities to Aden and generally their operations are yielding good results. We have, through the medium of Messrs Spinney's (1948), Limited, extended our interests in Iraq by acquiring a large part of the capital of Messrs W. J. Coker and Company, Limited, and by taking a substantial interest in a new company named Rafidain Developments Limited.

Both companies hold valuable agencies which should do well in this age of development in Iraq and the Middle East generally.

We expect soon to benefit through dividends from these increased activities.

EAST AFRICA

Messrs A. Baumann and Company, Limited, had a successful year and our interest in the company has been slightly increased.

Our timber company in Tanganyika, I am glad to say, is now earning profits and we hope will soon make a positive contribution to our revenues.

BRITISH GUIANA

Although still in the development stage, British Guiana Timbers, Limited, progresses steadily towards its objective.

CANADA

Towards the end of 1952 we acquired an 80 per cent interest in a lime-producing company in Alberta which had not been fully developed, known as Loders Lime Company, Limited. With the installation of certain additional machinery output will be very much increased and we are very hopeful that our initial venture into Canada will prove a success.

UNITED KINGDOM

Messrs Carbutt and Company (1928), Limited, had a satisfactory year. Recently the rice trade to and in this country was freed from control as from July 31st, but the prospect of taking over at a time when prices are an "all-time high" and out of line with other cereals is not a particularly encouraging one.

Mactaggart and Evans, Limited, I regret, again made a loss, but the volume of work is expanding.

Oil prospecting in Lancashire.—We started drilling at Croxteth in April last and as I write are approaching a depth of 2,500 feet. The interesting strata we expect a little lower down.

PROSPECTS FOR 1953

Prospects for this year are governed by many imponderables largely out of our control, but although trading is going to be difficult and margins small, we welcome the slow but steady movement in this country towards freeing trade and commodity markets. Unfortunately there is not yet discernible a complementary tendency in certain countries of origin without which it is going to be very difficult to give the service and standards of quality for which London markets stood in the past. It is to be hoped that even if through force of circumstances things will move that way.

I look forward to a moderately successful year.

STAFF

We continue to be indebted to a loyal and enthusiastic staff which now operates in seventeen different countries. It is a pleasure to thank them once again for a fine year's work.

The report and accounts were adopted and the dividends, as recommended, were approved.

The retiring directors, Mr J. K. Michie and Mr P. G. G. Salkeld, CBE, were re-elected and the remuneration of the auditors, Messrs Deloitte, Plender, Griffiths and Company, having been fixed, the proceedings terminated.

BLEACHERS' ASSOCIATION LIMITED

RECESSION AFFECTS PROFITS

NECESSITY FOR INCREASED EXPORTS

MR P. L. WRIGHT'S STATEMENT

The annual general meeting of Bleachers' Association Limited, will be held on Friday, July 17, 1953, at Blackfriars House, Parsonage, Manchester.

The following is the statement by the chairman, Mr P. L. Wright, which has been circulated with the report and accounts for the year ended March 31, 1953:

I hope that stockholders will welcome our decision to issue this statement with the accounts. In the past the chairman's review of the financial and trading position has been made at the annual general meeting, some four weeks after the accounts were sent out. The result was that stockholders were not able to read the review as and when they received the figures. I think that the practice we have adopted has much to commend it.

TRADING RESULTS AND APPROPRIATIONS

The association's profits for the year, before providing for taxation, amount to £456,000, compared with £1,046,000 in the previous year. Income tax and profits tax, based on the lower profits, amount to £321,000 less than a year ago. The provision made in the previous year for excess profits levy, amounting to £30,000, has been brought back to credit, since the association's "standard profits" for EPL exceed the aggregate chargeable profits. In accordance with our policy of spreading initial allowances over subsequent years, £10,000 has been brought back to the credit of profit and loss account this year, as against a debit of £31,000 in the previous year. After making these adjustments for taxation, the net profit for the year amounts to £222,959, which compares with £390,244 in 1951-52.

Arising from a settlement of our taxation liabilities up to 1949 we have brought back to profit and loss account £100,000 in respect of provisions made for earlier years but now no longer required, as we still have adequate provision to cover all our liabilities for taxation which have arisen since that date. After adding this figure of £100,000 to the net profit earned during the year and the balance brought forward from the previous year, there is a balance available for appropriation of £510,005.

You will see that the board have appropriated £50,000 to investments contingency fund, £50,000 to contingencies fund, and £100,000 to fixed assets replacement fund. We propose payment of the dividend on the preference stock and the same rate of distribution on the ordinary stock as last year—namely, 6 per cent. These preference and ordinary dividends will absorb £136,545 net, leaving £173,460 to be carried forward to the credit of profit and loss account.

BALANCE SHEET

The balance sheet this year is presented in a revised form, items having been regrouped with the object of presenting more clearly to stockholders the financial position of the company.

It will be seen that current assets at £3,474,000 are £370,000 less than they were a year ago, mainly due to a reduction of £216,000 in advances to subsidiary companies reflecting the lower stocks held by those companies. Sundry debtors are reduced by £214,000 following settlement by the insurance companies of the association's claim in respect of the fire at River Etherow Bleaching Company in October, 1951. Current liabilities and provisions at £494,000 are down by £287,000 due to lower creditors, the reduction in provision for taxation, and the transfer of £100,000 to profit and loss account to which I have already referred. Net current assets at £2,980,000 are some £83,000 less than last year.

At the date of the balance sheet the market value of quoted investments held by the Association was £64,000 below cost. There is a specific reserve of £53,029 in the investments contingency fund, and we consider that this is sufficient cover in view of the fact that the market value has increased since the date of the accounts.

Trade investments at £461,221 have been reduced by a transfer of £100,000 from investments contingency fund, representing the estimated loss on the closing down of an associated company engaged in a specialised type of work for which demand has fallen away.

During the year capital expenditure on fixed assets amounted to £213,000. After deducting the proceeds of sales and depreciation provided during the year, the figure of £5,393,430 which shows in the balance sheet is some £41,000 less than it was a year ago.

Revenue reserves and undistributed profits have risen by £76,000. This is after deducting £100,000 from investments contingency fund, to which I have already referred.

There is little else in the association's accounts which calls for particular emphasis.

The group accounts as you will see are now set down side by side with the parent company's accounts and do not call for special comment. The group profit and loss account closely resembles that of the association, the balance of profits retained in the consolidated subsidiary companies accounts amounting to £98,000.

TAXATION

Taxation continues to take its toll and even without any liability for EPL amounts to 60 per cent of our net profit. In the case of profits tax, the inclusion of cumulative preference dividends in the definition of distributed profit is particularly inequitable and bears heavily on companies whose financial structure was formed before the coming into force of the profits tax legislation. However, it is encouraging that the Chancellor in his recent budget has taken some steps to lighten the burden of taxation which has been drying up the sources of expansion and modernisation of buildings and plant. Applied to individuals and coupled with the rising trend of prices, it has almost killed personal saving. I suggest that one important way of obtaining increased productivity is to keep alive the hope that taxation will be further eased before long.

TRADING CONDITIONS

When I addressed you last year I said that the first three months of the year with which we are now dealing showed a considerable decline in our turnover and that we expected the fall to be even more severe in the following quarter, after which we might look for a subdued revival. And so it has turned out. The trade recession was maintained during the first half of the year under review and our profits dropped to a very low level. In the second half of the year, however, the volume of cloth we received for finishing showed a marked improvement, so that our results for the whole year are not altogether unsatisfactory when considered in the context of the most difficult trading conditions which the whole cotton trade has experienced.

The revival of demand experienced in the latter half of the year was mainly due to increased sales in the home market, while export business remained throughout at a low ebb. The import restrictions and controls imposed by so many of the markets which in more normal times took large quantities of bleached goods have proved a most formidable obstacle and in such cases the lowest prices and the shortest delivery terms do not count. In this matter of exports one gets the impression that the Government do not attach the same importance to the textile industry as they do to certain other trades, and there is, I think, increasing disquietude that the just claims of the industry have been so little pressed in recent trade agreements. A further matter in this connection which gives rise to some anxiety is the effect on the future of our industry of the bilateral trade agreements which are now influencing a large volume of trade in several parts of the world. When nations who have for long years been traditional customers feel that they must have recourse to barter as a mode of trading it would seem that this country will require to give some attention to the development despite the undesirable features connected with it.

Reduced output, such as we have experienced, necessarily tends to raise unit costs and it is our constant endeavour to find ways and means of increasing our productive efficiency and so minimise our costs, without impairing the earnings or the standard of living of our workpeople, and without impairing our quality of work. This question of productive efficiency is a matter of high national policy, but apart from its national importance it has a special significance for those of us who are in the textile trade, because of the competition to which we are exposed from low paid foreign labour. It is this which has been largely responsible for the loss of so much of our export trade in the past, and it is this which we shall have to face again in the future. We are, however, a service industry operating on cloth which we do not own. For that reason we cannot regulate production in accordance with a predetermined sales policy.

RESEARCH AND DEVELOPMENT

We continue, through our Research and Development Section, to keep abreast of the latest technical advances in the treatment of all types of fabric, and constantly to explore new methods and processes. Much of our fundamental research is long term and therefore of necessity not spectacular. We are, however, deriving much benefit from what has been done in the past few years. By paying especial attention to the works-scale application of laboratory work, we hope further to profit from this indispensable part of our organisation. Particularly, too, are we concerned with the mechanics of finishing. A part of this section is devoted to the study of new types of machinery directed towards the modification and improvement of existing plants. Any simplification of the chain of mechanical procedure must lead us towards higher productivity, and we are encouraged by what has already been achieved to follow up this work most assiduously. You will perhaps have noticed in the press some references to our activities in the field of mechanical manipulation of textile and other sheet materials. What was shown at the British Industries Fair of this year could only cover very briefly the beginning of a new series of "mechanical finishes" which aroused not only enthusiastic interest, but also encouraging forecasts.

THE OUTLOOK

We, in company with the rest of the cotton industry, have enjoyed a good degree of recovery from the recession which reached its worst point for us in the summer of last year. To say, however, that we can see our way ahead with confidence to the prosperity of 1951 would be to flatter the achievements of the last six months. Far too small a part has been played by the export trade and, to that extent, the recovery has only been partial. The future, as ever, is uncertain, but it would seem that any hopes of substantial progress during the current year must depend very largely on some relaxation of the restrictions imposed on textiles by countries overseas. Meanwhile stockholders can be assured that our plant is being maintained in a high state of efficiency and is in a position to obtain the maximum benefit from any increase in the volume of trade.

TRIBUTE TO STAFF

As regards our staff and our workpeople we continue to receive from them the loyal and never-failing co-operation to which we have long been accustomed. The past year has involved for some of them a measure of unemployment and for others extra efforts. Far from becoming downhearted, all have responded gallantly and no words of mine can convey to them the extent to which their labours are valued and appreciated.

IMPERIAL CHEMICAL INDUSTRIES, LIMITED

RECORD TURNOVER AND EXPORTS

MR J. ROGERS ON THREAT OF NATIONALISATION

The twenty-sixth annual general meeting of Imperial Chemical Industries, Limited, was held on June 18th in London.

Mr J. Rogers, OBE, LLD, chairman of the company, in the course of his speech said:

Your directors remain alive to the importance of adapting the company's operations and organisation to meet changing conditions. Perhaps I may be allowed to dwell a little longer on this aspect of our affairs.

Your company's activities range widely over the chemical field and indeed are not confined to that field, embracing as they do, for example, non-ferrous metals, "Lightning" fasteners, paints, leathercloth, and some semi-fabricated plastic materials. Its products are numbered in thousands and they are supplied to many industries. The organisational problems that confront your company are therefore much more complex than those experienced by undertakings concerned with the manufacture of one or two main products. Your company's research and development work is directed towards improving its existing manufacturing processes, developing new processes, developing new uses for its existing products, and to discovering new products and creating markets for them. On this work of research and development we are now spending at the rate of about £7,500,000 a year. Today we are making many products which were unknown before the war, and some of our methods of producing our older and more traditional products are very different and much more efficient than they were before the war. We can expect our new products to contribute an increasing proportion of the company's profits.

This process of change and development must go on if the company is to remain vigorous and prosperous, for the chemical industry still has great possibilities for expansion, and in expanding, it can contribute much to the national economy. Such expansion calls for more, not less, research and development and this work must be well inspired and well led. Not every research results in a new product or a better process, and it may take seven to ten years or even longer to pass from the first research result to commercial production.

Your company manufactures in many overseas countries, in most cases in association with nationals of the countries concerned; and, as our annual reports have clearly shown, our export trade is world wide. Its overseas interests are comparable in size and importance with the interests it has in the United Kingdom and are even more complex.

PLANTS AT HIGH EFFICIENCY

Here at home your company has maintained all its productive plants at a high level of technical efficiency, and we are constantly striving to improve our manufacturing processes. We are in the forefront in the study and application of modern methods of increasing productivity, and we are now giving our knowledge and experience in this field freely to British industry in general.

The steadily improving efficiency of your company's operations means lower costs of production, and these lower costs are reflected in the selling prices of our products. We have had to advance the selling prices of many of our products in recent years because of increasing costs of raw materials and rising wages and salaries, but we have been able to offset these cost increases to a considerable extent by savings resulting from improved methods and increased efficiency. As a result, our prices are, in general, lower than those ruling in America and in Europe.

You will remember that four years ago Lord McGowan told you that the whole board of ICI took the view that your company is not an appropriate subject for nationalisation. That remains the view of your board today, in whatever form State ownership is suggested. Lord McGowan also said that the board would take all proper steps to oppose the nationalisation of your company if the attempt were ever made. Let me renew that assurance. You will, I am sure, agree that it would be contrary not only to the interests of the stockholders and of those employed by your company but also to the interests of the country as a whole for ICI to come under any form of state ownership.

CHALLENGE TO BRITAIN

I have just read the Labour party's pamphlet called "Challenge to Britain." There is nothing in that document to cause me to change my view that any form of state ownership would be extremely detrimental.

The main reason given in the pamphlet for this programme of public ownership is that chemical production must expand to keep pace with the enlarged requirements of other basic industries. Of course chemical production must expand, and this is exactly what has taken place in the industry as a result of the enterprise shown by those in it. My speech today emphasises the expansionist policy which ICI has consistently pursued. ICI is meeting every demand for chemical materials made upon it in the United Kingdom, and the average level of prices is lower than that in the USA and Europe. In addition its exports have increased very substantially in volume and in value since the war and are now running at over £1 million per week. I can say without qualification that no company has a finer record of expansion and enterprise.

Why, then, should public ownership be suggested as a safeguard against possible shortages, which do not exist, and which will never occur, if private enterprise is permitted to go ahead? Surely the experience of the state-owned industries is convincing evidence that whatever else may be said about state ownership it is no guarantee that production will keep pace with increasing demand. I can only hope that those responsible for "Challenge to Britain" will give the whole subject further factual study and that in the long run wiser counsels will prevail.

TERYLENE

The plant to manufacture "Terylene" at Wilton on a large scale is planned to be in operation by the end of next year. The new articles of "Terylene" clothing which you may occasionally see in certain shops are made from "Terylene" produced at a small pilot plant at Hillhouse. After the most careful assessment of market requirements we are already putting in hand plans for a

large extension of the Wilton plant, even though the first unit of that plant is not yet in production. This is a good illustration of the point which I made earlier that an increasing proportion of the company's productive efforts is being devoted to products which were unknown before the war.

As already publicly announced, we have decided to manufacture "Terylene" in Canada as well. Pending settlement of plans arising out of the Anti-Trust case for the segregation from duPonts of our interests in Canadian Industries Limited, we have incorporated a new subsidiary, Imperial Chemical Industries of Canada, Limited, wholly owned by ICI, and this new company is going straight ahead with the purchase of land and the erection upon it of a plant to manufacture "Terylene." In this way we are taking time by the forelock and not awaiting the outcome of the protracted legal proceedings in the United States. After the proposed segregation, it is intended to offer this project to that successor company of CIL in which ICI will be the principal shareholder and in which Canadians will participate as shareholders. This procedure is in accordance with ICI's policy of regarding the successor company as the normal medium for developing manufacting projects in Canada.

Improvements in methods of producing our existing products and the reduction of costs go hand in hand with the development of new products. Your directors are also very conscious of the need to keep down the level of overhead expenditure. Special attention is being given to expenditure on central services, which is being kept to a minimum consistent with efficiency and progress.

CHAIRMAN'S RETIREMENT

I should like to finish on a personal note. This is the last occasion upon which I shall occupy this Chair. As announced to the Press immediately after the board meeting on May 15th, I am retiring both from the chair and from the board at the end of this month. I have been a director of this company since its formation twenty-seven years ago and my association with Nobels, one of the constituent companies which were merged on the formation of ICI, goes back to the beginning of the century. May I take this opportunity of thanking my colleagues for all their help, their kindness and their co-operation during my long association with them and particularly for their support since I took over the chairmanship from Lord McGowan two and a half years ago. You can be sure my successor, Dr Fleck, will be given similar support.

The report and accounts were adopted.

THE ARGUS PRESS HOLDINGS

CONTINUING POPULARITY OF PUBLICATIONS

The twenty-fourth ordinary general meeting of The Argus Press Holdings Limited was held on June 24th in London.

Mr H. C. Drayton, the chairman, in the course of his speech, said: The group profit for the year amounted to £189,100 as against £179,000 last year. After deducting expenses, directors' fees and taxation, we have £64,000 available, and if you pass the recommendation of your directors that an ordinary dividend of 17½ per cent should be paid for the year, we shall carry forward £211,400, as against £187,600 brought in.

We have in the past year, and the beginning of this year, had to face increased competition from the daily newspapers with their increased size, and this is having an effect upon our advertising revenue. We also this year have got to face another increase in wages on July 1st.

On our printing side we are meeting with more competition, and prices have become keener and more competitive. I am pleased to say that our publications are continuing to hold the favourable position they have won for themselves, and the circulation of our new periodicals—*Photoplay* and *Competitors' Journal*—continues to increase. Our printing works at Crystal Palace have continued to expand. I think you can look forward with quiet confidence to increasing profit from that source over the next two years.

Since the close of the year we have made an offer to acquire the whole of the share capital of Messrs Kelly and Kelly (Printers). Should this materialise, it will fit in with our present printing department and should make for more efficiency and a more economic basis.

As regards the prospects for the current year, we can give you some indication of what the prospects are likely to be. Up to date this year our profits are down. I think, as far as I can guide you, they will still be down at December 31, 1953, but not to any material extent or such that need unduly worry you.

The report was adopted.

MILFORD STEAM TRAWLING

The annual general meeting of Milford Steam Trawling Company, Limited, was held on June 23rd in London, Mr J. M. Whittington (the chairman) presiding.

The following is an extract from his circulated statement:

The results are most disappointing after we had been in sight of recovery last year. There is a loss of £16,881, an amount almost equal to the provision for depreciation (and we have no profits on sale of vessels this year against £17,778 last year). It is some small comfort that earnings have met outgoings in cash and the values at which our trawlers stand in the books are moderate.

The Fishing Situation.—Last year we were able to obtain a greater number of days at sea from our fleet and for this reason were able to hold our costs of operation per day at virtually the same level. But catches per day at sea were less and so the cost per lb caught rose. In other words it took more trawling to catch a given quantity of fish, although that trawling was more economically performed. In addition the average price received for our fish declined from 81s. 2d. to 74s. 2d. per cwt., a drop of 8¼ per cent: had the price remained the same, results would not have been far off last year.

It may be of interest to mention the general figures for England and Wales: the total quantity caught declined by about 1¼ per cent and the average value by 5 per cent from 5.7d. per lb last year to 5.4d. per lb this year. These figures do not sound much but they mean there was more than £2 million less to pay for running the fishing fleet. The total landings for all Great Britain amounted to 15.2 million cwt of a value of £38.9 million. The consumption of fish per head which rose from 28 lb to 30.9 lb last year fell away again to 29.9 lb; the prewar figure was 32.8 lb.

We can fairly claim that in the one department over which management has some control, namely the daily cost of operation, we have done reasonably well: the daily catch and the prices received are matters very largely beyond the control even of the most prudent management.

The report was adopted.

JOHN BRIGHT AND BROTHERS, LIMITED

SATISFACTORY PROFIT

The thirtieth annual general meeting of John Bright and Brothers, Limited, was held on June 24th in London.

Dr E. P. Andreae, chairman, in the course of his speech, said: Your company's accounts covering the twelve months to March 31st last show a net profit of £475,626, against £454,998 for the previous year. The increase of £20,628 arises mainly from the reduced provision required for taxation. On the other hand, the trading profit at £1,276,076, though highly satisfactory, is less by £115,541 than the corresponding figure for the previous year, which I then described as a record unlikely to be equalled in present circumstances.

In fact, unfortunately, we experienced a very marked recession during the second half of the year under review, more particularly in the tyre section of our business, though all departments suffered an appreciable decline in volume of business transacted. The effect of this setback was accentuated by a general fall in profit margins. Although, I am glad to say, the volume of business has improved and is still improving at the present time, the reduced profit margins are, I believe, a sign of the times, and can only be offset by a reduction in costs.

TRADING CONDITIONS

Our spinning mills have benefited from the new method of buying cotton as a result of "contracting out," and have been supplying the coarser types of yarn required by the manufacturing department on a satisfactory level throughout the year.

The Cord Fabric Section suffered from a severe setback during the second half of the year. This section of our business supplies a trade which is rather prone to fluctuations, sometimes unpleasantly violent, but they are, of course, of a temporary nature, and we can stand up to them. I am happy to be able to tell you that since March a steady improvement has taken place, and today, whilst not back to our figures of a year ago, this department is nevertheless running on a very satisfactory basis.

BELTING DUCKS

Sales of belting ducks were on a much reduced scale in the latter part of the year, and, at the present moment, there is little sign of improvement, but taking the longer view, I am confident that when stocks in the hands of our customers are back to normal, we may look forward to a steadier demand on a higher level.

Rayon.—It may interest you to know that, in the manufacture of tyre fabrics today high tenacity rayon has almost entirely replaced cotton. There is also evidence of increasing interest in the use of synthetic fibres in other sections of our business. These trends receive the closest attention of our expert technical staff, and are the subject of much experimental work. Whilst our sympathies naturally lean towards cotton, we are always ready to adapt our plant for the purpose of trying out new methods.

As to the future, your directors' report has already indicated that the present accounts do not fully reflect the results of the recession experienced. It follows that the earlier months of the current year have suffered their proportion of the reduced profits. It remains to be seen, therefore, whether the present improved volume of trade, if maintained, will be sufficient to counteract the effects of the depression before the end of the year.

The report and accounts were adopted.

TELEPHONE RENTALS LIMITED

ANOTHER SUCCESSFUL YEAR

HAMPERING EFFECT OF DELAYED CIC DECISION

PERSISTENT EFFORTS FOR CAPITAL ISSUE REWARDED

MR FRED T. JACKSON ON THE CONTINUED PROSPERITY

The twenty-fourth annual general meeting of Telephone Rentals, Limited, was held on June 22nd at the Caxton Hall, Westminster, London, S.W.1, Mr Fred T. Jackson, OBE, CompIEE (chairman and joint managing director), presiding.

The secretary (Mr G. H. Field) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman, which had been circulated with the report and accounts for the year ended December 31, 1952:

I am glad to be able to report that once more we have had a very successful year, and the forecast I made at our last general meeting of the profits for the year 1952 has been exceeded.

You will have seen by the accounts which have been circulated that the profit for the year ended December 31, 1952, amounted to £616,886, after charging £58,144 for employees' participation scheme. This shows an increase in gross profit of £151,303 over the year ended December 31, 1951. I am sure you will agree that this is most satisfactory.

The result achieved was in spite of the difficulties we had to surmount during the past year, which necessitated some restrictions on taking new business; nevertheless, we succeeded in increasing our annual rental by £157,131.

As you know, the nature of your company's business is such that it requires additional capital from time to time. The amount we can afford to spend out of our liquid resources on new installations is dependent on the margin left after meeting taxation and dividends to shareholders.

Taxation is a very serious item. You will see from the accounts before you that for the year under review we have to provide £405,282, which represents a £144,183 increase over the amount we had to provide for the year ended December 31, 1951. It is of interest that excess profits levy calls for £74,000 and profits tax £48,000.

With taxation at its present level, it is a matter for serious consideration by your directors as to whether it is worth while continuing to develop the business, in view of the difficulty of finding the liquid funds to meet the tax liabilities. We can now take into consideration the statement of the Chancellor that the excess profits levy will be abolished at the end of 1953, but nevertheless our liability for this tax in respect of the current year will be a very considerable sum. We therefore feel that we should exercise prudence and still restrict our activities to a certain extent, so that in 1954 we should be in a position to go ahead with the further development of the business.

You will observe from the accounts before you that we have tax reserve certificates amounting to £100,000. During the current year we have purchased further certificates to the value of £150,000; therefore, as far as we can judge, with restrictions on new business, we shall be able to meet our tax liabilities during the current year comfortably. The issue of 880,000 shares in December last has, of course, eased the financial position considerably.

It has always been the aim of your directors to build up the financial strength of your company, and I think that up to the present time this policy has been successful, inasmuch as the profit-earning capacity and the dividend record over many years past has been such that would merit your company's shares being designated one of the "Blue Chips" investments in Industrials.

BONUS ISSUE OF SHARES

At an extraordinary general meeting held on May 6, 1953, authorisation was given for the capitalisation of part of the share premium account by the issue of 1,120,000 fully paid ordinary shares of 5s. each in the proportion of one share for every 4,714 shares held, and these shares will rank for the final dividend for the current year under review.

This continues the policy initiated in 1951, when a bonus issue of one in ten was made, and although I am unable to prophesy that further bonus distributions will be made, it is reasonable to expect that there will be further distributions in the future, if the company continues to expand as satisfactorily as it has done in the past.

EMPLOYEES' PARTICIPATION SCHEME

Now I would like to refer to our employees' participation in profits scheme.

Recently there has been some comment at the hands of a few shareholders of the effect upon their interests by reason of the employees' participation scheme. This scheme was inaugurated in 1946 with the object of giving an added sense of partnership in the undertaking by ensuring that employees (subject to the necessary qualifications) should have a share in the profits which their efforts have helped to create. Reference thereto has been made by me from time to time in my statement which annually accompanies the accounts.

Because of the comment referred to above, your directors were of the opinion that it would be wise to have an investigation made into the scheme, and I am glad to be able to inform you that an investigation made by our own auditors has fully vindicated the directors' opinion of the scheme that it is in the interests of the shareholders and of the employees. In their investigation our auditors took into consideration all its future implications, and a full report was received from them on March 9th last. It is, I think, sufficient to epitomise their findings as follows:

The scheme, which has the merit of simplicity and easy application, has undoubtedly given a sense of co-partnership, has generated an excellent feeling of good will, and been productive of greater operative efficiency and economy, with better profit results.

The proportion of annual profit, before taxes, allocated to the scheme participants averages 10.2 per cent of such profit during the years 1946 to 1951, which cannot be regarded as a high proportion of the profits and would seem to warrant but little criticism. The increase in the amount allocated to the scheme from £21,332 gross in 1946 to £58,144 gross in 1952 is not due, in the main, to an increase in the individual participants, but to the largely increased number of participants admitted to the scheme.

The effect of inflation in relation to the background of the company's future business structure has been considered in its bearing on the scheme, and it is concluded that it would not have any penal effect, and even if it had, the company has reserved the right to amend or vary the scheme conditions.

Subject to certain suggestions contained in the report (which are recognised and have, to some extent, already been implemented), the conclusion formed is that the employees' participation scheme should continue in its present form and, in doing so, the company will not attract to itself a burden of distribution thereunder to the undue detriment of the holders of the ordinary share capital.

It is recommended that a full review of the scheme should be made periodically to ascertain its effect upon the company in the light of our changed circumstances.

SUBSIDIARY COMPANIES

The company's main operating subsidiary in South Africa has had a most successful year and is now making substantial profits. We have therefore taken the opportunity of writing off the goodwill of £16,961 which appeared in that company's balance sheet.

All the other subsidiaries of your company traded at a profit in 1952.

ACCOUNTS

I will now refer to the accounts. These are quite clear and do not require much in the way of comment.

Profit and loss account: After making provision for taxation amounting to £405,282, the transfer to general reserve of £100,000, and the dividends on both ordinary and preference shares amounting to £85,350 net, which includes the final dividend in respect of the recent bonus issue, we are left with an unappropriated balance of £122,685 to be carried forward to the current year.

Balance sheet: Taking the capital reserves first, you will see that the share premium account has increased by £41,702 to £291,032, as a result of the share issue made in December, 1952. This account has since been reduced by £280,000 by the issue of the fully paid bonus shares referred to above, and will be reduced further by the costs of the issue, when known. The only other movement in the capital reserves has been to increase the surplus on realisation of capital assets by the sum of £2,056, as a result of company-owned houses having been sold.

Under revenue reserves you will see that the general reserve has been increased by a further £100,000, bringing the total up to £650,000, which, together with the contingencies reserve of £50,000, makes a total of £700,000.

Turning to the assets side of the balance sheet, the net value of the revenue-bearing installations is £2,430,373, which lent to just under 1.6 years'

Freehold and
£81,475 shown
with the

by the disposal of certain house properties.

Amounts due from subsidiary companies have increased by £43,341 to £318,766, which is almost equally divided between the South African and British subsidiaries, and represents their working capital.

Quoted investments at cost—£10,837—is principally made up of a holding in an Australian company which is quoted on the Sydney Stock Exchange at a premium, and in total these investments are worth considerably more than the value at which they appear in the balance sheet.

CONSOLIDATED BALANCE SHEET AND PROFIT AND LOSS ACCOUNT

The only material change in the consolidated accounts is the disappearance from the balance sheet of a figure against the item of goodwill. As already mentioned, we have taken the opportunity of writing off the sum of £16,961 in respect of one of our South African subsidiaries. This leaves a surplus of £15,759, which appears under the heading of "other capital reserves."

The net profit of the group before taxation is £667,068, compared with £495,751 for 1951. After providing for taxation, the transfer to reserve and dividends the balance of unappropriated profits carried forward and attributable to the holding company's shareholders amounts to £160,998.

In conclusion, I would like to say that the year 1952 for your company was one of the most difficult in its whole history. The restriction on bank loans, and the refusal of the CIC in the early part of the year to grant us permission to secure additional capital, brought our expansion programme to a halt, and seriously hampered our activities, and the fact that we ended the year with such excellent results reflects great credit, firstly, upon the staff of all ranks for the excellent way in which they rallied round the company and performed their work in very trying circumstances, and secondly, to the directors, who refused to accept the decision of the CIC and persisted in their efforts until the necessary sanction for a capital issue was given.

Although we are obliged to continue to work in a restricted field, nevertheless I look forward to the continued prosperity of your company in the current year.

The report and accounts were adopted and the final dividend of 6 per cent, making 10 per cent for the year, was approved.

The retiring director, Mr C. P. Heseltine, was re-elected, and the remuneration of the auditors, Messrs Chas. W. Rooke Lane and Company, having been fixed, the proceedings terminated.

METROPOLITAN RAILWAY SURPLUS LANDS

SIR BERNARD DOCKER'S STATEMENT

The twentieth annual general meeting of the Metropolitan Railway Surplus Lands Company, Limited, will be held on July 9th in London.

The following are extracts from the circulated statement by the chairman, Sir Bernard Docker, KBE:

An increase in rents receivable is again the most important feature of the accounts. Net rents for the year to March 31, 1953, have increased by £24,193 to £168,511, fully confirming the expectation of expanding revenue to which I referred two years ago. After providing for taxation and the dividend of 4½ per cent which we recommend, we shall be able to carry forward £46,136 to next year compared with £45,575 brought in.

With regard to the subsidiary companies, Ortem Estates has since August of last year resumed trading and has made some contribution to earnings. We hope that this subsidiary will during the coming year find profitable use for a considerable proportion of our cash balance.

The difference between ourselves and the London Transport Executive affecting many of our properties to which I have referred before, has been the subject of negotiations which are still in progress.

I said last year that there were grounds for feeling that expanding revenue would over the next two or three years enable us to maintain the dividend at 4½ per cent, and I am glad that in spite of continued statutory rent restriction that view has been confirmed. I am encouraged thereby to take a rather longer view and can perhaps suggest, with all those reservations which unforeseen circumstances make necessary, that such expanding revenue should, after a year or so, from time to time permit of modest increases in the dividend.

ASSOCIATED PORTLAND CEMENT MANUFACTURERS LIMITED

NEW PRODUCTION RECORD

MR GEORGE EARLE'S STATEMENT

The annual general meeting of the Associated Portland Cement Manufacturers Limited was held on June 25th in London, Mr George F. Earle, CBE (the chairman), presiding.

The following are extracts from his circulated statement:

Deliveries of cement during last year by the Blue Circle Group were 7,400,000 tons, an increase of over 700,000 tons compared with 1951. Once again we have broken our previous record.

The sales of our other products were satisfactory, and exports of cement and other goods were well maintained, though some countries had to limit their imports owing to shortage of sterling.

THE YEAR'S RESULTS

The trading surplus of the group (Associated Portland Cement Manufacturers Limited, British Portland Cement Manufacturers Limited and Alpha Cement Limited) increased by £2,147,000 to £9,719,000, but after providing for taxation, including excess profits levy, depreciation and replacement of plant and machinery and other allocations, there is left for the stockholders but £75,000 more than last year. It is proposed that this small increase be passed on to them by way of a higher dividend.

If this proposal is approved our average ordinary stockholder, whose holding is £200 of stock, will receive £32 12s. 6d. after deduction of income tax at the standard rate. The dividend paid for 1938—20 per cent, or two-thirds of that recommended for last year—on a similar stockholding, and after deduction of income tax, at the standard rate, produced £29.

Wages and salaries have to a large extent kept pace with the increase in the cost of living, but company dividends have lagged far behind and it is fair to say that ordinary stockholders have had a raw deal. Surely the additional spending power, averaging £3 12s. 6d. a year—or 1s. 4¾d. a week—of our 20,000 ordinary stockholders from the proposed increase in our dividend cannot affect the inflationary position of this country very seriously, nor does it seem a sound argument for further increases in wages.

Our staff and workmen will all benefit under the profit-sharing schemes from the increased dividend and a workman with 40 years' service will have a profit-sharing bonus of £66 before tax. The average ordinary stockholder will have £60 before tax. It sounds very much like a partnership.

Once again I must point out the difficulty of providing adequate sums for replacement of existing plant and machinery at the present enhanced costs, out of profits taxed at penal rates.

Capital allowances which we are permitted to set off in reduction of tax liabilities are far too small to provide for the replacement of fixed assets. Thus, there is paid away in tax part of the trading surplus which, by all provident standards, should be retained in the business for renewals.

The country's prosperity is bound up with its industrial productivity. Industry cannot function to the maximum advantage under the tax burden it still carries. Without any doubt, the Chancellor of the Exchequer realises this as fully as those engaged in industry.

ISSUE OF NEW SHARES

Since the beginning of 1948 your group has invested large sums in the United Kingdom and overseas in capital expenditure. The total spent by the group, including the purchase of motor vehicles, amounts to no less than £18,900,000. This company alone has provided from its own resources during the same period £8,950,000 for expenditure on fixed assets and investment in subsidiary and associated companies at home and abroad.

It is obvious that the issued capital of the company is out of line with the capital permanently employed in the business. You are therefore being asked to approve an increase in the share capital and the capitalisation of certain reserves by an allotment to ordinary stockholders of one new share for each £1 of ordinary stock already held. Needless to say this does not carry any implication that the total amount to be distributed by way of future dividends will be any greater than it would be if the capital had not been increased.

Our 11,000 staff and workmen, under their profit sharing schemes, receive dividends on their notional shareholdings. These shareholdings will be doubled in the same way as those of the ordinary stockholders if this proposal is adopted.

PRODUCTION IN 1953

Four of our largest works were temporarily closed down owing to the floods and we lost more than 50,000 tons of output.

The demand at home is greater than we can supply, but the new kilns at Hope and Mason's works are running. This, together with the technical advances we have made, should enable us to show you good production figures for this year.

It is our duty to keep the home market supplied and for this reason we are importing cement from the Continent. We sell this cement at the home trade price, which is still the lowest in the world, and as the selling price is considerably less than we pay, it is an expensive business.

The export demand is still excellent, and fortunately the prices are good.

The report was adopted.

BANK OF BRITISH WEST AFRICA, LIMITED

GENERAL EXPANSION OF BUSINESS

LORD HARLECH'S REVIEW

The fifty-ninth annual general meeting of the Bank of British West Africa, Limited, will be held on July 14th, in London.

The following is an extract from the statement by the chairman, the Rt Hon Lord Harlech, KG, GCMG, circulated with the report and accounts for the year to March 31, 1953:

The balance sheet and profit and loss account are before you, and the results are clearly a matter for satisfaction. The figures indicate a general expansion of business, and represent a partial fulfilment of our aim to keep abreast of the many economic developments taking place in West Africa.

BALANCE SHEET FIGURES

A sum of £50,000 has been taken from profits and added to reserve fund, raising the total to £1,100,000. A further sum of £125,000, also taken from profits, has been placed to contingencies account.

Current, deposit and other accounts at £58,773,777 are higher by £4,206,800, compared with last year.

Liabilities on acceptances, confirmed credits and other engagements on behalf of customers at £7,630,591 are down by £1,717,985, and give an indication of a more cautious policy being followed by trading companies, many of whom have made serious endeavours to reduce their stocks during the year. When this situation has been corrected, we may confidently look for a revival of business under credits; meanwhile a healthier aspect in relation to stocks on hand is apparent.

On the assets side, our cash holdings at £6,766,164 are down by £1,046,781, while money at call and at short notice is higher by £4,760,714. At first sight these figures may perhaps suggest an over-liquid position, but the necessity for having ample funds at our disposal to finance the requirements of seasonal crops in West Africa is of paramount importance, and experience shows that practically the whole of our available funds are fully engaged during marketing periods.

Loans, advances and other accounts at £12,295,375 are lower by £2,328,927 and reveal a downward tendency in the flow of facilities required for the renewal of trading stocks. This trend is a normal one in a period when a heavy clearance of accumulated merchandise is taking place.

DIVIDEND DECISION

Your directors have given careful consideration to the payment of a dividend in a year that has shown a higher profit ratio, which it is felt may justify optimism to the extent of proposing an increased distribution. I, therefore, have pleasure in recommending the payment of a final dividend at the rate of 7 per cent, which, with the interim dividend of 3 per cent paid in November, 1952, will make a total of 10 per cent for the full year.

I think you will know that our dividend policy has always been elastic and in this respect it differs from that of most of the larger English banks. In good trading years we have felt justified in proposing a higher distribution, while in periods of recession it has been necessary to adopt a conservative attitude. It gives me pleasure to make the present recommendation, and I might add that this is the third occasion in the history of the bank that 10 per cent has been paid, the previous instances being in the prosperous years of 1908 and 1920.

NEW OFFICES

New branches have been opened at Hohoe, Sunyani, Tudu (Accra) and Keta on the Gold Coast and at Aba, Ilesha, Sokoto, Warri and Apapa in Nigeria. Attention is being paid to other areas where new developments are taking place.

We have an extensive building programme on hand, in relation to newly established branches, the modernising of existing offices, and the provision of additional residential accommodation for our staff. Although steady progress is being made, it will be several years before the schemes now under way are completed. The reconstruction of our principal office at Lagos, a major operation in itself, has been long drawn out. However, there are real hopes of its being finished within the next twelve months.

WEST AFRICA'S WEALTH

West Africa contributes a variety of products to world markets from her agricultural and mineral wealth. Although there is a tendency towards lower prices, the tonnage output of most of these products is well maintained, with the possible exception of timber and rubber, which are meeting fierce competition from other sources of supply.

With its varied range of exportable commodities, West Africa is able to insulate itself to some extent against possible recessions, as experience shows that slump conditions rarely involve more than one or two products at a time. Few tropical countries of such size have so much to offer, and West Africa is fortunate in being able to export extensive quantities of cocoa, groundnuts, palm oil, palm kernels, cotton, timber, gold, manganese, tin concentrates, iron ore, rubber, hides and skins, etc., the demand for which continues to be favourable.

A considerable change has taken place in the level of stocks of consumer goods in the hands of merchants since I alluded to this problem a year ago. Outward shipments to West Africa have been curtailed, and this, coupled with a successful period of retail selling, has resulted in a reduction of surplus stocks to a wiser level. This process has entailed some price cutting, but there have been few instances of panic sales, although reduction of profits has been frequent. Price adjustments in relation to existing stocks of consumer goods are now almost over, and a further writing down should not be necessary.

The most urgent needs of these colonies at the present time are in respect of nearly all types of building materials and more skilled technicians for the development of their resources. It is clear that West Africans are far-seeing people where the future of their country is concerned and there exists ample evidence that they are increasingly prepared to take a long-term view of the tasks that lie ahead of them.

Our bank has had a long history and extensive experience throughout West Africa, and, having sufficient financial resources at its disposal, coupled with a progressive policy, is ready to take its full share in the many tasks and opportunities that lie ahead.

ATLAS ELECTRIC & GENERAL TRUST, LIMITED

INCREASED INCOME AND DIVIDEND

The forty-fifth annual general meeting of this company was held on June 18th in London.

The Rt Hon Lord Remnant, MBE, chairman of the company, in the course of his speech, said:

When I addressed you last year I did not venture far into the realms of prophecy as to the results of the year which we are now reviewing. I did say, however, that on the one hand we did not expect our gross investment income to show as large an increase as in the previous year—namely, £86,000, and that on the other hand we did not expect it to fall below the income of that year.

In fact, the results have come out about halfway between these two extremes and we record an increase of £47,805 in our gross income from investments, the total of which is £681,136. Commissions, rents, and management fees at £8,603, and commissions on "free" underwritings of £4,101 both show a small increase. A profit on exchange of £861 and transfer fees of £243 bring our total income from all sources up to the record figure of £694,944, an increase of £51,007.

The balance of net revenue for the year is £306,429 compared with £279,918 in the previous year. We propose to increase the dividend on the ordinary stock from 5 per cent to 6 per cent. Out of our total net revenue we have distributed 71 per cent in interest and dividends and applied 29 per cent to increasing the general reserve and the amount carried forward.

PROSPECTS FOR CURRENT YEAR

One need never look very far to find discouraging features, and they are numerous today. Our country's export trade is having to contend with greatly increased competition, and business is increasingly hard to get and to hold. Company reports now being issued more frequently show a contraction than an expansion in profits. The fear of a recession in business is always round the corner. There is tension in Egypt and uncertainty in South Africa. We cast anxious eyes on Kenya and Malaya. At home ever-recurring demands for increased wages, and a fall in production, constitute threats to our slow recovery.

But there are encouraging signs also. Looking back over the past year, and particularly to the uncomfortable position a year ago, we can see a substantial recovery in our national finances, which has obviously given Mr Butler, the Chancellor of the Exchequer, more room to manœuvre. His new approach to the question of taxation inspires confidence in the future, and we can hope that the imperative necessity to give industry a greater measure of relief from taxation has been realised.

The shackles which trammel industry are gradually being removed. Our great industrialists are shaping events to their pattern and not waiting for changing conditions to convert prosperity into disaster. The Commonwealth Conference last December and the recent Commonwealth Prime Ministers' Conference have shown a unity of purpose and resolve which augurs well for the future.

With all these considerations in mind, I feel that we may experience some individual disappointments in regard to our revenue during the current year, but the final result should not be very different from the year just ended. In that case we should be able at least to maintain the present rate of dividend and at best continue the satisfactory rate of progress of recent years.

The report and accounts were adopted.

LONDON ELECTRIC WIRE COMPANY AND SMITHS, LIMITED

RECORD CONSOLIDATED PROFITS

The forty-fourth annual general meeting of the London Electric Wire Company and Smiths, Limited, was held on June 24th in London.

Mr A. Noel Smith presided in the absence through indisposition of the chairman and managing director, Mr W. J. Terry, and read his speech, from which the following is an extract:

The consolidated profits for the year at £1,307,110 are £89,891 higher than for the previous year and constitute a record for the group. Although there was an increase in earnings, the resultant profit of £510,580 after providing for taxation—including Excess Profits Levy, which appears for the first time—is lower by £29,241 than in the previous year. Taxation therefore absorbs 61 per cent of the profits, or the equivalent of 12s. 2d. in the £. The trading results for 1952 fully support the recommendation of a distribution of 15 per cent, described as "10 per cent dividend plus a Coronation bonus of 5 per cent."

The penalising effect of taxation still continues to be a heavy burden upon industry, and effective relief can only be achieved by substantial retrenchment in Government expenditure.

HOME AND EXPORT SALES

For the year under report our home sales were greater than in the previous year, both in volume and value, the value, of course, being influenced by the high price of copper. Our direct export sales were somewhat lower than in 1951. The electrical industry has, however, a vast export business of which our products are an integral part, the extent of which cannot be determined.

Since our last meeting the Monopolies and Restrictive Practices Commission have published their report on their inquiry into our industry, and it is very difficult to believe that some of their recommendations are necessary in the public interest. If the Commission's recommendations are insisted upon, it will imperil the existence of trade associations which have done so much to build up British industry and were essential in providing during the war a channel of communication between the Government and the various industries manufacturing vital equipment. They are equally essential in existing circumstances to encourage a common effort, ensure general progress and provide the necessary co-operation with trade unions.

THE FUTURE

Now that there is a measure of relief from Government control our necessary capital commitments for extensions and new plant for both home and abroad are approaching £800,000. Our financial results are greatly influenced by the load on the factories. A heavy load means satisfactory profits, whereas during a period of restricted trading our results are more than proportionately affected by reduced turnovers, because our factories are to a great extent laid out for mass production; in other words, good results, such as now reported, are dependent upon constant demands from our customers to provide the requisite load.

Our liquid resources will be required and should be adequate to finance larger copper stocks and the extensions already mentioned. In the circumstances, I feel that the future can be faced with confidence.

The report and accounts were adopted.

LAMBERT BROTHERS

EFFECT OF FALL IN FREIGHT RATES

The fiftieth annual general meeting of Lambert Brothers, Limited, was held on June 25th in London, Mr R. Rattcliff Steel (the chairman) presiding.

The following is an extract from his circulated statement:

The consolidated profit and loss account shows profits for the year amounting to £752,580 before deducting taxation, which absorbs £391,214.

After deducting the preference dividend, the 5 per cent interim dividend already paid, the final ordinary dividend of 15 per cent and a bonus of 5 per cent, there is left a sum of £279,311. To this is added the balance of £732,400 brought forward from last year and a sum of £2,945 released from taxation provisions no longer required, making a total of £1,014,656 for further appropriation. The sum of £223,640 has been put to fleet replacement reserve, leaving £791,016 which it is proposed to carry forward.

We also propose to repeat the payment of 2½ per cent on the ordinary stock out of realised capital accretions, which does not attract any form of tax in the hands of the stockholders.

GREATLY STRENGTHENED BALANCE SHEET

Though, with the fall in the freight market, the profits for the year under review are much reduced, they still exceed those of any year prior to 1951. Practically every branch of our business is linked in one way or another to the freight market, so that from year to year considerable variations in the profits must be expected.

Your board consider, however, that it is in the best interests of the stockholders that the dividends should not fluctuate proportionately, and it is with this object that after repeating last year's dividends it is proposed to increase further the reserves and carry-forward.

It will, I am sure, be appreciated that the transfers to fleet replacement and general reserves and the increased carry-forward greatly strengthen the consolidated balance sheet.

The fall in freight rates from the abnormally high levels of 1951, to which I have already referred, was most marked from the spring of 1952. Nevertheless, the vessels of your subsidiary company, Temple Steamship Company, Limited, continued to trade satisfactorily throughout the year and enjoyed in some measure the benefit of charters arranged previously at rates considerably higher than those currently ruling throughout the major part of 1952.

Unfortunately, however, running costs have continued to rise and at today's general level of freights there is little margin of profit.

In addition to our own Temple ships, our ship management department continued to operate several vessels for clients.

The first of the two new motor vessels for the Temple Company is expected to be delivered in October or November of this year, one or two months later than expected. In view of the serious difficulties with steel deliveries with which the builders have had to contend, this can be regarded as satisfactory.

I have no doubt the stockholders would like me to express my views on the future, but I feel that in the present still unsettled state of the world it would be dangerous to do so. So far this year there has been no material improvement in freight levels.

The report was adopted.

THE FORESTAL LAND, TIMBER AND RAILWAYS

The forty-seventh annual general meeting of The Forestal Land, Timber and Railways Company, Limited, was held on June 24th in London, Mr Gerard d'Erlanger, CBE, ACA (the chairman), presiding.

The following is an extract from his circulated review: Last year I stated that owing to a serious recession in the tanning trade the results for 1952 could not be so successful as the record results for 1951. The results of our sterling subsidiaries do in fact show an improvement though admittedly the profits of La Forestal Argentina have declined. The improvement is due to the sustained demand by the tanning trade for our wattle extracts during the latter half of the year.

The profit, after taxation, was £1,142,117, an increase of £184,679 attributable principally to the increase in earned profit at £1,492,195 of £128,468 and increased profit on sale of investments of £92,865.

The results before you, we believe, justify your board's policy of encouraging and developing the activities of the constituent companies of the group in South Africa, Rhodesia and Kenya.

In view of the considerably strengthened position of the group, it is your board's intention at an early date to capitalise reserves by way of a bonus issue of one ordinary stock unit for every four ordinary stock units or bearer shares held.

Your directors feel confident, barring unforeseens, the profit for 1953 will be sufficient to maintain the present dividend (12 per cent) on the increased ordinary capital.

The report was adopted.

THE INDUSTRIAL AND GENERAL TRUST

The 65th annual general meeting of the Industrial and General Trust, Limited, was held on June 18th in London.

Mr L. A. Stride, the chairman, in the course of his speech, said:

For the eighth successive year our gross income constitutes a record and for the first time has exceeded one million pounds. The actual figure is £1,054,767, an increase of nearly £71,000 over last year. Income tax and profits tax absorbed some £33,000 more, bringing our total direct liability for taxes up to approximately £451,000. Our net income is then nearly £50,000 up on last year.

The transfer to general revenue reserve is £120,000, bringing it up to the very substantial total of £1,420,000. We recommend a final dividend of 20 per cent on the ordinary stock, making 30 per cent for the year. These payments will absorb £214,156 and leave to be carried forward £331,915, which is £12,544 more than we brought in.

Although the peace and stability of the world seem less imperilled than for some years past, it is still not possible to foretell with any accuracy what the future holds for the Trust. Your directors are confident, however, that their conservative handling, over the years, of the finances of the Trust has provided it with the strength to withstand adversity or to benefit from any period of prosperity.

The directors recommend the capitalisation of a part of the reserves which will be used in paying up in full new ordinary shares of £1 each, which will then be distributed on the basis of one new share for each £1 stock held.

The report was adopted and the capitalisation proposals and share issue were approved.

N. GREENING & SONS, LIMITED

INCREASED TURNOVER BUT REDUCED MARGIN OF PROFIT

The seventy-first annual ordinary general meeting of N. Greening & Sons, Limited, was held on June 24th at the company's office at Warrington.

Mr C. G. Fraser, the chairman, presided. The following are extracts from his circulated statement:

It is with sincere regret that I have to record the resignation during the year of Mr H. R. Yorke, who had been a director of the company for sixteen years and chairman for the last ten years. The company has made very substantial progress during the period of Mr Yorke's chairmanship and I am sure shareholders will wish to join with the directors in recording their appreciation of his services to the company, and in wishing him improved health in his retirement.

In view of the difficult trading conditions commonly experienced during the year I feel that the final results can be regarded as very satisfactory. Group sales exceeded those of the previous year by nearly 20 per cent and thereby established a new high record, although various factors have resulted in a reduced margin of profit.

ACCOUNTS

The trading surplus for the year as shown in the consolidated income statement is £238,620, as compared with £271,604 last year.

Net profit, after taxation, is £90,823 as compared with £103,352 last year, and in determining their dividend policy your directors have again considered what further appropriations from taxed profits are required in order to maintain the real capital employed in the business. They feel that further appropriations to fixed asset replacement reserve (£15,000) and general reserve (£39,461) should be made, but they also feel that shareholders can reasonably expect some increase in dividend in recognition of the increased capital employed in the business. They have, therefore, provided for a final ordinary dividend of 10 per cent, making 12½ per cent for the year which is, in effect, an increase of 2½ per cent after making allowance for the share-for-share bonus issue made during the year.

On the balance-sheet, you will see the effect of the capitalisation of reserves and the issue of bonus shares and it is a measure of the growth and stability of the company that in spite of this capitalisation the total of the reserves still exceeds the issued ordinary capital.

TRADING CONDITIONS

Sales of the parent company covering woven wire, perforated metals and wire products established a new high record but the size of the order book has been reduced and the current rate of orders received is appreciably below the average rate of sales for the year. Export sales have been further increased in face of considerable difficulties—particularly in South America—and we have recently made a fresh approach to the North American market.

Development work on our electrolytically formed mesh marketed under the trade name of "Perflec" has proceeded satisfactorily and we are now able to produce this speciality in continuous roll form subject to certain limits of width and mesh count. Perflec has properties not possessed by either woven wire or perforated metals and a number of interesting and novel applications have come to our notice during the year.

The Greening Wire Company has had the benefit of increased steel supplies during the year—both home and imported—and this has enabled us to restore production to a more satisfactory level. Conversion margins have been narrowed by increased costs outside our control, but the higher throughput has been a compensatory factor. In the final outcome this subsidiary has been able to make a useful contribution to the group profits.

F. and G. W. Stonier and Company have experienced a very difficult year owing to the short-time working in the paper industry. Progress with the new factory buildings at Warrington has been held up both by licensing delays and steel shortages, but we have every hope that we will be able to commence the transfer from Manchester to Warrington during the current year.

OUTLOOK FOR THE CURRENT YEAR

Our main products are an essential consumable requirement for almost every industry and there is, therefore, a strong tendency for our sales to show a broad reflection of general business activity. Over these last six months there has been a definite falling off in demand, but there are indications that in part at least this may be a temporary phase arising from the difficulties common to all industries when delivery periods are shortened and the outlook changes from a "sellers'" to a "buyers'" market.

The report was adopted.

VENT-AXIA LIMITED

NEW RANGE OF IMPROVED MODELS

The seventeenth annual general meeting of Vent-Axia Limited was held on June 25th in London, Mr J. C. Akester (chairman and managing director) presiding.

The following is an extract from the report of the directors:

The company's trading profit for the year ended March 31, 1953, was £85,723. Although this is less than last year I do not think it is on the whole an unsatisfactory result. In 1950-51 we were seriously hampered by material shortages with the result that we ended that year with an abnormal backlog of orders. We managed last year (1951-52) to increase production sufficiently to catch up the arrears and build up stocks so that we reaped some of the benefit of sales made in the previous year. This year (1952-53) the home market continued to improve and despite the set-backs on the export side due to the temporary closing of certain countries the value of orders booked during the year was much the same as in the last.

Net assets are now £124,474, an increase of £13,579. Stock and work in progress has risen by £13,745; the increase is mainly due to the introduction at the end of March of our new range of improved models, production of which has taken place throughout the year.

Taxation takes its usual heavy toll and includes this year a full 12 months' excess profits levy. £10,000 has been placed to general reserve as against £20,000 last year and your directors recommend payment of a final dividend of 37½ per cent (less tax), making 62½ per cent (less tax) for the year. This leaves a balance carried forward in profit and loss account of £14,474.

While it is too early to gauge the effect on our sales of the new Vent-Axia Reversible which we recently put on the market the initial reception has been encouraging and we hope to be able to report a favourable reaction in the next year's results.

The report was adopted.

W. T. HENLEY'S TELEGRAPH WORKS COMPANY, LIMITED

SIR JOHN DALTON'S REPORT

The annual general meeting of W. T. Henley's Telegraph Works Company, Limited, was held on June 19th in London.

Sir John Dalton, AMIEE, FCIS., the chairman, presided.

The chairman, in the course of his speech, said: The net current assets—that is, the current assets less the liabilities—are £6,612,000, or some £2,400,000 more than at the end of 1951.

The market value of our trade investments exceed their book value by almost £1 million.

The balance in our trading account for the year is £1,364,135, which is within £5,000 of the balance in 1951.

The net profit of the parent company for the year at £594,554 shows an increase of £60,391 over the previous year, that is, an increase of 11.3 per cent.

We have transferred £300,000 to general reserve, the total of which reserve now stands at £3,100,000.

It is proposed to pay a final dividend of 8 per cent, which, together with the interim dividend of 5 per cent already paid on the £2,437,500 of ordinary stock becomes equivalent to 10½ per cent on the ordinary stock, issued at the end of the year.

Our subsidiary companies—Henley's (South Africa) Telegraph Works Company, Limited, and Oakley Brothers, Limited—both showed expansion during the year. Our other subsidiary—Henley's Tyre and Rubber Company, Limited, however, suffered a setback in common with a serious recession in the tyre industry generally.

As an example of the attitude taken up by your company in present changed circumstances, you may have noticed that we tendered for and obtained a contract in America a few weeks ago for the Seattle City Light Department against tenders from both British and American cable makers. We were nearly £20,000 under the nearest American bid.

EXPORTS

Exports represent an important part of our business, but, during 1952, we were handicapped both by copper rationing and the restrictions upon imports imposed in our principal overseas markets. Nevertheless, our export sales increased in relation to 1951 by approximately 10 per cent.

FUTURE PROSPECTS

The special problems which we face today are in the nature of things unusual and transitory, but they have a bearing on the immediate future. Impediments to progress, outside our control, arise from a variety of causes. Financial stringency overseas and credit restrictions at home have resulted in our company being obliged to accept deferred payments or asked to delay shipments, and indeed, at home we have found ourselves financing other industries to a certain extent. There was an overstocking of cables by the nationalised and other industries during the time of scarcity, and we now await the entry into the market of our larger h[illegible] soon as current stocks of cable [illegible]

On the other hand, [illegible] an industry coup[illegible] linked inev[illegible] indust[illegible]

keenness of foreign competition in world markets. The British Electricity Authority is fully alive to this necessity and is planning accordingly.

Thus there must be a continued and even expanding demand for our products. There is already a pent-up demand awaiting release as our more urgent national problems become solved.

The report was adopted.

JACKSON THE TAILOR LIMITED

ALL-ROUND IMPROVEMENT

The twenty-first annual general meeting of Jackson the Tailor Limited was held on June 24th at Newcastle-upon-Tyne, Mr Lionel Jacobson (chairman and joint managing director) presiding.

The following is an extract from the chairman's circulated statement:

Retail trading is steadier than for some years past. Our customers can now buy a well-made suit of excellent material styled to their individual requirements at a price which they can afford to pay. A competitive market now exists, and only on such a basis can increased turnover be regarded as healthy. I am happy to announce record sales for the year to January 31, 1953, and that sales to date are such as to dispel any anxiety for the current year.

We are careful to keep warehouses, works and retail stores up to the highest level of modern standards. Two branches opened recently in Oxford Street, London, and New Street, Birmingham, have already firmly established themselves. We have plans for steady expansion of the retail organisation.

The all-round improvement in the financial position is obvious and our trading profit is slightly higher than that of the previous year.

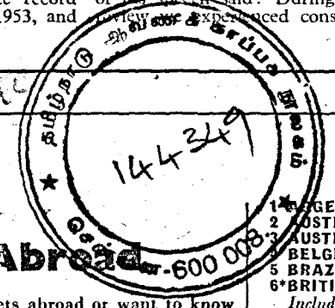
The past two years have shown me the strength of the group as a whole. I have confidence in those about me to strive to maintain our place in the forefront of our particular trade. More important still, we carry the confidence of the public.

The report was adopted.

VAB PRODUCTS

SATISFACTORY RESULTS DESPITE DIFFICULTIES

The sixteenth annual general meeting of Vab Products Limited was held on June 19th in London.



Mr Ivor Lloyd, AMIAE, FCS, MInstBE (the chairman), presided, and in the course of his speech said: During the year under review we experienced considerable difficulties with raw materials for more than one of our subsidiaries, and this, added to import restrictions abroad, has made it a difficult year for us and many concerns, as you will have noted in the Press, and as I forecast at our last annual general meeting. Nevertheless, I think that the result of 1952's trading is satisfactory.

You will note that the trading profit amounted to £56,642 for the twelve months ended December 31, 1952. Of the residual profit of £37,349, taxation absorbs £23,792, and it is very difficult to see how industry can carry the burden of such enormous taxation indefinitely. There is, however, one bright spot in that EPL will no longer operate after this year.

Conditions are still difficult and do not encourage any reliable forecast of future trading, but I am glad to state that all our factories are working at a higher level than during the corresponding period last year and we face the future with confidence, though in these days of keener competition one will find, in common with others, that margins are finer. This fact encourages your board to adopt the latest methods of production in all its subsidiaries, while retaining the high quality of our products.

Your directors are pleased to recommend a final dividend of 7½ per cent, making a total of 12½ per cent for the year. Not as much as last year, I agree, but in keeping with the trading and profits of your company.

The report was adopted.

Marketing Abroad

If you are seeking new markets abroad or want to know more about your present ones, the quarterly reports by The Economist Intelligence Unit will help you. These reports give concise and up-to-date analyses of economic and business conditions and prospects in other countries, and they contain a wealth of information of value to the exporter and investor. Each report is prefaced by a summary of the main facts and conclusions, and contains a comprehensive statistical appendix supplemented by maps and diagrams.

This service of reports was started by the Unit last year. From the outset the demand was large and came from many parts of the world, and in response to requests from subscribers the list of countries included in the service has been extended. Fifty reports are now published every quarter on a total of seventy territories.

THE ANNUAL SUBSCRIPTION to these reports is £10 per country or group of countries; single copies may be obtained for £3. Discounts up to 30 per cent. are available on subscriptions to reports on more than five countries.

Descriptive leaflets and a specimen copy of the reports may be obtained from:
