Water to your liking, Mr. Wishart?

In our homes we have come to take it as a matter of course that the turn of a tap will provide a limitless supply of the purest water. And rightly so. But in industry, water can play havoc with boilers and water installations by causing corrosion or scale formation, adding much to the burden of maintenance and cost. Experience has shown that the treatment of such water with small quantities of sodium metaphosphate (*Calgon*) will end these troubles. Albright & Wilson, who manufacture this and many other phosphates, maintain a Water Treatment Advisory Service for industry.

FACIT LX

for British calculating problems

Designed exclusively for British Business.

ASSEMBLED IN BRITAIN

The FACIT LX—with large 10-10-15 capacity—is ideally suited to meet the demands of our British systems. Incorporating check register, full tens' transmission and tens' carryover, the LX provides fast, positive figuring with the simplified 10-key setting—and can be mastered in minutes by any member of your staff.

Write for details—or ask for a free trial—without obligation

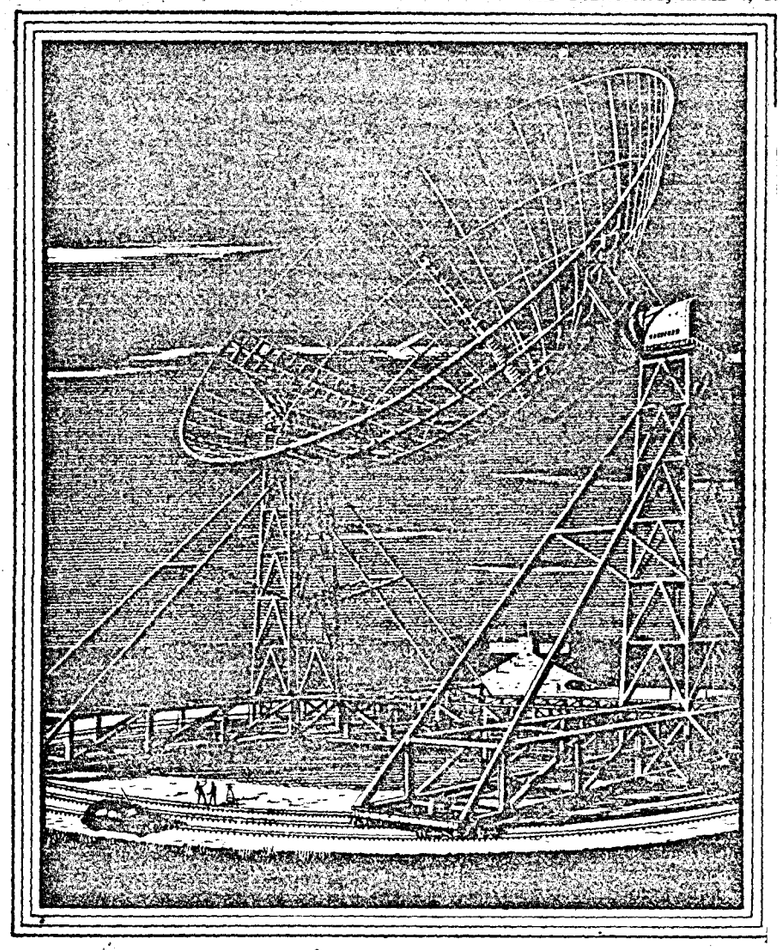
HANGARS

are needed all over the world—

and S·M·D is supplying them!

S.M.D. Aluminium Hangars are permanent buildings, directly competitive in cost with steel or concrete . . . *plus* STARTLING erection times . . . and, of course, no painting is required. Let us send you details.



ALMIN LIMITED · FARNHAM ROYAL · BUCKS

FARNHAM COMMON 595

Aluminium Hangars are built by S.M.D. ENGINEERS of Slough, the construction company of the Almin Group.

"If it's Aluminium - ask Almin,"

There's a future in STEEL

BRITAIN'S ASTRONOMERS will soon have a new way to the stars. Two thousand tons of steel are going into the building of a giant steerable radio telescope at Jodrell Bank in Cheshire. With this instrument, the first of its kind in the world to be built on such a huge scale, Britain's scientists will be able to receive radio waves from stars far beyond the range of the largest optical telescope. Here is a new method of penetrating the great dust clouds which until now have prevented mankind from exploring the vast regions of outer space.

This radio telescope contains a steel bowl weighing 300 tons, supported on steel towers 180 feet high. The whole instrument above ground weighs well over 1,000 tons. It rides on a circular railway and can be aimed at any part of the sky.

The steel industry is supplying the material for this and many other new projects and is constantly developing new steels to meet the changing demands of modern industry, science and engineering.

'What about my future?'
says
JACK SCRAP

The steel industry still needs all the scrap which engineering firms and other steel-users can send back. Search out every ton of scrap on your premises. Your local scrap merchant will help with dismantling and collection.

TRADE INDEMNITY COMPANY

INCREASE IN CLAIMS PAID

SIR JOHN MAKINS ON COMPANY'S FUNCTIONS

The thirty-fifth ordinary general meeting of Trade Indemnity Company, Limited, was held on March 31st in London.

Sir John Makins, the chairman, presided.

The following is an extract from his circulated statement:

Turning first to the underwriting accounts, the gross premiums earned in 1952 came to £1,064,055, as against gross claims paid, less salvages, £294,355 (28 per cent). After deducting brokerages and reinsurances from the premiums, our retention was £312,535, and, after deducting claims recovered from reinsurers from claims paid, our retention was £84,900 (27 per cent).

You will, doubtless, be struck by the increase in claims paid in 1952 (£294,355) compared with 1951 (£60,902). The corresponding figures of net retention were £84,900 and £19,074. The chief cause of this increase was the difficulties which arose in the textile trade in the second half of 1951 and in the early part of 1952, and which were, of course, precisely the kind of difficulties against which your company seeks to provide protection. This affected 1950 and 1951 policies in the main. Apart from that special factor, however, I do not think there can be much doubt that we have left behind the exceptional conditions of the war and immediate postwar years and have entered a phase when normal trade fluctuations will again have their effect on our operations. Nevertheless, the overall position as revealed by the combined figures of premiums and claims in 1952 is not discouraging.

The balance of the underwriting accounts transferred to the profit and loss account is £151,547. Adding £31,545 interest on investments and other income (gross) and after providing £102,432 for taxation on income in the account (56 per cent), the net profit for 1952 is £80,660. To this must be added the balance of £111,454 brought forward from 1951, less £50,000 capitalised and applied in paying up 50,000 £1 shares issued to members in 1952. The result is an amount of £142,114, out of which the directors recommend payment of a dividend of 10 per cent, less income tax. On the present paid-up capital this will absorb £18,375 and, following precedents of last year and the year before, I will again anticipate the proceedings of the extra-ordinary general meeting, which has been called to follow the annual general meeting, by mentioning the proposal to increase your company's capital by £50,000 for the third year in succession, thereby bringing it up to £400,000 in fully-paid £1 shares.

GENERAL REMARKS

Before I close I should like to add a few general remarks on the activities of your company and what we are trying to achieve.

Primarily, we are attempting to apply the principles of insurance to the risk of loss which may be sustained by a merchant or manufacturer due to the insolvency or protracted default of a customer to whom he sells goods on credit terms. In short, and without going into a lot of technical details, we are successfully combining with the function of insurance that of credit consultant. Our experience to date is that this combination is more appreciated and more beneficial than the alternative of mere reliance on the judgment of the insured with safeguards against overtrading. Our system obviously involves heavier expenses, but provided the expenses save even heavier losses it is to everyone's advantage.

Finally, a few words about export credits. The trade indemnity was originally founded with the idea of assisting British exporters to recapture their overseas trade which had been lost or restricted by the 1914-1918 war. Yet at no time have the company's foreign commitments amounted to 50 per cent of its portfolio and today they are considerably less than 25 per cent. The explanation of this involuntary change of objective is not far to seek. In part, it is due to the progressive increase in the political element in risks on overseas customers and, in part, it is due to the activities of the export credits guarantee department of the Board of Trade. The latter has been able to give British exporters protection against exchange transfer restrictions, frustration of contracts through cancellation or withdrawal of import or export licences or the imposition of prohibitions, and against non-payment directly due to war. For private enterprise to vie with the State in covering these contingencies would have been completely unrealistic and unsound.

Nevertheless, we continue to keep in very close touch with international affairs, and we have certainly not allowed our international connections to atrophy. It so happens that this year our general manager, Mr Patrick, is president of the International Credit Insurance Association which, as its name implies, is an association of credit insurance companies, each operating in a different country. At the end of April the association will meet in London and we hope that on that occasion a great deal of useful work will be done on international problems of credit insurance affecting not only the commercial aspect of the business, but also the political aspect.

The report and accounts were adopted.

ERICSSON TELEPHONES

SIR HAROLD WERNHER ON THE TAXATION BURDEN

The fiftieth ordinary general meeting of Ericsson Telephones, Limited, was held on March 31st in London. Mr T. Kirkham, vice-chairman, presided in the unavoidable absence of the chairman, Sir Harold A. Wernher, GCVO, whose speech he read. The following are extracts:

Successive Governments have found it convenient to treat industry as a major source of revenue; look at the balance sheets of public companies today and you will find that well over half the profits earned are taken by the State, and this is in addition to the very heavy charges borne in other directions, such as local rates, State insurances, purchase tax and the like.

Greater taxation relief might at least be given to that portion of a company's profit which is retained in the business, as it is mainly upon this that the replacement of obsolete and worn-out machinery at today's greatly enhanced prices, as well as the expansion and development of a business, must now rely.

Heavy taxation dulls incentive and discourages thrift, it fosters extravagance by the State and leads to high costs, reduced exports and a lower standard of living for all. Industry must be relieved of some of the burdens which handicap it in these postwar years.

Although the outlook is somewhat obscure and subject to world conditions, we have commenced 1953 with a good order book and I feel confident that we shall be able to maintain our strong position and a full measure of employment in our factories.

The report was adopted.

LAW LAND COMPANY

INCREASED NET PROFIT

The seventieth annual general meeting of the Law Land Company, Limited, was held on March 31st in London.

Mr M. E. F. Crealock (chairman and general manager), in the course of his speech, said:

It is with the greatest regret I have to report the death of Mr Langdon-Sparks, which occurred in June last. Mr Langdon-Sparks spent practically the whole of his working life with your company and I know you feel with me we have lost not only a colleague but a true friend.

The accounts show a net profit for the year of £35,292, compared with £26,850 for 1951, and you will no doubt wish to have my explanation of the increase of £8,442. Rents are up by £15,779 at £491,044, which is a record in the history of the company.

SERVICE COSTS

On the other side of the profit and loss account, our heaviest item of expenditure is for service, which is included in the figure of £204,351, and, although this shows an increase of £7,582, I can assure you that costs are constantly under review. The inevitable demand for increased wages which must be met if we are to retain the right type of staff, and the increases in all classes of fuel, and, indeed, in almost everything under this heading, makes the extra charge understandable.

The charge for repairs is always a heavy item, but, again, it is one that must be met, because, in my opinion, the whole structure of the company and the maintenance of its income is dependent upon the condition of our properties. Repairs include renewals, and we have now reached the stage where special attention has to be given to installations such as lifts, boilers, and fire-escape staircases.

Our war damage claim for Stafford House has at last been settled, and included in the repairs charge this year is the cost of decorative work which was done in conjunction with the making good of war damage and was not recoverable from the Commission. This disposes of the last of our major war damage claims.

Some explanation is required for the increase in our carry forward from £25,290 to £33,938. We are now dealing with lift and other renewals, and with this substantial balance in hand we should be able to meet all our commitments without recourse to reserves or reducing dividends.

SOUND BALANCE SHEET

You will, I am sure, agree that the balance sheet presents a remarkably sound picture. The progressive reduction year after year of the mortgage and loan debts, and the regular rise in the leasehold redemption and depreciation accounts are factors which cannot fail to reflect strength in the figures which it is my pleasure to put before you. It may appear to you that there has been a drastic reduction in the value of our current assets, and the explanation here is that we no longer have a debt of any magnitude outstanding against the War Damage Commission.

We have decided to recommend the payment of a final dividend on the ordinary stock of 5 per cent, again making 7 per cent for the year, but feel justified, in view of the results of the year's work and especially as this is our seventieth birthday, in recommending also the payment of a 3 per cent cash bonus, as against last year's 2 per cent.

The report and accounts were adopted.

JAMES PASCALL, LIMITED

PREVIOUS RECORDS SURPASSED

TRADE OUTLOOK

The fifty-sixth annual general meeting of James Pascall, Limited, was held on March 30th at Streatham Road, Mitcham, Surrey, Mr R. Ellman Brown, FCA (deputy chairman) presiding.

The following is an extract from the chairman's circulated statement:

I reported to you last year that our trade in 1951 had set up new high records, and it is now with pleasure that I am able to tell you that our figures for 1952 show a further considerable advance, both in tonnage and turnover.

So far as derationing is concerned, it would appear, as I prepare this speech, that stocks in the shops have stood up to the initial rush, but all indications are that there is a continuing brisk demand and it will be premature to assume either success or failure at this stage. Unless the import restrictions on non-allocated materials are lifted, or a substantial increase in the sugar allocation is granted to our industry, I fear a position will be reached in the early summer when production will be seriously curtailed. In that event, it may well be that any fall in demand resulting from higher prices will be more than counter-balanced by the drop in supplies. It is to be hoped that the Minister of Food has carefully weighed the risks involved in derationing at this time, and that means will be found to increase the supply of sugar to the industry in the near future beyond the comparatively minor increases granted at the moment of derationing.

There can be no doubt whatever that the whole basis of harmonious co-operation with the Ministry of Food, which was an outstanding feature of the war years and has continued during the recent difficult years, has been profoundly shaken by the Ministry's insistence upon its re-allocation scheme and the way in which it has ridden roughshod over the reasoned arguments put to it by the industry's representatives.

THE YEAR'S RESULTS

Our profit before taxation is £199,921 as against £152,970 last year. Tax this year takes £128,500, as compared with £87,500 last year, and you will see we have had to make an allowance for Excess Profits Levy. The charge for taxes is nearly 50 per cent more than it was last year, although our profits are only 30 per cent up. The difficulty with regard to this penal taxation is that the Chancellor of the Exchequer requires these taxes to be paid in cash at the time when we are really requiring extra working capital.

The policy of the board is to bring the issued capital of the company into line with the capital employed in the business, and with this in view your directors have decided to submit to you a proposal that the capital reserve, amounting to £35,653, shall be utilised in paying in full at par for 713,068 ordinary shares of 1s. each and that such shares shall be distributed as fully paid to the ordinary shareholders at the rate of one share for every three shares held.

I think you will agree that we have had a very successful year, but you will see that when I speak of trade outlook I cannot promise what 1953 will bring forth. I can assure you that your directors will use their best endeavours to produce, if possible, as good a result again.

The report was adopted.

ASSOCIATED ELECTRICAL INDUSTRIES

STEADY PROGRESS

The fifty-third annual general meeting was held on March 31st in London.

Sir George E. Bailey, CBE, MSc, MIMechE, MIEE, the chairman, in the course of his speech, said: The year 1952 was one of steady progress for your company. Production was at a higher rate than ever before; shipments invoiced reached the record figure of £76 million. The comparable figure for 1951 was £63 million.

There has been no significant change in the number of persons employed and the increased output is, therefore, largely due to the wise expenditure in the last few years on new factories and additional and improved plant and machinery. Full benefit could not have been obtained from the increased productive capacity without the active co-operation of all our employees.

Profit before tax has increased by nearly £2 million to £9,900,000, but after tax shareholders are left with only £178,000 of that £2 million. Last year I mentioned that the board's conservative dividend policy was due to the calls made on the company's financial resources by the heavy burden of taxation, the high cost of capital replacements, the increase in value of work in progress and the necessity of providing the extensions required to meet the ever-expanding demand for our products. These conditions will still apply today and the board, therefore, regrets that it is unable to recommend an increase in the rate of dividend. It should be borne in mind, however, that the additional capital which the ordinary stockholders subscribed on bonus terms in February, 1952, ranked for a full year's dividend, and accordingly the total ordinary dividend for 1952 amounted to £931,000, as compared with £673,000.

EXPANDING DEMAND

There is no doubt that the demand for electricity must continue to expand; as I mentioned last year, the consumption of electricity per head of population in this country is still only about half the corresponding figure in the United States. There is every indication, however, that we are entering a period when conditions will once again be highly competitive.

During the years of inflation success has depended very largely on maintaining production in the face of shortages of all kinds. Often more expensive materials and methods of manufacture have had to be adopted to overcome them. As the material supply position improves, costs are again of prime importance and our future prosperity will depend on our being able to manufacture at least as cheaply as our competitors at home and abroad. We have every confidence that our design and manufacturing staffs will be equal to the tasks which confront them.

As the sellers' market gives way to a buyers' market we have every confidence in the ability of our commercial organisations throughout the world to obtain the necessary supply of orders for many and varied products to maintain employment in our numerous factories.

During the years of prosperity a large proportion of the profits has been ploughed back into the business; our factories have been modernised and expanded and we have a highly efficient organisation. We are therefore in a strong position to face the challenge of the future.

The report was adopted.

THE INVERESK PAPER COMPANY

SIR BERNHARD BINDER ON THE STRONG FINANCIAL POSITION

The thirtieth annual general meeting The Inveresk Paper Company, Limited, held on March 27th in London.

Sir Bernhard Binder, FCA, the chairman presided and in the course of his speech said:

Trading conditions, particularly during the latter part of the year, were extremely difficult following a continuous fall in prices. As a result demands for all descriptions of paper were seriously curtailed, causing a severe set back in trade from last May onwards, which is still continuing.

At the last meeting I anticipated that there would be a reduction in the prices of our main raw materials, a fall in the sale price of paper, and that we would have to face losses on the realisation of our stocks. The position was subsequently aggravated by the embargo on imports imposed by Australia and the large paper stocks accumulated by consumers in this country. Consequently the profits for the year were adversely affected by the serious reduction in production in the second half of the year and the necessity of drastically writing down stocks by £1 million.

PROFIT AND LOSS ACCOUNT

The group's trading profits, after providing fully for all stock losses, including forward contracts, amounted to £2,083,700, and after charging taxation the net consolidated profits amount to £698,000. The directors have no hesitation in recommending the same dividend as last year on the ordinary stock of 10 per cent, free of income tax, which has been earned with a very substantial margin.

During the postwar era we have spent well over £4 million on capital expenditure and have written off depreciation of £2 million. It is essential for the continued process of modernising all our mills to provide for further capital expenditure in the coming years.

The group reserves now total nearly £6 million, including stock reserves of £815,000. With the general fall in prices our cash resources now appear to be more than adequate, but during the current year taxation liabilities of over £2 million have to be met and further capital expenditure has to be faced. Moreover, now that prices have fallen considerable funds will be absorbed in building up stocks of finished paper and products.

THE OUTLOOK

There are at present only slight indications of recovery from the recession in trade. Consumer stocks are being gradually reduced to more normal proportions, but orders continue to be spasmodic owing to the natural reluctance of consumers to buy until satisfied that no further drastic fall in prices is likely.

Since October last the prices of pulp have remained fairly stable, but present prices of both pulp and esparto are still substantially higher than those ruling in 1949 and early 1950.

For the first five months of the current financial year most of the group mills have earned profits, but on a reduced scale and the margin of profit is small. It is unlikely that such large profits will be earned as those of the last few years even when demand increases and trading conditions become more normal.

The present financial position of the group is, however, very strong and we should eventually reap the full benefits of our large capital expenditure during the last few years, some of which has not yet become effective. We are thus well equipped to meet and overcome future difficulties.

The chairman concluded with a tribute to the managing director, management, staff and workpeople.

The report was adopted.

JOHN EMSLEY LIMITED

SUBSTANTIAL PROFIT IMPROVEMENT

The sixth annual general meeting of John Emsley Limited was held on April 1st at Bradford, Mr H. Jaques, chairman and joint managing director, presiding.

The following are extracts from his circulated statement:

You will note with pleasure the substantial increased trading profit made by the operating subsidiaries as compared with the previous year. Your board feel that the result is most satisfactory, considering the conditions and trading difficulties of the year under review. Whilst the precaution was taken of reducing the interim dividend to 7½ per cent, the directors consider that the dividend rate for the year can be maintained, and therefore recommend that a final dividend of 17½ per cent should be paid.

The profit and sundry income of the operating subsidiaries, after deduction of directors' emoluments and depreciation of fixed assets but before charging taxation, was £428,379, compared with £73,535 for 1951.

Considerable difficulty has been experienced during the year with the buying hesitation both at home and abroad, the keen competition, and the longer period required for the supply of our raw materials; in addition there has been a shortage in labour.

The high cost of living and taxation and increasing costs of production tend to make the selling and production of goods more and more difficult. Our organisation, buildings, and machinery are in good condition and well able to meet the demands made, and whilst it is not possible to forecast the future, it is felt that the steadier level of wool values should bring about more confidence in market conditions.

The report and accounts were adopted.

UNIVERSITY OF EDINBURGH

CHAIR OF ORGANISATION OF INDUSTRY AND COMMERCE

The University Court will shortly proceed to make an appointment to the Chair of Organisation of Industry and Commerce, which is vacant following the retirement of Professor William Oliver.

The salary of the Chair is £2,000. The Chair is a full-time appointment.

Further particulars may be obtained from the undersigned with whom applications, together with the names of two referees, should be lodged, not later than May 15, 1953.

CHARLES H. STEWART, Secretary to the University.

UNIVERSITY COLLEGE OF NORTH STAFFORDSHIRE

Applications are invited for the following posts:

1. Assistant Lecturer or Lecturer in Mathematical Economics;
2. Assistant Lecturer in Economics.

Salary: Lecturer, £550 x £50 to £800 (E.B.) x £50 to £1,100; Assistant Lecturer, £450 x £25 to £500 with a special allowance of £25.

F.S.S.U. privileges are available and children's allowances are payable. Further information and application forms may be obtained from The Registrar, The College, Keele, Staffs, to whom completed applications must be returned not later than April 22, 1953.

GOLD COAST GOVERNMENT

VACANCY FOR ASSISTANT SECRETARY (FINANCE)
MINISTRY OF DEVELOPMENT

Applications are invited for a vacancy in the post of Assistant Secretary (Finance) in the Ministry of Development.

Duties: Aside from the wide and varied duties of an Assistant Secretary in a Central Ministry, the principal duties are to prepare the Annual Development Estimates; to supervise and control expenditure authorised under the approved Development Estimates throughout the year; to prepare and maintain Summaries of expenditure on Development projects within the Gold Coast Development Plan and, under the direction of the Minister of Development, to administer the Development Funds.

Qualifications: Candidates must have considerable administrative experience and a knowledge of public finance. A University degree and some knowledge of economics is preferable, but a high standard of general education, intellectual ability and moral qualities of the highest order are essential.

Terms of Service: The appointment will be on contract/gratuity terms for one tour of 18 to 24 months, with a possible extension to two tours. Salary will be in the range £810-£1,950 per annum (consolidated), according to age, qualifications and experience. A gratuity at the rate of £37 10s. (or £25, if salary less than £1,000) for each completed three months of satisfactory service will be payable on final termination of the contract.

Free passages on first appointment and on leave will be provided for the officer and his wife once each way during each tour of service. Officers will normally be required to travel by air. Free air passages will also be provided for a maximum of three children under 13 years of age.

Vacation leave with pay: seven days for each month of service. Free medical and dental attention provided for officer and family. Furnished quarters available at low rental. Income tax at local rates. Kit allowance on first appointment £30-£60, according to salary.

Intending candidates should apply in writing to the Commissioner for the Gold Coast, Melbourne House, Aldwych, London, W.C.2, for an application form.

ENGINEERS with initiative required for team making detailed study and preparing scheme for planned development of large integrated works producing pig iron and chemical products. Honours University Degree desirable and/or membership of professional institutions. Wide practical experience of works' layout and techniques essential. Some administrative experience desirable. Location London, but work will involve travelling. Salaries according to experience, age and qualifications.

ESTIMATING ENGINEER, with special experience of economics, the preparation of comparative estimates and consideration of costs, both capital and operating, for a complete integrated plant, works' services, etc.

Apply immediately, giving full details of experience, age, qualifications and salary required, to Box 212.

GRADUATE, Economics and Statistics, Inter. C.W.A. (34), eleven years' experience in industry, seeks position as P.A. or similar with scope for abilities. Widely travelled, languages.—Box 222.

AN opportunity exists with a well-known Industrial Organisation for a young man between the ages 29-35. Successful candidate will be placed on the commercial side of the organisation. He must have had 3/4 years' experience in the sales field, possess a good personality, and preferably a good engineering degree. The post offers good prospects. Write, stating qualifications and experience, to Box No. N.7808, A.K. Advg., 212a, Shaftesbury Ave., London, W.C.2. This vacancy has been notified in accordance with the Notification of Vacancies Order, 1952.

THE Economists' Bookshop, 11-12, Clement's Inn Passage, London, W.C.2, invites you to submit lists of books on Economics, History, and Social Sciences, you may wish to sell (*periodicals excluded*).

GOOD FOOD AND WINES in dignified surroundings will be appreciated by your guests.—Restaurant FRASCATI, Oxford Street, London, W.1. MUS. 7414.

UNIVERSITY OF OXFORD DELEGACY FOR SOCIAL TRAINING

RESEARCH STUDENTSHIP

The Delegacy for Social Training invites applications for a Research Studentship of £400 from graduates who wish to undertake research in the field of social work. Applications should be made by May 16th, 1953, to the Secretary, The Delegacy for Social Training, 35, Beaumont Street, Oxford. Candidates should give particulars of their academic qualifications and experience and proposed subject of study, and the names of two persons familiar with their previous work to whom reference may be made. The studentship will be tenable for one year in the first instance but special consideration will be given to applicants who propose to read for the degree of B.Litt. or D.Phil. The holder may also be given the opportunity to undertake some paid teaching work.

BRITISH BUSINESS OVERSEAS

SCHOOL OF ORIENTAL AND AFRICAN STUDIES
UNIVERSITY OF LONDON, W.C.1.

Short courses of background lectures are offered to business men and others covering the social, political, and economic problems of the countries of the following regions:—

The Middle East.
The Indian Sub-continent.

Intensive instruction in the languages of these areas can also be given.

For further details apply to the Organiser of Special Courses at the above address.

Telephone inquiries: MUSeum 2023, ext. 28.

THE YORKSHIRE PENNY BANK

announces that the following banks:—
Barclays; District; Lloyds; Martins; National Provincial; Westminster and Williams Deacon's

have purchased from the Midland Bank the whole amount of the Yorkshire Penny Bank share capital hitherto held by the Midland Bank.

There are now no shareholders in the Yorkshire Penny Bank other than those Clearing Banks which have made this recent purchase.

The Directors have elected Sir Robert A. Burrows, K.B.E., as Chairman, and Sir Cecil Ellerton as Deputy Chairman, and the Board is now constituted as follows—

Chairman: Sir Robert A. Burrows, K.B.E. (Deputy Chairman, District Bank); Deputy Chairman: Sir Cecil Ellerton (Deputy Chairman, Barclays Bank); The Rt. Hon. Lord Balfour of Burleigh, D.C.L., D.L. (Chairman, Lloyds Bank); The Hon. Rupert E. Beckett (Director, Westminster Bank); Sir Eric A. Carpenter, O.B.E., J.P. (Chairman, Williams Deacon's Bank); C. J. Holland-Martin, Esq., M.P. (Director, Martins Bank); The Rt. Hon. the Earl of Selborne, P.C., C.H. (Chairman, National Provincial Bank).

MARKET RESEARCH

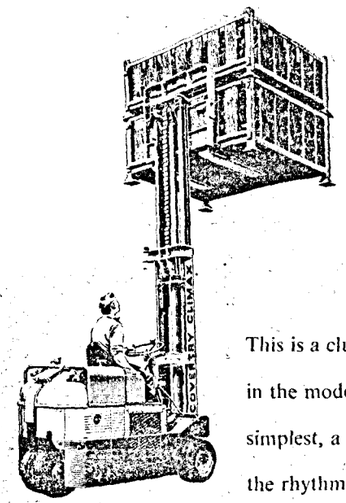
British Nylon Spinners Limited has a further senior vacancy for a man experienced in market investigation and with a sound knowledge of both home and overseas markets. Preference will be given to candidates with previous experience in the textile field, and an Honours Degree in Economics is an essential qualification. The position will carry a good salary and is pensionable.—Apply in writing to Personnel Manager, Pontypool, Mon.

OXFORD Arts Graduate, 25, fluent German, wishes to join import-export merchant or agency house as trainee. Free in August, available for interviews during April.—Box 214.

A MAJOR INDUSTRY requires a man of about 30-35 to prepare as ADMINISTRATIVE HEAD of the industry's PROMOTION ACTIVITIES. An Economics degree or comparable qualification would be considered more appropriate than an interest in or experience of publicity. The post justifies an immediate salary of £1,000 per annum, increasing to £1,500 in two or three years when full administrative responsibilities would be taken over. The long-term potentialities of the post warrant application by men of the highest calibre. Applicants should give full details of education and experience and are requested to indicate also their private interests and activities. Strict confidence will be observed.—Box 220.

FEMALE Market Research Field Supervisor required by Aspro Limited. Qualifications necessary: single, age 20 to 35, University Graduate, some practical experience, willing to travel about country.—Apply in writing, giving full particulars to Personnel Officer, Aspro Limited, Trading Estate, Slough, Bucks.

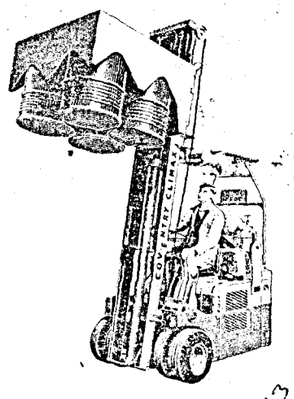
STAMMERING or NERVOUS "STOP" remedied by Psychological Processes. It is through the MIND that success is achieved. Weekly POSTAL tuition with continuous advice.—Prospectus: Mr Chas. Seymour, "Liberté," 69 Grosvenor Road, Aldershot, England.



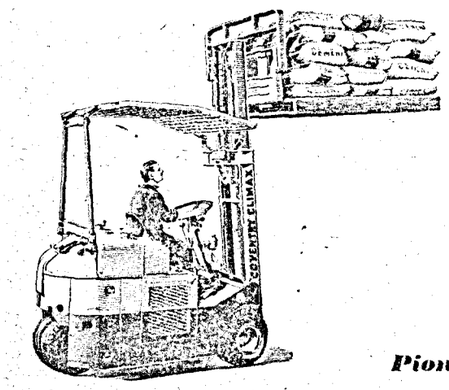
EXPORTING FIRM of food producers to dollar and Commonwealth countries requires additional capital to finance continuity of work. Excellent return for genuine actively interested opportunist.—Box 218.

HONOURS GRADUATE, experienced translator Spanish, French, German, requires work; general economic, sociological; own typist, commercial experience.—Box 264.

SPANISH EVENING CLASSES. All grades from April 20th.—Hispanic Council, 2 Belgrave Square, S.W.1. SLO 7186.



Printed in Great Britain by ST. CLEMENTS PRESS, LTD., Portugal St., Kingsway, London, W.C.2. Published weekly by THE ECONOMIST NEWSPAPER, LTD., at 22, Ryder Street, St. James's, London, S.W.1. Postage on this issue: Inland and Overseas 2d.—Saturday, April 4, 1953.



sine qua non . . .

some of the most experienced and long standing users of fork lift trucks have expressed the view that it is not only the savings which fork trucking has achieved, but the fact that their businesses *just couldn't* be operated today without these ubiquitous handling machines.

This is a clue to the value of fork trucks in the modern industrial scene : at its simplest, a beneficial influence speeding the rhythm of production . . . at its best, the cornerstone without which much business expansion could not have been achieved.

Symptoms of Sanity

AT one stroke, Mao Tse-tung has reduced to nonsense all the arguments about the Korean war reiterated by Communist China and its allies—and by neutralists in the West—for nearly a year. Since May, 1952, the only substantial reason that the Communists had given for rejecting truce terms put forward by the United Nations Command was their insistence on the forced repatriation of prisoners. Throughout the past year, all the ingenuity that apologists for Peking and Moscow could muster has been devoted to arguing that helpless men should be herded back into the hands of their masters, if necessary at the point of the bayonet. Nobody has worked harder for this repugnant idea than Mr Vyshinsky, who must now find it somewhat embarrassing to be back in New York after Mao's *volte-face*. How is the newly demoted ex-foreign minister to explain why the "world peace camp" extended the Korean bloodshed for eleven months by insisting on a demand which it now sets aside so blandly ?

An answer to that question would be enlightening, not least to those in the free world who have asserted throughout that the only way to get a Korean truce was to accept the forced return of prisoners. But other questions have to be asked more urgently. Chou En-lai's announcement on Monday came immediately after the news that the British ambassador in Moscow had been summoned home for consultations in the light of "indications of the possibility of an improvement in Soviet relations with other countries." To what extent does the Peking government's new move support the theory that any general improvement is imminent ?

The Chinese action is certainly a much more substantial gesture than anything of the kind that has come from Moscow since Stalin's death. There have, indeed, been plenty of straws in the wind that blows from Russia ; and they have attracted the more attention simply because the free world was already scanning the eastern horizon for portents of change. Some observers have thought to see hopeful indications in the admission to Moscow of a touring party of American journalists, and the Soviet government's assurance that it would look into the detention of British and French civilians in North Korea. Spirits were raised in the West even when a Moscow radio commentator referred briefly to allied co-operation during the second world war ; but this concession that Russia won the war not entirely alone was made in a broadcast not heard by the Russian public.

Apart from the acceptance of a Swedish nominee for the long-contested post of Secretary-General of the United Nations, the most solid of the series of Soviet gestures was General Chuikov's message to the British High Commissioner in Germany, which expressed guarded regret for the shooting down of the Lincoln bomber and offered to discuss new safety measures for the Berlin air corridors. Yet even this unexpectedly co-operative move could be interpreted, in view of the Czechs' failure to make any corresponding

gesture after their earlier attack on American aircraft, as consistent with the policy of dividing the western allies. It was not until last Saturday, when the North Koreans at last accepted the long-standing offer of the United Nations to exchange sick and wounded prisoners —a proposal which originated with Mr Eden—that the first concrete step in the direction of settlement was taken by the post-Stalin Communist world ; and this step was taken not by the Russians but by their Asian allies.

The impression that the new Soviet government may contemplate adopting a more amenable attitude has, however, become strong enough to justify the recall of Sir Alvary Gascoigne from Moscow. This impression can scarcely be inferred from any public protestations of peaceful intent made by Russia's new rulers. Indeed, Malenkov and his colleagues would be the first to deny that they mean to follow a more pacific policy than Stalin. All their statements embody pledges to carry on his policy exactly as it stood—and Stalin's "peace policy" found room at various times for blockade, intervention, threats, attacks on aircraft, war by proxy and annexation. But there may be sounder reasons for supposing that Malenkov and his immediate following badly need a temporary relaxation in international tension.

Both within and without, the first need of the new men in the Kremlin is to gain time, to secure a period of relative calm during which they can consolidate their personal power. To achieve this object, they appear to be willing to make concessions in various directions. The amnesty for minor offenders, and the gesture to the officer caste represented by Marshal Zhukov's recall from obscurity, suggest the application of this policy on the home front. Externally, Malenkov finds it necessary to woo Mao Tse-tung, not only by according him the most deferential treatment, but also by conceding to him the economic aid for which Chinese negotiators had been haggling in Moscow ever since last August. Against this background, it is no more than consistent to make a series of mollifying gestures to the West, and to instruct Mr Vyshinsky to abandon his bodyguard and to mingle affably with non-Communist delegates at the United Nations.

★

But can the free world expect anything more than gestures from Moscow ? There is, on present evidence, little reason to suppose so. The very weakness that inspires the new government's concessions to its own subjects and allies makes it difficult for it to concede anything substantial to the West. Until they are safer in the saddle, Malenkov, Beria and their intimates dare not incur the charge of failing to defend Soviet interests. Thus, while proffering their olive twigs with one hand, they have used the other to maintain a show of unyielding strength, by means which range from attacks on western aircraft in Germany and the Far East to Mr Gromyko's continued intransigence in last week's UN debates. The one change of importance is this: no one in the Kremlin can now prevent Mao Tse-tung from seeking his own objectives. The Chinese ruler may well have realised that he could never win the final victory in Korea which he once boastfully forecast, and that the value of his war as a rallying-point for patriotic feeling and an excuse for discipline and demands on the home front was diminishing, while its claims on economic resources and skilled manpower were coming more and more into conflict with the needs of the industrialisation programme. Perhaps he has wanted to call off the fighting for some considerable time, but has been restrained by his need for Russian economic aid. It is certain that he is no longer so restrained. Whether Malenkov and his colleagues like Mao's latest move or not, they are in no position to veto it.

A sharp distinction must, therefore, be drawn between the prospects of a Korean truce and the possibility of a general settlement between the Communist and the free worlds. The achievement of the former would not necessarily bring the latter any nearer. While the new Soviet government has everything to gain from a temporary lull in the cold war, there is no tangible evidence to suggest that it is anxious, or even able, to embark on a final settlement of any major international issue. Some of the aggressive tactics associated with Zhdanov must, admittedly, pass into eclipse with the enthronement of Zhdanov's rival. For the time being, the new government's attention is likely to be directed primarily to consolidation ; the key word in Moscow today is *monolitnost*—monolithic unity, the "supreme principle" propounded by Malenkov in his speech to the Supreme Soviet. It may be expected that the "peace" campaign will again be intensified and that every effort will be made to convince the free world that the danger of war comes only from the capitalist governments of the West. Propaganda on these lines would accord admirably with the policy of encouraging splits between the free nations. Was it not stated at Stalin's last Congress of the party, four months before his death, that wars between capitalist countries are still "inevitable," whereas war between East and West is not ?

But if the Soviet world is quiescent for a time, it will hardly be relaxed. A post-Stalin leading article in *Pravda* has called on the Russian people to fulfil their "sacred duty of strengthening by every means the mighty Soviet armed forces and our Soviet intelligence service." If there is to be any relaxation, it will be confined to the West ; and, however welcome a halt to the fighting in Korea must be to all those members of the United Nations that have helped to resist aggression there, they will need to remain vigilant at least until the implications of the new Soviet policy have shown themselves more clearly. What is surprising and alarming is to see how so little has to be said from Moscow to obscure the memory of so much that has been done.

What Went Right ?

THE attempt to make an annual economic plan began in 1947, and only the title now survives. The Government's "Economic Survey for 1953" is in fact a sensible, well-balanced report on the changes in the economy during 1952. A year ago the first survey to come from a Conservative Government carried to a logical conclusion the trend that had been marked in the later years of its predecessor: quantitative forecasts, which had been so often and so widely off the mark, were abandoned. This year's survey shows instead the beginnings of a new approach to policy-making. In its final pages the economic prospect is discussed—not, indeed, fully and decisively, but with some attempt to set out the conflicting influences at work. There is more sign of Government policy being consciously shaped to the prospect. As the functioning of the economy is left in greater measure to market forces, the Government finds itself more, rather than less, able to "take a view" of its own. To set out this view, with evidence and explanation, should become increasingly the purpose of the annual survey ; it is the foundation of a new technique of planning that could be considerably more effective than the old.

This trend, however, is as yet in its early stages, and for 1953 the main importance of the survey (which is discussed in more detail on later pages) is its analysis of what happened to the economy last year. In March, when the Chancellor had completed his policy for the dollar crisis, almost all outside opinion held that the policy threatened to be dangerously inadequate. As was pointed out in these columns at the time, Mr Butler leaned at every point to an optimistic assessment of the outlook for 1952 ; and while at many points he might be right, the odds against his being right all the time—against his final conclusion being justified—were formidably long.

In the following months this view grew rather than diminished. During the summer not only economists, but even many politicians were to be found fearing that Britain was standing on a trap-door and urging the Chancellor to strengthen his disinflationary policy. Yet by now the general opinion is that the critics were too gloomy and Mr Butler was right. And while this conclusion should be accompanied by several sophisticated riders, it can hardly be dismissed as a mere popular myth in face of the patent facts that disaster has not come, that the gold reserve is rising, that the balance of payments is in surplus, and that inflation has been subdued. At the level of political discussion, if not in the more rarefied heights of an economists' circle, the question to be asked about economic affairs since the Conservatives came into office is not, for once: What went wrong ? It is: What went right ?

Certainly the points made against Mr Butler's policy by his political opponents have proved to be ineffective. He was accused of reducing the import bill at the expense of a rake's progress of living on stocks. The survey shows that in fact in 1952 the country earned an external surplus without any appreciable change in stocks—a considerable improvement on the 1950 achievement of which Labour was so proud. Again, it was said that the external gap was being closed by sacrificing the industrial investment on which future efficiency and prosperity depend. That, indeed, has an important element of truth. But it was always necessary to add that Mr Butler did not begin the policy ; and it should now be admitted that on balance the outcome—which included, besides some cut in investment, a great expansion last year in business savings—is certainly not to weaken British industry's capacity for future improvement and expansion.

★

The truth is that there has been a remarkable turnround, and while it rests in large measure on good fortune—above all, on the improvement in the terms of trade—the Government is also entitled to considerable credit. Not only was the British economy snatched from disaster last spring. There is now widely spread through industry an atmosphere of competition, a degree of flexibility, which certainly compares favourably with the indifference and rigidity that persisted through the long period of sellers' markets. In the Economic Survey the Government can fairly claim that "at the beginning of 1953 the economy was in a much healthier condition that a year before."

If the outcome is better than most observers expected, the reason is certainly not that on all points Mr Butler's optimism was justified, or that his political courage was in all respects sufficient. He was gravely disappointed in the belief that industrial production would increase. And while he could bring himself to make realistic cuts in the food subsidies a year ago, he could not resist paying out bigger housing subsidies. He can be blamed for his inconsistencies, as well as praised for his decisions to let the open market and prices do more of his economic donkey work. One of the most significant lessons of this past year's experience is that a 4 per cent Bank rate has been more effective in checking inflation, despite the mildness of the Budget itself, than even the advocates of monetary policy generally dared to hope. It has not only helped to check stock-building ; it has induced a wholly healthy caution in both business and personal spending, with the result that savings have gained all round.

In the past few months one other thing has also worked powerfully in Mr Butler's favour. Twelve

months ago his critics assumed that in the later part of the year defence production would still be rising; this strain on the economy was to have been intensified at the same time as the burdens of the housing programme began to reach their full size. In fact, the decisions taken late last summer halted the defence expansion, and Mr Macmillan is able—as yet, at any rate—to build his houses without destroying Mr Butler's more substantial achievements.

Such are the things that have gone right—in the sense of making short-term economic policy more successful than at one time seemed likely; whether all of them are to the national advantage over a longer period is another question. What benefits do they promise for the future? The British economy in 1952 again made considerable progress in a period when external circumstances turned very much in its favour. The same thing happened in earlier years of even numbers—in 1946, 1948 and 1950—and hitherto the improvement has always been too small to give the country any real strength in face of the following year's crisis. If it is possible to congratulate the Chancellor for what is justified in his optimism, it is equally possible to regret that so little advantage has this time been reaped from so large a turn in the wheel of fortune. The economy is healthier now than it was a year ago; but how much healthier would it have been if Government expenditure had been cut a year ago by £200 or £300 million?

Great as the improvement in the terms of trade has been, a half of the shift to a surplus in overseas payments has nevertheless depended on cuts in imports that are now necessarily being relaxed. At the same time, hopes of any really large gain in the dollar reserve, or of any definite advance towards sterling convertibility, are dwindling. Internally, it is far from certain that the checking of inflation is really the "more lasting development" that the survey at one point claims. That check is the product of some changes in external circumstances—most notably, the import restrictions imposed by other countries—and of relatively small adjustments in policy at home. Other changes could reverse it quite as easily.

The temptation on the politicians, seeing a little slack here and there, is always to blow up the inflationary balloon again, and there have been hints enough in recent weeks that the Government is only too likely to yield to temptation. There is no sense in driving the British economy into underemployment and declining output; but there are inescapable reasons for securing a shift in the country's resources towards the export trades, and for tilting the balance of policy in favour of greater investment and not greater consumption. Little of this happened last year. The Conservatives are deluding themselves—and will pay heavily for the delusion—if they think that they have saved the country by a policy that has done its work and can now be relaxed. In fact, they have taken necessary emergency measures and with good luck the British economy has been pulled through a crisis. The tasks of establishing solvency on surer foundations and of moving from convalescence to true economic health still remain.

The Finance of the Dog-Fight

MR JUSTICE LYNSKEY said some sharp things recently about the legal aid scheme. The case before him arose out of a dog-fight between Prince, an alsatian, and Rex, a spaniel. The owner of Rex alleged that in the course of the fight Prince had butted her in the stomach and knocked her down, with resulting injuries to her spine. The owner of Prince told a different story. The plaintiff, he said, was not pushed; she fell. It was Rex that was trying to get at Prince, not the reverse; Prince, he added, was a friendly dog.

When Mr Justice Lynskey had given judgment for the defendant, he was told that both parties were assisted persons under the scheme. Then what chance, he asked, had the plaintiff of recovering her damages had she won? None, he was told, unless the defendant's financial position improved, as the result, say, of winning a football pool. It was then that Mr Justice Lynskey exploded, and it is difficult not to share his feelings over this particular dog-fight. Other judges have criticised other aspects of the present legal aid system, and it seems time to consider whether the comments from the Bench make up a case for complete revision of the scheme.

It has now been in operation for two and a half years. The sections of the 1949 Act that provide for legal aid, as distinct from legal advice, in civil cases were brought into operation on October 1, 1951, and the Law Society's report and statistics covering the first full year have recently been published. In the year ended March 31, 1952, 48,700 applications for aid were received; of these, 39,453 were granted certificates for legal aid. It is estimated that about 80 per cent of all applications are for matrimonial relief of one kind or another and that another 16 per cent are claims for damages for personal injuries, mainly on the roads or in factories. The remaining 4 per cent are miscellaneous. Cases resembling that on which Mr Justice Lynskey commented can, therefore, be only a very small minority. In matrimonial suits, although damages may be claimed on a divorce petition, money is not the whole, or even the main, object of the proceedings. Again, in most claims for personal injuries, the defendant, as the owner of a motor vehicle or proprietor of a factory, is insured; any damages he is ordered to pay will be forthcoming at once. Moneys recovered for assisted persons in damages and costs are now

running at the rate of about £1,000,000 a year. It is too early to say what the ultimate cost to the Exchequer of the whole scheme will be, for instalments both of contributions to costs and of recoveries of costs may be spread over more than one year; but in 1951-52 the grant in aid to the Law Society was £260,000—which compares rather remarkably with the current grant of £785,000 to the Arts Council.

Nevertheless, the fact that the system may produce satisfactory results for the majority should not stifle criticism. Is it really confined to those who cannot afford to pay the normal costs of lawyers? Does the system encourage litigation, and thereby impose hardship on those who, usually at their own expense, have to defend unjustified claims with no hope of getting back their costs if they are successful?

*

The legal aid system, under the ægis of the Lord Chancellor, is fairly and squarely in the hands of the Law Society for administration, with appropriate aid from the Bar on the various committees and in the proceedings themselves. There is also a national advisory committee of laymen (a committee which not only takes itself seriously but which is taken seriously by others) in the background. Administration is decentralised among twelve area committees of lawyers, unpaid, based on the provincial law societies, aided by 110 local committees covering all England and Wales. The application for aid goes to the local committee, which decides if the applicant has a case to prosecute or defend. The questions of his means, and the contribution he should make to the cost, are kept separate and are answered by the National Assistance Board. The Board works on a basis laid down by the 1949 Act itself, and lawyers consider that it functions efficiently and quickly. Two comments on the financial side of the system were made by the advisory committee in its report for 1951-52. One was that there seemed to be a small class of applicant whose paper incomes and declared means were small but who seemed to live very well none the less. The other was that there are cases, of a wife or a daughter at home, for example, where the applicant had no means but where it would be reasonable to expect the immediate family to help. In both cases the local committees have a remedy. They can refuse legal aid, whatever the merits of the case, if they think it unreasonable.

The second criticism is that the local committees grant the certificates for aid too easily, which means that a corresponding number of people have to fight legal actions that should never have been brought. From that criticism the comment easily follows that lawyers would naturally want to encourage litigation provided it was paid for by the state. The rider is unjustified—at least, in that crude form. The lawyers who take on assisted litigants get no more than 85 per cent of their standard charges, and that only after a close scrutiny of each bill by the court's taxing official. If the 10,000 or so cases dealt with by salaried solicitors in the Law Society's own divorce department are deducted, some 9,000 solicitors have handled an average of four and a half cases each in a year, which is hardly an opportunity to make a fortune. But there is more substance in the main criticism. Part of the difficulty arises from the failure to bring into force the legal advice sections of the 1949 Act. Despite the fact that the committee has heard only the applicant's story, if it acts it must authorise litigation and start the snowball of legal costs rolling at once.

This has two other consequences. The applicant himself is confirmed in his belief that he must have a good case, and is therefore less willing to think of a compromise. The solicitor he instructs, particularly if it is in a country area where the local reputation of a lawyer matters a great deal to the size of his practice, is reluctant to appear as the kind of man who takes on a case and then throws cold water on his client's hopes. The committees probably do give applicants the benefit of too many doubts. There is a natural reluctance to damn outright even a shaky case, and there is a justifiable belief that it is not for these committees to usurp the functions of the courts themselves and decide the merits of the claim. High Court judges cannot have it both ways. If they regard themselves as the fountain of justice, they should not complain if local committees decline to set up smaller springs of their own. Yet the possible injustice to the other party exists, and in its report the advisory committee was well aware of that. It certainly looks as though the committees have been too willing to back appeals; whereas 73 per cent of assisted cases fought in the Queen's Bench Division were successful, there were only 51 per cent of successful cases in the Court of Appeal.

The obvious step would be to bring into operation the section of the 1949 Act that allows a local committee to issue a certificate entitling the assisted person to advice only. One objection to this could be that the whole cost of the work done by the lawyer would fall on public funds because there would be no opportunity of obtaining a court order that the other party should pay them. On the other hand, everybody knows that many cases are settled without litigation on the basis that the compromise payment covers all the costs as well. The advantage of the preliminary investigation is that the real merits of the case are known before the expense of litigation started. Thus the final result might well be a saving of public money.

To return to the action of Rex v. Prince, it is easy to say that the action should never have been brought because the defendant could never pay the damages. But what of the old lady, badly injured by the careless errand-boy, on a cycle, employed by the small shopkeeper who was not insured against that kind of risk? She was assisted and was awarded £1,000 damages. The shopkeeper was asked what he was going to do about it. He did not plead that his only chance was to win a football pool. He said, "I'll pay her thirty bob a week while I can." And he did.

Notes of the Week

Mau Mau at War

THE unexpected debate on Kenya, which the Opposition managed to initiate in the House of Commons on Tuesday, fitted in well with its wish to delay the passing of the Transport Bill as long as possible. But no harm was done by forcing the Government to abandon what had become an unreasonable determination to have the Bill made law before the Easter recess. Moreover, the debate took place in its own right, for the massacre of Kikuyu loyalists last week was certainly "a definite matter of urgent public importance" and fully justified the use of the exceptional procedure that interrupts the normal business of the House of Commons.

Earlier, at question time, Mr Lyttelton had admitted that the situation in Kenya was now "more like a war than an emergency." This was made quite clear by the massacre, which was obviously well organised and took place only 25 miles from Nairobi. Fully 150 men, women and children were slaughtered; there was also a raid on the Naivasha police outpost, from which rifles and automatic weapons were looted; and in several smaller incidents the loyalists have lost in life and prestige. The Government certainly has not proved itself able to protect those who support it against Mau Mau.

It is too soon to know whether the Mau Mau counter-attack will achieve its objective, which is to destroy the morale of pro-Government Africans. In the debate, Mr Lyttelton suggested that the very success achieved in hemming Mau Mau in was forcing it to these organised attacks instead of sporadic acts of violence. He also asserted that more information was coming in. Since the raid, there have been reports that mothers who have seen their children butchered have come forward as witnesses. If it is true that Africans are providing more information, this would be a setback for Mau Mau, whose success hitherto has rested in part on the stultification of British justice through the intimidation of witnesses—so much so, indeed, that ugly stories are coming to Britain about the conviction of suspects on flimsy evidence. To drive a British community to mere reprisals would indeed be a signal victory for the Mau Mau thesis that the white men are just as much "savages" as Africans; it would wreck the whole Government case.

Evidence that the loyalist Kikuyu are standing up well to their ordeal, however, provides a hopeful sign in a thoroughly disquieting turn of events. The Mau Mau outbreak has shown the intelligence and adaptability of the Kikuyu in what is now virtually tribal civil war; and the loyalists can see that the Government has the might of Britain behind it—soon to be further manifest in the arrival of two more battalions of troops, of which further details were given in the debate. Meanwhile, as the mass exodus from the White Highlands goes on, famine threatens the reserve and production in the European area sags. Fortunately, the Government is now wisely intervening to stop this migration, which is causing both it and the United Kingdom Government considerable anxiety.

Forming Labour Policy

THE Labour Party is making fairly fast work of its new programme. In three weeks' time the national executive committee will be ready to review, and presumably in substance to approve, the draft that its sub-committees have been preparing. There is to be, by all accounts, much that will be new to the British Labour movement. At the preliminary meeting at Brown's Hotel four months ago there seems to have been a general agreement that, as a principal method of extending public ownership in future, the state should buy a controlling interest in important companies rather than create national bodies embracing whole industries, on the pattern of the 1945 programme. In the detailed drafting, firms in the aircraft and machine-tool industries have become the favoured candidates for this treatment.

Among the more familiar subjects of nationalisation, the rumours suggest that sugar is definitely off the list but cement may not be. The policy-makers are reported, however, to have developed a determination to nationalise—in the old, 100 per cent sense—most of the chemical industry. The main disagreement has arisen over some scheme for nationalising rented agricultural land. This is favoured by Mr Bevan and his friends; for some people less to the Left of the party, it has the attraction of combining a fine Socialist ring with the practical merit that the actual transfer of ownership could be piecemeal and very gradual. Some of the policy-makers, however, are less cynical and appear still to be standing out against any sort of land nationalisation.

The only other disagreement—or, at least, the only one that has leaked out—separates politicians of all brands from the trade union leaders: the politicians want to propose a new social security tax, graduated according to income, while the unions prefer to stick to the flat-rate "insurance" principle—and are likely to have their way. In general, the temper of the discussions leaves no doubt that this autumn the Labour Party will have a better chance of uniting itself than for many years past. Many slips, however, are still possible; and it remains in any event to be seen whether a policy that unites the party can be made attractive to the marginal voter.

A Guarantee for France

M. MAYER'S visit to Washington has produced one striking result: in a guarded but unmistakable way, President Eisenhower has committed American forces to indirect military support of the French effort in Indo-China. The war against Vietminh, together with that in Korea, has been defined as part of a common action, and China has been warned that any intervention in force against the Vietnam during the period of an eventual Korean truce would be regarded as a violation of that truce. This is the kind of American guarantee that France had, up to now, been unable to obtain and M. Mayer can justly claim to have achieved something of a diplomatic triumph.

With respect to the outstanding problems in Europe, the results of the Washington talks were less spectacular. M. Mayer reasserted his determination to press for the promptest possible ratification of the EDC treaty, but no agreement was reached on the vexed question of the Saar. Mr Dulles was unable to see why a solution to the Saar problem had to come before the ratification, so it is unlikely that Washington is prepared to champion the French case when Dr Adenauer arrives early this month. It is increasingly clear, on the other hand, that some form of mediation by America, and perhaps Britain, will prove to be the only way out.

The subject of increased aid to France and long-range planning for off-shore purchases was deferred for consideration at the next meeting of the North Atlantic Council on April 23rd. As to convertibility and American import policies, it was felt that both issues needed further study, particularly within the framework of OEEC. In short, M. Mayer's visit produced clarification rather than solutions. To what extent Dr Adenauer will be able to derive advantage from this fluid situation remains to be seen.

Stalinism without Bars?

THE new rulers of Russia have started their reign with a most impressive act of clemency. In Tsarist times the birth of an heir, royal celebrations or accessions were occasions for showing mercy. The Bolsheviks in the early days proclaimed amnesties almost every year. But all this changed under Stalin. The last large-scale amnesty took place in 1927, when mass concentration camps were not yet an inherent feature of the Soviet regime. Since then batches of prisoners have been released from time to time, particularly just after the war; but there has been no act of general pardon comparable in scope with the one now proclaimed by Moscow.

On paper, at least, the new decree promises freedom to probably half of the victims of the notorious concentration camps. All those condemned to less than five years' imprisonment should be freed at once; those serving longer sentences should have their terms halved, with the exception of specially dangerous gangsters and "counter-revolutionaries." The camps are no longer as crowded as they were in the late thirties after the purges, but even conservative estimates still put the number of inmates at somewhere between two and three million. Thus, if the decree is to be carried out hundreds of thousands should soon be swarming on Russia's roads as they return from captivity.

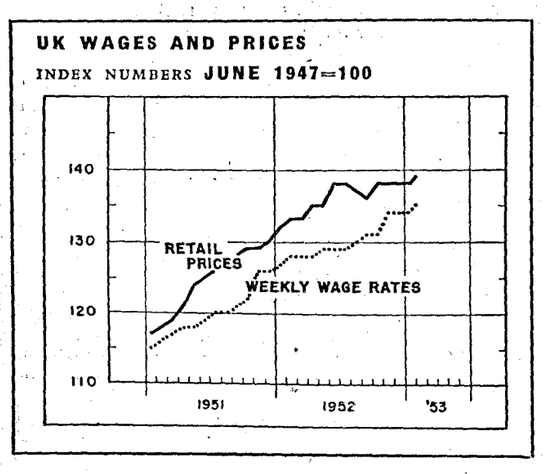
The new move is the more striking because Stalin's reign ended on a note of alarm, with a vigilance campaign clamouring for greater discipline and harsher penalties. A few weeks ago the same men, acting as Stalin's mouthpieces, were issuing warnings that Russia is still infested with "remnants of bourgeois psychology." Now they argue that an amnesty is possible because of "the honest attitude of the citizens towards the implementation of their duties."

The inhuman concentration camps must have been the most hated feature of Stalinism. Malenkov and his associates could not, therefore, have devised a better measure to sap the cult of Stalin and to increase their own popularity than this proclamation of general pardon. Special indulgence is shown in the decree towards offences committed in an official capacity, thus showing that even the bureaucracy reared by the regime was choking under police supervision. Yet, the camps were only the extreme form of a whole system of coercion that seemed inseparable from Stalinism. The weakening of one link is bound to increase the pressure on the other links in the chain. Are the new rulers willing and able to evolve a new form of "Stalinism without bars"? or will it all end with the release of some petty criminals? Will the new promise remain as empty as Stalin's own promise of democracy contained in the constitution bearing his name? The fact that the gesture was made so soon after the Leader's death is a clear recognition that Russians have not lost their thirst for freedom.

Dark Horse from Sweden

DR Dag Hammarskjöld, whom the Security Council on Tuesday chose as the next Secretary-General of the United Nations, was described in the press this week as "a politician little known in international circles." This highly inaccurate phrase did scant justice to a very remarkable man, who has in fact become internationally known without passing through the mill of party politics. Although Dr Hammarskjöld ranks as a minister without portfolio in the Swedish Cabinet, his function is that of deputy to the foreign minister, Hr Unden, with special regard to economic affairs. Since 1947 he has played an important role in the European conferences concerned with the Marshall Plan and OEEC, and has greatly impressed his colleagues by his penetrating analyses of difficult problems. Many Swedes consider him to possess the finest brain of any of their countrymen.

There are surprises in store for those who expect the replacement of one Scandinavian by another at the head of the UN Secretariat to mean no change at all. There could hardly be a more striking contrast than that between Dr Hammarskjöld and Mr Trygve Lie. The retiring Secretary-General was a veteran of Socialist politics, a bluff and colourful personality whose tactics were guided by instinct as much as by reason. Dr Hammarskjöld belongs to no party and has never fought an election or made a campaign speech; his background is that of a Treasury official. The



fact that he is not only Swedish but also unencumbered by having taken up a precise political position must have made him more acceptable to the Great Powers. In his published works he has, however, argued cogently that a democracy such as Sweden cannot take up an ideological middle position in a divided world. The Russians, with whom he has from time to time had dealings on delicate issues, can have few illusions about his malleability—a fact which makes their ready acceptance of his nomination all the more interesting.

The Unions and Productivity

THE British Productivity Council, the TUC and the general secretary of the United Society of Boilermakers, Mr Hill, have got themselves into a fine but unnecessary tangle over profits, productivity and wages. Mr Hill, whose followers have always been piece-workers, reminded a conference summoned by the Productivity Council that higher productivity was undoubtedly important, but that this fact had to be explained to "the bloke in the shop." And the bloke in the shop, according to Mr Hill, would not co-operate if higher productivity was merely going to mean higher profits for employers. Several other trade unionists said the same thing, but Mr Hill was the only leading member of the TUC who criticised in any way the Productivity Council's activities or methods.

He thereby drew an official rebuke from the General Council; there followed an explanation by Mr Hill of what had happened at the council meeting, a denial by Sir Vincent Tewson that Mr Hill's account had been accurate, and a denial by Mr Hill of Sir Vincent's charges of distortion. The last two exchanges were conducted in writing, with both parties sending their letters to the press as well as to each other. As yet, however, the quarrel has left Mr Hill apparently unperturbed at his union's headquarters in Newcastle and Sir Vincent Tewson firm, but apparently rather confused, in Transport House.

Unless more is learned about what actually happened both at the conference and at the meeting of the General Council, there is no point in trying to judge whether Mr Hill has really been disloyal to the General Council or to the principles of helping to increase productivity that it has embraced. The incident is important, however, because it shows how unreal a mere endorsement by trade union leaders of managers' platitudes about productivity is bound to be. In one sense, the need for productivity is old news to piece-workers like the boilermakers. It is disturbing to those, whatever their method of payment, who have been hit by unemployment and who are openly afraid of "working themselves out of a job." The Productivity Council's message—that Britain must produce and export more goods more cheaply—still needs a lot more explaining than it usually gets. In so far as this was Mr Hill's point, no one tried to argue with him at the conference, and no one should.

Caution on Local Government

MUCH as the two political parties shrink from being the first to produce legislation reforming local government areas and powers, one or other will have to do it eventually. It will doubtless produce a good deal of trouble whatever the merits of the scheme. But the discussion has at least been carried a useful stage further by the recommendations of four of the local authorities' associations—county councils, urban district councils, rural district councils and parish councils. These will not, of course, be to the liking of the county and municipal boroughs, whose views on the expansion of town and city boundaries would hardly be met. In general, the latest recommendations endorse traditional conceptions, and are indeed prefaced by the exordium that "the existing framework . . . has proved to be not only satisfactory but also so flexible as to be capable of modification and evolution without of necessity any alteration of structure."

From this standpoint, the four associations endorse the two-tier system of local authorities in the administrative counties, with the addition of a third tier—parish councils—in the rural districts. There are no proposals for merging rural and urban districts, or for other changes that would increase the financial powers of the smaller authorities. There is a useful attempt to straighten out the often haphazard arrangements about which authority is responsible for which service.

On the major question of boundaries, the associations recommend merely that, for "the creation of effective and convenient units of local government," the Minister of Housing and Local Government should undertake a review of the counties in England and Wales, with the power to alter boundaries; thereafter the counties should undertake the same task *vis-à-vis* county districts, with joint committees to settle the exact devolution of powers. The scheme thus favours voluntary organisation against imposed orderliness—but it hands back to the Government of the day both the job of demarcating the boundaries of the great conurbations (and their two-tier government) and also, in effect, the settlement of disputes between the county boroughs and the county councils. An acceptable compromise between the interests of town and country remains to be found.

UNITED NATIONS

NEW PUBLICATIONS

Economic Survey of Europe Since the War
400 pages. 25/- (26/1 incl. postage).
Prepared by the Secretariat of the U.N. Economic Commission for Europe, the current *Survey* presents a comprehensive appraisal of European economic developments and problems since the end of World War II. Among the important subjects covered are: the present stagnation of the European economy, problems of economic integration, trade with dollar areas, balance of payments difficulties, European manpower resources, etc. Two chapters are devoted to the economic policies, achievements and problems of the Eastern European countries and the U.S.S.R.

Demographic Yearbook 1952
518 pages.
Paperbound: 45/- (46/5 incl. postage).
Clothbound: 55/- (56/5 incl. postage).
Official statistics from the major countries and areas of the world on population, births, deaths, marriages, divorces and international migration are provided in the *Demographic Yearbook 1952*. The geographic distribution of population is featured in the current issue of this *Yearbook* which contains a special chapter on urban trends and characteristics embodying data from the 1950 and 1951 censuses.

Statistical Yearbook 1952
554 pages.
Paperbound: 45/- (46/5 incl. postage).
Clothbound: 55/- (56/5 incl. postage).
The latest available statistical information on world economic and social conditions is presented in the United Nations *Statistical Yearbook 1952*. The tables provide information for a twenty-year period so that pre-war, wartime and post-war trends may be easily compared. Subjects covered in the *Yearbook* include: Population, Agriculture, Forestry, Fishing, Production, Manufacturing, Mining, Construction, Electricity and Gas, Transport, Communications, Internal and External Trade, Balance of Payments, Wages and Prices, National Income, Finance, Social Statistics, Education and Culture.

A Study of Trade Between Latin America and Europe
117 pages. 9/- (9/6 incl. postage).
This is the most comprehensive survey yet made of trade between Latin America and Europe. A detailed analysis is provided of the course and composition of imports from and exports to Latin America and major problems in the further development of trade are discussed. Special appendices discuss six major Latin-American export commodities (coffee, sugar, cotton, linseed and linseed oil, wool and meat) and two European export items (textile machinery and tractors).

United Nations Publications are obtainable from
H.M. Stationery Office, P.O. Box 569, London, S.E.1,
or through any bookseller.

FOR PERFECT PACKAGING
hand it to T&N

BICYCLES OR BOTTLES, chicks or cathode-ray tubes, we have the right answer to every packaging problem. Countless manufacturers in many industries know that T & N corrugated fibreboard packaging provides their goods with the protection they need and the good appearance they deserve. We should be pleased to advise on your packaging problems—entirely without obligation, of course.

THOMPSON & NORRIS
Pioneers of Corrugated Packaging

May we help to improve your containers or method of packaging?
Our experience and expert knowledge is at your disposal.

PARKINSON & COWAN (GAS METERS) LTD

Our Infra-Red Division was started eight years ago to give specialist service in the supply of Paint Drying Equipment mainly to those engaged in the manufacture of sheet metal goods.

It has now been greatly extended in its scope and serves a wide range of industry with processes as varied as those employed in Fish Curing and the Textile Trades.

We are looking today for new problems to solve in drying technique.

the firm of Taylor Woodrow Limited and its Subsidiary and Associated Companies continue building for the future.

TAYLOR WOODROW
Building and Civil Engineering Contractors

Trying to pass, you little superman?

I'm not a superman—but Daddy is.

Oh he is, is he?

Yes—he's a BP Superman!

What's that?

It's a man who's kind to his car by giving it BP Super—the new super-performance petrol.

What does BP Super do?

Daddy says BP Super banishes pinking—AND gives more miles per shilling.

BP is the trade-mark of ANGLO-IRANIAN OIL COMPANY, LTD., whose world-wide resources are behind it

Character versus Brains

How to choose the right people for the universities is in any circumstances a difficult problem; it does not appear to be made any easier by the Minister of Education's new circular to local authorities.

The present procedure is that a candidate gets himself provisionally accepted by a university and then applies to his local authority for an award. Both the place and the award are granted on condition that the candidate reaches a certain standard in the examinations, which he usually takes after these provisional arrangements have been made. The required standard laid down by the working party on university awards in 1950 was a General Certificate of Education in two subjects at advanced ("A") level. But in practice many students have found that a more exacting standard is required of them—sometimes by the university faculty, sometimes by the local authority, sometimes by both. A recent survey by the Incorporated Association of Headmasters showed that only three out of 23 authorities in two northern counties were content with the two "A" passes; the others all wanted at least three.

In these days when examinations are regarded as a form of cruelty to children, such requirements are thought to have an unduly cramping effect on the curriculum. Certainly the universities have grounds for complaint if the effect is to send them people who have crammed their three subjects and know nothing else. It is therefore sensible to ask local authorities once again not to insist on more than two "A" passes as their minimum requirement. On the other hand, they cannot finance all pupils who reach this standard. The Minister says they should choose among the qualified candidates by setting up special panels to assess their "personal qualities"; county awards should be regarded not as prizes for outstanding students but as "assistance for students of good all-round quality for whom it is in the public interest that a university education should be provided."

But how is the right combination of academic prowess and "personal qualities" to be judged? The universities themselves should be best qualified to decide. Most of them insist on interviewing candidates and take headmasters' reports into account. There seems some danger that the local authorities, by applying non-intellectual criteria, will only complicate and confuse the choice. If that happens the universities have, however, themselves to blame, since the Minister's circular is based on an agreed statement by representatives of the universities and local authorities.

Italy Votes its Bill

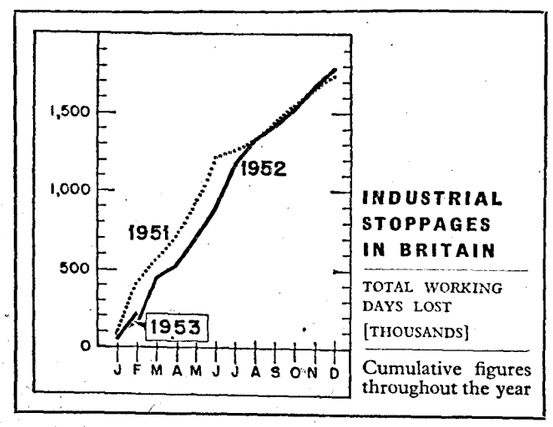
President Einaudi's signature of the new Italian electoral bill on Tuesday has greatly reduced the Communists' chance of gaining power at the polls on June 7th. Knowing this, they have fought the bill tooth and nail at every stage. They filibustered for weeks in the Lower House during the winter; and it was only at the end of last week, after a long struggle against obstruction culminating in a continuous sitting of 77 hours, that the government managed to get the bill through the Senate by a snap vote which caught the Communists off guard. They were in fact so busy fighting and throwing things at the government benches that they missed the roll call. This, however, gave them an excuse to brand the vote and the passage of the bill as invalid. In an attempt to prove this, they called a lightning general strike of protest, but this has been a fiasco, as it was opposed by the Socialist and Christian Democrat trade unionists.

There must be genuine doubts about the morality of what the government has done. The effect of the bill is to award a substantial bonus of seats to the party, or bloc of parties, which leads at the polls. This is reckoned to rob the Communists of the advantages they gain from proportional representation. But in favour of the manœuvre there are two things to be said. Under the new bill every party still stands an equally fair chance of reaching the top of the poll and thus gaining the bonus; indeed an outright Communist win cannot be entirely discounted, though it is most unlikely. Secondly, modern democracy has been forced by the Communists' own tactics to defend itself. Quite apart from unscrupulously attempting to hold the country to ransom by means of political strikes, their attempt to turn parliament into a rough house is aimed at discrediting the whole parliamentary system.

Naumann Changes Hands

Dr Adenauer has again had the courage and honesty to assure the Christian-Democrat press that the British were justified in arresting the Naumann group, and that Germans should be grateful to them for taking this action. The Chancellor refuted the assumption that the High Commissioner had handed over the arrested men to the German authorities because he had insufficient evidence to proceed himself against the majority of them. It was to be expected that the German popular press would jump to just this conclusion, especially as it had spread the report that the real reason for the action was that Naumann and his associates were business competitors of the British in Egypt. Dr Adenauer has proved once more how wrong it would be for the British to adjust their policy to wrong headed elements in Germany which will always be hostile to this country, whatever it does. With the outstanding exception of the Chancellor, the Germans who welcome the British exposure of neo-Nazi infiltration into the Free Democratic Party and the other right-wing parties are silent; but that does not mean that they do not exist and should not be heartened by evidence of British resolution.

Dr Adenauer broke part of the veil of secrecy that has surrounded the investigations. The Naumann circle had, he said, received money from British, French and other Fascists, and had been in touch with Nazis who had emigrated. He mentioned the former SS man, Otto Skorzeny, who escaped from an American camp some years ago and had been reported to have business interests in Spain and Cairo. The Chancellor could not say that there was specific evidence that the Naumann circle had also received money from Eastern Germany, but he indicated



that this might be assumed. Whatever emerges in this connection from the Naumann case, it is an indisputable fact that some link with pro-Russian or Communist organisations in the Soviet Zone is constantly cropping up in connection with the activities of former Nazis. Moreover, the Fascist international at some points seems to touch the Communist international. This is not so surprising as it might appear, for both have a common bond in hostility to the West. The German neo-Nazi who plays with Russian proposals for an armed "neutral" united Germany, or who refuses to follow American-sponsored bans on trade with the eastern zone, considers himself to be a German patriot who is showing "the Western enemy" that his country will not be bound to American or British "shackles." This is the type of man against whom Dr Adenauer is fighting—the man who thinks that Germany needs no friends.

Party Cell to Prison Cell

On March 24th the French police arrested a number of Communist trade union leaders and M. André Stil, the editor of *l'Humanité*. A warrant was also issued for the arrest of M. Benoît Frachon, general secretary of the Communist-dominated *Confédération Générale du Travail*. Although a defiant article has appeared over his signature in *l'Humanité*, his whereabouts are still unknown and it is believed that he has either escaped to the Soviet zone of Austria or has gone underground in France itself, following the example of half a dozen other Communists for whom the search has been on for several months. This new series of arrests is part of a general effort by the French government to break the charmed circle of parliamentary immunity within which the Communist leaders have been working and to make clear the clandestine nature of their programme.

It is difficult to see just why the government acted at a time when French Communism is involved in a profound crisis and when, more than ever, it needs martyrs. By removing such men as M. Stil from the party cell to the prison cell, moreover, the government may unwittingly help the Communists to allay the keen inner rivalry of various strong personalities within the central committee of the party. Finally, there is the fact that this move by the police coincided with M. Mayer's departure for Washington, thereby lending colour to the propaganda argument that France's Ministry of the Interior is run from the Pentagon. On the other hand, the government, and particularly M. Pleven and M. Brune, may have wished to demonstrate once and for all that the Communists were no longer a threat to the security of the state and that their backbone of militant action was snapped. They were proved right: despite a barrage of appeals for work-stoppages and demonstrations, the response throughout France was one of apathy tempered by derision.

This indifference on the part of the working classes and the deep *malaise* which has plagued French Communism over the past year, have made the return of Maurice Thorez more urgent than ever. His absence from Stalin's funeral, together with numerous reports and rumours of his total paralysis or even death, had made it appear as if there was no more possibility of his return. Now we are told that the latter is only a matter of days. If M. Thorez is able to come home from Moscow, even on a stretcher, the Communists may have the messianic symbol which they so badly need for the municipal elections in a few weeks. The one thing they will not obtain, however, is the sight of barricades against the arbitrary actions of the governments, and this despite the fact that Paris has so often thought of early summer as a time for tocsins.

Economics of Baby-minding

There have been protests in Parliament because several local authorities, notably the Kent County Council, have closed some or all of their day nurseries. This has also raised in its acutest form the problem of what a woman's work is worth inside and outside her home. The cost per head of keeping a child in a day nursery varies from thirty-five shillings a week to five pounds, according to staffing ratios and amenities. The average wage of adult working women is just under four pounds ten shillings a week. As a matter of plain arithmetic, this means that the full cost of the productive services of a working woman who sends her children to a day nursery may easily be both her actual wage, paid by the employer, and an equal amount paid through the local authority that looks after her children. Where several children must be cared for, the full cost may be several times the value of the product—a wildly uneconomic transaction. Where nursery costs are highest it would pay, hands down, to give the mother of two or more children her full market wage, plus a substantial bonus, simply to mind her own babies at home. That normally gratuitous job turns out, when actually priced in the market, to be more valuable than most other occupations open to those doing it.

This hard-headed arithmetical conclusion does not translate easily into practical policy. Not even the wildest speculations of welfare Utopians have included a universal payment to mothers of the market value of their work as child-minders. There might be a case for making such payments, as an alternative to the provision of day nurseries, only to those women who would suffer special hardship if they could not go out to work—to widowed or deserted or unmarried mothers, or to wives of disabled husbands. But an economic payment to such people would make them better off than many normal wives dependent on a breadwinner's earnings.

The problem must in fact continue to be fudged rather than solved. Those authorities whose nursery costs are highest should emulate those who have kept them down. The Kent scheme of "minders," avoiding the capital and upkeep expense of nurseries, offers an economical substitute. And it is probable that a nursery service run in part as a frankly commercial proposition, a babies' club for paying members, would earn enough from mothers valuing an occasional day of liberty to contribute substantially to the subsidised service for necessitous wage-earners. Almost anything would be better than a policy of first installing extravagantly expensive nurseries and then, by closing them down, driving their clients abruptly on to national assistance.

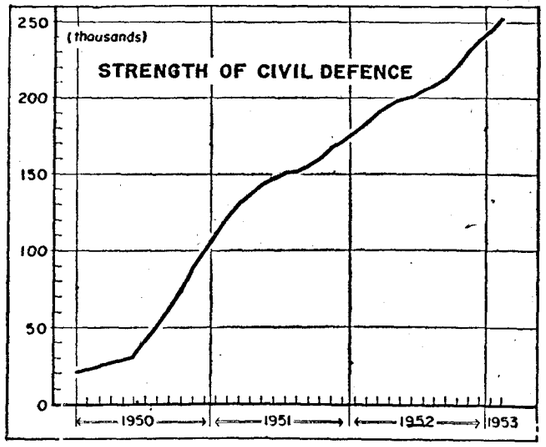
Living Costs in Cities

How much more does it cost to live in New York than in London, in Paris than in Rome? Such questions are of continuous importance to firms and governments with representatives in different countries. In order to help other employers to determine appropriate allowances, the Statistical Office of the United Nations has published the results of a study designed to meet its own needs in fixing salaries for international staff.

Living costs in a number of cities have been measured by pricing in each over one hundred items representative of the goods and services bought by international civil servants; wherever possible, account was taken of the different patterns of spending reported by the United Nations staff in these cities. On this basis, the level of prices in any one city was compared with that in New York. Many of these estimates were made twelve months or more ago; in the table, a selection of them has been brought more up to date according to movements in the local cost of living indices—a rough adjustment, but probably not too wide of the mark for this purpose.

COST OF LIVING FOR SALARY-EARNERS
(December, 1952; New York City=100)

	Food	Housing	Clothing	Total†
New York City	100	100	100	100
Copenhagen	65	53*	106*	75
Geneva	105	66	101	91
The Hague	71	47	110	72
London	60	79	94	75
Mexico City	87	...	121	90
Paris	95	100	121	100
Rome	98	90	82	89



* At July, 1952. † Including other items.

These figures do not compare the general level of prices; they relate only to the expenditure of salaried staff who are mostly newcomers to the area. Rents, for instance, are those likely to be paid for houses immediately available. The difficulties of obtaining truly comparable prices on such a basis are obvious, and several improvements may be expected in the further surveys that are contemplated. But, even allowing for their limitations, these estimates show clearly enough the wide differences between living costs in the big cities, when local prices are converted into dollars at the official exchange rates. One feature is striking: price increases of the past few years have not destroyed London's position as about the cheapest city in the world in which to eat.

New Tasks for Civil Defence?

The civil defence corps in England and Wales is now over a quarter of a million strong. Recruitment has been speeded up by house-to-house canvassing, but the most vulnerable areas are still the most thinly manned: it is in the country districts where no bombs will fall that people are most ready to spend their evenings on civil defence. In the eastern and south-western regions there are more than nine civil defence workers to every thousand of the population, but in London there are fewer than four.

The apathy of the city dweller can be dispelled only by taking the atom bomb out of the realms of unimaginable horror and showing it as a measurable disaster. In London a series of tactical exercises has been designed to show the local authorities the actual problems they would face in an atomic attack; in July, for example, an imaginary bomb will be exploded over the docks. Another injection of realism is the film shortly to be released to civil defence units all over the country; it shows that the area of complete destruction would be limited and that much damage and loss of life could be prevented by prompt action—even though there are no shelters.

All this, however, is preaching to the converted, for the exercises and the film will be seen only by those already in training. The unconverted would be less likely to regard civil defence as a waste of time if the corps had a peace-time function as well. The help given by civil defence workers in recent disasters such as the Harrow train crash

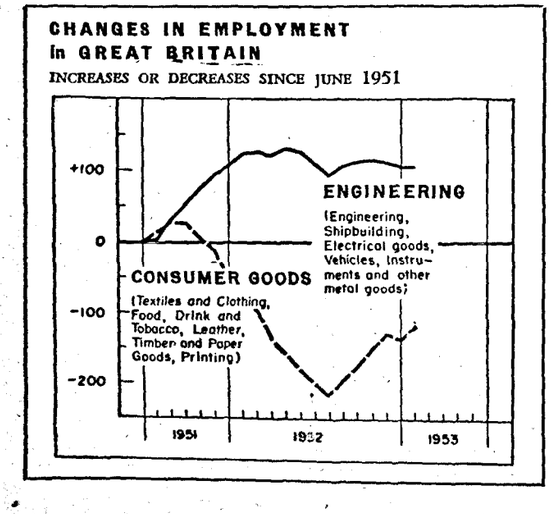
and the east coast floods has prompted the idea that such work should be officially included in their duties. Some local units are voluntarily seeking such responsibilities, but questions of insurance and compensation for injuries received in peacetime emergencies are involved. It is disappointing that Home Office deliberations on such difficulties have as yet reached no conclusion. An extension of civil defence functions would not only be useful in peacetime but would help to bring in the recruits without whom enemy bombs would be twice as effective. The legal difficulties should not be allowed to cause long delay.

New Bosses in Czechoslovakia

THE heirs to President Gottwald of Czechoslovakia are clearly determined to make all they can out of their dead leader's popularity, in the belief that a powerful Gottwald myth will prove the best foundation for their own pretensions. "The people regard every Communist as an embodiment of a particle of Comrade Gottwald"—this phrase from *Rude Pravo* is only one example of the eulogistic, not to say mystical, heights reached by comment on the dead president; and it was not for nothing that the same newspaper spoke of "our mighty Lenin-Stalin-Gottwald Party."

It is unlikely that the changes in the Czechoslovak government will increase the stability of the Communist regime. Mr Zapotocky, the former premier, is the new president; but, in spite of the many tributes to the "closest collaborator of Comrade Gottwald," it is plain that he will not be able—or will not be allowed—to turn the office into the dominating role that Gottwald made of it. Mr Nejedly, the aged vice-premier, who may himself have aspired to be president, has described the situation with brutal frankness; "Gottwald cannot be replaced; Zapotocky cannot become a second Gottwald. This is why he is not alone."

In party affairs the new president will be checked by Mr Novotny, who has risen rapidly in recent years under Gottwald's auspices, and has now been entrusted, in rather vague terms, with the direction of the central committee of the Communist party. In affairs of state Mr Zapotocky must reckon with the new premier, Mr Siroky, a veteran Slovak Communist and former vice-premier. His influence will largely depend on his relations with the vice-premiers composing the government praesidium, or inner cabinet, set up last January by Gottwald in order to concentrate—on the Moscow model—the regime's administrative control. Neither president nor premier is likely to have an easy passage with the praesidium's two most powerful and ambitious members; Gottwald's son-in-law and the Minister of Defence, Dr Cepicka, and the Minister of National Security, General Bacilek. It was these two who accompanied Gottwald to Moscow for Stalin's funeral.



Turkey's Trade Troubles

IT is an unfortunate paradox that Turkey's trade difficulties have been aggravated by the energy and initiative it has shown in modernising and developing its economy, especially its agriculture, and the success which has attended its efforts. For the first time the Turks have a large grain surplus on their hands, in addition to considerable quantities of cotton and dried fruit; but the heavy imports of machinery which have made possible the development of agriculture (as well as of industry) have played a large part in upsetting their trade accounts and they have not been able to redress the balance by selling their agricultural surpluses. This is particularly the case with Britain. Whereas in 1950 the Turks had a visible trade surplus with this country of £2,500,000, in 1951 they found themselves with a deficit of £14,625,000, and last year this soared to £26,125,000.

This yawning deficit, largely due to heavy imports of machinery, has been troubling the Turks for some time. Last week a somewhat critical speech by the secretary of the British Chamber of Commerce in Istanbul led the Minister of Commerce to threaten discriminatory measures against British imports. He argued that other European importers of Turkish grain, cotton and dried fruits did not, as did the British, complain of their price or quality, and suggested that Britain was interested in buying only from the countries in which it was anxious to sell.

★

These trade difficulties should not be allowed to impair the friendly relations between the two countries; and it cannot be too strongly stressed that no official policy is responsible for the failure to find markets in this country. Private importers agree with Government buyers that the fault lies in the price and quality of Turkish goods; and since a large part of British trade with Turkey is in private hands, the ability of the Government to help is limited. But it could make a renewed effort to reach agreement on the purchase of Turkish coarse grain; and the Turkish Government, which has been enforcing since last autumn a stringent general restriction of imports because of its difficulties with EPU, could refrain from carrying out its threats of discrimination.

Mao's Good Bargain

THE terms of the economic agreement signed last week in Moscow between China and the Soviet Union must have been greatly influenced by the growth in Mao's stature following Stalin's death. The new agreement is additional to the vague economic pact signed between the two countries in September of last year. Chinese delegates had remained since then in Moscow, bargaining hard for Russia's aid, but the deal was clinched almost immediately after Stalin's departure. The protocol itself does not show explicitly Russia's concessions since, like its predecessors, it does not state the volume and the value of goods exchanged. Yet China's gain is revealed by the emphasis in the communiqué on Russian supplies of equipment for China's industrialisation.

Hitherto there has been very little evidence that any substantial part of the apparently generous economic aid promised to China in the Sino-Soviet pact of 1950 has in fact been delivered. Indeed, Soviet propaganda has been at pains to prove that its chief contribution to Chinese development should be through the sending of experts and technicians. We must teach the Chinese, it argued, to produce their own machinery. Now Russia binds itself to provide equipment for China's metallurgical, mining, machine construction, chemical and electrical industries. Another protocol provides for Soviet assistance in the electrification drive. China, in exchange, will provide Russia with more of its traditional exports, such as non-ferrous metals, foodstuffs, wool, jute and raw silk.

The Chinese are earnest about their Five Year Plan of industrial development. In the greatly increased budget for this year published recently some 45 per cent of total expenditure is earmarked for "national construction" and over one-quarter just for industry and transport. China, however, has not a sufficiently strong basic industry to carry out its own industrialisation rapidly. To quicken the pace it needs Soviet equipment as well as the experts. Hitherto the Soviet bloc was begrudging its scarce machinery to its economically most backward partner. Now, in times of stress, Moscow seems to be willing to pay this price to keep the ties with Peking as close as possible.

Needling Nato

LORD MONTGOMERY does well to continue his needling of Nato, which is of course only a prodding of the governments which neglect the nascent Atlantic community. But it is curious that he should have insisted so much, in a speech this week, on a centralised political authority under which he and his superior officer, General Ridgway, could work. Such an authority exists in the Atlantic Council, but it is doubtful whether the generals would take too kindly a masterful exercise of its powers. Last year there was talk of the Council instructing the Supreme Commander to restrain his officers—notably General Juin—from making political speeches. But they continue to do so. For Lord Montgomery there is this to be said, that his comments are always designed to disturb complacency and to remind people of the nature of the cold war.

The trouble is that no member of the Atlantic Council in permanent session, except Lord Ismay, is sufficiently well known to get Nato into the headlines with a speech. So long as the deputies to the Atlantic Ministers are permanent officials, however efficient, the Atlantic Council will lack character and power. President Eisenhower, a former Supreme Commander himself, must know this well; and it is disappointing that he has not yet found time to put in the word for Nato that everyone has expected. The explanation is, doubtless, that he has been too busy; but it can be fairly argued that the deliberate building up of the Atlantic group in its political and economic functions would be the best contribution to political warfare that Washington could make. With the Council's next meeting only three weeks off, it is to be hoped that thought is being given to this not only in Washington and London, but also in Ottawa, which has shown leadership in the past in this respect.

Who Shall Educate Them?

Every one is aware that there are many candidates for the honour of directing the education of the people. The Church claims it; the Dissenters claim a large share of it; the gentlemen who profess the doctrines of the Manchester system claim it; the journals claim, and, in a great measure, actually direct a most important part of the public education; masters and workmen claim it for their apprentices and their assisting boys; and mothers very generally claim it, to a very considerable extent, for their offsprings. For the great mass of the lower classes, who are themselves too much engaged in toil and too ignorant to give instruction, except in their own most useful labours, it has for some time been expected that the State should, in some way or other, provide education. . . . As the State formerly undertook to regulate trade and to increase the national wealth—as it at all times undertakes to repress and punish crimes, it is generally concluded that it is bound to teach youth how to avoid being criminal, to acquire habits of industry, and to perform all the duties of men in society. Our infants are said, in our popular poetry and our popular prose, to be given up to misery and crime, because it is not yet decided who shall educate them and what education shall be given them. "Who bids," says Mr. Charles Mackay—

"Who bids for the little children—
Body and soul and brain?
Who bids for the little children—
Young and without a stain?
Will no one bid," said England,
"For their souls so pure and white,
And fit for all good or evil
The world on their page may write?"

"We bid," said Pest and Famine,
"We bid for life and limb;
Fever and pain and squalor
Their bright young eyes shall dim.
When the children grow too many,
We'll nurse them as our own,
And hide them in secret places,
Where none may hear their moan.". . .

From the contests between sects, education has been so delayed, so confused, and perhaps perverted, that by common consent—we may say even by urgent general demands— the time has come when the State must deal largely and liberally with the subject, or be prepared to make default, and acknowledge that it is incompetent to fill the duties generally required of it.

Letters to the Editor

Australia

SIR—I have read with a good deal of interest the supplement on Australia in your issue of March 7th. There is, however, one serious error to which I should like to draw your attention, as it concerns the production of wool, Australia's most important primary product. In the first line of Table III on page 686, the figures for wool production do not refer to the wool clip, but "factory" output of scoured and carbonised wool from Australian establishments. The official figures for the total raw wool production (in million lb. greasy equivalent) are as follows:—

1938-39	984 m. lb.
1948-49	1,030 „
1949-50	1,110 „
1950-51	1,092 „
1951-52 (a)	1,052 „

(a) Subject to revision.

The most recent official estimate for 1952-53 is 1,175 million lb. greasy; if this estimate is realised, and there are already signs that it may indeed be exceeded, it will be a record clip. I draw your attention to this very necessary correction, because of the extreme importance of wool to the Australian economy, and also because the correct figures give a rather different impression of the trend in primary production from the ones you have used.

Attention might also be drawn to an obvious error in Table I on page 685, where the figure of 1,200 million lb. is quoted as the increase in wool production aimed at over the next 5 years; actually 1,200 million lb. is the target figure of total production. It will be seen that good seasonal conditions have already brought the 1952-53 clip close to this target.—Yours faithfully,

R. B. McMILLAN

Bureau of Agricultural Economics, Melbourne

★

SIR—The wool growing industry is certainly a "major export industry"—indeed it is more important for Australia than all others taken together—but it is *not* one of which you are entitled to say that "high prices masked a considerable fall in production" (p. 689). The only year for which your statement has a semblance of truth is 1951-52, in which production was adversely affected by drought. This factor is entirely neglected in your discussion of Australian primary production in general, and you allow yourself to draw pessimistic conclusions on the basis of a single abnormal year. The current season shows considerable recovery in wheat, meat and dairy products as well as wool.

The wool scouring industry should properly have been included among the "selected secondary industries" in your Table IV. So, too, should a number of other industries which have also had a chequered postwar record, e.g., ladies' and children's hosiery, woollen and worsted yarn, slipper making and chocolate manufacture. Had such industries been included, your table would not have shown the uniform pattern of secondary industrial expansion which you claim exists.

Finally, it should be observed that the results of disinflation in Australia are only now becoming clear and adequate statistics thereon will only become available later this year. Your conclusion that the results for *last year* were "startlingly different" from those that appeared in Canada (p. 613) is, therefore, somewhat beside the point and seems to be based mainly on statistics for the 12 months ended June, 1952.—Yours faithfully,

WILFRED PREST

University of Melbourne

★

SIR—Your supplement of March 7th seemed to neglect a most important factor. The conditions existed in Australia which of themselves would have led to rapid industrialisation without governmental encouragement.

It is true that as a result of the '30s Australia was apprehensive about the long term prices of primary products, and consequently readily sought and agreed to international and bilateral agreements on quantities and prices. As it turned out, the prices obtained under these agreements (which, with the notable exception of wool, covered the principal Australian exports) were much less than those prices which could have been obtained on the open market. On the other hand, imports were the subject of no such agreements. It was found that a wide range of goods could be manufactured more cheaply than they could be imported. In many cases, in the immediate postwar period, due to the low priority accorded the Australian market by U.K. and other manufacturers, goods were just not available to the Australian consumer. Hence, high profits awaited the Australian producer, especially in those industries that could be quickly established. Except in wool, it became profitable to switch resources from primary production to secondary industry and it would indeed have been surprising if the trends against which your strictures are directed had not emerged.

It is agreed that a sector of Australian industry is "uneconomic," but what is the size of this sector? Does it represent anything more than marginal industry which it is difficult, if not impossible, to avoid in a period of rapid expansion? The problem of the marginal firm and industry is not peculiar to Australia, nor does it seem to be more significant in the Australian economy than elsewhere.

It is generally agreed that in an economy such as Australia's, high standards of living reflect high levels of productivity. Your implication had been that productivity in Australia was wrongly directed and was not high. Yet no attempt was made to explain or even suggest how the admitted high living standards, together with a high level of saving, were being maintained.—Yours faithfully,

Geneva L. K. CARLYLE

★

The Roots of Mau Mau

SIR—May I call your attention to an error of fact in the article headed "The Roots of Mau Mau" on page 790 of your issue of March 21st? You say:

> "The widening areas of disturbance, which is already costing £250,000 a day. . . ."

At the last session of the Legislative Council I stated that the emergency was costing between £200,000 and £250,000 a month.—Yours faithfully,

E. A. VASEY

Farm Policy in the Making

SIR—The article in your issue of March 28th shows a lack of appreciation of the present structure of the egg producing industry. The young hen, or pullet, starts laying about the beginning of September, and during 12 months lays about 180 eggs. At the new floor price of 4s. per dozen the annual income per hen is, therefore, guaranteed at 60s. Under the new food prices her food will cost about 45s. per annum, or 3s. 9d. per month. Of the 180 eggs about 100 will be laid by the end of February, but these 100 eggs will have yielded two thirds of the total annual income, while the hen will have consumed only half of her annual food. During the remaining 6 months from the beginning of March to the end of August the hen's food consumption will be half the annual total but her egg production will be only one third of the annual cash total. In addition the carcase value of the hen is considerably more at the end of February than it is at the end of August. Therefore it is touch and go whether it is worth the egg producer's while to produce eggs at all once the price per egg falls below about 4d. It is obvious from this that the type of floor price you suggest is completely out of touch with reality. Egg producers can no more work at a loss than anyone else, and most of the hens would be dead long before your "reasonable" two or three months were up. The Government is not quite so foolish as you appear to suggest.—Yours faithfully,

ROGER CHAPMAN

Books & Publications

Comrades in Conspiracy

EUROPEAN COMMUNISM.
By Franz Borkenau.
Faber. 564 pages. 42s.

THE secret of Communist success in Europe has lain in the expertness of the Party's tactics and organisation. "It is the innermost meaning of Leninism-Stalinism," says Mr Borkenau "to segregate a small *élite* from the masses. This *élite* alone knows the real meaning of the whole movement, and in consequence the real meaning of its tactical moves." Communism would be finished if its exponents could be prevented from underground, secret conspiracy and forced to use ordinary democratic methods. Then their means could be measured against their ends and would be rejected by every humane and rational person. That may well be true, coming from an ex-Communist who has specialised in the study of party conspiracy; *and what this book does is* to provide evidence, stretching back to 1919, of the unscrupulous opportunism with which Stalin and his foreign disciples have manipulated the political movements of the working class and the loyalties of the intelligentsia.

The story is of incredible deviousness and intricacy; it should cause great discomfiture to all comrades now preparing for Malenkovism. It falls into four parts. First Mr Borkenau studies the origins of the Comintern, culminating in the utter failure of the German Communists in 1933. Then he analyses the strange story of the Popular Front against Fascism, with France emerging as *the great hope of international* Communism. Then come the ups and downs of the Party line, first for and then against Hitler, culminating in the effort to seize power in Western Europe after D-day. Finally, the narrative comes to the recent past: the crisis of liberation, the founding of the Cominform, the establishment of the "popular democracies" and the decisive alignment with the West of Tito—a rebel, in Mr Borkenau's view, of the left not of the right, an ally of Zhdanov's in the protest against Stalin's caution and dread of war. All members of the Labour Party who feel some elective affinity with President Tito's brand of "Socialism" should study this last section.

It is the thesis of this deeply interesting and valuable book that in Communist affairs "the intra-party organisation must invariably be studied first, and policy must be treated as its consequence." And there are other arguments advanced by the author which will help in the interpretation of the post-Stalin developments in Russia. By studying the reasons for Zhdanov's failure—the Berlin blockade marked the end of his aggressive policy—it is possible to see further into the mind of his great rival, Malenkov. Russia cannot and will not risk world war for some time to come, and will try to split the West by manœuvring the United States into aggressive postures. The order has gone out to return to the tactics of the united front, even if that means—as it did in the late 'thirties—collaboration with the European Right. The crisis in the French Communist party now suggests that Mr Borkenau is right.

To many readers who have not seen the work of Rossi, Woodhouse and others the account given of Communist wartime activity in Greece and in France—the best chapters in the book—will come as a disturbing revelation. How right was General de Gaulle in 1944-45 and how right was Mr Churchill when he backed the Greek monarchists as the only basis for a mass movement against ELAS. And, if Borkenau is correct in his analysis, Stalin had already decided in 1936—not 1938—that France was no reliable ally and that a deal must be made with Hitler.

The obvious criticism to make of his whole approach to his subject is that he is obsessed with the conspiratorial aspect of Communism and Russian foreign policy and therefore over-simplifies the pattern of events. But that in itself is valuable, for the most familiar error of judgment about Russian behaviour is to assume that the men in the Kremlin think, plan and act as we do. For those who are prepared to concentrate, if only on portions of Mr Borkenau's story, here is the cure. He has done the free world a great and well-timed service.

Cold Comfort Farm

PROPHECY OF FAMINE
By H. J. Massingham and Edward Hyams.
Thames and Hudson. 192 pages. 12s. 6d.

FOR some unidentifiable but obviously compelling reason, the straightforward technical question of the future terms of trade between primary and secondary products has an extraordinary power to make people lose their sense of proportion and their tempers. "Prophecy of Famine" is a ripe example of this process. The authors (Mr Massingham died before the book was completed) begin by restating, as fact, quite uncritically, the very blackest Malthusian hypothesis. Famine does not merely loom a generation or two ahead, it will be on us at any moment; by the 1960s the majority of British children may have "the aged, haggard faces of the old and the swollen bellies of starvation." We face not only the world shortage of food but the fact—again uncritically and dogmatically stated—that no one wants on any terms what we can give in exchange for such food as is going. It is not merely that they want coal rather than cotton goods, or that our prices and delivery dates are insufficiently attractive, or that in general the changing pattern of world production demands of us more technical and commercial liveliness than we now exhibit. It is simply and flatly that nothing we produce is, or ever will be again, wanted in sufficient quantities to buy our food. Our trade is conducted partly as a sort of cold Opium War (that goes for the "backward countries" of the Empire) and partly as a cap-in-hand, matches-in-the-gutter beggary (that goes for the Americas.) Presently the exploited Empire will revolt, the Americans will get tired of us, and then.... Anyway, reliance on international trade is folly in a war-threatened world. How much better, one is led to suppose, Britain could have stood up to Hitler had it been a larger Denmark.

The moral is, of course, that Britain should become as self-supporting as is physically possible as fast as is physically possible, with no pernicious nonsense about this or that form of food production being "uneconomic." Home grown food is worth what it costs, whatever that may be. This frequently repeated aphorism means, if it means anything, that the most brilliant aeronautical engineer, or chemist, or for that matter violinist, would be better employed digging potatoes, and that the City of London should be laid out in allotments. In fact the authors envisage nothing of the kind; but that is where their logic leads them. Once the absolute priority of food production is qualified, one is back in the realm of economics, of marginal calculations, of the little less and the little more; one is asking the forbidden question, "Does it pay?" The scale and data of calculation may be altered, but the economist has returned. The villain of the piece is not so easy to expel.

It is all really rather a pity. There are powerful reasons for believing that the terms of trade will indeed move further against the factory and in favour of the farm. There is a corresponding need for a realistically higher valuation on the food-producer's activities and for its effective translation into practical policy. And despite all exaggerations and irrationalities, the late Mr Massingham's vision of a partnership between man and nature, of husbandry rather than exploitation, of reverence for the soil and its vital processes, of the integration of work and life, deserves a better summing-up than "muck and mysticism." Urban intellectuals do well to remember the myth of Antæus. The common ground exists for a rational debate in which ecologists as well as economists, historians and philosophers as well as chemists, have a contribution to make. But no rational debate can be

conducted in terms of dogmatic moral superiority, bad history, worse politics, and no economics at all.

Cobden in America

THE AMERICAN DIARIES OF RICHARD COBDEN.
Edited by Elizabeth Cawley.
Princeton University Press, (London: *Geoffrey Cumberlege*.) 233 pages. 25s.

WHEN one considers how great an influence the United States had on the thinking of Richard Cobden it is rather surprising—though of a piece with British historians' neglect of Victoriana—that his American diaries should have gone so long unpublished. This oversight has now been amended in this elegant, expensive and carefully (though not impeccably) edited volume. The first of the diaries, that which Cobden kept on his 1835 trip, was extensively quoted in Morley's "Life" (though the editor makes no allusion to the fact); the second relates to his 1859 visit and was ignored by Morley. The first is full of the romantic excitement of a young radical viewing, as it were, the site of his New Jerusalem, "the soil on which, I fondly hope, will be realised some of those dreams of human exaltation, if not of perfection, with which I love to console myself." His pages are full of prophecies—"What beauties will this inner bay of New York present centuries hence," "Here [the Mississippi Valley] will one day be the headquarters of agricultural and manufacturing industry, here will one day centre the civilisation, the wealth, the power of the entire world." Nature, even more than man, excites his enthusiasm—Niagara, still innocent of industry, electrical or tourist; the Hudson Valley, as unspoilt as in one of Thomas Cole's landscapes. But, of course, to the seeker after improvement there are other spots to be visited—Auburn for the model prison, Lowell for the model mills, a New York public school "pregnant with hopes of the exaltation of the character of future generations."

By the time Cobden returns for his second visit, he has become a world figure. The diary is full of engagements —"breakfasted with the President"— and catalogues of eminent citizens met and consulted. There are more figures about the value of real estate and fewer raptures and thrills. Niagara is surrounded with "Inns, houses, railways and bridges." But it is still "a spectacle suggestive of ideas of eternity and omnipotence," and although the main object of the journey is to rescue the Illinois Central Railroad from bankruptcy, its principal British shareholder still has a zest for exploring educational establishments and going to hear Henry Ward Beecher being "affectedly unaffected" in his New York church. The whole is alive with the keen observation of a critical but sympathetic traveller, singularly free from *parti pris*, vividly and crisply described. How many contemporary travellers' diaries will read as well in 2053?

Taxes and Risks in Canada

THE TAXATION OF CORPORATE INCOME IN CANADA.
By J. Richards Petrie.
University of Toronto Press (London: *Geoffrey Cumberlege*). 380 pages. £2 15s.

THIS book discusses comprehensively and authoritatively the taxation of corporate income in Canada; it also pleads for the abolition of double taxation by the integration of the corporation income tax with the personal income tax. There are two taxes levied on corporation income in Canada. Federal and provincial governments levy income tax on profits. The Federal government levies a further tax on the same income—in effect, a tax on distributed profits—through the personal income tax paid by recipients. Dr Petrie argues that the best way to avoid this double taxation, which he thinks is unjust, is the "dividends-paid credit plan." This would make the corporate income tax a tax on undistributed profits. The great difficulty of such a plan would be that dividends paid to foreign investors would be tapped only by the 15 per cent withholding tax, rather than by the personal income tax.

Dr Petrie complains that Canadian tax practice has encouraged saving by corporations and helped to reduce the supply of risk capital. At the same time it has made loan finance more attractive to corporations than equity finance. All this tends to discourage new and small enterprises. This is a serious charge against the tax structure of a country which must rely on private enterprise to explore and exploit new resources and build new factories. But it is difficult to avoid the conclusion that at present rates of tax in Canada the tax structure is not a serious hindrance to economic expansion, despite the shortage of risk capital.

The author is critical of recent Canadian experiments with deferred depreciation allowances "and other gratuitous departures from accepted accounting practice." Indeed he is convinced that, except in wartime, the corporation tax is not a good instrument of fiscal control. The Korean War, which broke out just as he was finishing the draft of this study, seems to have forced a partial modification of his conviction that taxation should be "for revenue only." This gives the book a tone of uncertainty, for this problem is nowhere examined at length. He is impatient, too, with the continued existence of provincial corporation income taxes. But a great deal has been done to create order out of the jungle of competing tax jurisdictions. There has been a considerable improvement since the Sirois Report in 1940, which noted that some corporations paid more for advice in making out their numerous tax returns than they paid in tax.

These, however, are minor criticisms of an important and readable study which should become the standard work on the subject. It will interest any student of taxing practice and any business man who plans to set up a company in Canada. The former will find the bibliography particularly useful. The Canadian Tax Foundation, which sponsored this study, is to be congratulated in making publication possible.

An Old German Dream

THE SHADOW OF STALINGRAD.
By Graf Heinrich von Einsiedel.
Allan Wingate. 254 pages. 15s.

GRAF VON EINSIEDEL, a great-grandson of Bismarck, was a German fighter pilot in the Stalingrad pocket when he was captured by the Russians. He was as innocent of political thought as a new-born babe, and naïvety is a strongly marked characteristic of his narrative throughout. Its interest lies in the light it throws on German-Russian relations in the past ten years.

After his capture, Einsiedel was recruited for the Free German Movement which the Russians were active in establishing; according to his own account, he became a convert to Communism. The grounds of his conversion are interesting: the attraction of a dogmatic and totalitarian system of ideas combined with the reflection that it was only by alliance with Soviet Russia that Germany could rise to power again. This up-to-date version of the "National Bolshevism" with which Reventlow and the German Right flirted briefly in the early 1920s chimed in well with the young Count's insistence that his great-grandfather had always believed in alliance with Russia as the basis of German policy.

The politics of the German National Committee, or, to be more precise, the scramble for privileges and power, form the most substantial part of the book. It is a squalid story, equally revealing for the picture it draws of the methods of propaganda, corruption and intimidation used by the Russians and for the reaction of the Germans, who ranged from generals like Paulus and Seydlitz to Communist exiles like Pieck, long resident in Moscow. The generals come out of it badly: their behaviour in captivity was as contemptible as their failure to stand up to Hitler.

The Russians never made up their minds what they wanted to do with the National Committee and it was disbanded soon after the end of the war. In 1947, Einsiedel was sent back to Germany and worked for a German Communist newspaper in Berlin. His picture of the relations between the leaders of the satellite regime and their Russian masters, a study in the pitfalls of political opportunism, leads into an account of his own disillusionment with Communism. The conclusion is well-stated, if a little glib, but it is not necessary to believe all an author says in order to recognise the interest of his book. In this case it lies not only in the unusual story he has to tell but in the many unconscious sidelights he sheds on the attitude of those Germans who, like himself, have attempted to realise the old dream of German-Russian co-operation.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

The State of State

Washington, D.C.

ON March 13, 1952, Mr George Kennan, after being nominated by President Truman as Ambassador to the Soviet Union, was confirmed by the Senate without debate or opposition. On March 27, 1953, Mr Charles Bohlen, nominated by President Eisenhower for the same post, was confirmed by the Senate after three long days of acrimonious debate by a vote of 74 to 13. From these facts it would be logical to deduce that Mr Truman was more firmly in the saddle in the closing months of his Administration than his successor is after only nine weeks in office, or that Mr Dulles is already less trusted by the Republicans than Mr Acheson ever was. Equally, it might be supposed that Mr Bohlen, who was present at Yalta, is inherently a more controversial figure than Mr Kennan, the author of the "containment" policy, against which much of the Republican campaign of last autumn was directed. None of these deductions, of course, would be true.

The explanation of last week's painful spectacle in the United States Senate is more complicated. A year ago the McCarthy clique cared little who represented the Democrats in Moscow for the next twelve months, and Mr Arthur Bliss Lane, the American Ambassador in Poland from 1945 to 1947, who is becoming more and more prominent in the speeches of the super-patriots, had not yet sold Mr Dulles the "liberation" policy which was used to belabour Mr Kennan. Finally, the "little group of wilful men," having lost their principal target, Mr Acheson, have turned their fire on "Acheson's lieutenants," those members of the Foreign Service who were in positions of trust during the war and the postwar years.

★

The American Foreign Service has always worked under extreme difficulties and looked forward to few rewards. Its members always knew that both the important diplomatic positions and the desirable, but unimportant, ones would go to the politically faithful and that their role would too often be the thankless one of trying, from subordinate positions, to prevent international illiterates from making major blunders. In their declining years they might find themselves, if they were lucky, as Ministers in some capital with an unpleasant climate. Under the circumstances, the United States got more devoted service and more efficient work from its diplomats than it deserved. It was not until Mr Hoover was President that, for the first time, as many as half of the Heads of Missions were career men, and even then few important countries were among that half. Under Mr Roosevelt the proportion reached 70 per cent and it is not expected to slip below 60 per cent in this Administration.

Over the last thirty years there grew up, within the service, two small groups of specialists who became the particular pride of the service as a whole. The members of one of these groups became expert in Chinese and those of the other in Russian and, as they developed experience and attained seniority, the Foreign Service began to feel that, in two fields at least, it could meet the diplomats of other countries on equal terms. Since 1948 the experts on China have been scattered by Messrs McCarthy and McCarran. One, Mr John Service, has been dismissed; two others, Mr John Carter Vincent and Mr Edmund Clubb, have had to resign; a fourth, Mr John Davies, has been in constant jeopardy for some years and can no longer be used in the area where his knowledge would be most valuable.

Now it is the turn of the Russian experts to be attacked. Mr Kennan is not, it seems, to be re-employed and will therefore be automatically retired. Thirteen members of the Senate have voted against Mr Bohlen as a bad security risk and a number of others made it clear that they did not like the appointment and approved him only because they did not want to oppose the President. Another member of the Russian group, Mr Bohlen's brother-in-law, Mr Charles Thayer, resigned rather than face another bout of questioning and investigation. It is not surprising that the morale of the State Department has suffered under these blows and that it feels that the traditions it has developed in the face of great difficulties are in danger of being destroyed for the momentary advantage of a handful of ambitious and unscrupulous Senators. Will any Administration be willing to face another struggle like last week's to get confirmation of the best man for the job or will it tend in future to choose somebody politically unexceptionable—which means, with Yalta for ever on the horizon, somebody with a record of ignorance?

★

As far as his actual policies are concerned, Mr Dulles seems to have recovered from the bout of dangerous announcements and pronouncements with which he began his career as Secretary of State. Both Mr Eden a month ago and M. Bidault last week were able to breathe more

easily when they found him in less adventurous mood than he had seemed earlier. But the improvement in political action abroad has not yet been matched by its necessary companion, the rebuilding of confidence in the machine that must carry out his policies. He has not remedied the mistake he made when he demanded "positive loyalty" and started engaging men to ensure it.

He began by having the post of Under Secretary of State for Administration created and telling his assembled staff with pride that the man he had appointed to it was "an all-American quarterback and I think that that is the kind of thinking and creative action we are going to see in this job today." To help the new Under Secretary with his creative action in the field of security Mr Dulles chose Senator Bridges's administrative assistant, Mr Scott McLeod. This appointment sent shivers down the spine of anyone who knew much about the Senator and his habits and it was not long before Mr McLeod was accused of disclosing to Senator McCarthy some of the contents of the Federal Bureau of Investigation's file on Mr Bohlen. Despite the trouble he caused both to the President and the Secretary, Mr McLeod is still in the Department, judging the security of others who are, it would be reasonable to infer, more trustworthy than their judge.

★

But the acid test of Mr Dulles will be whether he displays positive loyalty to his own department and, particularly, to the Foreign Service. He told the Foreign Relations Committee that it was "on the whole, a very fine body of men who have the tradition of service to the Administration in power," but he weakened the effect of his defence of Mr Bohlen by giving as a reason for sending him to Moscow that an Ambassador was not in a policy-making position while a Counsellor in the State Department, which Mr Bohlen had been, was. And there is, in Washington, a general feeling that it was the President who really made this appointment and who has the greatest enthusiasm for it.

In another case Mr Dulles took a course which, perhaps unjustly, tended to make the members of his staff apprehensive. His decision to allow Mr John Carter Vincent to retire, thereby saving his pension, when the Loyalty Review Board had decided that he should be dismissed, represented the best Mr Dulles could do in terms of political realities. It may be shocking that things have reached such a pass that this should be so and it is no consolation to those who may be under attack in future to realise that the Secretary of State can find himself in a position in which it is politically impossible to be just and in which it takes courage even to be merciful. But it did take courage.

It will take even more courage to stand up, perhaps for months on end, to the demands of Messrs McCarthy and McCarran and to carry the fight, begun over Mr Bohlen, to victory. But there is now no doubt that the fight is necessary and any illusions that, by some mysterious process, Mr McCarthy would become innocuous under a Republican Administration must have disappeared. Presumably also it has now been realised that it is pointless to try to appease the barbarians in the Senate by hiring any more friends of Mr Bridges or Mr McCarthy. Meanwhile, however, a McLeod considerably bigger than a man's hand hangs over the State Department.

Consumers Become Heroes

FROM A CORRESPONDENT IN NEW YORK

SHORTLY before President Eisenhower took office, the Department of Commerce issued a study called "Markets after the Defence Expansion," which may in future years become famous for being the last utterance of the New Deal. It tries, by means of statistical projections, to give business men an idea of what the charts of civilian demand may look like in 1955. Among other interesting feats of imagination it offers "a pattern of expenditure for 1955 on the assumption that a high level of general business activity can be maintained."

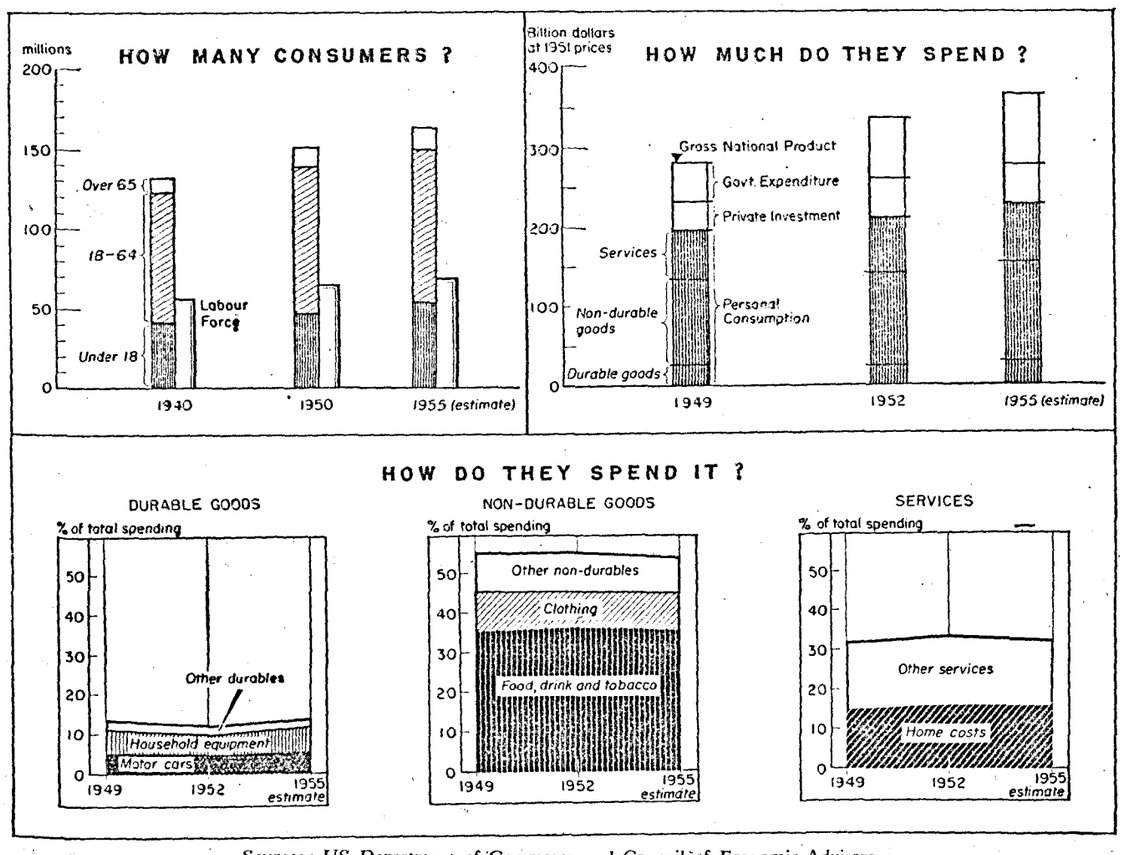
In that pattern the long-neglected consumer becomes the hero. Assuming that the country turns out a gross national product of $365 billion (at 1951 prices) in 1955, the consumer is supposed personally to acquire and dispose of $228 billion worth, or nearly 63 per cent of it. He and his wife and children, his pets and his servants (if any) are to spend $10 billion on motor cars, $3.6 billion on furniture, $1.6 billion on jewellery and watches. They are expected to buy $123 billion worth of non-durable goods (among other things clothing to the value of $18.5 billion and oil and petrol to the value of $6 billion). They should also spend $73 million on the service trades; it is hoped that businessmen will be able to charge them $900 million for laundry, $1.1 billion for barbering and beauty, $1.3 billion for making and showing them films, $800 million for taking them to foreign lands.

These estimates are accompanied by a warning that they are not forecasts, but merely "a possible set of estimates of expenditure," based on the assumption that 1955 will be as prosperous as 1951, or even a little better. But if, as seems also to be assumed, prosperity depends on the consumer, it might be well to add that the consumer has, in these years of neglect, become less dependable than he used to be. During the long boom with its accompanying redistribution of the national income, and more particularly since the war, the consumer has been left free to make up his own mind and he has grown so rich that he can now afford to be captious.

This captiousness is a new factor in the economy. Not only must it be studied in order that its quirks and implications for the market may be understood, but also because it strikes at the heart of certain economic theories. According to them, capital expenditure has been the unstable element which needs steadying, while personal consumption has supposedly been dictated by people's needs and has therefore been fairly dependable. But since the war it has been capital expenditure which has been running at a steady pace, and the consumer who has been acting like the daring young man on the flying trapeze.

★

The new pattern of income distribution which has made this new whimsicality possible is no mere paper change. The figures are startling enough: real income a head has more than doubled in the last fifty years; the majority of families have moved out of lower income groups into higher ones than they or their fathers before them knew; the pyramid showing the number of people in the various economic classes has been pushed in at its low-income base and broadened at the top until it looks almost like a cube.



Incomes before taxes have been moving toward equality since 1929; in that year the top 1 per cent of the nation's earners got 17.2 per cent of the nation's income, now they get only 9 per cent.

The changes which such figures reflect are visible on every side. Not even a New Deal politician would claim that the poor have entirely disappeared (though destitution in the classic sense is unusual); the difference is that the modern poor are now only relatively so. The New York laundress who, during the recent bus strike, went to work by taxi every day, the Connecticut roofer who puts on roofs (at a high charge) only until he has enough cash laid by so that and his family can spend the summer fishing in Maine, the New Jersey factory worker whose son is getting his Ph.D. degree at Columbia University—these are the people to whom income re-distribution has given an unaccustomed freedom of economic choice. It has come so gradually that they hardly recognise it, but they can no longer be appealed to as workers of the world who have nothing to lose but their chains. Indeed, they have so much to guard in the way of social status and other middle-class prizes that they have become very exigent in their ideas of what they are willing to do. It is ironic that Americans are now so rich that they can hardly find anyone to clean their streets, wash their windows or collect their refuse.

Evidence of this wealth accumulates on every hand. The country has enough motor cars for everyone to go riding at the same time, provided they did not all try to do it on the same highway. There are enough refrigerators and electric irons so that few but the annual crop of brides would suffer if no more were to be had. Most people have enough coats and shoes to go three or four years without buying new ones, if necessary.

Such plenty narrows the proportion of buying that is essential and gives the consumer a flexibility and a power which he enjoys and the economists fear. If, as one economist declares, 40 per cent of the consumer goods available can be bought, or left on the shelves, at the option of the consumer, the country's prosperity depends on the little man at the end of the line. This is presumably why the University of Michigan has undertaken a continuous study of consumers' intentions and what stirs them and why the economists at the McGraw-Hill Publishing Company think that the little man holds the answer to the year's foremost economic question—who will buy what comes out of America's shiny new factories when defence needs have been met?

The chief potential customers are three—war, foreign countries and the domestic consumer, but each has its drawbacks. War has such manifest horrors that even the most devoted consumption expert dare not approve it. Foreign aid and foreign sales are fine in theory, but who will pay for them in dollars? These difficulties lead planners

Sources: US Department of Commerce and Council of Economic Advisers

back to the domestic consumer, but he is no longer docile or predictable. His tastes for more expensive things do not advance steadily with his income. There is no regularity about the point at which he decides that he has enough money to work shorter hours. When men worked sixty hours a week, idealists used to point to the time when machines would do the work of the world in four hours a day, leaving the rest free for interesting avocations and the cultivation of the mind. The consumer has not reached that stage yet, but so far as he has gone he is proving a disappointment. Each American now has nearly $450 more real income a year after taxes than he had in 1929, and he works on an average seven fewer hours a week. He does not, however, devote his new leisure entirely to buying flower seeds or reading a good book. It is the proportion of income spent on horse and dog racing which has gone up 1,800 per cent since 1929.

Nevertheless, though moralists may groan at the way men use their new-won economic freedom, the fact remains that it has played a vital part in America's long boom. For the time being, at least, the men who believe in redistributing the national income have been replaced by men who believe in a more stereotyped system relying on free enterprise, hard money and high interest rates. If they hold the nation's economic course straight on that system, will the re-distributed income stay in its new channels or seep back to the old ones? On that second question hangs the answer to the earlier one. Even the consumer is not heroic enough to take up the burden when the defence programme leaves off unless he has cash in his pocket.

American Notes

McCarthy's Second Front

FRUSTRATED, thanks to Senator Taft's devoted efforts and to the Democrats' almost united stand, in his attempt to dictate who should be the President's envoy to Moscow, Senator McCarthy the very next day himself stepped forward as a rival Secretary of State. He announced that the staff of his investigating committee had concluded an agreement with Greek shipowners in New York to cease trading with North Korea and Communist China and to refrain from carrying cargoes from one Communist port to another. This had been done without informing any government agency because Mr McCarthy wanted "no interference"—and, in his view, was a much more effective step toward a naval blockade than the agreement with the Greek government which the State Department announced, with an air of anti-climax, two days later. Greece has put into effect an order, which has yet to be ratified, forbidding ships sailing under the Greek flag from carrying strategic materials to Communist ports. Senator McCarthy trumped this easily by pointing out that his agreement and another he proposes to negotiate with Greek owners in London, cover Greek-owned ships sailing, as well, under the Canadian, British, Liberian, and Panamanian flags.

It may be, as Mr Stassen, the Mutual Security Administrator, angrily hinted, that Senator McCarthy used confidential information about the government's negotiations, as well as an immoral promise to waive his announced investigation of east-west trade, to induce the shipowners to co-operate. So many loopholes for trade with the Communists are now being closed that his estimate that he was reducing it by from 10 to 45 per cent is no doubt a gross exaggeration. Official agreements have been reached with Liberia, Panama, Honduras, and Costa Rica about ships in their registries; mortgages have been foreclosed, on a technical excuse, on Greek and Italian ships known to have been trading with the Communists.

Nevertheless, the Senator from Wisconsin has made a brilliant and well-planned recovery from his failure in the Bohlen affair, and added new colour to the picture of himself he is building up in the country as the most relentless, swift-moving enemy of the Communists and their catspaws. This, as much as his invasion of the presidential prerogative or his undermining of government negotiations, is likely to harden the President's already angry mood.

Roberts Doubles and Quits

THE chief occupational hazard for the leaders of American party organisations today seems to be that they will be suspected of using their political influence for the benefit of their friends and their pockets. Mr Wesley Roberts, chairman of the Republican National Committee for only ten weeks, has just been forced to resign as the result of such accusations, and it is only a little over a year ago that the party then in power lost its chairman, Mr William Boyle of the Democratic National Committee, for the same reason. But the commission which is popularly supposed to have been the price for Democratic favours was only 5 per cent, while Mr Roberts received double that, 10 per cent, for arranging a deal not with the federal government, but with the state government in Kansas.

This is President Eisenhower's home state, and he has been nearly as ready to find jobs in Washington for Kansans as President Truman was to look after his fellow Missourians. Mr Roberts's predicament is particularly embarrassing for Mr Eisenhower, and particularly comforting for the Democrats, not only because the chairman was his personal choice, but also because one of the Republicans' winning cards in the election was the promise that the "five percenters" would be driven out of government. Furthermore, Kansas is one of the most purely Republican areas in the country.

For these reasons, as Mr Roberts realised without any prompting, it was essential for the sake of his party and his President that he should resign immediately an inquiry committee of the Kansas Legislature reported that he had "deliberately and intentionally" violated the spirit of the state lobbying law, although probably not its letter. Mr Roberts had not registered as a lobbyist, or disclosed his personal interest when, two years ago, shortly after he had resigned as chairman of the Republican State Committee, he arranged the sale of a sanatorium to the state authorities on behalf of an insurance company, the Ancient Order of United Workmen. The state paid $110,000, of which Mr Roberts received $11,000 for his services as a "public relations consultant"; there is some question, now being answered in the courts, whether the sanatorium did not already legally belong to the Kansas government.

The committee, which contained some of Mr Roberts's friends and had been expected to clear him, was unanimous in its condemnation, which hardly sustains his argument that he has been the victim of a plot growing out of a factional fight among Kansas Republicans. Without that fight, however, the deal might never have been brought to the attention of the voters. It was first discovered by the influential Republican paper, the *Kansas City Star*, and was immediately seized on by the progressive Republicans in the state, who hope in 1954 to win control of Kansas from the "old gang," led by the present Governor, Mr Arn, and his associate, Mr Roberts.

Agricultural Contradictions

AMERICA'S farms may have fewer and fewer people on them—under 25 million today compared with over 30 million in 1940—but they go on producing more and more. If farmers plant as many acres this spring as they plan to do, it will take very unfavourable weather to keep them from harvesting another record crop, although agricultural prices have been falling ever since last August as a result of last year's heavy output. Even cotton acreage seems likely to be increased this year, although farmers have been warned that, if they again produce 15 million bales, as they have done for the last two years, supplies will almost certainly reach the level at which the law requires the government to impose limitations on output of cotton, which must be observed by farmers who want the benefit of price supports.

Such limitations, always unpopular, might make the atmosphere more favourable for the flexible price supports which the Secretary of Agriculture, Mr Benson, advocates in principle (he has not yet worked out a detailed scheme) as a substitute for the present rigid system. In theory it is rigid only for the basic crops—grains, cotton and tobacco—but in practice it means that the government has to hold almost all farm products at high levels. For example, Mr Benson has just been forced to go on supporting the price of butter for another year at a level so high that the demand is perceptibly reduced, partly because to allow butter prices to fall would be unfair to the dairy farmers, who have to pay so much for their feed grains as a result of the mandatory price supports for them.

Dairy products also provide another example of how the present price support system undermines the demand for agricultural products. Because of the high prices they fetch in American markets, imports of dairy products have risen steadily in recent years. Congress has therefore forced the Secretary of Agriculture first to limit them by quota restrictions, and now to ban imports of milk altogether. Such restrictions prevent other countries from earning the dollars that they would spend on American wheat, cotton, and tobacco and frustrate efforts to encourage sales of American farm products abroad. The value of agricultural exports fell by 15 per cent, or over $600 million, last year compared with 1951, and Mr Benson, well aware that his hopes of a more flexible price support system depend upon his ability to guarantee farmers a satisfactory market for their output, has promoted the old Office of Foreign Agricultural Relations to be one of the six main groups in the Department of Agriculture. Headed by Mr Romeo Short, its new name is the Foreign Agricultural Service, and its new duties, which will bring it face to face with the contradiction in American farm policy, are to develop off-shore markets for American agricultural products and to aid other governments with their American marketing.

Lingering Death for RFC

THE Reconstruction Finance Corporation, which was created by President Hoover in 1932 to shore up the collapsing banks and railways and later became a Democratic maid of all work, is to expire in June, 1954, when its present lending authority ends. President Eisenhower and his Congressional advisers, in so deciding, have, for all their anxiety to get the government out of business, been less hasty and more concerned with orderly liquidation than the conservative Democrat, Senator Byrd. His Bill on the RFC would have had the corporation wind up next January and turn its $649 million of loans and investments over to the Treasury. With the addition of synthetic rubber and tin plants and other revenue-producing properties, the total value of the RFC's assets is over $1.2 billion. Under the Treasury's present system of bookkeeping, all this would serve to reduce next year's deficit, even though the loans may take twenty years or more to collect.

Such a windfall is particularly attractive when a Republican Administration is having difficulty in keeping its pledge to balance the budget, although over the twenty-one years of its existence the RFC, so far from losing money, has earned about $1 billion for the Treasury. But it is argued, in addition, that in times of prosperity there is no need for a great government bank which competes with private credit facilities, while its existence, as two investigations have showed, is a standing temptation to favouritism and to corruption of government servants.

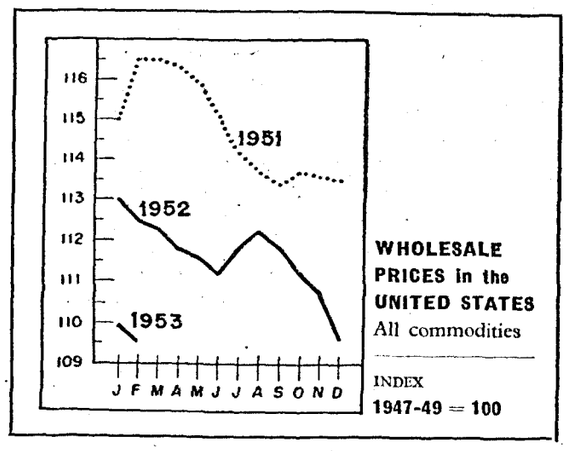
The RFC had already begun to contract under the Democrats. In future, no loan is to be made for more than $1 million, and within sixty days half its field offices will be closed. But if the new Administration foresees no new needs for the loans to big business the corporation made under Mr Hoover, for pump priming on the Roosevelt model, or for the defence loans made during the war, there is one function which must be carried on. Since the end of the war the RFC has concentrated on helping small business; last year 90 per cent of its loans were for less than $100,000. When it disappears, an agency is to be created to carry on this work, either as a bureau in the Treasury or in the Department of Commerce or, amalgamated with the Small Defence Plants Corporation, as an independent agency. An Administration in which big business is so heavily represented cannot afford to leave the little man to sink or swim and, in any case, Congress, which has always been sensitive to the voice and the votes of small business, will insist upon providing a life preserver.

Colour in the Air

THE ban imposed eighteen months ago, in order to save scarce materials, on the manufacture of television sets which receive programmes in colour has been lifted, but there are no longer any programmes in colour for the sets to receive. For the delay has sent the whole controversy over colour television up into the air again. It had been brought down to earth at the end of 1950 when the Federal Communications Commission decided that the Columbia Broadcasting System's method was the only satisfactory one available. But CBS had hardly begun to put colour programmes on the air when it had to discontinue them at the request of the mobilisation authorities.

The inventors of other types of colour transmission contended that, if given more time, they could develop a better method than that of CBS. It has the disadvantage of being incompatible, that is, it cannot be seen on existing sets even in black and white unless a special adapter is fitted, as well as the converter that all colour telecasting requires. The eighteen months' respite has been used by the industry's special National Television System Committee to work on a different method, similar to the one sponsored by the Radio Corporation of America and turned down by the FCC in 1950, that can be received in black and white on any set as it stands. This new method will be submitted to the FCC before long, but it will be many months before a decision is reached on it.

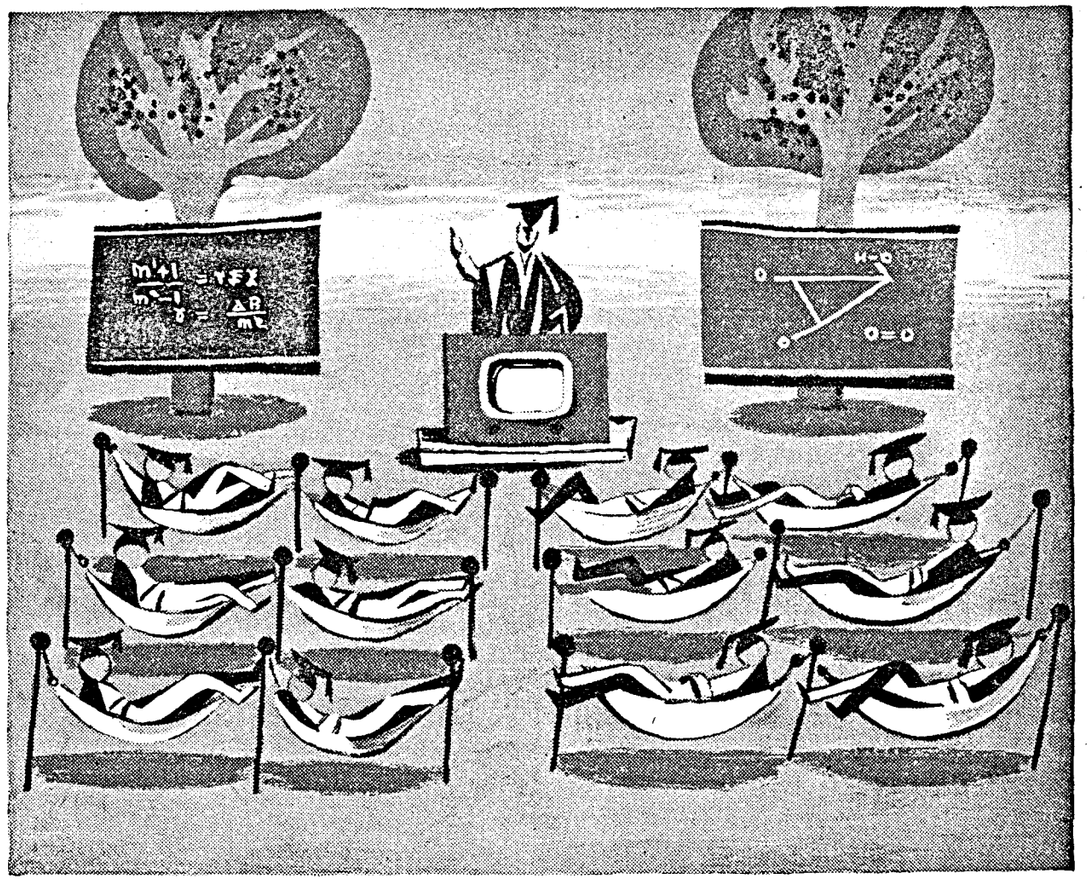
This means that there is no immediate prospect of colour television by the new system. Nevertheless, in view of the general uncertainty, CBS has decided that it would be economically unwise to resume colour telecasting by its method. The company's reluctance to make use of the start which the FCC has given it in a very competitive situation has left the industry gasping. It seems to stem mainly from the unwillingness of manufacturers to make sets that can receive CBS's colour programmes until they are sure that *this is going to be the accepted method.* Owners of sets will want to be equally sure before they buy adapters—and there are 23 million sets to be adapted today, about 40 per cent more than there were when CBS stopped its colour *transmissions in 1951. It has been suggested,* and a Congressional committee is now investigating the question, that manufacturers of television sets would like the introduction of colour television to be delayed, so that it can be used to stimulate demand when the market for ordinary television sets is saturated.



Bid for Labour Leadership

MR WALTER REUTHER has been using the annual convention of the United Automobile Workers, of which he has been head for eight years, not only to consolidate his new position as president of the Congress of Industrial Organisations, but also to strengthen his claim to lead a united labour movement should one by any chance develop out of next week's renewed discussions between the CIO and the American Federation of Labour. The automobile workers began by warning the motor manufacturers that, unless they were prepared to treat their five-year agreements with the local unions, which do not expire until 1955, as "living contracts" subject to renegotiation as conditions change, the unions would refuse to commit their members in future for more than a year or two. The General Motors Corporation has already accepted this renegotiation in principle, but the automobile workers will only be satisfied by the practical concession of an increase in their basic hourly wage. This is important, now that prices are falling, in order to make permanent the gains that have been achieved through the escalator clause in the automobile contract, under which wages keep in step with the cost of living.

Unless Mr Reuther can save his members from a drop in wages, he will lose popularity in his union and prestige in the CIO, particularly if his chief rival there, Mr McDonald of the United Steel Workers, wins a wage rise from the steel companies this summer. This rivalry also explains in part why the automobile union followed the steel union in setting up a guaranteed annual wage as its next goal. But such a guarantee also has special relevance in the motor industry, now that there is once more a prospect of overproduction of cars and therefore of the seasonal shut-down of prewar years.



Mr McDonald denies that there is truth in the rumours that the steel workers are going to desert to the AFL. The acquisition of a union representing such a basic industry would give the AFL, which already has more members than the CIO, an advantage so overwhelming that there would be even less hope than at present of achieving a merger between the two big labour associations. Such a merger requires substantial concessions on both sides and Mr Reuther's aggressive attitude to next week's talks will not encourage a conciliatory approach from the AFL.

From the automobile convention's platform he announced the four conditions on which the CIO would consider unity: it would not permit its system of industrial unions to be invaded by the AFL's craft unions; a method of settling jurisdictional disputes between AFL and CIO branches must be worked out; and the AFL's racial discrimination must be abolished. Such difficulties have always stood in the way of a merger, but Mr Reuther's fourth condition seemed like a gratuitous insult to the AFL's new president, Mr George Meany. For he is dealing energetically with criminal influences in the notorious New York longshoremen's union, to which Mr Reuther was obviously referring when he said racketeering elements must be expelled from the AFL.

World Economic Report—I

The West After the Boom

THIS year's World Economic Report, published by the United Nations for the coming session of the Economic and Social Council, is a decided improvement on most of its predecessors. It is written with more clarity than in the past, and the material is assembled with greater coherence. The report is divided into two main parts, the first focused mainly on internal developments in the three major types of economy — the industrialised, private enterprise economy ; the centrally planned ; and the underdeveloped. The second half deals with international trade and payments.

For the past few months Europeans have been deluged with studies of international trade, by their own organisations—the OEEC and ECE—and by the United Nations itself, which has recently issued such useful publications as the account of the terms of trade in backward areas. The European reader's primary interest in the current report, therefore, will probably lie in the comparisons drawn between all the industrial nations of the west, and in the evolution of the under-developed areas because of their importance as markets for western goods.

TABLE I—INDICES OF INDUSTRIAL PRODUCTION AND REAL GROSS NATIONAL PRODUCT

1950=100 Country	Industrial production		Real gross national product	
	1951	1952	1951	1952
Belgium	115	110	105·5	104·5
Canada	107	110	105·0	111·0
Denmark	102	98	100·0	99·0
France	113	118	106·0	107·5
Western Germany	120	128	116·0	123·0
Italy	113	113	106·5	107·5
Netherlands	104	104	101·5	103·0
Norway	105	105	103·0	104·5
Sweden	104	102	101·5	102·5
United Kingdom	103	100	101·0	100·0
United States	110	110	108·5	111·0

For its analysis of recent trends in the industrialised, free-enterprise areas of the world, the report has selected a sample of twelve countries*. Perhaps the most conspicuous thing about their development in the past two years is the fact that industrial production for the group as a whole remained almost stationary from 1951 to 1952, whereas it had increased by 10 per cent from 1950 to 1951. As will be seen from Table I, industrial production rose only in Canada, France, Western Germany, and Australia (precise figures not available) ; and even for these countries the rate of increase was much lower than in the preceding year. In three countries—Belgium, Denmark and the United Kingdom—industrial production fell markedly.

Much the same picture emerges for agricultural output. Only in Canada, Western Germany and Italy did agricultural production show a significant increase. In France, output remained unchanged in 1951-52 as compared with the previous year, while it fell appreciably in the Scandinavian countries, the United Kingdom and Australia.

Again, for the twelve countries as a whole, the gross national product rose by a mere two per cent from 1951 to 1952 as compared with a seven per cent increase in the previous year. Between 1951 and 1952 the relative shares of various components in the group's GNP showed small but significant changes. The report does not give the detailed 1952 breakdowns for each country but offers those of the United States as a typical illustration. Table II shows that the outstanding characteristics included a slight increase in personal consumption, a considerable increase in government expenditure (largely for armaments), a slight decline in private investment in fixed capital, and a substantial fall in private investment in stocks.

TABLE II—COMPONENTS OF GNP IN THE UNITED STATES

	1951	1952
Gross national product	100·0	102·4
Personal consumption	62·9	64·1
Government expenditure	18·9	23·0
Private investment	17·9	15·2
Investment in fixed capital	14·7	14·6
Investment in inventories	3·2	0·6
Balance of exports and imports of goods and services	0·3	0·1

There were, of course, variations from country to country. In the United Kingdom and Australia, for example, consumption showed no rise whatever. In both countries, too, the increase in government expenditure, including spending on rearmament, was lower—less than 2 per cent

* Australia, Belgium, Canada, Denmark, France, Western Germany, Italy, the Netherlands, Norway, Sweden, the United Kingdom, and the United States.

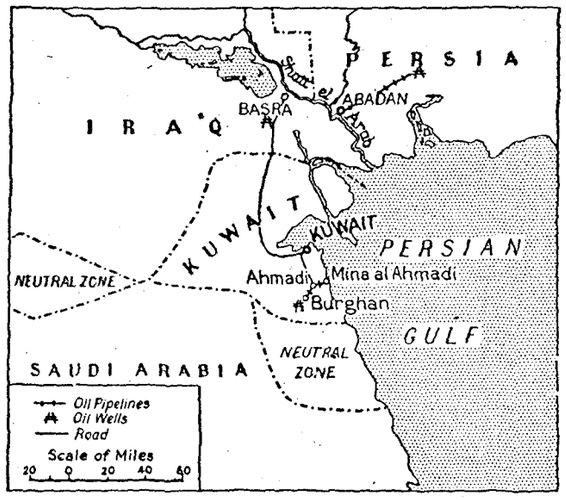
of GNP—than in such countries as France, Canada, Belgium, Western Germany and the United States, where the increase ranged from 3 to 5 per cent of GNP. The sole exceptions to the general decline in private investment occurred in Australia, Western Germany and Italy. This decline affected chiefly investments in stocks, although investment in fixed capital showed an important rise only in Australia and Canada.

Where price and wage movements were concerned, the United States also provided a rough model for behaviour in all twelve countries of the group. After reaching its peak in early 1951 the raw material boom subsided, but it was not until the second half of 1952 that this fall was fully reflected in the group's import prices. Except for the United Kingdom, the cost of living increased less from 1951 to 1952 than in the previous year, and in some cases it even declined towards the end of 1952.

In all twelve countries, however, money wages continued to rise throughout 1952, in response to the earlier increases in the price of raw materials and finished goods. Increased money wages did not always lead to increased real wages. For example, real wages failed to increase at all in the United Kingdom, largely because food subsidies were reduced in early 1952. In Western Germany the increase was limited by greater indirect taxation and in Australia by increased indirect taxation plus a rise in food prices. The largest expansion in real wages during the years 1951-1952 occurred in Belgium, Canada, France, Italy and Sweden. In two countries—Italy and Canada—improved food supplies played an important part in this rise.

(To be Continued)

Water for Kuwait



FROM OUR SPECIAL CORRESPONDENT IN THE PERSIAN GULF

LAST week, for the first time in its history, the town of Kuwait possessed its own sweet water supply. Its ruler opened the first unit of a seawater distillation plant which, when finished, will be one of the largest undertakings of its kind in the world. Few towns in history can have been founded on a spot where so little water was available. Rain is so rare that no one has ever troubled to build a catchment. For the 150 years of its existence, Kuwait's only amenities have been remoteness and a splendid bay that makes a sheltered anchorage. These conditions bred a seafaring and a trading people—a people of enterprise, for they existed on a few undrinkably brackish wells and fetched all their sweet water by boat from the Shatt-el-Arab over 50 miles away.

The discovery of oil in the desert to the south of their town altered this pattern. Two and a half years ago the Kuwait Oil Company put a seawater distillation plant into production, built a 20 million gallon storage capacity, and linked it to the town by 8-inch pipe. As municipal demand has increased, the company has come to pump down this pipe some 200,000 gallons daily in winter and 300,000 in summer. In the oil company's camp, a Kuwaiti's ration of sweet water from this plant is four gallons a day. Since the population of the town of Kuwait is, in the town's present building boom conditions, standing at about the 200,000 mark, this piped water supply nowhere near meets demand. Porters therefore still load up from a dhow on the sea-front and, bending beneath the weight of their dripping, swollen goatskins, plod into the town to sell their load.

The plant opened last week is a state affair (built by British contractors with Kuwaiti partners and Kuwaiti labour) and is being paid for out of the revenue derived from the oil company. The section now being erected will produce one million gallons daily; it is forthwith to be doubled under the five year development plan now being tugged into shape, and its capital cost for the two million gallon plant will be £3 million. Its running cost will in Kuwait be lower than the high level which makes such plant rare, because the fuel for its generators will be derived from the natural gas that is at present burning to waste on the oilfield 25 miles away. Fuel, as it were, will be free.

The principle of seawater distillation is familiar to anyone who has looked at a liner's apparatus. Broadly speaking, one boils the sea. A major problem involved is the insoluble deposit which, like scale in a kettle, tends to corrode the apparatus; to minimise this deposit, the volume of seawater boiled is twice that of the sweet water required and the second half is returned, doubly salty, to the sea. The seawater is chlorinated at intake and also fine-mesh filtered to rid it of sea life, and then distilled. In Kuwait, it will subsequently be diluted with 10 per cent of the local brackish water in order to give it body and a taste.

Three ground reservoirs, each of 3 million gallons capacity, are being built just behind the plant, with a distribution pump house to carry the flow to high static water towers that will ensure a given pressure all over the town. These towers will also contain a tank for brackish water, for which boring is proceeding and which will it is hoped produce another 15 million gallons daily for sanitary, dust-laying, car-washing and other such purposes. There is considerable argument about how much should be spent on making the towers look sightly, if not decorative. The whole scheme is highly costly, for with two kinds of water in supply, there must be duplicate mains all over the town. At present, all is coming out of the oil revenue and no Kuwaiti has contemplated the water rate that ought to be charged if the town is not to squander an expensive commodity. Gardens, for instance, hitherto unknown, need meters if there is to be anything left for push-button drinking fountains; the latter would, for some time to come, be the only way of supplying the distilled water to the poorer levels of the population. All new houses being built have a water system, but building costs have risen so much that, though called workers' houses, they are beyond the means of every manual worker.

But if Kuwait is to become a congenial place in which to live at the standards it is acquiring so fast, even the 5 million gallon distillation plant that is ultimately envisaged will not be enough. Sewage, at present running to waste, could be processed and used for agriculture, but would not adequately produce the green food for man and beast that is at present all imported from Basra. Yet a huge river system is flowing into the sea only fifty miles away. Just over three years ago, *The Economist* stated its view that a canal from the Shatt-el-Arab was the only way to prevent Kuwait from over-dependence on oil as its single source of prosperity; it was at the time criticised for doing so by Kuwaitis who dislike the thought of dependence on a source in Iraq. Today, that dislike has dwindled; but though relations with Iraq are better and minds broader it will not quickly die. To an outside eye, the scheme still seems imperative to Kuwait's prosperity. It also seems that an Iraqi stranglehold could be at least minimised by committing Iraqis to a participating interest in the venture; for about one-third of its length, any canal or large diameter water pipe would be in Iraqi territory, and there is no practical reason why Iraqi farmers should not depend upon the same system for supply. One Basra entrepreneur is said to be ready to instal the canal free of charge provided he can have a square acreage of land on either bank.

But the Kuwaitis do not like being beholden to anyone. Nor do they fancy sharing profits. Negotiation with Iraq will, if it happens, be a slow business. Yet the result could be of even more importance to the Kuwaitis' well being than any of the home developments they are now promoting with such enterprise. But, as with conceptions like the cross-Channel tunnel, one bar to execution of the idea is the proverbial conservatism of a seafaring people.

Uno's Staff and their Hosts

FROM OUR UN CORRESPONDENT

AFTER maundering in a never-never land of sick flies and infected chicken feathers, the United Nations Assembly emerged last Saturday into the relative sanity of Mr Trygve Lie's personnel problems. It can, of course, be argued that Chinese fear of germ warfare and American fear of Communist spying represent opposite sides of the same medal. But at least the objects of American suspicion are solid and tangible human beings, fed with the same food, hurt with the same weapons, subject to the same diseases as their accusers, the Secretary-General, and the delegates. Also, they are in the same country. It would, therefore, seem easier to cope satisfactorily with the problems which that suspicion creates than with an insectuous situation some six thousand miles away.

In essence, the immediate need is a formula which will at once safeguard the international integrity of the United Nations Secretariat and satisfy American demands for the right to investigate suspected American citizens who are members of that Secretariat. The Secretary-General claims to have been struggling with the problem since 1948, when he sent to the State Department a list of 377 Americans about whom he had questions. Since the Korean war began, and more intensely in the past year as spy hunts have grown politically more profitable, both the difficulties and the pressures have increased. Certain UN officials were called before Senate investigating committees and grand juries to answer questions about activities believed to affect American security. Some of them refused to answer, taking refuge either in the fifth constitutional amendment, which allows an American to fend off questions designed to incriminate him, or in the oath of loyalty to the United Nations which all Secretariat officials take. In the present public temper in America, people who refuse to answer questions are immediately suspect, and clamour for their dismissal grows loud. It was Mr Lie's attempt to satisfy that clamour, while at the same time saving Uno from the expensive lawsuits that might be brought by persons claiming to have been unjustly discharged, which led him to ask advice from a commission of jurists and then to ask the Assembly to let him report on the subject. It will be remembered that in November, two weeks before the jurists' report was presented, he attempted to resign his post, and three days later suffered the loss by suicide of his chief legal aide.

The FBI Investigates

The American demands, which of course reflect heavy political pressure on the State Department, have been met by quick compliance with an executive order issued in the last days of the Truman régime, and pressed by Senator Lodge as one of his first acts when he became the new head of delegation. Some 1,800 American members of the UN staff have now completed the same kind of questionnaire as is customarily answered by American civil servants; they have been finger-printed, and they are at present under investigation by the FBI. It is obviously the hope of the American mission, whose members have themselves gone through the same process, that when the investigations are completed and the American members of the Secretariat can be certified as security-pure the political attacks will cease. In view of the venom and resourcefulness displayed by the attackers this hope may be naïve. Already the press has quoted a State Department security officer as mentioning a suppositious French Communist cell in the United Nations, and the possibilities of inquiry are almost infinite.

Meanwhile a bill has been introduced into Congress which, if passed, would make it impossible for any American to be hired by the United Nations until he has first been cleared by the Attorney-General. Thus the past is to be mopped up, and the future made antiseptic. If the process seems to put the Secretariat squarely into the pocket of the American Government, so much the better (in the American view) for the United Nations.

QUARTERLY ECONOMIC REPORTS are now available on nearly seventy countries. These reports give information and opinion on matters of concern to exporters and investors; they are concise and have comprehensive statistical sections. A descriptive leaflet may be obtained from The Economist Intelligence Unit, 22 Ryder Street, London, S.W.1.

What seems to have been overlooked in all this, and what came out quite clearly in the Assembly debate, is the fact that the United States is after all only one of sixty members of the United Nations, and that while many of the others may sympathise with the American desire to clean its portion of the house some of them object to having their own *lares* and *penates* subjected to the same blast. There was even some feeling that if the United States continued to huff and puff at its present rate the whole glass house might be blown down around their ears.

In the main the debate turned on the importance of international versus national claims. Several delegates recalled that the San Francisco conference in 1945 had rejected a Jugoslav proposal that candidates for UN employment should first be cleared by their governments, and had underlined the vital need for building what should be in principle and practice an international civil service. It was clearly implied, and with some wonder, that the United States has now retrogressed to the Jugoslav position.

The Inviolable Precincts

The Indian delegate went further, and discussed in considerable detail what effect the jurists' concept of "host country" standards would have if they were accepted, and what changes would be needed if rules were made for American staff members which could not be accepted for their colleagues. He also raised an eyebrow over what he considered the jurists' hasty and incomplete construing of the fifth amendment to the American Constitution, stressed the inviolability of UN precincts (a hit at Mr Lie's complaisance in allowing American finger-printers and FBI investigators to work within the glass house) and urged that no action be taken by the Secretary-General on the basis of the jurists' report until all arguments had been carefully studied. To this the Belgian added a reminder that Uno has regional headquarters and specialised agencies located in many countries, and that its officials work and travel around the globe. If the principle of "host country" standards of loyalty is accepted, an official might head a mission when he gets into an aircraft and go to jail when he gets out.

Important as the prevailing American hysteria is in creating high tension and low morale among the secretariat, it is by no means the only element responsible for the personnel problem. Delegates were reminded that recruitment for the then new organisation was over-hasty in 1946. At the same time member nations scrambled to place their own nationals in high positions; had they been as eager to find the best possible man as to secure the best post, the organisation might have had a better high command. As it was, the good and less good no sooner took office than they joined in the game of expanding staff and staking out areas of influence. By 1950 a survey made for the Carnegie Foundation reported that, far from promoting the development of an international civil service on a high plane, "the personnel office of the Secretariat has accepted the attitudes and perspectives of the civil service commissions of the United States and the United Kingdom."

Fate of an Ideal

All this and much more lies in the minds of experienced delegates, and is in part responsible for a general desire not to be hurried by any country or group of countries into passing resolutions which may have unfortunate repercussions later. However much the American delegation may be battered by noisy Senators into pressing for the image of the thing they profess to hate, there is evident a disposition to look at this new American ideal from all sides and to picture what would be happening were it the Soviet bloc which was sending its version of the FBI to ask questions among the Secretariat.

The debate has put the strength of many nations behind the international ideal. For a while it looked as if Mr Lie's fate was to be identified with that of his personnel policy. Judging by the speech with which he presented his report to the Assembly a few weeks ago, this is what he wanted. Fortunately the new Russian tactics have now made possible the choice of a new Secretary-General in the person of Dr Hammarskjöld of Sweden. Mr Lie has been amply thanked for his work in assembling a staff, and his successor will have before him a roll-call of national opinions on the relevant issues. The outcome is better than seemed possible when the debate began on Saturday.

Clean Living in Mexico

FROM A CORRESPONDENT IN MEXICO CITY

In a recent talk with a friend, a leading figure in Mexico's last administration disgustedly brushed off the successor government, saying: "But honesty is *not* a policy. Nothing will get done that way." He was referring to the clean-up campaign of virtually revolutionary proportions ordered by President Adolfo Ruiz Cortiñes. When the new President was inaugurated in December, he announced in his first speech that the keystone of his government would be a vigorous drive for honesty in public affairs. The declaration was duly cheered, but Mexicans have heard handsome promises before and have learned their cynicism the hard way. Furthermore, Sr Ruiz Cortiñes was the protégé of his predecessor, President Alemán, although he is nearly a generation older.

After three months in office, it is impossible to say whether the President can succeed in making honesty a policy, but he has shown that he means to try. If he should succeed, it would mean almost as fundamental a change in Mexican life as the revolution of 1910.

The most important move thus far has been passage of the law against "illegitimate enrichment." Within his first month in office Sr Ruiz Cortiñes pushed through an acquiescent, gaping Congress a Bill requiring all public employees, including politicians, to register their total family fortunes upon taking office. At the end of their terms the officials must make another declaration. Any important discrepancies must be investigated and all suspicious cases must, by law, be turned over to the public prosecutor.

Officials were given until April 4th to comply. By the middle of March, over two-thirds of the 150,000 federal officials had actually taken the trouble to inventory their wealth. The President has declared that officials who fail to observe the law will be automatically sacked. What, if anything, he can do about recalcitrant deputies and senators has not yet come up for discussion, but the atmosphere of righteousness is at least making the stragglers feel uncomfortable. For the ecstatic reception given to the new measures has proved that people may have been resigned to the fact of bribery, but they never liked the principle.

It would be useless to try to estimate how much "illegal enrichment" took place under the Alemán regime, but the total undoubtedly surpassed anything in previous Mexican history. Especially during the last six months of the Alemán government, a kind of unabashed money madness spread from the top down to the most menial levels of the administration, with less and less regard for even the customary appearances.

President Ruiz Cortiñes broke the fever. To begin with, he retained in his cabinet only those few officials who had gained a reputation for honesty and efficiency. As the news trickled down through the bureaucracy, an astonishing pride of duty began to appear. Even traffic police have now taken to enforcing the regulations on the multitudinous holders of official credentials. Businessmen have reported quiet investigations in government departments aimed at eliminating the customary "mordida" before the placing of government orders. The representative of one foreign pharmaceutical company said he was called to the health service, which he supplies, and interrogated at length on whom he had paid off. Later he was told a directive had been issued not to buy from companies which had been giving bribes.

Nervous Businessmen

For the moment, the business community is waiting and rather nervously wondering how long this startling state of affairs will last. There is concern lest the President's effort to eliminate the grease will strip the gears of administration. In Mexico, bribes were not usually given to induce officials to act as they should not, but rather to make sure they actually performed their services with reasonable speed. The Alemán regime was hailed as an important measure of progress because bribes were conscientiously repaid with the favours requested—whereas, in the old days, the businessman paid in advance without the least assurance of getting delivery.

The clean-up has not been retroactive. There have been no public exposures, as was feared. But now, while "mordidas" are not being demanded, not much is being done either. Almost no government orders are being given, export licences do not seem to be coming through, and business activities in any way connected with the government are far from normal. It seems that a policy has been introduced of refusal to pay any government bills contracted under the Alemán regime until a thorough review has taken place. This standstill has created a shortage of money and a scramble for short-term loans with fantastic interest rates of as high as 3 per cent a month, according to some reports. But there is no good reason to doubt that the situation is a temporary one, made imperative by the decision to change the government's way of life.

Aside from honesty, there has been little in the way of clear indications of policy. Again, this seems to be because the new administration wishes to form its own views and take nothing left over from the Alemán government at face value. There has been an official statement that the government will seek no foreign loans but will continue to encourage foreign investment. If, as it seems, some of the conclusions on the Mexican economy made by a joint working team from the World Bank and the *Banco de Mexico* have been taken to heart, this may be a step towards cutting down the heavy public works programme which President Alemán favoured and concentrating on a more productive and at the same time less inflationary use of capital.

"Moralisation," if it works, should be a valuable aid in attracting private capital from abroad, and with it the know-how Mexico needs quite as much as money. The toll corruption has taken is greater even than Mexicans themselves realise. One important effect is that the country has no stock market. No stocks are bought or sold because everyone knows that practically all companies keep fictional books in order to cheat the government. As a result, the potential small investor can only spend his money on an extravagant house and car. There are no equities for the would-be foreign investor unwilling to launch an enterprise of his own. Thus both capital formation at home and attraction of capital from abroad have generally been limited to the narrow field of big money.

"Moralisation" has already come to include such things as enforcing price controls and fair weights and measures in the small shops that sell the poor their beans. Directly or indirectly, its consequences would affect Mexican development in every field. Thus, although Sr Ruiz Cortiñes's programme is still vague and, except for the reduction on public works, not notably different from Sr Alemán's, he has tackled the central problem which has hampered the solution of most other problems. If he proves that things can get done the new way, then Mexican policies, which have usually been impressive on paper, can also be impressively carried out.

Europe's Economy Since the War—II

Industrial Revolution Behind the Curtain

THE revolutionary transformation of the economies of eastern Europe since the war is clearly recognised in the latest ECE survey, which for the first time deals with this area in separate sections. In addition to a chapter on the Soviet economy the authors have collected and analysed a wealth of not easily obtainable material on the countries within the Soviet sphere.

There are two possible ways of looking at the postwar development of eastern Europe. From the short-term, consumer's angle one may deplore the relative stagnation of agriculture and the small progress of the consumer goods industries. The survey, however, judges eastern Europe by the standards it has set for itself: ". . . the eastern European governments have on the whole planned successfully, granted their order of priorities. . . ."

The paramount aim of these governments has been and still is to carry out in their respective countries a planned industrial revolution at the greatest possible speed, irrespective of cost; to transform this predominantly rural and backward area into an industrial region comparable with the West. Therefore, naturally enough top priority had to be given to the development of the fuel and power basis, of iron, steel and engineering. But the ambitious plans for expansion could not be started until the damages of war had been made up, industry put into gear, and transport restored. Short-term plans of reconstruction, varying in length, were undertaken throughout eastern Europe. At the same time, each state extended its control from the "commanding heights" to almost the entire field of indus-

try and to a substantial proportion of trade ; in addition, the fiscal system was overhauled on the Soviet model. Towards the end of the last decade the prewar level of industrial production was exceeded and all the countries within the area embarked on their long-term plans. The Council of Mutual Economic Aid founded in 1949 had as its principal task to co-ordinate these plans and to integrate them with Soviet development.

The scope of the programme for basic production can be gathered from the following table. It may be roughly calculated that in less than three years' time eastern Europe should produce annually over 250 million tons of coal (in hard coal equivalent), some 80,000 million kWh of electricity and about 17 million tons of crude steel, a level comparable with that of the United Kingdom now or Nazi Germany before Munich. Engineering production, which has already almost doubled its prewar level, should continue to expand at a still faster rate.

TABLE I—PLANNED OUTPUT IN EASTERN EUROPE

	Coal*	Electricity	Crude steel	Engineering ‡
	mn. tons	bn. kWh	mn. tons	
Bulgaria (1953)	2·2	1·8	...	580
Czechoslovakia (1953)	39·7†	12·3	4·3	231
Eastern Germany (1955)	78·5	33·4	3·1	211
Hungary (1954)	14·5	6·1	2·2	490
Poland (1955)	102·8	19·3	5·0	364
Rumania (1955)	2·8	4·7	1·3	216

* Hard coal and lignite translated into hard coal equivalent. † Target subsequently raised by 20 per cent. ‡ Year preceding plan=100. 1948 for Bulgaria and Czechoslovakia ; 1949 for Poland and Hungary ; 1950 for Eastern Germany and Rumania.

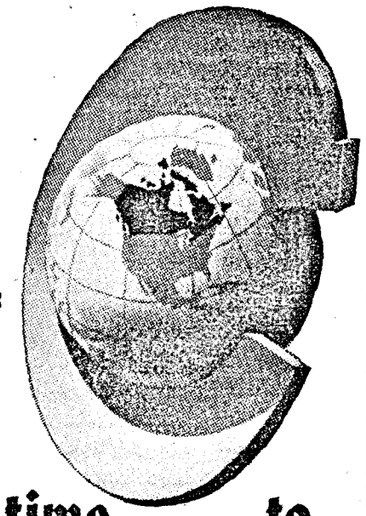
There is no economic reason why these targets should not be reached on time. Indeed, the survey estimates that they may be reached ahead of schedule. In eastern Europe, as in the Soviet Union, basic industry has first call on scarce resources. Whenever the plans have been revised the emphasis on producers' goods, and on that alone, has been strengthened.

The swift industrialisation of eastern Europe is only made possible by reinvesting a large slice of the national income and channelling investment into heavy industry. Poland, Hungary and Czechoslovakia are now investing about one-quarter of their national income every year. By 1955 Rumania should plough back the same proportion and even in Bulgaria the ratio should reach about one-quarter. Even when allowance is made for differences in the calculation of national income, the share of investment is still higher in eastern Europe than in the much wealthier West and incomparably higher than in southern Europe. Incidentally, in its integrated planning, eastern Europe does not push the advantages of division of labour to their rational extreme ; in accordance with current Soviet practice, each area is developing its own basic production.

Evidence is too scanty to draw general conclusions as to the fate of the individual consumer in this collective transformation. The survey estimates that at the end of the reconstruction period consumption per head was somewhat lower than before the war in East Germany and Rumania but higher in the other countries. The lower income brackets had also benefited by the elimination of prewar inequalities. Since then, wage-differentiation has been reintroduced as a tool for increasing productivity. The standard of life of skilled workers has probably increased, but the wages of unskilled labourers have apparently not kept pace with the price of foodstuffs.

PLANNED INCREASE IN PRODUCTION
(YEAR PRECEDING PLAN=100*)

	Producer goods	Consumer goods	Agriculture
Poland	254	211	150
Czechoslovakia	230	170	153
Hungary	380	245	154
Rumania	...	...	188
Bulgaria	326	273	137
Albania	386	324	111



* Five-year plans in all countries, except Poland where the plan is for 6 years.

The relatively low level of consumption is only partly the result of the governments' conscious investment policies. It is also partly due to their inability to solve the problem of "balance of payments" between the rapidly expanding socialised industry and stationary agriculture. The planners have enough cards in their hand to prevent rising food prices from jeopardising the objectives of socialised industry. But they cannot yet determine either agricultural output or the quantity of supplies. Agricultural production per head in Europe as a whole is now only very slightly lower than before the war, when the area was a net exporter of food. Now it is, on the contrary, a net importer. Hence a decline in the urban consumption of foodstuffs could only be accounted for by increased consumption in the countryside. Paradoxically, the smallholder may have benefited more hitherto than the urban worker from the "dictatorship of the proletariat." The breaking up of large estates has eliminated large surplus producers, and despite compulsory deliveries the state finds it difficult to extract sufficient supplies from the peasants.

The planner's method for restoring the balance between town and country lies obviously in the elimination of the "foreign" private sector in the countryside in the same way as it was uprooted in the towns. Through collectivisation it is hoped both to increase agricultural production and to bring more manpower into the towns. Collectivisation, however, has made little progress as yet. Only in Bulgaria do collective farms own over half of the total arable land. The total socialised sector—both state and collective farms—accounts for about one-third of the arable land in Hungary and Czechoslovakia and for much less in Poland, Rumania and Eastern Germany. The survey considers that more investment in agriculture—which now gets about one-tenth of total investment—and in urban housing, would pay good dividends in bridging the gap between town and country. There are no signs, however, that the governments intend to deflect any important resources from the primary task of rapid industrialisation.

Until eastern Europe has succeeded in carrying through its revolution in the countryside there seems little hope of a radical improvement in the standard of life of the urban consumer. Whether at this moment he derives any benefits from the rising national income it is impossible to say. But that the national product of eastern Europe is rising rapidly on the basis of industrial expansion, there is no doubt.

(Concluded)

June 1-12, 1953

...best time to take a trip to Canada

Exhibitor space bookings indicate that the 1953 Canadian International Trade Fair will offer buyers greater opportunities than in any previous year.

The C.I.T.F. is internationally recognized as a fruitful source of new ideas, new products, new contacts and new customers. Make it YOUR business headquarters for the North American Continent, in June, 1953.

Come and see for yourself the wealth of opportunities for business with Canada and with other countries.

IMPORTANT—write now for room reservations to: The Administrator, Canadian International Trade Fair, Exhibition Park, Toronto 2-B, Ontario, Canada —in the United Kingdom, write to Miss M. A. Armstrong, Canadian Government Exhibition Commission, Canada House, London.

1953 CANADIAN INTERNATIONAL TRADE FAIR

TORONTO, CANADA, JUNE 1-12, 1953

OPERATED BY THE GOVERNMENT OF CANADA TO PROMOTE YOUR BUSINESS

A gracious welcome to your guests

WORKERS IN THE TEAM

Number 1 in a series

MANY PEOPLE up and down the country will recognise this face with its twinkling eyes, and the battered old hat. Some have known Mark Ferris ever since he joined the company, thirty-seven years ago.

His tremendous energy, and his way of inspiring enthusiasm in others, were noticed. He was soon a ganger, and then a walking ganger with a number of gangs—sometimes as many as 1,000 men—under him.

The toughest jobs are the ones he likes best. His creed is that open air and hard work never hurt anyone. His back is as broad and straight as ever, and his laugh as merry. Because he has always spoken his mind—both to his men and to the "governor"—he has earned respect. He was one of the first employees to become a shareholder in the Company.

He is a happy man, and a proud one. From Cumberland to Cornwall there are jobs that were done better and faster because he had a hand in them. And the team that has men like Mark in it has something to be proud of too.

THE BUSINESS WORLD

Economic Survey for 1953

I—Demand Becomes Sovereign

THERE are two major themes that run through the Government's Economic Survey for 1953 (Cmd. 8800), with the insistence of the chorus in a Greek play. The first is that 1952 was a year of climatic alterations, a year that saw "the checking of inflation in the United Kingdom." In it "the effects of comparatively small reductions in personal consumption and exports were magnified by a big change from a phase of rapid stock accumulation to one of relative stability." The result has been a sea-change in the Government's outlook on economic policy. "Now that total demand is no longer excessive," report the authors of the Survey, "economic activity has become much more directly dependent on the assessment made by business people of economic prospects." In other words, demand is at last sovereign, and the Government apparently now considers its task to be to see that demand is kept up in the right places and down in the wrong ones; in all other postwar years its task has been the simpler but grimmer one of seeing that total demand was kept down, by hook or by crook, to match the level of potential supply.

This supposed change in climate and in necessary objectives inevitably raises some anxious questions, especially about the shape of the coming budget. Economists will be concerned to search the Survey for clues on whether any stimulus that is given to demand is in fact likely to be injected in the "right places"—in particular, whether it will go to those industries that ought to expand their share of national production if long-term solvency is to be attained, or merely to those that have some present slack in resources (and will want to be relieved of the tiresome necessity of releasing them for more vital industries). A wider public, perhaps, will be content to search for clues to a simpler question: how much will the Chancellor have to hand out on April 14, and who is likely to get it?

The second major feature of the Survey, however, is that the Government refuses to give any detailed answer to these questions. There are hints a-plenty—they are discussed in some detail in the concluding section of this article—but the recurrent theme throughout is that any quantitative assessments of the trends of total demand and supply—and thus of the scope for tax reliefs—cannot or ought not to be made in a Survey of this kind. One reason for this is that the Survey is meant to be a statement of the facts or guesses on which policy is to be based, and this year many of these facts and guesses (about potential supply

TABLE I.—CHANGES IN REAL SUPPLY AND DEMAND

	Govt's original *Hopes for* 1952-53 (£ million at 1951-52 prices)	Actual outturn in 1952 (£ million at 1951 prices)
Increase in gross national product	+ 250	− 100
Increase in Govt. expenditure	+ 150	+ 325
Available for private sector	+ 100	− 425
Personal consumption	*Nil*	− 110
Fixed investment	− 250	− 35
Investment in stocks and work-*in-progress*		− 450
Change in private demand	− 250	− 595
Available for improving external balance	+ 350	+ 170

as well as about permissible demand) will depend on that policy itself. A second reason for caution is that the guesses were so wildly wrong last time.

The outstanding feature in the background to economic policy in 1953, in fact, is that Britain's unexpectedly great recovery in 1952 was achieved for a number of entirely unexpected reasons. This is clearly demonstrated by Table I, which shows the changes in real demand and supply in 1952, and compares them with the Government's original hopes and expectations for the financial year 1952-53. It will be seen at once that the private sector of the economy had some £525 million less resources available to it than the Government had expected, but that it cut its demands on those resources by some £345 million more than the Government had dared to hope. Even so, the resources available from current supplies for improvement of the external balance in 1952 amounted to only £170 million, compared with the £350 million that the Government had hoped for in the financial year 1952-53.

II—The External Surplus

HOW then, with only £170 million of reduced strain on its internal economy, did Britain achieve the extraordinary improvement in its external accounts? As Table II shows, the swing-round from 1951 to 1952 is now estimated at £572 million—from a deficit of £402 million in 1951 to a surplus of £170 million in 1952 (both figures exclusive of defence aid). No less than £569 million of this improvement was due to a reduction in payments for imports; yet the authors of the Survey believe that there has been no net fall in domestic stocks of imported commodities—consumption of imports fell in line with, and in some instances faster than, the reduction of available supplies.

The explanation of this apparently incongruous arithmetic is to be found in two special factors, and to some extent non-recurring ones, that are not recorded in Table I. In the first place, there was a sharp reduction in British-owned stocks on the high seas last year. The values of British imports paid for but not yet received, and of British exports shipped but not yet paid for, were more than £100 million lower at the end of 1952 than at the end of 1951; incidentally, these variations in the time lag between shipments and receipts—together with increased exports of second-hand ships (which are also excluded from Table I, since they did not pre-empt current resources)—explain why the monthly trade accounts provided so misleading a record of Britain's external recovery throughout 1952.

The second main factor in bridging the difference between a release of only £170 million of real internal resources and an improvement of £572 million in the external balance was the favourable movement in the terms of trade. Britain's export prices rose by some 5 per cent last year, while its import prices fell by 2 per cent; on a total trade turnover of nearly £5,800 million, these two price movements strengthened Britain's balance by about £330 million in 1952, or by twice as much as Mr Butler had originally thought they would do in 1952-53. As some offset to this, however, Britain's net invisible earnings deteriorated by £85 million last year, whereas the Treasury had originally hoped for an improvement of perhaps £100 million. Abadan and the rise in military expenditure overseas, together with the fall in dividends from Malaya and the increase in interest payments on the sterling balances, had a sharper adverse effect than had apparently been expected.

To some extent, therefore, the improvement in Britain's external balance last year was not so good as the bare figures make it look. Only £170 million of the total turn-round of £572 million was due to internal disinflation; most of the rest was due to a favourable movement in world prices (which may soon be reversed) and to the highly technical—and once for all—factor of the time lag. But there is a brighter side to the picture than this. The really significant feature of

TABLE II—U.K. BALANCE OF PAYMENTS
(£ MILLION)

	1951	Jan.-June 1952	July-Dec., 1952	Total 1952	Change from 1951 to 1952

Total UK Balance (excluding Defence Aid)	− 402	+ 61	+ 109	+ 170	+ 572

* Reduction of imports (which improves the current balance) is shown here with plus sign.

Britain's external recovery last year was not the extent of the total improvement nor even of the massive—and remarkably easily absorbed—cut in imports; it lay instead in the fact that £520 million of that total improvement and £529 million of the total cut in imports occurred in trade with the non-sterling countries. The result, as Table II shows, was that Britain achieved a surplus of £44 million with these countries in the second half of 1952, compared with a deficit of £699 million in the whole of 1951.

Meanwhile, the overseas sterling area countries, which are believed to have been in exact balance with non-sterling countries in the first half of 1952, achieved a surplus of £135 million with them in the second half of the year. When receipts of defence aid are included, therefore, the whole sterling area had a surplus of no less than £242 million with the non-sterling world in the second half of 1952, compared with deficits of £165 million in the first half of the year and £531 million in 1951. The constituents of this recovery are shown by the figures in parentheses in Table II.

For 1952 as a whole, therefore, the sterling area achieved a non-sterling surplus of £77 million; this is, of course, at once the sum of the direct non-sterling surpluses listed above, and of the overall deficit of £214 million incurred by the overseas sterling area, plus the overall surplus of £291 million (including receipts of defence aid) achieved by the United Kingdom. In normal circumstances this latter surplus would have been sufficient to finance a fair measure of productive overseas investment and to add to Britain's hard currency reserves. Unfortunately, 1952 was not a normal year. No less than £410 million was required to repay overseas sterling balances (which must now be down to about £3,400 million, compared with £4,168 million in mid-1951), while only £109 million (compared with £325 million in 1951) was devoted to long-term investment overseas; the gap between the sum of these figures and the United Kingdom's surplus of £291 million had to be made up by a draft of £175 million on the gold reserves and a net addition of £53 million to Britain's debt to EPU.

Now that the sterling balances are down to a more reasonable level, the Government hopes that there will be some slackening in claims for their repayment. On this basis it believes that an annual surplus of "something like £300-£350 million" will enable the United Kingdom to meet its commitments for productive overseas investment; provided the overseas sterling area plays its part, such a surplus should allow for some strengthening of the gold reserves as well. The Survey emphasises that this estimate of £300-£350 million makes allowance for some capital receipts by the United Kingdom. Since those capital receipts are unlikely to exceed last year's receipts of £121 million of defence aid, since import restrictions will clearly have to be loosened, and since the improvement in the terms of trade may now be coming to a halt, attainment of this goal will demand a formidable increase in exports.

III—Slack in the Economy

DEMAND had begun to regain its hold on the economy early in 1951; during 1952 its grip was extended and tightened. The recession in textile sales that had followed a brief post-Korea boom deepened and became more general in the first half of last year. It was then strongly accentuated by import restrictions abroad that partly strangled demand for exports not only of soft goods but of the durable consumer goods made of metal, such as motor cars and refrigerators; and in their turn some of the industries making capital equipment for consumer industries felt the slackening of demand. By the second half of 1952

> the buyer's market extended over a considerable range of engineering products in addition to motor vehicles, and there was a fall in the number of new export orders received, though there were some signs of a recovery at the end of the year.

The physical brakes on output that had been familiar since the war—capacity, manpower, and materials—limited output in 1952 only in certain basic and heavy industries: coal, steel (of which the general shortage during the winter of 1951-52 and general maldistribution ever since contributed to the slowdown in engineering), shipbuilding and some other heavy capital equipment, the building industry (except for repair work), and agriculture.

Under both types of influence, the postwar rise in industrial output had already flattened in 1951; and after the first quarter of 1952, output fell sharply to some 5-6 per cent below mid-1951 levels. During October and November, it recovered almost to the 1951 level; and it has stayed a point or two less than a year before up to the latest month on record (January this year). The fall of some 3 per cent in industrial output between 1951 and 1952 might have been expected to reduce the gross domestic product by some £250 million at 1951 prices; but the Survey puts the fall at proportionately less, "perhaps no more than about 1 per cent, equivalent to a loss of approximately £100 million at 1951 prices." That assumes a countervailing rise in non-industrial production—mainly agriculture, transport, distribution, public administration, and other services—of perhaps £150 million, but the Survey does not explain how or where this rise occurred.

Within industry, the readjustment of 1952 was profound, though partly concealed. Employment declined less than production; output in manufacturing industry, with only 1 per cent fewer workers, was down by 4 per cent. Unemployment reached 2.2 per cent (468,000) in April, and in May 5½ per cent of the operatives in manufacturing industry were working short time. Employers thus held on to labour in the hope that demand would revive; with machines as well as men under-employed, productivity fell. Industrial consumption of most imported raw materials fell faster than imports did, so that stocks of these materials rose; so did stocks of steel and coal. On the other hand,

retailers, wholesalers, and manufacturers of goods for which demand was slackening were reducing their stocks and work in progress, thus accentuating the effects of the decline in current demand upon production. From "incomplete information" the Survey concludes that "the total volume of stocks and work in progress in the United Kingdom at the end of 1952 was little different from that at the beginning of the year"—apart from the decline of £100 million in stocks on the high seas.

Last year's policies of taking demand off the metal-using industries were thus to some extent overtaken by events. The emphasis then was upon efforts to curtail industrial investment in plant and machinery;

TABLE III—GROSS FIXED INVESTMENT BY INDUSTRIES

* Excluding the road goods transport industry which is included in "other."

and, in real terms, it did indeed fall slightly over the year as a whole. But overseas demand for certain types of capital equipment, and for motor vehicles generally, was already falling. Later in the year, therefore, the domestic quotas originally projected for items such as motor vehicles were much exceeded; yet home investment in plant and machinery is stated to have fallen fairly sharply between the first and second halves of the year.

The re-phasing of defence production could not take demand off the metal-using industries until the end of 1952; during the year as a whole defence took an increasing share of an unchanged output of metal goods. By the end of the year defence production in these industries had reached the rate of some £500 million a year; "no substantial increase above this rate" will be allowed. At that rate, defence would account for about one-seventh of the current output of metal goods, against one-twelfth in 1951 and one-eighth in the whole of 1952.

The varied experience of the metal-using industries in 1952 emphasised the diversity of the manufactures that are lumped together into this ragbag of a category, and therefore the dangers of basing hopes upon any assumptions about their unified behaviour. In 1952 the total output of these industries seems to have been about the same as in 1951; their exports declined slightly in volume, but rose 8-9 per cent in price and made up 44 per cent of the total value of all exports in 1952, against 41 per cent in 1951. In most of the metal-using industries the volume of orders on hand at the end of the year, particularly for export, was well below the volume a year earlier, says the Survey. Metal consumer goods were facing sales resistance at home as well as abroad; at the other end of the scale "many important export industries, especially those making heavy machinery, are still well booked up with orders." But this is by no means true of all capital equipment; and those industries in which demand remains high, such as shipbuilding, locomotives, aircraft, and heavy electrical goods, make up a fairly limited part of the whole engineering group. The Survey makes some play with the fact that industries whose order books have shortened can now offer more favourable delivery dates. This is obvious, and may be important where orders have been lost to foreign competitors rather than through lack of demand; but too much should not be made of it.

The flow of manpower within the economy in 1952 did not bring about the large-scale transfers that some had expected. The engineering group as a whole, for example, showed no net gain in manpower during the year; and though employment in textiles was down by about 55,000, this group of industries had been regaining labour fast in the later months of 1952 (and added 12,000 more in January). The lack of growth in the engineering group as a whole, however, concealed important shifts within this group; labour flowed from factories making metal consumer goods into the defence industries and some of the busier capital equipment industries, and even the shortage of skilled labour was moderated during the year.

The survey declares that it is too early to assess the significance of the general revival in the textile and other industries in the second half of 1952, "or to estimate to what extent it marks a change from the conditions of demand which prevailed earlier in 1952." Clearly, considerable slack has existed in the consumer goods industries since 1951; and in 1952,

> overseas demand remained high only for the heavier types of capital equipment, so that the policy of restricting home demand for metal goods in order to expand exports did not have the full results it would have achieved had world demand been maintained.

This year, the Survey concludes, resources should be available in the metal-using industries to provide for increased production of capital goods, both for home investment and for export. With adequate supplies of coal, ample supplies of steel, and no real shortage of other industrial materials, there is little doubt that the materials exist to support a considerable increase in industrial production in 1953. Labour has become somewhat more mobile, and the reserve of manpower exceeds the vacancies immediately available. The economy may be, as the Survey argues, in healthier shape to meet any increase in overseas demand than for some years past. But production no longer depends upon the mere assembly of resources. "What then," the Survey asks, "are the prospects for demand?"

IV.—Scope for "Incentive" Budgeting?

TO this crucial question the authors of the Survey studiously refrain from attempting any detailed answer—partly, no doubt, because they cannot know it in detail, but chiefly because even the attempt might reveal too much of the Chancellor's budget intentions. They do give, however, some significant indications of the way his mind may be shaping.

Having claimed that the first objectives set in 1952 have been handsomely attained, the Survey now reaffirms the longer-range objectives agreed at the Commonwealth conference, and the Government's determination to make Britain safe from the threat of recurrent crises. Past experience might make this an ominous pointer to the coming budget, since the post-war two-year cycle of recovery and crisis has been very largely attributable to the fact that external surpluses in the recovery years have never been attained without either drawing upon, or insufficiently adding to, stocks. This stoppage of stockbuilding has happened again in 1952—and there has also been the once-for-all depletion of stocks in the overseas pipe-line. Does this mean that the shadow of a new crisis may loom ahead because of the strain of re-building stocks in 1953 or 1954?

By implication, the authors of the Survey would say that this question cannot be judged by past standards, and for two reasons. First, they would emphasise the slack caused in the economy by the fall in demand, so that a reserve of potential output is available to meet any sudden increase in strain. Secondly, they would point out that the cessation of stockbuilding has itself been brought about mostly by the deliberate actions of business men (Government stocks of imported goods, the changes in which are less sensitive to the mood of the markets, have actually risen), partly in direct response to the new monetary policy and partly because of the general atmosphere of mild disinflation that it has helped to produce, so that precautionary hoarding of supplies has virtually ceased.

The first of these unfamiliar circumstances, the slack, suggests not only that output should rise if demand rises, but also that it may be expedient actually to stimulate demand—so long as that can be done in such a way as to promote the most vital types of output, and without prejudicing other vital objectives. The crucial need is for additional exports; but since these are mostly limited by overseas demand rather than by exporters' production, virtually the only ways of promoting exports by domestic policy are (1) to encourage industrial investment that will reduce export costs in future; (2) to check any rise—and, if possible, induce a fall—in export costs now, to help Britain to capture a larger share of the (limited) overseas demand.

The second unfamiliar circumstance, the change in stockholding habits, suggests that even a substantial increase in production might not, after all, create as great a need for additional stocks and work-in-progress as earlier postwar experience might suggest—provided, of course, that no new inflation is permitted.

With these new circumstances in mind, what shape might be envisaged for the balance sheet of real resources in 1953? If production merely maintains its present level, its total for the year should be £250 million or so above that for 1952; but this would mean that the rising tendency of productivity had entirely stopped since the second half of 1951. Given a sufficient demand, therefore, the potential gain in production should be substantially greater than £250 million. The Survey points to several known sources of expanding demand. In the calendar year the central government is likely to absorb an additional £125 million of real resources, mainly on defence (though only £70 million more in the fiscal year 1953-54), whilst local authorities may take a further £25 million. The ultimate target for new houses is reaffirmed at 300,000 a year, and new building will expand further this year (partly because of the relaxations on office building and the rise of defence building to its peak), but building repairs will decline further as war damage work dwindles. But, although these investment demands, and also those of certain basic industries, may be somewhat larger, the authors of the Survey seem to doubt whether other industrial investment in plant and machinery will rise at all unless some new stimulus is given.

Consumption, after its fall in the first half of 1952, has since shown a rising tendency, but the minor boomlet that developed in some directions just before Christmas seems to have subsided. An unexpected feature is that the cuts in the food subsidies last year imposed a smaller burden (£55 million) upon consumers than the value of the countervailing social reliefs (£60); but this odd relationship may be mildly reversed this year.

The impression that this rather tedious arithmetic leaves is that if the potential scope for additional output is regarded as substantial—say, over £400 million—then some stimulus of demand may be needed to bring forth any larger increase than that. The big question-marks over the budget are the size of the potential, and the extent to which any efforts to mobilise it would threaten renewed pressure upon industrial costs or impede the still highly desirable switches of labour to certain capital goods industries. And if the answers to these questions suggest that there is safe scope for granting a stimulus, it is towards industrial investment and general incentive that the relief should go. The Chancellor this year may have an enviable opportunity; but he likewise has an unenviable responsibility.

The Building Industry—II

Management among Builders

THE war smashed the complex, hair-spring adjustments of house-building under prewar private enterprise. The large contractors, who had hitherto done little house-building, came out of the war with more trained labour, organisation and machinery, but relatively less outlet for it except house-building in view of the restrictions on commercial and many other forms of construction work; the small "general builder" had waxed fat on war damage at cost-plus and also was ready to try his hand. But the specialist builder, who had made a profit in house-building, had been out of the game for six years, "pooled" on war work; his specialist teams were scattered, his organisation and capital dissipated.

At the same time, local authorities became the sole building agents; the builder became simply a contractor organising sub-contractors. There was no undue risk, or seemed none; firms rushed in and tendered successfully who had never built houses before the war and would have been bankrupted if they had tried. The big contractors turned largely to houses and flats; the engineering industry was given the chance to put surplus wartime capacity to use in providing non-traditional houses; and the small builder expanded in the inflationary sunshine. Success ceased to be measured by the tightness of organisation on the site and instead depended upon skill in the procurement of materials.

The management concerned with building houses, therefore, was far less experienced and economy was subordinated to output. Shortages of materials, inadequacies in transport, and lack of knowledge produced site delays, which inflation aggravated by putting a premium on the over-ordering and hoarding of materials. Labour, on the other hand, was scarce under conditions of full employment, piecework was impossible or ineffective, and to indiscipline was added every discouragement in the form of site delays. Builders adjusted their organisation to the tenders that they could secure, instead of planning production ahead to fit exactly the potential of their organisation as they did before the war. And the builder's ambitions were no longer tempered by the need to risk his own money. It was—and still is—possible for an experienced and careful builder to lose his best men to an inefficient rival who by cutting margins too finely has obtained a larger contract than he can handle. This means trouble for the inefficient man in the long run—but it may put the efficient man out of business in the short run.

These difficulties were increased rather than lessened by the greater use of architects and surveyors by local authorities in the designing and planning of houses. Houses have undoubtedly been better designed, but the rigidity of specifications and nomination of sub-contractors by architects has deprived the builder of his ability to make do and substitute. Expensive methods have sometimes been forced on the builder with attendant delays; and the process of saving the nation from the jerry-builder has been paid for at unnecessary expense to the ratepayer. Architects knew little about the technology or economics of house-building before the war, and many builders deny that they have learnt much since. They are certainly responsible for long delays in completion of contract documents and they have utterly failed to encourage improved cost planning.

★

The situation on the site has thus been transformed. It used to be self-adjusting; today time-keeping and supervision are necessary, but in addition the builder's foreman must be the site organiser, adjusting the phasing of operations to irregular arrivals of materials—sometimes materials that must be used in a new way or with the greatest economy, so that adaptation is the order of the day. The foreman has often to improvise because there has been inadequate pre-planning, which itself is the result of delays in placing contracts after the acceptance of tenders. Differences of efficiency among builders are shown by the very wide variations in man-hours required to finish identical houses—between 1,565 and 4,645, according to one enquiry. The pre-war builder roughly calculated that he put up a house a year per man employed; to-day it would be nearly a house per two men.

It is not surprising that costs have soared in these circumstances; it is remarkable that they have been held at all. The delays and disorganisation caused by local authority control are put at £100 per house by knowledgeable builders. Lowered productivity must account for at least a further £100; according to a work study conducted by the Building Research station in 1947, a quarter of the manhours consumed in putting up the shell of a house were wasted by unavoidable delays from such causes as weather or non-arrival of materials, while one half was wasted avoidably—so that brickwork that cost £335 to erect ought to have cost only £245 at the most.

Incentive schemes have reduced this waste only when associated with management and organisation of pre-war quality. An increasing minority of firms are able to operate bonusing schemes successfully, fixing a price for the job which repays in speed of completion an increase in wages-cost which may raise a man's remuneration from £12 to £16 a week, though incentive payment has not in general proved the panacea some people hoped. The large contractor, in particular, offsets his high overheads for transport and site supervision by good phasing and a measure of pre-planning. A progress department follows up deliveries to site,

with a special section to concentrate on any critical shortages that threaten costly delays. Delays arising from weather are minimised by both pre-fabrication and site-fabrication. Components are delivered ready to fix, and every house is treated as an "issue," controlled by tight stock control that aid forward planning; roofs, for example, are sawn and assembled under temporary cover, which also houses portable power to drive tools. While the small builder's foreman may be beaten by technical problems arising out of unfamiliar materials, the large contractor is often able to ring the changes on substitutes and non-traditional components, which his research department can examine so that they can be delivered to site ready to fix.

Nonetheless, large contractors are disposed, even now, to take a cautious view of their contribution to housing method. Though they build competitively in concrete and steel, by dint of mechanisation and organisation, they take only large contracts, not less than 100 houses, and only thus do they show as good results as the traditional house built by an efficient medium-sized builder. They doubt their ability to deal in small batches on odd sites, which still make up the bulk of building, and in future may make up an ever greater proportion of it. Nobody is more conscious of the sheer natural competitiveness of bricks, mortar, wood and craftsmanship than those who have developed other materials successfully.

Non-traditional methods are making an ever-larger contribution to productivity, but many hasty assumptions have been falsified. Both the steel and aircraft industries proved that they could build largely prefabricated houses in quantity but they cost more and the difficulties of site-preparation, transport, phasing, labour-management and the general rough and tumble of building astonished and discouraged their advocates, who were inclined to think in terms of smooth factory production. Nonetheless, before metals had to be taken off the housing menu, some systems were nearly competitive. Pre-fabricated houses for export are now considered competitive with traditional houses in cost, and indeed exports rose from £80,000 in 1949 to £7 million in 1952. No less significant, the schools traditional and non-traditional building programme has shown what can be done by planning by engineers, architects and local authorities in concert with scientific research. Between 1949 and 1952 the cost per place in schools was reduced by 50 per cent; the area per place was reduced by 30 per cent and the cost per square foot by 22 per cent despite the rise in building costs. Standards were raised and the cost and quality of non-traditional building compared favourably with traditional (besides being carried out without diverting craftsmen or materials from housing). It proved to be much faster in terms of site-time.

Much, therefore, has been learnt from experiment, and building has been enriched by new materials that fit well into any system. Outstanding examples which have eased shortages and reduced costs are Thermalite breeze blocks made from power station waste products for walls and partitions; rubber floor coverings which enable the builder to dispense with wood boards upon a concrete ground floor (and would do the same for upper floors if pre-stressed concrete was competitive with timber at £97 a standard, which in Britain, unlike France, it is not); plasterboard for ceilings and quick-drying plasters; quick-drying plastic and emulsion paints; pre-jointed plastic or copper plumbing. But by contrast, interior finishing is still in the hands of the plasterer using methods unchanged since the middle ages: in this and in other ways the craftsman is indispensible to the process of joining, waterproofing and "covering over" which is the art of house construction.

The same may be said of mechanisation. Site-preparation is eminently work for the digger and earth shifter—but not where the land is uneven. Few contractors would care to compete with the pre-war subcontracting gangs who would dig the foundations and sewer trenches of a house at £10 a time with spades and barrows. Mechanisation, like prefabricated components, pays off only on long runs and with adequate working capital.

* Covers general builders, building and civil engineering contractors, plumbing, joinery and carpentry, painting, roofing, plastering, glazing, demolition, scaffolding, shopfittters and miscellaneous firms.
† Covers constructional engineers, reinforced concrete specialists, heating and ventilating, electrical contractors, asphalt and tar-sprayers, plant hiring firms and flooring contractors.

Thus, in the last analysis, economic and managerial considerations prove more important than technological. Indeed, technological applications that seem promising will await reorganisation to produce their results for productivity. The problem is not to equip the large contractor—though taxation precludes him from investing in all the machinery he needs—but to provide the small man with tower cranes or mechanical diggers when he can use them. The concluding article will examine the conditions in which developments already helping to increase productivity can be speeded up.

Business Notes

A £400 Million Shortfall

THE out-turn of the Budget for 1952-53 proves to be even more unsatisfactory than seemed likely a few weeks ago. Last summer, when the gap between performance and budget expectations first became large, the official view was that most of it would be closed by an improvement later in the year. But in fact the improvement lasted for only part of the "revenue" quarter just ended, and for the whole of it the surplus was a mere £7 million better than in 1952. Hence the year ends with an "above-line" surplus, after provision for sinking fund, of only £88 million, whereas the budget had envisaged a surplus of £511 million (including the £80 million of net savings expected from cuts in subsidies not actually shown in last year's financial statement). The shortfall from the budget expectations therefore amounts to no less than £423 million. By comparison with the actual results of the previous fiscal year, which closed with an above-line surplus of £380 million, the deterioration as shown by the Exchequer returns is £292 million; but the true deterioration is £85 million worse than this, because defence expenditure in 1952-53 was brought into the accounts only after deducting that amount drawn from the sterling "counterpart" fund for defence aid.

THE DEFICIT ANALYSED

§ Including £25 million net issues to Civil Contingencies Fund.

The "below-line" account, however, showed a small improvement on 1951-52 experience, though it fell short of the budget hopes. Net expenditure below-line absorbed £524 million, compared with £526 million in 1951-52 if net charges to the Civil Contingencies Fund in that year are excluded and £551 million if they are included. The upshot therefore, is an "overall" deficit of £436 million on the basis adopted in the Exchequer return, or one of £521 million on the basis comparable with 1951-52, when the deficit was only £171 million (or £145 million if the net borrowing from the CCF is excluded). On the first basis, the Chancellor had budgeted, in effect, for an overall surplus of £5 million; on the true basis he was budgeting for a deficit of £80 million (i.e., ignoring the "counterpart" fund).

Disinflation Hits Revenue

THE causes of this disappointing performance are distributed more or less equally between the shortfall of revenue and the unexpectedly large rise in expenditure. As the accompanying table shows, the budget envisaged an expansion of revenue by no less than £228 million, but it actually rose by only £5 million. Income tax, which had been expected to yield £136 million more, rose by only £67 million; profits tax (including EPT), expected to rise by

£137 million, rose by only £61 million; customs and excise yielded only £12 million more, whereas £64 million had been expected. With the exception of surtax (£7 million above estimate), motor duties and miscellaneous receipts (down by only £22 million, instead of the expected fall of £29 million), every revenue item disappointed the budget expectations. This experience, which contrasts sharply with that of earlier postwar years, reflects very clearly the swing from persistent inflation and sellers' markets into an almost world-wide climate of mild disinflation and buyers' markets. To the extent that this is so, the revenue shortfall, as such, is not quite so disheartening in its implications as it may seem at first glance; it certainly cannot be judged simply by past standards.

The force of disinflation has also had some impact on the expenditure side of the account. The new monetary policy, which has played an important part in bringing about Britain's recovery in 1952—as the Economic Survey clearly shows—has been partly responsible for the addition of £63 million to the interest cost of the national debt; and sinking fund provision has also been larger. This influence, however, accounts for only a small part of the total rise in above-line expenditure—by £297 million, without counting the £85 million that is concealed in the accounting of the counterpart fund. At the time of the budget an increase of only £96 million was envisaged. Not all of this uncovenanted growth of expenditure, however, represents true current expenditure. Last year's estimates presupposed a decline in Government stocks, but, in fact, these stocks have increased.

Gold—Fixed and Free

IN an election speech at Johannesburg last week Mr Havenga, the South African Finance Minister, let a long-suspected cat out of the bag when he declared that Mr Butler "pressed the case" for a higher dollar price of gold during his recent discussions in Washington. This does not mean, of course, that there are yet any great grounds for hoping that this pressure may be successful. But the sterling area's interest in this matter is underlined by new provisional estimates of world gold production in 1952; as the accompanying table shows, sterling area countries are believed to have produced some 14.6 million ounces of gold last year, out of a total world production of 26.4 million ounces.

These estimates are compiled by the Union Corporation and they are included as usual in the Annual Bullion Review of Samuel Montagu and Co. The latest issue of this review, which has long been an urbane and authoritative guide to events on the world's free gold markets, deserves special mention in its own right; it appears one hundred years after Mr Edwin L. Samuel, "banker and bullion merchant" of Liverpool and Mr Samuel Montagu of London joined forces as Samuel and Montagu and set up shop in Leadenhall Street. The review estimates that over 12 million fine ounces of gold were absorbed by the free market during 1952, compared with 9½ million ounces in 1951; some 10 million ounces of the 1952 absorption represented newly mined gold, while the other 2,000,000 ounces came from various institutional holders of gold. It is expected that the gold offered in the free market in 1953 will be at least as great as in 1952, and might be "much greater" if South Africa decided to abrogate the self-imposed rule that limits its free sales to 40 per cent of its output. But the review adds that "the demand for gold in the free market remains strong and we see no reason to suppose that it will not easily absorb all that is likely to be offered."

This confidence is all the more challenging because it follows the admission that the bullion market on the mainland of China has virtually disappeared, thanks to the "knife and the noose of totalitarian methods." The temporary demise of the Chinese market is picturesquely described in the columns of the *Far Eastern Economic Review*:

> Canton gold market has come to an end, not even one transaction being reported for several weeks now. The authorities there have succeeded to stamp out all business in bullion. Elsewhere in China gold trading has long ago been suppressed and the once active China black market has been obliterated. It appears impossible to reintroduce illegal bullion and exchange business, so perfect is the control or rather the terrorism of the authorities. The internal spy system, coupled with draconian punishment meted out to offenders, has entirely wiped out illegal market operations.

The review's forecast of a continued bullish undertone to the free gold market must also, of course, have been made before hopes began to rise of an improvement in the world political situation.

WORLD GOLD PRODUCTION
(Thousands of fine ounces)

* Estimated production. † Gold production in the USSR in all three years is an estimated nominal amount.

Rising Bank Deposits

THE clearing banks' statement for March makes an inauspicious prelude to the budget. The seasonal contraction of bank deposits ordinarily loses most of its impetus after the end of February but, even so, the banks' make-up for March generally shows some further modest contraction in the volume of deposits. Yet in the four weeks to March 18th net deposits rose by £22 million, in contrast with declines of £12 million, £25 million and £59 million in the three preceding years, respectively. The credit trend during the "revenue" quarter as a whole, therefore, has been very much less satisfactory than was originally hoped; over the three months net deposits have dropped by £312 million, or by £38 million less than they fell in the similar

period last year. Government repayments of indebtedness to the banking system in these three months seem, indeed to have been only fractionally larger than in the similar months last year. They have therefore wholly failed to correct the inflation of credit caused by the heavy Government borrowings last summer and autumn, and over the twelve months to mid-March last net deposits have expanded by nearly £160 million.

The immediate cause of the deterioration of the credit trend in the past three months, and especially in March, has, however, been the upturn of demands by borrowers other than the central government itself. Bank advances rose in March by nearly £26 million, or by almost twice the amount of the corresponding rise last year; their total now stands £55 million above the low point of £1,744 million touched last November (in contrast with a rise of only £21 million in the first four months of the swing towards orthodox monetary policy). The past few months have likewise witnessed some re-expansion of the banks' portfolios of commercial bills. The rise in advances certainly owes much to the heavy borrowings of the electricity and gas industries, but there equally seems little doubt that the private sector as such has been absorbing additional supplies of credit. Investment portfolios have declined for the third successive month, the latest reduction being £7½ million; but this tendency can perhaps be regarded as the counterpart (though probably an indirect one) of the "departments" preparations for the redemption of the 1951/53 War Bonds on March 1st last. This is the season of the year at which the banks' liquidity ratios normally reach their lowest point; yet the average dropped only fractionally in March, to the still quite comfortable level of 32.9 per cent, compared with 31.8 per cent twelve months ago.

Recovery in Output Sustained

A REVISION of the industrial production index for January now puts output during that month at 115 (average 1948 = 100), which is the same as in January, 1951, but two points lower than in January, 1952. The index for February, on the basis of information so far received (which the Central Statistical Office considers may be slightly too favourable) is forecast as 117-118, which would be lower than in either of the two previous years (the index was 122 in February, 1951, and 120 in February, 1952). The comparisons with the two previous years are recorded because it was in 1951 that the postwar pattern of output and productivity in a seller's market first began to be moderated as the forces of demand gradually extended a more traditional control over output. No clear new trends have yet emerged though discussion of the possibilities forms a major part of this year's Economic Survey.

The Austin Strike

THE Austin Motor Company has thrown a spanner into the smooth machinery of negotiation by announcing that the strike that had partially paralysed the company's Longbridge works since February 17th no longer exists. Signs of the stresses set up by this decision could be detected in the Minister of Labour's statement in the House of Commons on Tuesday, when he said that the union involved, the National Union of Vehicle Builders, has written asking for intervention by the Ministry and that talks "with the parties concerned" were going on. Since Austin has decided that there is no strike, the Minister is clearly having some difficulty in persuading the management that there is any issue demanding conciliation. A further statement was promised before the House rose on Thursday —after this issue of *The Economist* went to press.

The background to this strike is deceptively simple; it conceals a certain amount of friction between the company and this particular union. Last autumn, the Austin works dismissed about 700 men, and in subsequent months has taken back rather more than 400 of them. The union has complained that subsequently men were taken on who had not previously been employed at the works. It decided to make a test case of the reinstatement of one of the dismissed men, a senior shop steward. The company refused to take him back, and the union called out its 2,000 members. This threw out of work a good many of the 14,000 or so other men employed in the factory and also many at component factories supplying Austin. After weeks of stalemate, the management made two announcements. The first was that all those men on strike would be dismissed if they did not report back to work within a given time; the second was that all the members of other unions who had been put out of work by the strike would be taken back and paid for a guaranteed 34-hour week until normal production could be resumed. About 800 of the strikers went back to work, but the union immediately prepared to extend the strike to other factories of the British Motor Corporation, and to enlist the co-operation of the other unions. Austin, meanwhile, is not expected to take any further steps before Easter; after the holiday it is likely to carry out its avowed intention of notifying any vacancies to the labour exchanges, through which it is prepared to re-employ the dismissed strikers. The company is presumably hoping that more of the men will return in the next few days.

Although this is one of the few official strikes to have been called in the motor industry—last year's stoppages were all unofficial—there have been no signs so far that the other

ABRIDGED REPORT

CANADIAN PACIFIC RAILWAY COMPANY

(Incorporated in Canada with Limited Liability)

SEVENTY-SECOND ANNUAL REPORT OF THE DIRECTORS FOR THE YEAR ENDED DECEMBER 31, 1952

TO THE SHAREHOLDERS:

The volume of transportation service provided by your Company in 1952 was in excess of that of any previous year. The record grain harvest in Western Canada, together with a continued high level of activity in industry and in the development of natural resources, resulted in heavy demands upon your railway facilities.

Notwithstanding a new peak in freight traffic and gross earnings, railway net earnings were equivalent to only 6.3 cents per dollar of gross, the same as in 1951. The average revenue received by your railway for its principal service, the carriage of freight, was 1.30 cents per ton mile and was less than in 1950 and 1951. On the other hand, both labour and material costs were substantially higher.

The Income and Profit and Loss Accounts of your Company show the following results for the year ended December 31, 1952.

INCOME ACCOUNT

Gross Earnings			$457,808,969
Working Expenses			428,878,189
Net Earnings			$ 28,930,780
Other Income			22,651,775
			$ 51,582,555
Fixed Charges			12,504,010
Net Income			$ 39,078,545
Dividends:			
Preference Stock—			
2% paid August 1, 1952	$ 1,556,832		
2% payable February 2, 1953	1,545,550		
		$ 3,102,382	
Ordinary Stock:			
3% paid August 1, 1952	$10,313,703		
3% payable February 27, 1953	10,350,761		
		20,664,464	
			23,766,846
Balance transferred to Profit and Loss Account			$ 15,311,699

PROFIT AND LOSS ACCOUNT

Profit and Loss Balance, December 31, 1951		$252,947,332
Balance of Income Account for the year ended December 31, 1952	$15,311,699	
Portion of steamship insurance recoveries representing excess over net book value, S.S. *Princess Kathleen*, and compensation for *increased cost of tonnage replacement*	2,225,088	
Excess of considerations received for sales of properties over book values	305,415	
Miscellaneous Net Debit	333,088	
		17,509,114
Profit and Loss Balance, December 31, 1952, as per Balance Sheet		$270,456,446

RAILWAY OPERATIONS

Increasing for the sixth successive year, railway gross earnings amounted to $457.8 million and exceeded the previous high of 1951 by $28.9 million. Freight earnings, which provided more than four-fifths of gross earnings, were up $25.7 million.

The volume of freight traffic rose by 8% in terms of ton miles, and was greater than in any previous year. There were decreases in the tonnage of many manufactured commodities, and total tonnage would have been below the 1951 level but for the substantial increase in *grain handlings*.

Passenger earnings increased $1.2 million. While there was a decrease in the number of passengers carried, a higher proportion of long haul traffic resulted in an increase in total revenue passenger miles.

Gross express earnings were up $4.4 million. About $2 million of this increase was due to higher rates. Net revenues, which are carried to railway earnings as compensation for the haulage of express traffic, increased $1.5 million.

Net earnings from railway operations were $28.9 million compared with $26.8 million for 1951, and $38.0 million for 1950. The ratio of net to gross earnings, at 6.3%, was less than one-half of the average for the previous twenty-five years.

GENERAL BALANCE SHEET, DECEMBER 31, 1952

unions, or the TUC, have much sympathy with the vehicle builders. Both sides, however, have been markedly reticent in providing information about the real nature of the dispute. For that reason alone, intervention by the Ministry of Labour might do a good deal to clear the air. The Austin management's attitude is not an unreasonable one, but it has yet to be demonstrated that a dispute can be made to vanish simply by denying its existence.

Capital Francs for Tourists

One of the more exotic of the many varieties of French francs has recently emerged from the jungle of the exchange market and stepped out into the open country roamed over by the tourist. It is the capital franc, a species that has some family relationship to Britain's blocked sterling and that is dealt in on a market that resembles, though somewhat remotely, the market in security sterling. Under existing French exchange regulations, foreigners who own investments in France may not sell them in order to repatriate the proceeds, but must hold the proceeds of any such sales in the form of these capital francs. The general rule has been that capital francs may be used for re-investment or for meeting current expenditure in France. Their transfer is allowed from one non-resident account to another in France—but only provided that the accounts concerned are in the names of residents in the same country. As a result of this rule, there are as many sub-varieties of capital francs as there are countries whose residents have ever invested in France. There are, therefore, markets in American, British, Dutch, Belgian and many other of these sub-varieties. By far the most important is the market in American capital francs, which is fed not only by the proceeds of capital transactions but also, and much more heavily, by the blocked portion of American film earnings in France. British capital francs have in the past been used by some important banking and commercial firms that had local payments to make in France ; in that respect, incidentally, the authorised uses of capital francs have always been much wider and more liberally conceived than those of security sterling.

The new development in the past two weeks is that the French exchange control has now officially condoned arrangements under which capital francs can be made available for tourist expenditure. The rule of limiting transfers within a single residential group still applies, so that British tourists are entitled to spend only British capital francs ; in order to obtain these they must buy French travel cheques in Britain—which can be obtained through the joint stock banks in the ordinary way—instead of taking their tourist or business allocations in the normal form of sterling travellers' cheques. The snag is that if the tourist does not spend all his allocation, he may find some difficulty in reconverting his unutilised capital francs when he gets back home again. The Bank of England has intimated that it has no objection to the use of capital francs by British tourists, provided the amount issued to each individual is limited to the basic tourist ration. The increase in the demand for British capital francs has already been reflected in the rate, which has hardened from F.1150 to F.1075 in the past ten days ; at this rate the new type of franc would be nearly 10 per cent cheaper than the official franc (at Frs. 980 to the pound).

Towards a Tin Truce

The attempt, abandoned in 1950, to reach an international tin agreement is to be resumed. At the conclusion of its meeting last week the International Tin Study Group announced that it had agreed "to set up a working party open to all members of the group." This working party will consider international action regarding tin and, if necessary, report to the United Nations that conditions exist for "the resumption of the 1950 Geneva conference on tin." The opposition of the United States to the operation of a buffer stock caused the "adjournment" of the conference in 1950 ; since it has now apparently agreed to setting up the working party, there may have been a step forward, however tentative, towards an international agreement. The subsequent announcement of renewed truce talks in Korea has caused a number of commodity prices to fall, and in a fairly active market the London price of spot tin dropped by £12 to £930 a ton.

The working party, when it meets on June 15th, will have to take account of two major considerations, one statistical and one historical. Statistically, world consumption of tin has been falling since 1950 while production has continued to rise. Historically, there are bitter memories: American consumers think they were overcharged in the thirties as a result of the operations of the tin producers' scheme of those years, and they believe they were "gouged" more recently, at the beginning of the Korea crisis. That ill-feeling led to the American buyers' strike of 1951, which enraged producers in Malaya who felt the fight against Communism was hard enough without an added economic blow. But now producers and consumers, including the United States, are prepared to talk again. This is the beginning of a truce in tin ; it is early to say whether it will lead to the beginning of an agreement.

The Comet and Airworthiness

The task of the British Air Registration Board in attempting to persuade the American Civil Aeronautics Board to accept British certificates of airworthiness for jet airliners in general—and, in particular, for the Comet IIIs ordered by Pan American—should be made a little easier by the report published in Pakistan of the cause of the fatal Comet crash at Karachi last month. The aircraft was on a delivery flight to Canadian Pacific Airlines and the pilot had not put in many hours flying Comets. He took off under conditions that called for very close observance of the instructions, but made precisely the same mistake as the more experienced BOAC pilot who crash-landed his Comet at Rome airport last October. This was to raise the nose of the aircraft too high during its take-off

run. When the angle between the nose and the run-way is kept at about 6 degrees, take-off is normal. But if the angle is raised to more than 9 degrees, it creates so great an increase in drag that the engines cannot get the aircraft off the ground.

There is a danger that pilots converted from flying piston engined to jet airliners will under-estimate the vast difference between the two types of aircraft, and while they do, tragedies of this kind may still happen. The training course is being modified to take this into account, but it may be necessary to add one more instrument to the already overcrowded cockpit in order to measure the position of the nose in relation to the runway. This is governed by the position of the control column, but two successive errors of this kind suggest that a second check is desirable. The investigation has cleared the Comet of any doubts as to its airworthiness and safety, and to that extent has answered recent American critics—one of them a member of the Civil Aeronautics Board itself—who have been saying that jet aircraft are unsafe at take-off. But it does not resolve such fundamental points of dispute as the position of the engines. Present American thinking insists that these should be suspended below the wings. There is no aero-dynamic justification for this ; it was a method of construction that was first adopted by American jet aircraft designers simply because they used wings too thin to house jet engines in any other way. But while basic misunderstandings about points of design persist, nothing that the Air Registration Board can do by way of sending detailed answers to detailed American technical queries—as it has done recently—can bring matters much further forward.

The Price of an Engine

THE history of the Proteus aero-engine, as outlined by the Comptroller and Auditor General last week, is fortunately not typical of all aero-engine development. The cost of most development work in the aircraft industry is financed by the Ministry of Supply, and the average cost of developing an aero-engine, in these days, can be put very roughly at £4 million. By the end of March last year, nearly £10 million had been spent on the Proteus project, and more than £13 million may have been spent before it is completed.

The Bristol Aeroplane Company began work in 1944 on the Proteus as a turbo-prop engine for long-range operation. It was intended to build first a low-powered pilot design (the Theseus) and follow this with a full-scale engine of 4,000 to 5,000 horse power. The probable cost of developing these engines was expected to be rather less than £500,000 ; they were to power those two flying dinosaurs, the Brabazon airliner and the Princess flying-boat. The engine was not developed as successfully or as speedily, as was necessary, and although this was not the main reason for the eventual abandonment of the Brabazon and Princess, it was a contributory factor. The Theseus pilot project was dropped after £3,600,000 had been spent on it ; a pure jet version was scrapped when expenditure had reached £600,000. The first two versions of the Proteus, both of which were failures, accounted for a further £5,600,000 by March, 1952. Most gas turbine engineers believe that the reason for these failures lay in the design chosen for the compressor. The engine now under development, the Proteus III, uses a different type of compressor, and is for all practical purposes a new engine. But a further £3 to £4 million may have been spent, in addition to the £10 million already accounted for, before the Proteus III is ready for commercial operation in Bristol's Britannia airliner in 1955. The cost to the public of developing the Brabazon, the Princess and their engines has been probably around £30 million, all of it a total loss. On the credit side, experience on these projects has contributed much towards the successful Britannia, with its Proteus III engines. This is a prolonged and expensive way of buying experience. It raises the question whether, in such cases, another company fresh to the problems might not more profitably be given an opportunity to try its hand at projects that have already baffled one group of designers.

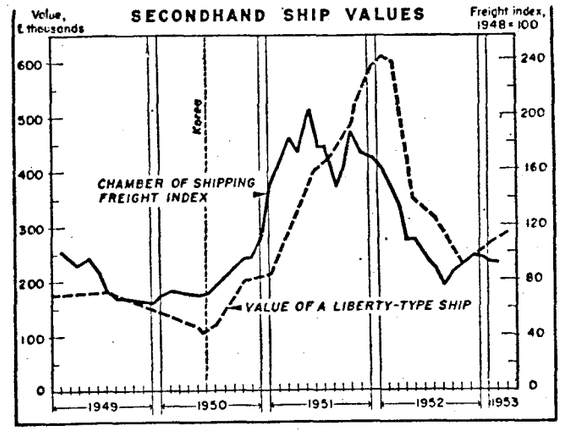
Aluminium in Plenty

FROM the beginning of April, the Ministry of Materials' selling price of virgin aluminium has been reduced by £5 to £161 a ton delivered into consumers' works. The Ministry buys most of its aluminium from Canada, and the reduction in selling price merely reflects the recent strengthening of sterling in terms of the Canadian dollar. There has been no reduction in the price charged by the Canadian producers. On the contrary, North American prices for aluminium have remained extremely firm, in response to the continued pressure of American demand for metal. Mr Nathanael Davis, president of the Canadian Aluminium, Ltd., said recently, that although the world shortage of the metal is over, defence and stockpile requirements in the United States continue to exceed supply. Indeed, now the United States has had to supplement its normal supplies—which come partly from home production and partly from imports from Canada—by further "borrowing" of Canadian metal that was under contract for purchase by this country.

In this country the shortage of metal had eased by June last year. In the whole of 1952 new supplies of virgin aluminium amounted to 262,000 tons, of which 234,000 tons came from imports and the balance from home production ; the output of secondary metal was a little under 100,000 tons. Total consumption of aluminium last year reached some 297,000 tons (about 200,000 tons of this being virgin metal) and although no figures of commercial stocks are available it is known that fears of a reduction in aluminium prices have led consumers to run down their stocks in the last few months of the year.

Since December consumption itself has fallen away sharply and in January it amounted to only 20,000 tons. The slackening of demand has affected secondary as well as virgin aluminium and there have been heavy falls in the price of most grades of scrap although the purer grades are still short. Practically all the aluminium using industries have been using less of the metal. Demand from the aircraft industry—one of the main users—has declined with the slowing down of the rearmament drive. The motor vehicle industry—which uses large quantities of cast aluminium products—and the hollow-ware industry have

encountered falling sales both at home and in the export field. For a time during the latter part of 1952 increased requirements of aluminium for export in the semi-manufactured state helped to cushion the slackening of demand elsewhere, but these exports are now encountering much heavier competition, notably from Germany. In the circumstances it is not surprising that the Ministry has readily agreed that another 50,000 tons of the 250,000 tons of Canadian metal which were due to be delivered to Britain can be diverted to the United States this year. Nor is it surprising that the Ministry has opened negotiations with the Canadian producers for handing back the metal to private trade. Once again the Ministry are baling out of a falling market.



Neguib's Cotton Market

THE Egyptian government has announced that it does not intend to reopen the Alexandria cotton futures market that it closed suddenly last November. At that time it argued that because of the absence of a Liverpool futures market and of a shortage of dollars that prohibited operation on the New York futures market, the market in Alexandria could not cover its operations and that its fluctuations in price had become dangerously violent. The Egyptian Government considers that these reasons still hold good, and it intends to continue its present system of fixing buying and selling prices. The selling price for government cotton will still be related to the previous day's closing price in New York for American cotton ; at present there is an addition of 30 per cent for Karnak and 5 per cent for Ashmouni cotton. The buying price, however, will not be subject to any such fluctuations. It will be fixed for the season on the basis of an estimate of costs of production, and the government has already given warning that its buying prices for next season may be set lower than for the current season.

These announcements are made after the return of the Egyptian cotton mission from its tour of Europe. There is little doubt that the mission was able to inform the government that consumer countries raised no serious objections to the present Egyptian arrangements. The mission was no doubt also able to report that the price reduction in Ashmouni resulting from the addition of 5 instead of 10 per cent on New York prices, announced while the mission was on tour, was very well received in Europe. The mission incidentally learned that there is no hostility in Lancashire to buying cotton from Egypt—at somewhat lower prices.

Secondhand Ship Values

THE prices of secondhand ships fluctuate even more rapidly than freight rates, but they do tend to follow the graph of freight rates—a few months in arrear. This trend is well illustrated in a graph that accompanies a ship sale and purchase market report issued by Harley, Mullion and Co., Ltd., in respect of the first quarter of this year. This compares the prices at which ships of the Liberty type have changed hands during the last four years, set beside the movement of the Chamber of Shipping index of sterling freight rates for tramp shipping during the same period. Before the outbreak of war in Korea, Liberty ships were being sold for as little as £125,000, when the tramp freight index was about the 70 mark (1948 = 100). The steep subsequent rise in freight rates was exceeded by the rise in price of Liberty ships ; but this rise in secondhand values did not take place until between three and six months after that in the freight index. This relationship has held good throughout the decline in freight rates, except that the temporary dip of freight rates

in the summer of 1951 was smoothed out in the graph of secondhand prices. But in the last three or four months, the trend of secondhand values diverged from that of freight rates. On the evidence, it may be that the value of secondhand prices for Liberty ships is due for a sharp drop.

Reviving hopes of settlement in the Korean dispute, which is still artificially swelling activity in the Pacific trades, suggests that the secondhand ship market is in for a sharp decline, which may exceed that of the freight index itself. During the last three months the price paid for a Liberty ship has increased from about £260,000 to £280,000 ; this rise has been attributed to a reluctance to sell on the part of Greek shipowners, particularly in New York and London. Some British liner companies, on the other hand, have been quietly releasing their "stopgap" tonnage on the market.

SHORTER NOTES

Argentina has again disappointed British exporters. Under the Anglo-Argentine protocol which was signed on New Year's day Argentina should have issued exchange permits for the import of £1,500,000 of non-essential British manufactured goods before last Wednesday. On the pretext that the two countries cannot agree upon which goods should be included in the list, it has taken no action at all.

★

Imperial Chemical Industries, Ltd., is to build a Canadian plant for the manufacture of its synthetic fibre "terylene." The $20 million needed to build the plant will be raised in Canada, and the scale of production proposed is expected to be sufficient to meet Canadian demands.

Company Notes

FORD MOTOR. The return to more competitive conditions in the motor industry may have been the final spur that pricked Ford Motor into a policy of closer integration between its assembly plant at Dagenham and Briggs Motor Bodies, the company that manufactures motor bodies for it. It has therefore applied for—and received—Treasury endorsement of its plan to acquire from Briggs Manufacturing Company and other United States interests 1,243,938 ordinary shares in Briggs Motor, at a price of $7.21 a share (ex the dividend of 12½ per cent just declared by the directors of that company). These purchases from the United States will give Ford Motor control over about 62 per cent of the issued capital of Briggs Motor. Most of the remaining 756,062 shares are in the hands of British shareholders, and for each of these Ford Motor is offering two new Ford ordinary shares and 5s. in cash; the existing Ford shares now stand at 56s. 6d., but as there is to be a share for share scrip issue in respect of these shares, the offer is equivalent to 61s. 6d. for each Briggs share. On the eve of the announcement the latter were quoted at 48s. 1½d. This is therefore plainly a very attractive offer.

As with the Austin-Morris merger it may be some time before this financial operation leads to any production economies, but ultimately it might buttress a wall against the chill winds of recession. Last year these winds were blowing less frighteningly in Ford's markets than in those of some of its competitors. In fact, in spite of the restrictions imposed in some foreign markets and in spite of last summer's strike at Dagenham, Ford succeeded in selling 164,760 vehicles in 1952, or only 912 less than in 1951; and in spite of the price reductions introduced in the middle of last year, the value of total sales increased from £70.2 million to £83.9 million and trading profits advanced from £11.3 million to £11.9 million.

Unfortunately for shareholders, the happy story ends there. Higher charges for depreciation (including a provision for exceptional depreciation) and for taxation (£5.7 million including £1.1 million for EPL), coupled with an increase in the provision for back service pension contributions, have reduced net profits from £3,984,512 to £3,029,526; the directors have also shown their awareness of the problem of replacing fixed assets at current values by setting aside £2.5 million to reserves for this purpose. It is not surprising, therefore, that the ordinary dividend has been left unchanged at 15 per cent. On the assumption that dividend disbursements will not be increased just because nominal capital is being increased—and no shareholder should expect that they will be—the £1 ordinary shares at the current price of 56s. 6d. yield 5.3 per cent.

	Years to Sept. 30, 1951	Years to Sept. 30, 1952

£1 ordinary stock at 30s. 6d. yields £4 18s. per cent.

★

DE HAVILLAND. There was a murmur—in fact almost a growl—of disappointment in the market when the De Havilland ordinary dividend was announced. Immediately after the announcement, the £1 ordinary stock units were marked down 1s. 4½d.; and in the following day of trading they fell by another 1s. 7½d. to 30s. 4½d. Investors had hoped that the dividend would soar with the Comet—perhaps to 10 per cent. Instead the company announced that a dividend rate of 7½ per cent would be maintained on an ordinary capital of £4,385,459; in 1950-51 the same rate was paid on a capital of £2,740,912, and a quarter of that rate was paid on a capital of £1,644,547 (in accordance with the terms of the new issue of that capital). The dividend disappointment was accompanied by what appeared to be a blot on the company's recent record of steadily expanding profits; in the year to September 30th last profits (struck after all charges except taxation) fell from £2,890,764 to £2,772,904, and net profits fell from £639,290 to £597,108.

It is possible that this fall in profits merely reflects the rather arbitrary incidence of contract completions in the aircraft industry. But it may also reflect the heavy cost of the company's capital development programme; certainly the massive outlays on that programme provide one of the main reasons for the restraint in dividend payments. As with the Hawker Siddeley dividend, the directors' decision may also, of course, be affected by political as well as economic overtones. Nevertheless, although De Havilland may soon reach the peak of its production for military aircraft, profits should increase in the current year; at the top of this wave, the directors should take the opportunity to increase the dividend—if only as a reward for patience.

★

BRITISH OXYGEN. When British Oxygen followed up its scrip issue in mid-1952 with a cash issue of ordinary shares last November, it set in train some divergent market guesses about what its final rate of dividend would be for the year to December 31st. Most guesses ranged from a dividend of 7½ per cent to one of 9 per cent. In fact, the company has fulfilled the most sanguine expectations by declaring a dividend of 9 per cent on a capital of £8,117,698, in addition to an interim dividend of 6 per cent on a capital of £6,244,383. These two dividends are equivalent to 22½ per cent on the capital existing in 1951, when a dividend of 20 per cent was paid. The increase in equity payments has certainly been justified by the year's results. Trading profits have advanced from £4,595,414 to £5,577,376 and net profits (after a much heavier charge for taxation) from £1,146,323 to £1,250,858. The directors are able to report that last year's trading was characterised by a "satisfactory and sustained growth in sales"—a growth that was aided by new capital development. On this showing, shareholders can probably expect—and they will certainly hope—that a dividend of 15 per cent will be paid on a capital of £8,117,698 in the current year. On that basis the £1 ordinary stock units, at the current price of 54s. 3d., would yield 5½ per cent.

Statistical Summary

EXCHEQUER RETURNS

For the 10 days ended March 31, 1953, total ordinary revenue was £134,255,000, against ordinary expenditure of £212,078,000 and issues to sinking funds £478,000. Thus, including sinking fund allocations of £35,227,000 the surplus accrued since April 1, 1952, was £68,124,000 compared with a surplus of £379,733,000 for the previous financial year.

COMPANY MEETINGS

THE STEETLEY COMPANY, LIMITED

SALES, TONNAGES AND EFFICIENCY AGAIN HIGHER

EFFECTS OF PENAL EXCESS PROFITS LEVY

MR N. M. PEECH'S STATEMENT

The twenty-third annual general meeting of The Steetley Company, Limited, was held on March 31st at the Royal Victoria Hotel, Sheffield, Mr N. M. Peech, chairman and managing director, presiding.

The following is the chairman's statement circulated with the report and accounts for the year to December 31, 1952:

In the last annual report, an attempt was made to present a picture of what dolomite and refractories are and of Steetley's activities in these fields. It was shown that dolomite (a magnesian limestone) and other minerals, such as magnesite, silica and chrome ore are processed into refractories which are substances that have to withstand great heat without distortion of shape and which, both in granular and in brick form, are widely used in industry. For example, all the metal and some other commonly used products begin life in a furnace that is lined with refractories.

This year the intention of the report accompanying this statement is to illustrate new works, to describe the further mechanisation of processes and to show the improvements in working conditions that have been achieved since the war in the dolomite division of the company.

SEAWATER MAGNESIA

Shareholders have been advised that the company has repurchased the Palliser Works at Hartlepool from the Ministry of Materials and a new wholly owned subsidiary named Steetley Magnesite Company, Limited, has been formed to take over and operate these assets.

It has always been the board's intention to repurchase these works from their wartime owners when circumstances permitted, not only because we originated the process of extracting magnesia from dolomite and seawater, but also because ownership of this plant would provide a more solid base for the refractory brick manufacturing operations of the group in the interest of customers.

STEETLEY OF CANADA, LIMITED

The formation of this company and the parent company's participation in it to the extent of $1 million, or some £360,000, has been announced together with the public issue in Canada of $2½ million in bonds. Canada attracted us for this investment because she is now forging ahead, she has a stable Government that acts on the premise that healthy and progressive industry is the life-blood of the country, she is blessed with exceptional raw material resources, and, as the population grows, so this vast country will be further developed and steel production will expand.

After extensive surveys which revealed *inter alia* that the Canadian steel industry was relying largely on imports of burned dolomite refractories from America, it was decided that the procedure in the early days of the Steetley Company should be followed, namely, to base initial operations on the acquisition of the best dolomite quarry, strategically located, and then build processing plant (designed for Canadian market conditions) to produce dead burned dolomite refractories for the daily maintenance of steel furnaces. In order to obtain supplies of dolomite from a quarry with a big enough production to be economic, it was necessary to acquire a controlling interest in the Canada Crushed and Cut Stone Company, one of the largest crushed stone and building stone businesses in Canada. It was expedient also to acquire all the outstanding capital stock of Dolomite Refractories, Limited, a company with which Steetley has worked for many years.

The foundation of this new enterprise we believe to be sound and although Canada cannot be immune from international trade cycles, we look to the building up of a valuable asset over a period of time. Early dividends on the common stock, of which Steetley of England owns $150,000 out of an issue of $250,000, certainly are not looked for but 4½ per cent interest per annum is payable on our cumulative preferred share holding of $850,000. The new plant is expected to be in operation in the summer of 1954.

THE NEW AND RE-EQUIPPED DOLOMITE WORKS

After six years of war with every effort concentrated on production and with no opportunity of building new works, a comprehensive survey of the group activities was undertaken in 1945.

In order to obtain the greatest production per man employed in the Dolomite Division, one new big quarry and processing works in the centre of Britain would have been ideal but the railway rate element in the cost of the product to the consumer among other good reasons clearly indicated that three works, one on the NE Coast (Coxhoe), one in the centre (Cadeby) and one in S. Wales (Taffs Well) were essential.

The new Cadeby works has proved successful and it is producting some 1,500 tons of dead burned dolomite per man per annum. This is due to two main factors. First, excavators bigger than those then made in this country were imported from America for use in the quarries and second, the new dolomite processing plant was built on a straight line layout and much ingenuity was shown in the design thereof; for example, the scale car charging machines (which are not unlike those used in modern blast furnace practice) feed, with one operator per shift, 7,500 tons of raw materials weekly into the cupolas and effect great economy in labour.

The Coxhoe works has also proved successful and we have similar expectations from Taffs Well when it is completed. To meet current demands, the old Steetley works and Llynclys works meantime have to continue in operation.

The new and re-equipped works brought about a marked improvement in working conditions and the new methods greatly facilitate continuity of production in bad weather.

DIVISIONAL REPORTS

In all three divisions, sales, tonnage produced and works efficiencies were again higher than those achieved in previous years.

In the Dolomite Division, the demand for dead burned dolomite remained unchanged from 1951 until the last quarter of the year when it rose rapidly. The various works operated satisfactorily throughout the year and at the time of writing this report the re-equipment of Taffs Well works, which has presented many problems due to site conditions coupled with the necessity for maintaining production, has reached the point that the plant is operating at 50 per cent of the new rated capacity and it will shortly reach full capacity. The Ground Limestone Company makes progress.

In the Refractory Brick Division, both the Oughtibridge and Steetley Brickworks did better than ever before. The new acquisition, the Cleveland Magnesite and Refractory Company, justified the purchase price.

In the Magnesia Division, the Palliser Works had a satisfactory year although Britmag exports had to be restricted on account of important home demands. Steadily rising productions were obtained at the reopened Harrington Works which the company continues to manage for the Ministry of Materials.

GROUP TRADING RESULTS

The group trading surplus, after deducting debenture interest, depreciation and directors' fees, and adding investment income, amounts to £652,694, compared with £465,488 last year. The figure of £652,694 includes a sum of £30,149 on account of trading by the Cleveland Magnesite and Refractory Company for ten months and the Steetley Magnesite Company for three months.

The provision for taxation is £427,061. In 1945 with excess profits tax at 100 per cent at the culmination of five years of war, taxation took 61 per cent of our trading surplus and this year it takes no less than 65 per cent.

The net profit amounts to £225,633, compared with £193,512 last year. After providing £73,960 for dividends based on the same moderate rates as last year, there is left to finance an existing and expanding business and to replace old machinery only £151,673.

The penal nature of the current excess profits levy is illustrated when the company's financial advisers state that if we need another £80,000 to pay for certain new capital equipment, and if it is possible to earn such a sum after tax, through increased efficiency or by the introduction of new methods, the group surplus before tax would have to rise from £650,000 to £1 million—earnings of £350,000 to provide £80,000 of capital equipment! The excess profits levy is an intolerable burden and a negation of just what is required to raise the standard of living in Britain today, and make the country strong and prosperous.

Clearly the economic predominance of America and Canada is due to their vast plant investment and consequent increase in production per inhabitant in the last decade. Every encouragement, not discouragement, must be given to the progressive undertaking to buy new plant, to produce more per head and more cheaply to enable us to export more goods to pay for more imports. It is gratifying to read that Government spokesmen now advocate Britain rewarding hard work, making the utmost use of technical skill and giving every chance to enterprise and adventure. We now await tangible results of such a declaration.

The table in the report illustrates the meagre sums the company has paid in dividends compared with taxation and wages.

The savings from increases in productivity have been shared with customers by a steady reduction in prices relative to current wage rates and with employees in the form of higher pay packets. The company has benefited from the expansion in volume output. The position is illustrated in other tables attached to this report.

BALANCE SHEETS AND THE NEW ISSUE

Principal changes in the parent company's balance sheet reflect the issue of 46,666 ordinary shares to acquire the issued capital of the Cleveland Magnesite and Refractory Co., the additional investment of £300,000 in subsidiary companies to take up the issued capital of Steetley Magnesite Co., Ltd., and a loan from the parent company to that concern of £200,000 which, since the close of the year, has been replaced by the issue of a further £200,000 in shares and the investment of £146,376 in Steetley of Canada, Ltd. The balance of the Canadian commitment is due for payment in 1953.

The consolidated balance sheet reflects the issue of a debenture by Steetley Magnesite Co. to Her Majesty's Treasury for £450,000 and the incorporation of the assets and liabilities of the Cleveland and Steetley Magnesite Companies. The group investment in the Palliser Works, operated by the Steetley Magnesite Co., thus amounts to £950,000. There is also shown in this balance sheet the sterling equivalent of the loan capital of $2,500,000 raised in Canada (to which earlier reference has been made) and temporary accommodation from the bank pending the completion of share subscriptions by Steetley of England.

The investments in Steetley Magnesite Company, Limited, and Steetley of Canada, Limited, are making a call on the liquid funds of the company to the extent of approximately £860,000, and after careful consideration, the board decided that it would be wise to supplement the liquid resources by raising some £600,000 and that this should be done by a new issue of ordinary shares in such a way that shareholders who have supported us so well in the past should be entitled to subscribe for these shares on favourable terms. Further, it was decided, when the new issue is completed, to bring the issued capital of the company more into line with the capital employed in the business. The scheme was submitted to shareholders on February 9th and met with their approval.

BOARD AND PERSONNEL

Mr R. Kinnear, who joined the board in 1935 and has rendered valuable services to the company and to a former subsidiary company, has decided, on account of age, not to seek re-election at the annual general meeting.

Shareholders will understand from this review that it has been a busy year for all ranks of the management, staff and employees and we are indeed grateful to them for the progress and financial results achieved in 1952.

PROSPECTS

The year 1952 closed with all the principal works operating to capacity. These capacities will be moderately increased and the Taffs Well re-equipment completed this year so that, based on the current demand for our products and in the absence of unforeseen circumstances, there is reason to believe the year 1953 will yield satisfactory results.

The report and accounts were adopted; the proposed dividends were approved; Mr R. F. Summers was re-elected a director and the remuneration of the auditors, Messrs John Adamson Son and Company, was fixed.

REFUGE ASSURANCE COMPANY LIMITED

CLAIMS PAID IN YEAR—£9,300,000

The chairman, Mr W. Proctor Smith, JP, in the course of a statement on the report and accounts for the year ending December 31, 1952, said:

This company, in its contacts with millions of policyholders, deals with a financial aspect of their private lives which is of supreme importance to them; for our life assurance funds, which exceed £113 million, are held entirely for their benefit, and each one amongst them owns a share in all those securities in which those funds are invested.

We are happily free to exercise discretion in our operations, and our guiding principle is that the customer is right, unless proved otherwise, and this necessitates an organisation designed to give personal attention to all the requirements of our policyholders. Life assurance is a personal business. The canvass takes place in the client's home; the proposal form is signed there; the policy is delivered there; and in the industrial branch, and often in the ordinary branch, the premiums are collected there. Our representative is at hand to consult, and it is he who arranges for the payment of the policy moneys when claims arise.

Crippling rates of taxes discourage saving, but life assurance provides a counter to this discouragement, for its importance lies in the habit it engenders of putting aside, year after year, moneys in payment of premiums. In this connection our new business figures for last year will give pleasure. In the ordinary branch, the net new sums assured amount to £13,476,946; in the industrial branch to £14,760,577.

It is our constant endeavour to secure efficiency with the minimum of expense. Our accounts for the year are affected by higher rates of remuneration granted last year to our staff. It has been our concern to adjust our organisation to minimise the effect of this increase in our expenses, and in a large measure we have been successful.

As regards mortality, that for the past year, which did not reflect such an experience as the influenza epidemic of 1951, was more favourable, except towards the close of the year when the shabby winter conditions began to exert their influence. The effects of the London fogs were immediate: the amount paid in Industrial Branch death claims in the fortnight commencing December 4th was 2½ times as great as that in respect of the previous fortnight. In one small area death claims increased from £302 to £1,332, emphasising the expedition with which our claims are paid—an aspect of service to which the Company has always attributed great importance.

An increase in the rate of interest is ultimately an advantage, but it brings depreciation in the value of securities the Company already holds. In the case of redeemable securities, in the absence of need to sell, this depreciation is not of permanent significance, but in other cases it may be, and we have taken steps to deal with it by additions to reserves. It is possible to invest increases in our funds at more favourable rates than have ruled for many years, and we hope that the increased interest may go some way to offsetting the heavier expenses to which I have already referred.

Transfers have been made to investments reserves of £1 million in the ordinary branch and £675,000 in the industrial branch, more than covering all depreciation at the end of the year. The net rate of interest earned on the life assurance funds increased to £3 8s. 7d. per cent in the ordinary branch and £4 5s. 6d. per cent in the industrial branch. The assets of the company increased by over £5 million during the year and a considerable part of this sum has been invested in mortgages, the company's total mortgage investments now being some £14,700,000, an increase of over £3 million. This increase reflects the continued popularity of the house purchase scheme, under which nearly £4 million was advanced in 1952. The total investments in British Government and British Government Guaranteed Securities together, show some reduction but there have been significant increases in investments in debentures, preference and ordinary stocks due in part to considerable investments in new issues.

We recently made an offer to purchase the share capital of the Federated Employers' Insurance Association, Limited, an office which transacts general insurance business. This offer was accepted by the shareholders of the Association.

In the industrial branch, the policies valued were 8,464,453, assuring £170,481,872. The premium income was £9,253,301, and the life assurance fund £55,196,865. It is proposed to set aside £550,000 for allocation amongst the policyholders to grant additional benefits to existing premium-paying policies (with certain exceptions) dated prior to January 1, 1948, and to certain paid-up policies. Certain additional paid-up policies will also be granted on whole-life assurances.

In the ordinary branch, the life assurances valued were 516,847, assuring £131,405,346. The premium income was £7,128,916, and the life assurance fund £57,917,756. It is proposed to declare on with-profit policies, in respect of each year's premium due in 1952 and paid, a reversionary bonus at the rate of £1 6s. per cent on the sum assured and also, in respect of each year's premium due in 1951 and paid, a bonus at the same rate on with-profit policies becoming claims by death or survivance before March 20, 1954, thus continuing for a further year the bonus granted following the 1951 valuation. An interim bonus at the same rate will also be paid until further notice. The allocation involves a distribution to policyholders of £1,199,917, and the sum carried forward is £1,215,236, which is available towards meeting any contingency which may arise, or to be dealt with otherwise as the board may determine.

This company has long attached great importance to staff relations. There is direct access from the bottom to the top, through the appropriate associations. We value highly this friendly relationship, and the opportunity for free discussions it provides; and we appreciate the loyalty, and willing and efficient service rendered by all grades of the staff.

We shall look for, and adopt, new and better methods of administration as they arise; and particularly we shall aim to give personal and understanding service to each one of the millions of policyholders we are proud to include within the Refuge orbit.

BRITANNIC ASSURANCE COMPANY, LIMITED

TOTAL CLAIMS PAID OVER £100 MILLION

INCREASED BONUSES TO POLICYHOLDERS

Mr J. A. Jefferson, FIA, presiding at the eighty-seventh annual general meeting, said:

The salient features of the 1952 report and accounts are substantial increases in premium income, interest income, and funds. The premium income in the life branches was £10,800,000—an increase of £465,000. The gross interest income passed the £3 million milestone and amounted to £3,139,000—an increase of £271,000. The total funds showed a record increase during the year of over £5 million to nearly £80 million. The mortality experienced in both branches was much lighter than in the previous year, and the net rate of interest earned improved. It can be said, therefore, that the company made all-round satisfactory progress in 1952. During the year the accumulated total of claims paid under life policies passed the impressive total of £100 million.

ORDINARY BRANCH

Policies for over £8,200,000 new sums assured were issued in the ordinary branch in 1952. The premium income at £3,639,000 increased by £182,000, and the funds increased by over £2 million to £29,484,000. Net interest was £921,000—an increase of almost £90,000—and the rate per cent rose by 2s. to £3 5s. 6d. per cent. Death claims at £361,000 were down by £33,000, but maturities at £1,197,000 rose by £120,000. The expense rate was slightly less at 12.3 per cent, compared with 12.5 per cent.

INDUSTRIAL BRANCH

Industrial branch premiums at £7,160,000 showed an increase of £283,000, and your directors believe that we shall be able to show favourable progress in the future—as in the past. When one realises that over £2,000 million a year is spent on smoking, drink and gambling, I think you will agree that there is plenty of scope to increase the £140 million a year in premiums at present being paid on industrial assurance policies. The net interest income at £1,642,000 was up by over £193,000. The net rate rose by 5s. 3d. to £3 19s. 3d. per cent. Death claims were less by £217,000 at £1,515,000, and this was actually the lowest total in the last four years. Maturities at £1,699,000 were approximately the same as in 1951. The expense rate at 26.7 per cent was almost the same as in the previous year, and in our opinion it was an achievement to keep the rate down to this figure in a year when costs were still rising. We continue to make positive efforts by the increased use of machinery and revision of our systems to improve efficiency and limit expenses. The assurance funds for this branch increased by no less than £2,667,000 to £43,262,000.

It may be of interest to mention that 85 out of every 100 new policies issued were endowment assurances, and the bulk of the business in force is now in this class. A long-term endowment assurance in an industrial assurance office is a good investment when bonuses are taken into account, even if one takes no account of the life cover provided during its currency. The habit of thrift is formed and sustained by the regular weekly or monthly calls of the agent at the policyholder's home to collect the premiums.

The lapse rate in 1952 was the lowest ever recorded. Policies lapsed during the first year were only 12.9 per cent of those issued. Lapses and surrenders, together with free policies for reduced sums assured, came to only 3.3 per cent of the total number of policies in force.

Where payment of premiums is discontinued, I would remind you that where premiums have been paid for at least one year, an automatic proportionate free policy is granted. This means that full value is given for premiums paid, quite apart from the life cover provided, and this is readily appreciated by the policyholder.

There is no doubt that home service insurance as a thrift movement, designed to meet the habits and circumstances of the people and backed by an unequalled service, is today more thoroughly understood and appreciated than ever before. As an industry we are still continuing to spread information about our activities, in the sure belief that the more that is known about our business the greater the chance that any criticisms—now fortunately less frequent and less ill-informed—will be seen in their proper perspective.

INVESTMENTS

During 1952 there was a further general fall in stock exchange values, but I think the future will show this movement to have been merely the dying swing of the pendulum after so long a period of artificially sustained gilt-edged prices. Whilst the fall from the dizzy heights of a 2½ per cent atmosphere to the surer ground of a 4½ per cent basis has caused severe depreciation over the last few years, I have no doubt that economically the nation is the sounder for this readjustment. Actually our greatest falls have been in British Government securities, of which we hold no less than £36 million.

To many of us the inevitability of this fall had been apparent for many years and we always had in mind the need to be ready to face it when it came. I hope that we can now take the view that the worst is over. We can therefore look back and see how we have weathered this storm. We emerge from it in a sound position without resort to any abnormal transfers. Our investment reserves of £5,700,000 adequately cover the depreciation as at December 31st, which results entirely from valuing fixed interest securities (the majority of which are in redeemable form) at present market values.

Mortgages through our house purchase scheme increased by £2,282,000, and again showed the greatest individual increase among our assets. The only other item calling for comment is an increase of £1,474,000 in ordinary shares. Whilst we are still believers in sound ordinary shares, we have had to take great care in their selection for two reasons. Firstly, there is the very disrupting effect of Excess Profits Levy which, if too long maintained, could have a stultifying effect upon the expansion of British Industry, and secondly, there is the probability of a shrinkage of profit margins in some trades. The first factor is, I hope, only temporary, whilst the second will have little effect upon the dividends of those sound companies which have adopted a cautious policy and paid dividends well within their earning capacity.

It is a source of pride and pleasure to state that despite the depreciation of securities which has had to be covered during the last two or three years, it has been possible to value the policy liabilities on the same strong bases used during the last few years, namely, by the net premium method at 2 per cent interest. If the improved yield on new investments continues, larger profits should emerge in future and our bonus prospects are improved by reason of the fact that we did not weaken our valuation bases.

INCREASED BONUSES

In the ordinary branch the surplus was £1,228,712, including £288,748 brought forward. The directors have allocated the increased sum of £708,854 to with-profit policies, which enables them to declare a reversionary bonus of £1 10s. per cent on the sum assured—an increase of 2s. on the 1951 declaration. The sum allocated to policy holders is almost £84,000 more than a year ago.

In the industrial branch the surplus was £2,344,077, including £681,876 brought forward. The directors have allocated £800,000, against £740,000 in the previous year, for bonuses to Britannic policies, which again enables them to improve the vested reversionary bonus scheme. Inclusive of those previously declared, the bonuses on premium-paying policies in force on December 31, 1952, on which 10 years' premiums had then been paid, will be 8 per cent, increasing by 1 per cent for each additional year's premiums paid, up to a maximum of 31 per cent for 33 or more years' premiums paid. All the policies to which these bonuses have been added were issued without any right to share in profits.

TAXATION

Profits Tax and Excess Profits Levy have this year absorbed £135,000 against £90,000 last year, but that is not the whole story. Taking income tax in each branch, together with the Profits Tax and Excess Profits Levy, the total provided for tax by the company this year came to £704,000, whilst the net dividends paid to our preference and ordinary stockholders totalled £243,000. In meeting the Excess Profits Levy, the unexpended balance brought into the profit and loss account has provided a useful buffer and although it has declined during the year, it still stands at the substantial figure of £393,000.

We advanced £3,398,000 under our house purchase scheme during the year, and after deducting repayments the net increase in mortgages in force was £2,282,000.

In conformity with the general rise in interest rates, we raised the rate of interest for new advances from 4½ per cent to 5 per cent as from July 1st last. We did not, however, raise the rates on existing mortgages, and so long as the borrower carries out his obligations by regularly paying premiums and interest, he may feel secure against a rise in his commitments. There has been some recession in house property values which makes it necessary for us to scrutinise even more carefully the applications submitted, and to discourage applications on the older types of houses which have not been modernised.

We are again recommending a transfer of £200,000 to the staff pension fund. A year ago I told you of the extension of the company's non-contributory pension scheme to provide for widows and orphans, and already 47 widows' and orphans' pensions have been granted.

As usual, I conclude with an expression of thanks to the staff. The excellence of the report is a reflection of their work, and I express sincere appreciation of their loyal and efficient services.

LEYLAND MOTORS LIMITED

NET CONSOLIDATED TURNOVER EXCEEDS £28,500,000

INCREASED VOLUME OF OVERSEAS SHIPMENTS

NEED FOR SOUND INCENTIVE SCHEME

MR C. BASIL NIXON ON "WHERE THE SHOE PINCHES"

The thirty-fourth annual general meeting of Leyland Motors Limited was held on March 31st at Leyland.

The following are extracts from the statement by the chairman, Mr C. Basil Nixon, circulated with the report and accounts:

The net consolidated turnover at £28,577,545, after elimination of purchase tax collections, is an impressive figure and accounts very largely for the increase in profits.

Although the export target was not reached, overseas shipments showed some increase in volume and exceeded in value 50 per cent of our total output of civilian vehicles.

The consolidated net profit is £928,612 (against £571,857) after providing a sum of £1,760,394 (against £1,014,885) for liability to tax on the year's trading.

Depreciation provided on our established basis is £468,076 (against £357,344). The board recommends that £500,000 should be placed to general revenue reserve, in addition to £265,000 by the subsidiaries.

Forward capital commitments are £476,942 (against £733,577). The value of stock, including work in progress, is £12,413,466 (against £10,674,905). Debtors, including payments in advance, show a very substantial increase and, after providing for doubtful debts, stand at £5,333,464 (against £3,505,501).

Higher taxation and the increase in stock and debtors have had a considerable effect on the liquid position of the company. The cash in hand and the net credit balances at the bank at the commencement of the year amounted to £699,753, and the year ended with a net overdraft of £568,023.

Continuance of the current method of computing wear and tear allowance for tax purposes on historic rather than replacement cost is of mounting concern to your board and to industry generally. The position is most unsatisfactory and the procedure inequitable. The problem has been in the hands of the Chancellor and the national negotiating bodies far too long. It is now urgently necessary to seek out and agree an immediate solution, not waiting for the report of the Royal Commission on Income Tax. EPL is increasingly recognised as a harmful tax.

TRADING REVIEW

The financial year started with a large book of unexecuted orders. In addition to the normal run of our business considerable progress was made in the development and marketing of industrial units, and numbers of railcar diesel sets have also been ordered by the Ulster Transport Authority and by British Railways.

Substantial progress has been made by the engineering research division and investigations of considerable potential value have been undertaken. New models have been produced which were very favourably received at the successful International Commercial Vehicle Show held at Earls Court in the autumn.

Mechanisation of your foundries is now highly developed and the output of all foundries continues to rise. Approximately half the castings produced are consumed within our own organisation and the remainder are sold to outside customers, mainly in the automobile industry.

Recently we issued a booklet entitled "Where the Shoe Pinches," which we sent to every member of Parliament and to other influential people, dealing with the many disabilities under which our industry labours; it is too lengthy to quote *in extenso*. A number of copies are, however, available to interested members.

The "pinching" may be summarised thus:

(*a*) The crippling burden of general taxation discouraging all development.

(*b*) The discriminatory tax burden aimed against road transport, a key tool of all productive activity.

(*c*) Frustrating regulations, internal and external, strangling all enterprise.

(*d*) Lack of any modern trunk road system in this country.

Everyone must be made to realise that the world is in the throes of a transport revolution.

At home the road coach fare from London to Glasgow, 400 miles, is 30s., and of that sum approximately 10 per cent represents fuel tax. The normal railway fare is 58s. 8d. third class and 88s. first class, nearly double and treble the coach fare.

Taxation on an eight-wheeled lorry over a normal life of ten years is £13,264 and is 20 per cent of the running cost of the vehicle.

The country needs the provision of modern roads and regulations, and equitable taxation for road vehicles.

In our sphere we look to the government of the day:

(*a*) To repeal the purchase tax on commercial vehicles.

(*b*) To provide for a uniform speed limit for all commercial vehicles.

(*c*) To reduce substantially the tax on diesel oil in order further to encourage the use of this highly efficient form of motive power.

(*d*) To remove at least some of the handicaps on industrial finance and international trade.

FUTURE OUTLOOK

International tension appears to have lessened, although the future remains clouded. World need for our products is fundamental, but only governments can engineer the mechanism by which they can be traded, financed and used freely for the well-being of mankind. It may, therefore, be hoped that recent Commonwealth and international conferences will give some practical leadership and produce beneficial results.

Since midsummer there has been a dramatic change from the "sellers'" market which prevailed after the end of the war to a "buyers'" market. This change has brought home to us more forcibly than ever before the necessity of increasing our efficiency by every means open to us.

The change has been brought about by the general recession in trade, continuance of restriction in many directions, lack of purchasing power, shortage of foreign exchange and a rapid build-up of European competition. With support from their governments, our foreign rivals have been able to offer extraordinary and, we think, unsound credit facilities over periods in some cases up to ten years. Such uneconomic practices have to be countered by the United Kingdom Government either by persuading the countries involved to desist or by giving British manufacturers tax rebates and comparable export credit guarantees.

A substantial amount of business is available on a five years' credit basis. I am glad to be able to tell you that we are very closely in touch with the Foreign Exchange Control Committee in the matter of all overseas business requiring these special terms. That Committee has been most co-operative and recently has shown willingness to extend its terms beyond the normal two years' limit.

I have referred to the need for some tax concession to enable industry to replace its plant and machinery on the basis of replacement value, and thereby to remain efficient, and produce economically without increasing its costs and again without reducing its quality. This country cannot hope to retain its markets abroad unless industry is freed from today's crippling level of taxation. Furthermore, the Government should encourage export volume as opposed to home sales by some sound incentive scheme. The motor industry has already put before the Chancellor of the Exchequer proposals for such a scheme, and it is hoped that he will make such provisions in his forthcoming Budget.

The good progress made in co-ordinating Leyland and Albion manufacturing capacities continues. Mr Henry Spurrier's and Mr Hugh Fulton's recent visits to South Africa were undertaken with the object of completing integration of our joint activities there, under the managing directorship of Mr Blackwood Murray. The new company is to be styled Leyland-Albion (Africa), Limited.

I visited Australia with a like object, and found the people over there determined to force up the local content of the transport equipment by raising a tariff barrier. This market is virtually closed, temporarily at least, due to trade recession and because of the severe restrictions recently enforced against long-distance road operations, designed to direct traffic to the railways, which in too many instances amounts to prohibition and the laying-up of vehicles.

DIVIDEND

The subsidiaries contributed their quota to the surplus, and help therefore to pay a dividend on the increased capital brought about by the Leyland-Albion merger.

Stockholders will realise that, under existing

conditions and with the uncertain prospects ahead, it is essential to conserve our resources and to absorb not only the recent direct wage advance, operative since November 10th last, but also, if practicable, any consequent increase in the cost of materials. Despite the possibility of increases in the cost of production, we have made substantial reductions in the selling prices of our chassis since the New Year.

We therefore recommend a dividend of 5s. on each ordinary £1 stock unit, payable, less tax, on April 1, 1953. This dividend is at the same rate as that paid last year, and represents only 3.5 per cent on the capital employed.

The directors are appreciative of the support and efforts made by the staff, both home and overseas, of the group during the year under review.

The report and accounts were adopted.

At a subsequent extra-ordinary general meeting the proposed new articles of association were adopted.

RYLANDS & SONS, LIMITED

SIR EDWARD RHODES'S STATEMENT

The annual general meeting of Rylands & Sons, Limited, was held on March 30th at 6, High Street, Manchester. Sir Edward Rhodes (chairman and managing director) presided.

The following is his statement which was circulated with the report and accounts:

In concluding my last year's statement on the result of the year 1951 I wrote, "Trade at home and abroad is in the doldrums. About the future . . . all one can truthfully say is that the prospect is dim." In the result it turned out to be a far worse year than I feared, owing to a combination of adverse conditions quite unforeseeable. It has to be borne in mind that your company are not only home trade textile merchants, but also cotton spinners, manufacturers, bleachers, dyers and finishers and considerable exporters. Therefore we have had to face a very severe recession in trade in each of these sections. In this and what follows I am not seeking to make excuses, but simply to give the facts concerning the extraordinary and disastrous year in the textile industry as they affected this company. I feel I cannot do better than to deal with each part of our business activities as I have so often done in the past.

HOME AND EXPORT TRADE

First, then, the most important one, our wholesale textile home trade. In the second half of 1951 demand had begun to slacken, and it became worse during 1952, especially in cotton and rayon textiles. Indeed stocks throughout the trade were disposed of at prices below the replacing cost of the day, and it would be no exaggeration to say that there was panic-selling, and the change from a sellers' to a buyers' market was startling. Our turnover in the home trade was 19¼ per cent less than the year before.

Now I come to our export trade, and it is in this section that we have had our severest set-back and our biggest losses. While it is true that we deal with various markets overseas, the largest trade has been with the Dominions. During the first half of 1951 we did a big business with the Dominion markets, which meant putting down large contracts with our suppliers for delivery extending many months ahead. The sudden collapse in the autumn of 1951 coincided with a curtailment of bank credits in Australia (our largest individual market) and New Zealand. This slowed down shipments and left us with heavy commitments. The position was aggravated still further by the sudden and drastic import restrictions imposed by Australia on March 8, 1952, which caused a virtual stoppage of shipments to that market which has continued until now. This naturally resulted in a heavy accumulation of goods primarily destined for Australia and New Zealand, and a heavy sacrifice was exacted in disposing of any of these goods elsewhere in shrinking and overstocked markets. Still another difficulty had to be met in Australia, where firms, having bought in the early part of 1951 at the peak of the market, had to clear their purchases in face of restricted credits from the banks and to customers unwilling to pay, in a rapidly-falling local market, the high prices at which they had placed their contracts. This brought appeals to their suppliers over here—to us among others—for reductions in prices and delayed payments.

MILLS AND WORKS

Taking our mills and works as a group, we just managed to escape loss, but the profit was much less than in 1951. It is to be remembered that 1952 was a disastrous year for the whole cotton industry. There was much idle machinery and short time, during which thousands of operatives left the trade, which is only now recovering from the set-back. It is hardly surprising that we did worse at Wigan last year than at the other works. Demand almost died out, and, like others, we had a period of short time. Moreover, some of our customers pressed us to hold back deliveries, and not only delayed deliveries but asked for reductions in contract prices. The market became chaotic and there was much wild selling at prices which had no relation to cost or even replacing value. There is still lack of demand at prices which show a profit and our machinery is far from fully occupied.

At our bleach and dye works at Heapey trade naturally fell off as we depend there on an active supply of loom-state cloth for finishing. Stopped machinery and short time do not help the bleaching and dyeing trade. I am glad to report that we are now working full time at Heapey and the prospects are much better.

Our Wadding works at Gorton had a quite satisfactory year and we worked full time the whole of the twelve months and are still busy.

Finally, about our allied company, Thomas Witter and Company, Limited, linoleum and felt-base floor-covering manufacturers, at Appley Bridge, Heapey and Chorley: Although that industry as a whole went through what was probably one of the worst years in its history—poor demand and reduced prices for its products—they got a big share of the available trade. Profits were smaller, but they ended with a most satisfactory result and paid us the usual good dividend. Witter's works at the three centres I have mentioned are excellently equipped, in first-class condition and now working at capacity. It is a very large concern, most ably managed and one of the foremost in the industry at home or abroad.

ACCOUNTS

In Rylands' balance sheet, fixed assets appear at £1,061,477; the amount due from the subsidiary, our overseas company, is £321,918, against £637,085 last year. This amount includes their stock, which has been conservatively dealt with in the matter of depreciation.

Investments at cost, less reserve, are £1,704,467, of which 83 per cent is in gilt-edged dated securities and in British corporations and public boards. On January 19th the market value was £1,584,388, and since that date it has increased by £23,802.

Under current assets, stocks are £787,239, against last year's figure of £1,320,132, tax reserve certificates £100,000, and balance at bankers and cash in hand £436,543.

On the liabilities side our capital still stands at £3 million and capital reserve at £572,161. The general reserve is £200,000. We propose to reduce the contingency reserve by £100,000, bringing it to £770,000. I would like to add that this contingency reserve was commenced in the year ended January 19, 1940, by the allocation of a sum of £35,000, and by the end of the year ended January 19, 1952, it had reached an amount of £870,000. In every one of the 13 years an allocation has been made to this reserve, averaging an annual sum of £67,000. The contingency reserve was established to meet, *inter alia*, any need for equalisation of dividends. I hope we shall never again need to touch it for this purpose, but, having regard to our very conservative methods during the last 20 years, the board feels this present consideration to our members is justified.

The profit and loss account balance carried forward will be £34,387, against the £99,627 brought in, if the recommendations of the board are approved. Revenue reserves and surplus will then amount to £1,004,387, against last year's figure of £1,169,627.

Grants made during the year under the Staff Consideration Fund to 78 retired members of the staff amounted to £5,934.

Consolidated balance sheet: From this it is to be noted that the value of our stocks at the end of the year was £1,056,864, against last year's total of £1,917,636. This includes the stock of our subsidiary, the overseas company.

Consolidated profit and loss account: We regret that against a trading profit last year of £294,151 we cannot show any this year, owing to the necessity of depreciating our large stocks. This depreciation amounted to £366,713 and swept away what, in ordinary circumstances, would have remained a reasonable profit.

The dividend from the allied company, Thomas Witter and Company, Limited, is again £57,143, and we brought in from taxation and deferred repairs provisions no longer required £42,790, disclosing a loss of £81,240 for the year.

Looking at the other side of the profit and loss account, directors' emoluments are £23,090; the amount of £32,000, profits tax, is incurred by the distribution of the dividends we propose to declare. Thus, instead of a net profit shown last year of £166,906, we show a loss of £81,240. I would like once more to emphasise that this result is caused by the heavy depreciation of our stocks necessitated by the conditions at home and abroad during a large period of our financial year.

The directors recommend:

(*a*) That the transfer of £100,000 from the contingency reserve be approved, reducing it to £770,000.

(*b*) That for the half-year ended January 19, 1953, a dividend of 6 per cent per annum, less income tax, on the preference stock shall be paid.

(*c*) That the dividend for the year ended January 19, 1953, on the ordinary stock shall be 5 per cent, less income tax.

(*d*) That £34,387 shall be carried forward to the next account, against £99,627 brought in.

PROSPECTS

Having already dealt with the state of affairs in 1952 and its consequences to our company, you will quite properly expect me to inform you of what is happening at the present time and what is the outlook for 1953. More than ever I am averse from prophesying. What I can attempt is to report what is going on from day to day and what seem to be the tendencies for the immediate future. The home trade is mending, but it must be added that our customers are still showing a marked selectiveness in their purchases and an equally marked disinclination to incur any addition of purchase tax. They dislike the D scheme and look for lower and cheaper qualities to keep out of its range. This is all to the bad, for both the home trade and export trade, and the sooner the Government realise this and amend, or abolish, the paralysing purchase tax the better. We shall spare no effort to get our share of the home trade in 1953 and are well equipped to do it. In the meantime all our stocks are written down to market price.

As for the export section, I cannot speak so hopefully as it is today or likely to be in the near future. As I have already explained, our main trade has been in the Dominions, especially Australia. It is quite true that it has improved from its worst, and I believe will go on improving, but the restrictions of imports into Australia are still to be continued, with this concession: that as from April 1st importers may bring in 30 per cent of the value of their imports in the year to June 30, 1950, which means that they may import 10 per cent more than they have lately been doing. New Zealand is also severely restricting imports, but there again we may, I believe, look for a gradual improvement. The prospects in South Africa are better. Most of their heavy stocks have been liquidated and there are now signs of a revival of interest. Full confidence, however, is still lacking out there. They fear a decline in the price of raw cotton and also the keen competition from the Far East and elsewhere.

We are well represented in all the principal markets abroad with which we deal, and we hope and expect to do better this year than last, although we hold considerable stocks, especially for Australia. All are depreciated to market value. Everything depends, to use an old tag, on our ability to offer the right goods at the right time at the right price—maybe a rather tall order under present conditions.

Once more I give hearty thanks to my colleagues on the board and to the heads of all departments and their staffs for their loyal support throughout a very difficult and trying year. I am confident that I can rely on their energetic efforts to lose no opportunity to bring back the company to its usual, and I hope increased, level of prosperity.

Sir Edward Rhodes and Mr Alexander Hamilton Dunbar, CA, were re-elected directors, and the auditors, Messrs Cooper Brothers & Company, chartered accountants, re-appointed.

THE HALIFAX BUILDING SOCIETY

ONE-HUNDREDTH ANNUAL MEETING

The one-hundredth annual meeting of members of this Society was held in Halifax on March 30th, the president, Mr Algernon Denham, JP, presiding.

The president, in the course of his speech, said:

Our experience during the year under review has been satisfactory, it being apparent that the changes in interest rates announced twelve months ago had the desired effect of maintaining an adequate inflow of investments and savings with which to support a record volume of mortgage applications and we have been able to retain so far the 4 per cent mortgage rate on existing accounts.

We are making a recommendation which will give to our matured subscription shareholders (paid up shares class 1) and our subscription shareholders, in addition to the usual bonus of ¼ per cent, a special centenary bonus of ¼ per cent.

Interest from borrowers, our principal source of income, is £732,866 higher than a year ago; we are also securing higher yields on our loans to local authorities and we are consequently looking forward to our liquid funds—always an outstanding feature—being more remunerative than has been the case in the past decade.

On the other hand, the cost of the interest and bonus to our investors is increased by £712,317, and there is also an increase of £30,860 in income tax and profits tax, and £162,140 in management expenses.

Perhaps the most pleasing feature of our centenary accounts is that our reserves have passed the £10 million mark; a reserve of such magnitude is without parallel in building society history, and in my opinion is of greater importance than our record growth in assets, which at £194,703,024 are £17,491,349 more than a year ago.

Our liquid funds amounting to £37,274,770 represent 19.14 per cent of assets, and I am happy to report that during the year we have been free from further depreciation in our investment portfolio.

In the encouragement of thrift and the provision of homes, we play an important part and it is a pleasing and an encouraging thought that 82,657 regular savers have total balances of £13¼ million invested with us and that over £17 million accumulated in a similar manner by 37,524 members still remains in paid up shares class 1.

It is no exaggeration to say that most of the country's economic ills would be speedily overcome if all who could would follow their example.

I pay special tribute to the National Savings Movement including the Trustee Savings Banks and to the insurance companies who are rendering a service to the State similar to our own.

I suggest that as a nation we are giving too much thought to present-day needs rather than future requirements and failing to realise the tremendous economies and advantages to be derived from concentrating our resources on the erection of old folks' and spinsters' homes to be let at rents within their means, thereby freeing for family occupation the larger houses they no longer require.

One welcomes the possibilities of a revision of the Rent Restriction Acts not only to assist in the more economic use of the accommodation available, but also to stem the deterioration of investment properties which is all too prevalent today.

THE BRITISH SOUTH AFRICA COMPANY

SIR DOUGAL O. MALCOLM ON THE STRONG POSITION

The annual meeting of The British South Africa Company was held on March 26th in London.

Sir Dougal O. Malcolm, KCMG (the president), in the course of his speech said: Our net profit at £2,674,776 is less by nearly £50,000 than last year; but this is much more than wholly due to the grievous burden of United Kingdom taxation. Our profit before taxation was indeed no less than £1,850,000 greater than that of last year, the great bulk of that increase being due to the growth of more than 1¼ million in our revenue from our Northern Rhodesian mineral rights.

From that profit before taxation of £8,309,930 there falls to be deducted £2,632,336 for Dominion income tax, nearly £600,000 more than last year. No complaint can fairly be made about that since it is from overseas that our great revenues are so very preponderantly drawn. But the burden of United Kingdom taxation grew by nearly £1,200,000, after allowing for Dominion relief, from £1,788,000 odd to £2,978,000 odd; and there is little indeed in the way of services rendered by our Government at home to our overseas undertaking to justify such a tribute as that.

Our investments at £11,247,354 show the large increase of over £2 million as compared with last year's figure. Our investments during the year have been partly in Rhodesian mining, but mainly in a wide range of South African mining investment companies. Here there has been a widespread all round fall in market values, but the outlook for the Western Rand and Orange Free State properties is, we consider, such as to warrant good hopes of recovery and satisfactory future profits.

Current assets at £7,707,857 exceed last year's figure by nearly £1,800,000 and cover an increase of nearly £1 million in Tax Reserve Certificates and of nearly £600,000 in the balance at bankers and cash in hand.

DIVIDEND MAINTAINED

We are enabled, as I hoped, to propose a renewal of last year's dividend, while maintaining our policy of such modest distribution as will still enable us to build up a great body of long-term investments in Rhodesian and other South African enterprises, especially mining enterprises, such as may to some extent replace over the 33 years which we still have left our Northern Rhodesian mineral rights which must come to an end in 1986.

For the year now current once more I feel able to express the hope that we shall be able to maintain our dividend in spite of the great burden of British taxation.

For the year under review the maintenance of our 6s. dividend, equal to 40 per cent per unit of stock or share of 15s., will absorb, as last year, £1,379,779 leaving us with £1,294,997 as compared with £1,343,430 last year to add to our figure of unappropriated profits which will then stand at £4,614,557, as compared with £3,319,560 last year.

I can claim that we are maintaining our very strong position; but this is a period of quite unprecedentedly high copper prices. And such are the burdens laid upon us that, as in the case of Alice in one of her adventures through the looking-glass, it is taking all the running we can do to stay in much the same place.

The report was adopted.

LEWIS'S INVESTMENT TRUST, LIMITED

POSITION OF STRENGTH AND PRESTIGE

MR S. H. LEAKE ON EXPANSION POLICY

The twenty-fourth annual general meeting of Lewis's Investment Trust, Limited, will be held on April 21st in Liverpool.

The following is an extract from the statement by Mr S. H. Leake, OBE, chairman and senior managing director, which has been circulated to stockholders with the report and accounts for the year ended February 1, 1953:

It is a pleasant duty this year to present our accounts for your approval, as they contain a number of records. When I addressed you at this time last year we were passing through a difficult trading period, and the severe drop which had occurred in many raw material prices, especially of textiles, made us think then in terms of a pending economic crisis. That phase, however, soon passed and after a short period of distress selling by manufacturers and wholesalers we ended our first half-year's trade on level terms. During the second half-year the removal of controls and the gradual restoration of free enterprise brought with them a more substantial flow in the supply of most merchandise. In consequence, and for the first time for many years, the public had almost a prewar selection of Christmas merchandise, particularly of china and toys, and the resulting rise in turnover throughout the organisation helped materially to produce the increased profits we now have to report.

RECORD GROSS REVENUE

Let me remind you again that the Trust is a holding company which does not itself trade but derives its income from rents and dividends received from subsidiary trading companies. This year our gross revenue from these sources amounts to £1,074,411, this being the first year in which this figure has exceeded £1 million. Apart from the increased revenue of some £6,000 from property the balance has been accounted for by an increase of some £67,000 in the gross dividends on the equity capital of the principal subsidiary, Lewis's Limited, of which the Trust holds 100 per cent. Our second largest subsidiary, Selfridge (Holdings) Limited, in which again the Trust holds 100 per cent of the equity capital, has also raised its dividend from 14 per cent to 20 per cent, representing an increase of some £63,000 gross.

After the usual deductions for interest, expenses, and taxation, the net profit for the year is up by £67,719 to the peak figure of £512,228. The sum of £127,280 which we propose to set aside to various reserves is in line with our recent practice. With regard to the disposal of the balance your directors have given much thought to their recommendations. They propose to allocate broadly one-third of the additional profit to an increase from 20 per cent to 22½ per cent in the final dividend on the ordinary shares, and the remaining two-thirds to increasing the carry-forward, which they have long recognised as being inadequate for a company of this magnitude. The results would have justified a larger increase in the dividend, but in the light of certain developments to which I refer later, the board considered it wiser to limit the final dividend to 22½ per cent.

The consolidated profit of the group after tax and various special items is this year £1,737,949, giving an increase of £439,121. Last year we ploughed back into the business out of group net profit £812,998, or 58 per cent. In the three previous years we had retained in the business 58 per cent, 56 per cent, and 62 per cent. This year the corresponding figure is £1,215,856, or 67 per cent.

Against the issued capital of the Trust of £3,890,176, as increased two years ago by some £630,000 for the purpose of the Selfridge acquisition, the capital and revenue reserves attributable to the group now total £8,224,095, an increase of just under £1 million since last year.

Our net current assets of £4,536,494 are about £650,000 greater than our issued capital. Moreover, they are in a highly liquid form, as no less than £3,664,183 is represented by cash, tax reserve certificates, and general investments. We also regard it as a healthy sign that the stock-in-trade in the group of £3,088,119 is £110,000 less than last year.

LEWIS'S LIMITED

The Trust's main source of strength lies in its principal subsidiary, Lewis's Limited, which is responsible for contributing more than half the Trust's annual revenue. It has been our policy for many years past to build up this subsidiary by steady expansion, consolidation, and conservative profit retentions every year, to a position of such strength that it could not only safely withstand any ordinary vicissitudes but finance the development of its own subsidiaries.

I am happy to report that Lewis's Limited, which operates department stores in Liverpool, Manchester, and Birmingham, and a clothing factory in Litherland, near Liverpool, has had another successful year, and for the first time its own trading profit, excluding miscellaneous revenue, has exceeded £2 million. Its consolidated profit of £2,604,924 is £312,270 up on last year, although this year there has been no investment profit realised, as against £53,159 last year.

Lewis's Limited controls S. Reece and Sons, which is a retail food and catering business, and Merseyside Dairies, which has an extensive milk distributing business and a cheese factory. We are beginning to benefit from a new bakery and dairy which are being erected at a cost exceeding £500,000. This has been rendered possible by financial support and careful nursing by the parent company, combined with the steady accumulation of reserves by the subsidiaries out of their annual profits.

SELFRIDGES

Our second largest subsidiary—Selfridge (Holdings), Limited—holds all the issued capital of the operating company, Selfridges Limited. In its first complete year as a unit of Lewis's organisation the trading company has in its turn attained several landmarks. For the first time its trading revenue has exceeded £1 million, and at £1,006,995 is £210,997 above last year. In addition, its general reserve has reached £1 million, which is equal to its issued capital; and it has also been able to increase the carry-forward in the profit and loss account to £250,781, as against £181,019 brought in from last year. Net current assets now total £1,325,840, which is one-third as much again as its issued capital, and these assets are in a highly liquid form.

Last year I announced that we had taken advantage of an opportunity to acquire the remaining freehold of the so-called "Northern Site." This lies behind the main store and is bounded by Wigmore Street, Orchard Street, Somerset Street, and Duke Street. A similar opportunity recently presented itself of acquiring the freehold of the eastern portion of the main store building, and we hope to complete this transaction early in May, utilising some of our present liquid resources for the purpose. When that has been achieved the freehold of all this highly valuable area running back from Oxford Street to Wigmore Street will (with the exception of a small leasehold interest) be in the ownership of the Selfridge group, adding to its financial strength and, indeed, to that of the Trust as a whole.

The board of Selfridge (Holdings), with the help of the best technical advice, has been giving much thought to the question of how much of the "Northern Site" is likely to be required in the future for the purposes of the company's business as a department store. The company is now in a position to deal with such portions of the site as it no longer requires for its own trading purposes. In pursuance of this policy it intends in the near future to offer for sale the valuable freehold of the whole of the Wigmore Street frontage. I hope when we meet again next year I may be in a position to report to you a satisfactory sale of this property.

FUTURE DEVELOPMENT: BRISTOL

Lewis's has achieved a position of national importance by its trading policy and by expanding into several of the most important cities in the country. It has not sought new money since February, 1939, and its expansion has largely come from resources which it has itself accumulated. With the restrictions now imposed on the raising of new capital, finance for expansion by any firm in the retail trade can only come out of its own resources. Your board intend to continue a policy of expansion, and I am happy to inform you that we have now made provisional arrangements to erect a new store in Bristol. We look forward with pleasure to the opportunity of giving service to the people of Bristol, and of achieving there that measure of success which we have enjoyed elsewhere. It is my hope that the necessary Government consents will be forthcoming to enable us to commence construction early next year. The economic position of the country can only be improved by such demonstrations of enterprise.

TRADING PROSPECTS

The trading prospects for the present year are not yet sufficiently clear to enable me to forecast with any degree of certainty whether we shall be able to improve upon our last year's results. Since the beginning of the year retail trade has fallen below last year's level, but the early months are notoriously subject to outside influences that are often transitory. The removal of controls and the restoration of free enterprise is having a wholly beneficial effect. It is bringing closer together again the manufacturer and the retailer in the interests of the customer.

PURCHASE TAX

I had not intended this year to refer to purchase tax but the report just published of the Hutton committee on tax-paid stocks calls for comment:

The conclusions of the committee are influenced by a legal quibble that purchase tax is a tax on the wholesaler and not on the consumer. It has never previously been questioned that since 1940 the retailer has acted as an unpaid tax collector of a tax which has, in the past, frequently been used as an instrument for restraining consumer demand. On one occasion when the rate of tax was reduced this organisation alone incurred stock losses of some £20,000—and, as the committee points out—there are half a million traders holding stocks of purchase tax goods.

Having recommended that compensation should not be paid when rates of tax are reduced the committee proceed to recommend that retailers should raise their prices when increased rates are imposed. Such a recommendation is conceived in tobacco but is completely divorced from the realities of the market place.

Purchase tax is already an ever-growing maze of ingenious anomalies. We appeal to the Government not to accept recommendations which involve so flagrant a disregard of elementary justice for retailers; and if so large a section of the trading community considers that it is suffering an injustice, the Government itself must accept responsibility for finding a remedy.

STAFF RELATIONS

In September last a Retail Wages Council decision brought a wage increase of some substance to most ranks of our staff. We have always maintained a Lewis's wage scale somewhat in excess of Wages Council minimum rates. On this occasion we not only maintained this plusage but ensured that all ranks shared in the wage increase. This has, of course, led to a substantial increase in our operating costs, but it is a source of much satisfaction to us that our staff, as well as our shareholders, have been able to participate in the prosperity of the business.

GENERAL INVESTORS AND TRUSTEES

The forty-sixth annual general meeting of General Investors and Trustees, Limited, was held on March 26th in London, Mr Sidney S. Lamert (the chairman) presiding.

The following are extracts from his circulated review:

A year ago I ventured to suggest that we should do well in 1952 to maintain revenue at its then high peak. In the result, it has further expanded by £10,000. We recommend that the distribution on our ordinary stock be increased to 16 per cent by adding 2 per cent to the bonus.

In normal circumstances, it would seem that out of a total distribution of 16 per cent, 6 per cent is too high a proportion to pay by way of bonus; but the circumstances are not normal. As world prices of raw materials fall, both turnover and the prices of finished goods will fall with them, and the tendency in buyers' markets will be for profits to diminish. Another and more important factor is the impact of the Chancellor's possible demands on trading companies. So for the present we recommend a policy of extreme caution, but so soon as we can see our way safely to increase the basic dividend of 10 per cent on the ordinary stock, we shall do so.

Our annual valuation, taken on January 31st, shows a drop of £114,000 in the appreciation of our portfolio as compared with the 1952 figure. It is only fair to point out that in these days official quotations of many stocks are no more than a nominal indication of actual dealing prices.

The report was adopted.

WILLIAM ASQUITH, LIMITED

INCREASED TURNOVER AND PROFITS

MR ROBERT W. ASQUITH'S REVIEW

The thirty-second annual general meeting of William Asquith, Limited, was held on Monday, March 30th, at the registered office of the company, Highroad Well Works, Halifax.

In moving the adoption of the report and balance sheet, Mr Robert W. Asquith, MIPE, the chairman, said:

The accounts have been in your possession for the statutory period, and I propose to take them as read. You will have noticed that in this year's balance sheet the full effect of the capital reorganisation scheme, on which I commented last year, is reflected. The increased profits are largely due to increased output which also resulted, I am happy to say, because of the incentive scheme in force in the works (based on output) in increased earnings for all employees in the factory.

A further wage advance also became operative in the period under review, and, for the first time, two weeks' holiday with pay for all operatives became effective.

INCREASED DIVIDEND

I am of the opinion that the shareholders also are entitled to benefit from the increased turnover and profits. This is one of the reasons, therefore, that your directors have recommended a final ordinary dividend of 11 per cent, making a total dividend on the ordinary shares of 15 per cent for the year, and I shall be asking you to confirm this action later in the meeting.

I would mention, in passing, that out of the increased gross profit of £299,804 our sleeping partner, HM Government, takes the lion's share of £196,150, and it should be noted that, for the year under review, excess profits levy is only applicable for nine months of the period. Stocks, which have been necessary to ensure the increased output, have increased by £86,585, and the fixed assets by £41,420.

CRIPPLING BURDEN OF TAXATION

So many company chairmen and heads of the country's big financial institutions have sounded a warning about the danger to British industry, if the current rate of taxation continues, that I feel any comments I might make may sound to be a repetition of what many eminent gentlemen have already said, but if repetition will impress upon our legislators the seriousness of the position, then it will not have been in vain.

The main industrial strength of this country is still, by and large, made up of small and medium-sized companies, and it is these (rather than the giant industrial organisations who also play such an important part in the industrial life of the country) which feel, perhaps, even more than their larger contemporaries, this crippling burden of taxation. As the chairman of a medium-sized company, I can only say that if such companies as this are to play their full part in the economic struggle which is still ahead of us, there must be a lightening of the taxation burden.

It seems to me that a necessary preliminary to lower taxation should be economy in Government expenditure. There has been much "lip-service" to this end, particularly during the General Election, but we are still awaiting really constructive action. Let us hope it will not be long delayed.

We have enjoyed a happy and prosperous year, and it must be evident that the team spirit throughout all departments and in all ranks has resulted in the satisfactory accounts which are in front of you.

RETIREMENT GRANT SCHEME

At various times in past years your directors have considered the possibility of instituting a pension scheme for the employees of the company, only to have to reject it, due to the very high cost which would devolve on the company in the initial stages of such a scheme. However, I am pleased to tell you that during the present year we have instituted a retirement grant scheme, which the company is financing itself.

Your company took part in the highly successful International Machine Tool Exhibition, which was staged at Olympia by the Machine Tool Trades Association, commencing in September of last year, and the reception accorded our new designs would seem to indicate that as long as business remains at a healthy level we can look forward to our share of orders, and the photographs which decorate this year's accounts show the Asquith exhibits at this important exhibition.

THE CURRENT YEAR

We can look forward to a successful year's trading for the current year, but there are many signs that the demand for machine tools is on the wane, and competition for the reduced demand has considerably increased, particularly in the export markets, where the resurgence of the German machine tool industry is such a phenomenon, and also because some of the newer machine tool industries built up in Continental Europe during the war are making themselves felt.

However, I feel that, given normal trading conditions, we can look forward with confidence to the future.

TRIBUTE TO CO-DIRECTORS AND STAFF

It only remains for me now to thank very sincerely everybody at William Asquith, Limited, and its subsidiary, Modern Foundries, Limited, who have made possible the presentation of what I am sure you would agree with me can be considered a satisfactory balance sheet, and I would also like to thank particularly my co-directors for the valuable services they have rendered to the company.

The report and accounts were adopted.

BEANS INDUSTRIES

The nineteenth annual general meeting of Beans Industries, Limited, was held on March 31st at Tipton.

Mr J. H. Bean, CBE (the Chairman), in the course of his speech said:

The net trading profit amounted to £367,219, a decrease of some £26,000. The charge for taxation absorbs £257,000 compared with £228,150, leaving a net available profit of £110,219 as compared with £165,181 for 1951. The charge for taxation has risen by some £29,000 as a result of the incidence of Excess Profits Levy, and absorbs some 70 per cent of profits as compared with 58 per cent in 1951.

I am strongly convinced that the time has arrived when steps must be taken to afford some substantial measure of relief if this country is to maintain its position in world markets and face intense foreign competition.

Your Board recommends a final ordinary

dividend of 27½ per cent making 37½ per cent, less income tax, for the year.

The company's liquid resources have been well maintained and the balance sheet indicates a strong position.

I am pleased to be able to report another successful year, and although as a result of the general trade recession, which became apparent towards the end of the year, customers' requirements were reduced or delivery dates extended, the overall turnover actually showed a small increase compared with the previous year.

Whilst it is now more than ever difficult to prophesy, I have no doubt that with our equipment and resources we shall obtain a good share of whatever business is going; I think we shall have a reasonably good year.

The report was adopted.

THE BRADFORD DYERS' ASSOCIATION LIMITED

IMPROVEMENT FOLLOWS DEPRESSION

MR JAMES EWING'S SPEECH

The fifty-fifth annual general meeting of The Bradford Dyers' Association Limited was held at the Midland Hotel, Bradford, on April 1st. Mr James Ewing (the chairman), who presided, in the course of his speech said:

At this time last year the textile industries of the world were in the throes of a general recession. In the horizontal arrangement of these industries in this country, the finishing sections are the last to feel the effects of a slump; so during the first quarter of the year our branches were still moderately well employed. But thereafter, until the final quarter of the year when trade improved, our branches were adversely affected by the general depression, particularly in the print section of our business. That we have been able to meet these fluctuating conditions in the manner reflected in the accounts is in large measure due to the reorganisation and concentration of our producing units which we have been steadily undertaking during the past few years.

The current year has opened much more favourably and our home branches, with one or two minor exceptions, are well employed. But I must add a note of warning. Costs are rising seriously and, owing to keen competition, particularly in the export markets, these increases cannot be reimbursed entirely by adjustments of our selling prices; without reasonable capacity running, today's prices would not be adequate.

ACCOUNTS

We have found it necessary to charge £408,000 to provide for the wastage of buildings, plant and machinery at the Association's home branches before striking our profit balance. That this is no excessive provision is evidenced by the fact that we expect to spend on an average over £400,000 per annum for the next five years on renewals and replacements. But, of the charge of £408,000, we shall only be allowed £196,000 as a deduction in our tax computations. The remaining £212,000 has to be found from taxed profits, so that we have to make a gross surplus of £620,000 in order to provide for plant wastage amounting to £408,000, of which the Revenue admit only £196,000. This is a situation which demands action by the Chancellor before the damage already done becomes irreparable.

The Association's share of the total group profit, after taxation, is £492,222—a reduction on the previous year of almost 38 per cent—which is not an unsatisfactory result having regard to the reduction in the volume of work available during a large part of the year. The trading profits of our overseas subsidiaries were well maintained, and made a very important contribution to the year's results.

The balance available for distribution is £396,002, from which £50,000 has been transferred to general reserve, which now amounts to £1,250,000. After provision for preference dividend and the interim ordinary dividend of 3 per cent, £83,011 is applied in payment of a final ordinary dividend of 7 per cent, less tax, and the balance of £160,501 is carried forward.

Our investments in associated companies have increased by £359,527 to £426,426. This represents interests we have acquired in Davies, Coop and Company Limited, of Melbourne, and James Nelson (Australia) Pty. Limited.

SOUND FINANCIAL POSITION

During the past six years, your company has invested, in subsidiaries and associated companies abroad, no less than £1,386,201 without recourse to borrowing or to further issues to the public. During the same period we sold interests in associated companies in India and Ethiopia for a sum of £210,286, on which we realised a capital profit. All the investments are not yet dividend earning, but the average return has been quite satisfactory, as is shown by the consolidated accounts of the company. These overseas interests are making a valuable contribution to the net profits. It may be useful to record that, in these six years, the company has expended in the UK an amount of £1,919,847 on capital account on additions and replacements of buildings, machinery and plant, and in reorganisation of the home branches, while it has realised the sum of £499,878 from sales of redundant buildings and obsolescent machinery.

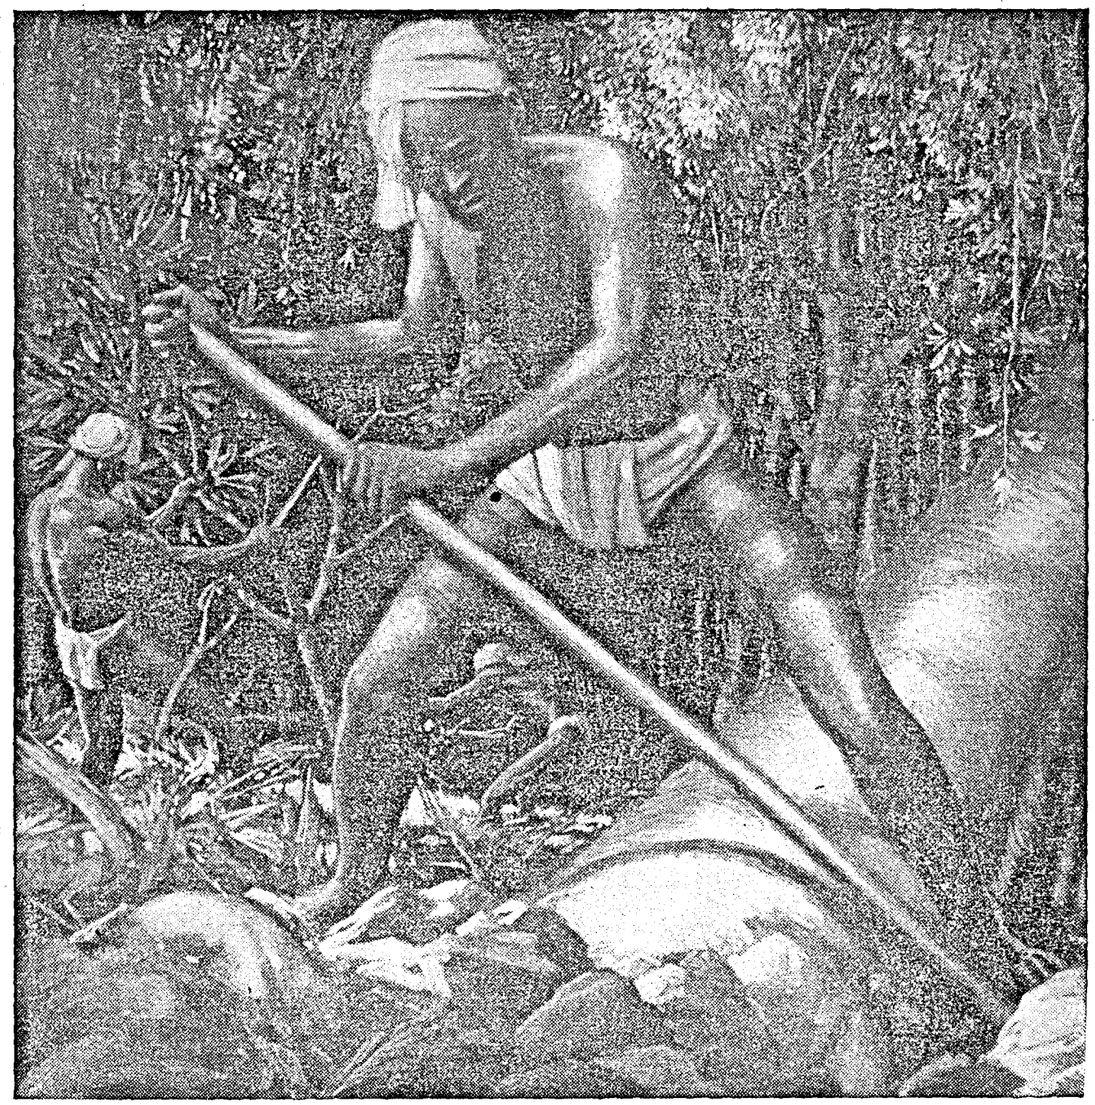
These figures demonstrate the sound financial position of your company, which, coupled with its increasing technological resources, place it in a strong position to face the competitive times which assuredly lie ahead. As I have stated before, it is the determined policy of your board to build up the resources of the company so that it may regain the healthy position it enjoyed prior to the debacle of the 1930s, with the object of maintaining steady dividends notwithstanding the vagaries to which the textile trade is prone. This is an aim, I know, which will commend itself to the majority of our stockholders.

EXPORT TRADE

Lancashire had to face the loss of her enormous markets in China and India and in other parts of the world; but today she is still in a position to look ahead to a future not without promise and opportunity. No longer is her future bound up entirely with cotton: an extensive rayon and synthetic-fibre cloth industry has become an integral part of the Lancashire of today. Within your own company's activities, the volume of cotton cloth for export markets, which in former times kept many of our works engaged, has been largely replaced by a substantial and increasing flow of rayon and synthetic-fibre cloths woven on the looms of Lancashire and dyed and finished in our specially equipped works. It surely is not too optimistic to anticipate that, as Asia's and Europe's living standards advance (as they must do), markets will be opened for our higher grade textiles. Having regard to all circumstances, one cannot help thinking that criticism of Lancashire is overdone and that recognition should be made of the efforts of her industrial leaders (both employers & labour) who have found common cause in the struggle to uphold Lancashire as one of the world's important textile producers.

At the International Cotton Conference held at Buxton last year, the United Kingdom representatives put forward an export target of 1,350 million square yards of cotton cloth, which compares with actual export figures of 865 million square yards in 1951 and 710 million square yards in 1952. This figure was regarded by many, even in Lancashire, as unrealistic; but in our view it is not being immoderate to fix a target which is only equivalent to the yardage exported in the slump year of 1938. Three-quarters of Lancashire's exports find their way to Commonwealth and Colonial Empire markets, and there should be every prospect of retaining this volume while adding to it exports of quality cloths to neutral markets.

SYNTHETIC FIBRES



Alarm has been expressed in some quarters about the impact synthetic fibres will have upon our technology and in particular upon our wool industry. We have no such apprehension. On the contrary, we welcome the contribution they will make to the virility of our industry. If we have any misgivings at all they are that the pace and extent of the development of these fibres in this country are not fast and wide enough in comparison with the rapid expansion in USA.

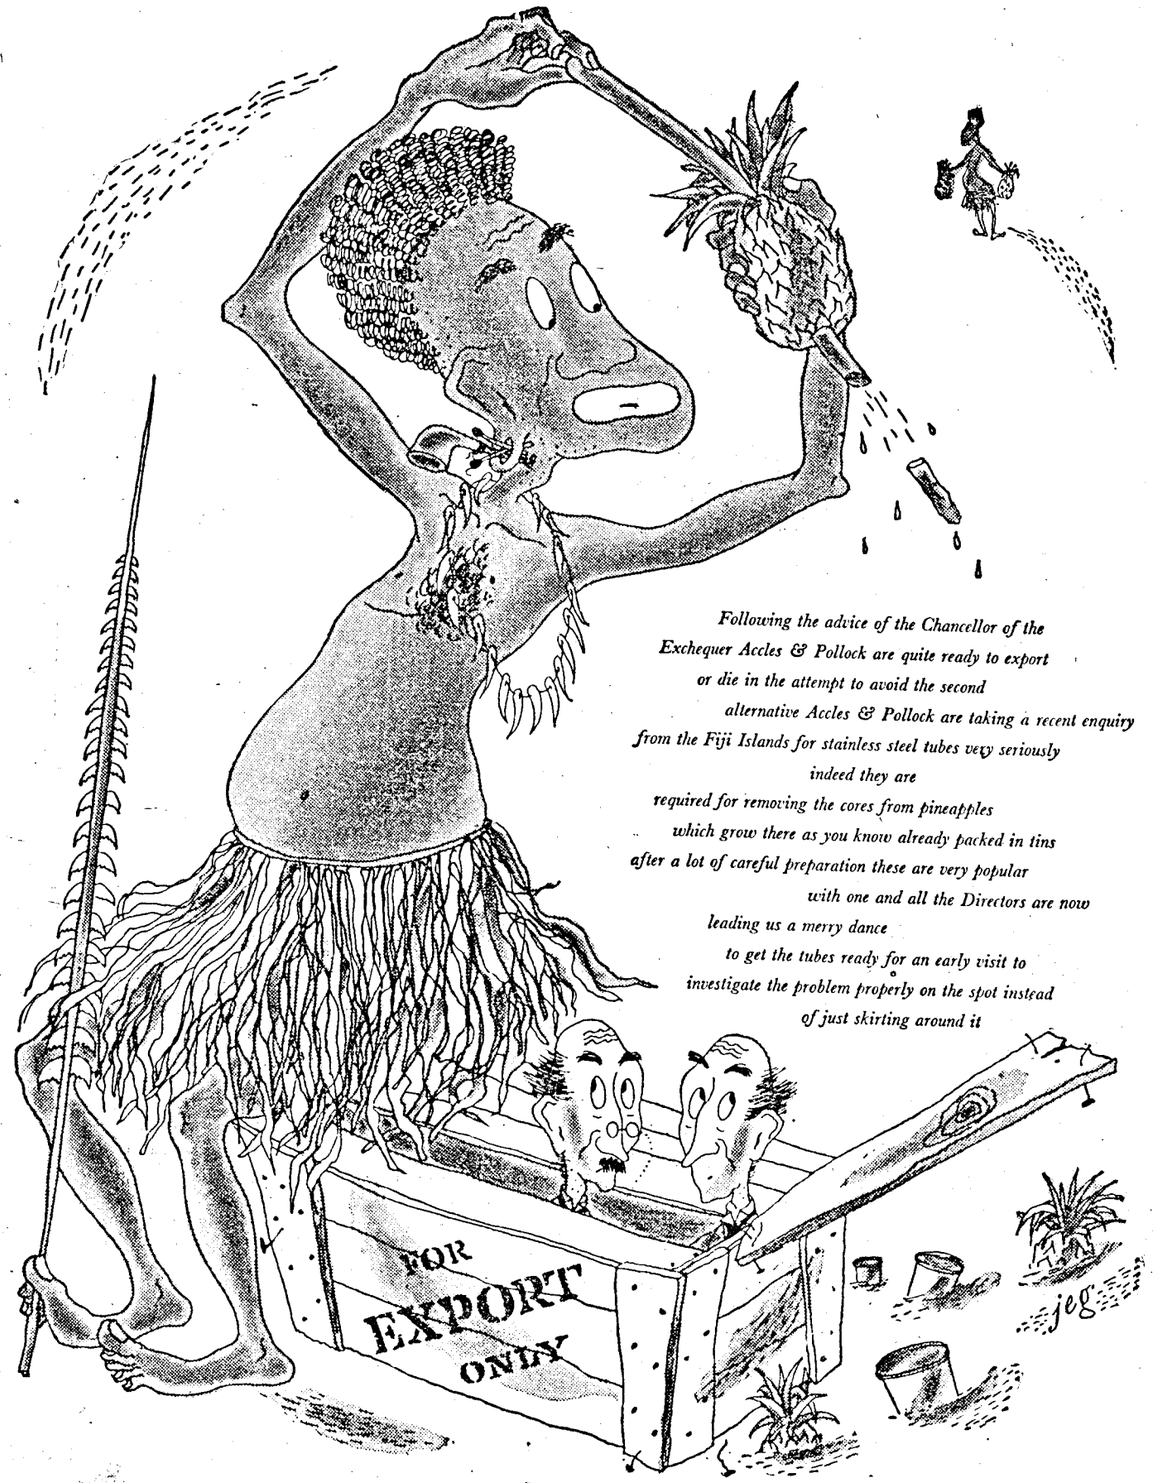
In Volume IV of the report, "Resources for Freedom," prepared by direction of President Truman, the probable consumption of synthetic fibres (exclusive of rayon) in 1975 is boldly predicted. It is estimated as almost equivalent to the present world consumption of wool, and to this there may also be added outstanding developments in the use of rayons. Let us be equally far-seeing, ready to adopt and adapt, to examine and to exploit. In such manner, at any rate, must your company, in common with many of the forward looking firms in the manufacturing and merchanting sections of our industry, approach the new textiles. Already we have nine branches engaged exclusively on rayon fabrics and synthetic fibre fabrics, and during the past year we re-equipped another branch —W. Grandage and Company Limited—for the processing of spun rayon fabrics in our effort to keep pace with the growing output and use of this class of goods.

THE OUTLOOK

As to the future, I hesitate to say too much. Our United Kingdom branches are at present well employed and I see no reason why this volume of business, which is considerably better than last year's, should not be maintained during the first six months of this year and, given a lessening of the cold war, for a much longer period. Your company is well placed to face the future, having developed production units in important markets abroad. The need for export trade in textiles need not be stressed by me, but the home market is the background of that trade and I hope the Chancellor, when framing his Budget, will release the industry from the crippling and damaging effects of purchase tax and "D" schemes.

The report and accounts were adopted.

Power For Prosperity



Power will transform this jungle scrub to fruitful acres. Power will build thriving cities where mud huts now crumble in the sun. Power is coming to these awakening lands in the giant Euclid earthmovers, the Euclid Tractors and Scrapers, the Carlisle Graders, the Marion Shovels and Draglines —power to clear, reclaim and irrigate the land, to dig the ditches, and the canals, construct the motorways, railways and airfields . . . power to prosper lives which now are so precarious.

Now—low-fare Rainbow Clipper Tourist flights to

ISTANBUL
BEIRUT

—In addition to regular 1st-class service to these destinations and further East

The Middle East is only half a day away—and you can now fly there at reduced fares, by Pan American's 'Rainbow' Clipper* Tourist service! Your airliner is a fast, luxurious Super 6 Clipper, manned by regular Pan American crews, who have behind them the know-how of the world's most experienced air-line. Specially-trained attendants see to your comfort, and serve you with complimentary hot meals aloft. Rainbow fare to Instanbul £61.10.0; return £110.14.0, Beirut £69; return £124.4.0.

Going further East? Take a ticket on Pan American's Asia Express, which flies on after Beirut to Karachi, Calcutta, Bangkok, Hong Kong and Tokyo. Pan American first-class flights are the only ones to the East with berths, and meals served aloft are by Maxims of Paris.

For more information, consult your Travel Agent or Pan American, 193/4 Piccadilly, London, W.1.

What Mildness Means

ONE forecast about Mr Butler's second Budget can be confidently made; he will rise to open it next Tuesday with a more cheerful song in his heart than any Chancellor for seven years—and the grounds of his optimism will be more substantial than Dr Dalton's ever were. In his survey of the past financial year it will, indeed, be Mr Butler's task to report that the main estimates on which he based his first Budget proved to be wide of the mark. But paper errors are nothing beside the visible justification that Mr Butler can claim in the surplus on overseas payments and a rising dollar reserve; internally, the economy was subjected, thanks largely to the dearer money policy, to a useful measure of disinflation—certainly to quite as much as the Government intended.

The Chancellor may, therefore, be expected to take last year's Exchequer outturn as a comfortable starting point for this year's budgeting. Revenue only slightly exceeded ordinary expenditure, and if capital expenditure "below the line" is brought into the reckoning there was a deficit of £436 million. This was a sharp departure from the disinflationary role hitherto assigned to Government finance in the postwar economy. The Government stopped providing a large part of the nation's savings in the form of a Budget surplus. But in the year when this disinflationary policy stopped, disinflation in fact began. The effect of a Budget surplus last year would have been to create some unemployment. There is no need, the argument proceeds, for Mr Butler to try to fortify the surplus this year. He should be satisfied to budget deliberately for what he unintentionally got last year—for a rough balance of ordinary revenue and expenditure. While expenditure is being held approximately constant, there are several reasons for expecting revenue to increase; and the Chancellor, therefore, has some scope for tax reliefs.

"Total demand," the Economic Survey declared, "is no longer excessive." If its vague assessment of the prospects for 1953 indicates anything at all of the Government's mind, Mr Butler will not aim at a bigger surplus and he may aim at even less. The time for thorough comment on this basis for the year's budgeting will be after the Chancellor has deployed the arguments for it—if he does. In any event, estimates of the inflationary "gap," and consequently of the right size of Budget surplus, have in the past been subject to so wide a margin of error that no arithmetical argument will shake the politicians from the belief that this Budget need not be tough. The commentator can only enter a plea for caution. Certainly the prospects for the later part of this year at present seem less definitely inflationary than at any time since the war; but there is also a fair chance that, once the usual spring lull is past, the forces of demand will run fairly strong in Britain during the summer. If they were much encouraged, they could harden into another upward twist of the cost-price spiral that would leave this country ill-prepared to face a possible recession. It is important to remember, also, that almost every Budget has turned

out to be less disinflationary than its author intended. It is relatively easy to correct, as the year goes on, an error on the side of severity. It is politically very difficult to tighten a Budget that proves too mild.

The passing—if such it is—of inflation does not, in any event, leave the British economy in a quiet haven in which the Chancellor has merely to keep demand on an even keel and guard against unemployment. There has to be a turn-round to more exporting and more capital investment, and it still remains to be shown that such a transfer of resources can be achieved without a really sharp disinflationary push. Mr Butler, however, wishes to try ; his objective is the mild degree of disinflation that makes a gradual transfer possible, not the sharp degree that would enforce a rapid transfer. The choice is open to criticism, but in the debate on the Budget it is more important to insist that even Mr Butler's cautious objective gives him very little scope for tax reliefs. He does not need to fill up people's pockets in order to prevent demand from sagging and to save workers from unemployment ; in fact, demand for most things is at present reviving, not sagging. If there is slack here and there in the economy, the Chancellor's task is to see that the slack is taken up by more production for export and more investment for productive purposes; his task is not, as yet, to stimulate the demands of consumers.

★

One rough rule of judgment can be applied when the Chancellor sits down next Tuesday: his tax changes ought not, on balance, to make any difference to the consumption of the British people. This is not a harsh doctrine. Consumption can be expected to rise automatically, as production and earnings increase. Mr Butler is not required to take away this automatic benefit ; still less is he required to repeat the experience of the past two years, when consumption was slightly reduced in real terms. This year Mr Butler can allow the country to have more jam—if the country earns it. But he should not give the jam away himself.

This does not mean, fortunately, that the Chancellor must leave income tax entirely alone. A remission of income tax may have three effects: it can increase spending ; it can encourage private saving ; and it provides some stimulus to harder work and greater production. The second and third of these are obviously good effects ; Mr Butler should achieve them provided that he offsets the first effect—the extra spending that follows from a relief in direct taxation. Even more, there must be an offset to any remission of indirect taxation—of purchase tax, or of Customs duties and Excise taxes—that the Chancellor decides to be necessary or politic. All the remissions that are made in these fields—all the extra personal spending that the Budget creates—should be balanced by a reduction in subsidies. The process that Mr Butler began last year should go on ; it ought, indeed, to be extended from the food subsidies to the housing subsidies. It is only to the extent that subsidies are cut that the Chancellor can, consistently with the country's major economic needs, give tax reliefs that will make the public feel able to spend more.

The Chancellor will not be greatly heroic in this matter. He will be showing a creditable measure of political courage if he again reduces the cost of subsidies by some £100 million or £150 million. That would not give him scope for dramatic changes in either indirect or direct taxation. Sixpence off the income tax, which would cost nearly £100 million, has an attractive simplicity and it is almost certainly within the range of what can be afforded. But there may be good arguments for leaving the standard rate alone, and making instead two changes that would most directly moderate the incidence of tax when a man increases his earnings: the reduced rates of tax at the lower end of the scale should rise more gently, and the earned income allowance should be increased—and extended some way into the surtax range. These changes would give the maximum of extra incentive in proportion to their cost in terms of extra spending power.

This is as far as Mr Butler's ambition should run, in his treatment of personal taxation. He can give away what he saves by cutting subsidies ; but he cannot carry that process very far without balancing it, in part, by increasing pensions and other social security benefits once again. The argument must return, therefore, to the margin for tax relief that the Chancellor may expect to have even without cutting subsidies. There are strong political reasons for throwing in this margin to help the consumer also. But they are reasons that Mr Butler should resist absolutely. The prime needs of the British economy are more exports, more investment and more savings. The encouragement that the Chancellor can give in these fields will in any event be perilously small. There is not this year any great natural buoyancy of the revenue to dispose of ; there is, at most, a modest margin for some net reduction in taxation. The Chancellor will be failing in his duty if any penny of that is squandered on the consumer. It is needed to encourage savings and investment, enterprise and efficiency, in British industry.

★

The relief that would immediately assist these ends is the repeal of the excess profits levy. The ill effects of this unrewarding and monstrously discriminating tax on improvement have become progressively clearer ; they are not disputed by any section of political opinion. The only obstacle to removing the levy may be the Government's pride ; the levy was introduced, in fulfilment of an election promise, only a year ago. But Mr Butler could well argue that, in the changed economic circumstances, the levy has outlived its usefulness sooner than was expected ; that the net yield it produces is already derisory ; and that the defence programme, which was EPL's original justification, has been changed out of recognition. He would have both right and reason on his side if he gave notice that EPL should disappear from the end of 1953. For the rest, the two most important changes that the Chancellor should make, in order to stimulate company saving and expansion, are those that were recommended in these columns six weeks ago: to restore the initial allowance on capital equipment and to remove the lower rate of profits tax that applies to undistributed profits.

These would not be dramatic concessions. They would leave fundamentally untouched the high taxation that represses enterprise and growth in the British economy. At this date Mr Butler cannot be expected to produce a truly reforming Budget: he has little scope for reducing the burdens, and it would be foolish to redistribute them in a spirit of thorough experiment before the Royal Commission reports on the whole issue of direct taxation. But the lines on which a measure of interim benefit can be achieved are plain.

Precisely because he has this welcome opportunity, the responsibility that falls on Mr Butler is peculiarly heavy. To open next Tuesday a popular Budget, a Budget that would please voters of all classes, would be easier for him than for most Chancellors in the postwar years. The country is not keyed for fresh sacrifices. To give sizeable reliefs to consumption would be less obviously short-sighted than for many years ; it would be less demonstrably false to a Chancellor's responsibility for the future economic strength of the country. That is the measure of the Chancellor's temptation. He is not called on to be tough when the need for toughness is plain for all to see ; he is called on to refrain from highly popular concessions when the national mood is one of relaxation. The second perhaps requires more courage and strength of purpose than the first ever did. The purpose is no less than this: to shift the structure of taxation back to a basis compatible with the continued industrial greatness of this country. Mr Butler can make this year only a small beginning, but the purpose ought not on that account to be any less compelling for him.

April Mood in the Kremlin

FOUR weeks have sufficed for Malenkov and his colleagues to play havoc with the legacy of Stalin. The revolution that was so greedy to devour its children is now, it seems, turning on its parent. Already the cult of the genius-like father of humanity is withering away ; he was not, after all, omniscient and infallible. Lesser men, who had long obeyed him in every particular, are now showing by changes in policy at home and abroad how deeply they disagreed with him in his old age. Police officials who would torture and starve their prisoners as a matter of routine must now pause to ask if it is safe to ignore the rights of Soviet citizens. Party leaders who cried vigilance and treachery now utter soothing assurances against " panic and disarray." Where all was dark and cruel and wintry there is a touch of spring. The police regime has rebuked its police ; the dictators have discredited, at risk to themselves, the tools of dictatorship.

These are, indeed, exciting days in Russia's history and the free world will rejoice if they portend for its people a freer and kindlier regime and for its neighbours an end to the frigid malevolence of the last seven years. But all that is still far from being fact ; the world must first discover why these changes have taken place and how firmly they are based. It is impossible to assume that those who agreed with the policies of Stalin's declining years and therefore disagreed with Malenkov have just melted away in the sunshine of the new regime, to believe that there are no rivalries within the triumvirate, no fears that men and jobs, as well as policies and tactics, are now in question. It is one thing to say that a revolutionary change is going on ; it is quite another to say that it is permanent. The Kremlin's gestures to the outside world must be interpreted as signs of a crisis within Russia.

There has been in the last fortnight a momentous admission that some restraints that Stalin believed essential to the authority of state and party were superfluous or dangerous, an acknowledgment that some of the ideals of the Revolution had been betrayed by the cynical and conservative Generalissimo. Take, for example, the amnesty. It can be said that this is Malenkov's way of bidding for popularity and prestige ; but to the mass of Russians it must mean the return to private life of hundreds of thousands of offenders with surprise in their eyes and questions on their lips. Why was it necessary for Stalin to die before they could be released ? Take again the promise of revised laws and a gentler hand with offending officials: why are these possible now, when a month ago the call was for tighter security against the agents of western aggression ? These questions are political dynamite.

Most striking of all is the affair of the doctors. Someone, it seems, had blundered, with Stalin's approval and under Beria's eye. They were incriminated with evidence secured by " wrong methods." The agents of the secret police have been sharply reminded that they, too, are subject to the law of the land. Here, indeed, is a revolutionary doctrine for a totalitarian state. Significant, too, is the conclusion that these doctors did not, after all, dispose of Zhdanov—Malenkov's rival until 1948—and endanger the lives of high officers of the army. The charge against them, and the vigilance campaign that went with it, were fraudulent ; it was all a stunt staged with Stalin's approval for internal political purposes.

What is the essential clue to these astonishing events? Perhaps the best guess is that Stalin's policy had become after the war increasingly rigid and out of touch with the mood of the Russian people. The technique of the secretary of the Party—to balance group against group and to give difficult colleagues enough rope to hang themselves—had degenerated into an obstinate, secretive and complicated habit of mind. Time and again Stalin showed his fondness for keeping two contradictory policies in play, each with its supporters in the hierarchy and then insisting on leaving things as they were. It seems likely, indeed, that both his foreign and domestic policies had become subject to the need to hold the balance between two views that were critical of his handling of affairs.

On the one side can be identified the "pessimists"—the opponents of appeasement—those who believed war within a year or two to be inevitable, who distrusted the morale of the Russian people, who demanded the utmost vigilance and discipline at home, and who wished to use Communist parties abroad for direct action against rearmament and the American alliance. On the other side were the "optimists," the party of appeasement, who believed war could be averted only if Stalin changed his methods, that time and peace were needed to build up the Communist bloc to industrial parity with the West, and that meanwhile it was dangerous and unnecessary to keep the Russian population on a permanent cold war footing. It is reasonable to suppose that the pessimists included the generals, those elements in the security services who feared the effects of relaxed vigilance, and those in the Party faithful to Zhdanov, who founded the Cominform outside Russia to gain greater independence for his aggressive policy in Europe. The optimists seem to have been led by Malenkov, Beria and, perhaps, Molotov; their strength lay in their control of the Party and Stalin's dislike of the aggressive ideas of their rivals, which he would check from time to time by personal intervention.

★

What then was Stalin's personal position? He seems to have tried to get the best of both views. He refused all concessions to the West, for example, over Germany and Austria; but he harped on the possibility of "peaceful co-existence." He was determined to avoid world war, but unwilling to negotiate a world settlement. He believed he could in time split the Americans from their allies with political gestures and offers of trade. He would not liberalise the regime at home because his distrust of human nature was too deep. The cold war suited him, so long as its techniques were not successfully used against him.

That was probably the situation when the Party Congress met last October, with Malenkov clearly marked out as the coming man and his group in the ascendant. Perhaps after this confirmation of their position the "optimists" grew too big for their boots; it was to chasten them that favour was shown to the army, and new men brought into the upper ranks of the Party. Perhaps, too, it was because the "pessimists" were resentful and difficult that the doctors affair was launched. In the form that it was presented to the public Stalin gave a stern warning to the appeasers, a clear gesture of respect to the army, and a free hand to the cynics in the security services. Certainly by January there was crisis in the country. Then came Stalin's death: providential—"remarkably well-timed" some future Gibbon may comment—for Malenkov and those who hoped for a *détente* with the United States.

If this conjecture is even approximately correct, two important conclusions follow. One is that Soviet foreign policy is determined more than had been thought by the internal politics of the regime; the other is that Malenkov's tenure of power, even as member of a triumvirate, may depend on the success of a conciliatory foreign policy. A tremendous responsibility therefore falls on the statesmen of the West, as they consider the possibility that Malenkov may wish to negotiate on matters in which neither Moscow nor Washington would find it easy to make concessions of substance. To put the problem simply and crudely: toughness on the part of the West might prove Malenkov wrong and his rivals right; a conciliatory attitude might establish Malenkov's position as nothing else could. The time may be approaching when the future master of Russia will be determined by decisions in Washington, London, Paris and Bonn.

★

It is an alarming prospect, speculative though the thought must be. For, unless diplomatic channels in Moscow are unfrozen, unless the West's knowledge of Kremlin politics can be improved, it will be hard to determine whether Malenkov is or is not strong enough to make the concessions that Stalin refused. There is, however, one scrap of evidence that can be clung to; it is that the victory of President Eisenhower in the American election created a new mood in the minds of some men in the Kremlin. Even Stalin marked Christmas by asking for an end to the cold war. For weeks the Soviet press and radio refrained from personal attacks on the President: Eisenhower was the former comrade-in-arms; Republicans had been isolationist and might become so again—especially if Stalin, the personification of cold war, were removed; the first flurry of Dulles dynamism passed harmlessly; the result of the President's visit to Korea was a decision gradually to disengage American forces. That, it seems, is how the "optimists" saw things. A change of ruler in Moscow following a change of President in Washington would create the opportunity of a lifetime.

What Malenkov's moves on foreign policy may, in fact, prove to be it is early to say. It is probable that he will reopen discussions about German unity, renew former trade offers, make life easier in Berlin, support peace negotiations in Korea, and instruct Mr Vyshinsky to go on cooing gently at the United Nations. He has shown in his public statements an intense interest in helping China to become a great industrialised power and in establishing the Soviet Union as the centre of a Communist economic bloc covering one-third of the world. Malenkov, in fact, sounds like a business-man of big ideas, who is determined that his country and its allies shall outstrip the West in power and wealth, and leave time to bring the ultimate victory. If that is his aim, then it is to be expected that he will try to reach in the West some *modus vivendi* that would check its rearmament, reduce the American interest in Europe, soothe the tension aroused by the cold war and tempt everyone to forget about the liberation of Eastern and the integration of Western Europe.

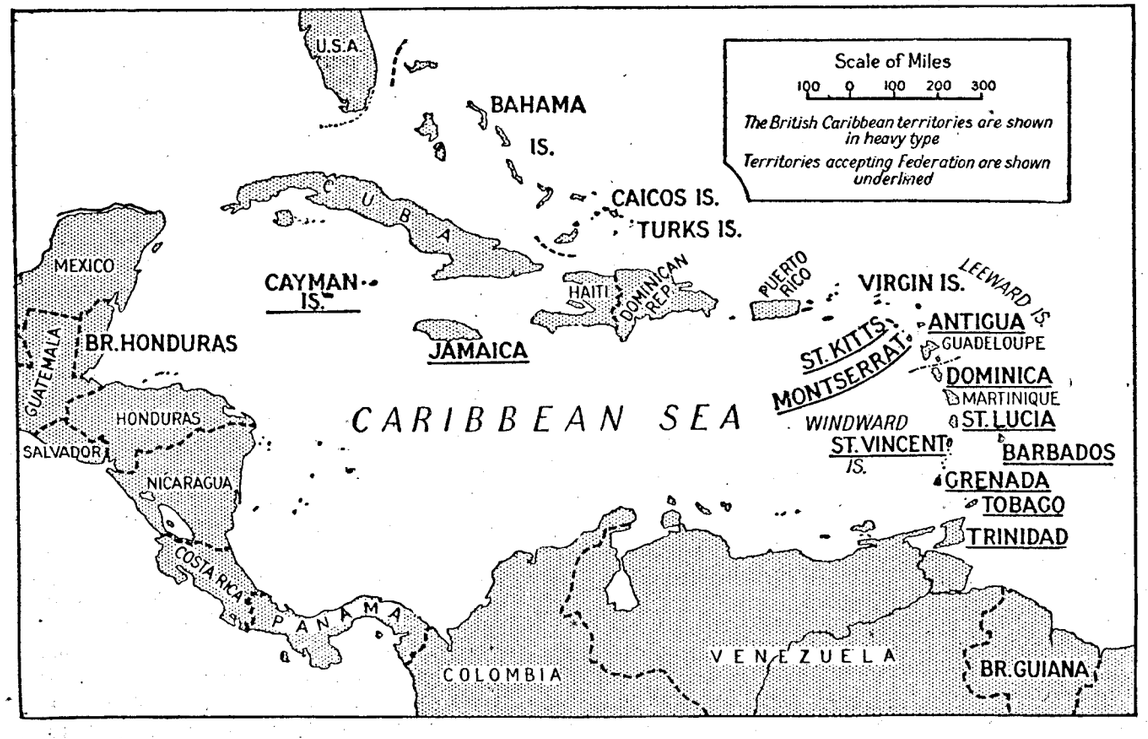
It cannot be repeated too often that we do not yet know the essential facts; we may not even know enough when Malenkov or Molotov has been seen playing a hand, say, over Germany or Austria. If, however, there is to be speculation, let it be based on the plentiful facts of the past, as well as the few facts of the present. There is no evidence at all that the basic Soviet aim—the ultimate world predominance of Communism—has changed; there is only evidence of a change of tactics and timing. Malenkov at 52 can look further ahead than could Stalin at 73; he may be anxious, above all, to buy time. The wise course for the West is not to heave sighs of relief but to decide what terms it would bring to the conference table and what strength it needs to make its case respected.

A Constitution for the Caribbean

THE protracted discussions on the federation of the British West Indies will be carried a stage further at the conference of representatives of the colonies concerned which meets in London next week. The inherent difficulties of the scheme—as well as the Caribbean temperament—have dictated the pace. It is fully two years since a draft constitution for the region was produced by the committee under the chairmanship of Sir Hubert Rance. It is four and a half years since delegates from all the territories met at Montego Bay in Jamaica. There, they accepted the principle of federation and set up the Standing Closer Association Committee to prepare a constitution, together with other committees to draw up plans for a customs union, the unification of public services, a single currency and other matters. Eight years have passed since Mr Oliver Stanley, then Colonial Secretary, urged the West Indians to federate, not only to form a viable economic entity, but also a viable political unit to which full self-government could be granted.

It cannot be said, however, that progress has been sure if slow. Federation is still a long way off. There is nothing final about the deliberations now to take place. No colony is committed in more than the principle, and anything that their representatives recommend jointly with the others will have to be further debated by their own legislatures. Moreover, several colonies have gone back on the degree of conviction that they achieved at Montego Bay. Faced with an actual draft constitution which makes clearer the sacrifices involved in federation, British Guiana and British Honduras, the two mainland territories, have retreated—though they are sending observers to London. The Bahamas and Virgin Islands are also out of the scheme, which has thus lost a sixth of the population and more than nine-tenths of the land area originally conceived for it.

The scheme is now reduced—at least for the time being—to proposals for an archipelagal union of Jamaica, Trinidad, Barbados and the Windward and Leeward Islands; the largest unit, Jamaica, with a population of 1,500,000, is a thousand miles away from the rest—about as far as West from East Pakistan. It is already clear that the ten colonies of this archipelago are themselves having extensive second thoughts about the Rance constitution. The islands are more inclined to hold on to their own local powers, and have become more conscious of the cost of the central government; the trend of discussion within the West Indian parliaments seems to have been that a far weaker federal agency should be given far more sovereignty. Unable to say boo to Barbados, it must be able to tell Britain to mind its own business.



★

Yet federation was to be based on the economic benefits accruing from closer association. Individually, the islands are too small to be viable economically, or to make their voices heard in world affairs. Their greatest interest is sugar—yet they produce only two per cent of the world's supply. Necessity has forced them to combine to negotiate with their customers; the same necessity dictates that they should ask with a single voice for financial aid from Commonwealth or world lending agencies. The cost of effective diplomatic and commercial representation could only be met by pooling it. It has also been urged that federation, implying a customs union, would enable the economy of the whole area to be strengthened by providing adequate markets for secondary industries and some greater diversity of production; it would make planning possible, and permit migration of labour from over-populated areas to those whose resources remain to be developed. There is substance in the argument; it is at least clear that such enterprises as a university and

agricultural research can be supported only on an intercolonial basis. But scope for increasing intercolonial trade among primary producing countries is, in any case, small. Regional West Indian trade accounts for a tiny fraction of the total ; the losses of customs revenue from a customs union will in most cases be less than five per cent. But with the mainland territories out of the federation the opportunity of developing an economic entity, based on their exports of rice and needs of manpower, will be lost.

The draft constitution worked out by the Rance committee was an ingenious attempt to find a lowest common multiple in a diversity not only of economic but political conditions. It sought, in fact, to combine the LCM of Caribbean economics and the HCF of Caribbean political institutions. Yet even on the political side it failed to satisfy British Guiana, which under its new constitution is about to be granted a large degree of self-government. These powers would thus be conferred only to be in part resigned to the federal legislature in Trinidad. Guianese spokesmen asked, "why give us a liberal constitution with one hand and take it away with the other by making us slaves to the islands of the Caribbean ? " The Guianese, like the Hondurans, have little trust for what they call the "ranting politicians of the West Indies." Nor do the people of East Indian race wish to be cheated of their electoral predominance in these territories by a large influx of West Indian negroes.

But the Rance constitution has also failed to satisfy the politicians of the islands. In Barbados the powers to be surrendered to the federal legislature are felt to be too great ; in Jamaica, and perhaps in Trinidad, the surrender of powers to the federation is clearly only acceptable on condition that the federal government is going to have greater powers than the islands have—to achieve Dominion status more quickly than Jamaica might hope to do on its own. The Rance committee recommended that besides a short list of exclusive powers reserved to the federal government, such as defence, external affairs, customs and communications, there should be a concurrent list, on which both federal and territorial legislatures might legislate, federal law prevailing ; this list would enable the federal government gradually to take over more functions, such as the control of trade, as it grew in experience and won the confidence of the constituent colonies. But "the spirit of colonialism" which runs through the Rance proposals has drawn fire from all shades of opinion in the islands, from extremists and moderates—in Jamaica, from Mr Bustamante and Mr Manley alike. Though the lower federal house is to be elective, the senate would be wholly nominated by the Governor-General ; though the prime minister would be elected by the lower house, the council of state would contain six nominated to eight elected members and be merely advisory to the Governor-General ; and many of the federal powers would be wholly reserved to the Governor-General. Such arrangements were criticised as amounting to the creation of a "super Crown colony" and representing no advance on the "existing federation" achieved by the powers still concentrated in British administration in the islands, and therefore ultimately in Whitehall.

While demanding more popular control of federal powers the colonies have also suggested that the expenses of the whole venture should be underwritten by British financial guarantees. It thus cannot be said that the West Indies have, as a whole, yet shown real faith in the effort to invest them with greater control over their own destinies—for which a stronger economic foundation is at least as important as more political power. It will be for the West Indian statesmen gathered in London to reconsider the very real advantages of the Rance proposals: they give the islands an opportunity of attaining Dominion status and at the very least of learning a more responsible approach to their problems. However a new scheme is drawn up, the way should be left open for the mainland territories to join at a later date, when the working of the constitution shows that, with energy and good will, it is no paper "federation of miscellaneous poverties." British Guiana has already indicated that it will continue to support all useful forms of joint representation and endeavour.

The political education that has been achieved in getting the territories as far as the London conference should not be underestimated. In the nature of things the making of a West Indian federation offered greater difficulties than a federation of Malaya, Central Africa, or Nigeria ; it may of necessity have to start with a very limited authority. If, in the making of it, West Indians learn more of the economic as well as the political realities, the effort will have fully justified itself.

TRADE OF THE WEST INDIES
(Average 1948-51)

Burma Accuses

BURMA'S complaint to the United Nations about the operations of the Chinese Nationalists in the Shan states could scarcely be more awkward. To deal with it before the present General Assembly ends means floodlighting a sordid business that reflects no credit on anyone concerned, least of all on the coherence and sense of purpose of the free world in South-East Asia. To postpone it until the dispute gets dealt with by the Security Council will almost certainly lead to the use of the veto by the representative from Nationalist China—a Gilbertian situation. And behind the whole confused affair stands the very sad fact that, whatever the outcome, much has already happened to poison the relations of a number of people in South-East Asia with the United States.

These Chinese Nationalists, numbering some 12,000, are the remnants of Kuomintang forces that fled across the Burmese border from Yunnan, when Chiang Kai-shek left for Formosa in 1949. They have lived on the country ever since, defying the inadequate Burmese government detachments sent to deal with them. During 1951 they attempted several raids across the border into Communist China, but soon returned with their tails between their legs. Since then they have existed more as a series of armed guerrilla bands than as an organised force. Basing their operations on the neighbourhood of Kengtung and Monghsat, they have represented a latent embarrassment to the Burmese Government and a possible incentive to the Chinese Communists to move across the frontier. (To make matters worse the frontier in this remote region is disputed.) Their ostensible commander, General Li Mi, has established a tenuous air link with the Chinese Nationalists on Formosa, but it has never been clear how much this has brought him. His forces are known to have received a few modern American arms, passed on presumably from equipment supplied to Chiang Kai-shek ; these, it would seem, come either direct by air or have to be smuggled up through Siam with the private connivance of a number of Siamese officials.

The Nationalists in any case make considerable use of Chieng-Mai in northern Siam.

So much for the less recent past. What has lately set the cat among the pigeons has been an apparent change of tactics on the part of General Li Mi's men—he himself was recently reported to be ill in Formosa. Instead of evading action against the Burmese forces they began a few weeks ago to take the offensive, or at least to stand and fight. In addition, they have lately on occasion made common cause with elements of the Karen rebels ; and this has occurred at a moment when Burma, less hard pressed by Communist insurgents elsewhere, has had rather more troops available than hitherto for service in the Shan states. Even these developments, however, might have had no serious results if the skirmishing could have taken place without international complications. But as things are, the Americans are widely suspected in South-East Asia of secretly backing General Li Mi ; or, when they deny this, it is urged that they could simply tell the Formosan

authorities to see that he stops his activities. This so-called interference, apparently now more determined than ever, last month became intolerable to the Burmese. Accordingly they not only brought it before Uno but, in order to make their meaning plain, also told Washington on March 17th that they will accept no more American economic aid after June 30th of this year.

The Burmese have thereby raised a number of serious issues. Their complaint to Uno is really a jab at the Americans ; it undermines American prestige in South-East Asia ; it calls in question Washington's whole policy of supporting Chiang Kai-shek ; and it reverses, so far as can be seen at the moment, the favourable trend of the last few months towards closer and better relations between the people of South-East Asia and the West. Moreover, by demanding the demilitarisation and internment of the Li Mi troops rather than their repatriation, U Nu, the Burmese prime minister, has almost certainly made the dispute more difficult to settle. Why the Burmese have now gone beyond the simple demand that the troublesome Nationalists should be repatriated to Formosa is not clear. This is the solution apparently supported by Mr Nehru, with whom U Nu was touring the Assam frontier last month. The Indian Government has long been deeply opposed to Chiang Kai-shek's continued masquerade as the ruler of China, and it may be assumed that it regards General Li Mi's activities as a menace to the stability of the area. But, in spite of the close relations now developing between Delhi and Rangoon, it would seem that the Burmese have suddenly adopted a stiffer attitude than the Indians encourage.

★

For the Americans this is a day of reckoning. Although Washington claims emphatically to have had nothing to do with these disturbances in Burma, the accusation dies hard. That is not surprising in the light of the clamour of the China lobby and its efforts to associate the United States with the Chinese Nationalists. People in other parts of Asia can hardly be blamed if they now take seriously what has been said in the past. Nor is it unreasonable to suppose that the Nationalists, dependent as they are on American support for sheer survival, must take Washington's word as law. If so, why cannot Chiang impose his will on General Li Mi and his ragged army ?

Nor, indeed, is this all. Burma's rejection of American aid may not be without effect on internal politics in the United States. It comes at a moment when the new Administration is re-examining the whole foreign aid programme and when the American taxpayer looks forward hopefully to the promised relief from some part of his burden. Economic aid to Burma, it is true, has not been heavy. The appropriations, begun in 1950, have amounted to $31 million, of which about only half have actually been shipped in the form of goods. But this rejection, coming on top of the trouble that the Americans have had in Burma—as in Indonesia and elsewhere—in switching from the Economic Cooperation Administration (ECA) to the military-sounding Mutual Security Agency (MSA) may encourage a general cutting of aid. If it does, then the slender lifelines between the economies of South-East Asia and the western world may be dangerously frayed.

★

There is at present no obvious way of resolving this complex and unfortunate situation. Certainly no vote at the United Nations can exorcise 12,000 armed and ill-disciplined ragamuffins in northern Burma ; nor is it any use instructing them to withdraw unless the Siamese will allow them passage to the sea. But so long as they go on with their depredations, they will continue to have an international importance out of all proportion to the damage they do—and this the free world cannot afford. The Americans are right to be seriously worried ; and yet probably they alone have the influence in both Taipeh and Bangkok to restore their own standing in Rangoon. They would be wise to do all they can to bring General Li Mi's adventures to an end.

Notes of the Week

Tunnelling With Mr Vyshinsky

THE two speeches that Mr Vyshinsky made on Wednesday during the United Nations Assembly's debate on disarmament were extremely revealing—but not entirely in the sense that the speaker intended. The ex-foreign minister was making his first major public statement since his return from Moscow, and his new mildness duly impressed all those who have endured his diatribes for so long. Indeed, the halcyon mood that has settled on the UN headquarters building, while largely attributable to the unexpected agreement on a new secretary-general, owes much to the astonishing sight of Mr Vyshinsky sitting in the delegates' lounge without his bodyguards and beaming conscientiously at all and sundry. The Soviet delegate's statements on disarmament were equally in line with the Kremlin's present conciliatory tactics ; but they illustrated much more clearly both the aims and the limitations of the new Russian approach.

The United Nations has been discussing disarmament ever since it came into being, and the deadlock on this issue between the Soviet bloc and the majority has lasted so long that people may well be forgiven for having forgotten exactly what is involved. The essence of the western position is that there should be truly effective international supervision at all stages of the proposed reduction in both "*conventional*" arms and atomic arms. The Russians have repeatedly accepted the principle of international inspection, but have rejected, with equal consistency, all practical proposals for turning that principle into a reality. The western powers have suggested that, as a first step, the manpower of the principal armed forces should be reduced in such a way that American, British and French numbers would be equal to those of Russia and China.

The Russians have rejected this, proposing instead a percentage reduction which would leave the Communist countries with their existing superiority in numbers ; and they have also pressed for the immediate elimination of atomic weapons, on which the West has been forced to rely to offset that superiority. Not surprisingly, the overwhelming majority in the United Nations has backed the western plan, which offers open and equal disarmament, as against the Russian plan, which—even if it allowed for genuine verification—would only perpetuate the Communist advantage.

This week Mr Vyshinsky sought to show that he was offering a major concession, and he appealed to his antagonists to "meet these proposals half-way" and to "dig the tunnel of friendship from both ends" by not reaffirming the Assembly's 1952 resolution on disarmament. His "concession," however, consisted only in not presenting again the Russian programme that had already been rejected in committee, and he gave no sign that his government had in any way changed its basic position. The Assembly did what it could to satisfy him by omitting a passage to which he specifically objected, but it firmly endorsed the 1952 resolution by 52 votes to five. The exchange revealed quite plainly that the Russians' aim was to represent themselves as far more conciliatory than their opponents, while in fact conceding nothing of substance ; and it held out little or no hope that agreement on disarmament was any nearer. Indeed, whatever possibilities of settling various issues may now arise, it is hardly probable that they will embrace a solution of so fundamental and difficult a problem.

Light for Prisoners

ONLY those who have themselves spent long years in prisoner-of-war camps can fully understand the anguish that the prisoners in North Korea must have undergone. In their case, the sufferings that are the normal lot of prisoners in any war—incarceration itself, and the fear of its indefinite extension—have been increased by the Communists' refusal to admit the Red Cross to the camps or to permit a regular exchange of letters with families or friends at home. Even the lists of prisoners' names that have come out of North Korea have been defective. There is, therefore, all the greater cause for rejoicing at the prospect of the early liberation, first of the sick and wounded and then of the remaining prisoners.

All is, of course, not yet clear. At Tuesday's meeting at Panmunjom the Communists could not produce lists of wounded prisoners to match those offered by the United Nations' representatives—although ten days had elapsed since their acceptance of the long-standing UN offer to exchange the sick and the wounded. They also referred somewhat obscurely to the question of accommodating certain prisoners in neutral countries. It is to be hoped that neither the exchange of the wounded, nor the general exchange of prisoners which is bound up with the prospect of a lasting truce, will be endangered by dispute as to what constitutes a neutral country. On past occasions, the Communists in Korea have described Poland as a "neutral" while refusing to recognise India as one. The plain fact is that, in a war between the United Nations and an aggressor supported by the whole Communist bloc, "neutrals" are inevitably few and far between ; and if the Communists want to, they can still create another deadlock by exploiting this fact. But if deadlock was all that they wanted, why have they dropped their insistence on forcible repatriation ? The apparent answer is that they are at last genuinely ready to end the fighting. If that is so, the technicalities of agreement are not important.

Warning from Nato

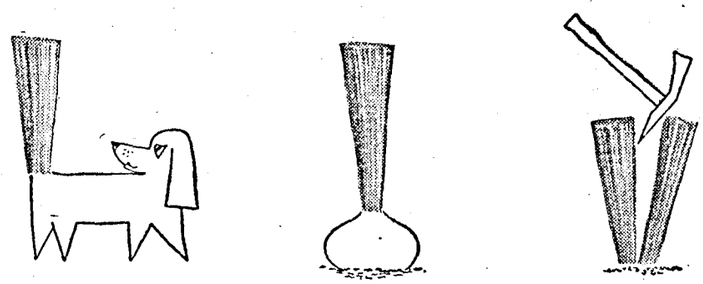
THE second anniversary of the Allied Supreme Headquarters in France evoked from General Ridgway a speech of great moderation and good sense. He emphasised that the forces arrayed against free Europe have increased and go on increasing, that the estimates on which his staff base their claims to allied resources are the minimum required for deterrent defence, and that a joint effort is cheaper than a divided effort. He repeated once again his warning that the allied forces available "would prove gravely inadequate if put to the test." These are words to be borne in mind when the Atlantic Council meets a fortnight hence to consider its postponed planning of force requirements for 1953 and 1954.

If there is to be at some time in the future negotiation with Moscow, a faltering in the Nato defence effort would be a poor beginning to effective bargaining. If negotiation proved fruitless or disappointing, the ground lost could not easily be made up. The only Russian move that would justify a check to Nato's present modest plans would be a withdrawal of the Red Army from Austria and Germany. Even if that took place, governments would be wise to think long and deeply before leaving Western Europe without an adequate allied army and air force in being. The strength of the present forces lies precisely in their international organisation and the political loyalties of which they are a symbol. Mr Eden struck the right note when he said in a broadcast message last weekend that "we must continue the work of the North Atlantic Treaty in every sphere. Our own safety and the peace of the world depend on it." Now that a most regrettable illness makes it impossible for the Foreign Secretary to attend the Council, it is to be hoped that Mr Churchill can find time to attend what should be a most important conference.

A New Chapter

THE political situation to which Parliament returns next week is subtly but greatly different from that which existed before Easter. The short recess has marked the end of a distinct chapter in the history of Mr Churchill's Government. Despite the last minute row about the House of Lords amendments to the Transport Bill, the Whips can return in the knowledge that neither of the denationalisation measures, for steel and for transport, will make large further demands on Parliament's time. Unless something very strange happens, both will be safely on the statute book before the coronation. The Government managers in the House of Commons are thus freed from their most burdensome task, and Ministers can think more about their own legislation rather than about undoing that of their predecessors.

Into this changed Parliamentary situation there is now injected the impact of change in the Kremlin. At the least, there will be a quickened and more varied interest in foreign affairs at Westminster. At the most, if anything like a truce in the cold war should develop, the repercussions on British politics would be very great. Since 1946 the field of manœuvre of both governments and oppositions has been narrowed by the exigencies of the international situation. The parties have moved year after year along a defile of which one wall was the British economic crisis and the other the cold war. But, temporarily, the economic problem is less tense, and on that side the defile has widened a little; if now the international tension should markedly ease, the politicians would find themselves at least in a bay in the defile, in an area where they can afford at last to think and act anew—and more differently from each other.



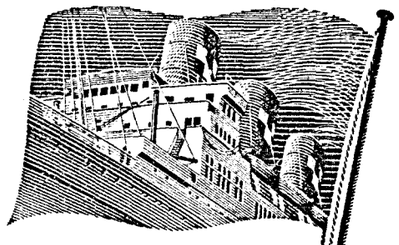
There would be some fine scamperings over issues that have long been half-submerged, and party differences would be accentuated as each side made use of the wider ground open to it. If there were any genuine pacification, ministers would be bound to think seriously whether this was the time to appeal to the country for a new mandate—particularly if, beyond the truce, the possibility of a recession loomed in their minds. There are no signs as yet that Mr Churchill is thinking on these lines. Indeed, for any responsible politician to do so is to count chickens before the eggs are laid. But in the recesses of the party headquarters, and in the gossip of the smoking rooms, exciting—or disturbing—new possibilities will certainly be stirring for a time.

Climax in Kenya

TWO fateful events took place in Africa this week. By the time this issue of *The Economist* appears, the result of Southern Rhodesia's referendum on Central African federation will be known. It will be clear whether the scheme has been killed outright or whether it has been approved by a majority of the predominantly European electorate of Southern Rhodesia and whether, therefore, it will be imposed on the much bigger majority of disapproving Africans.

Temporarily, however, the referendum has been overshadowed by the conviction of Jomo Kenyatta, the Kenya African leader, whose trial, with five others, on the charge of managing Mau Mau has lasted five months. The verdict, the date of which was known in advance, was preceded by elaborate precautions to prevent a fierce Mau Mau outbreak in the Nairobi district, which was suspected. A repetition of the recent massacre of loyal Kikuyu was averted; many more terrorists have been killed; and there are signs that, so far from being intimidated by the intensive Mau Mau attacks on themselves, the loyal Kikuyu have been provoked into striking back. A broadcast by the Governor last weekend struck a note of cautious optimism.

The conviction of Kenyatta—against which he has appealed—will almost certainly be a powerful influence against the terrorists. Perhaps it is too much to ask that a full report of the trial should be published so that those who wish, particularly in the world outside, can see for themselves that the magistrate had ample evidence on which to base his conviction. But in Kenya, and indeed in the rest of Africa, the conviction should prompt as much heart-searching as rejoicing that the "master mind" behind Mau Mau's objective has been removed. Why does British policy in Africa tend to drive the educated ambitious Africans into opposition to it? Why do the natural leaders become



animal, vegetable or mineral?

When you think of thousands of tiny fibres which can be teased away in the fingers, you don't usually think of a rock. With asbestos rock it's different. Asbestos is one of nature's freaks: a mineral, yet made up of gossamer-light fibres. These fibres, which never burn, can be spun, woven or moulded into a variety of materials. Hardly an industry, today, is not using Asbestos in one form or another. For the fullest information on its possibilities in your own branch of industry, consult

Everybody notices a Riley

The Riley looks exciting yet elegant, sporting yet dignified, because it is all these. It caters for the enthusiast by providing a race-proved engine which though rather more costly is infinitely more efficient. And it offers a particularly happy marriage of positive steering and sure road-holding. The Riley is in fact a car with a very pronounced character. That's why it stands right out wherever it goes.

extremists, determined to oust British rule? Why do the colonial governments fail to rally the support of the African moderates? In countries of white settlement, in Central Africa no less than in Kenya, some of the answers to these questions are plain. The conviction of Kenyatta should be the occasion for a new outlook among governments and settlers alike.

The Politician's Pay

"THE matter is under consideration" is a classic formula for dealing with importunate nuisances. But the deputation of Labour and Liberal members of Parliament, who approached the Prime Minister last week about higher pay for MPs, can scarcely have expected any other answer. This is a matter that any government must deal with cautiously. At the best of times it is a delicate business to vote one's self more money. Against the background of prolonged appeals for stability in wages, a rise on £20 a week cannot easily be explained to the voter.

That MPs should be paid more is not, however, in doubt. Out of their £1,000 members have to meet heavy expenses —secretary, stamps, fares (except to their constituencies), stationery (except House of Commons writing paper), and entertaining. These expenses, if duly accepted by the Inland Revenue, are tax free, but only £100 is accepted without question. The rewards of political life would be prohibitively small were it not for the fact that most MPs have other jobs. This has the great advantage of freeing them from complete dependence on the party machines, as well as widening their viewpoints, but it has its disadvantages as well. It distracts MPs when the growing complexity of modern legislation should be making bigger demands on their time. It tends to confine them to a narrow range of professions that can readily be combined with political life. And it is hard on those—Labour members—who have had to give up other income on entering Parliament and who are unlikely to be offered the company directorships that keep the wolf from so many politicians' doors.

Although ways of bettering the MP's lot without paying him more are often canvassed, all are open to some objection; a straightforward increase in salaries is, in general, the right course. But it is particularly important to give some special advance to junior ministers, who get only £1,500 a year plus £500 of their salaries as MPs, and who are not allowed to accept payment for any other work. They are the principal victims of a salary freeze that by now has spread a good deal of hardship at Westminster.

France Again Cuts Imports

THE French government last week announced new and substantial import cuts from countries in the European Payments Union area. Imports will be reduced from a rate of $130 million a month to $116 million, a cut of about 10 per cent. The main foreign commodities affected will be raw materials, such as coal, pulp, sulphur and cotton; and foodstuffs, including meat and dairy products. It is not possible to say how much of this monthly cut of $16 million will fall upon the sterling area, but it is clear that Britain, and more especially the overseas Commonwealth, will by no means escape unscathed.

This sequel to the action taken only the previous week by Britain, when it relaxed import restrictions that were alleged to be hurting French exports, is something of a surprise. It has been described by Mr Butler in the House of Commons as regrettable and "disappointing," a mild way to express the exasperation felt by all of France's partners at this latest demonstration of its inability to balance accounts without inflicting hardship on its neighbours. For most of the EPU countries 1952 was a year when, because of falling raw material prices and internal disinflation, they were able to restore stability and even to move towards greater liberalisation of trade. France was the outstanding exception. For a full year preceding the latest cuts, it had abandoned any pretence of liberalising its trade; and all its imports were governed by quota restrictions. Despite these stringent measures, however, its imports from many west European countries rose in 1952.

The new restrictions have been sharply criticised even within France. The critics do not deny that the French economy is in a bad way. The cumulative deficit with EPU has now reached $655 million, a total well above the point at which France must meet its monthly deficit entirely in gold and dollars. What they do say is that once again the French government has shirked the crucial issue. Its primary task is to halt inflation at home, so as to reduce prices and expand exports; and for this to happen the country must first have a budget that balances. The gap in this year's French budget, which is discussed in an article on page 97, is not unmanageable; but the present government, like many of its predecessors, has shown a natural reluctance to risk its own downfall by attempts to push through the Assembly the unpopular financial reforms required to cover the deficit.

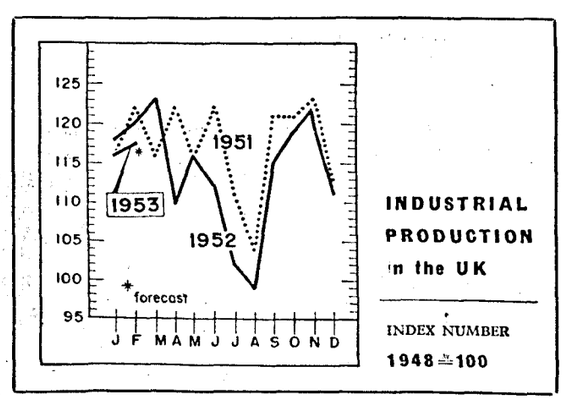
When Italy Votes

THESE have been stirring weeks in Rome. The Communists were frantic with rage at being outmanœuvred in the Senate, first by the courageous chairmanship of Signor Ruini, and then by President Einaudi's unexpected dissolution of the Upper as well as the Lower House. In the new parliament there will be no more members "nominated" for resistance services in the war, and that will tend to reduce the representation of the Left; the Social Democrats, however, by rallying to Signor De Gasperi's centre coalition, will make up for this by sharing in the bonus of seats if his coalition wins on June 7.

The three main choices before the electors are clericalism, Fascism and Communism. At first sight it is a choice of evils; but, since neither the extreme Right nor the extreme Left is likely to come out on top, the chief issue of the election is likely to be how much power should be allowed to the Catholics to curb Fascism without forcing the country to move further away from the secular state. A

great deal will depend, as it has already depended for several years, on Signor De Gasperi's ability to keep some sort of a coalition in being. By sheer personality he has so far propped up a somewhat artificial arrangement with the smaller parties. When he first became prime minister he was 64 ; can he still do it at 72 ?

For the world, the elections on June 7th will be less momentous than those of 1948. Today there is no question of Communist domination in Western Europe, except by war, and the military and economic strength of the West is far greater than it was. Russia, moreover, looks like trying to relax the cold war which in 1948 was just gathering momentum. Then, it was the Italian election result which played a material part in deflecting the main emphasis of Communist pressure from Europe to Asia. Nevertheless, for both Italy and its allies in the Atlantic Treaty, the elections are still of great importance. A vote for the extremes of either nationalism or Communism could destroy a great deal of what has been achieved so carefully and painfully under Signor De Gasperi's wise and moderate seven-year premiership.



Steel and the High Authority

THE European Coal-Steel Community takes its next major step on May 1, when the six countries open a common market in steel. Meanwhile, its officials are discussing with industrialists and government representatives whether or not to fix prices for steel circulating within the market. German press reports say there is provisional agreement that prices need not be fixed since the internal market is felt to be in equilibrium ; on the one hand, supplies are easing and on the other hand, because stocks have begun to fall, there is little fear of any sustained downward movement of prices. It is expected, however, that there will be local price reductions in all member countries except France and Belgium-Luxemburg, where internal prices are now well below the level elsewhere in the Community.

Steel export prices of the Community to non-member countries are seen in a very different light and the industrialists of the six countries have privately taken action to stabilise these prices. Since the end of the American steel strike in mid-1952, export prices of Community steel, particularly French and Belgian, have fallen as low as £28 per ton. In order to check excessive competition and to prevent further price cutting, the steel industrialists of the Schuman countries, meeting recently in Paris, first closed their export orderbooks and then fixed new minimum export prices for exports from all six countries. These are slightly above the level at which France and Belgium have lately been selling abroad and a little below British export prices.

So far the High Authority has made no public announcement about this "gentlemen's agreement" and indeed the Treaty governing the Community is obscure in defining the jurisdiction of the Authority on matters of this kind. The industrialists taking part insist that they are not forming a cartel, since their arrangement does not extend to quota fixing nor does it specify sanctions against offenders. It is probable that the High Authority will eventually lay down some basic rules for the organisation, leaving its day-to-day management in private hands, just as it did in the case of the Community's scrap association.

It is becoming clear, however, that at some point the High Authority will be held responsible for those actions of the Community that affect non-member countries. Searching questions on this very point have been put to the Authority by the economic committee of the Council of Europe at a recent meeting in Luxemburg. These discussions led to M. Monnet's extremely interesting declaration that the Community would welcome requests from any new country, whether producer or consumer, for membership. The Community, he said, was not intended to be an exclusive organisation of producers and was anxious to widen its markets. His invitation can be regarded as a response to growing pressure for membership in the Community from consuming countries, especially in Norway and Denmark. Norway has already joined the ranks of countries with special delegations at Luxemburg—Britain, the United States, Sweden, and Switzerland—and Denmark is about to do so.

How Much Health ?

FOR the third year in succession a spring storm has broken over the cost of the health service. Two years ago Mr Bevan resigned in protest at the charges imposed by the Labour government. Last year the Labour party was united in disowning its own charges as well as in opposing those introduced by the Conservatives. Last week Mr Macleod's innocuous announcement of an independent inquiry into the present and prospective cost of the service provoked wild abuse from Mr Bevan ; there is talk of a motion of censure after the recess. To the Labour party, and to Mr Bevan in particular, the health service budget is clearly sacrosanct.

Yet an inquiry is long overdue. Had the burden it would throw on the Exchequer been realised in 1946, when the cost to the taxpayer was estimated at £120-£130 million a year, it is possible that not even a Labour government would have been quite so carefree about it. Since 1950, the cost has been virtually stabilised at around £400 million only by the imposition of charges on the patient and strict control of hospital budgeting. No one pretends that this limit represents any close measurement of the amount the taxpayer can afford for the health service. Nor does anyone pretend that, within the service, the right amount is being allocated to each branch ; it is certain, for instance, that the mental hospitals have come off badly.

These are not questions that can be answered, as was suggested in the House of Commons, by the Select Committee on Estimates. This body has already reported on the administration of the health service and was unable to make recommendations on a matter as important as block grants to hospitals, because it was a question of policy. Issues like this will, however, be within the terms of reference of the new committee. It will also have to consider the two basic influences on the cost of the health service, which were ignored in 1946 but were clearly set out a year ago by Dr Ffrangcon Roberts in his book "The Cost of Health." These are the ageing of the population and the increasing complexity and specialisation of medicine. Both factors tend to push up the cost of the health service indefinitely. Mr Guillebaud's committee has the difficult task of deciding how far they should be allowed to.

Lightning Conductor for Nationalisers

IT is easy to understand why the Co-operative party, at its Easter conference, accepted a report proposing the nationalisation of rented land. To the rank and file of the Labour movement, a programme containing nationalisation proposals is recognisably Socialist, a programme omitting them is almost automatically suspected to be the work of faint-hearted and time-serving trimmers. The nationalisation of land has, moreover, a particularly valuable emotional appeal to the section of Socialist opinion that draws its ancestry from the old landlord-hating single-taxing, Radical wing of the Liberal party.

The proposal also has the practical advantage, compared with other possible nationalisation schemes, that it can be embodied in legislation by a future Labour government without committing that government to any rash and sweeping executive action, or indeed to any immediate action whatever. It is far less uncomfortable to be committed to the piecemeal acquisition—at whatever pace appears most convenient—of rented land, than to be pledged to apply the sledge-hammer and bulldozer of complete nationalisation to, say, Imperial Chemical Industries, or even to re-scramble the unscrambled steel and road haulage industries.

There are negative virtues of the Co-operative proposal, which is believed to be very like the scheme for land nationalisation now being argued about by the Labour party's own policy makers. Its positive faults are grave. At the best, it can serve as an efficient lightning conductor. The methods and timing of nationalisation proposed in the Co-operative report aroused plenty of controversy at the conference, and the national committee was instructed to produce a revised and amplified version next year. In this sense, land nationalisation may give the zealots something to think about—which is an advantage if, but only if, other people in the Labour movement get on with the overdue job of framing a realistic policy for an alternative government.

Teachers Make Themselves Scarce

THE National Union of Teachers spent Easter at Blackpool letting off steam at Miss Horsbrugh and all her works. The conference also performed its annual somersault, which begins by deploring the shortage of teachers and ends by advocating measures to make the shortage more acute.

The union's president said that there are too few teachers because too many pupils leave the grammar schools at 15 and 16 ; the remedy he proposed was bigger maintenance grants from local authorities to pupils who stay on. For the last four years these grants have seldom been more than £26 a year, and there may be a case for raising them to cover higher living costs. But the fantastic suggestion has been made that they should be comparable to the wages the child would have earned if he had left school: in other words, that parents should be heavily bribed to take advantage of schooling that is already free, of opportunities that can bring their children success. Could the abdication of parental responsibility go further ?

It is true of girls' grammar schools that their sixth forms are no longer large enough to staff the teaching profession—although there is little or no shortage of men teachers. Of those girls who do stay at school after they are sixteen, two-thirds become teachers ; but seven out of every ten grammar-school girls leave before they are seventeen. If nothing can be done to prevent this happening, the best hope of recruiting more teachers seems to be to modify the qualifications for entry to the training colleges. At present they can be relaxed in exceptional cases. One local authority, for example, has very sensibly recruited girls from the modern schools, by giving them a special course before they enter the training colleges ; and no doubt they are perfectly competent to teach younger children. But any such arrangements are always bitterly opposed by the National Union of Teachers. Their aim is the contrary one of raising the standard of entry and lengthening the training from two to three years ; and they argue that the way to get more teachers is to pay them more. Any lengthening of the training is obviously out of the question at present. But it is easy to understand the conference's decision to terminate, next March, the Burnham agreement that governs teachers' salaries.

Israel or the Canal

THE meeting of the Council of the Arab League, which has been taking place in Cairo this week, has done little to paper over the cracks between the member states, and the prospect of a united Arab front when Mr Dulles visits the Middle East next month is certainly no nearer. The trouble is that, although the new American Administration seems likely to lend a much more favourable ear to the Arabs' aspirations than the last, they disagree in their demands both on priorities and on tactics. The Egyptians can think of nothing but the Suez Canal ; the other Arab states are still obsessed with the struggle against Israel.

Egypt has already tried and failed more than once to get the other Arab states lined up behind its stand against negotiating any form of Middle East defence agreement until the British quit the Canal Zone. They refuse because they are not entirely opposed to such an agreement ; indeed, Jordan and Iraq are committed to some extent already by their treaties with Britain. At the same time, the key to the situation lies in the fact that the Arab states would not come into an agreement unless it improved their position in relation to Israel. But here they are divided among themselves on tactics. Some people in each country, Lebanon, Syria, Jordan and Iraq, argue against being too difficult, since to come to terms with the West would mean a flow of arms anyway. Others believe that their greatest opportunity to bargain is now and should not be thrown away. What all forget is that the British, French and Americans have in effect guaranteed the security of Israel since 1950, and that if the defence of the Middle East is to have any reality there must be agreement both on the Canal Zone and on the Israeli question.

Rivals to Mr Yoshida

THE Japanese electorate is to go to the polls on April 19th for the second general election in six months, the consequence of the recent vote in the Diet against the government of Mr Yoshida, whose Liberal Party had gained a narrow majority over all other parties. The principal new features of the political situation, as compared with that which existed at the time of the popular verdict last October, are the emergence of a new party formed by the faction of the Liberals which has seceded under the leadership of Mr Hatoyama and the sharpening of the challenge to Mr Yoshida's policy from the Right. During the occupation period his Liberals represented Japanese conservatism as far as it was practical politics to go ; for in those days nobody ventured to attack the new democratic constitution that had been bestowed on Japan by American tutelage, or to reassert the values and aims of a political order that was supposed to have been abolished. Purges and trials likewise limited the field of personal rivalry in politics ; Mr Yoshida was almost the only eminent public figure of the Right who was regarded as innocent of complicity in Japan's aggressive policies, whereas Mr Hatoyama was purged for former pro-Nazi utterances, and Mr Shigemitsu, now leader of the Progressive Party, received a prison sentence as a war criminal.

Today there is a considerable revival of old-fashioned Japanese nationalism, with demands for a revision of the constitution, a rebuilding of national military power and a foreign policy to include claims for recovery of Karafuto and the Kuriles. Mr Hatoyama and Mr Shigemitsu, now freed from their former disabilities, are leading the new trend, and Mr Yoshida is left as the champion of a middle-of-the-road policy in both domestic and foreign affairs. The Hatoyama Liberals and the Progressives have put up 271 candidates between them against the Yoshida Liberals' 316, and they are expected to make a large dent in Mr Yoshida's former majority.

The dissensions on the Right might be the opportunity of the Left were it not that the Socialists are now even more sharply divided than they were six months ago into two separate parties, which have been unable to reunite even in a *bloc* for electoral purposes. The issue between the Right and Left Socialists in Japan has a certain resemblance to the Attlee-Bevan feud in this country, but has developed much further. The Right Socialists adhere to the Socialist International and are resistant to Communism, while the Left Socialists are neutralist, anti-American and strongly attracted by Peking. The distinction between the Left Socialists and the Communists is, indeed, much less clear than that between the Socialist wings. The Japanese Communists themselves are putting up a substantial number of candidates, and it remains to be seen whether they will succeed in increasing their present very small parliamentary representation.

Nehru and Nazimuddin

IT is good news that the prime ministers of India and Pakistan are to meet during the next few weeks. Both are expected in London for the Coronation, but it is now understood that they will have direct talks before that. These would be the first since 1950, and the first since Mr Nazimuddin succeeded Mr Liaquat Ali Khan as prime minister of Pakistan. The stage has already been favourably set by the recent three-year trade agreement between the two countries. This came into effect on March 25th and governs the two key questions of jute supplies for India and of Indian coal for Pakistan.

Correspondence about a meeting began between Mr Nehru and Mr Nazimuddin over the question of passports, lately imposed for the first time by Pakistan on those moving from one country to the other. Since then, however, far greater importance has become attached to the dispute over the use of water from the river Sutlej in the two Punjabs. The Pakistanis, their economy at present in a very bad way, have developed the same kind of pathological fear about lack of canal water that is shown by Egyptians about the Sudan's position further up the Nile. And not entirely without reason. For, as in Kashmir, India is in fact in the stronger position and appears to be unwilling to make what it regards as concessions.

Mr Nehru's recent statesmanlike appeal that policies be thought of not in terms of the anger and passions of today, but in the light of the more distant future, must have rang hollow to statesmen in Karachi ; for he had spoken in the same breath of the "narrow and bigoted outlook" which had brought Pakistan to its present pass. But Mr Nehru has a way of often being right. The Pakistani government has lately been under severe political pressure from its over-religious supporters ; moreover, whenever there has been a lull in the cries of the mullahs, the prices of consumer goods have taken another spiral upwards. But what both countries need is genuine peace in the sub-continent, and, if previous meetings of their prime ministers are any guide, nothing is so effective as these personal contacts. They are all too rare, and no effort should be spared to bring them about.

Graduates' Employment

THE annual reports of the university appointments committees can never give a complete picture of the placing of graduates in their first jobs, since many find their way independently into employment—though of these a certain number register later in hopes of a better second start. The reports do, however, provide at least a significant index of preferences and opportunities. This year's report by the Oxford committee records an increasing use of its services by employers and graduates alike ; notes that half the permanent posts offered were for men with scientific qualifications ; and confirms the symmetrical and ominous fact that science graduates are, in overwhelming majority, averse to school-teaching. The number of vacancies offered for arts graduates in industry and commerce rose last year by only one per cent—a discouragingly small reflection of business's often-expressed need for recruits of the highest non-technical ability. The "gulf between administration and expertise" has still to be bridged.

It is noteworthy that the great majority of employers offering jobs for arts men "revealed interest in how the candidate worked and what part he played in college and university life rather than the subject he read." This is natural enough ; to the business employer an arts degree is simply evidence of general intellectual quality and of capacity for application. It hardly matters in what field this quality and capacity have been displayed ; it matters a good deal more that the candidate for employment should also have shown himself to possess the qualities of character that are demonstrated in community life rather than in the examination hall or the tutor's study.

This difference between the academic and the industrial or commercial assessment of the "highest ability" has in the past been responsible for some wasteful misplacings and for a regrettable, if understandable, prejudice against the university recruit to business. The growth of a better mutual understanding of needs and qualifications is encouragingly recorded in the expansion of the activities of the appointments committees. With them rests, in great measure, the responsibility for avoiding one grave danger inherent in the widening of the educational ladder and the growth of the graduate population: the danger, that is, of creating a chronically under-employed class of frustrated mandarins.

The Cruel Sea

IF the country's sea defences are to be in a condition to stand up to next winter's storms, works will have to be completed in six months which would normally take 10 to 15 years. On 1,000 miles of coastline the sea this winter made 1,200 breaches, now only temporarily stopped. In these circumstances the Government is right to introduce the exceptional legislation that came before Parliament just before Easter. The Coastal Flooding (Emergency Provisions) Bill will enable river boards to do the large-scale work with the necessary urgency. The first part of the Bill gives power to the Minister of Agriculture to authorise river boards to enter upon land, construct new defences and drains, build access roads and the like without going through many of the normal formalities which protect the private rights of citizens and are in some cases required by local bye-laws. The power is substantial—but is limited to the period ending June 30, 1954. The second part of the Bill provides payments to farmers for the restoration of the 158,000 acres of land that was inundated and impregnated with salt, but it also gives the Minister reserve powers to coerce any farmers who are recalcitrant or negligent.

The Bill is to be treated as a non-party measure, and was welcomed by both sides of the House as comprehensive and necessary, however drastic. Labour members, however, expressed the tenderness for private rights which they considered would have been even more strongly urged by government members had they been in opposition and been faced with such a Bill. Some amendments providing for rather more power to appeal against decisions and bargain about compensation may be advisable. Parliament also showed doubts about the proper co-ordination between authorities, and over the relation of the short-term measures now to be taken, for which the government is authorised to advance £10 million, and the long-term measures to be worked out by Lord Waverley's committee. But time is short and the sea is a remorseless enemy unhampered on its side by private rights ; the committee and tribunal work must be cut in retaliation, even if it means some cost in normal liberties.

Two and a Half Per Cent

The difficulties which beset the Chancellor of the Exchequer in these days, when he looks round in order to see how he can lighten the burden of the country in relation to our enormous national debt, and to enable the public to participate in the advantages of the greater abundance of capital which it is manifest this country possesses, are not confined to the huge amount of stock upon which he must operate, if he attempts a conversion to a lower rate of interest in the ordinary way, but he is embarrassed in a still greater and more formidable degree, by the fact that, as the law now stands, the stockholder is entitled to twelve months' notice before any such operation can be effected . . . Mr. Gladstone has for the first time laid the foundation for a permanent and irredeemable stock paying 2½ per cent. The great advantage which it is to accomplish this object, as the foundation of future operations, is the only ground on which the conversion of the present stock into one of a higher capital (£110) could possibly be justified. There is no principle in relation to the creation of a public debt, which we regard as more unsound or improvident, as that which, for the sake of securing a present apparent low rate of interest, creates an obligation nominally higher than the amount actually borrowed. As a rule in making loans, it would obviously be always more profitable rather to pay a high rate of interest and to create a low amount of debt, because if the value of money becomes less, there is always the option of converting stock to a lower rate of interest, but there is no means of reducing the amount of the debt.

Books & Publications

Development and Salvage

OUR UNDEVELOPED WORLD.
By L. Dudley Stamp.
Faber. 187 pages. 18s.

DR STAMP approaches the perennially overheated Malthusian debate from its cooler side—that of geography. His concern is to give solidity, both qualitative and quantitative, to that rather ambiguous concept the "underdeveloped area." "Underdevelopment" is a term which can be used on the one hand as a euphemism for poverty and ignorance, on the other as the expression of latent and unexploited potentialities. In both senses it is relevant to policy; but in one sense it is relevant to humanitarian rescue, in the other to productive investment at the point of highest return. Dr Stamp's primary interest is in "underdevelopment" in this second sense. The mid-century population of the world is of the order of 2,350 millions, and growing fast; fastest—and here is the first shock for Dr Stamp's readers—not in the teeming East but in the Americas. (In 1947 the crude birth-rate of the United States was equal to that of India.) A survey of the world's "cultivable" surface, including tropical rain-forest and savannah, shows a substantial but diminishing margin over the minimum area per head calculated as necessary for a "minimum adequate diet." The actually cultivated area, on the other hand, is already grossly deficient. Can one infer that there are "vast" areas undeveloped and awaiting utilisation?

Dr Stamp considers in turn that equatorial belt which has held out so many delusive promises in the past; the tropical savannahs of Africa, graveyard of the groundnut scheme; the arid and semi-arid zones which irrigation may fertilise only to poison; the far north with its frontier of permanent frost; and our own mid-latitudes. After discussing geology and ecology, rainfall and erosion, crop yields per acre and per worker, he reaches the paradoxical conclusion that the real undeveloped lands, whose full exploitation offers the fairest prospect of that "minimum adequate diet" for humanity, are those of the United States, Canada and Argentina. Cultivated as Denmark is cultivated, these could provide an addition to world food supplies compared with which the possible output of the tropical lands "seems to fade into insignificance."

How this addition to the human diet should reach the mouths that most need it is, of course, another matter; before the Dollar Curtain Dr Stamp throws up his hands and calls on economists and politicians for an answer—not without posing, first, what is surely the central question of world food policy: "If famine in India or China or Africa is to be explained primarily from population pressure . . . should the Western nations be compelled to accept such a position, or should their help be contingent upon conscious efforts . . . to change social conditions?" Has the West an unlimited moral obligation to underwrite, by its own work and sacrifice, any and every demographic explosion on the face of the globe? Even the most stalwart equalitarian may hesitate before answering "Yes," and from moral obligation to practical policy is a still farther cry. Yet to make aid—under Point IV or otherwise—conditional, would be "dictation and a new form of imperialism." Dr Stamp's survey of the "estate of man" is in a technical sense highly encouraging; his concrete suggestions for the development and conservation of that estate, based on long study of land utilisation, are constructive, practical and humane; but his disclosure that its potentialities are as unevenly distributed between haves and have-nots as its present yields leaves the Malthusian problem as thorny as ever.

The Miners' Struggle

THE MINERS. *Volume II. The Years of Struggle.*
By R. Page Arnot.
Allen and Unwin. 567 pages. 35s.

MR PAGE ARNOT is a Communist publicist commissioned by the National Union of Mineworkers to write a history of its forerunner, the Miners' Federation of Great Britain. This volume, the second in a series of three, covers the period from 1910 to 1930, years of bitter struggle and frequent national strikes, in the course of which the hostility between owners and men became ineradicable. The faults of Mr Page Arnot's treatment of such a story are not those that might be most expected. There is no attempt to force the facts into a framework of rigid Marxist analysis. Indeed, one could do with far more analysis: more discussion of the changes in outlook which impelled the federation to elect in turn such strikingly diverse General Secretaries as Thomas Ashton, Frank Hodges and Arthur Cook; more attempt to explain the difference between the districts—the relative militancy of South Wales, Lancashire and Scotland and the relative caution of Northumberland, the Midlands and, to a lesser extent, Yorkshire; and, above all, more attempt to set the strategy of the federation against the background of a declining industry, under inefficient management, in a stagnant economy.

It is not that Mr Page Arnot is too preoccupied with the human suffering involved to have time for such abstractions. He avoids by a fair margin another frequent Communist fault—that of regarding every agitation and every strike as a rehearsal for revolution and good for its educative effect without regard to its immediate result. But if this is because he feels deeply with the miners, it is not apparent from his narrative. The spirit of the miners, in their isolated and close-knit communities, comes through only in the first few chapters, which are a prelude to the main part of the book, in a few quotations from Herbert Smith, their dour Yorkshire President, and in some of the excellently chosen photographs. For the rest the story is told too much in terms of London negotiations. The picture which emerges is that of a number of men of great honesty and strong character, sometimes a little overwhelmed by the difficulty of the battle in which they were engaged, sitting in their Russell Square offices and exchanging rather stilted letters with the Prime Minister of the day.

In his account of the negotiations, Mr Page Arnot's predisposition towards militancy is never far below the surface. In particular, he is consistently impatient of hesitancy on the part of the miners' allies in the Triple Alliance or the Trades Union Congress. As a result, he oversimplifies one of the great problems of the Labour movement in the twenties. The miners were the best organised but most exposed section of the working class. As such they alternated between a desire for support and a sullen determination to "go it alone." This created a series of difficulties for their allies, which are not without some parallel in the international politics of today. Ernest Bevin, characteristically, wanted to solve them by the abandonment of the right of unilateral decision, from which would follow greater unity of action. But Mr Page Arnot hardly discusses this issue.

Nevertheless, the book has considerable merits. It is well documented and the narrative, despite a few quite dreadful sentences and an irritating habit of referring to some individuals as though the author were addressing an envelope to them, is on the whole clear and precise. Biographical footnotes on the leading characters would have been a considerable help.

Repulsive Figure

HIMMLER.
By Willi Frischauer.
Odhams Press. 270 pages. 16s.

WITH the exception of Hitler, none of the leaders of the Third Reich repays study so much as Heinrich Himmler. His personal qualities were negligible. Compared with Goebbels or Goering, leave alone with Hitler, he was a zero, without the intelligence of the first, the brassy self-confidence of the second or the magnetic powers of the third. His importance lies in an unusual conjuncture: he combined the most powerful position in Germany after Hitler's with the most literal belief in the racist fantasies which served as the ideology of Nazism. His career thus provides a unique double key alike to the struggle for power which dominated the internal policies of Hitler's Germany and to the mentality of Nazism.

In writing the first life of this repulsive and sinister, yet unimpressive figure, Mr Frischauer has neglected neither interest. He has read widely, if sometimes without discrimination, and he has made good use of the talk which was current in SS and party circles. The picture which emerges is a recognisable likeness, but as a serious study it is marred by the same faults as the author's earlier book on Goering. Apart from a style that too frequently borders on the sensational, Mr Frischauer is uncritical in his use of sources and rarely bothers to cite chapter and verse for his facts or his quotations. As a first attempt to collect the evidence the book is worth reading, but its permanent value is likely to prove slight.

Democracy Overseas

DEMOCRACY IN THE DOMINIONS.
By Alexander Brady.
University of Toronto Press (London: *Geoffrey Cumberlege*). Second edition. 604 pages. 52s.

IT is five years since Professor Brady published the first edition of this book and a great deal has happened to the British Commonwealth in that time. Much of it, however, does not directly affect the subject-matter of the book, for the author confines himself to a discussion of the working of democracy in the four "original" Dominions, the countries of overseas settlement—Canada, Australia, New Zealand and South Africa. For this reason there was no discussion of Ireland in the first edition—not, as the author explains in his preface, from any

> doubt whether Ireland was a Dominion or whether she was in the Commonwealth but by the circumstance that in character she was different from the young nations which developed from colonies in the last century and whose people experienced the social transformations of settlement in new and often severe lands.

For similar reasons it was considered proper in this second edition to exclude a consideration of the new Asian members of the Commonwealth—India, Pakistan and Ceylon—which have been established since the first edition was published.

Although it may seem odd to write a book on democracy in the Dominions and to leave out most of the interesting and difficult cases, and to exclude thereby the governments of the overwhelming majority of the people of the Commonwealth, there can be little doubt that Mr Brady is wise to exclude them, at any rate at this stage. It is too early to speak yet of the working of democracy in the Asian members of the Commonwealth; even if it were not, an attempt to understand the working of democracy in the four Dominions for which some comparisons can be fruitfully attempted should be made before the extremely difficult task of comparing its working in all the eight members is undertaken.

Although politics in the Dominions concerned, apart from South Africa, are often dull, Professor Brady has written an interesting book. It runs to over 600 pages, and it contains a great deal of information upon the political systems and policies of the four countries. The author's judgments are sober and, indeed, often ordinary, but they are always sensible and sound. He will not provoke thought upon the Commonwealth as a writer like Professor W. K. Hancock invariably does, but he provides a good basis for study. He has added a new part to the second edition. In this he devotes much space to a comparative study of his material—an important improvement upon his first edition. He is never narrowly constitutional or political, but shows an appreciation of economic and social forces and institutions which enriches his book. It is to be hoped that he will be encouraged to attempt a similar study, in a separate volume, of the working of democracy in the Asian members of the Commonwealth.

Statistical Methods

STATISTICAL THEORY IN RESEARCH
By R. L. Anderson and T. A. Bancroft.
McGraw-Hill. 398 pages. 59s. 6d.

ASSOCIATED MEASUREMENTS.
By M. H. Quenouille.
Butterworths. 242 pages. 35s.

BOTH these books are intended to familiarise research workers with statistical methods, but they differ both in scope and in treatment. The first is essentially a text-book presenting the theory in a formal manner with numerous examples to test the understanding of it. This book cannot be recommended as a first introduction to statistics, but it will be of use to those research workers already familiar with general principles who want to grapple with the underlying mathematical concepts. A considerable amount of material is presented, ranging from matters such as the theory of estimation, tests of significance, the properties of the chi-square distribution, to the analysis of variance and regression analysis and their link with the classical method of least squares. Special attention is given to the design of experiments, and for those who have to make extensive use of statistics, there are useful lists of references to original sources.

But the book has been condensed too much; it suffers from insufficient explanatory discussion to bind together the mathematical theory and an overzealous desire to set everything down as rules or theories. Possibly this adds to its value as a reference book—which is one of its objects—but it does not make for easy understanding. It also seems unfortunate that it has been felt necessary to give only a minimum treatment to the theory of probability, since it is the parent of mathematical statistics.

Mr Quenouille has confined his book to a study of the associations between quantitative measurements and he deals with it very competently. A particularly useful chapter shows how far graphical treatment can be used to decide whether or not there is a relationship between two or more variables. While the full regression analysis is discussed, some quick approximate methods are given which are useful when exactness is either not necessary or would take a prohibitively long time. A short introduction to the analysis of time series is included, distinguishing between trend and serial correlation. The amount of mathematics has been kept to a minimum, but it has been well mixed with practical application to produce a valuable book.

The Party First

THE COMMUNIST TECHNIQUE IN BRITAIN.
By Bob Darke.
Penguin Books. 159 pages. 2s.

IN 1933 Mr Darke, aged 25, unemployed, and of solid working class origin and upbringing, became chairman of the Hackney branch of the National Unemployed Workers' Movement and joined the Communist Party. Until May, 1951, he worked unremittingly in the borough for the Party, and this book gives simply but vividly the record of his eighteen years as a Communist NCO in

THE PROCESS OF ECONOMIC GROWTH
By W. W. ROSTOW
25s. net

This book presents and illustrates a general framework for the analysis of the growth and fluctuations of economies. Since growth is partially dependent on the political, social and cultural framework of societies, an effort is made to link such non-economic variables to the structure of modern economics. Keynesian income analysis emerges as an essential part of the mechanics of the system, but not as its central feature.

ECONOMIC STABILITY IN A CHANGING WORLD
By JOHN H. WILLIAMS
30s. net

The essays and papers collected in this volume centre round the application of Keynesian economics to current international problems. Professor Williams discusses fully the relationship between economic theorising and actual events; himself an adviser on American aid to postwar Europe, he devotes several papers to a detailed examination of the Marshall Plan and to the long-term development of American economy under peace conditions. A final essay considers Keynes's monetary theory.

OXFORD
UNIVERSITY PRESS

the class war. As a trade unionist and a borough councillor he realised every day of his life and in every facet of his life four basic tenets of western Communism: that every situation is a political situation; that the party member's first responsibility in every post he holds is not to his constituents but to the Party; that Communism's advance depends above all on the Party's influence in the trade union movement; and that industrial and social conflict *per se* always benefits the Party.

For almost eighteen years Mr Darke conformed in every detail. As a borough councillor he "activated" cycling clubs, tenants' associations, groups of old age pensioners, the tuberculous, pacifists, parent-teacher associations, anti-Mosley demonstrations and anything else that came to hand. As a trade unionist he, with the help of his faction, committed the branch to endless Party resolutions, supported any and every strike, hand picked union officials, and dominated Trades Councils. At no time did the membership of the Hackney branch exceed 800, but thanks to hard work and organisational ingenuity their influence, especially in the trade unions, was out of all proportion to their numbers.

Those who argue that Communist trade union officials are primarily "good trade unionists" should remember that when the Party first applied for affiliation to the Labour Party it declared that "in all cases representatives must be considered as holding a mandate from the Party and not from the particular constituency for which they happen to sit. In the event of any representative violating the decision of the Party . . . the resignation follows of his or her membership of Parliament or municipality and also of the Party." The same principle applies in the industrial field and it is, therefore, no surprise that on the eve of the 1952 Trades Union Congress and Labour Party Congress Mr Pollitt was able to announce to his *friends*:

> Six annual trade union and co-operative conferences have gone on record against *rearmament of Western Germany*; thirteen trade union and co-operative conferences have gone on record for either a Five-Power Peace Pact, or peace through negotiation; eleven trade union conferences have gone on record against the policy of rearmament . . .; eight trade union conferences have gone on record for East-West trade; 28 trade union conferences have passed resolutions demanding wage increases; and seven trade union conferences have recorded votes against atomic and bacteriological methods of warfare.

Mr Darke's book, with its account of how such things come about, ought to be read and pondered by rank and file trade unionists everywhere.

Letters to the Editor

Australia

SIR—May I refer to two points in your survey of Australia? Your mention of a surplus in the 1951 Budget might imply that spending was reduced by that amount and a deflationary effect produced. The nominal surplus, about £100 million, was merely transferred from public to Government and used to finance capital expenditure on State public works. In fact, taking State and Commonwealth works together roughly £300 million of a total budget of about £1,000 million was so spent. Since it will be long before these come to fruition, the immediate effect was inflationary rather than the reverse.

Owing largely to our excessive cost structure, signs of a recession, together with the failure of the loan market, had occurred some months before the Budget itself. It is therefore highly questionable whether "draining off purchasing power" (the Treasurer's own phrase) was the right policy at all. It was indeed carried out, if not by the Budget, then by credit restrictions; but here, I think, your comment is quite appropriate that the axe rather than the surgeon's scalpel was employed. But in any case this policy was inconsistent with the policy of extravagant allotments for public works which the States have not always handled efficiently.

For the last two years we have been attempting the utterly impossible task of financing our own development on top of the rising cost structure. Fortunately costs are rising no longer, but they are excessively high. Until we convince the outside world that we have stabilised them it would be optimistic to expect a large inflow of outside capital.

A number of factors which you mention contribute to this problem. One is the link between prices and the basic wage. This can be ended in one of two ways; either by the Government abandoning the Federal Arbitration Court or by a Federal assumption of complete powers over trade and industry which would involve a referendum. Either course seems most unlikely. The other factor is the state of unbalance between rural and industrial economy. Except in the case of wool, almost all rural products have their prices or profits limited by various means either by internal price control or by external marketing arrangements. It is natural, then, for capital expansion and for labour to flow into commerce and industry. Excessive taxation makes matters worse.

It is fair to add that commercial life has adjusted itself to the present costs to a degree which three or four years ago would not have seemed possible, but the future snag, of course, will be capital replacement and high capital costs. An even more serious aspect in the long run is that margins for skill and for brain work have been reduced to a disastrous extent and are in many cases literally a minus quantity. It will be extremely hard in any circumstances to readjust this.—Yours faithfully,

W. O. FAIRFAX

Sydney

★

SIR—The main arguments in your article, "The Price of Economic Growth," cannot fail to lose some weight in Australian eyes, for it is obviously in the interests of British consumers and exporters for Australia to increase primary production and decrease secondary. There is no possibility whatever of this happening if the forces of what was called "men, money and markets" in the nineteen-twenties are to be relied upon. *Laisser faire* has produced the problem, and *laisser faire* will do no more than continue to push it in the same direction.

It is impossible to do more than mention a few of the fundamental propositions underlying your argument. You couple (as we have always done) the need for population and development to secure Australia against Asian expansion. Is it not obvious that a more highly developed Australia would be far more of an attraction for Asia than an arid and backward one? If we greatly increase primary production exports we will earn more sterling. If we are to get the capital needed for national development in exchange we would have to turn to the dollar area. You recognise the limitations of dollar spending since the war (page 690). Is this not likely to become a critical and permanent problem in the event of a much higher permanent level of Australian exports? There still remains the most fundamental problem of all—Australia's export industries employ little labour per unit of output. Australia's present position is the outcome of population artificially increasing by immigration for non-economic reasons, and now the problem is to find it economic employment.

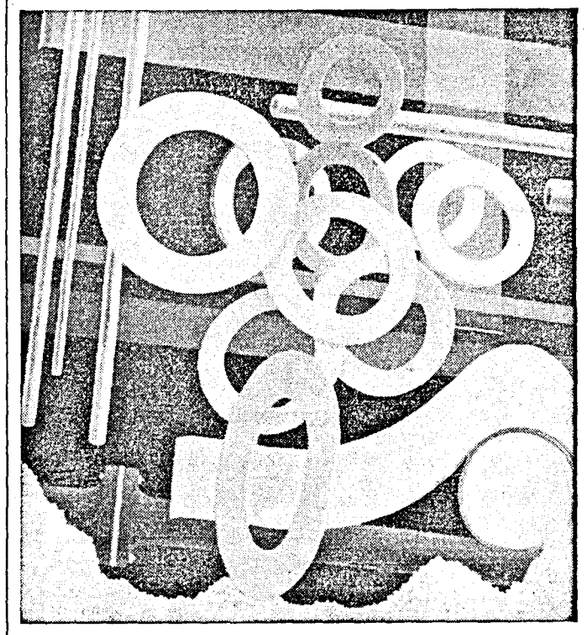
In an attempt to solve this problem in the past Australia turned to tariffs and measures to secure compensatory redistribution of income. Export income was left subject to world inflationary and deflationary forces, as was capital development in industry. The Australian method has now proved unsatisfactory. The future, however, does not hold more *laisser faire*, but less. It means a great deal of Government inspired and directed action in accordance with a national plan, for, as you conclude, "to allow the uncontrolled interests of the economy to run where they will must certainly cost Australians their living standards and could conceivably cost them their country, too."—Yours faithfully,

J. F. CAIRNS

University of Melbourne

For twenty-six years Tommy Brooks has been Head Carder at one of Vantona's Spinning Mills. He keeps constant watch on the standard of Vantona Textiles, for he has oversight of all stages of production from cotton to yarn. His extensive fund of knowledge, accumulated in forty-seven years on the job (by the way, his wife had forty-four years' service) fully fits him to settle new problems, and to give advice to the younger generation in the Carding Room, so that they, in their turn, might acquire the same skilful knowledge and pride in their jobs, which is the key to the world-wide demand for Vantona Textiles.

Tommy Brooks's is the kind of experience that sets the seal on the standard of every piece of merchandise that leaves the Vantona Mills. In all corners of the globe this high standard upholds the 'British is best' tradition. Craftsmanship and pride in good work prevail among the 'cotton people' of Vantona, and it is their devotion and skill which ensures the excellence of Vantona products.



No Vantona dyes are absolutely permanent—they are only as fast to sun and wash as modern science can make them.

FLUON GASKETS

A CHEMICAL manufacturer in Manchester, making sulphuric acid, found that the packing rings joining two pipes in his plant would not stand up to the highly corrosive action of the boiling acid. As a result, the joint leaked and production had to be interrupted every two weeks whilst new packing rings were fitted. Having tried different types of jointing material without success, the manufacturer asked I.C.I. if they could offer a satisfactory alternative. The problem was referred to I.C.I. Plastics Division, who at that time were engaged in the experimental manufacture of "Fluon"—a fluorine organic compound which is completely resistant to acids, alkalis and solvents. A number of "Fluon" rings made specially by the Division's technical service department were supplied and fitted to the joint. These proved entirely satisfactory. The "Fluon" rings and the joint are still intact today after more than four years of constant use! "Fluon", in the form of valve seats, tape, packings and gaskets made by trade fabricators, is now used by the chemical industry in the manufacture and storage of corrosive liquids.

Offshore Oil—A Precedent?

Washington, D.C.

IT is very probable that the first Republican law for twenty years to reach the statute book after being passed by a Republican Congress and signed by a Republican President will be one that repudiates many of the best traditions of the Republican party. Last week the House of Representatives approved, by 285 to 108 votes, a Bill to give control of petroleum and other minerals which may be found under the sea to the adjoining states. The Senate had already held its committee hearings on the subject and began its debate on the measure this week; although there will be vigorous opposition, it is virtually certain that the Republicans will have enough support from southern Democratic Senators to enable them to carry the measure. When twice before, in 1946 and 1952, Congress passed a similar Bill, Mr Truman had no hesitation in exercising his veto. This time the new President is the proposal's avowed and enthusiastic supporter.

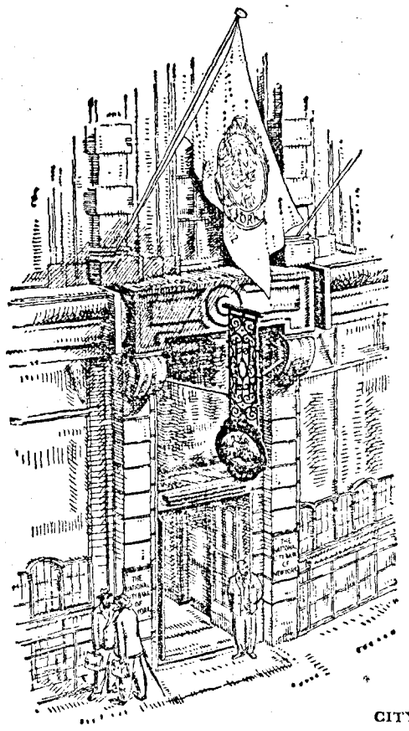
In the Gulf of Mexico the American continent dives only gradually below the waves, and in places the continental shelf extends outward for a hundred miles or more at depths at which modern ingenuity can develop its resources. Ever since oil became worth exploiting, three states with known oil deposits off their shores, Texas, Louisiana and California, have persistently claimed that this underwater ground was within their own borders, and therefore within their own power to lease or develop. Successive Democratic Administrations, upheld by two Supreme Court decisions, maintained that the federal government—that is the United States itself—had paramount power over the offshore lands.

Whether General Eisenhower had ever considered the problem before he gave his support so decisively to the position of the states may be doubted, but by so doing he enhanced his popularity enormously in the southwest, and especially in Texas; this was the nearest that he permitted his advisers to bring him to a direct purchase of votes, and in view of his overwhelming victory even this was unnecessary. Now the promise is being redeemed, but not quite in the coin the coastal states had been led to expect. The Attorney General has concluded that they can only claim title to resources within their "historic boundaries." These are the offshore boundaries the states possessed before they joined the United States; for Texas and Florida they mean three "leagues," or ten and a half miles, out to sea, and in the case of the others three miles. Even the concession to the vagaries of Spanish measurements in Texas and Florida has been opposed by the State Department, which rightly fears that it will be hampered in its battles to persuade other nations, especially Mexico, to restrict their definition of their seaward boundaries to the three-mile limit. With wry faces the representatives of the Gulf and Pacific Coast states have accepted the Attorney General's ruling and the House Bill gives the states quitclaim rights to the submerged lands within their "historic boundaries" but reserves control over the rest of the continental shelf to the federal government. The Senate Bill is somewhat weaker since it does not specifically provide for federal control over the area beyond "historic boundaries." The measure has not gone unchallenged, for there was nothing during the election on which Republicans and northern Democrats were more flatly opposed, but there is as yet no aroused public opinion on the subject.

★

What is disturbing is not the offshore oil Bill itself so much as its demonstration of the apparently weak resistance of the Republicans to raids on the national assets still held by the federal government on behalf of the people as a whole. The government still owns one-quarter of the land in the United States, 455 million acres in the country itself and 365 million acres in Alaska; a century ago before the western states were carved out and the railway companies lavishly endowed, the government owned three-quarters of the land. It ranges from grazing land which is let usually to small farmers and ranchers, timber land which has been cautiously forested and conserved, and national parks to mineral resources, estimated at four billion barrels of oil and 325 billion tons of coal. It brings in a revenue of well over $300 million a year, of which two-thirds comes from the sale of electric power.

For many years the attack on the federal domain has been growing in intensity, from the big ranching concerns, from the oil interests, represented in equal strength in both political parties, and most particularly from the private power and utility companies. It takes various forms; in the case of power and lumber projects, the demand is that federal assets should be sold to the public. With careful disingenuousness Mr Charles E. Wilson, of the electric, not the motor, company, asked last September:



> What is wrong with selling our national dams, generating equipment and distribution facilities to the people? The potential buyers are all around us. They are the people who own government bonds. Bonds could be exchanged for shares of stock in the new companies to spring from the presently government-owned plants.

The national debt would be reduced and millions of citizens would own a tangible part of American business, added Mr Wilson. Soon after the election Mr Laurence Lee, the president of the United States Chamber of Commerce, inaugurated a crusade for "land freedom," the gradual transfer of all federal lands to private owners. More often, however, covetousness for federal lands appears decently clothed as a desire to see them "returned" to the states; the hidden assumption is that a state government would be more amenable to giving permission for the quick exploitation of land or resources than the remote, upright and powerful federal government.

Apart from the legal impossibility of "returning" property which historically belonged to the nation before any of the western states existed, the general Republican dislike of "big government" or any federal initiative even faintly reminiscent of the New Deal has led to an attitude of mind which, by permitting ruthless exploitation of natural resources, could weaken irreparably both the western states themselves and the rest of the country. Furthermore, the typical cry that the west is underprivileged in relation to the rest of the country, because almost all the federal land is situated there and state governments cannot levy taxes on federal property, is hardly justified. For like other poorer areas, such western states as Montana and Wyoming are indirectly subsidised by the richer states through the federal grants-in-aid which they receive for roadbuilding and other development projects.

It would seem that ingrained dislike of the New Deal has perverted one of the strongest and finest Republican traditions. With the exception of Franklin Roosevelt, the pioneering work in conserving the federal lands has been done by Republicans. The word "conservation" was invented by a Republican and the two men who arrested the frittering away of public lands and made them an example of careful development were Theodore Roosevelt and the intensely Republican head of his conservation service, Gifford Pinchot. Indeed, much of the political support which the Republicans gained in the west in the early part of the century rested on admiration and gratitude for federal safeguarding of natural resources. But now the chairman of the Senate Interior Committee, Mr Hugh Butler, of Nebraska, has hinted darkly at a Bill which would make the theory behind the offshore oil Bill "applicable to public lands." And he is likely to get the fullest support from Mr McKay, the Secretary of the Interior, and his new assistants, most of whom have been connected with private utility companies.

Offshore oil is clearly the opening shot of an attack that will be hotly pressed. It is, unfortunately, no adequate answer to say, as many Democrats are saying, that the Republicans are digging their political grave and making themselves very vulnerable to a rousing radical campaign next year. The public lands exist as such only as a result of the special historical development of the United States. As Mr Bernard De Voto points out in a recent issue of *Harpers* magazine: "If the public lands are once relinquished, or even if any fundamental change is made in the present system, they will be gone for good."

Trade follows this flag

In every corner of the world, wherever trade is possible, the flag of The National City Bank of New York symbolizes the march of commerce.

The National City Bank provides the means of making trade easier, safer, and more profitable. In a world of complex and changing regulations it offers business men an invaluable service: up-to-the-minute knowledge of trading conditions in all parts of the world.

The National City Bank provides this service through its network of 57 branches in 19 countries, and through its banking correspondents in every commercially important city in the world. The London branches of the bank offer, as well, an intimate knowledge of trade with the dollar countries.

A visit to The National City Bank of New York will always ensure the speedy and successful transaction of your business.

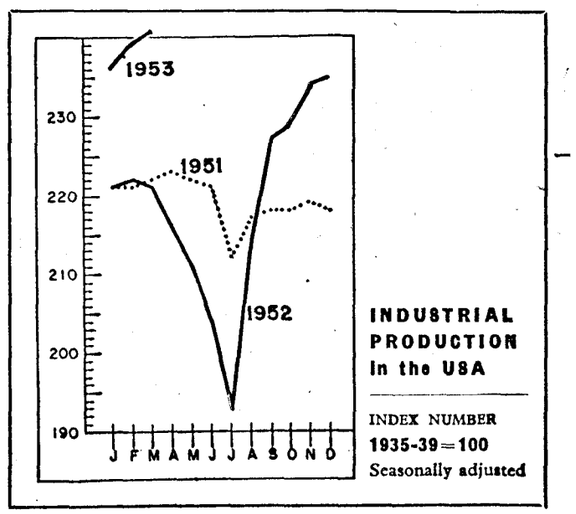
American Notes

Feeling Prosperity's Pulse

THE fresh hope of peace in Korea and the improved prospects for a more settled world, which have been inspired by the conciliatory approaches from Peking and Moscow, naturally depressed and unsettled the stock and commodity exchanges. They will probably recover from their immediate fears fairly quickly under the influence of the Administration's warnings that Communist words cannot be believed until they have been followed by a great many deeds. Furthermore, there is a widespread suspicion that the Russian move would achieve its real purpose if it threw the free world into chaos by upsetting the American economy. Nevertheless, the health of that economy will certainly be watched with new care should the improvement in the international situation be maintained. As a result more importance may be attached to the symptoms of recession which some economic specialists have already discerned beneath the present high flush of prosperity.

Industrial production has been breaking records for six months; 10 million tons of steel were produced in March for the first time; non-agricultural employment did not fall in February as it usually does; and businessmen are planning to invest more in new plant and equipment this year than last, contrary to earlier forecasts. But the satisfactory demand for factory products, particularly durable goods, has depended on a growth in hire purchase credit that is beginning to cause anxiety. If consumers decide, as they are likely to do if peace seems imminent, that both their incomes and the prices they have to pay are going to decline, then they may stop buying. That would have serious consequences for the big industrial companies which are, or say they are, unconcerned about the direct bearing of peace on their operations, since only a small proportion of their output is governed by defence spending.



An armistice in Korea might not have much immediate effect on that spending, since it might mean chiefly that more arms would be available for other countries. The new Secretary of Defence has in any case been holding down arms buying since he took office, as a temporary measure until he can decide exactly how permanent economies should be made. He apparently favours two main methods of doing this—calling up fewer men and stretching out deliveries of arms over a longer period. Both would be facilitated by an easing of tension, but both are controversial and the President has emphasised that the final decision rests with him. So far Congress has shown itself willing to trust the man who is after all the country's greatest expert on these questions, but, as Senator Taft has recognised, it may become difficult to keep defence appropriations up to a safe level should the Korean war end. In that case, however, Congress is also almost certain to insist on tax reductions which would probably have a tonic effect on the economy which would help to counteract any debility arising from reductions in government spending.

Nibbles at the Deficit

IT will be several weeks before Congress is told exactly how much the Administration plans to save during the coming fiscal year on defence and on foreign aid, where a substantial reduction from Mr Truman's estimate of $7.6 billion has been promised. Senator Taft is hoping for an economy of at least $4 billion on the $46.3 billion proposed for defence last January. Unless something of that order can be managed, there does not seem to be much chance of achieving a cut of $8 billion, almost 10 per cent of Mr Truman's planned expenditure for 1954. This is all even the Republicans now seem to think possible, although it will probably not be enough to ensure a balanced budget in the fiscal year beginning next July.

Other less expensive departments have been sending their requests for funds to Congress this month. Several of them propose to save more than the desired 10 per cent, and Congress may insist on further reductions in some cases, but even so these departments cannot do more than nibble at the deficit, since they are responsible for only about an eighth of the government's total spending. The most drastic cut so far announced is for the Department of Commerce—15 per cent less than Mr Truman requested—but it adds up to only $169.5 million; and this is taken mainly out of shipbuilding subsidies, which Congress may insist on restoring. When compared with this year's appropriations for the department, the reduction comes to only $12 million. Democrats, determined to out-economise the Republicans, are insisting that this is the only true comparison and that the real test of whether money is being saved is to be found not in requests for appropriations, but in actual amounts spent.

The Treasury usually spends about the amount appropriated for it; its latest request is for $614 million, $50 million less than the January estimate and $40 million less than was appropriated last year. The Departments of Justice, Labour and the Interior are together asking for about $72 million less than Mr Truman suggested. The Department of Agriculture hopes to save $131 million, but this is without allowing for the rapidly mounting cost of supporting farm prices.

Buying Time on Tariffs

THE test of how far the new Administration can wean the Republican party from its high tariff traditions has been put off until next year by the President's request for only one year's simple extension of the Reciprocal Trade Agreements Act. The usual renewal is for two years. This Democratic measure, which empowers the President to reduce tariffs in return for concessions by other countries, expires on June 12th. The decision not to seek any changes this year is to give time for Mr Lewis Douglas to make his broad study of foreign economic policy and, according to report, for a special group to examine the controversial question of the tariff.

Combined with certain other concessions, the standstill proposal also promises to take the wind out of the sails of Mr Richard Simpson, the Pennsylvania Republican who is responsible for re-electing a Republican Congress in 1954 and believes that more protection for American industry is what the voter wants. Mr Simpson's Bill would take most of the flexibility out of the Trade Agreements Act. The President would lose his present power to ignore the recommendations of the Tariff Commission; the Commission itself would be required to add unemployment in an industry to the factors it weighs when considering whether a tariff concession should be withdrawn. The Bill would also set duties on lead and zinc imports which the President might not touch and— a present for domestic oil producers and the coal owners whose markets are being invaded—fix a quota on imports of crude oil and residual fuel oil.

Mr Simpson has not abandoned his Bill, on which hearings start on April 22nd, but he and his supporters on the House Ways and Means Committee have been much gratified by the appointment of Mr Joseph Talbott, an advocate of protection, to one of the two vacant places on the Tariff Commission. The Administration is also said to be ready to promise to negotiate no new general tariff reductions during the coming year—something which costs little, as most of the tariff reductions authorised in the Trade Agreements Act have already been made. Finally, the President has let it be known that, if a new body to study the tariff is created, Congress may be allowed to appoint some of its members. This would guarantee a sympathetic hearing both for those interests who are rallying their forces against the philosophy of "trade—not aid" as well as for those who point to the fall in American grain and cotton exports as proof that import bans, such as those on butter, peanuts, and dried milk, simply invite catastrophic retaliation. There is no doubt where the Administration's sympathies lie; spokesmen for both the State Department and the Department of Agriculture have asked that the section of the Defence Production Act authorising embargoes on dairy products, fats, and oils should be removed.

THE *First* SINCE 1784

The United States had only just become a sovereign power when in 1784 the First National Bank of Boston was founded. The bank has grown with the country — indeed helped the country to grow — and maintains important branches in Argentina, Brazil and Cuba as well as a wholly-owned foreign banking affiliate in New York City.

America's oldest chartered bank offers traditionally courteous and comprehensive financial service to bankers and concerns engaged in overseas trade with North and South America.

McCarthy's Verbal Victory

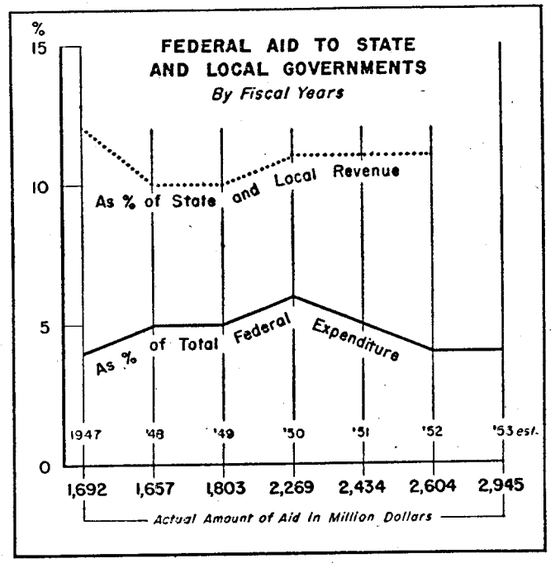
WHEN Senator McCarthy announced last week that he had "negotiated" an agreement with a group of Greek shipowners who had undertaken to stop trading with Communist ports—something which they later declared they had not in fact done for two years—Washington decided with relief that the President could no longer avoid calling the Senator to account. Not even a man as anxious as President Eisenhower to conciliate Congress could, it was thought, tolerate such blatant mockery of the executive's exclusive power to make treaties.

But when Mr McCarthy was summoned to lunch with Mr Dulles on April 1st, it was not the Senator who was made a fool of. From that meeting of legal minds there emerged a statement in which Mr McCarthy conceded that dangers would result if Congress entered into the field of foreign relations and that Mr Stassen, the Director for Mutual Security, was responsible for controls over exports from other countries. Later Senator McCarthy also denied, against the evidence of his own press releases, that he had ever used the improper word "negotiate" in connection with his approach to the Greek shipowners. But the statement went on to say that the voluntary agreement arrived at by the shipowners as a by-product of the McCarthy investigation was in the national interest, and that Mr Dulles thanked the Senator for his help.

Any remaining doubt that the Administration had decided to keep the peace with Mr McCarthy at whatever cost to its prestige was dispelled when, at his next press conference, President Eisenhower accepted Mr McCarthy's word that no "negotiating" had been done and went on to say that when Mr Stassen had spoken of Mr McCarthy "undermining" the government's efforts to curb east-west trade, he had probably meant "infringing" on government prerogatives. Such infringement, said Mr Eisenhower, might be misguided but was nothing worse. Next day Mr Stassen, the only official who had openly condemned Mr McCarthy, publicly swallowed "undermining" and substituted "infringement."

If President Eisenhower wanted to counter-attack Senator McCarthy, he has what many believe would be a most effective weapon. This is the exhaustive report of the committee which during the last Congress, without any help from the Senator, inquired into his unusual financial arrangements. It was left to the Department of Justice to decide whether legal action should be taken against Mr McCarthy, and the department is now being urged to investigate his affairs thoroughly by Mr Francis Biddle, a former Attorney General who heads Americans for Democratic Action, a liberal group.

Back to Federalism?



A GREAT depression, a great war and twenty years of Democratic rule have transferred more authority from the states to Washington than most Republicans and some conservative Democrats consider healthy. There are now 48 different programmes of federal aid to state and local governments, costing $2.6 billion a year, under which such state activities as road-building and social security are subsidised and supervised. The table gives a rough idea of where the money went in the year ended June, 1952, and estimates for this fiscal year.

	1952	1953*
	($ '000)	($ '000)
Grants-in-aid		
Veterans' services	6,656	9,695
Social security, welfare, health	1,475,429	1,637,212
Housing	33,777	88,501
Education, research	122,235	222,133
Agriculture	83,864	96,319
Natural resources	19,755	25,070
Transportation	447,921	537,560
Labour	186,528	193,780
General government	2,392,957	2,827,670
Shared revenues	38,104	48,438
Loans and advances (net)	172,659	69,034
TOTAL	2,603,720	2,945,173

* Estimate.

The reverse side of the coin is that the federal government now spends 75 per cent of all government outlays, federal, state and local, compared with 25 per cent in 1915, and that, in the three-fold scramble for revenue, the taxpayer not infrequently pays two or even three taxes on cigarettes, petrol, or cinema tickets. Income taxes are collected by 34 states and over 200 localities, as well as by the federal government, though tax credits make the system less burdensome than it might be.

President Eisenhower has now asked Congress for authority to appoint a commission to redefine the proper functions of each level of government, and to find methods of eliminating duplication of taxes while securing to the states enough income to discharge their responsibilities. The news has been received with joy by the states, who have even offered to pay part of the commission's costs; they forget that, in harder times, they themselves lobbied for federal aid. Now they are prepared to give up certain federal grants if the federal government will withdraw from given tax fields: highway grants, for example, if the federal tax on petrol is dropped. This tax is a sore point, since Washington collects more than it returns to the states. The big cities, on the other hand, do not relish at all the prospect of relying on state legislatures, in which rural interests are over-represented, for the money for slum clearance, housing and airports.

Source:—US Bureau of the Budget.

The President hopes his commission may report in time for Congress to act at its next session. This seems optimistic. The Under-Secretary of the Treasury considers that to hack a way through the tax jungle alone may take several years. Even in theory there is doubt whether reserving certain fields of taxation would provide the states with adequate revenue. In practice, their joint agreement to give up other sources of income to the federal government would be almost impossible to obtain. Grants-in-aid, too, have served to siphon income from the richer to the poorer states which, left to their own resources, could not provide proper services for their citizens. They cannot be pruned too rashly.

Defining Academic Freedom

WITH Congressional committees searching for Communists among teachers and students in places as far apart as Boston and Los Angeles, the question of freedom for teachers is far from academic, and the stand of the Association of American Universities has been eagerly awaited. Its statement on the "Rights and Responsibilities

of Universities and their Faculties" says at one point:

> The whole spirit [of a university] requires investigation, criticism, and presentation of ideas in an atmosphere of freedom and mutual confidence. . . . It is essential that the faculty of a university be guaranteed this freedom by its governing board and that the reasons for the guarantee be understood by the public. . . . Timidity must not lead the scholar to stand silent when he ought to speak.

This is no more than one would expect from the presidents of the 37 great American and Canadian colleges and universities represented by the association. But what in more normal times would be regarded as platitudinous is now hailed as a blow for freedom.

The association has picked a careful way between the deep red sea of Communism and the devil of McCarthyism. Its statement says flatly that Communist affiliations "extinguish the right to a university post." It enjoins upon professors the necessity of complete candour and integrity and concludes that those who invoke their constitutional rights to refuse to say whether they are or have been Communists—as 54 have in the current investigations—place themselves under a heavy burden of proof to show that they are fit to teach. In fact a number of teachers have been discharged for refusing to say whether they had been Communists, although even present membership in the party is no crime. The association does not believe teachers should be silent, either on conscientious grounds or out of fear of the consequences; it feels that investigating committees have a right to co-operation, and that abuses should be met by appealing to public opinion, not by defiance.

On the other hand, the association, while insisting that teachers are not immune from criticism, urges that they should be left to university discipline unless they have violated the laws, and promises that it will never condone irresponsible accusations. It deprecates the practice of requiring university professors and teachers to take loyalty oaths from which others are exempt. This is not so sweeping an indictment of "inquisitorial procedures" and "political misuse of legal processes" as the statement of the American Association of University Professors adopted last month, but university presidents, who depend on legislatures and wealthy contributors for funds, must speak softly.

SHORTER NOTES

Reconsideration of the Atomic Energy Act has been delayed for over two months because an intra-Congressional dispute has held up the work of the Joint Committee on Atomic Energy. The House members insisted that it was the turn of one of their representatives to be chairman and the Senate members maintained that they had a standing right to the appointment. It has now been decided that the chairmanships of all Joint Congressional Committees shall rotate between the Senate and the House every two years and Representative Cole of New York is the new head of the Atomic Energy Committee.

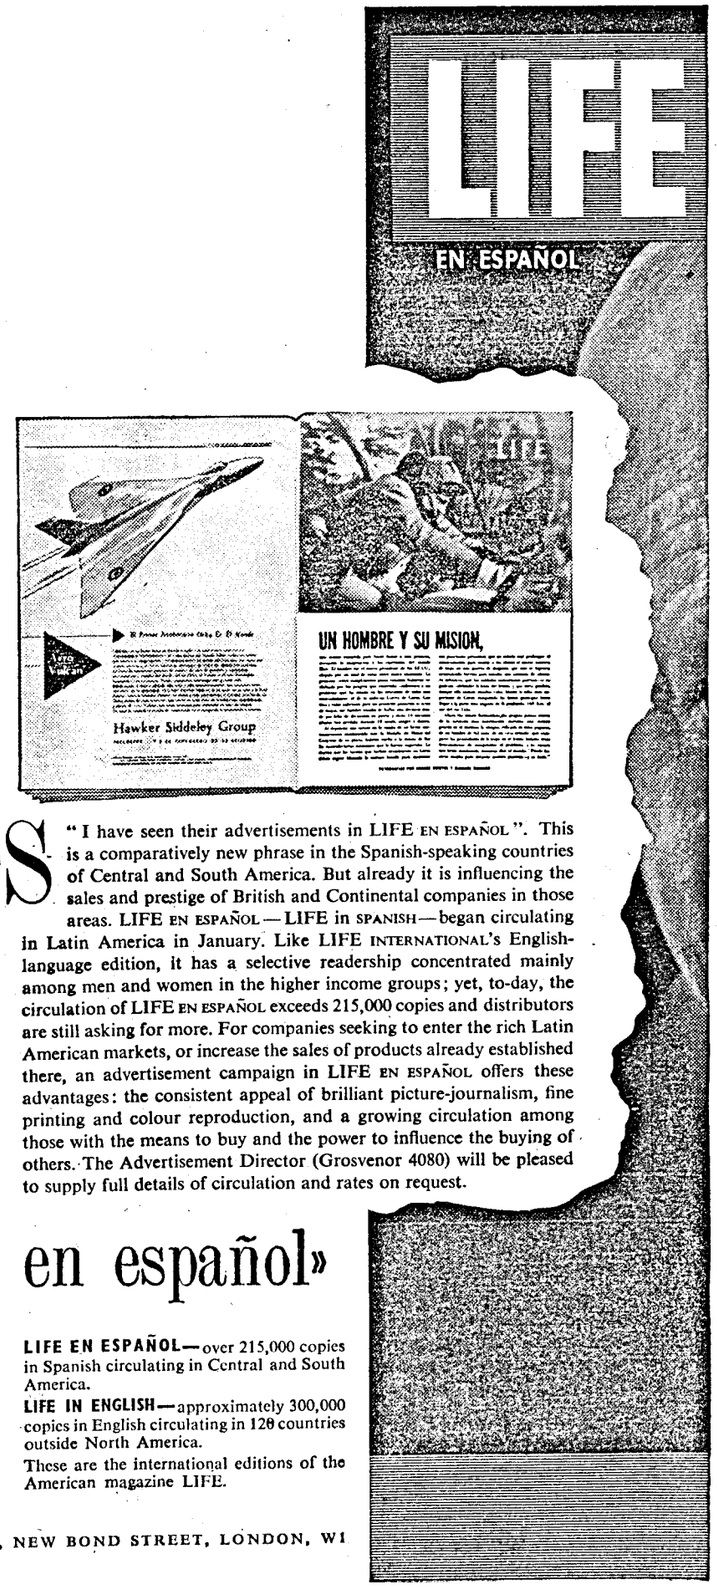
★

A House committee has been horrified to discover that on leaving Washington the members of Mr Truman's Cabinet took with them lump sums ranging from $4,000 to $7,000 in payment for accumulated leave that they had not had time to enjoy while in office. Altogether over $700,000 was paid for this reason to 215 outgoing officials, who were under the impression that they were getting what was due to them. The committee thinks differently, arguing that the Civil Service ruling under which the sums were paid was a violation of Congress's intention that vacation pay should enable government officials to improve their efficiency by taking adequate holidays.

★

Almost unnoticed because of the flood of news from the federal legislature, the state legislatures have been quietly passing measures to deal with some of the lesser issues of the day. In North Dakota the sale of chocolate cigarettes has been banned because they might encourage children to smoke, while in Delaware it is now legal to be a witch. The State Assembly abolished an old law that made it a penal offence to "pretend to exercise the art of witchcraft, conjuration, fortune telling or dealing with spirits."

★



Tourist travel to Europe will not be noticeably increased by members of Congress this year, for the House Rules Committee has decreed an end to government-paid trips abroad for Congressmen, except for members of three key committees. In 1951 and 1952, over 300 Congressmen saw the world at the taxpayers' expense, and there were suggestions that some of the trips were not of vital legislative significance.

«Hé visto sus anuncios en español»

"I have seen their advertisements in LIFE EN ESPAÑOL". This is a comparatively new phrase in the Spanish-speaking countries of Central and South America. But already it is influencing the sales and prestige of British and Continental companies in those areas. LIFE EN ESPAÑOL—LIFE in SPANISH—began circulating in Latin America in January. Like LIFE INTERNATIONAL'S English-language edition, it has a selective readership concentrated mainly among men and women in the higher income groups; yet, to-day, the circulation of LIFE EN ESPAÑOL exceeds 215,000 copies and distributors are still asking for more. For companies seeking to enter the rich Latin American markets, or increase the sales of products already established there, an advertisement campaign in LIFE EN ESPAÑOL offers these advantages: the consistent appeal of brilliant picture-journalism, fine printing and colour reproduction, and a growing circulation among those with the means to buy and the power to influence the buying of others. The Advertisement Director (Grosvenor 4080) will be pleased to supply full details of circulation and rates on request.

LIFE

LIFE EN ESPAÑOL—over 215,000 copies in Spanish circulating in Central and South America.
LIFE IN ENGLISH—approximately 300,000 copies in English circulating in 120 countries outside North America.
These are the international editions of the American magazine LIFE.

TIME & LIFE BUILDING, NEW BOND STREET, LONDON, W1

TWA

knows America

TWA is the only airline linking Britain with America which also has services within the U.S.A. All round the clock, fast and frequent TWA flights serve 21 world centres, in Europe, Africa and Asia and 60 major cities in America.

This can be of great advantage to you. Wherever you want to go in the States you will find friendly TWA people ready to help you in every way possible.

These TWA experts know their areas intimately, they know schedules, connections, people. TWA's knowledge of America may lead to a considerable saving of your time—may even enable you to enjoy a quick vacation between business appointments.

The World Overseas

New Phase of German Recovery

FOR some time past, German business men and their allies in the Ministry of Economics have been convinced that the country's "dash for freedom" has come to a temporary stop; and it has done so before Germany has gone nearly far enough in recapturing its prewar share in world trade. Graphs of production and foreign trade, which used to show such spectacular leaps, have settled down to a gentle climb. In export markets Germans are faced with three new factors. Competition, particularly in heavy industrial goods, is much keener than it was, and Germans can no longer "sell delivery dates" to the same extent. More than ever, orders for capital equipment go to the firm that can offer the best credit terms. Secondly, German exporters, after their bad experience in Brazil, are now reluctant to take risks in other countries which have difficulties in transferring payments. Lastly, the home market no longer provides the same basis for high profits and large investments.

"Economic stagnation" is the term applied to the present situation, with some exaggeration. The optimistic Minister of Economics, Dr Erhard, and market research organisations see no cause for alarm. As Dr Erhard has pointed out, there is at the most a lull in Germany's economic progress, and new ways must be found in order to renew the forward drive. Production in January was up 6 per cent over the same month in 1952, and stood at 142 (1936=100). Some branches of industry are still booming both in the home and export markets; at home consumer goods are doing well but in overseas markets heavy engineering has been badly hit.

All Restrictions Opposed

The Ministry of Economics and the business world are at one in thinking that the first phase of German recovery is closed. The year 1952 saw Federal Germany with a trade surplus of DM702 million (£58.5 million) compared with a small deficit in the previous year. Trade with the dollar countries still showed a so-called "structural gap." It is regarded as essential to overcome this gap by a shift in trade policy, even though Germany was able to earn more than enough to cover its dollar deficit in other ways than direct sales to America. Payments by Americans in Germany and the amounts paid by the European Payments Union to settle part of the large German credit balance have been the chief sources of indirect gold and dollar earnings. In one way or another, the central bank was able to double its holdings of gold and foreign exchange last year.

The German plan for the next phase is designed with faith in German capacity to win any free competition. First and foremost, Dr Erhard will oppose restrictions in any shape or form. Germany has recently increased the extent of its own liberalised trade with the OEEC countries to 84.4 per cent of the total, and is now moving to 90 per cent. Moreover, the German authorities do not see why other countries in the OEEC should be allowed in future to reimpose import restrictions in order to save themselves from the results of over-valued currencies and a bad economic policy. Conscious of German rectitude, Dr Erhard suggests that such delinquents should in future be subjected to some international supervision over their internal economic policy.

Pros and Cons of Convertibility

The same faith in freedom has led Dr Erhard to champion convertibility. But the fate of the tentative British proposals in this direction, and the warnings of his own financial colleagues have put a brake on his impetuosity. The Bonn Ministry of Finance, under the very capable and hard-headed Dr Schaeffer, has pointed out that convertibility of the D-mark might well mean a flight of capital from Germany, in view of the very large amount of blocked marks whose foreign owners would use the opportunity to shift their money out. The Ministry of Economics has now proposed that convertibility should be approached gradually and jointly by increasing the extent to which the Payments Union requires debits to be settled in gold.

The proposals for expanding trade, which have in part been put into effect, mark a break with the postwar anti-inflationary policy of Germany. They are based on the idea that in order to expand exports the German standard of living must rise, with a greatly increased volume of low-tariff imports, and a newly-created internal market for mass-produced home manufactures. Germany, in fact, must repeat the experience of the United States in its earlier days, or, to some extent, that of nineteenth-century Britain. It is a bold conception that will strike sympathetic chords in the United States—to which country Dr. Erhard and his associates in the industrial world are confidently looking for the capital to assist them.

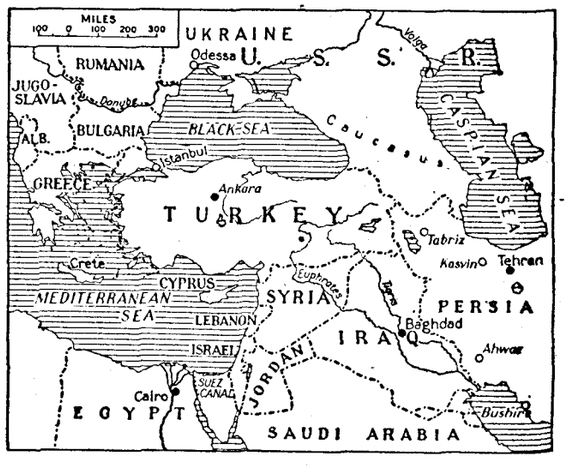
More specifically, the German idea is to increase home purchasing power. A number of moves have already been made in this direction. Income tax has been cut, salaries

of civil servants have been raised, pensions increased, and wages raised ; payments to refugees and others who have lost property through the war will shortly be made, savings dating from the days of the Reich (which were drastically cut in the currency reform of 1948) are to be revalued by about 20 per cent and holders of Reich bonds will later have their turn. Dr Preusker, a Free Democrat who is active in the *Bundestag's* financial committee, has formulated a scheme for further increasing purchasing power. It is gaining widespread approval, though now and again voices are heard protesting that prices will rise and so reduce Germany's export chances. But greater productivity—for which new machines in industry are required—will, it is thought, remove this danger. Inflation is held to be a thing of the past ; the public is saving at a greater rate than before the war and prices have been falling. Now, says Dr Erhard, the man in the street must get it into his head that refrigerators are not a luxury.

If the German plan is to work out as intended, part of this increased spending power must go into investment in new capital issues by private enterprises. The heyday of self-financing is over and the need to induce the public to buy shares is urgent. Dr Schaeffer is much criticised for having monopolised the limited market with his 5 per cent tax-free government bonds and for the insufficient extent to which he reduced taxation on profits distributed in dividends. This is said to be quite inadequate to stimulate share-buying. Dr Preusker has just stated that Dr Schaeffer will indeed, cut the tax further. But even so, it will mean a revolution in German thinking to induce boards of directors to distribute high dividends, or the public to invest in equities.

In foreign trade, Germany intends to concentrate on development schemes in backward countries. The Ministry of Economics plans to draw up " Point Four Programmes " and to conclude long-term agreements with countries that will offer Germany supplies of raw materials and a stable market. This means that Germany, in spite of its own lack of capital, must offer long-term credits and export capital by setting up or participating in enterprises overseas. Britain's latest arrangements for financing Commonwealth development are regarded with envy ; Germany, too, will try and secure the aid of the World Bank, to which the Federal Republic now belongs, for financing projects in countries that will equip themselves in Germany.

Support for Preusker Plan



A part of Dr Preusker's plan is the issue of a DM500 million loan to finance exports of capital equipment at a low rate of interest. He proposes that the State should not only take up part of the loan, but subsidise the interest rate ; and that payment of interest and amortisation should be offered in foreign exchange to Germans as well as foreign investors. Such proposals have been frowned on in the past year by some economists and bankers. They point out that Germany should not simply export for exporting's sake—it is in any case bound to transfer without counterpart about DM1 million a year for Reich debts and reparations to Israel. The money would in the long run have to come from the central bank. Moreover, the banking consortium founded a year ago to grant export credits of up to four years (the Ausfuhr Credit A.G.) has still only used up 80 per cent of its credit line. But the Preusker plan—though it has not yet been adopted—has been taken up surprisingly rapidly. One reason may be that the Germans want to be able to offer funds towards building the new Assuan dam.

An essential part of the new German policy will be to foster its trade with Eastern Europe and China. It is constantly asserted that Germany must buy from countries to which it can sell in increasing quantities and on a long-term basis, even though prices in the Soviet bloc may be above the American level. German-American trade was not important in prewar times, and many Germans are convinced that it never will be again once the natural links with the Eastern bloc are re-established. An effort to overcome the political handicaps to this trade will certainly be made during the new phase on which Federal Germany is now entering.

New Outlook for Middle East Defence

BY A MILITARY CORRESPONDENT

NOW that Marshal Tito has come and gone it is opportune to appraise afresh the strategy of the Middle East as it affects Britain and its friends. A new combination of "western" military power may soon be emerging in the eastern Mediterranean to modify our conception of the defence of that region. Hitherto, we have directed our energies to maintaining a force and a well-provided base on the Suez Canal. Should we not now recast our plans ? For so long we have been accustomed to look from Egypt towards the north-west that we may not have given enough attention to the north and north-east.

If Turkey, Greece and Jugoslavia are to be counted as a single strategical unit co-operating with the western powers, then their special role can be readily understood from the position that they occupy. This bloc, with its mountainous borders, is not only a strong bastion of defence held by staunch fighting men, it is also a base for a counter-offensive into the satellite countries of southern Europe and into the Ukraine, and eastwards from Turkey to the Caspian. It should be possible to thrust at the flank of any hostile advance southwards from Tabriz and the Caspian Sea, westwards from Kasvin into Iraq, or south-west from Teheran on Ahwaz and Bushire, all by the main rail or road routes through Persia.

Lying back from the southern flank of Turkey is the mountainous fringe of Syria, Lebanon and Israel, containing ports of entry by sea from the west for forces operating to meet frontally these hostile advances, either on the western edge of the Persian plateaux or in the deserts. Here again, not only do these tangled mountain masses form a barrier against landborne attack from the east upon the ports, but they also simplify defence against sudden airborne invasion launched with the object of seizing the eastern Mediterranean littoral and severing Turkey and Egypt from sea communication with the West. Furthermore, they menace the flank of an enemy passing south of them towards Egypt. The history of the Crusades is full of evidence which confirms this estimate of the importance of these small countries.

Of immediate importance to the British today is the plain fact that they could not maintain a garrison and base in Egypt with this coastal fringe in the hands of a well-found enemy. Forces placed here and in Turkey defend Egypt ; forces in Egypt, ours or anyone else's, exert little influence on the defence of these countries from the onslaught that we have in mind. Useful as bases in Egypt may be, they can effect little without offensive bases farther forward, whereas forward bases on the eastern Mediterranean littoral and on the northern shores of that sea need not depend on an Egyptian base.

Importance of Air Transport

The Suez Canal has been described as our lifeline in the event of war, the Canal Zone as an essential base area for the defence of the Middle East and as the staging post for sending support to our friends in the East. Having been deprived of the use of the Canal in two world wars and having emerged none the less victorious, we tend to accept it as inevitable that in another war our ships will again be prevented from making anything like free use of this waterway. It is safer to assume that with the greater neutralising effect and range of weapons now in sight, we will in war derive little benefit either from the Canal or even from the Red Sea. Having decided that we will probably be unable to pass this way by sea, then we have to content ourselves with sending our ships round by the Cape and with a greater use of transport aircraft. It is an ill wind that blows no good, and if this decision were to lead us in peacetime to make greater efforts in the production of freighter and passenger aircraft, then this would be no bad result. Gradually the air replaces the sea as a means of movement both in peace and war, particularly as a means of moving human beings, whether civilian or military.

As a defensive base and entrepot the Canal Zone is admirably placed. It is served by excellent harbours for traffic from the east and the west and it provides valuable staging posts for aircraft. It lies back from the threatened areas and was—until there were signs of a new military confederacy of the eastern Mediterranean—centrally situated for the defence of the Middle East. But now its importance seems to be declining as the strategic emphasis passes northwards to the opposite shores of the Mediterranean, where it now appears likely that friendly countries will be ready to accept and to look after bases that offer port and airfield facilities not only to the British but, far better, to an international body. If the offer were to be made and accepted, then Britain could at once shed its lonely and unenviable responsibility for Middle Eastern defence.

Vicious Circle for French Finances

IN Goethe's *Faust*, the Devil invents a very ingenious method by which to help bankrupt governments: he mints gold coins, buries them all over the kingdom and organises a general treasure hunt. The French government's dramatic last-minute request for a loan of 80 billion francs from the Bank of France, shows clearly enough that it is once again in a precarious financial state ; nor is there much doubt that there are pots of gold as yet untapped, both in the form of gold-coin holdings by the agricultural population, of often disguised foreign assets held by industrialists and private speculators and, above all, of general income which has escaped taxation. Although M. Pinay's gold-backed three and a half per cent loan of last year succeeded in charming 196 billion francs out of the clinging ground, this is not an operation that can be successfully repeated each year. By now it must be obvious even to the most cheerful of French parliamentarians that drastic action rather than magic is needed to stabilise France's internal financial position. Moreover, as long as French finances continue their present meanderings from crisis to crisis, no measures for balancing France's external accounts can be really effective and France will continue to be the main obstacle in Europe's general progress towards a system of liberalised international trade and payments.

What has brought about the present crisis, whose full severity has been disclosed by the government's announcement that it will not be able to repay the Bank of France loan by May 31st ? What has happened, essentially, is that the budget unbalance has shown up somewhat earlier than was anticipated. In order to meet this situation, the government borrowed 25 billion francs in January from the Bank of France and has now borrowed a further 80 billion with part of which it intends to repay the earlier loan. A number of factors contributed to the difficult position of the Treasury. M. Mayer's government obtained the voting of the budget as a whole, whereas usually the National Assembly merely votes provisional amounts during the first few months of the fiscal year. These provisional amounts, or " twelfths," ensure that government spending is kept within rigorous limits.

Heavy Demands on the Treasury

Secondly, municipal elections are taking place in the last days of April and the first week of May. As a result, local politicians were eager to make some efforts towards redeeming earlier electoral promises. Municipalities, therefore, drew on the Treasury earlier and more heavily than usual to finance various works projects. Another drain on it was created by the provisional liberation of funds for various nationalised industries which had been blocked last spring, during M. Pinay's drive " to save the franc." These industries have been anxious to use up their credits before the government once again froze them. Finally, there is the perennial problem of France's burden in Indo-China where an unending struggle draws as heavily on French financial resources as it does on French lives. The $255 million promised to France by Washington for the year 1952-53 had not, until recently, been forthcoming. On returning from the United States, however, M. Bourges-Maunoury, the Finance Minister, announced that agreement

has now been reached on $230 million worth in off-shore purchases. An unspecified part of the counterpart funds thus made available to the French government will be used for Indo-China.

At the very time when these various demands were being made on the Treasury, the government's revenue proved to be less than was expected. Too optimistically, the last government had assessed budget revenue in the expectation of a 3 per cent expansion in economic and industrial activity. Instead, the index of French industrial production has remained at about 145 as compared with 149 in February, 1952. But the central fact is a budget deficit variously estimated at from 600 to 800 billion francs. Originally, the government had planned to span this gap by floating special loans in imitation of M. Pinay last year. During his drive for austerity and renewed confidence in the currency, M. Pinay was able to raise a total of 505 billion francs, of which 196 billion came from the gold-backed loan, some 34 billion from long-term Treasury bills, and 275 billion from various forms of loans, some of which were raised in the form of tax reserve certificates. It should be noted, however, that of these 275 billion, 175 billion were subscribed directly by the banks (largely through inflation of credit), whereas other sections of the capital market took up only a 100 billion.

Inflexible Hard-Core Deficit

At present, M. Mayer's government has little hope of approaching M. Pinay's total. Although the government's highly inflationary policies with respect to the Bank of France have not as yet been reflected in the price structure and have not given a new momentum to the cost-of-living spiral, when it comes to getting money from the capital market the present atmosphere is frankly hostile. M. Pinay's integrity of purpose and willingness to propose harsh measures had created a resurgence of confidence of which few traces are now left. Even if the government is able to raise 200 billion francs (a rather optimistic estimate under present conditions), it will have to cover the gap of some 400 billion. Compared with the total budgetary expenditure of nearly 4,000 billion francs, this is obviously not a very vast margin. It does represent, however, a rather inflexible hard-core deficit which must introduce a note of realism into the financial levities of French parliamentarians. So far, however, the government coalition has not been prepared to alienate the voters, particularly in rural constituencies, by laying before the Assembly a drastic programme of tax and fiscal reform.

The National Assembly itself had rejected the far-reaching proposals for reform put forward by M. Pinay when he wished to introduce a single tax on sales, whittle down tax-exonerations, and redress the general situation in which the salaried, urban, fixed-income groups bear a far greater tax burden than the business class or the peasants. It was, in part, because of his bold suggestion that peasant-distillers should no longer be allowed to distil a large part of their alcohol tax-free that M. Pinay had his parliamentary ground cut away from under him. M. Mayer is perfectly well aware that a similar fate may await him if he comes forward with the kind of draconian programme being rumoured in the press and Treasury circles.

This programme might include an increase in the price of cigarettes and public services, a measure immobilising certain blocked budget credits indefinitely, a tightening of control over the spending of nationalised industries, and a number of positive measures calculated to stimulate productivity, such as an anti-cartel law. If the Moscow peace offensive continues, moreover, France may feel itself tempted to cut its defence expenditures which amount to 863 billion francs for Europe and 376 billion for Indo-China. The problem, unfortunately, is not one of designing a proper blueprint for reform, but of getting it through the Assembly and of obtaining some form of response from the public. As long as French deputies are unwilling to risk the displeasure of their peasant electors, reform will remain a distant mirage. But until reform is carried through, the peasant will not give up his gold and the industrialist will not bring his hoards back to France from Zurich or New York. That is the vicious circle in which French finances have for so long been trapped.

Strange Coalition in Austria

THE fate of the new Austrian coalition government will be watched with interest in Western Germany, where the next elections may raise the question whether a partnership in power of Socialists and Christian-Democrats is possible or desirable. On the face of it, the outlook for the new coalition of Socialists and People's Party in Vienna does not look bright. The previous division of spheres of influence between the two groups holding opposing economic principles broke down over the deflationary budget of the Finance Minister, Herr Kamitz. The Socialists, anxious to lessen unemployment, could not agree to the pruning of public expenditure, even though Herr Kamitz's policy had halted Austria's dangerous wage-price spiral. They in turn demanded that the government-owned *Kreditanstalt,* which is a large holder of industrial shares, should come under the control of the Socialist Minister for Nationalised Industry. The coalition broke down and elections were held last month. They resulted in an overwhelming vote for the two centre parties, which are now almost equal.

In spite of the moderation that is so clearly preferred by the voters, the People's Party insisted that Dr Figl, the excellent and conciliatory premier who had held the peace with the Socialists so long, should be replaced by their party chairman, Herr Raab. It is much more difficult for the Socialists to serve under the new premier, who was associated with the Heimwehr and is head of the Chamber of Commerce. But the alternative of refusal would have been that the People's Party should form a coalition with the League of Independents, which has provided a political home for many former Nazis. After tough bargaining, a share-out of offices has been arranged, which leaves the Socialists with two more under-secretaryships than before.

The main difference between the old and new coalition is that there is now even less of a joint programme than before. The Kamitz line will continue to guide fiscal policy, and the budget will soon come up as a hurdle for the Socialists. One hopeful sign may, however, be noted. A loan is to be raised for financing expansion in Austrian power plants which will provide employment; and the National Bank has lowered the discount rate on the assumption that the first phase of stabilising the currency is over and steps must now be taken to stimulate both production and demand.

MECHANISED HANDLING

"Whenever material is handled, something is added to its cost but nothing to its value"—and many post-war reports on British industry have called for better handling methods. The ever-widening field of mechanical and pneumatic handling owes not a little to the research and fifty years' experience of Simon Handling Engineers. Since the war, for instance, over a hundred materials have been tested in the Simon experimental centre at Cheadle Heath, and many of the results have been incorporated in plants built for clients. It all helps to ensure that whenever material is handled as little as possible is added to its cost.

Radio Circuits in Aspic

—but instead of a jelly, a hard plastic resin, proof against extremes of temperature and humidity, preserving the circuit—however delicate—under all conditions. This is typical of the technical advances made possible by the products of Bakelite Limited—just one side-line from the continuous main stream of development that goes on day after day. The polyester resins used for 'potted' circuits, in association with glass fibre, also make plastic boat hulls and have already been used experimentally for car bodies. The story of plastics is already a long one, but new pages are being written every day—by the organisation whose pioneering efforts were mainly responsible for the general adoption of these wonderful man-made materials.

Patches in Britain's Purse

THE preliminary estimates of national income in 1952, presented this week by the Central Statistical Office as Cmd. 8803, had been preceded by draft figures in last week's Economic Survey, and they will be followed by fuller—apparently unprecedently fuller—estimates later in the year. To some extent, therefore, this latest White Paper is neither fish nor fowl, although it no doubt includes its customary proportion of good red herrings. But its rather complicated tables deserve close study nonetheless, for they throw new light on what went right with the British economy last year—and they reinforce the impression that last year's recovery was somewhat (though only somewhat) more soundly based than the very brittle recoveries of 1948 and 1950.

Three main, though interrelated, lessons can be drawn from the new White Paper. The first is that—contrary to the recent claims of Labour politicians—the redistribution of real incomes towards the poorer sectors of the community seems to have been resumed last year; but that there was nevertheless some increase in personal saving. The second is that, although trading profits (as defined by the Inland Revenue) fell for the first year since the war, there was an even bigger reduction in the burden of stock finance, so that companies achieved a much more ample supply of liquid funds. These two factors together left the private sector of the economy with a surplus of receipts over immediate payments that amounted to £607 million in 1952, against a shortfall of £361 million in 1951. This big swing-round was more than sufficient to balance a deterioration in the Government sector of the economy, whose excess of payments rose from £41 million in 1951 to £437 million in 1952 (both figures excluding receipts of ERP grants and defence aid). For the economy as a whole, therefore, there was a net improvement from a savings shortfall of £402 million in 1951 to a savings surplus of £170 million in 1952.

These two figures for the economy as a whole are necessarily the exact equivalents of Britain's balance on external payments—in other words, there was an external deficit of £402 million in 1951 and an external surplus of £170 million in 1952. This simple identity between an internal surplus of savings and an external surplus on the current balance of payments is the third main lesson to be derived from the national income statistics, but it is not always an easy one to assimilate; in fact, it can fairly be labelled as a *pons asinorum* of modern economic analysis. The main function of this article will be to try to act as a guide across it.

★

The redistribution of real incomes last year can be gauged only imperfectly from the White Paper. The first of the accompanying tables shows that the money value of Britain's gross national product rose by £1,111 million (or nearly 9 per cent) in 1952; since unearned income from abroad fell by £110 million net, the money value of gross domestic product rose by £1,221 million, or nearly 10 per cent. The Economic Survey had already reported, however, that the real value of Britain's gross domestic product fell by £100 million, or about 0.8 per cent, in 1952. The general level of domestic costs and prices therefore seems to have risen by rather over 10½ per cent, but the fall in prices of imports kept down the rise in prices of consumer goods; in fact, it can be estimated from Cmd. 8803 that this rise amounted to only 6½ per cent. Against this, employees' incomes rose by £587 million or just over 7 per cent, farmers' incomes rose by £30 million or just over 8 per cent, and social security payments

rose by £114 million or 12½ per cent. It is reasonable to suppose that most recipients of these three types of income enjoyed some small rise in their real earnings last year, but there were three other classes in the community who definitely lost ground. They were professional people, whose money incomes stood still; small business men, whose money incomes (as reported to the Inland Revenue) fell by £69 million, or 7½ per cent; and those relying on unearned incomes (rent, dividends and interest) whose incomes fell by £57 million, or 4½ per cent.

The rise in total personal incomes—that is, the aggregate incomes of these six classes—therefore amounted to £605 million, or 5 per cent, compared with the 6½ per cent rise in domestic prices of consumer goods (equivalent to some £638 million at the 1951 level of consumption). But, despite this rise in incomes and prices, and despite a reduction of £84 million in personal provisions for income tax and national insurance contributions, personal consumption rose by only £528 million—with expenditure on food up by £347 million, but expenditure on clothing and household goods down by £29 million and £33 million respectively. The result was that what the national income statisticians call the personal "balance"—and what ordinary people, ignoring the fact that the figure includes small businesses' depreciation allowances and other questionable items, will call personal savings—rose by £160 million to £341 million; this very tentative figure suggests that there was a jump in personal savings from 3¾d. to 6½d. out of very pound of personal income last year.

TABLE I—NATIONAL INCOME AND OUTLAY

★

While the gross incomes and savings of persons were rising, the gross profits and savings of companies were falling—but by much less than the claims imposed upon them. The domestic trading profits of private enterprise companies fell by £179 million (or 7 per cent) in 1952 and their gross income from abroad fell by £19 million; this was partly offset, however, by increases of £53 million in companies' non-trading incomes and of £7 million in the profits of the nationalised industries, so that total corporate earnings fell by only £138 million, to £3,433 million. Out of this £3,433 million, companies and corporations laid aside £1,071 million (or £68 million less than in 1951) for taxation and £1,041 (or £64 million more than in 1951) for gross dividend payments and provisions; they therefore had an unexpended current balance of £1,319 million (or £134 million less than in 1951) out of which to finance new capital formation and additions to their reserves.

This unexpended current balance of £1,319 million is the nearest approximation that can be made to an estimate of gross corporate savings in 1952; it represents about 38½ per cent of gross corporate income, so that, broadly speaking, about 7s. 8d. out of every pound that goes to profits appears to be saved, compared with 6½d. out of every pound that goes to wages and other personal incomes. In addition (on the conservative assumption that the average rate of tax on dividends is the standard rate of income tax), about 9s. 2d. out of every pound of company profits goes in direct taxes, compared with about 2s. 7d. out of every pound of personal income. This is the basis for the inconvenient political fact that a transfer from wages to profits almost invariably leads to an increase in savings, which the British economy so badly needs.

It is with these figures in mind that attention now needs to be turned to Table II. In the first two columns of that table the unexpended private balances already referred to—i.e., in 1952, £341 million for persons and £1,319 million for companies and corporations—are added to the sums laid aside at the end of the year for future tax and dividends payments, and to certain capital transfers to and from the central government. When these corrections are made, it will be seen that the private sector of the economy had £1,730 million available for capital formation in 1952, compared with £2,105 million in 1951. But, in 1951—and it was here that the source of the crisis of that year lay—the private sector had had to devote the huge sum of £1,201 million to stock finance, including some £850 million that was needed merely to maintain its stocks intact as prices rose. In 1952, the national income statisticians estimate, there was no increase in stock prices and the physical volume of private stocks was allowed to fall by some £137 million. The result was that while private balances available for capital formation fell by £375 million in 1952, private capital formation itself fell by £1,343 million; and that while the private sector had had to borrow £361 million from other sectors in 1951—and those others could only be the Government or foreigners—it had £607 million over and to spare in 1952.

* Unofficial estimates.

If public authorities had managed to keep a tight rein on their own expenditure, Britain's balance with the outside world would have benefited by the full extent of this turn-round of £968 million (from a shortfall of £361 million to a surplus of £607 million) in the capital account of the private sector. Unfortunately, however, the expenditure of central and local government authorities continued to rise. The result, as the third and fourth columns of Table II show, was that the balances available to public authorities for gross capital formation fell by £380 million, to £340 million, in 1952. Simultaneously, the increase in housebuilding and other forms of fixed capital formation by the public sector swamped the economies on Government stockpiling; in consequence, the public sector, which had added £41 million to the private sector's net deficit of £361 million in 1951, absorbed £437 million of the private sector's net surplus of £607 million in 1952. Therein, in bald summary, lies the whole story of Britain's progress from external deficit in 1951 to external surplus in 1952.

In one respect, at any rate, the story has an unaccustomed and healthy ring. In the three years from 1948 through 1950, only the public sector had had a surplus of domestic savings over domestic investments; in 1948 and 1949 this surplus was barely sufficient to offset the shortfall in private capital accounts, though in 1950 it did so with a balance of payments surplus of some £250 million to spare. In 1951 the public sector relapsed suddenly into deficit, and the private sector widened its deficit at the same time. In 1952 the public sector's deficit deteriorated again, but the private sector swung round into its first postwar surplus of savings over investment.

This strengthening of private capital accounts brings with it an opportunity, and a challenge, for the future of British economic policy. It is now universally recognised that if Britain is to maintain its position in a competitive world it must increase its stock of productive capital equipment; the £1,260 million of fixed capital formation in the private sector of the economy in 1952 probably did little more than provide adequate replacements for the machinery that was currently wearing out. But three problems have always lain in the way of an increase in productive investment. One problem has been the shortage of investable funds in private hands. That problem was notably—though perhaps only temporarily—eased in 1952; the private sector had funds on hand to finance £1,867 million of fixed capital formation if it had wanted to. The second problem, which has only recently come to the fore, has been the blunting of the incentive for private investment under conditions of crippling taxation. The third problem has been that if private investment is to rise, then public savings must increase or public investment must fall—unless the economy is to relapse into a deficit on the balance of payments again. It is not going to be easy for Mr Butler to frame a budget next week that will bring solutions to each of these three problems. But all the indications are that he is going to try.

The External Surplus

BRITAIN'S march back to external solvency has been further documented by three separate Government papers since the Easter holiday. The first of these, discussed in the preceding article, was the preliminary national income White Paper for 1952. The second was the usual monthly communique on the state of the gold reserves. This revealed that the reserves rose by another $63 million in March, following increases of $125 million in February and $132 million in January. As $29 million of the increase in March was due to receipts of defence aid and $19 million represented a transfer of gold from EPU (in part settlement of the sterling area's surplus with Western Europe in February), the sterling area's gold and dollar surplus with other countries—mostly those on the North American continent—appears to have fallen from $74 million to $15 million in the month. This fall, however, was partly due to seasonal influences—there were, for example, substantial British payments for American tobacco last month—and it need not be taken too tragically. It is true the rise in the gold reserves must be expected to slow down from now on; for one thing the mid-April transfer of gold from EPU—in part settlement of the sterling area's surplus of £7½ million with Western Europe in March—will be only $11 million. But the trend of the reserves should continue to be upward nevertheless.

The third new document is the balance of payments White Paper for the second half of 1952 (Cmd. 8808). This paints in the foreground to last year's recovery from an external deficit in 1951 to an external surplus in 1952, whereas the national income paper had sketched in the background. Like Cmd. 8803, however, it is a rather forbiddingly technical paper, and one that can give rise to confusion at first sight.

A prime source of confusion is that the balance of payments White Paper talks throughout of two different external balances—the ordinary balance (a deficit of £402 million in 1951 and a surplus of £170 million in 1952) and the balance including defence aid (a deficit of £398 million in 1951 and a surplus of £291 million in 1952). The case, such as it is, for including aid rests on the fact that the strict rules of eligibility that have been evolved under the Mutual Aid Programme ensure that no imports into Britain rank for such assistance unless they are directly connected with the defence programme. These imports appear in the statistics of visible trade. Whether the aid counterpart should be included on the receipts side of the balance of payments depends on whether the imports in question would have been made had American aid not been forthcoming—or, alternatively, whether, if this aid had not been forthcoming, far greater restrictions would have been put on other imports from the dollar world. The true answer may lie somewhere between the figures inclusive and exclusive of aid. But the British people would be unwise to regard its defence programme as something that would be dispensable if the Americans did not pay for part of it; and if one of the two measures has to be chosen, the balance excluding defence aid certainly seems the one to pick.

Whatever criterion is adopted, however, the reality of a remarkable improvement remains, and the main interest in Cmd. 8808 is the light that it throws on the sources of that improvement and on the likelihood that it will be maintained. The principal factor in the improvement is still shown to lie in the favourable turn in the terms of trade. Price changes appear to have been responsible for something like one half of the improvement of £657 million in the visible trade balance, and therefore of more than half of the total turn-round of £572 million (including invisibles, which deteriorated by £85 million). Although this improvement in the terms of trade has shown signs of slowing down in the last two months, it may gather momentum again if commodity prices continue to flag before the protestations of peace from the East. This is therefore an aspect of the situation from which some encouragement can be drawn for the year 1953—provided of course that the weakening of commodity prices does not deteriorate into a world-wide trading recession.

The next most important item in the improvement of the balance of payments last year was the fall in the volume of imports. The Economic Survey suggested that about three-quarters of the reduction of £423 million in the value of import arrivals in 1952 reflected a fall in volume and that one-quarter reflected a fall in prices. The data given in the balance of payments White Paper, and summarised in Table I, show more clearly than could previously be ascertained where the impact of last year's import restrictions fell. Imports from the overseas sterling area were substantially unchanged in value; the total for 1952 was £1,236 million or only £40 million less than 1951—a modest fall that was more than accounted for by price declines. The axe, therefore, fell wholly on imports from non-sterling countries. Imports from Western Europe fell by £186 million, those from the dollar area fell by £137 million, those from the rest of the western hemisphere by £94 million, and those from other non-sterling countries—a group that covers

the Middle and Far East, Eastern Europe and Spain—fell by £112 million. Imports from the worst hit of these geographical groups, namely the OEEC countries, should before long begin to respond to the relaxations that were recently announced by Mr Butler in Paris, but there will not necessarily be any major upsurge in imports from other countries.

A third important factor in the improvement in the balance of payments last year was a change in the timing of payments to and from the sterling area. The Economic Survey had already pointed out that while the monthly Trade and Navigation Accounts had shown an improvement of £490 million in visible trade between 1951 and 1952, the comparable improvement in the balance of payments figures was no less than £657 million. This difference of nearly £250 million was largely explained by the difference in timing of payments. The new White Paper gives a great deal of new information on the vexed problem of reconciling the trade and navigation accounts with the balance of payments figures. The problem is a far more complicated one than had been implied by earlier facile deductions of some 10 or 12 per cent from the value of imports, to allow for the costs of insurance and freight that are included in the trade and navigation figures. For one thing, stocks bought and accumulated overseas enter the balance of payments on purchase and not on import; for another, the trade and navigation figures exclude trade in diamonds, silver and second-hand ships but include trade with the Channel Islands and landings by British whale fisheries, which have no relevance to the balance of payments calculations.

The difference in timing of payments is of considerable importance when the level or the geographical distribution of trade is changing. The balance of payments figures for any given year or half-year include some imports that have been paid for but have not yet arrived, but exclude some exports that have been shipped but not yet paid for. The result is that an increase or decrease in imports shows sooner, and an increase or decrease in exports shows later, in the balance of payments figures than in the trade and navigation accounts. This had a very marked effect on the figures for 1952, when imports were declining. In 1951, when the trade and navigation accounts showed imports at £3,904 million, the actual item appearing in the balance of payments estimates—i.e., after allowing for the cost of freight, insurance, differences in coverage and imports paid for but not yet shipped—was £3,496 million. In 1952 when the c.i.f. value of import arrivals (as listed in the trade and navigation accounts) dropped by £423 million to £3,481 million, the value of import payments (as shown in the balance of payment figures) dropped by £569 million to £2,927 million. This widening of the discrepancy was largely due to the timing of payments which, as the White Paper points out, is influenced among other things by "changes in credit policy, trade practices, or sentiment about exchange rates." There is no doubt that dearer money in London, the restriction on overseas acceptance credits and the growth of confidence in sterling brought this country a considerable windfall in 1952; it is a windfall that would swiftly disappear if the hard won confidence in sterling should be undermined.

The details of the sterling area's gold and dollar accounts in 1952 are shown in Table II. They record a striking improvement from the disastrous outcome of 1951, although it was admittedly one that occurred almost wholly in the United Kingdom's own direct accounts with the dollar area (including capital transactions). This bare analysis, however, is somewhat misleading; it will be seen from the table that almost all sections of the account were in a healthier state in the second half of 1952 than in the first half—except for the direct dollar balance of the colonies (which, however, have maintained a persistent dollar surplus despite the fall in raw material prices). The net result, as the

* Highest level of the reserves since 1945. † EPU settlements in any one month depend on the surplus or deficit with Europe in the preceding month. ‡ After taking account of the payment of $181 million on December 31st for the service of the United States and Canadian lines of credit, the United States lend-lease loan and the ERP loan.

table shows, was that the central gold and dollar reserves, which had fallen by $965 million in 1951 and by $650 million in the first half of 1952, rose by $161 million in the second half of the year.

In 1952 as a whole, therefore, some £175 million was drawn out of the reserves. This draft, taken in conjunction with the surplus of £170 million in the United Kingdom's balance of payments and the receipt of £121 million of defence aid, made available a sum of £466 million for net overseas investment and financing. Of this total, £357 million was used in repayment of the sterling balances. It is notable, however, that the reduction in these balances amounted to £344 million in the first half of the year and only £13 million in the second half. As will be seen from Table IV, the sterling liabilities to all countries, but excluding those of non-territorial organisations and excluding also British official holdings of non-dollar currencies, fell from their peak postwar total of £3,807 million to £3,422 million during 1952. The biggest drop occurred in the sterling liabilities to non-sterling countries, reflecting the new scarcity of sterling in Japan, Latin America and Western Europe. The sterling balances of the colonies continued to increase, and at the end of 1952 were nearly twice the already adequate figure at which they stood at the end of 1948. The rise in these colonial balances was, however, more than neutralised by the fall in the balances held by the dominions, a contrast that provides further evidence of the now familiar phenomenon of the undeveloped countries of the Commonwealth helping to finance the more highly developed—in fact, the Colombo Plan in reverse.

The net repayment of sterling liabilities left £109 million for improving the longer term capital position of the United Kingdom, *vis-à-vis* the rest of the world. Of that total, £93 million was invested in the oversea's sterling area—about half the amount that was invested there in 1951. But whereas in 1951 Britain had been borrowing on short term rather more than it lent on longer term, last year this smaller investment went hand-in-hand with a repayment of short-term liabilities.

TABLE IV—THE STERLING BALANCES
(£ million)

	Dec. 31, 1949	Dec. 31, 1950	June 30, 1951	Dec. 31, 1951	June 30, 1952	Dec. 31, 1952

Now that those short-term liabilities are down to a more reasonable level, any future United Kingdom surpluses may be more likely to be invested in productive—and profitable—long-term development schemes. But Britain will need to secure and strengthen this surplus before such schemes can hatch.

The Building Industry—III

Future for Building

IN so traditional an industry as building, it is reasonable to expect that improvements and reorganisation can best be sought along lines upon which successful development has taken place in the past. Enough has been said in previous articles to suggest that there are today encouraging portents, if no short cuts.

The factory-built house, almost wholly prefabricated, and put together on the site in a few hours by trained mechanics, is not destined to supersede traditional methods and so to slice through the difficulties caused by site disorganisation, low labour productivity, and the inefficiencies of management evinced by a multiplicity of small firms. This house has been achieved, but so far only for export, or to fill gaps left by other methods. It is useless to make comparisons with America, for American prefabrication is based on an abundance of the most versatile building material—timber. British building is geared mainly to bricks, with a gradual increase in concrete construction, which now represents perhaps 10-15 per cent of house-building.

On the other hand, the trend towards pre-fabrication of components is well-established, and so is its corollary—partial prefabrication of units such as roofs and floors on the site in temporary workshops. But these technical advantages cannot be realised without organisation; planning must move back from the assembly point into the drawing office and pre-planning department. To carry pre-fabrication further, two things are necessary: simplification and standardisation in the design of houses, and some form of modular co-ordination of the dimensions of building materials such as tiles and plasterboards, and of components (windows, joinery and the like). Even craft building has never been entirely unstandardised, for dimensions have been based on the brick, the primary pre-fabricated unit. But to use effectively all the materials at the industry's disposal, and especially to increase the pre-fabrication of interiors, it is necessary to standardise in a far greater degree. So far, such standardisation has eluded the materials and components producers, in spite of the efforts of the British Standards Institution. Discussions on modular co-ordination have beaten the air for years. As the Bailey Committee on quicker finishing of interiors pointed out, the right end from which to tackle this problem is the ordering end. If local authorities within reason, were to standardise house designs and notably interiors, the supply side would conform naturally. There never was so good an opportunity to secure this revolutionary economy as in the last six years, when house design was at the discretion of 1,470 local authorities in England and Wales, and 229 in Scotland. If the larger among these had worked as intelligently and imaginatively in concert over houses as they later did over schools, immense economies would now be in sight. In fact, house designs were if anything multiplied in terms of prewar "spec" building practice. The planners simply did not plan.

★

Pre-fabrication implies, of course, a considerable degree of mechanisation before the house reaches the site stage; the next problem is to mechanise the process of assembling and joining and bonding the sub-assemblies on site. In the past, the principal machine for this purpose, which did all the handling of materials, was the labourer. Heavy unskilled labour is now uneconomic in all industries. Yet 1,200 tons of material in a house today is often all moved by hand—unloaded, stacked, transported, and hoisted to the craftsman to fit into place. The machinery cost in a house has been estimated at £30 compared with a labour cost of £400. The use of the tower crane has been shown by the Ministry of Works to reduce the average number of manhours per house from 2,800 to 1,000, and to save £100 on the total cost. The unskilled labour is replaced by a skilled crane team; the craftsman works as before, only faster and better paid.

Notwithstanding its appearance, however, the tower crane is no *deus ex machina*. It is but one mechanical handling device among many. Indeed, the crane's present design is far from perfect: it needs to be lighter, cheaper and more manœuvrable. But tests have shown that, given full employment, it could be made to pay for its keep on runs of 14 houses—a gratifyingly small batch that accords well with the industry's practical problem. But the replacement of unskilled labour by machinery of every kind demands precisely the same changes as does the introduction of standardised components: better site management. The use of machines must be treated with the same skill in phasing operations as was the marshalling of sub-contractors before the war. There is little sign that any but the largest firms appreciate this need. Many builders expect expensive machinery to solve problems and pay for itself by being placed on the site. The result is that it proves uneconomic and confirms builders in their prejudice that, in building, traditional methods are best and least expensive in the long run.

Nothing could be further from the truth than this prejudice. For whether the industry likes it or not unskilled labour is certain to become expensive and scarce under conditions of full employment, alternative factory employment, educational opportunity, and rising wages. The danger is that the retention of outdated ideas, by preventing wages from rising fast enough in the industry, will imperil its supply of craftsmen, which would be an unmitigated disaster. Already its high costs and general disorganisation have forced it to accept a much poorer type of craftsman. To remain attractive to apprentices, it must become (as in America) a high-wage, mechanised occupation.

This in turn implies considerable changes in capital structure and management. The very small firm cannot make an economic use of heavy equipment. The medium-sized firm may be able to deploy machinery hired from firms of machinery hirers, which are coming into existence and represent, probably, a better solution than co-operative ownership or a Government-run pool of equipment. But such developments must logically give a competitive advantage to larger firms—firms employing from 200 to 500 men—and it is for these to evolve means of producing houses economically in small batches as well as on large estates. It will encourage the specialist sub-contractor; even now the sub-contractors are often far more substantial firms than the main contractor, or "site agent." Only large firms, moreover, can employ site-managers and planning staff—that greater ratio of non-productive to productive labour in American building that impressed the Anglo-American productivity team. The promoted bricklayer often made a good foreman in the days when the materials used on site never went beyond his experience. Today the shortage of technicians able to deal with the growing array of non-traditional materials and with the problems of large prefabricated sub-assemblies is an understandable reason for the industry's conservatism.

★

A multitude of tiny firms cannot sustain the research required into new materials and methods. A large part of the Building Research Station's time and finance is consumed in answering queries and making routine tests for the industry. Only a few large firms have research departments of their own capable even of quality control, in striking contrast to shipbuilding or aircraft construction. The small and medium-sized builder, partly from lack of capital, partly from ignorance, is slow to take up methods successfully demonstrated by large contractors, and he often suspects official ideas. He is, traditionally, under-capitalised, for building is

an activity that requires a relatively small permanent outlay, and a large working capital, which can be obtained by progress payments, advances from banks and especially builders' merchants, whose position has notably and undesirably strengthened since before the war. The general lack of competition has sapped the managerial incentive of the builder, as it has the pride and diligence of his workpeople.

Reorganisation—involving a return to higher productivity and pre-planning that can take advantage of technological advances—depends on the restoration of competition to the whole industry: not only to the builder as such, who commonly controls the expenditure of not more than 30 to 45 per cent of the total cost of a house, but also to the materials suppliers and merchants. The Monopolies Commission may soon take a hand in the dissolution of rings and zoning agreements that keep up the prices of materials. But it can also usefully look at the agreements that are believed to affect the relations of the big contractors. Where such builders really compete to some extent on tenders, quotations for houses have been known (in 1950) to drop from £1,340 to £1,270. Nor is it known just how much competitive certain non-traditional types may be with bricks and mortar. When work is to be had for the asking, and a tender of £50 below the price of traditional building will secure the contract, why lower prices further? There is reason to believe that prices for non-traditional methods could in fact be brought much lower.

★

Competition has begun to return, although so long as the housing target is kept high, and housing is subsidised so heavily, it would be misleading to suppose that it will return (especially in the supply of materials) in its prewar effectiveness. But the tailing off of war-damage, and deflation in the rest of the economy, has had an impact on building. Sub-contracting of labour alone has returned, and some experienced builders, working largely on prewar lines, have achieved a notable increase in productivity. But local authority control remains a dead hand, and still often cheats the efficient firm of its proper reward. It lacks assurance of continuity, and therefore the power to build an efficient labour supply. The annual labour turnover of building operatives is still 76 per cent, compared with the average for manufacturing of 30 per cent. It was hoped that permission to build houses under private enterprise would assure efficient builders continuity between one local authority contract and the next; but this concession has partly failed in its object. When rents for local authority houses represent a capital subsidy per house of £700, only the keenest home-owner will buy freehold. Moreover, most of the eligible sites have been reserved in advance by local authorities. Until this handicap is removed, competition cannot be expected to bring mechanisation fully into play with better management and larger building organisations.

The unions are often blamed for the inefficiency of postwar building. Much of this criticism is misplaced; full employment and disorganisation has demoralised labour more than union policy. The unions still acquiesce in rigidities that have lowered productivity and hence threaten the true interests of their members, out of their dislike of sub-contracting for labour and their desire to "decasualise" building. They have preferred a situation in which bad craftsmen and idle labourers have found work, even if it meant lowering standards all round. They have gingerly supported bonus schemes, well knowing that these were unlikely to have much effect. They favour the engineering contractor as an employer, on the grounds that he alone can ensure continuity of employment and "factory amenities"—regardless of the fact that the industry can never be run by its largest units. They need to reconsider the conditions which would bring building workers to an equality with workers in manufacturing—high wages and regularity of employment imply high productivity, mechanisation, "inter-availability" of labour to encourage new methods, and better management. As it is, building workers, in defiance of union policy, are returning to the sub-contracting methods that ensure the members of a good team £20-£22 a week, though, at the moment, without the need to equal prewar output.

★

Building performance is perfectly capable of rapid improvement, both by the return to competition, and the use of proved technological advances. The divergence between the public works section at one wing, and the small "general builder" at the other may remain. All stages of an industrial revolution will be represented simultaneously. For this reason it may, for example, remain cheaper to buy a new house than to rebuild an old one. The householder may find it cheaper to do his own interior decoration with specially retailed paints than to call in the high-cost small builder and decorator. Moreover, building as a whole is likely to remain a relatively high-cost industry because the craftsman will remain indispensable; no rosy technological dreams of mass-producing housing are likely to come true.

But that is no reason to tolerate the continuance of housing costs at an absurdly inflated level. It is hard to be precise about the degree of that inflation, for house-building costs have never been thoroughly and impartially examined. But it is highly probable that if contracts became hard enough to get, and the need to keep costly equipment at work grew sufficiently keen, the large firms would find means to reduce costs fully 25 per cent in quite a short space of time. Smaller firms would suffer badly until they found it possible to compete on those terms—which in time they would. Only a shake-out on this scale, involving the whole industry, is likely, over a period, to bring building costs down by the third or so that existing aids to higher productivity make possible.

Business Notes

Flutters from the Dovecote

THE cooing doves from the Kremlin dovecote have this week set the keynotes for all the free markets of the free world. But the shadows cast by this unfamiliar flight—extending at one extreme to the United Nations assembly and at the other to Panmunjom—have left both markets and business opinion in a patchwork of light and shade. It was in New York that incredulity and scepticism first abated sufficiently to make this spectacle influential upon business psychology. Wall Street and some international commodities became sensitive to the possibilities in the last week of March, and induced a corresponding weakening of equity prices in London on the eve of the holiday. Then, during the holiday week-end itself, came the sudden revival of hopes of peace in Korea, and on Monday last a pause on Wall Street gave place to a renewed fall, as speculation about the possible reaction upon the American business scene became more widespread. The Dow Jones index of American industrials dropped on that day by 6 points, to 274.10, compared with 287.98 as recently as March 25th and with the 1952-53 peak of 293.79 (reached early this year).

London, therefore, returned to business with the certainty that industrial and commodity equities would be further marked down, and the probability that the rise in gilt-edged would go still further. In the event, the precautionary adjustments in stock markets were intensified in response to some further sharp declines in rubber, tin and other base metals. The industrial share index of the *Financial Times*, which had fallen from 124.6 to 121.7 in the pre-holiday week, dropped further, to 120.6, whilst leading shares in the armament, commodity and oil groups were flat. Gilt-edged, by contrast, were quietly firmer: this market has risen steadily, though slowly, without pause since March 26th. The moderateness of its advance this week fairly reflects the caution with which the wider international hopes are viewed in the City; yet the gambling fraternity found the prospect sufficiently alluring to justify a flutter in "Iron Curtain" bonds. These adventurers even sought out the "pre-revolution" defaulted Russian 5 per cent loan, and saddled it with a 300 or 400 per cent appreciation—from 1 per cent of parity to 4 or 5 per cent. Chinese 5 per cents 1912 rose from 11 to 25 and Polish 4½ per cents 1927 from 13½ to 22 (the lower prices in each case being those of March 27th).

The thought that underlies the more important of these adjustments is, of course, the possibility that moves towards peace in Korea might, for psychological reasons, dampen down the American boom activity even if they do not produce any early change in defence outlays; and nobody in London needs any reminder of the speed with which any slackening of America's demand for commodities could revive difficulties for the sterling area. But both the steadier tone of commodities on Wednesday (and, except for tin, on Thursday too) and the recovery of sterling after its very minor loss of strength reflect a spreading realisation that the force of an outbreak of Korean peace upon commodities is not to be judged from the force of the 1950 outbreak of war. Sterling is still very strong.

Russian Bear in Commodities

IN spite of sharp falls in the prices of tin, rubber, lead and zinc during the past fortnight, commodity prices in general, have tottered rather than tumbled. Admittedly, a bearishness—of Russian origin—has spread widely over the commodity markets, and business has been repressed; but in many commodities the actual fall in prices has been slight. For example, pepper and copra—which are usually highly sensitive to international developments—have declined only fractionally, and raw wool prices have continued to rise. No doubt prospects of reduced crops this year have provided effective props to the first two of these commodities; the third is buoyed up by increasing world demand. In the event, *The Economist* indicator of commodity prices (July, 1949-June, 1950=100) has declined by 4 points since March 24th, to 119.

As was to be expected, metals have shown the sharpest falls, but tin had already to contend with its own specific sources of weakness. Tin prices, which only three weeks ago were about £350 above the pre-Korean level, had proved vulnerable to the news at the end of March that the American Government agency—which in the past year

HOW COMMODITIES HAVE MOVED

* Mid-June, 1952. † November, 1951.

has absorbed most of the world's surplus of tin—is to cease buying some time next year. The fear that rearmament demand might soon dry up was superimposed on this weakness, and the London spot price of tin dropped by about £100 a ton in the first week of April; on Tuesday last it fell by no less than £70. It recovered by £32 a ton on the following day but fell back by £25 to £840 a ton on Thursday. It should, however, be noted that, owing to the shortage of stocks in London, the fall in the spot price has been much less than the corresponding drop in forward prices. Lead and zinc prices, which were already considerably below their pre-Korean levels, have not fallen so steeply as tin. The London spot price of lead declined steadily from £94½ a ton on March 25th to £86⅝ on April 8th, but it recovered to £86⅞ on the following day. Zinc, though it has more defence uses than lead, declined more slowly at the start: the London spot price dropped from £80¼ a ton on March 24th to £74⅛ on April 7th, but then recovered to £76 a ton. Copper is not at present dealt in on the London market, but the so-called world export price (the average price of imported copper sold in New York), which had been unchanged for several months, remained unaltered at 34.91 cents a lb, until April 8th, when it dropped to 31.075 cents a lb.

Outside the metals group, the greatest decline in the past fortnight has been shown by rubber. But rubber prices had been falling for some time, owing to the slackening of American buying. The improvement in the international situation has merely accentuated this decline. On Wednesday the London spot price reached 1s. 7⅞d. a lb—its lowest level since April, 1950. Natural rubber is now slightly cheaper than American synthetic rubber (GR-S).

Last Year's Retail Sales

THE Board of Trade has published its analysis of last year's retail trade in the twelve months from February, 1952, to January, 1953. Taking the year as a whole, food sales rose in value by 12 per cent, while those of other goods showed no change. The year could best be described as a period of adjustment after the frantic swings from boom to slump that took place in the 1951-52 trading year preceding it, and the Board of Trade refers to recovery as taking place "towards the end of 1952 after a long period of uncertainty." It was also a year of changing prices. Experience suggests that although the value of food sales rose 12 per cent last year and by 10 per cent the year before, the volume of those sales did not change much. The increase in their value came from higher prices, especially since the reduction in the subsidies last year.

Sales of clothing and shoes suffered their first check since the war. Year after year, an increase in their value has been recorded but last year the index (1950=100) remained unaltered at 110. Prices came down sharply during the year, but the Board of Trade nevertheless estimates that taking the year as a whole, they were on average still slightly higher than in 1951, indicating a fall in the volume of sales; the fall in output of shoes, clothing and textiles tends to confirm this deduction. But the Board of Trade's method of measuring retail price levels often shows a much smaller movement up or down than those actually observed in the trade, and it is possible that in this case the extent of the fall in prices that took place in the past year has been under-estimated, and with it the revival in the volume of sales in the autumn.

Sales of furniture fell during the year, from 106 to 100 for large retailers and from 107 to 97 for the small men; no change in price is indicated, but a slight reduction did take place during the year. Sales of hardware held their ground. The index for the big shops rose from 110 to 112, while that of the small ones remained unchanged at 109; since prices had risen here, this again indicates a probable decline in volume. The small shops, however, recorded larger sales of radios and electrical goods, the index rising from 126 to 133; the increase in the television transmission area and the high unit cost of receivers may have played some part here. Sales of chemists goods continued their inexorable rise, the index moving from 113 to 120 for the big shops and from 102 to 103 for the smaller ones. Sales of jewellery fell from 107 to 101 but those of books and toys rose. So did sales of petrol, cycles and car accessories—the biggest rise of the year with the exception of food—from 118 to 128, and probably the only one that gives a true measure of an increase in turnover.

★

The picture that accumulates is one of a much lower level of trading than that to which retailers had been accustomed in previous years. But the sharpness of the recession was heightened for the manufacturers of consumer goods by the fact that retailers chose this period to run down their stocks. At the end of the year, those of food and perishables showed no change on 1951, having risen 21 per cent the year before. But stocks of other goods had fallen by 9 per cent, having risen 10 per cent the year before. The fall is particularly marked in clothing, where a decline of up to 25 per cent is recorded for men's and boy's clothes, and smallest in chemists' goods (1 per cent) and hardware and electrical equipment (4 per cent). In other respects, however, retailers' figures for trade in January were, with the exception of clothing, higher than twelve months before. The combined index stood at 112 compared with 104 twelve months ago. Since lower prices are fully reflected in these sales, 1952 may prove to have been a temporary check only in the steady upward curve.

Wheat in the Balance

TWO months of negotiation among representatives of forty-six wheat exporting and importing countries in Washington have failed to produce a new agreement to replace or prolong the existing four-year International Wheat Agreement that terminates at the end of next July. The length of the discussions and the information which has seeped out of the conference make it plain that most of the countries are not averse to the principle of a price stabilising agreement; they differ only, or mainly, on the price. From the beginning there was a natural lining up of importers against the exporters on this issue: the importers offered a maximum price of $1.75 a bushel, compared with

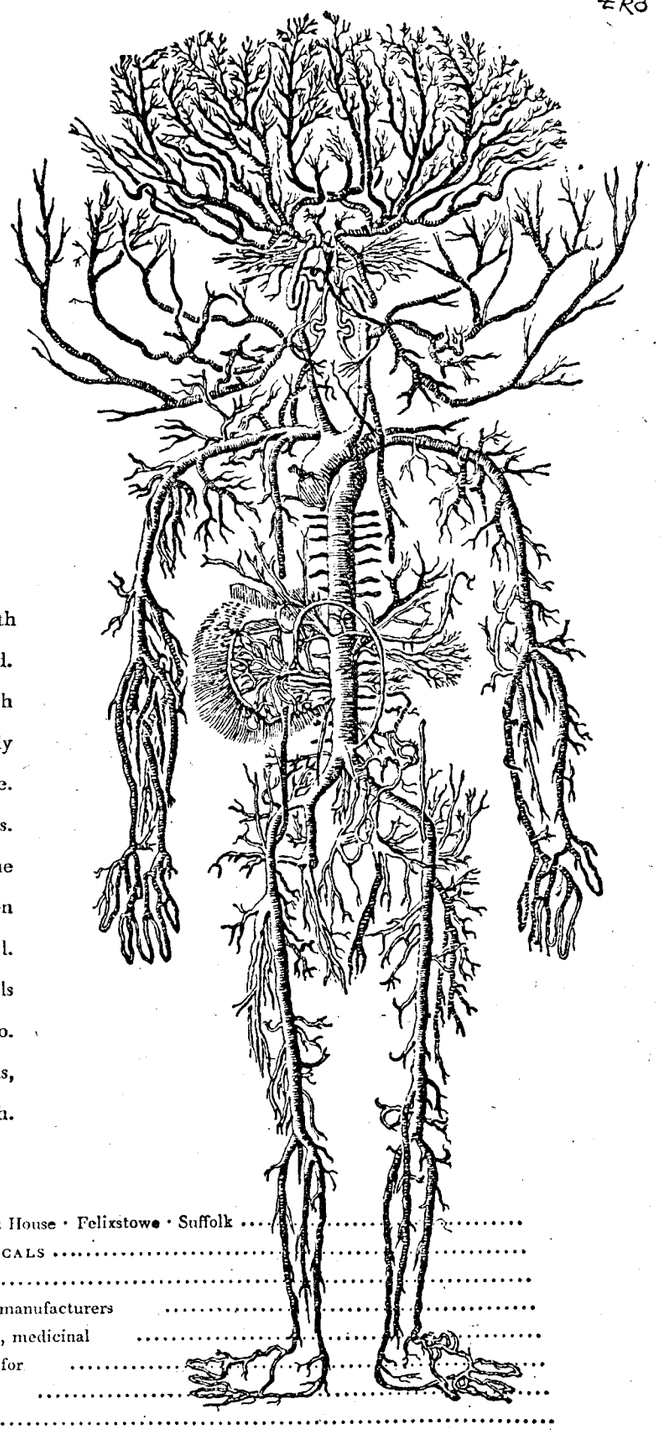
Branches at BIRMINGHAM and SWANSEA



In the tradition of things well done

Down the centuries, the art of the gold and silversmith has ranked among the finest in the world and today it provides a valuable source of revenue from Overseas markets, where demand for this fine craftsmanship is heavy. Karachi, situated in the Sind Province, is famed for this kind of traditional work and, like so many centres of Eastern commerce, its industrial and domestic banking needs are served by the National Bank of India. For almost a century the National Bank of India has continued to further the interests of those concerned with Eastern trading and is, in consequence, well equipped to advise on any such matters. Your enquiries will be welcomed at the Head Office of the Bank, or at any of its branches.

NATIONAL BANK OF INDIA LIMITED

Branches in: INDIA, PAKISTAN, CEYLON, BURMA, KENYA, TANGANYIKA, ZANZIBAR, UGANDA, ADEN AND SOMALILAND PROTECTORATE.
Bankers to the Government in ADEN, KENYA COLONY, ZANZIBAR AND UGANDA.
Head Office: 26, BISHOPSGATE, LONDON, E.C.2.

man and tree

If nature is kind, a man may live in health to a hundred years, a tree to a thousand. Man's knowledge of the chemistry of health is increasing. Through science man is gradually making nature kinder and more predictable. Fisons are in the business of chemicals. Their main manufacture over the last hundred years has been chemical fertilizers to enrich the soil. But they make chemicals for medicine and industry, too. Fisons contribute to Britain's harvests, health and wealth.

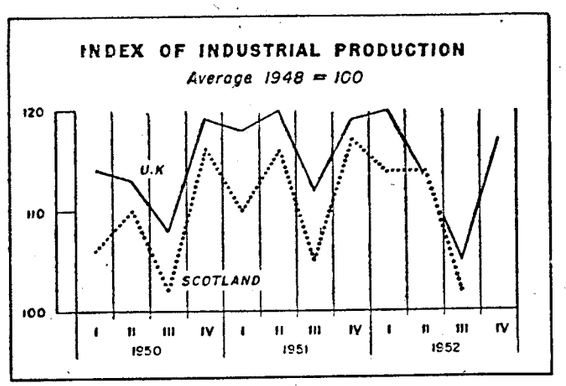
FISONS LIMITED · Harvest House · Felixstowe · Suffolk
FERTILIZERS · HEAVY CHEMICALS
Fisons are also among the largest manufacturers in Great Britain of pharmaceuticals, medicinal food preparations and fine chemicals for Industry. Many of Fisons products in these fields are household names

it's all in FISONS field

the present maximum agreement price of $1.86, and the exporters asked for $2.25. Both sides have since improved their offers; importers are resolved not to pay more than $2 a bushel, but the United States seems unwilling to sell for less than $2.10, though Canada, while naturally eager to get the best price it can, seems willing to compromise.

Importers should be prepared to back their own logic and pay no more than $2. Any higher price would ignore the improved world outlook for wheat and grain production; it would fail to recognise the advantage to the growers of assured sales at a fixed price; it would ignore the increased productivity of American wheat growing; and it would aid and abet a price support system in the United States that has promoted uneconomic wheat production at the cost of the American taxpayer. If producing countries are still sceptical about the prospective abundance of wheat supplies they could limit the amount of wheat that they are prepared to put in the agreement, and leave a larger proportion available for free sale. Equally, the importing countries should accept the logic of an economic price of $2; if an international agreement, desirable as it may be, cannot be obtained at that figure, they should let free markets have their chance and be prepared to back their confidence that wheat will be obtainable over the next few seasons at an average price no higher than this.

Japan and Sterling Markets



DURING the past nine months Japan's sterling balances have fallen steeply; from some £125 million in June, 1952, they ran down to only £70 million at the beginning of this year. They are even lower now, and are apparently expected to go on falling; the Japanese Finance Minister recently estimated that Japan's total holdings of foreign exchange (now about $1,030 million) were likely to decline by another 10 per cent in the next six months. Since July, 1952, Japan has run a persistent deficit with the sterling area, largely because the import restrictions that sterling countries have recently applied to Japanese goods have been almost as severe as those imposed upon dollar goods.

It is not surprising, therefore, that last week's financial talks between the United Kingdom and the Japanese Government were held at Japan's request. The only published outcome of these talks has been an undertaking by the United Kingdom to recommend to the Colonial Governments "certain limited relaxations" in the restrictions upon the import of Japanese goods into the colonies; Japan has accepted this very vague agreement on the understanding that its working will be reviewed after four or five months. It is understood that the "recommendations" relate to the extent to which colonial governments may increase their total imports of Japanese goods: the categories of the goods to be admitted more freely will be decided by the individual Colonial Governments, but cotton piece-goods and certain other cheaper consumer-goods will clearly be well to the fore. It is expected in London that colonial imports from Japan, although likely to recover from their drastically curtailed level in the second half of 1952, will not return at once to their 1951 level—still less to the much higher rate reached in the first half of last year.

The independent Commonwealth countries have been informed of the new agreement; if they choose to follow suit, there should certainly be scope for an increase in their imports from Japan: it is startling to note, for instance, that whilst Japan has recently regained its prewar position as Australia's second-best customer, Australia's imports from Japan fell from over £A34 million in the period from July to February, 1951-52, to only £A4 million in the same eight months period in 1952-53. The agreement about colonial imports, and possible extensions of it to Japan's trade with the independent dominions, may mean that some British exporters will lose some sterling markets; but if agreement had been refused, other British exporters would certainly have lost their markets in Japan. The British economy as a whole should therefore not lose from this sensible, if cautious, advance towards liberalisation; and colonial consumers will clearly gain from it.

Index of Scottish Output

ONE feature of the new "Digest of Scottish Statistics," which was published last week with the annual White Paper on industry and employment in Scotland and will in future appear twice yearly, is an index of Scottish industrial production. This has been prepared by the Statistical Office of the Scottish Departments; it is based on 300 separate indicators, mainly based upon physical output, though including some engineering series based upon value of output. The index takes 1948 as its based year, thus

according with the revised production index for the United Kingdom; index figures are calculated quarterly. The calculation suggests that production in Scotland increased by 12 per cent between 1948 and 1951 (compared with an increase of 17 per cent for the United Kingdom as a whole), and will probably have fallen by 1 or 2 per cent in 1952 (against a fall of 3 per cent for the whole of the country). Scottish manufacturing output is estimated to have risen by 16 per cent between 1948 and 1951, while mining and quarrying output was barely maintained and during last year was probably lower than in 1948.

Most of the other tables in the new digest are counterparts for Scotland of the main industrial and social statistics in the monthly digest for the country as a whole; in several

cases they contain much more detail than has previously been available. The digest now replaces the statistical appendices to the annual White Paper on Scottish industry. This, like last week's Economic Survey, has a year of set-back in business to record ; a number of Scottish factories making consumer goods were closed during 1952 and some light engineering industries in the development area suffered from overseas import restrictions and slackening in demand. Shipbuilding in Scotland was particularly affected by shortage of steel plates ; the gross tonnage of merchant ships completed fell from 490,943 in 1951 to 454,723 gross tons, while launchings and the tonnage of new ships laid down declined accordingly. Nevertheless, most Scottish yards have full order books that will provide steady employment for four years ahead. Unemployment reached 75,864, or 3.6 per cent of the estimated number of employees in Scotland, in February, and over the whole of the year it was greater than at any time since 1947.

50 Years in the Factories

WHAT are the most obvious ways in which British factories of today differ from those of 50 years ago ? A first hazarded answer might be that most are only one storey high, against the multi-storied buildings at the turn of the century ; but a factory building lasts a long time. In many cases, particularly in Lancashire and Yorkshire, the factories of today are the factories of 1901 ; and they may contain some of the same equipment. But even in these, a changed layout of machines, fluorescent lighting, cleanliness and colour have often transformed the interior. The 1951 report of the Chief Inspector of Factories, which has recently been published, picks out some outstanding points of change in a most interesting survey of inspectors' records and reports since 1901.

Within the factory, many inspectors suggest, the most obvious change is the almost complete disappearance of the forest of shafting and pulleys, belts and driving straps that used to provide motive power for every machine in the factory from one main steam engine, " the pride and joy of the engine-man and endowed with almost human personality by the workers." Electricity has gradually been superseding most other forms of industrial power ; in more and more factories individual drives on each machine in the factory have taken the place of any main prime mover. A more diverse but equally widespread technological change is the application of mechanical power to more and more operations formerly done by manual labour. One large bakery firm, which in 1901 was advertising " all bread made by hand " and today advertises " bread untouched by the human hand," may exemplify not only the technical shift but a profound swing in public attitudes towards machinery. But some of the outstanding changes concern the conditions of work rather than its processes ; lighting, ventilation, cleanliness have improved vastly, welfare has appeared, and canteens have become fairly general since the second world war. One Scottish manager said that the greatest difference was in the workers themselves : " it was hardly possible to recognise in the healthy, well-dressed girls of today the puny, ill-clad factory ' hands ' who used to come to the door and ask for work."

As regulations have altered between the two dates, accident statistics for the two years are not comparable ; for what it is worth, says the Chief Inspector, Sir George Barnett, " in 1901 there were 1,035 fatal accidents and 82,725 non-fatal [notified] . . . in 1951 there were 828 fatal and 182,616 non-fatal accidents." The factory inspectors themselves have grown in number (from 95 with 34 assistants to an overworked 322, including many specialists). " Older workers," says the Chief Inspector, " remember little of the earlier inspectors except their dignity and their bowler hats," while managers remember them " with some awe." Today the bowler hat is less inevitable, and the inspectors give " friendly and skilled advice " ; the dignity, it may be hoped, is not impaired.

Tokyo by Comet

THE Comet service to Japan, opened by British Overseas Airways Corporation last Friday, is the first real competitive test of that aircraft and of BOAC's belief in jet operation. Unlike the African services, the flight from London to Tokyo lies on one of the major trunk routes of the world, second only to the North Atlantic in importance, and earning by far the highest margin of profit of any of the long-distance services. The prestige value to BOAC of flying such a service in competition with the major American and European operators cannot be over-estimated. But it is on this route that the Comet is likely to meet its most dangerous competitor, the super-Constellation that will shortly be introduced by some of the other operators. The Comet has cut more than 50 hours off the old BOAC London-Tokyo schedule, but that service, operated with Canadair IVs, provided for two overnight stops. The express services operated by other airlines cut schedules by keeping the passengers in the air throughout the journey. It is believed that the piston-engined aircraft, though much slower than jet aircraft in the air, might be able to provide a service on schedules approaching those of the Comet I by spending less time re-fuelling on the ground. The advantage of the jet airliner during this evolutionary period, before the introduction of the more economical Comet II next year, might then rest more on its anticipated ease of maintenance and the greater travelling comfort that it gives in the air.

BOAC badly needs a stimulus of this kind. During the first ten months of its current financial year—to end-January last—the corporation showed a fall in profit of £1 million compared with the same period in the previous year. Although total revenue had risen from £28 million to £30 million, profit was down from £1,154,000 to £141,000. Revenue rose 8 per cent, but expenditure—before payment of interest—rose even faster, by 12.1 per cent. An ominous indication is a drop in the load factor, from 65.6 per cent to 64.4 per cent—which is probably less than the corporation needs to break even. The heavy bookings on the Comet services mean that these aircraft are carrying a big enough load to cover all costs (even though their break-even point is slightly higher than that of a piston-engined liner), but the margin of net profit earned on them and on other passenger services (where the numbers carried have risen 15 per cent) is probably not sufficient to compensate for the drop in freight and mail revenue, the real reason for the deterioration of the corporation's finances.

Coal Performance and Plans

ALTHOUGH the total number of men on British colliery books has been declining for some weeks now, the average for the year so far is still nearly 721,000, about 14,000 higher than at this time a year ago ; and the number of miners at the coal face is still rising. If this increased mining force were still working as long and as effectively as last year—assuming no improvement in performance of any kind—it would be producing about 130,000 tons a week more than a year ago, as Sir Hubert Houldsworth has argued during his marathon tour of the coalfields in recent weekends. It is not doing so. The miners are working on average about 4.96 shifts a week, against 5.09 in early 1952 (perhaps an hour a week less) ; and absenteeism has risen to 13.4 per cent, against just under 12 per cent in the opening months of last year (entirely through a large increase in " involuntary absenteeism "). Nobody in the coal industry who has digested Sir Hubert Houldsworth's recent strictures on the use of averages is prepared to guess just what these individual figures may signify. But together they add up to a probable loss of about 100,000 tons of coal a week ; so far this year, deep-mined output has been only about 20,000 tons a week more than a year before, in spite of the extra miners.

This disappointing performance in coal production is already jeopardising the very modest plans of the National Coal Board for this year. The board is hoping that output from the miners in 1953 will be 2-3 million tons higher than last year's ; since this working year in coal will be a week and two days shorter than 1952 was, the real increase demanded from the miners is some 7-8 million tons.

This increase may still be practicable, given some increase in the effort and the efficiency of the industry. It is therefor a pity that at this time a report should be published that presents British spokesmen as faintly complacent about progress towards coal output targets for 1953 that were set fantastically higher. This report was published in January by the Organisation for European Economic Co-operation, but has only recently become available in Britain. It is the second report (and apparently the swan song) of the " Ministerial Coal Production Group " that in May last year published estimates of coal output in the OEEC countries for 1952 and 1953, and on which Lord Leathers was the British representative. The figure then given for Britain in 1953 was some 236 million long tons, to be reduced by 3 million tons if the miners took their second week's holiday, as they are doing. The second report suggests that progress towards these production targets was considered reasonably satisfactory ; a foreword reveals that the ministers' group has not met since July last year, though adding that the results of the first 48 weeks of 1952 seemed to support their moderate confidence. This particular target of 233 million tons was from the beginning one that most of the British industry's planners hastened to disown. It may have historical interest as the high-water mark of Conservative confidence in nationalised coal. But this seems hardly the time to recall it.

Modernising the Trade Accounts

THE Board of Trade has announced that certain changes are to be made in the form of the British overseas trade statistics from the beginning of next year. Their main purpose is to bring the grouping of the various items as far as possible into line with that of the standard international classification approved by the United Nations. This is a wholly admirable object, and there are reassuring indications that the changes will produce much gain and little loss.

Continuity between the old and the new bases will be secured by presenting the accounts for 1952 and 1953 on both the old and new classifications. Moreover, it is hoped to provide a direct prewar comparison by converting the 1938 statistics to the new basis. The new classification will make it easier to compare British trade in different commodities with the figures of other countries. There will in addition be a distinct improvement in bringing together all fuels under one heading, including the revision of the oil figures, and in the larger machinery group electrical machinery is to be separated from the rest. Another welcome improvement will embrace larger groups of commodities under the present analysis by countries so that general trends should be more easily discernible. Here many users would doubtless like to add a plea for commodity totals for the sterling and dollar areas—a more significant division for many purposes than the present one between Commonwealth and foreign countries.

Changes in statistical series always cause some inconvenience. But the trade classification has been virtually unaltered over the last thirty years, and it would be surprising if there were not room for improvement. Since prewar comparisons are promised, and bridges will be given between the old and the new forms, most users of the trade statistics should welcome the proposed changes.

Investment Trusts on the Rein

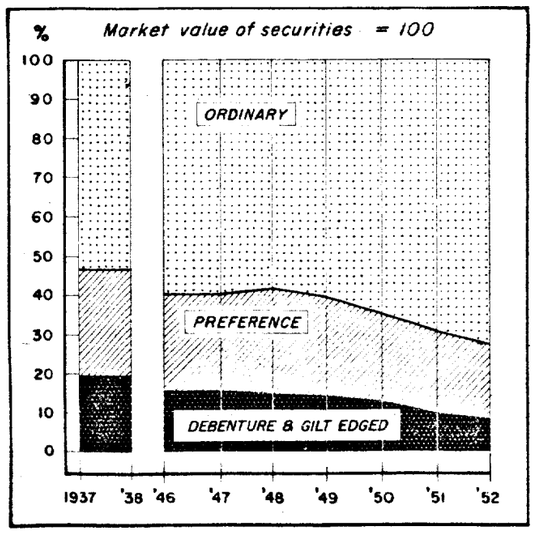
THERE are now 234 investment trusts quoted in the Stock Exchange Official List ; they hold a portfolio of securities with a book value of between £450 million and £475 million and a market value that is probably between £600 million and £650 million. A recent analysis by a well-known firm of London stock brokers makes it possible to examine more closely than before the part that these trusts have played in the stock markets—and in the national economy—since the war.

The first fact that emerges is that the trusts have expanded very slowly indeed in the last fourteen years. According to the new analysis the book value of portfolios reported by 130 leading London trusts in the year to June 30th last amounted to £279 million, compared with a book value of £232 million shown by 120 leading trusts in the year to June 30, 1938. Similarly, 73 leading Scottish trusts last year held a combined portfolio with a book value of £160 million, compared with one worth £152 million held by 73 trusts in 1938. The main check to the movement's growth has, of course, been the effective ban by

the Capital Issues Committee on new issues of over £50,000 by the investment trusts; this has meant that the trusts have been able to add to their portfolios in one way only—namely, by ploughing back the net income and the realised capital gains that they have made in their market operations. During the last three years, in which almost the whole of the increase in book values over the 1938 levels has occurred, these realised gains have probably amounted to no more than £25 million, which is equivalent to a 6 per cent increase over the book value of the trusts' portfolios in 1948-49.

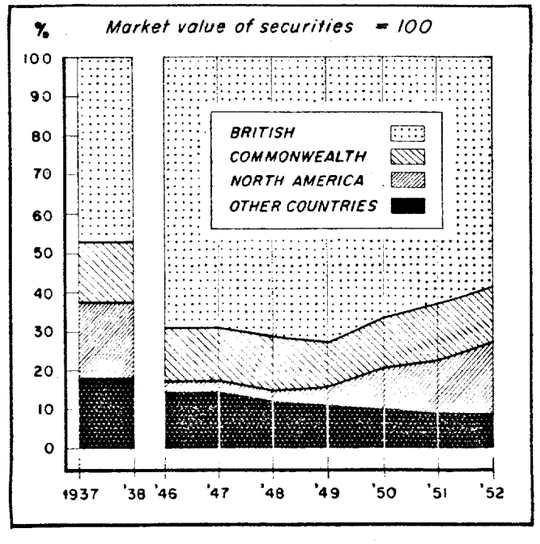
Reshuffle of Trust Portfolios

THE actual, as distinct from the realised, capital gains made by the investment trusts since 1938 have, of course, been very much higher than this 6 per cent; the market value of their gross portfolios has probably risen by as much as 60 per cent in these fourteen years. This growth, which compares with an increase of 44 per cent in the *Actuaries' Investment Index* of ordinary shares and a fall of nearly 13 per cent in the price of old Consols between the end of 1938 and the end of 1951, has been achieved largely because the trusts—in a period of rising prices, restraint on new issues, and (up to November, 1951) of low interest rates—have been quick to switch out of fixed interest stocks into equities and out of British securities into dollar stocks.



The extent of this switch in portfolios can be traced in the accounts of only that minority of trusts that have published consistent and full details of their investment holdings since 1938. The experience of this minority, which holds perhaps one-eighth of all investments owned by the movement, is shown in the charts at the bottom of this page. These charts cannot cover many of the changes in investment policy that have been made under a regime of a 4 per cent Bank rate, since they are based on portfolios published in yearly periods to the end of June, 1952; and they almost certainly exaggerate the swing towards equity investment, since the decline in the market value of fixed interest stocks in the last few years reflects a depreciation in capital values as well as actual sales. Nevertheless it is clear that the trusts are now holding more equities than they did before the war.

Since the end of the war the London trusts appear to have plunged more heavily into the industrial equity market than their Scottish counterparts. In 1951-52 the market value of equities held by the London trusts in this sample accounted for 69.9 per cent of the total value of all their holdings, compared with 43.1 per cent in 1937-38; while the comparable figures for the Scottish trusts in the sample are 79.6 per cent in 1951-52 and 69.9 per cent in 1937-38. Scottish trusts have traditionally relied more on equity investment than London trusts, but the south now seems to be catching up with the north in this respect.



By contrast, the switch in the geographical distribution of the trusts' investments in the last few years seems to be merely a deliberate attempt to return to the prewar pattern, though the trusts are now obviously much more chary of investing in foreign securities other than dollar stocks. During the war the trusts were forced to sell their holdings of dollar stocks, and hence to add to their portfolios of British investments; since 1945 they have been switching back—by selling British and other non-dollar securities in order to buy American and Canadian stocks, presumably from private investors on the London market. In this the Scottish trusts have led the way; and in 1951-52 the market value of their dollar stocks accounted for 25.1 per cent of their holdings, compared with 15.1 per cent for the London trusts; before the war the relevant figures were 23.9 per cent for Scottish and 16.5 per cent for London trusts.

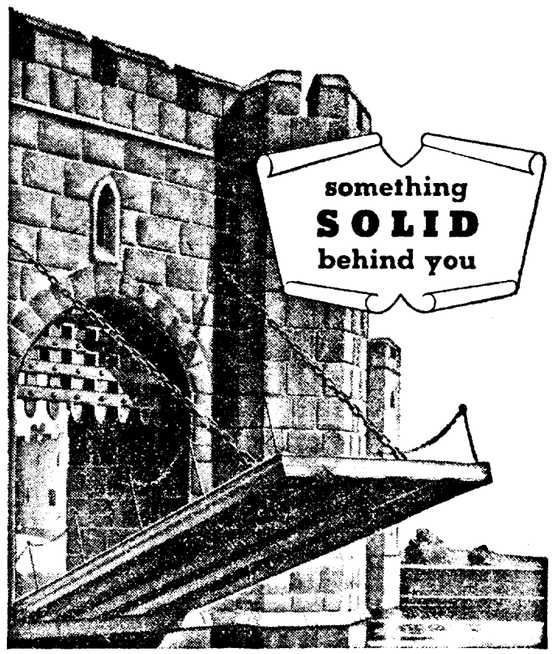
PLASTICS
inspire new ideas

Plastics not only provide materials for fabricated products, they play their part in simplifying industrial processes. The pickling cabinet illustrated, made entirely of Cobex, is a case in point. By confining the acid fumes and gases evolved in the bright dipping of non-ferrous metals and the de-scaling, de-rusting and pickling of ferrous metals, it allows these processes to be carried out anywhere in the works, without injury to adjacent plant. Previously, they had to be undertaken in a separate department, which could become a bottleneck in the production flow. Cobex, being unaffected by the corrosive fumes and gases whilst possessing high mechanical strength, was the only material found suitable for this cabinet. (Quantities of which, incidentally, are helping to swell our exports to the United States).



Plastics are serving industry in new ways every day. You, too, may have a problem where you could use them to advantage. The BX Technical Service Department will gladly advise you. Write to Dept. E.H.2 for full range of literature.

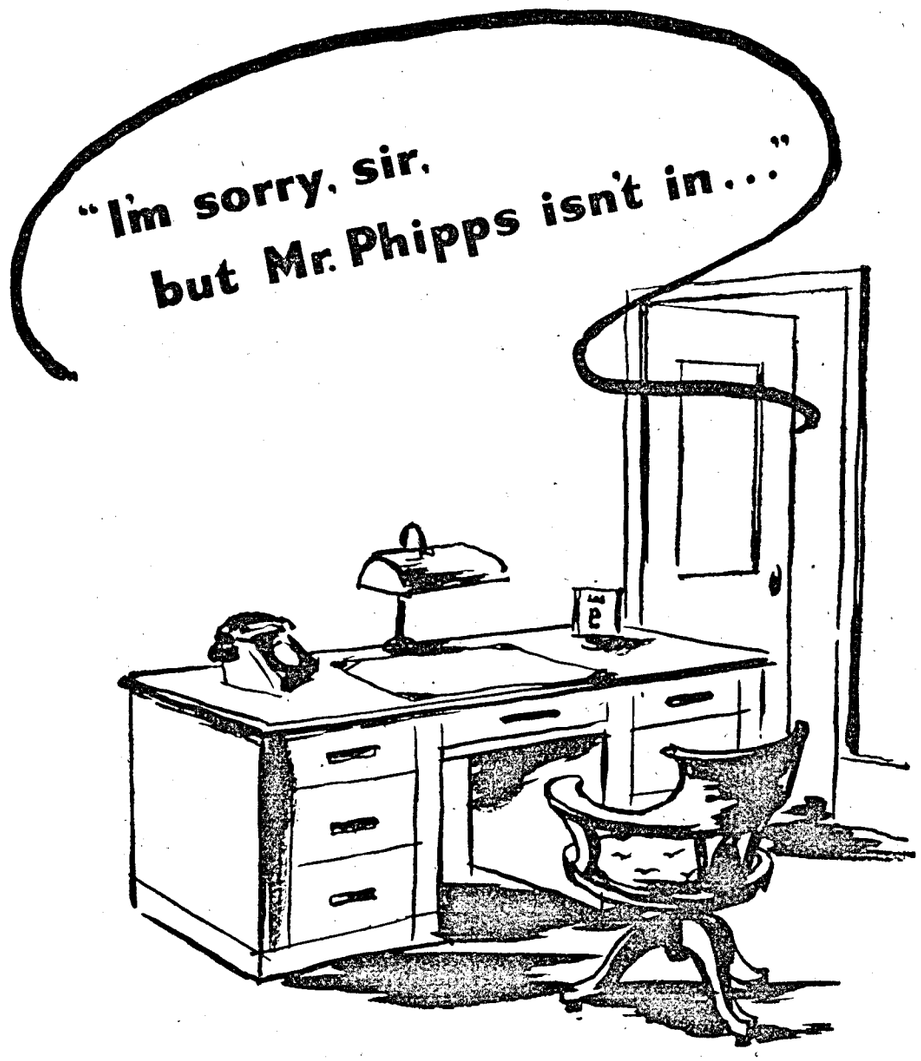
SECURITY

Since the dawn of time the search for security has occupied the minds of men. Until comparatively recent years security consisted of the building of immense walls, in digging moats, in fitting heavy bolts and bars and locks to secure both persons and personal possessions.

Financial security today also relies on building, but with a difference. Perhaps the modern view is best expressed in the growth of the Co-operative Permanent. Here is a savings institution where investors' money is secured by mortgages on thousands of privately owned houses, and where non-fluctuation of values, easy accessibility of capital and good interest with income tax paid by the Society add profit to security.



The Society invites investments of any sum up to £5,000 at 2½% per annum with income tax paid by the Society.

Company Notes

HUDSON'S BAY. The preliminary report of the oldest trading company in Canada—and, for that matter, the oldest of all British companies still alive—has a special interest to investors, now that the gates through which British funds can flow into new investment in Canada are being gradually opened. The report itself (for the year to January 31st last) makes very cheerful reading by any normal standards; but it does little to encourage the wild bulls who have been speculating in Hudson's Bay's ordinary shares.

The company, whose interests are still chiefly but not solely confined to retail and wholesale trading in Canada, has recovered from the slight setback it suffered in 1951-52 and its trading profits have risen from £2,526,388 to £3,328,836. It has had to provide more for taxes both here and in Canada, but its net profits have risen sufficiently—from £654,446 to £989,493—to encourage its directors to raise the distribution on equity capital. Effectively, after allowing for the 100 per cent bonus issue of shares in October, the ordinary dividend has been raised from 7½ to 10 per cent; in addition equity shareholders again receive a special distribution, equivalent to a tax-free dividend of 2½ per cent on the new capital of £4,984,448, from receipts due to land sales. The effective gross equity distribution has therefore been increased from 12½ to 14⅜ per cent. But—and here is the rub—on this basis the £1 ordinary shares at the current price of 5⅛ yield only 2⅞ per cent.

This high price reflects hopes either that the company's interests in the developing oilfields will soon pay big dividends or that bids from across the Atlantic will lead to a change in the domicile of the company. Yet on both these points the directors have spoken clearly in the past: they will resist all efforts to bring about the migration of the company from Britain and they have continually warned shareholders that the company's investments in the oilfields do not hold out the hope of large immediate returns.

★

VAUXHALL MOTORS. The full report of Vauxhall Motors contains the most encouraging appraisal of the motor trade that has been published for several months. The directors state emphatically that the demand for Vauxhall cars and Bedford trucks has continued to be exceptionally heavy both at home and abroad and to be much in excess of output. Moreover, they claim that there are definite signs that an improvement in material supplies is breaking down the restrictions on production and that a period of greater stability in costs and prices is dawning. Since the middle of last year the rate of production has increased steadily month by month, and as a consequence the company was able to produce 79,162 cars and trucks in the calendar year 1952, compared with 77,877 in 1951; of this total 56,725 vehicles were shipped to overseas countries, compared with 53,271 in 1951. The comforting story does not end there, for the value of the company's net sales rose from £35,907,479 to £44,532,711 (or by about 24 per cent) and gross trading profits rose from £5,129,065 to £8,102,855 (or by over 58 per cent).

As the company again paid the customary ordinary dividend of 6 per cent, all of which goes to the American parent company General Motors, the greater part of its net profits (£1,484,921, against £775,760) was ploughed back into the business. These profit retentions, together with the increase in reserves for future taxation, helped both to finance an increase in investment in stocks (which rose in book value from £7,438,602 to £9,276,758) and to strengthen the company's liquid resources; the company has still a bank overdraft of £1,500,000 outstanding but its cash balances have risen from £761,890 to £2,349,923.

The only flies in this sweet smelling ointment are the directors' references to the high rate of purchase tax and to the restrictions that have been imposed on the import of vehicles in some overseas countries. But it should be noted that these references are far more temperate than those of some other motor manufacturers and that the company is going ahead with the production of newly designed vehicles with every indication of confidence in the future. The cheerful tone of this report, following so soon upon the satisfactory results published by Ford Motor, prompts an uncomfortable question for British investors: are the motor companies with a strong American backing better equipped to ride out any squall in the industry than their purely British rivals?

★

MONSANTO CHEMICALS. The Easter holiday was not a happy one for Monsanto shareholders on either side of the Atlantic. While the American giant, Monsanto Chemicals, took a leading part in the general tumble on Wall Street, its smaller British offspring of the same name had to report on a very disappointing year. The British company's 5s. ordinary shares were marked down 1s. 1½d. to 20s. 9d. on the London market immediately following the announcement that trading profits in the year to December 31st last had fallen from £2,889,330 to £1,476,400, and that net profits had fallen even more sharply from £911,929

Consolidated earnings	Years to Dec. 31, 1951	1952
	£	£
Trading profit	2,889,330	1,476,400
Total income	2,892,987	1,548,350
Depreciation	406,307	546,734
Taxation	1,483,395	543,592
Net profit	*911,929*	*261,785*
Ordinary dividends	318,937	259,875
Ordinary dividends (per cent)	22½	18⅜
Capital reserve	6,743	3,257
Added to carry forward	532,272	*Dr 1,651*

5s. ordinary stock at 20s. 6d. xd yields £4 0s. per cent.

to £261,785. As a result, the directors have been forced to reduce the ordinary dividend from 22½ to 18⅜ per cent.

In explaining why this young and rapidly growing company has suffered such a setback so early in its life, the directors report that 1952 witnessed "an emphatic shift from a seller's to a buyer's market in the chemical industry"; in consequence, the group's original estimates of production had to be revised. The fall in profits, however, does not appear to have sprung from any undue cuts in production, for the total value of its sales was only 3 per cent below the 1951 level and the total volume of sales was actually 10 per cent higher. Earnings fell because profit margins were squeezed between lower selling prices (forced on the company by more intensive foreign competition) and higher raw material and labour costs. Although the directors expect that some of the adverse factors of 1952 will persist, they have budgeted for a further increase in turnover this year.

Addressing the meeting, Mr Aly Shamsy, the President, in the course of his speech, said: The year 1952 was not a good one for Egypt's economy. Two years of official intervention in the cotton market resulted in the disorganisation of the Egyptian price mechanism during the 1950-51 and 1951-52 seasons. Thus, this mechanism no longer functioned normally, but only in the direction of a rise which was almost continuous up to the spring of last year. This policy raised expectations which subsequent events showed to be illusory. Indeed, the fall in the prices of raw materials that followed the localisation of events in Korea was felt in world markets as early as the first half of 1951. Cotton-producing countries, in particular, suffered on this account owing to the double effect of import restrictions imposed by certain countries, and of the slackening in demand from the textile industry. Yet, it was in the face of this situation, symptomatic of a recession, that Egypt gave new life to inflation by imposing, through her price policy, a virtual embargo on exports.

Our fears, then, were only too justified when we told you here in March, 1952, that the search for ever higher prices, without regard to international prices, was highly injurious to the whole of the national economy.

Owing to the difficulties of cotton marketing during the 1951-52 season, the inflationary situation we were formerly facing has now been succeeded by signs characteristic of deflation, the direct causes of which are to be found in the fall of prices and the relative stagnation of exports.

In November, 1952, cotton prices were brought into line with those of America. This new contingency has naturally resulted in the reduction of income from agriculture and the value of our exports. It follows that there will be a tendency for imports to diminish, thereby accentuating the contraction due to the restrictive measures taken by the authorities. In this way the inflationary situation which was steadily debasing the internal purchasing power of the currency will be gradually mitigated. However, the fall in the national income ought not to be aggravated by an abstention on the part of certain sectors of the economy from their normal activities. A favourable psychological atmosphere is essential in order to encourage the full utilisation of available or potential resources. It is pleasing to state that the new regime seems fully cognisant of this necessity as evidenced by the appropriate measures they have already taken or are in course of taking.

Circumstances have ordained that the agrarian reform should come into force at a time of economic depression. The effects of the recession are of a passing nature, while the evil from which Egypt is suffering and which the reform is intended to remedy is endemic. Happily introduced within the framework of law and order, the reform appears to us, notwithstanding transitional difficulties and vicissitudes, the commencement of an era which will ultimately create in Egypt a more balanced society.

The net profits amount to £E632.703, against £E629,074 in 1951, which enable us to propose a dividend of 20 per cent.

The report was adopted.

Copies of the President's Address in full will be available at the National Bank of Egypt, 6/7, King William Street, London, E.C.4.

BANK OF SCOTLAND

A NOTABLE YEAR

LORD ELPHINSTONE ON THE SUCCESSFUL MERGER

The annual general meeting of the Proprietors of the Bank of Scotland was held on April 7th within the Head Office, Edinburgh.

The Right Honourable Lord Elphinstone, KT, Governor of the Bank, presided and, in the course of his speech, said: The past year has seen a most important development in the bank's history. I refer to the amalgamation with the Union Bank of Scotland, Limited, the first stage of which has been satisfactorily concluded. Ownership of the whole share capital of the Union Bank is now vested in the Bank of Scotland. While the amalgamation has at this stage taken this form the aim and object of the merger is to unite completely the undertakings of both banks under the name and Constitution of the Bank of Scotland, and this will be accomplished in due time. In the meantime the Union Bank will continue to operate as hitherto.

BALANCE SHEET

The balance sheet which is presented shows all its customary strength. A new entry in the balance sheet records the holding of the share capital of the Union Bank. This appears at £2,100,000, the par value of the stock of the bank issued in exchange for it.

The year's accounts include dividend from the Union Bank for the period from October 23, 1952—the date at which the offer to acquire the share capital became effective. This amounts to £75,748 before deduction of income tax.

The net profit for the year amounts to £341,711. Adding thereto the balance brought forward of £191,099 there is available £532,810. From this there has been transferred to reserve for contingencies £100,000, and to staff pension fund £30,000, leaving £402,810. An interim dividend of 6 per cent actual on £2,400,000 stock of the bank was paid on October 15, 1952, requiring, less income tax, £75,600, and a final dividend of 6 per cent actual is now recommended, payable on £4,500,000 stock of the bank, which will require, less income tax, £141,750, leaving a balance to be carried forward of £185,460.

These results, which I think you will regard at satisfactory, cover a year of change in the bank's capitalisation and direct comparison with previous years is therefore inappropriate. It will be seen, however, that while the stock issued by the bank in exchange for the shares of the Union Bank will receive six months' dividend, the bank's profit and loss account has only been credited with dividend in respect of the Union Bank shares for a period slightly in excess of four months.

BANKING CONDITIONS DURING THE YEAR

Banking conditions have been dominated during the year by the increase in the Bank Rate made in March, 1952, and the stricter application of credit restrictions. These measures, dictated by the need to preserve the financial resources of the nation, have, along with more rigid control of imports, succeeded in arresting the drain on the country's exchange reserves, and for this we must be thankful. There is, however, no occasion as yet to believe that any major relaxation of these measures is likely. The country's international trade position is much

too precarious to justify any such expectations and the need to stimulate export trade remains as great as ever. It is only by increased saving and increased production that the situation can be permanently bettered.

The persistently high level of taxation, with its deadening effect on enterprise and endeavour, is serious. Reduced spending by Government is the obvious means of effecting reduction, but while this is easily said it is not so easy to indicate where that can be achieved. The Chancellor of the Exchequer has no light task in dealing with this so long as rearmament expenditure, the housing programme and the social services of a welfare state continue to make their present demands. Nevertheless, the need for reduction and simplification of taxation is clearly imperative. The total time spent in dealing with taxation problems must be absorbing the country's best brains at a time when their employment in productive enterprise could not have been more valuable.

Experience appears to indicate that in present economic conditions the effect of an increased rate of interest as a means of checking demand for credit internally is in some degree offset by the present level of taxation. The extra cost to the borrower in terms of net income is greatly minimised, and it would seem therefore that so long as the need exists to direct the country's savings and financial resources in a manner best designed to serve the national interests we must expect the continuance of present restrictions on the granting of credit as the principal means towards that end. These restrictions, while they are irksome, are now more widely understood, but there is no doubt that their application involves the rejection by the banks of much business of an otherwise satisfactory nature.

INTERNATIONAL COMBUSTION (HOLDINGS)

RESULTS AGAIN A RECORD

The nineteenth ordinary general meeting of International Combustion (Holdings) Limited was held on April 2nd in London.

The following is an extract from the circulated review of the Chairman, Mr G. R. T. Taylor.

The gross profit of the group is again a record, being £1,580,403 for the year, as compared with £1,262,338.

Taxation has, however, become a very heavy burden. At a time in the country's history when incentive is a vital necessity, the ultimate effect of this penal factor is to stifle enterprise and initiative in every direction. I cannot see how the country can be expected to get on to the road for recovery while such a position obtains.

An interim dividend of 10 per cent on the ordinary stock in issue on July 31, 1952, having been paid, your directors recommend a final dividend of 10 per cent on the ordinary stock capital as increased in December last from £959,245 to £1,918,480.

With our present order book and the necessity for meeting the increasing universal demand for electrical power, I can see no immediate recession in our business, subject, of course, to world happenings which are beyond our control.

The group has successfully overcome the difficulties in connection with obtaining raw materials and other supplies, with the result that the output is again much higher than previously and constitutes yet another record.

The report was adopted.

TELEPHONE AND GENERAL TRUST LIMITED

SATISFACTORY TRADING RESULTS

PORTUGAL'S 6-YEAR ECONOMIC PLAN

IMPORTANT FACTOR IN FUTURE EXPANSION

SIR ALEXANDER ROGER'S REVIEW

The twenty-seventh annual general meeting of the Telephone and General Trust Limited will be held on April 28th in London.

The following is an extract from the circulated statement of the chairman, Sir Alexander Foger, KCIE:

The results are again satisfactory—the profit of £90,189 showing an increase of £2,850 after charging £101,100 (against £94,200 in 1951) for taxation, which absorbs 52.85 per cent of our gross profit. Dividends, interest and miscellaneous income at £262,802 are up by £10,244. Management expenses and directors' emoluments increased by £1,839, while interest paid on loans and deposits was £1,345 less than in 1951. We have transferred £20,000 to revenue reserve, bringing that up to £130,000.

I told you last year of the success of the issue in April, 1952, of 373,000 ordinary shares of £1 each at 23s. This increased our issued ordinary stock to £1 million, upon which an interim dividend of 3 per cent was paid in October, 1952, and provision is made for a 5 per cent final dividend.

BALANCE SHEET

Investments at £1,446,043 have increased by £63,316. The valuation of £1,920,484 for quoted investments represents an appreciation of 52.36 per cent on the net book cost of £1,260,450.

We are in a liquid cash position with £786,276 upon call and at bank, most of which we anticipate will be required during 1953 for the further development of the telephone systems of our overseas operating subsidiaries and associates.

PORTUGAL

The Anglo-Portuguese Telephone Company has been operating the telephone services in the cities and suburbs of Lisbon and Oporto for 66 years under concessions granted to it by the Portuguese Government. The Trust became connected with the Anglo-Portuguese Telephone Company in 1927.

At December 31, 1927, the number of telephone stations in service was a little over 21,000, whereas the number at December 31st last exceeded 119,000, and is steadily increasing. The progressive nature of Portugal's national economy is reflected in the constant stream of new applications for telephones and the waiting list remains a heavy one with which the company is dealing as expeditiously as possible.

The cordial relationship between the Anglo-Portuguese Telephone Company and the Portuguese Government was again demonstrated in January, 1953, when the Minister of Communications presided at the opening of a new telephone exchange, with an initial capacity for 10,000 subscribers, in the north-eastern sector of Lisbon.

The highlight of Portuguese internal affairs during the past twelve months has been the introduction of the six-year economic plan for the agricultural and industrial development of Portugal and her overseas territories. The cost of this plan, when completed, is estimated to be 13,500,000 contos, that is, at the present rate of exchange, approximately £169 million.

Within the plan further development of hydro-electric power is contemplated in addition to the development of agriculture and a number of other projects of importance. The progress of this plan from year to year will be an increasing benefit to Portugal and its overseas possessions and, so far as the Anglo-Portuguese Telephone Company's operations are concerned, must be an important factor in the expansion of the business which lies before it.

VENEZUELA

The Trust has been connected with Venezuela for 25 years and it has a substantial interest in the telecommunications of that country through the—British—Telephone Properties Company and the Venezuelan operating company, the Nacional Telephone Company of Venezuela. Over 7,000 stations were added to the system during 1952, the number at December 31st last exceeding 79,000.

The plans of the new Venezuelan Government, as they affect the future operations of the Telephone Company, require clarification, and financial and technical representatives of the Trust and Telephone Properties are in Caracas participating in discussions with the authorities.

WEST INDIES

In close collaboration with the boards and managements of our associated telephone operating companies in Jamaica, Trinidad and Barbados, the Trust has continued its policy of providing financial and technical assistance in their plans for development of the telephone systems in their respective territories.

I offer no excuses for repeating that these services are of great benefit to the companies concerned and thus to the public to whom they provide telephone service. The companies are able to plan ahead in the knowledge that they have the backing of the Trust for initial finance.

THE COST OF TELEPHONE SERVICE

My report this year would not be complete without some reference to costs and telephone services in general. It is, I think, widely accepted today that the modern telephone service is good value for money.

Telephone companies, such as those in which the Trust is interested, at all times seek to improve efficiency at the same time as eliminating waste in every form. Any increase in tariffs is delayed as long as possible, but with higher costs it follows that income must, when necessary, be expanded to meet them.

Nevertheless, it remains our policy to provide more telephones with the most modern type of equipment at the lowest economic cost to the public.

JAS. WILLIAMSON & SON, LIMITED

DIFFICULT CONDITIONS AFFECT PROFITS

HOME MARKET ORDERS MAINTAINED

LORD PEEL'S STATEMENT

The annual general meeting of Jas. Williamson & Son, Limited, was held on April 2nd at Lancaster, The Rt. Hon. The Earl Peel (the chairman) presiding.

The secretary (Mr L. Beswick) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended December 24, 1952:

The year 1952 may, I think, be regarded as significant in the postwar history of many industries in this country. Not only was it a difficult year but the future may disclose that it marked the beginning, if not the end, of a period of transition between the abnormal years following the world war and what may well be much harder trading conditions. The net profit of your company for the year, after rising from about £600,000 in 1950 to over £800,000 in 1951, has fallen to £242,000. This reduction was, in the main, caused by more difficult trading conditions, both at home and abroad, and to the fall in the price of raw materials.

THE TRADE RECESSION

Last year I mentioned that we were beginning to feel the effects of a recession of trade and it is well known that business in the home market for nearly all consumer goods remained poor in 1952, particularly during the summer months. Moreover, at a time when the prices of many household goods were moving upwards, the linoleum industry, in spite of rising costs, was forced by price control to keep selling prices down, with the result that when the price of other goods was reduced that of linoleum remained unchanged. This situation led to a good deal of ill-informed comment and, in addition, to uncertainty in the minds of both traders and public, which prevented steady buying. In spite of these difficult conditions, I am happy to say that we succeeded in maintaining a good share of home market orders for all our products; floor coverings, leathercloths and table-coverings.

On the other hand, our turnover in export markets was substantially reduced, mainly because of financial and quota restrictions placed on their imports by countries overseas. To name only two, Australia and France made very substantial cuts in their imports of our types of goods. However necessary may have been the Government's efforts to balance payments at a critical time by imposing restrictions, reduction in imports can only bring temporary advantages. The inevitable retaliation means that there is less trade and consumer goods suffer first.

TRIBUTE TO STAFF AND WORKPEOPLE

At this point I would like to pay a tribute to all our staff and workpeople who, by their understanding of the company's problems, did so much to bridge some difficult months during which short-time working was necessary. That their spirit remains unimpaired is a good augury for the future and for the success of the efforts we are making in the buyers' markets of the world.

The cost of our principal raw materials fell during the year, particularly towards the end, and the market price in December, 1952, was considerably lower than at the end of 1951. Linoleum cannot be made either in small quantities or in a short time, with the result that substantial stocks of raw, intermediate and finished materials must be held. Although the volume of stocks was reduced appreciably during the year, it has been necessary to write down their value to considerably below the original cost.

Last year your directors decided to set aside out of profits a reserve of £100,000 to meet a situation they felt would certainly develop and they have appropriated the sum of £50,000 towards the cost of this heavy writing down.

REPLACEMENTS AND MODERNISATION OF PLANT

During the year the cost of replacements and modernisation of plant was £238,000. When a piece of plant is replaced it is always difficult to say how much of the new price is due to improvement and how much to mere replacement, but it is certain that, even if a machine purchased some years ago is replaced by an exactly similar one, the cost today is several times that originally paid. This extra cost is not provided by depreciation and under present law has to be found from so-called profits after they have been taxed. It is evident that the asset represented by the machine is not being maintained intact until replacement is provided for. It is known that the Government are studying this problem and I hope they will find a solution. In the meantime your directors consider it necessary to provide for this extra cost and recommend setting aside the sum of £90,000 to plant replacement reserve, bringing the total provided for this purpose to £565,000.

DIVIDEND RECOMMENDATION

Last September, when the figures for the first half of the year's trading were available, an interim dividend of 2 per cent, less tax, was declared as compared with 2½ per cent, less tax, in recent years. Your directors now recommend a final dividend of 5½ per cent, less tax, making a total of 7½ per cent, less tax, for the year.

At the last annual general meeting your board lost by retirement the services of Mr H. E. Sier, FCA, who had advised on financial matters for so many years, but I am now pleased to be able to tell you that as from October 1st last we have had the benefit of the experience of Mr T. H. Bell, FCA, a partner in a well-known firm of chartered accountants in Manchester, whose appointment as a director you will be asked to confirm.

The report and accounts were adopted; the final dividend, as recommended, of 5½ per cent, less tax, making a total of 7½ per cent, less tax, for the year, was approved; the retiring directors, Mr G. G. Parkinson, Mr L. Beswick and Mr T. H. Bell, FCA, were re-elected; and the remuneration of the auditors, Messrs Viney, Price and Goodyear, having been fixed, the proceedings terminated.

WESLEYAN AND GENERAL ASSURANCE SOCIETY

INCREASE OF OVER £100,000 IN PREMIUM INCOME

INCREASE IN NET RATE OF INTEREST EARNED

The one hundred and twelfth annual general meeting was held on April 7, 1953, Mr A. H. Sayer, MC, JP, the Society's chairman, in the chair.

The chairman, in moving the adoption of the reports, said:

During the year 1952 the total new sums assured of £3,507,648 secured in the ordinary department did not quite reach the record total of £3,796,302 for 1951. In the industrial department, however, policies were issued for a total sum assured of £3,482,761, which was an increase of nearly £200,000 over the total for 1951.

New business, however, is not the only, nor in fact the best, test of whether an office is making progress. The growth of premium income is the generally accepted indication. The Society's progress during 1952 is demonstrated by the fact that premiums received from all departments, amounting to £3,777,384, were £129,971 greater than those received during 1951.

The directors have decided to add a further £350,500 to the already large investments reserve.

It is gratifying that the yield on the Society's investments during 1952, after deduction of income tax, was £3 19s. 9d., an increase of 5s. 5d. per cent over that for 1951.

The liabilities under policies both in the ordinary and industrial departments have been valued assuming that a rate of interest of 3 per cent will be earned on existing and future funds. This is the same basis as was used at the end of 1951 for the industrial department but is ¼ per cent higher than the rate that had been assumed that year for the ordinary department.

The surpluses emerging in both the ordinary and industrial departments are higher than for any previous year when the figures are made comparable by deducting releases of actuarial reserves and profits on realisation of investments. The main reason for the improved results is the higher yield obtainable on investments. A contributory factor, however, has been the satisfactory rate of mortality experienced during the year, which, as far as the Society is concerned, has been lower than for any year except 1948. The directors have been able to declare in the ordinary department a rate of bonus of 28s. per £100 sum assured, which is an increase of 3s. over the rate declared for 1950 and 1951.

Life assurance is a great builder of character, holding before the individual the ideal of providing for himself and his dependants by his own exertions. Life assurance, too, is a real and vital factor in the economic life of the country. The new capital required to provide and re-equip factories and to provide all those things which will make us more efficient as a manufacturing nation, which must export to live, can only come from savings. These savings will be either compulsory savings levied by the Government by way of income tax, purchase tax, or other taxes, or voluntary savings for which perhaps the most important channel is life assurance.

The combined weight of these various factors demonstrates the great importance to the community of the services which our staff render.

The report and accounts were adopted.

THE NATIONAL MUTUAL LIFE ASSURANCE SOCIETY

TWO PROSPEROUS YEARS

Mr Kenneth A. E. Moore, FCA, presided on April 8th at the one hundred and twenty-third annual general meeting of the National Mutual Life Assurance Society.

In his speech to the members he said that the proper conclusion to be drawn from a perusal of the directors' report, the valuation report and the audited accounts, taken together, was that the affairs of the Society had prospered exceedingly in the two years which had elapsed since the last valuation. The satisfactory experience over the period had enabled rates of compound bonus to be declared of 41s. per cent for whole life assurances, 36s. per cent for endowment assurances, and 16s. per cent for low premium policies.

The cost of these higher bonuses would be £403,000, which was a figure well within the trading profits of £490,000 earned in 1951 and 1952. Furthermore, the reserve fund had been augmented and now stood at £800,000. Various factors had contributed to this good showing. Firstly, the rate of interest earned had increased by 7s. 10d. to £3 14s. 7d. per cent net of tax. Secondly, the expense ratio had fallen in the last two years from 15.5 per cent to 14.3 per cent and, thirdly, the Society's mortality experience had been extremely favourable.

INTEREST RATES

He continued: It seems difficult to escape the conclusion that by the natural law of supply and demand—if that still exists in the strange and topsy-turvy times in which we live—when additional capital is in great demand and the volume of savings is shrinking, the tendency must be towards a rise in the long-term rate of interest. Of course, in practice it is not so simple as that because for one reason or another the practical problem is for how long and to what extent can Government action divert natural forces from their full effect.

In this connection there are those who believe that the provision of adequate capital requirements is compatible with a low rate of interest, inflationary finance and physical controls, but I think there is fairly general recognition now that for this country, which is to an extreme degree not a closed economy, internal inflation has disastrous effects upon the external balance of payments.

Be that as it may, the rise already experienced in the long-term rate of interest has, of course, resulted in depreciation of investment values but, by following an active and flexible investment policy, we have been able to escape the full weight of this depreciation and such depreciation as we have suffered from this cause is more than offset, actuarially speaking, by the increased yield actually achieved and in prospect.

NEW BUSINESS DEVELOPMENTS

The society is anxious to encourage the growth of its business in whole life with profits policies and as well as the higher rate of bonus which has been given for so long by the society for this type of contract, a special additional reduction in premium rates for large whole life policies has recently been made. Highly competitive new rates for immediate annuities have also been introduced.

The society continues to make excellent progress with staff pension schemes, showing that an increasing number of businesses have found such schemes desirable not only for their staffs but also for their senior executives.

The report was adopted.

NATIONAL PROVIDENT INSTITUTION

EXCELLENT BONUS RATES

The annual meeting of the National Provident Institution for Mutual Life Assurance will be held on April 14th, at 48, Gracechurch Street, London, E.C.

The following are extracts from the address which will be submitted by the chairman, Mr Vincent W. Yorke:

It gives me great pleasure to report another year of satisfactory progress in the affairs of the Institution and net new business in excess of £5 million. The development of business is to some extent due to the widening interest in pension and life assurance schemes for employees of commercial concerns.

BOARD CHANGES

Two additional names will be submitted to you for confirmation at the annual general meeting. Mr Patrick Gathorne-Hardy is a local director of Barclays Bank, holding an executive position in the Pall Mall East District in London. I am sure that he will be an energetic and useful member of our board. Mr John Sparrow is a barrister by training and both before and after the war practised in the High Court. He was recognised as a most able Chancery lawyer, but he has also had a fine academic career, was elected a Fellow of All Souls College, Oxford, in 1929, and was recently chosen for the much honoured position of Warden of the College. In him we have a man of outstanding attainments and of wide experience of business problems.

Now I must ask you to forgive me if I refer to myself. I feel that the time has come when I should make way for a younger man to take on the chairmanship of this fine office.

To succeed me in the chair of the Institution after the annual meeting my colleagues have chosen Mr L. E. D. Bevan, who is a full-time working director of Barclays Bank. He has already been a member of our board for seventeen years, and his wide business knowledge and the experience he has gained of the conduct of the Institution's affairs eminently qualify him to occupy the position for which we have chosen him, and I wish him and the Institution every success during his tenancy of the chair.

FIFTY YEARS' DEVELOPMENTS

I myself joined the board of the Institution in 1906—nearly 47 years ago—and I doubt whether any similar period in the history of this country has seen so many and varied developments in industry and commerce and in opportunities for investment—quite apart from the calamities of two world wars.

In 1906 our total assets amounted to just £6½ million, compared with £20 million today. About one-third of this was represented by mortgages and policy and other loans; ground rents and properties accounted for about one-fifth and debentures for another one-fifth, and Colonial and foreign Government and commercial stocks for the balance.

A great expansion in the insurance company holdings of British Government securities took place during both great wars, through the support given to issues then made for the conduct of the war, and today about one-third of insurance company funds are so invested.

INVESTMENT IN ORDINARY SHARES

It was not until the 1930s that ordinary stocks and shares began to figure seriously in life office balance sheets. There are two main reasons which may have guided those offices, like the Institution, that have decided to invest a definite proportion of their funds in ordinary shares. The first is the increase in rates of income tax, to which the interest earned by life funds is subject.

The second reason is that in a period of inflation ordinary shares, properly selected and well spread, should create some "hedge" against the falling value of money. Normally during such a period dividends would increase, and would reach the with-profit policy holders through better bonuses.

The outstanding interest yields on our funds make an important contribution to the excellent rates of bonus which are now current, namely, £2 10s. per cent on whole-life policies and from £1 15s. per cent to £2 7s. 6d. per cent on endowment assurances.

We watch our investments with much care and I consider that it is indeed satisfactory that we can say, after two years of adverse experience with prices of most Stock Exchange securities, that there is still a substantial margin between the balance sheet values of those securities and their market values.

EXCELLENT TRADING RESULTS

The trading results of the year do not call for much comment on this occasion. We keep a close eye on our expenses and they remain on a moderate level. Mortality has again been particularly favourable. The rate of interest earned showed a further increase to the high level of £6 5s. 11d. per cent gross, or £4 14s. per cent net after deduction of income tax.

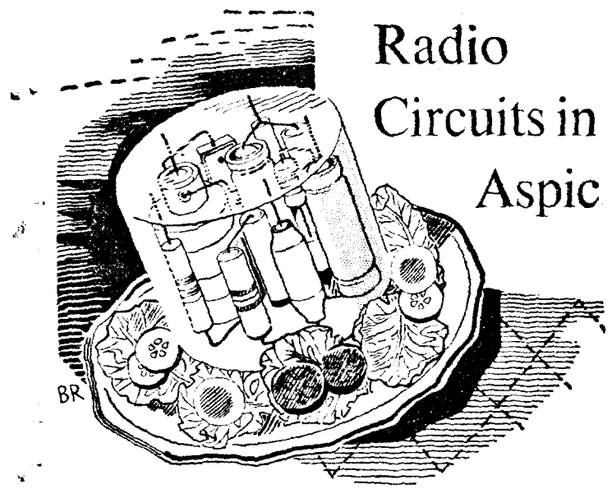
In this, my final address to you, I would like to say that I regard it as a great honour to have served as your chairman for 10 years.

BREVITT LIMITED

The fourth annual general meeting of Brevitt Limited was held on April 9th in London, Mr E. S. Harding (the chairman) presiding.

The following is an extract from his circulated statement:

The decrease in the Group's net profits to £73,042 for the year is due to several causes, namely, the general and exceptional decline in business available for the home market; stock losses due to the fluctuations in market prices of raw materials and, as a consequence, of finished goods; and thirdly, the lower margin of profit which resulted from the sudden introduction of the Douglas Scheme for purchase tax.



Everything has been done to combat as far as possible the adverse conditions and, notwithstanding such trading difficulties, by reason of the company's substantial export trade the factories have been and continue to be fully employed.

The directors recommend the maintenance of the dividend on the ordinary shares at 20 per cent, less tax.

Certain reorganisation within the Group has had the consideration of the directors and will take place immediately. The business of the subsidiary, J. A. Sabin Limited, will be taken over by a new subsidiary company to be known as Brevitt Shoe Manufacturers Limited. I am satisfied this reorganisation will have a beneficial effect.

Such reorganisation and the fact that trading conditions have now improved, at least temporarily, enable me to conclude with the expression of my belief that the company will be able to show a better return of profits at the time of my next report.

The report was adopted.

Radio Circuits in Aspic

—but instead of a jelly, a hard plastic resin, proof against extremes of temperature and humidity, preserving the circuit—however delicate—under all conditions. This is typical of the technical advances made possible by the products of Bakelite Limited—just one side-line from the continuous main stream of development that goes on day after day. The polyester resins used for 'potted' circuits, in association with glass fibre, also make plastic boat hulls and have already been used experimentally for car bodies. The story of plastics is already a long one, but new pages are being written every day—by the organisation whose pioneering efforts were mainly responsible for the general adoption of these wonderful man-made materials.

Can you drink
SEA WATER?

Weir Evaporating and Distilling Plant, by providing ample supplies of fresh water distilled from sea water, has made possible the economic development of many areas with no natural supply of fresh water.

Ships too, with Weir Evaporators, can make the longest voyages without buying fresh water en route, leaving more room for paying cargo, and always being sure of pure fresh water for all the ship's services.

Orders now in hand for large land installations will result in extensive developments in some tropical areas of international importance.

HIRE A CAR . . .
DRIVE IT YOURSELF!

To see the best of Scotland you will need a car. With a car you can plan your own route entirely to take you to the lochs and glens, the moorlands and mountains, the ancient castles and wee crofts.

There will be a big demand for self-drive cars in Great Britain during Coronation Year, and even the large and especially increased S.M.T. fleet of post-war Vauxhall cars will be heavily booked. To be sure of having the use of a car when you are in Scotland, make your reservation in advance. Write or cable for illustrated booklet EC2 containing order form and complete details of this invaluable car hire service.

You're just being STUBBORN, he said

And what was your reply?

Well, I got a bit heated but I had to admit he was right. You see, I've always held the view that our products are luxury products with an 'A' class appeal only. His argument was that working class purchasing power has increased so dramatically that many working class families can buy luxury products.

In other words many products that were originally classed as luxuries now come under the mass market banner?

That's right. He instanced the phenomenal number of television sets on council estates. Proved how working class families buy washing machines, radiograms and the best-branded foods. Then, to cap it all, he said our advertising was all wrong. Said it was aimed at the wrong market.

And is it?

Not now, it's not. We're in the mass market from now on. Didn't you see our ad. in the Daily Mirror last week?

Yes, I did. Pretty good I thought.

And it was read by nearly 4½ million people. That's how many buy the Mirror every day. As for cost of space, on a square inch per thousand basis it's the cheapest of all national dailies. As this chap was saying to me, you can't afford to ignore the Daily Mirror.

Biggest single shipment ever dispatched to Italy

Fifty-two David Brown Tractors—47 Cropmasters, 4 Trackmasters, and 1 Taskmaster—were in one consignment that recently left for Italy. *It is David Brown's biggest* Italian shipment to date, fulfilling a *growing demand for David Brown* Tractors from all over the world. The demand stems from good design and good engineering. David Brown build tractors which can get the best out of the worst of the world's land. Indeed, the whole vast range of David Brown products is made and sold in the conviction that Britain's future prosperity lies in the export of inventive genius and mechanical skill. This policy is to day paying dividends—and paying them in foreign currencies.

A Vehicle of Information

Good Policy

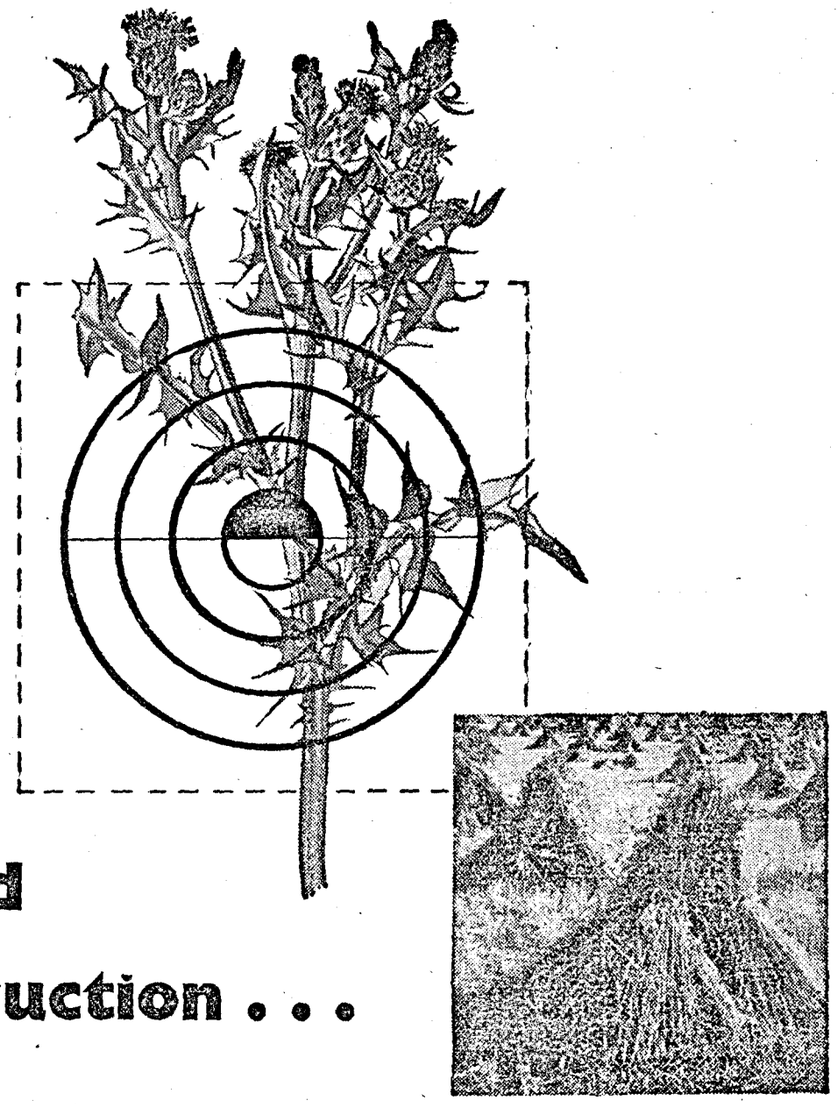
Choosing a suitable Life Assurance for your needs—and those of your dependants—can be a most difficult business. That is why our booklet 'How to be Well Assured' is well worth reading for a good deal of valuable information. Why not write to us for a copy?

All Sports

It has been written
No game was ever yet worth a rap
For a rational man to play
Into which no accident, no mishap
Could possibly find its way.
But you need never be the loser if your person and paraphernalia are insured by our Sportsmen's Policy.

Fire Alarm

An alarming thing about a fire on business premises is, after the fire, the increased cost of replacing equipment and stock. Has your Fire Policy been adjusted accordingly? Adequate cover now is a lot more comfortable than sackcloth and ashes later.



House for Sale

If you are thinking of buying a house we have a booklet which can be of great use to you. Curiously enough it's called 'Buying a House'. We will gladly send you one.

P.S.

If you would know more about any of the policies outlined here, if we can provide information about any other particular policies or about insurance problems generally—pray make what use of us you wish. Our address is 1 King William Street, Department Q6, London, E.C.4.

THE LONDON ASSURANCE
Very good people to deal with

Weed destruction . . .

One of the most brilliant achievements of the agricultural chemist in recent years has been the selective destruction of weeds in growing crops. It is a development of great importance in the production of food supplies—and one in which Shell has been actively concerned. Today, with Shell weed killers, weeds like Charlock, Buttercups, Thistles and scores of others, can be brought under control in cereals, grassland and many other crops. The use of Shell weed killers is practical farming too, on even the smallest holding, for the cost of application is far less than the value of the crop-increase obtained—to say nothing of the improved quality, the easier handling and the cleaner state in which the land is left. And included in the Shell range are weed killers which are harmless to man, stock and game.

Turn of the Fiscal Tide

A BUDGET is a political occasion as well as an instrument of economic policy, and it is safe to say that the majority of those to whom Mr Butler's speech was addressed on Tuesday were judging it by its probable effect on the course of politics. Its reception in the House of Commons was not as dramatic as last year's, when a House that had expected very little was gradually raised, as the Chancellor unfolded the bold prospectus of a revolution in economic policy, to a pitch of spontaneous excitement. This year a budget of concessions had been expected and the realisation therefore brought few surprises. But there can be no doubt that, from the political point of view, this is a more interesting budget than the last; there are fewer changes in overriding policy, but more remissions of taxation. When the response of public opinion can be measured, it will be surprising if it is not found that Mr Butler has given a new impetus to the rising confidence of the Conservatives. It is, indeed, a very difficult budget for politicians to criticise, as the glum Labour faces revealed on Tuesday and as the speeches on Wednesday could not conceal.

The political success of a budget, however, is not necessarily a safe guide to its economic merits. However much it may seem to the parliamentarian killjoy pedantry to do so, the economic tests have to be applied. Was the balance struck by the Chancellor between revenue and expenditure about right in view of the economic situation and prospect? And within that balance were the changes in taxation judiciously chosen for their fairness and probable effect?

Neither question, of course, can be given an absolute answer; both are matters of opinion. Last year, Mr Butler budgeted for a surplus on the conventional definition ("above the line") of £510 million; in the event he realised only £88 million. Or, to take the comprehensive figures that include all the operations of the Exchequer, both current and capital, whereas he expected to reduce debt on balance by £4 million, in fact he had to borrow a net amount of £436 million. The cardinal point to be decided in budget making this year was whether, in laying his plans for 1953-54, the Chancellor should be content to aim at a result something like that actually achieved, or whether he should try to restore the surplus that was originally intended. Mr Butler decided for the former course; his final figures show a surplus of £109 million "above the line" and a comprehensive net figure of estimated borrowing of £440 million.

This was a deliberate exercise of judgment. As Mr. Butler said, the necessary surplus "cannot be determined by exact calculation." In the briefest and roughest terms, his argument was that though last year turned out worse than was expected in the strict budgetary sense, it turned out to be at least as good in the wider economic sense. Though in the event the budget was over £400 million more inflationary than was intended, other forces happened to be unexpectedly disinflationary in at least equal measure. Some of these other influences were external and beyond the Government's control: "our

economy, like our island climate, is always exposed to changes in the world economic weather." Others were the direct effect of the tighter control of credit which, though it was announced in the budget speech a year ago, formed no part of the budget proper. Since a surplus of about £100 million had in fact proved to be compatible with an improvement in the national economic health in the last twelve months, it could be assumed to be good enough for the coming year.

There are certain risks implicit in this decision. It embodies an assumption that the non-budgetary factors will be broadly as advantageous in 1953-54 as they were in 1952-53—that is, that the terms of trade will continue to move favourably and that the restraining effects of dearer money will be as great in their second year as in their first. If the estimates prove to be as faulty as they were last year, there will be a dangerously large deficit. Some people might have drawn from these possibilities the conclusion that it would be prudent to seek a somewhat larger surplus, even if not as large as the £510 million originally intended last year. But the responsibility is on the Chancellor; and, as a working hypothesis, his judgment deserves the benefit of the doubt until events have proved it right or wrong. To [illegible] with it in advance would be an excess of [illegible]ism.

★

This decision once made, the Chancellor had about £170 million of revenue to give away. But to what purposes should the reliefs be directed? Here Mr Butler's reasoning was impeccable: "the reliefs which I shall propose are designed to improve our competitive efficiency, to provide incentives for greater effort, and to encourage private saving"—or again "all reliefs are carefully designed for the prime purpose of giving the incentive for greater production."

Unquestionably, this is the right doctrine, and it is heartening to hear a Chancellor make it the central theme of his policy. Unfortunately, it has to be recorded that Mr Butler's practice fell a little short of his precept. Two criticisms in particular have to be made. First, if incentive and realism were his objectives, it is disappointing to find him making so little further progress in abolishing the subsidies. The food subsidies are to cost only £30 million less than the total of £250 million to which Mr Butler reduced them a year ago. This is the more surprising because last year's policy of cutting the subsidies has been a manifest success, not only in its economic effects, but also in political terms, since the initial odium incurred has been much more than outweighed by the popularity of the liberating process it has made possible. It was not unreasonable to hope that the budget speech would not only carry the policy to a conclusion but would begin to apply the same logic to the housing subsidies. The failure to pursue such an obvious advantage requires an explanation; and perhaps a hint of its nature can be gleaned from Mr Butler's declaration that "we shall work in the spirit that wherever appropriate the Government should do less and that the private citizen should be in a position to do more." If the process of de-subsidising is to be carried on piecemeal and *ad hoc*, it may give rise to fewer wage claims than if a large total of cuts is announced at one moment. This, however, is pure speculation; what is certain is that the restoration of economic health will not be complete until the subsidies are reduced to the basic minimum necessary for specific welfare purposes.

★

The second criticism of Mr Butler's proposals is that, for all his talk of stimulating production, by far the greater part of his tax concessions in fact go to the relief of consumption, which already takes too large a part of the total national resources. He gave away £169 million of revenue in the present year. Of this, £45 million was the cost of the reduction in Purchase Tax. There will be little dissent from the view that a start needed to be made with the process of licking this monstrous tax into shape; but the fact remains that virtually the whole of this £45 million is a grant in aid of consumption. Of the £117 million that is to be knocked off income tax, only £45 million accrues to the undistributed profits of industry; the rest goes into individual incomes of one sort or another and, unless there is a radical alteration in habits, nearly all of it will be spent. The political attractions and administrative convenience of a straight cut in the standard rate of income tax are obvious enough. But it is a very blunt instrument. It benefits consumption more than saving, unearned incomes more than earned, single persons more than families. Mr Butler could have come much closer to his declared purpose if he had been more selective, in particular if he had concentrated his attention on the earned income allowance.

Broadly speaking, only one-third of Mr Butler's concessions of actual revenue go to industry and to thrift and the other two-thirds to consumption. No politician, of course, can afford wholly to ignore "the vital human element." But the proportions should have been reversed. It is true that the speech had two further pieces of good news for industry, in the shape of a restoration of the initial allowances for capital expenditure and the promise that the Excess Profits Levy will die at the end of the year. But neither of these will have any effect on industry's tax burden this year, nor much effect next year, either. Though the initial allowances are of real value to industry, they are, as has often been pointed out, no more than an interest-free loan, since whatever is gained in the early life of a piece of capital has to be repaid in the end. And the early demise of EPL may actually be the means of increasing its total eventual burden on industry, since there will now be no refunds if profits fall below the standard in 1954, 1955 or 1956. (This is not, of course, to say that the repeal is a mistake; almost any price is worth paying to get rid of this fabulous piece of fiscal nonsense.) There can be no doubt of Mr Butler's sincere desire to help industry. But if the test is (as it must be) the effect of his proposals on the actual amounts of money that have to be set aside for taxation, now or in the future, they can only be called a small beginning. The greater is the hope that will attach to the promise that "before the next budget . . . it should be possible to make a full review of the level of taxation, and of industrial taxation in particular, in the light of the Royal Commission's report."

Mr Butler's second budget is thus not without economic blemishes to set alongside its great political attractions. But possibly to particularise them in this way is to run the risk of giving a false impression. For the budget's greatest merit is one that cannot be put into figures. It marks a change of direction, a turning of the fiscal tide. This year's proposals, with the world standing at what promises to be a watershed, and with the British system of taxation under review, were bound to be of an interim character. Whatever criticisms may be made of their details, they have the great recommendation that they mark a determination to "step out from the confines of restriction to the almost forgotten but beckoning prospects of freer endeavour and greater reward for effort."

Under the Olive Branch

THE speculation caused by recent Soviet gestures, especially in the United States, seems to be making a bold and dangerous assumption. It is that Malenkov and his colleagues are now, or soon will be, able to offer new and specific terms for the settlement of international problems which must cause much heart-searching and irresolution in the West. It is not difficult to see how this has come about. It had been obvious for long enough that Stalin, in order to check western rearmament and detach the United States from its friends, would be well advised to do, as well as say, a few friendly things. For reasons at which we can only guess he chose not to do them, and so the Atlantic alliance grew up out of fear and suspicion of his attitude. Now that his successors show signs of changing that attitude, it is argued that they must have seen the opportunity that Stalin missed and are willing to make to an armed alliance the concessions that he would not or could not make to a weak and disunited West. The *non sequitur* is flagrant: because Malenkov has instructed his representatives abroad to behave more reasonably, it does not follow that he has decided, or is free to decide, more than that. Indeed, the evidence of statements in the press and radio, for what it is worth, has been that the new Soviet manner does not yet express a fresh policy abroad, even if fundamental changes are in progress in Russia itself.

The more closely one examines the kind of intentions with which the Kremlin is now being credited, the clearer it becomes that any real appeasement of the West—with the concessions that Stalin refused—would present Moscow, no less than the western capitals, with a host of grave difficulties. The moral is, of course, that negotiating strength and policy positions cannot be accurately judged until the negotiators are round a table.

To take first the prospect in Germany, which is agreed to be the most important and difficult issue between the two camps. Malenkov's advisers could argue, from the record of previous four-power talks, somewhat as follows: if the West were now offered properly supervised free elections for an all-German government, with which the four powers would conclude a peace treaty and afterwards withdraw their troops, then present western defence policy would collapse like a pricked balloon. The Germans, it could be urged, would turn swiftly away from Western Europe to the new possibilities offered by national unity; the American and British forces would have to retire to new garrison positions west of the Rhine; and the whole strategy of Nato would need review. It is a formidable prospect, but is it any more formidable than what would confront the Russians? Would nothing collapse on their side of the iron curtain? To set such events in train could mean a spectacular end to Communist rule in Eastern Germany, the withdrawal of Soviet forces from Central Europe, and the end of their stranglehold on Berlin. It could mean, too, an end to the Soviet insistence that the Oder-Neisse line between Germany and Poland should be regarded as the final, inviolable "frontier of peace"; for no freely elected German Government, whatever the inducements, could formally recognise that frontier and renounce the lost territories. Such a collapse of a "people's democracy," such a weakening of the hold on German affairs, such a betrayal of solemn pledges to Poland could have in Eastern Europe—perhaps in the Soviet Union itself—effects that are unpredictable.

★

It may be that the Soviet triumvirate feel themselves strong enough to take such far-reaching risks. If they do not, then they must feel some alarm at the assumption of western commentators that they have some such offer in mind. In fact, we do not know whether they are thinking of doing any such thing, whether they could afford to do it, or whether they need peace at any price. To argue, in the absence of such evidence, that this would be the quickest and therefore the most likely way to get the Americans out of Europe and to split the Atlantic alliance is to ignore Soviet difficulties and to

conjure up for the West a distracting and confusing phantom.

In Korea, too, there is a crucial situation with which speculation is busy, but one in which negotiation is just about to get down to brass tacks. It is being said that the agreement to exchange sick and wounded prisoners is only one result of Malenkov's conciliatory initiative and that the Chinese are doing what the Russians, as part of a general plan, want them to do. The evidence, however, points the other way: it is that Stalin's death strengthened Mao Tse-tung's bargaining position in Moscow, that a nervous—and perhaps disorganised—Kremlin granted him some of the economic concessions he had so long been asking for and that it then became unnecessary for China to pay the price of continuing the costly Korean war, the objectives of which might be secured by patience and political means. It looks, in short, as if the bid for peace in Korea comes primarily not from Moscow but from Peking. It looks, too, as if the chances of a settlement depend on whether China, with its North Korean allies, can come to terms with the United Nations and not on the possibilities of a general *détente* between the Soviet Union and the Atlantic alliance. This is not, of course, to deny that the Soviet Government will continue to have a great deal to say about the future of Korea, about China's relations with the United States, about the future power of Japan, and—above all—about industrialising China and integrating it with the Communist economic bloc. But it is highly doubtful whether settlement in the Far East depends on settlement in Europe.

★

If, in these two important aspects, much current speculation turns out to be premature and ill-grounded, what is to be said of the view that the western time-table, its agenda for the next few months in Europe, in Nato, in Congress, is in danger of delay even of complete frustration? It is clearly within the power of propaganda, if French political leaders try to resist it, to convince a majority of French deputies that Moscow might offer an alternative to the European Defence Community and the rearmament of a divided Germany. That would be sufficient to delay French ratification of the treaty for a defence community, to postpone decision until the autumn; then elections in Western Germany, also held in the shadow of doubt about Soviet intentions, might turn against the policy of integration with Western Europe that Dr Adenauer has just reaffirmed with such emphasis. These things, it is true, might happen; it has already been shown how easily a feint from the East gets the West off balance. But what is the use of speculation about them so long as it is not known whether the Russians would permit the rearmament of a united Germany in order to please the Germans or refuse it in order to please the French? To give equal satisfaction on both sides of the Rhine is, as the Americans and British have learnt, wellnigh impossible.

There is yet another major problem to which Soviet propaganda, and Malenkov himself, have given marked attention but which western speculation has virtually ignored. It is clear that the Communist bloc of seven hundred million people could achieve industrialisation and living standards on the western model much more quickly if all restrictions on trade with the free world were removed. The economic progress of Eastern Europe, whatever the planners may think of it, has not come up to the expectations of either rulers or ruled. The speedy industrialisation to which China has—with Soviet encouragement—pledged itself is a task of colossal dimensions, almost certainly beyond the technical resources of the Communist nations alone. If Malenkov has economic aims nearest his heart—and there are obvious reasons why he should—then it may well be that the first specific approaches to the West from Moscow will come in the field of trade and finance. It needs little imagination to foresee the soft spots in Europe at which these could aim:—for example, German industry's search for new markets, particularly in under-developed countries. In this economic field the Russians would have little to lose and much to gain, whereas in the field of political and military settlement they have much to lose as well as to gain.

★

In such doubtful circumstances the wise course for the Atlantic Alliance is to stick to its time-table and go on with its agenda. By doing so it can at least progress towards equal, as well as peaceful, co-existence with the growing giants of the Communist East; by doing so it may eventually succeed in getting Moscow to reveal its terms. By pausing to see what the Russians may say—still worse, by pausing to think aloud what should be said in reply—the western governments would merely make it unnecessary for Malenkov to reveal or do very much. That is not to say that they should do nothing. If the Russians make small, human and reasonable gestures such as the British Ambassador has been discussing with Molotov, then other gestures should be made in return. But they should be on the same scale; one does not exchange an embrace for a bow. At the same time the allies would do well to study together, through diplomatic channels and in the strictest secrecy, what would be their agreed terms for general and particular negotiation with the Russians. For it is as clear as anything can be that the reason why some people in the West are a little nervous of peace—and they should not be ashamed to admit it—is because a serious and reasonable Russian peace offer made now, whether in Europe or the Far East, would reveal differences of view and interest among the allies which they have not seriously tried to resolve because it has not been necessary to do so. If ever there was a time for the West to practise secret diplomacy, and to put a curb on wishful public speculation, it is now.

Perón at Bay

THE suddenness and intensity of the new crisis in Argentina came as a shock not only to General Perón but also to many more dispassionate observers. In the first weeks of 1953 the Argentine economy, however shaky at bottom, seemed to be looking up. Bumper grain crops had appeared just in time to prevent a grave shortage of food and the complete paralysis of the country's export trade. White bread was back, and "meatless days" seemed a thing of the past. The regime of austerity imposed early in 1952 had gone some way towards closing the national gap; currency in circulation and gold reserves were at last showing signs of stability, and wages and prices were no longer chasing each other skywards at jet speed. The President's perennial optimism seemed for once to have some basis in reality, and his government was not slow to exploit the occasion. In Buenos Aires and Europe Argentine negotiators, with some strong cards in their hands, were briskly discussing or renewing trade agreements with half a dozen countries. Chile and Bolivia were apparently moving meekly into Argentina's economic and political orbit. The change of administration in Washington at least meant the disappearance of men from whom General Perón could expect nothing, and might mean even better things.

Broadcasting to his subjects in mid-February, the Argentine President assured them that conditions had never been more favourable to the *Peronista* movement. He thanked the workers for the sacrifices they had made in the past year, and declared that Argentina, thanks to those sacrifices, had emerged from its difficulties. His gratitude was no doubt sincere enough. In the course of twelve months the organised workers, who had once been led to expect so much from *Peronismo*, had experienced not only a wage freeze, and a steeply rising level of unemployment and short time, but also the disappearance first of their accepted champion, Eva Perón, and then of her most vigorous lieutenants, men such as Sr Espejo, who was succeeded as secretary-general of the trade union front by the docile Sr Vuletich. General Perón may well have felt that if he could weather a year as difficult as 1952 without running head-on into serious labour unrest, he could ignore the Cassandras who held that a split between the government and the workers was inevitable.

At all events, the President felt sure enough of himself to be rather more frank with his people than usual. In a series of broadcasts on the new five-year plan, he abandoned to some extent the pretence that the austerities of 1952, the year between the plans, had been only a temporary necessity. From a cloud of magniloquent phrases, he let drop some disconcerting facts about the next five years. The plan, he revealed, required every consumer to avoid waste in any form; to buy Argentine, not imported, manufactures; and to adjust his eating habits in the direction of fish—a change which most Argentines are most reluctant to make. Specifically, General Perón disclosed that the new plan involved a definite restriction on consumption of beef, together with a concentration on the export drive.

★

There was no immediate reaction to this or to the government's other indications that the new plan would be arduous and uncomfortable for the ordinary Argentines. They were, after all, no more than indications, and the public's attention was mainly directed to more cheerful developments—the economic agreement with Chile, the bumper grain crops, the record wheat deal with Brazil, and the revival of the chilled meat trade. The President was able to claim that the country was now politically calm, a fact which he attributed to the defeat of the Democrats in the United States. Looking around him, he can indeed have seen few signs of even potential opposition. The anti-*Peronista* parties and newspapers were virtually silenced; the army had been systematically purged since the abortive coup in 1951, and officers who continued to appear restless were regularly cross-posted to prevent the formation of rebellious cliques; Señora Perón's fierier friends had been weeded out, and replaced by men whom the President felt he could handle; and the police had been considerably strengthened. Even the farmers, who had suffered so much at the hands of the regime, seemed more inclined to co-operate; towards the end of March General Perón publicly thanked them for their support of the government's drive to increase grain crops.

Beneath this calm surface, however, several quite distinct currents were coming together to foment trouble. As in past years, nature could be allotted part of the blame. Recent months have been unusually wet on some of the pasture lands, and breeders who would normally have had to send their cattle to slaughter for lack of grass have been able to hold them back. They have done so partly because they need to rebuild herds which drought and *Peronismo* have reduced from 41 to about 27 million head (the results of the livestock census taken in November have been withheld, but they are believed to confirm the more pessimistic private estimates); and partly because they have not been attracted by the fixed prices in the Buenos Aires market. Official mismanagement has made matters worse; prices at provincial markets have not been held down as rigidly as those in the capital, and such beef as was forthcoming has therefore gone to the inland cities rather than to Buenos Aires.

The resultant shortage of meat had become serious as early as the end of February, and at the beginning of March packing companies were told that they must fulfil fixed quotas for the home market before they could export. This rule, however, was not fully implemented. Some shipments continued, and public discontent was increased by the grumblings of dockers who, although unable to get meat for their families, had to carry it to the ships. At the end of March all beef exports were indefinitely suspended; but even so the shortage in Buenos Aires continued, and only those who could afford to pay black market prices tasted the traditional Argentine diet, while the prices of other basic foods rose sharply in sympathy.

★

The pace of events then accelerated. On April 1st General Perón lashed out at the farming community whose praises he had been singing only a few days before, and assured them that he would use troops to storm the cattle ranches if beasts were not immediately sent for slaughter. He also announced drastic action to be taken against speculators in foodstuffs. A corps of inspectors descended upon the capital's food shops, and by the beginning of this week some 500 shopkeepers were in the central gaol. These vigorous moves were obviously popular with the urban masses, and they have been followed by an increase in the amount of beef available in Buenos Aires—although this was largely achieved merely by lifting the price ceilings by some 15 per cent. Thus, when the government arranged that the workers should be given a holiday on Wednesday and brought to the Plaza de Mayo to demonstrate their loyalty, it felt confident of the outcome.

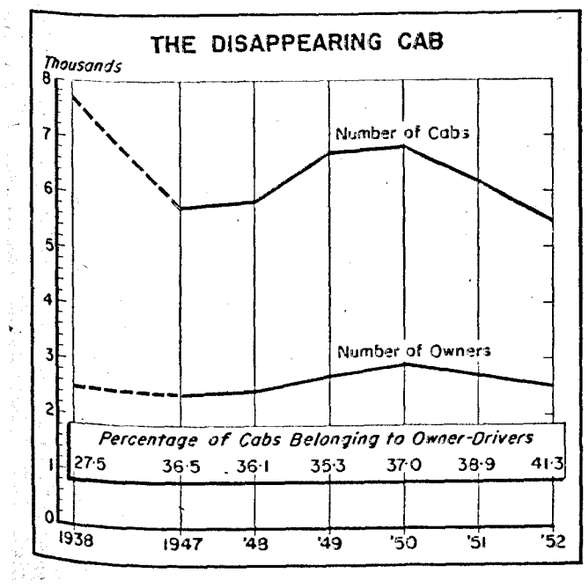
But the fact that this demonstration was thought necessary showed how deeply the crisis had affected the regime. It was much more than a shortage of meat. In recent weeks, confidence in the government has been sapped by two distinct waves of rumour, one alleging that the *Peronista* leaders were at loggerheads and the other charging them with corruption on a vast scale. Substance was given to the first belief by the expulsion from the governing party of Colonel Mercante and seven other leading figures, and by the resignations of the Minister of Labour, Sr Freire, and the President's secretary, and brother-in-law, Sr Juan Duarte. The subsequent suicide of Sr Duarte increased suspicion that the corruption charges were well founded, and although the President himself attended the state funeral the army leaders were conspicuously absent. General Perón took the talk of corruption seriously enough to announce that he had ordered an inquiry into the personal assets of all public officials, beginning with himself and his ministers, but the prevalence of rumour was officially attributed to the opposition parties and the expelled *Peronistas*, who were said to be jointly attempting to overthrow the government.

Yet, despite his talk of "a major attack by internal enemies," the President has shown signs of realising that, at bottom, his troubles are due to the fact that the regime has lost contact with its former supporters. In a bitter broadcast last week, General Perón called his people a nation of "eighteen million *estupidos*" who allowed themselves to be robbed by profiteers and misled by rumour-mongers. The people themselves, he said, were mainly responsible for the high cost of living. But he admitted the seriousness of growing unemployment, and promised that steps would be taken to "reactivate" industry and refill the worker's pay packet. No clear indication of how this is to be done has yet been given. Industry is in the doldrums because it cannot carry the heavy load of labour privileges; because it cannot import machinery, fuel or materials owing to Argentina's lack of foreign exchange; and because the government has not only failed to ease credit restriction but has even failed to pay its own bills. All these difficulties are the fruits of Perón's policies; and whatever solution he may find for his problems must involve a further tightening of belts.

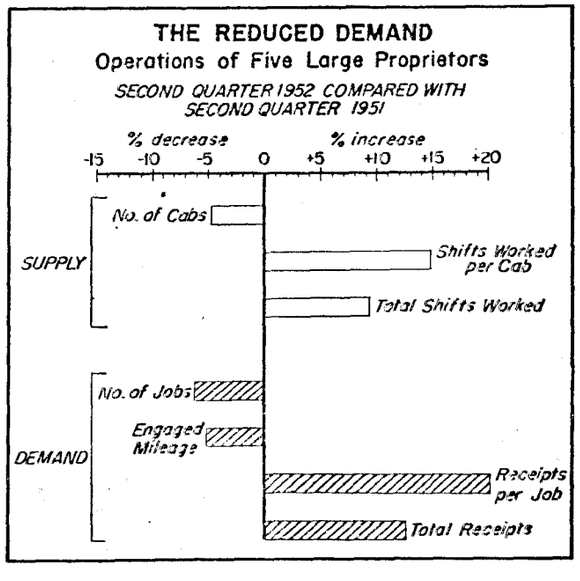
★

The Argentine has had to tighten his belt before, and last year he did it without protest. If he is now more restive, the reason is that the regime has reached a point in time when its magic no longer operates. Señora Perón died nine months ago, and the intensive period of mourning, which in itself served as a distraction, is over. Not only have the urban masses lost their lady bountiful; they have also realised that the austerity which, trusting in her, they accepted last spring as an emergency measure, is to remain with them indefinitely. They suspect the bereaved President of a tendency to the right, and it is unlikely that they can be appeased for long by the mass arrest of shopkeepers. Among the very poor and very simple there is still faith in the regime, but the artisan and lower middle class elements which once lent strength to *Peronismo* have got near the end of their tether. The food shortages and rocketing prices of the past few weeks served as sparks to this dangerous tinder.

There is as yet no clear sign that the government's days are numbered. If General Perón has succeeded in nothing else he has at least made it difficult for his people to find any alternative to him. But the latest crisis has revealed exactly how shaky his position is. There are now no cushions on which to fall back if fresh difficulties appear. Both internationally and internally, the government's funds are low. It has lost the faith of many of the workers, without restoring that of the business men, the farmers or the soldiers. Appeals for national solidarity in the face of imagined threats from abroad are of little use when the nation's problems are so obviously internal in origin. There seems only one alternative: the increasing use of police methods. It may not be long now before General Perón's police, instead of marshalling demonstrators on the Plaza de Mayo, are busy keeping them off it.



Taxis and Taxes



THE Runciman Committee has said hey presto and the purchase tax on taxicabs of the London model has vanished in a puff of budgetary smoke. So too have restrictions on their hire purchase. It does not often happen that the recommendations of an official committee are carried out in less than a week. But the need was urgent, so sharp has been the fall in the number of London cabs since the end of 1950. It was then 6,800; now it is 5,400.

The taxicab trade is a classic case of one that consumes its capital in a time of rising costs. If depreciation is reckoned on the current cost of replacement, rather than the actual cost of the old cab, most of London's taxis would probably be shown to run at a loss. When cabs are too old to pass the annual police inspection without unduly expensive repairs, owners have therefore lacked the capital to replace them. The price of a new cab, until last Tuesday, was £1,139, compared with £355 before the war. Nearly £300 of this sum was purchase tax, which Mr Gaitskell had doubled in 1951 to a rate of 66⅔ per cent. Mr Butler added to the terrors of replacement a year ago with his restrictions on hire purchase. These were afterwards relaxed so that payment, instead of being confined to 18 months, could be spread over 30 months; but even this was hardship compared with the five years that was normal before the war. It is not surprising, therefore, that the number of new cabs licensed in London fell from 960 in 1950 to 698 in 1951 and to 132 in 1952. (Figures for the provinces are not known, but the position is probably quite different, partly because traffic conditions are better and partly because provincial taxis do not have to comply with costly technical requirements as London taxis do.) At the present rate of demand for new cabs of the London type it is hardly worth while to manufacture them, and the only firm that still does so was making plans to cease production.

The Budget will revive the demand, but whether it will raise it to as much as 1,000 cabs a year (including some for the provinces), which the manufacturers say is the minimum economic output, is another matter. Certainly the concessions will cause no universal rejoicing in the trade. Indeed they have brought to light a lack of solidarity within its ranks that is an oddity in this highly organised world. Those, on the one hand, who drive their own cabs seem quite satisfied with Mr Butler; but the cab proprietors, the fleet operators, as well as the men who drive the proprietors' cabs, are breathing fire and fury.

The men—the journeymen drivers—are wrathful because neither the report of the Runciman Committee nor its implementation by the Chancellor of the Exchequer has anything for them. They complain that their earnings have not kept pace with the rise in the cost of living and with the earnings of other workers. But they cannot claim a rise like industrial workers, for they are technically self-employed persons. They hire their cabs from the proprietors and pay for the hire, according to the present agreement, by handing over 62½ per cent of the fares. The proprietors pay all the running costs, including petrol. According to figures supplied in an appendix to the report, the average journeyman driver does 17 jobs a shift (or day's work) at 3s. 4d. a job. After paying the proprietor his percentage, he thus retains about £1 1s. a day, and to this must be added tips worth not less than 10s. even if the

average is as low as 7d., as well as the extras for luggage and for more than one passenger. That does not seem bad pay. If the drivers want to increase it they must negotiate, through the Transport and General Workers' Union, for a higher proportion of the fares than the 37½ per cent they now get. In 1950 they did push up the percentage from 33⅓ per cent, and any further increase is out of the question unless there is a radical change in the financial position of the proprietors.

The report's assumption that the proprietors are running their cabs at a loss is based on figures supplied by five large companies. It appears that running costs are just over 8d. a mile, of which nearly 5d. goes on petrol and repairs, and 1½d. is for depreciation, based on the recent replacement cost of £1,139 and an 8-year life. The remaining 1½d. covers the fixed costs and overheads. Against these running costs of 8d. a mile, receipts of the five proprietors averaged only 7¼d. a mile. Not one of them showed a profit.

The fact that so outrages the cab proprietors is that the proposals of the Runciman committee will not eliminate this loss. The abolition of purchase tax on new cabs reduces the cost of depreciation by about ¼d. a mile, and still leaves an average loss of ¼d. This suggests that London taxis will continue to go out of business. But the committee faces the prospect blandly —indeed, welcomes it as the way to make the trade profitable again ; when some taxis are starved out the survivors will do more business to the mile and spend less time on empty cruising. The cab proprietor complains that, on the one hand, the service he provides is regarded by the committee as essential to London's status as a business and tourist centre ; and that, on the other hand, he is told that he can go on making losses for the next few years, until his financial troubles right themselves. He also feels aggrieved because the abolition of purchase tax only helps those who are shortly to buy new taxis ; it does not make cabs bought since the war (about two-thirds of the cabs in London) any more profitable.

★

The strength of the proprietors' case is weakened by the owner-drivers' apparent satisfaction with the Budget concessions. In evidence before the committee they did not say that they could not make a living ; and although they would, of course, have been delighted with a rebate on petrol duty (the proprietors' proposal), their two main demands have now been granted. Most of them would account for the difference of view with the proprietors by saying that the owner-driver is likely to be more efficient than the journeyman driver. As the proceeds of his efforts are all his own he has a greater incentive to be at the right place at the right time, and that is very important to successful plying. He also has more opportunity to be at the right place at the right time, for he works when he likes and not to fixed hours as the journeyman driver usually does. He inclines to the view that the proprietors do not seem to know when they are making a profit, whereas the proprietors say that the owner-drivers do not know when they are making a loss. Here the proprietors seem more likely to be right. The owner-drivers produced no figures for the committee for the simple reason that most of them keep no books. They may be content to find that they have £15 or so in their pockets at the end of the week and probably make no proper allowance for depreciation. But at least the evidence suggests that they are finding the trade more profitable than the proprietors, for, as the chart shows, the proportion of owner-driven taxis to the total—now 41 per cent—has been rising.

Even the proprietors, however, have some remedies in their own hands. Their fares are controlled by the Home Secretary, but they could apply to have them raised. But neither they nor the committee think this would be wise. It might reduce custom, so that the higher fares would be offset and receipts remain roughly as before. If it cannot increase its receipts by higher fares the taxi trade's efforts must all be directed to raising the proportion of engaged to disengaged mileage. The use of radio equipment (hired from one of two companies, which do not themselves own taxis) is one way of doing this ; the customer telephones a control point, which sends the radio-taxi nearest to him. This device is limited by the number of frequencies that the General Post Office can provide and the number of cabs that can be controlled on one frequency. There is, however, scope for far more than the 430 London taxis that are now equipped with radio. Another way of keeping within call of the customer, and at the same time of wasting less petrol by cruising, is to provide more cab ranks. This is limited by the state of London traffic ; but better use could at least be made of existing ranks if it were easier to telephone them. The committee suggests that an intending customer should be able to dial something simple, like CAB or TAX, and then be put through to the nearest rank. This is done in other cities, for example, in Amsterdam. It is badly needed in London, and the Post Office should co-operate with the cab trade in providing the facilities.

Here is one way in which the Government can add to the help that it has just given in the Budget. But that is the only other kind of help it properly can give. The committee was quite right to turn down the proprietors' proposal for a rebate of petrol duty and to reject, too, the proposal to limit entry into the trade, which would be particularly inappropriate when the number of cabs is in any case falling. It is in the public's interest that anyone who can run a taxi profitably should be free to do so. It is, indeed, convenient for Londoners that there should not be fewer taxis, but there is no reason why the Government should grant special favours in order to keep more on the streets than the public is prepared to pay for. Mr Butler has gone far enough, and the taxi trade should be thankful for mercies that are not only large but are also prompt.

Notes of the Week

Mr Dulles Thinks Aloud

HOPES of a truce in Korea have already begun to show that what might happen after it had been concluded is far from clear. The drop in Communist pressure has already begun to reveal, like an ebb tide, the rocks of allied disagreement on Far Eastern policy, until recently more or less covered by the swell of war. The furore in Washington over the calculated dinner indiscretions of the Secretary of State, Mr Dulles, has outlined the difficulty in which the Administration stands. It cannot, on the one hand, make concessions without arousing the wrath of the China lobby. On the other, if it pitches its terms too high, it will prejudice that unity of allied approach which is still essential in bargaining with the Communists.

American public opinion being in the state it is in, Mr Dulles was in fact doing some useful and necessary thinking out loud. He suggested that, if a military truce could once be reached in Korea, the subsequent political negotiations should no longer be confined solely to the future shape of Korea. The time had come, as President Eisenhower has publicly indicated more than once, to try to include the wars in Indo-China and Malaya on the agenda. Where Mr Dulles caused the most dismay in the Republican party was with his hint that Formosa might have to come under United Nations trusteeship. This implied giving up positive support for Chiang Kai-shek's claim to be the government of China. Mr Dulles was careful not to propose recognising the Chinese Communists in return, but he is reported to have commented that after a period—admittedly, perhaps, a long one—the claims of the Peking government to be admitted to Uno might become strong. These are bold words in the United States.

If these sentiments upset some of his supporters, Mr Dulles can hardly have expected an easier passage with America's allies in a number of his remarks about Korea itself. He suggested that, if Korea cannot be united, then the split between North and South should be at the narrow waist about 100 miles north of the present fighting line. This would put 85 per cent of the total Korean population in the South, and give Mr Syngman Rhee's Republic important sources of hydro-electric power. But can one really suppose that the Communist powers would be prepared to give up this amount of territory ? It is one thing to put up a counterweight to concessions over Formosa and to bid high, but another to expect the other side to yield actual territory, as a result of the apparent decision to relax tension ; there has been no instance of the Communists surrendering territory, except when forced to, since the Russian army pulled out of Manchuria after the end of the war against Japan.

There are two important things on which the United Nations have to decide before anything else can be done. The first is whether unity of the country is possible in present circumstances. The second is the type of guarantee that can be given to prevent a repetition of the events of the past seven years. Mr Dulles in effect brushed unity aside by presupposing a partition at the waist. But is it necessarily against the interests of either side to reunite Korea ? Uno is theoretically committed to unity as an aim of the campaign, though a truce would obviously not now be held up because it could not be obtained. The Communists might well argue that if, by unity, they could ensure the withdrawal of American troops, the gamble would be worth while ; they might in the end infiltrate back into complete power. Clearly, if there are to be two Koreas, Mr Dulles was right to suggest that the South should now be given a public American security guarantee.

Where Mr Dulles's conversations may have started an unfortunate precedent was in discussing so openly the aims and interests of the allied powers. It is true enough that Korea is now a lively issue in America and in the other UN countries with troops there ; public opinion must therefore be kept fair and square behind allied policy. But governments should beware of talking too indiscreetly until they have cleared their own minds about what is agreed policy.

Trade on Whose Terms?

THE experts from western and eastern Europe who have been discussing mutual trade at Geneva this week were pledged to secrecy by their host, Mr Myrdal of the Economic Commission for Europe. It is possible, however, to deduce some of the general trends involved in the talks. For reasons that have often been discussed in *The Economist*, the Soviet Union and its satellites have hitherto shown little readiness to increase the direct exchange of goods between the two halves of Europe. The only practical ways for them to expand trade are to increase their own deliveries of the products which the West most desires and to halt the cold war. This the Russians have shown no inclination to do. The east-west trade theme was a useful propaganda device and little more. In recent weeks, however, the Soviet authorities have elevated east-west trade to a first principle of Soviet foreign policy, and there are grounds for thinking that their intentions are more serious than usual.

The new emphasis may or may not signify a willingness to make practical economic and political concessions, but the reasons for the shift are fairly plain. Even the outsider can see that it is hardly conceivable that the resources of the sphere can be stretched to meet all the competing demands

now made upon them. With an annual steel output at its disposal of perhaps about 45 million tons all told, how does the Soviet Union intend to carry out its avowed aim of simultaneously strengthening its armed forces, proceeding with the industrialisation plans of both the USSR and the satellites, raising the Soviet standard of living—and helping to industrialise China ?

Perhaps the essential fact is that China has set its heart on industrialisation, and the essential question is who shall provide the equipment and the credits. Clearly, the Soviet Union cannot handle more than a limited part of the job ; although the new Sino-Russian economic pact provides for more tangible deliveries than the Chinese have yet had from Moscow, it has now lessened Peking's anxiety for supplies from other sources. Equally clearly, the Russians have no wish to see China find in Japan or the West a source of supply that would free it from dependence on Moscow. Yet the only thing that prevents China from trading where it pleases is its identification with Russia's aggressive policy. This is a most delicate situation for the Kremlin to handle. Its ideal solution to the problem is to channel all China's trade with the free world through the Russian-controlled "Comecon" organisation. The setting up of the main Chinese trade office in East Berlin, and the boycotting of traditional channels such as Hongkong, are integral parts of the scheme, which not only keeps the Chinese on a leash but also gives Moscow a new hold on, for example, Germany. In these circumstances, for the West to agree that its trade with China should pass through Big Brother's hands is to help cement the Communist bloc.

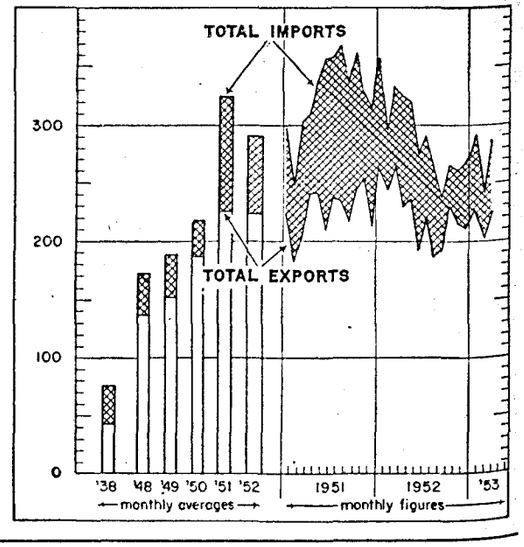
Budget without Offence

THE Opposition has six days in which to marshal its general case against the Budget ; and since Mr Bevan has been chosen to make the concluding speech on Monday evening, it would be rash to assume at this stage that no real party controversy is going to develop. But certainly the Labour party has been hard put to it to work up any indignation or even sustained criticism.

The efforts to identify Mr Butler's workmanship with a "class" Budget have so far had a strangely academic flavour. It is, of course, true that the reduction in income tax benefits a man more the larger his income and the more of it is unearned. But no one seriously regards this as a sinister Tory design. It reflects the bluntness of changes in the standard rate as an instrument for improving incentives, and the rich are too few, and taxed enough in any event, for most Labour MPs to feel strongly against a little incidental benefit for them. The "class" criticism would have bite to it only if the Budget made some people worse off while reducing taxes for others. And this, the Opposition is lamenting, is precisely what Mr Butler has studiously avoided. He has helped the lowest incomes to only a slight extent, through the reduction in purchase tax, but he has not hurt anyone at all. Complaints about the way the Chancellor has distributed his reliefs therefore lack political sting, and the Opposition has no other ground to manœuvre on. It does not want to risk unpopularity by saying that Mr Butler should have kept taxation higher. On the other hand, to say that the tax cuts are not enough would be to admit that the economic position has improved marvellously since the Conservatives took charge. If any political fireworks are concocted in this situation, they are likely to damage their creators more than the Chancellor.

The Opposition's helplessness is reflected in the comment that Mr Butler has devised an election Budget. There is a negative sense in which this perhaps conveys an element of truth. The Budget avoids offending anyone ; it creates no barriers to an autumn election if by then the Conservatives should want to appeal to the country. That they will is possible, but not yet more.

Liberalising Agriculture



IN adopting a motion for the gradual abandonment of the control of agricultural prices and markets, the Liberal party assembly showed a refreshing ability to return to, and reconsider, first principles. But it may be questioned how far a party that depends for most of its remaining electoral favour upon country districts is wise in selecting this issue to diverge so signally from other party platforms. The objection was quite properly raised that the new policy was not one on which Liberalism could fight an election. The electorate may be pardoned for concluding that the Liberals are less interested in fighting elections than in tilting at windmills.

Liberal speakers who insisted on the importance of retaining some free, independent, middle of the road members in Parliament were on solid ground ; but to re-adopt principles (however softened by the word gradual) that might have the effect of reducing the number of such members further is to confuse priorities. Political parties exist to win and exercise power, and the way to do this is to champion real, not lost causes. A free market in agriculture is, regrettably, a lost cause. The practical problem is to find a way to remove fixed prices, and to restore enterprise to farming, while providing for farm products floor prices no more than sufficient to safeguard the countryside against disasters. Intellectual concepts do not directly convince electors, as Liberals have had reason to learn from their free trade doctrines in the past. The countryside wants security—and it is increasingly hard to argue that the national interest does not require it too. If a sturdy minority of farmers, with costs well below the rest, does not think that the present agricultural price system is necessary, they certainly keep fairly quiet about it.

The high cost of food provided Liberals with ammunition to enable them to win and keep power—but that was over a hundred years ago. It is still a real issue—but it must be approached in a way that suits the times. The return of competition to agriculture is of the greatest importance, but the closed shop in agriculture is not a thing to be tackled by sweeping generalisations. That can only too easily make a present of more Liberal votes to the Socialists and Tories.

THE UK TRADE GAP

£ MILLION

Dr Adenauer's Mission

DR ADENAUER can count his visit to Washington as highly successful, even if concrete results are few at the moment. He appears to have received an assurance that the United States will not come to an agreement with the Soviet Union at the expense of Western Germany, and he himself has restated his conviction that even the reunion of the Federal Republic with the present Soviet Zone should not prevent Germany from entering the European Defence Community. He also pointed out that a United Germany would inevitably be drawn right into the Soviet orbit if the country were neutralised and concluded a new Rapallo treaty with Moscow, pledging it to close economic cooperation with the eastern bloc. Such ideas appeal in Germany, even to the most anti-Communist circles.

It is a remarkable indication of Germany's new prestige, not at all welcome in France, that something like terms for Moscow should have been announced as the result of talks held exclusively between Dr Adenauer and President Eisenhower. The joint communiqué issued after the Chancellor's visit laid down two things that Malenkov and his colleagues should do to show that they genuinely want peace and unity in Germany: they should allow free elections, and should return German prisoners of war and deported persons now held in the Soviet Union. These are, fortunately, terms with which the allies of the United States can agree; but this was hardly the Atlantic method of formulating them. The episode underlines the need for continuous joint consultation, which will include the Germans themselves but will not exclude other allies.

The difficulties that the Russians would face in allowing free elections are referred to elsewhere in this issue. As for the German prisoners—some hundreds of whom are generals and high-ranking officers—it has always been clear that they are held as valuable hostages. Some quite substantial concessions from the West would be required by Moscow before they would be released to become part of a German army allied to the United States.

Bargaining with the Caudillo

WHATEVER one's views may be about General Franco's politics, there is no denying that he is a patient and cunning negotiator. As Hitler discovered before them, the Americans are finding out that to get anything out of the Caudillo is like staying at the proverbial Spanish inn: one has to bring along whatever one hopes to find there. When the Republicans took over in Washington, the draft of a treaty with Spain was supposedly ready for signature and the new administration looked forward to concluding negotiations that had been dragging on for well over two years. Repeatedly, during the past few weeks, American officials, ranging from General Vandenberg to Ambassador Dunn, have hinted that a Madrid-Washington pact was ready save for a few finishing touches. On Tuesday, however, General Franco arrived in Seville for a holiday, and there is every indication that any sense of urgency that may exist about the negotiations is to be found among Americans rather than in Madrid.

This is not merely part of the Spanish bargaining tactic ; it reflects the strengthening of Franco's hand. Fears of a protracted drought and of a setback for Spanish agriculture have been calmed by a spell of wet weather. Spanish trade prospects are improving continuously, owing to new agreements with France and Germany and active propaganda in the Middle East. The fact that the Catalonian cotton-spinners have received a 12 million dollar credit from the Export-Import Bank with which to purchase cotton in the United States shows, moreover, that Spain can make its claims heard even before signing a formal treaty with Washington. It is not known, at present, whether the hitch in the negotiations is caused by Franco's raising his price or by disagreement about the duration of the treaty beyond the sixteen-year period originally envisaged. One thing, however, is clear: General Franco is proving that governments which put national independence above everything and are willing to submit their peoples to austere sacrifices can, in fact, bargain with the United States on nearly equal terms.

Nato's Meeting

THE meeting next week of the Atlantic Council should do something to brace political and business morale in Western Europe. It will provide a reminder that $63 billion is still going into defence in the year that ends on June 30, that there is to be no immediate substantial drop in Nato's armament aims and that the elements of permanence in the Atlantic alliance have been solidly laid. There is above all the habit of periodical consultation by fourteen Foreign Ministers and the almost daily consultation of their permanent representatives in Paris. There is the growing tendency of finance and defence ministers to say to their cabinets "This is what Nato thinks we should (or should not) do." There is the concentration of strategic planning in the Standing Group, even if it is not global enough to please some people ; and for those who accept no evidence of allied solidarity save bricks and mortar there is the quite astonishing achievement of "infrastructure," to which Lord Alexander referred this week.

Infrastructure means that the fourteen allies share in Western Europe static and permanent installations for ground and air forces worth, when they are completed, over £350 million, to which the British have contributed some £50 million. Most of 140 airfields will be completed during this year and they are being provided with a common pipeline system for the delivery of jet fuel. The Minister of Defence quite rightly called this "an unprecedented international effort for common defence" in peacetime. These installations, plus the air warning and communications system built up for Nato, provide a hard basis for a continued collective defence effort, however much the international situation may change.

Decision for Federation

THE majority in favour of Central African federation shown by Southern Rhodesia's referendum was greater than most people in this country had expected, as, too, was the size of the poll. Nearly 83 per cent of the electorate voted, and the final figures were 25,570 in favour of federation and 14,729 against. As recently as four months ago, the result of the referendum was in doubt. It now looks as if the debates in this country, in and out of Parliament—and the hard things said in them about Southern Rhodesia's native policy—stung liberal opinion there to vote in favour of federation.

It can be taken for granted that the legislatures in Northern Rhodesia and Nyasaland, where the federal scheme will be debated shortly, will approve it. After that, the next stage will be an enabling Bill in the United Kingdom Parliament, giving power to introduce an order-in-council containing the federal constitution as proposed in the last White Paper. The order-in-council is expected to be made before Parliament adjourns for the summer recess, and in that case federation will formally come into force at the beginning of next year.

These next few months can be crucial for the success of the whole scheme. On the eve of the referendum, Sir Godfrey Huggins stated that he accepted partnership

> as meaning that all the races will work together to promote the prosperity of the federal state, in which all the inhabitants will have a stake. Leadership does not mean domination.

Now that he is freed from the fear that he might prejudice the outcome of the referendum, and the majority of the Southern Rhodesian electorate has endorsed his policy, Sir Godfrey Huggins's next task is to try to reassure the six million unfranchised Africans of the three territories. He has still to prove to them that it is leadership, not domination, that the Europeans of Southern Rhodesia want. Nor should reassurance stop at the Zambesi. It is even more urgently wanted in the two northern territories. Mr Welensky should reflect that though federation may be "an accomplished fact," it cannot be a success if the Africans remain in their present mood. And the quickest way to dispel their bitterness would be a start to remove the economic colour bar in the copper mines. At the very least, the attempts to extend it to other industry should be dropped forthwith.

Kenya Command

THE decision to unify the command of all the forces fighting Mau Mau, with General Hinde as Chief of Staff, had become inevitable; it follows growing complaints from leaders of all races in Kenya that there has been muddle and laxity in handling the emergency. Divided counsel and infirmity of purpose, it is said, are responsible for the humiliating situation in which the initiative has largely remained with the Mau Mau gangs. After six months of disorder, outrage and dislocation of the colony's life, it is certainly hard to deny that African organisation has been more effective than European. The first Mau Mau reaction to General Hinde's new command has been to inflict a smart reverse on a loyalist patrol.

Kenya is now being organised for a "Malayan solution" of the emergency. General Hinde gives orders to all military, police and auxiliary forces. Military and administrative action is co-ordinated by a committee comprising the Governor, the General Officer Commanding, the Chief Secretary and three European elected members of the executive council. Co-operation between military and civilians is to be assisted by provincial security committees. Hitherto, the police operation has been against Mau Mau; the settlers now urge that the whole Kikuyu people should be declared to be in rebellion, arguing that this in practice would enable summary justice to be done and would help the authorities to distinguish between Kikuyu loyally fighting Mau Mau and those who in greater or less degree abet the terror. It has been suggested that land should be taken from Mau Mau adherents and given to loyalists. The Government will need to be sure of its ground before it adopts either idea.

The immediate question is whether General Hinde's composite forces can take the offensive against the Mau Mau in arms. So long as the terrorists score what in African eyes amount to military successes, it will be impossible to swing the majority of Kikuyu to the side of law and order. But the task of breaking down the Mau Mau organisation—like that of breaking down the Communist organisation in Malaya—will inevitably be a long one, perhaps longer than the six months predicted by Mr Blundell last week. And the longer it takes, the more racial relations must be expected to deteriorate.

Impasse in Nigeria

AN ugly situation has developed in Nigeria. The federal constitution has broken down, and the difficulties of carrying on the Queen's government have forced the Governor, Sir John Macpherson, to fly to London for consultations with the Colonial Office. These will be critical. It is evident that any attempt to rule by decree—as happened in India in analogous circumstances—might be accompanied by mob violence fomented by local politicians. But the northern province will not continue to work together with the two southern provinces in their present mood. The only obvious alternative seems to be a hurried partition of the country—undoing "the mistake of 1914" as one of the northern ministers described it. Unfortunately, Nigeria lends itself even less to partition than most other countries upon which Britain has executed, in desperation, the judgment of Solomon. For the north has no access to the sea, and is wholly dependent on a unified system of communications.

The circumstances which have produced the crisis are described in our correspondent's report on page 161. A federal solution of Nigeria's regional differences never promised to be easy to work, because the ministers from the regions—meeting with European nominated members, as a federal executive—regarded themselves as regional delegates; no national parties developed. Thus the situation in the central Council of Ministers rather resembled that when both Nehru and Jinnah were members of the Viceroy's Executive Council before the partition of India. In the event, the two southern parties have sunk their differences and demanded full self-government by 1956; but the Muslim north—though just as anxious for self-government—is in no mind to be rushed into an autonomous union in which it would be dominated by Southern Nigeria.

The crisis hardly suggests that Nigeria is ready for self-government, even if the records of the parties did so, which may be doubted. African politicians have learnt a lot about power and perhaps a little about administration, but nothing about either democratic or federal compromise. Britain's policy must be to play for time in the hope that Nigerians will see the case for reason. It may not be easy.

Waiting for the Moscow Line

THERE is increasing evidence that the sudden reversal of the Kremlin's policy over the "doctors' plot" took by surprise not only the "other ranks" of the Soviet propaganda force—like those Ukrainian broadcasters who went on castigating the doctors while Moscow radio was already flaying their accusers—but also those higher officers who are normally abreast of developments in ruling circles. The elevation to the Party's Secretariat immediately after Stalin's death of Ignatiev—later to be made a culprit—shows clearly that no decision about the plot had then been taken. A copy of the *Komunist*, the former *Bolshevik* and chief theoretical organ of the party, which was published much later and has only just reached this country, still follows the original line over the doctors. Thus almost on the eve of the spectacular *volte-face*, the leading Soviet propagandists were ignorant of forthcoming moves.

This shock of surprise and the fear of yet another reversal may account in part for the caution now being shown by the Soviet press. Another explanation may be that the writers have been ventriloquists' dummies for so long that they find it difficult to recover their own voices. They may need time and actual encouragement to utter their own thoughts. Whatever the reasons, Soviet commentators avoid embroidering official pronouncements about the amnesty or the criminal offences of the security police. They repeat the official communiqués and republish *Pravda's* leaders after a day's delay. In one respect, however, the papers have already changed radically: the nauseating glorification of

Stalin has ended. For more than a year after his 70th birthday all were full of telegrams of praise; after his funeral the rites lasted only a few weeks. A recent copy of *Pravda*, picked at random, contained only one reference to Stalin on its first page. Another copy, of a few months ago, contained on the same page eighteen references to the "great father and teacher."

Centrifugal forces take some time to reach the periphery, and so propaganda in the satellite countries is still more Stalinist than the Kremlin. It is playing safe until the new line and the new set-up have crystallised. Yet, once the full significance of Moscow's moves have been appreciated, some radical rethinking will be provoked. The startling new developments need only time to produce an important echo outside Russia.

Neutralists and Neutrals

IT is no reflection on this country's friends and allies to say that we should be genuinely grateful that there are still some "neutrals" in this divided world. When a secretary-general has to be found for the United Nations, or a foster-parent for frightened prisoners of war, progress would be practically impossible if no "neutral" were willing to come forward and take on a delicate and hazardous job. International loyalties and commitments are now so extensive that few nations or even individuals are available to play these thankless roles, and the burden on those who remain is correspondingly greater.

Gratitude to neutrals, however, need not extend to "neutralists." The distinction between the two terms, as they are applied today, is clear enough. The neutralist enjoys the protection of the very defences which he devotes himself to weakening; he does not contribute to the maintenance of peace, but detracts from it. This is exactly the opposite of the conduct of those neutrals who, declining to shelter under a mightier wing, see to it that their own frontiers are manned against aggression. They not only play the indispensable parts of the objective arbitrator and the trustworthy Samaritan, but also reduce the obligations of those other powers that are banded together for common defence. But they are a dwindling race, as has been shown by the difficulties involved in finding suitable neutrals to help liquidate the problems of Korea. Is there anything that can be done towards preservation of the species before it dies out altogether?

Surprise for Jugoslav Farmers

JUST before Easter excitement was caused in the Jugoslav countryside by a government decree which allows peasants freely to leave collective farms. The measure gives compensation for the land and equipment they put into it, frees the remaining collectives from state administrative control and deprives them of their special economic

privileges. This is the most dramatic step yet taken by the Communists in their effort to undo the ill-effects of forced collectivisation and the general neglect of agriculture during the first years of Marshal Tito's rule. Over a year ago they decided to wind up all collectives that were not paying propositions ; as a result the number of these farms which at the beginning of 1952 was over 7,000, has sunk to just over 4,800, farming 19.6 per cent of the arable lands. How many more are now to be disbanded will not be clear until the decree is actually put into effect after the harvest. First reports suggest that in some districts the peasants are striving to get out as soon as they can ; but a provision that they will be responsible for a part of their collective's debt may well have a sobering effect. It would, indeed, be disastrous if the decree were to defeat its own ends by upsetting the year's agricultural work.

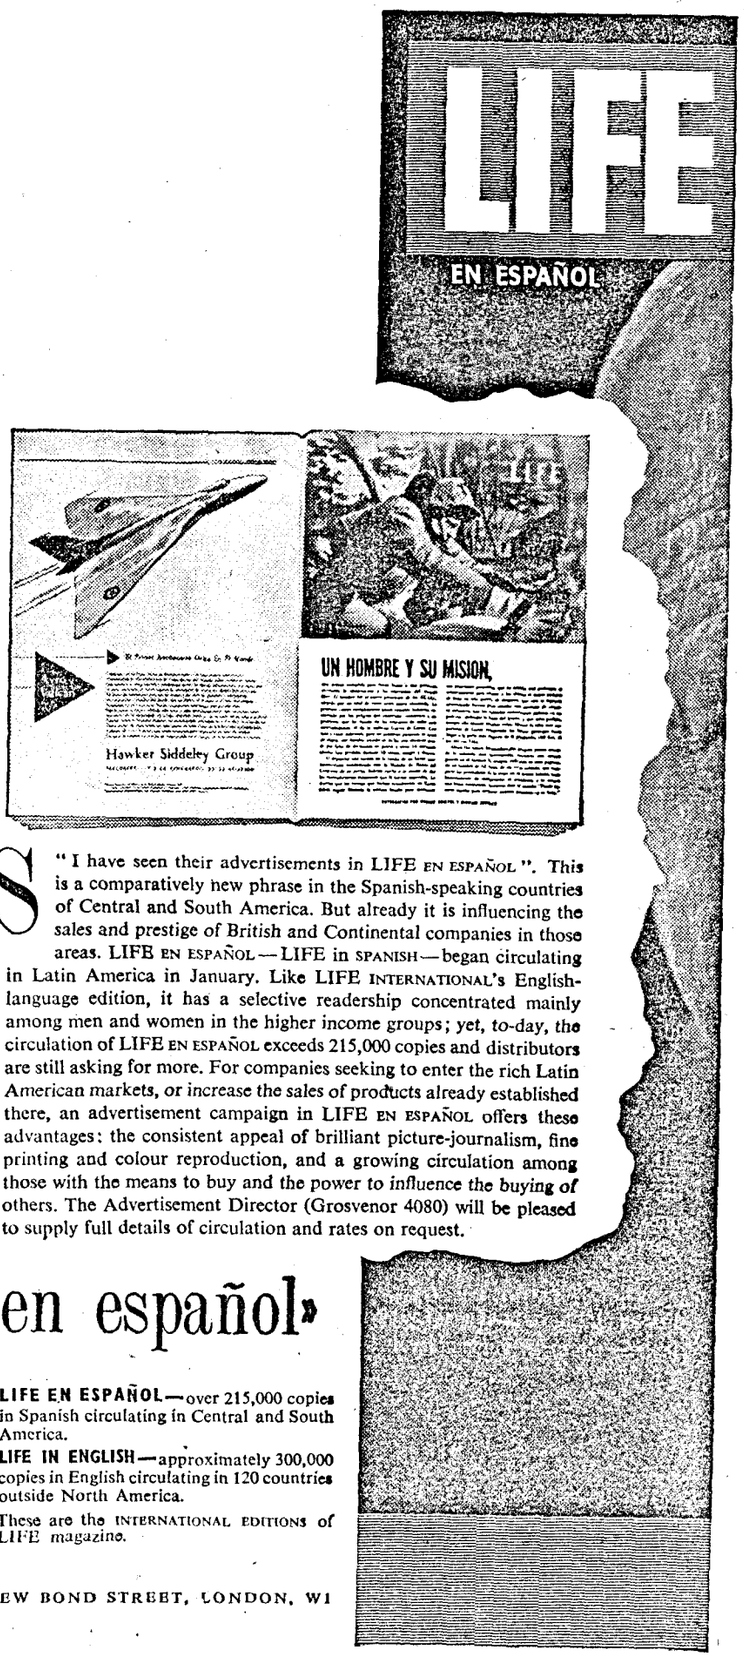
This new development is designed to give to Jugoslav agriculture the benefits of freer competition and emancipation from stifling bureaucratic controls that have already been given to industry. But there appears to be no intention of giving up " the ideal of the socialist transformation of the countryside." Mr Kardelj has even said that there is " little change to make in the general line for the struggle " to secure this transformation. The significance of these assurances is not yet clear ; they do not square very well with the urgent need to increase production. They may, however, be primarily designed for bewildered party members. In the immediate future, at any rate, the Jugoslavs will probably concentrate their energies on the further development of the " general collectives " for buying and selling which flourished in Jugoslavia before the war and have recently been encouraged to enlarge and extend their activities.

Families in Need

THE sharp wartime and postwar levelling of incomes has not, as its prewar advocates would have supposed, moved all families to a point well above the subsistence level. According to the findings recently reported by Mr H. F. Lydall in the *Bulletin* of the Oxford Institute of Statistics, about one British family out of every four had, for each person in it, less than £2 a week to spend during the year 1951-52. In this concept, the family—or more strictly, the " income unit "—may consist of single persons of 18 years or over whether living alone or not, so that an income of less than £2 does not necessarily indicate hardship. But it was among the large families that a high proportion of people had less than £2 a week per person. One-third of four-person families, over half of five-person families, and four out of five of those with four or more children had a yearly income, after tax, of less than £100 per person.

A net income of £1 18s. a week per person does not represent abject poverty. The average, according to this survey, is hardly more than £3, and the cost of keeping a family does not increase proportionately with its size. Moreover, the figures collected for this survey may give rather too gloomy a picture. Its findings about personal savings have already been discussed in these columns, when it was pointed out that the fact that 16 per cent of those originally approached would not co-operate may well have biased the sample. Furthermore, the natural tendency to understate additional sources of income has been at work and there is a serious deficiency of investment income in the survey figures. The average figures are, therefore, likely to be rather too low ; but there is no reason to believe that this would affect the disparity between the incomes per person of small and large families. After all the qualifications, Mr Lydall's report does show that some large families are having a very difficult time despite family allowances.

One other result is of particular interest. Where the main income-holder is a woman, there is, as would be expected, less money than in other families. But, after taking into account the smaller number of persons to support, these families had a net income per person of £153—only £11 less than those with a male head: a finding that will not further the cause of equal pay.



National Health

THE theme of the latest report [Cmd. 8787] of the Ministry of Health's chief medical officer is that the improvement in public health resulting from better physical environment is unlikely to be carried much farther ; henceforward better health will depend rather upon personal effort. In the last hundred years " a silent army of sanitary technicians " has worked on behalf of the average Briton's health. Today, " we are leaving the era of sanitary engineering and entering into that of personal hygiene. . . ."

The report covers the year 1951. The influenza epidemic at the beginning of the year was almost entirely responsible for the increase of 39,000 in the total number of deaths. But there is no such obvious explanation for the fact that the fall in the infant mortality rate was temporarily halted. In England and Wales, infant mortality, as in a number of other countries, has been halved in the last twenty years. But the rate of just below 30 per 1,000 live births has still some way to go before it reaches the low levels of Sweden and New Zealand and will have to be halved again before it is as low as Harrow's. The comparative stability of the rate in 1951 bears out the view that further big reductions will depend less on a wide generalised campaign than on a concentrated attack on special features—on prematurity, for instance, or on the death rate for illegitimate infants. In any case, the resumption of the downward trend last year, when the rate is provisionally given as 27.6, is reassuring.

" It is a sign of the times," says the chief medical officer, " that, in referring to the causes of death . . ., the infectious diseases should be left to the end." Deaths from tuberculosis were lower in 1951 than deaths from accidents of all kinds. Diphtheria, before the war a main cause of death in childhood, caused only 33 deaths in 1951. But the continued disappearance of diphtheria depends on a high rate of immunisation. There is always a danger that with immunisation, as with vaccination against smallpox, the public will be lulled, by the dramatic fall in deaths, into a false sense of security. In this respect, as in other branches of public health, future progress depends on the individual's readiness to play his part.

«Hé visto sus anuncios en

LIFE en español»

"I have seen their advertisements in LIFE EN ESPAÑOL". This is a comparatively new phrase in the Spanish-speaking countries of Central and South America. But already it is influencing the sales and prestige of British and Continental companies in those areas. LIFE EN ESPAÑOL—LIFE in SPANISH—began circulating in Latin America in January. Like LIFE INTERNATIONAL's English-language edition, it has a selective readership concentrated mainly among men and women in the higher income groups; yet, to-day, the circulation of LIFE EN ESPAÑOL exceeds 215,000 copies and distributors are still asking for more. For companies seeking to enter the rich Latin American markets, or increase the sales of products already established there, an advertisement campaign in LIFE EN ESPAÑOL offers these advantages: the consistent appeal of brilliant picture-journalism, fine printing and colour reproduction, and a growing circulation among those with the means to buy and the power to influence the buying of others. The Advertisement Director (Grosvenor 4080) will be pleased to supply full details of circulation and rates on request.

LIFE EN ESPAÑOL—over 215,000 copies in Spanish circulating in Central and South America.

LIFE IN ENGLISH—approximately 300,000 copies in English circulating in 120 countries outside North America.

These are the INTERNATIONAL EDITIONS of LIFE magazine.

TIME & LIFE BUILDING, NEW BOND STREET, LONDON, W1

Not for women?

ABOUT WOMEN and the reading of newspapers, there still remain traces of Victorianism. The male assumes that papers such as the Manchester Guardian are for the masculine mind; for the feminine mind something 'lighter' is often prescribed.

Women, no doubt, can and do make up their own minds. This advertisement seeks merely to take their side. If husband or father takes pleasure in the good reporting, good thinking, good writing in the Manchester Guardian, then wife or daughter takes no less pleasure.

Let no male, therefore, appropriate the Manchester Guardian to his sole use, and allot a 'popular' paper to his womenfolk. The Manchester Guardian has something of a mission in life—to tell the truth, to guard the humanities, to ignore the base or trivial. These aspirations are equally important to women. See to it, Sir, that the women in your household share with you the deep satisfaction of being a Manchester Guardian reader.

If you have any difficulty in getting your Manchester Guardian regularly, please write to: The Manchester Guardian, Manchester.

25/PM/22

But where's the alloy THAT WILL DO THIS JOB?

New designs with higher standards of performance often require improved materials. It is the job of the metallurgist to see that these materials are available when required. He and the designer both have the same objective — the project which in a few years' time may be depending on materials not yet commercially developed.

Mond Nickel is working now on such problems in the field of nickel alloys. Now is the time for designers to . . .

Educating Leaders

IT is a good thing that brilliant children have some powerful champions, for they certainly have very few champions. Much in the English school tradition (as opposed to that of Scotland and Wales) seems to be against the clever child. The philistinism that rated intellectual achievement far below athletic prowess, and *rationalised* its envy of brains with slogans about "*character*" and gibes about "swots" is happily dying out; but the new philistinism is worse than the old and its seed falls on ground already fertilised by the former prejudices against intellect. Brilliance at school has lost its social stigma, but the new campaign is to prevent it gaining social prestige. At a time when the largest educational authority in the country considers it to be a grave danger that the grammar schools may enjoy better teachers, better equipment and higher prestige than other kinds of school, it is a relief to hear a voice raised to plead the opposite case.

Dr Eric James, High Master of Manchester Grammar School, pleaded it powerfully last week in talking to the grammar school members of the National Union of Teachers. He argued that exceptional care should be devoted to educating the most able children. The staffing ratio should be much higher than at present and the teachers require high intellectual quality. Two-thirds of the teachers in this country, Dr James said, could never even begin to understand the work that these children were capable of doing. If an education of this standard was to be provided, some segregation was inevitable. Dr James thus briskly disposed of the current over-emphasis on the value of mixing clever children with stupid ones.

It is doubtful whether the audience followed him so far, grammar school teachers though they were. The educational levellers have held the floor so persistently that any other view is almost unfamiliar. That is the measure of the need to state it.

The Packet's Progress

"SHORTAGES and a better standard of living" have between them so changed the national taste in foodstuffs that the prewar diet would nowadays seem "a little unpalatable." This is the conclusion drawn from reports recently compiled by the National Federation of Wholesale Grocers. It refers, therefore, to a limited field; public attitudes to fish, meat, fresh fruit and milk are unreported and unanalysed. But within the grocery range, one general and predictable trend overrides local variations: a great increase in the demand for processed, tinned and generally ready-made foods. The consumption of sweet biscuits has trebled, the sweetest and most expensive being most demanded; tinned fruits of the dearer kinds, tinned meats, tinned tomatoes, tinned baked beans, breakfast cereals—all show large increases.

The influences at work are the inflation of incomes, rationing and the decline of housewifely arts. This decline, however, is not an entirely independent factor. Let the basic materials of the home cook's craft be cut off for long enough, and even the keenest domestic artist's skill will grow rusty, or never get a chance to develop. It is doubtful how far the ready-made or ready-processed preparations are really labour-saving; the shopping for them may be quite as strenuous as cookery itself. But the housewife who has lost, or never acquired, the skill to use ample basic ingredients variously and satisfyingly on her own account has no option in the use of her energies.

Here is the making of a vicious circle. Manufacturers of ready-made foods, from quasi-jam to pudding-mixes, find a ready and growing market for their wares and can accordingly put up a good case to the Ministry of Food for sustained and increased allocations of sugar, fats, dried fruits and the rest. The better their case, the more remote the day when housewives will be able to scour out their preserving pans and baking tins and regularly give their families real home cooking; the longer that day is postponed, the more certain the decline in skills and the better established the habit of packeted pseudo-cookery.

The Incidence of Taxes

One of the most common errors which is committed in the discussions which take place in relation to taxation is, that the incidence of every tax which, in its turn, becomes the subject of consideration, is treated as if it were the only tax collected—as if the whole revenue of the country were raised from it, and from it only. . . . It is, however, plain upon the face of the question, that in a system of finance . . . derived from a great variety of sources, altogether different in their character, and affecting the various classes of the community in a variety of ways and degrees, it is utterly impossible to judge fairly of any one tax without taking into consideration the incidence of others. It is plain, that if we are to regard the effect of taxation upon different classes of the community, we must look to the taxes *as a whole*, and to the relative pressure which each has upon such classes. In the first place, we derive a large share of our revenue from indirect taxes, Customs and Excise alone to the amount of about £37 million a year. Now no one will deny that to such taxes *the labouring population* contribute a larger portion of their incomes than any other class. Small as the expenditure of each person may be, a larger share of it goes in the shape of Customs duties on tea, sugar, tobacco and spirits, and in Excise duties on beer (hops and malt) and spirits, than is the case with the more wealthy classes. And it is on this account that those classes, by common consent, have been exempted from *the payment of* all direct taxes. There was always an exemption in their favour in the window duty and in the house tax; and of late years it has been expressly on this ground, that persons with incomes under £150 a year have been entirely exempted from the operation of the income tax. It was on such considerations that Mr Mill *defended* the exemption of such classes from the income tax, and it was the expressed necessity of considering *the incidence of* all taxes together, that made him hesitate in pronouncing a very distinct opinion as to the incidence of the property tax in general.

Letters to the Editor

The Building Industry

SIR—In the second article on the building industry entitled "Management among Builders," in the issue dated April 4, 1953, you have confused the function of the architect with the machinery of local housing authorities and unfairly attributed the faults inherent in the actions of such authorities to the inefficiency of architects. Similarly, you exaggerate the powers of architects responsible for the design and erection of houses subsidised by the state. These criticisms do not apply to the work of architects engaged in state subsidised housing. You say:

1. "The rigidity of specifications and nomination of sub-contractors by architects has deprived the builder of his ability to make do and substitute."

Any variation in the specification can only be made with the consent of the housing authority and indirectly of the Ministry of Housing and Local Government, who have approved the plans and specification. If the houses were being built for sale by a private builder, any defect arising from an inadequate specification would be a matter between the builder and the purchaser, but when houses are owned by the local authority such a defect would have to be remedied by the authority. Cumulatively, on a large number of houses, this could become a very serious matter for the authority.

2. "Expensive methods have sometimes been forced on the builder, with attendant delays."

It is difficult to see what this statement refers to. If it means constructional sequences, these are entirely the responsibility of the builder, under the standard form of contract.

3. "They are certainly responsible for long delays in completion of contract documents."

This is untrue. Architects are not responsible for the completion of the contract documents. These are completed by the building owner, in this case the local authority, and the architect has no control over this procedure. As a tender cannot be obtained until the proper drawings are available, the drawings forming part of the contract must be prepared by that time. The preparation and execution of the contract itself is the responsibility of the local housing authority.—Yours faithfully,

London, W.C.1 RICHARD SHEPPARD

★

SIR—I was surprised to read the statement in your article, "Industry Without Mechanisation," of March 28th, that since mid 1952 "civil engineering costs have dropped by 20 to 30 per cent." That is certainly not my experience. Far from falling by so great a margin, civil engineering costs in my submission were at about the same level in the early months of 1953 as in June, 1952; if anything, rather higher.

This difference in views may possibly be explained by a difference in terminology. Thus while you may be referring to specific civil engineering prices, I have in mind civil engineering costs in general. I can understand, for example, that there may now be substantial reductions in prices for new site work in individual cases, but surely the explanation of this is to be found in the special circumstances governing those cases. I contend that they are not applicable to the civil engineering industry as a whole.

Admittedly the cost of materials has dropped—the materials index fell by just over seven points between April, 1952 (the peak), and December—and productivity (always difficult to measure accurately) may have risen slightly. On the other hand, labour and transport costs have risen, the wage-rate index last December being about six points above what it was at the beginning of 1952. In view of the cardinal influence of labour in civil engineering construction, and indeed in building materials, I fail to see how a substantial overall fall of civil engineering costs could have taken place. Nor to my mind does there appear to be any real prospect of such in the near future.—Yours faithfully,

J. P. MCDONAGH

Wimbledon, S.W.19

[The figures quoted do in fact refer to the prices paid in new civil engineering contracts by a number of local authorities in recent months.—EDITOR.]

★

SIR—I must join issue with you on one or two points, particularly in your latest article on building. Sub-contracting for labour-only constitutes one of the most vicious practices of the industry and it is our task, that is the organised operatives' task, to end the pernicious system wherever possible. It may be that some of these sub-contractors walk away with £20 to £30 a week but this is indeed poor consolation to our members who frequently have to walk away with unstamped insurance and holiday cards, and even without wages, because these labour-only sub-contractors have made a quick but silent get-away.

Of course, the unions desire to decasualise building but we do not, I assure you, "acquiesce in rigidities." We have not "preferred a situation in which bad craftsmen and idle labourers have found work . . ." While I have no difficulty in subscribing to a number of your views, I am afraid that part of them are still informed by prejudice. You may rest assured that the unions want the maximum building output under conditions of the best possible craftsmanship. Unfortunately the building industry has for so long been a prey to politics that it is difficult for the outsider to notice it with any kind of impartial judgment.—Yours faithfully,

London, S.W.4 R. COPPOCK

The Finance of the Dog-Fight

SIR—Taxpayers should be grateful to Mr Justice Lynskey for his strictures arising out of the strange case of Rex v. Prince, in which two fellow citizens were enabled to engage in litigation up to the High Court, at no cost to themselves.

May I as one who contributes heavily to the welfare state and receives little or no benefit therefrom make the following comments:

(1) To have been logical and effective, the 1949 Act should have provided that where the defendant is unable to pay, the state should bear the burden of damages as well as costs.

(2) For the better protection of the community in general, postmen and farmers in particular, the Government might increase the cost of dog licences by 1s., and use the money as a fund from which to pay compensation, legal costs and damages awarded by court.—Yours faithfully,

Weybridge, Surrey J. C. HOWISON

The Rommel Papers

Edited by Capt. Liddell Hart

- **Rommel's own great story** of his campaigns in France and Africa.
- **The book he was writing** for publication in a victorious Germany.
- **Hidden for 5 years** by Frau Rommel to keep it out of the hands of the Gestapo, then of Allied Intelligence.
- **He wrote to his wife daily** and his letters are woven skilfully into the text.
- **Read Rommel on Montgomery,** Wavell and Auchinleck, and on the French collapse in 1940.
- **Illustrated** with his own photographs taken during his operations, and with his own battle maps.
- **"No commander in history** has written an account of his campaigns to match the vividness and value of Rommel's." —LIDDELL HART

The Right Test for the Boards

THE FUTURE OF NATIONALISATION.
By H. A. Clegg and T. E. Chester.
Basil Blackwell. 211 pages. 12s. 6d.

THIS is an excellent book, well informed, well argued and clearly written. It seeks to analyse with as much scholarly detachment as possible a general question that is both highly complex in itself and complicated by a mass of emotion and prejudice. The authors try to keep unemotionally to the central issue by laying down for themselves a simple path of argument. What were the reasons for nationalisation? Why have the nationalised industries failed to achieve, in a satisfactory measure, the purposes for which the change in ownership and organisation was made? What different organisation would be better suited to the purposes? And here, they conclude, is the answer: this is how the nationalised industries should be reorganised, this should be the future of nationalisation.

This is an attractive simplification, but it goes grotesquely too far. The purposes of nationalisation are not the purposes of nationalised industry: they reflect the adjective, not the noun. In the last analysis, coal and the rest are still industries. They exist for economic purposes; the distinctive decisions of those who run them are the entrepreneurial decisions about prices and scale of operation and investment. The right organisation is the one that leads, within the context of public ownership, to the right decisions. The test of efficiency in a nationalised industry is economic, not administrative; still less is it suitability to the motives of the nationalisers—motives that were valid enough in their historical context, but have no particular value as tests for the future. For all the good sense with which they hoe the row they have chosen, what the authors of this book are really doing is to lay down standards for nationalisation while shutting their eyes to its main problems: which is common enough, but too small a task for their scholarship.

Mr Clegg (of Nuffield College) and Mr Chester (of the Acton Society Trust, not Mr D. N. Chester of Nuffield College) base their proposals on two central propositions. First,

> The only criteria which we can even try to handle are impressions about the effect of forms of organisation on those who work in the nationalised industries, and guesses about the probable effect upon them of changes in organisation.

Secondly, Messrs Clegg and Chester point out with great force that the nationalised organisations are based on a fundamental error. Some functions of the nationalised industries—say, development policies in coal, or the securing of an economic load-factor in electricity—were believed to require large-scale organisation. The nationalisers went on to conclude that all functions—finance, labour relations, sales, etc.—also required large-scale organisation. They therefore made the big new units responsible for what the authors call "over-all management."

They perform a very important service by demonstrating the fallacy of this view. They go on to show that, by the criteria of how people can best work together and achieve the maximum administrative efficiency, it would be better to have smaller units for general management. In coal, they propose area boards with limited responsibilities, transferring more authority down to the colliery manager than was proposed in Colonel Lancaster's better-known scheme; and, unlike him, they would abolish the National Coal Board (at least as a managerial body) and place such central functions as are essential in the hands of the Minister, assisted by a Coal Commission. Similarly, in electricity they would transfer control over generation to the area boards, reduce the BEA to something of the status of the former CEB, and re-establish the Electricity Commissioners.

These are interesting and important proposals. The line of development they indicate is probably the right one. But they certainly cannot be justified on such narrow grounds as Messrs Clegg and Chester argue their case. The future of nationalisation cannot be settled by administrative standards. That may produce the most efficient execution of policy, but in itself it does nothing at all to ensure that the policy is right. In the early years of nationalisation, organisational problems have inevitably been given most public attention, but it is at least possible that the most damaging mistakes of the nationalised industries have been to price their products on unsound principles and thereby lead themselves into uneconomic investment policies. In this respect the area electricity boards are quite as likely to go wrong as the National Coal Board, and the administrative case for decentralisation—important though it is—is at best a small part of a case. To that part Messrs Clegg and Chester make an important contribution; but it needs a broader view to settle the future of nationalisation.

Prolegomena to Africa

STRUGGLE FOR AFRICA.
By Vernon Bartlett.
Muller. 251 pages. 15s.

SYNOPTIC pictures of the situation in Africa are rare; but they are valuable both to author and reader. For Africa is no longer a series of compartments impervious to ideas, political or even technological; amorphous though it be, the great continent is beginning to come to life as a single, interdependent whole. The process has not proceeded far, and will not perhaps proceed farther very fast; but it has proceeded both far enough and fast enough to make evaluations of single regions, or of Africa generally based on knowledge of single regions, incomplete and even misleading. It is the merit of Mr Bartlett's book—which he has written with charm and clarity for the general rather than the specialist reader—that he does consider Africa as a whole, and that he bases his judgment on visits which he made himself to all parts of the continent. To the network of inter-African airways alone do we owe the possibility of up to date eye-witness books on "Africa"; and they in turn are spreading ideas as well as journalists and insect pests, sharpening up contrasts, deepening communications, tracing a pattern of unity.

Mr Bartlett's underlying thesis is indeed the growing interdependence of Africa; certainly of Africa south of the Sahara. The absurdity of *apartheid*, for example, is not merely that Europeans must somehow live on tolerable terms with Africans and Indians in South Africa, but that South Africa must live within the continent as a whole on tolerable terms with the diverse territories to the north of it. British policy, on the other hand, ought to show some consistency as between East and West Africa—but does not. British, French, Belgian and Portuguese policies toward African social and political development, as well as towards economic development, will in the end have to be reconciled, divergent as they at present seem. At present the European is tending to carry on as though the aeroplane, radio, and newspaper had no effect on the African mind at all; or as though the education which he himself has introduced leaves African mentality as village-bound and tribally-orientated as before the art of writing existed.

In fact, all problems—those of nutrition and agriculture, no less than those arising, for example, from urbanisation or the creation of a new white and a new black dominion in Africa—must be assessed within the wider context. Mr Bartlett has provided a handy and readable, if necessarily personal, frame of reference. The intelligent newspaper reader will find that a short course of Bartlett will greatly improve his understanding of the growing, if still scattered, references to Africa that spread through his daily reading. He might have been grateful for a few more maps—practically, there can never be enough new

maps, especially of Africa. But he will find this an illuminating, if not original book—even though, in 250 pages, much of Africa necessarily escapes even a newspaper man's eye and pen.

Foreign View on Labour Policy

LA POLITIQUE SOCIALE DE L'ANGLETERRE CONTEMPORAINE.
By Jean Lhomme.
Presses Universitaires de France. 517 pages. 1,800 frs.

IT is not always true that the outsider sees most of the game; but an intelligent foreign observer, provided that he confronts the facts without national prejudice, may have a certain advantage over the native when it comes to tracing or assessing an historical sequence. For one thing, he can apply standards of comparison afforded not only by the past of the country which he is observing, but by the present of his own; for another he is (particularly if he happens to be a Frenchman) likelier than the native to draw the essential distinction between paper plans or legal powers and the way things happen in practice.

Professor Lhomme's study of British social policy is a good example of this external perspective. His title is, in fact, rather misleadingly wide. He has little to say about the social services, nothing about education, no interest in the distribution of property or of incomes in general. His concern is with wages, employment, and the wage-earner's purchasing power; and "wages" does not even include salaries. Within these limitations, his book is a most remarkable achievement, the tidiest, fullest, and most percipient account available of a whole complex of related subjects: trade union structure and history; the levels, differentials, and movements of wages; relevant legislative and administrative organs; price control, rationing, and the subsidy system as it affects the real wage; full employment policy from budgetary measures to the development areas; planning techniques.

As a work of reference alone the book deserves translation as soon as possible. As a guide to the interrelations of different forms and phases of policy its merit is equally high. As a study of the empirical British genius at work, it is, if a little flattering, at all events reassuring. If this is how our particular brand of planning strikes an obviously intelligent foreigner, perhaps it is not so bad. As a long-run assessment of social results it is, however, completely null. It is not that Professor Lhomme denies either the dangers of economic ankylosis or the possibility that there may be some long-run disadvantages in simultaneously increasing the need for the services of a professional *élite* and grinding that *élite* out of existence. Neither the danger nor the possibility appears at any stage, to have attracted his attention at all. This is, let it be repeated, a very good book. Had Professor Lhomme paid any attention to M. de Jouvenel's "*Problèmes de l'Angleterre Socialiste*" (which does not appear in his bibliography) it would have been a great deal better.

Members of the Commonwealth

THE STATUTE OF WESTMINSTER AND DOMINION STATUS.
By K. C. Wheare.
Oxford University Press. Fifth Edition. 346 pages. 21s.

THIS new edition of the standard book on the effect of the Statute of Westminster upon status in the Commonwealth, first published in 1938, is timely and welcome. Its general thesis is that a fundamental characteristic of the constitutional structure of the Commonwealth is not the isolation of strict law from convention but the interaction and co-operation of strict law with convention. Much rewriting and revision have been made necessary by the constitutional changes which have occurred within the Commonwealth since 1948, and Professor Wheare analyses the significance of the most important of them.

Allegiance to the Crown has ceased to be regarded as "an essential prerequisite of membership of the Commonwealth"; the rule now is that every member must accept the Queen as the symbol of the free association of its members. Could one conceive of this rule prevailing if all those members were republics? Could there be a King or Queen without any kingdoms? Professor Wheare points out that "it would be rash to conclude that so absurd an anomaly could not happen in the Commonwealth." The history of this community of diverse nations has been one of continuous adaptation to meet new circumstances, and that history has also shown that names are of great importance. The new term "Member Status" is very little, if anything, more than a new label on an old bottle, a new name for an old thing. "If it was wise to replace 'Colony' by 'Dominion' who can doubt that it is wise to replace 'Dominion' by 'Realm,' or by 'Member of the Commonwealth'?"

Successive editions of this book have maintained that the enactment of the Statute of Westminster destroyed the legal efficacy of the provisions prescribing the procedure for altering the "entrenched sections" of the South African Constitution. Mr Wheare acknowledges that this view was "ill founded." He now accepts the view that although there are no legal limits to the power of the Union parliament, the first and fundamental question is: "What is the parliament of the Union?" It is curious that the author twice records the fact that South Africa abolished all appeals to the Judicial Committee of the Privy Council without making any reference to the fact that several other members of the Commonwealth have done the same.

"Hardly have done it better ourselves, my dear: this whisky is White Horse."

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

How Broad an Arms Base?

Washington, D.C.

SINCE his now classic appearance before the Senate Foreign Relations Committee at the time of his appointment, when his share holdings were the issue, Mr Charles Wilson, the new Secretary of Defence, has had very little contact with the general public or the press. But during recent weeks he and his motor manufacturing colleagues in the important civilian positions in the department have given an impression of furious activity. They have been turning Mr Truman's request for a $46 billion military budget for the next fiscal year this way and that, in an effort to see how it could be reduced, without loss of military strength or efficiency, in order to redeem at least a portion of the Republican campaign promises. The first inkling that the public has had of the direction in which Mr Wilson's mind is moving has already caused some questioning and alarm among businessmen and in Congress.

The American rearmament programme since the beginning of the Korean war has been designed not only to produce a large supply of finished armaments, both for expenditure in Korea or elsewhere and for reserve, but also to create the widest practicable "mobilisation base." This programme has had two halves. One is the expansion of raw material production for present military and civilian needs, and a further increase in basic capacity to meet the still greater demands of total industrial mobilisation if it should ever have to come. Except in electric power expansion, which is lagging somewhat, the goals are well on the way to being met. The other half of the programme consists of an expansion of manufacturing capacity for weapons and defence equipment.

The object has been to provide a supply of weapons adequate to the needs of the cold war while creating enough plants which could go into production in the event of a hot one to enable the United States to reach full military output considerably sooner than it did in the last war. Generally speaking, no American manufacturer is working to full capacity on the piece of military equipment he is responsible for producing, and orders for a particular gun or aircraft have been split between three or four manufacturers, each working at, say, a quarter of capacity so that their combined rate of production could be quadrupled if necessary.

This programme has been pursued over the past two years as coherently as any plan of its size could be, and a good deal of it is completed—81 per cent of the tax-aided facilities for the private expansion of the mobilisation base will have been put in place by the end of 1953. The continuance, indeed the extension, of the scheme was specifically recommended by the Truman Administration.

Mr Wilson now seems prepared to question the validity of the whole policy. He is reported to feel that too much money has gone into the creation of a broad mobilisation base and not enough into the actual production of war potential. His argument is that, with aircraft and other manufacturers operating below their full capacity, the unit cost of each piece of equipment is unnecessarily high and that it could be reduced by allowing a few firms to produce at capacity instead of a number of firms at half or quarter speed.

With the exception of railway wagons, which he feels have been overproduced under the government's encouragement, the change of emphasis which Mr Wilson would like to bring about refers to manufacturing capacity for arms, not to the expansion in the basic industries, and it would be accomplished, not by sudden reversals of orders, but gradually over a two-year period. His great enthusiasm is for the system put into effect by his own company, the General Motors Corporation: the "dual purpose plant" in which the military production line rests under dust sheets at one side of the factory when full-scale mobilisation is not required, while washing machines are made in the centre of the building. The order can be reversed when necessary without having to move the skilled labour which, in theory at least, is versed in both types of machine tools and products.

★

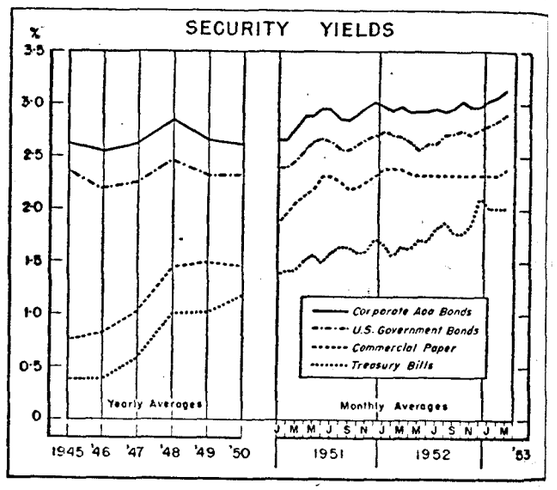
At first sight this change in emphasis seems to have a number of advantages, even though saving in costs is not likely to be astronomical. No one can really tell how much more cheaply tanks or aircraft could be made if their production were concentrated, and the direct cost of the stand-by plant scheme, of just over half a billion dollars, is picayune by comparison with the economies of four or five billion dollars for which Congress is at present baying.

But Mr Wilson's decision, if it really bears the hall-mark of the National Security Council's approval, without which, under the new Administration, no policy can be certified as genuine, raises certain interesting questions. Does the Defence Department really think that the danger of full-scale war has receded to a point where the plans for rapid industrial mobilisation can be partially dismantled? If Mr Wilson's office is working on that assumption, the news has not been communicated to other parts of his department. In the second place, it is hard to see how Mr Wilson's thesis that there should be more concentrated armament production and greater stockpiling of reserves can be reconciled with his own insistence on winning the techno-

Mr Dulles gave the impression that the United States was thinking seriously of asking the Communists at the hoped-for peace conference to accept a division of Korea at the waist, some hundred miles north of the present battlefront, and less seriously about a United Nations trusteeship for Formosa as part of a general Far Eastern settlement.

The possibility that General Chiang Kai-shek might be, in effect, once more neutralised, and the aim of a united Korea abandoned caused great indignation among the Republican adherents in Congress of both the Generalissimo and Dr Syngman Rhee. Mr Knowland, now the chairman of the Republican policy committee, who won the gratitude of the Administration over the Bohlen appointment, protested; and the White House promptly denied that the published views represented settled American policy or that a trusteeship for Formosa had ever been considered. The impression that is left is that, although Mr Dulles may propose, it will be the President and the National Security Council who make the final decisions on foreign policy.

Mr Dulles and the President may not have been prepared for the immediate crop of almost identical stories in the press, which clearly pointed to a single highly placed inspiration and made it only a matter of time before his name became known. They can also complain that some accounts presented Mr Dulles's ruminations as settled policy. But the Secretary of State is too old a hand at press conferences not to have appreciated that, under the etiquette of a background briefing, the journalists would feel free to report what he said as long as they concealed his identity. It is hard to believe that Mr Dulles was not attempting to break through the frozen surface of Republican policy on the Far East, or at least testing the thickness of the ice. The effect, inside the United States, however, has been to make the Secretary of State seem inept, and he may think twice before attempting another similar reconnaissance by press conference.



First Fruits from the Treasury

THE 3¼ per cent bond issue, with a 30-year maturity, which the Treasury put on the market last Monday, has an importance out of all proportion to the amount of cash it is intended to raise—$1 billion—although the comparative smallness of the issue is one of the important things about it. It is not only that this is the first time that new money has been raised since the Treasury came under Republican control, but also that the money is being raised by the first long-term issue since the war years and one bearing a higher interest rate than any issue since 1934. The new Administration's promises—to check inflation by indirect monetary means rather than by direct economic controls, and to reorganise the structure of the public debt, now concentrated in short-term issues—are already bearing fruit.

If the new bond's long-term precedent can be followed in future issues, then the Treasury will gradually be relieved of the frequent refunding operations that have hung over both it and the market in recent years, and the Federal Reserve system will no longer be hampered in its regulation of the flow of credit by having to safeguard the market for government operations. Long-term issues have the

further advantage, in an inflationary period, that they do not add appreciably to the volume of credit, since they do not appeal to banks. The new issue is intended for institutional investors, such as insurance companies and the managers of pension funds; commercial banks are not allowed to subscribe more than 5 per cent of their deposits.

The objection to long-term bonds, from the taxpayer's

Source: Federal Reserve Board.

point of view, is their cost, but under present conditions 3¼ per cent, a full half-point above any other outstanding marketable government bond, was generally agreed to be the lowest rate at which the new issue could be a success. The smallness of the issue shows, however, that the Treasury is only testing the market in preparation for the next time that it needs new money. This will not be until after the fiscal year ends on June 30th; the $1 billion from the present issue and another $1 billion, to be raised by increased offerings of 91-day bills, will provide enough cash for the next few months.

The 3¼ per cent rate of the new government bonds will have the directly deflationary effect of pushing up already rising interest rates for other types of borrowing, and will thus help to check the current growth of credit which many observers (including Treasury officials) feel is becoming excessive. But a check on this expansion of credit, particularly of mortgage and instalment loans, combined with the uncertainties of the international situation, may hasten the downward adjustment of the economy. If so, the time for the Republicans' hard money policy may already have passed before the Treasury again needs to raise new funds—and then the flexibility of the new Administration will be put to the test.

New York Takes its Medicine

THE long and bitter dispute between Mr Dewey, the Republican Governor of New York State, and Democratic New York City over the city's financial troubles has all but ended in a victory for Mr Dewey's unpalatable measures. The Governor's chief demand is that fares on

the public transport system should be increased at least enough to cover the operating deficit, which makes so big a hole in the city's pocket; his plan is to transfer the system to a new authority which would be required to make ends meet. The budget which Mr Impellitteri, the Mayor, has just submitted to the Board of Estimate is built on the assumption that the city will not have to meet the estimated $47 million transport deficit, and that it will receive the new $50 million in property taxes authorised by the state legislature only on condition that the transport deficit is eliminated. To defy Mr Dewey, the Mayor sadly pointed out, would require a $97 million cut in the city's services, something which would turn New York into a "ghost town." The budget totals over $1.5 billion, and is second only to that of the federal government, but New York carries the heaviest burden of fixed charges of any city, thanks to its liberal pension policy and its heavy debt.

Although the city seems to have no choice, it is not yet certain that the Board of Estimate will accept the inevitable. Mr Rudolph Halley and Mr Robert Wagner, both possible candidates for Mayor in next autumn's elections, have declared war on both Mr Dewey and the unfortunate Mr Impellitteri. They want to preserve the ten-cent fare as a Democratic vote-getter. For more honourable reasons Mr Joseph, the Controller, who holds the balance of power, is undecided; he feels that the details of the transport transfer are unfair to the city. However, under the law passed by the state legislature, the transfer must take place by June 1st if the city is to collect its new taxes and, under the City Charter, the budget must be accepted by June 15th.

The irresponsibility of the city leaders is said to have been an important factor in Governor Dewey's decision to create a commission to examine the desirability of a city manager for New York. The first report is expected in June. The city cannot be forced to accept its recommendations. But a very similar plan has been proposed by the Mayor's Committee on Management Survey, a group of experts who have been examining New York's problems for three years at a cost of over $2 million to the city. The committee concludes that a Director of Administration should be appointed, under the Mayor, to overhaul archaic practices and run the city in a business-like way. Less to Governor's Dewey's liking will be their conclusion that the city, as it has always argued, deserves more financial aid from the state.

Pressure on Standards

AT first sight the forced resignation of Dr Allen Astin as head of the Bureau of Standards seemed to be merely another example of the desire of incoming Republican administrators, in this case Mr Sinclair Weeks, the Secretary of Commerce, to choose their own subordinates. But, quite apart from the fact that the Bureau of Standards, the government's principal agency for scientific research and testing, is hardly a suitable place for political patronage, it now appears that Dr Astin's resignation may be the result not of political, but of commercial, pressure and that Mr Weeks may have encroached on the fundamental principle of scientific impartiality and integrity. It is not surprising, except perhaps to Mr Weeks, that a swarm of scientists are buzzing around his head. It may need more to quieten them than the thorough evaluation of the bureau

and its functions that he has asked a group of them to undertake.

The immediate question is whether a particular chemical additive, AD-X2, lengthens the normal life of storage batteries in cars and elsewhere. The Bureau of Standards, after prolonged tests, decided that it was of no value. Other tests seemed to the Senate Small Business Committee, to which the manufacturer had appealed, to indicate that his product was satisfactory and a number of people, including Mr Weeks's own firm, have found it useful. Mr Weeks therefore decided, for this and other unspecified reasons, that Dr Astin should resign, and added that the bureau had not been "sufficiently objective" in its tests.

This phrase apparently referred to the contacts which men employed by the bureau had had with firms making storage batteries, who would not welcome a favourable report on AD-X2. The implication that scientists, who have been glad to work for the bureau at salaries less than they could have earned in industry, were influenced in their reports by such contacts is naturally regarded as insulting. So is Mr Weeks's readiness to accept the verdict of outside research organisations rather than that of his own highly esteemed officials, whose tests were more comprehensive even if less pleasing to the manufacturer.

In discussing the matter, Mr Weeks said that more attention should have been given by the bureau to "the play of the market place," evidently meaning that if customers can be found for a product, the manufacturer should not be prevented from selling it by the government, provided it is not dangerous. This is perhaps the most controversial aspect of the dispute, for it calls into question the powers to regulate industry and protect the consumer which have been given to the Federal Trade Commission and other agencies by Congress. The Bureau of Standards came into the matter only because the Commission asked it whether the manufacturer of AD-X2 was justified in his advertising claims—and the bureau decided that he was not.

Atoms for Civilians

THE President will shortly ask Congress to amend the Atomic Energy Act so that private firms can share in the development of atomic energy for peaceful purposes, primarily the production of electric power. The ending of the present government monopoly was recommended by the National Security Resources Board last year while Mr Truman was still President, and the problems involved have been studied ever since, so that it is not a party matter. But the present Administration naturally takes particular pride in opening new vistas to private enterprise and welcomes, especially at this moment, the chance to show its interest in the peaceful potentialities of the atom.

The Atomic Energy Act of 1946 gave the Atomic Energy Commission sole power to own, produce, and distribute fissionable materials, as well as authority over all atomic information and the right to take over any privately developed processes. The suggested amendments would give private interests the right, under government licence, to possess critical amounts of uranium 235 (quantities large enough to produce an explosion); and the right to produce plutonium; permit the government to enter into long-term contracts to buy privately produced plutonium, and give

firms certain patent rights in new processes which they develop. This last concession is necessary if private research is to be encouraged and corporations are to invest their own funds in discoveries they make, but it is expected that the government will have the power to require patents to be shared if this is in the national interest.

The right to produce plutonium must be granted because it is the end-product of the processes used to produce heat ; firms could not produce electric power without also illegally creating plutonium. Most of the industrial teams which are designing their own reactors count upon government purchase of this plutonium, which is used at present in the manufacture of atomic weapons, to make their own operations pay, at least at first.

Although it is now technically possible to build an atomic-powered electric plant, the day when electricity from the atom will be produced in commercial quantities at competitive prices is thought to be ten or even fifteen years away. Both the atomic submarine engine developed at Arco, Idaho, and the new homogeneous reactor at Oak Ridge create only very small quantities of power at a cost uneconomic for private enterprise. In size, the reactor being designed for an aircraft carrier by the Westinghouse Electric Corporation is more like what will be needed for commercial electric power. But the cost of atomic power is still, according to the Atomic Energy Commission, more than twice as high as that from coal or hydro-electric plants ; private experts think the difference is much greater. If Congress decides to raise the atomic curtain, it will be up to private enterprise to make power from the atom an economic supplement to present power sources and demonstrate that excessive secrecy has been the enemy, not the ally, of progress and security.

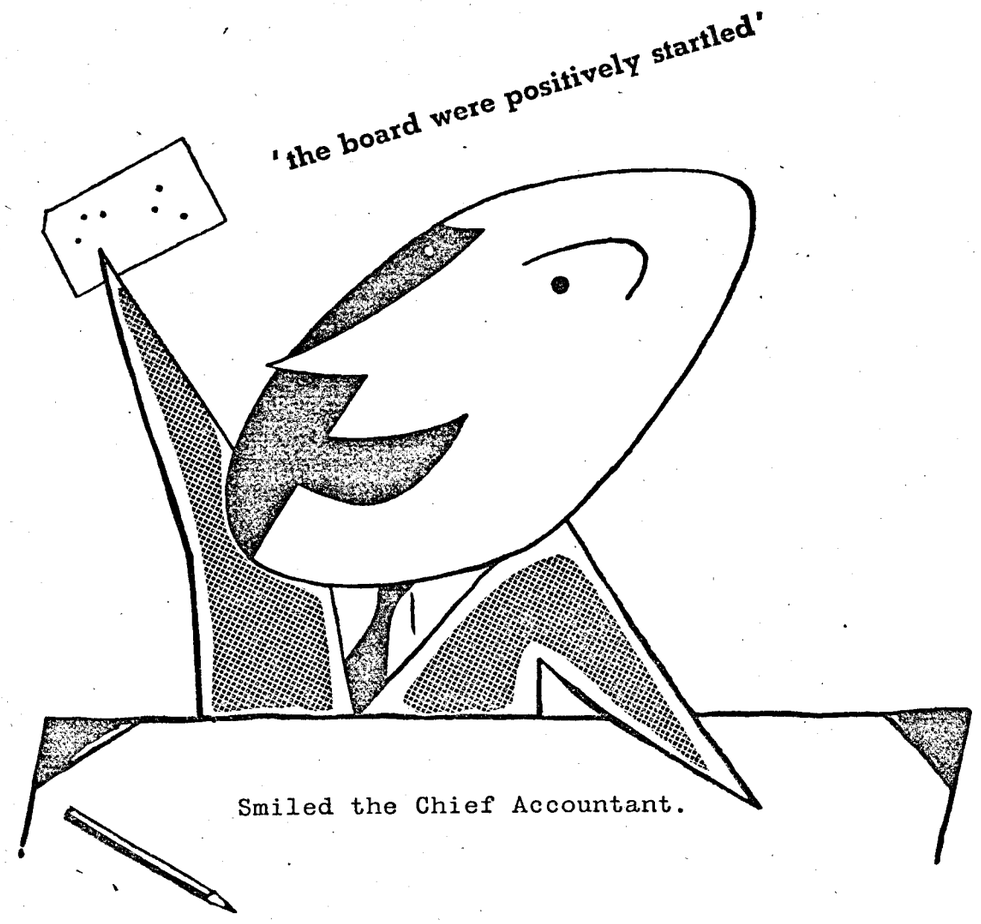
Oil in the Anti-Trust Machine

THE announcement by the Attorney General that the alleged world oil cartel is to be sued for civil damages implied that the Administration will ask, and will probably get, permission to drop criminal charges when the grand jury investigation of the international activities of these oil companies is resumed at the end of the month. Mr Truman's Attorney General made a similar offer in January, which was angrily rejected by the leading American oil companies—the Anglo-Iranian and Royal Dutch-Shell companies are also involved in the case—because the condition of the offer was that they should agree to produce in the civil court all the documents that they had been fighting to keep from the grand jury. This time the State, Defence and Justice Departments and the Central Intelligence Agency are to decide whether the national security will be endangered by the production of records of the companies' international negotiations, with a final decision from the President if the departments disagree. Both he and the Cabinet have endorsed, " in view of existing world tension," the move to enforce the anti-trust laws against the alleged petroleum cartel by civil instead of criminal proceedings.

The main difference is that the companies would no longer be liable to conviction for crime, with their officers in danger of jail sentences. Such charges would hamper them seriously in their relationships with Middle Eastern governments and might jeopardise the free world's oil supplies, especially if other governments, the Venezuelan for instance, were thus given an excuse to follow the Iranian example and nationalise their petroleum industries. If found guilty in a civil suit, the companies would probably be required, by court order, to " cease and desist " from illegal practices ; but these suits are frequently settled by a consent decree, agreed by both sides. Such a decree may save years of judicial proceedings, and also thousands of columns of publicity, both of which it is particularly desirable to avoid in this case, with its international implications.

If, as seems almost certain, the new Administration has been prevented from dropping this case entirely, as its foreign and defence advisers might have preferred, by domestic political considerations, then there is little likelihood that many of the other pending anti-trust suits can be dropped. For if charges against the major petroleum companies appeal to independent oil producers, other small businessmen welcome attacks on the du Pont Company and General Motors Corporation—and it would be especially invidious to abandon this case because President Eisenhower's Secretary of Defence is concerned in it. To drop the suit against the big grocery chain, the A. and P. company, might alienate the votes of housewives who think they are being overcharged. It is the same with nearly all the 130 or more anti-trust cases which the last Administration had begun and from which the firms charged had hoped to be freed by a business-loving Republican Administration. But for many of them, as for the oil companies, a consent decree may provide a way out.

SHORTER NOTES



The Republicans' concern with the 1954 Congressional elections is evident in their selection of Mr Leonard Hall of New York as the new chairman of their National Committee. Mr Hall, who served seven terms in the House of Representatives and was the chairman of the Republican Congressional Campaign Committee last year, will have the difficult task of increasing the present narrow Republican majority in an "off-year," when there is no presidential election and when the party in power is usually expected to lose some seats.

★

As had been generally expected, Mr George Kennan, the State Department's greatest expert on the Soviet Union, is to retire to private life and will probably go into academic work. If Mr Dulles had any desire to find a post for the man who had inspired the Truman policy of " containing " Russia, it was discouraged by the difficulty of getting the Senate to approve the appointment of Mr Charles Bohlen, another close associate of Mr Acheson's, as Ambassador to the Soviet Union.

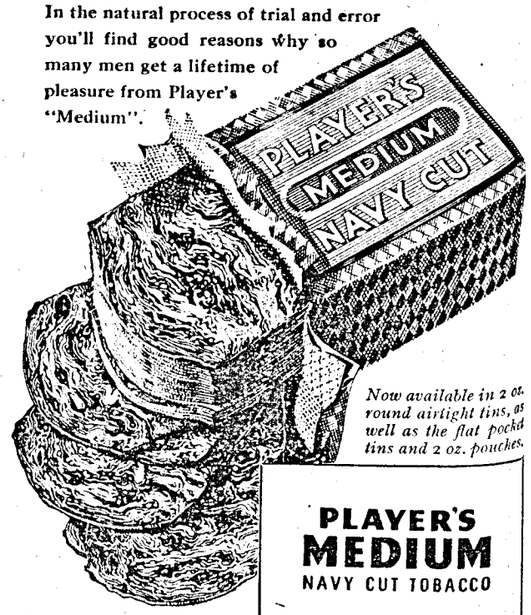
FRUITFUL ENQUIRY

One of our clients received from Spain a Peseta quotation for citrus fruit. Knowing that multiple rates for sterling were involved, he at once telephoned us to ask exactly what this quotation represented in British currency. Within a matter of minutes we rang him back with the answer. Part of the exchange earned from this export was negotiable at the special rate of about 61 Pesetas to the £ and the balance at the free rate of about 110, making a composite rate that could easily be calculated.

It is unlikely that our client could have obtained this information so quickly from any other source.



The advantages of being here and there

As the only British Bank with branches in Spain and Portugal as well as throughout Latin America, we can offer you special services—either direct or through your own bank. These services are set out clearly and concisely in our leaflet "The advantages of being here and there." We shall be glad to send you a copy on application to:—

The World Overseas

Egypt and Middle East Defence

FROM A CORRESPONDENT IN CAIRO

THE British Government's announcement that discussions on outstanding questions between Britain and Egypt will open shortly in Cairo does not alter the fact that Egypt will not negotiate the Canal Zone question and the Middle East defence plan simultaneously. If the British Government has any lingering doubts on this matter it would be wise to abandon the hope now. Rightly or wrongly, the present leaders of Egypt believe that the country was behind the Wafd in its rejection of the original proposals for regional defence in October, 1951; and they are not prepared to force upon the country something which the Wafd rejected.

Nor will they be prepared to negotiate back-stage a kind of Middle East defence system in relation to the Suez Canal base. Their reason for this is twofold: in the first place they do not believe it would be possible to keep the matter in the background, and, secondly, they have not yet so far imbibed the authoritarian doctrines which go with some of their methods as to be willing to go against what they believe to be public opinion. They will tell anyone who asks that they could force on their own people a settlement of both issues; but, they say, in the long run it would be valueless.

The Egyptian leaders argue somewhat in this fashion. The original Middle East proposals were very humiliating in their form and presentation and have been discredited in Egypt and everywhere in the Arab Middle East. It is useless, they believe, to try to convince the Egyptians that Russia is the main enemy when they have been brought up to believe that the "British usurpers" are the immediate enemy. Elsewhere in the Arab world, the view is reinforced by the Palestine question. The Arabs find it difficult to accept the idea that they must join a pact directed essentially against the threat from Soviet Russia while they feel the western powers are the mainstay of Israel. The Egyptian leaders bolster their own arguments with the Palestine issue but without feeling it acutely. To them, the issue at hand is the Canal Zone and British occupation of it. They are prepared to believe there might be a change in Egyptian opinion if evacuation was accepted and executed by Britain; but they are unwilling to anticipate that change of heart.

The Arab states tend to think Egypt goes too far in this matter. They believe that the new Administration in the United States might help them to improve their situation *vis à vis* Israel and may be discouraged by too rigid an Egyptian attitude towards the Canal Zone. It is for this reason, mainly, that the Levant press has been encouraged to complain of the independent policy which Egypt is pursuing. Furthermore, the Arab states want to be strong, and they feel that if the Canal Zone base can be maintained on terms which could be accepted as evacuation by Egypt, that base could be the cornerstone of Arab military strength. Then Israel will be forced in time to be reasonable.

It is at this point that Egyptian leadership may meet that of the other Arab states; for whereas the Egyptian leaders rule out any discussions of Middle East defence, they do not by that mean a vacuum. The Army leaders insist that they are realists who will agree to terms concerning technicians which will ensure the continuing efficiency of the base. From this they deduce that if Britain is sincere in its desire to negotiate a settlement and does not want to cloak continued "occupation" by thousands upon thousands of technicians, a settlement can be reached. How many technicians will be needed, they say, must depend on detailed discussions between army experts of both countries.

They presume, of course, that the whole Canal Zone base and more or less everythng in it will be Egyptian, and therein lies the difficulty of the British Government. It is no easy matter for Mr Eden to go before the House of Commons with proposals which involve British evacuation and the handing over of base installations worth hundreds of millions of pounds, without any advance guarantee that they will remain within the orbit of western defence arrangements.

The Egyptian leaders say that this argument against their claims is not well founded. Obviously the base would naturally stand to the advantage of Egypt's friends. It would, they say, encourage a growing friendship in the economic and military co-operation which it would foster. They contend that the obvious weakness of the Middle East is an objective fact of more value than all paper guarantees.

In short, they see Middle East defence growing from the co-operation of Egypt with its friends and then by the co-operation of the Arab states with Egypt and its friends. The Arab states would be strengthened to create air bases of their own, so that the whole mechanism of regional defence would steadily be built up without any conflict developing on nationalistic grounds. This mechanism would stand "at the ready." Perhaps, in time, it would be formally dovetailed by the Arabs themselves into the eastern Mediterranean system that Turkey, Greece and Jugoslavia are creating.

Whether the Chiefs of Staff or the Pentagon would consider such a vague prospect as of value to them is open

to doubt. It is presented here as an Egyptian leader might privately present it. In essence, it means recognition that some system of regional defence is necessary but that it cannot be negotiated from above. It must be, as it were, of indigenous growth and the guarantee of its purpose would lie in the fact that only with the help of friends could the Egyptians plant and sustain it.

Shopping Under Malenkov

IN the first days of April the new Soviet regime must have gained much popularity among its consumers. The housewife who went shopping paid half the former price for potatoes, vegetables and fruit and from ten to twenty per cent less for other main foodstuffs. Price reductions for clothing, footwear, household and other consumer goods ranged from 5 to 25 per cent. In the current year the cuts should allow consumers to save 46,000 million roubles in their purchases in state retail shops. This lowering of consumer prices was certainly a wise move, but it was not a radical departure from precedent, like the amnesty or the *volte-face* over the "doctors' plot." On the contrary, in this respect Stalin's successors have only administered a stronger dose of a favourite medicine. This is the sixth consecutive price reduction since the monetary reform of 1947.

By this method the planners have been passing on to the consumers at least a slice of the growing national income and have been restoring their standard of life from the appallingly low wartime level. The biggest cut came in 1950—when the success of the last Plan was assured. Then the annual saving from purchases in state shops was officially estimated at 80,000 million roubles and the prices of light industry products were affected as well as foodstuffs. In the following two years only the prices of foodstuffs were reduced and the saving amounted to 27,000 million and 23,000 million roubles respectively (it must, however, be remembered that each new cut is applied to a lower price level). Now the saving is doubled and the products of light industry are once again included.

SOVIET PRICES
(ROUBLES)

Commodity	Unit	1940	1950	1951	1952	1953	% Decrease 1953 over 1952

A cut in prices need not necessarily mean a corresponding increase in consumption. Both prices and supply are determined by the planners. A reduction in consumer prices is normally carried out through a cut in the turnover tax on that commodity. This sort of purchase tax—falling almost exclusively on consumer goods—is the main source of budgetary revenue; it brings in about half of the total. By linking the expected yield of the turnover tax with the "saving" it is possible to estimate how much the planners intend to boost consumption. But the budget for 1953 is still to come.

Unfortunately it is not possible to evaluate the Soviet standard of life on the basis of current prices because so little is known about the level of wages. The Russians have ceased to provide data on the wage fund and the average wage. Still, from the evidence available as well as from the alternative method of measuring average consumption, it appears clearly that the purchasing power of the Russian town-dweller has been rising steadily and is now greater than it was before the war. Progress is most marked in the case of foodstuffs. The Russian now consumes incomparably more than his wartime starvation diet and, with the exception of meat, considerably more than before the war. He has been promised a rise in real wages by about one-third in the current quinquennium, and since foodstuffs still account for the bulk of his expenditure, he looks like getting it.

It is logical that price reductions and increased supplies have been mainly concentrated on foodstuffs, since both in the period of reconstruction and that of the cold war the development of food production was less of a drain on scarce resources. Last year's successful harvest should by itself ease the task of supply, and if any substantial progress is made towards the exacting goals set for agriculture in the current Five-Year Plan this should allow a very great improvement in food supplies.

With industrial consumer goods, however, the solution is more difficult. In the years preceding the war the hard-working Russian was getting the first benefits from the planned industrial revolution that he had carried through and was promised much more for 1942. The war shattered these hopes and reduced almost to nothing the supplies of industrial goods to the civilian population. By 1950-51 the prewar level of consumption was roughly restored and—taking into account the growth of population—the Russians are promised for 1955 what they were already promised before.

A Break With Stalinism

It is in this field that unqualified comparisons with the West are most unfavourable to Russia. The economic might of the Soviet Union has grown tremendously in recent years. By 1955 even its per caput production of coal or electricity, steel or engineering will be comparable with the prewar output of many of the older industralised states. The per caput output of light industry, however, will still lag behind that of Third Republic France or Weimar Germany. The rapid expansion of basic production required heavy investment and the neglect of the immediate needs of the consumer.

QUARTERLY ECONOMIC REPORTS are now available on nearly seventy countries. These reports give information and opinion on matters of concern to exporters and investors; they are concise and have comprehensive statistical sections. A descriptive leaflet may be obtained from The Economist Intelligence Unit, 22 Ryder Street, London, S.W.1.

It would be idle to suppose that the average Russian thinks on these lines. He does not look beyond the curtain and through the official channels he is not told that his English or American counterpart gets, say, three pairs of shoes for his one, but only that the level of consumption in the West is not rising at the same pace as his own. Besides, looking backwards, he must conclude that two pairs of shoes every three years is better than one pair every year and certainly much better than walking barefooted. Napoleon used to argue that he feared nothing but hungry Paris. Malenkov and his associates may take comfort in the fact that the Muscovite, and the other Soviet town dwellers, are now better off than ever before.

This is only one side of the story. Stalinism was largely the product of this need to peg down consumption. Camps as well as the curtain were Stalin's reply to real or potential discontent. The new rulers, however, have started their reign as if it were their intention to purge Stalinism of its worst features. They released prisoners and attacked the secret police. Yet, to maintain themselves in power with less coercion they will have to think more of the material needs of the population. They will also need more industrial consumer goods if they intend to carry out reforms "on the path to Communism," particularly if they want to put into effect in the near future and without force the distant plan outlined by Stalin for the countryside—namely, the transformation of exchange relations between town and country into planned barter relations. But can the new rulers in the Kremlin afford partly to restore the balance between the development of heavy and light industry? With the powerful economic basis at their disposal even a small shift would pay handsome dividends.

Nigerian Setback

FROM OUR CORRESPONDENT

THE Nigerian house of cards has collapsed. Fifteen months ago the central Council of Ministers was set up with infinite care and patience under the new constitution. For fifteen months it has led a stormy but not unconstructive existence. But now four ministers have resigned—those from the Western Region, all members of Mr Awolowo's Action Group party, who with four colleagues from the east, four from the north, and six official members, formed the "Cabinet," under the Governor's presidency. Whether, or how, another complete Government can be formed is uncertain. The "daily miracle" is over; and if ever the work of rebuilding confidence can be resumed it will only be in far more difficult circumstances than before. This is the most serious setback British policy and Nigerian unity have yet had.

The occasion of the breakdown was unexpected. Shortly before the House of Representatives was due to complete its budgetary session, a private member's motion on self-government came up for debate. The northern members would not toe the line in setting 1956 as the target date; one of its members suggested an adjournment; in great excitement other members from east and west protested and walked out; the two party leaders, Awolowo and Zik, forgot the past and embraced; the western ministers resigned. But this brief account leaves out too much—everything, in fact, that makes the crisis intelligible.

What really did happen? It seems that Mr Awolowo's Action Group was predetermined to force to an issue the timetable for British withdrawal, and had made up its mind to have a showdown with the north, which is just as hostile to continued British "imperialism" as the south but sees no reason to exchange British for southern Nigerian domination by premature "independence." Either way Mr Awolowo stood to gain. If they refused to accept his date, he would still stand out as the champion of Nigerian freedom; if they agreed, it would be a major triumph for him. After various manœuvres, a motion for debate was put down by the assistant secretary of the Action Group, that "this House accepts as a primary political objective the attainment of self-government for Nigeria in 1956." In other words, let battle begin.

The first round was fought in the Council of Ministers. When the prospect of a debate was discussed there—and what happened has been very fully revealed by one of the western ex-ministers—it was questioned "whether the debate on a motion which set out to establish a target date for self-government would help or hinder the progress of a united Nigeria towards that unanimously agreed objective." To avoid public demonstration of the rift in the lute it was decided that members of the "Cabinet" would refrain from speaking or voting on the motion. This decision was reached on a vote, the six officials and the four northerners being in favour, three easterners neutral (these being the former Zikists who have split with Dr Azikiwe's National Council), one easterner and the four Action Group westerners against.

It appears that Action Group then decreed that their ministers should not abide by this decision, and when the debate began, one of them crossed the floor and announced his resignation. He was in rather a different category from the others, being the Oni of Ife, Sir Adesoji Aderemi, and a leading western chief, and he had previously told the Governor that he was "under compulsion" not to abide by the Cabinet's decision. The leader of the northerners, the Sardauna of Sokoto, had already moved an amendment altering "1956" to "as soon as possible," but another member moved the adjournment; at this point the House emptied of most Action Group and N.C.N.C. members, so that the motion for adjournment was carried in their absence. Later the resignations of the remaining three western ministers were announced. In fact, they resigned in protest against a cabinet decision which, owing to the course which the debate took, they had not had to implement. Resignation was their only course once they had been deprived of the pleasure of acting against the cabinet's decision and running the risk of dismissal by the Governor.

A special meeting of the western house of chiefs in Ibadan on Tuesday approved the resignation of the four western ministers from the central Council of Ministers and resolved that if asked to submit nominations for the vacancies on the Council the western region "will always submit the names of the resigned members."

Will the Heavens Blaze?

In effect this breakdown is worse than anyone expected because the tactics used have seriously alienated the North. This is indicated by the departure to London for consultation of the Governor, Sir John Macpherson. The two

fundamental problems of Nigeria—how to build up a trinitarian unity between three diverse regions, and the pace of movement towards self-government—have coalesced, and each is further complicated by the other. The breach with the North may be irreparable; already it is being asked whether northern representatives will ever come south again.

This major crisis has developed hard on the heels of the crisis in the east and the breakdown of the regional government there, and though the two crises are distinct, they were brought about by the same factors in the Nigerian political situation. As the country rushes towards nationhood, the impetus rapidly increases. The last stages are concertinaed, the extremists of yesterday become the "Uncle Toms" or "imperial stooges" of today, parties and politicians must steadily outbid each other to keep the lead. Zik made his come-back; Awolowo must run harder than ever to keep his position. Moreover, the fact that the Gold Coast is a neck ahead is important, and its leaders are believed to be preparing to extort a Coronation present of further concessions from Britain. If Nkrumah is the pacemaker, can Zik or Awolowo be far behind?

The great danger is that the situation may get thoroughly out of hand. Passions are rising and hooligans already shouting. Nigerian leaders so far lack the kudos of martyrdom. An incident which gave them this—and what then? True, it has been said that Nigeria is a place where the best is impossible but the worst never happens. The responsibility rests with Nigerian politicians.

Can M. Mayer Survive?

FRANCE appears to be moving constantly from one crossroad to the next with a crisis looming in every possible direction. Sometimes one feels that this picture is conjured up by journalists and members of a parliamentary opposition, with their vested interest in all trouble. Over the past ten days, however, and with the municipal elections due in the final week of April, it has become increasingly obvious that France has got itself into a dangerous *impasse*, both financially and in foreign policy. In France a politician's lot is not a happy one, and one can readily sympathise with President Auriol's decision not to stand for re-election in December. This signal, however, that the presidential derby is now open, will only intensify the inclination of many French party leaders to put personal ambition and a taste for intrigue above the need to encourage a sense of unity.

The most spectacular aspect of the present difficulties is the fact that the Treasury owes the Bank of France 105 billion francs and that the government will have to ask for a further extension on the recent loan of 80 billion with which M. Mayer has sought to tide over this difficulty. Far from there having been the expansion in economic activity on which the government had counted, there has been a slight recession, and France's foreign trade balance in March has deteriorated appreciably after some improvement had been registered in February. The March trade deficit, which amounted to some 29.5 billion francs was the severest since July last. At the very same time, however, France has a trade surplus of nearly 20 billion francs with its overseas territories, a fact which suggests that the flow of "hot money" to North Africa and the resulting inflation have in no way been checked.

Everyone is aware that the French government must finally make up its mind in favour of a certain measure of fiscal austerity if the budget is to be balanced. Expenditure, which amounted to 2,422 billion francs in 1950, reached 3,720 billion in 1952, and is estimated at 3,831 billion francs for this year. Corporation taxes will flow into the Treasury during April, and the gap in the budget is relatively modest compared to expenditure as a whole; because of this, the government may be tempted to tide over with stopgap measures. There is no realistic alternative however, to a substantial reduction in public expenditure, and although every government in turn has admitted this, the National Assembly is hardly prepared for draconian reforms. If M. Mayer insists on them, his days are clearly numbered and his government may never have to face the storm that will break over the ratification of EDC.

As M. Pleven has had to explain in Washington this week, it seems most unlikely that the EDC treaty will be debated in the Assembly before the summer recess, and even in the long run its ratification is doubtful. Part of the reason is the continued state of suspended animation with regard to the Saar. Without always appreciating the tremendously difficult task which Dr Adenauer has been carrying out, or the fact that Germany had to overcome a good deal of national feeling when it ratified the Bonn conventions, the French feel that the Germans must make concessions before they can be considered good Europeans. The Saar is the touchstone in present French political thinking and M. Mayer will not retreat from his insistence that some solution must be arrived at before France can ratify the EDC treaty. The Socialists, moreover, on whose vote ratification ultimately depends, are more anxious than ever to see whether some other solution can be found, in concert with the new Soviet mood, and want to wait to see what the outcome of the German elections in September will be.

This combination of a financial crisis at home and of a sense of exasperation in foreign policy may lead to a cabinet crisis after the Assembly reconvenes on May 12th. A good deal depends on the strength shown by various parties in the municipal elections. It is expected that no major changes will take place, although the Gaullists will lose a number of municipalities and may suffer losses in the Paris region. The Communists are expected to hold their own and the one man who will probably emerge with his position strengthened is M. Pinay with the Independents; his zeal for fiscal reform and loyalty to the franc have made a deep impression on the population. Whatever their losses, however, the Gaullists cannot change their position on the defence community and will have to withdraw whatever slight support they have given M. Mayer when the treaty comes up for debate.

Two major actors have recently returned to this confused and rather lethargic scene. General de Gaulle has concluded a very successful tour of the French territories in Africa, and M. Thorez is home from his long sojourn in Moscow. It is symptomatic of France's two strong men that one should be getting rather stout and acquiring the figure of the retired warrior, and that the other should be partially paralysed and forced into virtual retirement. The Communist messiah can do little except straighten out the tangled ambitions in his own party. De Gaulle, on the other hand, is increasingly out of touch with the voter. It looks, therefore, as if France will continue along a *via media* from stopgap to crisis and from crisis to parliamentary vacation.

Delhi and the Drought

FROM OUR CORRESPONDENT IN INDIA

INDIA'S latest reaction to Pakistan's concern about canal waters has been one of rather annoyed boredom. Almost everyone is so sure that Pakistan has no case that they ask themselves what they are being used as a scapegoat for this time—the drop in cotton prices or the anti-Ahmedya riots? As the Indians state it their case is simple. First, India considers its water to be its own, since there would appear to be no rule of international law imposing any burden on an upper riparian state for the benefit of a state lower down the river. The United States was not prevented, it is argued in Delhi, from building the Boulder Dam because Mexico was adversely affected. And if there are disputes in such cases, the usual way of settling them is by bilateral agreements or by bilateral commissions ; there is, therefore, no reason to go to third parties for arbitration, as the Pakistanis suggest. Delhi has on various occasions offered Karachi a commission composed of an equal number of representatives from each side.

Secondly, although India considers that it has this unrestricted right, it entered into an agreement with Pakistan in 1948 by which it undertook to reduce the supply of water to Pakistan only progressively, so that Pakistan could develop alternative sources meanwhile. The Indians claim that they have kept this agreement, but that Pakistan repudiated it in 1950 ; Karachi, they say, stopped paying the disputed amounts for "seigniorage" charges and the capital costs of certain works which it had promised to deposit with the Indian Reserve Bank. India is, moreover, prepared to accept arbitration on the validity of this agreement although an arbitrator might well find the relevant clauses difficult to interpret: they are more friendly than definite.

Thirdly, India has, in fact, not yet acted on its rights under the agreement. There are only two canal systems in dispute out of a total of 31: the Central Bari Doab from the Ravi, and the Dipalpur from the Sutlej. India has built no new canal works so far to use Ravi water, and the works which will use Sutlej water, the Harike and the Bhakra-Nangal, are not yet ready; the Harike weir and canals will only be finished in 1954, the Bhakra dam perhaps in 1959. The cut in water this season was purely the result of the drought which occurred last year in both Punjabs, and which over the period from September to December reduced the flow of the Ravi to 57 per cent of normal, and the flow of the Sutlej to 55 per cent. Since the total flow was thus reduced by drought, the flow to Pakistan was also reduced in proportion, but only in proportion.

The Indians admit, however, that the areas in Pakistan, especially in Bahawalpur, have suffered more because they are farther away from the headworks and have lost more of the water through seepage. But they assert that the ill effects have been aggravated by two purely Pakistani factors. There has been a considerable switch in Pakistan from wheat to cotton ; and cotton needs water for maturing just when the wheat should get it for sowing. And, whereas the Sikhs, who before partition held so much of the land in the Pakistani canal colonies, were first-class farmers of irrigated land, many of the Muslim refugees from India who have now taken their place were either not farmers at all, or were labourers, or else were used only to dry farming.

Finally, the Indians claim that it is they, not the Pakistanis, who have more cause for complaint. Five million refugees fled from west to east Punjab at partition and they have now to be supported in what was previously an underdeveloped area. Before India was divided, the British preferred to undertake irrigation works in west Punjab and Sind, where they could be partly paid for by selling Crown land, rather than in what is now the Indian Punjab where land was mostly privately owned. Taking the Indus basin as a whole, the population and the cultivable area are only slightly larger in Pakistan than in India: 22 million people and 45 million acres against 20 million people and 40 million acres. But Pakistan has 18 million irrigated acres and 66 million acre feet of irrigation water against India's 5 million acres and only 9 million acre feet.

Water from Six Rivers

Indeed, of the six rivers concerned, India can get nothing from the Indus, which carries just over half the total amount of water carried by all six put together, and for topographical reasons virtually nothing from the Jhelum. These two rivers flow only through Kashmir, and there the country is too mountainous for them to be used much. Of the water of the Chenab, too, India at present gets nothing, though it hopes to get 3½ million acre feet one day by building a tunnel through from the Chenab to the Ravi, and then a link canal to the Beas in Himachal Pradesh ; the idea, however, is that this will come out of waters at present flowing to the sea, and not from Pakistan's water.

It is only on the Ravi, the Beas and the Sutlej rivers, which between them have less than one fifth of the water of the Indus Basin, that India proposes, in due course, to divert water from Pakistan. The Harike weir would enable India to divert the Beas water (8½ million acre feet) and the Bhakra dam would store the Sutlej flood waters (this is not very important, as it involves only 1½ million acre feet). The Ravi water which goes to Pakistan is also only flood water, but some of that might eventually be diverted to the Indian Upper Bari Doab system.

The Indian interpretation of the agreement of 1948 is that Pakistan has undertaken to replace the water cut off by building a canal across the Punjab in order to bring water from the Indus and the Jhelum over to the Pakistan Ravi and Sutlej. Pakistan has already built one of the necessary canals and will finish another in a few months. What makes India uncompromising, however, is that, instead of building up the other, and vital, cross

canals, Pakistan is spending its money, and using its Indus water, on new barrages in Upper Sind and at Dehra Chazi Khan in the Punjab. This is felt to be an attempt by Pakistan both to keep its own water and to use international opinion to make India go on supplying Indian water as well.

For the moment, there is a slight lull while people await the report of the working party of Indian and Pakistani engineers which, with World Bank assistance, is drawing up comprehensive water proposals for the whole Indus Basin. Indians hope these will show that the area irrigated in India can be increased to 14 million acres and in Pakistan to 24 million acres. But no one in Delhi doubts that, if Mr Nehru and Mr Nazimuddin can meet, the two prime ministers will find the canal waters dispute very near, if not at, the top of their agenda.

World Economic Report—II

The Under-Developed Areas

FOR the less industrialised countries of Latin America and the Far East the years 1950-52 gave rise to a very special set of difficulties. The experience of these two groups of countries, all of them primarily producers of raw materials, followed a broadly similar pattern, but there were important variations both within and between the two groups, depending on the nature of the commodities they exported and on government policies.

The United Nations World Economic Report, reviewing a selected group of Latin American countries (Brazil, Chile, Mexico, Cuba and Argentina), finds that during the three-year period most of them exhibited two dominant characteristics. The first was a marked increase in inflationary pressure leading to a sharp rise in the cost of living, and the second was a substantial increase in imports that, more often than not, was greater than they could afford.

To some extent the rise in the cost of living throughout most of these countries was the result of higher prices for imports, but a more fundamental reason was the failure of domestic food production to increase as fast as private incomes. In all of them except Argentina, food production did rise by a moderate amount but expanded production as well as high export prices generated by the boom in raw materials, meant that private incomes increased even more swiftly. As Table I shows, Cuba alone managed to prevent inflation and it did this by raising food imports. Argentina, with the worst record of all in this respect, is a case apart. Technically speaking, it is not of course an under-developed country ; moreover, a poor grain harvest in 1951-52 and the decline in meat production coupled with a switch in government policy to higher controlled prices for agricultural products, all combined to drive up prices.

The second and equally disturbing feature of these Latin American economies was the large expansion of imports which in most cases turned a small trade surplus for 1950-51 into a sizeable deficit in the following year. While it is true that some of their exports suffered from the weakening of commodity markets—for example Brazilian cotton and Argentine wool—the continent, by and large, managed to maintain its exports reasonably well and to escape the wild fluctuations that marked primary producing countries in the Far East. They failed, however, to control their appetites for foreign goods. The big increase in imports was due partly to precautionary buying, partly to speculation, but it reflected also the abundance of easy money. Table II shows that the largest expansion of imports took place in manufactured consumer goods and producer goods.

Those under-developed areas of the Far East which chiefly produce raw materials and food were more successful than the Latin American countries at curbing at home the inflationary effects of the boom. Throughout the years 1950-52 the cost of living remained stable or rose only moderately in Ceylon, Pakistan, the Philippines, Burma and Thailand. In Malaya, however, the increase was 25 per cent, while in Indonesia the general price level almost doubled.

The relative success of most Far Eastern countries was due to a mixture of fortuitous circumstances and deliberate

TABLE 1.—INDICES OF COST OF LIVING
(1950=100)

Country	1951		1952	
	1st Half	2nd Half	1st Half	2nd Half*
Argentina:				
General	121	151	184	189
Food	118	154	191	200
Brazil:

Food	102	108	120	132
Chile:				
General	113	131	141	158
Food	113	139	152	175
Cuba:				
Food	110	112	113	113
Mexico:				
General	107	118	127	130
Food	108	122	132	135

*Based on prices for 2 or 4 months.

acts of governments: internal prices were kept down by large imports of food and consumer goods, by the application of export duties, the operation of food subsidies and also by the fact that rising profits frequently went into the coffers of cautious plantation companies rather than into the pockets of peasant farmers with an itch to spend. In the one country where small farmers predominate—Indonesia—the increased profits in their hands led to an immediate rise in consumer spending.

The fluctuations during the boom and the subsequent period of setback were more violent in the Far East than in Latin America because such a large number of Far Eastern exports—rubber, tin, wool, copra—are especially vulnerable to swings in demand. The dollar value of exports from Asia as a whole was 17 per cent lower in 1951-52 than in the preceding year, and the earnings of individual countries fell even more steeply—Malaya, for example, suffered a drop of 26 per cent. The countries least affected were the food producers, Burma and Thailand.

The immediate economic interest of the industrialised countries of the west in this situation is obvious. How will reduced earnings affect the imports of the under-developed Far Eastern countries from the West? Much of the prosperity of the western world's export industries has sprung from the fact that throughout 1951 and the first half of 1952 these primary producing countries were flush

with money and falling over themselves to buy the manufactures of the West. As will be seen from Table II, almost half of these imports were in producer goods. By mid-1952 there was still no appreciable decline, but the report indicates that since then this group of countries has been compelled by lack of purchasing power to reduce its imports

TABLE II.—EXPORTS FROM U.S. AND WESTERN EUROPE
(Millions of U.S. dollars)

Commodity Groups	To selected Latin American countries			To selected Far Eastern countries		
	1950	1951	1952 1st Half	1950	1951	1952 1st Half
Foodstuffs	362	444	521	90	304	389
Raw Materials	162	248	210	113	220	294
Consumer Goods	737	1,050	1,063	288	427	437

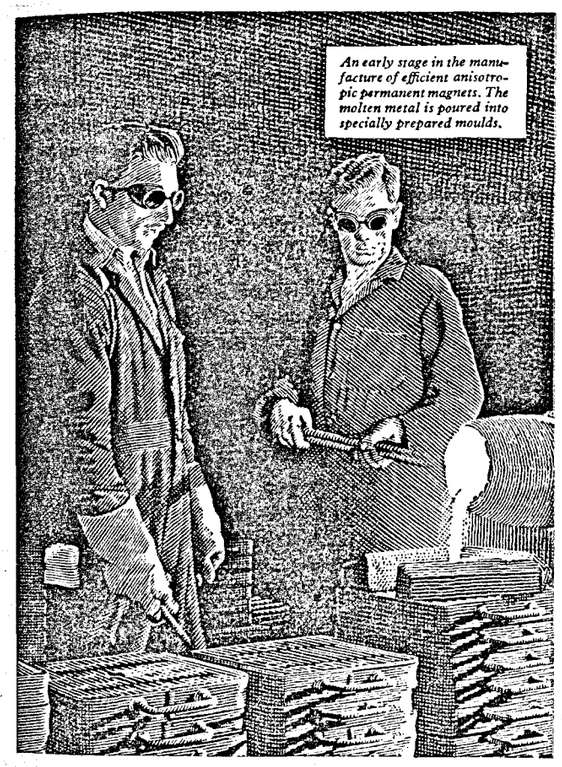
The Indonesian Jigsaw

FROM OUR CORRESPONDENT IN INDONESIA

THE trial in Jakarta of Sultan Hamid of Pontianak, who last week was sentenced to ten years' imprisonment, has again drawn attention to one of the deepest divisions in Indonesian politics. Before the recognition of the country's independence in December, 1949, Sultan Hamid was a leader of the Indonesian federalists—those who wanted to see the end of Dutch rule but opposed the creation of a unitary state. He was a member of the federal government that was constituted when the Dutch withdrew, but in April, 1950, he was arrested and charged with responsibility for the attempt to seize and kill members of the government that had been made in January by the Dutch freebooter Westerling. At his long delayed trial, he declared that he had allied himself with Westerling because he feared that the federal government would be subverted by the Jogjakarta republicans, whose aim was a unitary state.

This fear was, in fact, justified by events. By August, 1950, Indonesia had abandoned the federal system and transformed itself into a single republic. This rapid development was in part due to the fact that federalism was widely regarded as a Dutch device; it was the last Dutch governor-general who conceived the idea of a federal state, and during their long struggle against the Jogjakarta republic the Dutch encouraged the formation of autonomous political units in various parts of Indonesia. Yet the federal idea corresponded closely to some of the country's most obvious needs.

Indonesia covers a vast area. From Sabang in northern Sumatra to Merauke in New Guinea the distance is something like that from Ireland to the Black Sea. Wide stretches of water divide the islands from one another, and for centuries their peoples have been largely independent of centralised control and have developed their own special characteristics. The Jogjakarta republic, although drawing a surprising number of its leaders from the west coast of Sumatra, was based on the support of the overcrowded and land-hungry Javanese; and in the outer islands there was a real fear of Javanese domination, or even colonisation.



Regional feeling, indeed, still runs extremely high. Usually the people of a region will give their ungrudging support to none but a local man. One result has been the considerable measure of autonomy recently granted to south-east Borneo. The south Moluccas set up their own Ambonese republic, which for long resisted the forces sent against it by the central government, and even now these islands are unreconciled to Javanese domination. Only in south Sumatra has migration from Java been able to make much headway, and this is largely due to the sparse population and the undesirable nature of the countryside.

Nowhere, however, has Javanese interference met with such protracted resistance as in south Celebes. In 1950 the Buginese people of this area were divided, some of them supporting federation and others a unitary state; and a Javanese battalion was able to land, despite a preliminary repulse by forces led by Andi Abdul Aziz (who still awaits trial in Jakarta). The central government's hold remains

precarious, as is shown by the series of "Macassar incidents," and the current leader of the rebels in south Celebes, Kahar Muzakkar, may well be the true popular leader of the area. But, as he has long been openly fighting the government's forces, it could not easily reach a compromise with him without further loss to its already flimsy prestige. Its weakness enabled Colonel Warouw, an ex-guerrilla commissioned into the Indonesian army, to depose his superior officer, the commander in south Celebes, last November and then to get himself officially confirmed as commander of the territory. But although Warouw is in a fairly strong position *vis-à-vis* Jakarta, he is by no means unassailable in Celebes. A north Celebes man, he is in Buginese eyes a cut above anybody from Java, but not much above. His control is based on an ill disciplined body of troops which holds the balance between the Buginese on one side and the central government on the other; and for this reason alone he is now making some effort to come to terms with Kahar Muzakkar.

It is, indeed, an unhappy fact that some of the natural local leaders who could contribute usefully towards the development of a strong Indonesia are now permanently branded as rebels. This situation is liable to be complicated, as in south Celebes, by the tactics of ambitious politicians or army officers. More and more leading Indonesians are becoming convinced that some form of regional autonomy that respects the traditions of local peoples is essential.

An early stage in the manufacture of efficient anisotropic permanent magnets. The molten metal is poured into specially prepared moulds.

PROGRESS IN ELECTRONICS

MANY of the great technical achievements of this age stem from scientific investigations that have led to improvements in the properties of materials. This is especially true of the electronics industry.

The rapid progress in electronics has been marked, for instance, by the development of new and improved magnetic materials. One of the most important of these is an efficient anisotropic or directional permanent magnet. Another is a magnetic ferrite of exceptionally high permeability eminently suitable for the cores of high frequency inductances. A third is a non-metallic permanent magnet which is actually a true ceramic.

All these remarkable materials, which were pioneered in this country by Mullard, have had a considerable influence upon the design of better and more compact electronic components and apparatus. Their successful use is due in no small measure to the work undertaken by the Mullard Applications Advisory Service, which is itself backed by a comprehensive research organisation.

JET

WHITTLE'S OWN LIFE STORY

The genius who shrank the world tells how it all happened.

As a boy he dreamed it, as a youth he planned it, as a man he brought it to triumph. It was an invention that changed the war and still more the peace, that gained Frank Whittle a knighthood and an award of £100,000 while still only forty-one years of age.

Now, for the first time, Sir Frank Whittle will tell you himself how he unleashed a new kind of power – the mighty thrust of the jet engine that has carried an R.A.F. plane to Australia in less than a day, and now enables you to travel from London to Tokyo in less than two days by commercial airline.

He tells of his meetings and correspondence with the famous – the big moments of the Revolution in the Air.

It is the most enthralling, dramatic chapter in the story of man's conquest of the skies that has yet been written.

THE BUSINESS WORLD

The Budget Analysed

MEASURED by the standards of recent years, Mr Butler's second budget must seem to most people particularly difficult to understand. At the end of a year in which his realised budget surplus fell short of estimate by more than £400 million—and was, indeed, really no surplus at all, since it was almost wholly represented by the sterling "counterpart" of American aid—he has elected to give tax reliefs costing £169 million in 1953-54, £259 million in 1954-55 and possibly over £400 million eventually. But if the general shape of this "incentive" budget looks paradoxical, it yet conforms to the most recent forecasts—or, at least, to the more sophisticated among them.

If there is room for surprise, it is that it embraced virtually every one of the major reliefs that had been discussed at all seriously, went further in purchase tax concessions than had been expected, yet imposed no new taxes and no cuts in subsidies beyond those already projected. The standard rate of income tax and each of the "reduced" rates have been cut by 6d.; EPL is to end on December 31st next; initial allowances are restored forthwith (at 20 per cent for plant and machinery); purchase tax on the main classes is cut by one quarter (with still bigger concessions on a few selected articles); and there are some miscellaneous minor reliefs.

To those who had already digested the implications of the Economic Survey (analysed in *The Economist* a fortnight ago) there will, of course, be no paradox in this approach. But the Budget speech itself made no attempt to supply the statistical argument by which the bewilderment of others might be resolved. The Chancellor's figuring was, indeed, cast in the conventional pattern of budget accounting that is apt to be misleading rather than revealing. He showed that prospective "above-line" expenditure, at £4,259 million, will be £91 million less than was actually spent (though £109 million more than originally estimated) last year, and that prospective revenue, on the old basis of taxation, would have been £99 million larger. Hence he was confronted by an improvement in his "above-line" surplus, on the conventional reckoning, by £190 million, to £278 million; so that even after cutting taxes by £169 million he was able to show a bigger prospective surplus than that achieved in 1952-53—one of £109 million.

Misleading Arithmetic

It is not in such figuring as this, however, that justification for tax reliefs can be found. And that would still be true even if it were not the fact that almost the whole of the prospective improvement in the conventional surplus, before tax changes, was attributable to capital items or purely nominal credits. Most of the £169 million expected gain in income tax was apparent rather than real, since it resulted from the new "net" basis for profits tax, the yield from which (and from EPT) is expected to drop by £161 million. The expected net gain in total ordinary revenue was, in fact, represented by the £97 million additional yield that should come from EPL, and this revenue has to be regarded simply as a transfer from the tax reserves or other undistributed profits of businesses. Moreover, the income tax estimate takes credit for a considerable yield from the suspension of initial allowances effected by Mr Gaitskell (and now made applicable only to expenditure incurred in the fiscal year 1952-53), which likewise will be at the expense of company savings.

Similarly, on the expenditure side, £55 million of the expected decline of £91 million results merely from the crediting of a larger sum from the "counterpart

fund," whilst nearly all the remainder reflects cuts in capital outlays that cannot properly be included in a budget surplus—a reduction of "strategic" stockpiling and a much increased rate of actual decline in other Government stocks (owing to the coming cessation of Government trading in grain). If the counterpart fund had not been brought in, the "conventional" above-line surplus would have been only £138 million before the tax changes, and would have been converted by those changes into an "above-line" deficit (comparable with the above-line figures for all previous years except 1952-53) of £31 million. On the "alternative" classification, which excludes capital items, the exclusion of the counterpart fund would still have left an above-line surplus of £288 million before and one of £119 million after the tax changes, compared with £190 million achieved in 1952-53.

THE TAX CHANGES

	Estimate for 1953-54	Estimate for a Full Year
	£	£
INLAND REVENUE :—		
Income Tax :—		
Reduction of 6d. in the standard rate and in each of the reduced rates	−117,000,000	−134,000,000
Increase from £500 to £600 in the income limit for age relief	− 1,000,000	− 2,500,000
Increase from £50 to £60 in the dependent relative and housekeeper allowances	− 3,500,000	− 4,250,000
Income Tax and Profits Tax :—		
Restoration of initial allowances at 10 per cent for industrial buildings, 20 per cent for plant and machinery and 40 per cent for mining works	nil	− 84,000,000*
Income Tax, Profits Tax and Excess Profits Levy:—		
Removal of limitation on unilateral double taxation relief	− 2,750,000†	− 3,000,000
TOTAL INLAND REVENUE	−124,250,000	−227,750,000
CUSTOMS AND EXCISE :—		
Customs :—		
Mechanical lighters	negligible	negligible
Excise :—		
Entertainments duty	− 220,000	− 230,000
Purchase tax	− 45,000,000	− 60,000,000
TOTAL EXCISE	− 45,220,000	− 60,230,000
TOTAL CUSTOMS AND EXCISE	− 45,220,000	− 60,230,000
MOTOR VEHICLE DUTIES	negligible	negligible
Total	**−169,470,000**	**−287,980,000**

EXCESS PROFITS LEVY :—No figure for the cost of terminating the Excess Profits Levy as from January 1, 1954, is included in the above table. The revenue of the current year will not be affected and the cost in 1954-55 will be £5,000,000. At current levels of profits the ultimate cost of repeal in a full year is estimated at £125,000,000.

* The cost in 1954-55 will be £50,000,000.

† Dividend approximately as follows :—Income Tax, £1,250,000; Profits Tax, £1,000,000; Excess Profits Levy, £500,000.

The Real Explanation

Dissection of the figures on these lines should disabuse those commentators who regard the "new look" in the Budget as evidence that Mr Butler has abandoned the Keynesian approach and is reverting to prewar criteria. What he has done is to follow Keynesian principles and then to try to justify his conclusions by the old-fashioned accounting. Those principles led him to give full weight to the existence of "slack" in the economy and to conclude that, despite the huge shortfall on the 1952-53 budget estimates, it was safe and wise to give tax reliefs. But he expressed this, in budgetary terms, by concluding that he could safely reduce his prospective surplus provided that he retained "rather more than was realised last year." Yet, as the above analysis shows, on the true "alternative" classification he is retaining less; and, on the conventional basis, is really in deficit. Moreover, he has had to reckon upon an increase in "below-line" expenditure from £656 million to £696 million gross and from £524 million to £549 million net—principally because loans to local authorities are put at only £12 million less, at £400 million (foreshadowing only a very small response by the authorities to their new freedom to borrow in the market), while £22 million is to be expended by paying war damage claims on business chattels. The overall deficit is expected to rise from £436 million to £440 million (or, before taking credit for defence aid, from £521 million to £580 million).

The key to this seemingly paradoxical budgeting lies, in fact, not in the Exchequer figures, but in the scope for increased production—scope that arises from the fact that production declined last year because of the contraction of demand, whereas the creation of new capital equipment in industry and the easing of the steel shortage should have raised productive capacity still further. Production has recovered from its low level of last summer because demand has recovered; and the "incentive" budgeting is founded on the hypothesis that the spontaneous recovery of demand will not be strong enough to raise production as much as it could safely be raised. The Chancellor reckoned that the additional "real" resources that will be absorbed by the defence programme, by "small" expected increases in fixed investment and consumption, and by "some"

EFFECT OF TAX CHANGES

	Exchequer Receipts in 1952-53	Estimate for 1953-54 at 1952-53 Tax Rates	Estimates for 1953-54 at New Tax Rates

increase in stocks and work-in-progress and exports will call forth an additional output of only about the extent of last year's fall in output—allowing for the fact that part of this year's demands will be met by an increase in imports.

This is equivalent to saying that output, if not specially stimulated, would not rise perceptibly above its present level (already well above the 1952 average, but slightly below the 1951 average); and at that level the economy would not be getting any return from the "productive" investment that has taken place in the past two years. But, argued the Chancellor, "we must not be content with this. We can, and we must, do much better." Therefore, he applies the stimulus of tax reliefs, and seems to be hoping that these may call forth a further increment of output of about £150 million, of which perhaps two-thirds would be absorbed into consumption and one-third into additional productive investment. It is noteworthy that some £45 million of the income tax relief will accrue to companies, so that the personal reliefs and purchase tax concessions account for about £120 million this year.

The Chancellor's hope for production is not, on the face of it, an immoderate one. Indeed, a production increment of £150 million, over and above the increment that is already reasonably in sight for this year, would be equivalent to barely half the gain in productivity that occurred in 1951, which was a poor year. It ought not, of itself, to threaten a recrudescence of inflationary pressure on costs—which, if it occurred, would utterly condemn this "new direction" of budget policy. But if this danger is to be kept at a safe distance, and if the Chancellor is to have as much margin for flexibility in the economy as he obviously thinks he is retaining, it is imperative that the habits of restraint born of last year's disinflation shall persist. In particular, there is need to ensure continued economy in the use of stocks. And that will not be attained unless monetary policy is kept taut.

The fact that the Chancellor is deliberately stimulating investment and consumption must not, therefore, be construed as giving a green light to the banking system in its lendings. On the contrary, the justification for taking some risk in fiscal policy, in the hope of breaking out of the vicious circle of these postwar years, lies precisely in the fact that a flexible monetary policy is available to meet danger if it arises. The most reassuring feature of the Chancellor's speech is its indication that he realises this. "The budget," he said, "will not be operating alone, but in combination with monetary policy"—and appearances now suggest that this year's conditions "will require broadly a continuation of the monetary measures in operation now."

Tax Reliefs for Industry

"LIGHTLY burdened and nimbly competitive" was the posture prescribed for British industry by the Chancellor. His tax reliefs for industry were given for competitive improvement, modernisation and re-equipment. The Chancellor's first concession—by no means an unexpected one—was to reinstate the system of initial allowances that had been discontinued by his predecessor Mr Gaitskell in the 1951 Budget as from April 6, 1952; it is more than a little ironical that this year Mr Butler gains the first real benefit in revenue of the suspension that has been in force for the past twelve months, whilst the reinstatement of the allowances (oddly enough, on capital expenditure incurred after Budget day, not after April 6, 1953) will not involve him in any loss of revenue until 1954-55 (£50 million) and thereafter at £84 million for a full year.

The initial allowance will be 20 per cent for plant and machinery (Mr Gaitskell suspended the allowances when they were 40 per cent), 10 per cent for industrial buildings and, exceptionally, 40 per cent for capital expenditure on new mining works (though not the plant and machinery that may go with them). Although the loss to the Exchequer is much deferred owing to the familiar delays in accounting work, the incentive effects that the Chancellor seeks are expected to show themselves fairly quickly. But the initial allowances are a gift horse that would appear on a race card as "aged"—a certainty, indeed, but one whose mouth requires examination. Those followers of the industrial handicap who have long memories will recall that Sir John Anderson (as he was in 1945) introduced the initial allowances at 20 per cent as a means of providing post-war finance to needy industry. In 1949, Sir Stafford Cripps offered 40 per cent as a means of redressing the injustice of historical costs; two years later Mr Gaitskell gave advance notice to suspend them because demand for capital resources was excessive.

Now Mr Butler offers 20 per cent as a stimulus towards increased investment, higher output and lower costs. No doubt there will be some such impetus. But it could easily be exaggerated. Industry has become more familiar with the once esoteric principle that after a period of years of steady investment, the initial allowances amount to a fixed but revolving pool of interest-free loans; if the rate of allowance or of new investment slackens, the loans became repayable. A formal exercise in the working out of the allowances since they were introduced with effect from 1944-45 suggests that Mr Gaitskell's suspension may have brought many companies within the danger area of enjoying no current depreciation allowance (and therefore involved in higher tax payments). Mr Butler's 20 per cent may do little more for such cases than to relieve them from the necessity to repay further sums in

1954-55. But by that time (although his speech did not make the point explicitly) Mr Butler may be engaged on a major recasting of industrial taxation, fortified by the conclusions of the Royal Commission—in which, without doubt, the working of the initial allowances will have full consideration.

One of the matters on which Mr Butler deserves the heartiest congratulation fell almost unremarked by the House of Commons last Tuesday. The Chancellor has given notice that the Excess Profits Levy will terminate at the end of this calendar year—a step argued in these columns, but widely reckoned to be politically difficult. The case for the disappearance of the tax was argued with all the conviction that was to be expected of an unwilling foster-father landed with such an ungainly foundling on his doorstep. No part of his incentive budgeting for industry would have stood intact so long as EPL remained. Its disappearance with only two years' standing puts it among the shortest-lived of all impulsive fiscal measures. But these two years have yet to produce their doubtful fruits—Mr Butler counts on £100 million this year and "rather more" than £100 million in 1954-55. In other words, EPL will be a factor making for industrial dis-saving for a full two years after the immediate impact of the benefit of the 6d. reduction in the standard rate of income tax.

For that reason, it seems desirable to reckon the effects of the two changes in two phases, as is done in the accompanying table. This shows the effects of the two stages, and compares them with the pre-Budget tax situation, for companies at three assumed levels of profits, and three assumed rates of distribution. After the two stages have been completed—that is, after the remission of EPL has become effective—companies will pay out 61½ per cent of their profits in income tax and profits tax if they make a "full distribution," 57½ per cent if they distribute a notional half of their profits before tax, and 47½ per cent if they pay no dividend at all. The telling comparisons are in the last section of this table, showing the percentages of profits absorbed in taxes on the various assumptions. Where no EPL has been payable (Division I) the total saving in tax compared with the pre-Budget impost is small—up to 2½ per cent to mark the change in the standard rate. The truly important savings are shown in Divisions II and III. For example, a 50 per cent gross distribution with chargeable profits of 150 would have cost no less than 70 per cent in income tax, profits tax and EPL before the Budget changes; the same distribution will eventually cost 57½ per cent in total taxes, and leave a residue to augment reserves equal to 15 per cent of the profits. Again, where chargeable profits reached 200, a 50 per cent distribution was impossible before the Budget, since the maximum distribution amounted to 48.3 per cent—at which 74.6 per cent of total profits was absorbed in taxes. A 50 per cent distribution will in future attract the 57½ per cent in taxes already referred to, leaving 15 per cent of profits to be retained.

In the fulness of time, therefore, the gain to industrial savings and thence to industrial improvement resulting from the combination of the disappearance of EPL and the 6d. reduction in the standard rate of income tax should be most material. The latter, according to the Chancellor's calculations based on current levels of profits and distributions, should provide an immediate relief of no less than £45 million on the undistributed profits of companies—a "very potent augmentation" as he claimed, to company reserves, and one that could not have been provided with similar immediate force except through a revision of the profits tax. Industrialists will note that Mr Butler made no reference (except on a technical point) to the profits tax; it may be early to infer that no revision of rates is in the Chancellor's mind after the end of EPL—but by that time, in any case, the largest issues of company taxation will be before him.

STANDARD PROFITS FOR EPL = 100

(*a*) Maximum distribution is 48·3 per cent.

Some technical changes in tax law to give effect to certain "Tucker One" recommendations and to some of the proposals of the Royal Commission in their recent interim report should be noted. It would appear that various devices for avoidance that are open to partnerships following the decision in *Osler* v. *Hall* are to be stopped. On the taxation of overseas profits, the Chancellor proposes to give a legal option (in replacement of the present administrative concession) to defer payment of tax on profits blocked in foreign currencies and to make the full concession of unilateral relief for double taxation. These two courses were urged by the Royal Commission's interim report, but there was no mention in Mr Butler's speech of the recommendations in that report on "Pioneer Industries Concessions" granted by certain Colonies, which are valueless in the hands of United Kingdom residents. Other "Tucker One" reforms include the carrying forward of trading losses for one year to set off against other income (reversing the *Odhams Press* v. *Cook* decision) and relief for payments made by companies towards the trading losses of associated companies. The Chancellor also proposes to reverse the decision in *Hall* v. *Marians* to stop the "small loophole" whereby income arising abroad is offset by a loan enjoyed in this country, thereby avoiding normal tax. Thus, on balance, the Chancellor in these technical changes has been more concerned to release some fiscal traps than to stop up earths where the harried taxpayer seeks escape.

Personal Income Tax Changes

THE reduction of 6d. in all four rates of income tax will cost the Exchequer £117 million in 1953-54 and £134 million in a full year, but about £45 million of this should accrue to the undistributed profits of companies. Taken in conjunction with last year's changes, this means that the first £100 of taxable income will now be charged at 2s. 6d. in the £, the next £150 at 5s., the next £150 at 7s., and the rest at the new standard rate of 9s. (with surtax, unchanged for the next two years, beyond £2,000). Mr Butler has also thrown in three other minor income tax reliefs with an avowedly social purpose. He has given away £3,500,000 in 1953-54 (and £4,250,000 in a full year) by increasing both the housekeeper's allowance and the allowance for aged or infirm dependants from £50 to £60; and he has given away £1 million in 1953-54 (and £2,500,000 in a full year) by raising from £500 to £600 the income limit for age relief—in other words people over 65 whose total incomes do not exceed £600 can now claim the earned income allowance on their investment income.

These reliefs have aroused two criticisms. The first, which is quite unjustified, has come from those who have manœuvred themselves into the invidious position of claiming that all reliefs on income tax are regressive—and have thus laid themselves open to the charge of believing that to go on increasing income tax is the progressive thing to do. It is true that income taxes—and therefore income tax reliefs—do not begin to affect the single man until he is earning some £175 a year, and the married man with three children until he is earning some £600 a year. It is also true that—to take one group only—the married man with one child will secure only £2 7s. of new income tax relief if he is earning £500 a year, £12 1s. 4d. if he is earning £1,000 a year, over £231 if he is earning £10,000 a year, and will enjoy an increase in his net income from £5,755 to £8,248 if he is securing a gross investment income of £100,000. But since surtax rates remain unaltered it is nonsense to lay great emphasis on exotic calculations of this sort; even when allowance is made for them, those with net incomes below £1,000 a year will still enjoy nearly 90 per cent of the net disposable

purchasing power in this country, and will still pay rather less than half of the total direct taxes.

A much more serious criticism is that the Chancellor would have done better to concentrate his reliefs on the earned income allowance (which remains at two-ninths) instead of on the tax rates; and certainly he would have been wise to extend the earned income allowance beyond the £2,000 a year mark, for it is at this level that the disincentive effect of the jump in marginal rates of tax is most marked. Mr Butler's answer would presumably be that any further tinkering with earned income allowances would have had to be accompanied by a reduction in profits tax if companies were to gain as well as individuals; and direct, as distinct from circuitous, reductions in profits tax rates are still politically out of fashion.

From Purchase Tax to Cricket

THE changes proposed in purchase tax are sweeping. They will cost some £45 million this year and £60 million in a full year. They affect all classes of goods except clothing and textiles which were converted from utility to "D" schemes last year, and represent a cut of a quarter. Goods previously taxed at the rate of 100 per cent—jewellery and furs, cosmetics, mirrors, china figures, pictures, electric fires and certain water heaters—come down to 75 per cent. The 66⅔ per cent rate that applied to passenger cars, radio and television sets, and most gas and electric household appliances comes down to 50 per cent, and the next lowest general rate, 33⅓ per cent, is reduced to 25 per cent. This last category includes most household goods, including furniture, wallpaper, stationery and drugs, as well as commercial vehicle chassis, cycles and motor bicycles.

A few further changes are being made to meet special cases. Batteries and accumulators for radio sets become exempt from tax. Taxis, electric goods vehicles, and pianos are also freed from the tax. An important concession is made for the three-wheeled "mechanically propelled tricycles" that are, in fact, an ingenious variation of a side-car combination. Because the driver is under cover as well as his passenger, these until now have been classed as a passenger car and taxed at 66⅔ per cent; they will in future be recognised as motor-bicycles and taxed at only 25 per cent. Umbrellas and sunshades get a similar tax relief, but only if they are, in the Chancellor's words, "common and trusty." The more exotic article will be taxed at 75 per cent. The Chancellor gave the House notice that his financial resolution would prevent members from haggling in committee about the rates of tax on individual articles.

These changes in tax have naturally provoked complaints from retailers about tax-paid stocks. Total stocks of goods in all taxable categories in retailers' hands at the end of January were probably in the region of £350 million in value, at prices including 1952-53 rates of purchase tax. A good deal of spring stock must have been taken in since then, but much of this would have been clothing and textiles, neither of which are affected by this year's tax changes. A proportion of the clothing, furniture, stationery and chemists' goods included in current stocks attracts no tax whatsoever, and a further proportion, brought under the "D" schemes last year, has a certain tax-free element in its price. There is nothing to show how much of this total value of stocks represents tax already paid on goods, or how much of the taxed stock is affected by the new changes in the rates of purchase tax. The Hutton Committee that only recently—and, as it turned out, prophetically—reported on the stock losses suffered by retailers when the rates of tax are reduced, estimated that the tax paid on stocks held "at any time" might amount to £75 million.

When rates of tax on textiles were reduced last year, retailers were able to avoid heavy book losses on stock on which tax had been paid at the old rate, by averaging out the price of old and new merchandise. They have less scope for doing so this year, as a higher proportion of the goods affected by the latest tax reductions are probably either branded and nationally advertised or subject to resale price maintenance, and thus unsaleable at more than the new price. On the Chancellor's estimates, the new concessions represent about a fifth of the total yield of purchase tax last year so on the broadest of guesses retailers might have to write down the value of their stocks by £15 million or more. Some of them, of course, have managed to avoid loss by "sale-or-return" agreements; these have become almost universal in the motor trade and increasingly common in the radio and durable consumer goods fields. Variations on this system have been developed whereby the retailer pays for the goods on delivery, but the manufacturer still retains some right to those goods, and tax need not be paid so long as they remain unsold.

★

Finally, the Chancellor has added in sundry pittances of relief—which will cost £220,000 in 1953-54—to the £124 million he has given away on income and profits tax and the £45 million on purchase tax. It is an apt welcome to Lindsay Hassett and his men that cricket led the way among these sundries, and received the loudest cheer in the House. It will be freed from entertainments tax altogether, as will the amateur stage and amateur sport. This last relief is one that the Treasury has had in mind for some time, but it had run into constant difficulties of definition. The definition now adopted is that any club that enjoys the relief must be "established and conducted for the promotion and furtherance of amateur sport and not conducted or established for profit"; in addition, none of those actually taking part in the game must be paid for it. Professional sportsmen, who have had to be content with a codification of the mighty muddle about entertainments tax on season tickets, have already objected loudly to this discrimination. Certainly it seems that the Courts may have some difficulty in defining what is "shamateurism"—and what is plainly not cricket.

Among his other changes Mr Butler proposes to allow authors to spread the first two years of receipts from royalties on any of their books in the same way as they can already spread lump sum payments received for outright sale of their copyrights; the Royal Commission on Taxation is studying the case of professional boxers and others who clamour for similar dispensation. Farmers who are hit by foot-and-mouth disease get another special, and reasonable, concession; they will be given a further opportunity to elect for the herd basis of compensation.

The welcome for the Budget will stop short at Lands End, for the Chancellor has decided that income and profits arising in the Scilly Isles can no longer escape taxation. The Scilly Islanders, who suffer from inordinately high transport costs and certain other disabilities, have some grounds for complaint about this, and more will be heard of this matter in Committee; but a blanket relief from income tax was clearly not the right way to subsidise them.

On first impression this Budget, besides being better than many, looks tidier than most. Last year's farce, when substantial sections of the Finance Bill were found to be so leaky that they had to be rewritten in Committee, should not be repeated. The Chancellor seems to have done a workmanlike job on the basis of the figures presented to him by his experts. And those figures themselves seem as reasonable a compromise as could be struck at a time of inconveniently changeable economic weather.

Business Notes

Cautious Revel in the Markets

A BUDGET that gave the stock markets virtually everything that the optimists had hoped for—except relief from stamp duty—was bound to lead to an early revel in Throgmorton Street. The big question, which remained unanswered after two days of post-budget dealing, is whether the new fiscal order will bring sufficient funds into the market to support—and carry forward—the initial marking up. Under the rallying cry of tax reliefs, dealers came early to the "House" on the Wednesday to find that the jobbers had already marked prices up in all sectors of the market except in commodity shares. In the event, they had to mark some of them down again before the close. Gilt-edged were one of the few sections that did better than originally expected. Although the shorts, which had been supported on Tuesday in some fond and false hopes of a reduction in Bank rate, merely held steady, the mediums and longs advanced throughout the day—to finish between ⅛ and ¼ higher. There was some sign here that institutional investors, who had been holding off before the budget, had come back into the market; on Thursday, when some of the shorts fell back, the mediums edged further forward.

In the industrial market the advances in prices on Wednesday, which led to a gain of 2 points in *The Financial Times* ordinary share index to 124.6, probably flattered the actual number of buying orders. Almost without exception equity prices were marked up at the start, but the demand for them proved determinedly selective. The biggest rises were shown by shares that will benefit from the abolition of the Excess Profits Levy, notably in the electrical equipment

and brick-making industries. Not far behind came the advances in shares of companies making household goods and of department stores; the argument here was that a budget that gave £169 million of tax relief (£45 million of it on purchase tax) should lead to some increase in retail sales this year. The restoration of initial allowances also played a part in stimulating interest in equities in companies in the engineering industry and in those that face heavy capital development programmes; thus Associated Electrical (which will also benefit from the demise of EPL) rose by 3s. to 80s. 6d. and Leyland Motors (which will also benefit from the fall in purchase tax) rose by 3s. 9d. to

91s. 10½d. But here, too, the first exertions seemed to drain away the market's strength, and on Thursday it was precisely these early favourites that led *The Financial Times* index back by 1.2 points to 123.4.

Although the market outlook after this budget can hardly fail to be better than it was before it, two considerations seem to be holding back investors' hands. First, the mere fact that Mr Butler has given so much away implies that his advisers do not believe that inflation lies ahead; and, secondly, if they are wrong, monetary policy remains as the Chancellor's long stop. Meanwhile, there are already rumours of a new Government loan, as well as of the impending and inevitable issue by the British Electricity Authority.

Wheat Agreement Breakdown

Two months of strenuous, if not always well-directed endeavour to prolong the international wheat agreement have come to remarkably little. The exporters, led by the United States, have managed to patch up an agreement, signed by 17 nations so far, on the basis of a maximum price of $2.05 a bushel during the next three years; but an agreement that leaves out Britain, the largest international buyer, which with its colonies had a buying quota amounting to 30 per cent of the total trade covered by the agreement, may not mean much. India, with a quota accounting for another 10 per cent, also seems unlikely to sign the pact. The deadlock is a matter of five cents on the maximum price. The tone of the Minister of Food's explanation on Wednesday does not suggest that the United Kingdom is disposed to make any concession whatever above $2. For this evidence of determination there should be full support in this country. To be responsible for a major breach in international arrangements of this importance is not a light matter; but the arguments for taking a stand at this time are strong.

Last July, the estimated stocks of wheat held by the three major countries in the international wheat agreement, USA, Canada and Australia, plus stocks in Argentina (which is not in the agreement) amounted to approximately 16 million tons; importers have been able to buy first quality wheat under the agreement, which was working smoothly, at the maximum price of $1.86. World production of wheat this year has improved, and the stocks in these four countries by the end of next June may well reach 34 million tons,

WORLD WHEAT SUPPLIES AND BRITISH CONSUMPTION

	Year 1952-53	Year 1953-54
	Million tons	
Four main producers:—		
USA, Canada, Australia, Argentina:		
Stock at July 1	16	34
Exportable production	66	46
Stock at end year, June 30	34	30
United Kingdom consumption:—		
Imported	4	5
Home grown	1·5	1
IWA quota for Britain and Colonial Territories	4·8	—

more than double those of twelve months ago. This surely suggests the likelihood of a fall, and not a rise, in the price of wheat. Estimates for production of these four countries, put at 66 million tons for the current year, 1952-53, may come down next year to 46 million tons. But even so, the stocks at the end of June, 1954, are still expected to be 30 million tons, not very much less than the large stocks expected this June. In view of these expectations, Britain's willingness to agree to $2.00 was reasonable and perhaps even a little generous—but not to be disregarded as a gesture of willingness to continue the agreement system. It is not easy to imagine as liberal an approach from the United States to any international agreement over commodities of which it is the dominant importer.

Apart from the statistical position there was another reason for trying to break from the "maximum price psychology" that dominated the former agreement. Most of the wheat coming on the international market is sold by four monopolists: the Australian wheat board, the Canadian wheat board, the authority of the Argentine government, and the United States, where private sellers enjoy a "floor price" set by the government's price stabilisation mechanism. These arrangements can ensure that first quality wheat coming on to the world market shall be sold only at prices above the IWA maximum—or not sold at all. This twofold support for prices has proved too much of a good thing.

Closing the Gap in Sugar

The purchase of one million tons of sugar from Cuba by the Ministry of Food, at what the Chancellor of the Exchequer described as "an advantageous price," will enable domestic sugar rationing and industrial sugar allocation to be brought to an end later this year—probably by July. Past estimates by the Minister of Food suggested that an end to sugar rationing would require an additional 750,000 tons in the first year and 500,000 in the following year, over and above the present annual consumption of about two million tons. Under the Commonwealth Sugar Agreement Britain takes all the sugar offered by Commonwealth countries; therefore the extra imports necessary for derationing must cost dollars. Under the new contract, Cuba is expected to supply about 600,000 tons this year and 400,000 tons next year—roughly enough to fill the gap that has caused the prolonged rationing.

The price to be paid to Cuba will vary over the period, but the total cost in dollars will equal about £23 million. Evenly spread over 12 to 18 months, this is an appreciable dollar drain; but it is well worth while to remove the expense and irksomeness of sugar rationing and the straitjacket of restrictions it has placed on the confectionery and other food industries. Moreover some saving of foreign exchange is expected from cuts in the import of expensive substitutes for sugar. The average price for the Cuban sugar works out at about 3 cents a lb. This is a fraction below the recent open market price; but Cuba has large stocks of sugar made unsaleable by the world shortage of dollars. The price is about 45 per cent cheaper than the price that Britain pays Commonwea'th producers under the long-term contract—some £42 a ton. However, Commonwealth producers need have no immediate anxiety, because they are secured by the agreement with Britain until 1960; the deal with Cuba is a commercial operation without any commitments about future purchases.

Imports Rise

Both imports and exports for March were higher than for February; but while imports rose by £42.7 million to £285.7 million, exports and re-exports increased by only £19.5 million, to £223.6 million. Total exports were a fraction above the monthly average for the last three months of 1952, and on a daily rate basis there was a very slight increase in exports in March, compared with the two previous months. But the daily rate of imports was up by 8 per cent, and the monthly average of imports for the first quarter of this year has therefore risen to £272.8 million, £9.5 million more than the monthly average in the first half of 1952.

There was some improvement in exports to Canada. After the low seasonal levels of £11.9 million in January and £9.8 million in February, shipments to Canada rose to £12.3 million in March. On the other hand, exports to the United States in March, at £12.4 million, were slightly less than the average in January and February.

Widening IMF's Facilities

A significant comment on the future policy of the International Monetary Fund was made by its chairman and managing director, Mr Ivar Rooth, when he recently presented the annual report of the Fund to the Economic and Social Council of the United Nations. Any authoritative indication of the Fund's attitude is, of course, of particular interest now, in view of the discussion that is being focused upon the role that might be played by the IMF in any new international plans for expanding trade and payments. Mr Rooth announced that the directors and officials of the Fund had been engaged for some time in working out procedures designed to facilitate a more extensive use of the Fund's resources as a means of providing secondary reserves for member countries. Some of the ways in which this object is to be secured have already been announced. The Fund has revised its scale of charges so as to make the use of its resources for short periods less expensive. The initiative taken last June to make "standby arrangements" for the sale of currencies to Belgium has now been generalised. Any member country that expects to run into temporary balance of payments difficulties may now establish, for a period of six months, an account on which it can draw in case of need. It can hardly be claimed, however, that these developments throw the door wide open to increased co-operation between the IMF and the European Payments Union. Mr Rooth suggested that, though many proposals had been made for revising the Fund's Articles of Agreement, there was little that the Fund could usefully and sensibly do that it was at present prevented from doing by its existing statutes. If that is the belief of the new regime at the Fund, it does not promise well for an early expansion of its activities.

The main barriers to its more effective intervention in world monetary affairs have been the essentially political character of its administration and its dominant concern with the danger of world inflation. There is still no sign that the power and influence of the essentially political executive directors is being in any way diminished. But Mr Rooth has issued an invitation to all member countries of the Fund to join in the task of improving its techniques and attitudes. He suggests that these members "will find it in their own interest to co-operate with us in extending the range within which the Fund can strengthen their reserve position." This is an invitation that should not be allowed to remain unanswered.

Dorman, Long Development

One of the first companies on the list for resale to private investors may well be Dorman Long. The operation will pose some technical questions, not least in connection with the financing of the £36 million development scheme on which the company is about to embark as the third phase of its postwar expansion. The scheme, to be spread over five years, will provide the technical complement and fulfilment of the work that has already been

done. Ore unloading and preparation provided the first phase ; the new steelworks now approaching completion at Lachenby represents the second—it is, incidentally, to be extended by a fifth steel furnace to bring its annual capacity up to 625,000 ingot tons. Stage III will include two new blast furnaces of 27 ft. 6 in. hearth with a total capacity of 750,000 tons and costing £6-£7 million ; new coke batteries at Cleveland handling 1,300,000 tons of coal a year and costing £7-£8 million ; a new medium section mill and a new rod and bar mill, with capacities of 175,000 tons each, which will enhance Dorman Long's interests in lighter finished products.

But the *chef d'œuvre* will be the projected universal beam mill and heavy section mill—a development long awaited in this country and one that will incorporate a feature giving new versatility to this type of plant, since it will incorporate the means for rolling standard structural sections. The structural steel products from this new mill will provide a saving in fabrication and material costs that should make for important economies in construction work. The total effect of these various schemes can perhaps best be measured by the expansion of half a million tons in the company's rolled products from 1,347,000 tons last year to 1,879,000 tons when Stage III is completed.

The finance of the scheme raises many interesting questions. No doubt it will be the directors' firm intention to provide as much of the £36 million out of revenue as can be found without opening before prospective shareholders the prospect of jam deferred for five years. No doubt also they will argue—with some justification—that a company with a scheme of this order of magnitude on the stocks should not be resold to private investors with the initial burden of a heavy capitalisation. The company was taken over for a net sum of about £12 million, and it has spent £14 million out of internal resources on the first two stages of development. But even if as much as one half of the prospective expenditure on the third stage is found from revenue, there will still remain a serious capital commitment to be financed externally. In these circumstances, the preoccupation of the directors over the resale price for the company is understandable.

Commodities Still Weak

WEAKNESS in the commodity market, recently accentuated by hopes of peace in Korea, continues—with the same few exceptions. Whatever winds may blow, the raw wool market keeps firm in response to continuing steady demand ; and likewise demand continues to maintain the price of cocoa and tea. Indeed, it is expected that although the higher-priced teas may weaken a little more, popular types such as common broken pekoe, recently quoted at 3s. 5d. lb, may get dearer. Shellac and certain spices are firmer. Metal prices, however, despite short-lived recoveries, have continued to slip ; before the end of the week a further fall of about £3 brought lead down to £80 10s. a ton, and zinc was down to £71 5s. a ton, both prices being the lowest reached since free dealing in the metals was resumed. At the current low prices there was some buying in the tin market, causing some erratic movements ; but even after a slight improvement the cash metal

was only £717 a ton compared with about £900 a fortnight ago. Rubber recovered a little on Mr Eisenhower's statement that the American synthetic rubber plants will be sold to private enterprise.

* Mid-June, 1952. † November, 1951.

The Economist's Commodity Price Indicator was down to 117 on April 14, 2 points lower than a week earlier. The index for food showed a small increase on the week ; that for fibres was unchanged ; and the fall in prices was reflected in the indices for metals and other raw materials.

Prospects for Electrical Exports

TOASTERS, as well as turbo-generators, come under the heading of electrical equipment ; indeed, some of the largest companies in the industry manufacture both. Its market prospects, both at home and overseas, are always, therefore, something of a patchwork. Last year, according

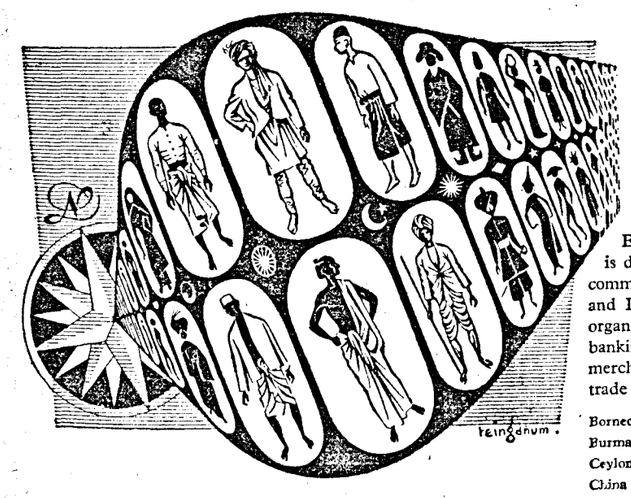
PROBLEM CORNER



Education, we are told, is not so much a matter of knowing the facts as knowing where to find them. In matters of finance, you will find 'the facts' at the Westminster Bank. Special departments exist to advise on overseas trade, to help with customers' Income Tax problems, to obtain foreign currency and passports, to act as Executor or Trustee, to . . . But why go on? We have said enough to show that, when problems like these arise, the simplest thing to do is to leave them in the efficient hands of the Westminster Bank.

BUSINESS ABROAD?

Wherever you're bound for on the Continent, French Railways will get you there punctually, speedily—and cheaply. If you intend to visit many centres you'll find French Railways certainly the most convenient and sometimes the only practicable means of so doing—for French Railways serve the whole of France, not merely a few large centres.

So that the whole day may be devoted to business appointments, many fast evening trains and night expresses (the latter with 1st or 2nd class couchettes or wagon-lits) are run between large towns. The small self-drive cars that can be hired at the Paris termini and 71 provincial centres are a great help when many calls have to be made and time is pressing

S.N.C.F. POINTS TO BETTER TRAVEL

SPEED French Railways have the fastest trains (steam, diesel and electric) in Europe—in some cases the fastest in the world.

CHEAP RATES offered to Continental Trade Fair exhibitors and for carriage of exhibition materials.

SLEEP EASY Many couchette and wagon-lits berths (1st and 2nd class) are available.

MEALS EN ROUTE France's station buffets are famed for excellent cuisine and reasonable charges. On certain trains, where there is no dining car, light refreshments are served on the train.

TOURIST TICKETS offer reductions of 20% and 30% off ordinary fares for minimum journeys of at least 1,500 and 2,000 km. in France.

FREE BOOKLET The exquisitely coloured printed booklet "France" is available free on application to French Railways. Write today, a postcard will do.

Information, tickets and reservations from any good Travel Agent or

179 Piccadilly, London, W.1

CVB—74

to the annual report of the British Electrical and Allied Manufacturers' Association, the total value of the industry's exports rose by 15 per cent, to £218 million, making it the second most important exporting industry in the country (after motor vehicles). But within this continued expansion the overseas sales of different types of equipment showed sharp contrasts.

Exports of the heavier types of capital equipment rose slightly, being limited mainly by supplies of materials or by the capacity manufacturers could put to work; this is still a seller's market, where price matters less than delivery dates in obtaining orders. Exports of electrical machinery as a whole rose by about £10½ million, and exports of cables and wires by £8½ million. At the other end of the scale, exports of domestic equipment fell sharply throughout the year, and home sales were hampered by high purchase tax and hire purchase restrictions; so production was cut by up to 50 per cent in some factories making durable consumer goods such as vacuum cleaners, refrigerators and washing machines. If overseas import

COMPETITION IN ELECTRICAL EXPORTS, 1949-52
(£ million)

	1949	1950	1951	1952
Japan	2·6	2·8	5·3	8·6
Germany	7·1	26·2	56·3	85·0
Britain	140·0	158·0	189·0	218·0

restrictions remain in force, these exports cannot be expected to recover much this year, while the heavy end of the industry is still short of labour. Transfer of resources between sections of the industry may not be practicable on a large scale; but without it, further expansion in electrical exports as a whole may be difficult.

Competition from Germany and Japan, as expected, is increasing; in the Far East Japan has now found itself able to obtain business by short delivery dates alone, and has raised its prices towards British levels for electrical equipment. Germany's credit arrangements and export incentive schemes are ambitious, if not yet quite as extensive as some British manufacturers had feared. But it is worth noting that the largest exporter of electrical equipment, and Britain's most important competitor, is the United States. And the United States is more lavishly equipped as regards credit facilities than any other competitor, with credits from the Export-Import Bank and the International Bank. Power development schemes financed by the International Bank since its inception have usually meant contracts for America; partly because American consulting engineers, who have usually been on the technical missions sent to investigate the projects, have none of the professional reluctance to recommend their country's manufacturers that inhibits British consultants. There now seems some likelihood, says BEAMA, that the British consultants may become slightly more commercial—and that the International Bank, in recruiting its technical teams, may include some British engineers.

Shortfall in Small Savings

ALTHOUGH total private saving increased in 1952, the national savings movement has fallen on lean days. Its tally of small savings remaining invested declined during the financial year by as much as £163 million (if allowance is made for the repayment of £45 million of defence bonds) and by £73 million even if account is taken of accrued interest remaining invested. This is the greatest rate of net withdrawals ever recorded in a single year. It is true that gross receipts of small savings showed an increase of some £34 million for the year, but this was more than offset by an increase of some £65 million in repayments (excluding defence bonds redeemed at maturity). Some £15 million of the increase in gross receipts and some £12 million of the increase in gross repayments occurred in

SMALL SAVINGS
(£ million)

	1951–52			1952–53		
	Gross receipts	Repayments	Net change	Gross receipts	Repayments	Net change

Trustee Savings Banks	376	371	+ 5	389	401	− 12
TOTAL	932	1,019	− 87	966	1,084	− 118

* Excluding defence bonds repaid on maturity (£43 million in 1951–52, and £48 million in 1952–53).

defence bonds; this was the natural consequence of the new issue of these bonds, carrying interest at 3½ instead of 3 per cent, which appeared in September, 1952. No less than £51 million of the increase in gross repayments, however, fell on balances in the Post Office Savings Bank and the Trustee Savings Banks—no doubt partly in reaction to the Inland Revenue's tax probe. National savings certificates may have received part of the backwash from these withdrawals; gross receipts and gross withdrawals both rose by £3 million. But the impression remains that this devoted and hard-working movement urgently needs a helpful shot in the arm from government economic policy; and the minor exemption from stamp duty on certain documents used by the savings groups—which Mr Butler announced in his Budget speech—hardly seems likely to effect it.

A Surplus for Australia?

AUSTRALIA is now entering upon an election campaign for the Senate, and therefore into a period of cheerful economic utterances from the Government leaders. Mr Menzies told a Brisbane audience this week that the Australian budget in September will bring "important and valuable tax reductions," which will not be effected in a "conservative or over-cautious spirit." More important,

the Treasurer, Sir Arthur Fadden, has estimated that Australia may succeed in adding "well over" £A100 million to its international reserves in the year to June, 1953. As the Australian economy will have benefited from considerable overseas borrowing during the year (as in every year since 1945), this does not necessarily indicate a current account surplus of this magnitude; but it certainly constitutes a notable contrast with its huge current account deficit of £A576 million in 1951-52.

The year's recovery is due almost entirely to an improvement in Australia's visible balance, from a deficit of some £A380 million in 1951-52 to an expected surplus of about £A300 million in 1952-53. For the first nine months of 1952-53 the visible surplus has been £A249 million. Sir Arthur pointed with some satisfaction to the increase in exports, from £A675 million in 1951-52 to some £A800 million in the present year—though this has, in fact, played a relatively minor part in effecting the improvement; by far the biggest factor, of course, has been the import cuts, which are likely to reduce Australia's imports to about £A500 million in the current year, or less than half the inflated figure for 1951-52. Nevertheless, the expansion in primary production to which Sir Arthur referred—especially in butter, grains and sugar—does indeed constitute a notable and encouraging improvement upon the figures for the drought-affected year 1951-52. The greater is the importance, therefore, that internal inflation should not be allowed to sweep the sources of this recovery away. It perhaps needs to be re-emphasised that critics of Australian economic policy in this country have never cavilled at Australians "earning a high standard of living"; what they have cavilled at is the bland assumption that if inflation there runs away—as it did last year—then it must continue to be supported by subventions from the rest of the sterling area. In 1951-52 these subventions (as measured by the financing of Australia's net current account deficit) reached the staggering figure of nearly £A70 per head of the dominion's population; those who pay the piper to this extent can surely be allowed to sing a slightly plaintive tune.

Drachma Devalued

THE Greek authorities last week-end announced a 50 per cent devaluation of the drachma. This move raises the rate of the U.S. dollar in Greece from 15,000 to 30,000 drachmae. The official rate for sterling has been raised correspondingly, from 42,000 to 84,000 drachmae. A development of this character has long been regarded as inevitable. The level of prices and the cost of living in Greece had lost all touch with the previous official rates for the currency. In the unofficial foreign exchange market, transactions in sterling had recently taken place on the basis of 100,000 drachmae. The fact that the new official rate has not wholly caught up with the black market rate does not, however, necessarily indicate that the devaluation has been inadequate. Black market rates, reflecting as they do, illegal flights of capital, invariably tend to undervalue the currency concerned. Superficial indications suggest that the new parity is near the equilibrium rate indicated by the domestic purchasing power of the drachma.

If the Greek authorities can now achieve equilibrium in their budget and arrest the steady inflation of means of payments that has been proceeding throughout the postwar period, there is no reason why the new parity should not become the basis of a long period of stability. The balance of payments, however, is still in considerable deficit. In 1952 visible exports, valued at $120 million, were not much more than one-third of the value of imports. Earnings of Greek shipping should go a long way to make up this difference, but it can be assumed that the bulk of these earnings, instead of being handed over to the Greek authorities, are salted away abroad. The Greek Government has taken special measures to build up domestic confidence in the new rate of exchange. In particular, it has arranged substantial imports of sugar, frozen meat, cereals and canned milk, so that for a time at least there should be plentiful supplies of food in the shops to exchange against the currency at the prices that are rapidly being established following the devaluation. Heroic measures will, however, need to be taken to safeguard the balance of payments, given the fact that help from the United States is likely to diminish in the months to come. The devaluation of the drachma was referred to and approved by the International Monetary Fund, which has welcomed it as a contribution to the stability of the Greek economy.

EMI Records in America

THE news that Electric and Musical Industries Limited is forming a new company to distribute its records in America gives the first clear indication of the group's response to the big changes caused in the arrangements of its recording companies by developments in the record industry during the past year. Until the beginning of this year, the British Columbia company (a subsidiary of EMI) and the American Columbia company distributed each others' recordings in the territories in which each held the rights of the Columbia trade-mark. But from January this arrangement was terminated, and EMI's right to distribute the American Columbia catalogue outside America was transferred to the Dutch Philips group. As a corollary, the American Columbia company is no longer pressing and distributing in America recordings made under the British Columbia name by EMI in this country. EMI records carrying the "His Master's Voice" trade-mark are handled in America by the American Columbia company's rival, RCA-Victor, which presses discs from matrices and tape recordings made here by EMI. The British Columbia recordings, however, instead of being brought into this arrangement, will be handled in America exclusively by the new American company to be set up and owned by EMI. A new trade-mark will, however, have to be found for them, since the American Columbia company owns the rights to the Columbia name in America.

The formation of this new company, in preference the negotiation of an exchange of catalogues with another American producer, may foreshadow a more aggressive selling policy by EMI. Since the group began its tardy introduction of micro-groove records last October, it has recorded about 160 titles on the long-playing 33 rpm records and more than 200 on the 45 rpm discs (these latter

UNION CORPORATION, LIMITED

(Incorporated in the Union of South Africa.)

ABRIDGED REPORT OF THE DIRECTORS FOR YEAR 1952.

After providing £818,300 for United Kingdom taxation the profit for the year is £1,058,145, plus £313,541 brought forward, making a total of £1,371,686. The Directors have placed £400,000 to the credit of Exploration Reserve Account, and have declared a final dividend of 10*d.* United Kingdom currency per 2*s.* 6*d.* share free of United Kingdom Income Tax, absorbing £387,500, and making, with the interim dividend of 6*d.* per 2*s.* 6*d.* share, a total distribution of 1*s.* 4*d.* per 2*s.* 6*d.* share free of United Kingdom Income Tax or £620,000 for the year, leaving £351,686 to be carried forward.

In July, 1952, each of the Corporation's Ordinary Shares of 12*s.* 6*d.* was sub-divided into five Ordinary Shares of 2*s.* 6*d.* each.

Holdings of shares, debentures and other securities have been taken into the Accounts at cost or under but in no case above the market value of December 31 last, or, where no market price exists, above the Directors' valuation. At present market prices these holdings show a very substantial surplus over the amount at which they stand in the Balance Sheet. The Directors, as on other occasions, have thought it expedient to write down the book cost of certain holdings below both cost and market price.

A copy of the Corporation's Annual Trade Cycles Chart, revised to date, is enclosed with the Report.

GOLD MINING INTERESTS

Summary of the operating results for the past year of the Companies operating in the Witwatersrand in which the Corporation is largely concerned:—

	East Geduld Mines, Ltd.	Geduld Proprietary Mines, Ltd.	The Grootvlei Proprietary Mines, Ltd.	Marievale Consolidated Mines, Ltd.	St. Helena Gold Mines, Ltd.	Van Dyk Consolidated Mines, Ltd.
Tons milled ...	1,725,000	1,253,000	2,316,000	723,000	598,000	1,246,000
Yield per ton, dwt.	6.00	2.90	4.33	5.01	3.96	2.95
Working Costs, per ton	27s. 2d.	29s. 9d.	26s. 2d.	38s. 0d.	46s. 6d.	34s. 8d.
Working Profit, per ton	49s. 7d.	7s. 6d.	29s. 2d.	26s. 2d.	4s. 2d.	3s. 0d.
Total Working Profit	£4,274,000	£469,000	£3,376,000	£948,000	£123,000	£189,000
Net Profit ...	£2,029,000	£1,055,000	£1,621,000	£507,000	£130,000	£186,000
Dividends: Total	£1,837,000	£913,000	£1,430,000	£375,000	—	—
Per Stock Unit or Share	4s. 1d.	12s. 6d.	2s. 6d.	1s. 8d.	—	—

The net profit figures include revenue from other sources. Thus East Geduld Mines' dividend income in 1952 on its shareholding in The Grootvlei Proprietary Mines was £67,200 and Geduld Proprietary Mines' dividend income in 1952 on its shareholdings in East Geduld Mines and The Grootvlei Proprietary Mines was £720,270.

Tonnage milled and working profits of St. Helena Gold Mines, Limited, increased gradually but steadily during the year. The amount of payable footage disclosed by the accelerated development programme was more than three times that in the previous year, although the values were somewhat lower. Expenditure of capital funds in 1952 amounted to £673,900, of which £267,613 was for development footage in excess of that covered by working costs.

THE WITHOK PROPRIETARY COMPANY.—No prospecting operations have been carried out by this Company since the completion of the borehole referred to in last year's Report.

Interests in Gold Mining Companies not under the administration of the Corporation:

STILFONTEIN GOLD MINING COMPANY.—Since this Company commenced milling in July, 1952, production and profits have steadily improved. The capacity of the reduction plant is to be increased by the end of 1953 to 80,000 tons per month. To provide funds for this and for the necessary extension of mining operations, the Company, in November last, made an offer of shares to its shareholders in which the Corporation participated.

WESTERN HOLDINGS.—Development work to date has shown a high percentage of payability with good values on the Basal Reef. In preparation for production test runs of the reduction plant have been carried out successfully. The capacity of the plant is being expanded from 50,000 to 75,000 tons per month.

OTHER MINING INTERESTS

SAN FRANCISCO MINES OF MEXICO.—This Company earned a Working Profit of £3,474,000 in the year ended 30th September, 1951, and paid a dividend of 6*s.* 0*d.* per 10*s.* 0*d.* Stock unit in respect of that year compared with 3*s.* 0*d.* per unit for the preceding year (after allowing for the bonus issue of 1 for 1 in May, 1951). In the year to 30th September, 1952, 657,000 tons of lead-zinc-silver ore were milled compared with 597,400 tons in the previous year. Operations during the first three months of the year were curtailed by power cuts and a fire in the South Shaft affected production in January, 1952, but during the remainder of the year the mill worked to its expanded capacity of approximately 60,000 metric tons per month.

CHROME MINES OF SOUTH AFRICA.—Owing to the limited number of trucks made available by the South African Railways, production had to be restricted at both the Zwartkop and Groothoek Mines and large stockpiles have accumulated at the Mines against orders in hand.

Interest in other Mining Companies not under the administration of the Corporation:

TSUMEB CORPORATION.—The net profit of this Company for the year ended 30th June, 1952, was £4,645,443, compared with £2,966,843 for the previous year and dividends totalling 14*s.* 6*d.* per share were declared. During the first nine months of the Company's financial year dividends totalling 10*s.* 0*d.* per share have been declared.

OTHER INTERESTS

BAY HALL TRUST.—The net profit for 1952 was £96,845 and a dividend of 7 per cent. free of tax was declared. The Trust's investments as at December 31st last showed an appreciation of £422,412 over book cost of £2,189,144.

BRITISH ENKA.—Production in 1951 was further increased. Net profits for the year rose to £419,415, to which was added £84,688 in respect of taxation and deferred repairs over-provided in previous years and no longer required, making a total of £504,103. Dividend of 10 per cent. was again paid, absorbing £98,437. £350,000 was transferred to General Reserve and Carry Forward was increased by £55,666. During 1952 the Company was forced to reduce production owing to a severe recession in trade.

SOUTH AFRICAN PULP AND PAPER INDUSTRIES.—During the year production and sales were again increased notwithstanding a substantial fall in the price of imported papers in the latter half of the year. The net profit for 1952, after making provision for taxation and depreciation, amounted to £424,149. Dividends totalling 2*s.* 0*d.* per share have been declared.

The second and larger of the two additional paper machines at the Enstra Mill is expected to start commercial production shortly. Satisfactory progress is being made in the erection and construction of the new Mill in Natal. To provide funds to complete the programme the Company has recently made arrangements to obtain a further long term loan of £750,000 from The South African Mutual Life Assurance Society.

EXPLORATION

During the year Capital Mining Areas, Limited, increased the area it holds under option in the Bethal and adjoining Districts of the Transvaal. For the sake of convenience, the bulk of the options, covering an extensive area, about which very little is known at present, were apportioned amongst five new small exploratory Companies, which are subsidiaries of the Corporation, leaving Capital Mining Areas to confine its energies to drilling a limited area within which it has obtained some encouraging gold values in the Kimberley Reef. A good deal of drilling remains to be done before any conclusions can be drawn as to the economic possibilities of this limited area.

Central Mineral Exploration carried out further exploration work during the year on its concessions in the Mlala area of Tanganyika.

Copies of the full Report and Accounts can be obtained on application at the London Office, Princes House, 95, Gresham Street, E.C.2.

PEARL

ASSURANCE COMPANY LIMITED

Chairman: **G. R. L. TILLEY, M.A., F.C.I.S.**

Points from the Annual Report and Balance Sheet for the year ending 31st December, 1952.

POLICYHOLDERS' FUNDS £195,959,425 **GROSS INCOME £39,835,966**

INVESTMENTS

The Assets show an increase of £6,966,734. The valuation of the investments taking Stock Exchange securities at middle market prices showed a comfortable margin compared with the values shown in the Balance Sheet after taking into account the Investments Reserve Funds.

LIFE BRANCHES

In the two Life Branches the total sums assured on new policies issued amounted to £47,010,518 compared with £42,453,837 for 1951 and the total sums assured and bonuses in force (including the Capital Redemption Fund) amounted to nearly £469 million (an increase for the year of over £19 million).

FIRE AND ACCIDENT

In this Branch the premium income was £6,684,696.

REVERSIONARY BONUSES

ORDINARY BRANCH—A reversionary bonus of **£1 15s. 0d.** per **£100** sum assured on United Kingdom policies entitled to participate in full profits.

INDUSTRIAL BRANCH—A sum of **£1,607,135** has been allocated to provide bonuses and other benefits to policyholders in the Industrial Branch making a total allocation up to date of **£20,897,068.**

HOME SERVICE INSURANCE SERVES OVER TEN MILLION FAMILIES

Issued by the Industrial Life Offices

CP.31

Paper for everyone

Your daily newspaper is one of millions printed in a matter of hours. Such speed necessitates ultra-fast-drying inks and a uniform printing surface — not too porous, not too hard — a surface in fact which is super-calendered. In developing the high-speed manufacture of British super-calendered newsprint, the Reed mills have played a great part in establishing the high standards of printing and photographic reproduction of which Britain's newspapers are so justly proud. And in every other field of its activity — whether paper or packaging — the Reed Paper Group, by studying and solving the particular problems of its customers, makes better paper serve more people.

Pioneers in modern paper technology

7-inch play no longer than the standard 10 to 12 inch 78 rpm discs but, like the 33 rpm, are less fragile and are relatively free from surface hiss). In this second type of micro-groove record EMI is aiming directly at the juke box market. The Decca Record Company—whose export sales reached £1 million last year, a high proportion of which was earned in the United States—has already discovered that its sales of records are far higher when distributed by its own agency in the United States than when they were handled by the American Decca company as a second string to the sale of American recordings. British Decca's recordings are now sold in America by London Records, Inc., and in setting up Electric and Musical Industries (US) Limited, EMI is presumably following Decca's example in the expectation of repeating Decca's success.

D-Marks Rather than Dollars

ALTHOUGH the British Government is now looking with more favour on direct investment in Canada by British business organisations, it is still barring the way for personal investment there. Zealously guarding the gate, the Treasury has refused to provide dollars for subscriptions by British shareholders in Aluminum Ltd. to the recently announced "rights" issue by that company—even though the issue, of 818,657 shares at a price that will not exceed Canadian $37.50 a share, seems as attractive as any issue in the (possibly over-expanding) aluminium industry could reasonably be. But although the Treasury has locked the front gate, the Capital Issues Committee has shown these shareholders the gap in the hedge. In giving its consent to the flotation of the issue in London, the committee points out it will be possible for British shareholders "to take up their rights by selling certain foreign currency securities or blocked foreign currency funds, as in the case of the 1951 rights issue." In other words, shareholders can exercise their rights in a roundabout way by purchasing D-marks, which stand at a small premium to the dollars that can finally be purchased against them. Investors have long been aware of this circuitous route into Canadian investment, but it seems a little strange that a British government agency has so neatly signposted the way.

Gas in the Potteries

THE changeover from batch to continuous firing of pottery that has been taking place during the past 20 years constitutes a minor technical revolution in the industry, and one involving a radical switch from one type of fuel to another. Before the war, the potteries used about a million tons of coal a year. This has fallen to 400,000 tons. Meanwhile the consumption of gas has risen from 7.4 million cubic feet in 1932 to 4,760.6 million last year. Consumption of electricity has also risen, but gas is the industry's major fuel.

The reason for the change in fuels arises out of the difference in the two firing processes. The old beehive kiln was bricked up when the ware had been stacked in it and was coal-fired from outside. The fumes that would have contaminated the ware were for the most part drawn off by the roof of the kiln. This process of firing lasted for five days, allowing for the heating and the cooling of the kiln; drying processes carried out at lower temperatures by some sections of the industry took as long as 14 days. The change from batch firing by these methods to the use of continuously fired tunnel ovens through which the ware passes in 34 hours has speeded up production, but has also created technical problems for which it has taken some years to find a satisfactory solution. Since the ware is packed almost to the roof of the continuous tunnel, the fuel has to be exceptionally clean. Electricity, which is probably the best fuel in this respect, is generally too expensive; even with gas, extra oxygen has to be pumped into the tunnel to make certain that all carbon particles are completely burned.

The installation of continuous tunnels has brought with it a big increase in capacity. Some potteries have re-equipped on the basis of one tunnel for as many as eight beehive kilns put out of commission, and the wiser among them have installed several small tunnels rather than one large one. But over the industry as a whole, this increased capacity is not at present fully employed. When the Coronation souvenirs have all been made sections of the industry expect trade to slacken.

SHORTER NOTES

Supported by a record output of pig iron, steel production in March was at the rate of 351,300 ingot tons a week, the highest ever recorded in this month (though slightly lower than in February). In the first quarter of 1953, 4,552,000 tons of steel were produced, compared with 4,261,000 tons in the last quarter of 1952, and with 3,998,000 tons in the first quarter of last year.

★

Timber importers have welcomed the reduction of 5s. a standard in the contribution they make to the demurrage fund for timber cargoes arriving in this country from the Baltic. The rate has been cut to 2s. a standard, from the previous 7s. The average freight rate is at present about £8 5s. a standard for Baltic cargoes. The fund came into existence to operate as an insurance when congestion at ports brought about a risk of delays that might cost an importer up to £500 per shipload in demurrage. Improved shipping conditions at ports of late have reduced the time and risks of delays.

★

Through the British Institute of Management, the Harvard School of Business Administration is again offering management training for two junior executives from British industry, commencing this autumn. The course will last two years; the Harvard authorities will grant each student $1,200 a year to cover board and tuition providing that this sum is matched by the British employer.

Company Notes

BRITISH ALUMINIUM. The full accounts of British Aluminium for the year to December 31st tell an uninspiring story in a singularly uninspired way. Without any help from the directors, shareholders are left to draw their own conclusions from the very slight fall in trading profits (from £3,399,892 to £3,336,152) and a much bigger fall in net profits (which are shown after making appropriations to plant replacements reserves) from £861,834 to £678,984. In themselves these figures are sufficient to explain why the ordinary dividend has been left unchanged at 12 per cent, but shareholders in such an important concern as British Aluminium should certainly be given more background information about them. For example, the directors might reasonably have considered it their duty to explain in their report why the book value of stocks rose from £5,983,172 to £7,402,344 last year.

In the absence of any explanation, there are grounds for fearing that this increase may have reflected a piling up of stocks of unsold products in the company's factories and warehouses. The world supply of aluminium has recently been expanding rapidly, while British demand for it, particularly from the companies concerned with rearmament orders, may have slowed down. While the financial resources of British Aluminium are strong enough to tide the company over any period of slack in the industry that may now be emerging, shareholders should not cherish any high hopes of an early increase in dividend payments. At the current price of 41s. 6d. xd, the £1 ordinary shares yield 5.8 per cent.

★

BRITISH-AMERICAN TOBACCO. It is no mean feat of accounting skill to present the accounts of a world-wide net of trading subsidiaries in one consolidated report. The accountants of British-American Tobacco, who have to do this year in and year out, deserve praise for their compilation, but its readers, the shareholders, need to exercise care in examining it. They must, for example, always remember that exchange controls restrict the available profits that can be transferred from the accounts of subsidiary companies to the holding company. Apart

£1 ordinary stock at 110s. yields £5 7s. per cent.

*Transferred to replacement reserves. † Tax free.

from the use and complication of profit retentions by subsidiaries, the main interest in BAT's full report will be concentrated on the general stability of its profits and in the directors' decision to raise the tax-free ordinary dividend from 15 to 16¼ per cent. This decision was discussed in these columns on March 28th, and the full report now gives investors the chance to examine the changes in assets and liabilities that lay behind it, and also behind the recent decision to capitalise £11.9 million from reserves.

The report confirms that the decision to capitalise part of the reserves reflects a permanent growth in the group's strength. Last year's profit retentions helped to finance an increase of nearly £5.8 million in the net book value of fixed assets, and of about £16.4 million (to £159 million) in the book value of stocks; this increase in stocks is partly due to a rise in prices, particularly of leaf tobacco, but it also reflects an increase in physical volume. The directors describe the present level of stocks as being "more satisfactory in relation to the current trading position." Another happier portent for the future is the reduction in the appropriations to replacement reserves; as the directors point out, this is a sign that world-wide inflationary fires are being damped down.

★

SWAN HUNTER. The tone of Mr J. W. Elliott's address to shareholders of Swan Hunter is not a happy one for investors in the shipbuilding industry. Mr Elliott suggests that, as the adoption of welded in place of riveted structures becomes more general, Swan Hunter and other shipbuilding companies will be faced with heavy capital commitments; and although he declares that Swan Hunter is determined to go ahead with its reconstruction schemes, in order to keep up with its competitors, he does not believe that this will necessarily lead to higher profits. It can be inferred from his statement that Swan Hunter, for one, is more likely to finance this technological revolution by ploughing back profits rather than by raising new money on the capital market; the implication is therefore that shareholders can expect little in the way of bigger dividends in the next few years.

There are other reasons why the special jubilee dividend of 10 per cent for 1952, which has been added to the maintained ordinary dividend of 18 per cent, must be regarded as a non-recurring bonus. For one thing, the company needs to retain substantial profits in order to finance contracts on which long-term credits have been granted, and Mr Elliott suggests that the granting of these credits may well become of even greater importance in the future. Secondly, Mr Elliott reports that the flow of new orders slowed down last year; although the company's productive capacity should remain fully employed in the next three years or so while it cuts back the existing backlog of orders, the high costs of current construction and the recent reduction in shipping earnings make the longer term prospect look less bright than it was. Moreover even in the short run Swan Hunter faces some difficult problems. It does not yet seem able to secure all the steel that it needs. Last year the shortage of steel reduced the aggregate tonnage of ships launched from its shipyards and its trading profits fell from £3,001,942 to £2,709,966; Mr. Elliott suggests it will be some time before the adverse effects of the steel shortage will have worked themselves off in the shipbuilding industry. In these circumstances ordinary shareholders would be wise to base their yield calculations on an 18 per cent dividend; on this basis the £1 ordinary shares at the current price of 66s. 3d. xd yield 5.4 per cent.

Statistical Summary

EXCHEQUER RETURNS

For the eleven days ended April 11, 1953, total ordinary revenue was £132,006,000, against ordinary expenditure of £126,566,000 and issues to sinking funds £287,000. Thus, including sinking fund allocations of £287,000 the surplus accrued since April 1, 1953, was £5,152,000 compared with a deficit of £24,935,000 for the corresponding period of the previous financial year.

COMPANY MEETINGS

EQUITY & LAW LIFE ASSURANCE SOCIETY

A SUCCESSFUL TRIENNIUM

POSITION OF OUTSTANDING STRENGTH

SIR RICHARD HOPKINS'S SPEECH

The Annual General Meeting of Equity & Law Life Assurance Society was held on April 15th at the Chartered Auctioneers' and Estate Agents' Institute, 29, Lincoln's Inn Fields, London.

The Rt. Hon. Sir Richard Hopkins, PC, GCB, the Chairman, who presided, said: Ladies and Gentlemen, I rise to move—"That the report and accounts for the year ended December 31, 1952, be received and adopted and entered on the minutes." These have been in your hands for several days and I assume may be taken as read. (Agreed.)

LOSSES BY DEATH

During the past year death has robbed us of two friends. In September last occurred the death of Dr A. E. Gow, our Principal Medical Officer. A Society such as ours owes much to the guidance which it receives from its chief medical adviser. We recall with sincere gratitude all the wise help that we received from Dr Gow during his eleven years of office. More than that, our principal medical officer has many personal dealings with the staff, and Dr Gow was regarded with great affection by all in the Society's service who came in contact with him.

The death occurred in October last of Mr A. C. Thorne, who served the Society for nearly fifty years and who, during his career, served not only as chief official but also as a director. We mourn the loss of one who was well known to many of those who are and who have been connected with the Society.

We are delighted that Dr R. Bodley Scott, who for some years past was Dr Gow's deputy, has accepted the appointment of Principal Medical Officer. We count ourselves fortunate in having so eminent a physician as our principal medical adviser.

THE DIRECTORATE

The report in your hands alludes to the resignation of Mr Lewis G. Whyte from the board and from his post as investment adviser. Mr Whyte has for some time past wished to take up other work, and, though naturally we are sorry, he leaves us with our warmest good wishes for his future. The prosperity of the Society, on which I shall be commenting in a few minutes, owes much to the skill and prescience which Mr Whyte has brought to the conduct of our investment policy.

We have invited Mr I. J. Pitman, MP, to join us as a director, and I am happy to say that he has indicated his willingness to accept; we propose to elect him formally at our next Board Meeting.

Before dealing specifically with the accounts I should refer to the Centenary of our wholly owned subsidiary, The Law Reversionary Interest Society, Limited; this Society reached its hundredth anniversary on March 18, 1953, and continues to be a most useful channel of investment and a valuable connection with the legal profession.

HIGH RATE OF BONUS

As for the accounts, the results for the triennium were outstandingly successful, and the position of the Society at the end of the triennium was one of outstanding strength.

The bonus declared—44s. and upwards—should give great satisfaction to our With-Profit policyholders and to all who have supported the Society. I mention particularly that before arriving at the surplus we transferred £300,000 to contingencies reserve—making this reserve £400,000; this reserve is in addition to the strong reserves brought out by the actuarial valuation basis which we employ. We need make no excuse, however, for building up additional strength in days such as the present.

Last year I was able to tell you that the margin by which the market values of our assets exceeded the values at which they appeared in the balance sheet actually increased during 1951. It will not surprise you that this margin decreased during 1952, but it still exceeds comfortably the substantial margin which existed at the beginning of the triennium. I would also draw your attention to the trend in the gross rate of interest earned on the Society's funds; for the current year 5¼ per cent appears to be a reasonable expectation.

STRENGTH THE CARDINAL AIM

We have made the best estimate that we can of the current surplus earning capacity of the Society; it appears to us to be very satisfactory. We are declaring as interim bonus the same high rate of 44s. and upwards which we have allocated to policyholders for the past triennium. I would add one comment; in these days when life assurance funds are expanding rapidly it is vital that as they expand so should they maintain their strength; this is a cardinal aim of our policy.

On this occasion, reverting to our prewar custom, we are recommending the dividend in the form of a net payment. The income of the proprietors' fund is received mainly in the form of a net transfer from the life assurance fund, and only to a lesser extent in the form of gross interest. It appears to us that as the major contributing element to the proprietors' fund is in a net form, the dividend itself should be declared in this form.

SUBSTANTIALLY LARGER DIVIDEND

The dividend now recommended represents a substantial increase on the rate which we have recently been paying. The accumulated balance standing to the credit of the proprietors' fund at the end of the year was, as the accounts show, in excess of £117,000; this sum has been built up over a number of years and—bearing in mind the important fact that full reserves are made before any sum is transferred from the life fund—we now consider this balance to be ample.

We are thus recommending a dividend which, if continued for the second and third years of the current triennium, will result in the full distribution of the £105,773 transferred to the proprietors' fund at the beginning of the current year and also the interest expected to be earned on that fund in the current triennium. I do not propose to look further into the future regarding our rate of dividend, but your Directors felt that the foregoing words of explanation were necessary lest in ignorance anyone should deduce that comparable increases in dividend should be expected in future.

One final comment before I leave the report and accounts; during 1952 we placed Equity & Law Investment Trust, Limited, in voluntary liquidation; the Trust was formed in May, 1934, and we felt that, having served its purpose, it should be liquidated. Two results followed from this action—first, Bank Insurance Trust Corporation, Limited, now appears in the Society's own balance sheet; secondly, there was in the Trust a large revenue reserve which, passing through the Society's own accounts as revenue, created an interest "windfall"; we have shown in the report before you the gross rate of interest, ignoring this "windfall."

GROWTH OF FUNDS

During the triennium our funds increased by about £5 million; this increase is a measure of the personal savings which were absorbed by the Society. I have spoken before of the vital need of savings at this stage in our national affairs. It is essential that they be forthcoming. I borrow the concluding sentence of a recent leading article in *The Economist*:

> "And there is neither magic nor manipulation that will create capital out of nothing. Saving is thrift; it is consuming less; and it has to be done by people."

Therefore I address myself primarily to those agents who may be present and emphasise to them that in securing new business for the Society they are most directly helping our national well-being.

You will have seen that, in his Budget speech yesterday, the Chancellor stated that the reliefs which he proposed were designed—among other things—to encourage private saving.

We feel that the results now disclosed place our branch organisation and our agents in an excellent position to secure an ever increasing amount of With-Profit Life Assurance. For some years now these policies have offered outstanding value in life assurance and they continue to do so. We welcome here to-day members of our branch organisation, agents and With-Profit policyholders, and we hope that the results now disclosed will be a real source of satisfaction to them and help in securing further policies.

TRIBUTE TO MANAGEMENT AND STAFF

I have spoken already of the great services rendered by Mr Lewis Whyte as investment adviser—our thanks to him have been expressed on more than one occasion and I repeat them now. I think you all appreciate also the great and continuing debt which the Society owes to its General Manager and Actuary, Mr Kirton. If, in addition, an expression of thanks is offered to our staff generally from this chair every year, it is no less sincere on that account. We, your board, would say to you as shareholders that we are served by a most loyal and efficient staff. We thank them sincerely; results such as we have set before you today can only be achieved by good work at all levels.

The report and accounts were unanimously adopted.

CO-OPERATIVE INSURANCE SOCIETY, LIMITED

109 Corporation Street, Manchester 4

ORDINARY SECTION BONUS INCREASED

MR ANEURIN DAVIES REPORTS ON THE YEAR'S PROGRESS

Mr Aneurin Davies, chairman, at the eighty-fifth annual general meeting held on April 15, 1953, said:

This year it gives me the greatest pleasure to announce that largely as a result of our improved interest earnings, your directors have been able to increase the rate of reversionary bonus in the ordinary section by 4s. per cent from 28s. per cent to 32s. per cent.

INVESTMENT POLICY

As I have stated on previous occasions, our policy is to invest our funds to the best advantage of the policyholders who have entrusted us with their savings.

Our aim is to spread our investments over the widest possible range in order to secure the advantages of favourable and minimise the disadvantages of unfavourable influences.

HOUSE PURCHASE

The total amount outstanding under our house purchase mortgages at the year end totalled over £25 million, secured on nearly 40,000 properties; the average mortgage outstanding was £634, as against £616 at the end of 1951. Despite a fall in the value of house property during the period, the losses incurred under the scheme last year were negligible. However, with the increase in the number of houses which can be built for sale and the steady increase in the number of new houses available for letting, your directors decided early in 1952 to adopt a more cautious attitude, particularly as regards older types of houses which were in demand when the housing position was more acute but which are now losing their attraction to prospective houseowners.

Our scheme still offers attractive terms to purchasers of suitable properties and as there are considerable advantages to the right type of borrower in borrowing under the endowment mortgage scheme, we anticipate making rather more advances in 1953 than in 1952.

EXPENSES REDUCED

The constant attention of your board is devoted to the question of administrative costs. The rapid expansion of our business during the past few years has meant that many of our offices have become too small, with the result that new premises have had to be secured at a substantial increase in costs. Improved salary scales have also been granted, and replacements of office equipment have increased in price. It is very pleasing, therefore, to report that by keeping a close watch on the administration of the society we have been able to exercise an effective control on costs with the result that once again our overall expense and commission ratio has been reduced and the figure for 1952 (24.46 per cent) is the lowest we have ever recorded. Naturally, the expense of administration varies from one department of our business to another.

In the industrial life section the expense ratio for 1952 (including pension costs) was 28.50 per cent, as against 28.49 per cent for 1951, but here we may congratulate ourselves that we have limited the increase to so small a figure.

ENCOURAGEMENT OF THRIFT

Before passing to a review of the departmental accounts I would like to emphasise that your society performs an extremely useful and important function. It not only provides the means by which persons can protect themselves against the financial effects of most of the various misfortunes which may befall, but it is also one of the most effective organisations for the promotion of thrift in the country. Our ordinary and industrial life funds are, in effect, the savings of our life policyholders, and when I draw your attention to the fact that, contrary to the experience of other savings movements, there has been a regular increase in our policyholders' accumulated funds and that during 1952 the net increase was £9,250,000, you will appreciate the trust which our policyholders repose in us and the reliance which the public place upon life assurance as a form of saving.

There can be no doubt that it is absolutely essential for the well-being of this country that a substantial proportion of our national income should be saved. Owing to changed circumstances the bulk of the saving must now come largely from persons of moderate means, and that is why the CIS, through its close daily contact with the general public, is giving such valuable service not only to its policyholders but to the financial stability of the nation.

LIFE DEPARTMENT

Although as a result of a policy decision the completed sums assured in the ordinary section fell from £23,970,000 to £16,615,000, the new sums assured in the Industrial section increased from £39,443,000 to £41,447,000, so that the total new life business in 1952 was £58,062,000, as against £63,413,000 in 1951.

The ordinary section expense ratio has fallen from 13.68 per cent to 12.94 per cent whilst, as mentioned earlier, the industrial section ratio is practically unaltered.

MOTOR DEPARTMENT

INCREASED BUSINESS—SATISFACTORY SURPLUS

I am pleased to report that the premium income in this department has been increased by £187,679, and has now reached a total of £2,915,162.

Economy of management, prudent underwriting and the revision of premiums for commercial vehicles and motor cycles which applied in June, 1951, have combined to produce a surplus of £162,130, which, having regard to the difficulties which continue to beset the conduct of motor insurance, is a highly satisfactory result.

Very few offices with a large premium income have shown such consistently good results as the CIS over the past few years. You will realise that this is the more remarkable when I remind you that a large block of our private car policyholders continue to enjoy the benefit of premiums very considerably below current rates.

FIRE DEPARTMENT

RECORD SURPLUS

The 1952 results for the fire department were exceptionally favourable, and the gross surplus of £313,933 is the largest ever earned in this department.

The premium income, at £1,409,895, showed an increase of £73,700.

The number of claims paid during the year rose to 63,415, as against 62,550 in 1951, thus clearly demonstrating the need for fire insurance protection. A great many people refuse to take fire insurance cover because they cannot be persuaded that they are likely to suffer loss by fire. The fact that we paid so many claims last year—mostly to small householders—should convince them that fire insurance cover is a necessity.

ACCIDENT DEPARTMENT

The premium income in the personal accident account was £115,704, and the account showed a surplus of £36,154. In reviewing the accounts for 1951 I commented on the improvement in our claims experience in that year in the personal accident account, and it is, therefore, pleasant to report that the improvement has continued during 1952.

The general insurance account received a premium income of £1,198,373, which is £86,876 more than the corresponding figure for 1951. After making the usual allocations to reserves, there was a balance of £62,785, of which £36,000 has been transferred to profit and loss account, the remaining £26,785 being added to the additional reserve.

PROFIT AND LOSS ACCOUNT

After making adequate reserves for contingencies and taxation, the total amount to be distributed to policyholders in respect of our operations for the year 1952 is £2,850,000, of which nearly £2¼ million is due to our ordinary life and industrial life policyholders.

During the year we made 1,309,000 payments under all classes of policies.

This report sums up the results of the year's work of our staff of over 12,000 persons, of whom 7,350 are our full-time agents, all of whom collaborate to provide that personal service which our policyowners have grown to expect, and gives me the opportunity of expressing on behalf of the directors our appreciation of the loyal service which has been rendered by all grades of the staff during the past year.

The report and accounts were adopted.

BALLITO HOSIERY MILLS

POSITION OF GREAT FINANCIAL STRENGTH

SIR CYRIL ENTWISTLE'S SPEECH

The twenty-fourth annual general meeting of Ballito Hosiery Mills Limited was held on April 14th at St. Albans.

Sir Cyril F. Entwistle, QC, MC, LLB (the chairman), in the course of his speech, said:

As you are aware, the company has sustained a grievous loss in the death of Mr Charles Kotzin, its founder and managing director. I have been chairman of your company since its incorporation in 1929, and during the whole of this period my relations with Mr Kotzin have been of the most intimate and cordial character. He was a man of outstanding ability, with great foresight and breadth of outlook, and although a dominant personality, was much loved and admired by all who worked under him. He had been in very poor health for many years before his death, and consequently had had to delegate much of his executive functions to Mr J. R. Kellard and Mr F. V. Ault, who have now been appointed our joint managing directors. Mr J. R. Kellard joined the business in 1922 and has been on the board since 1933, Mr F. V. Ault came to Ballito in 1930 and has been a director since 1936. Mr Kellard is responsible for sales and distribution and Mr Ault for production. They work happily in harness, and without any hesitation I confidently assert that they are both admirably equipped in ability, experience and temperament to perform their responsible task.

RESULT OF YEAR'S OPERATIONS

The net profit for the year under review, before taxation, amounts to approximately £120,000, which I am sure in the circumstances you will regard as eminently satisfactory. It enables us, notwithstanding the increase in our ordinary share capital, to recommend to you the maintenance of the same rate of dividend (viz. 25 per cent, less income tax) as for the previous year and at the same time to transfer to general reserve the substantial sum of £25,000, making that reserve now £189,500. The profit shows a fall from the record figure of the previous year, but, as I indicated in my speech last year, there have been some reductions in gross profit margins, particularly in our exports.

Our continuously increasing productive capacity has enabled us to a substantial extent to offset this tendency, but we have been handicapped throughout the year by the limited supplies of nylon yarn available. Women undoubtedly prefer nylon to any other form of stocking, and the demand for our nylon stockings far exceeds our capacity to supply owing to the shortage of nylon yarn. This shortage we hope and understand will only prove a temporary state of affairs.

As you will see from the balance sheet, during the year we incurred a capital expenditure of £187,743 in addition to our fixed assets. Towards meeting the cost of this expenditure and our other capital commitments we issued a mortgage debenture for £100,000 and an additional 206,468 ordinary shares of 3s. each were issued for cash at a premium of 1s. 9d. per share.

The balance sheet of your company reveals a position of great financial strength. The current assets exceed the current liabilities by the sum of £232,689. The total of all our reserves amount to the figure of £381,496, which is equivalent to over 6s. per share of the issued ordinary share capital. Furthermore, according to valuations we have had made, the real value of our fixed assets exceeds their book value by a sum at least the equal of the last-mentioned figure.

PRODUCTION

A number of new fine-gauge American fully fashioned machines were installed last year, and still more are now in course of erection, but until the supply of nylon yarn increases maximum production cannot be achieved. Progress on our new factory extension at St. Albans has been delayed owing to the steel shortage, but the building will be completed in July this year, approximately twelve months behind schedule. We have now replaced about 75 per cent of our pre-war fully fashioned machinery and are hoping to replace the remaining 25 per cent within the next two years.

Wages are subject to a fluctuating bonus which is tied to a cost-of-living index figure, so increases or decreases are automatic. Increases this year amount to exactly 10 per cent, or approximately £30,000. Bearing in mind that net dividends amounted to only £30,900, it would appear that the employees have been extremely well looked after.

HOME TRADE

The increase in our exports has meant a slightly lower percentage of our production available for the home trade during the year. We are looking forward to a not too distant date when a sufficient supply of nylon yarn will enable us to change over entirely to nylon stocking production, and are indeed fortunate in that every machine we possess is ideally suited to the production of nylon stockings.

The de-control of the distribution of nylon yarn has been greatly publicised, and while it does not mean a plentiful supply of nylon yarn immediately, it is a distinct easing of the position, and we can look forward to greater supplies becoming available very much quicker than originally anticipated. In view of my remarks above on the subject of our machine capacity, we should be able to take immediate advantage of any increases in supplies.

EXPORTS

It is with pleasure that I am able to report our export trade improved considerably from the middle of the year, and our figures in 1952 were an improvement on 1951. This improved position of exports has been maintained during the first three months of 1953.

Our advertising is continuing on similar lines to previously, keeping our productions well before our customers, not only at home, but also abroad. The name Ballito is not only well to the fore throughout the markets where we trade, but is established and known as one of the best quality productions in this country.

With regard to the prospects for the current year, it is far too early for me to venture on any forecast. Trading conditions, particularly in the export markets, are far from easy, but our main trouble, as I have already stated, is the continued inability to obtain supplies of nylon yarn commensurate with our productive capacity. All I will say is that we are better equipped technically in every way than ever before, and no effort will be spared to produce a satisfactory result for the current year.

The report and dividend proposals were unanimously adopted.

NORTH BRITISH AND MERCANTILE INSURANCE

SUCCESSFUL YEAR'S OPERATIONS

The annual general meeting of the North British and Mercantile Insurance Company, Limited, will be held on May 7th in Edinburgh.

The following is an extract from the circulated statement of the chairman, the Rt Hon Lord Brand, CMG, DCL:

Fire Department: I am happy once again to present to you figures which reflect a successful year's operations, and these are the more satisfactory in that the progress achieved in the expansion of income owes little to inflationary tendencies.

Premiums at £16,046,997 show an increase of £467,756 compared with the 1951 figure of £15,579,241, whilst losses at £7,315,300 show an increase of £160,984 over the figure of £7,154,316 in the previous year. The profit is £1,312,496, 8.18 per cent, comparing with £1,308,530, 8.4 per cent, in the previous year.

Casualty Department: The premium income in 1952 again showed an appreciable advance on that for the previous year and the underwriting result has been satisfactory despite the continuance of certain unfavourable factors.

Our casualty business produced premiums in total amounting to £4,747,698, being £528,563 in excess of those for 1951 of £4,219,135. Losses were £2,391,869 against £2,159,376. After making the necessary provision for unexpired risks, the underwriting profit is £290,943, compared with £264,612, for 1951.

Marine Department: Premiums for the year 1952 amounted to £1,845,375 against £1,977,842 in 1951. We have transferred £221,914 from our marine fund to profit and loss account.

Life Department: The year 1952 produced a record amount of new life business, the total after deducting reassurances amounting to £13,713,864, against the previous year's figure of £10,446,886. One of the chief factors contributing to this result was the increase in group life assurance which totalled £4,575,180, compared with £2,506,664 in 1951.

The life revenue account now stands at over £36,500,000, an advance of approximately £700,000 on the 1951 total.

CONSOLIDATED PROFIT AND LOSS ACCOUNT

The results of our operations for the year are summarised in the consolidated profit and loss account. Interest on investments amounts, after deduction of income tax, to £864,023, compared with £807,884 in 1951. The fire, accident and marine accounts contribute a total of £1,825,353 against an amount of £1,770,385 in the previous year. In addition, there is a further share of profit from the life branch of £49,878.

United Kingdom taxes absorb £590,519 and overseas taxes charged to this account £200,517. A sum of £120,000 has been written off investments and we have made the usual transfers to the staff pension fund and the widows' pension fund.

On the ordinary share capital the directors are recommending the payment of a dividend of 10s. per share, less income tax.

We are left with a final balance of £14,253,230, representing the aggregate amount carried forward not only of the "North British" but also of its associated companies at home and overseas.

AERATED BREAD COMPANY

INCREASED TURNOVER OFFSET BY RISING COSTS

MR J. G. GIRDWOOD ON IMPRESSIVE FINANCIAL POSITION

The annual general meeting of the Aerated Bread Company, Limited, was held on April 10th in London.

Mr J. G. Girdwood, CBE, CA (chairman and managing director), presided, and in the course of his speech said:

The net profit of the parent company, at £238,155, is sufficient after payment of the preference dividend to maintain the ordinary dividend at 10 per cent, transfer £125,000 to reserve, and add £20,852 to the amount to be carried forward to 1953. £142,931 of our profit arises from the surplus on the realisation of certain fixed assets, the principal item here being the sale of one of our leasehold properties.

In the light of my remarks last year on the continuing rises in costs of every kind, some decrease in our operational profit was to be expected. The rapidity of the increases in costs with which our industry is faced makes it hard to be up to date for more than a very brief period, and shortly after our meeting last year we were confronted with fresh unforeseen increases. The most serious of these was the effect on the prices we had to pay for many of our most important items of consumables following the withdrawal of a large part of the food subsidies in the 1952-53 Budget. During the year increases in wages were granted to the workers in practically every section of the business, some trades obtaining more than one increase within the year. It is common knowledge that the cost of repairs to, and maintenance of, properties continues to rise, and our annual expenditure under this head is a very heavy item. You are all familiar with the increased prices we have to pay for the products of our nationalised industries, coal, gas and electricity, and the increased charges for transport and freight rates. And added to all these are the increased and increasing charges we have to bear for local rates. In 1952 the amount we had to pay for local rates was more than half as much again as the amount payable by way of dividend to the ordinary shareholders.

Naturally we endeavoured to recover some of the increased costs through increases reluctantly made to the prices charged for the goods we sell to our public. Such increases are made only under the stress of necessity and after full consideration of their potential effect on the volume of our trade, but you will appreciate that inevitably there is a time lag between the increased costs we have to meet and the increases in our prices to our customers.

Our turnover in our normal branch trading showed a substantial increase over the 12 months to December, 1951, but the benefit was more than counteracted by the increased costs and charges we had to meet.

In any comparison of 1952 with 1951 it should be borne in mind that 1951 was Festival of Britain year, and that the influx of visitors to London on this account was of considerable benefit to the business generally.

These are the causes for the decline in our operational profits in 1952. To overcome these causes every department and every activity of the business is being overhauled and strengthened. Every effort is being made to speed up work on our programme for the improvement and modernisation of our branches.

LIQUID POSITION

Including the suspense account, current assets exceed current liabilities by £361,583.

I think you will agree that the strength of the financial position disclosed in the balance sheet is impressive.

TAXATION v. DIVIDENDS

In the last seven years ordinary shareholders have received in all £503,986, while reserves and "carry-forward" have been increased by £574,270 out of revenue. In the same seven years we have paid £655,953 in respect of local rates—it seems inevitable from recent announcements that the burden of local rates will increase further and heavily as the real cost of our welfare State unfolds. This charge is one which has to be met irrespective of our earning capacity, and must be reflected sooner or later in our prices for our services.

In the seven years since 1946 we have provided out of profits no less a sum than £2,225,862 for Imperial taxation.

These two forms of taxation, Local and Imperial, have taken out of your business in these past seven years nearly six times as much as you, the owners of the business, have received in that same period.

THE OUTLOOK

In the first three months of the year now current our turnover has been well maintained, but profit margins have narrowed. This year, however, will be a memorable year in the annals and the history of our country, and in the atmosphere of rejoicing which will surround the Coronation of Her Majesty the Queen, the demands on the catering industry, particularly in London, will be great. We are assured of our full share of this increased activity. Our confidence in the long-term prospects of this company was never so high.

The report and accounts were adopted.

THE BRITISH VACUUM CLEANER AND ENGINEERING COMPANY

The forty-ninth ordinary general meeting of The British Vacuum Cleaner and Engineering Company, Limited, was held on April 15th at Leatherhead, Surrey.

In his speech to the shareholders the chairman, Mr J. J. Hambidge, reported continued growth in the industrial sections of the business, but referred to the difficult conditions in the domestic electric appliance section consequent on the combination of double purchase tax and consumer credit restrictions.

There had been a decline in profits against the high level of the previous year, reflecting the adverse conditions of the latter half of 1952 and the incidence of rising costs.

The financial position showed improvement, whilst fresh working capital had recently been made available by the negotiation of the sale of freehold property reflecting substantial capital profit.

Rising costs and the adverse trading conditions of the first six months, due to double purchase tax and hire purchase restrictions, would inevitably find reflection in the current year's results.

In his introductory remarks the chairman paid warm tribute to his predecessor, Mr H. C. Booth, who retired from the chair last year after serving as a director of the company which he established 50 years ago following his original invention of the vacuum cleaner.

The report and accounts were adopted.

IONIAN BANK, LIMITED

EARNING CAPACITY MAINTAINED

The one hundred and fourteenth annual general meeting of the Ionian Bank, Limited, was held on April 14th in London, Mr A. H. Reid, CBE, the chairman, presiding.

The following is an extract from his circulated statement:

The bank's figures for 1952 reflect the fall in world prices of commodities and the recession in trade since the post-Korean boom. Thus the total balance sheet figures stood at £16,232,568 on December 31, 1952, compared with £18,813,514 at the end of 1951. Most of this decrease is due to the smaller amount outstanding on December 31, 1952, in the liabilities of our customers for documentary credits, guarantees and other obligations, the total of which was £3,578,128, as against £5,244,683 on December 31, 1951.

Investments have increased during the year from £1,704,220 to £1,889,066, this being due almost entirely to an increase in other investments. This item includes a holding of short-term Egyptian Government bonds to which we subscribed at the end of the 1951-52 cotton season in common with other banks operating in Egypt. The total of our current, deposit and other accounts is rather lower at £11,619,056, compared with £12,617,253 on December 31, 1951, but the liquid position of the bank continues to be strong.

The earning capacity of the bank has been well maintained, and in the circumstances we feel justified in recommending the payment of an increased dividend.

PROGRESS IN GREECE

In Greece the national economy has had to adjust itself to a lower level of foreign financial aid. State expenditure was considerably reduced and credit had to be restricted, which naturally resulted in a slight decline in industrial production, for there is still a great shortage of capital in the country. The increase in bank deposits, which had been a satisfactory feature of the two preceding years, was checked and throughout the year funds were scarce, a proof of which has been a fall in the price of the gold sovereign in Greece. The authorities were, however, successful in preventing a further rise in the cost of living. Our Greek branches have benefited from the more stable conditions and have played their part in assisting the country's economy. The profits earned are made in drachmae, but, as in previous years, the Greek exchange control authorities have allowed us to remit only such amounts as could be shown to be required to meet specific liabilities incurred in this country on behalf of our Greek branches.

EGYPT AND CYPRUS

Since the recent political changes in Egypt, conditions in the cotton market have been more stable and more realistic. The price of Egyptian cotton now bears a closer relation to world prices than for several seasons past. This has put Egypt in a better position to find purchasers abroad. Unfortunately, there has been a steep decline in British imports of Egyptian cotton, which for the calendar year 1952 totalled only £10,033,000, as compared with £43,429,000 in 1951. This has naturally led to a shortage in Egypt's holdings of sterling, and to a sharp decrease of imports from this country. The quantity of cotton handled by our branches during the current season was in excess of that handled in the previous season. Our commercial banking business also has been well maintained, and results in Egypt have been satisfactory. In Cyprus our branches had on the whole a satisfactory year.

The report was adopted.

TELEGRAPH CONSTRUCTION & MAINTENANCE COMPANY, LIMITED

(Manufacturers of Cables, Metals and Plastics)

The eighty-ninth annual general meeting of the Telegraph Construction & Maintenance Company, Limited, was held on April 14th in London, The Rt Hon Lord Colgrain, chairman, presiding.

The following are extracts from his circulated statement for the year 1952:

The difficulties I referred to a year ago in connection with the supply of raw materials gradually eased, so that during the latter half of the year our machine capacity and manpower were worked to a maximum, with the result that production and turnover were considerably higher than in the previous year and the trading profit also increased.

The liquid position has been maintained on a sound basis consequent on the new issue successfully carried out during the summer, current assets exceeding current liabilities by £1,804,100, an improvement of £650,496 on the position a year ago.

The gross profit, after charging depreciation and research and development expenditure, amounts to £486,054. The net profit is £194,017, against £165,654 in 1951.

The directors' final dividend recommendation is 3¼ per cent on the new capital of £1,954,092. In view of the year's good results, the directors feel justified in also recommending a special cash bonus of 1 per cent rather than an increase in the ordinary dividend.

Our operations continue to expand throughout the Commonwealth, as well as with other countries.

The report and accounts were adopted.

SAPONG RUBBER

In his statement accompanying the annual accounts and the directors' report for 1952 of the Sapong Rubber Estates, Limited, the chairman, Mr W. Percy Pinckney, writes:

The primary concern of a company operating in North Borneo is the inadequate supply of labour. On Sapong Estate we found ourselves better off than previously, but we still have not enough tappers of the right quality. In our jungle reserve, 235 acres were cleared and 92 acres were planted; it is hoped to plant the balance, and perhaps a small further extension, in 1953.

The year's crop having been sold at prices averaging 2s. 3d. per lb. London landed terms, as against 3s. 6½d. per lb. for the previous year's crop, the net profit after tax, at £14,836, is little more than a quarter of the previous year's figure. The board recommends a dividend of 10 per cent.

The company has now received the whole of the grant from the Government of North Borneo for which it is eligible in respect of war damage suffered during the years 1942 to 1945. After provision is made for taxation on this grant, a balance of £5,225 remains available. From this sum and from the profit earned in 1952 the directors have transferred £10,000 to the reserve for replacement of planted areas. Sapong Estate is fortunate in having a large area of excellent land in reserve. After providing for this transfer and for the dividend recommended, the balance to be carried forward to the next year's account will be £11,874 against £8,113 brought in from the preceding year.

My colleague Mr Horner was in North Borneo recently and visited Sapong Estate. He was much pleased with all he saw, after inspecting all sections of the property.

SENIOR RESEARCH-PLANNER

CITY OF VANCOUVER (COMP. 0-150) Senior position as research analyst to take charge of basic economic and sociological surveys. Qualifications: High academic qualifications in economics with specialization in statistics, land economics and related subjects; considerable experience in financial and statistical studies in industry, business or social work, preferably including experience in City Planning. Salary: **$428 to $514** per month.

All applications should be submitted in detail to the

Personnel Director, Room 210, City Hall, 453 W. 12 Ave., Vancouver 10, B.C.,

within 3 weeks after date of publication.

SALES MANAGER. The appointment of Sales Manager in a prominent company of glass container manufacturers is now vacant, and applications are invited from men between the ages of 35 and 45 who feel they possess the requisite qualifications and experience to fill this important position satisfactorily. The main duties fall into two parts:—

(1) The control and organisation of an office staff dealing, among other things, with sales records and statistics, order routines and progressing, and invoicing.

(2) The control and organisation of the activities of the company's outside representatives.

In addition, the ability to co-operate with and gain the co-operation of other sections of the company, and the ability and presence for customer contact as occasion requires, will be essential qualifications. Knowledge of the industry is desirable, rather than essential, but applicants should be prepared to live and work in N.W. England. The salary to be paid and other amenities available will be in keeping with the importance of the work and the qualifications of the successful applicant. Letters should be addressed to Bdx F 781, Lee and Nightingale, Liverpool.

OPPORTUNITY for educated young man, preferably Graduate, to commence career with Insurance Brokers specialising in Credit Insurance and Credit facilities. This vacancy has been notified in accordance with the Notification of Vacancies Order, 1952.—Box 227.

BARRISTER (41), chambers trained, called July, 1952, after successful services career up to 1950, requires administrative or legal post with good long-term prospects. Public school and university background. Widely travelled Europe and East. Good linguist. Would serve abroad.—Box 233.

CITY OF BIRMINGHAM
ASSISTANT STATISTICIAN

Applications are invited for the appointment of Assistant Statistician in the Central Statistical Office of the Town Clerk's Department. Candidates should have a University Honours Degree in Science, Mathematics or Economics and should have had some experience of research involving the analysis and interpretation of mass data. Experience in Local Government Service, whilst not essential, will be an advantage. Salary Scale A.P.T. VIII (£760 x £25—£835). Post pensionable; medical examination.

Applications, giving age, where educated, details of degrees, diplomas, etc., particulars of previous occupations, including details of statistical training and experience, with names of three referees, to the Town Clerk, Room 30B, Council House, Birmingham, 1, not later than Saturday, April 25, 1953. Canvassing disqualifies.

SALZBURG SEMINAR IN AMERICAN STUDIES, SCHLOSS LEOPOLDSKRON, SALSBURG, AUSTRIA

Scholarships are offered for the following sessions:—

General Session, July 15th to August 23rd (Art, Literature, Music, Philosophy, Political Science and Psychology).

Economic Session: An Approach to the American Economy, August 30th to September 27th. Lectures and seminars at the post-graduate level. General age range, 23-35. Special attention given to those engaged in teaching, public life, or creative work, and to advanced students.

For further information and application forms, please write promptly to Salzburg Seminar, 55, Upper Brook Street, London, W.1. For the General Session, application forms must be returned by May 1st, and for the Economic Session by July 1st.

EAST AFRICAN INSTITUTE OF SOCIAL RESEARCH, MAKERERE COLLEGE, THE UNIVERSITY COLLEGE OF EAST AFRICA

Applications are invited for the appointment of Junior Research Fellow in Anthropology to undertake a field study.

Salary commencing at £600-£650 p.a. according to experience. Temporary cost of living allowance 30 per cent. of salary. 24-year contract, of which 2 years will be spent in Africa. Return passages paid. F.S.S.U.

Applications (six copies) with names of three referees and full details of qualifications and experience, should be sent to the Secretary, Inter-University Council for Higher Education in the Colonies, 1 Gordon Square, London, W.C.1, from whom further particulars may be obtained. Closing date April 25, 1953.

CANADIAN PACIFIC RAILWAY COMPANY—(Incorporated in Canada with Limited Liability)—ONTARIO & QUEBEC RAILWAY COMPANY—5 PER CENT. DEBENTURE STOCK—6 PER CENT. COMMON STOCK. In preparation for the payment of the half-yearly interest payable on June 1st next, the Debenture Stock Transfer Books will be closed on May 1st and will be re-opened on June 2nd. The half-yearly interest on the Common Stock will be paid on June 1st to holders of record on May 1st.—R. F. TREMAYNE, Deputy Secretary, 8 Waterloo Place, Pall Mall, London, S.W.1. April 13, 1953.

FEMALE Market Research Field Supervisor required by Aspro Limited. Qualifications necessary; single, age 20 to 35, University Graduate, practical supervisory experience essential, willing to travel about country.—Apply in writing, giving full particulars, to Personnel Officer, Aspro Limited, Trading Estate, Slough, Bucks.

LAKE DISTRICT.—Leathes Cottage, Borrowdale, Keswick. Comfortable guest house. 11 & C. all bedrooms. Central heating. On bus route. Centre for the high hills, near Derwentwater.

COST ACCOUNTANT.—Qualified man required as Assistant to Cost Accountant of a large factory south-east of Manchester. Must have first-class experience of accounting and standard costs. The person appointed will initially be engaged in the development and installation of a new scheme of standard costs, and will be expected and encouraged to make an effective contribution to this work. In their own interests, routine plodders need not apply. Please give fullest possible details of personal history, qualifications, experience, and an indication of the salary range expected. All letters will be acknowledged and treated in the strictest confidence.—Apply to Cost Accountant, marking envelopes "Private and confidential," Box 223.

"My—My" said the M.D.

"Yes sir, thanks to you" "Thanks to me?—don't be facetious, Smith." "No sir, sorry sir—but you see, sir, since you had the forethought to install Tan-Sad chairs throughout the office our typists are all still as fresh as a daisy at the end of the day, still full of youthful vigour and charm"—"All right Smith, there's no need to go into raptures—but—well I do see what you mean, old boy."

The kind of briefcase you NEVER see in the shops

It moves in exalted, exclusive circles . . . serves Ambassadors of State and Captains of Commerce . . . is easily recognised as the impeccable accompaniment to an immaculate appearance. You won't see many "UNICORNS" about, and never in the shops. For these fabulous briefcases are as rare as the skill of the craftsmen who make them to individual order.

Yet a "UNICORN," slim but capacious, and hand-finished in English hide, is a surprisingly reasonable buy, because you pay only workbench prices. Two interior foolscap compartments and zip-sealed section for overnight things. Capacious exterior zip pocket for newspapers, books, etc. English lever lock and fittings of solid brass. All leather handle. Press studs in the base for slimming. Size 17 in. x 11½ in. In golden tan, brown, or black; smooth polished hide, 9 guineas; selected hog-grained leather, £7 10s. Matching zip folio cases, size 16 in. x 10½ in., available separately at £2 5s. and £2 respectively. Post free and tax free in U.K. (In U.S.A., $27.50, $23.75, $8, and $7.25 respectively, carriage and insurance free—20% Customs duty payable in U.S.A.).

Obtainable only direct from the craftsmen who make them. Prompt despatch. Complete satisfaction guaranteed or purchase price refunded immediately.

FOR MEN WHO KNOW GOOD TOBACCOS

Do be comfortable at work

Some disgruntled genius has worked out that one spends a third of one's entire life in the office. There must be a moral there somewhere. But until somebody thinks of something better, let's say it is a suspiciously good advertisement for Peter Catesby and his staff. He'll get them to adapt furniture to meet your precise needs. He's your man if you want to spend a more comfortable third of your life.

After Eisenhower

IT has still to be shown whether the Moscow triumvirs understand the full import of President Eisenhower's reply to their recent gestures of goodwill. They will be mistaken if they treat the speech he made in Washington on April 17th as no more than a tough and public declaration of minimum terms for peaceful co-existence or a return to Rooseveltian rhetoric. In fact it contained some of both ingredients, as well as a number of other things calculated to satisfy different tastes. The crusading note was there for the militant Republicans; yet it was used not to threaten the Chinese or to cheer Chiang Kai-shek but to declare that Americans are ready to "dedicate our strength to serving the needs rather than the fears of the world." The idea of going beyond containment of Communism was there for Mr Dulles, but only in a restrained and quite general demand that the peoples of Eastern Europe should be free to choose their own forms of government and to associate with what peoples they wish. There was no surrender of the Democrats' plans for integrating Germany, divided or united, with Western Europe; only a hint that the Europe to be united should stretch up to the frontiers of Russia. For the free world of America's allies there was the insistence that the Communists must show "the fullest respect for its rights and interests." And for the mass of ordinary, peaceful folk there was offered the vision of "a golden age of freedom and peace."

Indeed, the President was speaking in a predicament that Malenkov should be as well placed as any man to understand: the position of trying to create out of a confused home situation and a dangerous foreign outlook a basis for national unity and personal leadership. It is to be hoped that each of these two new leaders of great nations understands that the other, like himself, is restricted by internal difficulties from doing just what he wants to in foreign policy. It is because the speech reveals the hopes and fears that make up the American attitude in the cold war that it is valuable. And it depends very much on the Russian reaction whether the Americans begin to think seriously (they have not done so yet) about the terms on which peaceful co-existence is acceptable or whether they apply the crusading spirit to "winning the cold war"—whatever that may mean.

This necessary ambiguity should be remembered before the President is criticised. Mr Churchill, under less pressure, could content himself with saying

> It seems to me that patience is needed rather than haste. In my opinion no one can measure the extent or purpose of the change which has become apparent in the Soviet mood, or even perhaps in their policy.

If the President had said no more than this, he would have been accused in the United States of lack of leadership and in Europe of fearing peace. As it is, he succeeded in combining hope with caution, shrewdness with enthusiasm and general terms with particular objectives.

Supposing that the Russians take time to make their views

clear, whether publicly or privately; supposing that the path towards negotiation shows itself to be steep and narrow; what do the western governments do meanwhile? Should they go on with their programmes and stick to their agenda? The answer is still Yes, more especially at a moment when the Atlantic Council is meeting in Paris for the first time since Stalin's death and President Eisenhower's inauguration. They cannot, indeed they should not, pretend that nothing has changed; in particular it is futile to urge that Nato's policy for the defence of Western Europe and the general rearmament effort in the West can be wholly unaffected by the Russian attitude and the western reaction to it. On the other hand, until there have come from Moscow the clearest signs not only of practical goodwill but of the present regime's power to make substantial concessions to the free world's demand for security—those "clear and specific acts" that the President asked for—talk of disarmament as just around the corner is foolish and harmful. Even if it comes to negotiation with Moscow and Peking on major issues, the days of bargaining may be among the tensest the world has known since 1945. If agreements are reached on paper, their execution will involve risks as well as difficulties. Mr Dulles is quite right when he says that the Atlantic Alliance must remain strong while peace is being organised.

★

But this does not mean that the Atlantic allies have yet found—or even sought—the right method of reaching and maintaining military strength. If they are thinking this week in Paris of a protracted rather than an intense effort of armament, then the methods of the past three years cannot be right for the next three. The fact is that neither the Americans nor the British really understand how to arm for a period of armed peace; and Lord Montgomery is right when he goes on insisting that the problems of national (and international) defence during cold war or armed peace need thinking out afresh. One wonders whether the fighting men and the scientists would not be compelled to do that thinking now if they had reason to believe that they would be offered a fixed and limited volume of resources for a period of years instead of fluctuating sums on an annual basis. There are reports that the Americans have come to see the immense advantages of such a method of financing the defence of their allies, and that they will ask Nato to examine it. If they do, they should be strongly supported, whatever national treasuries may have to say about practical and political difficulties.

It is not too much to say that no one knows how much cold war the Russians want to stop. It may be that they wish to stop it in areas where it is hurting, or threatening to hurt, them. They may wish to stop it altogether but find it not easy to call to heel the dogs of war they have unleashed—for instance in Asia. Nor is it known how long it would take to carry out agreements involving enormous movements of troops and supplies. It is a reasonable calculation, therefore, that to modify the cold war will bring at first nothing better than an armed peace, and that the vision of a world dedicated to social and economic improvement is one to be treated with caution and patience.

Those, therefore, who are talking already of the economic revolution that might follow the lessening of tension—among them, surprisingly, Mr Butler—should choose their words carefully. For if little is known about the right way to conduct defence in a long period of armed peace, even less is known about the right way to conduct economic policy in such a situation. And it is the balance between military and economic risks that it is Nato's special task to weigh.

Policy for Africa

DR MALAN's victory in the South African general election will have widespread repercussions outside the Union. It will affect alignments in the United Nations and cannot be expected to leave the atmosphere of Commonwealth relations unchanged. But its immediate impact will be upon Africa and consequently upon Britain as the colonial power dedicated to the development of self-governing institutions in Africa and, therefore, at grips with rising African nationalism.

Political actions in any one part of Africa—or at least of British Africa—now affect the rest. There is no African International, but African leaders everywhere react to news with increasing quickness, intelligence and political maturity. The very smallness of the African educated elite gives it disconcerting influence over a gullible but education-hungry majority. The pace of African political development has quickened to a degree which greatly complicates the carrying out of British policy, and magnifies every development on a continental scale.

The pre-eminent example of this, apart from the worsening of race relations in South Africa itself, is the rapid advance of the Gold Coast towards self-government and Dominion status. In West Africa it has fired Nigerian politicians with a nationalist precipitancy which threatens to wreck the country's federal structure. In Central Africa, the mere prospect of "a Gold Coast solution" helped to inform and and turn African opinion in Northern Rhodesia and Nyasaland against the more moderate alternative of federation, and to convert the Southern Rhodesian settlers to it. In East Africa, the reaction of the white settlers to the

speed with which self-government for the Gold Coast is being hurried on has been to harden their distrust of the Colonial Office; in the south, it has further convinced the Afrikaners that British policy is second only to Communism in danger to the future of "white civilisation in Africa." The West Africans react in turn from the plan of federation in Central Africa and from Dr Malan's triumph by stepping up their campaign for rapid Africanisation of their administration and by serving notice to quit on the white agents of a protean white imperialism. The Mau Mau outbreak, though confined to a single tribe in Kenya, has had a comparable effect—increasing the groundswell of African resentment in West and Southern Africa, and hardening the feeling among the white settlers of East, Central and South Africa against British liberal policies.

★

As the cleavage between "Black Africa" and "White Africa" deepens, British policy begins to appear so inconsistent as to seem merely opportunist; a policy made by events rather than shaping them. In West Africa, the African is accounted capable of the highest offices, political, judicial, administrative. In Central Africa, such promotion is inconceivable. There, as in Kenya, nominated Africans represent their people as a small minority in the Legislative Council and are socially kept outside the pale; but Tanganyika is treated as ripe for a constitution in which each race, European, African and Asian, has equal representation. Moreover, Uganda is developing visibly towards "a Gold Coast solution," while the Sudan, which has a common frontier with Kenya, is to be hurried not only into self-government and Sudanisation, but even into political independence, outside the British Commonwealth, possibly within the year. African opinion is overruled in the making of the federation of the Rhodesias and Nyasaland—but is held to constitute an indefinite veto on the transfer of the Bechuanaland, Swaziland and Basutoland protectorates to an impatient South Africa. But no bones are made about handing the Southern Sudanese over to the control of the descendants of those who formerly oppressed them.

Put in these terms, British policies in Africa hardly make up an impressive picture. But under this patchwork there is—or at least until recently there was—a perfectly consistent central design. If less clear-cut than French or Belgian policy in Africa, it was none the less definite; it was, in fact, the same liberal Commonwealth policy that found expression first in the growth of the self-governing Dominions and later in the peaceful transfer of power to succession governments in India, Pakistan and Ceylon. Britain's policy for Africa was education for nationhood and self-government—self-government of a kind which presupposed representative institutions, a British system of justice, and fair treatment of minorities. But it was, and indeed is, a policy which involved different rates of advance according to the circumstances—racial, political, economic, social—of each territory. The engrafting of organs of local self-government began in British Africa in the nineteenth century—in the Cape and in Sierra Leone. Progress has been steady if at times slow; it has had to keep in step with the growth of the local community. Thus it was inevitable that the Gold Coast's political development, in view of the growth of its middle class, made prosperous by cocoa, should overtake Sierra Leone and outstrip Nigeria; and it was inevitable that in East Africa self-governing institutions should be overshadowed by the white settlers, who developed those countries and largely created their wealth. It was always clear that in these territories African social evolution would take some time to catch up with European—a contingency far enough ahead to make it unnecessary to examine closely its ultimate implications.

The record is one in which the British people can justly feel pride and from which they can still draw inspiration for the future. Quite specifically the British liberal can feel gratified by the transformation that his ideas have wrought, within half a century, in what used to be called the dark continent. But the time is coming to wonder whether the same basic, and basically simple, formula of western liberalism can continue to be applied to the whole of Africa. There are two groups of territories with a difference between them, and year by year the difference is becoming more fundamental. There are, on the one hand, the territories where the white man is no more than a temporary sojourner who, when his service is performed or his business done, will go home. These are the West African territories, Uganda, the Sudan and (still largely) Tanganyika. On the other hand, there are the areas where other races, from Asia as well as from Europe, have settled and show no signs of going home—Kenya, Rhodesia and the Union itself. In the first group, the all-black territories, nothing has happened to shake the basic premises of British policy. There is room for plenty of difference in the tactics of its application—differences of local circumstance and differences of opinion about the pace of change that can be made to work. But there is no reasonable doubt about the objective, which is to build self-reliant and self-governing societies.

★

But in the second group, it is impossible not to feel that something is going wrong with the policy that the liberalism of the Colonial Office has set: the policy of working towards a state in which all educated men, of whatever race or colour, shall have equality of political

SPRING BOOKS, 1953

Page 261

and economic rights. The doubts do not relate to the moral rightness of the policy but to its practicability and they turn on the question of timing. It is not just that the timetable has been speeded up; the trouble is that there needs to be a timetable. There may be fewer educated Africans in East or Central Africa than in West Africa, but man for man they are no less capable and their numbers are growing every year. They will soon demand to know how long they are to wait. And is the longest time that they can be made to wait anything like the shortest time that it will take the white settlers to adjust themselves to the idea of black legislators, black ministers—and eventually black voters in a majority?

This question is not asked with any suggestion that it is unanswerable. But it is the question that both parties in this country, and people of British stock in East and Central Africa, should face while there is yet time. It would be wrong to presuppose that disaster must supervene in West Africa or that partnership must shrivel to mere hypocrisy in Central Africa. It is profoundly in the interest of West Africans to make a success of self-government, and to show that the "Gold Coast solution" will not, as many Afrikaner observers aver, merely produce so many Liberias of prewar vintage. It is no less in the interest of a Central African dominion to find a solution as satisfying for different circumstances and historical evolution as the Gold Coast one on the west coast.

Yet the problem of the indigenous white minority in a black territory remains a profoundly difficult one. Perhaps it cannot be solved by the application of any formulae evolved in the far less complex setting of Western Europe and North America. Certainly it will not be solved if it is allowed to become the plaything of attitudes struck for domestic consumption by politicians safe in the certainties of an all-white homeland. It does no service to West Africa to look at development there through rose-tinted spectacles—to assume easily, for example, that even the Gold Coast can now produce, or will for a long time produce, sufficient men with the training and character wholly to man the public services, technical or administrative. Equally, it brings the solution in East or Central Africa no nearer to overlook the fact that the mainspring of these territories' economies and past progress has been the dynamism of the settlers, and so it will remain for decades. But the fact remains that the settlers' powers, privileges and future are what Britain makes them; the presence of British troops in Kenya is an earnest of the extent to which Britain underwrites present white leadership. The problem cannot be solved without the settlers' cooperation; but unless people start to think about it here at home in Britain, it will in the end be solved either by connivance in Dr Malan's methods, or by the savagery of which Mau Mau has given a foretaste—and in neither case by the principles of enlightened western liberalism.

Budgetary Risks and Incentives

THE discussion of the Budget, both in and out of Parliament, has during the past ten days been concentrated to a remarkable extent on only two main issues. First, is Mr Butler taking too big a risk with his tax reliefs? Will he be able to cover a large part of the Government's capital expenditure by borrowing instead of by taxation—by borrowing, that is, from genuine savings? Or will the attempt to borrow in fact involve creating additional bank credit, and therefore lead on to a revival of inflation, a new pulling of resources away from export production, and hence trouble once again with the balance of payments? This is the economists' question, raised in outside discussion rather than in Parliament. The politicians on both sides are readier to agree with the Chancellor that the economy can afford, and indeed requires, the stimulus of tax reliefs without corresponding cuts in government spending. The four days' debate in Parliament was therefore concerned chiefly with the second issue. Given that the shape of the Budget is about right—given that tax reductions costing £169 million this year leave the Chancellor with enough revenue—are the particular reliefs he has chosen those that give the right kind of stimulus?

Mr Butler, as a politician, was content to dismiss his critics outside Parliament very briefly. In his winding-up speech on Monday he said that last year he was accused in the same way of presenting too soft a Budget, but the critics were proved to be wrong and his hunch was justified; if he had budgeted for a bigger surplus, there would have been a million unemployed. Last year he was right to think that demand should not be depressed, and he therefore this year trusted his own judgment that it needs some encouragement.

This argument hardly matches in seriousness the weight of the criticism. If the Chancellor was right last year, it was certainly in part for reasons that neither he nor anyone else foresaw; he had a liberal share of good luck. That is no very sound basis for confidence in this year's guess. The real argument for Mr Butler's policy—and it is a very powerful argument—is quite different. It rests not on confidence in one hunch against another but on the fact that neither he nor anyone else really can have a hunch at all; there never was a time when the economic weather of the next twelve months was harder to forecast. This is the prevailing feeling not only among the administrators and economists but also in the board room and the market place. And, precisely because there are so many uncertainties, there is a real danger that business decisions will err on the side of caution at a time when the output of British industry

undoubtedly could be increased. It is reasonable to argue that if industry is not to neglect the opportunities of expansion open to it, the Chancellor should give some concrete sign that its markets will not contract.

Mr Butler was less than fair to himself in confusing this point with the argument that a harder Budget would create unemployment. That is as misleading as the current talk about the "slack" in the economy that must be taken up. If slack means unemployment, there is certainly no more of it than there has to be if any transfer of resources to exports and productive investment is to be achieved. What is true is that there is low productivity; there is under-production from the resources that are employed. The case for giving a stimulus rests not on the present state of employment, nor on its unforeseeable state later in the year, but on the belief that productivity can be improved provided only that industry does not fall into pessimism. Mr Butler's stimulus by tax relief is not an exercise in national income accounting—in reckoning how much money consumers need in order to provide full employment; it is an exercise in psychology. It expresses a belief that if the Chancellor is optimistic and encourages industry to be optimistic, production will rise and the optimistic assumptions of the Budget will thereby be justified.

★

This appears to be the specific doctrine behind Mr Butler's phrases about a "new look" in fiscal policy. The doctrine has so attractively expansionist a flavour that no one but a political opponent could wish to crab it. Nevertheless, it does leave the outside critics with a powerful case; by its very nature, Mr Butler's policy is risky. If it were not, would he confine his stimulus to £169 million of tax relief—to 4 per cent of the expected yield of taxation this year? If production does not in fact respond to this small lifting of burdens, an inflationary pressure of demand on available supply may well revive. Last year's great increase in private saving reflected, after all, merely an initial reaction to an unfamiliar situation; this was the first time for many years that it had been unnecessary to finance stocks at rising prices. Internally, there is no certainty that savings will remain at this new level. Externally, it is far from clear that disinflationary pressure in the rest of the world—if it should materialise—is going to justify an attempt to keep up demand at home. For this country to go on inflating, however gently, while demand abroad receded, would be a short cut to deficit in overseas payments and disaster for the gold and dollar reserve.

All this does not mean that the Chancellor should have shunned the risk he is taking. When the outlook is in any event so uncertain, he is right to take the risk, but he is right only on two conditions. The first is that he should be very conscious of the possible need to change course quickly, to tighten up his fiscal or monetary policy at the first sign that an excessive home demand is again straining the British economy. He cannot go out walking with a gay confidence that it will be fine today because, as he thought and the professional prophets did not, it was fine yesterday; on the contrary, he should be on the lookout for clouds and (unlike Dr Dalton; either in reality or in metaphor) keep an umbrella close at hand.

The other requirement on which the justification of Mr Butler's policy depends is less simple. Since the margin for tax reliefs is in any event small, the risk should be taken only if the reliefs can be made closely to serve their purpose of expanding production. Are the measures that Mr Butler has chosen those that will provide a direct stimulus to industry, and stimulate it in the right directions? This is the second main issue of the Budget debate, the issue with which Parliament chiefly concerned itself. The Opposition, naturally, approached it from two angles: it asked not only whether the reliefs were adequately expansionist, but also whether they were sufficiently fair.

Fairness in the Labour mind is almost identified with egalitarianism, and a reduction in the standard rate of income tax is plainly not egalitarian. Of the total reduction in tax liabilities, 23 per cent is enjoyed by a mere 270,000 people with incomes of £2,000 and over, while the remaining 77 per cent is shared among 15,170,000 taxpayers—56 times as many. But the main significance of this comparison is that it reflects how high a rate of tax is paid by the rich. The effect of the Budget is that people with incomes of £20,000 and over will pay 2½ per cent less tax on the average; taxpayers with under £500 a year will have their tax bills reduced by 15½ per cent. Only the most extreme egalitarian can complain much about this. Certainly public opinion shows no sign of complaint. There is no one so poor that he does not gain a little from the reductions in purchase tax, and when no one is being hurt for someone else's benefit, the fact that a very few very rich people are being saved large sums in tax is too obviously unimportant for indignation. Certainly the serious Labour case, as it was put by Mr Gaitskell and his more able colleagues, passed on quickly from the argument of equity as such to the practical argument that more relief for the poor would be more effective in encouraging production.

★

In principle, the Conservative reply on this point is clear and convincing. The extra activity that it is most important to stimulate—the thing that should take up the slack in the economy if there is any slack—is investment that will raise the productivity and increase the general efficiency of the major industries, and particularly of the export industries. The Chancellor's fine words were rightly addressed to this aim. But the actual measures fall considerably short of it. This year, industry is relieved of £45 million in income tax when its bill for the excess profits levy will increase by more than twice as much. Unless gross profits rise consider-

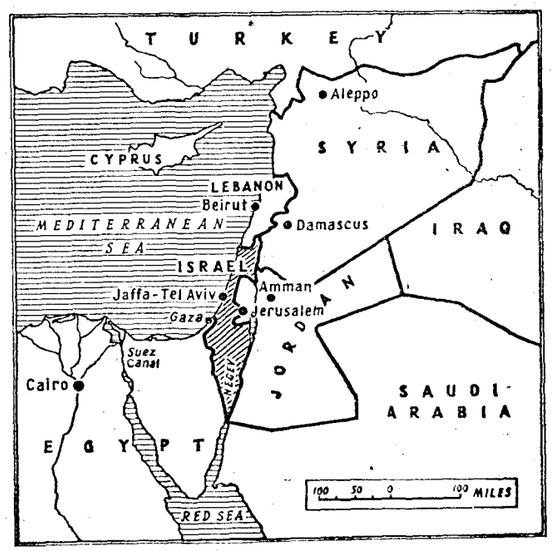
ably, the Exchequer will in fact leave companies with less, not more, resources to finance investment this year. It will be more than twelve months before Mr Butler's major reliefs to industry—the promised withdrawal of the excess profits levy and the restoration of initial allowances—have a large direct impact on industrial finances. The real stimulus to investment is a promise for the future, not a fact for the present.

Immediately, Mr Butler's stimulus to industry is simply the increased consumer demand that will flow from the cuts in purchase tax and personal income tax. Because there is scope for increasing productivity, and therefore no need to draw extra men into work for the home market, this extra demand may well do no harm. But it will do good—it will stimulate investment in the export industries—only to the extent that a more optimistic mood is contagious. And whether it is contagious depends primarily on world circumstances far beyond Mr Butler's control or anyone's foreseeing.

This, on reflection, appears as more than ever the main doubt about the Budget. It is whether the Chancellor's measures match his intentions, whether the stimulus he is providing will operate at the points that are decisive for the strength of the British economy. It is possible only to hope that—if the overseas demand for British goods keeps up—the political limitations within which the Chancellor has felt compelled to work do not prove to be too stultifying of his economic design.

Neither Milk Nor Honey

THE Jewish calendar proudly reckons its 5713 years and in Jewish history decades are as nothing. Nevertheless, when Israel this week celebrated the fifth anniversary of its statehood, it had every right to consider the past five years as exceptional, both for endurance and achievement. In these years 700,000 immigrants have been brought to their promised land, and there are now over one and a half million Jews gathered on this narrow strip between the desert and the sea. Over these last five years Israel's military strength has tripled and large areas of wasteland are being tilled for the first time in a millennium. Out of a chaos of terrible memories, out of refugee ships and frontier camps, a state is being welded, and it has withstood adversities under which nations far more solidly established might have foundered. But together with the legitimate sense of pride which animated Mr Ben-Gurion's Independence Day broadcast, there is a sense of deep anxiety. The people of Israel (and this very phrase has a biblical ring) are perfectly aware that their survival as a nation with economic and political independence hangs in the balance.



Israel's difficulties make an economist's nightmare. In order to survive and feed its continually growing population it has had to try and build productive industries as rapidly as possible. This has increased the strain on the balance of international payments and it has also created purchasing power in a field of employment that is unproductive of consumer goods. As a result, Israel exists on the very edge of uncontrollable inflation. Although there is some improvement over April, 1951, when eggs cost 2s. apiece and coffee 24s. a pound, the situation remains extremely critical. Over the past four years the trade deficit has amounted to £1,400 million, and with every 100,000 new immigrants £1,100,000 a year is added to the nation's import bill. Israel's exports have been declining steadily owing to their uncompetitive prices and the latter, in turn, arise of necessity where eighty per cent of factories employ less than ten workers each and where the trade union organisations play a dominant and often shortsighted and restrictive role. The cost of living has risen by nearly sixty per cent during 1952 and home purchasing power has correspondingly declined. In a state where socialism was to be the reality of today rather than the dream of tomorrow, rationing now goes by the purse.

Agriculture is also going through a difficult period, and the government's decision to reorganise it completely along co-operative lines has caused a sharp decline in immediate efficiency. Too much, moreover, has been spent on agricultural machinery, much of which is being swiftly worn out by inexperienced handling, rather than on irrigation, and the recent drought in the Negev is assuming disastrous proportions. The government clearly recognises that Israel must grow more of its own food if it is to survive, and every effort is being made to move the population from the overcrowded cities on to the land: in the last eight months alone, 2,000 families have been transferred, and by 1955 Israel hopes to grow enough food to support two million inhabitants in everything except bread grains and meat.

★

This general economic situation has resulted in the fact that most factories now work under capacity and that fourteen per cent of industrial workers are unemployed. In a land where existence is to be synonymous with a new life, unemployment is doubly tragic. Despite the devaluation of the currency in February, 1952, the inauguration of a more selective immigration policy, and a shift away from the over-ambitious socialism of Israel's first years, the government still faces a financial situation which is nearly desperate. At the end of 1952, export earnings covered only eleven per cent of imports. There is not enough foreign currency available to import capital goods, and production in Israel itself is continually stalled by a shortage of supplies and raw materials. Israel has kept its head above water by expedients ranging from borrowing to begging; since its foundation in mid-1948, it has received $293 million in official aid from the United States and about $186 million in the form of released sterling, aid from other governments and the unceasing private efforts of Jews throughout the world. At present, however, Israel realises more and more that economic salvation must come from within itself. At the end of last month foreign exchange rates were further modified, which, in some cases, means a sixty per cent devaluation of the Israeli £ in terms of the dollar. The Knesset has voted a compulsory loan of £1.45 million to be extracted from property owners, and defence expenditure will be cut from £1.45 million to about £1.42 million. Above all, efforts will be made to rally the trade unions to a more realistic view and to halt the continuous spiralling in wages.

In all this dark picture, there is a ray of hope in the form of the German reparations which were ratified by the Bundestag in February. They will amount to some $820.4 million and payment is to extend over the next twelve years. One-fifth of Israel's imports will be in the form of reparations and a plan is ready for investing some $615 million of the German payments in railways, road transport, telecommunications and irrigation. But even in its penitential guise, the German dragon has a perilous sting in its tail: German consumer goods, imported as reparations, can easily undermine Israeli prices and this help, bestowed in memory of the dead, may bring further unemployment to the living. The obvious answer to this is that the labour force now occupied in Israel's highly protected and inefficient consumer goods industries should be moved into more necessary tasks. But to many of the immigrants, particularly among the elderly, neither the toils of a frontier agriculture nor heavy industry offer an inviting prospect.

When considering the grave difficulties of the future, Mr Ben-Gurion has to look not only at the economic plight within Israel, but also at the ring of enemies which surround its frontiers. He may have thought of the words of another ruler in Israel who found himself in a similar situation many thousands of years ago: "Mine enemies would daily swallow me up: for they be many that fight against me." The Arab nations have by no means forgotten the defeat they suffered in 1948-49 and, although General Neguib himself may take a more mature view of the situation, his Arab colleagues continue their sabre-rattling and nurse dreams of vengeance.

So deep do passions run in the Middle East that it is idle to look for a quick solution of Israel's problems. It may be, however, that the outside world could give some help. If one thing is clear it is that the indefinite continuance of bitter tension and heavy armament expenditures will be ruinous to Israel, to the Arab states and the foreign policy of the western powers. The United States and Britain have already jointly stated that they will not tolerate another Arab-Jewish war; they might say it again, in such a way as to carry the conviction that they mean it. They might also reflect that their present policy of supplying arms to both parties is a dangerously negative form of demonstrating their impartiality. The Jews, of course, would like an open declaration of partiality, in the form of pressure brought to bear by Washington and London on the Arab states to abandon their hopes of revenge and accept the armistice settlement as permanent. But this is not practical politics—if relations between London and Tel Aviv are better than they were, so are relations between Washington and Cairo—nor would it be right. If the western powers are to go over from their present negative indifference to one of positive conciliation, quite substantial concessions will be needed from Israel. In the first place, the new state will have to show that it has outgrown the terrorism and violence in which it was born. It will have to rid itself of the political temper that results in the planting of bombs in legations or in attempts to cripple the hand of a Heifetz because he had performed music by Strauss. And secondly, there will have to be a recognition from Tel Aviv of the injustice that was done to the Arabs of Palestine in the process of doing justice to Jewish aspirations, and a willingness to make some reparation.

This is a great deal to ask of a fiercely proud new nation. But not too much. In its first five years, Israel has conquered its enemies and gone far to conquer the harsh realities of the desert. If in its second five years it can show itself master of its own passions, then the way will open up to the realisation of that dream of a prosperous and progressive homeland with which so many generations in so many lands have buoyed themselves up amid their tribulations. To the Jewish people endurance and survival are not a mere goal: they are a habit.

Notes of the Week

The Gap Continued

THE indignation aroused in this country by the Chief Joseph affair (on which our Washington correspondent comments on a later page) is only natural and perfectly justified. After all the preachments that have been addressed in this direction since the war, the spectacle of the American Cabinet trying to find some dodge to avoid accepting the lowest bid is very well calculated to stir resentment. But indignation by itself serves little purpose ; what is far more important is to draw the consequences for policy.

The essential moral to draw is that forecasts of the probable future course of American commercial policy should not be based on the speeches of private persons, however eminent, or on the resolutions of Chambers of Commerce, or on the reports of Committees even if officially appointed, nor yet on the generalised opinions of members of the Administration, but on the views of the majority of Congress. And as the practical men in Washington know, the problem of 1953 (and probably of 1954 also) is not to make progress in reducing the barriers round the American market, but to prevent any serious back-sliding. When Senator Taft was asked what he thought of Mr Butler's slogan "trade not aid," he said he agreed with the second half ; there is no reason to suppose he was trying to be funny.

★

In laying out any course of policy for Britain, and quite particularly for the pound sterling, the essential thing to know is whether there is a good realistic hope that the dollar gap can be closed before too long and without too much restriction. If it is reasonably possible to look forward to a time when the supply of dollars in the exchange markets of the world will be roughly equal to the demand for them, then it is also reasonable to make promises of convertibility, of removing exchange restrictions and of abandoning discriminations against American goods. But if there is always going to be a dollar gap, then to promise any of these things —and even more to promise all of them together—is to run into certain trouble. And it is no sort of answer to say that an inconvertible, restricted, discriminating world will be a very unpleasant one.

The view that has been consistently held by this journal for at least a decade is that the dollar shortage is—unfortunately but inescapably—likely to be a permanency. That conviction has led us to oppose, in turn, the Bretton Woods agreements, the conditions attached to the dollar loan of 1946 and—more recently—the plan to make the pound sterling convertible—not because any of these things were in any way undesirable, but because they were unattainable. The more optimistic views held by others have always seemed to us to be based (among other things) on illusions about what is likely to be practical politics in Washington. If the Chief Joseph affair, and the other straws in a protectionist wind that are clearly visible in Washington (some of them are mentioned in a Business Note on page 242) help to dispel these illusions, they will serve some purpose.

The Opposition's Case

MR BUTLER'S second Budget has brought further political success not only to himself but also to his chief opponent, Mr Gaitskell. A Budget devoted solely to relieving taxation, and therefore by definition "popular," left the Labour party facing an apparently unscaleable wall. Mr Gaitskell earned his followers' gratitude by pointing a way up and even hacking out some footholds. They are beginning to realise that the "fair shares" slogan has a very limited appeal when it comes to handing out concessions. Few people object to selective reliefs provided that there are no selective penalties on other sections of the community. Protests about a "Budget for the rich" will doubtless gain credence among the Labour party's most faithful adherents, but for general consumption they are weak. Mr Gaitskell gave his side a positive case by focusing discussion on the most doubtful point in Mr Butler's position—the real effectiveness of his intended prod to production.

Mr Gaitskell's judgment was vindicated by the fact that the only audible doubts from Conservative members have nearly all been essentially on the same point. Argument by prophecy is, of course, dangerous. If Mr Butler's hopes of higher output are fulfilled, the Labour party will look a little silly. But for the present it is grateful to be given a case of some sort, and at least Mr Gaitskell has his side well placed to profit from any economic disappointments.

The Opposition presumably intended that Mr Bevan's winding-up speech should provide emotional contrast to the cooler arguments of Mr Gaitskell and others. But over the weekend Mr Churchill intervened from Glasgow with his carefully worded remarks about election prospects. In effect he said no more than that the Government does not propose an early election unless the Opposition makes life unbearable at Westminster—which leaves him with all the room in the world for manœuvre. But his words nevertheless helped to dispel any genuine passion that might have remained in the Budget debate. It was no doubt because he sensed this that Mr Bevan tried to lace his normal, florid class appeal with some economic arguments of his own. In the event he fell between the two and was unusually ineffective. Although odd bursts of rhetoric brought cheers from the Labour benches, the speech as a whole was heard by his party with a friendly detachment more dismaying to a potential leader than any hostility. Those Labour tacticians who pushed Mr Bevan to the front bench in the belief that on the extra length of rope he would hang himself are beginning to think that they deserve congratulation.

Returned from Korea

EVERY day now brings its quota of new, and often conflicting, information from returning prisoners of war or internees about conditions in North Korea. Each individual can, of course, speak only of his own experiences, and there are other inhibiting factors ; men are reluctant to say anything that might lead to reprisals against their comrades still in captivity, and after two years or more of complete insulation from the world of truth a prisoner needs time to get his facts into proportion. It would, therefore, seem wise to postpone any final conclusions about the Communists' treatment of their prisoners until a larger volume of evidence is available.

Several points, however, already emerge clearly enough. The rapt attention paid to each returning prisoner's least word in itself reflects the rigidity of the barrier of silence behind which the Communists had kept them. No Red Cross missions had been allowed access to the camps in North Korea; no reliable lists of prisoners or postal arrangement had been available ; some of the men returned this week had been "missing," without a sign that they were still alive, for many months. It will be remembered that for a long time the fate was unknown even of the British diplomats and missionaries captured in Seoul, who, by the practice of civilised nations, should never have been kept prisoner at all.

Prolonged attempts were made to indoctrinate some of the prisoners, and the Communists made—and are still making—propaganda use of statements attributed to individual prisoners and internees, some of which have already proved to be distorted or wholly false. More immediate propaganda value, however, is now being found in the alleged contrast between the appearance of the prisoners at the exchange point. Prisoners being returned by the United Nations have dishevelled themselves and ripped their clothing in order to appear ill-used ; one batch went to the length of squeezing the toothpaste out of the tubes their captors had given them. Unfortunately these naive tactics are not all. Several prisoners returning from North Korea report that many of their comrades, who are not yet being handed over, are far more seriously ill or wounded. If it is true, as this would suggest, that the Communists have deliberately held back the men who are in the worst shape in order to present a false picture of the general condition of their prisoners, it can only be described as one of the most revolting deceptions ever practised ; and it is earnestly to be hoped that fuller information will reveal that this is not so.

SPRING BOOKS, 1953

Page 261

Mildness for May Day

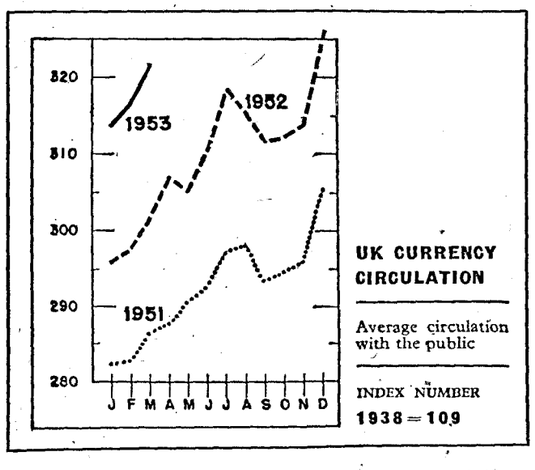
THE May Day slogans broadcast each year by Moscow Radio are the texts for Communist sermons everywhere until further notice. They therefore reflect faithfully the prevailing orthodoxy. The list broadcast for this year's celebrations shows a clear shift of emphasis from the slogans of Stalin's day: the stress is now on peace and on the posibility of settling all issues "by peaceful means on the basis of mutual understanding." Slogans about "imperialism" and its "criminal schemings" have been dropped, even in reference to Germany. A newcomer among slogans for home use, but characteristic of the Kremlin's present mood, is the greeting to the Soviet constitution "which guarantees the rights of all the citizens."

There are other significant departures from precedent: for example there is, unlike last year, not a single hostile reference to Jugoslavia; on the contrary there is a good old-fashioned exhortation "to raise higher the banner of proletarian internationalism." The Communist party, which used to be called the "party of Lenin led by Stalin," is now called—naturally enough—"the party of Lenin and Stalin led by the Central Committee." Yet the Communist Youth (Komsomol) which was normally called "Leninist-Stalinist" is now referred to with the single adjective "Leninist." Such omissions and changes are seldom in Russia due to mere negligence ; they suggest that Malenkov should still be regarded as one of three.

The Ration Prospect

STORIES that have appeared in some of the papers about a Cabinet plan to make further cuts in the food subsidies are mere guesswork. But while there is no basis for talking about a definite "plan," it does seem quite likely that the cost of the food subsidies in 1953-54 will work out at less than the £220 million estimated by Mr Butler. The rate at the end of the financial year (as opposed to actual expenditure over the year) was already less than the £250 million at which he aimed in last year's Budget. The derationing of eggs, feedingstuffs and flour will in themselves reduce the expenditure to about £220 million.

This does not mean, of course, that there will be no more changes. There will certainly have to be some juggling, even within a total of £220 million. Some subsidies may be reduced or removed so that the retail price of others may not rise. It may, for example, be thought desirable that prices of welfare foods and of milk in schools should not rise, but as the Ministry will be paying higher prices for milk that would mean a higher subsidy. On the other side of the account, the only subsidy whose abolition is promised is the sugar subsidy, which is to go when sugar comes off the ration towards the end of the year. It is not usually considered safe to deration a food until the public's purchases fall below 90 per cent of the ration. For sugar, the whole ration is at present being bought. But the Cuban deal will increase supplies by about 30 per cent over the next twelve months or so, and larger supplies are expected from the Commonwealth.



On the evidence of demand in relation to present supplies, the foods nearest to freedom would be bacon and cooking fat ; only 90 per cent of the total ration is being taken up in the shops. The danger with cooking fat—as with margarine—is that if it were freed too much might be bought up by the manufacturers, who are getting only 50 to 60 per cent of the sugar and fats that they had before the war. To free margarine without butter would cause trouble with Commonwealth butter producers ; and to free bacon might cause trouble with British farmers. Bacon gets a subsidy of 5d. a lb and its removal might cause a drop in demand which, since the public shows a preference for Danish bacon, would be at the British farmer's expense. The Government is, however, showing a commendable determination in its food policy, and it will be surprising if some at least of the remaining bulls are not taken by the horns in the course of the year.

The Claims of the Services

DEFENCE policy was debated for two days in the House of Lords last week, but relatively little was said about the general level of rearmament and defence expenditure. The debate circled instead about the problem of priorities. Their lordships were critical of the shape of the country's defence effort, but less along lines of party loyalties than of loyalties to the particular services in which many of the speakers had served. Some, like Viscount Trenchard and Lord Tedder, laid most stress on the slow rate at which the Royal Air Force is getting adequate numbers of jet aircraft. Others, like Lord Strabolgi, voiced their anxiety at the way the Navy seems to be coming a bad third for finance and supplies ; they drew a distressing picture of British weakness at sea, with the strength measured by numbers of ships obsolete in reserve. Others again emphasised the way in which the Army's resources are stretched tight as a drum across the world ; if the commitments laid on Britain by its position as a world power or by voluntary undertaking are to be discharged, it is almost impossible to achieve reductions in Army manpower, l length of service, or in the quantity of supplies locked u in the pipeline, even when the defence effort as a whol is scaled down.

Such a debate—conducted with much technical knowledge—cannot be decisive. A country that has traditionally won its wars at sea, and which now must as decisively ward off the attack in the air, in fact finds its Navy reduced i strength to eleven cruisers and its air force still awaiting the promised aircraft of superior performance. This is nc less alarming because it occurs when Britain is co-operating in Western defence as a major land power. But it cannc be helped. Western defence as a whole depends on co-operation, and to reduce Britain's contribution, which othe powers think of so largely in terms of land formations would merely be to risk the whole structure over which in fact, the Americans hold an air umbrella and whose sea lanes the American Navy guards.

A few particular criticisms may be well founded, but or the whole the arguments of the Lords from the three services cancelled out. Within the present total of defence expenditure, the priorities fixed by the Government are about right. They represent compromise decisions determined, with little real margin for choice, by the facts of existing commitments. If the flow of new weapons were to be increased, research expanded or accelerated, more ships completed or commissioned—then more would have to be spent, and income tax reliefs must not be given. This is the hard choice. But as things are, at least it is true to say, as Lord Winster pointed out, that only three nations seem able to undertake the cost of modern war, and of these Britain, in terms of current expenditure and effort, is one. This is no cause for complacency, but it is a fact that might be more widely known through the world.

Who Guides the Missiles?

So meagre is the information provided by Whitehall on air defence that useful public discussion of the subject is limited and sporadic. A scientific and strategic revolution of the utmost importance therefore goes on without any impetus that criticism or approval might give it. From the morsel of revelation that Lord Alexander let fall last week in the House of Lords it appears, for example, that research and experiment with guided missiles have gone far ahead of arrangements for their use. Only within the last few weeks has the decision been taken—no doubt bitterly contested between War Office and Air Ministry—that the manning and operation of these new factors in air defence should be the responsibility of the Royal Air Force ; and it still remains to be settled how Fighter Command (under the Air Ministry), Anti-Aircraft Command (under the War Office), and the static defence of ports (under the Admiralty) will work together. What degree of skill, physical fitness and education is needed to guide ground-to-air missiles Lord Alexander did not say. Is it a job for Territorials or for the Home Guard, for men or for women, for regional or more local organisations ? The public does not know. But the Minister of Defence did insist that anti-aircraft regiments would be necessary "for

The cheque seemed to be for £20. The bank might have spent weeks locating the error — had it not been for a machine that threw new light on the matter.

Of all the cheques—*one* was to blame, but which?

MODERN BANKING works at high speed. Nothing can be allowed to interrupt the smooth flow of business. From the Commercial Bank of Scotland comes a story that illustrates the value of one of the methods used to detect errors—without loss of handling-time or inconvenience to their customers.

Among the millions of cheques banks handle, many are badly written, and, recently, the Commercial Bank received one in their clearing that seemed to be for £20. In accordance with banking practice this cheque, with many others, was listed and added in its appropriate batch and promptly forwarded to the Branch concerned. On attempting reconciliation with the in-clearing total, an error of £100 was revealed. The Head Office then had the problem of tracing it without holding up the daily work.

Normally, this would have entailed reference to all amounts of £100 or over, and, if that failed, the examination of every cheque for amounts of under £100. The search would have to be conducted after hours.

The Bank's method was less complicated, far faster. Knowing the day the error occurred, they simply ran off on the Reader of their Burroughs Microfilm Equipment the film of their clearing for that date. Within minutes the "guilty" cheque appeared on the screen, and scrutiny showed that, in its typing, the hundreds figure of £120 had merged with the printed £ sign—leaving a clear amount of only £20 showing.

Result: By such use of their Microfilm Equipment, this Scottish Bank, which photographs and retains in their original order some thousands of cheques a day, has been able to save hours of after-closing labour and time. In this unusual case, the search for the "two-faced" cheque might have taken weeks.

What about you? In any business, document-storage must be considered in terms of time and cost—the time it takes the staff to trace important records, and the cost of the space that is needed to keep them safe. By transferring all statistical information to compact, non-inflammable spools of Burroughs Microfilm, the saving in storage-space alone will be greater than 99%.

Burroughs offer, from their great range of modern record-keeping machines, the finest Microfilm Equipment in the world, British made by G.B.-Bell & Howell. Call Burroughs about Microfilm *today*. Burroughs Adding Machine Ltd., Avon House, 356-366 Oxford St., London, W.1. Sales & Service Offices in principal cities.

Seen here at the Recorder of Burroughs Microfilm Equipment is Mr. R. M. Thompson, the Burroughs Representative who supervised the installation of this equipment at the Commercial Bank of Scotland Ltd. With the Reader, and the Automatic Processor, this machine offers you a complete storage-system for all your documents. For clients who don't wish to process their own film, Burroughs operate a fast Processing Service.

For expert advice on *microfilming*

***CALL IN* Burroughs**

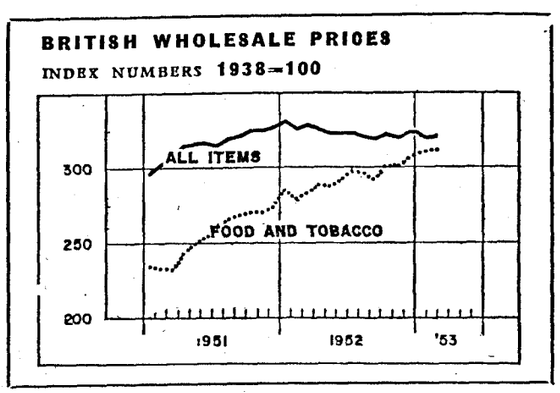
many years to come." So missile defence looks like making, at first, an additional demand on manpower.

It would be reassuring to know that somewhere there exists a nucleus of technicians (specialists in artillery as well as in air warfare) which could expand as required into its defence role, without having to fight every inch of the way against administrative and inter-departmental difficulties. It is hard to believe that this is a job for Territorials, strained as they are now; on the other hand, it is hard to believe that it is a job exclusively for airmen, concerned though they are with the guided missile (air-to-air) used by the fighter aircraft. Some blending seems necessary. Perhaps Mr Churchill could find time to devise something that will satisfy the three services and the scientists.

A Vote Against Vereeniging

THE extent of Dr Malan's electoral victory has surprised the Nationalists just as it has surprised the United Party. The new majority of 29 seats (when Labour wins the by-election for the safe seat of Johannesburg City) will represent a gain of 16 on the margin in the old parliament. This has been achieved, however, on a minority vote, just as was the Nationalist victory of 1948. Only 45 per cent of the electorate has voted for Dr Malan even now; indeed, the majority of votes against him is even greater this time than last, 130,000 instead of 100,000. The Nationalists' success has three technical reasons: their alteration of constituency boundaries during the last parliament to suit themselves; constituencies in the country districts smaller than in the towns; the fact that young people—mostly Afrikaans-speaking Nationalists—are put on the voters' role as they grow up, while immigrants (usually anti-Nationalists) have to wait a long time.

Nothing can conceal the failure of the United Party to win new ground; it effectively summoned all its supporters to the poll, but it made no impression whatever on the unconverted. This is the main lesson of the whole campaign. It was not just Dr Malan's "white civilisation" argument that carried the day; Mr Strauss preached it in only a slightly different form. Both dwelt on the crisis facing the white man in Africa. What prevented any conversion of Nationalist voters was the Nationalist creed of a *Boerenasie* (Boer nation). Mr Strauss failed because he stood for "South Africanism."



It is fifty years since the Boer war and forty since General Hertzog resurrected a public appeal to Boer nationalism in 1912. The present election has confirmed what many have feared for a long time. Although the magnanimous Peace of Vereeniging gave South Africa half a century of close association with the ideals of the Commonwealth, its dominant minority will never accept them. Few can now doubt that the new Nationalist administration will mark a turning back on the road of Commonwealth partnership. Does this mean a republic? Perhaps; but if the ways of the English-speaking world are to be finally rejected, the British, too, must act. They must see that their relations with the rest of the continent in the crucial decade ahead are not prejudiced by African suspicion that they sympathise with the ruling South African attitude to racial problems.

Purging Through Georgia

A SEQUEL to the Kremlin's *volte-face* over the doctors' plot took place in Stalin's native Georgia last week when there was a radical reshuffle among the top personalities of both party and state. The Georgian dignitaries who, like the Jewish doctors, had been dismissed or arrested during the vigilance campaign preceding Stalin's death now stand vindicated. Once again it is admitted that the accusations of "bourgeois nationalism" were fabricated by the security police. As the toll of the vigilance campaign among Georgia's leaders had been heavy, the reversal of policy led to an almost revolutionary reorganisation of the hierarchy. Not only the Minister of State Security, Rukhadze, but also his protector—the first secretary of the party, Mgeladze—is now accused of criminal activity. Thus in the space of a few days Georgia was furnished with a new party secretariat and bureau, including some of the "culprits," a new president and a new head of a reorganised government.

Georgia had already gone through one "antinationalist" purge in 1951 and another exactly a year ago; yet the campaign did not get really under way until the second half of 1952, on the eve of the All-Union Congress (see *The Economist* of September 27th). Stalin, always interested in the affairs of his Corsica, could not be unaware of the struggle and of the issues involved. Indeed, the Mgeladze who is now in disgrace was prominent at the October Congress, and he referred specifically in his speech to deviations and to the cure effected with Stalin's personal intervention. Yet even in Stalin's homeland his policies and men are now being pushed aside, as in the rest of the Union.

The same interpretation might be applied to Beria, Stalin's fellow-Georgian and Malenkov's partner in the triumvirate, who seems to have been personally in charge of the purge last April. Yet there are indications that Beria was acting on Stalin's orders and that some of the later appointments, including that to the Ministry of Security, went against his choice. However, the new Minister of Security, Dekanozov, is an old collaborator of Beria's from the time when he was in charge of security in the Caucasus, and held for some time the post of vice-Minister of Foreign Affairs. The appointment to a provincial ministry of such an important person may be read as a symptom of the struggle going on between the "reformists" in the present

Soviet leadership and their more rigid opponents, who seemed to have the upper hand on the eve of Stalin's death. With the shadow of Bonapartism hanging over them Malenkov and his fellow "reformists" cannot afford to indulge in personal rivalry.

Atlantic Amateurs

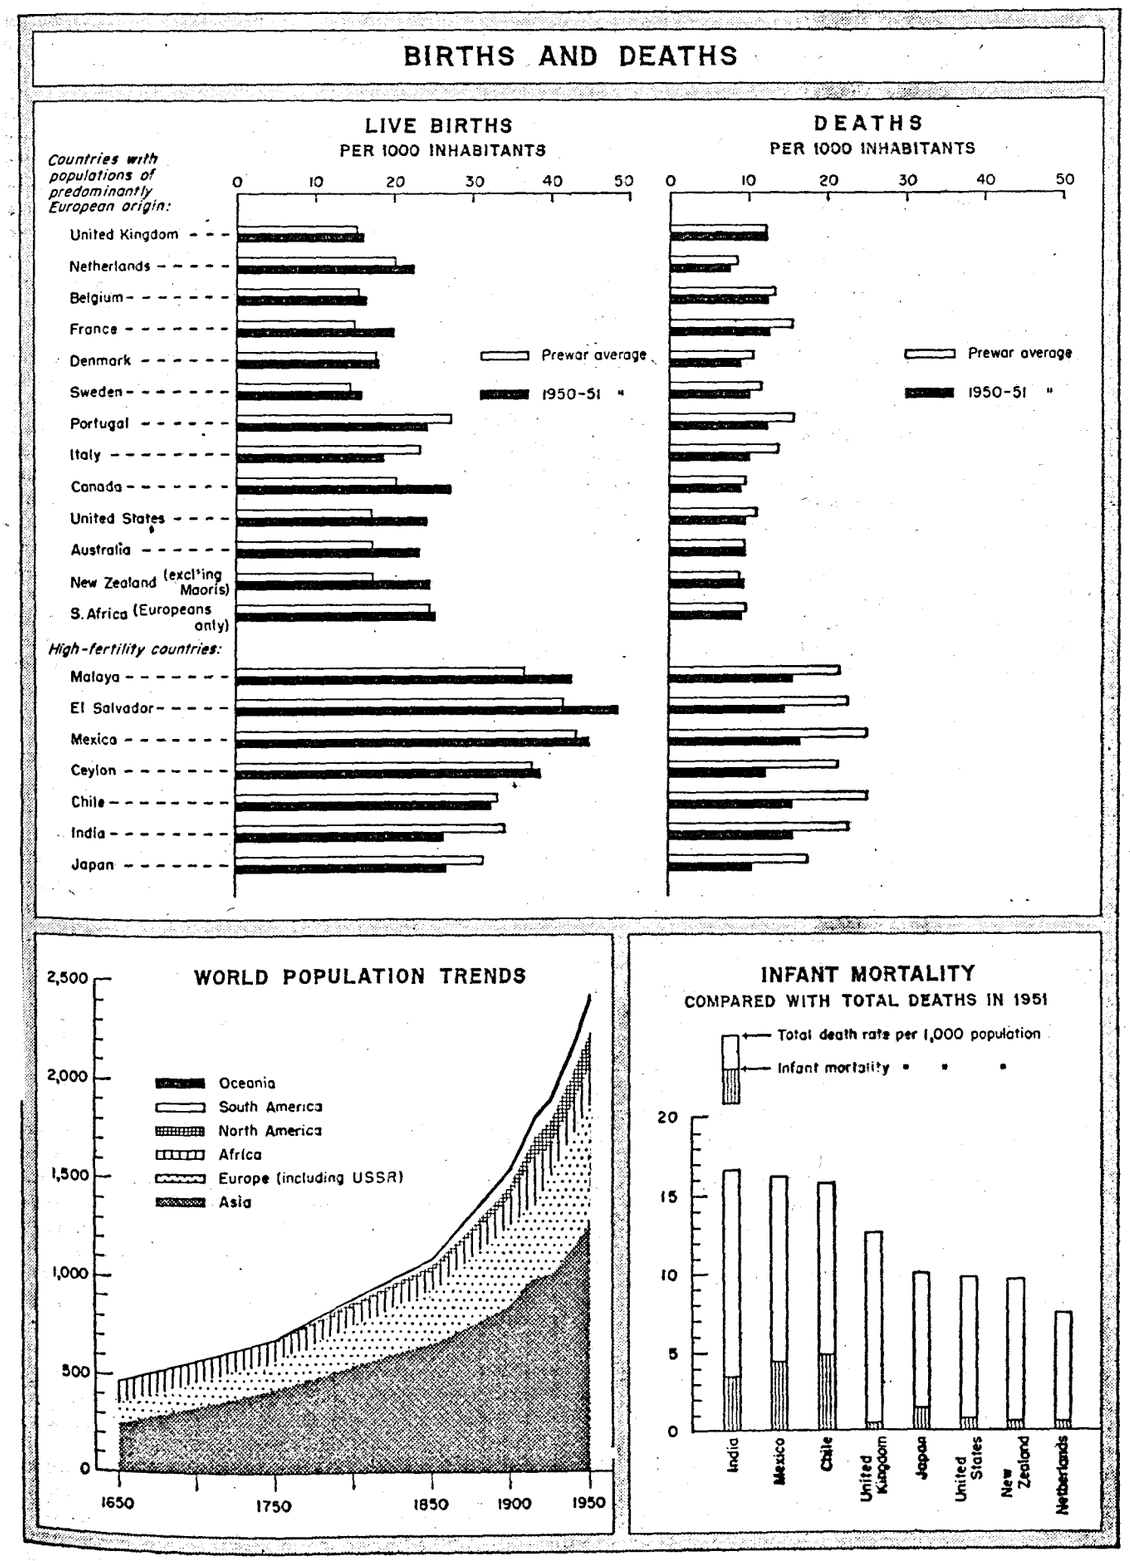
THE ministers of foreign affairs, finance and defence who are meeting in the Atlantic Council this week-end cannot ignore the open letter addressed to them by over 150 prominent persons from the United States, Canada, France and Britain. Both in the North Atlantic Treaty and in many passages of ministerial rhetoric is to be found justification of their proposal that Nato should take more responsibility for the economic problems of its members. They ask, indeed, for a joint declaration by the Council that it will propose immediate steps to expand and liberate trade "so that the Atlantic nations may eventually become one financial and trading community." They also want Nato to absorb the functions of international economic agencies (presumably bodies like the OEEC) wherever this could improve efficiency and relations between governments.

The purpose of all this is simply stated: more co-operation between member governments in order to produce better defence at less cost, and higher standards of living. This admirable objective should stand whatever future Russian action or intentions may be. But there are two comments to make. Those who want the Atlantic Community to develop powerful institutions within Nato must recognise—and above all study—the solid difficulties in the way. No government or legislature has so far shown signs of wishing to have national sovereignty modified one jot, least of all the United States. Until more has been done to illuminate the obstacles, discussion will be inconclusive and woolly, eventually discrediting by its futility the cause it has at heart. To create a real Atlantic Community is to bring about a revolution, and here there is a lesson to be learnt from the Communists. They do not propose revolutions, they organise them in detail.

The letter, unfortunately, also proposes setting up a North Atlantic Consultative Assembly. Such a body, unlike the Council of Europe, would come after instead of before the creation and growth of efficient functional bodies and might therefore serve some practical purposes. But it could also tax unduly the time and energy of the small permanent staff in Paris who are in a position to create an international tradition in Nato. If there is to be an Atlantic debating chamber let it start by being unofficial and let it first test the capacity of its enthusiasts for hard work.

Ireland Awaits More Taxes

FOR the first time in many years Irish taxpayers read of the British Budget with envy rather than sympathy. Comparison of receipts in the last financial year with the estimates shows that Mr MacEntee, unlike Mr Butler, will be obliged to find further revenue when he opens his Budget in the first week of May. And that, our correspondent in Dublin points out, will not be all; legislation now contemplated will involve further outlays. Not the least depressing aspect of the situation is that public expenditure appears to have slipped free of all control. It is difficult to see how revenue can be expanded proportionately to the needs of the state unless Mr MacEntee is prepared to raise income tax to within one shilling of the British rate—which would be a narrower differential than has existed for almost a decade and a half. Mr de Valera has lately agreed that the limits of taxation have been approached, but as yet he does not appear to have made the corresponding calculations about expenditure.



The immediate difficulty in Irish public finance is the commonplace embarrassment that results from trying to live beyond one's means. The momentum of politics favours increased capital and current outlay. The policy of high state investment is still accepted by both sides in the *Dail*. It is true that there is much necessary investment that has to be done by the state if it is to be done at all, but the difficulty of financing the programme is steadily increasing now that the economy is subject to dearer money and higher taxation. At the same time, recent and contemplated policies of social welfare are increasing the number and the weight of charges on the budget. Mr Butler's decision to leave the public with more money in its pocket did not go unremarked, but it is hard to see how his example can be followed in Ireland.

The difficulty will be the greater because present conditions do not favour any quick expansion of production. The economy is strained not only by high state spending but also by the continuous augmentation of an already high tariff, which drives up prices and wages. Although exports have expanded in recent months, there are now dangerous signs that Ireland will be priced out of export markets. Mr MacEntee's problem, which indeed will have to be faced sooner or later by the Opposition also, goes deeper than the budgetary provisions that must be made next month.

The Sovereign Union

MR HARRY BONSOR has won his legal action against the Musicians' Union. His expulsion from the union in 1949 has been declared null and void, and it has been restrained by an injunction from acting on that expulsion. Mr Bonsor has thus had restored to him his right to earn his living by his own lifelong profession and been rescued from the necessity, inflicted by the union's interpretation of its rules, of subsisting by casual labour such as chipping rust off seaside piers.

To anyone but a convinced syndicalist this is a satisfactory upshot; but satisfaction is tempered by consideration of the grounds on which the judgment rested. A union's right to pass an economic death sentence on any member for any reason whatever was not questioned—provided its rules could be shown to cover the particular set of circumstances concerned. Mr Bonsor's expulsion was invalid because of a technicality of procedure; had the proper procedure, under the union's rules, been duly

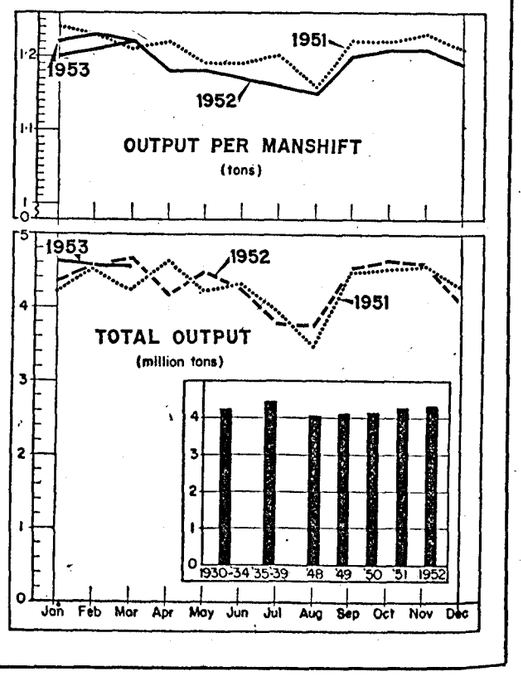
followed, he could have remained, for all that the law could do to help him, a casual labourer for life. No doubt it is something that correct procedures must be followed ; they can give some safeguard against personal spite and tyranny. But they can also be framed so as to give no safeguard at all. There is nothing to prevent a union from drafting or changing its rules in such a way, and from electing such a hierarchy to administer them, as would quite legally subject its members to the most arbitrary and all-pervading tyranny ; nothing, that is, except the unreliable libertarian sentiments and vigilance of the rank and file majority. Where, as in this instance, the union has succeeded in imposing a closed shop, not only the individual's benefits of membership but his entire livelihood may depend on the wording of a rule or the state of an official's liver ; and nothing in Mr Justice Upjohn's judgment alters this fundamental evil.

The closed shop is bad enough in itself, bestowing as it does, on any union strong enough to impose it, the power of economic life and death. That this should be exercised within a privately erected constitutional framework of which the law takes no cognisance is a further anomaly. Sooner or later, the unions may have to choose between a limitation of this power and limitation on their internal autonomy. They would be wise to choose the former.

Worried East Germans

THE letter addressed by the presidium of the "People's Chamber" of Eastern Germany to the Speaker of the House of Commons is a preposterous performance: a body that has no valid claim to represent the people of Soviet Germany appeals over the heads of the Government to the House of Commons through the Speaker. The men who drafted this document only recently called on the West Germans—not for the first time—to overthrow Dr Adenauer and his Cabinet by force. They are beyond the parliamentary pale and should not be taken seriously at Westminster.

Their gesture is as sinister as it is clumsy, for it reveals the credulity and ignorance of these politicians beyond the Elbe as nothing else could. Dr Adenauer, they say, is encouraging separatism in Alsace-Lorraine and has claimed colonies ; the offices of the Bonn Government "have become the playground of sworn enemies of peace and democracy." There is no hint of conciliation or reasonableness. When they say that a conference of the four powers on German unity would lead to "democratisation of its institutions" they mean that the whole of Germany would then be open to the treatment that only the East has so far experienced



The Communist tools in the People's Chamber may, of course, be in deeply troubled mood. If Malenkov and his colleagues wished for a four-power settlement in Germany, big concessions would have to be made in the Soviet Zone by the Communists. The appointment this week of Professor Yudin as political adviser to General Chuikov in the Soviet control commission may point towards a review of policy, for he is a member of the central committee of the Soviet Communist Party and former editor of the Cominform Journal. He is a Malenkov man and has the necessary repute as a theoretician to get the German Communists out of the appalling dilemmas in which a policy of appeasement by Moscow would place them. The direct evidence of such an intention remains of the slightest ; indeed, the persecution of Christians and liberal-minded people in the Soviet Zone has become worse in recent weeks. But something is certainly brewing on the Russian side.

Pakistan's Crisis

TO most people the sacking of Kwaja Nazimuddin at the end of last week came as something of a shock. In no other Commonwealth country could the head of the state dismiss the prime minister without any reference to the legislature. Yet it may be argued that this action by the Governor-General, Mr Ghulam Mohammed, was as legal as it was courageous. Pakistan has no proper constitution ; its administration is based on the last Government of India Act before the British handover of power. This, indeed, is one of the factors for which blame must be laid at Mr Nazimuddin's door. It is high time that the constitutional issue was settled ; national elections were held throughout Pakistan ; and a serious attempt made to give the government roots among the people.

COAL PRODUCTION in GREAT BRITAIN

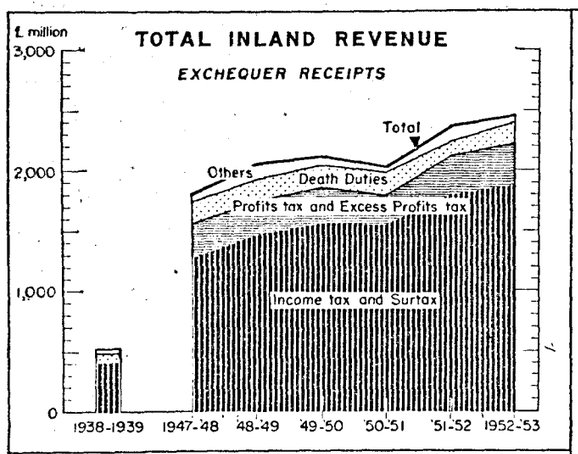
WEEKLY AVERAGES

The wisdom of the Governor-General's bold move may be judged by the calm with which it has been accepted by the country. The indecisiveness of the administration had come to endanger the security of the 70 million people in this strategically placed Moslem state. The hold on power of the little group of skilled and intelligent men who fought for and built Pakistan has looked increasingly tenuous unless they could establish a progressive state, at once economically viable and politically stable. In both respects, Pakistan has lately been losing ground fast. During the past eighteen months it has gone from a food surplus to the real threat of widespread famine, and from a sense of unity and political purpose to a series of plots against the government ; even now the outside world has heard virtually nothing of the recent severe crisis in the Punjab. Religious intolerance and reaction have increased. Above all, an insidious if sometimes indirect censorship has begun to impose itself on vital liberties such as freedom of speech and press. The full facts about recent events have even been prevented from reaching the outside world.

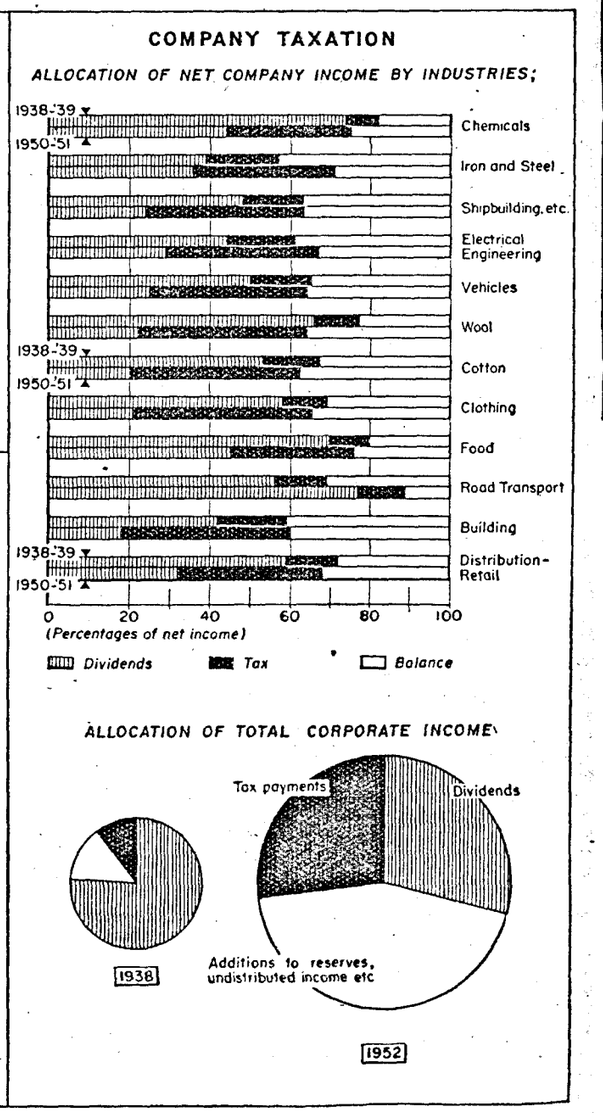
If the youthful new prime minister, Mr Mohammed Ali, has an unpleasant mess to clear up at home, the outlook is also difficult abroad. The proposed talks with Mr Nehru should certainly take place even if they have to be postponed for a few weeks ; and Pakistan's relations with the Commonwealth, the United States and the Middle East all demand clarification. Fortunately, Sir Zafrullah Khan continues as Foreign Minister and Mr Mohammed Ali has himself just come back from being ambassador in Washington. But the new government will have to act fast if it is to avert famine and restore Pakistan's position as a factor of stability in southern Asia.

Japanese Election Results

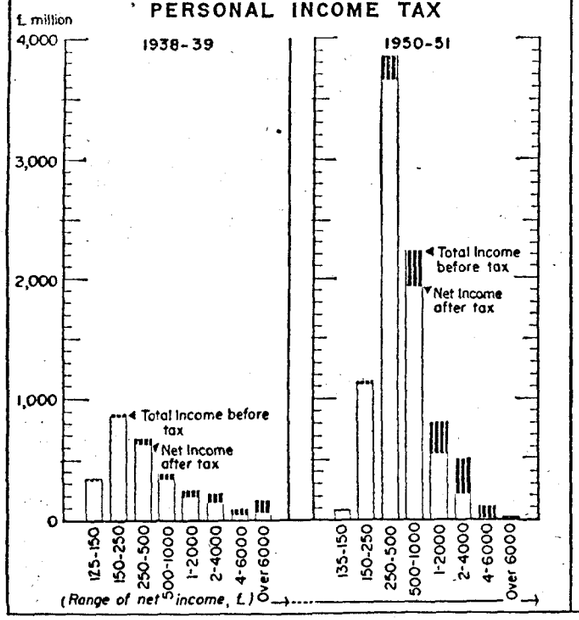
THE general election in Japan has had an interesting outcome which appears to reflect not only trends in internal politics, but also recent events in the international field. The developments which led to the fall of Mr Yoshida's government indicated a political offensive from the Right ; for Mr Hatoyama, who broke away from Mr Yoshida's Liberal Party with a group of followers, adopted a programme distinctly to the right of the Prime Minister, while the Progressive party, led by Mr Shigemitsu, stood for a more substantial scale of rearmament and a revision of the postwar "MacArthur Constitution." The issues were, however, defined while the cold war was still icy and there was a widespread feeling in favour of restoring Japan's armed strength and something like the old state authority as conditions of survival in a harsh and dangerous world. But the scattering of springtime blossoms of good will from Moscow during the past weeks has created fresh doubts about the need to devote any part of Japan's overstrained budget to the building of new armed forces. Thus the Socialists, as the opponents of rearmament, have gained the advantage from the new climate of popular sentiment. A move to the Left might, perhaps, have occurred in any case on issues of purely domestic concern, but the great prominence of the rearmament question in recent political controversy indicates that it has been the main factor on which the election has turned.



In the last Diet the united Liberal Party had 245 seats out of a total of 466, assuring Mr Yoshida an absolute majority. Now the Yoshida Liberals have 199 and the Hatoyama Liberals 35 seats, which means that the two Liberal factions together have lost 11 seats. The Progressives have gone down from 88 to 76, losing 12 seats. The Right Socialists, on the other hand, have gone up from 60 to 66, and the Left Socialists from 56 to 72. Only one Communist has been elected, but the Left Socialists have a strong Communist tinge, and may be regarded as a "Nenni party" in Japanese politics. If Mr Yoshida now tries to form another Cabinet, he must look for a coalition with either the Progressives or the Right Socialists ; each of these parties could provide him with a working majority in the new Diet. Neither combination, however, is likely to be very stable, and Japan seems to be entering on a period of political stress.



The Good Old Days



The glorious old days of Parliamentary Government and Parliamentary tactics are over—the days of Walpole and Chatham, and Pitt, when the House of Commons consisted of two armies ranged in battle array against each other, subjected to military discipline and acting according to an almost military code of honour ; when absence from parade or division required leave asked and obtained ; when the slightest insubordination met with prompt rebuke and severe punishment ; and when desertion, whether temporary or entire, was visited with ignominy as certain and penalties almost as serious, as if it had been committed by an actual soldier on the field of battle and in the face of the enemy. In those halycon days, not only was there no third or fourth party to embarrass action and set calculation at defiance, but "independent members" were animals almost as rare as the sea serpent and as mythical as the unicorn ; and, when they now and then appeared, were coolly put aside and left out of the estimate altogether as, according to the definition of one of the Premiers whom they plagued, "members on whom no dependence could be placed." Now, all this is changed. Even before the Reform Bill a new party, neither Whig nor Tory, had been formed ; and after that measure they increased greatly in numerical strength, in influence, and in organisation ; while, in addition, a number of really "independent members" have found their way into the House—politicians "unattached"—men who work, as the phrase is, "On their own hook"—owning no allegiance, bound by no engagements, acting on no system. . . . It is obvious that the real strain and trial of the British constitution, which has been staved off for generations, has come now. Those old traditions, those conventional rules, those ingrained habits of political action, which have so long masked the theoretical defects and unworkable contradictions in a Representative Government like ours, are no longer applicable, and can no longer be observed . . . a startling fact which fills us with gloomy forebodings for the future, not so much of this Ministry as of Parliamentary Government altogether.

Letters to the Editor

The Building Industry

SIR—I have read your articles with interest and I see from your current issue that Mr Richard Shepherd has taken you to task from the architect's point of view. May I be allowed to deal with the three points he has selected from your second article.

1. "The rigidity of specification and nomination of sub-contractors by architects has deprived the builder of his ability to make do and substitute." The view expressed in your article is correct. Rigidity of specification starts in the architect's or surveyor's office. In these cases we see sub-contractors nominated right down to the supply of locks and bolts to be fitted to doors. When the builder asks for delivery he finds it is not forthcoming—usually because the concentration of one pattern has exhausted the manufacturer's stock. When planners held less sway than they do today the practice was to leave the builder to obtain his own supplies, after submitting samples to the architect for his approval. Let me quote another example; the architect included a prime cost sum of facing bricks of sound quality, but he instructed the builder to buy second facings from a nominated supplier. The result was that the seconds, for which there is no merchantable quality, arrived with numerous fire cracks which led to excessive wastage of material and increased labour costs; this wastage and loss the architect expected the builder or the brick-maker, or both, to bear.

2. "Expensive methods have sometimes been forced on the builder, with attendant delays." This statement is also quite true. The point you make frequently occurs where the architect possesses no knowledge of specialist's work. He relies upon the specialist not only for the design, but for the detailed drawings and the work is included as a prime cost item in the specification based on whatever sum the specialist decides to quote. Sometimes a large part of a building contract consists of such items which have not been the subject of competitive tendering. The specialist knows that neither the architect nor the builder can go elsewhere for his product and both have to await his convenience; this means delay for which the builder suffers financially. The architect grants an extension of time and makes a suitable explanation to the building owner.

3. "They are certainly responsible for long delays in completion of contract documents." The legal department of a local authority cannot complete contract documents without the technical details, which must come from the architect. Often many changes are made between the tendering and the contract stage; this causes delays and often needless trouble for the builder for which he obtains no reimbursement. There are still many architects who are not prepared to supply the builder with a counterpart of the contract signed by the employer, which, incidentally, is the builder's legal entitlement. If either the employer or the builder wishes to inspect the contract document he must attend at the architect's office by appointment. Architects generally need to be reminded that a building contract represents a mutual bargain and is not a master and servant agreement.

One final point; a builder can be held responsible for an architect's faulty design. Builders need to protect themselves by drawing the architect's attention, in writing, to faulty constructional planning and they should refuse to proceed with the work until the architect has undertaken, in writing, to accept full responsibility for any faulty planning. This is a matter the architects themselves should put right; it is unjust that the builder should be held legally responsible for other than his own failures.—Yours faithfully,

W. KEITH MARTIN

Eastbourne, Sussex

★

SIR—Your articles on the building industry reached the conclusion that "building performance is perfectly capable of rapid improvement, both by the return to competition and the use of proved technological advances."

The progressive introduction of technological advances is unfortunately hindered at present by a ruling of the Royal Institute of British Architects which prohibits the use of their letters designate to any member who becomes a director in a contracting firm. There is thus a psychological barrier preventing qualified architects from moving into the contracting field. In the civil engineering industry, by contrast, contractors have for long been recruiting qualified civil engineers to their staffs, and many of these men have now reached directorial positions, and are thus able to introduce and experiment with mechanised equipment and new techniques. Furthermore, in the Institution of Civil Engineers, these civil engineering directors mingle freely as equals with their opposite numbers from the consulting engineers' offices for the exchange of learned information. The result is that both design and construction reap valuable benefits. It would therefore seem that the Royal Institute of British Architects could make a most helpful contribution towards the improvement of technical standards in the building industry by encouraging, instead of discouraging, any of their members, who so wish, to make their careers on the contracting side instead of on the designing side.—Yours faithfully,

London, W.9 J. H. W. TURNER

Australia

SIR—As an Australian, may I comment on Mr J. F. Cairns's expression of the Australian point of view? Firstly, it is not *laisser faire* which has produced a lop-sided Australian "milk-bar" economy; actually this largely results from opposite causes, including government wage and tariff policy which has made sheltered industries more profitable. As the most important primary products sell at or around world parity prices, the high cost of labour and of most machinery has made this form of production, except in recent years, relatively unprofitable and private investment has been channelled into sheltered consumer projects where returns have been greater. In the rural branch of primary industries, production was maintained and increased during the thirties mainly because of the prevalence of the family farming system; in this period with lower average returns farmers attempted to maintain total returns with increased production. In the last few years, although average returns have been high, output on established farms has tended to diminish for the same reasons, aided by the city forty-hour week, the high cost of hired labour and capital, and steeply progressive taxation. In contrast, the mining industries, which employ practically no family labour, showed an output decline in the thirties (except gold output, which increased due to devaluation and increased private prospecting). Even today, largely due to union control of labour entry and capital input expansion, total mining output is below 1913 levels. If there were a partial return to *laisser faire* many of the anomalies within the Australian economy would disappear—after a difficult transitional period.

It is apparent that Mr Cairns misunderstands the concept of the sterling area. Although he is correct in stating that Australia will earn more sterling through increased exports of primary products, Britain would then purchase proportionately less from dollar areas, and with the resulting larger dollar reserves Australia should be able to make greater capital imports from those areas. In fact, if Australia had a greater export surplus it is likely, even with existing United States tariffs, that many primary products—for example, meat—would find a ready sale in the United States.—Yours faithfully,

IAN SHANNON

Corpus Christi College, Oxford

★

SIR—Mr Colin Clark's letter in your issue of March 21st states:—"There are, in fact, very large areas where additional sugar cane could be grown, but Queensland State legislation prevents this.... Queensland farmers are forbidden to produce additional supplies of the commodity which Britain and other

sterling area countries have to import for dollars."

These passages would suggest to your readers that the acreage under sugar cane in Queensland has been kept stationary, under legislative enactment, at a time of high overseas demand for sterling sugar.

In fact, the Queensland sugar industry (which produces over 95 per cent of Australia's sugar output) is in the final stages of a major expansion of acreage cultivated. This expansion began in 1947 and has been progressively accelerated, particularly after an export target and quota of 600,000 tons of sugar per annum was agreed upon with the UK Government in December, 1949. Acreage has been increased by 37 per cent since 1946.

Under long-standing legislation the Central Sugar Cane Prices Board has the duty of assigning to each sugar mill the lands from which the mill is obliged to accept the crop of sugar cane for crushing. Sugar cane can be grown for the purpose of sugar manufacture only on such "assigned areas." The Board has full authority to add to the "assigned areas," as required to meet the demand for sugar in Australia or overseas, and has exercised this power very extensively in recent years.—Yours faithfully,

Brisbane E. T. S. PEARCE

Investing in the Commonwealth

SIR—The recent announcement of some relaxation of restrictions on UK investments in North America has been warmly received in Canada. It is distressing, however, to see that neither British companies with interests already here nor prospective newcomers seem to have noticed that there is a vigorous and self-conscious nationalism mingled with, and in part propelling, the Canadian expansion.

In this connection it is well to recall the fate of the huge American Viscose Corporation, which was carried off in broad sunlight by a senatorial lobby when the passage of Lend-Lease through Congress was in the balance. There would seem very little doubt but that this could have been avoided if the former owners of AVC had previously made available to the American public even a small percentage of its stock, and those concerned with the permanence of British investment in Canada might well ponder this. A timely stitch now might save ninety times nine in the bleak days ahead.

Quite apart from the enlightened self-interest of such a move, it would be an appropriate and much appreciated recognition of Canada's increasing position and prestige if UK firms investing here were to invite local financial participation. It would also serve as an example, to other countries requiring foreign capital, of the type of regenerated Western investment policy which could flourish under steady and responsible government, and was not flagrantly at odds with sensitive national feelings.—Yours faithfully, J. P. HALL

Decision for Federation

SIR—We liberal South Africans appreciate the difficulties of those who have had to advocate federation before such different audiences as the British public, the S. Rhodesian settlers and the indigenous African population. But we can also imagine how the appeal to S. Rhodesia to support federation in order to prevent the establishment of a "Gold Coast" on its northern frontier must suggest to thinking Africans that federation will delay their advance to self-government; and the argument that the alternative to federation is for S. Rhodesia to turn south suggests that the dominant settler mentality is not averse to Malanite principles.

It is not fair or reasonable that conservative and backward peoples, who came under the protection of the British Crown at their own request, should be stampeded into a new allegiance with white settlers at a time when events in South Africa have seriously impaired the good faith of settler communities in the eyes of all Africans. If Britain, the most liberal of the colonial powers, imposes federation in haste against African wishes, what answer shall we give to our own illiberal white majority which (even Dr Malan according to his lights) seeks to compel the Africans "in their own interests"? And what answer will Britain give to the next South African request for the incorporation of the High Commission Territories "in their own best economic interests" despite the opposition of their inhabitants?—Yours faithfully, C. W. M. GELL

Rustenburg, Transvaal

Patches in Britain's Purse

SIR—In your article of April 11th you say that the "simple identity between an internal surplus of savings and an external surplus on the current balance of payments is the third main lesson to be derived from the national income statistics, but it is not always an easy one to assimilate." This is an identity which you yourselves have often, and rightly, stressed, but might I suggest that you seem now to be in danger of confusing an identity with an analysis of cause and effect? This appears most clearly when you point out later in the article that the private sector "had £607 million over and to spare in 1952," and then go on to say that "if public authorities had managed to keep a tight rein on their own expenditure, Britain's balance with the outside world would have benefited by the full extent of this turn-round . . in the capital account of the private sector."

Surely this is much too simple? If public authorities had spent less they would have released resources which could have been used up in several ways. What you say would only have been true if *all* the resources so released had been used to supplement exports or dispense with imports. At a time when the volume of exports was dependent on demand as well as on resources available, one could hardly expect the balance of payments to be improved by anything like the amount you imply. Some of the released resources (assuming no more unemployment of factors of production than actually occurred) would certainly have been used at home, and might, for example, have gone into capital formation in the private sector.

The national income figures would then have shown less overspending in the public sector, a smaller surplus in the private sector, and a more favourable balance of payments. The identity you mention would still, of course, exist, but the figures would not be those which you imply.—Yours faithfully,

AUBREY SILBERSTON

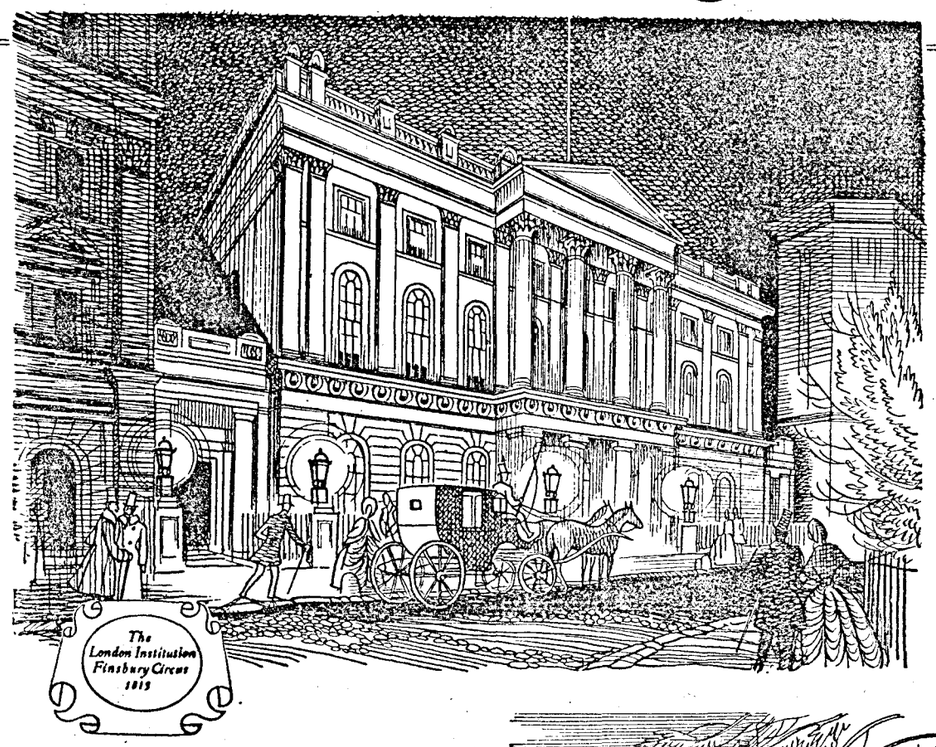
St. Catherine's College, Cambridge

Economic Survey for 1953

SIR—The summary in your issue of April 4th makes the arithmetic of the terms of trade seem more impenetrable than it is. You say: "Britain's export prices rose by some 5 per cent last year, while its import prices fell by 2 per cent; on a total trade turnover of nearly £5,800 million these two price movements strengthened Britain's balance by about £330 million in 1952. . . ." Movements of this size on such a turnover could hardly produce so large a result. In fact the 5 per cent and the 2 per cent presumably refer to trade account statistics, while the £330 million refers to balance of payments figures, and therefore covers a different period.—Yours faithfully, F. G. DAVIDSON

Croydon

Losses on Export Credits



SIR—In the issue of February 7th you state that "some of the money may still come back." This pre-supposes that Brazil is going to default on her commercial debts; a supposition which those closely connected with Brazil do not for one moment believe.

In a second article, which appeared on February 28th, which has to do with the settlement of Brazil's sterling commercial debts in arrears, it is said that "there have been hints from Rio de Janeiro that the Brazilian authorities . . . will . . . try to clear commercial arrears, if they do so at all, by applying the free rate of exchange."

This is the first time that we, in Brazil, have heard that this country will try to pay off these debts in the free market. Everything said in official and semi-official circles points to the fact that Brazil will pay these accounts and will pay them at the official rate of exchange. We, here, have no doubt of this.—Yours faithfully,

Sao Paulo GILBERT A. LAST

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Words, Not Trade

Washington, D.C.

"WE care nothing for mere rhetoric" the President said in his speech before the American Society of Newspaper Editors last week when he demanded that recent Russian gestures should be "attested by deeds." The English Electric Company probably added a fervent "Amen" as it prepared to bid again for the contract for transformers and generators for the Chief Joseph Dam, a power project being developed by the Army Engineers in the State of Washington. At the first attempt, the company's tender had been nearly $1 million below that of the nearest American firm. This case is important not only because it involves more than $5 million worth of business for a foreign industry but also because it provided the first practical test of the sincerity of the new Administration's professed belief that the United States should, as General Eisenhower put it during the campaign last autumn, "seek out opportunities to increase imports of commodities, goods and services which will improve our economy and help make our allies self-supporting." The Administration came out of the test with drooping colours.

Over the last few years those English firms which have been trying to sell electrical equipment in the United States have had some unnerving experiences but they have, until now, had the help of the federal government in their efforts to get fair treatment, and where the government itself had jurisdiction there has been no cause for complaint. Both the Bureau of Reclamation and the Department of the Army have behaved with great fairness, recognising the existence of the Buy American Act, which requires government purchasers to give preference to domestic producers, but interpreting it with reasonable flexibility. In the case of the Chief Joseph Dam, however, the Secretary of the Army, not being willing to take the decision himself, passed it up to the Secretary of Defence. Mr Charles Wilson, whose ideas on trade policy seem to differ somewhat from those of his late rival in the motor car industry, Mr Henry Ford, took the problem to a Cabinet meeting.

In spite of all the efforts of General Bedell Smith, the Under Secretary of State, and Mr Harold Stassen, the Mutual Security Director, Mr Wilson's arguments won and the English Electric Company did not get the contract. It was not given at once, however, to the lowest American bidder, as it should have been if the Buy American Act, which is now being quoted in defence of the decision, really made it impossible to award it to a foreign firm. Instead, all the tenders were rejected and everyone is to have the chance to bid again—with the American firms now knowing the figure which they must approach next time.

All this could be dismissed as but one more example of a familiar commercial patriotism if it were not that the President himself made the decision in favour of Mr Wilson and against Mr Stassen and General Bedell Smith. The *Washington Post* has suggested that Mr Eisenhower was unaware that, under the Buy American Act, he had discretionary powers and that he believed that he had no alternative. If so, it is surprising that he was not told by somebody present at the Cabinet meeting of April 3rd, or by one of his staff, that he was not merely a helpless instrument of Mr Roosevelt's first Congress.

★

Four days after that Cabinet meeting the President sent to Congress a recommendation that the Reciprocal Trade Agreements Act should be extended for one year in its present form, a form which, as the *Washington Post* pointed out, would not "open the doors for an avalanche of new imports." In the message he spoke of

> the need to develop, through co-operative action among the free nations, a strong self-supporting economic system capable of providing both the military strength to deter aggression and the rising productivity that can improve living standards,

but he postponed discussion of the measures which might make this possible until a thorough and comprehensive re-examination of the economic foreign policy of the United States has been undertaken by a group headed by Mr Lewis Douglas.

Meanwhile, Representative Simpson, of Pennsylvania, has stolen the initiative and introduced a Bill into Congress which, in the absence of anything sponsored by the White House, will be the instrument for the extension of the Reciprocal Trade Agreements Act. It is full of crippling amendments which will have to be defeated one by one if the Act is to re-emerge even in its present unsatisfactory condition. One of the chief features of Mr Simpson's Bill is that wherever the words "serious injury to the domestic industry producing like or directly competitive articles" appear in the existing Act they shall be replaced by "unemployment of or injury to American workers, miners, farmers, or producers, producing like or competitive articles, or impairment of the national security"—a splendidly comprehensive phrase. And he also proposes that when the Tariff Commission, to which the President has recently appointed a man of known high protectionist views, reports that damage is being done by imports to American workers, miners and so on, the President must

take action, instead of being permitted, as at present, to reject the commission's recommendations.

The Simpson Bill, which is, through most of its length, general in tone, includes one very specific section called "Additional Duty on Lead and Zinc," and another imposing import quotas for crude petroleum and fuel oil which would, according to the Standard Oil Company of New Jersey,

> injure fuel consumers, jeopardise military fuel supplies and run counter to our country's efforts to help friendly nations toward greater economic strength through freer trade.

The whole Bill, indeed, would, if passed, "create consternation among countries of the free world and lend credence to the Communist theme that the United States wants to sell but does not want to buy," according to the Assistant Secretary of State for Congressional Relations. But the fact that the Administration has not sponsored a Bill means that this one will have to be considered and, although all its dangerous features may be defeated, it is by no means certain that they will. Where tariffs are concerned, the House of Representatives is a collection of representatives of special interests, who, much as they may wish individually that certain measures had never been introduced, find it politically expedient to vote for them.

★

These measures will, however, continue to be presented to them as long as the President sticks to the policy that he has decided to follow. It is his belief that he should not, like his two predecessors, attempt to dragoon Congress. He sees his task as one of keeping in step with Congress and trying to influence it only by education. On the particular issue of foreign economic policy, for instance, he is aware that he is the head of a party with a historical belief in tariffs and so he is willing to accept for the moment a one-year extension of the present Trade Agreements Act, including all its drawbacks. He will wait for Mr Lewis Douglas to produce his report and hope that it will have some impact on Congress and that something can then be done. In the meantime, the risk is that the believers in high tariffs, who are in important places in the Cabinet and in the almost equally important sub-Cabinet posts, will be making policy and, at the same time, making it almost impossible for their policies, sure to be popular in Congress, to be reversed.

Shackles for Treaties

FROM A CORRESPONDENT IN NEW YORK

THE proposed Bricker amendment to the Constitution, which purports to save the country from abuses of the President's treaty-making power, draws its strength from fears about the effect of international agreements upon American rights and domestic legislation. Similar fears helped to keep the United States out of the League of Nations a generation ago. They have now been resurrected in an effort which some people believe is meant eventually to drive the United States out of the United Nations.

The treaty-making machinery of the United States is derived from John Locke, Montesquieu, and the experience of the Continental Congress, and is governed by the system

of checks and balances so carefully laid down by the founding fathers. The conduct of foreign affairs is, of course, vested in the federal government, with the President empowered to negotiate and the Senate to approve or disapprove treaties. The states are bound to respect such treaties under Article VI, which reads:

> This Constitution, and the laws of the United States which shall be made in pursuance thereof and all treaties made, or which shall be made, under the authority of the United States, shall be the supreme law of the land; and the judges in every state shall be bound thereby, anything in the constitution or laws of any state to the contrary notwithstanding.

This system of giving treaties, once they are ratified, validity equal to that of the Constitution and federal law, and superior to that of state law, has worked for 165 years,

"We Don't Want You To Get Tied Up Abroad"

Herblock in the *Washington Post*

through intermittent changes of political party, and half a dozen foreign wars. But not until the last decade or so has it been used to ensure American co-operation with international bodies enjoying much authority. It is the creation of such bodies which is the ostensible source of Senator Bricker's fears that international agreements may over-ride domestic law, and the country find itself forced to accept decisions not made within its own borders.

The clearest example of how the treaty power might over-ride state law and alter the balance of power between the federal government and the states is the case brought by a Japanese against the Californian law which prohibits ownership of property by those barred from American citizenship. A lower court found that the law conflicted with the United Nations Charter, which had been ratified as a treaty, and hence that the law was void. But the Supreme Court of California reversed the decision on the

ground that the relevant part of the Charter was not self-enforcing, and would not go into effect until Congress passed enabling legislation. It is not only state and federal laws, however, but the Constitution itself which some alarmists profess to feel is endangered. They point to the minority opinion in the steel seizure case, which came perilously near to citing the Charter and the North Atlantic Treaty as giving the President, by implication, the power to seize the steel mills, something the majority found clearly unconstitutional. Finally, the United Nations covenants on human rights, on genocide and on press freedom mark a new departure in treaties, dealing as they do with relations between a government and its subjects rather than between two governments. Some Americans fear that, if ratified, these covenants might be used to justify the lowering of American standards of freedom, others that social reforms would be forced down American throats.

★

Senator Bricker's present remedy (a revision of an earlier measure) provides, first, that "a provision of a treaty which denies or abridges any right enumerated in this Constitution shall not be of any force or effect." No treaty which contravenes the Constitution has ever been negotiated by a President or approved by the Senate, and if it were its domestic provisions could be repealed by Act of Congress, but the Senator still feels unsafe. Section Two is fuzzier and more dangerous. It would forbid any treaty to

> authorise or permit any foreign power or any international organisation to supervise, control or adjudicate rights of citizens of the United States within the United States enumerated in this Constitution or any other matter essentially within the domestic jurisdiction of the United States.

No mixed-claims courts, no reciprocal rights such as are vital when bases are established in other countries for American defence, no international control of atomic power, no agreements such as the United Nations Charter could be entered into under these prohibitions. Even participation in the Monetary Fund, the International Court of Justice, or the International Postal Union might be endangered.

Section Three reads: "A treaty shall be effective as internal law in the United States only through the enactment of appropriate legislation by the Congress." At the present time treaties are negotiated by the executive branch and ratified by a vote of two-thirds of the Senate, a process already difficult enough. Mr Bricker would require not one Congressional vote, but three. The New York City Bar Association says: "Thus to have internal force, a treaty would need approval by (1) the President, (2) a two-thirds vote of the Senate, (3) a majority vote of the House, and (4) a majority vote of the Senate." The delays and opportunities for obstruction which any such provision would create are obvious. The final judgment of the New York association is that Senator Bricker's amendment "would place so many impediments upon our conduct of foreign affairs as to constitute a grave threat to our chances of survival in the modern world."

If this is true, and it accords with separate analyses made by Mr Dulles, the Secretary of State, and Mr Brownell, the Attorney General, one wonders why the names of more than sixty Senators are attached to such a concoction, why the weight of the American Bar Association has been lent to give it added dignity, and why the Eisenhower Administration is seriously concerned lest the proposed amendment pass—so concerned that the President authorised Mr Dulles to promise the Senate that the United States would sign neither the United Nations covenant on human rights, nor that on the political rights of women.

The answer to the first question lies partly in the fact that several of the Senators who sponsored the measure introduced in 1952 said they did so because they thought the effect of treaties on domestic law should be publicly discussed. This does not commit them to vote for the Bricker Amendment, but it does give the amendment unfortunate weight with the public. So far the desired discussion has raged mostly in legal circles, where plenty of heat and considerable light have been generated. Until Mr Dulles made his opposition to the amendment known before the Senate judiciary sub-committee in a complete reversal of his views before he became Secretary of State, even the press seemed unable or unwilling to understand the danger. As for the public, it has yet to be aroused. Usually Americans rush to the defence of the Constitution, but this time they are the victims of propaganda which pictures what is really an attack on the Constitution as a way of defending it. Moreover, the deep national distrust of international commitments, swept aside after 1941, has reasserted itself since the beginning of the Korean war.

As for the part of the American Bar Association in sowing fear of the treaty powers, the explanation seems to be that a small group of elderly officers from the Middle and Far West, led by a Rhodes scholar from Seattle, banded together some four years ago to stop the country's forward progress in international affairs. By a series of shrewd moves they

seized control of a Bar Association "Committee on Peace and Law through United Nations," and placed themselves in a position to speak for all the lawyers in the country. This group's efforts on behalf of an amendment very similar to that of Senator Bricker and another curtailing the President's powers to make executive agreements on matters not requiring treaties have alarmed groups of lawyers in New York, Chicago and San Francisco, who are jealous of the reputation of their profession for impartiality. Their disagreement is being made public.

In its present mood, and for a variety of reasons, the United States trusts neither the President, nor the Senate, nor its nearest neighbours, nor itself. Whether this distrust can be exploited to make dealings with other nations harder at a time when, for the safety of the country, they should be made easier remains to be seen. But the full force of the Eisenhower Administration, which on this issue will have the support of most of the Democrats in Congress, has been thrown behind the effort to prevent such a suicidal course.

American Notes

Challenge to Peace

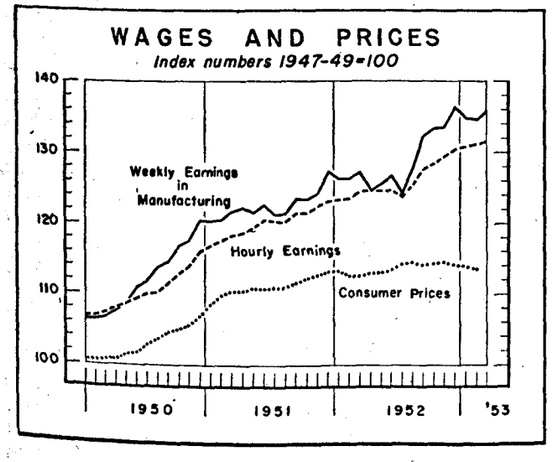
To the world in general the chief significance of President Eisenhower's considered statement of his international aims, made last week to the Society of Newspaper Editors, probably lies in the evidence it offers that the new Administration in the United States is as prepared to take a constructive lead in a struggle for peace as its predecessor was in the struggle against Communist aggression. But to Americans, even more suspicious of Soviet sincerity than other people, it is equally, if not more, important that the President made it clear he would never consent to appeasement and that he set standards by which the genuineness of the Russian desire to change the cold war into a warm peace can be judged. He challenged the Communists to conclude an "honourable armistice in Korea," to sign an Austrian treaty, to release prisoners still held from the last war. If such deeds were followed by political settlements for other specific issues that divide the free world from the Soviet Union, then, and only then, agreements on disarmament might follow. Finally, after that there would arise a great opportunity to use the resources thus released for an international war against poverty.

This imaginative proposal is perhaps President Eisenhower's substitute for Mr Truman's more modest but also more immediately practical programme for underdeveloped areas. For the new President has so far given no indication whether he intends to continue the various Point Four schemes that are now under way, although he is sending his brother to Latin America, an area which he feels was neglected by his predecessor, to report on conditions there, with special reference to technical aid from the United States. Such an indication was, however, hardly to be expected in last week's speech, since it contained little in the way of precise plans. Its lack of detail, its failure to map the road to the objectives it sets up, is in fact one of the few points about it that has been criticised, especially by Mr Walter Lippmann.

Seldom has a presidential address been received with greater enthusiasm; it is already being justifiably hailed as a great state paper. Not surprisingly, since one of its most outstanding characteristics was the continuity which it established in American foreign policy, the acclaim has come even more whole-heartedly from Democrats than from Republicans. It was Mr John Foster Dulles who injected a partisan note into the peace campaign, when he followed the President with the first of a series of speeches on the subject which will be coming from various members of the Cabinet. For Mr Dulles insisted that the President's fresh approach to foreign policy and his creative challenge to the Soviet Union was possible only because of the new vigour and decisiveness which ninety days of Republican responsibility had brought to the government.

Fair Deal Filibuster

The filibuster, the process of talking a measure to death, has customarily been popular with southern Senators, who rely upon it to ward off Negro civil rights measures, and anathema to the northern, and Fair Deal, wing of the Democratic party. In the Senate debate on the Bill to give states title to the oil under the sea along their coasts, however, the shoe is on the other foot. It is the Fair Dealers who are responsible for prolonging the debate into its fourth week, though they disclaim any intention of filibustering; they are merely "educating the public" to the enormity of giving away billions of dollars worth of oil to three geographically lucky states, and encouraging other states to make raids on national resources. Not all those in the "talkathon" come from the north, however. Its leader is the liberal Senator Hill, of Alabama, a state which has no coastal oil; he has prepared a 73-page speech to add to the hundreds of thousands of words that have flowed over the tidelands.



It is true that the opposition can have little hope of success. The House has already passed the Bill, a majority apparently exists in the Senate to do the same, and Senator Taft, the majority leader, is determined to push the measure through, even if it means that federal rent controls, which the Administration would like to see temporarily extended, die on April 30th. The Senator has called for the first evening sessions of 1953 in order to clear the decks, and even so is almost resigned to keeping Congress in session through July. The schedule calls for consideration of the Bill to give the President emergency powers to freeze prices and wages, and then for the Hawaiian Statehood Bill. But right of way will be made at any time for appropriation Bills, which are the indispensable business of Congress.

None of these has yet been passed by the House, in which they must originate. The House Appropriations Committee claims that by various economies and other devices—such as ordering the sale of government assets and voting for the liquidation of all public housing—it has "improved the government's financial position" to the tune of nearly $3 billion. Most of the economies consist, however, of postponements rather than genuine savings, and the estimate for the deficit in the year ending on June 30th is rising; revenues are expected to be disappointing. This year's deficit is now put at $7 billion; Mr Truman estimated that next year's would total nearly $10 billion. The opportunities for really large cuts in spending must await the foreign and defence appropriations, which account for 67 per cent of the requests for new money in the Truman budget. What the Administration will ask, or Congress grant, is still unknown, but in Congress, at least, there are still hopes of heavy slashes which will justify tax relief this year.

Wages on the Down Escalator

The trade unions, which were eager to secure cost of living bonuses while prices were rising, are less enthusiastic about them now that the escalator clauses have begun to work in reverse. The railway unions have had to accept a 3 cent an hour pay cut, and the employees of the General Motors Corporation, who at one time were receiving 26 cents an hour under the cost of living scheme, have lost a cent an hour. Textile and farm implement workers have suffered similar reductions in their pay packets.

The Bureau of Labour Statistics' new index of consumer prices is lower than it has been since June, although the drop has been slight. The wage escalator, however, is still governed, in most cases, by the unrevised index, which is based on the buying habits and the price level of 1935 to 1939, rather than those of 1947 to 1949. The railway workers helped to persuade President Eisenhower to order the old index to be continued temporarily. They probably regret now that they were not ready to convert to the new

index when it made its first appearance. The old index gives more weight than the new to food prices, and hence has fallen further.

As the chart shows, while prices have been levelling off, earnings have continued to rise. But this is due to longer hours as well as to higher basic rates. The trade unions are afraid that, if business slackens and prices drop further, many of their gains may be wiped out. One response has been the drive to have the major part of the cost of living increases incorporated in the basic wage. Another is to justify future wage demands on the score of increased productivity. Automobile workers already receive annual productivity increases. The National Association of Manufacturers has moved to nip in the bud any effort to extend this practice. It argues that gains in productivity should be shared by all consumers through lower prices and not confined to trade union members.

With labour still scarce and business humming, some wage concessions will be necessary. But large increases will not be as easy to win as they were last year, when the steelworkers secured their big rise. Their demands this year, which are now being formulated, will be watched closely. The steelworkers have no cost of living clause in their contracts. Any substantial rise they may win would increase the dissatisfaction of workers on an escalator that has begun to move down.

Villain of the Shell Shortage

That there was a shortage, at times a grave one, of certain types of ammunition in Korea has been conceded by the defence authorities summoned by the Senate Armed Services sub-committee to answer General Van Fleet's complaints. Having established this, the task of the chairman, Senator Margaret Chase Smith, and her colleagues is to discover where the responsibility lay. Mr Lovett, the

WALL STREET JOURNAL
NOW AIR-DELIVERED
TO BRITAIN

To bring you first economic news daily from America

SUBSCRIBERS in the London postal area receive The Wall Street Journal by air from New York two days after publication date—a day later in the provinces. Service was inaugurated March 1, 1948; has been in successful daily operation more than three years. Subscribers include leading industrial and financial firms.

• • • • • •

You are invited to subscribe. You will have the advantage each day of this fastest possible complete news which The Wall Street Journal brings you—covering U.S. industrial, financial and political developments. You will be kept speedily and intimately informed, as never before, of U.S. changes and trends affecting England's export potentials and your own future business and income. You will receive no modified or abridged edition, but the exact, full-content Wall Street Journal circulated in the U.S.

Subscription price is $72 a year—payable in sterling (£25.14.4 at current rate of exchange) at our London office by permission of the Foreign Exchange Control of the Bank of England. Address: The Wall Street Journal, 83-86 Farringdon Street, London, E.C.4.

former Secretary of Defence, and Mr McNeil, his Assistant Secretary, have stoutly resisted Senator Byrd's demands for an individual scapegoat. The villain, they insist, is the "basic system of Army procurement, obsolete accounting, and splintered authority."

Nominal unification of the services has not prevented Army spokesmen from disagreeing. Mr Pace, the former Secretary of the Army, has testified that in September, 1950, it was assumed by the top defence authorities that the war would be over by June, 1951; the Army was discouraged from spending too rapidly the ample funds for ammunition voted by Congress. No one, moreover, foresaw the entry of the Chinese or the heavy expenditures of shells required by the trench warfare that followed. Moreover, an ammunition industry had to be built up virtually from scratch in 1950. Others reminded the sub-committee that in peacetime the Army is compelled, by Congress, to rely on competitive bidding and to consider the claims of small businessmen and distressed areas to a share of the contracts.

No doubt all these factors contributed to the delay. But what most shocked and impressed the committee was Mr McNeil's description of the birth of an arms contract. An order must go through thirty or forty departments and be approved by 200 officers before it emerges as a firm contract. This might take as long as 287 days; the "speedometer" on one order registered 10,000 miles. The system which has grown up—some of it dates back nearly to George Washington's time—makes it difficult to get the facts and almost impossible to assign responsibility. In Senator Byrd's words, it is "terrifying . . . incomprehensible . . . ridiculous." Mr Stevens, the present Secretary of the Army, has testified that in Korea the shortage is now a thing of the past. He hopes that within six months, as new facilities come into production, the home reserves will be built up to a safe level. The enquiry will have served a most useful purpose, however, if it brings about a reorganisation of the Army's traditional business and administrative methods. The last war was won only by disregarding most of them.

Young Men in a Hurry

MR COHN and Mr Schine, Senator McCarthy's cocksure young deputies recently in Europe, are leading members of a rapidly growing Washington profession, that of counsel to congressional investigating committees. (It is surprising that no college yet seems to offer a degree in this subject.) "Like master, like man," applies in this case: no reputable investigator would consider a ten days' whirlwind visit long enough to collect full evidence whether the "maximum constructive use" is being made of the taxpayers' money by the overseas propaganda services, the ostensible purpose of this trip. But ten days is quite enough time in which to collect a full batch of specimens to be examined later for Communist symptoms by Senator McCarthy and the television cameras.

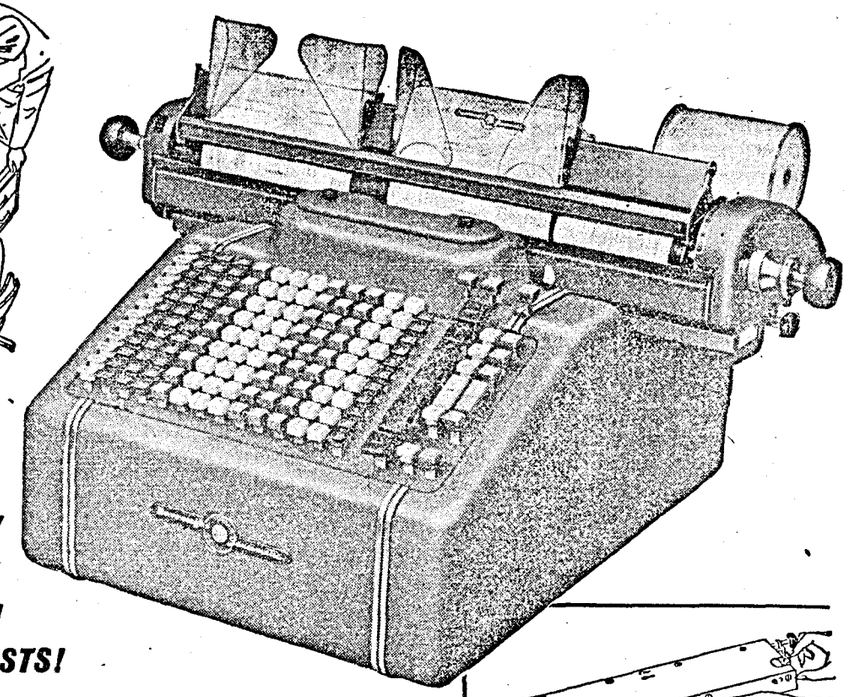
One specimen who has already turned on the two "junketeering gumshoes" is Mr Theodore Kaghan, a leading American information official in Germany. Another courageous victim of this inquiry, Mr Reed Harris, who earlier answered Mr McCarthy back most satisfyingly, has now given up the struggle and resigned from his post as deputy director of the State Department's International Information Administration. Dr Robert Johnson, President Eisenhower's new head of the whole United States Information Service, has expressed his regret at Mr Harris's departure with heartfelt sincerity. But the rivalries and disagreements on policy within the service, which the McCarthy investigation has brought into the open, show that it would certainly be better off without some of its other employees. Dr Johnson is therefore probably not sorry that the new Administration's insistence on economy is forcing him to dismiss over 800 of them—although probably not the ones that Senator McCarthy would choose to dispense with. It is also forcing Dr Johnson to reduce drastically the hours in which the "Voice of America" speaks to the free world; broadcasts to countries behind the iron curtain will, however, apparently be maintained in full.

Dr Johnson has brought in several outside experts to examine various branches of the information services and a thorough reorganisation is expected before long. This may involve taking overseas propaganda away from the State Department completely and setting up an independent agency to deal with it. This has already been recommended by several experts and may be favoured by the sub-committee of Senate Foreign Relations Committee which for some time has been covering much the same ground as Senator McCarthy, but digging into it more deeply, with responsibility and without publicity.

SHORTER NOTES

Whether or not America's government-owned synthetic rubber plants will be taken over by private industry now depends on Congress. Following the recent report of the Reconstruction Finance Corporation on this subject, the President has recommended legislation permitting their sale. He stipulated, however, that the sale price should enable the plants to realise their full, fair value and should ensure the country the benefits of competition in the industry.

★

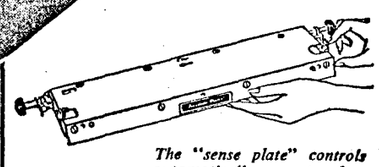


Mrs Oveta Culp Hobby, the head of the new Department of Health, Education and Welfare, and the second woman to be a member of an American Cabinet, does not wish to be called "Madam." She prefers "Mrs Secretary."

★

President Eisenhower has had great difficulty in finding anyone to accept the position of head of the Anti-Trust Division of his Department of Justice, for in a Republican Administration the holder of this office will certainly be subject to embarrassing pressures from his party's business supporters. Mr Stanley Barnes, a judge from California, has now been appointed. His slogan will be "prosecution but not persecution"; he has no previous experience of anti-trust work. The opposite is true of Mr Edward Howrey, the new Republican head of the Federal Trade Commission, which is also concerned with anti-trust cases. He has been defending companies against FTC charges for over twenty years, and businessmen will hardly now be able to claim that the commission is prejudiced against them.

The most versatile accounting machine ever made



A COMPLETELY NEW MEANS TO SPEED OFFICE PRODUCTION AND CUT OFFICE COSTS!

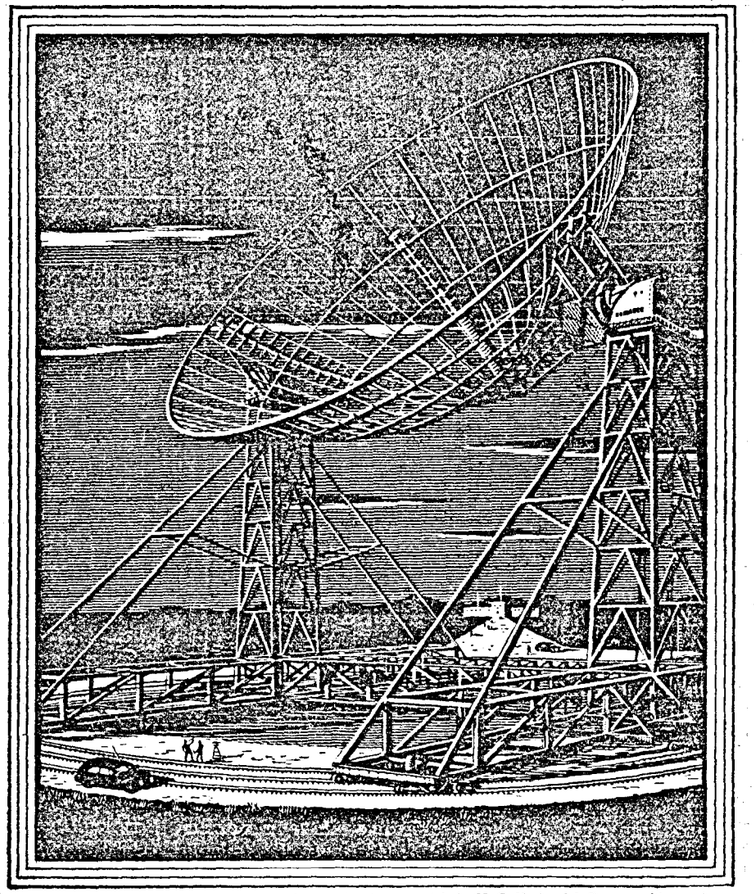
HOW MUCH OFFICE TIME AND LABOUR can the Burroughs Sensimatic save your business? The answer's up to you—for there is practically no limit to the work this *entirely new* "business tool" can do. Many different posting operations for a small firm, or a huge volume of work on one peak posting operation for a large firm, the Sensimatic takes the lot—with never a moment lost between changes in application.

The key to this astonishing flexibility is the principle of "sense plate" control, which directs the machine through every mathematical function and every carriage movement. Each plate (or unit) controls up to four different posting jobs, and to change from one unit to another is a matter of seconds only. Call Burroughs about the Sensimatic *today*. You'll be surprised at the low cost of this incomparable Accounting Machine.

Like every record-keeping machine in the wide Burroughs range, its day-by-day efficiency in operation is guaranteed by Burroughs Service—the expert maintenance men who are trusted, welcome visitors to thousands of business houses.

Burroughs Adding Machine Limited, Avon House, 356-366 Oxford St., London, W.1. Sales & Service offices in principal cities.

The "sense plate" controls automatically up to four separate accounting procedures in any combination



Does practically all accounting jobs

At the turn of a knob, the Sensimatic switches from one accounting operation to another. One moment you are on Accounts Receivable (say), the next on Stock Records. And so on, up to four different accounting operations for each Control Unit. Payroll; Stores; Costs; Sales, Purchase and General Ledgers; Dividend Warrants; Statistical Analysis . . . the Burroughs Sensimatic speeds them all.

Burroughs Sensimatic

makes accounting *move*

There's a future in STEEL

From a drawing, copyright by H. C. Husband & Co., consulting engineers.

BRITAIN'S ASTRONOMERS will soon have a new way to the stars. Two thousand tons of steel are going into the building of a giant steerable radio telescope at the Jodrell Bank Experimental Station of Manchester University. With this instrument, the first of its kind in the world to be built on such a huge scale, Britain's scientists will be able to receive radio waves from stars far beyond the range of the largest optical telescope. Here is a new method of penetrating the great dust clouds which until now have prevented mankind from exploring the vast regions of outer space.

This radio telescope contains a steel bowl weighing 300 tons, supported on steel towers 180 feet high. The whole instrument above ground weighs well over 1,000 tons. It rides on a circular railway and can be aimed at any part of the sky.

The steel industry is supplying the material for this and many other new projects and is constantly developing new steels to meet the changing demands of modern industry, science and engineering.

'What about my future?'

says

JACK SCRAP

The steel industry still needs all the scrap which engineering firms and other steel-users can send back. Search out every ton of scrap on your premises. Your local scrap merchant will help with dismantling and collection.

The World Overseas

Canada Feels Its Strength—1

Power Not For Export

FROM OUR OTTAWA CORRESPONDENT

NOT so long ago people talked about Canada as the only country in the world to suffer from two inferiority complexes at once. The wisecrack derived from the overshadowing influence of Britain on the one hand and the United States on the other. But the Canada of 1953 is less like a psychiatrist's patient than a poor relative who has come into a sudden fortune. Considering the access of riches, the country has commendably resisted the temptation to arrogance ; and if signs of it show here and there they can still be considered a healthy alternative to a double inferiority complex.

In the early years after the war Canadians sometimes wondered if they had merely exchanged the habit of saying "Ready, aye, ready, sir" to the British for the habit of saying it to the Americans. There was considerable doubt whether, in that case, the exchange was an improvement. But in more recent years fewer and fewer Canadians feel any inclination to say "ready, aye, ready" to any other country. Great Britain, in its long experience with evolving national entities, learnt long years ago that the Canadians were apt to be touchy. Now, in the postwar bloom of Canada's expansion and the established recognition of national independence, touchiness is no longer a characteristic that bothers Anglo-Canadian relations. When Britons complain about Canadian attitudes, it is not because they are touchy but because they are tough. But Americans, still short of experience in dealing with smaller powers and newer national entities, are apt to complain even in these days that Canada is touchy.

What American observers often call touchiness is what Canadians call "putting them in their place." What they consider "awkwardness" in Canadian foreign policy Canadians regard as the exercise—often frustrating and sometimes futile—of a duty and a right to criticise wrong-headed policies. These differences are now becoming apparent in a new and important sphere, the development of Canadian natural resources. The Canadian Government, with widespread public support reflected in the attitudes of the principal political parties, is insisting on a policy of development in the interests of "Canada First." Many Americans find themselves puzzled by the attitudes taken here, and they are apt to regard them as "nationalistic" or even "isolationist," and certainly "touchy."

The phrase "Canada First" in this connection has an interesting history. It came into prominence during a protracted parliamentary manœuvre which was planned by opposition members to delay the incorporation—demanded by Act of Parliament—of companies planning to export Canadian natural gas. A group of members, including some Government supporters, set itself some years ago to resist the incorporation of any company whose object was to export natural gas from Canada to the United States. Canada, they said, must be served first.

In the spring of this year, the Government at last proclaimed its own policy in the matter, and Mr C. D. Howe, Minister of Trade and Commerce, corrected the "Canada First" slogan. He said he did not like it because it immediately raised the question who would be second and third. His slogan, he said, was "Canada Always." Whatever the phrase may be, the policy comes to the same thing. It is that Canadian natural resources may not be alienated until it is established that Canada has no use for them, and that not merely in the foreseeable future but in any conceivable future.

Alcoa and Alcan

The case has arisen lately not only about natural gas, but also about water-power. The Aluminum Company of America has a plan for a huge aluminium smelter near Skagway, Alaska, at the historic entrance to the Yukon. Its plan depends on turning back the headwaters of the Yukon River and tunnelling them through the coastal mountains, very much as the Aluminum Company of Canada is doing at its Kitimat-Kemano development in northern British Columbia. The Alcan development uses Canadian water and uses it on Canadian territory. The Alcoa development would use Canadian water on United States territory. Moreover its aluminium production would thus come within the American tariff boundaries. The suggestion could hardly be popular in Canada at a time when the Canadian company has made repeated efforts to contract to sell some of its output to the US Government—efforts which have always been frustrated by the protectionist pressures of the American industry.

Yet, in rejecting the American company's request, the Canadian Government deliberately refrained from basing its refusal on any of the details of the proposal. It has not raised the question whether it would be economically desirable or not. Instead it has reverted to a parliamentary Act of 1907 governing the export of water-power, and has simply asserted that it is contrary to Canadian policy to permit export of power which may be required for Canadian development. The refusal was also made without reference

to, though not without knowledge of, an alternative proposal now under serious study for use of the Yukon's water-resources within Canada for a major metallurgical development. None of the details of the plan are yet revealed. But it is known that one of the biggest Canadian mining groups—headed by the companies of Ventures Ltd. and Frobisher Ltd.—is interested in a huge power development to enable it to conduct smelting operations by new processes which it has developed. An ultimate capacity of 5 million horsepower is envisaged, and it appears that ores from all over the world as well as from North America might be brought to the source of power, much as bauxite is brought to power for the production of aluminium.

This development, clearly, may be so important that it would by itself provide complete justification for refusing to sanction an alternative use of the power. But this is not the ground on which the Canadian refusal was made. If the Ventures-Frobisher project had never been heard of, the Canadian attitude would have been the same. The power would have been reserved to Canadian use against the day when somebody else came along with a project for using it in Canada.

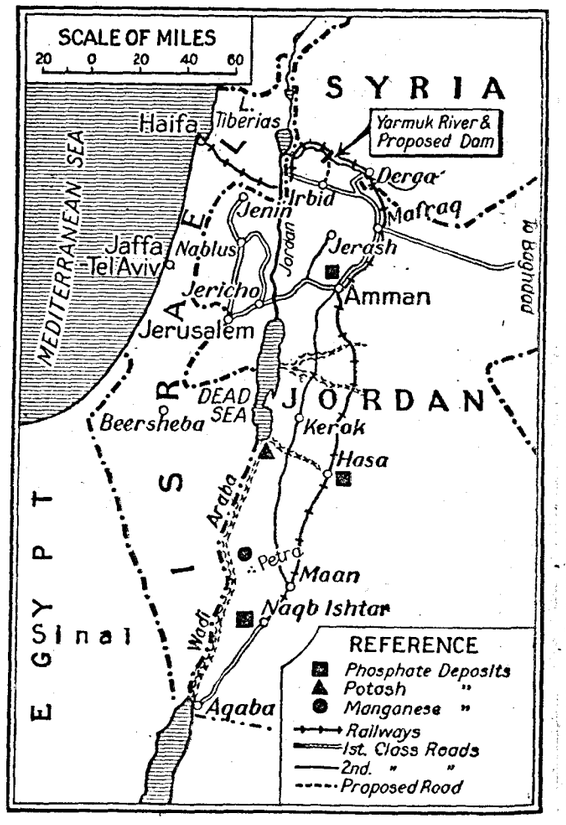
(To be concluded)

Prospect for Jordan

BY OUR SPECIAL CORRESPONDENT IN THE MIDDLE EAST

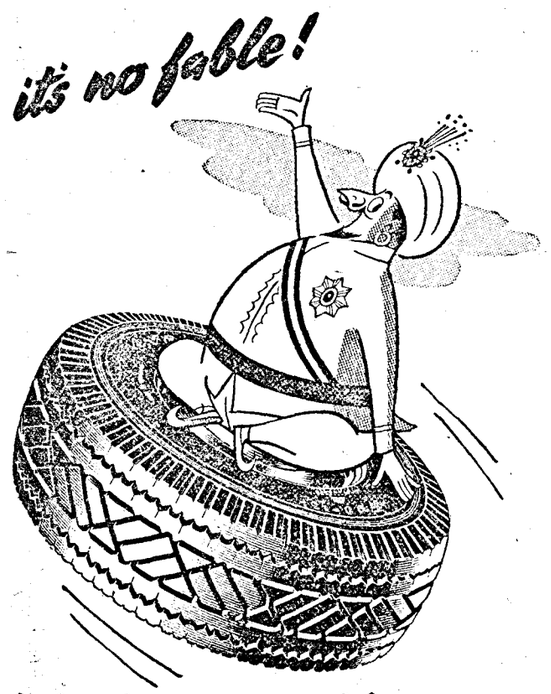
ON a cold and windy evening early this month, the people of Amman watched the young King Hussein return to his kingdom from Harrow and Sandhurst. He will be crowned on his 18th birthday, which falls next week. In a few respects his coronation is a moment of promise. He has a good Sandhurst record for sturdiness and leadership and, judging by the aplomb with which he at once set about visiting his ministries and his distressed areas, he has a mind to be a worker-king. The people that he is to rule also possess some sturdy qualities, as was proved when, in the course of two years of distressing economic need, they weathered first the murder of King Abdullah, and then their abdication crisis.

Yet against these advantages must be set at least three dreadful drawbacks. A people that was sadly poor to begin with has been shorn by the Palestine war of its natural market, the coastal plain of Palestine, and its natural port, Haifa. Poverty of communication with the world outside is present-day Jordan's chief bar to an improved economy; it is the only Arab sufferer by the Arab boycott of Israel. Simultaneously, it has joined to itself the poorest part of Palestine—bare hills full of people once quite well to do, but now destitute and drifting in search of someone or something to be loyal to. Lastly, to these two handicaps is added the crushing burden of the nearly half a million refugees who fled east in 1948; these are only partially cared for by the United Nations, and remain an unsolved problem because even a greatly improved Jordanian economy could not sustain such numbers. The prospect is not bright.



Jordan's map and its trade figures are two pieces of solid evidence of its difficulties. A relief map shows at a glance that all roads, whether north-south or from east bank to west bank, must (unless they veer out into the eastern desert where there are no paying loads) climb up and down huge escarpments which are expensive in time and money, not only to pave but to cross; till roads are good, the limit to better living standards is set less by what can be produced than by what is worth carrying to a paying market.

A decade of foreign trade balances shows, however, that this handicap has not prevented the Jordanians from spending the proceeds of war booms on equipping themselves from abroad. Visible trade runs at a tremendous unbalance:



(000,000 Jordan Dinars)
1JD = £1 sterling

	1950	1951	1952
Imports	13.48	16.18	16.85
Exports	1.95	2.00	2.11

In so poor a country, this gap appears at first sight unbridgeable. Even when about JD3 million worth of imports paid for by the United Nations Relief and Works Agency (Unrwa) is deducted, it remains huge. In fact it is bridged by a quite abnormal number of unilateral transactions; official transactions such as that part of the British subsidy towards the Arab Legion which is spent inside Jordan, and local expenditure by Unrwa and the United States Point IV organisation between them provided over JD9 million in 1952. In the same year invisible exports included over half a million as rent for the passage of pipe lines and JD2.46 million of remittances from emigrants and foreign religious foundations. Any young man who can afford the fare is ready to leave for Kuwait tomorrow; this figure is therefore likely to rise, and, for the sake of an overcrowded country, one must hope that it will do so. Tourist earnings would be greater if communications were better; they deserve to be

it's no fable!

higher mileage is a REALITY!

HIGHER MILEAGE
Avon's thicker and deeper tread gives many thousands of extra miles.

GREATER GRIP
The wider Avon tread gives more road contact and extra 'bite'.

BETTER BRAKING
Centre traction bars and multiple slots give extra stopping power.

Thousands of motorists throughout the country have *proved* it beyond all doubt—you get far higher mileage from the AVON H.M. Thus day-to-day motoring triumphantly confirms years of Avon research—on unique testing machines and over 1¼ million miles of roads. Lower the cost of *your* motoring. Save *your* money. Fit AVON H.M. all round and enjoy the real economy of this remarkable higher mileage tyre. Send for illustrated folder "The Story Behind the Greatest Development in Car Tyre Construction", free on request to The Avon India Rubber Co. Ltd. Melksham, Wilts.

FEEL THE DIFFERENCE for yourself

Mitre Club is a new kind of notepaper. Ask to see it, run your fingers over its specially-processed surface. You can tell the difference at a touch! Take any kind of pen to it—this new, satin-smooth finish *does* make writing easier! Mitre Club costs no more.

MITRE CLUB

Makes writing easier

Available in white and an attractive new shade of blue in three sizes of pads, and in boxes of single and double sheets with distinctive envelopes to match.

FROM ALL REALLY GOOD STATIONERS

so, for Jordan's manners to its visitors are first class. Currently, therefore, there is a favourable balance on foreign exchange, the scales being finally tipped by payments from a series of British development loans towards the country's five year plan and—negotiated during the financial talks which took place in London this spring—a British grant-in-aid (£750,000 for the year that is about to begin) towards budgetary stability while development materialises. In a word, Jordan rounds the bend only because of a peculiar series of subsidies, and—for years to come—would collapse if they were to stop.

The Taxpayer's Question

To the British taxpayer who inquires, legitimately enough, why his money should go to developing the lands of a distant ally, the answer is that the bargain is mutual. Jordan cannot carry its present burdens without more money than it is in a position to earn ; the British need a dependable military and air ally in Jordan's part of the world—a region that is elsewhere a prey to anti-western mouthings and to social instability. A bargain has been sealed because the Jordanians, despite the knocks that they suffered over the Palestine settlement, are ready to do business ; they are more apt than most of their neighbours at weighing their interests on a basis of reality as opposed to emotion. The British, when closing the negotiations which, last month, produced the third development loan and the budgetary grant in aid, with equal realism told them that they must enforce more control of unlicensed imports and of foreign exchange transactions if the arrangement was to be mutually satisfactory.

The job of shortening the period of Jordan's dependence on outside aid as much as possible falls to its development board, on which sit Jordanian ministers and civil servants with a British secretary-general and a representative of the US Point IV organisation. The funds at its disposal are chiefly the last two British loans (£1.5 million in 1951 and £500,000 this year). Point IV's contribution is largely in kind ; it finances a variety of experts and, in Jordan in particular, would do more good if it spent less on people and achieved a greater concentration of funds on its best projects, which are good ; Unrwa is also contributing to one long-term scheme which promises directly to settle some refugees.

The question of the moment is: in what order shall projects be furthered ? Shall communications come first—roads, Jerusalem airport for tourists, proper equipment for the port of Aqaba ? Or is the most urgent priority west bank morale, in the interests of internal security ? Or shall the country stake the bulk of the money on the manganese and phosphates that, after cursory survey, are known to exist in considerable quantities—though the manganese in particular is most inaccessibly placed ? Or shall close settlement of peasants on irrigated land take first place? Or the planting of forest trees to arrest erosion ? The debate is on.

The board was founded only last year, and few projects have as yet paid dividends, but communications are improving and good work is in hand (it will be described in a subsequent article) in restoring some employment and self-respect in the nearly desperate west bank frontier villages and in Jerusalem. Two agricultural schemes of promise are the damming of the Yarmuk river in order to provide power for both the Jordan valley and Syria as well as good land for perhaps 100,000 cultivators on the floor of the Jordan valley, and a so-called "water spreading" scheme on the fringe of the desert where, by the raising of banks, Point IV is already proving on sample plots that winter rains can be made to grow lush grass and nourish fatter cattle.

Some Jordanians are fired by the prospects of mines and industry and feel that all the money should be devoted to these. Certainly much capital is needed for the former and the sums raised by public subscription in Jordan itself are pitifully inadequate for full development. But here, if anywhere, seems to be a point at which private foreign capital might be enlisted. Jordan's problem is how to afford the necessary security. The private investor has become shy owing to recent treatment in Middle Eastern countries, but might be tempted into mixed joint-stock enterprises run in harness with Jordanian private capital if the Jordanians were, in their sturdy way, to promise reasonable security over the export of profits and the employment, at the start, of expert foreign technical management.

Even this cursory survey reveals that King Hussein has a heavy load to shoulder. Over and above an economic situation in which, in any year when rains are short, his own people are closer to starvation than are the refugees fed by Unrwa, he has to contend with bitter east-bank-west-bank feeling that causes good men to be passed over, and with the sad weaknesses of an administration that has slipped downhill under the strain of too many problems and too little money. But some of these ills could be cured by an injection of personality. This is much to ask of a young man of 18, but the chance is there if he chooses the best advisers available and decides to seize it.

Dilemmas for Peking

SINCE the beginning of the year two decisions taken in Peking have indicated the serious economic difficulties which now confront the Chinese People's Republic. First, in January a conference of ministers concerned with economic affairs decided to reduce by 30 per cent the expansion of industry planned for 1953 on account of shortages of materials and skilled labour. It also issued a warning on the disruption of these plans by competitive bidding for skilled workers between various state organisations anxious to achieve or surpass their production targets. Then, in March, a directive from the Central Committee of the Communist party spoke of "impatient and adventurist" tendencies among party officials in the countryside, pointing out that work by peasants on their private holdings was "perfectly legal" and that they must not be compelled against their will to enter collective organisations.

At the beginning of January it was proudly claimed that the five-year plan for the expansion of industry would be carried out successfully because of three factors: China's rich natural resources, the "wise leadership" of the Communist party and the "selfless help" of the Soviet Union. Since then the government has been running into all the difficulties which confronted the Soviet Union in its industrialisation and which exist in China today in an even more obstructive form. What the Chinese Communists want to do—and it is, of course, a Chinese national aspiration quite apart from any Communist doctrine—is to carry out a high-speed industrialisation of the country, and particularly to build up a strong heavy industry, without

any dependence on loans or credits from "imperialist" nations. Such an effort in an economically backward and poverty-stricken country has two inevitable adverse effects: first, a scarcity of materials and skilled labour due to targets being set beyond the availability of these factors, and, secondly, a famine of consumer goods due to the maximum diversion of resources into the capital goods industry. The latter consequence is particularly important in relation to the peasantry, because peasants owning their own land and producing enough food for themselves are unwilling to produce for the support of the urban population unless they can obtain purchasing power in terms of consumer goods.

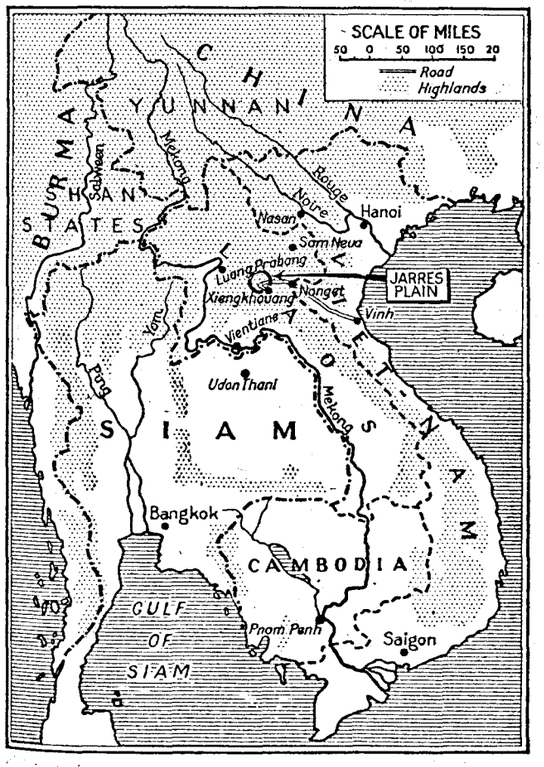
The materials and labour shortages have already, as pointed out above, enforced a drastic curtailment of plans for this year. A planned economy is quickly upset if materials are diverted from priority requirements and if wage rates are forced up by competitive bidding for an inadequate labour supply. The Chinese Communists have centralised the administration of the country to a far greater degree than any previous regime, but there is no central control comparable to that which Stalin had over the Soviet economy in 1930; consequently, it is much harder to enforce a strict scale of priorities for materials and labour. There is still a large sector of private industry and the various regional authorities and state trusts are highly competitive among themselves. Peking says that all this scrounging for scarce materials and "luring" of skilled workers from one place to another is a "deviation" which must be "examined and corrected." It will be more easily examined than corrected and, meanwhile, the government has done the wisest thing in reducing the plan.

Doubled-Edged Weapon

The scarcities in industry, however, are not the only major difficulty in the way of the plan. Industrialisation requires that the town population, including a greatly expanded labour force, be fed from the villages while the work is in progress. But how is the peasant to be persuaded to produce a sufficient surplus of food for the market? Either he must be compelled to produce it and deliver it to the state as a tax without any return for it, or else he must be given the incentive of sales which will enable him to buy consumer goods. But the former course means increasing unpopularity for the government, perhaps leading to active disaffection and even revolt, while the latter involves a relaxation of the austerity in consumer goods supplies which a plan concentrated on heavy industrial construction necessarily requires.

The Chinese Communists are discovering what all Communists in power find out sooner or later, that agrarian reform is a double-edged weapon. Giving the landlord's land to the peasant in private ownership is a wonderfully effective tactic in the period of revolution, but the price has to be paid when it comes to forced industrialisation in the Communist manner. The peasant who has come to own the land he cultivates expects to be better off than when he was a tenant, but he gains nothing if the state takes everything in taxes that he formerly paid in rent. But if he is to be induced to supply the towns with food by the availability of consumer goods, this limits the state's capacity to divert national resources into heavy industry. The ideal solution is, of course, collectivisation, which is not merely a theoretical aim of socialist policy but has the vitally important practical effect of transforming the independent peasant producer into a wage-worker no longer able to determine the quantity of his own production or to withhold it from the market. But as the recent Central Committee directive sorrowfully admits, collectivisation is not yet practical politics in China; the vast majority of the peasants are hostile to the idea and it would be too dangerous to enforce it.

With the Nationalists in Formosa watching for any opportunity to make trouble, Peking cannot afford to provoke peasant insurrections. So the over-zealous comrades who have been trying to coerce peasants into joining "mutual aid teams" and "producers' co-operatives"—the preliminary stages on the way to the collective farm—have been told to go slow and be more careful.



Retreat to Persuasion

The programme now declared is to win over the peasants gradually to a favourable attitude to collective farms by establishing models in each province to demonstrate their advantages; similarly, the mutual aid teams and producers' co-operatives are to carry on propaganda by example. The idea, as in Eastern Europe, is to make the system attractive by endowing the model collective units with farm machinery and various facilities and privileges which are withheld from the private producer. At present, according to Peking, there are ten collective farms in the whole of China (of which six are in Manchuria) and 1,200 producers' co-operatives. Mutual aid teams are very numerous, but they are partial and unstable forms of organisation which involve no real break with the system of private ownership and are of little significance unless they can be made to lead on to the "higher" stages of collectivist evolution. It remains to be seen how successful the propaganda will be in persuading the Chinese peasant that it is good for him to be collectivised. In any case, it is a long-term prospect, and, meanwhile, the impatient industrial planners have to reckon with a peasant who is a private entrepreneur and must have an incentive to produce for the urban market.

One consequence of the Communist propaganda in the countryside for social levelling and collective enterprise has been a migration of peasants to the towns in numbers which have become embarrassing to the Government. The swarming of unskilled workers into industry from the rural areas does nothing to relieve the shortage of skilled workers, and sets the authorities a problem of unemployment relief when construction projects have to be abandoned or slowed down. The Communist party now denounces "blind entry" of peasants into the cities and chides them for their "lack of understanding" of the importance of agricultural production. The flight from the land, however, has been due, not to the peasants' "lack of understanding," but to the strong disincentives imposed by the system of classification of peasants into grades with various kinds of discrimination against the higher grades and the menace of future expropriation. Everyone wants to avoid being classified as a "rich peasant," and in order to make the grade downward one must not lend or borrow money, hire labour or make conspicuous improvements on a private holding. With so much discouragement to productivity on the farm, many peasants have preferred to take the chance of earning a good wage in the town. They are unlikely to understand the importance of agricultural production until it is made safe to be a kulak.

The Vietminh Strikes West

THE Communists in Indo-China are somewhat belatedly asserting that the fighting in Laos is a popular rising against the French, in which none of Ho Chi Minh's troops are involved. It is true that Ho's rebel "government" in Vietnam has always fostered the idea that a sister "government" existed in Laos, and that its guerrillas had long been active on their own soil. In fact, however, Laos has hitherto been relatively untroubled either by indigenous or by Vietminh Communists, and it was only lightly garrisoned by French Union forces. Moreover, the military evidence is clear; four separate Vietminh formations have been identified as pushing across the frontier into Laos.

However strongly the French feel that the attack on Laos must be treated as an internal problem, there is no doubt as to its wide international significance. If the Vietminh invaders succeed in striking across this difficult but relatively small area to the Mekong river, they will have come for the first time to the frontier of a non-Communist country—Siam. Moreover, the Mekong is not so much a barrier as a link between Indo-China and Siam. The Siamese on the far bank are cousins of the Laotians and mix with them freely. There are signs that Communist China hopes to make good use of the relationships between all the peoples of the Thai group; in February an autonomous Thai administration was created in southern Yunnan, and last week, when the drive into Laos was well under way, an autonomous Lahu area was proclaimed in the south-west of the same Chinese province. The implications are obvious, not only for Siam but also for Burma, for the Shans also belong to the Thai group.

Clearly, no great military advance across South-East Asia could be routed through the mountains and forests of Laos. But political penetration, based not only on appeals to Thai solidarity but also on manipulation of the troublesome Vietnamese colony in north-east Siam, could be a serious threat. For the first time, the Communists look dangerously like breaking through the shield—composed of mountains and French Union troops—that has hitherto protected the soft heart of South-East Asia. The fact that they chose to launch the attack just when Moscow and Peking were talking of peace (and hard on the heels of the Vietminh's own "peace congress") is more than ironic; it sheds a revealing light on the true nature of present Communist policies.

Boris Kidric—Jugoslavia's Empirical Planner

BY A CORRESPONDENT

WITH the death of Boris Kidrić Marshal Tito has lost the first of the four friends and close collaborators who have been associated with him in building up the post-war republic of Jugoslavia. The illness that caused Kidrić's death at the early age of 41 was brought on by the intensity of his overwork over the past ten years. He spared neither himself nor his subordinates. As president of the Economic Council Kidrić had the hardest job in the government. He was responsible for the five year plan launched with such high hopes in 1947; a year later he had to reorganise it fundamentally because of the economic blockade of Jugoslavia by the Cominform. At this time it was of vital importance to Marshal Tito to have a strong man of unquestioned loyalty in charge of economic affairs. Economic collapse would have meant the end of the regime. The Russians calculated that it was bound to come within two years and did their best to win over Kidrić. Although they gained the support of two of his subordinates, Hebrang and Zujović, Kidrić himself never wavered; he worked on with ferocious determination to prevent a breakdown in the economy. He succeeded, but economic collapse at that time was nearer than many people realised. Tito's gratitude for Kidrić's labour of love has been apparent ever since; he has stood firmly behind Kidrić in the storms of criticism that have assailed him in the past five years.

Kidrić was not a trained economist. Unlike many of the economic chiefs of present day underdeveloped countries, he had not studied at the London School of Economics. Had he done so, he might have avoided some of the elementary errors that were allowed to remain in the five year plan; two of the most glaring of these were the excessively high investment rate and the neglect of investment in agriculture. On the other hand, the lack of doctrinaire training gave Kidrić some advantages. His goal was simple and unchanging—to bring prosperity to Jugoslavia, raise the standard of living, cure underemployment, and modernise the whole country by the rapid development of Jugoslavia's great potential. Industrialise first and fast, sacrifice now for benefits in the future—such were his slogans.

Neither Russian threats nor western aid prevailed on Kidrić to abandon this aim, though he frequently changed his policy and methods—and was quite prepared to expound and defend each change in speeches remarkable both for their length and obscurity. The economic laws and

regulations which have followed each other in bewildering variety over the past few years caused some criticism of Kidrić—particularly in the agricultural areas—but they were in fact a tribute to his capacity to learn by experience and his willingness to throw over a policy once it had been proved ineffective. Of course policy was not entirely of Kidrić's making; but his views usually prevailed. Towards the end of his life he had come to change his ideas on the relationship between the socialist state and the private peasant and to realise that the peasant must be given some real incentive to produce.

Kidrić was a Slovene. Through his Austrian education and his exile in Prague and Paris between the two wars he had acquired a fair knowledge of western life and culture. He had been a Communist since his schooldays, and like Tito had been gaoled for Communist activities in prewar Jugoslavia. During the war he was political commissar to the partisan group in Slovenia—a key position in Tito's wartime hierarchy. Thus Kidrić's career, though on a less heroic scale, had run parallel to that of Tito for many years and their sense of comradeship was close.

Kidrić did not live to see his vision of prosperity in an industrial Jugoslavia realised, but before he died, he saw most of his plans firmly backed by western aid, and some of them already on the way to achievement.

Arson in Argentina

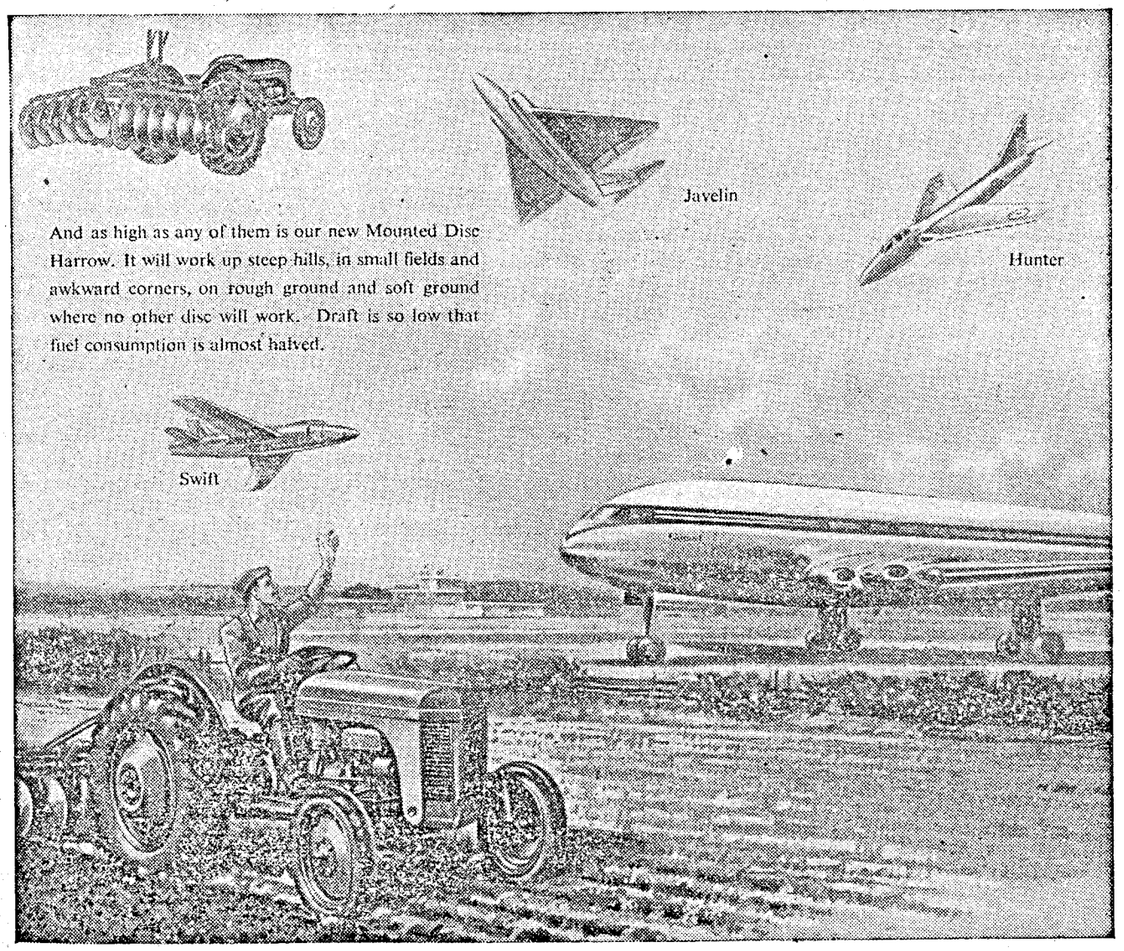
FROM A CORRESPONDENT

RARELY in Argentina's history has Buenos Aires seen an orgy of destruction like that of the night of April 15th. The acts of hooliganism, which began with window-breaking and culminated in incendiarism, were ostensibly a popular reaction to the bomb explosions during General Perón's speech from the balcony of Government House; but they were the work not of a mob but of organised gangs.

Bomb explosions have become a feature of recent political events in Argentina. One explosion greeted the President on his return from his Chilean tour. Exactly a week before these latest outrages a bomb went off a couple of blocks from the house where the corpse of Juan Duarte, Perón's brother-in-law and ex-private secretary, and notorious black-market entrepreneur, dead allegedly by his own hand, lay "in state." But, curiously and perhaps significantly, in every case the bombs were planted in places where a minimum of damage might be expected. Of the two which punctuated General Perón's speech, one burst in a hotel undergoing renovation, 150 yards from the presidential rostrum, the other in an underground railway station which owing to its proximity to the rostrum was temporarily out of use; and it was probably by pure bad luck that the first explosion killed six and led to the injury of about ninety of the audience.

But it will be difficult for Perón to evade all responsibility for the events that followed. The explosions provided him, apparently, with an opportunity of changing the tenor of his speech. It became a violent denunciation of rumour-mongers, profiteers, and "psychological warfare" waged from abroad through agents in Argentina. He suggested that these "agents" should be sought out and "hanged on trees"; that the time had come to return to the days "when people went about with garrotting wire in their pockets." He was interrupted at one point by cries of "*leña*" (firewood) from some individuals, and told them that they should take matters into their own hands and provide their own kindling. Finally he saw fit to forecast his future policy, in words which might have been uttered by a Tiberius or Caligula:

> . . . if in order to finish with the evils within and without, to finish with dishonesty, it becomes necessary for me to go down in history as a tyrant, I shall do so with much pleasure. Until now I have employed persuasion; in future I shall employ repression. God grant that circumstances will not force me to resort to most terrible punishments.



After such a tirade, it would not have been surprising to find the capital at the mercy of an inflamed mob. But, contrary to the official police version, the acts of violence which followed were not the work of any mob. They were the work of small but well-organised gangs of youthful toughs, most of them carrying banners and streamers of the ALN (*Alianza Libertadora Nacionalista*), a noisy but unimportant group of ultra-nationalistic and anti-semitic tendency which supports Perón. This fraternity had evidently been given a free hand. The night before the demonstration of April 15th their loud-speaker vans had made the streets of Buenos Aires into a fair imitation of Bedlam. After the rally the vans, their orators hoarser but still enthusiastic to the point of hysteria, led small parties of young toughs from street-corner to street-corner.

A Night of Flames

Cafés and bars, which had been closed since 4 p.m., were officially allowed to reopen at eight. Those which opened punctually had cause to regret their taking this permission at the letter. Soon after midnight the headquarters of two opposition parties (Radicals and Socialists) were in flames and those of a third (National Democrats) had been wrecked. The Argentine Jockey Club was looted and also in flames. In the fire perished the contents of the Club's famous library—priceless manuscripts, books and works of art, including one of the greatest Goya collections in the world. Apathetic or terrorised crowds watched this act of vandalism; police stood idly by; firemen arrived long after the conflagration was in full blast but concentrated on an attempt to prevent the fire spreading.

Violence has distracted popular attention from General Perón's crucial problem—discontent caused by rising living costs and food scarcities. Perón had undertaken to explain his handling of this problem, but the bomb explosions relieved him of this responsibility. Beyond a claim that prices had come down by 25 per cent since the CGT a few weeks ago brought the matter to his attention ("held a knife to his guts," in the General's forceful if inelegant phrase), and that Argentina's economy was never better than at present, his speech hardly touched on economics. How deeply dissension and discontent have cut into the *Peronista* ranks is evinced by the fact that the widely advertised rally on April 15th was only sparsely attended by industrial workers. The crowd of 100,000 which assembled was largely made up of office workers, shop assistants, and above all of government employees, who attended *en masse* because they were ordered to do so.

In the meantime General Perón's campaign against *agio* (speculation) continues apace. Every day the papers carry lists of arrests; and accommodation in Buenos Aires being now exhausted, prisoners are being sent to country gaols. The era of the concentration camp may not be far away.

LEADING THE WORLD

Britain still leads in discovery and engineering achievements! In the air, Britain's designs have blazed a new trail of safety, speed and comfort, and have brought new fame to British engineers and industrialists. From just such engineers and industrialists comes the Ferguson System with its tractor and team of implements. This revolutionary System has blazed a new, spectacular trail throughout the world.

The System has provided a new hope for mankind, in that it can make the good earth produce more than enough to feed its whole population. And—what is equally vital—produce it at prices which all can afford to pay. Thus we raise the standard of living for all by bringing down prices. We also destroy the seedbed of Communism. That is the course to which we are wholly dedicated.

HARRY FERGUSON LTD.

Ferguson tractors are manufactured for Harry Ferguson Ltd., Coventry, England by The Standard Motor Company Ltd.

IF YOU BUY MAN HOURS—*read this factual schedule:*

Internal Telephones	*Staff Location & Broadcasting*	*Time Control*
❶ By freeing G.P.O. switchboard from inter-office calls, we've saved 50% of operating cost. Quick access to personnel and information has reduced our G.P.O. account 5% and we save £300 p.a. on other messengers' wages.	10% saving of executives' time increases efficiency. Quick reporting and repair of breakdowns reduces time wastage by 2%, adds 1% to production... regular broadcasting of music increases keenness, alertness and output.	Time recording system in departments and automatic break and pre-resumption signals system made 36,500 extra man hours per annum available for production—equalling 2% of total wage bill and 2% of output.
❷ ...we would certainly be lost without them . . . extending our system to cover all departments has much increased administrative efficiency.	Our staff are happier and more contented. Broadcasting for locating staff is of immense assistance.	Departmental time recording saves 5 hours 40 minutes paid man hours per day . . . break time signals system saves 10 hours 40 minutes man time per day. £1,950 extra man hours value thus made available per annum.
❸ Specific cash savings are 5% on G.P.O. telephone charges and £150 p.a. wages of messenger...switchboard operator is able to do other work.	. . . we consider that speedy broadcasting of information and quick location of breakdown personnel increased production efficiency by over 5%.	Recording of time in departments instead of at the gate adds 3% to productive value of wages paid. T.R. Attendance Cards save 2¼% of salaries of wages department.

It is compiled from information supplied by users of T.R. Service who, like more than 20,000 other subscribers, find T.R. Internal Telephones, Broadcasting and Staff Location and Time Control essential to the smooth and efficient running of their businesses. The cases quoted below are as follows:

❶ Plastic Manufacturers—448 employees ❷ Metal Stampers—160 employees ❸ Ironfounders—550 employees.

Originals of these users' reports and many others from widely differing industries are available for inspection.

THE BUSINESS WORLD

The Houses in Between

BRITAIN'S housing programme since the war has been concerned entirely with adding to the country's total accommodation—increasing the existing "stock of dwellings." Mr Macmillan has already given notice that slum clearance is next on the agenda. But when the shift of emphasis in housing comes it is essential that the whole stock of houses shall be taken into consideration, rather than just "the two ends"—new houses and those fit only for demolition.

While households multiply—there are 13 million of them against 10 million twenty years ago—houses decay. The most generally accepted estimate of the age-distribution of the houses in England and Wales is that of the late Dr M. J. Elsas. His figures, with houses of recent construction, may be given in a simplified table:

Number of dwellings built:	
Before 1851	2½ million
1851-1881	1½ million
1881-1911	2½ million
1911-1941	4½ million
1941-1953 (new dwellings)	1 million
Total	12 million

No one would suggest that all the houses built over a century ago deserve to be demolished: that would condemn all historic buildings. But it is clear that a sizeable proportion of these are no longer fit to live in.

In various eminent quarters the rate at which dwellings are becoming unfit for habitation has been put at 200,000 a year. Perhaps this is too high. But it is fair to assume that three of the four million dwellings that were built before 1881 will have reached the end of their useful life before 1981; that would imply a demolition programme of 100,000 dwellings in each of the next 30 years. The number of houses already unfit for habitation has recently been estimated at two million; if this figure is accepted—and it represents an average of 150,000 for each of the thirteen years since 1939—the total of houses marked for demolition exceeds the total of postwar houses.

But between the two million houses that may be fit only for demolition and the million and a half new dwellings provided since the war there are 8½ million dwellings that deserve at least as much consideration. Of these, there are perhaps five million old houses, built before the present century, that will have to remain in use for another thirty years. Nearly half the population live in them. Unless there is to be an increasing social gulf between those who live in these "houses in between" and the fortunate tenants of modern local authority dwellings, the old houses must not merely be repaired: they must be brought up to an acceptable modern standard.

What is the state of these houses? The table below is drawn from preliminary samples of the 1951 Census. These set out the provision of certain minimum household facilities by reference to the number of households—of which there are 13 million occupying

THE STATE OF BRITAIN'S HOUSES
Single household dwellings (England and Wales)

	Shared	Entirely without	Shared or without	
			Number	Percentage
Piped water....	339,400	692,000	1,031,400	9
Cooking stove ..	53,800	189,200	243,000	2
Kitchen sink ...	85,000	659,800	744,800	7
Water closet ...	464,900	994,900	1,459,800	10
Fixed bath.....	94,200	4,034,000	4,128,200	37

12 million dwellings. Eleven million households occupy single-household dwellings; it is to these that the table refers. It includes five out of the sixteen points of fitness for habitation recommended (as a standard to be aimed at) by the Mitchell Committee in 1946. A house improved to such standards, the committee held, should bear comparison with a new dwelling, without including any item that might be regarded as a luxury.

The modernising of old houses not yet due for demolition presents three groups of problems—technical, financial, and administrative; and the technical aspect of housing improvement, at least, is now receiving increasing attention. Two important experiments in this direction are at present being conducted by firms of ironfounders. At Stockton-on-Tees, Allied Ironfounders Ltd., have acquired four two-bedroomed terrace houses. These houses are 73 years old, and contain four rooms (two up, two down), scullery, outside WC, coal shed and back yard. There is no piped hot water, and only a cold tap at the scullery sink.

A bathroom with a fixed bath and hot and cold water is being built in the back yard of these houses, leading off the existing scullery, and itself leading to a new separate WC. The scullery has a sink and drainer unit, with hot and cold water, and a ventilated food cupboard. There is space here for a gas cooker, but it is expected that cooking will be done at the modern combination grate that is being installed in the living room. This grate—which replaces an obsolete kitchen range—heats a hot-water tank installed in a new airing cupboard in the back bedroom. The estimated capital costs of this work are :—

	£	s.
Building work	159	0
Plastering	22	0
Electric light	8	0
Bath and general plumbing	95	0
Combination grate	33	0
Roofing	30	10
Reinstatement of road	2	10
Total cost	£350	0

The other experiment, by Federated Foundries, Ltd., is being undertaken at Croydon, where six adjoining houses, let at inclusive rents of from 10s. 8d. to 15s. 11d., have been purchased by the company. Here again there are no bathrooms or running hot water. Three plans for improvement have been drawn up; one for a built-on bathroom; another, which is cheaper, for converting a third bedroom into a bathroom; and the third, cheapest of all, for installing a bath in an existing room or landing. In each case the water will be heated by a solid fuel fire with a back-boiler.

A third example of housing improvement is provided by a housing society which is improving cottages at Letchworth. In this scheme, back downstairs rooms are being divided to provide a separate bathroom and kitchenette, as well as dining space, and hot water is provided from an independent boiler. The cost ranges from little over £200 per cottage, where no building-on is needed, to rather more than £300, and the work is done by direct labour to plans prepared by the society.

Lastly, improvement schemes sponsored by the Northern (Northumberland and Cumberland) Division of the National Coal Board have been carried out in four mining villages in the Division. Here running water has been laid on, and a hot-water system, operating from a modern solid-fuel cooker, has been provided. The cost of this work has been less than £100 per house; this must be regarded as the minimum cost of a very simple improvement scheme.

These and similar experimental schemes are already providing useful experience of the technical difficulties. Is it practicable—and economical—to provide main space and/or water heating by gas or electricity, or desirable to encourage more solid-fuel cooking by installing a modern solid-fuel appliance that can take care of the space and water heating as well as the cooking? Might space and money be saved by installing a shower and/or an American type water tub instead of the traditional English type bath? These technical problems—of which these are two obvious examples—will vary from house to house: but they may be simplified where large groups of houses of identical original design—of which the rows of terrace houses in many

industrial towns are a good example—can be handled in one scheme.

Financial and administrative difficulties may be greater. Under the Rent Restriction Acts, many landlords are unable to pay for basic repairs out of rents, much less improvement schemes. Under the Acts, they may increase the annual rent by 8 per cent of the cost of any improvement work, given the tenant's consent. The schemes at Croydon and Letchworth are of such a kind. At Letchworth the effect has been to increase the inclusive rents from 10s. 6d. to 21s. per week. This method avoids any charge on local authority or Government funds, but many landlords have insufficient capital to proceed with it; it may, however, have attractions for corporate house owners who desire to protect and improve their investment.

The Improvement Grant scheme embodied in the Housing Act, 1949, offered an alternative solution.

Applicants have to put forward schemes for the approval of local authorities; before they approve any scheme for a grant (of up to 50 per cent) the local authorities must be satisfied that the dwellings will provide satisfactory living accommodation for 30 years, and that they will meet the fairly stringent fitness conditions laid down by the Mitchell Committee. The cost of the work has to lie between £150 to £800; the

THE COST OF IMPROVING HOUSES

£800*	9 2½	24 7½

* Minimum and maximum costs for improvement grants.

owner must hold either the freehold of the property or a lease with at least 30 years to run. Many landlords have hesitated to undertake the obligations that the scheme involves or to spend money on drawing up improvement applications that might not be accepted; but perhaps the most serious handicap to the grants scheme has been the indifference or hostility of local housing authorities, who have complete freedom to reject any application for grant.

For the tenant, improvements under the grant scheme are preferable, for his rent can be increased only by 6 per cent of the landlord's share of the costs. But few landlords can be expected to incur a capital commitment which can be barely amortised by the 6 per cent increase in rent—and improvements such as piped hot water supply add to the potential burden of normal repairs over the 30 years' future life of the house. In the Stockton experiment the local authority has agreed to make a 50 per cent improvement grant. The net cost to the owners is estimated therefore at £175 per house and the tenants' rent will be increased by 4s. per week; their present rent is 5s. 3d. per week (unaltered since 1921) plus 3s. 7d. rates. Rent increases of up to 10s. a week, on very low previous rents, appear to be acceptable to tenants (as at Letchworth). If this attitude is general, some substantial grant-assisted improvement schemes ought to be possible, if landlords could be given some slight further incentive.

Annual capital investment on housing cannot for much longer be allowed to increase at the present rate. On the other hand, the slums must be cleared. The capital investment needed to provide modern amenities for an old house is but a fraction of that required to secure a new house of equivalent accommodation. Some redeployment of the country's limited capital resources, to provide the "houses in between" with modern amenities, is not only necessary and desirable as a welfare project; it is one of the keys to the problem of rational expenditure on housing.

The Pattern of Profits

WITH a bold sweep of their brush, and considerable reliance on guess work, the national income statisticians have recently estimated that the trading profits of all public and private companies in the United Kingdom fell by £179 million, or 7 per cent, in 1952; but that as the price levels of their stocks broadly stood still and the volume of stocks (in the hands of industry at any rate) fell slightly, companies as a whole secured a considerable accretion to their liquid funds. The accounts of the 523 public companies that were published in the first quarter of this year cover a period that corresponds broadly with the calendar year 1952. How far do they tell a similar story to that of the national income White Paper, and how far do they supplement it by showing which industries suffered the sharpest setbacks and which industries continued to gain?

At first sight the figures thrown up by the analysis of these 523 accounts do not tally very closely with the estimates in the White Paper. Total trading profits reported by these companies fell by a fraction of one per cent (compared with the White Paper estimate of 7 per cent) and their total income rose by £5½ million, or 1.7 per cent; at the same time the book value of stocks held by these 523 companies rose by nearly £13.8 million, or 2.3 per cent. These figures, however, include the separate accounts published last quarter by twenty nationalised steel companies. If these steel results are excluded, trading profits of the 503 companies in private ownership show a fall of £22 million, or 8½ per cent and their stocks fell by £6.7 million or 1:3 per cent. This is a reasonably close approximation to the White Paper estimates.

The correlation does not end there. Interest and dividend payments to non-corporate shareholders were shown in the White Paper to have risen by £56 million, or 5.9 per cent in 1952. The published accounts of the 523 companies show that total payments of debenture interest, preference dividends and ordinary dividends rose by 5.7 per cent; within this total, equity payments rose by £2.2 million to £35.7 million, or by 6.6 per cent. There is, admittedly, a discrepancy between the changes in corporate taxation revealed by the two analyses. In the White Paper, corporate tax payments and provisions were shown to have fallen by £38 million to £1,073 million (or by 6.3 per cent); by contrast, tax provisions shown in the 523 accounts published last quarter increased by £4.4 million to

£155 million (or by 2.9 per cent). This discrepancy, however, may merely reflect differences in timing and in the definition of tax payments and provisions.

One more important parallel must be drawn before any details can be filled in. Perhaps the most striking feature of the national income estimates was that they showed that companies and private businesses, encouraged by the readier supplies of raw materials to work with a lower level of stocks and actively deterred from adding to their working capital commitments by higher interest rates, had substantially reinforced their liquid resources in 1952—after having sadly depleted them in the previous year of inflation. There is, of course, no exact basis of comparison in company accounts for the "savings surplus" of £607 million shown for companies, corporations and private individuals in the White Paper; for one thing, the White Paper's definition of companies in this context necessarily includes the banks. But, for what it is worth, the 523 balance sheets analysed here show that the total of net cash assets (that is the total of cash, gilt-edged securities and other quoted investments, less bank overdrafts and loans) rose by £22 million to nearly £310 million, or by 7.7 per cent; the 475 balance sheets published in the first quarter of 1952 showed a decline in net liquid assets of over 10 per cent.

* Including utilities and services, fuel, financial and trust companies, rubber and tea.

The usual quarterly analysis of profits and balance sheets will be published in next week's issue of the *Records and Statistics* supplement.

The broad impression in both analyses is, therefore, one of stable profits and of hard-won elbow room. But in the words of Robert Bridges, "stability is but balance"—and the apparent stability of profits last year was only attained because sharp increases in earnings in some industries were balanced by equally sharp declines elsewhere. These divergences are clearly apparent from the accompanying table, which analyses profits and stock values in different industries. It is fortunate that they are broadly consonant with Britain's long-term economic health. By far the biggest increase in earnings and in stock values has been recorded in the capital goods industries. Companies in this group have reported a rise of over 38 per cent in profits and of over 23 per cent in stock values. Within this group it is the nationalised iron and steel companies that have reported the biggest increases, as was to be expected after the estimate in the Economic Survey for 1953 that production in the metal manufacturing industries increased by 2.4 per cent in 1952. In this group, too, engineering profits are up by over 30 per cent, although profits reported by shipbuilding and building companies have fallen—a fall in which the uneven incidence of maturing contracts may have played its part.

The profits of all the other main industrial groups have fallen. In the consumption trades increased profits reported by breweries, by entertainment businesses, by stores and the food trades have been more than offset by the recession of profits in the textile industry. Trading profits published by the textile companies in this analysis have fallen by 44 per cent and the book value of their stocks by nearly 26 per cent—declines that accord with the Economic Survey's estimate of a fall in production in the textile and clothing trades of 14.6 per cent during 1952. The plantation companies, particularly the rubber producers, have suffered an even sharper setback, but here the downward swoop in prices has played the dominant role. Elsewhere earnings have also been on the ebb, but the fall in earnings of 7.4 per cent in the group classified as "general industries" is due in the main to the recession in the paper and chemicals and paint trades. The industries in this general group that can be classified as durable goods producers rather than consumer trades—the electrical equipment manufacturers and the motor, cycle and aircraft companies—have continued to do well; they have reported increases of between one-sixth and one-third in both profits and stocks.

The general pattern in the last year has, therefore, been that most producers of capital goods have shown

increases in profits, while many of the consumer goods trades have taken quite hard knocks; this may provide some encouragement towards the movement in resources that Britain needs. Last year's change in pattern appears even more reassuring when it is remembered that windfall gains on inventories contributed only a small part towards the higher profits of producers of capital goods; where an increase in stock values has taken place—as in their case—it seems attributable to an acceleration in the tempo of production and of work in progress rather than to increases in prices. As the delivery of raw materials became quicker and more reliable last year, companies with fat order books—but only they—became more willing to step up production. And there are some signs, which the increases in stocks held by the capital goods producers do nothing to contradict, that manufacturers in many fields have discovered that they can gear their output to a lower level of investment in working capital than they would have thought necessary a year ago. There are also early indications that the rise in profits on which Mr Butler is by implication counting as a support to his Budget policy will be forthcoming—so long as no rough winds start to blow across the Atlantic.

Business Notes

BEA Comes to Market

THE queue-marshals who regulate the admission of borrowers to the gilt-edged market have been kinder to the British Electricity Authority this time than on some former occasions. Both this year and last, the BEA's entry has been delayed until after the Budget, although on both occasions its borrowings from the banks had long been mounting to very high levels. Last year's delay, though not necessarily the responsibility of the marshals, had the effect of making the BEA the first gilt-edged borrower after the increase in Bank rate to 4 per cent—and the first to have to concede a flat yield beyond that figure, actually almost 4 5/16 per cent. This year the delay has worked the other way; through many weeks in which the authority's indebtedness to the banks had been rising to levels that cried urgently for funding—it had reached £92 million by March 31—the gilt-edged market has been gaining strength. The Budget gave it a further lift, so that by Monday afternoon, before the new issue was announced, last year's stock—the 4½ per cent, 1974-79—stood at just over 100 13/16 net, compared with 100⅛ before the Budget and 98⅞ three months ago, and offered a redemption yield of £4 4s. per cent. Hence the new issue, which proved to be a further tranche of last year's stock, could be offered at par, compared with 99 last year, and thus afforded both flat and redemption yields of 4¼ per cent.

The "turn" conceded was therefore adequate but not impressive. It sufficed to bring the price of the existing stock down by ⅜, but although the rest of the market faltered, there were still some notable net gains on the day. This firmness has been well maintained since, to the accompaniment of "recession" talk that is diverting buyers from the equity markets into gilt-edged. Hence, when the lists were closed at 10.30 on Thursday morning, it was taken for granted that the "departments" had had to subscribe for a notably smaller share of the £125 million offered now than the massive proportion that went to them from last year's £150 million. Meanwhile, the gilt-edged borrowers, strictly so-called, are not the only ones to reap advantage from the now quite widespread assumption that the trend of interest rates is more likely to be downwards than upwards. The effect of this changing view has been clearly demonstrated in the terms of the £3 million debenture issue by Tate and Lyle, the lists for which will open on Monday. The days of "coupon" rates of 5 per cent for first-rate stocks are gone; the Tate and Lyle stock, dated 1968-78, carries 4¾ per cent, though its price is 98½, and thus offers a redemption yield for the full period, of £4 17s. per cent.

These assumptions about the future of interest rates take a good deal for granted. Moreover, they are not strictly in line with the caution shown in the budget speech, when the Chancellor opined that the present pattern of monetary measures would need to be maintained this year. On the other hand, those in the City who are now so worried about the financing of the Chancellor's "overall" Exchequer deficit seem to have left out of account some of the economic premises that underlie the Chancellor's budgetting—for Mr Butler is counting on savings, largely from industry, to see him through.

Second Thoughts in Industrials

THE implications for industrials are perhaps more clearly seen. But investors generally have not, so far, demonstrably endorsed Throgmorton Street's first assessment; and, lacking this support, equity prices this week have fallen back. The extent of the reaction, however, owed a good deal to technical influences; quite a large bull position

had been built up by professional dealings. Hence, on Tuesday, the last day of the Budget account, some dealers found it quite expensive to sell for the old and buy for the new account. In the equity markets, of course, the influence of "peace" talk and of other possibilities that might dampen down world demand, is clearer and more direct than in gilt-edged; and it has become more apparent as a market factor since President Eisenhower's speech and the beginning of

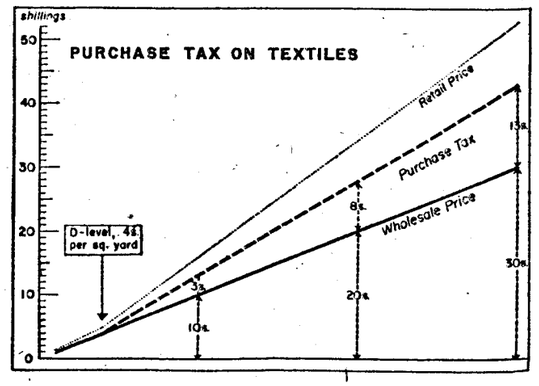
the exchange of prisoners in Korea. Hence it is virtually impossible to guess how far this week's behaviour in the markets reflects second thoughts on the budget itself.

The wider and less tangible influences have in any case been communicating themselves to the London market also through the jittery tone of Wall Street and the weakness of metal prices. Altogether, the pre-budget calculations of the market professionals have gone much awry. The staid ordinary share index of *The Financial Times*, which jumped two points to 124.6 on the day after the Budget, had fallen by the close on Wednesday to 120.8, or 1.8 points below its level on Budget eve.

Thumbs Down from America



THE "plan" hatched at last December's Commonwealth Conference has now become even more firmly embedded in the American mud. The Eisenhower Administration's reaction to its discussion with the recent OEEC mission and its unhappy manœuvring in the case of the Chief Joseph Dam combine to tell as depressing a story as has come out of Washington for many years. The OEEC mission crossed the Atlantic to present, in effect, a tentative and "Europeanised" version of the Commonwealth's plan—with the advantage that the eventual

advance to convertibility would be a combined European operation, but the disadvantage that the pace of advance would necessarily be slower than if sterling had gone forward alone. Any such advance would have to be preceded by the same changes in procedure at the International Monetary Fund and in foreign economic policy in America that Mr Eden and Mr Butler had asked for at their ill-fated visit to Washington in March. The OEEC mission therefore apparently asked the Americans for specific reforms in the fields of commercial policy, of foreign investment and (rather more vaguely) of stability of raw material purchases.

The communiqué issued in Washington at the end of last week suggests that the Americans' answer was an extremely dusty one. The Americans agreed with the OEEC mission about the theoretical desirability of some advance to a new world payments system and about the need for sound internal economic policies. They emphasised that they would like to see Europe increase its exports to "third countries," by which they meant countries other than their own. But they declared that Mr Lewis Douglas was now engaged in a long-term study of the way in which their own foreign economic policy should move; and that they were not willing to do anything until the results of that study were known. So there is no single portent in the trade outlook to give Britain encouragement in the near future—no certainty of the continuance of the limited degree of liberal trade policy that the United States has pursued in recent years, and no plausible hope of real reform in Customs procedures and the "Buy America" act.

Lancashire Aggrieved

THE textile industries did well out of Mr Butler's first budget and have been disproportionately disappointed to get no concessions at all out of his second. For the past ten months, they have enjoyed specially favourable rates of

purchase tax of 25 per cent on clothing and 50 per cent on piece goods. They feel now these rates have been extended to other consumer industries that the "exceptional nature of the textile case" should continue to qualify for special treatment. The Chancellor has taken an opposite

view; it would have been surprising had he done otherwise. Last October the cotton, rayon, silk, nylon and linen industries joined under the leadership of the Cotton Board to put their case for tax relief to the Chancellor. They argued that the "D" scheme, which imposes purchase tax only on part of the wholesale price and not—as for most other goods, and, under the former utility scheme for textiles—on the total wholesale price, had been doing serious harm to the industry. A formidable volume of evidence was marshalled to show that quality goods, which are some of the principal export lines, were being taken out of production as a direct result of retailers' and customers' refusal to buy goods attracting purchase tax.

It is difficult to believe that the "D" scheme of itself is to blame if the goods in question are no longer selling as well as they did. The accompanying chart shows the amount of tax payable on a non-wool cloth. At a wholesale price of 4s. a square yard, such cloth pays no tax at all and probably bears a retail price of 4s. 9d. At 5s. a yard, 6d. tax is payable and the retail price might be 6s. 8d. The tax becomes heavier as the cloth becomes more expensive—a plight common to all goods assessed for tax on the basis of their value. But probably the great majority of Lancashire cloths are sold—with tax—at less than 25s. a yard retail; this corresponds to a wholesale value of 15s. on which the purchase tax under the "D" scheme represents little more than an effective rate on the price of the cloth of 33⅓ per cent. When the cloth is made up into clothing, the garment pays tax above the "D" level only at the rate of 25 per cent.

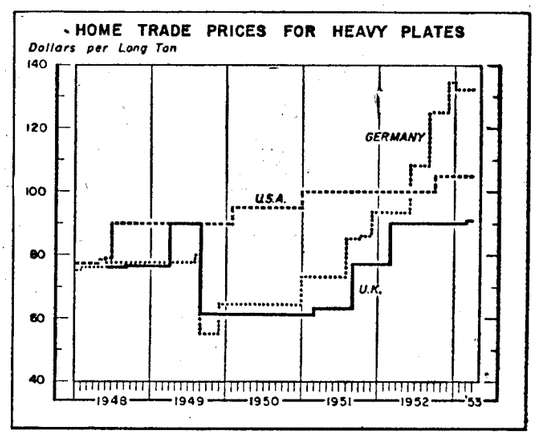
Many retailers report that since the "D" system was introduced, customers have paid less regard to the tax element in the retail price of textiles, and that they themselves pay little attention to the relatively small sums involved in all but a few lines. They argue, moreover, that since the slump in home sales last year, the tendency has been to "trade up"—to improve rather than to lower the quality of the stock carried. There appears to be some conflict on the manufacturers' belief that purchase tax is the reason why goods are difficult to sell. May not the difficulty be due partly to one product of the slump—a more discriminating home market?

Shortage of Cheap Steel Plate

SINCE the war, production of steel plate in Britain has been rising—more steadily and to a greater extent than the total production of steel. Last year deliveries were about 2.2 million tons—33 per cent higher than in 1947. Nevertheless, a shortage of plate is today almost all that remains of the 1951-52 steel shortage, and this has been the main reason why the Minister of Supply has delayed so long in bringing the steel allocation scheme to an end. This week Mr Sandys announced "a voluntary scheme under the guidance of the Government" by which the steel industry will establish a clearing house for plate requirements. This measure admits the obvious—that allocation of steel in general is of no use whatever in dealing with special shortages of particular products. It should enable the Minister at last to get rid of the now largely meaningless allocation scheme—a control that during most of its existence seems to have done more to aggravate than to alleviate the real shortage of steel.

Plate is short today partly because more industries than before are consuming it and partly because the largest consumer, shipbuilding, is consuming much more of it. The programmes of capital investment in oil refineries, chemical works, boilers for power plant, railway wagons, and recently rearmament, all at the same time, have together greatly increased demand. Shipbuilding, which takes something over a quarter of the total tonnage of plate, has been extremely busy; moreover, since the war its pattern of demand has altered. A ship in which the proportion of plate to other steel required was formerly about two to one may now require about four tons of plate to one of other steel products. Demand here has followed technical change; the corrugation of plate for strength in bulkheads, the use of flanged plates instead of angle sections, and the construction of new welded structures instead of heavy castings have all made for the use of more plate.

Plate-rolling capacity has been supplemented by the rolling of light plate on the strip mills and by the extension and modernisation of existing plate mills. The steel industry has not installed a new plate mill, and though various additions to existing capacity are proposed over the next four years, no new mill is planned; it simply does not believe that long-term demand would justify one. Very few shipbuilders, it is worth noting, have taken advantage of the freedom to import steel allowed since last year. Despite their heartfelt complaints over their shortage, they have not been prepared to pay perhaps £10 to £25 a ton extra for foreign plate. For British steel prices, compared with the world level last autumn, may have amounted to a subsidy of £30,000 to £70,000 in the cost of a ship.



Price Stability and Steel

UNDER Government influence, the British steel industry since the war has pursued a policy of controlled and stable prices. Such a policy leaves little alternative but some form of rationing to deal with the results of fairly rapid changes in demand, such as the current shortage of steel plate. Indeed, the whole policy is based upon the belief that the demand for steel, like the capacity to supply it, is fairly unresponsive to price changes, at least over a considerable area of demand. The way in which the British price of plate has been held fairly stable, instead of being allowed to respond freely to increasing demand, as on the Continent, or to a more limited extent in the

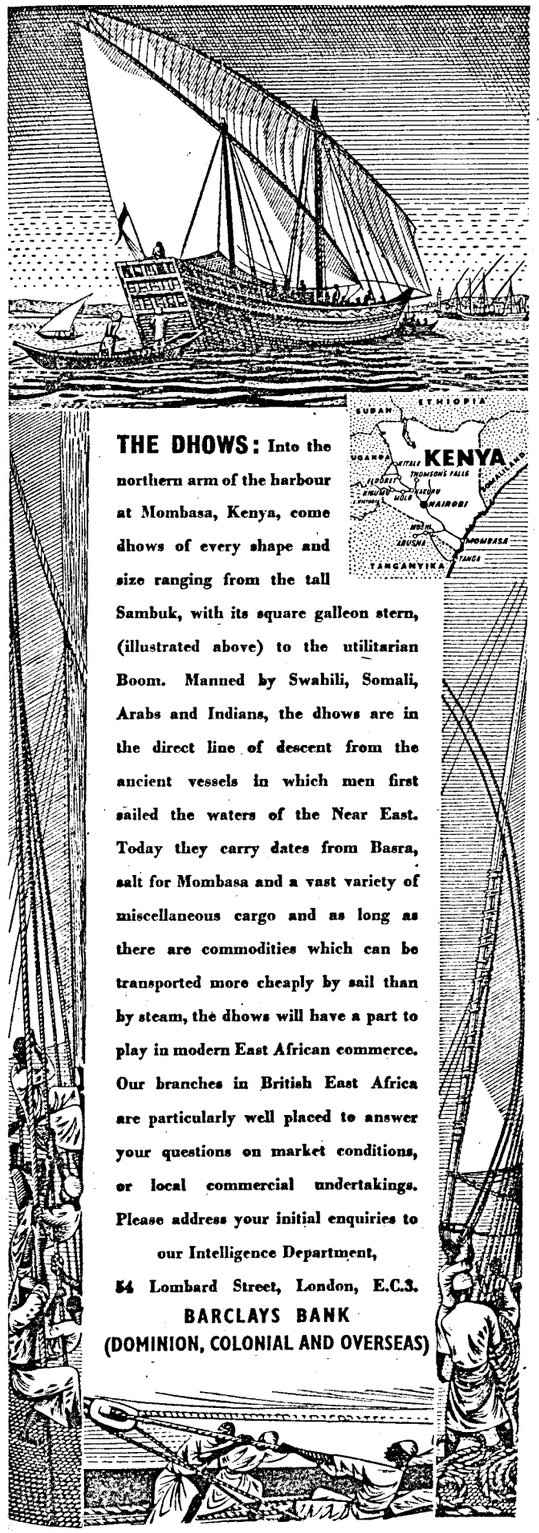
QUARTERLY ECONOMIC REPORTS are now available on nearly seventy countries. These reports give information and opinion on matters of concern to exporters and investors; they are concise and have comprehensive statistical sections. A descriptive leaflet may be obtained from The Economist Intelligence Unit, 22 Ryder Street, London, S.W.1.

United States, is shown in the accompanying chart. The expansion of British steel capacity, at the same time, is planned in accordance with the industry's estimates of long-term demand; in plate, for example, these estimates justify considerable additions to existing rolling capacity, but not the laying down of a new mill—which in any case could not be ready in less than four to five years.

Broadly, the control councils of the steel industry have been in agreement with this policy of stable prices; the major responsibility for administering the complex centrally managed price system that goes with it has perhaps always rested with the British Iron and Steel Federation, subject to Government agreement. In its current *Statistical Bulletin*

the Federation lucidly, if rather guardedly, discusses British price policy. Where prices do not depend upon demand, they must be constructed from costs (though the costs that may be selected, as Mr Robert Shone has commented elsewhere, remain open to choice). The federation is today concerned in particular with the allowance for capital charges included in the gross profit margin fixed for heavy steel products. In current prices, this figure is about £3 a ton; but capital charges on a new and efficient plant built now would cost about £10 a ton. In most cases, the difference exceeds the saving in operating costs from the higher productivity of a new plant. Formally, this would suggest that replacement might not pay; it is perhaps more likely to curtail expansion. A price review, as the federation comments, is overdue.

British steel is certainly cheap by international standards. Even so, the current market prospects for the steel-consuming industries may suggest that this is rather a delicate time to be asking, on grounds of principle, for an increase in steel prices—and one that would considerably enhance the earning power of the companies about to be devested and simplify their needs for further capital. The request, certainly, is entirely in line with the ruling policy of price management. An indication of the federation's reaction to any decline in demand is contained in its suggestion that maximum prices in the boom might logically be complemented by minimum prices (perhaps co-ordinated with the United States and Schumania?) in "periods of slack trade." It would be interesting to learn the Government's reaction to this quite logical extension of a policy to which it is firmly committed. Those who are not so committed may regard the argument with some reserve.



Freeing the Grain Trade

THE grain trade is now busily engaged in loosening up for the restoration of private importing next month. Traders have been filing their applications for open general licences that will cover the period from next month to the end of June, 1954. Some advance business in cargoes of cereal feeding stuffs to be shipped from the St Lawrence has already been reported on the Baltic. But pending the revival of proper facilities for "hedging," trading in grains is likely to be restricted. Before the war there was dealing in grain "futures" on the Baltic, but the main terminal market was in Liverpool. The full re-establishment of hedging facilities must depend, of course, upon the restoration of adequate foreign exchange and credit facilities. In present circumstances the satisfaction of both conditions, particularly the first, presents difficulties, but it remains as true as ever that "hedging" facilities are an essential adjunct of a freely functioning market in basic foodstuffs and raw materials.

Meanwhile, it seems far from certain that the new International Wheat Agreement negotiated after months of travail—and signed, after the defection of the British Government, by a bare quorum of the importing countries—will in fact come into force. After Major Lloyd George had made it clear that the British Government had finally burned its boats and would not recant and sign at the eleventh hour, the Australian Minister of Commerce stated that Australia reserved the right, before final ratification, to reduce her quota of 75 million bushels if countries that provide "traditional markets" for her wheat did not become parties to the agreement. It is understood that Canada will make the same reservation. In those circumstances, and in view of the probability that the exporting countries will have an aggregate carry-over of approaching 1,000 million bushels at the end of the season, it is hardly likely that the importing countries that did sign retain much enthusiasm for the Agreement.

Plans For a Copper Market

THE pace of events leading to the freeing of the copper market has recently been gathering momentum, and it now seems likely that the market will be opened by or before next autumn. Earlier this month the Ministry of Materials took the first step towards ending the present system of bulk purchase, when it informed the Rhodesian copper producing companies that it wished to reduce from six to three months the period of notice required to end the present arrangements under which it buys their output in bulk. This week the companies formally accepted the Ministry's amendment. The price paid by the Ministry under the existing agreement—at present £268 a ton—can be changed without any such notice being given. Negotiations have recently been taking place between the Ministry and the companies for a substantial reduction in this price, and these should enable the Ministry to effect a speedy cut in the price of £280 a ton (inclusive of freight and other charges) that it

THE DHOWS: Into the northern arm of the harbour at Mombasa, Kenya, come dhows of every shape and size ranging from the tall Sambuk, with its square galleon stern, (illustrated above) to the utilitarian Boom. Manned by Swahili, Somali, Arabs and Indians, the dhows are in the direct line of descent from the ancient vessels in which men first sailed the waters of the Near East. Today they carry dates from Basra, salt for Mombasa and a vast variety of miscellaneous cargo and as long as there are commodities which can be transported more cheaply by sail than by steam, the dhows will have a part to play in modern East African commerce. Our branches in British East Africa are particularly well placed to answer your questions on market conditions, or local commercial undertakings. Please address your initial enquiries to our Intelligence Department,

has been charging United Kingdom consumers. That selling price of £280 a ton is about £40 higher than the price quoted in the free market on the Continent and its reduction has long been overdue.

Meanwhile, a great deal of hard thought is being given in the Ministry of Materials, the Bank of England and Metal Market circles to the problem of admitting copper to the list of metals in which free dealings can take place. The problem presents greater difficulties than in the case of tin and other free metals, for there is a substantially larger dollar element in the world production and trade in copper. But some observers hope that the Ministry may feel able to give the necessary notice of three months to the Northern Rhodesian producers in May; if so it would be possible to allow free dealings to start early in August. The relevant exchange control arrangements will probably follow however the same lines of those made to accommodate the restoration of free dealings in tin, rubber and other commodities, though greater restrictions may have to be applied in order to thwart the greater opportunities that the copper market would enjoy for undesirable conversion of sterling into dollars—and also, incidentally, as a recognition of the greater strategic significance of copper. But one of the earlier arguments against restoring freedom to the copper market, namely the scarcity of supplies, has largely disappeared in the last few months; one sign of this is that arrangements have lately been made to allow the Rhodesian copper companies to sell part of their output on the Continent of Europe. Freedom will, therefore, clearly not be long delayed.

Increase in Imports

THE continued recovery in the sale of cars to the United States and Canada is one of the brighter aspects of the detailed trade figures for March; on the whole, these figures, which show imports increasing more rapidly than exports, are not too reassuring. Total exports from this country in March amounted to £223.7 million, about £8 million more than the monthly average for January and February and roughly equal to the average for the last quarter of last year. Imports, valued at £285.7 million, were, however, £19 million more than the January-February average and the average for the last quarter of 1952—though lower than in March, 1952, before the import restrictions began to have their full effect. Volume indices are not yet available; taking into account the lower prices now prevailing, the increase in the volume of imports for the first quarter of this year compared with the fourth quarter of last year will be greater than the increase shown by the value figures alone. On the quarter, the volume of exports is likely to be about the same.

Exports of food, drink and tobacco and manufactured articles in general, and most engineering products were lower in March than a year before; but exports of iron and steel, woollen and worsted yarns and fabrics and also of raw materials were larger; in particular, coal exports rose to £4.9 million. Total exports to the sterling area seem to have been about the same in the first quarter of 1953 as in the last quarter of 1952; those to the non-sterling area fell by about 4 per cent. The increase in imports for the quarter was wholly accounted for by increased arrivals from the sterling area; imports from elsewhere were practically unchanged. Unfortunately, total British exports to Australia, although recovering slowly, are still only about 15 per cent of their value before the imports restrictions were imposed. The increase in the sale of cars to North America is marked. In the first quarter of 1953 sales to the United States rose to 9,798 compared with 4,286 in the first quarter of last year; and exports to Canada reached 5,323 compared with 548 a year before.

The Board of Trade estimates that the average level of prices paid for United Kingdom exports was lower by one point in March, but there was no change in import prices, so that the terms of trade moved one point against this country to 94. The price index for metals and engineering products declined on the month by one point; although this fall contributed to the worsening in the terms of trade, it is satisfactory to learn that in increasingly competitive overseas markets British engineering firms are managing, to some extent, to meet competition in price.

Looser Reins for Export Credits

DURING this week's debate on the Budget proposals the President of the Board of Trade announced an important relaxation of exchange controls over credit for overseas transactions. More than a year ago, as part of the return to credit discipline and of the attempt to stop loopholes for semi-commercial (but also semi-speculative) operations against sterling, the exchange control authorities started to impose stringent restrictions on the credit facilities previously available to overseas customers of British banks. This was an attempt to accelerate payments for exports from the sterling area and to prevent the substantial credit facilities of the London market from feeding speculation against sterling. One of the lessons of the recent balance of payments White Paper was that British exports are now being paid for much more promptly; the policy has therefore had a real measure of success.

The climate in the export markets has, however, changed since these restrictions were imposed, and some British exporters of capital goods have found that they have lost orders because foreign customers have demanded credit facilities for periods (sometimes up to four or five years) — that the exchange control would not sanction. Mr Thorneycroft announced this week that the government had recently reviewed exchange control policy in this context in order to ensure that, subject to balance of payments considerations, no unnecessary obstacles to exports would be erected. He declared that as a result of this review "exporters can be assured that they will be given greater freedom for granting credit terms which they wish to offer to overseas buyers." This, it should be emphasised, is not a promise of provision of the credit facilities themselves, or even of an extension of the facilities of the Exports Credit Guarantee Department, which in turn might help exporters to mobilise the necessary credit in the City of London. There is still no sound case for anything that would amount to government subsidisation of export credits; the countries that demand extravagantly long periods in which to pay for capital goods are mostly in soft currency areas, and any

indirect subsidisation of exports to them would tend to lengthen delivery dates to (and thus lose orders from) hard currency countries. But the government is clearly right in deciding to lift artificial restrictions over credit facilities that the commercial capital market finds that it can economically provide.

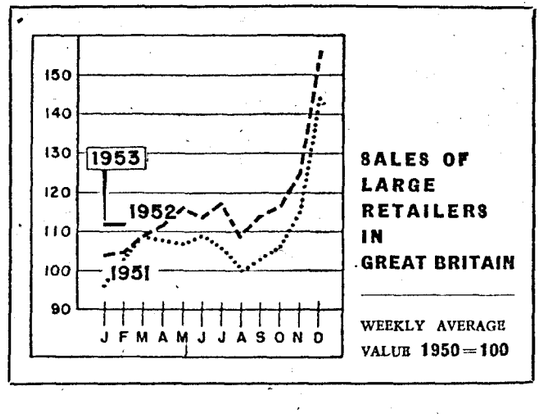
Off-Shore Orders

THE protracted process of allocating the dollars provided by Congress for the purchase of aircraft in Europe had by this weekend been advanced one step further with the signing of an order worth $153 million for 450 Hawker Hunters and 100 Hawker Sea Hawks, leaving similar negotiations for the Vickers-Armstrongs Swift still to be decided. The division of the $225 million ear-marked for the purchase of aircraft, between competing British and European manufacturers, has been fraught with political, strategic and aerodynamic pitfalls. The condition originally imposed by Congress, namely that deliveries should be completed by June, 1955, has been an added, and as it has turned out, unnecessary, complication. Deliveries of Humbers will not begin until 1955 and will be completed in 1956. The RAF, which already has Swifts but will not have Hunters in service before next year, may not think that it has come out of the negotiations as badly as was at one time feared.

Dollar orders for Centurion tanks to the value of $100 million that were signed earlier this year presented less difficulty because there was no obvious alternative and the tank was being produced in such a volume that deliveries could be started immediately. A further off-shore order placed in this country for an unspecified quantity of ammunition was equally uncomplicated. A good deal of military equipment, including aircraft, has also been ordered direct (without American aid) from British factories by foreign governments. The most recent of these was a repeat order for £2.5 million worth of army trucks placed by the Belgian Government with Vauxhall Motors.

Last Act for IMC?

SHORTAGES of many essential raw materials which followed the war in Korea in 1950 led to the creation, at the instigation of Britain, France and the USA, of the International Materials Conference. Its work of studying the production and supply of scarce commodities—fourteen of them in all—and arranging for the international allocation of supplies, where necessary, is now coming to an end. The Conference worked through seven committees, dealing with groups of commodities, of which only two remain. Most of the critical shortages originally within the purview of the Conference—as the second annual report of IMC records—have eased to the point where multilateral action is no longer necessary.



During the second year of IMC's work—March, 1952, to February, 1953—improvement in supply led to the winding up of three committees, for cotton, paper and wool; more recently the copper and sulphur committees have ceased to operate. Now only the nickel and molybdenum committee still function, but as about 80 per cent of the supply of these metals is controlled by two companies it may be found that the existence of international committees for their control is hardly justified.

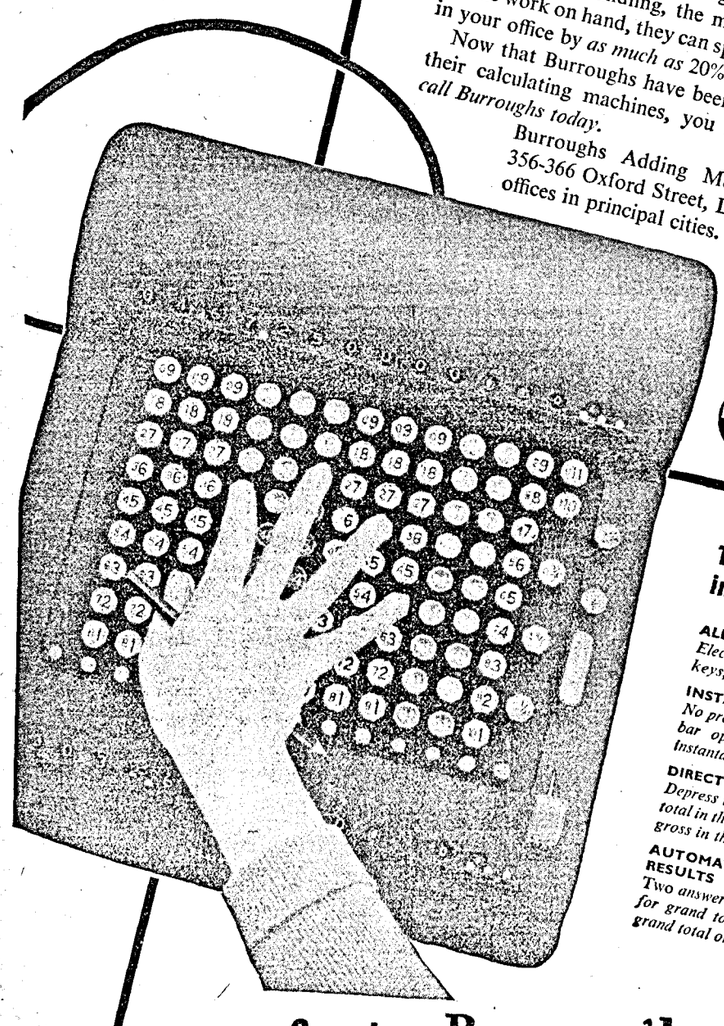
The second report of the Conference states that improvement in the supply of most of the commodities with which it was concerned was due to four main causes: increased production; conservation and substitution; more orderly marketing; and levelling off in demand, especially for defence. The conference claims it has helped to make the first three of these causes effective, and there is little doubt that by collecting and publishing statistics and fixing quarterly allocations the Conference has diminished the urge and restricted the opportunities for panic buying of the scarce commodities. But if the two last allocation committees are presently wound up it will still be pertinent to consider whether, on strategic, and on economic grounds, some form of international secretariat may be desirable to continue the study of raw materials which have been, and may again become, scarce.

Courtaulds in America

AS the new rayon plant of Courtaulds, (Alabama) Inc. comes into production, Courtaulds, Ltd., its British parent, has severed its remaining ties with the American Viscose Corporation which Courtaulds founded in 1910. After the greater part of its holding in the company had been sold during the war, Courtaulds still retained 234,634 common shares in the corporation, representing 5 per cent of its capital. These shares have recently been sold for a figure believed to be in the region of $11 million. The cost of the new Alabama plant has not been disclosed, but it is certainly considerably higher than the amount received from this sale.

The new plant is expected to be in full production within a few weeks, with a capacity of 50 million pounds of viscose rayon staple a year. This will represent an appreciable

It is the calculating machine that gets through routine figures faster that serves your business best



FORGET THE FRILLS—
get down to the facts

95% of the calculating done in a normal business will be a matter of simple arithmetic—adding, multiplying, and subtracting. On payroll, invoicing, stock records, and the great volume of routine analysis, there's no place for a calculating machine that will do trick computations.

What is needed is a calculating machine that gives the very maximum output of facts and figures for the hours it is in use. This is where Burroughs calculating machines excel. Operating with the minimum of rehandling, the minimum number of key-depressions for the work on hand, they can speed up the rate of figure-production in your office by *as much as* 20%.

Now that Burroughs have been able to reduce the initial cost of their calculating machines, you have one more good reason to *call Burroughs today.*

Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1. Sales and Service offices in principal cities.

The how and why of speed in operation

ALL-ELECTRIC OPERATION
Electrification gives light uniform key stroke for all keys, controls registration, safeguards accuracy.

INSTANTANEOUS RESULTS
No pre-setting of amounts, no control key or motor bar operations. Addition and multiplication are instantaneous.

DIRECT SUBTRACTION
Depress the subtract key. The single amount or the total in the front dial is instantly subtracted from the gross in the rear dial for the net amount.

AUTOMATIC GRAND TOTALS OR NET RESULTS
Two answer dials—one for single calculations, one for grand totals or net results. After completion, grand total or net result without "recapping."

addition to American capacity. Last year, American production of synthetic fibres reached 1,396.4 million pounds, 7 per cent below the 1951 output. The reduction was most marked in continuous filament yarn of all kinds and in acetate staple. Production of viscose and cupra staple rose from 207 million pounds to 212 million pounds. American production of non-cellulose synthetic fibres rose last year from 209.7 million pounds to 260.6 million pounds.

Reductions in Fats Prices

THE Ministry of Food has now made substantial reductions in the prices of unrefined oils mainly used for the manufacture of soap allocated to wholesalers and large trade users. These reductions represent as much as 33 per cent for crude palm oil and 35 per cent for groundnut oil. It may be some months, however, before the reductions are reflected in retail prices of soap. Some of the Ministry's price changes are shown in the accompanying table:

	Old price per ton	New price per ton
	£ s.	£ s.
Crude palm oil	106 10	71 10
Prime mixed	107 10	72
Low gut	85	54
Cotton, ex washed oil	106	68
Groundnut	108	70
Whale oil	50	30

The new prices are more in keeping with world prices, but it seems that the Ministry of Food is judiciously easing prices to liquidate stocks before going out of business. The market now awaits price reductions for fats used in the manufacture of margarine, in accord with the fall in world prices; orderly price reductions by the Ministry of Food would be a natural preliminary step before the margarine trade reverted to private enterprise.

Recovery in Power Sales

DURING the financial year that has just ended, the British Electricity Authority sold 57,286 million units, or 3·5 per cent more than in the same part of the previous year. But such is the momentum of postwar expansion in the electricity supply industry that this increase will probably be regarded as a setback; 1952-53 was certainly a year in which BEA experienced a sharp moderation in its bounding curve of demand. The sea-change can be seen fairly clearly in the authority's informative monthly statistics. From March until August last year electricity sales appear to have been actually lower than the year before; from September to the end of the year there was a marked recovery, but this has not been maintained evenly. The industry's statisticians produce a refined version of these figures "adjusted to normal weather and standard working days," which renders the monthly and cumulative figures into a smoother outline of recession and recovery; the monthly figures suggest that the industry may now be back at least to the steady annual rise of 6 per cent that the old Central Electricity Board used to consider "normal" (BEA between nationalisation and 1951-52 recorded an average annual increase of some 8-9 per cent). The disconcerting element in these statistics (which is to be seen, too,

in statistics of coal consumption) is that the recovery in the rise of electricity sales has been much more marked in what the authority calls "mainly non-industrial areas" than in the areas where industrial consumers normally take more than 50 per cent of total sales. These fuel figures, which become available slightly in advance of the index of production, do not indicate any quickening in the slow recovery of industrial output.

SHORTER NOTES

The Society of British Aircraft Constructors has revised the standard formulæ for calculating direct aircraft operating costs to include gas turbined aircraft. The revised formulæ also cover two rates of utilisation—3,000 hours a year, which represents a considerable feat of administrative organisation, and 1,500 hours a year.

★

As the market had feared, net profits earned by Imperial Chemical Industries in 1952 slumped from £23½ million to £15.8 million, but as investors had also confidently expected ICI has maintained its ordinary dividend at 13 per cent. The directors have attibuted the slump in profits to last year's recession in the textile trades and the restrictions on trade in certain overseas markets.

Company Notes

VICKERS. The preliminary report issued by the directors of Vickers for the year to December 31st offers shareholders a bigger slice of a bigger cake. The directors propose to raise the ordinary dividend from 12½ to 15 per cent on the firm foundation of an increase in net profits from £2,072,872 to £2,844,638. This means that the company's £1 ordinary stock units at the current price of 47s. 3d. xd. offer a yield of £6 7s. per cent—an attractive one for a "blue-chip" of this standing.

Having tasted the fruits of success, shareholders will look forward to the full report for the chairman's comments on the remarkable rearrangement of Vickers' investments that took place last year. The sale of nearly one-fifth of the group's holdings of steel stock has reduced the book value of these holdings from £15,267,081 to £12,517,081; in making these sales the group has made a loss of £374,086 and there is still a very heavy unrealised loss on the remaining stocks, which at the end of last year had a market value of only £10,974,534. In addition, the group has realised its holdings of other British Government securities (which stood in the books at £4,353,792 at the end of 1951) and of other quoted investments (which had a book value of £1,276,534 at the end of 1951). Following these sales, the group's holdings of cash and tax reserve certificates have increased from £2,645,723 to £6,017,861. This apparent surfeit of liquid resources must, of course, be read in the light of the opportunity that steel de-nationalisation will soon offer to Vickers to buy back its old holdings in English Steel. Cammell Laird, the other part-owner of English Steel, appears to have been following the same investment policy as Vickers, for in announcing an increase in profits and in the ordinary dividend (from 14 to 15 per cent, plus a new 2 per cent tax-free bonus) its directors have reported a book loss of over £680,000 on the sales of securities.

But the realignment of Vickers' resources may also be a sign that the directors are turning more of their attention towards investment within the group itself, for the sale of part of Vickers' holdings of quoted investments was accompanied by a rise in its trade investments (from £867,566 to £1,128,516) and in the amounts owing to subsidiaries (from £7,351,476 to £11,581,268); moreover, Vickers' holdings in Powers-Samas Accounting Machines has increased (following a cash and bonus issue) from £1,971,265 to £3,276,262, while the book value of its investments in other subsidiaries has risen from £3,754,819 to £4,176,033. These redeployments suggest that the group is widening the front along which it faces the future—come cooler war or not.

★

UNION CASTLE. Investors in shipping shares, always one of the most speculative—and until recently one of the most optimistic—sectors of the market, have run into some rough waters in the past few weeks. The first signs of disturbance came a week ago when the directors of Peninsular and Oriental Steam Navigation, in announcing the expected increase in operating profits for the year to September 30th (from £18.8 million to £23 million) and in the ordinary dividend (from the equivalent of 16 per cent on the present capital to 20 per cent), warned shareholders that "conditions for shipping generally have been far less favourable during the first half of the current year and are prospectively no better for the remainder of the year." On the strength of this gloomy forecast, and in spite of the increase in equity payments, P. and O.'s £1 deferred ordinary shares were marked down 1s. to 60s.; while the £1 ordinary shares of Cunard, which had also reported an increase in gross profits (from £7.1 million to £8.2 million) and in the ordinary dividend (from 15 to 16 per cent), were marked down by 2s. to 40s.

In general, however, danger signals had been hoisted so often in the cautious boardroom of P. and O. that investors in shipping shares had become hardened to them, and it was not until Union Castle announced its results early this wek that the market took the warning really seriously. Union Castle, whose financial year ended three months after that of P. and O., reported a fall in gross profits from £4.9 million to £4.5 million; it therefore had to disappoint its shareholders, who had been expecting an ordinary dividend as high as 10 per cent, by declaring a dividend of only 7½ per cent, compared with an equivalent distribution on the present capital of 6½ per cent for 1951. The £1 ordinary stock units of Union Castle were immediately marked down 3s. 3d. to 23s. (to offer a yield of 6½ per cent), while the deferred shares of P. and O. fell by another 9d. to 57s. 9d. and the £1 ordinary shares of Cunard by another 1s. to 39s. The upset in the market was due not so much to a disappointment with Union Castle's dividend as to a realisation of the implications of its report. The directors declare that the fall in gross profits last year was due wholly to an increase in operating costs; there is no doubt that many other shipping companies are now being squeezed between these increases in costs and flagging freight rates.

★

BRITISH INSULATED. To the cheering batch of reports recently issued by companies manufacturing electrical equipment can now be added a particularly impressive preliminary statement by British Insulated for the year to December 31st. The directors have recommended a dividend of 10 per cent on the ordinary capital of £12,350,000 (as increased by last spring's rights issue of 3,109,614 shares at 22s. each); this compares with the 1951 dividend of 9 per cent on the original capital of £9,240,386. The higher dividend is backed and justified by a notable advance of profits. The group's trading profits have jumped from £7,966,464 to £9,423,182 and, although the provision for taxation has inevitably risen (from £4,081,211 to £4,869,146), its net profits have risen from £3,054,868 to £3,464,435. The increase in net profits has meant that the holding company has been able not only to distribute £673,075 (against £436,608) in equity dividends, but also to add £2,318,461 (compared with £2,195,362) to revenue reserves and the carry forward.

The improvement in profits almost certainly stems from a further increase in sales. A year ago the group's activities were being held up by shortages of raw materials; most of these shortages have now disappeared, allowing the group to step up output to meet the heavy demands for its products. Mr Butler's budget concessions suggest that these demands are unlikely to slacken, and there may therefore be a chance of another increase in equity payments a year hence. Indeed investors seem to have already discounted some part of this chance, for at the current price of 37s. the £1 ordinary stock units offer a yield of £5.4 per cent.

Statistical Summary

EXCHEQUER RETURNS

For the week ended April 18, 1953, total ordinary revenue was £58,973,000, against ordinary expenditure of £116,679,000 and issues to sinking funds £150,000. Thus, including sinking fund allocations of £437,000 the deficit accrued since April 1, 1953, was £52,703,000 compared with a deficit of £74,221,000 for the corresponding period of the previous financial year.

PROXIES

Shareholders are reminded that proxies in connection with the forthcoming Annual Meeting should reach this office not later than Friday morning, May 1st.

R. F. TREMAYNE, Deputy Secretary.

8, Waterloo Place, S.W.1.

SALES or General Manager—man with wide experience seeks appointment where proved ability in sales and commercial development is required. Used to large volume business home and export. Well known engineering and food manufacturing industries. Box M/242, Strand House, London, W.C.2.

UNIVERSITY COLLEGE OF WALES, ABERYSTWYTH

Applications are invited for the post of Research Assistant in the Departments of Welsh History and Economics. Salary £450 per annum. Three copies of applications, with the names of two referees, should be sent to the undersigned, from whom further particulars may be obtained, not later than May 16, 1953.

T. MAELGWYN DAVIES, Registrar.

SALZBURG SEMINAR IN AMERICAN STUDIES, SCHLOSS LEOPOLDSKRON, SALSBURG, AUSTRIA

Scholarships are offered for the following sessions :—

General Session, July 15th to August 23rd (Art, Literature, Music, Philosophy, Political Science and Psychology).

Economic Session : An Approach to the American Economy, August 30th to September 27th. Lectures and seminars at the post-graduate level. General age range, 23-35. Special attention given to those engaged in teaching, public life, or creative work, and to advanced students.

For further information and application forms, please write promptly to Salzburg Seminar, 55, Upper Brook Street, London, W.1. For the General Session, application forms must be returned by May 1st, and for the Economic Session by July 1st.

GROUP PERSONNEL OFFICER

A group of engineering companies comprising autonomous manufacturing divisions seeks an officer to exercise general oversight upon staff, promotion, training and education, and to advise manufacturing divisions on labour relations matters. This is not appointment of personnel manager in the ordinary sense as the group policies must be conveyed by persuasion and inspiration. The chosen officer will be responsible for selection of university and other trainees and for all training curricula in the group. Applicants must have background of manufacturing industry and the necessary intellectual or academic qualities to enable them to assess technical staff. They must also possess vigorous and persuasive personality. The appointment will involve considerable travelling and although based on London does not necessitate residence there. Appointment is permanent and pensionable. Four figure salary commensurate with qualifications and experience.—Write stating age, education, present earnings and full details of career, to Box E.C.237, c/o 191 Gresham House, E.C.2.

ACCOUNTANT

A young Chartered Accountant, not over 28 years of age, is required by a leading industrial company. The successful applicant will be expected to undergo a period obtaining the experience necessary to undertake duties of a responsible nature. In addition to professional qualifications a university degree would be considered an advantage, although not essential. An adequate salary will be paid during the preliminary period, but the prospects of the appointment are outstanding, including remuneration of £2,000 per annum within five years of being confirmed in the appointment. Thereafter further advances may be expected as increased responsibility is assumed.—Send details of qualifications and experience to Box 230.

EXPANDING ORGANISATION requires young statistician with investment experience and knowledge economics. Write full details, in confidence.—Box 237.

INDIA.—Chairman of publicity organisation visiting India shortly for top-level contacts is willing to undertake selected commissions. —Box 232.

FACTORY PREMISES FOR SALE.—Central town situation in Lancashire Development Area. Excellent load facilities, all services. Adequate office accommodation. Floor area, approximately 24,000 sq. ft.—Write Box 231.

DIRECTOR of a Midland group of light engineering companies is considering the appointment of a Deputy in order to meet the needs of expansion. This is an extremely responsible appointment and only men with experience at this level and whose qualifications are in line with the following specification are invited to write, in the strictest confidence, with a view to a preliminary discussion: —

(a) Qualified Accountant, age 35 to 45 years.
(b) Good general education, good appearance and forceful personality.
(c) Sound commercial background and knowledge of Commercial Law.
(d) Experience in budgetary control and modern office systems.
(e) Practical experience of top level management in the engineering industry.
(f) Progressive approach to problems of staff control.

The terms of the appointment will include an initial basic salary in the £2,000 to £2,500 p.a. range; a bonus dependent upon company results; participation in attractive pension and life assurance scheme. —Give full details of age, education, qualifications and experience, to Box 239.

A GENERAL SALES MANAGER required by nationally known Midlands engineering company with present turnover about £2 million annually in a rapidly expanding market. Applicants should have proved sales record and be capable of directing the efforts of a direct selling organisation in the U.K. and export sales by agency agreements. Experience is required of co-ordinating extensive sales promotion by advertising and other media with existing live sales force and keen managing director. The position offers excellent permanent prospects leading to executive directorship after proven success and carries a starting remuneration of not less than £2,000 per annum including commission. Outstanding applicants who can satisfy the managing director that they are worth more will be favourably considered.—Applications, in writing, should be addressed to General Sales Manager, c/o Urwick, Orr and Partners Ltd., 29 Hertford Street, Park Lane, W.1. Envelope marked AS/F. 1080.

Combining Mediterranean climate and Alpine scenery in the Sterling Area

Spend your Summer and Autumn holidays at the

BERENGARIA HOTEL

CYPRUS

A first-class hotel with all amenities situated in the Island's famous pine forests. Open May 20 to November 10. Please apply to principal Travel Agencies in London, or write to Manager, Berengaria Hotel, Prodromos, Cyprus.

BEDFORD COLLEGE (UNIVERSITY OF LONDON)

REGENT'S PARK, N.W.1.

The Council of Bedford College invites applications for the following posts in the Department of Sociology, Social Studies and Economics, vacant as from October 1, 1953: —

(i) Assistant Lectureship in Sociology.
(ii) Lectureship or Assistant Lectureship in Social Statistics.

The posts are open to men and women equally. Candidates should have a Degree in Sociology or in Economics with qualifications in Sociology and Social Statistics respectively. Salaries in accordance with University of London scales. Last date for receiving applications May 15, 1953. Further particulars from the Secretary.

THE AUSTRALIAN NATIONAL UNIVERSITY, CANBERRA, A.C.T.

Applications are invited for the position of READER IN PUBLIC ADMINISTRATION in the Department of Political Science of the Research School of Social Sciences.

The salary range for Readers is £1,590-£1,840, plus a cost of living allowance, at present £180 per annum.

Superannuation will be under the University's scheme, which is based on F.S.S.U., or under the Commonwealth Superannuation Scheme. A year's study leave, with travel allowance, will be granted after five years' service.

Copies of the conditions of appointment and a statement about the office may be obtained from The Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1, with whom three copies of application should be lodged before May 31st; these should include date and place of birth, age, marital status, war service, academic record, publications (single copies to be forwarded if available), appointments held, and the names of three referees.

BRITISH BUSINESS OVERSEAS

SCHOOL OF ORIENTAL AND AFRICAN STUDIES
UNIVERSITY OF LONDON, W.C.1.

Short courses of background lectures are offered to business men and others covering the social, political, and economic problems of the countries of the following regions: —

The Middle East.
The Indian Sub-continent.

Intensive instruction in the languages of these areas can also be given.

For further details apply to the Organiser of Special Courses at the above address.

Telephone inquiries: MUSeum 2023, ext. 28.

BOARD CHANGES

Insurance Engineers Limited. Mr. E. Lansdowne has been appointed Chairman, and Mr. J. A. Miller, DSO, Deputy Chairman.

THE Nuffield Foundation has a vacancy for an Assistant Secretary. Applications are invited from university graduates (any faculty) having an informed interest in contemporary developments in the natural, medical or social sciences. Commencing salary not less than £1,850 p.a. with superannuation and child allowance.

Applications giving full details of qualifications and experience and the names of three referees (no testimonials should be submitted) should be sent to the Secretary of the Nuffield Foundation, Nuffield Lodge, Regent's Park, London, N.W.1, by not later than May 31, 1953.

LAWYER (35-50) required by engineering company in S. Midlands for work connected with patent licences and similar agreements. Practical experience of drafting or interpretation of licence agreements is essential. Salary £1,200 to £1,500 according to experience. Pension and Profit Sharing Schemes. State particulars of qualifications, age, positions held.—Box 238.

SWISS political science graduate (25) seeks interesting post in the field of economics. Special interest in research and planning. Languages: English, German, French. London and surroundings preferred.—Box 235.

CAMBRIDGE GRADUATE ECONOMICS, 28, four years' executive experience export department large electrical group, seeks similar position smaller electrical or mechanical firm. Moderate French, Spanish.—Box 236.

THE Nuffield Foundation wishes to fill the post of Fellowships Adviser. The holder of this post will be expected to carry out under the direction of the Secretary of the Foundation such duties as may be required in the administration of the Foundation's Commonwealth schemes for fellowships and like awards and particularly to advise and help holders of these awards, many of whom are from overseas. Commencing salary £1,250 p.a., with superannuation and child allowance.

Applications giving full details of qualifications and experience and the names of three referees (no testimonials should be submitted) should be sent to the Secretary of the Nuffield Foundation, Nuffield Lodge, Regent's Park, London, N.W.1, by not later than May 31, 1953.

OTHER NOTICES APPEAR ON PAGE iii OF COVER.

COMPANY MEETINGS

THOMAS TILLING LIMITED

LARGER GROUP PROFIT AND DIVIDEND

"FAMILY OF FIRMS IN FINE SHAPE"

MR W. LIONEL FRASER'S REVIEW

The fifty-sixth annual general meeting of Thomas Tilling Limited will be held on May 13th at Crewe House, Curzon Street, London, W.

The following are extracts from the review by the chairman, Mr W. Lionel Fraser, CMG, circulated with the report and accounts for the year to December 31, 1952:

The consolidated profit and loss account shows that the profit of the Group before taxation is £1,264,640, showing an increase of £14,746 over 1951, and while taxation takes a greater proportion of this profit, a smaller amount of the profit after taxation is attributable to minority interests. The net profit attributable to your company is consequently £378,824, which is £24,263 more than the figure for 1951. Out of this profit there has been paid the preference dividend for the year, and the directors now recommend the payment of a dividend on the ordinary stock of 7½ per cent, as compared with 6 per cent last year.

The chairman then reviewed in detail the activities of the subsidiary companies:

Cornhill Insurance Company, Limited;

Daimler Hire, Limited;

Mark Dawson and Son, Limited (Worsted Spinners);

Hobourn Aero Components, Limited (Manufacturers of Light Engineering Components, Textile Machinery, Electrical Convection Heaters);

James A. Jobling and Company, Limited (Manufacturers of "Pyrex" Brand Glassware);

Newey and Eyre, Limited (Industrial Electrical Engineering Suppliers);

Stratstone Limited (Distributors of Daimler and Lanchester Cars);

F. Troy and Company, Limited (Building, Civil Engineering and Painting Contractors); and of the associated companies:

British Steam Specialties, Limited (Manufacturers and Distributors of Valves, Gauges, etc.);

Timothy Hird and Sons, Limited (Worsted Combers and Spinners);

E. R. Holloway, Limited (Comb Manufacturers, Fancy Goods, etc.);

Stevensons (Dyers), Limited (Hosiery Dyers and Finishers);

Western Motor Holdings, Limited (Motor Car Distributors).

The review then continued:

NEW ACQUISITIONS DURING THE PAST YEAR

John H. Ashton Limited.—Mahogany and Hardwood Merchants, Salford.

During the year we purchased an interest in this company, which was established in 1831 and which is one of the leading mahogany and hardwood merchants in the country. Ashtons have large modern sawmills for the conversion of logs, mostly from Borneo and the West Coast of Africa, also kiln drying plant for the seasoning of boards and deck planking. For over forty years the company has been in close relationship with Harrisons and Crosfield Limited, the Eastern merchants, and has exclusive rights in the disposal of the timber shipped to the United Kingdom by the British Borneo Timber Company which Harrisons and Crosfield manage. Our invesment does not amount to a big sum. We are impressed by the management as well as by the prospects, and we appreciate the indirect association we thus have established with Harrisons and Crosfield.

Heinemann Holdings Limited.—The Windmill Press, Kingswood, Surrey.

This company owns or controls a group of companies engaged in book publishing, printing and binding, whose activities are world-famous. In addition, Heinemanns have subsidiary companies or branches in Canada, Australia, New Zealand, South Africa, France, the Netherlands, Austria and Germany. Your company has for several years owned some of the ordinary shares of Heinemann Holdings Limited, and it has during the last year taken the opportunity to increase the investment. This will involve no change whatsoever in the management or policy of Heinemanns, in whose future your directors have full confidence.

Lime-Sand Mortar Limited.—Ready-Mixed Mortar and Ready-Mixed Concrete Manufacturers; Sand and Gravel Producers, Knaresborough, Yorkshire, also at Newcastle and other depots.

Since the date of the balance sheet we have been able to buy part of the ordinary share capital of this company. Its main business, that of producing ready-mixed mortar, is unique in this country on the scale of operations conducted. The business was introduced from the Continent in August, 1939, but due to the war its output was restricted until 1945. Since then development in this country has been rapid, in keeping with the demand from builders who appreciate the high quality of mortar produced and the value of the service offered. In 1949 a plant went into production in Toronto, Canada, and is now operating on a profitable basis. There are plans for further developments at home and abroad. After thorough preparation the company has entered the ready-mixed concrete field, and a new plant in Leeds, opened in June last year, is expected to make a growing contribution to profits. A subsidiary company, A. Braithwaite and Company, Limited, owning large sand and gravel quarries, is also operating satisfactorily. We are of opinion that Lime-Sand Mortar Limited, has great potentialities, and we are glad to have the occasion to participate in its development. Its management is go-ahead and very able.

GENERAL REVIEW AND PROSPECTS

This Industrial Holding Company, as we describe ourselves, is in verity a family of firms. Your directors trust that from the full details given above, it is manifest that, taking an overall view, the family is in fine shape. Some of the underlying companies have been able to show better results than others, but your directors avow their faith and confidence in the future of them all. So far we have no reason to be other than satisfied with the acquisitions which we have made and we find our relations with the boards and the personnel concerned entirely harmonious and everything that we could wish. All are inspired by a sense of service and responsibility, and exhibit a marked desire to enhance the interests and the reputation of the Group of which they are members.

Many of our holdings have come our way because the previous owners have felt it necessary, often for death duty reasons, to protect themselves by disposing of part, or even of all, of their interests, and have decided to throw their lot in with our Group, in which they are free to develop along their traditional lines. This freedom of action is much appreciated, as is our very natural wish to give our help and advice wherever required.

During the year we disposed of the balance of our holdings of quoted ordinary shares, with the exception of Heinemann Holdings Limited, to which reference has already been made. As I have said in previous annual statements to stockholders, we are not content merely to hold parcels of quoted shares in companies to whose destiny we can make no effective contribution. Rather do we prefer to interest ourselves in companies in whose development and progress we can play some real part, but we are aware that in so doing we shall stand or fall by the correctness of the choices we make. We are fully prepared for that and we do not expect our path to be free from care and anxiety. Our main emphasis is always on the quality of management, and your directors believe they are acting usefully and constructively in following the policy they have laid down. Many of our companies will sooner or later be requiring additional finance—indeed some are already calling upon us—and our funds, on deposit at attractive rates in the meantime, will be available for the expansion of our existing interests or for the acquisition of new ones.

Your directors maintain an optimistic and expectant outlook, and they anticipate that the year 1953 should produce results at least comparable to those of last year, provided no unforeseen setback overtakes us in the meanwhile. We have embarked upon a long-term undertaking, and we are only in its early stages.

EXPRESSION OF THANKS

It is always a pleasure to be able to thank those who do so much for us. I refer to my colleagues on the board of Thomas Tilling Limited, and to the headquarters staff at Crewe House, also to the directors, to the executives and to all the employees, men and women, of our subsidiary and associated companies. I assure them all of our sincere gratitude for their great endeavours.

FORD MOTOR COMPANY LIMITED

YEAR OF SATISFACTORY ACHIEVEMENTS

IMPORTANT NEW ACQUISITION

The twenty-fourth annual general meeting of Ford Motor Company Limited will be held on May 15th at Grosvenor House, Park Lane, London.

The following are extracts from the statement by the chairman, Sir Rowland Smith, MIMechE, which has been circulated with the report and accounts:

The achievements of your company in 1952 were very satisfactory. Sales of cars, commercial vehicles and tractors (164,760 units) and trading profit (£9,791,851) for the year 1952 were within 1 per cent of 1951 figures. This might suggest an uneventful year, but these simple facts mask the compensating effects of a number of greatly changed conditions, the most important of which were: a 13 per cent decline in unit sales abroad; a 29 per cent increase in sales at home; the introduction of a new tractor, the diesel proportion of which has greatly increased; the production of four-wheel drive trucks for the Services; a substantial increase in turnover; a decline in profit margin.

In the export market we were adversely affected early in 1952 by protective financial measures taken within the sterling area. A minor recovery in sterling markets developed later in the year and our efforts to compensate the decline by increased sales elsewhere were partly successful.

As a result of all this, the pattern of our exports has changed appreciably as under:

	Per cent of total sales	
	1951	1952
To sterling area ...	58	48
To dollar area ...	13	9
Elsewhere	29	43
	100%	100%

In 1952 we exported 108,700 units to a total value, including spare parts, of £46 million. The whole motor industry exported £324 million and contributed 12.7 per cent to the nation's exports.

Our new tractor incorporates the choice of three engines, diesel, petrol or paraffin. We are thus able to sell the diesel version at an attractive price which has swung demand towards the diesel, which latter now constitutes the larger proportion.

As a result of the larger proportion of higher priced units—Zephyrs, diesel tractors and government trucks—produced during the year, turnover increased to £83.9 million from £70.2 million in 1951. However, average trading profit margin declined somewhat, largely because of our general price reduction in June last, viz.: home prices—all units by 5 per cent; export prices—cars 10 per cent; trucks 7½ per cent; and tractors 5 per cent.

The Anglia is priced 11.7 per cent lower than its nearest competitor in this country, and, at the other end of our price scale, the Zephyr gives value and performance which are rapidly receiving universal recognition.

TRADING RESULTS

The year's profit for the group was £8,780,878, of which tax took nearly two-thirds, leaving £3,029,526. To this is added the £400,000 reserve for contingencies no longer required, and £300,000 for adjustment of excess profits tax and more recent tax liabilities.

The Chancellor's welcome income tax reduction of 6d. in the £ reduces our tax charge by about £200,000.

Our contribution to Excess Profits Levy for the year was no less than £1,100,000—out of all relation to our profit from the armament programme, the taxation of which was the original purpose of the levy. Excess Profits Levy has been a brake on progress, and its passing will not be regretted.

During the year we made our two millionth vehicle and our millionth reconditioned engine.

The blast furnace has had a run of over 1,580,000 tons since its last relining, a record for the country and a tribute to the men who operate it.

In 1952 we had more than 36,000 visitors at our plants.

During the last five years over 200 service exhibitions, with an attendance of nearly 350,000, have been arranged in co-operation with our fine Dealer Organisation.

BRIGGS MOTOR BODIES LIMITED

In recent weeks arrangements have been successfully concluded whereby your company has acquired the majority share interest in Briggs Motor Bodies Limited, which company has supplied us with almost all our body requirements. You can well understand, therefore, the importance of this transaction to your company.

As already announced, we intend to make an offer for the remaining Briggs shares which are publicly held. Both companies are leaders in their respective fields, and co-ordination of resources will ensure more efficient operation and provide added strength for the competitive days ahead.

THE OUTLOOK

During the first three months of this year sales have substantially exceeded those of 1952, but the future is too uncertain to derive from this trend any reliable indication for the rest of the year.

With our comprehensive range of products at competitive prices and the incomparable access to export markets provided by the Ford world organisation, I am confident that we are well placed to get at least our proper share of the export trade.

At home it is clear that the last arrears of demand accumulated since the war will be cleared and the whole industry will again be on a fully competitive basis during 1953. We welcome this, and our sales organisation, dealers and company alike, are prepared to meet this situation. Ford quality and low price, backed by unrivalled service, will more than hold their own.

The spectre of heavy Purchase Tax continues to hang over our industry, which has concurred in a temporary "sale or return" arrangement to protect dealers as and when this tax is reduced or abolished, but this is only an expedient, and does not help the retail customer; only the Government can do that, and it is encouraging to note that a start has been made.

Motor-vehicle users are probably the most heavily taxed section of the community, carrying an annual load of tax from all sources of £373 million per annum. The greater part of this burden falls on industry, which is entitled to demand that the carriage of its goods should not, in addition to this penal taxation, suffer the extra costs imposed by our inadequate road system.

"SOFINA"

The annual shareholders' meeting of Société Financière de Transports et d'Entreprises Industrielles (SOFINA) was held on April 23rd in Brussels, Vicomte Van de Vyvere, Chairman of the Board, presiding.

In their introductory remarks to the report, the directors make, *inter alia*, the following statements:

"Too liberal an investment and credit policy has without doubt been the source of the difficulties which certain European countries have encountered in balancing their external payments. Although they are still insufficient, praiseworthy efforts have nevertheless been made recently towards the progressive abandonment of cheap money policies. This return to orthodoxy is rational, but it should be accompanied firstly by the suppression of government controls which hamper the free play of market forces, and secondly—and above all—by a substantial reduction in public expenditures. Governments should convince themselves of the idea that the main prerequisite for a return to currency convertibility is the re-establishment of order within their own countries, in public finance as well as in economic and monetary policy.

"If this elementary truth were understood—and above all applied—it would be surprising to see with what rapidity a return to broader markets and to transferability of currencies would take place, such as the world knew them before 1914, between the two wars until 1930 and, though to a lesser degree, in 1937 and 1938. . . .

"Formerly, the situation was simple. Apart from customs duties, which at times were very modest, economic barriers and exchange controls did not exist. Today the new conceptions are more complicated. Indeed, they involve the creation of supranational organisations, the purpose of which is progressively to liberate exchanges, either on a regional scale (Schuman Plan) or on a geographically wider scale (European Payments Union, Organisation for European Economic Co-operation).

"This is the subject, dealt with in the essay which we present to you this year. . . .

"The book value of investments is Belgian francs 1,998,869,000, or B.frs. 54,263,000 more than in the preceding balance sheet.

"The market value of quoted shares and the estimate of unquoted shares gives a total estimated value to investments of B.frs. 3,119,575,415 at December 31, 1952, compared with B.frs. 2,934,980,964 at December 31, 1951.

"Net liquid assets and debtors, after deduction of liabilities to third parties, amount to B.frs. 702,814,362, or B.frs. 43,815,892 less than at the end of 1951.

"The book value of investments in associated companies having their principal interests in Argentina amounts to B.frs. 263,780,321, and claims against such companies to B.frs. 374,638,873. Non-Argentine securities with an estimated value of approximately B.frs. 100 million have been received as a pledge for the payment of part of this last-mentioned amount.

"Gross income from all sources amounted to B.frs. 271,704,369, as against B.frs. 239,591,899 in the previous year.

"Profits derived from sales of securities (B.frs. 96,790,630, as against B.frs. 69,075,300 for 1951), and earnings which could not be cashed in Belgian francs (B.frs. 34,083,940, as against B.frs. 43,650,728 in the preceding year) have been applied mainly to writing down investments and to writing off claims expressed in Argentine pesos in accordance with the practice adopted by the company in regard to other claims in non-transferable currencies."

A dividend of B.frs. 80.—net per ordinary share has been declared, as against B.frs. 70.—net for the preceding year.

Translations of the report and of the essay, entitled "International Economic Co-operation," as also of Mr Heineman's address, are obtainable on application to Runaples Trust Co., Ltd., 121, Queen Victoria Street, London, E.C.4, or to Electric and Railway Finance Corporation, Ltd., Claridge House, 32, Davies Street, London, W.1.

BONDOR LIMITED

RECORD SALES

MR JOHN GOODENDAY'S STATEMENT

The twenty-fifth Annual Ordinary General Meeting was held on April 20th at 10c, Hanover Square, London, W.1. the following is the statement by the Chairman, Mr John Goodenday, circulated with the report and accounts:

This is the twenty-fifth year of the Company's existence and it is therefore with pleasure that I am again able to report that sales in 1952 constituted a record. Despite the well-known difficulties of the textile industry, all the Company's manufacturing units operated on full time throughout the period.

The increase in cash value of sales amounted to 6½ per cent but as the average selling price of our merchandise was approximately 10½ per cent lower than in 1951, the unit volume in fact increased by 19 per cent. Due to the fall in overseas demand and in the main to the restriction of imports into Australia, there was some decline in the Company's export business.

HOSIERY DIVISION

With regard to the Hosiery Division, Stockholders may be interested to know that the Company's output of fine gauge full-fashioned stockings has now reached 250,000 pairs a week. For a period last spring the home market was freely supplied with nylon hosiery due to the release of large stocks arising from frustrated exports. Whilst this Company encountered no difficulty in selling its production of nylons, the temporary surplus caused a slump in the demand for non-nylon stockings during the summer months. In consequence stocks of this merchandise accumulated in our warehouse, but by autumn this situation rectified itself and our overall production of hosiery was again heavily oversold.

UNDERWEAR

The Underwear Division had a more difficult year. The biggest element in cost is fabric and as conditions in the trade became increasingly depressed, distressed stocks of materials and of made-up garments were being freely offered in the trade. As fabric prices fell so we wrote down our stocks. By the end of the year a higher volume of sales had been achieved although the money value was slightly less than the previous year. These trading conditions necessitated an unusually large number of style changes in the production lines at the underwear factories, and these factors, coupled with lower selling prices and substantial losses on fabric and finished garments, are reflected in the reduced profits shown in the Accounts Although stocks of fabric and finished garments are well below the level of the previous year, they were higher at the end of 1952 than was desirable, but this position is steadily improving.

Our confidence in the strength of the brand Kayser Bondor is reflected in the level of sales which has been attained in recent months during which more normal market conditions have prevailed. It has justified our policy of maintaining full production throughout last year.

Capital expenditure amounting to £339,808 was incurred in 1952 and was mainly in respect of new fine gauge hosiery machines. A number of machines were scrapped in accord with our policy of replacing old machinery in all departments as improved equipment becomes available.

Reference should be made to a new project at the Baldock factory where a plant comprising the most modern machines for the production of ribbed vests has been installed. The initial production has been well received by the trade and the public.

NEW PREMISES

Since the close of the financial year we have entered into a contract for the purchase of the lease of 24, Albemarle Street, W.1, a building previously occupied by the Court Jewellers. It will be recalled that the Company's original London premises were destroyed during the war and that alternative premises were obtained in Hanover Square. These premises have become too small as the business of Kayser Bondor has expanded. The new premises are particularly adaptable for London showrooms and administrative offices and will provide double the existing accommodation. It is anticipated that the building will be ready for occupation in June. The lease has been acquired at a cost of £108,000 by this Company and will be financed out of its own resources.

The accounts are set out in full detail and so I will only make brief comments thereon.

In the Consolidated Profit and Loss Account the profit from trading operations amounts to £1,071,594 and the Net Profit available for distribution after providing for Depreciation, Debenture Interest, Taxation and other expenses, amounts to £285,746.

The large burden thrown upon industry in the form of Excess Profits Levy is unfortunate for this Company. As two of our principle factories were requisitioned during the war, the first two postwar years were a period of reorganisation and the benefits of our long-term programme were only obtained after the period on which our standard profit is based. In consequence, we are penalised for our enterprise and a large proportion of our earnings are liable to Excess Profits Levy.

DIVIDEND AND ALLOCATIONS

With regard to the profits available for distribution, the Directors recommend a Final Dividend of 15 per cent, less tax. This Dividend, together with the Interim Dividend of 10 per cent, less tax, already paid, will make a total distribution for the year of 25 per cent, less tax, and the total cost of these dividends will amount to £85,312. The Directors recommend that £200,000 be transferred to General Reserve. In addition the sum of £200,000, which previously stood to the credit of Reserve for Contingencies has been transferred to General Reserve. The result of the above appropriation and of the transfer from Reserve for Contingencies will be to increase the General Reserve from £700,000 to £1,100,000. Moreover £6,710 has been appropriated to Capital Reserve for reasons which will be apparent later. The amount of profit to be carried forward will be £107,674 as compared with £113,950 brought forward from the previous year.

It is also proposed to utilise the sum of £6,772 standing to the credit of Share Premium Account, together with the Capital Reserve of £43,228 (which includes the £6,710 appropriated from Profit and Loss Account), making a total of £50,000, by distributing this amount to stockholders in fully paid Ordinary Shares of 5s. in the proportion of one new Ordinary Share for each 13 5s. units of Ordinary Stock held by them on March 26, 1953. The new Ordinary Shares will thereafter be converted into stock ranking *pari passu* with the existing Ordinary Stock. Fractions will be sold and ordinary stockholders will receive the appropriate amount in cash. In view of the fact that the Authorised Capital of the Company is £650,000 and that this amount has all been issued, it is proposed to increase the Authorised Capital from £650,000 to £1 million. The necessary resolutions to cover the increase in the Authorised Capital and the issue of the new shares will be submitted at the General Meeting as Special Business.

Turning to the Consolidated Balance Sheet, it will be noted that Stock in Trade (in the consolidated figures) is £1,356,404, a decrease of £286,910 as compared with the previous year. Debtors and Payments in Advance amount to £943,431 as compared with £985,630, but the reduction in the rates of Purchase Tax has affected this gross figure. Excluding the element of Purchase Tax, actual Book Debts are £108,000 in excess of the previous year. Our cash resources at the end of the year were £463,784 as against £316,861 at the end of the previous year.

CURRENT YEAR

One must be guarded in anticipating the trend of business during the current year. There is greater stability in the price of raw materials than a year ago; our turnover so far has been increased and there are better prospects in the export markets. There is abundant evidence of the continued growing esteem with the trade and public for our brand Kayser Bondor. Research and development work has been intensified within the organisation and our technicians in every section strive to improve the quality of our merchandise.

Mr Michael Colefax, who has rendered valuable services to the Company since he joined the board in 1934, was appointed Deputy Chairman with effect from January 1, 1953. In his new appointment he will be devoting more of his time to the business of this Company.

TRIBUTE TO STAFF

The annual tribute to the staff is apt to become somewhat of a platitude. In the year under review much additional work was imposed on the manufacturing personnel and the sales force. I should like to express my deep appreciation of the loyal and able service rendered by the Executives, the sales force and all our employees in 1952. It is no exaggeration to say that throughout our organisation there is an exceptional spirit of loyalty and enthusiasm.

W. & A. GILBEY, LIMITED

CHAIRMAN'S STATEMENT

The annual general meeting of this company was held at Gilbey House, London, N.W.1, on April 20th.

The following are extracts from the speech of Mr Ronald Gilbey, the chairman:

The global sales of our products showed a gratifying increase both in quantity and value. This applies particularly to the home market, except Eire, where the duty on spirits was substantially increased during 1952 and our sales of Irish whiskey in several popular brands showed a sad falling-off, the price having outstripped the purchasing power of the public.

The introduction of the full range of inexpensive French table wines, including some from our own vineyard, to which I referred last year, has been highly successful. It is evident that these wines have filled an appreciable want and that wine at a popular price is still in demand. Our sales of sherry, gin and our well-known wine cocktail "Odds On" have been well maintained, and so have sales of port, for which our brands have such a deservedly high reputation, but we cannot look for much increase as long as the high rate of duty is continued. We have, through our representatives, supported the efforts of the trade to persuade the Chancellor to reduce the general level of duties, a step which we believe would benefit the Exchequer as well as ourselves. But, even as matters stand, the ratio between the duties on dessert wines and table wines is very much out of balance, the present rate of duty on the high-strength wines being six and a quarter times the pre-war rate, standing at 50s. per gallon, against 13s. for beverage wines. For many years before the war the ratio between the rates of duty on the two types was approximately 2 to 1, and we feel that this ratio should be restored.

In Canada our sales of gin and also of our three brands of Canadian rye whisky have all shown substantial increases. It was not possible to make sufficient matured whisky available to meet all demands, but next year our stocks will be larger and we are confident of being able to sell the additional supply.

In USA, where the sale of the ten millionth case was observed with nation-wide publicity, Gilbey's gin keeps its place as second to none in the public favour. A few weeks ago we were grieved to learn of the untimely death of Mr Seton Porter, the founder and architect of the National Distillers Products Corporation, who have for many years given us the benefit of their fine organisation in that great country. We offered his colleagues our sincere sympathy in their sad loss. His successor as president is Mr J. Bierwirth.

The trading profits show a decrease compared to the exceptional figures of 1951, although they still compare favourably with the 1950 figure. I consider the final result not unsatisfactory. The consolidated balance sheet now shows net assets of over 6¼ million pounds, an increase of nearly £400,000 during the year. As stated in the directors' report, the general reserve has been substantially strengthened and we have, therefore, felt justified in maintaining the dividend at the same rate as last year, including the bonus of .6d. per share.

We are also carrying out a more modest, though important, scheme of re-equipment at our Dublin stores. These premises comprise excellent buildings in a fine, central situation. After this modernisation, we shall be able to give our customers in the Republic of Ireland, where we have always been firmly entrenched and where our goodwill stands very high, a distribution service equal to the best.

The report and accounts were adopted.

UPSONS LIMITED

(The Dolcis Shoe Company)

INCREASED SALES

The thirty-third annual general meeting of Upsons Limited was held on April 16th in London.

Mr F. J. Stratton (chairman and managing director), in the course of his speech, said: The year 1952 will be remembered as one of greater difficulty for the footwear industry. Disastrous fluctuations took place in the price of its main raw material—leather, purchase tax under the new D Scheme added to the problems of those trading in medium to higher-priced merchandise and costs of all kinds continued to rise while consumer resistance to price increased. Our general strength nevertheless is unimpaired. Though the industry as a whole was compelled to reduce its production, we have succeeded for the sixth year in succession in achieving an increase in unit sales.

FIRM AND SOUND POSITION

Though net profit at £746,359 is some 18 per cent lower than last year, we have come through our tribulations well and, in the circumstances, we consider the results to be very satisfactory. We are in a firm and sound position to tackle the problems of 1953-54.

We have continued our previous policy of steady expansion. I believe the Bristol store opened in the new Broadmead shopping centre on August 28th is an outstanding example of all that is best in modern store design and not surpassed elsewhere in the world. On the day that we opened this store we were able to open our second store in Toronto, our third in Canada. This new store is already trading up to target. Our fourth new Canadian store will open in London (Ontario) on May 1st simultaneously with the opening of our newest branch in London (England) at 212, Piccadilly. At home six new stores have been opened and modernisations completed at eight others.

BUDGET CHANGES

The Chancellor's new budget contains welcome changes and we applaud the principles upon which it is based. The reduction of the standard rate of income tax is a helpful step in the right direction and encourages us all. Although provision for the final dividend has been made in the accounts on the basis of the old standard rate of tax, we propose the deductions shall now be made at the new rate of 9s. in the £ and we feel sure the shareholders will give us their indulgence for the inevitable delay which will follow while the dividend warrants are reprinted. They will now be payable on May 1st. The maintenance of purchase tax on footwear at the old rate under the much disliked D Scheme is to be deplored because of its adverse effect on quality and craftmanship which are vital to us in home and export markets alike.

I do not share the opinions of those who take an easy optimistic view of trading possibilities in 1953. We expect to see increased buying of fashion shoes throughout the Coronation and holiday period, but the movement is late in starting and spring trade has been disappointing. The leather market is in a dangerous condition and the public has less money to spend. It is a time to watch out; to keep stocks down and clean and to be sensitive to the rapidly changing needs of the public. We are well equipped to do all those things and you can rely upon us not to fail in our duty.

The report and accounts were adopted.

RHEOSTATIC COMPANY

CONTINUED EXPANSION

The annual general meeting of the Rheostatic Company, Limited, was held on April 23rd at Slough.

Mr M. J. Gartside, BSc (Eng), AMIEE, MAmerSoc H and VE, chairman of the company, in the course of his speech said: I am happy to report continued expansion of the company's business in the year under review. Turnover has increased by 18 per cent compared with the previous year, with a commensurate increase in profit. The profit before taxation was £116,585, taxation at £72,000 leaving a net profit of £44,585. The board recommends an increase in the final dividend to 15 per cent. This makes a total of 19 per cent for the year, comparing with last year's figure of 16½ per cent.

POSITION WELL MAINTAINED

Your company's position has been well maintained in all its markets. The increased output of Satchwell temperature controls has been applied to many new buildings both at home and overseas and to a wider range of industrial processes.

The demand for Satchwell thermostats for domestic electric water heaters and cookers has remained at a modest level compared with that existing a few years ago, but again your company's position has been upheld. Overseas markets provided an increasing outlet for your company's manufactures, and the proportion of export to home sales has been maintained in the record figures of the past year.

I am particularly pleased to report a considerable advance in turnover of both Service and Satchwell resistors for application in heavy industry and electric traction. Subsidiary companies overseas have contributed very profitably to the group figures which you have before you, and record figures of sales and of profit were achieved both in France and South Africa.

Your company is at present fully engaged in meeting the demands of its customers and continues to achieve a high output. A further wage increase took place in the engineering industry in November last, but in view of the improvement in productive methods the additional cost has been absorbed, and we have refrained from passing any increase on to our customers.

This year there is no danger of losing business due to long deliveries nor have we an order book extended to a year ahead; we have now returned to conditions where the company is meeting the short-term demands of its customers in an atmosphere of healthy competition. Planning for the future is consequently more difficult than it was a year ago, but your board is confident that, subject to no unforeseen circumstances arising between now and the end of the current financial year, a satisfactory level of profits will be maintained. This confidence is enhanced by the Budget proposals, which are likely to give encouragement to all our home markets.

NEED FOR FURTHER CAPITAL

Reference to the accounts will show that the company is using a much larger bank overdraft than ever before. At the time of the last share issue nearly two years ago, your board did not foresee expansion as great as that which has taken place, and was consequently too conservative in the amount of additional capital then requested. The position now calls for some further increase of working capital, and your board, being fully confident of the future, is exploring the most advantageous means of raising this at an appropriate time.

The report and accounts were adopted.

DERBYSHIRE STONE

MR JOHN HADFIELD ON EXPANSION OF BUSINESS

The seventeenth ordinary general meeting of Derbyshire Stone Limited was held on April 23rd at Matlock Bath, Derbyshire, Mr John Hadfield, MSc, ARIC (chairman and managing director), presiding.

The following is an extract from his circulated statement dated March 31st: The gross profit for the year ended December 31, 1952, was £264,205, compared with £236,172 for the preceding year. The net profit remaining after all charges and taxation of £91,000 was £73,418 as against £55,834 in 1951.

The company's trading is expanding and your directors consider it advisable to raise at the present time approximately £50,000 to provide further working capital. It is intended now to offer 150,000 ordinary shares of 5s. each for subscription at 6s. 8d. each to existing ordinary stockholders on the basis of one new unit for each eight units held.

At the annual general meeting resolutions will be proposed to increase the share capital of the company from £850,000 to £950,000 by the creation of 400,000 ordinary shares of 5s. each.

SPECIAL ACTIVITIES DURING 1952

Reference has been made at previous annual general meetings to your company's interests in the search for lead and other minerals in the Matlock area of Derbyshire. A new company, Matlock Lead Mines Limited, has now been formed in collaboration with Johannesburg Consolidated Investment Company Limited to continue the exploration with an initial capital of £100, in which your company holds 32½ per cent of the shares. If the exploration proves successful, your company's proportionate shareholding in the increased capital of Matlock Lead Mines Limited would probably be on a similar basis.

The first of the two large new blast furnaces at the Shotton Works of John Summers & Sons Limited, is now being operated by that company, and Derbyshire Stone Limited is carrying out investigations with the object of ascertaining the suitability of the slag for roadmaking and similar purposes.

During the year the ore-dressing plant at the company's Fluorspar refinery has been further extended. The national demand for this important mineral, Fluorspar, in Great Britain, is increasing and your company, as the largest producer, is securing its full share of the increased demand.

Cawdor Quarry, Matlock, is the largest property owned by the company. A large and completely new plant for the manufacture of tarmacadam and bituminous macadam for roadmaking purposes has been built.

The new properties at Louth, Lincolnshire, and Foss Cross, Gloucestershire, are running satisfactorily and justifying their existence.

PROSPECTS

I believe that, providing there are no national or international crises, the results for 1953 will show an appreciable improvement over those for 1952.

In recent years there has been a criticism of the working man. As managing director of this company in addition to being chairman, I do not accept this criticism in relation to the men who work for Derbyshire Stone Limited. They are worthy people; they give of their best; they do a fair day's work, and I pass to them my thanks.

The report was adopted and the increase of capital was approved.

JOSIAH PARKES AND SONS, LIMITED

REDUCED PROFIT MARGINS

The annual general meeting of Josiah Parkes and Sons, Limited, was held on April 17th, at Willenhall, Mr Cyril W. Parkes, JP, chairman and joint managing director, presiding.

The following is an extract from his circulated statement: The outstanding feature of the accounts for the year ended December 31, 1952, is the fall in consolidated net profit to £158,635 from the record level of £198,681 in the previous year. This fall was mainly due to increases in manufacturing costs. The position was aggravated by a falling off of demand in the latter part of the year which necessitated a reduction in output, and although total turnover was maintained in value at much the same level as the previous year, increases in operating costs narrowed the profit margin.

DIFFICULT CONDITIONS

In my review last year I mentioned that the international situation was still very obscure, and that overseas trading was extremely difficult. These difficulties were accentuated in 1952. Visits by directors and staff to a number of overseas markets confirmed our opinion that our products, prices and deliveries were satisfactory. Our customers want our goods, but in many countries are unable to obtain them owing to political and economic difficulties outside the control of our customers or ourselves. We have at the moment a substantial volume of orders held up for these reasons. Fortunately, our home trade has been maintained at a satisfactory level. The South African Company also operated on a smaller profit margin.

Despite these adverse factors the net trading profit was still higher than that of any preceding year except 1951, and your directors consider the result not unsatisfactory in the circumstances. The level of profit was such that we considerably exceeded our EPL standard, and although the profit for the year is down, the total tax chargeable is higher by £3,366 than in the previous year. The total amount that it has been necessary to provide for UK taxation is nearly two-thirds of the total profit. At the moment the volume of orders is better than in the latter part of 1952 and the sales outlook is not unpromising. There is, however, still a tendency for profit margins to become even narrower.

DIVIDEND AGAIN 15 PER CENT

Having regard to the fall in the trend of profits, the heavy incidence of taxation and the uncertain outlook, your board decided after careful thought to recommend that a final dividend of 10 per cent, less tax, be paid again, making a total of 15 per cent, less tax, for the year, as before.

As to future prospects, conditions in overseas markets continue uncertain, whilst at home general business conditions have become unsettled, although the outlook for the building trade seems quite bright. The greatest problem facing us as manufacturers, and of vital importance to the country as a whole, is the expansion of our export markets. British manufacturers can and will compete with any in the world in quality, patterns and prices, without exhortation, given an opportunity. The Government could do more of practical benefit to widen the opportunities for trade by greater concentration on policies designed to remove some of the handicaps.

The report was adopted.

THE RIO DE JANEIRO FLOUR MILLS AND GRANARIES

The sixty-seventh ordinary annual general meeting of The Rio de Janeiro Flour Mills and Granaries Limited was held on April 23rd in London, Mr G. McT. Sheppard (the chairman) presiding.

The chairman said that he was pleased to be able once again to report a good year of trading, the group profit attributable to the company being £1,091,808, as compared with £1,008,890 the previous year.

The chairman said that in the flour mill trading had again been very much of a mixed character, due to the extremely limited supplies of wheat that had been made available. At times it had been necessary for the flour mills to close down temporarily for lack of wheat, which, of course, affected the earning capacity.

The Brazilian authorities were obliged to turn to North America for most of the country's needs, which had of necessity to be very restricted because of the shortage of dollars.

As to the future, it was impossible to say what this had in store, because so much depended on adequate wheat supplies being made available in order to be able to maintain maximum grindings in the flour mills, for the demand for bread throughout Brazil, which was continually increasing, was nothing like satisfied.

As regards the current financial year, the chairman said that although the shortage of wheat supplies had continued, prospects were brighter and the first shipments of Argentine wheat were on the way.

The report was adopted.

CONWAY STEWART

(Fountain and Stylographic Pen and Gold Nib Makers)

POSITION FULLY MAINTAINED

RECORD SALES

MR. S. W. JARVIS'S SPEECH

The eighteenth annual general meeting of Conway Stewart & Co., Limited, was held on April 21st at the Holborn Restaurant, High Holborn, London, W.C., Mr S. W. Jarvis (chairman and managing director) presiding.

The secretary (Mr W. G. F. Nash, ASAA) having read the notice convening the meeting and the report of the auditors,

The chairman said: It is with the greatest pleasure that I present to you the accounts for 1952, which show that the company has fully maintained its position. This, in spite of the further restrictions of imports by certain countries, which I reported to you last year. During 1952 the total value of sales of the products of your company reached a record figure. The net profit for 1952 was £28,483 after making full reservation for depreciation of plant and taxation. This compares with £25,121 in 1951, when there was an over-provision for taxation of £2,400, which has been credited in 1952.

BALANCE SHEET CHANGES

Turning to the balance sheet, you will notice that the main change is in the current assets, which are £266,904 against £251,215. Although the stock was down by £22,467, the debtors and bills were up by £11,323 and the cash had increased by £26,833, making a net increase of £15,689 in the current assets. You will thus see that our financial position

is very liquid. The goodwill of your company is stronger than ever, and if it were not for the factor of the effect on commerce of "world politics," I should feel confident of continued expansion.

I regret to tell you of the death of Mr Thomas Howard Garner on May 29th last. He was one of the founders of the company, and also joint managing director for many years. His loss has been keenly felt by us all.

TRIBUTE TO STAFF

It gives me very great pleasure to pay a tribute to all members of our staff, who have continued to give us their full support and co-operation.

The report and accounts were unanimously adopted, and a final dividend of 30 per cent (making 40 per cent for the year) was approved.

The retiring director, Mr Frank Capper, was re-elected, and the remuneration of the auditors, Messrs Chalmers, Wade and Company, having been fixed, the proceedings terminated with a vote of thanks to the chairman, directors and staff.

BANK LEUMI LE-ISRAEL B.M.

MR S. HOOFIEN ON AGRICULTURAL DEVELOPMENT

The annual general meeting of Bank Leumi le-Israel B.M. (formerly The Anglo-Palestine Bank, Limited) was held on April 9th in Tel-Aviv, Israel. Mr S. Hoofien (the chairman) presided.

In his introductory remarks the chairman referred to the stock bonus of IL. 1 stock for every IL. 3 held which had been issued to stockholders during November, 1952, thereby increasing the issued and fully paid capital from IL. 1,200,000 to IL. 1,600,000. The balance of net profit amounting to IL. 455,705 compared with IL. 374,975 for the previous year. Out of this sum an amount of IL. 200,000 had been appropriated to the payment of dividends to the stockholders. An interim dividend of 6 per cent subject to tax was distributed on the original capital of IL. 1,200,000 in November, 1952, absorbing IL. 72,000, leaving a sum of IL. 128,000 to be distributed as a final dividend at the rate of 8 per cent subject to tax on the increased capital of IL. 1,600,000. An amount of IL. 250,000 had been allocated to the reserve fund, bringing it up to IL. 1,450,000. Deposits stood at IL. 100,508,659 (1951, IL. 92,552,035) and loans at IL. 60,972,832 (1951, IL. 49,886,371).

Mr Hoofien reminded the meeting that the Anglo-Palestine Company, Limited, opened its first office in Jaffa in the summer of 1903, and the bank would therefore be celebrating its fiftieth jubilee within a few months. He mentioned that there were very few enterprises in the country which had not, in one way or another, been supported by the bank during that period.

In analysing the statistics of credits granted by the bank, which represent some 50 per cent of the total credits granted by all banks in the country, the chairman emphasised that the greatest care was taken to grant credits only for purposes vital to the economy.

He then turned to the main theme of his address, and called for re-examination of the country's agricultural development policy. This had undergone no radical change after the setting up of the State in spite of a basic change in the Israel economy. After the disappearance of the Arab farmer Jewish agriculture had, indeed, expanded considerably, but the general lines of agricultural development had not altered. It was mainly based on livestock production with some vegetable and fruit growing. The very large additional areas accruing as a result of the flight of the Fellahin were largely used to grow fodder for animal consumption. The turning of greater areas to the production of food for direct human consumption and for industrial crops would considerably ease the strain on the country's foreign exchange position. The large areas of hill-pasture should be used for feeding cattle, sheep and goats, as was done by the Fellahin in mandatory days. The upshot of such a re-orientation of the country's agriculture would be a better supply of food on which less foreign currency would be spent.

The accounts were unanimously adopted and the proposed dividend approved.

THE UNITED KINGDOM PROVIDENT INSTITUTION

RECORD VOLUME OF NEW BUSINESS

FUTURE PROVISION OF RISK CAPITAL

MR JOHN BENN'S SPEECH

The one hundred and twelfth annual general meeting of the United Kingdom Provident Institution was held on April 15th. Mr John Benn, the chairman, reported that the net new sums assured in 1952 had increased to £7,275,808, the highest figure in its long history. The premium income rose to £2,745,725, and the rate of interest earned on the fund was £5 15s. 5d. per cent gross or £4 3s. 10d. net.

The position is so encouraging that the Directors have decided that the interim bonus payable on all claims arising on and after April 15th by death or maturity and prior to January 1, 1954, shall be increased to 37s. per cent per annum on policies in the General Section and 39s. per cent per annum on policies eligible for the Temperance Section bonus, representing an increase of 2s. per cent per annum on the rates fixed at the last valuation.

The Directors have issued a supplement to their latest report and accounts, designed to take the reader behind the scenes of life assurance. As the first detailed study of its kind this breaks new ground; and its title, "Our Policy—and Yours," reflects the mutual character of the Institution which is responsible for its strength today. Copies are available to the public, and should help to explain the importance of life assurance savings to the nation.

This Institution's long standing practice of investing in equities is spreading, to judge from the reports of other mutual life offices. Our holdings in ordinary shares represent more than 40 per cent of our marketable securities or 20 per cent of our total assets. While most of these are in well established concerns they include some investments in new and developing enterprises both in this country and the Commonwealth.

Apart from the capital that insurance companies directly invest in equities, they are large participants in the Finance Corporation for Industry and similar bodies, the latest example being the Estates Duties Investment Trust Company. It is easy to underrate what the insurance companies are already doing for industry, but I believe that they must be prepared to extend their holdings in new as well as tried ventures, a view which I note is shared by Mr E. H. Lever. The subject calls for further study in the circumstances of today, for all will suffer if the fixed interest mentality should come to dominate British industry through lack of resources for taking risk and promoting enterprise.

In viewing the financial outlook today, the increasing sums being saved through life assurance provide one of the brighter features, and the United Kingdom Provident Institution, which has served its members in six reigns, will continue to play a vigorous part in this valuable movement.

THE LONDON AND LANCASHIRE INSURANCE COMPANY LIMITED

SIR ARTHUR S. ROGERS' REVIEW OF THE RESULTS

The annual general meeting of The London and Lancashire Insurance Company Limited will be held on May 13th at 7, Chancery Lane, London, W.C.2.

In a circulated statement, Sir Arthur S. Rogers, chairman, reported that the company had experienced another year of substantial progress and that the total premium income had advanced by more than £2 million to £27,676,108. The total profit was £1,346,803, an increase of £332,000.

FIRE DEPARTMENT

The fire department, which is the largest department, had yielded a record profit of over £1 million. Fire damage in the United Kingdom was higher in 1952 than in any previous year, and in the United States the fire wastage was substantially higher and constituted a record for that country. Canada had the same experience, and the constant increase of fire wastage gave cause for serious concern.

ACCIDENT DEPARTMENT

The accident department premiums had increased substantially to £10,956,000, but that department had produced a loss although less than one-half of that of the previous year. Motorcar insurance again resulted in a loss in every important territory where the company operated, and employers' liability claims, particularly in this country, were an important consideration.

MARINE DEPARTMENT

Marine insurance business, which was conducted by "The Marine" and the "Standard Marine" had produced very substantial profits, which related to 1950 and previous years and it was clear that subsequent years would not be so good.

The Law Union and Rock Insurance Company Limited, which handles the life business, had had a very good year and had been very well looked after.

The interim dividend last November was increased by 6d., making the total dividend for the year 6s. per £1 stock, i.e., 2s. 9d. interim and 3s. 3d. final. While the directors had not recommended a further increase in the final dividend, they intended—and so far 1953 had gone reasonably well—to pay an increase of 6d. in the interim dividend payable next November, thus equalising the interim and the final.

During the year Sir Arthur visited the United States, Canada, Peru and Cuba, and visits abroad, he commented, were very helpful in forming one's views and in confirming how efficiently the "London and Lancashire" organisation operated.

Tribute was paid in the statement to the general manager, Mr Thomas Wallas, who would be retiring on May 31st, his deputy, Mr F. J. Cottle, who was to succeed him and the other executive officers and the staffs.

SPRING BOOKS
1953

Author's Pay

MUCH has been said lately about the unstaunched wounds in the body of literature—the impossibility of getting a living wage from authorship. The tale is usually told in terms of the "creative writer," essentially the novelist. The public seems predisposed to think of the problems of publishing and authorship—when it thinks of them at all—in terms of success or failure in the marketing of novels and plays. For that reason the public, influenced doubtless by the puritanism in the English subconscious, cannot find it in its heart to take the emergency seriously. The Chancellor of the Exchequer is a noble exception. Yet of the 18,000 new titles and reprints published yearly, only a small number are fiction. Novels produce only a small part of the £14 million earned yearly by exports of books (author's overseas royalties benefit the balance of payments by a further sum). Of Britain's 350 publishers, less than a score live even substantially from the novels in their lists, and several of these have recently given up the unequal struggle. The great proportion of publishers', authors' (and printers') income from books is earned from serious books—general non-fiction and textbooks.

What rewards—what inducements to continued effort and output—do authors of "serious books" command? Their position today is probably somewhat happier than that of the average "creative writer" though this is not necessarily saying much. Relatively few of them, however, seek to live by their books; nor is it so usual for the neophyte to wish to live wholly by his pen while acquiring experience. The non-fiction writer in the majority of cases obtains the material for his books while practising some other profession, of which teaching is the most important. Falling incomes from royalties may produce chagrin and even household economies, but hardly turn a man from his vocation.

Non-fiction writers, however, fall into two classes. The writing of school and university textbooks has always paid pretty well, and it still pays well. The expansion of secondary and higher education has permanently increased the textbook writer's market; and his overseas market has grown also. His advantages over other authors have become more marked in the postwar period. His market is larger and surer, but, more important, the life of his product is much longer. There are fashions in textbooks, and, especially at the advanced technical level, they must be kept up to date or superseded; but ten years is a reasonable expectation of life, and is thus unsurpassed by the hopes of most other writers, except the handful of geniuses who write to withstand the centuries. The very keenness of competition, particularly in the schoolbook market, requires educational publishers to spread plant costs over several printings and to think in terms at least of a ten-year life for a competitively priced book. But the author gets his ten percent or so; and this means a regular and calculable annual cheque for the textbook writer. It means further that the energetic and successful textbook writer can hope to have a number of books in print simultaneously and all selling steadily. Sales will depend on the book and many educational changes will affect them, but even modest sales from ten books or so in print add up to a very comfortable additional income. Only well-established names outside the educational field can now achieve this—and often not till they have well passed the prime of life.

Writing textbooks is in its own way an art, and not every teacher can master it. Publishing textbooks is a skilled trade also; the publisher must have his contacts in the educational world and be ready to produce books as examinations, syllabuses and subjects change. He picks his authors with care; and authors stand to gain immeasurably from working for a well connected publisher. Incomes from textbooks vary. An educational publisher would regard a 7s. 6d. grammar school textbook as successful if it sold 10,000 copies a year; it would thus make £350 a year for its author.

But even the average return on a textbook makes non-educational authors' mouths water. It is not uncommon for an author to derive £100 to £150 a year for ten to fifteen years from a single book written in the course of one or two school holidays. On the other hand, an advanced science textbook selling only 1,000 copies a year at a published price of two guineas may bring its author a regular £300 a year in recompense for two years of initial hard work and more or less extensive revisions every three years thereafter. It should be clear from this that while small but steady incomes to buttress scholastic salaries may be the rule, it is far easier to make a good income out of textbooks than in any other form of writing—and probably easier to make a fortune. A scientific author with half a dozen or so good textbooks in print may have a steady £2,000-£3,000 a year. A famous Latin grammar, published a hundred years ago, still sell a comfortable 15,000

copies annually; a medical textbook, almost equally venerable and ten times dearer, sells more copies in its current edition yearly than the annual intake of students at all British medical schools combined.

Only a small group of established authors outside the educational and specialist fields can hope to make comparable livings from the general public's demand for serious books. It is doubtful whether even best-selling political biographies, outstanding feats of travel or endurance, or the most successful scientific wonder-books can compare with educational books—even economics textbooks—as investments of time, trouble and literary talent. For what they gain in astronomical initial sales they lose in the brevity of their earning life. It is not unknown for a publishing "sensation," which sells 100,000 copies in the year of publication, to drop to a sale of 1,000 in the second year, and a few hundred in the third. The effective life of general non-fiction is a year; so much so, that booksellers will not reorder. Income tax, therefore, heavily penalised the author who had to take all his earnings in a year from a book which took two or more years to produce. Mr Butler has partially righted the wrong by allowing him to spread his earnings over two or three tax years. But of many books it might be said, as a painter said of his picture: "How long did it take to paint it? A week—and my whole life." Some books take a year to write—and a man's whole life. The operation of income tax will thus still heavily favour the schoolmaster-author with his well-spread annual sales. A good fourth form geography does more for its author than the most shattering exposé of postwar politics or biographical study of Nazi generals.

The average non-fiction book, however, sells nothing like so well. It is true that editions are larger than before the war; they have to be to cover the increased cost of production. A publisher must sell 1,500 copies of a serious book (which is more expensive to produce than a novel) to cover his prime costs, and a further 1,000 to make his overhead; his profit comes from the last 500 copies of an edition of 3,000. During the immediate postwar boom, most books, in fact, made a profit, but today three-quarters of the titles published make little more than their prime costs; perhaps one in ten makes a profit for the publisher, and as much as £400 in advances and royalties for the author. New—even garish—light on eminent Victorians, for example, cannot according to publishers be guaranteed to sell more than 3,000 copies in present-day conditions even from authors with established reputations. A sale of 5,000 for a serious book is a palpable hit. If published at a guinea, this brings the author something over £500 for perhaps two years' work. The majority of books earn far less; many, less than £100.

Although Mr Butler's concession will help, it will not go far enough. Even an established author finds it hard to keep a list of books in print which sell, if only in hundreds, at least reliably, so that he has a basic income to operate from. For even if a book sells out its first printing, the cost of reprinting is prohibitive. Printing and binding costs are up 250 per cent since 1939; paper has risen from 2¾d. per lb to 1s. 1d. (it touched 1s. 7d.); and incidentals have increased *pari passu*. A publisher, therefore, hesitates to risk a new edition. Even worse, he justifiably hesitates to keep type standing. The cost of renting type is now so high that if a book's sales drop below even 250 a year, it loses money if kept in print.

Yet many valuable books never sold more than 300 a year. Before the war an author with several such modest sellers had a small but helpful income. Not only do such books now go out of print, but the cheap reprint (apart from the Penguin) has almost disappeared. Before the war there were not only half-a-crown and five-shilling editions of books first published at fifteen shillings, but booksellers were ready to take the original edition at half-price, in a new jacket, as a cheap edition—much as films first appear at the West End and later circulate in the suburbs at a third the price per seat. This is no longer possible; only the latest titles, and the standard editions, get into the overburdened shelves of booksellers today.

The rewards of authorship are therefore mainly to be sought elsewhere than in royalties. Books are an advertisement; they may even get a man a professorship. They justify the work and love put into them in other ways. But though this may mean that publishers will not lack manuscripts, it does not mean that all is well. Publishers are less able than ever to take a chance—less able to buy a book for its long-term future. Many of the most influential books of the past—seminal books—had small initial sales, and had to wait for another generation to discover them. It is deplorable that today such books stand less and less chance of getting printed. Indeed, the growing difficulties of publishing serious books amount to the gradual destruction of the one channel through which, in a mass society, minority opinion can make itself heard and slowly but surely effective. Only by a drastic reduction in the cost of book-making, and an increase in the habit of book-ownership, can this distressing tendency be righted.

Dedicated Explorer

EXPLORATION FAWCETT.
By Colonel P. H. Fawcett, arranged from his manuscripts, letters, log-books and records by Brian Fawcett.
Hutchinson. 312 pages. 15s.

It is very nearly twenty-eight years since Colonel Fawcett disappeared on his quest for a lost civilisation, a fabled, pre-Inca city of white Indians, marooned in an inner area, bordered by a waterless belt and insulated by an unknown region said to be infested by tribes of unsubdued savages, somewhere between latitudes 10°30′ and 11° in the Matto Grosso of Brazil. Here he believed that he would make the most stupendous discovery of modern times, which would immeasurably further historical and anthropological knowledge.

Some men travel for adventure, some for notoriety, and some for money. Fawcett explored because he could not help it. He wanted no personal glory or gain—"Because my price was paid me ten times over by my Maker." From 1906, when he was offered the chance of boundary delimitation in Bolivia, with a minimum of equipment and desultory official encouragement, until 1925, when with his eldest son and young Raleigh he set off from Dead Horse Camp, his life was a dedicated prelude to his "Quest."

Mr Brian Fawcett has wisely chosen to publish his father's notes and letters with a minimum of editing. For exploration is an unglamorous and exhausting affair; one anaconda is much like another; shooting rapids is terrifying, thrilling, a test of skill, and a heartbreaking chore—in that order; the approach to hostile Indians inevitably demands the risky technique of unarmed friendliness to secure co-operation and hospitality. The very reiteration of events bears witness that courage is an occupational qualification, and that the most insidious enemy of endurance is monotony. The character that emerges from these simple records and anecdotes is that of a patient, stubborn, kindly and rather prim Don Quixote of the *montaña*, tilting against every odd in the gamut of a tropical forest; crashing his way through impenetrable jungle; ignoring torture by climate and insect, the frustration of disease and exhaustion, the menace of beast or savage—in a fascinated pursuit of a will-o-the-wisp. An unbroken and dangerous trail was an unfailing stimulus. Advice that it had better not be attempted was as a lodestone to a magnet; prognostications of disaster were irresistible. And so he traversed his persistent way, untouched by disease, befriended by cannibals, ignored by deadly reptiles, undaunted by failure. The amazing thing is not that, finally, he succumbed, but that he was able to carry on his flirtation with death for so long.

His last preparations were haunted by misgiving. Years of delay, due to war, lack of funds or backing, and the indifference of scientific opinion, put off the final expedition until he was fifty-seven, and though his faith in his promised land was never dimmed, he began to doubt whether he would possess it. For the first time the pack of forty pounds which had to be carried for months on end became a burden. But his final gallant message to his family—"You need have no fear of any failure"—makes a fitting epitaph, as the present book is a fitting requiem to a life of single-minded service to an ideal. Fawcett's great dread was that he should have to admit his vision to be a mirage, and the fact that he was spared this must have comforted his family, who were also involved, willingly and lovingly, in his sacrifice.

Radicalism for Socialists

PURSUIT OF PROGRESS.
By Roy Jenkins.
Heinemann. 186 pages. 10s. 6d.

MR JENKINS will irritate all closed minds, whether Socialist or anti-Socialist. He discusses the achievement and prospect of the Labour party with the intimate sympathy of the son of a Welsh miners' MP. But that does not make him any less outstanding among the intellectuals of the postwar generation who stand nearer the right wing than the left wing of the Labour party; Mr Jenkins can look at politics with a detachment rare among members of parliament on either side.

The first part of his book is a critical analysis of the conflicting attitudes that have governed Labour's views on foreign policy. It shows bluntly what is involved—and what is at stake—in a resolution of the conflicts. It is here, probably, that members of his own party have most to gain from Mr Jenkins's cool appraisal. Others will pass more quickly over what is, in effect, a plea to Socialists to support a national foreign policy with understanding, and not merely from loyalty to their leaders. By contrast, the rest of the book is concerned to make clear the distinctiveness of Socialism, even of a right-wing variety, in domestic politics. The idea that Labour could ever embrace an essentially conservative policy of consolidation could only have arisen, as it did in 1949, in a Government at the end of its tether. Mr Jenkins does not put the point quite in that way, but he recognises clearly that the necessary periods of consolidation are the periods when the country wants and will generally get a Conservative Government. Labour should remain true to itself as the leftward of the two major parties. It is because he makes this point so clearly that Mr Jenkins can dismiss, more effectively than most of his party's leaders, the error of the left-wing faction. That error is to stick to the attitudes appropriate not to a major party but to a movement of protest; it is to be true not to the principles of Socialism but to the mood of men remote from power and responsibility.

On this basis, Mr Jenkins sets out the heads of the Labour programme that will be "radical in the context of the moment." Some of the points were made last year in his contribution to "New Fabian Essays," but they gain by restatement. Above all, Mr Jenkins's logic leads him to assert with unusual clarity that a right-wing Labour view is still a Socialist view. The postwar discussion of nationalisation has been confused by an inclination to rest the case for nationalising particular industries on arguments internal to those industries—the need for better labour relations in coal, or for larger units in electricity. Mr Jenkins does not quite say that a case for extending nationalisation cannot be made out at this level, but he in effect admits that it is indecisive. It is subsidiary to the general case for a doctrinal Socialism. The pace of turning industries over to public ownership should be decided

> in relation to the need for a smaller private sector in order to keep in step with the move towards greater equality of property, to make possible a greater equality of incomes at sources, to reduce nepotism, and to ensure that management, over a wide field, does its best to associate workpeople with its functions.

This insistence on a pure doctrine of Socialism is still a moderate's case: Mr Jenkins wants a mixed economy mixed in different proportions from the present, but he does not try to say whether the smaller private sector should eventually be 30 per cent or 70 per cent of the economy; nor does he discuss directly the pace at which its compression should be carried on. Although the argument is doctrinal, its practical impact is therefore subject to almost unlimited variation. These uncertainties apart, the argument is powerful but is also exposed to two major criticisms. First, the defence of the economic record of Labour Government is weak, while the general argument pays surprisingly scant attention to the needs of economic expansion and flexibility. For example, the dependence of material progress on private risk-taking and initiative is recognised; but Mr Jenkins does not even consider whether these permitted activities will flourish if the reward for the expanding business is, at some arbitrary point, either to be taken into public ownership or to have shareholdings converted into fixed-interest stock and government directors brought into the company.

The second major weakness of Mr Jenkins's argument is political. While he is liberal in his championship of consumers' choice and of small-scale organisation in the public sector of industry, he ignores the implications, for personal freedom and democratic organisation, of extended state ownership and control. It is all very well to avoid creating new industrial giants by putting outside directors on the boards of existing companies, but if this really involves "public" control the new directors have to be appointed by someone and have to be given instructions on the public interest. The shadow of a centralised, managerial authoritarianism therefore lurks round the corner with this as much as with any other policy. But if Mr Jenkins admitted this danger the whole political framework of his argument would become questionable. Is it certain that, with extending public ownership, the right-wing party will remain one of consolidation rather than reaction, able to alternate with the left-wing party because each time it accepts most of the preceding stage on the road to Socialism? Is it certain, on the other side, that the trade union leaders will remain associated with even a right-wing Socialism that is as clearly doctrinal as Mr Jenkins makes it? His book is an important contribution to contemporary political thinking; that it raises far more questions than it answers is merely symptomatic of contemporary thinking.

JONATHAN CAPE

Shakespeare in His Setting

SHAKESPEARE. HIS WORLD & HIS WORK.
By M. M. Reese.
Arnold. 589 pages. 36s.

THE one-man band has vanished from our streets, but there are still a few hardy souls prepared to command to the utterance of harmony the whole complex orchestra of modern Shakespearian research and criticism. In this ambition Mr Reese notably succeeds. Persuaded that here is a subject vast indeed but of which a synoptic view can still be taken, he has produced, at a high level of scholarly competence, a survey and discussion of Shakespeare's entire career and achievement viewed in its historical setting. Merely popular expositions apart, there has for too long been a pronounced gap between the "non-æsthetic" criticism typified by Sir Edmund Chambers's standard "Facts and Problems" and the rich but sometimes bewildering field of the newer interpretative studies. For the general reader with a serious interest in Shakespeare the present book should be a bridge as invaluable as it is shapely and boldly engineered.

Mr Reese is at his best where the gifts and training of the historian are most relevant. A major biographical perplexity, which recent investigation has revealed, concerns the change that appears to have taken place in the fortunes of John Shakespeare during his son's boyhood. The facts are explicable (at least for the greater part) in terms of recusancy. But was John Shakespeare a Protestant recusant or a Catholic? Mr Reese discusses this strange problem admirably; but yet more notable is his perception of that in the dramatist's attitude to religious and other dogmatisms which may be attributed to the spectacle of his father's conduct—on whatever side engaged.

When he approaches more specifically literary influences Mr Reese is at times discernibly on less congenial ground. Writing of Machiavelli, he supposes that "Shakespeare perhaps found him tiresomely doctrinaire." Shakespeare is unlikely to have tried to read *Il Principe*. And is it even quite accurate to say that Machiavelli's "writings permeated Elizabethan thought and had an almost intoxicating effect on Marlowe"? Marlowe indeed may have been acquainted with certain works of Raleigh's in which there is considerable covert conveyance from the Florentine; but in general his notion of Machiavelli's doctrines—and this holds of his contemporaries at large—was in part at least a perverted one, gained only through Gentillet's *Discours sur les moyens de bien gouverner. . . . Contre N. Machiavel.*

In point of detail, however, a survey of the present scope is bound to be challengeable here and there. Viewed as a whole, Mr Reese's achievement is remarkable. Works like his are commonly so written and constructed as to be more frequently consulted than read. But anybody who enjoys reading through Shakespeare is likely to enjoy reading through this book too.

Manner and Man

CARLYLE, AN ANTHOLOGY.
By G. M. Trevelyan.
Longmans. 183 pages. 16s.

IN this century so many political theories have ended in ruin and hopes proved unfounded, so many revolutions ended in second-rate Cæsars, that most of our historians are masters of prudence and detail rather than of prophecy. No longer for us the glittering pages of Macaulay under full sail or the fire-ships of Carlyle which obscure by an excess of light. For it is Carlyle's manner, its volcanic tone, its Pelions of adjectives on Ossas of epithets, that will first strike the reader as he turns to Dr Trevelyan's anthology. Wherever one dips in this book—into Carlyle's immortal full-length portrait of Coleridge, with his "eager musical energy," or into the grim comments on Peterloo selected from the often forgotten "Reminiscences"—one needs to readjust the ear. But it is far more than a question of style; the whole outlook on history and politics has changed since Carlyle. For the many who have been scared off him because of modern embarrassment about grandiloquence and rapture, Dr Trevelyan's book will open a new world

Trying to make an anthology of Carlyle's writings (a standard edition of which runs to some thirty-six volumes) is like trying to give a picture of a stream by scooping water from its ever-changing course. Anthologies are obviously a highly individual matter, and one might cavil at Dr Trevelyan's predilection for "Sartor Resartus" or regret his failure to include anything from such fascinating minor works as Carlyle on Schiller. Taken as a whole, however, he has done admirably, bringing into relief both the variety of Carlyle's work and the underlying unity—the strong deep chord of commitment to certain ideals of social justice and welfare.

"The French Revolution" towers above the rest of Carlyle, and this anthology includes the famous chapters on September, 1792. It must have been hard to leave out the account of Varennes, or the later pages on Danton. But even the relatively brief extracts which Dr Trevelyan has included suffice to show that Carlyle was not only a magnificent architect of image and sound, but also the first historian to grasp fully the nature of the revolt of the masses. Carlyle asks whether a people in the wind of revolution, and to whom the millennium is a street away, can think of obstacles and setbacks as anything save the work of traitors, spies and enemy agents. There are pages in "The French Revolution" which might be written today. The same sense of present relevance comes with a reading of Carlyle's angry reflections on Chartism and the Poor Law of 1834; in the easy labelling of Carlyle as a "hero-worshipper" of a faintly Prussian tinge, one forgets how much he knew about hunger. On every score, both literary and historical, Dr Trevelyan's anthology should put many readers in his debt.

Newspaper Colossus

THE LIFE AND GOOD TIMES OF WILLIAM RANDOLPH HEARST.
By John Tebbel.
Gollancz. 386 pages. 16s.

THE publisher for whom the phrase "yellow journalism" was coined makes lively copy, as Mr Orson Welles, the creator of Citizen Kane, discovered long ago. There is so much of it that Mr Tebbel has not been altogether successful in sorting out all the different strands: the newspaper colossus, the frustrated politician, the art collector, the benefactor of Miss Marion Davies, and the empire builder in property and films. Hearst is usually held responsible for all the worst excesses of the American popular press and for the debauchery of taste. Mr Tebbel, in all fairness, is compelled to point out that Hearst did not originate sensationalism; he learned it at Joseph Pulitzer's knee and then taught his grandmother a trick or two. Circulation, however, was Hearst's god, and in "sin, crime, and corruption" he had the formula to secure it. He also had the inherited wealth to buy the men who would present the mixture most enticingly.

To this, however, was added a passion for newspaper crusades, and Mr Tebbel does not agree that these were all cynically undertaken with an eye to sales—though they did the circulation no harm. The trusts, the Southern Pacific Railroad which had a stranglehold on California, machine rule in the cities, Wall Street, all felt Hearst's blows, and they were personal ones. Throughout his life he wrote many of his papers' leaders himself; he was no absentee proprietor. He was a strange capitalist, who only made peace with his own kind when he was growing old. In his early, almost uniformly unsuccessful attempts to enter politics and open a way to the White House, he cast himself as the tribune of the people, fighting for the eight-hour day, direct election of senators and a host of other popular reforms. But his political sense was only proved right once—when he assured the Democratic nomination to Franklin Roosevelt in 1932—and a few months later he was in the vanguard of the Roosevelt-haters. He did not even learn from the fury caused by his pro-German stand in 1916 and 1917; coming from California, he was convinced that the Japanese and Russians were the real threat to American interests, and he was obstinately pro-Hitler and pro-Mussolini. He was a born MacArthurite.

Politics, foreign affairs and even his newspapers themselves had to take second place, however, to collecting, Hearst's absorbing lifetime passion. He believed that money was there to be spent, and he spent it. Perhaps the most astonishing statement in Mr Tebbel's book is that for fifty years Hearst spent a million dollars or more a year on art. It was "artistic nymphomania," but not so undiscriminating or so scatter-brained as his detractors suggest; in some fields the Hearst collections were unexcelled.

Hearst's influence on journalism was no doubt bad, but the tendency now is to write down that influence. Historians today have even robbed him of the doubtful distinction of having started the Spanish-American war. As Mr Tebbel says in his somewhat confusing, but always fascinating and perspective, pages, Hearst was more successful as a paper salesman than as a salesman of ideas. But if his place in history is a small one, it was well worth exploring.

Undersea Pioneer

THE SILENT WORLD.
By J. Y. Cousteau, with Frédéric Dumas.
Hamish Hamilton. 148 pages. 18s.

THE frontispiece of Captain Cousteau's remarkable book shows the author, his wife and their two young sons going down for "their usual Sunday afternoon under-water excursion" on the bed of the Mediterranean. No picture could illustrate more vividly the swift transformation of diving methods that has taken place since the day in June, 1943, when Captain Cousteau cautiously swam down to a depth of sixty feet to test the first "aqualung"—the automatic compressed-air device he developed, which enables a man to swim freely under water for two hours at depths of as much as 200 feet. Today, as he records with gentle ruefulness, holidaymakers on the Riviera hire aqualungs as if they were waterwings, and women and elderly men reach 130 feet on their third or fourth dive.

Thanks to the courage and perseverance of the pioneers, the Riviera excursionist has been made free of a world of strange sights and fantastic colours—free to float and linger where the unaided diver must hasten back to the air, and the helmeted diver can only clump slowly along at the end of his cumbrous cables. But only a few of the hundreds of people who have used the aqualung have used it to such purpose as Captain Cousteau and his undersea research group, formed as a unit of the French navy in 1945. They have charted wrecks and detected minefields; they have filmed a submarine firing torpedoes fifty feet down; they have gone 400 feet into the famous fountain of Vaucluse, near Avignon; and they have explored sunken Greek and Roman argosies at the bottom of Mediterranean bays, and brought up vases, marbles and complete Ionic columns of pre-Christian date. They have learnt to live amicably with sharks and octopuses, but to beware of sea-urchins, jellyfish and fire coral. And they have brought up from the depths some of the most astonishing photographs ever taken, 85 of which, in colour and black and white, provide superb decoration for a crisp, humorous and absorbing narrative.

THE
POWER
AND THE
VALLEY
HENRY BILLINGS

The inspiring story of the most imaginative large-scale experiment of this century — the regeneration of the **Tennessee Valley,** which turned despair into rich promise and showed how the capital resources of the state could be used to liberate private enterprise.

LORD WAVERLEY
(Sir John Anderson)
writes:

"I have read with the greatest interest this story of the progress of plans under the Tennessee Valley Authority over a period of twenty years. I find in it a most interesting account of developments carried out on a regional basis which, intelligently studied, may point the way to fruitful efforts in many widely differing fields. Central control is here reconciled with private interests and individual initiative. **I heartily commend the book** to all concerned in the study of administrative method."

With many drawings, maps and diagrams.

HART-DAVIS

Napoleon's Last Days

NAPOLEON AT ST. HELENA. *Memoirs of General Bertrand, Grand Marshal of the Palace, January to May, 1821.*
Deciphered and annotated by Paul Fleuriot de Langle, Secretary-General of the Napoleon Institute, Paris. Translated by Frances Hume.
Cassell. 292 pages. **21s.**

THE story of the discovery and decipherment of Bertrand's St. Helena Journal loses nothing in the telling of it by M. Fleuriot de Langle in the introduction to his *Cahiers de Sainte-Hélène;* most of this is included in the English translation (though the equally exciting preface by his friend Marcel Dunan is not). The manuscript had remained locked up, like so many French family records, as though it were a Vatican archive; and such distinguished historians as Masson and Aubry had ventured to say that it was of no value—M. de Langle's account of all this is more entertaining to historians than to the general reader. At last the box was opened and found to contain more than anyone had hoped—a day-by-day account of life at Longwood from the time Las Cases, the author of the famous *Mémorial,* was sent home in April, 1816, to the death of Napoleon in May, 1821.

Since the only other continuous diary, that of General Gourgaud, ends on March 14, 1818, the importance of this new source for the history of Napoleon's last days was at once obvious, especially for the fresh evidence it might throw on the disputed questions about his illness and death. But, to the astonishment of M. de Langle, the manuscript was found to have been written in a series of abbreviations more difficult to read than a cipher, because they follow no system and each initial letter or syllable has to be interpreted by the light of nature and the help of its context. (Facsimiles of the script are given in this book.) M. de Langle has undertaken this difficult and tedious task, and he is still at work upon it. The volume now translated, covering the last five months of Napoleon's life, appeared in 1949; a second, covering the first period, 1816-17, followed in 1951. It is to be hoped that the work will be completed in French and in English, for it is of the greatest value and interest.

Bertrand's manner is as dry and detailed as can be—only once or twice do his emotions break through; and the reader cannot doubt (as he constantly does with Las Cases) that these are the words and manner of the real Napoleon. Gourgaud is justified, time after time: the same topics, the same turns of speech, the same egotism, the same kindliness reappear. But there is much that is new, especially in the medical details of Napoleon's illness (enough material to start all the doctors' controversies over again), and in the painful and pathetic account of his last hours. New light, too, is thrown upon the making of his will and its many codicils. It is not too much to say that, when all Bertrand's Journal is available, as well as the almost equally important *Mémoires* of Marchand—the first instalment of which was published last year—the whole history of Napoleon's exile will have to be rewritten.

M. de Langle admits in the *avant-propos* to his second volume that he has taken certain liberties with Bertrand's crabbed style, and his translator speaks of sometimes "amplifying a reference for the benefit of the English reader." But, such trifles apart, she seems to have followed the text faithfully and fully. The Notes, which are detailed and valuable, have been rearranged at the end of each month of the Journal, with only a few omissions and additions. The index (absent, as usual, in the French) will be found a great help.

Their Master's Voice

HITLER'S TABLE TALK.
Introduced by H. R. Trevor-Roper.
Translated by Norman Cameron and R. H. Stevens.
Weidenfeld and Nicolson. 782 pages. 30s.

THE English version of *Hitler's Tischgespraeche* has two advantages over the German edition reviewed in these columns on September 1, 1951. The translation has been made from a fuller and more reliable text than that published in Germany in 1951, and the records have not been rearranged according to subjects but have been left in their original chronological sequence. This is much more satisfactory: these conversation pieces in Hitler's wartime headquarters are brought vividly to life, and the Fuehrer's opinions clearly related to the passage of events.

The impression left by this fascinating collection does not substantially alter the self-portrait already drawn in Hitler's speeches (especially those before he came to power), in *Mein Kampf* and in Rauschning's "Hitler Speaks." Its value is to be found in the depth and colour added to the picture and in the wealth of confirmatory detail. Every page bears the authentic imprint of Hitler's harsh, narrow and brutal mind and illustrates the terrible consistency of his opinions from the earliest speeches in Munich after the First World War to the political testaments he dictated on the last night of his life. The value of such a document to the historian is obvious; it is of scarcely less importance to anyone who is interested in political psychology. For once, the publishers' use of the word "unique" is fully justified.

Mr Trevor-Roper's introductory essay on the mind of Adolph Hitler begins in brilliant fashion but fails to live up to its opening promise. Mr Trevor-Roper is better at asking than at answering questions. His analysis of Hitler's mind adds little to what has already been said and makes surprisingly little use either of the rich material contained in the "Table Talk" or Hitler's speeches. The author of "The Last Days of Hitler," however, is incapable of being dull, and his cogent statement of the problems raised by Hitler's career should be read by any who are inclined to dismiss that extraordinary phenomenon with indignant contempt.

The Great Lord Salisbury

SALISBURY 1830-1903: *Portrait of a Statesman.*
By A. L. Kennedy.
Murray. 423 pages. 25s.

THE opening of the Foreign Office archives up to the date of his retirement in 1902 might have made possible a detailed study of the great Lord Salisbury's foreign policies, had not the sources for such a study been so elusive. For most of his thirteen years as foreign secretary "our official records," as Eyre Crowe noted in his famous memorandum, "are sadly incomplete, all the most important business having been transacted under the cover of 'private' correspondence. It is not known even to what extent that correspondence may have been integrally preserved." What Salisbury's private papers may have to reveal is left unclear by the book under review, for its author does not seem to have made use of them—though he has talked to many people who knew the statesman well, and has made use of scores of telling anecdotes.

Instead of confining himself to foreign affairs, Mr Kennedy has essayed an appreciation of Salisbury's life as a whole. He has not been able to make up his mind whether the Conservative leader's views—or lack of views—on the injustices of the Victorian social system really were what he once calls them: "the abiding blemish in Lord Salisbury's record." His handling of the Irish difficulty shows that he shares Salisbury's entire lack of sympathy with Irish nationalism, and is consequently lopsided. He applauds the prescription of 1885—good government applied "honestly, consistently and resolutely for twenty years"—and omits the event that befell when the prescription ran out in 1905: the foundation of Sinn Fein. For this omission he could shelter behind one of Lord Salisbury's most revealing remarks: "With the result I have nothing to do."

Mr Kennedy deals with diplomacy more skilfully and with greater understanding (in spite of an unfortunate misdating of Turkey's cession of Thessaly to Greece). His passages of diplomatic narrative are well contrived and more smoothly written than much of the rest of the book, which has evidently suffered from cutting. He prints a little new material of interest to experts on the events of 1878 and 1897, and this striking, half-humorous remark which Salisbury made to his daughter in March, 1898:

> Of course the Russians have behaved abominably and if it would be any satisfaction to my colleagues I should have no objection to fighting them. But I don't think we carry guns enough to fight them and the French together. . . . In six months' time we shall be on the verge of war with France; I can't afford to quarrel with Russia now.

Salisbury was a formidably clever man, and to his few intimates a most charming one. This sketch of him will serve a good purpose if it turns its readers back to his own caustic political articles in the *Quarterly Review,* and to Lady Gwendolen Cecil's delightful, unfinished *Life* of her father.

Humane Letters

MEMORIES.
By Desmond MacCarthy.
MacGibbon & Kee. 223 pages. 16s.

THE perfect critic, it has been said, has this much in common with God: that he is easy to please and impossible to satisfy. Desmond MacCarthy must surely, in this respect, be judged the most Godlike of critics. It is hard, certainly, to think of anyone else who could have written with such evident sincerity of appreciation, such luminous understanding, about James Joyce *and* Rudyard Kipling, W. H. Davies *and* Maupassant, Lytton Strachey *and* Walt Whitman. "He was adored," says Mr Raymond Mortimer in his Foreword, "by persons who detested one another"—and this, it is explained, without any protean propensity to be all things to all men. In these essays there shines the converse of this amiable characteristic; a capacity to relish, with delicate discrimination and large enjoyment, the work of the most mutually antipathetic writers. (That this trait is not a merely negative thing, an incapacity for dislike, is demonstrated by one essay, a perfect exception to the rule; reviewing Mr Auden's selection from the poems of Tennyson, he is very unkind indeed to Mr Auden.)

"Memories" is not solely concerned with literature; it is also, almost indeed primarily, a series of character studies. Nothing could be more remote from that "scientific criticism" which lays out its subject, dead, dissected, and neatly stained with selective dyes, in convenient segments under the microscope. The most wholly delectable essay in the book is that on Roger Fry, which records the organising of the Post-Impressionist Exhibition of 1910; unless perhaps one were to prefer the ripely delicate appreciation of Sir Max Beerbohm. There is a vignette of Bloomsbury, dispelling some popular misconceptions. There is an unforgettable account of Henry James, surrounded, at Keynes's rooms in King's, by "a respectful circle of silent, smoking, observant undergraduates." There is a classical portrait of Wilfred Blunt. From the *Memoir of Youth,* which describes MacCarthy's school days at Eton (and a sequel among the bright lights of London), to the account of Sir Max Beerbohm's seventieth birthday, these essays indeed compose a picture of a period, a significant continuity. It is a period to be recognised, perhaps, by readers of a later generation as enviably different from their own; different as that Sunday breakfast at King's differs from the scurry of conscientious brown-baggers in the tiled and disinfectant-smelling entrance hall of an Evening Institute. Perhaps it is quite unnecessary, in order that literature may flourish, that there should be a certain humane *douceur de vivre* among at least some literary men. Perhaps a brown bag is all that is necessary. But one would feel happier about civilisation (as distinct from productivity-statistics) if the world conjured up by these essays seemed less irrevocably vanished.

HAMISH HAMILTON

WHAT ARE RUSSIA'S INTENTIONS?

In his book *The Communist Conspiracy* (completed in December, 1952, and published on April 20th) **Commander Stephen King-Hall** predicts with extraordinary accuracy (see pages 196-198) the change in Russian policy which began to become apparent in March, 1953.

What does this Russian move mean? Is it good or bad news? The answer is given in this topical book which, largely compiled from Russian sources and fully documented, is indispensable to any citizen who wishes to know what this Russian move portends and why it has been made.

CONSTABLE

Swedish Imperialist

GUSTAVUS ADOLPHUS: A HISTORY OF SWEDEN, 1611-1632. VOLUME I, 1611-1626.
By Michael Roberts.
Longmans. 585 pages. 63s.

SWEDEN emerged as a first-class military power with meteoric brilliance in the early seventeenth century. Till then poor and backward, a land of nobles and peasants, Sweden had maintained with difficulty its independence against Denmark, dowered with the lucrative Sound dues. Restless energy and soaring ambition characterised the impoverished Vasas, who envisaged not only control of the Baltic, but dominion over the Arctic and the Tsardom of Russia. But since Swedish resources bore no relation to these dreams, Gustavus Adolphus was faced at his accession by an exhausted country, a disputed title and a factious nobility. Yet he extinguished the Danish threat, excluded Russia from the Baltic, stripped Poland of its maritime provinces and secured a glittering constellation of ports stretching from Riga to Stralsund. The dynastic conflict with the Catholic Vasas in Poland gave Swedish expansion the character of a Protestant crusade and ultimately led to Gustavus's dramatic intervention in Germany.

This aspect of Gustavus's career has been the only one to attract the attention of English historians. The present book is therefore particularly welcome since it is the first thorough and scholarly history of Sweden in its great age of expansion to appear in English. Professor Roberts will earn the gratitude of English readers for this comprehensive account of Swedish society and institutions in this formative period. "In the long run," as he puts it, "the foundation of the *gymnasia* and the endowment of Uppsala University have probably meant more to Sweden than all the captured standards of Tilly and Wallenstein." Mr Roberts ends the present volume in 1626, reserving for his second volume an account of Gustavus's campaigns in Germany and of the economic and military developments which made those campaigns possible.

The policy and personality of Gustavus can be variously interpreted. Mr Roberts sees in him a salutary touch of Christian humility, but there is little of this in Gustavus's own contemptuous reference to the Swedish clergy as the "tribunes of the people" or in his belief that the victory at Wallhof was a divine judgment on the Poles. One of the merits of this book is that it allows the reader to see how divided Swedish historians are in their interpretation of the constitutional tensions of this period. It may seem that the enduring aspirations of the Swedish nobility were temporarily sublimated in the aggressive foreign policy of Gustavus. But Mr Roberts prefers to explain Swedish expansion in terms of the quest for security, that dangerously elastic concept. Moreover, he relegates to his concluding chapter on literature his fascinating account of the astonishing racial theories of Gothic superiority in which the Swedish professors were encouraged to indulge and which proved so attractive to the Vasas. Gustavus himself took a lively interest in the symbolism of the Runes and, when he invaded Finland, took with him tapestries displaying the victories of the ancient Goths. But if Mr Roberts is cautious and even charitable in his interpretations, he is scrupulously fair and thorough. The mastery of detail, clarity of arrangement and sustained lightness of touch shown in this volume promise to make the completed work an authoritative and enlightening study of a major chapter in European history.

Pious Mary

MARY II: QUEEN OF ENGLAND.
By Hester W. Chapman.
Jonathan Cape. 279 pages. 25s.

MARY II has attracted little attention from historians since she played so passive a part upon the political stage. But Miss Chapman shows that although Mary was uninterested in politics and power, she played her part as queen with dignity and charm. Her courtesy and tact offset the chilly reserve which made William III so depressing a hero for the victorious Whigs. Mary's success is the more creditable in view of her upbringing. Unlike Elizabeth I, who enjoyed the benefits of a Renaissance education, Mary was taught only pretty accomplishments. She painted and embroidered, knotted fringes and played cards, gardened and collected china.

Mary always preferred the role of a wife to that of a queen. Her almost oriental view of a wife's subordinate position fortunately matched William's masterful temperament. Her constitutional naïvety is astonishing. Only a year before the Revolution did she realise that William would not automatically become king on her own accession. When this point was explained to her by Bishop Burnet she immediately protested to William, who had been sulking on this account for nine years, how shocked she was to discover that the laws of England were contrary to the laws of God. She never wavered in her devotion and obedience to William, who seems to have found her clinging ways and easy tears irritating, and who early in his married life acquired an ugly but intelligent mistress. On one occasion Mary only learnt of her husband's projected movements from a continental newspaper. Her conscience was deeply troubled by what she described as "the irregularity by us committed upon the revolution"; and this, combined with the difficulties and disappointments of her private life, early led her into exaggerated religiosity and morbid introspection.

Miss Chapman has written a swiftly moving and sympathetic biography in rich, brocaded prose. The politics of the period are only lightly sketched in, but the domestic life at court is vividly portrayed. And from the uninhibited diaries of the period she has been able to draw some very entertaining stories.

Heads of Governments

BRITISH PRIME MINISTERS.
Introduced by Duff Cooper.
Wingate. 177 pages. 15s.

THESE essays by diverse hands cover in their entirety the two hundred years during which the office of prime minister was modified from a post conferred by the king on a chosen servant to an office which falls to the acknowledged leader of the House of Commons on the routine recommendation of the outgoing minister. This evolution started when Walpole's ministry continued after the death of George I, who approved of him, into the reign of George II, who did not. The preferred candidate was incompetent, and thereafter it was accepted that the necessary qualification was not the favour of a monarch but the ability to dominate the House. It was, however, still necessary to obtain the agreement of the sovereign to any proposed measure, and for the next hundred years the most adroit and successful ministers were those who were able to persuade the king that they were carrying out the policy he himself had laid down.

The period saw the rise of the struggle between property and population and its gradual resolution by social legislation. This was inaugurated by Conservatives, without illusion and with cynical disdain for radical enthusiasm. Disraeli defined the fruits of democracy as extravagant expenditure, discontent in meeting it, and insecurity of property and liberty. Salisbury declared that universal suffrage would mean that the rich paid all the taxes and the poor made all the laws. The period also covered the settlement of the major issues of Electoral Reform, Catholic Emancipation and Home Rule; the rise and metamorphosis of the Empire; and the crucial change from waging war for aggrandisement which increased British trade, and for which the enemy paid, to fighting for survival in spite of the inevitable impoverishment and disruption of victory.

These character sketches of leaders of the government against the background of their times are written from varying viewpoints, so that the protagonists appear stereoscopically in relation to each other and to different sets of circumstances. The result, sometimes confusing, but always stimulating, provides a handy summary of indispensable facts as a basis for further inquiry. From these facts certain generalities emerge: that a time of national danger produces an inspired and trusted leader, who is rejected as soon as the crisis is past; that the general tempo of British constitutionalism has been maintained by benevolent mediocrities, galvanised at intervals by the eruption of genius; and that the indispensable qualification for success in high office is an iron constitution, an infinite capacity for work, expert knowledge over a wide field and a sure sense of what will and will not work. Readers of *History Today* will be glad to have these essays collected in one volume, with an able introduction by Lord Norwich.

A Great Captain?

HAIG: MASTER OF THE FIELD.
By Major General Sir John Davidson.
Peter Nevill. 158 pages. 21s.

THE military reputation of Field-Marshal Earl Haig is higher among the skilful enemy whom he outgeneralled, out-fought and defeated than it is with his own countrymen. Critics make two charges against him: first, that he never exploited the potentialities of the tank and, secondly, that he threw away lives in the heavy attacks in the autumn of 1917. General Davidson, his Director of Military Operations from 1916 to 1918, deals with the second of these charges.

Haig was the victim of the time and the circumstances of the military period in which he commanded. From the first he, a cavalry soldier lacking an effective arm of manœuvre, was pinned down to a siege war of redoubt, trench, sap and sortie. To make matters worse, he had no alternative in 1917 but to attack his besiegers frontally, for at all costs he must draw Ludendorff's attention and the German reserves away from the French front. The French Army, after Verdun and Nivelle's costly failure, was, as its commanders freely urged upon Haig, good for nothing, not even for defence. The Russian Army had disintegrated and released thirty German divisions to reinforce the Western Front within a few months; the Admiralty was pressing Haig to neutralise Belgian and French ports to stem the savage losses of submarine attack.

Haig took upon himself the whole responsibility for dealing with this anxious situation. No one will deny that his early attacks in July and August, 1917, were unnecessarily costly, and the blame is his. Thereafter, learning his lesson, he dealt a series of steady, carefully staged and successful jabs which by that winter, as Ludendorff acknowledges, wrecked the German Army as an effective fighting force. Ludendorff thereupon packed every man and gun into an overwhelmingly strong punch against the British Army in the spring of 1918. Haig and his men took the whole weight, held it, decisively defeated it and saved the French Army and the Western Front.

Despite its heavy losses and severe trials the British Army, again almost unaided, under its trusted leader returned to the offensive with heightened morale to break the Hindenburg Line and the German Army. The strategic plan was Haig's.

General Davidson's authoritative book makes it clear that it was the British Commander-in-Chief who dominated the Western Front in 1917-18 over Foch, Hindenburg and Ludendorff. Those who have criticised Haig's leadership should read this book and recast their opinions. History may yet rank Haig among the great captains.

Two Prosperous Valleys

THE POWER AND THE VALLEY.
By Henry Billings.
Hart-Davis. 208 pages. 12s. 6d.

UNCLE SAM IN THE PACIFIC NORTHWEST.
By Charles McKinley.
University of California Press (Cambridge University Press). 673 pages. 56s. 6d.

IT is almost twenty years since the United States Congress passed the Act providing for the Tennessee Valley Authority, one of the first and one of the most successful experiments of the New Deal. It was a project under government auspices for the reclamation and development of all the resources, in people and in land, of a huge rural slum, a river valley covering 40,000 square miles and parts of seven southern states. Today the series of dams, for controlling floods and generating electricity, which were the basis of the scheme, are finished and the growing prosperity of the valley has almost stifled political and economic opposition. Until fairly recently this was a constant threat to an undertaking to which the damning term "socialistic" could be applied with more justification than it could to some of Franklin Roosevelt's other, less fortunate, experiments.

Mr Billings's book is a simple and readable, if somewhat idealised, history of why the TVA was necessary, of its growth as an engineering and educational project and of its effect on the lives of the people in the valley. From this success story it is obvious why to many people the TVA seems to have set a pattern for the development of river basins all over the world, from the Euphrates to the Columbia in the northwest corner of the United States. Why it is not a practicable pattern, for the latter at least, is made clear by Mr McKinley's detailed study—far too detailed for the general reader—of all the activities of the federal government in Washington, Oregon and neighbouring states.

These activities are almost entirely connected with the problems that concern the TVA—generation of electricity; control of floods; conservation of land, forests and wild life; mineral exploitation and so on. The number of government agencies and private interests involved, the overlapping and competition between them, the pressures they exercise on Congress and on the executive, explain why a Columbia Valley Authority seems so desirable. They also explain why such an authority is most unlikely to be set up, especially under an Administration as amenable to outside influences as the present one seems to be.

Such rivalries were largely non-existent when the TVA was established, before the great extension of government activity under the New Deal, and in any case the Tennessee Valley was not an attractive enough proposition to inspire much rivalry. The valley of the Columbia River and its tributaries is very different, a prosperous area full of enterprising, educated people who do not feel the need of government aid—at present. Perhaps more important, the Columbia Valley is much larger, has far greater potentialities than that of the Tennessee and is much less homogeneous. To Mr McKinley the best prospect of securing its orderly and full development seems to lie in better co-ordination of existing government agencies rather than in the establishment of a new one.

Turret and Spire

ENGLISH ARCHITECTURE SINCE THE REGENCY.
By H. S. Goodhart-Rendel.
Constable. 296 pages. 25s.

THIS book, which consists of lectures delivered at Oxford in 1934, deals with the dark ages of architecture. Mr Goodhart-Rendel is largely concerned with the Victorians; and very tolerant of them he is.

The nineteenth century was in one sense the golden age of English architecture. The sight of its buildings may give posterity pain, but at least it was a good time for architects. There was profusion of building and profusion of styles. There were stately houses to build for newly rich merchants—turreted castles (all mod. con.), and neo-Elizabethan manor houses; for the less well-to-do there were *cottages ornés*, italianate villas and Gothic parsonages; and there were town houses to be built by the thousand. But urban styles were more limited; the Gothic revival there played a minor role. Rooted though it was in patriotism, as well as in religious revival, neo-Gothic design was not normally considered suitable for public buildings other than churches. When Gilbert Scott designed a Gothic Foreign Office it was too much even for that age, and it was soon clear that he must either resign or redesign. His prudent if inglorious choice gave us an italianate Foreign Office which, as Mr Goodhart-Rendel says, is regarded by many people as the least unpleasing of his works.

The Gothic revival, the author implies, was all very well in its place, and its place was ecclesiastic and scholastic. As churches and colleges have not changed their function since the middle ages the mediæval style can still be appropriate. Its cult was carried to absurd lengths; yet the results could sometimes produce a pleasing harmony with tradition and environment. For churches, too, there was a grain of sense in Pugin's passionate conviction that a mediæval setting would help to evoke a mediæval devoutness. Mr Goodhart-Rendel calls attention to churches of real merit that are too readily dismissed as worthless imitations.

Perhaps the greatest achievement of the Gothic revival, however, was the Houses of Parliament, where, as the author points out, the Gothic embellishments of Pugin were not allowed to destroy the underlying order and unity of Sir Charles Barry's design. Readers may feel less well-disposed towards post-Regency architecture than Mr Goodhart-Rendel appears to be. Yet his book is an interesting and entertaining guide to more discriminating judgments.

Imperialist Wizard

CECIL RHODES.
By André Maurois.
Collins. 142 pages. 7s. 6d.

THE present political struggle between Afrikaners and Englishmen in South Africa, and the celebrations which are to mark the centenary of the birth of Cecil Rhodes, bear witness to his heritage. It may have been this centenary which suggested this book as part of Collins's remarkable series of "Brief Lives"; nor could there have been a more natural choice of biographer than that of M. Maurois. He has always been interested by men who combine something of the artist with the politician, and if ever there was a dreamer with a formidable sense of the empiric—or a poet of finance (as Balzac would have called him)—it was Rhodes.

Unfortunately, this brief life of him is disappointing, even within its own intended limitations, and shows every sign of having been composed too hastily. It is based largely on standard authorities such as Basil Williams and Sir Lewis Michell, and there are numerous imprecisions in M. Maurois's treatment of fact. To speak of the award of "some scholarships" to Germany as a direct result of the Kaiser's benevolence towards the Cape to Cairo telegraph line project is to overlook the entire conception of Rhodes's successive wills. And there is no evidence that, on the latter question, M. Maurois has made any use of the recent book by Dr Frank Aydelotte. The account of how the De Beers group gained control of the Kimberley shares and of the particular role played in the background by Lord Rothschild is somewhat inadequate. To dismiss the problem of how much Chamberlain knew about the Jameson Raid affair in a short paragraph, moreover, does not make one happy about M. Maurois's use of sources.

The most disappointing aspect of this book, however, is the author's failure to come to any firm grips with Rhodes's puzzling and tormented character or to make plain the quality of his genius. What was there in this moody, infinitely stubborn man, with his racial ideas and Ruskinian politics, which enabled him to beat all his rivals, such as Barney Barnato, and to leave the magnificent scholarly foundation that perpetuates his name? How much of a charlatan was Rhodes, with his Marcus Aurelius in the saddle-bag and his grandiose plans for his own burial in the Matapos hills? And what caused his bouts of depression and his utter inability to find an anchorage? Was it that he had all too rarely found anyone without his price or, to use his own expression, whom he "couldn't square"?

To these questions M. Maurois's small portrait gives few answers. This, however, may be merely the first of a number of books which will coincide with the Rhodes centenary celebrations both in Rhodesia and at Oxford, those two pillars of his monument.

Impressionist Portrait

BIRTH OF A WORLD: BOLIVAR IN TERMS OF HIS PEOPLES.
By Waldo Frank.
Gollancz. 432 pages. 21s.

FEW books can have been published under a more misleading title than this biography of Simon Bolivar. There are already so many studies of the South American liberator that Mr Frank may be forgiven for seeking a novelty for his title page; but he has chosen unwisely. This is an intensely personal book, the work not of a historian but of a novelist with an undoubted insight into the individual mind. It sheds light on Bolivar himself and on several of his intimates and enemies, but little on the peoples they fought among; and where the narrative broadens out in places to consider the background to the struggle, it reveals that the liberation of the Hispanic republics was no birth of a new world, but the evolution of an old one.

Mr Frank has, indeed, attempted to discover the links between the tiny group of men who robbed Spain of the continent—that a tiny group of Spaniards had seized three centuries earlier—and the peoples of the continent itself. But the novelist in him has triumphed over the sociologist. Thus, the reader has no sooner opened the book than he is plunged into half a dozen pages of prose as luxuriant as its subject, which is the Amazonas jungle. This fierce, uncontrollable forest becomes the recurring symbol of the wild continent which Bolivar could free but could not organise. From an artistic point of view, this is wholly satisfying; but the prosaic tongue of history records that the jungle tribes had no part in the drama of American liberation, and that it was the *Andinos*—the men of the mountain valleys, whom Mr Frank dismisses in two sentences—that fought Bolivar's battles and threw up his lieutenants and successors.

Other things offend the historical sense: the author's strong antipathy to Santander; his scant treatment of Andres Bello; the omission of the interesting interview at Apsley House; the summary and uncritical account of the arrest of Miranda; the odd claim that the execution of Piar proved Bolivar's indifference to race; and the somewhat turgid mysticism of the concluding chapter. But once it is accepted that, despite the author's long and catholic researches, this is less an objective biography than a series of vivid impressionist portraits, it can be read with appreciation and enjoyment. It is a rambling, untidy, vigorous book, awkward in places and inspired in others—the mirror of the confused period with which it has to deal. Mr Frank succeeds in imparting the fascination which he himself finds in the contradictory, tragic character of Bolivar; and if he has not greatly increased the sum of our knowledge about that extraordinary man, he will at least excite his readers' interest in a personality and a chapter of history to which too little attention is given on this side of the Atlantic.

A Stimulating History

THE MAKING OF THE MIDDLE AGES.
By R. W. Southern.
Hutchinson's University Library. 280 pages. 25s.

MR SOUTHERN has for some time been known to specialists as the author of a number of stimulating monographs on English and European medieval history. With this, his first book, he steps at once into the front rank of historians. To write a satisfactory "introduction" for the general reader to a wide period of history is a difficult task; to accomplish this and at the same time to make a major contribution to the specialist study of the subject is a rare achievement.

Perhaps the most striking feature of the book is its unity of form. Ranging between the broad limits of 972 and 1204, it discusses in turn the relations of Latin Christendom to the outside world, the ordering of secular society, the ordering of the Christian life and of the intellectual world. Each section develops naturally from the last until in the final, majestic chapter all the previous themes are brought together and related to something wider: the spiritual growth during this period. Within each section the well-worn small change of textbooks on this period is never used; instead the discussion is developed by fresh and skilful use of a wide number of contemporary sources. This leads not only to a greater sense of reality but to greater succinctness. Take, for instance, the author's treatment of the cultural differences between north and south France in the eleventh century. The usual hackneyed examples—William of Aquitaine's travelling library, the *pays des sceaux*—are missing; in their place is a discussion of the little known mortuary roll of the Count of Cerdaña. At the end of two pages and after a minimum of generalisation the whole important problem has been brought home in concrete terms to the reader.

For this is the work of a man with a rare historical gift: the imagination to recreate the world of which he writes and the critical scholarship to make the exercise of imagination fruitful. The picture of Saint Odilo, abbot of great Cluny, drenched to the skin but producing a spontaneous adaptation of some lines from the Aeneid to cheer his bedraggled companions, is vividly drawn. But it is not introduced just as a picture; it makes, rather, an important point in a discussion of the relations of monasteries to the outside world.

Imagination and scholarship in themselves would be insufficient without two other qualities that Mr Southern possesses in abundance: a prose style which expresses precisely formulated thoughts with clarity, wit and often beauty; and a spiritual insight which enables him to portray with equal success and sympathy such disparate characters as St. Anselm and Fulk of Anjou, Agnes of Poitiers and St. Bernard. The combination of these qualities makes this one of the most exciting books on history to appear in recent years.

Strange Bookfellows

TWO STUDIES IN VIRTUE.
By Christopher Sykes.
Collins. 256 pages. 16s.

THERE is no obvious reason why Mr Sykes should have brought within one pair of covers these studies of Richard Sibthorp, a minor character in the Oxford Movement, and of the origins of the Balfour Declaration. Still, each of them contains much that is interesting in itself and will be new to many readers.

Sibthorp was a Fellow of Magdalen, born in 1792, who was unable to make up his mind whether he wished to belong to the Church of England or the Church of Rome. As an undergraduate in 1811 he had fled to the Roman Catholic Bishop Milner and was brought back to his studies with a chancery order. In 1841 the impulse returned again, and this time there was no one to say "Nay." But in 1843 he was back in the Church of England, very strongly anti-Roman. In 1865 the thought that the Church of England could not produce—or did not seek to produce—a Curé d'Ars led him back once more to the Roman communion. But barely was he in full communion with Rome again when papal infallibility was defined to torture his easily tortured soul. When he died in 1879, still nominally a Roman Catholic, the Book of Common Prayer fell from his hands and in accordance with his will the rites of the Church of England were used over his grave. Mr Sykes tells the story from the point of view of a Roman Catholic and not unfairly, though a few details need tidying up.

In the other study, the rise of Zionism, Mr Sykes's kinsman, Sir Mark Sykes, played no small part; with Mr Amery he was an Assistant Secretary to the War Cabinet, was taught the principles of Zionism by the Chief Rabbi, Dr Gaster, and made the agreement with France concerning the Sanjak of Jerusalem, generally known as the Sykes-Picot agreement.

Mr Sykes has had the advantage of using unpublished papers belonging to Sir Mark Sykes and Dr Gaster.

He shows how Zionism arose in the great Russian pogroms of the nineteenth century, and he examines the various proposals that were made by British statesmen for satisfying it—Cyprus and Uganda among them—before the policy of "a national home in Palestine" was finally settled. As his main narrative gives only the undertakings to Zionism, Mr Sykes wisely gives in appendices some of the pledges to the Arabs and leaves it to the reader to determine whether they can be reconciled with each other.

European Beauty Spots

NORMANDY AND BRITTANY.
By Ralph Dutton.
Batsford. 261 pages. 18s.

AUSTRIA.
By Monk Gibbon.
Batsford. 258 pages. 18s.

THE first of these two new Batsford books is a guide for those travellers to France who are half-way between a general feeling of being at home there and a real regional expertise. It is no good for the beginner, unless he is a landscape and culture snob who wants to follow in the footsteps of the master; and it must be said that Mr Dutton is a tasteful, experienced, inquisitive and clear-spoken guide. It will tempt the lover of the Breton coast to look more closely into the towns and churches, and it will tempt the person who seldom gets beyond Normandy to think of north-west France as an admirable touring ground whether by car or bus. The photographs are excellent and there are four pleasing reproductions from paintings by Christopher Wood.

Books like this, of course, usher one into beauty and interest; there is little risk of stumbling into discovery after having travelled with their help. Mr. Dutton is systematic and makes allowance for the special needs of the visitor from Britain. He starts in the Seine valley and swings through lower Normandy towards the Cotentin Peninsula. He then begins again moving from the Channel coast down to the valley of the Loire, an approach to that region which many tourists miss. Then he strikes westward back to Brittany and the great Atlantic promontory. If one is interested in seeing the Rouen that Flaubert knew, Mr Dutton has blazed the trail; if one is under the impression that operation Overlord devastated Bayeux Mr Dutton is there to remind one that it is quite unspoilt. He has a keen eye for domestic as well as religious architecture and describes local customs and legends without sentimentality. A most readable volume even if the currency allowance for the year is already spent.

Looking at Austria with the eyes of a lover, Mr Gibbon is eager to praise its virtues, reluctant to admit any faults. This book recalls the ghosts of the past, sees in the baroque architecture the enchantment of the age in which it was conceived. If sometimes the eulogies seem too pressing and the discords of history rise to interrupt the serenity of these pages, yet it would be ungrateful of the reader not to appreciate the enthusiasm that has gone into writing this book. For an enthusiast can be a delightful and informative travelling companion.

To many, perhaps to most, British holiday makers in Austria, it is first and foremost an alpine country. Mr Gibbon would not dispute this, but he is drawn less to the mountains than to the Viennese palaces, the monasteries of the Danube, the decorative buildings of Innsbruck, the fine paintings and carvings in many of the village churches and the life of the villagers themselves. Although he describes the wonders of Salzburg his praise here is somewhat stinted—in his eyes it has become too popular and has committed the unpardonable crime of overcharging for tea. But among the many fine photographs in this book, the few of Salzburg are particularly pleasing.

ANDRE DEUTSCH

The Queen's Commons

ELIZABETH I AND HER PARLIAMENTS, 1559-1581.
By J. E. Neale.
Jonathan Cape. 434 pages. 25s.

IN his earlier book, "The Elizabethan House of Commons," Professor Neale gave a brilliant analysis of the political structure and procedure of the Commons, cast largely in terms of clientage, the grouping of the gentry round the great men in a society both highly aristocratic and highly competitive. He now partly fulfils the promise he then made of writing a chronological account of Elizabethan parliaments. Here he takes the story to 1581, making the relations between the Queen and Commons his main theme and linking up the substance of his many published articles in a connected narrative.

By selecting this theme, Mr Neale is able to give unity of form to his book and to stress the rapid evolution of the Commons in encroaching upon the prerogative and in fortifying and extending its privileges. In elaborating it he is able to use unpublished diaries and pamphlets to bring to life the personalities of members and to trace the ingenuity of their tactics. But by concentrating on this topic and relating it to the greater struggles under the Stuarts, Mr Neale sacrifices much of the general history of parliament in relation to society and government under Elizabeth. The lobbying of local interests expressed in the private bills, the major acts seeking to regulate the national economy and the effects of divisions in the Privy Council receive little discussion.

Mr Neale was the first to reveal how hard a tussle Elizabeth had with her parliaments and how skilfully she controlled them by alternate cajolery and coercion. What is new in the present book is his thesis that from the very first parliament of the reign a highly organised group of Puritan zealots was systematically responsible for the opposition. The Marian exiles, imbued with the organising genius of Calvinism, planned the moves which forced through the decisive Act of Uniformity, and from a study of the later parliaments there emerges "a general pattern of Puritan revolutionary conspiracy," a "fanatical movement" with an "hysterical fringe," composed of men who sought through ceaseless parliamentary agitation to make England into an ideological state. Nor were these fanatics few in number. Mr Neale estimates the irreducible Puritan core in the first Parliament at ninety strong and holds that "Elizabethan England, as mirrored in the House of Commons, was overwhelmingly Puritan in its sympathies." Against these powerful and prejudiced forces Elizabeth stood virtually alone, a liberal *politique*, who yielded only enough to enlarge the constitutional freedoms and but for whom "the broad way of English life would have been narrowed."

It is of great value to have Mr Neale's unique knowledge of Elizabethan parliamentary privilege and procedure assembled and presented with his familiar literary skill; and undoubtedly his thesis lends a vivid dramatic interest to his account. But the drama is misleadingly heightened by the reiterated comparison between Puritans and Communists. Geneva was not a sixteenth-century Moscow. "There were," Mr Neale told us in his earlier volume, "no party politics in the Elizabethan period"; but he now analyses the first parliament of the reign in terms of "the Protestant party" and "the conservative party." As he admits, the thesis of an organised Puritan conspiracy in that first parliament depends on fitting the evidence into a pattern produced by ingenious speculation. His interpretation of the passing of the famous Acts of Supremacy and Uniformity involves the introduction of fresh hypotheses at every step in an argument, which makes difficult reading and a dubious starting point. But if the general thesis is sometimes strained and the field of inquiry disappointingly narrowed, Mr Neale's account of a crucial stage in parliamentary development will be welcomed not merely for its learning and ingenuity but also for its warmth and human interest.

Hollywood's Lawgivers

PICTURE.
By Lillian Ross.
Gollancz. 240 pages. 16s.

THIS is a vivid account of the production from first to last of a Hollywood film that was going to be fine and memorable but in the end was cheapened and spoiled by the employers of the artists who made it. Miss Lillian Ross writes with much skill and little mercy. Her story attracted a good deal of attention in the United States when it first appeared in instalments in the *New Yorker*. But both in America and, since the book appeared, in Britain there has been an over-eager acceptance of the idea that what is here presented is a fierce and impeccably documented indictment of Hollywood. The idea needs a little overhauling.

John Huston, the director, and Gottfried Reinhardt, the producer, are shown to have approached with the high elation of artists who know their job the opportunity of making a film of Stephen Crane's "The Red Badge of Courage." This is a novel about the American Civil War, which sensitively examines the impulses behind bravery and cowardice. Huston and Reinhardt brought their abundant energy and imagination to bear upon the film; they also spent a million and a half dollars of Metro-Goldwyn-Mayer money on what they and the studio executives agreed, when it was finished and privately shown, to be "a great, great picture."

But the film they saw in their own projection rooms was never released to the millions in the movie theatres. What *they* got was a debilitated bowdlerisation of the picture Huston and Reinhardt made—rearranged and ruined, its best scenes left out, its point blunted and its subtleties submerged beneath hackneyed devices never contemplated in the script. Yet to conclude that the men who thus

reduced a masterpiece to mediocrity, and their attendant sycophants, did so simply because they were too stupid and coarse-minded to know any better is to miss the point of this clinical study of Hollywood at work. They acted in obedience to the law which made it possible to create their fabulous and flourishing industry, and which continues to make it possible for Hollywood to survive. They turned something that seemed likely to incur a financial loss into something which, their experience led them to believe, would come closer to making a profit.

"The Red Badge of Courage" went wrong only after it had been received with apathy or derision by a substantial section of the first preview audience at the Picwood Theatre in Hollywood. For:

> As the showing went along, some of the preview-goers laughed at the right times, and some laughed at the wrong times, and some did not laugh at all. When John Dierkes, in the part of the Tall Soldier, and Royal Dano, in the part of the Tattered Man, played their death scenes, which had been much admired before, some people laughed and some murmured in horror. The audience at the private showing had been deeply and unanimously moved by the death scenes. There was no unanimity in the audience now. Several elderly ladies walked out. Now and then, there were irrelevant calls from the balcony; one masculine voice, obviously in the process of changing, called out "Hooray for Red Skelton!"

These were the representatives of hundreds of thousands of audiences upon whose sanctions the big and technically proficient Hollywood industry depends. It can be argued that the "sneak preview" system is a bad one, that greater intellectual and moral courage would occasionally produce unexpected profits, that some of the men of Hollywood, whose wealth and authority rest upon their instinct for what will be popular, are repulsive types. But the moronic element is rooted not in the obedience of Hollywood to the law by which it lives, but in the givers of the law.

The Politics of Eatanswill

POLITICS IN THE AGE OF PEEL.
By Norman Gash.
Longmans. 517 pages. 45s.

THE author of this study in the technique of parliamentary representation between 1830 and 1850 has interwoven, with much skill and judgment, an extensive knowledge of contemporary blue books, of memoirs, and of manuscript sources, particularly the Peel papers in the British Museum. The book does not pretend to be a comprehensive history of these two decades; it hardly refers to the economic transformations of society that were in progress in the early railway age; the solitary reference to the People's Charter misdates it; and newspapers are little regarded. Nevertheless Mr Gash has done a most useful piece of work, and provided necessary modifications to the over-simple view of the great Reform Bill as the start of a new, cleaner era in British politics.

"In comparison with what actually happened in many constituencies," he explains, "Dickens's account [of the Eatanswill election] is underdrawn, conventional, and staid." Numerous examples demonstrate the degree of plain cash corruption that followed the Reform Acts of 1832, showing both where the cash came from, and through what channels it found its way into the pockets of an expectant electorate. Other methods of persuasion were in use as well; indeed a friend of Peel's once wrote to him that he had "never heard of anything so monstrously unconstitutional" as an attempt by a canvasser to persuade the Irish tenants of an absentee peer to vote against their landlord's expressed wishes. On the whole, however, the toils and strains of a contest, the risk of riot and the certainty of expense, were avoided by politicians unless the clash of ambition was not reconcilable by private talks among the gentlemen concerned; and one of Mr Gash's most useful passages shows that "in the five general elections that took place between 1832 and 1847 the average number of those [constituencies] that were contested was only just over half." By the standards of today, even this is better than the election of 1859, in which only one constituency in four was fought; but the standards of today are different, for bribery has been nationalised, and the electorate as a whole is offered a better insurance system or "more red meat" instead of the golden *douceurs* to individuals (£7 a head was a standard rate in a corrupt borough) which might secure the return of a particular pair of members a century or so ago.

Mr Gash also expounds in detail the survival of the nomination boroughs which the Reform Acts are popularly supposed to have abolished: an appendix shows 59 members certainly, and a further 14 probably, returned by patrons of "proprietary" boroughs in England and Wales alone, and many more "family" boroughs like Peel's own seat at Tamworth could hardly be distinguished from them. (It was the boroughs under the control of the Crown that suffered worst from the acts.) A separate chapter expounds some of the mysteries of civil service appointments, to which disproportionate importance was attached; once in 1845

> Two peers of the realm and a baronet, two of them ministers of the Crown, exchanged . . . some eight or nine letters full of compliments, apologies, and requests; and the occasion of it all was a post that brought in ten shillings a week.

An excursus into the local politics of Berkshire contains a general comment typical of this interesting and important book:

> However mistaken in its motives and disappointed in its hopes, the reform movement was the genuine vindication of a principle. If the principle is to be associated with a party, it was in a truer sense the last successful demonstration of the old eighteenth-century "country party" against the "government" rather than a victory of whig and radical over tory.

TRAVEL

BATSFORD'S books on travel and topography are famous. Full of information and profusely illustrated, they excel not just as guide books but as intelligent companions to travel. The following titles are new or recently re-issued.

AUSTRIA *Monk Gibbon*

NORMANDY AND BRITTANY *Ralph Dutton*

SPAIN *Sacheverell Sitwell*

THE LAND OF FRANCE *Ralph Dutton*

SCANDINAVIA * *Eric de Maré* 21s.

THE DERBYSHIRE DALES

By NORMAN PRICE. With 16 plates in colour and 8 in monochrome by FREDERICK J. KNOWLES, and numerous line drawings. 35s. net

The dales of Derbyshire provide a feast of scenic beauty, appealing to the sightseer, the antiquarian, the rambler and the climber. The author's love and knowledge of the district are apparent in this book in which he describes many beauty spots and stately homes, and in which he includes local legends, folklore and historical facts gathered during his explorations in the county.

FLAGS OF THE WORLD

Edited by H. GRESHAM CARR, F.R.G.S.

With 30 plates comprising 300 illustrations in full colour, and 12 in monochrome, and over 200 line drawings. 42s. net

This new edition has been thoroughly revised and brought up-to-date. The chapter on the flags of the United States of America has been completely reconstituted, and now includes a list showing how the number of stars in the Stars and Stripes was increased, and *when each successive design was brought into use.* As far as is known, this is the only list giving the actual date of the first appearance of each additional star or stars.

Search for a New Religion

EVOLUTION IN ACTION. (Based on the Patten Foundation Lectures delivered at Indiana University in 1951.)
By Julian Huxley.
Chatto & Windus. 160 pages. 9s. 6d.

WITH missionary insistence, Dr Julian Huxley has for some time been propagating a view of human affairs professedly derived from his own science, biology, a view which is, he asserts, religious in intention. The present volume is a useful restatement of his thought. He extends the idea of evolution from biology, where it is admittedly of central importance—though not, as Dr Huxley seems sometimes to imply, the whole of biology—to the inanimate world on the one hand and to human history on the other. He is thus enabled to set out in time a series of three evolutionary epochs in the world's history—the inorganic, the biological, and the "psycho-social." As he passes from one to the other the complexity of structure and the pace of development increase while their extension in space and time decreases.

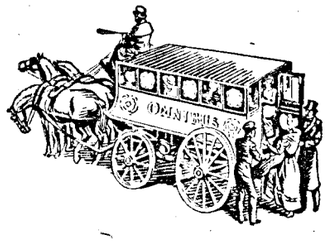
This picture of the world, the idea of a continuous evolutionary process from the beginning of time to our own day so flattering to contemporary man, has become familiar since the Darwinian revolution and was explicitly popularised in the nineteenth century by Herbert Spencer. Though still the common position of a fair number of scientists, politicians and publicists on both sides of the iron curtain, the picture is today somewhat tarnished. As the starting-point of a system, purporting to reveal the whole destiny of man and to furnish a complete set of ethical criteria, it will seem very thin to all those who are not carried away by Dr Huxley's Victorian optimism.

His account of biological evolution, even when allowance has been made for the needs of popularisation, will cause eyebrows to be raised at some of its more sweeping simplifications; but it makes lively reading, and the evolutionary concept does at least apply here. On the other hand, the illumination it can bring to our study of the inorganic is not apparent. But it is as a way of understanding human affairs—and this is critical for Dr Huxley's whole argument—that evolution is today so largely discredited. Evolutionary theories are explicitly rejected in much recent work in archaeology and anthropology. It is not, as Dr Huxley implies, a matter of giving the convenient name evolution to a historical process which is generally recognised. Far from taking such a total view, a modern historian is more likely to question the value of the notion "process" in this context and to insist that history is not that kind of study. For Dr Huxley's assertion that "the main unit of evolution in the human phase is not the biological species, but the stream of culture," if it means that some kind of family tree of "cultures" can be established, will not find much support today.

Dr Huxley speaks for a great number of his non-Christian or ex-Christian contemporaries in voicing the need for a religion to replace that which they or their fathers have lost, but there is really more even in these days to the foundation of a religion than the adaptation to social use of a bundle of metaphors from the natural sciences.

Small and Sturdy

GREEN GOLD AND GRANITE. *A BACKGROUND TO FINLAND.*
By Wendy Hall.
Max Parrish. 190 pages. 17s. 6d.



THE green gold is the mantle of forest that covers Finland; the forest whose pine, spruce and birch still enable the rural Finn to build his own house and furnish it; the forest whose timber and pulp provide nine-tenths of the country's exports. The granite, on which Finland stands, emerges in rugged outcrops under the windows of office blocks in Helsinki itself; it emerges, too, in the Finnish personality. But it does not make the typical Finn as materialistic and dour as the caricaturist's Aberdonian. As this delightful book shows, he is an intriguing blend of characteristics, addicted to pints of coffee and to British football pools; voraciously curious and a mighty reader; as fond of understatement as any Englishman but far more articulate; musical and intuitive without any loss to an essentially practical nature; hardworking and reliable despite an occasional spark of violence which calls for "either solitude to soothe him or alcohol to release the tension."

The granite in the Finnish character has been amply demonstrated to the world by the country's resistance to the successive pressures of Sweden, the Tsars and Soviet Russia, and by its astonishing postwar recovery under the burdens of half a million refugees and a crushing Soviet reparations bill. Less familiar is the Finn's tendency, well described by Miss Hall, to live for the day. This weakness has not prevented him from meeting his international obligations and guarding his democratic liberties; but it does not make for thrift.

A certain carelessness about the future may, however, be something of an asset to a people whose ultimate fate rests so largely in foreign hands. Miss Hall's very readable outline of Finnish history, politics and economics makes it painfully clear that now, as in the past, this small and admirable nation cannot hope to chart its own course. What it can do is to assert its sturdy independence to the utmost within the limits set by its mighty neighbour; and this the Finns have done. Due tribute is paid to their feats in these and other directions in this timely and well produced book; but it is by no means wholly uncritical, and the author does not minimise the serious political and economic problems which Finland faces even now.

Introducing

THE LONDON OMNIBUS

When Shillibeer's omnibus first clattered its way through the city streets in 1829 the citizens of London realised that here indeed was a public service worth knowing and using.

Likewise, the London Assurance offer the public another kind of useful service by journeying into print with selections from their own omnibus collection of insurance policies.

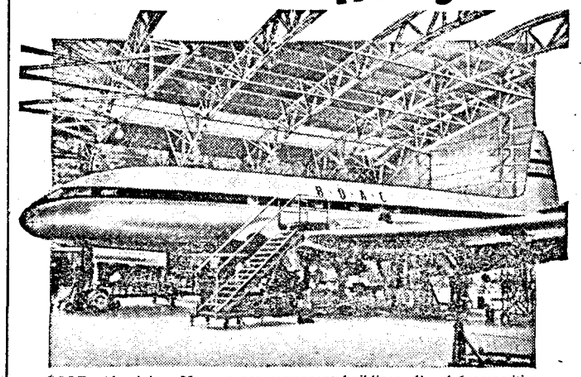
"Life" is what you make it

What kind of Life Assurance you need depends, of course, on you (not forgetting your dependants). Our booklet "How to be Well Assured" can help you to choose the policy that suits you best. Would you care to read it?

Aftermathematics

After a fire on business premises the reckoning must include not only material losses but also reduced earning power and trading profits. An ordinary Fire Policy *plus* our loss of Profits Policy sums up what is needed.

Injury and Innocence



However innocent of intent to injure a fellow-being, you may be held liable for heavy damages quite accidentally caused to someone's person or property. Our Personal Liability Policy provides indemnity up to £5,000 for any one accident—which is a lot of indemnity for 10/- a year.

and please remember . . .

If you would know more about any of the policies outlined here, if we can provide information about any other particular policies or about insurance problems generally—pray make what use of us you wish. Our address is 1, King William Street, Department S6, London, E.C.4.

THE LONDON ASSURANCE

Why ALUMINIUM Hangars?

S.M.D. Aluminium Hangars are permanent buildings, directly competitive in cost with steel and concrete . . . *plus* STARTLING erection times . . . and, of course, no painting is required. Let us send you details.

ALMIN LIMITED · FARNHAM ROYAL · BUCKS
FARNHAM COMMON 595

Aluminium Hangars are built by S.M.D. ENGINEERS of Slough, the construction company of the Almin Group.

'ENGLISH ELECTRIC'

Current technique of shipbuilding widely used in Britain's shipyards, is that of fabricating sections in workshops and then assembling them by arc-welding on the ways. On a large cargo ship, 100 to 200 welding operators may be at work during peak periods in her construction. A considerable proportion of the arc-welding and other equipment used by shipbuilders on the Clyde, Tyne, Mersey and at other important centres, is manufactured by 'ENGLISH ELECTRIC.'

bringing you

Both in the interests of Britain's economy and the development of international communications, it is vital that there should be no flagging in the output of our shipyards. At a time when foreign competition in the industry is reaching formidable heights, 'ENGLISH ELECTRIC' equipment is helping British shipbuilders to quote competitive prices, and to continue supplying the world with the world's finest ships. In this, as in so many other ways, 'ENGLISH ELECTRIC' contributes to the better living of millions.

On Reading *Pravda*

OF all the gestures that have lately come from Moscow the most important is certainly the article in which *Pravda* replied to President Eisenhower's peace programme. Its value is twofold: firstly, it sets clear limits to the hopes that have been aroused in the West and therefore narrows the field of argument and expectation. That is sheer gain, for it should encourage cautious and discreet examination of what Moscow is after and discourage the cut and thrust of public propaganda with which Mr Dulles undid so much of the good done by the President's balanced statement. The job of diplomacy is to inquire and negotiate, not to argue and strike postures. Secondly, the article has put the issues—and President Eisenhower's statement—before the people of the Soviet Union much more fully and rather more fairly than one can remember happening before. That Malenkov and his colleagues have chosen to do this suggests that they are confident not only of the merits of their own case, but also of the possibility of doing business with the West. Indeed, the article explicitly says that they are ready for "a serious, businesslike discussion of problems both by direct negotiation and, when necessary, within the framework of the United Nations." "The Soviet side," it declares, also has its "claims"; but it is ready for "a friendly settlement of contentious questions" provided that unacceptable terms are not laid down in advance.

There is much in all this that is by any standards reasonable and by Kremlin standards strikingly so. Some of the article's statements are admittedly insufferable in their intellectual conceit and objectionable in their interpretation of postwar history: for example, it is useless for the Soviet leaders to defend their active support of "colonial liberation movements" by telling the President that he "simply sins against the commonly known historic laws" when he demands that they stop the incitement; and the record of Stalin's double-dealing in Korea, in Germany and in Eastern Europe is clear beyond any doubt. But it was not to be expected that his successors would go so far as to disavow publicly all his past policies—Stalin's name is not mentioned in the article—or to offer unconditional surrender of all that was gained to the Soviet Union in the years immediately after the war. They might barter some of the fruits of victory, but they would not give them away. It is therefore remarkable, and to a modest extent comforting, that *Pravda* should have discussed terms with restraint, and with notable politeness to Mr Eisenhower himself. Manners under Malenkov have improved.

To say this is not to imply that there is under way any revolution in Moscow's basic policy; the article refers very firmly to "the fundamental interests of the Soviet people" and of their allies. What may be ripe for change is the tactics of that policy, and manners in such a situation are part of tactics. Peace does not mean for Malenkov and his colleagues complete confidence and friendship between present international rivals; it means a state of affairs in which their activities

as leaders of world revolution and directors of Communist parties all over the world can be continued without endangering the security of the Soviet state. Stalin's methods provoked such a powerful resistance in the United States that some of his advisers must lately have seen a clear danger of a war that could destroy the Soviet system. It may well be that Malenkov was among them, and that he sees an improvement of relations with the West in Europe as the condition of continuing the onward march in Asia, the advance of the Soviet economy and the building up of China. Those, at any rate, have been the purposes implied or stated in his speeches. His aim is to find the terms on which the West will give him the treaties and agreements he wants or needs, not to work out some general, all-embracing settlement everywhere.

If there were any illusions on this point—and there seemed to be some here and there in President Eisenhower's speech—the article should modify them. There is no question, it says, of Eastern Europe liberating itself by its peoples freely choosing their governments: "it would be strange," says *Pravda*, "to expect the Soviet Union to interfere in favour of installing the reactionary regimes overthrown by these peoples." It would indeed; but after the Soviet flirtations with Nazi elements in Germany it would be wise not to exclude entirely such a possibility in Eastern Germany. Indeed, Soviet abandonment of the East German Communists is a condition of getting a freely elected government for a United Germany—and *Pravda* knows it.

This does not mean that there is to be any quick and easy way to German unity: the talk is still of Potsdam, which would involve reviving the machinery of four-power control for Germany, postponing the independence of Western Germany and abandoning the European Defence Community. Then there is polite, and not unjustified, criticism of Mr Eisenhower's failure to say anything definite about China, about the Communist government's claim to a seat in the United Nations or about the position of Formosa. There is rejection of any world economic plan which might resemble the Marshall Plan or Point Four. In other words, the United States is told that there is room for discussion and negotiation on some of these matters, but without conditions laid down in advance and on a basis of bargaining between equals about vital national interests. The purpose is said to be a *détente* followed by disarmament—which is almost exactly what President Eisenhower proposed.

Both sides having asked for deeds not words, and the Russians having spoken last, the next move clearly lies with the West. The general and cautious statement issued last weekend in Paris by the Atlantic Council does not amount to such a move, for none of the fourteen foreign ministers had had time seriously to study the *Pravda* article. Three courses, therefore, are open to the western allies. One would be to do nothing and to wait for Moscow's next move. Another would be to find out through ambassadors what is the exact significance of the article and some of its contents. Another would be to concert some move by the three western governments which would test the expressed desire for concrete and businesslike negotiation. The choice is difficult, but the second course seems the best. Further public exchanges would merely increase confusion without increasing confidence. "Businesslike negotiation" is possible now in Korea and would be possible at any moment on Austria, if the Russians wish it. A concerted move by the western allies would be difficult to plan—and far more difficult to concert—until more is known of the circumstances in which Stalin's successors find themselves. Discreet and patient inquiry in Moscow would be best, if only because past experience proves that the Russians will negotiate seriously only in secret and because the present stresses of American domestic policies are best kept in the background. To do nothing is to court the risk that the Russians will decide to go straight to the heart of the difficulty and propose a conference on Germany. It would be wiser to test the ground on other matters first.

Farming Without Boards

THREE thousand growers of apples and pears last week administered a sharp check to the recent attempts to work out a permanent policy for British farming in the postwar world. Those attempts had not, indeed, got far, despite the stimulus that came with the change of government in 1951. The Conservatives have given some earnest of their intention to restore a measure of freedom and flexibility in place of the state buying, fixed prices, subsidies and controls with which British farmers have so long worked. But the farmers—or, to be more exact, those who play an active part in the National Farmers' Union—are suspicious of free markets, linked in their minds with prewar depression; the immediate response to the Government's initiative was, therefore, a greatly strengthened interest in setting up marketing boards. These producers' organisations have the blessing—expressed in the Agriculture Acts from 1931 to 1949—of both Conservative and Labour parties. The minority of fruit growers who have successfully opposed the apple and pear scheme have thereby upset the settled policy not merely of the National Farmers' Union but also of the Ministry of Agriculture and of most politicians on either side.

The boards, of which the best known and most firmly established is the Milk Marketing Board, are designed to enable producers to regulate the marketing of particular farm products. Of the various new schemes

now in preparation, that for eggs is consciously intended to replace state control over distribution. The National Farmers' Union is also thinking about a scheme for cereals, with the same purpose. A fat stock scheme has already been considered, and generally approved, by the union's county branches and is now being worked out in detail. Smaller marketing schemes, for peas and for herbage seeds, have got to the stage of examination by the Ministry of Agriculture. But now all such ideas require reconsideration. For the first time, a scheme for a marketing board has failed to gain the support from producers required to give it statutory force.

★

The Apple and Pears Board was the result of careful preparation. The Minister of Agriculture recommended it with enthusiasm, and the necessary motion approving the scheme was passed by the House of Commons three months ago without a division. The board, consisting of twenty elected representatives of growers and two to four members appointed by the Government, was to have had, immediately, two main powers. It could fix minimum prices for hard fruit sold for processing—that is, in the cheapest market. And it could keep supplies off the market by prescribing minimum qualities; "sub-standard" fruit, as defined at any time by the board, could have been sold for processing (if the processors would take it at the minimum prices) but not for human consumption. In order to make these major powers effective, the board was to be empowered to inspect farms, to prescribe forms of contract and terms of sale, and to forbid producers to deal with wholesalers who did not satisfy the board's conditions. The board was also intended, of course, to improve efficiency by introducing a voluntary grading scheme, providing market information, and so on. But the real point certainly lay in its regulatory—and, potentially at least, restrictive—powers. The NFU's propaganda to the growers emphasised that "a fully organised home industry" provided the "firm base and full authority on which representations for import regulation can be effectively made."

The rejection of these arguments—not for the sake of British people who want the best fruit at the lowest possible price, but by a large minority of the fruit-growers themselves—is the more significant because of the conditions in which the poll was conducted. The Ministry of Agriculture gave the National Farmers' Union its list of hard fruit growers, in order that the case for the scheme should be fully circulated; it refused to let the opposition committee have the list. Whatever the technical rights and wrongs of such an action, its moral effect is plain: the scheme appeared to have very strong official backing. Once again, there seemed to be an uncomfortable element of truth in the gibe that the Ministry of Agriculture would set up a marketing board for buttercups and daisies if the NFU asked for it.

The rejection of the scheme by the producers themselves should at least shake this organisational grip on the country's agricultural policy. Of the growers who voted, only 27 per cent opposed the scheme but they owned nearly 40 per cent of the acreage of orchards. The scheme thus failed to get the necessary two-thirds majority measured by size of interest. It was killed primarily by the larger growers. A glut in the fruit market is as unpleasant for them as for the small men. But they seem to have calculated that they could cope with adversity better on their own account than through an organisation that might be chiefly concerned to bolster up even the growers with the highest costs; and, on the positive side, the board's regulatory powers might have been a handicap to farmers who had sufficient resources to improve the quality and packing of their fruit by their own efforts.

Such considerations will not necessarily work with the same force against other marketing schemes. Hard fruit keeps better than some farm crops, and in principle the producer has more to gain from a marketing board the more perishable the product—and therefore the more the producers, if unorganised, are at the mercy of the middlemen during a temporary glut. But the NFU and the Ministry of Agriculture will be deluding themselves if they think that the vote on apples and pears has no general significance. It follows a great deal of dissatisfaction with the tomato and cucumber marketing scheme. Moreover, of the 30,000 fruit growers with whom the marketing board would have had to deal if it had been established, only 16,800 registered and only 11,000 actually voted. It is impossible to believe that this lack of interest in marketing schemes is a unique characteristic of hard fruit growers.

★

This indifference may be dismissed in part as thoughtlessness. But it also reflects, if in a somewhat muddled way, the dilemma surrounding attempts to use in the fifties the type of marketing scheme that arose in response to the problems of the thirties. In the conditions of agricultural contraction it was plausible to think that competition could be "excessive" and to identify restrictions by producers with the long-term interests of consumers. In the conditions of agricultural expansion no government can afford so simple a view. Conservative spokesmen have been careful to avoid definite promises about restricting imports of apples and pears. The Minister of Agriculture announced his intention of appointing the maximum number of independent members—four—to the proposed board. Above all, the scheme required that the board's main regulatory powers should be used only after it had given the Minister prior notice of its intended actions, which he might then refuse to sanction. According to Sir Thomas Dugdale, this was

> a most important new development in marketing policy, which should end once and for all the criticisms that the producers' boards . . . may act detrimentally to the public interest.

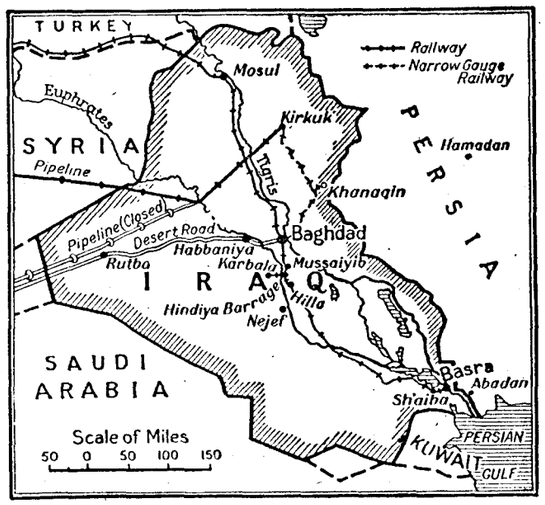
That is an excess of confidence, but it has enough basis to have been noted by farmers who think realistically about agricultural policy. If a marketing scheme contains full safeguards of the public interest—safeguards on which a government of either party should insist—will it seem of sufficient value to the farmer? Will it be a producers' organisation that he can effectively influence and through which he can achieve an extra measure of security and protection against foreign competition? Or will it merely be another species of remote control, another wedge of bureaucratic interference, as tiresome as other kinds of form-filling and ineffective as a means of regulating the market? These are the questions that are being asked in the country.

The Government should now have courage to look beyond the NFU and take note of the real doubts about marketing schemes. The rejection of the hard fruit scheme points the need for a serious reconsideration of agricultural policy. There is not, it should be quite clear, any possibility of abandoning all regulation and restoring a completely free market in agriculture. Output would not be expanded if the promise of stability to the farmers were thrown over. But that promise requires government support through such devices as floor prices or deficiency payment schemes rather than by restrictive regulation in the interest of producers. And if the regulation is not restrictive, it offers the producer little advantage, and much inconvenience, compared with a free market—free, that is, to move above the support level. For a few farm products marketing boards will probably survive or be established. But for the majority of products, there is now at least a chance that the farmer will be content (as he should be) to have a guarantee against disastrously low prices and beyond that to face relatively free competition. If the Government is serious in its belief in economic freedom, that chance will be vigorously explored.

New Reign in Iraq

FROM OUR SPECIAL CORRESPONDENT

ALL Iraqis love a good story. Today they tell the tale that when the Creator was flown round the world by Comet, He looked out on country after country and did not recognise it. New York, London, Europe—all went by and He was baffled until He got to Iraq when He exclaimed: "Now I know where I am; this place is just as I made it." Upon the tone in which this story is told—whether in that of hope or of despair—hangs the future of the new reign that begins in Iraq today.



Baghdad is flagged and tonight will be fairy-lit, as is appropriate in view of the immense promise of the moment at which King Feisal II comes to the throne. Millions a year from oil royalties, ample water supplies that have flowed by unused for centuries, millions of acres of potentially fertile land, no population pressure and plenty of living space—nowhere else in the Middle East are all these boons available at once. Even a lethargic peasantry is becoming aware of them. Why, then, has the country for more than two working years had a Development Board which has brought the underdog so few benefits despite so much money? Why do successive ministries hold out glorious plans which hang like a mirage somewhere just out of contact with the earth? Why do the people who ought to be men of action criticise, bicker and pick trouble with one another rather than get on with the job of converting royalties into material improvements? These are the questions which are being asked today in the three leading towns of Iraq—Baghdad, Basra and Mosul.

Even a coronation cannot paper over some alarming features of their gloom—notably that some of it is justified. In the last two or three years, ministries have enormously increased their staffs and, as happens when too many civil servants are appointed to keep applicants quiet, decreased in efficiency. The machinery for carrying out the plans is seriously defective. In the same period the landed upper class of which parliament so largely consists has, while paying lip service to reform, turned one at least of the new land laws to its own account; it seems quite unable to learn twentieth century wisdom. When, last November, despair came to a head in the form of riots in Baghdad and in the Shiah pilgrimage town of Nejef, only the army saved people's skins; yet the bad fright which politicians then received has been quickly forgotten. They have returned to their carping ways and unless the new and effective reign produces a more determined and effective cabinet, there will be no disguising the fact that educated society in Iraq is cloven from top to bottom. The cleavage is epitomised in the arguments that take place over whether there should be fireworks tonight or a new royal palace this year; the older men contend that "the people expect it," the younger that it sickens them to see such expenditure while the poor go hungry.

Someone must be blamed for the lack of action and one target is, of course, the foreigner. Fed by the habit of blaming the British and by anti-western propaganda, much of which is carried into Iraq by the million Persian pilgrims who each year visit Nejef—the Shiah equivalent of Mecca—anti-western tales abound. All

the new schools are "western barracks" and even the new water storage schemes for flood control and irrigation are "making lakes for seaplanes—small lakes for British, big ones for American." But far more disquieting than this uneducated nonsense is the other and native target for criticism. Even ministers and potential ministers have taken to sapping the strength of the Development Board. This body was founded in 1950 on a non-ministerial and permanent basis, in order that it should not be over-subject to the whims and changes of cabinets and parties, and could do its long-term job with continuity. Today, there are alarming suggestions that as it has shown so few results, it should once more, either immediately or by stages, become a ministry.

This week, however, a new and promising start has been made with the appointment of a former economics Minister, Dhia Jaffar, as chairman. His predecessor was much criticised, and judgment of what was best for the country was clouded by this fact. In fact, the Development Board has in two years begun some good work, a little of which has been completed either by it or by ministries, but most of which is unappreciated by Baghdad because, being in the provinces, none of it *shows*. To mention only the major jobs: it has taken over and completed work on the Euphrates Flood control and storage scheme at Habbaniya lake; and since 1952 the lake has been used to avoid serious floods. Farther downstream, at Mussaiyib below Baghdad, it is extending existing canals and restoring old ones, and will have the Habbaniya summer storage water to bring new land into use to settle some 12,000 families by 1956 or 1957. On the Tigris, it has begun the great outlet channel into the Wadi Tharthar which will be completed in 1955 and will save Baghdad and southern Iraq from almost annual flood disaster.

All over the country, the Board has constructed a great number of schools, hospitals and houses for officials. It is confronted with many conundrums, such as whether to contract for road and drainage projects using hand labour and so remedying unemployment, or whether to employ machinery and work faster. Yet whatever it does, it is now, out of impatience, coming to be judged wrong. "Give us seven years," it says, "and the Creator won't know Iraq." But it is engaged in a losing race with public opinion. To give some idea of its struggle for repute: when the first 400 lots of small holdings from the Mussaiyib scheme were distributed, there were 16,000 applicants of whom 12,000 were thought to be valid. The next 4,000 lots will not be available till the end of next year. A man forced to wait harbours a grievance, and a peasant whose land is for once unflooded does not appreciate why.

The board could be doing far better in the race. Its drawbacks are that it is unimaginative about handling public feeling and that its publicity is lamentable. It could have built something for the critics in the capital to be proud of, such as a new Royal Hospital in Baghdad. It could, but does not, show its valuable but distant works in films and photographs; it could, but does not, even invite journalists to come out and see them. Its lack of capacity to check impatience may be its undoing, and its undoing would be a disaster because, given its problems, no conceivable alternative form of body would be an improvement upon it.

The trouble with the board's political critics is that they are unable to let well alone. Daunted by the magnitude of their social duties, and torn by personal considerations, they grow disheartened and cure their mood simply by changing the shape of their organisation, by appointing a new higher council here, or moving a department there. So overworked is this gambit that one hears on all sides fervent hope that a Neguib will emerge and abandon it, or that a post-coronation cabinet will at least take on some of the facets of national socialism.

Even Nuri Pasha, who—though he was the butt of the November riots and belongs to the generation of the socially unconscious—is widely recognised as a man of action, is being mentioned by younger men as a possible dictator. The gloomy side of the medal is that the middle class is at present merely radical and, immediately it is driven to despair, has at its disposal a ready crowd of unemployed, of students with red leaflets in their pockets, and of suburban peasants. The bright one is that, given vigour at the helm, relatively few improvements could tide matters over until the Development Board shows results. A great deal hangs upon using a new reign to open a new vista in this, one of the most important states of the Middle East. If Iraq can be given good government, its prospects would be bright indeed.

Cat and Mouse Truce

THE news that the truce talks would reopen at Panmunjom last Sunday for the first time since October had aroused great expectations. It is not surprising, therefore, that their apparent deadlock after only a few days' session has led to sharp disappointment. The free world's yearning for peace has been so intense that in some quarters hopes were naturally raised which were bound to prove false. For nothing that has happened so far, either in Korea or anywhere else on the broad front of the Communist struggle, has given proof that the Communists, if they have changed their general tactics, have changed their methods in matters of detail. If there really is to be peace in Korea it will certainly come only after hard bargaining.

Part of the present disappointment springs from the way in which the reopening of the truce talks was preceded by the Communists undertaking to release immediately all those prisoners of war who were seriously sick and wounded. When to this was added the release of a number of civilian internees, some of whom had at times been given up for dead, the Communist intention to have a truce at first seemed clear. Hopes were still further encouraged by the sudden access of apparent sympathy and warmth with which the Communist authorities had begun to treat returning prisoners. The first substantial blow to be struck at this mood of optimism was the statement made by some of the returning prisoners that others had been left behind in far worse condition than they. The whole exchange of sick and wounded had been based on the idea that the worst should be first; instead it began to look as if those released had been hand-picked. A further shock was felt as reports were spread of atrocities committed in the prisoner of war camps, particularly those where Americans were held.

From the evidence of the last two or three weeks, however, it would clearly be wrong to expect the Communists to stop squeezing the last drop of propaganda value out of any given situation. It is a sickening thought that the grim sufferings of the individual victims of war should be used as a pawn in a political game. Yet the cynicism of such an act is part of modern war itself, and the Communists have never yet spared anyone if their purpose was served by making him suffer. The campaign in Korea, though on a limited scale, has been a total war. There is, on the other hand, no evidence to suggest that the Communists have gone out of their way to treat those who have fallen into their hands with special harshness. There have been revolting accounts of appalling hardship in the earlier stages of captivity, brought back by those who have already been released; but these former prisoners seem equally agreed that this brutality was due in general not so much to deliberate policy, as to a mixture of barbaric callousness, the impact of Asian conditions on westerners, and the desperate shortness in North Korea of everything that makes life tolerable.

In these circumstances, if public opinion is to support governments effectively, it needs to strike a balance between the first careless rapture of optimism and an opposite tendency to discount the Communists' willingness to have a truce at all. That the talks have been reopened is already something; and if that event has any meaning, it is surely this: whereas the Communists were previously bargaining without intending to achieve a truce, they are now doing so with the intention of having one.

★

There are five main elements in the bargaining which this implies. The most important point discussed at Panmunjom this week was the nomination of a neutral power, to take charge of those prisoners who decline to be repatriated in the period immediately following a truce. The Swiss are willing to play this role; they have officers standing by ready to fly to Korea at a moment's notice, and by tradition and instinct they are a most suitable choice. It is, however, understandable that the Communists should have objected to Switzerland, which is a western country and one already nominated, as they protest, to be a member of the neutral nations supervisory commission for the truce as a whole. The second and third objects of bargaining are the location—in Korea or elsewhere—of temporary camps to house the prisoners unwilling to be repatriated, and the length of time they should spend there. General Harrison, the head of the United Nations delegation, condemned the Communist proposal that the prisoners should remain in neutral custody for a total of nine months, and asserted that two months should be quite enough to separate the sheep from the goats. But what the Communists really appeared to be seeking by proposing such an inordinate delay was the opportunity to re-indoctrinate their own unwilling citizens.

Clearly it is reasonable that representatives from a prisoner's native country should be allowed to visit him during the interim period. The difficulty is to decide for how long, how often, and in what circumstances. It should not, however, be beyond the wit of the negotiators to lay down conditions which would not leave scope for intimidation. Above all, in bargaining with the Communists about these all-important details, particularly the length of time for which neutral responsibility should be maintained, it must be recognised that for them this procedure may represent the only way

of abandoning without loss of face their original insistence that all prisoners must necessarily be repatriated. For, indeed, the last question always remains: what happens at the end of the temporary period to those who still refuse to go home? The best that can be hoped for is that this question should be included in the political negotiations that must follow the signing of a military armistice.

The problems of that political conference remain as forbidding and obscure as at any time. It is, of course, reasonable to argue that the fresh possibility of a military truce now increases the need to secure agreement among the United Nations themselves about their political aims in Korea; but it will do no good to insist that these political talks should take on the nature of a grand peace conference for the whole Far East. It may be that the Russians and Chinese, once they had secured a truce, would continue to demand that it be followed up by a discussion of all outstanding questions in the Far East. But, whatever softening there may or may not have been in the recent Russian attitude, it has not led to any reduction of Russian support for China's two predominant claims: that the Chiang Kai-shek regime should be liquidated, and that Peking should have a seat at the United Nations. The British and American governments, it is true, approach the long-term solution of these two questions from different angles, but neither is prepared at present to concede these demands. That being so, it would be foolish to hope to turn the discussion of a local Korean settlement, which seems possible, into a wider inquest on Far Eastern problems, which still seems impossible.

Self-Improvement and the State

THE appointment of a committee is a common preliminary to making an official decision. But the Minister of Education has gone through the looking glass. She makes the decision and then appoints a committee to inquire into the reasons for it. She announced last week that a committee is to be appointed to review the arrangements whereby grants—amounting to 75 per cent of their teaching costs—are made for adult education to the Workers' Educational Association and to the universities. This marks a truce in a long controversy. In January this year the WEA and the university departments received a letter from the Ministry informing them of Miss Horsbrugh's decision to cut their grant by 10 per cent. This news was badly received in the press and in the country generally; indeed, it appeared that adult education was dearer to the nation's heart than anyone had realised. The Minister then pleaded that she had only "proposed" to cut the grant; nothing was settled and she had asked the "responsible bodies" for further information, particularly about their commitments towards their full-time staff and about the extent to which they could raise fees.

At this point the Prime Minister burst into the controversy. A letter of protest from the TUC received the following reply:

> There is perhaps no branch of our vast educational system which should more attract within its particular sphere the aid and encouragement of the state than adult education. . . . The mental and moral outlook of free men studying the past with free minds in order to discern the future demands the highest measures which our hard pressed finances can sustain. I have no doubt myself that a man or woman earnestly seeking in grown-up life to be guided to wide and suggestive knowledge in its largest and most uplifted sphere will make the best of all pupils in this age of clatter and buzz, of gape and gloat.

Prime Ministers' letters are sometimes drafted by their private secretaries; but this one had the authentic touch, and though it went on to say that the level of fees should be looked into, it doomed the 10 per cent cut. Perhaps the Prime Minister did not know that a definite decision had originally been made; perhaps he was bowing to public opinion; perhaps the Chancellor of the Exchequer, with his interest in education and his past support of the WEA, had put in a word. Whatever happened, the Prime Minister's letter was in spirit a repudiation of Miss Horsbrugh and there was nothing for it but to appoint, after a decent interval, a committee.

It so happens, however, that there are some interesting matters for the committee to inquire into. Times have changed much since the existing arrangements were made. It is arguable that the state is now doing enough by assisting local authorities to provide adult education—an education which they are urged to make primarily vocational, and in which the nation therefore has a direct economic interest. Is there any longer a case for giving state aid also to the liberal education that is provided by the WEA and the universities when—on paper at least—everyone now has a chance to begin his liberal studies at a secondary school, and when everyone who is capable of profiting by a university career can get to a university? In 1924, when the school leaving age was fourteen and the university population was half what it is now, the state could feel some obligation towards able people who were thrown out of school barely provided with the mental equipment necessary to teach themselves. Today, when it is spending at the rate of £286 million a year on education, has not that obligation disappeared?

The Workers' Educational Association was founded by Dr Albert Mansbridge in 1903, to bring workers into university extension lectures. But the smatter-

ing of culture that they gave was unsuited to the WEA's serious purpose, which was to enable "working people" to develop their capacities and to equip them "for the work of securing social and industrial emancipation." In 1907 it therefore proposed that the universities—in the first place Oxford—should form joint committees with the WEA to run three year tutorial classes of university standard. The universities assume the academic and financial responsibility (aided by government grants) for these classes, while the WEA is responsible for organising them and finding the recruits. Since 1924 the WEA has also received a direct grant from the Ministry in order itself to provide classes of a less exacting standard—terminal and one year courses—which are intended to be a prelude to the longer courses of study arranged with the universities.

★

The appeal of the WEA is certainly less potent than it was. The actual number of manual workers who are its students is hardly higher than it was twenty years ago, and as a proportion of the total it has fallen from 33 per cent then to less than 20 per cent today. (It is higher in the North—40 per cent in Yorkshire, for example.) This may not be a true measure of the social status of the students, because one of the occupational groups that has grown considerably is classified in WEA statistics as "home duties and nursing"; this presumably includes many working-class housewives. But it is certain that the proportion of middle-class students in WEA classes has increased. If this process continues the association will lose at least part of its *raison d'être*. Dr Mansbridge would have thought it had lost it already, for he said that at least 75 per cent of its members should be "labouring men and women." It may be objected that this is unduly class-conscious, that the workers are now all who work with hand or brain. But if the WEA is to become primarily a middle-class organisation it is not the organisation that the state originally decided to subsidise, and it can be argued that middle-class people who like to use their leisure in this way should pay the full cost of lectures for themselves. This argument will become stronger if the increase in the proportion of middle-class students feeds on itself, as it may. The "labouring man" begins to feel a fish out of water, even in the pond that was specially provided for him; and he may find it hard to learn when most students in the class have been better educated than he has.

If the composition of the association is not what it was, nor are the standards of its work. In its early years it aimed only at university standards. Today membership is not so exacting. The percentage of students in tutorial classes has fallen from 20 per cent twenty years ago to 11 per cent today. The modern middle-class students seem to lack the enthusiasm, the crusading spirit, that inspired the association's earliest members. This loss of objective probably accounts, too, for a change in the subjects studied. "Education with a social purpose" and "social and industrial emancipation" both demand studies that are directly related to the economic and social problems of the time. Changes in WEA classes have shown in the past correspondence with the issues of the day. Today economics and social studies still form the largest group of subjects, with 18.6 per cent of all the classes; but classes in appreciation of the arts, particularly music, have increased their share of the association's work to 15 per cent. It is an excellent thing that people should develop their appreciation of the arts; but it is education for pleasure rather than for social purpose. It encourages them to put their feet up and listen to the radio, but hardly to change the world for the better—as Dr Mansbridge had intended it should.

Such are problems of adult education after fifty years of the WEA. The association's leaders are certainly aware of them. The director of extra-mural studies at Leeds, for example, has urged that they should try to narrow their clientèle to the working class. As for raising standards, the association is increasing the proportion of its advanced tutorial classes, and this may partly account for the recent fall in the total number of students, now 96,000. But the standards of its early years are unlikely to be regained because it has fewer people of university calibre to draw on. And even if these efforts are only moderately successful, the WEA certainly remains a valuable organisation, whose activities it would be a pity to curtail. It helps to bridge the gap between the best and the worst in British education; in an age of slogans it is teaching at least a small part of the electorate to weigh facts more accurately. It strives honestly, even if not with entire success, to be non-partisan in politics. The danger in cutting the state grant for these purposes is that it might—in time, not immediately—intensify the association's problems beyond hope of a solution. If the grant were cut by 10 per cent, the fees to students would have to be raised very sharply, unless more could be raised from other sources, such as affiliated trade unions. The present fees are, indeed, very low—between 3s. 6d. and 5s. for a course of six lectures; but the increase might be enough to drive away precisely those students whom the association most needs, making it still more a middle-class organisation, with little sense of purpose. Before very long, that change in character may have to be accepted as irrevocable. But it would be a pity to accept it just yet. In real terms, adult education did sustain a cut in government aid last year: its grant remained unchanged, although costs had risen. This year the WEA celebrates its jubilee, and it would be a bad moment to continue the process of attrition. The proper task for the committee is rather to consider what sort of adult education is still properly a matter for state aid, and what scope for such education survives in the new Britain. It would be foolish to complicate this decision by a concern for tiny savings—the 10 per cent cut would have been £34,000—either this year or next.

Notes of the Week

Knight of the Garter

THAT the Queen has repeated her father's offer of the Garter to the Prime Minister, and that this time Sir Winston Churchill has accepted it, has given great pleasure. Generally speaking, most people would prefer to hold to the convention that the leader of the Commons is plain Mister—it is the English form of Napoleon's *redingote grise* among the brilliance of his marshals. But this breach can be excused on the double ground that it is temporary—for Sir Winston must surely now be nearer the end of his career than its beginning—and that it is exceptional, for there is never likely to be another Prime Minister with such a remarkable variety of claims to personal distinction and, to top them all, with the magnanimity of character that makes it difficult to dislike him. He has, in a long lifetime of controversy, collected more opponents than any man now living; but never has there been a politician with fewer enemies. The Garter sits well. *Honi soit qui mal y pense.*

Final Fling on Transport

No one emerged with much credit from the wrangle in the House of Commons over the Lords' amendments to the Transport Bill. If the Government can claim that Labour's delaying tactics made a "guillotine" motion inevitable, it cannot itself escape the charge of having needlessly provided a *casus belli*. It applied the match to this powder barrel before the Bill ever left the House of Commons. Possibly because the chief architect of the Bill, Lord Leathers, sits in the Upper House, the Government allowed a number of amendments that could have been handled during the report stage in the House of Commons to be left for the Lords to deal with. Not one of the 70 amendments made by the Lords really introduced a new issue, but several entailed substantial additions or redrafting. There is no reason why the Lords should not do such work, but the Government does not seem to have made adequate allowance for the right of the Commons to consider changes of substance. This is a constitutional point, and it is not made less valid by the antics of the leaders of the Opposition. First, they over-stated their case and then flagrantly broke a convention themselves by trying to repudiate all pairing arrangements made by Labour MPs.

The Opposition launched into its talking marathon when it became satisfied that the Government was unwilling to allow reasonable time for the Lords' amendments to be considered. At an early stage in the dispute there appears to have been some misunderstanding behind the scenes, and there is no reason to doubt that the Government was genuinely surprised by the Opposition's reaction. But the Leader of the House and the Tory Whips should have been quicker to sense the fact that Labour MPs were spoiling for a last-ditch fight on transport, and that Mr Attlee's absence allowed free rein for competitive leadership from their front bench. If the Government had graciously offered an extra day for discussion at an early stage, the Opposition's obstructionism would have been shown up quite clearly for what it was and charges of undemocratic behaviour against the Government would have been laughed out of court. As the orderly passage of the Steel Bill has shown, in the long run it usually pays a government to err on the side of generosity in granting time. A day or two lost on the matter in hand is usually recovered later because other business can be transacted more speedily thanks to the more amicable atmosphere created.

In the case of transport the day saved at the price of a good deal of bitterness must now be set aside for a censure motion. The Government can gain little satisfaction from the fact that out of the three occasions on which it has had to resort to the "guillotine," two have been for such minor matters as amendments from the other place and the paltry little Bill to denationalise public houses in the new towns.

Soft Pedal for Labour

THE national executive committee of the Labour party spent last weekend in a second intensive discussion of future policy. Almost all the important decisions have now been made. The declaration of policy will be ready for publication soon after the Coronation.

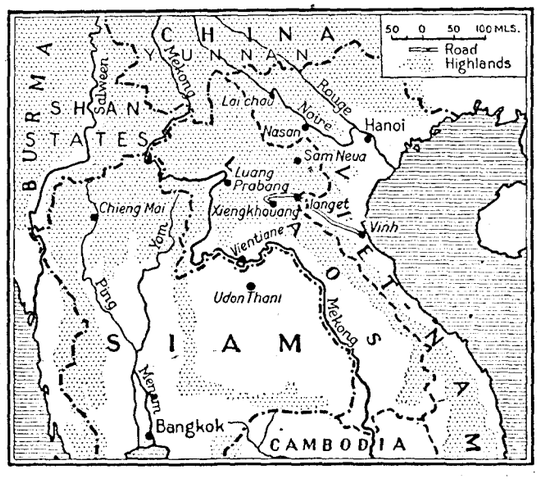
By all accounts, this weekend meeting confirmed what its predecessor indicated five months ago: both wings of the Labour party are tired of quarrelling, and in this mood they can discuss policy with a measure of friendliness and agreement that might not be remarkable anywhere else but certainly is remarkable—by contrast with the past two years—in the Labour party. Left and Right last weekend failed to compromise on only one matter: the proposal to nationalise rented land. This had to be put to a vote, and the Left was defeated. This leaves only one major matter unsettled. The party executive appears to be fairly well agreed that the chemical industry (defined as Imperial Chemical Industries and perhaps one or two other firms) should be nationalised. The General Council of the TUC thinks that a commitment to this policy would be rash;

but the disagreement seems to be less wide than many of the press reports have suggested, and some form of words satisfactory to both sides will no doubt be found.

If the proposal to nationalise chemicals is postponed, the new programme will contain (apart from the renationalisation of steel and road transport) little Socialism of the 1945 vintage. The pale new version of nationalisation—a controlling state interest in selected firms of major national importance—will be applied at the first bite to the aircraft, machine tool and mining machinery industries. The idea of disturbing ownership in shipbuilding firms seems to have been dropped ; instead the industry will be subjected to a development council "with teeth," whatever that may mean. Industrial proposals of this sort are supposed to be related in the policy statement to the national need for higher productivity, and Labour is also putting great stress on the necessity of growing more food. A new housing policy is clearly a political necessity, and it is said to be fairly close to the ideas for more municipal ownership that the Co-operative party has already advanced. It would be unwise to pass judgment on the strength of these reports before the policy statement is published ; but it seems clear that the new Labour tune will be played with more use of the soft pedal than was at one time threatened. Nevertheless it remains difficult to see how the tune can be alluring to the marginal voter—or offers much promise of a realistic economic policy.

Nato's Spring Meeting

THE more businesslike Nato becomes the more undramatic the meetings of its council. That is an excellent thing, for it is now possible for fourteen foreign ministers or their permanent representatives to consult regularly without creating a newspaper story or a diplomatic incident. Last weekend in Paris the statesmen spoke in council but did not seriously argue. (It would have been difficult to do so with 250 people in the inadequate conference room.) They found their main business, the approval of the annual review of forces and resources, already negotiated and tidied up by the secretariat and national representatives. Bitter arguments over contributions to infrastructure had been brought to an end by the Secretary General, and the military had won their fight for quality against quantity and for secrecy against boasting. With the city's chestnut trees in blossom it must have been a satisfactory experience for the statesmen.

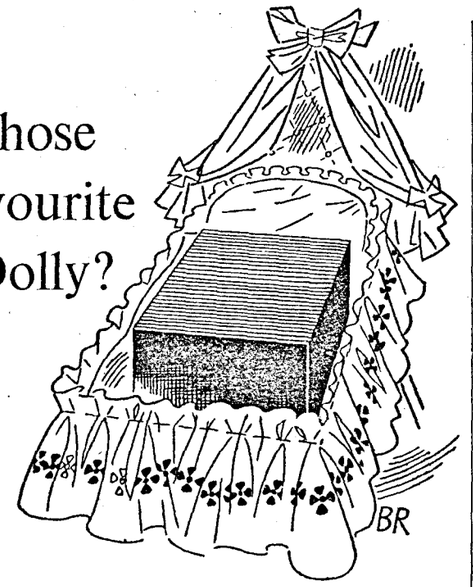


Their decisions constitute a plan to conduct as usual the business of rearmament and defence organisation, in spite of Soviet gestures. General Ridgway will get more divisions and those he has will be greatly improved ; one or two bluffs by staff officers in south-eastern Europe have been called by exacting higher standards of training, equipment and support units. The uncertainty about future American aid and about the German contribution to the EDC remains ; indeed, much planning could be wrecked either by an unfriendly Congress or by a failure to create German units. An excellent and less painful technique of inquiry and examination has been worked out for bringing and keeping defence and finance ministers up to scratch ; and it can perhaps be claimed for the first time that Nato—especially through Lord Ismay—can bring real authority and pressure to bear on national governments.

But it has still to be emphasised that Nato's military advisers are dissatisfied with the forces given to them for the job they are told to do ; and it may also be said that Mr Dulles, who was attending the Atlantic Council for the first time, has much to learn about the tact, modesty and readiness to listen that are required in that body.

Next Victim Laos

ALTHOUGH the Communist drive into Laos is not a great military achievement, its political consequences could be considerable. The attack was not entirely unexpected and the operation might have been attempted a good many months ago ; but the fact that it is now going ahead without serious opposition creates a new situation in Indo-China. To the question why this moment was chosen the simplest answer is that the Vietminh, having failed to dislodge the French-controlled forces from the rich Red River delta in Tonking, are striking down into Laos as an easier alternative.



But the stakes are potentially so big that this explanation is not quite adequate. It is impossible not to feel that both the Russian and Chinese leaders are licking their lips at the prospect of the added prestige to be won by capturing an

entirely fresh country in South-East Asia, however small. Laos, with its politically indifferent population of three million, is in danger of complete collapse before the Vietminh invasion. The Communists can hardly be expected to forgo such a neat thrust towards several bigger, long-term objectives. One of these would be the intimidation of the Siamese ; another would be to push on into Cambodia too—equally a soft spot—and turn the flank of the whole French military position in Vietnam.

What can be done to stop this ? Perhaps very little. A contributory factor has already been the unfortunate

Whose Favourite Dolly?

Far from being pampered, this BAKELITE Laminated pile driving dolly has to stand up to forty-five blows from a 4-ton hammer every minute. Yet it is certainly the constructional engineer's favourite, for it outlasts the elm and oak dollies formerly used. The unusual toughness of the fabric-based BAKELITE Laminated Materials is one result of the continuous process of experiment and development that goes on from day to day. The story of plastics is already a long one, but new pages are being written every day — by the organisation whose pioneering efforts were mainly responsible for the general adoption of these versatile materials.

Please write for booklets describing BAKELITE products.

B T-H Industrial Motors

BTH is particularly well placed to meet the needs of Industry for electric equipment in general—D.C. and A.C. (single or polyphase) motors and associated control gear in particular. Present day production represents the results of over fifty years' continued progress in original research, design, and manufacture, of all types and sizes of rotating electric machines—second to none in performance and reliability. No manufacturer can offer a wider choice in electric motors. Whatever the conditions of service or type of drive there is a BTH motor well suited to the job.

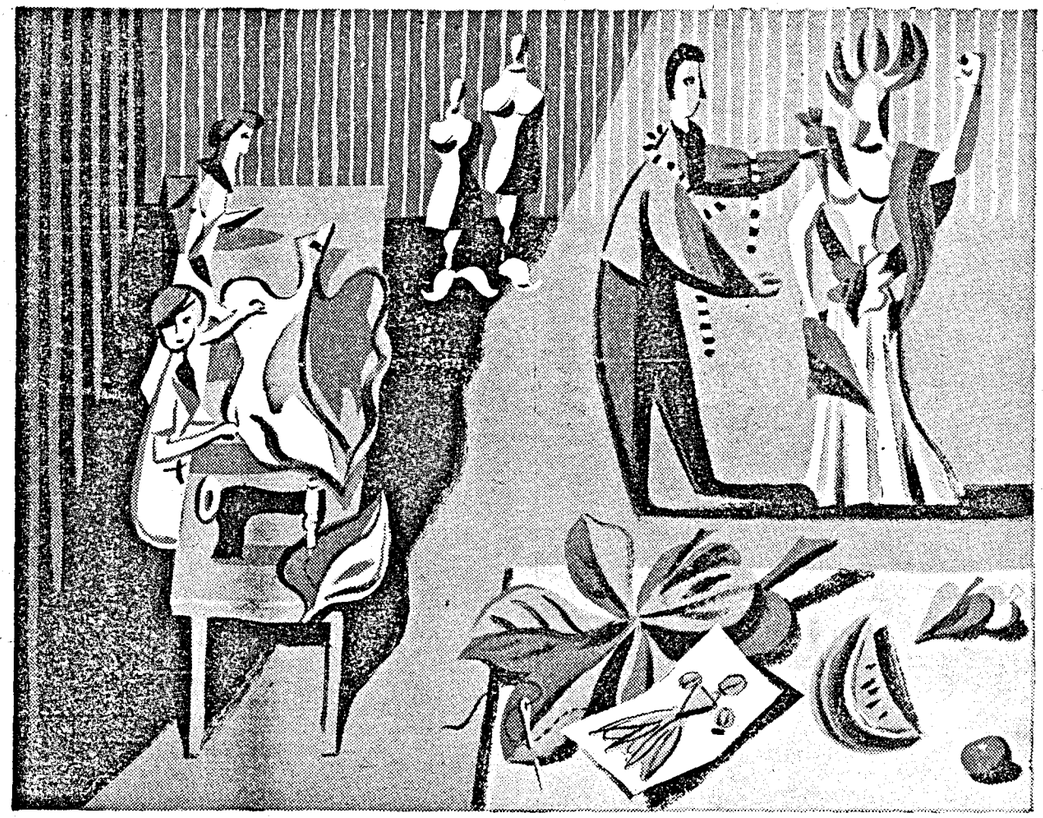
EQUITY & LAW
LIFE ASSURANCE SOCIETY
HEAD OFFICE: 20, LINCOLN'S INN FIELDS, LONDON, W.C.2

IF YOU LIVE . . .
to age 65, you will receive £1,000 together with bonuses which, *if maintained at present rates*, would then amount to a further £836.

IF YOU DIE . . .
before age 65, your family will receive £1,000 with accrued bonuses immediately and, in addition, £200 a year until you would have been 65.

These figures relate to a life aged 35 next birthday and represent a Family Provision Scheme for the maximum term of 30 years at a premium of approximately £60 a year.

To: The General Manager,
Equity & Law Life Assurance Society,
20, Lincoln's Inn Fields, London, W.C.2.



Please forward, without obligation, an illustration of this Family Provision Scheme with full details.

Schweppshire shows the Way—3

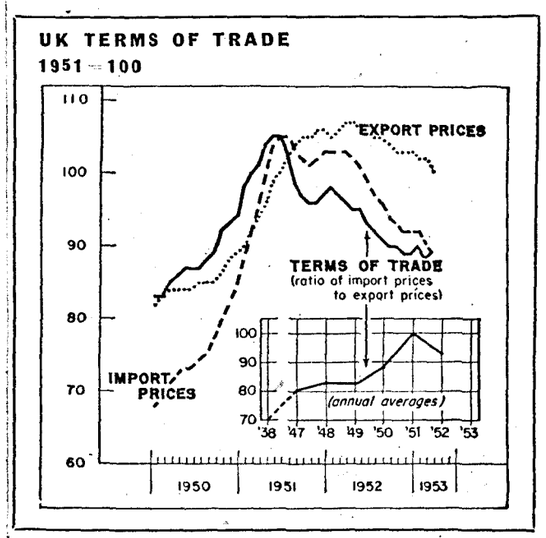
Chlorophyll Fashions

THE MODERN BIO-ELEGANCE

That Schweppshire moves 'forward to Nature' is clearly visible behind the scenes of dress designer Schwepperelli. Materials created in the laboratory, woop and warf evolved literally from the pure blade of grass, include a simple gown of chlorophyll-treated gaberdine, wired by molecularly reconstituted, furnace hardened chloroin (rhymes with heroine), innocently adapted to the contemporary fashion. Syringes impregnate the material with 'Natural Sun' chlorogen whose ultra-violet radiation conquers inert heat just as surely as it does away with cold, and, without trying to substitute warmth for chilliness by the old method, produces the ideal *temperatureless* state without which natural poise can never be achieved. These models are for schwepsport only, but identical patterns at cheaper rates made in the atomically counter-equivalent Phylochlor are on sale at more convenient prices.

AND DON'T FORGET that spectacles with 'Chlorophlex' lenses give *longer and more lasting* sight, since the eyes are literally *fed*, the optic juices actually nourished, by chlorophyll's magical alchemy of light.

Designed by Lewitt-Him, written by Stephen Potter.



SCHWEPPERVESCENCE LASTS THE WHOLE DRINK THROUGH

strategy of the French high command in tying up no less than 16 battalions in the useless garrisoning of Lai-chau and Na-sam. But unless these troops can be extricated quickly by air and flown down to hold a line across the narrow waist of central Laos, the probable fall of the capital, Luang Prabang, may be only the prelude to the seizure of the rest of the country.

Rebuff for the Coal Reformers

To offset its rejection of the Government plan to give judges a tax free increase of salary, the 1922 Committee has now come to the Government's rescue by rebuffing the group of backbenchers who have been waging a campaign against its fuel policy. Having thus impartially displayed its strength, the committee can feel it has largely recovered the independent status it used to enjoy but lost to some extent after 1945. The formal title of the 1922 Committee is the Conservative Private Members' Committee. It follows that when the party is out of office, and all Conservative MPs are private members, all belong to the committee and it loses its distinctive character as a separate instrument of back-bench pressure. Now that it has again become exclusively a backbenchers' body, the committee is regaining its position as a force independent of the party leadership.

Regarding itself as the guardian of the party's conscience, the 1922 Committee does not seem to have been very impressed by the campaign being waged by a few of its number, ostensibly for an inquiry into the Coal Board but in reality for a change at the Ministry of Fuel. But the committee's willingness to be persuaded by Mr Lloyd to rebuff the campaign was conditional. It is far from complacent about fuel and proposes to keep the matter "under close and continuous review." In effect it accepts Mr Lloyd's argument that the Coal Board and the miners should be allowed time to develop their own production drive. Certainly an inquiry at this moment would be politically tactless. But the committee served notice on the Minister that if the additional output is not forthcoming, the debate will be resumed in a less happy atmosphere. It is ironic that a Conservative minister should thus find his reputation—possibly his job—depending on the success of a nationalised industry.

Wages and Output

Economic policy was debated on Wednesday in both Houses of Parliament. In the House of Lords, Labour peers expressed their fears that the Budget was inflationary and that it would make Britain more vulnerable to the effects of an American recession. In the House of Commons, the Opposition blamed the Government for the fall in production during 1952, and for its failure to take remedial measures. It is not easy to reconcile these two lines of criticism. If there really is scope for a financial stimulus to production, the Budget is unlikely in itself to cause inflation. The Opposition seems to be mainly concerned to prepare the ground for saying "we told you so" whatever happens. Certainly if the Chancellor's calculations do not come off, and the tax concessions fail to stimulate production, then the Opposition will have been right in saying that the Budget is inflationary. But that does not justify its criticism now, when the risk has to be taken, one way or the other. Moreover, Labour's alternative apparently is to direct all the Budget concessions to those who are least likely to save, with results that would have been more inflationary.

Certainly a failure to increase production is likely to upset the Chancellor's policy disastrously. The trade unions are making sure of that by their latest wage demands. On Wednesday the representatives of the 38 unions affiliated to the Confederation of Shipbuilding and Engineering Unions decided to recommend a demand for a wage increase of 15 per cent. They got their last increase, after a prolonged struggle, only last November and the cost of living has risen only two points since then; but they have not forgiven the fact that they were then beaten down from £2 to 7s. 4d. If the confederation decides to press this demand—as it is likely to do, for the claim has the approval of the powerful Amalgamated Engineering Union—that would probably fire off another round of wage claims. Already the shop workers are asking for an increase of 15s. a week and the building workers the additional 6d. an hour that was not granted when their wages were automatically adjusted to the cost of living in January. The agricultural workers too are demanding a substantial increase. The situation is familiar. Some workers have reasonable grounds for higher wages on the assumption that other wages stand still, but in practice the claims are once more developing into pressure for an all-round rise in wages that will help no one and will probably—unless the overseas demand for British exports is more buoyant than it looks—hurt everyone.

The Town Hall and the Parties

A YEAR ago, heavy Conservative losses in the county council elections were taken, rightly, as some measure of Government unpopularity. Next week, the Conservative party machine can face the local elections with more confidence; after 18 months in office the Government has a far better record than it had after six months.

The results of the local elections will, however, be overshadowed this year by the verdict to be given by the electors of Sunderland South at the parliamentary by-election on May 13th. This is a marginal seat. It could be captured by the Government. It was won by Labour in 1951 with a majority of only 306, and even the intervention of a Liberal candidate does not make another Labour victory certain. If the Government won, its majority over all parties would be raised from 16 to 18, and its majority over Labour from 24 to 26. In a narrowly divided House such a gain would magnify the impact on public opinion of any noticeable swing towards Conservatism. All these things will no doubt be made plain to the Sunderland electorate, and the by-election will be fought much as if it were part of a general election.

The poll for the local elections, on the other hand, must be expected to be relatively light, the issues partly local, the sense of political occasion inevitably far less. Nevertheless, the results will not be unimportant; for as usual the parties are treating the elections as an issue of party faith and national interest, and thrusting the real purpose of local self-government into the background. The contest will be hottest in the metropolitan boroughs, all of whose members retire; 17 Socialist and 11 Conservative boroughs will be choosing again. In the case of the county and non-county boroughs, and of the urban and rural districts, only one-third of the council members retire, so that the control of relatively few councils will change hands. Of the 309 non-county boroughs, 60 are at present Labour, 246 Conservative or anti-Socialist and three equally divided; of the 83 county boroughs, 37 are Labour, 42 Conservative or anti-Socialist, one Liberal and three equally divided. Only 27 councils, however, are regarded as properly borderline cases. Though the Conservatives can point to a favourable national record, Labour is making good use of the continued rise in rates and alleged cuts in social services: both of these strike urban ratepayers and local government electors most forcibly. The Conservatives would be unwise to assume that their firm seat in the saddle in Whitehall will enable them to strengthen their grip on the Town Hall.

News Values in Moscow

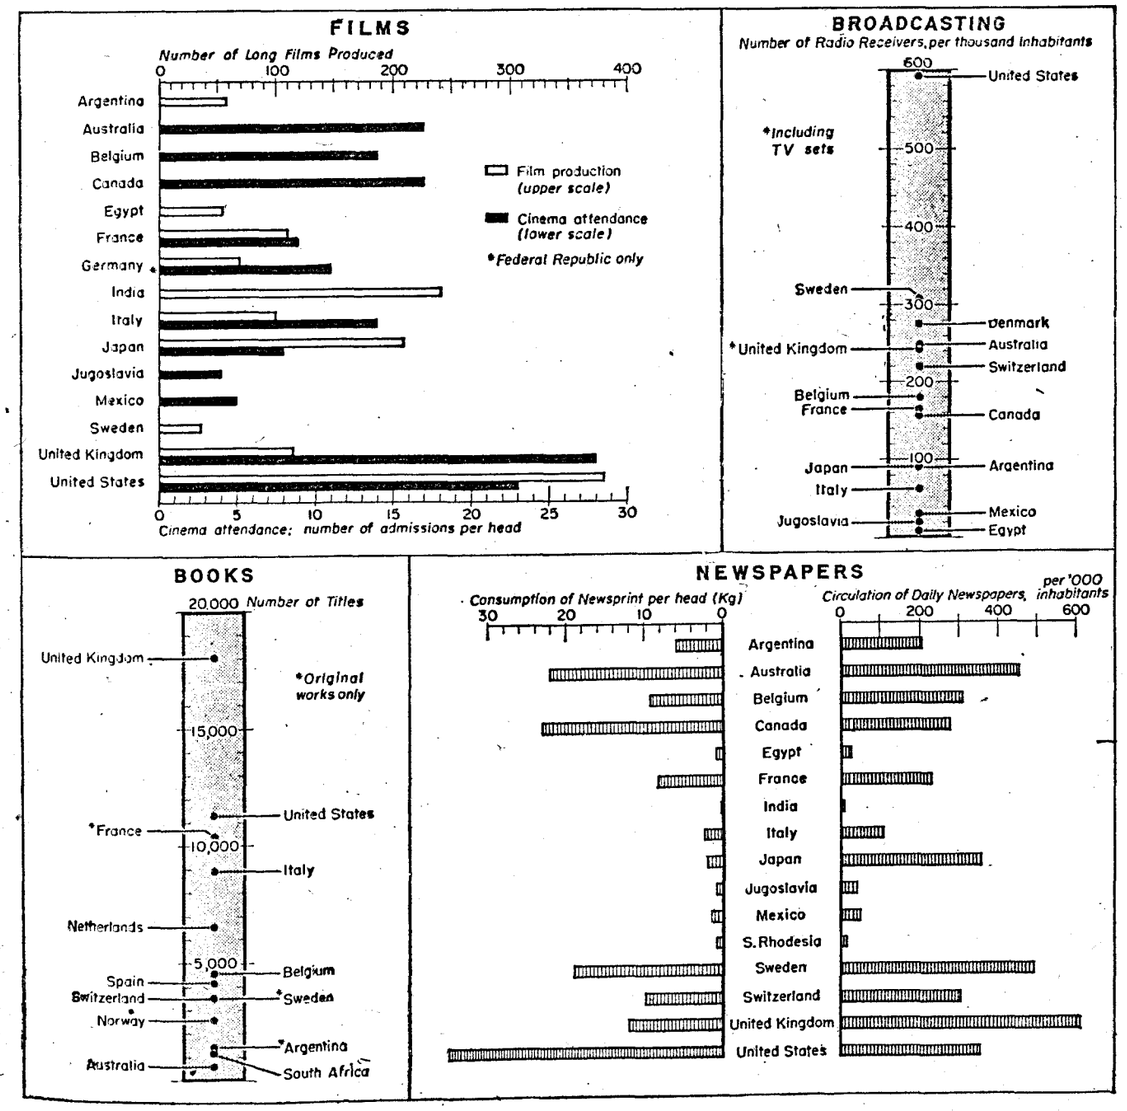
LAST Saturday the Russian reader was offered a big dish of foreign news with his breakfast. Already for some weeks the space devoted to international topics had been increasing, but this time only a quarter of the newspaper was left for domestic news. Both in *Pravda*, the official organ of the party, and in *Izvestia*, the official state organ, all the six columns of the first page were taken by the Soviet reply to President Eisenhower's speech. The speech itself was reported *in extenso* over four columns on the third page. On the next day the trade union journal, *Trud*, and other Moscow papers followed suit, giving both the speech and the reply.

There was an occasion when Mr Morrison was allowed to present the western case in *Pravda*; but the new departure is much more important. This time, without any apparent compulsion, the Soviet leaders decided to include the other side's argument together with their own, thus enabling the reader to make his own judgment. This, even more than the mild, reasoned tone of polemics must have struck as a novelty the readers of the Russian press. Here, indeed, was a review of the international situation with a difference. The effect on the Soviet public is well illustrated by the fact, reported from Moscow, that throughout the day crowds gathered around the boards where *Pravda* and *Izvestia* were posted and discussed the news.

It is significant that the bulk of the remaining space in *Pravda* was taken up by a feature called "More Consumer Goods for the Population," echoing the reaction throughout the country to the May Day slogan calling for a better supply of the products of the light and food industries. Indeed, this has been the other main topic plugged by the Soviet radio and press since the advent of the new regime. Implicitly the two topics are closely interwoven. On the eve of Stalin's death, vigilance against the enemy, discipline and sacrifices were the order of the day. Then the Malenkov group came forward with the promise of peace and a better standard of life. The Soviet public is now being made aware that the two are inseparable, that the standard of life may largely depend on the outcome of the polemics with Eisenhower.

The Little Stalins Remain

THE slogans published for May Day celebrations show how Warsaw, Prague and Budapest are still lagging behind the revolutionary developments in Moscow and therefore find themselves out of step. In Russia the cult of the omniscient and omnipotent leader has been discarded in a spectacular way since Stalin's death. No one is being built up to stand on the vacant pedestal. Indeed, the pedestal itself has been shaken, with *Pravda* insisting on the superiority of collective over individual leadership. Whenever individual names have been mentioned those of Malenkov, Beria and Molotov are linked together; but usually, as in the slogans, the government and the Central Committee of the Party are described as the ruling organs of the country.



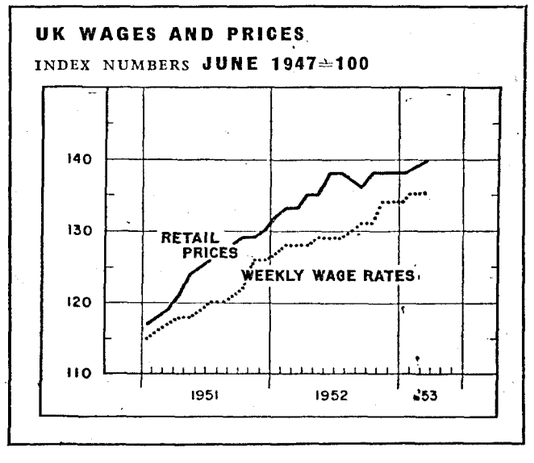
No such change, however, has yet come about in eastern Europe. The Czech slogans still contain a "Long Live Our Beloved Comrade Antonin Zapotocky, President of the Republic," while the Hungarians call on the workers to rally around the "beloved leader of our people, Comrade Rakosi." Poland, however, is still most conspicuously out of tune with references to Bierut not only as the beloved leader, but also as "the Great Builder of People's Poland." Only recently at a meeting of philosophers Bierut was hailed as a great philosopher.

(*Continued on page 294*)

Culture under Survey

ACCORDING to a pamphlet of "Basic Facts and Figures" published by Unesco, the British people go more often to the cinema than other nationalities; they read more (though smaller) newspapers, and have more books published for them. They are not, however, wireless addicts. Not only the United States but also many smaller countries have more radio receivers in proportion to population. The charts below illustrate some of the statistics contained in this pamphlet. (In many instances the figures have, however, been brought more up-to-date; they refer to the latest year available.)

These "cultural" activities obviously reflect, in part, different standards of education. Unesco thinks that at least half of the world's people today still cannot read or write, but there is no up-to-date record country by country. Over a fifth of the Italian population aged ten years or over was declared illiterate in 1931, one-half of the Portuguese in 1940. But the really high rates of illiteracy are found, of course, in Asiatic countries such as India (91 per cent in 1931) and in parts of Africa. By contrast, students enjoying "higher education" number as many as ten out of every thousand of the population in the United States. Britain appears to be undistinguished in this respect, with only two adult learners out of every thousand persons. This figure is surpassed by most European countries and nearly doubled by Russia. There seems to be room for argument about what is higher education by Unesco's recognition.



Having just got rid of such idolatrous antics in their own country, the new Soviet leaders cannot view them with a favourable eye within the Soviet sphere of influence. Furthermore, if they have decided that no one of them shall don Stalin's mantle they can hardly tolerate the existence of " Little Stalins " in the neighbouring republics. There is no room for such a build-up of Bierut, Rakosi and Zapotocky as long as collective leadership is the rule. Yet this is only one of the many changes in store for eastern Europe.

Trade with the Communists

ALL reports from Geneva, where east-west trade discussions have just ended, are compounded in equal parts of good will and evasiveness. Mr. Myrdal, executive secretary of the Economic Commission for Europe, has said that the talks have " opened up possibilities for change in the trend in east-west trade relations " and that " certain extremely important trading propositions were put forward." Comment from other representatives is less exuberant and some delegates—the Germans, for example—are downright disappointed because the east Europeans had present no experts who could talk specific prices, quantities and delivery dates. The British reaction is one of cautious optimism.

Certainly the eastern delegates were more amiable than for some time, and they were at least equipped with general lists of available exports. The various rumours that emerged from the meeting agree on three things. The iron curtain countries expressed readiness to import consumer goods from the west—the first occasion that their interest has extended beyond the strategic goods that the West withholds. Furthermore, the Soviet Union showed a marked interest in imports of raw materials from colonial territories, such as coffee, cocoa, and copra. Finally, the Communist bloc is willing to sell some commodities that appear on western strategic lists, such as oil and tungsten.

Whether any of these hints—they are at present nothing more—turn into something tangible only time can show. The preliminary discussions in Geneva will have to be continued, presumably on a bilateral basis, in the various European capitals. The most expected by reasonable observers is that current bilateral trade agreements will be expanded and a few new ones negotiated. It is not expected that anything will come at the moment of ECE's project of a multilateral mechanism for east-west trade comparable with the European Payments Union.

Benefits for Births

THE maternity benefits provided under the national insurance scheme were referred by the Labour Government to the National Insurance Advisory Committee. The Bill introduced by the present Government, which had its second reading this week, is based in the main on the committee's recommendations. Political controversy over the measure could, therefore, hardly be expected, nor did any arise. Unlike housing, unlike education, unlike the health service, unlike the food subsidies, national insurance is the one social service topic that can be guaranteed relatively smooth sailing in the House of Commons.

The present maternity benefits and the proposed changes are shown in the accompanying table:—

	Now	Proposed
Maternity grant.....	£4	
Attendance allowance.....	£1 a week for 4 weeks*	£9
Grant for home confinement	...	£3
Maternity allowance.....	36s. 0d. a week for 13 weeks†	32s. 6d. a week for 18 weeks‡

* Not payable if maternity allowance is being drawn. † Beginning sixth week before expected date of confinement. ‡ Beginning eleven weeks before expected date of confinement.

The maternity allowance is payable to employed women. It was originally intended as a benefit for interruption of employment, comparable with sickness or unemployment benefit, with the implication that a woman returned to work some time after the birth of her child. In fact, the advisory committee found that not more than one-third of the women who receive this benefit return to work later. Nevertheless, the committee thought that the allowance should continue, but at the standard rate of benefit under the national insurance scheme. The Government has accepted this recommendation; but the Bill also provides that to draw the allowance women must have actually paid a specified number of contributions. At present, they can have the contributions credited to them and thus draw the allowance even if they have opted out of the national insurance scheme.

Oddly enough, this provision that contributions should be paid caused some criticism from the Labour benches. Stranger still, much more criticism was roused by the proposal to grant £3 to the mother confined at home. The purpose of this is to remove the financial incentive to mothers to have their babies in hospitals where they get free board and lodging. More beds would thus be released for those who need them on medical grounds. Dr Summerskill, making the speech to be expected from her, declared that the grant would be an incentive to mothers to be confined at home when they should be confined in hospital; what was wanted was a bigger and better hospital maternity service. Non-controversial though the new Bill is, throughout the debate there appeared among Labour speakers this streak of wanting still more social services, whatever the cost.

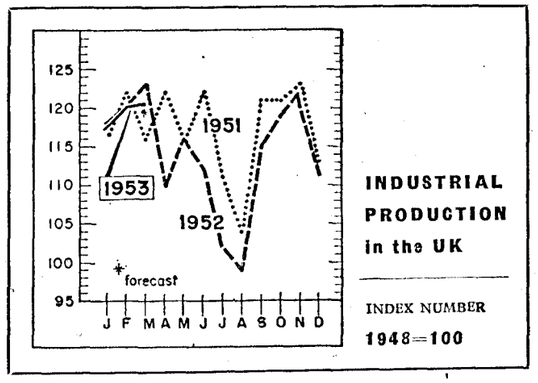
The Tax on Authors

WHEN the Chancellor in his Budget speech announced a tax concession to his " particular favourite "—authors—he did not describe precisely what he was doing to ease their tax payments. He said that royalties payable during the first two years after publication could in future be spread for tax purposes " in the same way as " lump sums received for the sale of an interest in the copyright. There has been some confusion about what exactly that way is. From the Finance Bill it appears that the concession is in fact smaller than many people had assumed. Taxation may not be spread over the five years, or more, that would be appropriate to some works, scholarly or otherwise. The maximum period is three years.

This is a straightforward application to royalty payments of the provisions of section 471 of the 1952 Income Tax Act. This section concerns the author of " a literary, dramatic, musical or artistic work." If he has been engaged on making the work for more than twelve months but not more than twenty-four months, a lump sum payment for the copyright can be split into two for tax purposes. Half can be treated as being received on the actual date, and the other as having been received twelve months before. If he has been engaged on the work for more than twenty-four months, the payment can be treated in a maximum of three parts—one-third counting for tax on the day received, one-third a year earlier, and one-third two years earlier.

Clause 20 of the Finance Bill simply extends this treatment to all " payments in respect of the copyright in any work " which " become receivable " within two years of its first publication. This will cover the normal case of the author who draws most of his royalties within a year or so, though it will not make any difference to the book that enjoys a delayed blaze of popularity—which must sometimes happen to the early novels of authors who achieve fame after several attempts. These are not, however, the authors with the greatest need of help; for the majority, the right to average two years' royalties over two or three years will mean a substantial and well-deserved reduction in the average rate of tax—always provided that no author is foolish enough to finish a book in less than twelve months.

Bribing the Pilot



THE right to political asylum is a deeply cherished part of western ideas on individual liberty, and to use it as a weapon of war is to debase it unpardonably. That apparently, is what General Mark Clark has done in Korea by offering political asylum and £35,700 to the first Communist pilot who brings a MIG15 behind the lines held by his troops. It is hard to understand how a United Nations' commander, who has been instructed to stand on principles in the Panmunjom negotiations about prisoners, can do such a thing on his own initiative, and at a time when delicate and difficult negotiations affecting thousands of lives are under way. Perhaps the political control exercised by the United Nations over its generals is still inadequate.

The trick is, of course, an old one but is now called psychological warfare. One may not seriously hope to get a bidder for the prize but one hopes that all Communist pilots will become suspicious of one another, or that their commanders will enforce security measures which become intolerable. That in turn will affect morale. It is an ingenious idea, but General Clark's advisers might have thought one step further. If the offer has this effect of tightening security then it becomes more, not less difficult, for a pilot who wants to desert to do so. Perhaps it is still believed in Korea that the Polish pilot who landed on Bornholm was attracted by money; if so, it should be made clear that he was not.

Will M. Pinay Return?

FRENCH municipal elections by their very nature are intensely local affairs usually fought on personal and regional issues. Those of last Sunday, however, showed both by their outcome and by the extraordinarily high percentage of voters—among the highest ever recorded in a French election—that there were national issues at stake. The results are difficult to interpret because in many communes the complex system of proportional representation will necessitate a second ballot next Sunday. Moreover, political parties were allowed to present joint lists and this has created a fantastic variety of permutations and alliances. Nevertheless, there is no question that the French voter has moved some degrees to the left.

The Gaullists have suffered heavy losses, not only in comparison with their finest hour in 1947, but also in comparison with 1951. In Paris, there are now ten Gaullist municipal councillors, instead of the fifty-two elected in 1947. The right-wing Independents, led by M. Pinay, have scored at their expense and have emerged as the spearhead of the centre parties. The Communists have, on the whole, maintained and even strengthened their position. Although they have lost a number of rural communes, particularly in the south-west, they have gained in the industrial suburbs of Paris, Lyons and certain cities in the North and kept their

grip on parts of Marseilles. Many of France's major cities are, in fact, surrounded by a belt of Red suburbs. The most obvious victors, however, are the Socialists, who turned into a strong electoral asset the mere fact of being in continuous opposition. They have scored important gains in the coal-mining regions, in the Ardennes and in cities such as Lille and Calais. They have also improved their position in working-class communities throughout the central regions of France.

M. Mayer and his coalition government will draw a number of rather disturbing conclusions from these results. The Socialists owe their success to their opposition tactics, and it is most unlikely that they will switch over to support the government when the treaty for a European Defence Community finally comes up for ratification. The Gaullists, on the other hand, have been so severely beaten that their future course is unpredictable. Some of them feel they would have done better if they had given no support whatever to M. Mayer ; whereas others may decide to break away from a losing side and to join the already existing dissident group. M. Mayer must also be clearly aware of the fact that these municipal elections, despite a general tendency towards the left, have been a personal triumph for M. Pinay and that the latter's return to power is on the cards. All depends now on whether M. Mayer can weather the financial crisis which looms when the Assembly reconvenes on May 12th.

Showdown at Luxembourg

THE showdown between M. Monnet and the steel masters in the new Coal-Steel Community has come sooner than many people expected. The opening of the common market in steel is scheduled for May 1st and the High Authority's intention is that inside the six-power community the price of steel should find its own competitive level. The steel producers, however, have other views.

After getting together some weeks ago to fix export prices, some of the producers have now reached an informal agreement about internal prices ; the Belgians, it seems, have promised to raise their steel prices to the higher German level. On the question of export prices the provisions of the treaty are hazy, but where internal prices are concerned it is unequivocal: it gives the High Authority complete power to prevent all rigging and boosting of prices by private agreement in the Community market. M. Monnet has publicly castigated the offenders, though not by name. He has also stated that if there is to be any price fixing, it will be done by the High Authority and not by the producers themselves. The Authority does not think that market conditions warrant the fixing of prices, but if on May 1st steel prices start moving upwards, it will assume that a private cartel agreement is at work. In that event the Authority itself would be compelled to fix prices and these, M. Monnet implied, would be lower than those agreed on by the Belgian-German price ring.

With M. Monnet this issue raises first principles. Although his policy has been to move with the utmost care and to avoid inflicting any hardships on the coal and steel industries, the one thing he cannot afford to tolerate is that producers should *de facto* take over the functions of the High Authority and exercise these in the interests of a private cartel. The Treaty contains all the necessary powers for succouring any producer hit by the transition to a common market. He would undoubtedly invoke these powers if the need arose. In addition to this tussle over cartels the High Authority has another battle on its hands—the complicated question of taxation, which is discussed in detail on page 312.

Neither Milk nor Honey

In the article in last week's issue under this title, several of the figures appeared in a form that readers have found confusing. The difficulty arises from the close typographical similarity between £I, which is the symbol for the Israeli pound, and £1, which means one pound. The correct figures, all in Israeli pounds, are as follows:—

Trade deficit in the last four years	£I 400
Addition to import bill for each 100,000 immigrants	£I 10 million
Compulsory loan voted by Knesset	£I 45 million
Defence expenditure ...	To be reduced from £I 45 million to about £I 42 million

Financial Football

Nothing could be more disgraceful to a great nation, nor injurious to its best interests, than to permit its financial condition to be exposed to the serious uncertainty which has prevailed in this country, at least since the expiry of the Income Tax Act in 1851. Since then more than *five millions* of the necessary income of the country has been subject to an annual vote. The means of discharging our national obligations and providing for the public services is rapidly being converted into the mere battleground of party conflict. It must be obvious to every man, who, apart from political strife, looks calmly upon this subject, that the present state of our financial affairs can no longer continue without inflicting a serious blow at our national credit, and our character as a prudent and business-like people, who, whatever may be our political differences, have hitherto continued to keep, at least, the national finances unimpaired by such struggles. What are we to expect, if year after year our whole fiscal system is to be reopened—if a Budget is to be converted into a mere foot-ball, to be kicked about in a political game—if concessions are to be demanded, not on their own merits, but as the condition of party support, and to be conceded, not as a matter of justice or of high policy, but as bribes for the votes of small but unscrupulous factions ? . . . The great advantage of Mr Gladstone's Budget is, that it will settle for a period of seven years all these unseemly and damaging disputes. Come what may in our political struggles in the meantime, at least we shall know that there is a fortress erected around our finances which will preserve them from party passions, and secure our national resources and credit under the solemn obligations of measures deliberately adopted by Parliament. The apparently irreconcilable differences of opinion which exist on the subject of the income tax are solved, by a provision for its entire extinction in 1860.

The Hungry Hordes of Ghengis Khan

A quarter of a million Usbecks, Kalmucks, Kirghizes, Merkits, Keraits, Naimans, Juriats, Uighurs and Chinese Engineers careering across Asia on twelve-hand ponies — such was the Golden Horde of Ghengis Khan.

A problem that has long engaged the attention of military strategists is how exactly the Great Khan managed to feed his hungry hordes of Usbecks, Kalmucks, etc., etc. His commissaries would have found things a great deal easier if they had been able to use Falkirk Heavy Duty Cooking Equipment.

The Great Khan would have been the first to welcome a complete and balanced range of equipment with no weak links in the standard of its component parts.

As an enterprising strategist, he would have welcomed the fact that every installation is specially designed and planned for each individual customer. Modern equipment would have released for massacres, lootings and pillagings many of the eager Mongols on cookhouse fatigue.

The long life of Falkirk equipment is due to its solid cast-iron construction. This quality would have appealed greatly to a man into whose soul that element had entered at an early age. He would also have appreciated the Falkirk Company's versatility in making equipment for gas, electricity, oil, steam and solid fuel.

A hard bargainer, as is shown by his negotiations with the Kin emperor in 1214, the Great Khan would have been most pleasantly surprised at the Falkirk Iron Company's extremely low initial quotation.

Letters to the Editor

Lancashire Aggrieved

SIR—As a cotton manufacturer, I am sure the textile trade would not wish to show ingratitude for the concessions in total tax burden received last year, on the strength of which you say in your Business Note last week that we "did well" in 1952. But although concessions were made, they were applied within the framework of the "D" scheme as then introduced for the first time, and it is the peculiarly vicious effects of this scheme from which the industry is now suffering.

The viciousness lies in the fact that not only is the amount of tax per yard increased as price and quality increases, but the effective rate of tax also increases. Your own graph showed that the rate of tax rises from nothing on wholesale prices at and below the "D" line up to 43⅓ per cent on the top wholesale price shown. It is quite wrong therefore to say that textiles' plight is "common to all goods assessed for tax on the basis of their value." In all cases other than those coming under "D" schemes the rate of tax is constant on all goods of a kind whatever their value, and there is therefore no automatic urge to produce down to a price so as to come below the tax level, or to qualify for a lower rate of tax. Further, the retailer's rate of mark-up allowed in your calculations would appear to range between 19 per cent and 22 per cent on wholesale price plus purchase tax. This is a much lower figure than the 30-40 per cent or more on which a retailer would in fact normally work; the discrepancy due to the increasing rate of purchase tax is therefore magnified in the final selling price.

It may be correct to say that with the abolition of the Utility scheme the consumer is less conscious of the amount of tax included in the final price, but in judging true "value for money" she will inevitably choose those goods that contain a less proportion of tax in their final price, and hence, under the "D" scheme, her choice and that of the retail stockist is artificially, but inevitably, driven towards lower quality. It is quite contrary to the experience of my own firm, and of the great majority in the trade, that the retailers themselves "pay little attention to the relatively small sums involved in all but a few lines." Apart from the general urge just mentioned to offer the best value for money, the retail trade is still faced with the grave problem of tax-paid stocks. For both these reasons its buying policy is today dominated by the attempt to reduce to the absolute minimum the stocking of goods bearing purchase tax of however small an amount.

"Trading-up" may well have taken place in qualities below the "D" line insofar as lower raw material prices may have allowed better qualities to be produced at that level. There is, however, no doubt at all that, directly as a result of the incidence of Purchase Tax, a decreasing proportion of high quality goods in general is being produced, at a time when their continued production, and indeed expansion, is imperative to retain our export markets. The textile trade wants to continue the vital contribution to the country's exports of which it knows it is capable, but it cannot do so effectively as long as its home market is distorted by the "D" Scheme. It will continue to clamour until these distortions are eradicated, and it will press for action to be taken urgently before both productive capacity and skill at home, and trading goodwill abroad, disappear beyond recall.—Your faithfully,

Carlisle J. W. F. MORTON

Policy for Africa

SIR—I feel that you have approached the problem of the multiracial territories with undue circumspection. You say, rightly, that the aim of the Colonial Office in these territories is equality of political rights for educated men of all races. But this is only half the story; for the Colonial Office is at the same time pursuing in Central Africa the directly contrary policy of transferring political power to the white settlers—of whom probably the majority oppose ultimate political equality for all races—while at least 90 per cent of the Africans concerned are still incapable of taking any responsible part in government. Attempts to surmount this obvious contradiction by providing "safeguards" for African interests in the new federation can at best prevent the Africans' present status from deteriorating; they cannot promote political progress. The history of Southern Rhodesia since it gained internal self-government in 1923 shows that provisions for United Kingdom supervision of native affairs can become virtually a dead letter when financial control lies with the local legislature.

There was much to be said for partitioning Central Africa into one European and two African states with the hope of ultimate federation based on inter-racial co-operation between equals; but unfortunately the opportunity for a solution along these lines has already passed. A less radical alternative is that a series of remedial measures should be put into operation, in Kenya as well as Northern Rhodesia and Nyasaland, at the same time as Central African Federation; and that they should carry the clear implication that in this new phase the United Kingdom Government was beginning as it meant to go on. Such measures should include the provision of a special grant by the United Kingdom for African education, in health and agricultural methods as well as the three Rs; the encouragement of colonial officials to take a positive lead in lifting social restrictions at present operating against educated Africans; the increase of the native reserves in Kenya, if necessary at the expense of some of the European reserved land still lying idle; the progressive lifting of the colour bar on skilled jobs in the Northern Rhodesian copper mines and the reduction of the disparity in wages between Africans and Europeans doing the same work. Such action would involve Britain in financial sacrifice and in opposition from most white settlers, but this would be a small price to pay to help clear our national conscience and avoid the spread of Malanist and Mau Mau methods throughout the multiracial dependencies.—Yours faithfully,

Godalming, Surrey FRANCES BOYD

Power for Industry

SIR—Your doubts concerning the wisdom of some Area Boards of the British Electricity Authority appearing to discriminate in favour of the consumer with a low load factor seem to be well founded.

The official argument to justify this practice is that, as load factors decrease, diversity increases. As a result, the user with the low load factor tends to contribute less to the system peak.

Domestic cookers might be taken as a typical demand with a low load factor. If it is assumed that the average domestic cooker is on for six hours daily, its load factor is then 25 per cent. According to the official argument, out of 10,000 cookers, some 2,500 might be expected to be operating at any hour of the day or night, including the time of system peak. Since people tend to eat meals at roughly similar times of the day, however, the number of cookers switched on at 11.30 a.m. or 5.30 p.m. is more likely to be in the order of 7,500.

During these times, the *hourly* load factor is high, and consequently the diversity is low, even though the *daily* load factor may be quite low. If the hourly load factor of a given type of demand should happen to rise at a time close to the system peak, then the argument which presupposes a great deal of diversity breaks down. The official argument therefore appears to be open to some criticism, unless it is based upon hourly load factors overlapping the time of system peak. It is doubtful whether this is the case.—Yours faithfully,

L. T. HIGGINS

Financing War Production

CONTRACTS AND FINANCE
The History of the Second World War: United Kingdom Civil Series.
By William Ashworth.
H.M. Stationery Office and Longmans. 309 pages. 22s. 6d.

THE role of finance in wartime, *The Economist* observed in 1941, is to ensure that nothing is decided on financial grounds alone. Mr Ashworth's study tells the story of how—and how far—that precept was put into practice in the important sphere of production and "procurement" of war supplies. It tells it fairly and realistically. Indeed, to those with first-hand recollections of these functions, the realism may seem its most striking characteristic; even granted that the historians in this civil series have the assistance of permanent officials and secure free access to official documents, it is remarkable how this study has recaptured the considerations and difficulties—and even many of the nuances—of the moment.

This realism owes a little, perhaps, to Mr Ashworth's use of the contemporary official jargon, and much to the departmental tradition of thinking on paper. Hence the story is at its best where that tradition suffered least from the pressure of war. The papers of (and for) the Contracts Co-ordinating Committee and the Committee of Public Accounts obviously furnished a rich vein, and Mr Ashworth has exploited it with discrimination. His account of the bewilderingly divergent methods of price-determination for Government contracts, of the effort to secure some uniformity in principles and basic objectives, and of the related thorny questions of price (or profit) control on sub-contracts and on "bought-out" supplies, is excellently done. Almost the same standard is reached, too, in the similarly well-documented field of capital assistance to contractors, and in part of the chapter on problems of working capital—which reveals for the first time full details of "Scheme C," the arrangements agreed between the Treasury, the Supply departments and the banks. The account of price-fixing methods and policy for raw materials, however, where the underlying vein was erratic and relatively thin, is less convincing; but it does include a useful summary of the incredibly intricate arrangements adopted for price-fixing in the steel industry—and one that is sufficiently clear to disclose the weaknesses to any thoughtful reader.

Mr Ashworth has obviously striven hard for objectivity; and this effort has been assisted by his own awareness of the trap that awaits any historian who fastens too enthusiastically on the best documented parts of his study. His method of exposition, a natural one, is to indicate the problems and difficulties and then consider how they were tackled. He perceives, as is certainly the fact, that this gives "an impression of greater ease and smoothness of adjustment than actually existed." But, while he is alive to this, it is not so clear that he fully realises how the inevitable preponderance of departmental evidence over other evidence—of departmental replies to criticisms, of departmental explanations of how difficulties were overcome—was almost bound to tilt the scales at least a shade in the departments' favour. There are profits at which this influence, combining with his own commendable habit of restraint, leads him into under-statement that will raise many a wry smile—as where he remarks that "policy did not always develop in a completely orderly and predictable manner." In face of that, it is almost an equal under-statement here to advise Mr Ashworth's readers to look sometimes between the lines.

On the broadest question of all, the role of finance as such, this study has both real merit and real weakness. It tells excellently how financial control was relaxed to meet the needs of wartime urgency; how, indeed, it was too much relaxed in the first frenzy after Dunkirk and had later to be revived in altered shape as a means of checking waste; how the principles changed so that financial control often appeared to be exercised by *reference to non-financial criteria*; and how the centralisation that financial control provided became an important instrument of co-ordination of production processes and purchases that would otherwise have been at variance, with resultant waste or delay. Except that Mr Ashworth perhaps gives insufficient weight to this last contribution, his account of these well-documented matters is impeccable.

But what was not documented, and does not get its due place in this study, is the continuing contribution that was made at all levels by the function of independent financial criticism. Mr Ashworth seemingly underrates the worth of this technique at its best; he does not dispel, and may even foster, the widespread illusion that efficiency in financial terms differs from efficiency in "real" terms; and he is trapped into assuming that the drawing together of the functions of finance and production in some departments was always an unqualified gain. These are blemishes in Mr Ashworth's study that must be noted for the record; but mostly they are flaws in emphasis at particular points. The work as a whole is admirable.

Meminisse Juvat

RECOLLECTIONS OF THE CAMBRIDGE UNION, 1815-1939.
By Percy Cradock, with contributions by ten others.
Bowes and Bowes. 192 pages. 12s. 6d.

THIS is really two books in one. The first half is a long essay by Mr Percy Cradock (President, Lent Term, 1950) on the Cambridge Union in the nineteenth century. The lustre of two or three quite exceptional names has given the Oxford Union such fame that it will come to most people as a surprise to learn that the Cambridge Society is by several years the older and, presumably, the model for its sister. It was founded in 1815 and the book contains in an appendix the names of the officers for each term from then to the present day, interrupted only by the two world wars. The list contains no Prime Minister (as yet), but it does nevertheless include an astonishing number of great names: Whewell, Macaulay, Bulwer Lytton, Praed, Thackeray—in the earlier years Cambridge seemed to run to literature as Oxford to politics. It is no easy task to pass in rapid review so many names and to deal with such small slices of so many careers. Mr Cradock has performed his task admirably. Indeed, his essay is well worth reading, even for those who have no interest in the Union, for its graceful picture of life in the old Cambridge—of that section of its life that falls between the strictly academic and the purely social, that is educated without being pedantic, high-spirited but not wholly frivolous. Mr Cradock, in a sense, was writing about his ancestors; clearly he is worthy of them.

The second half of the book consists of contributions from ten ex-Presidents of the twentieth century whose recollections between them cover the forty years up to the outbreak of the second war. These latter-day names, too, are impressive enough for any dust-jacket, including as they do the former editor of the *Spectator,* the President of the International Court of Justice, a Lord Justice of Appeal, the Chancellor of the Exchequer and the Bishop of Durham. The story shows that not all who are brilliant in their youth become eminent in their maturity; but no one can read it without reflecting how astonishingly early able men stand out among their fellows, how much there must be in native qualities and early environment, how little in experience.

Unlike Mr Cradock's essay, these ten are simple reminiscence, and they naturally vary in length, in style, in quality—and, it must be added, in modesty. Everybody tends to be sentimental about his youthful triumphs (the sweetest that life brings). Everybody, in doing so, also feels the temptation to stretch the truth—but these eminent men have their style cramped by being in the unusual position of having this portion of their early lives fully documented. The result is that, while they all clearly still think it was tremendous fun, the casual reader may be left wondering just why. The appeal of this second part of the book is therefore likely to be greatest for those (there are many) who are named in it and can themselves remember, with a warming of the heart, those great nights long ago, how sweet some of them were, how bitter others, and how terribly much at the time it all mattered.

Destroying the Jews

THE FINAL SOLUTION: *The attempt to exterminate the Jews of Europe,* 1939-1945.
By Gerald Reitlinger.
Vallentine Mitchell. 630 pages. 30s.

THIS is a compilation of the vast amount of hitherto unco-ordinated material dealing with Hitler's attempt to bring about the "final solution," in other words to destroy the Jewish race. It describes the coy technique that veiled the most dastardly crimes in history with academic phrases of this kind. It apportions the approximate responsibility between Hitler himself, Himmler, Heydrich, Eichmann and the rest, supplying probably the best study of the co-operation between Himmler and Heydrich which has appeared in English. Mr Reitlinger considers that "Generally speaking, Himmler knew what went on but without understanding the causes" for the causes were Heydrich's special department. Mr Reitlinger's book makes one blush once again for the impunity with which their accomplice, Karl Wolff, escaped all disagreeable consequences, only, apparently, because he negotiated the surrender of the German forces in Italy with the Allied representatives in Switzerland.

Mr Reitlinger knows and understands the essential differences between the German and western Jews and those of the east. About the latter he quotes M. Guérin's illuminating words:

> It did not occur to the Jews to take to the woods, to disappear forever from the towns where there was so much danger. It was not lack of courage on their part so much as racial fatalism forcing them to crowd into the ancestral ghettoes in virtue of an ancient gregarious instinct.

On the other hand Mr Reitlinger's account of the rebellion of the Warsaw ghetto, which "has become a Jewish epic in its own right," is somehow not so moving as one might expect.

Mr Reitlinger follows Dr Kogon in discovering the seed of long-run failure in the Nazi system itself, because anything so wicked was inevitably corrupt. Plans to sterilize half-Jews became a farce—"The stamped cards, that freed the owners from wearing the Jewish badge, had for the most part been sold them by Gestapo agents." Mr Reitlinger's chronology is particularly helpful in this shapeless but shattering story, and his list of sources is useful. This, however, is one of the many books now being published in which the notes are placed at the end instead of at the bottom of the page concerned. This practice may have advantages, but it may also prevent those who are anxious to use the notes from doing so by the bother of finding the place.

Domesday Book for Australia

THE STRUCTURE AND CAPACITY OF AUSTRALIAN MANUFACTURING INDUSTRIES.
Division of Industrial Development, Department of National Development, Commonwealth of Australia.
Distributed by *Angus and Robertson.* 528 pages. £3.

THIS comprehensive and detailed survey of Australian secondary industries was originally undertaken by the Government as a departmental inquiry into the gaps in Australia's manufacturing capacity. Besides providing detailed technical and production information on every kind of Australian-made article, it gives, significantly, imports of comparable foreign ware and frequently indicates where scope appears to exist for the replacement of imports. The criteria are, however, primarily technical; it is stated when a market exists large enough to absorb a plant's output, but not whether such output could compete in cost with imports. This, however, will depend in many if not most cases on the protection given by the Tariff Board or obtainable from it; and the British, American, or other overseas manufacturer, who contemplates setting up a branch behind the Australian tariff, will find in this volume most of the critical information he wants, not only on size of markets but also supply of components, accessories, power and materials.

The survey covers the output of some 43,000 factories in 200 major industries and in itself constitutes a valuable market survey of Australian industrial activity and requirements. It records the astonishingly rapid, if at times lopsided, development of the Australian economy. Summary tables at the end of the volume perhaps inevitably provoke the speculations of the economist, showing, as they do, the way in which Australian manufacturing capacity expands at a far greater rate than basic production. Manufacturing now employs 917,000 persons compared with 563,000 in 1938-39. In ten years the value of manufacturing output has tripled. At the same time, import replacement is by no means diminishing Australia's dependence on overseas producers. Between 1938-39 and 1951-52, for example, the value of its imports of metal manufactures and machinery increased more than tenfold. In 1938-39 its exports of machinery and manufactures were nearly a third of the value of its imports in this class; in 1951-52, they were only a little over one-sixth of the value of imports.

Although this survey may not be entirely a monument to economic wisdom, it most certainly is a monument to Australian ingenuity, skill and commercial enterprise in the processing of all locally produced materials, and in the development of a heavy industry which in efficiency is second to none in the Commonwealth. It is a domesday book of which the Australian business man can be proud, and the British business man can keep on his shelf of reference books with interest—if not always with profit.

Guide to Libel

THE LAW OF LIBEL AND SLANDER.
By Oswald S. Hickson and P. F. Carter-Ruck.
Faber. 244 pages, Statutes and Index. 30s.

THE late Mr Oswald Hickson was a solicitor with great practical experience in the law of defamation; he acted for Lloyd's underwriters issuing many of the policies that cover periodical proprietors, and he was later a member of the Porter Committee itself. This book was begun in his lifetime and has since been completed (to include the changes made by the Defamation Act, 1952) by Mr Carter-Ruck. It is described as not a textbook but a guide to those whose concern or interest it is to know something about this subject. It is a good guide, but in two respects it might have been better.

One defect is perhaps inherent in the authorship. It must be very difficult for a lawyer to write a book on a complicated branch of the law and to escape the atmosphere of a textbook, for the lawyer is interested in the law as it was not only as it is. The layman for whom this book is intended is less likely to be. He may well find it hard enough to grasp the law as it is and he may be confused rather than helped by references to repealed statutes and changed common law. The book would be improved by some excisions. The second defect is perhaps inherent in the date of publication. The Act of last year made many important changes whose effect may not be completely clear until the courts have ruled exactly what the words of the Act mean. The surviving author has been compelled to graft the 1952 Act on to existing stock (and some of the grafts are still a little rough) at a time when the Act has not, to mix the metaphor, been run in by use. He leaves the impression that he is, mentally, looking forward to the law as it will be after the 1952 Act, not of surveying it afresh after the Act. One further small point—it would have been more helpful to have printed the statutes concerning defamation as they stand today, with the cumulative effect of all the revisions incorporated.

But the book remains, in intention and largely in performance, a practical guide. The law of defamation cannot be understood without the illumination given by the decided cases and these are there. The chapter on the liabilities of booksellers and distributors, for example, is admirable.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Looking Eastward

Washington, D.C.

IF proof were needed that the American public as a whole is often wiser than the political representatives that it elects, this was provided in ample measure last week. As the first sick and wounded United Nations prisoners crossed the line at Panmunjom, the correspondents assembled there began to cable stories of atrocities, brutal treatment by Chinese guards, and death marches like those which ten years ago raised American blood to the boiling point in the war against Japan. Within a day Senator Styles Bridges—perhaps seeing an issue on which he might with luck get greater headlines than his colleague Senator McCarthy—began to demand various and vague retributive measures, though his connection, as the Chairman of the Senate Appropriations Committee, with the subject of war crimes is not easy to detect.

At the end of the week Senator Byrd released correspondence with General MacArthur, whom he was seeking to involve in the long and tedious debate on ammunition supplies. In these letters the General, scenting perhaps a favourable wind for his ideas, advocated warning China and Russia of the ability which the United States possesses (in his opinion) to destroy China's industrial base and cut her communications with Russia. Such a warning, he considered, would hasten a Korean settlement. Senator Bridges followed this up by announcing his own "standby" programme of increasing military pressure in order to force China to conclude a truce.

There have been times when such ideas could have brightened the clouded reputations of both the Senator and the General, but public opinion has not taken fire either at the atrocities or at the attractive suggestions of making peace by threatening war. If any generalisation is valid about the state of American opinion it is that greater anxiety probably exists today for a successful and pacific outcome of the Korean armistice negotiations than at any time since they began.

This does not mean that there has been any great advance in clarifying public opinion on the complicated and thorny issues which surround Far Eastern policy. In a sense, the new Administration inadvertently contributed to the confusion when President Eisenhower and Mr Dulles, on taking office, developed the doctrine of treating all forms of aggression and resistance to aggression in Asia as a common front. This was intended to have the laudable purpose of showing Russia and China that the United States stood as firmly behind France in Indo-China and Britain in Malaya as it did behind the United Nations action in Korea. But the effect of the doctrine on American opinion has been to create a belief that a settlement in Korea can be made into a settlement of all causes of tension in the Far East. When Senator Taft said ten days ago that every effort "should be made to settle all the questions of the Far East in one bite" he was voicing the views of a number of other Senators. He was probably also expressing the ordinary American's reaction to the reopening of the armistice negotiations in the light of the Soviet's novel mildness and the new Administration's policy.

★

Mr Dulles's explanation the following day that the armistice involved a purely military settlement and that this must precede the holding of a political conference on the future of Korea was a plain statement of fact. Even if the Administration wished to, it could not at this stage unpick an arrangement that had been so laboriously worked out with the Communists and with the Allies. But the fact that Senator Taft and his fellow Senators should even consider a "one bite" solution desirable shows how greatly the American attitude on the Eastern question has changed. Eighteen months ago, when the truce negotiations first started, there was fear in Washington lest the Chinese Communists use the bait of a truce in Korea to extract concessions on trade, on admission to the United Nations, on Formosa, or on diplomatic recognition. Great care was taken to separate the question of a military truce from that of a political settlement, and the negotiations have been conducted on that basis ever since. The change that has come about in the minds of the Senators is (as Mr Joseph Harsch, the correspondent of the *Christian Science Monitor*, points out) the acceptance, consciously or unconsciously, of Communist China as a state which must be negotiated with and no longer as a distasteful revolutionary movement which might perhaps be exorcised by world disapproval or the withholding of political negotiations.

But despite the Administration's decision to adhere to the distinction between a military and a political settlement the consolidation of Communist China as a power has led to a shift in aim. The Truman Administration envisaged the process of settlement as taking place in three stages: the conclusion of an armistice in Korea which would have to be as watertight as possible, since it might be the only settlement achieved for many years; a political conference to settle the future of Korea; and eventually a further political conference to discuss all other causes of tension in the Far East. What the new Administration would prefer

to see would be a dovetailing of stages two and three, so that bargaining counters which the United States and the West possess outside Korea, such as the trade embargo and Formosa, could be used to improve the United Nations position in demanding a unified and free Korea.

There is no very great optimism in Washington about an early conclusion of the negotiations for a military armistice. The indications of the brutal treatment of the United Nations prisoners are not considered by the State Department to introduce a new factor, since such brutality was well established before the sick and wounded were returned. There is something akin to a conspiracy of silence to stifle Senator Bridges and to avoid making the treatment of prisoners an issue. But the evidence of the Communist failure to return all the sick and wounded in their care is taken very seriously by the State Department, for it raises the question of whether the Chinese Communists will observe any armistice agreement in good faith.

But if the armistice is finally settled and gives way to a general conference on Far Eastern questions, another "great debate" in American opinion is presumably to be expected, which will make the last one look like a nursery squabble. There is no agreement in America about what concessions the United States should be prepared to make to reach a permanent settlement with China, and very little effort has been made to guide opinion. Although the Republican Administration has probably, in its heart of hearts, decided that it must live with Communist Peking, since it cannot ignore or subvert it, it is doubtful if the Republican party has come anywhere near such a decision.

When it does, what concessions is the United States actually willing to make in return for a United Korea and the calling off of Ho Chi Minh in Indo-China? Mr Dulles's tentative idea of putting Formosa under United Nations trusteeship was throttled at birth, and a lifting of the embargo on the shipment of materials means reversing one of the new Administration's first "positive" policies. Indeed, any whispers of possible political compromises or manœuvres bring forth cries of "appeasement" from the dominant section of the Republican party. There is not even any generally agreed view on the strength and objectives of the Peking government, and divisions of opinion run through the State Department and the Pentagon as strongly as through Congress. The present intense speculation on the battle for power in Moscow obscures the fact that a similar battle is going on in Washington and must be resolved before the new Administration can reach a decision on the long-term policy it intends to pursue towards China.

Democracy's Hollow Core

FROM A CORRESPONDENT IN WASHINGTON, D.C.

WHEN President Eisenhower appeared for the first time before Congress it was perhaps a trifle incongruous to hear, wedged in between the de-neutralisation of Formosa and other high matters of state, that he intended to appoint two additional commissioners for the District of Columbia. But, far from being of only trifling importance, the President's desire to increase the district commissioners from three to five was a tentative attempt to grapple with a striking and singular anomaly—that the city which regards itself as the heart of the democratic world, in which the struggle for freedom is inspired and planned, is one of the very few places on either side of the Iron Curtain which lacks, both in theory and in fact, any semblance of democratic choice of its rulers or control over them. Except for the fortunate few, mostly government employees who maintain voting rights in their home states, the inhabitants of the District of Columbia are completely disfranchised. They can neither vote for the great officers of state, the President and the Vice-President, nor for members of Congress nor even for their local administrators. The capital city is, in short, a not so tiny enclave (70 square miles) of authoritarianism in the great continent of democracy.

The peculiarly undemocratic system of government under which the District suffers dates back to the founding fathers who, understandably enough, were determined that the seat of the federal government should not be in any way dependent on local or state authorities. Accordingly, in the Constitution, Congress was given "the sole power to exercise exclusive legislation in all cases whatsoever over such district as might become the seat of government." As the Constitution granted only to states the right of electing Senators, Representatives and presidential electors, who in turn elect the President and Vice-President—and the founding fathers precluded the District from ever becoming a state—it was clear that they never intended the inhabitants of the ten square miles they originally chose for the capital to play a very marked part in the democratic processes of the Union.

When, in 1788 and 1789, Maryland and Virginia ceded sections of marshland lying on either side of the Potomac river to the federal government on which to build the capital, the population was largely animal and the few federal employees who came to live there could maintain their voting rights in their states of origin. But now, with a population of almost 900,000, which exceeds that of thirteen fully fledged states, the problem is no longer academic. Both parties always include, in their electoral programmes, some good intentions about rectifying the position, but as the campaign gets under way the question recedes into the background. The candidates are, after all, out to get votes and a disfranchised community is at a disadvantage in such matters. And after the election is over Washingtonians are so excited at the prospect of the inaugural parade that they forget that, although privileged to cheer and live with the incoming President, they were allowed no hand in electing him.

★

Instead of the present arrangement, under which the capital's affairs are controlled by two Congressional committees, working through three district commissioners appointed by the President, some reformers demand a democratically elected municipal council and an elected or appointed mayor. A form of local government existed from 1800, when the federal government moved to Washington, to 1874, when the system of commissioners came into being, but throughout most of this period the District was hopelessly administered, corruption was rife and the capital, without a paved street until 1871, was a disgrace to the country. So Congress, disillusioned by mayoral corruption and alarmed by the municipal debt, resumed direct control itself.

Within the very narrow limits allowed them the commissioners have done a good job. But they are bound hand and foot by their masters in Congress, the Senate and House District Committees, which exercise day-to-day jurisdiction over district affairs. Still worse, the members of these committees are more interested in earning the good will of their constituents back home than in deserving well of the politically valueless District of Columbia. The present chairman of the Senate District Committee comes from South Dakota, some 900 miles away, which is like having a Roman politician administer the London County Council. If he spends too much time working on District affairs he is immediately criticised in South Dakota for not attending to his constituents' business. Moreover, the commissioners are faced with the difficulty of having to have Acts of Congress passed—a laborious and lengthy process—for even the trivia of local administration. It is, for example, forbidden *by Act of Congress* to fly a kite in the streets of Washington.

But the main problem of the commissioners is money. Since half of the taxable land in the District is federally-owned and therefore tax-free, the revenue from this source is only half of what it would otherwise be. In addition, the capital is relatively bereft of business and commerce, which denies it another major source of income. The needs for expenditure, on the other hand, are greatly increased by having to keep up appearances. For example, it is estimated that the new district court, a massive and imposing building just completed, cost about four times more than would be normal for another city of the same population.

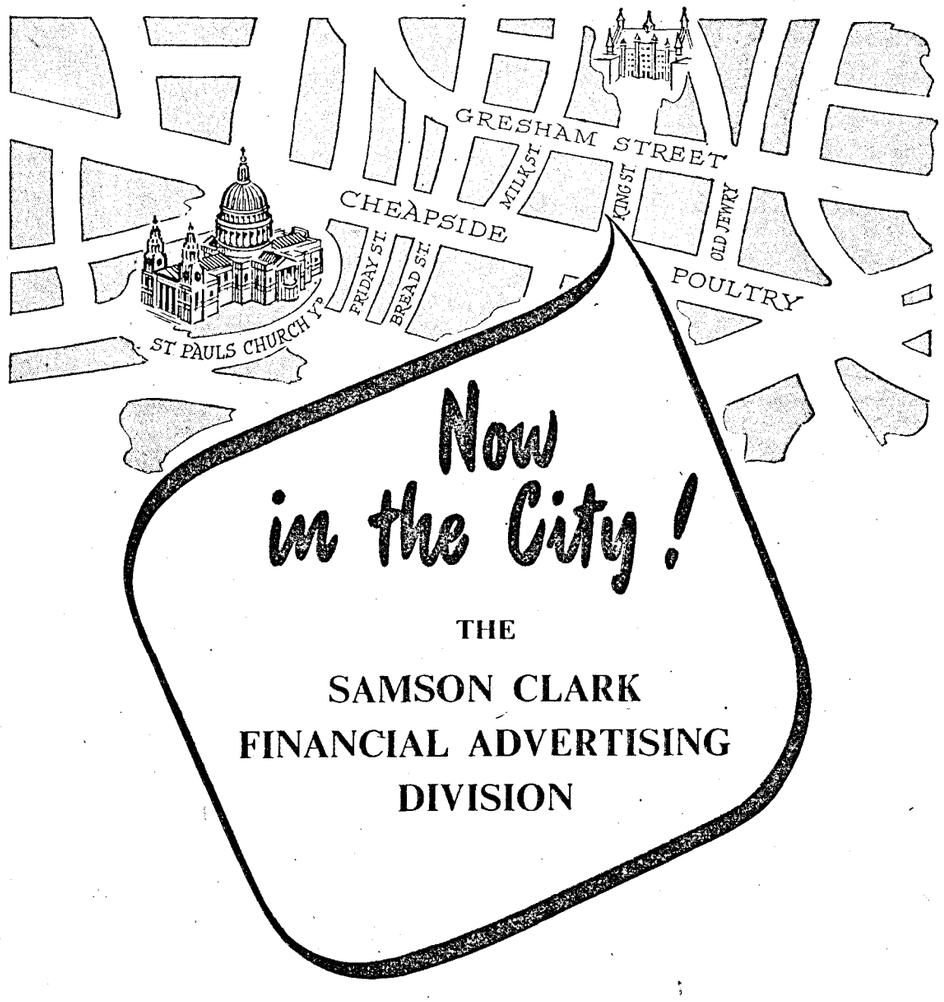
In view of the absence of revenue and the burden of prestige spending, it was originally laid down that the federal government should finance 50 per cent of the District's outlay, but this year Congress fixed the figure at 8 per cent, the lowest figure so far. This is a woefully inadequate sum and means that drainage and prisons are sacrificed to the fine avenues and imposing federal buildings by which the casual visitor judges the nation's capital.

★

Home rule, the remedy which had the backing of President Truman, passed the Senate in the last Congress only to be blocked by the House. It is again before the present Congress, but runs into stubborn southern opposition. About one-third of the District's population is coloured—the proportion has increased enormously in recent years—and southern Congressmen refuse to tolerate the possibility of a black mayor in the nation's capital, or a city council dominated by Negro members who might try to pass laws against segregation which it would be embarrassing to Congress to have to vote down.

It is precisely to overcome this Congressional obstruction that a second home rule group argues that the first agitation should be for the right to vote for the President and Vice-President. Then Congress could no longer afford to turn a deaf ear to the District's plea. But for the District to get such a franchise would need an amendment of the Constitution, which itself requires a two-thirds majority of the House and of the Senate and approval by two-thirds of the states. Recognising this as the first step to home rule, the southerners have in the past obstructed such a change and show every sign of continuing to do so.

So one is brought back to the proposal put forward by President Eisenhower, to increase the three district commissioners to five. The idea is that one new commissioner would be a Negro and one a woman, which, if it did not begin to solve the problem of democratic government, would at least give two additional groups in the District some say in local administration. The reformers, of course, reject the proposal as simply scratching at the surface of the problem. But it has one cardinal advantage—that it has a good chance of being acceptable to Congress. After a century and a half of talk one reform, however slight, on the statute book would be something of a red-letter-day for the citizens of the District of Columbia.



American Notes

Shadow Chiefs-of-Staff

For some time Senator Taft has been urging that a broad survey of United States military policy should be undertaken and that the basic strategic concepts as well as the actual armament programme should be thoroughly reviewed, if not before this year's appropriations for defence and foreign aid are considered, at least before the Administration presents its requests for the 1955 fiscal year next January. It certainly seems unlikely that Congress's appetite for economy will be satisfied with anything less, especially since personal rivalries and military inefficiencies have been brought into the open by the inquiry into the ammunition shortage in Korea. Mr Kyes, the respected new Deputy Secretary of Defence, agreed this week that a complete review of the present position was needed, but he seems to have been thinking mainly in industrial and administrative terms. However, Mr Taft, who is convinced that greater sea and air power would permit the withdrawal of American land troops from Europe on a large scale, undoubtedly intends to bring up this old controversy once again.

It is a controversy in which he has been opposed by the present Joint Chiefs-of-Staff, which may explain his lack of confidence in them and his feeling that they have been guilty of political partisanship. The terms of office of three of the four expire in August, and General Bradley, the chairman, cannot be reappointed. It is now being proposed, by Senator Taft and other prominent Republicans in Congress, that their successors should be nominated, and confirmed by the Senate, immediately and that in the intervening three months this shadow group should bring fresh minds to the survey of the whole question of national security which Mr Taft desires. The President is thought to be sympathetic to the idea, even though he has always insisted that the Joint Chiefs-of-Staff ought to be kept out of politics, while Senator Taft seems to be dragging them right in.

In fact, however, it is difficult to see how the Joint Chiefs can be kept above politics when, as happens at present, many of the bitterest political issues revolve round strategic

Now in the City!

THE

SAMSON CLARK FINANCIAL ADVERTISING DIVISION

The better to serve their clients, Samson Clark & Co. Ltd. have transferred their Financial Advertising Division to 39, King Street, Cheapside, E.C.2, in the heart of the City. This expanded Samson Clark Service provides facilities for all forms of financial advertising, including the publication in the Press of Prospectuses, Statements for Information, Reports of Company Meetings, together with a Press Cutting and Editorial Service to clients and a Financial News Service to City Editors.

In charge: Robert H. S. Lyall

Picture your products to the world in

Once a fortnight the English-language edition of LIFE INTERNATIONAL goes to 120 countries outside the U.S. and Canada. A new Spanish-language edition circulates in Central and South America. Most of the people who read these editions are in the higher income groups; men and women of the professions, government officials, industrialists, business executives, their wives and families. People who not only want and can afford the best of the world's products, but who also have a hand on the purse strings of companies, industries and nations. Against the background of LIFE's outstanding picture-journalism these people see the advertisement pages—beautifully printed in black and white or colour—a brilliant international showcase for the world's foremost companies and products. An advertisement campaign in the LIFE INTERNATIONAL EDITIONS builds sales and prestige in the most profitable quarters of the world. The Advertisement Director (Grosvenor 4080) will be pleased to supply full details of circulation and rates on request.

LIFE International Editions

LIFE IN ENGLISH—approximately 300,000 copies in English circulating in 120 countries outside North America.

LIFE EN ESPAÑOL—approximately 215,000 copies in Spanish circulating in Central and South America.

*These are the INTERNATIONAL EDITIONS of LIFE magazine.

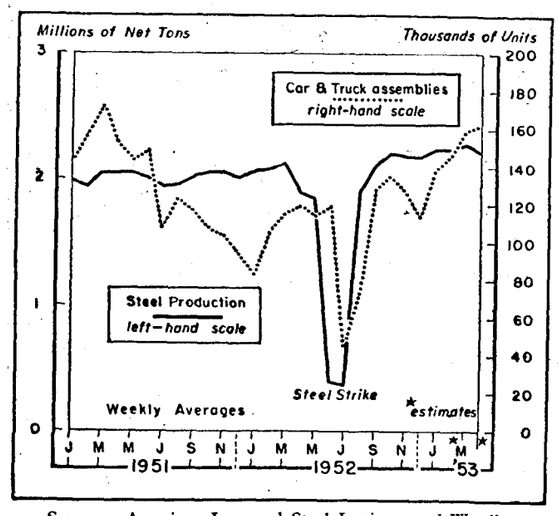
questions. They have, however, been involved in Congress's day-to-day arguments more than is necessary, as the result of the details of service administration in which they have become involved and of the weakness of the civilian control over them. To remedy these faults and to clarify the role of the Joint Chiefs-of-Staff, who are intended to be military planners and advisers to civilian officials, and no more than that, is the chief aim of the scheme for reorganising the Defence Department which has now been submitted to the President by Mr Nelson Rockefeller's committee, which was asked last November to suggest ways of improving the efficiency of government.

Iron Curtain or Golden Door?

IT has always been easier, although more dangerous, to escape from behind the iron curtain than to get through the "golden door" that leads into the United States. But that door has been even more difficult to penetrate since the Displaced Persons Act expired and the new McCarran Immigration Act came into force at the end of last year. President Eisenhower has never concealed his sympathy for the psychological as well as the practical reasons why the United States should welcome not only refugees from Communist oppression but also emigrants from other overcrowded European countries. He has now suggested that Congress should relieve the immediate pressure by admitting an extra 240,000 immigrants in the next two years, and remedy the permanent problem by amending the McCarran Act.



As regards the latter, Mr Eisenhower has so far asked the Senate subcommittee on immigration only to study once again the many complaints about the "serious and inequitable" restrictions in the Act. But criticism of it has never followed party lines and it will take a far stronger lead than the President has as yet been prepared to give Congress, on this or any other matter, to force a reconsideration of the Act. For Senator McCarran's Republican successor as chairman of the subcommittee, Senator Watkins of Utah, differs from his predecessor in little except his party allegiance.

Mr Watkins has no intention of holding hearings on the Act at present, for he argues that it is too soon to judge how it works in practice. There is some truth in this; the restrictions on foreign seamen, for example, which caused so much ill-feeling at first, are now, it appears, giving rise to less irritation. But it is not too soon to answer the objections to the Act in principle, especially if, as its supporters contend, the critics have either failed to read, or have misinterpreted, its 300 complicated pages.

The complaints against the Act which the President has asked Mr Watkins to study concern mainly its discrimination against naturalised citizens and other groups and the excessive responsibility put upon officials by the vagueness of its definitions of the conditions under which visas may be denied and aliens deported. Not even Mr Eisenhower seems to have any hope of remedying the basic fault of the Act, its perpetuation of the national origins basis for immigration quotas, which means that only small numbers are allowed in from the countries of eastern and southern Europe where the need is greatest. He has, however, drawn attention to the provision under which refugees coming in from these countries under special legislation in excess of the permitted numbers are counted against the quotas for future years, thus cutting down further immigration very drastically. This is one of the reasons why it seems impossible to carry out the President's proposal for admitting 120,000 extra immigrants a year, within the framework of the present Act, as he suggests, since it only provides for 155,000 a year from all countries.

Boom on Wheels

STEEL producers continue to work to capacity, although a few small strikes prevented April from becoming another record-breaking month. But they are beginning to wonder how long they will be able to go on selling all they can produce. So far there is no indication of a fall in demand, but some at least of it comes from manufacturers who are laying in extra stocks in anticipation of a price rise or a possible steel strike this summer. The latter seems unlikely but the former has already begun on a small scale. The government's increased need for steel for shells is another important source of demand, which could shrink sharply should there be a truce in Korea. Most important

Sources: American Iron and Steel Institute and Ward's Automotive Reports

of all is the demand from car and truck manufacturers; even last year they bought 15 per cent of all the steel produced and now that restrictions on their output have been removed their requirements seem insatiable.

Steel producers ask themselves whether this can continue, but the automobile makers do not admit to any doubts. Output of cars in the first quarter of this year was 50 per cent above the same period of last year and continues to rise, with double shifts being worked in most plants. If, as seems likely, nearly 2 million vehicles can be produced in the second quarter, 1950's amazing record will be broken. This high rate of output is directly related to demand; new cars are selling well, although used cars are beginning to accumulate.

The General Motors Corporation, from its first quarter's report, finds itself in an especially satisfactory position and is well on the way to regaining its prewar share, 48 per cent, of the automobile business. The Chrysler and Ford companies, each with about 20 per cent, compete closely for second place and the new company, just formed by a merger between the Willys-Overland and Kaiser-Frazer corporations, expects, probably over-optimistically, to come fourth. It seems odd that the Kaiser-Frazer firm, which was near bankruptcy, was able to borrow the money to buy its more prosperous rival. The answer lies partly in the large Kaiser losses in recent years, which can be set off for tax purposes against any future profits the new company may make, and partly in the well developed Willys system of distribution, something which the Kaiser-Frazer company has lacked.

Housing in the House

ONE of the ways by which the House of Representatives managed to cut over $700 million out of the first Appropriation Bill it has passed was to halt all new federal subsidies for low-cost housing in the year beginning next July. The vote on this step provided the first clash between the conservatives, of both parties, determined to justify tax reduction by cutting government spending everywhere, and the Democrats and Republicans, chiefly from big cities, who feel that the first Republican Administration since the nineteen-twenties cannot afford to balance its books at the expense of its social responsibilities.

The present housing subsidies had a bi-partisan, not a New Deal, origin. Senator Taft was one of the authors of the long-range Housing Act passed in 1949, which authorised a total of 810,000 low-cost dwelling units to be built over a period of six years. The annual total of 135,000 units to be built by localities and subsidised by Washington has, however, never been reached. In 1951, because of the Korean crisis, President Truman asked for only 75,000, and Congress appropriated money for only 50,000. Last year the allowance was cut to 35,000. This is only a drop in the housing bucket ; thanks, in part, to a mild winter, houses are still being started at a rate of over a million a year. But despite the long run the housing boom has had, demand for subsidised dwellings remains high, at least in the big cities. How strong the demand even for the dearer ones remains in New York may be judged by the fact that 10,000 people stormed Gimbels, a department store, the day it put on sale 3,700 co-operative flats in buildings yet to be constructed.

President Eisenhower had asked Congress to provide money for 35,000 subsidised dwellings ; this would continue the *status quo* until his commission on federal-state relations decides what role the federal government should play in housing. But he refused to rebuke the House for turning down his modest request, which was conveyed loyally, but perhaps not over-enthusiastically, by Mr Cole, the Administration's new housing head, and a long-time enemy of low-cost federal housing. Similarly, the Administration made no great effort to secure the five months' extension of federal rent control it favoured to enable states to pass their own rent control laws if they wanted to. Mr Eisenhower may count himself lucky to have secured a three-month reprieve for rent ceilings. If the public housing programme is saved from extinction in the Senate, as happened last year, the credit will belong to Mr Taft, a handful of liberal Republicans, and the Fair Deal Democrats, not to the White House.

Internal Security

IT will surprise many to realise that the Subversive Activities Board, created under the Internal Security Act of 1950, has only just last week concluded, after two years of hearings, that the Communist party is "nurtured by the Soviet Union" and dedicated to overthrow, by violence if necessary, the government of the United States. Such a finding was necessary before the party could be required to file with the Department of Justice its list of members, its sources of funds and a detailed account of how they are spent, and be forced to identify all its propaganda.

The party has no intention of complying until it has exhausted its legal—or perhaps its financial—resources. It will be a year or more before the constitutionality of the requirement and of the Act which authorises it can be determined. And even then, the effect may be not to make the party operate in the open, but to force it underground. But Mr Brownell, the Attorney General, has already asked the board to require twelve "Communist-front" organisations —groups alleged to be dominated by the party—to register as well. None of this means that the party is about to be outlawed. It can still hold meetings, publish newspapers and magazines, if the money can be found, buy radio time and run candidates.

Meanwhile, Mr Brownell has finally unveiled his plan for keeping the federal government free of disloyal or unreliable servants. President Eisenhower's announced aim has been to maintain the executive house in such good order that Congress would have no further excuse for trespassing. A loyalty programme has existed since 1947, with departmental boards to weigh charges against individuals and a supreme review board to hear appeals. These are all swept away ; a new and broader standard—behaviour consistent with the national security—is set up.

The heads of some departments dealing with secret matters have before this had the power to dismiss summarily those whose loose talk or personal weaknesses made them dangerous to employ. Now all heads of agencies and departments will have this power and will be responsible for the security of their staffs. They may set up loyalty boards—made up of government servants from other departments—but these will be purely advisory.

One advantage of the new standard is that a man can be dismissed without impugning his loyalty and making it hard for him to find even a private job. But from the point of view of the individual's rights, the lack of any appeals procedure is a backward step. Uneasiness on this point was one reason why the new plan, which was expected in February, was held up so long. Mr Brownell, however, appears to have won his point. A heavy responsibility is thus put on heads of departments to avoid even the appearance of victimising people they do not like, perhaps for the sake of replacing them with good Republicans.

The World Overseas

The Assembly in Perspective

FROM OUR UNITED NATIONS CORRESPONDENT

THE seventh session of the United Nations General Assembly recessed in a flickering glow of unanimity far more amicable than the atmosphere in which it began. The session closed—it has been recessed, technically, until an armistice pact is signed at Panmunjom—in a series of warm congratulatory speeches, but tensions were still so close that men watched their words. When Sir Gladwyn Jebb tagged a bow to Vishinsky with a Latin flourish about meeting again *auspicium melioris aevi*, the translator failed to put the phrase into Russian and for a moment the old suspicions bristled.

Too much hard-taught cynicism pervaded the corridors to permit of many statements that the pale halo of the Russian sun will last, or even that its rays may in the longer run prove beneficent. The more philosophic contented themselves with enjoying the respite while it lasts, and with it the opportunity to finish what otherwise threatened to be some very sticky items. It would have been hard to believe in October that the Polish resolution, originally intended to embarrass the United States, would eventually be transmuted into a set of phrases which could be approved by every nation present. It was equally unlikely that a Burmese complaint against the activities of Chinese Nationalist troops would be passed with reasonable discussion, no negative votes, and only two abstentions.

The unquestionable gains made in the wavering light of the Russian sun were the agreement on a new Secretary General and the airing of personnel woes. Whatever happens next, the replacement of the unhappy Mr Trygve Lie by Mr Hammarskjöld counts as an unadulterated good. The complexities of the personnel tangle have been set before the Assembly with some hope that confidence, courtesy and a firm understanding of the powers and responsibilities of office may restore shattered morale ; these should also help to re-establish the prestige of the organisation and the self-confidence of the staff. The Assembly debate on the subject was outspoken enough to be salutary. The resolution, with its restatement of the Charter design of an international secretariat not to be meddled with by any member nation, with its recognition that this ideal needs support from members as well as firmness on the part of the Secretary General, added more than pious hopes.

Although the session ended with its dignity repaired and its bruises healing, it leaves behind it certain basic questions to which member nations need to give attention. The first of these is the damage wrought by the continuing disproportion between west and east. France, Belgium and the Netherlands are there ; so are the Scandinavian nations. But Germany is not represented, nor is Italy, and nor are Spain, Portugal and Switzerland. This lack of European weight is partly to blame for the ease with which UN meetings have deteriorated into slugging matches between Russia and the United States, with the more timid nations sitting on the sidelines and dodging when opponents come too close. It also encourages the United States in such ungainly ventures as sending the FBI to interview foreign secretariat members, or refusing visas to accredited representatives of Ecosoc who do not fit within the straitjacket of the McCarran Act.

The second problem arises out of the need for a clearer understanding of what the United Nations should, and should not, be expected to accomplish. The Assembly continues to be over-burdened: in part because matters are brought to it which should not come until all other means of discussion and agreement have been exhausted ; in part because its procedure, though improved with experience, is still clumsy and time-consuming. The popular concept of the Assembly as a town meeting of the world has led to a disregard of Charter limitations in favour of an expansive feeling that anything can, and should, be brought before it.

Some method is needed by which items can be more closely screened before they are put on the agenda, without arousing cries of political pressure. Nations can discipline themselves in this matter, and those which are both experienced and mature do so; but the newer ones, still finding it exhilarating to walk in world company, have yet to learn that it may hurt rather than help their cause to rush too quickly on to the Assembly floor. The Arab nations hardly helped Tunisia and Morocco by bringing their complaints to the world area at this point ; the Burmese were wiser in accepting the handling of their case rather as a news item for the world's attention.

By the same token a bridge between action and responsibility is badly needed. In colonial and trusteeship discussions, in proposals for helping underdeveloped countries, this session has shown an increasing tendency to rest content with fuzzy resolutions asking for pie in the sky and promising in return not even discreet table manners. To clamour for funds, and in the next breath to assert the right to nationalise enterprises built with earlier funds, is to pretend that bankers and Congressmen can neither hear nor read. Uno cannot long be patient with such fantasies without imperilling its own sources of support.

The problems of tightening procedures and developing

responsibilities are difficult, as long as every nation sits on every committee and casts one vote. Obviously a committee of sixty members is a clumsy body in any situation, slow to agree and susceptible of infinite procedural manipulation. The committee's task is to discuss the problems assigned to it, and to put its findings in the form of a resolution. When these resolutions come to the floor, they are subject to editing by the entire sixty, an undertaking which sometimes bogs down into comments on commas. Whether passed or refused, committee resolutions may then go to plenary sessions and can be discussed all over again.

It can be argued that this slow motion method is inherent in the parliamentary tradition, that it discourages hasty decisions and provides an outlet for irritation, that when east and west sit down together no one should try to hurry them. Unfortunately the system also produces such boredom that one wonders whether the dangers of inattention may not be as great as those of haste. Fortunately, some members of the secretariat, at least, are beginning to look ahead to 1955 when the Charter is to be overhauled.

Comedy of Diplomats

Meanwhile the most pessimistic reporter must grant that, for all its irritations and inconsistencies, this most controversial of sessions has had certain positive values. The Russians have at least shown that they have not completely forgotten the ways of reason. The new American Administration, however clumsy, clearly intends to take the UN seriously. The organisation has settled into its new home, and got itself a new Secretary General. In the process it has taken on a solidity which, however illusory it may have seemed at moments in the last six months, does create an impression, if only by the mere process of staying in one place. At least it is now possible to issue a detailed calendar of meetings for 1954-55.

It must also be admitted that certain aspects of the session seem in retrospect not unlike a film comedy of the days when the high dramatic moment was marked by the throwing of a custard pie in the face of an opponent. Around the big glass house the cinematic chase went on and on, in and out of glass doors, up and down moving staircases, with Mr Vyshinsky usually in the lead, Sir Gladwyn Jebb tripping him in the corners, Mr Gross and then Mr Lodge thinking they were sitting firmly on his head, only to find him roaring at them from a new vantage point. Confusion followed confusion, stretches of unbearable dullness were followed by moments of tense excitement.

The things that were accomplished owed, in the main, more to extraneous events than to the policy pushed by any one country. It will be remembered that, on convening in October, 1952, the Assembly faced stormy omens and an agenda of some seventy items. Had the various committees not marked time until after the American elections, they might have finished their work by Christmas. Having then postponed seven prickly political items until after the new Washington Administration was installed and a new American delegate appointed, the delegates might today have been making the same ugly speeches at each other had not Stalin died. The second event relieved the extra pressure imposed by the first. Then the Russian change of policy arrived; symbolised by a smiling Vyshinsky and some sweetened speeches, it proved to be the biggest custard pie of all.

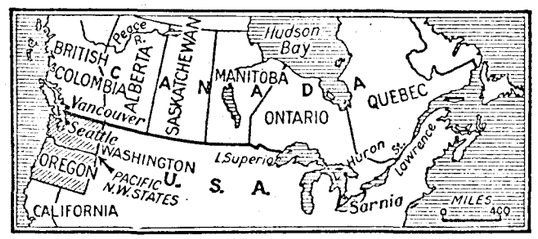
Canada Feels its Strength—II

The Question of Gas

FROM OUR OTTAWA CORRESPONDENT

THE natural gas situation is more complicated than that of hydro-electric power, though the same principles apply. The essential similarity between the two is that supply is no good to anybody unless it can be guaranteed. Power plants cannot be built without an assurance that the water will continue to flow. Gas outlets, whether in factories or homes, cannot be provided without an assurance that gas will continue to flow through the pipes. In every project for a natural gas pipeline the first question is what reserves are available for the line, and how long they will last. It is on this principle that the province of Alberta has until now refused permission to export gas from the principal and most accessible fields in the centre and south of the province. The provincial government has insisted that reserves must be adequate for all the province's own conceivable needs for at least thirty years. It has thus enforced in miniature the policy which the Federal Government is now enforcing on a larger scale.

What the provincial government did last year was to authorise export from the remote northern area of the Peace River of gas which was unlikely to be economic for the central part of the province. This northern reserve was greatly boosted by new finds in northern British Columbia, and a Canadian pipeline company is now trying to build a line to carry it south through central British Columbia to serve Vancouver and the markets of the Pacific Northwest states. Vancouver itself does not provide an adequate market to justify the pipeline, and the fate of the project is now in the hands of the Federal Power Commission (FPC) in Washington. The FPC has to license construction of the line south from the Canadian border to the US markets of Washington and Oregon.



The remaining problem was what to do with the prolific gas fields of southern and central Alberta. Their nearest market, and therefore the most profitable one for the gas-producers, is certainly in the neighbouring US territories to the south. But eastern Canada, with all the industrial centres of Ontario and Quebec, is hungry for cheap fuel. There was much discussion some while back of the possibility of making an exchange, whereby gas from western Canada would be piped to the United States, and the United States would supply Ontario and Quebec. This idea is now dead and buried as far as Canada is concerned. It has been killed by two things, both of which are highly significant in Canadian-US relations.

The first is that Canadians have become convinced that any supply dependent upon the whims of American authorities like the Federal Power Commission is an unreliable supply. The needs of American users, it is firmly believed here, would always come before those of Canadian users. Political lobbyists and pressure groups, the whole uneasy wrangle of Washington politics, would be involved. Canada knows enough about them—with the St. Lawrence Seaway as an awful example—to be determined to keep clear of them wherever it possibly can.

The second, and perhaps more significant, thing is that United States supplies of gas are already running short. The chief supporter of a Canadian pipeline from northern Alberta and British Columbia to Washington and Oregon is the State of California. California knows it will be short of gas within a comparatively few years, and it wants to make sure that the remaining untapped supplies in the United States are available to it. Canada, in other words, emerges as the country with the untapped and still inestimable resources for the future.

This is why the Canadian public so warmly supports the "all-Canadian" gas pipeline which has now received official endorsement from the federal government. It will be a mammoth enterprise. The line is projected from southern Alberta clear across the prairie provinces, and then along the rugged, difficult, and sparsely-settled route north of Lake Superior, down into southern Ontario. Capital costs will be considerably higher than they would be for a line parallel to Imperial Oil's proposed oil pipeline, which is to run through the United States from the Head of the Lakes and comes back into Canada at Sarnia (at the foot of Lake Huron). Higher capital costs are apt to mean a lower price to the producer or a higher price to the consumer. But Canadians remain determined to keep their own gas in their own country, and there are rosy dreams of what industrial development may be encouraged—both from by-products and from cheap heat—right along the line.

Later on this month, the Alberta provincial authorities

have fixed hearings to reconsider the possibility of export from southern and central Alberta in the light of new finds. This time there are good hopes that a permit will be granted, mainly for two reasons. One is that, with the prospect of the transmountain oil line to the Pacific coast taking out much more oil than was at first planned, and the promise of another line right through to Ontario south of the lakes, enormous quantities of gas are going to be wasted if a market cannot be found. Much of the Alberta gas is associated with oil; as the oil is drawn off the gas must be either used or flared. Another reason is that the province of Saskatchewan to the east is beginning to show up as a promising gas producer. One trillion cubic feet have already been proved in Saskatchewan, compared with the estimated 12-13 trillion in Alberta. But Saskatchewan has already promised that its gas can be exported; and unless Alberta removes its restrictions soon the drilling rigs will be switching their sphere of operations.

In view of the new federal policy, it would seem that Alberta has no alternative but to approve export through an all-Canadian pipeline to Ontaria and Quebec. The federal government has the authority and the will to forbid export to the United States. Once Alberta's consent is given, therefore, it looks as though the main line of the Canadian Pacific Railway, which did so much to make possible the development of a Canadian nation in the early years after Confederation, will soon be followed by a gas pipeline spanning half the continent.

It can be argued—and many Americans do argue—that it would be much more sensible and much more economical to develop gaslines north and south. In the case of oil Canada has no objection to doing it that way, because an oil pipeline is not something that can never be interrupted. It serves refineries which can switch to alternative supplies if necessary. But in the case of gas and water-power a supply once given must be maintained. To allow their export, Ottawa argues, is to alienate permanently a permanent Canadian resource.

(*Concluded*)

Opinion in Nigeria

FROM OUR CORRESPONDENT

PRESS, politicians, people, university students, Europeans, all are deeply concerned with the present political and constitutional crisis, although they vary in the extent to which ideas have crystallised.

For the journalists it is jam; and on the whole they have made the most of a big chance. The reporting and presentation of news has been fair, and the technical advances made lately by the Nigerian press have been demonstrated. Comment, however, is a different matter. There, with the greatest relief and the most joyous abandon, the daily papers have plunged into attack. Such restraints as were imposed by the policy of modified co-operation with Britain in working the new constitution have been abandoned.

Its full force has been delivered against the three "sit-tight" ministers from the Eastern Region, who now find themselves still in office—but sans Zik, sans friends, sans party and sans respect. After them comes the progressive and liberal-minded Governor, Sir John Macpherson, "the most formidable obstacle to Nigerian progress," "himself a Tory imperialist of the deepest dye," in the words of Mr Awolowo. Third in line for attack are the Northern leaders, the "pro-Britishers"; Nigerian journalists have revelled in a quotation from a British left-wing weekly describing the Fulani chiefs as agents of British imperialism, maintained in power by British influence. Fourthly comes the Colonial Office, Mr Lyttelton appearing as "the diehard Tory politician who will go down in history as one of the greatest failures as Colonial Secretary," words which might have had more sting if they had not already been applied in very similar form to Mr James Griffiths and Mr Creech Jones.

Now and again an ugly note is struck. An article "Mau Mau or no Mau Mau?" has appeared in the Action Group papers which threatens that terrorist methods are in reserve. "Those who fight shy of Mau Mau are not realistic. The Mau Mau, with all its terror, with all its horror, with everything that makes it the scarecrow of the imperialist, may still be the way out of Nigeria's bondage." This is probably of no immediate significance, but might become so if criticism of Britain in the peasant mind became identified with the increased taxation the government will shortly be forced to collect in the Western Region, though it was imposed by Action Group ministers to finance their ambitious programme for universal primary education. Already there have been riots at Badagri, not far from Lagos. If Mr Lyttelton is waiting for the dust to settle, it

might be wise for him to arrange for showers of rain before the tax collection in August.

Like the gentlemen of the press, politicians have been rejuvenated by the crisis. For the moment they play down any suggestion of terrorism. More disconcerting to anyone who still believes it possible for Britain to hold on here beyond 1956, is the quiet self-confidence of Nigerian leaders and their determination to make the utmost of Britain's present colonial embarrassments. The Westerners and their new Zikist allies have a calm sense of duty done—it becomes daily clearer that the crisis was deliberately contrived—and of duty to be done: the mounting of a three-pronged offensive against the Eastern renegades, the Northern feudal magnates, and the central officialdom. They are satisfied they can manage all three. If they can undermine the Northern chiefs by direct agitation among the people of the North, and present Britain with the *fait accompli* of a united Nigeria, one important argument against self-government in 1956 will disappear. The only opponent which the Action Group leaders may have underestimated is the strength of Islam in the North. Immediate tactics are to press the demand for self-government in 1956 at every possible meeting, assembly, or legislative house, until Britain is forced to recognise the power behind it.

University opinion on the crisis is passionate but amorphous. Intelligent enough to discount the cruder forms of nationalist propaganda, undergraduates are nevertheless profoundly in sympathy with its purpose. "I don't know how I'm not free" said one of them. "And yet I desire 'freedom' with all my heart." Nigeria's next generation of politicians will not become anti-British unless Britain at the last minute withholds the consummation of all its previous colonial policy—independence.

French *versus* German Steel

THE European Coal-Steel Community had to postpone the opening of its common market for steel from April 10th to May 1st in order to give officials time to straighten out the problem of taxation. Tax systems vary widely throughout the six countries and some producers felt that the disparity would give their competitors an unfair advantage. A commission of experts, headed by Professor Tinbergen, was appointed to sort out the intricacies and to recommend some arrangement which, short of revising the entire fiscal systems of the Community, would ensure fair competitive conditions. Its final recommendations have raised a storm of protest from the German steel producers.

Briefly, the commission proposed that French steel sold to Germany, for example, should be divested of all French indirect taxes at the frontier and should bear only the indirect taxes imposed by the receiving country, in this case Germany. It would thus compete with German steel in the German home market solely on the basis of differences in costs of production and transport. The Germans had opted for the reverse solution—that French steel should carry its own high domestic tax wherever it went in the Community.

To the Germans the commission's proposal seems outrageously unfair. German indirect taxes are comparatively low and insofar as industry is concerned the German government raises its revenue by relatively high rates of direct taxation. This is completely contrary to the French fiscal system, where indirect taxes are high and direct taxation low. The upshot is that French steel exporters will pay little to their government from any profits they make on steel sold to Germany, while German exporters will not only have to bear high French indirect taxes but will also have to pass on a big share of their profits to the German government in the form of direct taxes.

At first glance, the case presented by the Germans seems to be a fairly strong one. But the commission's report puts a finger on the weaknesses. The argument that high direct taxes in any country can destroy the profitability of a country's export trade is a hoary and, in the main, very muddled one; the commission dismisses it with the somewhat debonair argument that it is the function of rates of exchange to offset any discrepancies between nations in the burden of direct taxation. As for differences in the rate of indirect taxation, the report, in a very concise table, shows that if its proposal is adopted, these variations will in no way harm Germany's competitive position. The report rejects the solution advocated by Germany simply because it would entail a radical alteration of all six fiscal systems.

In fact, these technical arguments disguise what is probably for the Germans the heart of the matter—the fact that since last summer, French steel producers have kept their prices low, largely in response to M. Pinay's pleas to save the franc. The Germans, on the other hand, have allowed their prices to rise sharply in order to build up substantial profits for ploughing back into their steel industry. Therefore, at the prices currently prevailing in the two countries, and given the commission's proposed solution, French steel would undercut German steel in the German market. The prize for producers in both countries is the south German market, where the Ruhr now has a slight advantage because of a special rebate it grants to users there and because of a German monopoly selling arrangement in the area; under the treaty both of these practices must go.

The Germans are so exercised about the affair that they now threaten to manipulate their taxes in such a way as to protect their steel industry, unless French steel prices are raised or unless the commission's proposal is modified.

The Threat to Siam

THE advance of Vietminh forces to the frontier of Siam is an event of great importance for the general situation in South-East Asia. It is extremely unlikely that this offensive was planned merely as a move in the war within Indo-China and without any thought of the leverage it would provide for bringing pressure to bear on Siam; if there were any doubt on this matter, it should be dispelled by recent violent propaganda attacks on Siam from Peking. Siam is accused of helping the French colonists and the Kuomintang of having become "an American military base in South-East Asia" and of oppressing the large Chinese minority in the country. The fact that this new military drive by a force now completely dependent on Communist China for essential supplies has coincided with the intensification of Chinese political warfare against an independent Asian state which has so far failed to be submissive to

Peking's "new order in East Asia" indicates that South-East Asia is not meant to be included in the list of regions to which the Soviet peace offensive is to bring quiet and relaxation. Russia, of course, is not responsible for what China does, and China is not responsible for what the Vietminh does, so that there is not much prospect for including South-East Asia in any negotiations which may be undertaken with either Moscow or Peking. Nor is even the Vietminh responsible; what is now happening in Laos is nothing but the irresistible will of the Laotian people struggling against imperialism. Soon no doubt the will of the Siamese people will be similarly invoked.

Siam can hardly be considered a reliable bulwark against an army so well equipped and battle-trained as the Vietminh, and invaders of Siam would not lack a fifth column among the Chinese minority, which has long been very discontented at the nationalist policies of the Siamese state. It is doubtful whether Siam would stand up to Chinese-Vietminh aggression better than it did to the Japanese invasion from Indo-China in 1941, unless it was confident of really effective military assistance from outside.

The question is whether the protection which has been given by the United Nations to South Korea has set an example sufficient to create such confidence. Siam is a member of the United Nations and could appeal to the Assembly if its territory were violated. But what could the United Nations do against either China or the Vietminh, under the existing rules of the cold war, except to make Siam a second Korea? And how many of the United Nations would now be willing to undertake a second Korean war?

Dr Adenauer's Party

THE pre-election conference of the Christian-Democrat party was held in Hamburg at the beginning of last week with the glow of Dr Adenauer's triumphal tour through the United States upon it. For the time being, Germans are so proud of the way he has raised national prestige that they are prepared to overlook that the actual practical results of the visit were not too great. This glow may fade rather quickly, but at the moment of the CDU conference it was strong; and it was evident that if the elections could have been held this month, the CDU would have been in a very favourable position. As it is, the elections are to be held at the end of August, and opinion may have swung somewhat by then.

The main government speakers at the conference—the Chancellor and the Minister of Economics, Dr Erhard—were able to recount the tale of Germany's spectacular recovery under the free enterprise regime of the coalition led by the CDU. The greatest tribute to the popular success of the system is that the Social-Democrat party has been able to water down socialism in its economic programme. It has even criticised a Liberal deputy, Dr Preusker, for proposing a partial re-introduction of coupons to enable poor persons to buy cheap imported food.

The CDU programme as drawn up for the Hamburg conference contains a mixture of conservative-liberal economic policy with proposals for removing conflicts between capital and labour. Although the CDU is anxious to establish the fact that it is not a clerical party or even an exclusively Catholic one—and the Protestant president of the Bundestag, Dr Eulers, has been mentioned in the CDU Press as a possible future successor to Dr Adenauer—the party's internal policy is that of the enlightened Catholic industrialist. The programme reaffirmed the law introduced by the government by which labour representatives (including nominees of trade unions) sit on boards of directors and managers. This law was a compromise between the extreme demands of the Trade Union Federation and the objections of the extreme anti-trade-unionist employers. It goes beyond anything that exists in other countries in the way of co-direction of business by labour. In addition, the party programme proposed that part-ownership of enterprises by employers should be fostered.

The religious element in the party came to the fore in the programme's insistence on the family as the basis of national life, and any interference of the state in the private lives of its citizens was rejected. At the same time, the programme called for, although not in very specific terms, an improved system of social welfare that would look after the young and all the millions who have suffered from the effects of the war. Like most pre-election announcements, it proclaimed the intention to do something for everyone. Moreover, the speaker could honestly point out that relief payments have been greatly increased under the present government and that real wages are actually higher than before the war.

No Neutralised Germany

One striking clause in the programme paid tribute to the German soldiers and promised to work for the condemned men—the term "war criminals" was avoided—who are still in prison. All parties, particularly those of the right, are making a bid for the votes of the ex-soldiers by similar means. The tributes they pay are not likely to affect the men who were conscripted into the Wehrmacht so much as the volunteers, the regular army and *Waffen S.S.* The Free Democrat party, particularly the right wing under Dr Middelhauve, has been making a much stronger and more systematic bid for these groups than the CDU. Dr Adenauer has declared himself against any German National Army, whereas other party leaders are not as wholeheartedly against it.

The CDU platform naturally stressed the party's support for the European Defence Community, as well as for the reunion of Germany in peace and freedom. Dr Adenauer had been fiercely criticised by the Social-Democrats for declaring that the reunited Germany must be included in the European institutions; on his return to Germany from the United States to attend the conference, he had to correct himself. He made it clear that the Federal Government could not bind any future all-German government to the EDC, the Coal-Steel Community, or the Atlantic alliance. All that can and will be done by the CDU, if Dr Adenauer remains German Chancellor, is to back the allied demand that a reunited Germany should be free to join such institutions if it desired. In other words, under Dr Adenauer the West German Government will be committed to reject any proposals from Moscow for a demilitarised, neutralised Germany.

Britain's Price for Wheat

FROM OUR OTTAWA CORRESPONDENT

THE last-minute British decision to stay out of the renewed International Wheat Agreement has baffled and mystified Canadian observers. It is believed here that the singular position in which the United Kingdom has placed itself cannot fail to prove costly to Britain and uncomfortable for Canada.

British irritation at the effect of the US domestic subsidies on wheat is fully understood here. Canadian officialdom is bound to agree that the US price support programme is wrong in principle. Although in this case it benefits the Canadian wheat trade, Canada suffers too much from other US agricultural support programmes to put up any defence for them. They lead inevitably to agricultural protectionism of the worst kind and to violation of US tariff obligations under the General Agreement on Tariffs and Trade, against which Canada frequently protests.

But, to be realistic rather than merely indignant, two comments are made here about the British reaction. The first is that talk about the "cartel" of wheat producers oversimplifies the situation. It happens that the world's largest exporter of wheat has set price supports far higher than the world price. As a consequence it always exercises an upward pull on the market. This must be the inevitable consequence of US policy either inside or outside an international agreement. As an equally inevitable result, the other wheat producers, including Canada, can always market their wheat outside the Agreement at a price a little lower than that set by the United States. The Canadian Class II price has always been well above the Agreement maximum and a little below the US Class II price. Consequently Canada has, in these postwar years, always been able to sell all the wheat it could move to seaboard.

Tactics for Bargaining

The second comment concerns the tactics by which the United Kingdom might have set about reducing the world price or breaking up the alleged cartel. It seems here that out of three possible courses the British Government has chosen the least favourable. One course, which some influential people in London advocated consistently, was not to renew the International Agreement at all. It cannot be doubted that the United Kingdom could have prevented the Agreement being renewed, if that had been its set policy. Even as late as January, when the negotiations started in Washington, an adamant refusal to bargain for any maximum above $1.80 could have broken up the negotiations at a time when the United States was still talking about quite unreasonable prices like $2.50.

By this course the United Kingdom could have ensured that the world wheat trade returned to free international bargaining at the time when the UK trade returns to private hands. It would have been, it is argued, a logical course to follow if the United Kingdom was convinced that world wheat prices would fall on a free market. The influence of the United States support price would, of course, still have been felt. Only new United States legislation can change that. But it is at least a tenable argument that the absence of an agreement would give more opportunity for the largest importer to get lower prices.

The second course would have been to try to break the market from inside a renewed agreement. It would have been fully understood here if the United Kingdom, or any other of the importers, had tried to get a lower minimum price than the $1.55 now decided. That would have been the logical expression of the belief that prices were due to fall. But there was no argument about the minimum. It was only the maximum of $2.05 which caused the trouble. Yet the only obligation the importers undertake is to buy their quota at $1.55. The maximum of $2.05 is the limit of what the exporters may charge. It represents an obligation of the exporters and not of the importers.

Under the old Agreement, the demand for the importers kept the Agreement price at the maximum, and sales outside the Agreement were consistently above the maximum. The United Kingdom evidently argued that it would always be so as long as there was an agreement. If this is so, the logical thing was to prevent renewal of the Agreement. If it is not so (as Canada believes), then the logical thing was to break the price within the Agreement. But to have an agreement and stay out of it is to get the worst of both worlds.

Wheat stocks in North America will be unusually high at the beginning of the next crop year on August 1st: there is no argument about that. If supplies from other sources are also plentiful enough to reduce the price below $2.05, the importers under the Agreement may get their wheat for as little as $1.55. In this event the United Kingdom will undoubtedly benefit, because it will not be required to pay the minimum of $1.55. If this is the calculation which British ministers are making, Canadians will question their forecasting ability. On any other forecast it is incomprehensible here what advantage the United Kingdom can gain from its present position.

Time alone can settle the argument. Not till the three years of the renewed Agreement are complete will it be possible to prove whether the United Kingdom has gained or lost. But, remembering that the United States price support programme seems, unhappily, to be one of the invariable factors, Canadians will go on the record officially as prophesying that the UK Government has blundered.

So far as the situation is understood here, the outcome represents the price of a divided mind. Once having held out through nine weeks of negotiations, once having helped to bring the US demands down to $2.05, it must have been clear at least to the British delegation at Washington that an agreement would be signed at that price. It was too late then to revert to the policy of preventing a renewal. But it was precisely at that point that the anti-Agreement forces in the British Cabinet won the day. The UK Government—reportedly on the personal decision of the Prime Minister, since the other ministers were divided—came crashing down between two stools, either of which might have been reasonably comfortable.

For this year, and it is believed here for subsequent years also, the Canadian Wheat Board expects to be in the unhappy position of selling wheat to the Agreement importers for $2.05 a bushel, and charging the United Kingdom importers whatever higher price may be going for Class II sales. Nobody here will like it. If the British Government wants to change its mind, Canada would support a later request to accede to the Agreement. But if Britain sticks to its decision this is the way Canada expects it to be. Either London or Ottawa must be wrong. Time will show which it is.

dyed in the cotton

SCIENTIFIC THEORY and practical application go hand-in-hand where dyeing problems are analysed and settled. Miss Constance Smith, who has been in the Vantona laboratory for seventeen years, helps to find the answers to questions of bleaching, dyeing, and colour-fastness.

Each type of cotton goods presents its own problem of colour impregnation, so she tests and checks and tests again to make quite certain that the dyes used in household textiles come up to the Vantona standard of quality, though no dyes are absolutely permanent—they are only as fast to sun and wash as modern science can make them.

Here, Constance is examining a dye specimen with William Rothwell, who has been with the Company for forty-one years. He entered the dye house at the age of seventeen, and for the last eight years has been foreman of the department where gaiety and 'eye appeal' are added to the other virtues of Vantona quality household textiles.

As in all processes which go to making Vantona household textiles, so in dyeing—quality must be carefully watched to dye as near to perfection as modern scientific methods can achieve.

Mr. Rothwell's practical application is based on Miss Smith's laboratory tests and trials. Together, in close collaboration and constant co-operation, they ensure that the standard of dyeing of Vantona household textiles is of a piece with the craftsmanship that goes into every other stage of production.

PARKINSON & COWAN GAS METERS

(A DIVISION OF PARKINSON AND COWAN LIMITED)

Our Infra-Red Division was started eight years ago to give specialist service in the supply of Paint Drying Equipment mainly to those engaged in the manufacture of sheet metal goods.

It has now been greatly extended in its scope and serves a wide range of industry with processes as varied as those employed in Fish Curing and the Textile Trades.

We are looking today for new problems to solve in drying technique.

WORKERS IN THE TEAM
Number 1 in a series

MANY PEOPLE up and down the country will recognise this face with its twinkling eyes, and the battered old hat. Some have known Mark Ferris ever since he joined the company, thirty-seven years ago.

His tremendous energy, and his way of inspiring enthusiasm in others, were noticed. He was soon a ganger, and then a walking ganger with a number of gangs—sometimes as many as 1,000 men—under him.

The toughest jobs are the ones he likes best. His creed is that open air and hard work never hurt anyone. His back is as broad and straight as ever, and his laugh as merry. Because he has always spoken his mind—both to his men and to the "governor"—he has earned respect. He was one of the first employees to become a shareholder in the Company.

He is a happy man, and a proud one. From Cumberland to Cornwall there are jobs that were done better and faster because he had a hand in them. And the team that has men like Mark in it has something to be proud of too.

THE BUSINESS WORLD

Gilt-edged and the Deficit

THE gilt-edged market has taken the electricity issue less comfortably in its stride than seemed likely immediately after the budget, despite the indications that the "departments" did not need to absorb quite so large a proportion as on previous occasions. This faltering may perhaps be partly explicable on technical grounds, for the market can now look back upon a long-sustained advance; and a pause that was perhaps due in any case may have been signalled by second thoughts about the Kremlin's peace offensive. But beneath the day to day influences there has certainly been a more fundamental one: the City is still bewildered about the monetary implications of the budget.

The market's first impressions were favourable. The Chancellor had drawn attention to the fact that private savings expanded last year sufficiently to offset, with a substantial margin to spare, the shortfall in Government savings. He had emphasised that, for the future, the Government would not need to contribute as large a budget surplus to the nation's whole pool of savings as it had done in earlier years. And he suggested that present indications implied that the economy would require in 1953 broadly the same monetary measures as those now in operation. This last statement, though it dashed the hopes of the few who had supposed that a budget designed to encourage investment might be accompanied by a reduction in Bank rate, reassured those who suspected that a policy that rested upon a larger supply of private savings might demand firmer monetary measures in order to foster them.

These, however, were first thoughts. The market's second thoughts have provoked a somewhat more sophisticated argument. Attention has focused on the fact that the Chancellor has saddled the Exchequer with a prospective "overall" deficit, even on his own reckoning, of £440 million, yet has said nothing about the way in which he intends to finance it. Obviously, unless the external balance of payments plunges into deficit again, he will get no net new finance from overseas. And if the external account maintains its 1952 rate of surplus, as the authorities may be hoping it will do, the Treasury's domestic finances will have to bear the strain of financing that as well. This, moreover, is tantamount to saying that, unless the external surplus diminishes, the Treasury cannot reckon the "counterpart" of defence aid dollars as affording any relief to its domestic finances, so that the prospective Exchequer deficit is really £140 million bigger than the £440 million shown in the accounts.

The Treasury's programme for domestic borrowings therefore promises to be even larger than last year's, despite the fact that it is shifting to the private sector some of the capital financing for which it had previously accepted the whole responsibility. The persuasion of some local authorities to use the new freedom to bypass the Public Works Loan Board is the best understood of these switchings; but a comparable switch occurs unobtrusively every time a commodity is released from Government trading—since the Government then secures cash by liquidating its stocks and the private sector has to find cash to build up stocks anew. Moreover, a budget that is intended to stimulate private capital outlays gives this year an estimated tax relief of only £45 million to company savings while raking in some £200 million from those same savings in the shape of EPL and suspended initial allowances.

The City statisticians who have been totting up these quantities then reach a dilemma in interpreting them. The Government, they say, must borrow heavily again; but if it repeated last year's expedient of con-

centrating its borrowings upon the banks, would this not generate a new and strong expansion of credit that would be dangerously inflationary for the economy and equally dangerous, in the end, for gilt-edged? Would it not stimulate an undue expansion of imports and simultaneously put pressure upon costs, and so reduce exports? Moreover, would not these dangers be further accentuated by the technical fact that borrowings on Treasury bills would ease the liquidity ratios of the banks and lead them, therefore, into an undue loosening of their grip upon bank advances, so that more liberal lending policies would add a further quota of inflationary demand?

Reasoning on these lines has led many commentators to the conclusion that the Government's only means of avoiding these dangers would be to divert its borrowings to the gilt-edged market—to follow, in short, the course that was widely advocated (but not followed) last summer, of borrowing "genuine" savings to ensure that the finance was not obtained even indirectly through the creation of new bank credit. But if the Government had to take care to borrow only savings of that character, surely, it is argued, it would have to offer terms that would put severe pressure upon the market—a market already burdened by the demands diverted to and fostered in the private sector. And how, in any case, could either of these alternative methods of borrowing be squared with the Chancellor's assumption that presently foreseeable conditions require no change in monetary policy? Surely the first method would sharply relax monetary policy, whilst the second method would sharply tighten it?

★

It may be that the City's instinctive caution that underlies this kind of analysis is justified, and that the dangers it fears will materialise; but, if so, it will not be because its analysis is sound. If the Chancellor has blundered, as the City argument implies, it will not be because he has overlooked the supposed difficulty of Government borrowing, but because he has founded his whole policy on the supposition that the condition of the national economy is radically different now from the condition of chronic inflation with which the previous Government had to contend. If that former condition still persists, then the City argument would be unchallengeable. But the Chancellor and his advisers believe that it persists no longer; and they attribute its dispersal partly to their own monetary policy and partly to the changed climate of world demand that derives from wider influences. They do not claim that the condition of excessive demand—which is a synonym for insufficient savings—will not return to Britain's economy; but they do say that last year, for the first time since before the war, its total potential savings were larger than was needed—despite the fall in Government savings. They also say that this year, without the budget stimulus, total demand would still be less, and total saving more, than is required to keep the economy working at the optimum level of output. Even after the stimulus to demand given by the budget, they believe that there will be a sufficient safety margin of potential saving to prevent the recurrence of embarrassing inflationary pressures.

★

There is no need to discuss again here the merits of these assumptions. *The Economist* has already expressed its view that, whilst some degree of risk has been run, the Chancellor was justified in running it. He has given the assurance, moreover, that if conditions change unexpectedly in either direction, he will use monetary policy as the controlling lever to vary the level of domestic demand (including, of course, the balance between saving and investment in the nation's capital account). The point upon which the City and the gilt-edged market should now fasten is that, if the Chancellor's diagnosis is right, the dilemma it fears will not arise. Sufficient savings will be flowing into the capital market, in its widest sense, to finance the demands made upon it—and without the need either for the sanction of rising interest rates or the arbitrary stimulus of credit expansion.

Indeed, if the principle is conceived only in these broad and theoretical terms, that will be true whatever method the Treasury adopts for financing its domestic deficit and the overseas surplus. In principle, if the requisite savings are being generated, but are not being absorbed by government borrowing in the gilt-edged market because the government chooses to borrow instead from the banks, then these savings will by one means or another be used to relieve the banks of other assets, so that most of the credit created by government borrowings will be extinguished. If it is assumed that the public desire for liquidity remains constant, an undesired increase in its cash would lead it to repay indebtedness or buy securities that either the banks or the authorities would supply.

This general principle of course greatly oversimplifies the relationships that would obtain in practice; but the practical complications do not invalidate it. Indeed, so long as the underlying conditions envisaged in the budget obtain, it should be the day to day task of monetary management to ensure that the complications and frictions are so smoothed out as to leave the capital market and the banking mechanism approximately in the broad equilibrium that this principle implies. If that is successfully done by nice apportionment of the government borrowings between the two channels, the future of gilt-edged will depend above all upon the changing whims of investors. And at the moment the balance seems to be tilting just slightly towards fixed interest securities rather than equities. But it is not a stable balance.

Tied Beer and Free

BY A CORRESPONDENT

AMALGAMATIONS and rumours of amalgamations in the brewing industry have hit the headlines in recent weeks. The latest and largest acquisition is that of Tamplins, of Brighton, by Watney, Combe, Reid; but in the past few years a dozen or so of the smaller breweries have been absorbed by larger firms.

This process, of course, is nothing new. For years amalgamation has been the way in which the brewing industry in Britain has adapted itself to changing technical conditions and to the downward trend in demand, with its persistent pressure on overhead costs. With beer consumption in the UK falling from some 36 million bulk barrels to about 25 million in the thirties, the industry had a chronic excess of capacity over demand (and may still have). But amalgamation was not carried through simply to close redundant breweries and reduce costs; the licensing laws that restrict the number of retail outlets and created the tied house system made it necessary for strong brewers to buy up weaker rivals for the sake of their houses, in order to maintain or expand their own volume of trade. This process has also been necessary to follow regional shifts in population since licences cannot be transferred over wide areas. What is new is the modern trend in the demand for beer, to which amalgamation may no longer be the only, or the most suitable, answer.

Following the temporary wartime boom in beer sales, demand has returned to 1938 levels, at which there have been signs of levelling off. But within this total there has been a most significant shift in demand towards bottled beer, the sales of which have actually increased in volume by about a quarter since 1938; and the whole weight of the postwar fall has been concentrated on draught beer. In 1900, probably less than 5 per cent of beer sold was in bottles. By 1938 the figure was 25 per cent; last year it reached 35 per cent (it would have been higher but for lack of materials for bottling plants) although it varies widely from 15 per cent in the north to 50 per cent or more in the south. Alongside this development has come a slow but steady increase in the free trade—the sale of beer in clubs, restaurants, canteens and for consumption at home, as well as to a small extent in other brewers' houses. These developments are of differing importance to the trade; but both seem firmly established.

The decline in total demand may be checked in the 1950s. But the need to adapt retail outlets to movements in industry and population will continue; and there will—fortunately—be enterprising brewers who will want to grow. What the bottled beer and free trade developments offer the brewer is an alternative way of holding or expanding his sales of beer: to infiltrate into other brewers' areas and stimulate sales by intensive advertising that may turn his bottled beer into a "national," or perhaps a "regional," brand.

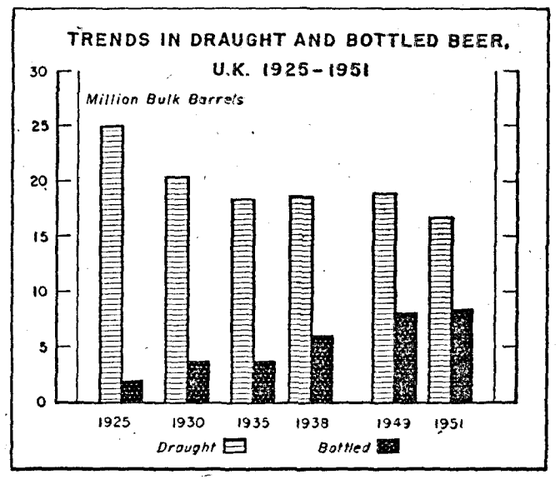
Whether a brewer decides to amalgamate or infiltrate (or both) will depend partly on fortuitous domestic circumstances—financial resources, the chance opportunity to buy out a neighbouring firm, perhaps even the disposition to regard the tied trade as reputable and the free trade as "commercial." But underlying economic trends may begin to tell against amalgamation. These are not merely the expanding opportunities for bottled beer in the free trade, but also the economic problems of the tied trade.

★

First, rising overhead costs in the public house have to be incurred not to increase trade but merely to maintain it. Competition from modern social amenities and rising standards of hygiene demand ever better facilities and equipment. The chairman of a brewing company told his shareholders recently that a public house had been rebuilt at three times the 1939 cost.

> The result is an entirely uneconomic one for this company. There will be many similar cases where we shall be obliged to replace at great expense existing assets which will produce no better return than they do now.

And the brewer has not merely to replace, but also to improve and modernise.



These high costs mean that some houses yield a very low or even a negative return on the investment. The cost of maintaining tied houses may, of course, be the cheapest way of selling beer. But if the costs of maintenance continue to rise, brewers must decide at some point how long they can continue to put into some of their houses new money that might better, in the public interest as well as in their own, be used to improve more promising houses or even the brewery plant itself. And in future, the building of public houses may well be controlled as much by the laws of supply and demand as by the laws of licensing.

The rigid controls imposed by licensing and its administration by the justices upon the operation of a public house are also significant in the brewers' choice of ways forward. They govern not merely its hours of opening and the ages of customers, but also its construction, layout, and amenities, and sometimes whether it is to be run by a tenant or a manager. Even its demise is not uncontrolled. At law the brewer is free to give up the licence of a public house if he cannot make it pay, although many unprofitable houses are maintained—partly out of a sense of obligation to the public. But in practice he is frequently not free to

cut this loss even if he so wishes in order to adjust himself to changes in the pattern of demand. Justices usually regard it as their own prerogative to declare a house redundant; the police may request that an uneconomic house should be kept open; and brewers are usually anxious to meet these authorities more than halfway. Whether these controls and restrictions on the brewers' freedom of action remain necessary or desirable in a period of increasing competition, their economic significance is clear; they make the tied house a rigid instrument for marketing beer compared with the flexibility of the free trade.

★

Thirdly, the tenants who run five-sixths of the 60,000 public houses in Britain owned by brewers are not employees but independent business-men. The tenant is Mine Host of old, a friend of the "regulars"; and his business is also his home; when he gets past his best, he cannot lightly be replaced by a younger man. Brewers, also, put a high value on good relations with tenants in defence against political and temperance criticism; they sometimes tolerate inefficiency among a minority of tenants and neglect opportunities of developing club and other free trade. Increasing competition may force brewers to look for higher standards in order to improve service in the pub, or to deploy their tenants—the front line of the industry—more effectively.

In these ways public house trade and profitability might be maintained. But if the tied trade is becoming a more difficult and expensive method of winning sales, is advertising and infiltration into local brewers' markets easier and cheaper? Will investment in consumer persuasion pay better than investment in bricks and mortar? Until recent years, and with the exception of the three national beers, Bass, Guinness and Worthington, the markets of most of the 350 brewers were largely safe from outside competition. The high cost of transporting beer from brewery to public house limited the market of the typical brewer to about 40 or 50 miles around the brewery. Draught beer is bulky in relation to its selling price; it is also perishable and needs costly equipment in the public house; it therefore cannot be stocked in wide ranges and must be delivered frequently in small lots from a not-too-distant brewery. But this market structure has been to some extent disturbed by the trends toward free trade and bottled beer that together enable outside brewers to sell in local markets. Bottled beer has a longer shelf life than draught, it can be stocked in wider ranges, and it can be brought in from a longer distance; its transport costs are higher, but the customer seems prepared to pay them.

Brewers' markets may therefore be expected to overlap increasingly to the extent that advertising succeeds in building up consumer insistence for particular brands. Ind Coope and Whitbread, since the end of the war, have been expanding the markets for their beers nationally by advertising; their "Double Diamond" and Mackeson's Stout, respectively, are stocked increasingly in free outlets all over the country, and, in the last year or two, in some public houses owned by local brewers. Other firms are spreading regionally. Several in the South are exchanging beers with brewers in the North; Simonds of Reading have been spreading in the South-West and Wales; Tollemache are arranging with local bottlers to bottle and sell their beers in Lancashire, Yorkshire and Cornwall.

Yet infiltration has its own difficulties. Tied trade is assured, orderly, and unrushed; free trade is uncertain, highly competitive, and needs persistent and costly salesmanship. It is hard to win, and hard to keep. Clubs and other independent outlets may insist on very generous terms. And advertising needs a large outlay. The quicker way to expand sales in the short run, therefore, may be to acquire more houses. But its ultimate success cannot be as likely as in the old days; and business policy must be based on assumptions about the future. Unless there is sufficient reason to suppose that the trend towards free trade and bottled beer will not continue in the next ten or twenty years, public houses may need to be regarded as investments to be developed increasingly as catering establishments and community centres as well as outlets for beer. And brewers concerned primarily to find new markets for their beers rather than to extend their catering interests may consider infiltration a better gamble than buying more public houses.

Competition in the free trade may thus increase further; and it may stimulate defensive amalgamations. How far both will go depends on the reaction of the smaller firm. The high costs of improving public houses and modernising breweries and bottling plant, or perhaps the need to pay death duties, may induce more smaller firms to sell out. But the local firm has natural advantages in local trade that might perhaps be exploited more than they have been. It is in the centre of its market. Its transport costs are relatively low. It can keep in closer touch with its free trade customers. It may be better able to cater for local tastes. The growing firm, on the other hand, can try to meet local competition by decentralisation, but to achieve its major objective of maintaining or increasing output, it may ultimately have to centralise brewing. The economies of bottling on a very large scale might also outweigh the high costs of transporting to distant markets; if not, beer can be sent in bulk—in cask, or better still, in tanker—to local bottling depots. The balance of advantage is not certain; it remains to be seen whether the local firm can outbid outside beers by offering comparable beers at lower prices. Those that cannot may still survive profitably by selling outside beers and concentrating on developing their houses, as a few have done.

If the tied house has weakened as an outlet for beer sales it is partly because the dice have been loaded against it by licensing laws and by attitudes, inside and outside the industry, that lag behind social and economic change. Enterprise from brewers and tenants, assisted by realism from the justices and other authorities, may yet help it to recover some of its lost ground. But if the buying of houses continues for the present as a quick method of keeping up or expanding sales, growth by infiltration through the free trade seems likely to increase in the future.

Business Notes

Credit Conundrum

THE latest return from the clearing banks is unique in recent banking history. For the first time since 1931, an April statement reveals a perceptible decline in net bank deposits. The seasonal influence of the government's borrowings to finance the current Exchequer deficit at the end of the old fiscal year and the beginning of the new one—borrowings that were associated in 1952 with a rise in bank deposits by £31 million—has this time been wholly obscured by other special influences, and net bank deposits have dropped by £20 million, to £5,822 million. In the whole period since World War I, there have been only six April declines, and four of them were almost imperceptible.

The special influences have not, however, arisen from any contraction of credit demands from the private sector of the economy. On the contrary, the further heavy borrowings of the nationalised electricity and gas industries—and probably, too, a slightly more liberal attitude in bank lending policy—have contributed to a rise in bank advances by £16 million (compared with one of only £6½ million in April, 1952). And portfolios of commercial bills, which were shrinking rapidly twelve months ago, have continued the modest recovery that started towards the end of 1952. Investment portfolios, however, have contracted a little further. On the usual basis of reckoning, this increase in the demands of the private sector, when set beside the contraction in the total volume of credit, implies that the government has been repaying indebtedness to the banks, to the extent of about £35 million, whereas last year it was increasing its borrowings to the extent of nearly £70 million.

Since the seasonal "overall" deficit of the Exchequer during the most nearly comparable period was only a little less than last year (at rather more than £100 million) and since disclosed borrowings by the Treasury from non-banking sources were moderately larger, the main explanation of so large a disparity in the figures cannot lie in the sphere of purely domestic finance. An intriguing pointer can be discerned, however, in the fact that the month's decline in net deposits was wholly due to an extraordinary contraction—by nearly £50 million—in those of the National Provincial Bank (whose figures had previously been rising fast), and in the possibly related fact that Middle East banks have lately been heavy lenders of funds in London. This suggests that balances had been accumulated to meet abnormally heavy payments due to be made overseas, probably for oil, and that the making of these payments put a large but probably temporary strain upon Britain's external balance of payments during the period in question. The new overseas funds may be presumed to have flowed, directly or indirectly, into Treasury bills, so that the clearing banks' aggregate money market assets have fallen even more noticeably than their deposits have done. Indeed, this same special influence may have played an indirect part in provoking the fall in the Treasury bill rate at last week's tender—a fall that resulted directly from the discount market's effort to secure a larger share in the weekly allotment than it has lately done. The odd behaviour of bank deposits last month does not, therefore, portend a major change of trend—even though a subsidiary factor may have been the release of gilt edged securities through the (now suspended) "taps" of the authorities.

A Committee for Atomic Energy

THE Prime Minister's decision to separate the control of atomic energy and all that it implies from the Ministry of Supply, and to hand it over to a new and novel type of organisation, is the first step towards making up the ground that Britain at one time seemed in danger of losing in this uncharted territory of atomic physics. Under the Ministry of Supply, a pilot organisation has been built up capable of producing enough fissile material for the Monte Bello explosion of last autumn and providing the research facilities and the finance that made such an explosion possible. But it has been apparent for some time that the organisation must be expanded, and expanded quickly, if some of the ground lost—in atomic propulsion in particular—is to be made up. The scale on which the development will have to be undertaken makes it peculiarly unsuited to control by a Government department. The building, running and staffing of so vast a project cry out for the administrative techniques used in industry.

The principal weakness of the British method of organisation has been that it excluded not only industrial methods, but also industry itself, from participation in development. There has been no opportunity for anyone outside the Ministry of Supply's establishments to acquire the "know-how" associated with nuclear physics or with applied atomic energy. How great a handicap this may have imposed upon the power engineers, the aircraft and aero-engine designers, the chemical industry, and the ship-builders will become apparent only in the future; but some of those close to the aircraft industry are already seriously concerned with the retarded state of work on atomic propulsion of aircraft in this country by contrast with the work done in the United States.

It is clear that the Prime Minister had these points in mind when he said that "the form of non-departmental organisation appropriate in this case will differ from any existing model" and that a body on the lines of any of the nationalised corporations is clearly unsuitable. In the United States, a semi-autonomous Atomic Energy Commission, its budget voted by Congress, controls policy and owns vast plants and research stations. But it does not concern itself with their day-to-day administration, which is carried out by various companies on an agency basis. Both in the results achieved and in security, the American experiment must be counted a success. The committee to be set up under the chairmanship of Lord Waverley to work out a suitable form of organisation is not expected to require much time to come to a conclusion.

The Comet and the CAB

MR Lennox Boyd had no contribution to make on Wednesday to the now heated Anglo-American dispute about the eventual airworthiness of the Comet IIIs ordered by Pan-American World Airways; but he did, in re-stating the main issues, clear away much of the confusion that has surrounded the controversy in recent weeks. Pan-American expects delivery of the Comets in 1956, and would have liked to have known by last Thursday, at the latest, that the aircraft would be accepted as airworthy in the United States. The Comet III has not flown, so there can be no question of the granting of any certificate of airworthiness anywhere for a matter of years. But the American Civil Aeronautics Administration (the licensing branch of the Civil Aeronautics Board) was asked to undertake to accept a British certificate of airworthiness for the Comet III, should such a certificate eventually be granted. This the CAA has refused to do, pleading that since there were no American standards for turbine aircraft in existence, its duty to the American public prevented it from accepting those of any other country.

The Americans have therefore refused to negotiate any agreement on the Comet III, and the discussions have reverted to contentions that were fully but abortively debated more than three years ago—the airworthiness requirements of turbine-engined aircraft. The American views, in theory, on these requirements differ widely from the requirements that the British Air Registration Board has already laid down and applied to the Comet I and the Viscount. The points of difference range from key aerodynamic considerations about the position of the engines (the Americans do not like to see them buried in the wings) to the shape of the control knobs in the cock-pit.

A technical team from the CAA was expected to come to this country to examine British methods. But since the general feeling is that it will come with the intention, not of negotiating, but rather of learning what cannot be learnt in the United States, the reception given to the team by the British industry might be a little distant. It is difficult to see how an American agreement to accept a British certificate for one particular aircraft would in any way commit the Americans when they come to drawing up their own requirements for turbine-engined aircraft. For some years, the British have accepted American certificates although they embody certain features, particularly in their fire requirements, that would never be agreed to in this country. The Americans cannot be surprised if their refusal is interpreted as meaning that a British certificate of airworthiness is not safe by American standards. Although the British view is that further discussions are hopeless, Pan-American, one of the main parties concerned, takes a more philosophic view. The company wants its Comets, and it might be that a little lobbying at home could succeed where representations from this country on a higher level have so far failed.

Finance Bill Provisions

THIS year's Finance Bill should give a minimum of trouble—certainly far less than last year's, which was radically changed in mid-course. Details of the necessary changes to give effect to the Chancellor's tax proposals (set out in *The Economist* of April 18th) are, on a first inspection, of an unexceptionable character. There is one matter not then commented on that should be mentioned: the transfers of local authority stocks issued at any time from the beginning of 1953 will attract single stamp duty only, as from August 1st next.

The provisions relating to partnerships, which have been evoked by the *Osler* v. *Hall* decision and its consequences,

Trade with the East

The Chartered Bank of India, Australia & China, celebrates this year the centenary of its incorporation by Royal Charter. Merchants and manufacturers are invited to view the Bank's Centenary Exhibit at the British Industries Fair and to avail themselves of the Bank's services.

BRITISH INDUSTRIES FAIR
STAND V8 EARLS COURT

The Bank provides exceptional facilities for conducting every kind of financial operation connected with trade investment and travel in the East.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter in 1853)

Head Office — 38 Bishopsgate, London, E.C.2

Branches at — Manchester, Liverpool, and throughout Southern and South-East Asia and the Far East.

Agencies in — Hamburg and New York.

A MEMBER OF THE THREE BANKS GROUP

WILLIAMS DEACON'S BANK LTD.

Williams Deacon's Bank Ltd. originated in 1771 and has always been closely associated with the industrial and commercial life of the North of England. The Governing Office is in Manchester, so long a centre of the export trade, and the Bank's world-wide connections enable it to further this trade, now more than ever of the greatest importance in the life of the nation. In London the Bank was one of the first Members of the London Clearing House. Williams Deacon's is a Member Bank of the Three Banks Group.

appear closely to follow the recommendations of paragraph 72 of the first Millard Tucker report. They will, no doubt, be variously regarded, in some quarters, as the "junior partner's charter" and in others as a licence for any partner, junior or senior, who is captious enough to take advantage of the clause without carrying his colleagues with him in support. The termination provisions for EPL are short and simple—much more so, indeed, than the special provisions that are being made to secure that distributions by steel companies in connection with denationalisation are not penalised by profits tax. A certificate from the Treasury will, in particular, enable a distribution in the form of redeemable preference shares to be made without falling under the penalties of Section 31 of the Finance Act, 1951, for liability to profits tax.

Textiles and the BIF

THIS is one of the years when, by tradition, textiles dominate the London section of the British Industries Fair, although many of the traditional leaders of the industry are beginning to wonder whether the extra business they do there justifies the expense of exhibiting. At the 1953 Fair that opened this week, some of the best known names in textile finishing, many of the most successful weavers, and such giants in the rayon industry as Courtaulds and British Celanese are missing, and comparative newcomers to textiles, such as Imperial Chemical Industries and British Nylon Spinners are prominent. Both companies are bringing new plants into production within the next twelve months, and both have chosen the opportunity offered by the Fair to make an all-out effort to build up markets for their new fibres. British Nylon Spinners' production will be trebled, rising from 10 to 30 million pounds of yarn a year, while ICI's "terylene" plant, at present producing sample quantities of about 600,000 pounds a year, will be turning out 11 million pounds of yarn. ICI's other textile venture, the protein fibre "ardil," is already in full production at the rate of 20 million pounds of yarn a year, and markets for this product, despite its similarity with wool, are no easier to develop than those of the chemical synthetics.

Companies such as these, being yarn producers only, are dependent upon the co-operation of the mills to develop and market the finished fabric; and the frictional inertia that they are bound to meet in selling a new unknown laboratory product in Lancashire and Bradford is clearly irksome. To yarn producers in this position, a big exhibition provides their best, and probably their only opportunity, of demonstrating the fibre in the way in which they believe it should be used by trade customers—by commissioning sample cloths, garments and industrial textiles made and dyed to their own specifications. Older members of the textile industries may no longer feel the need for this form of promotional selling, but the textile recovery hardly seems so complete that they can afford wholly to ignore so important a shop-window. If they dislike the heavy expense of exhibiting individually—and many Lancashire companies, big and small, still appear to think it worth while to do so—then co-operative stands such as those organised by the wool industry would seem better than no appearance at all. Such a policy may foster the opinion that the companies concerned have nothing new to offer.

Record Rayon Output

THE leaders of the rayon industry may have decided not to support the British Industries Fair, but they have not ignored it so completely as some other prominent members of the Lancashire textile industry have done. Courtaulds has what amounts to a small private show in Manchester and British Celanese has one in London, while the Rayon Federation, which has contented itself with an inquiry stand at Earls Court, is holding quite an ambitious exhibition of rayon fabrics, representing nearly 30 companies, at its new Piccadilly offices. As a matter of prestige, the rayon industry may not have been wise in leaving the field at Earls Court so completely to the traditional fabrics such as cotton, with their greatly improved finishes, and to the newest synthetics. But the present level of demand for rayon suggests that the industry has not much to fear—at the moment—from their competition. The production figures recorded in March, 36.3 million pounds of rayon, are the highest yet recorded, indicating that the industry is working to full capacity. By contrast, production of cotton yarn is running at about 3 million pounds a week below the weekly average of 18 million pounds of yarn recorded before last year's textile slump, while consumption of wool in Bradford is running at the rate of 41-43 million pounds a month compared with the peak figures of 45 and 46 million pounds recorded in 1950. The present heavy demand for rayon, and especially for rayon staple, has arisen because producers were slow to bring plants closed last summer back into production. It is, therefore, not easy to say whether it will continue once the immediate backlog of orders has been met. But rayon remains the cheapest textile fibre on the market; whilst the newer synthetics are technically superior to it—perhaps even to the extent of making up for the great difference in selling prices—their combined output when the new plants are in full production will amount in a year to less than two months' output of rayon.

ICI's Profits

UNDER an accounting system by which income from stock appreciation has to be included—and is taxed—with profits from trade itself, published profits are not always what they seem. No finer example of this pitfall can be found than in the reception accorded in the stock markets to the preliminary profit figures published by Imperial Chemical Industries last week. Immediately after the news that ICI's dividend had been maintained at 13 per cent on the ordinary capital of £70,651,162 (as increased by the rights issue at the beginning of 1952) but that its consolidated profits had fallen from £49 million in 1951 to £39.8

million in 1952, the £1 ordinary stock units were marked down 10½d. to 43s. 4½d. On the expectation of a decline in earnings these units had been a weak market for some time; they were poised and prepared for a further drop immediately after the preliminary announcement. But after a few hours of more mature consideration investors reversed their earlier judgment and on the following day the units completely recovered their earlier loss; by Wednesday evening these stock units had risen to 45s. to offer a yield of 5¾ per cent.

Initially the market had taken far too gloomy a view. The directors' announcement shows that ICI's sales actually increased in value by £13.5 million in 1952, to the record figure of £276.3 million, in spite of a sharp decline in activity in the third quarter of last year. This decline, which was associated with the recession in the textile industries and with import restrictions in many overseas markets, inevitably led to an increase in costs of production (particularly, of course, in the burden of overhead costs); coupled with a decline in the profits of certain marketing subsidiaries overseas and with last year's fall in raw material prices (which forced the group to write £2 million off stock values) it made the drop in total earnings inevitable. But, as the directors are at great pains to point out, the published profits of £39.8 million in 1952 are much more real than those of £49 million in 1951, when income was automatically inflated by the rise in prices. In fact, profits last year do not, in the directors' words, "contain any significant amount due to the inflation of price levels"; as a direct result—and for stockholders this is a most encouraging sign—only £700,000 (compared with £7 million in 1951), has been transferred to stock replacement reserves. In these circumstances the fall in profits loses most of its sting—especially as the directors are able to report that there had been a considerable improvement in trading by the end of last year.

I.C.I.'s SALES AND PROFITS

Background For Film Policy

WHETHER or not they considered the Eady Levy desirable in principle as a method of giving British film production a reasonable chance of profit, most people in the cinema industry—including the producers—have assumed up to now that in practice, at least, the levy did work. The National Film Finance Corporation's annual report last year provided perhaps the strongest basis for that assumption; but this week the corporation has produced some disappointing evidence to question it. In its 1951-52 report, the corporation felt able to conclude that the levy (charged on cinema seat prices to assist the producers) had

> . . . made it possible to invest new money [the most risky part of film capital] with profit, provided the investment is spread over a fairly large number of films and provided an arrangement is made for setting off losses against profits.

This year that confidence seems to have gone. The levy, the corporation feels, may not be providing enough to make production, even taken as a whole, a paying proposition. It has, certainly, tipped the scales for some of the films that the corporation financed:

	1951	1952
No. of films released	34	34
No. likely to be profitable	16/17	15
No. likely to be profitable without Eady Plan	13	8
No. of losses on 70% distribution guarantees	9	13
No. of losses on 70% distribution guarantees without Eady Plan	21	20
Aggregate cost likely to be recovered	106%	99%
Aggregate cost likely to be recovered without Eady Plan	73%	69%

But costs, 3-D prospects, television, and the unwillingness of the exhibitor to see his trading margins narrowing may all tell against the producer:

> Only the two big combines—the J. Arthur Rank Organisation and the Associated British Picture Corporation—and some small distribution companies seem likely to be as independent of Government assistance at the end of the Corporation's life as they were at its beginning.

That end is less than twelve months off. The corporation, as now constituted, is due to cease making loans for film production in March, 1954.

★

In the year ending March 31st the corporation earned £121,559 in interest and fees received on loans and completion guarantees for film production, and this total exceeded its expenses by £87,495. However, against the £151,654 that it received in addition as its share of profits upon successful films, it had to make provision for £285,000 for losses upon failures. It ended up, therefore, with a net loss of £45,851. This was largely accounted for by the sharp downward revision of estimates of earnings for a number of the films financed by the corporation. In particular, further provision had to be made for losses on one film made specially for the Festival of Britain, which the corporation had financed for not wholly commercial reasons; the further provision on this film accounted for virtually the whole of the net loss of the corporation in 1952-53. The outlook for film production, provided with working capital by the Government and with its earnings enhanced by the levy, therefore, may not be quite as doleful as the tenor of the report at first suggests. But the report does emphasise the risks inherent in any film policy—usefully, since the Government will soon have to formulate one.

The Coal Board's Borrowing

BETWEEN 1948 and 1951 the National Coal Board was able to cover all its capital investment by "self-financing"; but last year, it has now been disclosed, the board began borrowing again from the Ministry of Fuel and Power. The board's powers of raising new money differ slightly from those of the electricity and gas industries, which make periodic issues of stock in the London market; it enjoys perhaps even greater convenience in obtaining funds. It has power to obtain advances from the ministry for "expenditure properly chargeable to capital account, including working capital"; the total amount obtainable was originally set at £150 million, but in 1951 was increased to £300 million, of which not more than £40 million may be advanced in any year without Parliamentary approval.

In 1947, the first year of nationalisation, the board borrowed just over £41 million, of which it repaid £8 million the next year. Of the remaining £33 million, £20 million was funded for repayment by 50-year annuities at long-term rates of interest. The remaining £13 million has been on loan to it at short-term rates of interest for five years (though the board's banking arrangements with the Bank of England allow for the use by public funds on a day to day basis of any sums in excess of an agreed daily balance for the NCB). Between 1948 and 1951, the board provided the whole of its £117 million of capital investment from its own resources. By the end of that period its needs had began to outrun its own capital resources; it borrowed £11.5 million during January and February that year and has since obtained advances totalling about £37.5 million. At the end of March this year, it owed a total of £80,996,606. The recourse to borrowing has accompanied a welcome though still moderate increase in the industry's rate of physical investment; since more than a third of its planned expenditure under the long-term investment plan was expected to come from "outside," the total of advances from the Ministry is likely to grow.

Petroleum Prices Lowered

DEMAND for petroleum products, in general, no longer exceeds supply, and this week their prices in Britain have been formally freed from Government control and, simultaneously, reduced. The reduction in home prices, which followed cuts in bunker prices, reflects the low level of tanker freight rates. Rates in the London spot tanker market have shown no sign of the usual seasonal increase during the past winter; and on April 1st the notional time charter rate "awarded" by the London Tanker Brokers' Panel was cut almost in half (from 42s. 3d. per deadweight ton per month, for a standard 12,000-ton motor-tanker on two-year charter, to 22s. 3d.). This award, made twice yearly, is an estimate designed to iron out some of the wider fluctuations of the spot tanker market rate; its main purposes are to serve as a basis for the negotiation of time charters and for the calculation of changes in the freight element in petroleum prices. Its link with the actual freight element in the costs of any company is inevitably tenuous. The major companies operate large tanker fleets of their own as well as chartering many independent vessels, and in slack periods such as last autumn may even offer their own tankers for charter; the freight element even in crude costs will vary from time to time and from company to company.

The latest cuts in the prices of petroleum products—ranging from 14s. 6d. to 24s. 6d. a ton for bunker oils and from ¼d. to 1d. a gallon for the chief products in the home trade—represent about three-quarters of the extent that the notional "freight element" has fallen. The remaining quarter has been offset by rises in other costs, some of them considerably delayed. These include wages, rail freight rates, and the costs imposed upon the oil companies' road tanker fleets by last year's increase in fuel tax.

Government control of prices for petroleum products was brought into force when the Petroleum Board was dissolved five years ago. So far as petrol is concerned, it has applied since February this year only to the standard grades that succeeded "pool" spirit; prices for the premier grades introduced then were not controlled. This week's reductions bring "inner zone" prices for the standard grades down to 4s. 2d.; prices for most premier grades down to 4s. 5d., and prices of the more expensive ones down to 4s. 6d. a gallon.

A Fighter for the Navy

THE new Vickers-Armstrongs fighter that has just been ordered in "substantial" quantity for the Navy will provide the aircraft carriers with their first really modern aircraft. Since the war, the Navy has come a poor second, so far as development has been concerned, to the Air Force. Most of its machines have been adaptations of those designed primarily for other purposes, and this is one of the few intended from the start for carrier operation. In March, the First Lord of the Admiralty, reviewing the Navy's inadequate air arm, announced that a new and then unidentified swept-wing fighter with a remarkable rate of climb had been ordered. The predecessor of this aircraft, the Supermarine 508 which first flew in 1951, had exceptionally thin, straight wings, a concession then to the difference between landing on a carrier and on an airfield. Other features of the 508, the "butterfly" tail and the two Rolls-Royce Avon engines, have been retained. This is a remarkable amount of power for a fighter aircraft; the supersonic Swift and Hunter have each a single Avon. Only the radar-equipped Gloster Javelin night fighter and the spectacular de Havilland 110 have had power similar to the new fighter—an indication of the kind of performance that the Navy expects and also, perhaps of the weight of equipment that the new fighter may have to carry.

Majority for Wheat Agreement

DESPITE Britain's bold decision to remain the odd man out, the new three-year International Wheat Agreement now seems likely to come into force on August 1st next. Forty-one of the forty-two importing countries under the old agreement have agreed to the new terms; the only exception is Britain, which accounted for 39 per cent of the imports under the old agreement and which believes that the new maximum price of $2.05 a bushel is too high. All four of the exporting countries on the International Wheat Council—the United States, Canada, Australia and France—have signed, although France has reduced its export quota, protesting that the new maximum price is too low. The agreement now requires ratification before July 15th by countries accounting for 50 per cent of the trade under it.

The main feature of the new IWA is that it stipulates a new minimum price of $1.55 a bushel and a new maximum price of $2.05 a bushel, compared with a minimum of $1.20 and a maximum of $1.86 under the old four-year agreement that expires on July 31st; hitherto virtually all transactions under the agreement have taken place at or near the maximum price. The new agreement, however, also makes some variations in the amounts that the exporters can call on the importers to buy at not less than the minimum price and that the importers can call on the exporters to supply at not more than the maximum price. A summary of the new allocations—showing the changes from the old—is given in the accompanying table. If the agreement is ratified, the new Wheat Council will have to consider applications for membership from several importing countries, not at present within the agreement; and it will also have to set about the disposal of approximately 4¾ million tons that would have been guaranteed to Britain and the colonies if they had not contracted out of the fold. The stage will then be set for a critical poker game. Two of the most interested players in it will be Britain, playing a lone hand outside the agreement and with its wheat trade in course of transfer to private enterprise; and Australia, hitherto the largest sterling seller of sterling wheat to a number of wheat hungry sterling buyers.

The Holborn Giant

THE investment policy and the profits experience of the Prudential always attracts and deserves close interest in the insurance industry—and indeed in the stock markets as a whole. "In the light of the continuation of the higher general level of interest rates" the Prudential has now decided to raise to 2½ per cent the net rate of interest that it assumes will be earned in the future on the reserves of both its ordinary and industrial life branches; previously it had assumed the ultra-conservative net rates of 2 per cent and 2¼ per cent respectively on the assets of these two branches. After these changes, and despite a depreciation of the market value of assets that seems to have been of the order of 3 per cent, the 1952 balance sheet shows total assets at the mammoth figure of £664.9 million. This figure is struck after writing off £20.9 million, of which £9,750,000 was released from the actuarial reserves of the ordinary life branch by the change in the valuation basis and £9,500,000 was similarly released from the reserves of the industrial life branch; the total assets of these branches at the end of the year were £269.3 million and £369.2 million respectively. The balance sheet certificate states that the book values of the assets at the end of last year were in the aggregate less than the middle market prices of quoted Stock Exchange securities and the directors' valuation of other assets (after taking the branch contingency funds into account).

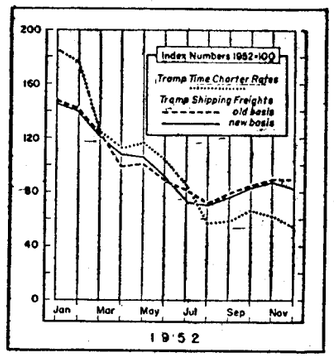
In all, the balance sheet total increased during the year by £19.3 million. British Government securities fell by £5 million to 42.9 per cent of total assets, compared with 45.0 per cent in 1951 and 47.4 per cent in 1950. Ordinary shares rose by £9.9 million to 11.4 per cent of total assets, debentures by £5.9 million to 13.8 per cent, mortages by £5.0 million to 5.4 per cent and properties by £7.9 million to 9.6 per cent of total assets. This change in the pattern of assets, including the substantial increase in equities, is in line with the investment policy of most other life offices last year.

★

These changes follow another year of expanding business. New business in the "Pru's" ordinary life branch rose by £11.5 million to £119.1 million, including increases under existing group life assurances; excluding such increases, new business, at £112.0 million, was 4.1 per cent higher than in 1951, compared with an average increase for all other offices that have reported so far of about 3½ per cent. In the industrial life branch the

QUARTERLY ECONOMIC REPORTS are now available on nearly seventy countries. These reports give information and opinion on matters of concern to exporters and investors; they are concise and have comprehensive statistical sections. A descriptive leaflet may be obtained from The Economist Intelligence Unit, 22 Ryder Street, London, S.W.1.

rate of expansion was rather lower than that of the other leading industrial-cum-ordinary offices; new sums assured were £78.4 million compared with £77.9 million in 1951. The proportion of the Prudential's new ordinary life assurance business transacted overseas continues to increase; last year £45.9 million of the new sums assured were underwritten abroad (including the Republic of Ireland), and thus accounted for 38.5 per cent of the total new business (compared with 36.6 per cent in 1951). Together with most other offices that declared reversionary bonuses as at the end of last year, the Prudential was able to raise its rate of bonus, by 4s. to 34s. per cent of the sum assured for United Kingdom business.



Copper Price Cut

THE easing of open market copper prices in the United States and on the continent earlier this month led to an expectation that the Ministry of Materials would lower its selling price; but this had to await the re-negotiation of the Ministry's buying price with its Rhodesian suppliers. The expected reduction came at the end of last week; and the Ministry's selling price for electrolytic copper delivered consumers' works is now £253 a ton, a cut of £27 a ton.

The Ministry also took the occasion of its talks with the Rhodesian producers to alter the basis of its buying price. With the abandonment of price control of copper in the United States in February, the New York price can again be taken as a fair reflection of world prices, and the Ministry has accordingly now abandoned its fixed buying price and gone over to an arrangement based on average American prices. Fifteen days' notice of price changes must still be given, but the price the Ministry pays may alter according to world price movements much more rapidly than in the past, and its selling price will be subject to more frequent changes. One consequence of this greater flexibility is that when copper dealings are handed back to the London Metal Exchange the Ministry's selling price is likely to be more in line with world quotations.

Revised Freight Index

THE expert sub-committee set up by the Chamber of Shipping to examine its index of sterling tramp freight rates has now made recommendations for a revision to bring this into line with the postwar pattern of trade, and has proposed that a parallel index of time charter rates should be compiled; it decided that an index of operating costs would not be practicable. Since 1949, the monthly voyage rate index has been calculated on the base 1948 = 100, but the trades taken into consideration and the weights allocated to commodities and routes were still based on the experience of 1935. The new index will be based on the results of an inquiry into the employment of United Kingdom tramp ships during 1951. The returns, which were about 85 per cent complete, showed that 90 per cent of the total freight was earned in the carriage of coal, grain, sugar, ore, fertilisers, timber and esparto; these are the same as in the previous index, except that esparto is substituted for iron, steel and scrap. The weightings, however, have been changed, the importance of timber and sugar having increased and that of coal and grain having considerably decreased. A considerable amount was earned during 1951 in the carriage of coal from the United States to Europe, but this has been excluded from the calculations as "a temporary factor." Because freights were abnormally high in 1951 (partly as a result of this unusual movement), it has been decided to make 1952 the base year for the new index number. While the weighting of the index is based on the pattern of employment of British tramp ships, all fixtures in sterling in the relevant trades, which may not necessarily touch the United Kingdom, are used for compiling the index.

The 1951 inquiry into tramp ship employment revealed the interesting fact that more than half of the British tramp fleet in that year was engaged on time charter. Examination of the movement of time charter rates showed that they did not necessarily follow the same pattern as voyage rates. Many different factors affect the rate of freight on time charter, such as the size, speed and method of propulsion of the vessel, the owner's and charterer's opinion of the likely changes in market conditions over a period of time, and the distance between ports of delivery and re-delivery. The new time charter index, therefore, will take into account only fixtures for vessels of 8,000 tons deadweight and over, chartered for round voyages or for periods not exceeding nine months, fixtures being excluded in any event when ports of delivery and re-delivery are widely separated. It is expected that monthly publication of the new time charter index will begin in July, and it will be interesting to compare the different trends of the voyage and time charter indices.

New Managers for Wankie

THE decision to transfer technical control over the Wankie Colliery in Rhodesia, from Powell Duffryn to the Anglo-American Corporation, was unexpected—indeed, even abrupt. But there is an undeniable logic in it. Powell Duffryn had extensive coal mining interests in Britain before nationalisation; the Anglo-American Corporation, through Rhodesian Anglo-American and its other subsidiaries, has interests spread across southern Africa from copper mines in Northern Rhodesia to coal mines in the Cape. Coal mining practice and organisation in South Africa are so different from those in Britain that Powell Duffryn—even though for the last year it has acted through a Rhodesian subsidiary on the spot—may have found it difficult to manage operations there, and to arrange for the appointment of suitable supervisory staff and for the recruitment of native labour. In addition, the switch in management will accord with the well-known desire of Rhodesians for local control of their own economic resources. The change will be effected (subject to the consent of the Treasury) by the issue by Rhodesian Anglo-American of 250,000 of its 10s. reserve stock units in exchange for Powell Duffryn's holding of 800,000 shares of 10s. each in Wankie Colliery, and by the acquisition by the Anglo-American Corporation of Powell Duffryn's entire shareholding in Powell Duffryn (Rhodesia) Limited in exchange for 70,000 10s. reserve stock units in Rhodesian Anglo-American.

In the three years in which Powell Duffryn has been in the saddle, production in the Wankie coal mines has been raised by nearly 50 per cent to its present level of over 2,750,000 tons a year. Even so, this output is not sufficient to meet the demands of the Northern Rhodesian copper belt and other Rhodesian consumers—for which Wankie represents the sole local source of supply. At the moment demand is running at about 3,100,000 tons a year and it is expected to increase to 5,000,000 tons by 1956. If output is raised to this level (and, incidentally, this will have to be accompanied by an improvement in rail communications between Northern and Southern Rhodesia) more capital will have to be sunk in Wankie Colliery. Here again the wide experience and the strong resources of the Anglo-American Corporation could be decisive.

SHORTER NOTES

Industrial production in February, according to the official index of industrial production, is provisionally estimated to have been 120 (1948 = 100). This compares with figures of 118 in January and of 120 in February, 1952, but is still two points lower than in February, 1951. The index figure for March, on the basis of information so far received, is expected to be 120-121—which compares with 123 in March, 1952, and 116 in March, 1951.

★

The new London futures market in wool tops began business on Wednesday. The basis for dealing is the Bradford 64s B Top, and the first day's turnover was 56 contracts of 5,000 lb, representing total money transactions of about £180,000. The first business was done at 158d. a lb for September delivery. The closing call for September was 159½d.; October quotations were around 140d. The London prices were a little below those of Bradford. The market will operate three calls, one in the morning and two in the afternoon.

Company Notes

VICKERS. Equity shareholders in Vickers—at the end of last year there were 35,495 of them—will read Sir Ronald Weeks's detailed factual survey of the group's industrial activities with close interest, but also with some disappointment. Throughout its sixteen profusely illustrated pages there is no reference to the group's financial experience last year or to the very substantial switch in its investment holdings, which was discussed in some detail in these columns a week ago. Even more disappointingly, Sir Ronald gives no hint about the attitude of Vickers's directors towards the possible repurchase of English Steel after its denationalisation. Perhaps Sir Ronald will have more to say at the annual general meeting three weeks hence, but until then shareholders will have to remain content with the knowledge that the present structure of assets led last year to bigger profits, a bigger dividend and to reassuring signs of expansion in the balance sheet. Apart from the shift in investment holdings, the most significant change in the consolidated balance sheet is the increase in the book value of stocks and work in progress from £59,252,719 to £77,826,805; this certainly indicates a rising tempo of production, but it has not imposed an impossible strain upon the group's resources as there has been a parallel increase in "instalments on account of contracts" from £40,060,674 to £53,302,353.

Consolidated earnings	Years to Dec. 31, 1951	1952
	£	£

£1 ordinary stock at 47s. 8d.xd yields £6 7s. per cent.

* Including credits relating to earlier years (1951: £639,000 1952: £501,000).

The tempo of production has not, however, risen in all branches of Vickers's activities. Sir Ronald reports a reduction in sales of certain light engineering products, particularly those used in industries closely in touch with the consumer. Production at the Metropolitan-Cammell Carriage and Wagon works was also continually held up; throughout most of 1952 this was due to the shortage of steel, but in the last few months the intake of orders—70 per cent of which are for export—has fallen off, largely as a result of "exchange difficulties" in overseas countries. But the slackening tide of production in one sector of the group's business last year was overcome by the rising flood of orders and sales for aircraft and heavy engineering products. Even if rearmament expenditure falls, it may be in this sector of the group's activities that the best hope of extending profits will lie.

★

FORD MOTOR. The remarkably stable figures of production and profits already reported by Ford Motor for 1952 (and discussed in these columns on April 4th) are shown by the full accounts to have masked a whole complex of changed conditions for the company—and perhaps for the industry as well. Broadly, both profits (after depreciation) and the number of vehicles sold in 1952 were within one per cent of the 1951 figures; the value of the group's sales increased from £70.2 million to £83.9 million (largely as a result of increased sales of such higher priced vehicles as the Zephyr models, diesel tractors and military trucks), but average profit margins were lower as the company made a general cut in prices in the middle of the year. These figures, however, conceal a substantial shift in the pattern of trade: unit sales abroad declined by 13 per cent and unit sales at home rose by 29 per cent. Incidentally, despite last year's import restrictions, Australia is still Ford's principal overseas market.

It is not surprising, therefore, that the chairman, Sir Rowland Smith, devotes much of his statement to a discussion of prospects in the domestic market. He believes that the last arrears of demand accumulated here since the war will soon be cleared up and that "the whole industry will again be on a fully competitive basis during the year 1953." Moreover, he reports—rather surprisingly—that Ford's rearmament orders have now been completed. Against this, however, sales in the first three months of this year were higher than those in the corresponding period in 1952, and the company has already prepared itself for a return to more competitive conditions. These preparations have included the reduction in prices, the introduction of a new tractor and, more recently, the plan to absorb Briggs Motor Bodies into the group. The cost of a car body represents about 40 per cent of total costs in manufacturing a car, so that the purchase of Briggs Motor Bodies may put Ford Motor into a strong position if any price war breaks out in the industry—

	Years to Dec. 31, 1951	1952
Consolidated earnings:—	£	£
Trading profit	11,203,715	11,797,028
Total income	11,871,821	13,095,518
Depreciation and obsolescence	1,302,740	2,318,331
Taxation	5,461,679	5,751,352
Net profit	*3,984,512*	*3,029,526*

£1 ordinary stock at 55s. 7½d. xd yields £5 8s. per cent.

although shareholders should note that it may be some time before the merger leads to any real technical economies in production. But Ford Motor is now well equipped to operate with trimmed sails if the need arises, and arise it may.

★

BRISTOL AEROPLANE. Ordinary shares in the aircraft industry, whose fortunes depend a great deal upon the flow of Government orders, have been one of the weakest features of the stock markets since the death of Stalin; indeed, since the beginning of March the *Financial Times* index of aircraft equity shares has fallen by about 16 per cent, compared with a fall of just over 3 per cent in "blue-chips" as a whole. In these circumstances, the big increase in ordinary dividends announced by Boulton Paul and the very small increase announced by Bristol Aeroplane have been regarded as a reflection of past performance and not as encouraging augurs for the future. Boulton Paul increased its dividend from 10 to 15 per cent, in line with an advance in gross profits from £94,022 to £107,744. Bristol Aeroplane effectively raised its ordinary dividend (once allowance has been made for the bonus issue of shares made last January) from 13½ to 14 per cent —by announcing a rate of 10 per cent on the revised capital of £4,620,000. This increase was made in the knowledge that in the year to December 31st Bristol's trading profits had risen from £1,930,289 to £2,316,427, but that its net profits—thanks largely to a bigger provision for depreciation—had fallen fractionally, from £566,573 to £563,829.

Bristol's increased dividend also follows a year that witnessed a depletion of its liquid resources. The group's cash balances have fallen from £2,743,241 to £696,458 and this balance is almost completely offset by a bank overdraft of £682,120. The reason for this strain upon liquid resources can be found in the increase in the book value of stocks and work in progress from £6,148,232 to £9,354,835. But it may also arise from the concentration of the group's energies on the development of the Britannia turbo-prop airliners, none of which has yet been delivered. The company's interests in the production of civil aircraft should afford it some protection against any slowing down in rearmament orders. It is for this reason, perhaps, that the very small increase in equity payments was followed by a rise in the price of the company's 10s. ordinary shares by 9d. to 17s.; at this price they offer a yield of 5⅞ per cent.

★

UNITED MOLASSES. In spite of a dip in profits last year, the directors of United Molasses have recommended a slightly—though only slightly—higher distribution to ordinary shareholders. They have proposed a total tax-free dividend of 10 5/6 per cent for 1952, on the present equity capital of £5,683,500; this compares with a tax-free interim dividend of 6¼ per cent in 1951 on a capital of £3,909,000 and a final dividend at the same rate after the capital had been increased to its present level by a scrip issue of ordinary shares. In effect, therefore, the gross equity dividend has been increased from 19.84 per cent in 1951 to 20.06 per cent in 1952, and on this basis the 10s. ordinary stock units at the current price of 28s. 9d. offer a yield of 6¼ per cent. The fall in the group's gross profits (from £8,186,344 to £7,360,426) can be attributed to a decline in earnings from the sale of molasses and, perhaps even more particularly, to the fall in cargo and tanker freight rates.

The directors frankly forecast that there will be a further decline in gross profits this year. But shareholders have no real cause for despondency. It has been obvious for some time that profits could not easily be maintained at or near their wholly artificial level of 1951. Indeed, the fall from that level last year was surprisingly small; the decline in net profits, from £2,452,650 to £2,072,942, was actually more than accounted for by the provision of £825,000 for EPL in the total tax bill of £4,086,628. There is no sign yet that the dividend, which absorbs £635,212 at its current level, is in danger.

★

HUDSON'S BAY. The full accounts of the Hudson's Bay Company for the year to January 31st last, and the report of the Governor, Mr W. J. Keswick, strengthens the two main impressions set down in these columns when the company's preliminary accounts were discussed three weeks ago. The first of these is that the present high price of the company's £1 ordinary shares (which yield only 2.9 per cent) seems to reflect unreasonable hopes about the possibility of the company's migration to Canada and about future earnings from its oil interests. Mr Keswick states flatly that no conclusive evidence has yet been produced to justify a change in the company's domicile; and he emphasises that "it will be some years before we take out more than we put into Hudson's Bay Oil and Gas Company," in which the parent company has invested $2,970,000.

The second lesson, however, is that the company's normal trading activities are going from strength to strength. In a year of unprecedented boom in Canada, the value of sales in Hudson's Bay retail stores—the principal source of the company's profits—rose from £27,971,893 to £32,260,284, and profits from these sales from £884,683 to £1,776,115; the value of sales in the company's wholesale department also increased (from £11,518,731 to £12,655,794), leading to an advance in profits from £290,136 to £333,247. Moreover—and this may be a significant pointer to the future—these increases in sales were apparently achieved without any serious addition to working capital commitments and were accompanied by a reduction in selling costs. The only disappointing feature last year was one of the periodic slumps in the fur trade—profits from fur sales declined from £508,829 to £332,971, due wholly to a drop in prices—but this line of business can now be regarded as little more than a sideline to the company's retail interests. Another heartening fact for shareholders is that the undistributed balance in the land account is sufficiently large to permit the directors to continue the annual tax-free bonus (at the present rate of 2½ per cent) from this account for about another eight years; at the end of this period royalty income from oil should go some way to offset the loss of these bonuses.

Consolidated earnings	Years to Jan. 31, 1952	1953
	£	£
Trading profit	2,473,876	3,252,904
Total income	2,566,974	3,656,227

COMPANY MEETINGS

THE CUNARD STEAM-SHIP COMPANY, LIMITED

RESULTS OF 1952 GIVE REASONABLE CONFIDENCE AND HOPE

STATEMENT OF THE CHAIRMAN

Mr F. A. Bates, Chairman of the Company, in a statement to stockholders for submission at the seventy-sixth annual meeting to be held on May 20th, says:

Before dealing with the accounts and reviewing operations I should like to refer to the impending retirement from the board of Mr J. R. Rooper and Mr Charles E. Pierce, and to the appointment since the last meeting of Mr A. Rigby Hughes, Mr R. H. Senior and Mr R. J. Lockett as new directors.

"We are a team of many thousands—with our eyes looking seaward for our living and our trade—with our hearts in the science of ships and in the art of their operation." These words from my statement at the 1948 annual meeting were never more true than they are today.

In storms and hazards from which no skill or watch—save by the Grace of God—can keep a shipping company completely clear, it is this same teamwork guided by tradition and the discipline of experience which remains the finest aid we can have to our company's navigation, both at sea and in finance. I thank all for their part in these far-reaching teams—the ships and offices and agents all over the world.

The stockholders themselves are members of the team and by adventuring their capital in sea trading, they play a part essential to the life and development of the British Isles and Commonwealth. Being an islander, my own feeling is that it is good to have a living interest, however humble, in British ships and so to take part in our sea trading venture with all the thousands of the staffs and stockholders to whom I pay tribute today.

In the 1952 accounts the surplus at £3,624,648 is £273,000 higher than in 1951 after including £4,557,691 for taxation, a figure which is itself £864,000 higher than a year ago.

The results of the year give reasonable confidence and hope. Though costs have been swelling in most directions, all services have had some success. Even in services where trade has at times faltered and competition increased, the steady and united endeavour to give service has brought a reward. The surplus is a little higher than 1950, considered a peak year, but the 1950 results were earned with less tonnage and less competition than in our operations today.

OVER-TAXATION AND RENEWAL OF SHIPS

It must again be emphasised that the allowances permitted against the tax computation of profits provide an insufficient money total each year to pay for the renewal of the ships as they wear out. The result of this too small allowance is simply to swell the taxable computation and to take away as tax some part of receipts which should by every provident standard be retained for fleet renewal.

This is a grave matter for our country—an island with limited acres and a growing population—and particularly is it grave for the shipping industry if over-taxation of current profits brings to an end the continuing renewal of the ships in every class of British trade, including the tramps. It is clear beyond doubt, from the pronouncement of all shipping authorities, that the future of our tonnage is already being endangered by the impossibility of setting aside enough money to provide for the heavy costs of replacement under current conditions in the shipbuilding yards.

To spend in taxes money that should be replacing the hulls and engines, augmenting the fleets and conducting the commerce by which an island lives is far worse than just going to sleep and letting the cakes burn.

The figure of £1,312,039 retained by subsidiary companies, this year works out at £138,000 less than in 1951. It is needed for maintaining the fleets. The current cost of a large and fast ship specially refrigerated and fitted for the Australian and New Zealand trades, is now upwards of £1,750,000 and some quotations at the present time are even more.

HEAVY COSTS OF REPLACEMENT

In provision for pension funds is the item of £460,000. The transfer to Cunard reserves is £1 million, the same as last year. Taxation at £4,557,691 is not exactly comparable with last year. Any comparison is affected by variable. factors such as initial allowances, alteration in rate of income tax, larger operating surplus and changed rate of profits tax, which tax is not now deductible when computing profits for income tax purposes.

In the consolidated balance sheet, general reserves are increased to £31,528,000, a rise of £2,520,000. The increase indicates the company's efforts towards making good the present inadequate wear and tear allowances in the tax computation. The figures are large, but it is questionable if they are large enough when the problem of tonnage replacement under present and prospective contracts is considered in the light of estimated costings in British shipbuilding yards. Fixed assets this year are at £31,851,772, £1,103,000 less than last year. Instalments on new tonnage will later have an increasing effect as they are brought into the accounts. Cash at £21,163,760 and tax reserve certificates at £3,905,000 are further evidence of gathering resources which are so essential for the problems including taxation and the shipbuilding contracts which lie ahead.

The final dividend proposed for 1952 is 13½ per cent, or a total of 16 per cent including the interim already paid. This for a shipping company may be regarded as a satisfactory result. The company's dividend policy over recent years has been to strive for a steady course which will strengthen its financial foundations and enhance its credit. The carry-forward is £1,253,888, being £97,181 more than last year.

£15,425,000 SHIPBUILDING PROGRAMME

The new chapter of our shipbuilding is proceeding smoothly, with careful regard to developments in naval architecture and engineering. The only aspect of it which continues to cause concern is the growing cost of construction. In effect, for every step up the ladder of costs, all the past reserves laid by during the lifetime of the present ships have to step down the ladder which reaches to replacement. And so is placed an increasingly severe burden on each current year's trading, to make up the deficiency.

The first of the three new ships for our Mediterranean service—one of the company's oldest services—was launched and named "Pavia" a few weeks ago by Mrs F. H. Dawson, the wife of our director. It is hoped that this ship will begin her service this summer. The other two will follow her in due sequence. Of the two new large ships for our Canadian service, the keel of the first has been laid and that of the second is expected to be laid in the Coronation month of June.

The Port and Brocklebank Lines are equally active. The former have three fast, modern refrigerated ships building specially for Australia and New Zealand, while the Brocklebank Line have three new ships under contract for the requirements of India, Pakistan and Ceylon.

The problem of replacement can never be neglected by a shipping company and in every department of our organisation there is preparation, with all possible initiative and scientific research, to ensure that our shipbuilding contracts, present and prospective, shall lack nothing for want of experience and enterprise in naval architecture and marine engineering.

The estimated obligations under contracts presently signed amount to £15,425,000 but plans for the future are constantly under consideration which could greatly increase this figure. Much depends on the processes of tonnage replacement and the trend of costs in the shipbuilding yards.

OVER 270,000 PASSENGERS CARRIED

The ships of the Cunard group of lines had a busy year; they steamed 3,869,000 miles and carried 3,160,000 freight tons; passengers carried during the year numbered over 270,000.

In the North Atlantic, prospects for passenger traffic during the coming Coronation season are good. World trading conditions affect the cargo business of the group's services in varying ways. In the North Atlantic, outward cargoes are presently good, but there is a shortage homeward. The same conditions apply in the India, Pakistan, and Ceylon trades, but in the Australian and New Zealand trades the reverse is the case. With such varying conditions in the different trades it is difficult to forecast results. However, experience has taught that fluctuations in commerce can be sudden, and growing crops and increased production could improve cargo conditions generally.

We are an island people. It is, therefore, natural that we should look ever seaward and beyond for our living and trade. Without British merchant shipping we would continue to look in vain.

In all operations and in what has come to be known as the North Atlantic Ferry, the Cunard Company, now in its one hundred and thirteenth year as a unit of British shipping has continued extending old ties of friendship and forging new ones between our ships, offices and agents and supporters throughout the world.

It is in such spirit of friendship and in continuing endeavour to give the service which it inspires that the mainspring of Cunard fortunes, present and future, rests.

COMMERCIAL UNION ASSURANCE COMPANY, LIMITED

EXPANSION OF PREMIUM INCOME

LT. COL. JOHN LESLIE'S SURVEY

The annual general meeting of the Commercial Union Assurance Company, Limited, will be held on May 18th in London.

The following is an extract from the review by the chairman, Lt. Col. John Leslie, of the report and accounts for the year 1952:

During the year our premium income has continued to advance, and in the fire, accident and marine departments alone exceeds £48 million. I recall that in my first review as chairman, which covered the operations of the company for the year 1948, I mentioned that the fire and accident premiums amounted to £29½ million, of which £19½ million was in respect of business transacted outside the borders of this country. Today the respective figures are £45¼ and £32½ million—a truly remarkable achievement, of which we can be justly proud.

The fact that such large sums are involved inevitably attracts attention to our financial resources and our importance as a financial institution. The statement of our total assets, which now amount to over £138 million, gives additional emphasis to this conception of our organisation; but if a proper appreciation of our affairs is to be obtained, it must be realised that our fundamental business is that of insurance and that our financial operations are supplementary to this.

I will now refer to the departmental accounts.

FIRE DEPARTMENT

	£
Net premium income, 1952.....	21,771,090
Net premium income, 1951.....	21,270,843
Increase	£500,247

The ratio of claims paid and outstanding was 43.75 per cent, commission absorbed 19.99 per cent, and expenses of management accounted for 22.88 per cent. After adjustment of the reserve for unexpired risks, there was an underwriting profit of £2,712,428, of which £2,500,000 has been transferred to profit and loss account. The fire fund now amounts to £18,815,020 or 86.42 per cent of the premium income.

The continual growth of our fire premiums is a source of special satisfaction to us, particularly in view of the fact, so well known, that it was to undertake fire insurance business that our company was originally formed.

At home there was a further advance in the premium income, but at a slower rate than in the previous year. In many directions values tended to fall, particularly in the textile industries, and there was a corresponding reduction in sums insured.

Overseas, where the greater part of our fire business is transacted, there has been a steady expansion of premium income in nearly all the terrorities in which we are represented.

LIFE DEPARTMENT

A new record figure was established for net sums assured retained at the company's own risk, after allowing for reassurances given off. The gross sums assured for 1952 totalled £17,677,560, compared with £17,443,069 for 1951, and only once previously has the former figure been exceeded.

During the year the life fund increased by £1,836,890 to £44,205,389, after providing a further £800,000 in addition to the tentative provision of £1,100,000 made last year to cover depreciation of investments on a strict market price valuation.

The net premium income in respect of life assurance contracts was £4,421,824 (1951, £4,063,126) and, in addition, we received £731,364 as single and annual premiums for various types of annuity contract. Commission and expenses absorbed 12.9 per cent of the life assurance income, compared with 13 per cent for 1951. Death claims and matured endowment assurances required £816,064 and £1,694,145 respectively (1951, £768,458 and £1,526,714) and £361,265 was paid upon the surrender of life policies and bonuses (1951, £316,177). Death claims were very much below the figure for which provision had been made by the company's valuation tables and in this respect the experience of 1952 was easily the most favourable to date.

MARINE DEPARTMENT

	£
Net premium income, 1952.....	2,786,921
Net premium income, 1951.....	2,549,701
Increase	£237,220

ACCIDENT DEPARTMENT

	£
Net premium income, 1952.....	23,764,785
Net premium income, 1951.....	20,440,921
Increase	£3,323,864

The ration of claims paid and outstanding was 56.65 per cent, commission 18.32 per cent, and expenses of management 17.93 per cent. After adjustment of the reserve for unexpired risks, there remained an underwriting profit of £356,737, or 1.50 per cent of the premium income. The accident fund now amounts to £15,351,880, or 64.60 per cent of the premium income.

Our business at home has continued to expand with all the principal classes making substantial contributions.

In the Commonwealth and the overseas field generally a striking advance in premium income has been made, coupled with an overall improvement in the claims experience.

PROFIT AND LOSS ACCOUNT

Gross interest, dividends and rents continue to increase and now exceed £2½ million. The transfer from fire revenue account at £2,500,000 is £650,000 more than last year's, largely due to the smaller reserve requirement on the 1952 premium income. The reverse has occurred in the accident revenue account, where the substantial rise in the premium income has involved such increases in the reserves that it is only prudent to leave the whole of the year's profits in the accident insurance fund.

Notwithstanding the immense burden of taxation, the directors have given careful consideration to the question whether there should not be some increase in the distribution to the stockholders. I am glad to say that they have no doubt on that score and are, therefore, recommending a final dividend for 1952 of 6s. per unit of stock, making, with the interim dividend of 4s. paid in November last, a total for the year of 10s. per unit of stock. The balance available in the appropriation account, after providing for this dividend, is sufficient to allow an increased transfer to contingencies and taxation reserve of £450,000 and raise the carry-forward by £7,720 to £727,661.

INTERNATIONAL NICKEL OF CANADA

ANOTHER OUTSTANDING YEAR

The annual meeting of this Company was held on April 29th at Toronto.

Dr John F. Thompson (the chairman), in the course of his address, said: Nineteen fifty-two was another outstanding year in the company's history. For the third successive year we maintained production at capacity and supplied more than 75 per cent of the nickel used by the free world. In the last three years, in response to an unprecedented demand, the company delivered a total of nearly 100 million pounds more nickel than the amount which we delivered over any prior three-year period, exclusive of World War II. Our 1952 deliveries of nickel in all forms totalled 249 million pounds, an increase of more than 5 million pounds over 1951.

During the year wages were again increased in general conformity with the wage pattern in the three countries in which we operate. The costs of supplies and services, such as freight and electric power, also rose.

Throughout the year the price of nickel remained unchanged at the level prevailing during the latter half of 1951. On January 14, 1953, however, and pursuant to earlier discussions with the governmental authorities at Ottawa, the price was raised 3½ cents (United States) per pound. This brought our United States price for electrolytic nickel to 60 cents per pound, including the 1½ cents United States import duty. Substantially equivalent prices were made effective simultaneously for our Canadian, United Kingdom and other markets.

The company has consistently endeavoured to maintain a strong cash position. In the light of the world-wide inflation which has characterised the postwar period, this policy has proven to be well justified. With the continued rise in costs, including wages, more cash is required to carry on our operations and to defray the expense of our capital expenditure programme.

PRODUCTS

Distribution of nickel throughout the year was made internationally in accordance with allocations recommended by joint action of the Canadian and other member Governments of the International Materials Conference.

Deliveries of refined copper in 1952 of 234,300,000 pounds closely approximated those of 236,900,000 pounds in the previous year. Our Canadian consumers, as in 1951, received 55 per cent of the total. The remainder continued to be marketed in the United Kingdom, the United States and Continental Europe.

Following the release of copper from price control in the United States in February of this year, the Canadian Government discontinued its official policy with respect to the price of copper for consumption in Canada. Thereupon, your company increased its price to domestic consumers in Canada from the previously existing 29½ cents (Canadian) per pound to 33½ cents (United States). This brought our domestic price into conformity with the price at which the United Kingdom Ministry of Materials had been buying copper from Commonwealth producers.

Deliveries of platinum metals totalled 287,000 ounces in 1952, compared with 375,000 ounces in 1951, and 267,000 ounces in 1950.

In conclusion, your company is in a strong position, both in material resources and in skilled and experienced personnel, to successfully continue its task.

The report was adopted.

GENERAL ACCIDENT

FURTHER SATISFACTORY PROGRESS

The sixty-seventh annual general meeting of the General Accident Fire and Life Assurance Corporation, Limited, will be held on May 20th.

The following is an extract from the circulated address by the chairman, Sir Stanley Norie-Miller, Bt, MC, JP:

Further satisfactory progress in the volume of business undertaken has been accompanied by increased profit balances in the underwriting accounts. The net income from all sources amounted to £39,885,202, an increase of £4,715,661, and the balance for the year amounted to £1,401,116. Appropriations have been made to reserves and pension funds calculated on the usual basis, and the directors recommend a final dividend of 4s. per share on the ordinary shares, making the total dividend 6s. per share as against 5s. for the previous year.

The gross new life business completed during the year was slightly in excess of the corresponding figure for 1951, but, as a result of reassurances, the net figure shows a small decrease. The life and capital redemption funds now amount to £12,171,668.

Our business in the United States of America has again made marked progress and our assets there now exceed $110,000,000. The assets of the group now amount to £64,126,017, being an increase of £5,902,388.

The "General Accident" can be proud of its fine record in keeping pace with insurance needs, and through its integrity and capacity for valuable service has won the confidence of the public wherever we operate. We can look to the future with confidence in continuing progress and success.

BIRMINGHAM RAILWAY CARRIAGE AND WAGON COMPANY, LIMITED

STEEL SHORTAGE AFFECTS RESULTS

The ninety-ninth annual ordinary general meeting of this company was held on April 29th at Birmingham, Sir Bernard D. F. Docker, KBE, the chairman, presiding.

The following is an extract from his circulated statement for the year 1952:

The results of the year are less favourable than for any of the previous three years, despite the fact that the monetary value of sales constitutes a record. The main cause was our inability to employ our works to their full capacity, due to shortage of materials, particularly steel. The lower production at increased cost is responsible for the reduction of £137,498 in the profit.

Once more I would point out that the small improvement in sales does not reflect increased production but increased costs following advances in wages, steel, coal and transport charges which, in turn, forced up the price of the many other materials and components incorporated in carriages and wagons. I am very perturbed lest such increases seriously prejudice this country in markets abroad, facing as we do increasing competition from the Continent and Japan, where comparative production is at a much higher rate than in this country.

An increase in the country's production is even more important today than ever before if we are to maintain the high standard of high living to which we, in Britain, have become accustomed and which is in peril unless we expand our exports.

The report and accounts were adopted.

ALBERT E. MALLANDAIN

ABNORMAL CONDITIONS

The sixteenth annual general meeting of Albert E. Mallandain Limited was held on April 29th in London, Mr Albert E. Mallandain, chairman and managing director, presiding. The following is an extract from his circulated statement for 1952:

The aggregate net profit for the year under review amounted to £59,414, compared with £126,978 for the previous year. The aggregate net profits, after taxation are £20,543 compared with £50,818. When making these comparisons, however, it must be borne in mind that the profits for the year 1951 were an all-time record for the company, including as they did, profits from stock appreciation as a result of rising values of raw materials. As a natural consequence of price reductions, a certain amount of consumer resistance was encountered. Considering the difficult and abnormal conditions your Board are of the opinion that the results now placed before you may be considered as satisfactory and, in view of the greater degree of stability again recommend a dividend of 50 per cent, less tax.

It is difficult under present trading conditions to gauge the trend of business a long way ahead, but the state of our order book is healthy and full production for some time ahead seems assured. The company's reserves and the assets which they represent are a sound foundation upon which our several well-equipped departments have been built up, and if we can experience a comparable degree of stability in wages and overheads, and if the burden of taxation can be lightened, I look forward to the results of this Coronation year with reasoned confidence. The report was adopted.

GENERAL REFRACTORIES LIMITED

GENEFAX HOUSE, SHEFFIELD, 10

A comprehensive range of refractories serving all industries is produced by the Company and its Subsidiaries at their Works and Quarries situated in many parts of England, Scotland, Wales, and in Belgium. Research and technical field service facilities are available. The Company has Offices and Representatives throughout the United Kingdom and Agents in all parts of the world.

SUMMARISED CONSOLIDATED BALANCE SHEET OF GENERAL REFRACTORIES, LTD., & SUBSIDIARIES.

Based on figures as at 31st December, 1952.

	£		£	£
Issued Capital	1,040,000	Fixed Assets	2,805,009	
Capital Reserves	196,922	*Less* Accumulated Depreciation	1,471,611	
Revenue Reserves and Unappropriated Profits ...	600,492			1,333,398
Liabilities	1,372,825	Trade Investments		5,092
		Current Assets...		1,871,749
	£3,210,239			£3,210,239

SUMMARISED APPROPRIATION ACCOUNT OF GENERAL REFRACTORIES, LIMITED.

	£
Profit for year after providing for Depreciation, Taxation, etc.	166,198
Net Distribution for year to Stockholders	81,900
Retained in the business	£84,298

EXTRACTS FROM THE CHAIRMAN'S STATEMENT

I am happy to tell you that your company has again experienced a very satisfactory year's trading. At nearly all the works our manufacturing resources have been stretched to the utmost and many fresh tonnage records were established. The recession in trade which affected many industries in 1952 had little or no effect upon the company as our principal customers are in the steel industry which continued to be exceptionally busy and for which even higher tonnages are forecast for the current year.

As you are aware, there has been for many years an annual increase in the turnover of the group, and I am pleased to report that for the year under review there was a further expansion in sales both for the home and export markets.

The group trading surplus for 1952 amounted to £634,741, a fresh record in the history of the group. All subsidiary companies contributed their share to this excellent result. Your directors recommend the payment of a dividend of 15% (less income tax at 9*s.* 6*d.* in the £).

The amount provided for taxation in the group amounts to £295,038, an increase of £37,976 over the 1951 figure. Despite the heavy drain by the tax authorities and substantial capital expenditure, your company is in a strong financial position.

Copies of the Accounts and Chairman's Statement may be obtained from the Secretary, Genefax House, Sheffield, 10.

HOFFMANN MANUFACTURING COMPANY, LIMITED

RECORD TURNOVER

The annual general meeting of this company was held on April 30th in London, Mr J. W. Garton, chairman and managing director, presiding.

The following is an extract from his circulated statement:

The year 1952 which is now under review was one of tremendous activity. The turnover during the year reached a record level whilst production continued at its highest rate. The profit of the Hoffmann Group for the year 1952 before taxation but after all other charges amounts to £1,469,061 and compares with £1,088,337 for the previous year. The net profit of the group for the year 1952 after taxation is £466,074, and compares with £470,668 for 1951.

The record profit during the year was achieved under exceptionally favourable circumstances, namely, a full order book, a high rate of production, sound planning of our supplies of raw materials and first-class labour relations.

During 1952 there were advances in the cost of materials and in wages, and these have been carried in part by increased productivity; the wage award at the close of the year and increases in cost of raw materials have been borne in part by the company and not passed on to our customers.

Your directors consider that they are justified in recommending a final dividend of 10 per cent, free of tax, which together with the 5 per cent paid as an interim is an increase of 2½ per cent, free of tax, on last year. They are also adding a special cash bonus of 2½ per cent, free of tax, on account of the exceptional results.

Hoffmann Gloucester, Limited, has also had a year of intense activity and by its increased output helped the group to achieve its record result. Hoffmann Tweedales, Limited, in which Hoffmann Gloucester, Limited, has a 50 per cent holding, has had a satisfactory year.

FACTORS IN THE OUTLOOK

Your company supplies its products to nearly every industry in the country and the demand on us can be taken as a guide to general trade conditions. We have found over this last six months that the incoming orders have been considerably less than the deliveries and this situation, while healthy from the point of view of a shortened order book, will if it goes on too long become a serious matter. In addition, we have received several very heavy cancellations while customers readjust their production programmes.

There is no doubt the balance of profit left with companies after paying the very high taxation leaves little for capital development out of their own resources. In our own case the high cost of plant today compared with the prices immediately prior to the war means that we get one machine instead of two. This is bound to have a slowing up effect on the rate of replacement which must affect trade generally.

Although your directors have every confidence for the future it must be realised that in 1953 we cannot equal the record level of 1952, but have taken every possible step to enable the company to trade successfully in the much harder and more competitive times ahead.

The report was adopted.

STANHOPE STEAMSHIP COMPANY

SATISFACTORY RESULTS

The first annual general meeting of Stanhope Steamship Company, Limited, was held on April 23rd in London. Mr J. A. Billmeir, FICS (the chairman), presided, and in the course of his speech said: The profit on ships' trading is £769,671, after charging all business expenses. In this connection it will, no doubt, be within your knowledge that soon after the inception of the company there occurred a severe setback in freight rates for dry cargo tonnage, and whilst there has been some subsequent improvement in that respect, there is now a pronounced fall in tanker rates of freight. Considerable loss of earnings has also been suffered through ships being out of commission for various reasons. The directors consider that the result now shown is in all the circumstances very satisfactory.

The balance of profit after bringing in profit on sale of investments and bank interest and debiting directors' emoluments and auditors' remuneration is £770,680.

Taxation takes no less a sum than £455,000, including £99,000 excess profits levy, the impact of which was unpredictable at the beginning of the year.

So far as the future is concerned, two of the tankers are chartered for some time ahead at remunerative rates, and in general I am of the opinion that our modern and well-maintained ships will be able to earn a fair reward for their services in the future.

The report was adopted and the dividend of 7½ per cent, less tax, was approved.

AMALGAMATED BANKET AREAS, LIMITED

The seventeenth annual general meeting of Amalgamated Banket Areas, Limited, was held on April 29th in London, Major-General W. W. Richards, CB, CBE, MC, chairman, presiding.

The following is an extract from his statement:

The net profit for the year ended September 30, 1952, £139,819, added to the balance of £202,867, brought in from the previous year, gives a total to the credit of profit and loss account, before appropriations, of £342,686. A dividend of 5 per cent, less income tax, is recommended, absorbing £75,729 and leaving a balance of £196,559 to the credit of profit and loss account.

The total ore reserves are computed at 3,979,173 tons. Of this tonnage, 2,054,033 tons averaging 5.553 dwts over a width of 40.465 inches represents the underground ore; and 1,749,208 tons averaging 1.966 dwts the surface deposit at Pepe; the balance of 175,932 tons at 0.757 dwts being the value of the parting reef at Pepe.

The technical reports and data accompanying the annual report give a fair picture of the magnitude and importance of the company's operations. It has been vital to our success that the utmost care and vigilance be unceasingly exercised by our able management in West Africa.

The current year should see the completion of the ambitious programme laid down at the date of amalgamation in March, 1950. Technically, the various steps for bringing into production the Tamsoo and Fanti Mines have proceeded smoothly according to plan.

The report and accounts were adopted.

JOHN BARKER AND COMPANY

IMPROVED TRADING RESULTS

The sixtieth ordinary general meeting of John Barker and Company, Limited, was held on April 24th in London.

Mr Trevor A. Bowen, DL, JP (chairman and joint managing director), in the course of his speech, said: As regards the trading results of the Barker Group, I am able to report a net profit before taxation of £666,357. Of this amount taxation absorbs £381,374 (or, say, 57½ per cent), leaving a balance profit of £284,983. These results compare with a net profit of £624,415 last year, less taxation £367,591, leaving a balance profit of £256,824.

The trading year has, broadly speaking, seen a process of slow recovery after a period of acute depression. The abandonment of the Utility Scheme and the introduction of the "D" Scheme did much to improve trading conditions, but industry generally was still burdened by numerous Orders and Regulations governing supplies and prices. Many of these have now ceased to exist. With the object of giving further relief to trade, concessions were made by the Board of Trade, at various times during the year, by reducing purchase tax on a number of goods.

The further reductions in purchase tax brought in by the Chancellor in his recent Budget will involve additional heavy loss to the company. From the customers' point of view, however, I heartily welcome these reductions, and the prospect of an increase in trade.

The report was adopted and the total distribution of 22½ per cent was approved.

OLDS DISCOUNT

EXTRACTS FROM THE CIRCULATED STATEMENT OF THE CHAIRMAN MR W. A. OLDS

Our assets are now £5,621,296, while the Reserves and Credit Balance of Profit and Loss Account total £670,419, being equal to 186.2 per cent of the Equity Capital. The operating profit for the year has increased to £282,273 before tax.

We have received a 20 per cent dividend from our £50,000 Investment in T.I. Cycle Credit Facilities, Limited, the company jointly owned with Tube Investments, Limited.

We have recently enlarged the scope of our business by opening new branches, commencing operations in Eire, and forming a subsidiary company in British West Indies. These developments may prove to be the source of considerable increase in our activities and be the forerunners of others.

RECORD OF PROGRESS IN STAGES DURIN LAST 15 YEARS

	Profit before Taxation	Ordinary Dividend Paid (Net)		Profit Retained after Taxation
	£	%	£	£
1938 ...	23,363	13¾	9,969	1,438
1945 ...	53,873	15	10,100	15,273
1948 ...	138,579	20	27,500	24,951
1952 ...	282,273	22½	43,875	52,648

The 22½ per cent Ordinary dividend paid for 1952 represents 7.8 per cent (gross) on the Ordinary Stock and Reserves.

RALLI BROTHERS LIMITED

SUBSIDIARIES' CONTRIBUTION TO RESULTS

GROUP'S POSITION MAINTAINED IN DIFFICULT YEAR

MR JACK VLASTO'S STATEMENT

The annual general meeting of Ralli Brothers Limited will be held on May 26th in London.

The following is the statement by the president, Mr Jack Vlasto, which has been circulated with the report and accounts: In my statement a year ago, I referred to the favourable results achieved in our merchanting business during the early months of our 1951-52 financial year and also to the setback in trade which made itself felt so acutely in February, 1952. As it turned out, the whole of the second half of our year to August 31, 1952, was a most difficult period for our merchanting departments. It included much of the heavy tumble taken by commodity prices and of the spell of inactivity and dislocation in many world markets which were the sequel to previous overbuying. Against this unfavourable background, the liquidation of old contracts, on which, by shipment time, there was often a substantial market difference compared with replacement value, proceeded remarkably smoothly; however, in a number of cases we were obliged to make concessions or extend deliveries to overseas buyers. Even now, we have not by any means seen the last of the problems arising from the price fall and have, therefore, thought it necessary to make a provision in our accounts of £200,000 against various doubtful outstandings. All things considered, however, it is indeed satisfactory that the final profit from this year of ups and downs is sufficient to pay maintained dividends and to cover the provision referred to, while the reserves, to which we added so materially in the previous accounts, in order to meet the storm which loomed ahead, remain intact.

SUBSIDIARY COMPANIES' RESULTS

In the past, the consolidated trading profit has not been materially affected by the results of our present subsidiary companies. On this occasion, however, our subsidiary companies, thanks to record results by two of them, account for over 40 per cent of the total for the group of £1,843,744. The Maritime Shipping and Trading Company, Ltd., taking full advantage of the high rates ruling for ocean freights during their year ended March 31, 1952, contributed close on £370,000 to this total, while Ralli Estates, Ltd., taking equal advantage of the high prices obtainable for sisal, contributed about £390,000. Both these subsidiaries are adding substantially to their capital assets. The liquid resources of the Maritime will be sufficient to defray the full cost of the new ship, *Appledore*, which is being delivered very shortly, and will go a long way towards paying for the other new ship on order. The board of Ralli Estates have placed £200,000 to development reserve against estimates of expenditure for extensions to labour and staff housing, extensions to one factory, the complete rebuilding of the other factory and the first stages of development of the virgin forest areas.

Of our other subsidiaries, Berg River Textiles, Ltd., have felt their share of difficulties which befell the cotton textile industry and our associated company, Rallis India, Ltd., encountered merchanting setbacks in the early months of 1952. Neither of these companies paid any dividend on their ordinary shares for the year ended August 31, 1952, and, in consequence, the 1952-53 profit and loss account will not receive any income from these investments.

THE OUTLOOK

On the last two occasions I have not found it difficult to give a fairly accurate line on the forward prospects, but this time comment on our 1952-53 year is more hazardous. After a poor start, our merchanting business tended to improve, although not to the extent we should have liked. In volume we may reach a turnover of £40 million, but, while conditions have certainly become more stable, competition everywhere has become intense and the margins obtainable are small. Despite the fall in freight rates and in the price of sisal, both the Maritime and Ralli Estates should show satisfactory results, but not, of course, comparable with last year's records. Berg should do better and Dehns (Africa), Ltd., have found more demand from East Africa for their Kangas. While I therefore anticipate a reduction, perhaps appreciable, in the consolidated trading profit, provisions for taxation and doubtful outstandings which, for several reasons, were exceptionally onerous last year, should on present indications call for a considerably smaller proportion of the profit.

Our thanks are again due to our staff in all parts of the world for their continued wholehearted efforts to further the interests of our company.

THE TIMES FURNISHING (HOLDINGS)

CONTINUING SUCCESS

The fifth annual general meeting of The Times Furnishing (Holdings), Limited, was held on April 30th in London, Mr Henry Jacobs (the chairman) presiding.

The following is an extract from his circulated statement:

The total book value of current assets was £2,979,717, which exceeded current liabilities, provisions and bank loans by £1,698,678, an increase of £229,356 over the previous year's figure.

The combined profits of the group for the year were £704,759, an increase of £64,322 over the previous year.

After providing for all taxation, including an additional provision of £90,000 to meet the Excess Profits Levy, there remains £221,179, this amount being £16,471 less than the previous year, when no EPL was imposed.

During the year under review, as compared with the previous year, turnover of the furnishing business declined in the first six months, but increased during the remainder of the year. Turnover of the Willerby business improved consistently throughout the year.

The year's profits of the tailoring business showed a gratifying improvement; a noteworthy achievement in what was, in fact, a year of much anxiety in that trade.

Your directors are pleased to recommend the raising of the dividend to 25 per cent, less tax, for the full year, and a capital scrip bonus of one ordinary share for each ten of such shares held.

The trading experience during the first quarter of the current year in both the furnishing and the tailoring subsidiaries has been most satisfactory, and the directors feel justified in anticipating another year of continuing success. Your board has been most ably and loyally supported by the staffs, to whom its best thanks are extended.

The report was adopted.

THE LIVERPOOL AND LONDON AND GLOBE INSURANCE COMPANY, LIMITED

Record fire, accident and marine premiums at £28,782,000 and record new life business at £7,400,000 were figures given in a statement issued by the chairman Col A. C. Tod, CBE, TD, DL, with the 117th annual report and accounts of The Liverpool and London and Globe Insurance Company, Limited.

Underwriting profit at £1,231,231 (4.28 per cent of the premiums) represented a figure only once previously exceeded by the company.

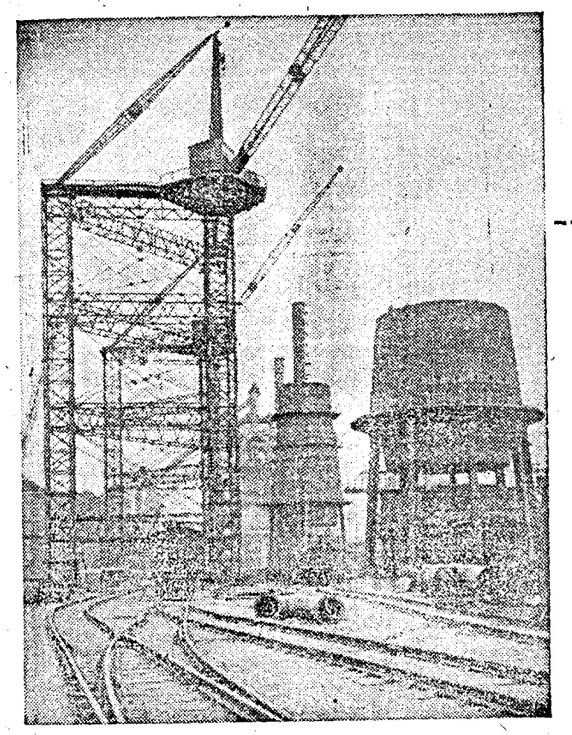
The chairman said the success of British Insurance abroad was in no small measure due to its quality; to its financial strength, experience, and the confidence it inspired. It avoided difficulties which might beset the exporter of material goods—there was no delay in delivery date, for branches, agencies and officies at strategic points throughout the world met the insured's needs immediately; there were no "packaging" difficulties; the policy form used was traditional in the local market, the language, currency, terms and conditions used were all local, and thus assisted the companies in establishing that confidence on which the success of the business was founded.

A final dividend of 19s. 6d. per share is recompended, making 37s. for the year (against 35s. for 1951).

EBURITE CORRUGATED CONTAINERS

SATISFACTORY RESULTS IN MORE NORMAL TRADING YEAR

The ordinary general meeting of Eburite Corrugated Containers, Limited, was held on April 30th in London, Mr J. F. Fielding, the chairman, presiding.



The following is an extract from his circulated statement for the year to December 31, 1952:

The substantial rise in raw material prices came to an end early in 1952, with the result that the trading year has been carried through under very different conditions from those prevailing in 1951. In the circumstances, your directors consider the results satisfactory in a year in which trading had become more normal.

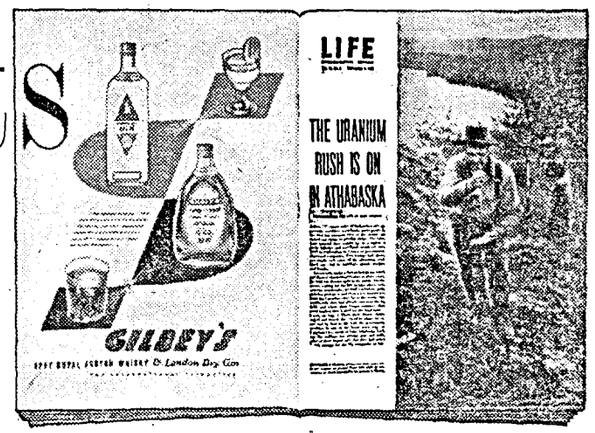
The net profit on trading for the year, 1952, amounts to £151,714, as compared with £277,781 for the previous year. Your directors propose a final ordinary dividend of 2s. per share, less tax, making 2s. 6d. per share for the year.

Your directors propose to increase the authorised share capital of the company to £750,000 by the creation of 1 million additional ordinary shares of 5s. each and that £191,125 should be capitalised out of the undivided profits of the company and that such sum be applied in paying up in full at par 764,500 of the unissued ordinary shares, to be allotted and distributed to existing ordinary shareholders. This distribution is equal to one new ordinary share for every two ordinary shares held.

Under present conditions, it becomes increasingly difficult to give any indication of future trading, which is affected by so many circumstances beyond our control. The improvement in trading conditions which be-

PGC ABP

With over fifty years experience in the design, manufacture and erection of process plant and equipment these two companies have expanded their business in every continent.



The Power-Gas Corporation Limited have recently completed the construction of the largest fertiliser factory in India and one of the numerous gas plant installations on hand is an extension to the largest gas works in the world.

Amongst their other activities Ashmore, Benson, Pease & Company have been entrusted with the design and manufacture of twenty blast furnaces in the last ten years, including one at present in the design stage which will be the world's largest. — They are represented by subsidiary companies in Australia, South Africa, Canada and France.

Wage Restraint

IT is now certain that the engineering workers will claim a rise of 15 per cent in their rates of pay. The national committee of the biggest trade union concerned, the Amalgamated Engineering Union, endorsed this proposal on Wednesday, and the other unions in the engineers' confederation can be expected to fall in with it. The AEU also proposes to press for a shortening of working hours from 44 to 40 a week. The importance of the wage claim does not stop at engineering. The farm workers and the shop assistants had, indeed, got in ahead of the engineers, and the movement will now spread. During this summer British industry will face, once again, a general pressure for more money; an all-round advance in costs is threatened.

The engineers' claim must be judged against this background. It cannot be considered in isolation. There are, indeed, at almost every moment some groups of workers who, taken by themselves, can be said to have a strong case for more pay, for a rise in economic status relatively to other workers. They may have a special case based on equity, because their incomes have lagged behind in a period of inflation. Or they may have a case based on the needs of the national economy, because their industry requires to attract more labour. But such arguments are hard to apply to so many as three million engineering workers. The present pay claim applies not only to the engineering activities that are profitable and need expansion but also to many others of slight national importance, where the employers have little ability to afford higher wages. Why should the worker in a light engineering factory, making consumer goods with no export market, get a wage advance while textile workers—for example—stand still? A special case for an industry so large and so heterogeneous as engineering can be sustained only if it is very special indeed.

There is no such case. The engineers, as a whole, have not lost ground in the great transformation of the wages structure that has taken place since 1938. On the contrary, the latest figures of the Ministry of Labour show that the earnings of men in the engineering industry have increased since 1938 in almost exactly the same proportion as the earnings of the average adult male. The engineers' most recent rise—the 7s. 4d. increase granted last November—followed one of 11s. only twelve months earlier. Since last year's increase, the cost of living has risen by little more than one per cent.

No considerable increase in engineering pay can, therefore, be claimed on considerations of equity. Is there a case based on the second possible consideration—economic need? The output of many engineering products undoubtedly ought to be increased. This is particularly true of a variety of capital goods, both for export and for the re-equipment of British industry. But not only is the need far from uniform over the whole engineering field; it is also doubtful whether the markets even for much-needed equipment will stand an increase in prices. The necessary expansion of output, in face of growing competition, depends on keeping costs down. The only

circumstance in which an increase in wages could safely be granted would be if it followed on an increase in general productivity actually realised.

The engineering unions have, therefore, no special case. The moral status of their claim is the same as its practical status: the engineers should get a rise, as in fact they will get a rise, only if it is part of a general advance in money wages. The engineers cannot argue their case realistically on any other basis. Are there, then, general reasons for a rise in money wages?

It is important to recognise that this question can now be asked. For years everyone has at least paid lip-service to the need for wage-restraint in a time of full employment and inflation. It was obvious to the Left as well as to the Right that by getting more money the unions would merely raise prices and, at the best, leave everyone where he was. This argument was plain; intellectually, if not in fact, it won the day. There is a temptation, everywhere except in the unions, to go on stating it by habit, in the same terms. That is no longer an entirely adequate answer to wage claims. Mr Butler in his Budget has endorsed the proposition that, with inflation checked, an increase in purchasing power may now make people better off. More money may not now simply chase the same quantity of goods; conceivably it may result in more production than there would otherwise be. The unions will certainly ask why, if this is true of tax reliefs, it should not also be true of wage increases. Similarly, the existence of just a little more unemployment gives a shade more credibility to the "militant" view that the benefits of higher productivity should be drawn out by the workers in the form of shorter hours rather than in lower prices, expanded output or higher earnings.

The case against these union claims, both for higher pay and for shorter hours, is every bit as strong now as it has ever been. But it is a slightly different case. It no longer rests mainly—as in the popular mind at least it has rested for six years—on the simple point about money chasing goods. The real case is that an economy so delicately poised as this cannot afford to add to its costs of production. The check to inflation and the improvement in payments overseas both rest on margins that are too narrow. What risks in expanding purchasing power may be taken, the Chancellor has already taken—and perhaps over-taken. No risks of raising the prices of British goods, in face of growing overseas competition, can be taken at all. Indeed, there is as much danger as ever that a general rise in wages will make the members of trade unions as a whole worse off—by reducing exports and in the end enforcing another devaluation, with a reduction in imports. And even if higher wages did no definite harm to the country as a whole, do the unions seriously think that they will give their members a bigger share of the same cake? Can either the investment outlays of industry or the real incomes of pensioners be squeezed enough to provide, even in the short run, any appreciable benefit to those workers whose wages rise faster than prices? Plainly, they cannot, and neither the unions nor the Labour party would want such a result if it were possible.

The unions have done remarkably well since the period of comparative wage restraint came to an end. Since the great rise in prices that began with devaluation and the outbreak of the Korean war, wages have kept pace with the cost of living. Real earnings are now slightly higher, if anything, than they were three years ago. Prices are at last comparatively stable, and the only threat to the living standards of the workers lies in the sort of economic disaster that insistence on big increases in money wages might help to create. The hope of being better off lies in increasing production and pushing up earnings close behind output, not in advance of it. That is not, admittedly, an easy formula for trade union leaders to put to their followers and to act on; but nobody has yet thought of anything except a reasonable restraint by the unions as the one possible way of combining full employment with collective bargaining—without a raging inflation.

Mr Dulles and the Arabs

BY OUR SPECIAL CORRESPONDENT

MR DULLES leaves Washington today for his tour of the Arab world. He will find it hoping for great results from this personal investigation; in particular he will encounter the hope that the United States will abandon President Truman's policy of giving Israel a Benjamin's portion of all its official aid to the Middle East. This is not to say that all the Arab-speaking states concentrate with equal intensity on this grievance; for beneath their superficial likenesses they remain highly parochial in their interests. Mr Dulles will find in the easterly, oil-bearing countries greater concern with turning new wealth into national advancement and social improvement, and in Egypt a greater concentration on "national aspirations," which entail getting rid of one foreign power while planning to borrow large sums of money from another. By contrast, in the states bordering Israel he will be confronted with the Arab-Jewish question in the living shape of the Arab refugees.

This flotsam of war has lately escaped the West's attention; but the Secretary of State's visit is a reminder that this is still one of the worst of the world's refugee problems. Living on the dole of the United Nations there are 874,000 listless indigents, plus a further 120,000 even more listless people on the barren hills near the Israel border, who have not lost

their homes—and therefore get no dole—but who have lost all means of earning what used to be a fair livelihood. These malcontents number more than half the population of Jordan and 11 per cent of that of Lebanon. Mr Dulles should find the time to leave sophisticated Beirut and inspect the misery in the hills; for there he would feel the full impact of the refugees' role in Arab relations with the West. The danger they represent is as serious as ever. So long as it persists there can be no peace on the Arab-Israel frontier, and therefore no hope of solvency for either Israel or Jordan; the living evidence will remain of what the Arab-speaking states regard as a piece of gross sharp practice by the West; the mutual confidence required to create a Middle East defence organisation will not exist; and any western aid now being given or planned will pay no dividend.

Even for those acquainted with the refugee problem its proportions become easily distorted. Publicity is rightly given to each small effort at improvement: to the tenacious Arab who offers new hope for 80 orphan boys, to a bishop who builds a village, or to the United Nations Relief and Works Administration when it opens fifty suburban houses. People see the photographs and their consciences are stilled. What escapes notice is that the scale is pitifully inadequate: UNRWA has so far settled 2,369 breadwinners—say, 12,000 people—whereas the refugees are increasing at the rate of 25,000 babies a year. Then there is the distortion that comes from the over-optimism of the United States and the United Nations about plans for large-scale settlement. These are always on the stocks, and many of the planners on the spot—the majority of them Americans—still base their calculations, despite five years' frustrating experience, on what American management and methods could do, given the money and a free hand. "Why," they ask, "do you British always divide our estimate by three?"

The answer is that one must calculate not what could be done in Arizona but what will happen when operations have to be conducted through Arab governments. Allowance must be made for local refusal to give to the refugee more privileges than to Jordanians or Syrians who are almost as poor, and for the weakness and lack of continuity in the working of the governments and civil services. It must not be assumed that, for every family settled on the land, two or three more will find employment in subsidiary services. No plans at present on foot either in Jordan or Lebanon can accommodate even half the people now herded there.

It would be far better to admit realistically that only two courses are open to the few interested member governments of the United Nations. One is to stimulate demands for labour from member states, not necessarily from Arab states only; for the individual refugee is not as unwilling as he once was to listen to such offers, even though it means giving up the UNRWA ration card which is the only certainty in his life. The other is to let the problem drag on for decades, and to accept the annual burden of paying out for relief from starvation sums which yield no dividend because the basic grievance remains.

The founders of UNRWA intended that it should apply the first remedy. Why has it failed? To blame defects of the organisation is to behave like the player who misses his shot and scowls at his racket. The real blame lies with the governments, western as well as Arab, who have had a hand in its work. The Arab governments, in the first place, have no reason to put the Administration to the use that intended. To them its mere existence is a godsend, a satisfying proof that the West admits guilt in the Palestine settlement. They also find it a useful buffer between themselves and the mass of refractory indigents whom their own administrations are too weak to handle. The western governments have tried to make the Administration work, but in a spirit of make-believe, deceiving themselves with the thought that economic means alone can remove what is a grave political problem. In the financial year 1952-53 they intended to spend $60 million in the Arab states on works leading directly to refugee settlement. Most of that sum has been allocated to "projects," but the latest figures available show that up to the end of February only $1.1 million was actually spent, plus $900,000 for administrative expenses. The Arab governments, by sheer inaction, have made it politically impossible to spend more than one-thirtieth of the money available.

Settlement operations are also held up by economic obstructions. The western subscribers to the Administration have not wished to get involved in the general problem of Middle East poverty and have, therefore, insisted too much that funds be spent only on direct benefits to the refugees. But Arab governments, whose peoples are all lamentably poor, cannot admit that newcomers should receive special benefits. So the vicious circle continues: general development schemes, which provide the only method by which large numbers can be absorbed into local economies, have proved politically impracticable. Syria is the nearest state which, if aided and developed, would need and could attract labour; yet it has not accepted such schemes. It has held back in the hope that Israel will pine and die; or because it does not trust the United States to make Israel conform to UN rulings; or because acceptance of foreign aid reduces its claim on the conscience of the West to remedy the Palestine settlement. Such ideas have to be removed if Syria, or, indeed, Iraq, is to budge.

The circle can be broken only by giving up the illusion that political resistance can be overcome by economic means unsupported by a determined political purpose. A way of breaking the deadlock—difficult but not impossible—is now beginning to emerge. It is provided by the hopeless economic weakness of Israel and Jordan, both of which live only thanks to subsidies from the West. It should be possible to reinforce the

present Anglo-Franco-American guarantee of the frontier between those two states by dictating a permanent and economically less fantastic line. The process might need the backing of force, and its price would be high, though no higher than relief paid over future decades without dividend. It would include a large contribution to the collective compensation which Israel admits that it owes for Arab loss of assets, but which it is too poor to pay. It would mean financial pressure on Israel to cede under-developed frontier fields and orchards, and on the Arab states to abandon a blockade that is more damaging to Jordan than to Israel. It would mean a dignified insistence by Christian governments that the UN resolution making Jerusalem—at present twin slums with a veneer of orderliness—a *corpus separatum* be carried out. It must end the fiction that the refugees can or want to return to their former homes in Israel.

By playing at UNRWA the western governments are following the old British habit of behaving as if nothing can be done unless it is agreeable to both Arabs and Jews. Nothing ever was, and nothing is, agreeable to both: they consort only if made to do so. A dictated settlement is the only cure for a disease as deadly to western as to local interests. It would raise, it is true, an outcry that would swell as it spread farther from the frontier and would become a roar in New York; but unless the nettle is grasped there is no chance of starting a sequence of events that would settle the refugees and so prepare the way for some degree of confidence in western intentions. What otherwise is the outlook for pauper Israel and pauper Jordan? Or for any lasting arrangements between the Arabs and the West? These are some of the questions Mr Dulles should ask himself as he comes to Jordan. For if he is primarily interested in the security of the Middle East, then he will find that the danger of war lies for the Arabs not in Russia but in Israel, that the condition of creating a defence organisation is that they should trust the West, and that the West is being judged not by what it plans for the improvement of the future but by what it will do to remedy the injustices of the past.

Hearing the African

TWO separate debates in the House of Commons on the same subject in the same week is an unusual occurrence. That this has happened over Central African federation is a measure of the interest and anxiety it has aroused. Fortunately, the second debate, in which a second reading was given to the Bill enabling the Government to bring the federal constitution into force by order-in-council, was much the better of the two. Both Mr Lyttelton and Mr Attlee rose to the occasion, and the tone of the debate was much less partisan than on Monday. Mr Attlee, though affirming his party's right to vote against the second reading of the Bill—to register disapproval of the speed with which federation was being pushed through—gave a statesmanlike pledge of Labour support once federation was law. It is a pity that more of the debates on federation have not been conducted in the same spirit.

Yet Monday's debate, which produced no Labour abstentions in the division such as had occurred in March and occurred again on Wednesday, hardly justified Mr Lyttelton's complaint that the Labour party was merely trying to paper over its own cracks. It took place on a Labour motion that African petitions against federation should be referred to a select committee of the House of Commons and that the signatories should be allowed to appear in person before the committee. Probably, the motion is one that would, on the face of it, commend itself to most people in this country. It appeals to the British instinct for fair play. Nobody likes imposing on unfranchised Africans a scheme of which they are intensely suspicious. Since they cannot outvote the scheme in their own legislatures, here is a device for enabling them to make their protests before the Parliament that is still ultimately responsible for the government of two of the territories to be federated.

This argument is lent some force by events in the territories concerned since federation was debated in March, events that have confused rather than clarified the issue. In Southern Rhodesia, the referendum showed a larger majority in favour of federation than had been expected. It is also significant that although the Africans in that territory are alleged by the opponents of federation to be overwhelmingly opposed to it, the 4,000-odd of them who could have had themselves placed on the electoral roll, and thereby enabled themselves to vote against the scheme, did not bother to do so. In Northern Rhodesia, the two days' strike called by the African Congress was a failure—thanks in part to the commendably responsible attitude of the African trade union leaders on the copperbelt, who refused to advocate industrial action for political ends. Yet the two Europeans nominated to represent African interests in the legislative council voted with their two African colleagues against the scheme. One of them, Mr Moffat, took part in the last London conference and then gave the impression that he was satisfied with the revised scheme—partly as the result of concessions that were made to his point of view. Since he has now identified himself with the African opposition, it looks as if he has found that opposition much more clear-cut and widely based on his return to Northern Rhodesia.

In Nyasaland, the two African members on the legislative council walked out when the federal scheme was debated. The chiefs in that territory appear to be uncompromisingly opposed to the scheme and have aligned themselves with the politicians of Congress. The chiefs of Northern Rhodesia, however, are not entirely unanimous. The paramount chief of the Barotse, the biggest tribe, has declared that he will not oppose federation provided that the special protectorate status of Barotseland is preserved in the constitution—as indeed is proposed in the federal scheme.

But confusing as the state of African opinion may be, it does not follow that the course advocated by the Labour party in Monday's debate would be practicable or, in the long run, advantageous. If Africans were given the chance of voicing their opposition to federation to a select committee, they would naturally assume that they were being given a chance to prevent federation from coming about. The opportunity would be seized by the extremist nationalist leaders to organise the opposition, and the select committee would find it as difficult as the people of this country do today to distinguish between opposition that is fomented by politicians in their own selfish interests and opposition that is based on genuine fears of European domination.

★

It was argued that the motion need not delay proceedings on the enabling Bill. Africans would then realise that there was no chance of preventing the scheme altogether; all that would be necessary would be some delay in approving the order-in-council, and this delay, it was said, would be well worth while if as a result African opposition were overcome. This was the gist of Mr Marquand's argument in the most temperate and constructive speech of Monday's debate. Yet it is more likely that even the appearance of hesitation in implementing the scheme would have the same effect as hesitation itself. Extremists on either side would intensify their efforts; wild and provocative statements would be made that would destroy what slim hopes remain of founding the new federal state on a basis of inter-racial goodwill.

Must this, however, be the last word to the Africans who are genuinely fearful of the future? There is a strong case for sending a Parliamentary delegation to Central Africa as soon as the enabling Bill is law and the order-in-council approved. Federation has had an unhappy history. The Labour Government, which was responsible for starting the scheme, lacked the courage of its convictions and enabled extremism to get the upper hand. The Conservative Government has shown determination to push the scheme through, but Mr Lyttelton seems to lack his Labour predecessor's ability to see things through African eyes. Lack of determination on one side and apparent lack of sympathy on the other have prevented Great Britain from playing its part in making federation a success. The Labour party has come to be identified with the African cause and the Conservatives with the European. The Europeans' cause is now in the ascendant; it is on them—on their words and on their deeds—that the main responsibility for improving racial relations now lies, and the best news that has come out of Central Africa for months is Sir Godfrey Huggins's expressed view that the proposed university for the three territories should be open to all races on equal terms. Hardly less important in its implications is the announcement, also made in Wednesday's debate, that the managements of two of the copper companies are trying to initiate talks with the European trade union on the advancement of African labour. The whole case for proceeding with federation rests on the assumption that the Europeans, now that greater powers are to be transferred to them, will show that African fears and suspicions are largely groundless. But a great deal might be done to allay them if, once federation is an accomplished fact, a mission, not necessarily composed solely of members of Parliament, were to visit Central Africa and listen to the Africans with patience and sympathy. A great deal of misunderstanding might then be cleared away, which, if allowed to persist and be fed by extremist propaganda, would blight the new federation from the start.

Links With Latin America

ON Monday the Duke of Gloucester is to declare open the new London headquarters of the Hispanic and Luso-Brazilian Councils. The ceremony at Canning House will symbolise the new attitude towards Latin America that is slowly developing in Britain. Last November, for the first time in many years, this important region was mentioned in the Queen's Speech at the opening of Parliament. Among other signs of official interest in recent months have been Lord Reading's goodwill visits, a demonstration tour by a flight of Canberras, and the journey to the Caribbean republics of a trade mission sponsored by the Board of Trade, whose report was published this week.

A beginning, at least, has thus been made with the strengthening of Britain's "long-standing ties of friendship and of mutual trade" with Latin America that was promised in the Queen's Speech. As yet, however, it is no more than a limited beginning. Many Latin Americans visiting London now receive the encouraging impression that official interest in their countries has increased; but to their compatriots at home last year's reduction of British information services in Latin America is a more conspicuous fact. Nor can it be said that unofficial thinking is ahead of official policy in this matter. The commercial and industrial concerns that enable Canning House to carry on its educational and social activities are to be praised

for their enterprise, whether its fruits are seen in Belgrave Square or in Bogota or Bahia ; but they are a relatively limited group, and the attitude towards Latin America of a great many British businessmen remains one of polite disinterest.

Yet the attitude of the businessman was never more crucial. The British connection with Latin America has always rested upon trade. This has been true ever since Spain's commercial monopoly was swept away a century and a half ago ; and before the first world war a quarter of all Latin America's imports came from the United Kingdom. But the last four decades have seen this trade rapidly dwindling—while, ironically enough, they have also witnessed the dramatically swift development of most of Latin America, and the conversion of part of it into a highly desirable dollar market. Today, the old colonial towns to which our grandfathers built British railways and shipped British textiles have mushroomed into cities of skyscrapers, with busy airports where one may see the commercial agents of every trading nation in the world. The population of the twenty Latin American republics is rising sharply (that of Brazil alone increased from 41 to 53 million between 1940 and 1950) ; their national wealth and economic activity have increased with equal speed ; and their foreign trade has multiplied itself several times, both in value and in volume, since the early years of this century.

★

This great upsurge, however, has been accompanied by an equally marked decline in the British connection. In 1910, 25 per cent of Latin America's imports were of British origin ; in 1938, only 12 per cent ; in 1951, under 7 per cent. In the past three years, the United States has provided over half of the twenty republics' imports, while Western Germany has restored its Latin American trade to the same order of magnitude as that of Britain—an achievement which ranks among the most startling of the Federal Republic's postwar feats. Other European countries, and also Japan, have improved their positions in this important market. For Britain, however, there is little sign of a break in the clouds, and it is still questionable whether it can even hold on to the modest share of the Latin American market to which it is now reduced.

It would, of course, be ridiculous to blame the commercial world itself for more than a small part of the loss of trade that Britain has suffered in Latin America. Quite other factors have been responsible ; to note them briefly (since post-mortems are always painful), the sharp blows dealt to trading relations by two world wars, the resultant strengthening of the United States' position, the twenty republics' natural efforts to protect their own growing industries, and the drastic reduction of Argentina's foreign trade activity have between them made it impossible for Britain to regain its former preeminence in Latin American trade. Yet this does not tell the whole story. Why, it must be asked, has the British share in this trade continued to fall, while the shares of other European countries, equally affected both by United States competition and by Latin American protectionism, have increased ?

It may be said, cruelly but with some measure of truth, that British trade has suffered because it was partly directed to selling the wrong goods in the wrong places. Among the staples of the old British export trade to Latin America were textiles and other consumer goods of types which fell early victims to the republics' protectionist programmes. Moreover, the main weight of the British commercial effort was concentrated on the southern part of the continent—not only in Argentina, the decay of whose foreign trade is notorious, but also in the other five "non-dollar" republics (Brazil, Chile, Uruguay, Peru and Paraguay) all of which have had to restrict their trade severely owing to lack of foreign exchange at various times since the war. British traders paid relatively little attention to the fourteen smaller republics to the north ; yet it is these countries that have both preserved the hardness of their currencies and proved able to import more freely. Last year they imported over £1 billion worth of goods, paying on a dollar basis ; but only 4 per cent of these imports came from Britain.

The report of the Crosland trade mission, which visited five of these dollar-account countries (Mexico, Venezuela, Colombia, Cuba and the Dominican Republic), comes as a timely and authoritative reminder of the scale of the opportunity that exists in this area. The mission emphasises the fact that these swiftly developing countries have programmes for the expansion of their industries, communications and public works, which call for immense quantities of engineering products and other capital goods of types which Britain can now supply. The bulk of this capital equipment is being provided by the United States, while continental Europe has also obtained substantial orders. If Britain has failed to secure more than a fraction of this valuable dollar business, this is not because its prices are too high but because its products and techniques are little known. The trade mission, therefore, urges that British consulting engineers should be given a foothold in the Caribbean countries, and in particular that Britain should be adequately represented in the technical teams sent to the dollar republics by the International Bank. Hitherto, these teams have consisted almost exclusively of Americans, with the natural result that equipment for projects endorsed by the Bank has usually been ordered from the United States.

The Crosland mission's report has already been criticised for restating the obvious fact that in highly competitive dollar markets neglect of detail must lead to costly losses. Yet the fact that the mission found it necessary to stress this point shows that many traders still fail to grasp the obvious. The relatively small commercial communities of the dollar-account republics are whispering galleries which echo every British failure to answer an inquiry promptly or to provide adequate spare parts. Real damage can be done by even a small mistake, if it reveals a failure to understand the mood and need of Latin America. If, as may be hoped, the mission's report is to be widely read among British businessmen who have not hitherto taken the Latin American dollar market seriously, it was right to say these things.

Indeed, quite apart from the value of its detailed recommendations, the most encouraging feature of the report is the fact that it was clearly written by men who have taken the trouble to start from the Latin American viewpoint. There is no trace here of the dour old attitude of "our stuff is good ; why won't these fellows buy it ?" The mission has begun by considering the Latin Americans' real needs, and has gone on to see how Britain can help to meet them. Its report is, therefore, more than an exporters' handbook ; it is also an additional piece of evidence to support the argument that greater trade between Latin America, Britain and Europe is necessary for both parties. This thesis was argued at length in a recent United Nations report, which pointed out that both continents suffer from lack of dollars, and that both can ease this difficulty by developing their mutual trade. Indeed, it is now habit and haste, rather than any clear economic advantage, that lead Latin Americans to buy from the United States so much that they could get elsewhere without exhausting their dollar balances ; while, on the other hand, it is clear that a country such as Britain cannot indefinitely continue to find dollars for, say, the sugar of Cuba and the Dominican Republic, if those countries insist on rejecting British goods in favour of American ones. A greater volume of trade across the South Atlantic would offer clear advantages to both sides, and the Crosland mission's report should stimulate increased interest in the widening horizons of trade with Latin America.

Mink to Beaver Lamb

THERE is no overwhelming reason why London should be—as it is—the centre of a big international fur trade. Any one of half a dozen other capital cities would serve just as well for the meeting point of furs from South West Africa or Russia or Canada on their way to Germany or the United States or Latin America. No doubt, like most London commodity markets which serve an international rather than a purely domestic trade, the London fur market owes its existence largely to historical accident. Even so, there must be more than mere commercial conservatism at work, for during the war the business was lost entirely to New York, yet subsequently re-established itself in London as firmly as ever. After some initial help with hard currency to prime the pump, it has since paid its way with the dollar countries, and even proved a net dollar earner. In the contemporary world this market is something of a curiosity. Raw fur has never suffered much from the attention of governments, nor lent itself to the organisation of big business. It remains one of those highly competitive open markets more familiar in the never-never land of textbook economics than in the real world.

The highlights of the year are the periodic raw fur auctions, noted by a babel of tongues in the the Garlick Hill district. Whether furs are bought by English or foreign dealers in the first instance, the bulk of them are ultimately re-exported in a raw state ; only a few are retained for the home market or for export in various stages of dressing or manufacture. The quantities of furs offered at the auctions have risen sharply over the past few years, though the proportion of re-exports fluctuates considerably.

The Hudson's Bay Company's auctions of their own Canadian furs originally established this trade in London, and in time they attracted shipments from sellers in all the producing countries. Today the company's four or five auctions a year (together with those of three specialised brokers) are the occasions when this impressive twenty million pound turnover takes place. The New York market is bigger ; but it is mainly a domestic affair, and since the war the currency problem has kept it so. The rest of the world's fur trade is dominated by these London sales. There are two reasons for this extreme concentration. One is the advantage of size, of collecting large quantities of furs together for fine sorting and grading of an uneven, unstandardised product. The bigger the melting pot, the more the likelihood that the hundred assorted pelts from some small producer will each find a home in a bundle of its exact fellows, where it will bring the best price from the buyers who want well-matched skins. The other is the skilled service of brokers in carrying out this sorting in a way that commands the confidence of both parties. At the sales of the Hudson's Bay Company, for example, the buyer will bid many thousands of pounds for lots he has never

THE TRADE IN FURS
(£'000)

	1938	1949	1950	1951	1952
Re-exports (mainly raw)	*9,039*	5,983	11,120	17,298	19,092
British home produce (mainly rabbit)	*596*	778	1,053	1,272	753
Manufactures (at all stages)	*1,971*	2,776	4,079	4,207	4,026
Total Exports	**11,606**	**9,537**	**16,252**	**22,777**	**23,871**
Total Imports	**13,519**	**8,802**	**16,209**	**25,999**	**21,761**

seen, trusting to a sample and to the company's grading experts. The transport costs of fur are negligible in relation to its value, so the trade gravitates to a central market, and the reputation of the four London brokers keeps that market firmly anchored here in spite of efforts to tempt it away to Paris or Frankfurt.

Although many foreign buyers attend the auctions, most of the purchases pass through the hands of London dealers. Some of these are commission agents, acting partly for manufacturers in this country but probably doing most of their business on overseas account. Other dealers are, of course, merchants buying on their own account and often re-selling on extended credit terms. The intermediaries of both types are said to number in all about seven hundred; many of them are one-man or small family businesses which come and go with the winds of prosperity. A jigsaw of small operators—some specialising in particular types or grades of fur, some specialising by market and others in cheap oddments or costly varieties—they constitute the colourful, the adventurous part of the fur industry. In the little side streets behind the dignified headquarters of the Hudson's Bay Company, everything from fifty raw rabbitskins to a coat bundle of "sapphire" mink has its market price at any hour of the day. No one firm could carry such expensive stock in all its varieties, and no outsider who had not talked and thought and dreamt about fur from the cradle could hope to play this erratic and highly technical market with the slender resources that commonly obtain. The initial entry of a bundle of furs into the merchanting network is a strictly cash transaction—the fur auction. This necessity for large cash payments for raw materials is a continual strain on the unorganised and generally undercapitalised fur merchanting business; and the frequency with which later credit transactions are settled by bills of exchange, discountable at the banks, is due to the need to carry and spread this strain. Since many small speculators are thus tightly committed to future payments at fixed dates for an expensive commodity with an uncertain outlet, it is hardly surprising that whenever business sags many firms die and are reborn.

★

Dressing furs—that is cleaning, oiling and refining them ready for manufacture—is a complex industrial process in which laboratory secrets play an increasingly important part. Leipzig, that fabulous craft centre of pre-1914 days, had a traditional monopoly of fur-dressing, along with dyeing and other chemical processes, which was increasingly challenged in the inter-war years, but not finally lost until the Nazis drove out the Jews. In England, fur processing is dominated by one firm, together with some two dozen other, mainly specialist, firms engaged in dyeing and dressing for the trade. Abroad, Frankfurt has now attracted many of the old Leipzig craftsmen, and is building a big trade on Germany's recent demand for cheap furs. In France, Italy, Belgium and Scandinavia, and wherever Jewish craftsmen settled after the migration of the thirties, local fur industries are springing up.

The types of fur dealt with are always changing. There is now a much greater dependence on ranch-bred furs than before the war, and a consequent tendency to hold more special auctions throughout the year instead of a few general ones. The long-haired furs, skunk, opossum and, above all, fox—once so important for neck furs, capes and coat collars—have fallen out of the favour they enjoyed in the thirties. Nowadays the slim furs, suitable for coats, and mink above all, are the furs of chief importance whose prices have risen. Mink now dominates the market for better quality furs, and so many varieties are bred that its price can be anything from fifty to five hundred shillings a skin. The United States and (to a smaller extent) Canada breed mink in huge quantities, but it is ranched in Scandinavia as well—and even in English back yards.

Even more striking than the dominance of mink is the rise to fame of lamb. Persian lamb farming was tried in South-West Africa before the war, largely for the German market. London thought poorly of its prospects then; "Wool, after all, is not fur." But with skilful dressing and dyeing, it has forged ahead since the war, to enjoy a popularity second only to that of mink among costly furs—and that in spite of being farmed in vast quantities in South-West Africa, instead of coming, in limited supplies, from remote uplands of Central Asia. The London market received £5½ million worth from South-West Africa alone in 1952 (a six-fold increase since 1948) besides smaller supplies from Russia and Afghanistan.

The fur processing and manufacturing industry operates chiefly for the home market. Of its total output of dressed furs and finished garments, nearly two-thirds remain in this country (of finished garments, five-sixths). Some nine thousand people are employed in it, most of them in small firms, most of them relying on the bread and butter trade in cheap coats as near as possible to the tax-free limit of £12 10s. wholesale. For most manufacturers would rapidly go out of business if they had to rely on sales of medium-priced or expensive coats, with a high rate of purchase tax, to the present-day public. But even in the cheapest coats the cost of the fur is all-important. This is where the humble rabbit comes in, its skin transmogrified by science. Even more important, this is where the common or garden sheep fills yet another of its many roles. The epoch-making discovery that all wool is potentially fur is not only making fortunes in South-West Africa; thanks to the postwar prices of woollen (cloth) coats, "Beaver Lamb" coats have provided the English fur manufacturers with a mass market that has been their salvation. But the ball never stops rolling in the fur trade. If fashion can bless the trade by decreeing that wool shall be fur, may it not soon blast it by saying the same thing about the new nylon imitations?

Notes of the Week

The Battle of Laos

THE Communist drive into Laos has posed in a new light many of the old questions about Indo-China. It is forcing public opinion in the free world to probe again into the murky background of this interminable war, and to look more closely at problems that the quick passage of time had begun to blur. Uncomfortable as this process is, it is essential if the present dangerous drift towards defeat is to be reversed. Moreover, three of the immediate questions raised bear directly on the whole cold war in Asia. Should the Indo-Chinese war be brought up at the United Nations? What is the purpose of the Chinese and Soviet governments—if indeed they have effective control over the rebel Vietminh—in launching this thrust into Laos at a moment when moves have been made elsewhere that have at least a peaceful appearance? And, not least, what will be the effect of probable further successes by these Communist forces under General Hoang Minh Tao on the situation in South-East Asia as a whole?

To none of these questions is there a quick and simple answer. The Indo-China war is certainly no longer just a matter of domestic concern to France and the French Union; this has been recognised in the United States' payment of 40 per cent of the cost and in the Atlantic Council's declaration of interest last December. But to bring the problem before Uno would produce extra military help only at the risk of provoking an open Chinese invasion; there is nothing to be gained by turning Indo-China into another Korea. In addition, a public debate in the Assembly would provide some delegations—perhaps those from Asian states such as India—with an opportunity to let off steam about colonialism, from which none would benefit except Communists. In France itself such a discussion would serve to undermine rather than stiffen morale.

★

The main immediate reason for the Communist action is probably sheer opportunism; it was easier to move into Laos than to make yet another attempt to take the Red River delta by direct assault. On the other hand, *Pravda's* reply to President Eisenhower neatly suggested that he had been sadly misled if he thought that the Soviet Union could, or would, attempt to hold back the forces of history in the colonial world. Whether or not there is to be a *détente* in Europe or a discussion of the leading problems in the Far East, *Pravda* implied, the struggle for liberation from imperialism goes on. To invade Laos must seem to the Communist mind a good way of proving it.

The probable effects in South-East Asia are causing serious concern in Paris, London, Washington and Bangkok. At best, the Vietminh invaders will be unable to take the whole of Laos before the rains; but what they have done so far has been sufficient to push King Norodom Sianhouk of Cambodia into a threat to make common cause with the Vietminh unless he gets complete independence from France; and already the Siamese ambassador in Washington, Mr Sarasin, has been begging for more American arms. At worse, the fall of Laos and then of Cambodia might be accompanied by Communist success in forming a "Free Thai State" and producing a *coup d'état* in Siam.

These are the possibilities and problems to which Western policy must now be applied. Unfortunately, disagreements about long term aims have hitherto prevented decisive and immediate action. Now, unless the invasion of Laos can be used as a last chance to bring about full political agreement between the French and their partners in the Associated States, there is little hope of ultimate military success. If the position in Indo-China continues to deteriorate at the present pace, all the progress of the last few months in Malaya and elsewhere in South-East Asia may prove to have been made in vain.

The Eisenhower Way

IT can now be assumed that all military staffs in the West have given up planning for a critical date at which the danger of war is likely to be at its greatest, or much greater than it is now. It is doubtful whether this is due to improved intelligence about Soviet intentions, and even more doubtful whether it is due to clearer thinking in cabinets. The cause has lain far more in three factors: the increasingly accurate estimates that are being made of what the Atlantic allies can afford to produce for the common defence; the resulting insight into the staggering cost of maintaining, as distinct from creating, modern forces; the determination of politicians not to make themselves unpopular by insisting that danger of war persists when the man in the street believes it is passing. For the growth of these influences Sir Winston Churchill and his advisers can, if they wish, claim some of the credit. But it is President Eisenhower himself who is leading the Atlantic alliance towards the policy of small, powerful, up-to-date forces.

Something of this important change of outlook is reflected in reduced estimates of funds for foreign aid and defence now submitted to Congress. How these cuts will affect American strength and the British balance of payments is discussed elsewhere in this issue (page 366 and page 384) but it is already clear that the pattern of rearmament will change. And hard things will doubtless be said (the President has already said a few) about the ideas and figures that prevailed hitherto. Before the reputations of Mr

Truman and Mr Acheson are riddled by a barrage of wisdom after the event, it is only fair to say this: without the idea of working to a critical date, without bold and spectacular plans for years ahead, without shocking the imagination of the western democracies it is most doubtful whether they would have the effort they have made. President Eisenhower and Sir Winston Churchill make cuts and claim wisdom because Mr Truman and Mr Attlee took risks and made guesses. This should not be forgotten.

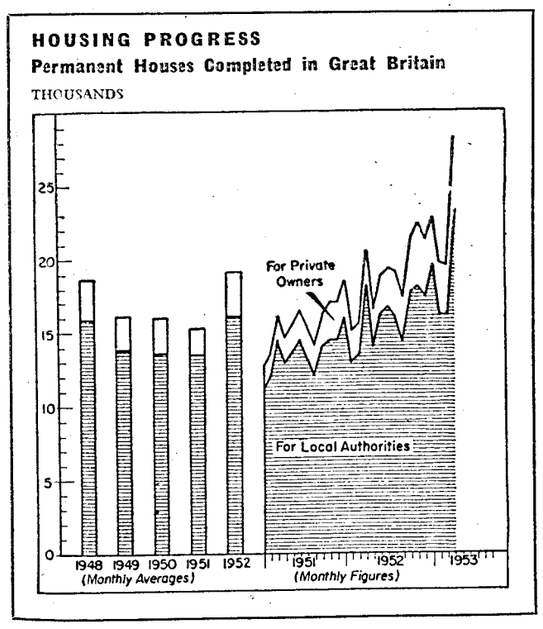
The General without Party

THE decision of General de Gaulle's following, the RPF, to cease operating as a party in municipal and parliamentary affairs is a startling piece of political realism. The Gaullists had suffered a formidable defeat in last week's municipal elections, and it was clear that their parliamentary group would split even further when the National Assembly reconvened on May 12th. In foreign affairs, the RPF had fought a constant battle against the European Defence Community without, however, devising a workable alternative. In domestic politics, owing to clumsy parliamentary manœuvering, the Gaullists opposed M. Pinay, with many of whose measures they in fact agreed; but they supported M. Mayer, with whom they had virtually no common ground. The sense of political frustration that afflicted the RPF was being constantly aggravated, moreover, by the General's own attitude. Increasingly he has withdrawn into silence and aloofness from the transitory happenings of daily political life. It was doubtless the combined effect of these things that led to his party's decision that it should continue as a group of individuals with similar views rather than as a regular political unit.

The history of Gaullism and its present exit form a disturbing chapter in French politics. In 1947 General de Gaulle and his followers emerged with high hopes and an electoral triumph. Theirs was the dream of reforming France's fiscal system, of simplifying the judiciary, of strengthening the executive and the bonds of the French empire and of fighting Communism on its own ground, with its own energy and sense of dedication. Instead, the RPF became just another political party with blunt axes to grind. It involved itself in continued and sterile opposition against successive centre coalitions, some of which it helped to destroy and to others of which it gave embarrassed and unreliable support. Soon the Gaullists in the Assembly split into two parties, and in their internecine struggle much of the initial sense of high purpose vanished. The General understood this long before his supporters, and left his party with a leadership made up half of more or less skilful politicians, and half of great memories.

However much one may have disagreed with this or that aspect of the Gaullist programme, the exit of the RPF should give no cause for rejoicing. It constitutes a major triumph for the Communists and is in itself a grave indictment of present French politics in which considerations of the national interest seem to have small place. It is to be hoped that men as obviously gifted as M. Soustelle and M. Palewski will be able to continue their work, and that the French people will at last find some way of showing to General de Gaulle that his great hours are not forgotten. His tactics, policies and arguments were often wrong; but much in his diagnosis of France's weakness is correct.

Lords and Commons



THE Opposition's censure motion, which the House of Commons debated on Tuesday, brought the dispute over the Lords' amendments of the Transport Bill to an unexciting climax. The argument revolved round two questions. Had some violence been done to constitutional principles? If so, who was to blame? The Opposition were chiefly concerned to prove that the Government's use of the guillotine to close discussion of the amendments in the House of Commons was unconstitutional; the Government concentrated on pinning responsibility for the outrage on Opposition filibustering. Both sides may feel that they substantiated their points. Mr Lennox-Boyd's detailed analysis of the Lords' amendments, showing how limited in scope most of them were, dispelled any lingering doubts there might have been about the Opposition's behaviour; it carried its rights of debate to unnecessary lengths. At the same time, Mr Morrison's claim that some of the few amendments of weight were never considered by the Commons was never seriously challenged.

So many words had already been spilled over this dispute that some straining for effect was inevitable. It was left to Mr Bevan to use the occasion for a hectoring attack on the House of Lords as an institution, a line of argument which naturally touched off a ready response, not only from the minority on the Opposition benches who advocate single-chamber government but also from the larger number of Labour MPs who retain a sentimental affection for the controversies of their youth. Provided that the Government does not offer further provocation, this flicker of feeling against the Lords has little significance.

No doubt in anticipation of some such display from Mr Bevan, Labour MPs packed the chamber for his speech. This was, however, the only stage at which the debate ever approached the tension normally associated with a censure motion. Mr Morrison, who is, after all, the Opposition's deputy leader, could not attract 100 of his supporters at a time into the chamber for his opening speech, and even fewer Conservatives were present. There might have been more interest if either side had paid some attention to the ways in which the same trouble could be avoided in future. Mr Lennox-Boyd suggested that the Opposition had used "a gap in our Parliamentary procedure to hold up proper Parliamentary business." He might have explained how the Government proposes to close the gap without damaging the unquestioned right of the House of Commons to be, in Mr Morrison's words, "the predominant legislative authority." It is plain that political tension is already easing in deference to the approach of the Coronation, but a serious discussion of a valid procedural difficulty need not have heightened it.

350,000 Houses

IF March were an average month, the rate of building new houses in Britain would now be 350,000 a year, and Conservative platform orators could already claim that their derided target of 300,000 houses was unduly modest. In fact, of course, the number of houses finished in any one month reflects many accidental circumstances and the March number (29,000, compared with 22,000 in March last year) is unlikely to be maintained. Even so, this new record for any month since the war has an important significance in the success story of the Minister of Housing. It means that 69,000 houses were completed in the first quarter of the year, compared with 53,000 in the same period of 1952. In every year since the war, fewer houses have been built in the first quarter than in subsequent quarters. There is every reason to expect this pattern to be repeated, and it is more than ever likely that the vision of 300,000 houses, which came to the Conservatives after they had failed to displace Labour at the 1950 election, will this year become a reality.

This has been done, moreover, in a way that prevents any effective counter-propaganda by the Labour party. Greater freedom for private building has enabled some 5,000 more houses to be built for sale in the first quarter of 1953 than were built in the same period of 1952. But, at the same time, the number of houses built to let increased by 10,000. No one can say that Mr Macmillan's policy is housing for the rich; on the contrary, it is housing at the expense of the taxpayer. Each additional council house built means another £37 10s. from the Exchequer alone, in addition to the subsidies from the rates.

The very success of Mr Macmillan's policy means, indeed, that more than ever it should not go on. The election promises are being fulfilled this year; that done, the Minister of Housing can surely feel free to turn to less crude and more important tasks than that of providing the greatest possible number of houses in the shortest possible time, whatever the cost. It is more than time to think about slum-clearance rather than about building everywhere, and to think also about the uneconomic level of controlled rents that is the dry rot of existing houses.

West Indian Teamwork

A SENSE of West Indian solidarity, fanned solicitously by the Colonial Office, grew steadily during the London conference on federation. The conference therefore ended last week with unexpectedly hopeful results. The delegates worked through the Rance committee's proposals for a federal constitution of the Australian type, and agreed upon a revised version. This remains to be accepted by the island legislatures individually before it can be brought before the United Kingdom Parliament; that will take time. Moreover, Mr Gomes, of Trinidad, made some reservations, and though opinion in Jamaica has become increasingly favourable, both Mr Manley and Mr Bustamante will scrutinise the Governor-General's reserved powers in order to decide whether the scheme is a "sham" or not. These powers have evidently been whittled down, but how far will remain uncertain until the White Paper is published.

The modifications agreed at the conference are in practical detail rather than in principle. To conserve scarce Parliamentary experience, members of island legislatures will be allowed for five years—until the constitution is reviewed—to serve as members of the Federal House of Representatives as well. In the executive body, the Council of State, seven unofficial members, nominated by the Prime Minister, are now to outnumber the six members nominated by the Governor-General (three from the Senate, and three others). The council becomes more like a cabinet responsible to the lower house. The rivalry of Jamaica and Trinidad has been resolved by putting the federal capital in Grenada, which, it is to be hoped, West Indian politicians and officials will like better than their Australian opposite numbers like Canberra. While the federal power has been weakened financially by having its proposed share of customs revenue reduced from 25 to 15 per cent, Britain has now undertaken to make a capital grant of £500,000 to establish the federation, and to make grants adequate to cover the budget deficits of the "units" that have hitherto received grants in aid.

Federation in the Caribbean is thus nearer than ever before. Moreover, while the conference was sitting, the People's Progressive party won the first general election held under the new constitution in British Guiana, with a programme including adherence to a federation. Possibly the party upheld this idea because the former legislature rejected it, but one may hope that it will stand firmly by this intention—while reconsidering some of the more extreme proposals of its election manifesto. Nationalisation will not increase Guiana's wealth or hasten its development, while the demand for independence will be more realistically pursued through membership of a West Indian dominion.

Full Circle at Panmunjom

THE news that the Communists had dropped their insistence on the removal of hesitant prisoners from Korea could hardly have come as a complete surprise to any careful observer. True, General Nam Il had given no outward sign that he was going to yield on this point. Yet, in

yielding, the Communists have merely conformed to the pattern of tactics set out by Chou En-lai six weeks ago. When, on March 30th, the Chinese foreign minister suddenly agreed that Chinese and North Koreans "who are afraid to return home should be handed over to a neutral state," he tacitly admitted that for nearly a year the Communists had kept the war going by insisting on a point which was not essential to them—the repugnant principle of forced repatriation. Nam Il has now made a similar tacit admission. It would seem that the Communists have almost exactly repeated their now familiar routine: to state an unreasonable demand, to wait to see if public impatience in the free world will force the United Nations negotiators to accept it and, if that fails, to drop it as blandly as if it had never been made.

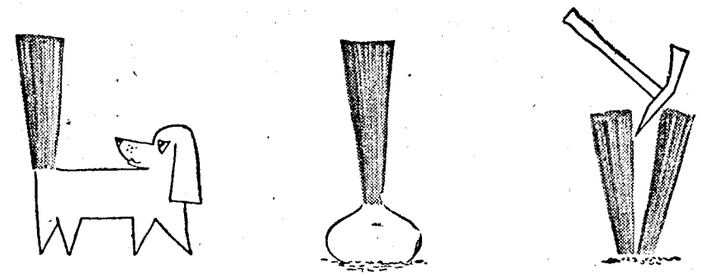
Against this background, some of the criticism recently launched against General Harrison, the chief UN negotiator, looks distinctly wide of the mark. It is true that the General does not give the impression of a man completely at ease at the conference table, and his statements to the press seldom bear reporting in full. But it is difficult to see what the most urbane of diplomats could have achieved in the hut at Panmunjom. At the least, it would seem that General Harrison—who, like Nam Il, is no plenipotentiary—has faithfully carried out his mandate to match the Communists both in firmness and in unwearying repetition of familiar argument. It is too early to tell how fast things may develop now that the Communists have made their new move; but the move itself adds to the mounting evidence that the Chinese are at last negotiating to obtain a truce, rather than to prevent one.

European Assembly Line

At Venice last week, a conference of European journalists discussed the difficulty of keeping the public interested in a project as complex and continuous as the movement for European unity. Representatives of even the most serious newspapers said sadly that their editors felt bound to eliminate many reports of conferences and speeches on the ground that even the enthusiastic reader can be bored; and there was some fairly justified criticism of the technical jargon that tends to grow up at such new European centres as Strasbourg and Luxemburg. Nevertheless, many of those present showed a sincere wish to present both the facts about, and the case for, European unity to the widest possible public.

The kind of handicap under which they work is, however, amply demonstrated by the current series of meetings in Strasbourg and Paris, all of which have to do with the plan for "little Europe" which would unite France, Germany, Italy and the Low Countries in a political community. Strasbourg, this week, is the venue for sessions of the Committee of Ministers and the Consultative Assembly of the Council of Europe, and of the Assembly of the Coal and Steel Community. The most important gathering, however, will take place in Paris, on Tuesday; the foreign ministers of the six "Little Europe" nations will then meet to discuss for the first time the draft constitution for the political community that was presented to their governments on March 10th by yet another body—the "ad hoc" Assembly. If it is difficult to arouse a keen interest in these complex proceedings, it is fatally easy for the European press and public alike to get involved in polemics about such detailed issues as the weighting of representation in the projected European parliament. Meanwhile, the assembly line for European unity still moves slowly and jerkily, but it is still moving forward.

Soviet Germany Needs Food



The great mystery in Eastern Europe remains: what is to be the policy of Moscow towards the Soviet zone of Germany now that so much is being changed under the post-Stalin regime? The East German Communists themselves are obviously without any clear clues; are they to remain devoted Stalinists or is there a Malenkov band wagon on which they should now be jumping? The question may remain unanswered for some time yet; but Soviet policy in economic matters may before long suggest one. For some Soviet aid there will have to be.

Last year the East German planners completely misread the prospects and were unable to adapt themselves to the severe winter. The food situation is already serious and will become critical before the next harvest, unless food is imported. Some two million Germans have been deprived of their ration cards; they will have to buy what they need in the State shops at prices four to five times as high as the prices of rationed goods. Thus the Communist planner mops up the surplus purchasing power arising out of shortages of food and consumer goods. The flight westward of farmers and farm workers goes on, and between five and seven per cent of the total agricultural area of the Zone has already been given up. There is great confusion in industrial planning, with bottlenecks preventing the ordered increases in production. The whole system of planning, adapted from Soviet models, is too crude and rigid; and the use of threats and penalties makes people produce sham results in the factories and the villages.

The food crisis can still be mastered if the Russians are willing to help. So far all they have done is to postpone delivery of reparations in the form of food until the next harvest. (Hitherto the German Communists have always denied that food was taken out as reparations.) If they are planning to put the screw on Ulbricht and his colleagues they can do it most effectively by withholding food imports.

Full Employment and Productivity

Mr Attlee, in his May Day speech, reiterated one of the best known and least examined commonplaces of discussions on full employment. Productivity, he argued, depends on the will to work. The will to work is inevitably sapped when, with short time and redundancy in prospect, the worker sees every increase in effort as a short cut to unemployment for himself or his companions. The prerequisite of hearty co-operation in industry is full confidence in the security of the worker's job; to shake that confidence

animal, vegetable or mineral?

When you think of thousands of tiny fibres which can be teased away in the fingers, you don't usually think of a rock. With asbestos rock it's different. Asbestos is one of nature's freaks: a mineral, yet made up of gossamer-light fibres. These fibres, which never burn, can be spun, woven or moulded into a variety of materials. Hardly an industry, today, is not using Asbestos in one form or another. For the fullest information on its possibilities in your own branch of industry, consult

How small is BIG ENOUGH?

In the language of Hollerith, size is measured by the number of transactions. Take invoicing.

If you flourish—however modestly—on the strength of a multiplicity of monthly or weekly transactions, then your sales accounting is potential Hollerith material. The accurate and timely production of invoices means speedier collection of cash: in this one facet alone punched card mechanisation can pay for itself.

Invoicing is, of course, not all. Once Hollerith has taken root, it will grow into and strengthen the whole structure of a business.

★ *May we see, entirely on our own responsibility, whether your business could benefit by punched card mechanisation?*

is to ensure a slackening of effort. Full employment and high productivity are thus, Mr Attlee argues, inseparably linked; this is supposedly demonstrated by their joint decline since 1951. The moral is, of course, to bring back Labour and the brimful employment for which Labour stands.

No one denies, of course, that gross production must—other things being equal—vary to some extent with employment. But Mr Attlee's psychological argument is concerned with output per man-hour. There are, indeed, powerful *a priori* reasons for expecting a threat of unemployment to reduce productive effort. There is also—though it is considered boorish, heartless and immoral—an equally powerful *a priori* argument for thinking that the economic stick will encourage good time-keeping, discipline, attention to the job in hand, and other ingredients of high productivity. No politician has so far seen fit to look beyond the *a priori* arguments to the facts of productivity in those industries which, since 1951, have experienced a decline in employment. Such evidence as there is shows, disconcertingly from Mr Attlee's standpoint, that short time and redundancies have had effects on production per man-hour varying from the negligible to the electrically stimulating; that while time workers do, indeed, sometimes spin out work, pieceworkers go all out to earn their target income in the shorter hours available to them; that time-keeping improves, "frivolous" turnover lessens, and labour costs in general fall.

One may draw encouragement from the fact that this good response to economic pressure was generally reported to be least marked in the factories where labour relations were best. There was less scope for improvement in those cases because the will to work had not previously been so weakened by brimful employment; its effects had been offset, or at least moderated, by good leadership from the management. But this proves only that brimful employment is not an insuperable obstacle to high productivity. It is very far indeed from being the indispensable condition of high productivity that Mr Attlee asserts. But no doubt the myth is too useful to be discarded in a hurry.

Leasehold Reform

THE debate in the House of Commons on Thursday of last week on the subject of leasehold reform served the purpose of getting the formal approval of the House for the policy outlined in the Government's White Paper of last January. But it hardly succeeded in bringing the subject to life. This is perhaps in the nature of the case, for the speeches, after Sir David Maxwell Fyfe's admirably lucid opening, tended to alternate, without establishing contact with each other, between the close reasoning of the lawyers and emotional appeals by members for Welsh mining constituencies, where there happens to be a heavy concentration of maturing leases of small residential property.

The system of leasehold tenure, though in some ways an odd one, has advantages both to the ground landlord and to the lessee. But whereas the advantages to the lessee (that is, the man who owns the house) tend to be greatest at the beginning of the period covered by the lease, for it is then that he gets the land for his house on easy terms, the advantages to the ground landlord lie at the end of the term, when he re-possesses his land with all that stands on it. Hence the political dynamite of the subject. If the Welsh mineworker now has to surrender the house which for many years has been his property, just because the land on which it was built has never been his, and if in addition he has to pay a large sum for dilapidations, he will feel very aggrieved, and his grievance will not be palliated by the reflection that his predecessor-in-title a century ago entered into the bargain with his eyes open.

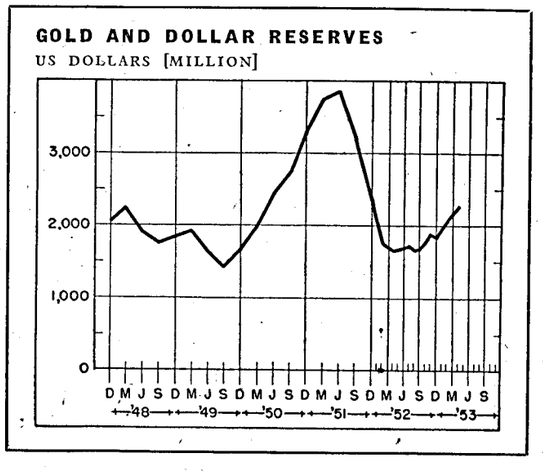
The Labour Party's instinctive feeling that, in any dispute between landlord and tenant, the best thing to do is to get rid of the landlord, has led it into adopting the policy of leasehold enfranchisement—that is, of giving the lessee the statutory right to buy out the ground landlord. But the Government, following the majority of the Jenkins Committee, has rejected leasehold enfranchisement by reason of a formidable list of practical difficulties set out in the White Paper. Sir David Maxwell Fyfe's challenge to the Opposition to show how they would get over these difficulties was never properly answered in last week's debate—not, at least, in a way that is intelligible to the non-legal reader of Hansard. The Government's plan, in the broadest outline, is to give the residential lessee the right to renew his lease—or, more accurately, to convert it into an ordinary statutory tenancy protected by the Rent Acts. He will have to pay more rent, if only to compound his liability for dilapidations. And instead of being any sort of an owner, he will only be a tenant. But the essential thing is that he

FROM VICTORIA TO ELIZABETH

Mid-century Perspective

The issue of The Economist of May 30th will contain a special twenty-four page supplement illustrated in colour. In a series of six articles some of the main aspects of British life will be considered in the light of the changes that have taken place in the last fifty years. Among the questions discussed are: the Crown and the constitution, the changing pattern of democracy, Britain's position in the world, and the dethronement of money.

This Coronation Number of The Economist, which will also have a coloured cover, will be on sale at the normal price of 1s. Readers may wish to make sure of obtaining their copies by ordering them in advance from their usual newsagent.



will keep his home without having to raise a large sum to buy out the ground landlord. It is difficult not to believe that, in practice, he will find this preferable to the rather theoretical attractions of leasehold enfranchisement.

The Colour Bar

THE circumstances in which Parliament can legislate far in advance of public opinion do exist; but they occur infrequently. The House of Commons last week debated the colour bar, and clearly failed to establish that any piece of general legislation would abolish the complex set of practices and attitudes generalised in the phrase "colour bar"; Mr Fenner Brockway's motion was therefore rightly rejected. Labour members were fearful that such rejection would produce misunderstanding abroad; if it does, the responsibility will rest with their own refusal to accept an amendment which conceded virtually all that the motion really required or could be expected to achieve. The amendment promised selective legislation whenever and wherever possible, and Conservative members showed themselves of one mind with Labour in condemning discrimination on grounds of racial prejudice alone. But they realistically saw the difficulty of doing more than tackle the problem piecemeal—for example, by writing into the federal constitution for Central Africa the requirement that promotion in the public service must be by merit alone, not on racial grounds.

Remarks were made during the debate which, torn from their context and from the sense of earnest inquiry which distinguished the occasion, will provide ammunition to hostile propagandists—in India, for instance. The debate was none the less valuable, for it showed that the House was alive to an issue which may even determine whether the Commonwealth can survive, and yet be beyond the power of Parliament to influence very greatly. Labour members revealed their predisposition to think of African resentment against discrimination—apparent or real—in terms of the British working-class struggle, but they were silenced by the observation that the colour bar is imposed in its most disabling form by the organised British working class in the copperbelt. Conservatives were able to vindicate much of the settlers' attitude to Africans on the grounds of cultural rather than racial differences; but their argument broke down at the point at which settlers extend their discrimination to educated Africans.

Yet it is at this very point that British policy in Africa, grounded in ideals which are never realised in everyday life, may fail where a far more autocratic rule may succeed, because French or Italian workmen and Belgian or Portuguese administrators and professional people behave so differently. Parliament is right to give the problem attention as one of first public importance, but changes of heart do not come out of even a "shock by legislation" as Sir Richard Acland demanded. The most Parliament or the Colonial Office can do is to open settlers' eyes to the relation of cause and effect.

Economics Under Dr Malan

DR MALAN'S resounding victory at the polls at least removes uncertainty from the immediate economic outlook, even if the prospect revealed is dark and gloomy. No official pronouncements on economic policy are to be expected before the budget early in July, but there are some suggestive straws in the wind. Dr Malan's implied threat against "concentrations of financial power" should not be taken too seriously—he is only striking a familiar attitude—but Mr Strijdom's more conciliatory manner on this subject suggests that this future wearer of the Prime Minister's mantle has at last grasped the elementary economics of the situation.

When Mr Havenga opens his budget he will be in the happy position of having an unplanned surplus of some £18 million from last year resulting from intensified collections of arrear tax assessments. With a string of recent precedents in other countries to guide him, he should be able to make substantial tax reliefs; but he will have to allow also for additional expenditures on such things as civil service pay increases, cost-of-living allowances, farm subsidies and internal security. Even if tax reliefs are granted to industry—the Nationalists might prefer to court popularity by reducing personal income tax—the outlook for production costs is not bright. Intensified *apartheid* measures are bound to be reflected in higher labour costs; the Native Services Levy Act throws the cost of separate housing and facilities directly on to industry. "Job *apartheid*" will ensure that labour productivity will be kept at a low ebb. It is not surprising that South African industry is generally uncompetitive in world markets.

The balance of payments has shown great improvement in the past fifteen months, thanks largely to restriction of imports to 45 per cent of their 1948 level. South Africa consistently runs a current deficit (£65 million in 1952) which is financed by official borrowing from abroad, drawing on gold and foreign exchange reserves (now standing at £115.9 million), and the inflow of private capital from foreign sources. Everything should point to the government's taking a reasonable attitude towards foreign investment in the Union; but there is no telling what folly rampant nationalism might commit.

Ballots and Bullets in Tunisia

THE tragedy of French rule in Tunisia is that its command is divided. The cabinet in Paris has, at various times, been prepared to take a realistic view and to understand that France will ultimately have to grant a larger measure of self-determination to its North African territories. On the spot, however, and as in most colonial possessions, the settlers are not ready to give up their privileges or to accept condominium with Africans. Finally, there is the French army, which insists with good reason on the vital strategic importance of North Africa, and which tends to feel that terrorism must simply be stamped out. As a result of this divergence in outlook, French rule in Tunisia has produced a series of embarrassed attempts at strengthening democratic institutions, interrupted by assassinations.

Both features have been underlined by recent events. Last Saturday M. Chedly Kastally, Deputy Mayor of Tunis and a leader of moderate nationalist opinion, was murdered by a young fellow-countryman. It seems probable that the shooting was carried out under the direct orders, or at least with the tacit approval, of the Néo-Destour, the extremist nationalist party, most of whose leaders are either interned or in hiding. The murder coincided, moreover, with the municipal and rural district elections on Sunday, which the nationalists wanted to boycott. M. Kastally's death was intended to discourage Tunisians from voting and from standing as candidates. The nationalists argue that these elections represent a purely French method of keeping Tunis quiet by means of small concessions. The Bey appears to support this interpretation and his appeal to the voting population was a remarkable piece of understatement.

The polling figures show clearly that the boycott was all but complete, and 90 per cent of the Muslim electorate abstained. This means that the French will receive little help from the Tunisians themselves in their attempt at introducing partial reforms. There are numerous hints, moreover, that the terrorism will increase in the near future. The French must bear part of the blame, and it would help if they displayed half as much energy in tracking down the assassins of prominent nationalist figures as they do when it comes to avenging the death of a pro-French leader.

Help for the Backward

GENERAL concern about the high proportion of children who remain illiterate after ten years of state schooling will not be lessened by the new statistics about illiteracy in the army that have been published. In four months of 1952, 45,000 national servicemen were called up, and of these more than 10,000, or 23 per cent, were either illiterate or backward. ("Illiterate" is defined as inability to complete a simple form asking for personal details, and "backward" means failure to reach minimum scores in some simple verbal and arithmetical tests.)

Until now it has been possible to excuse the high proportion of semi-illiterates among the youth of today by the broken and inadequate schooling of the war years. But the men who are the subject of this survey were eleven when the war ended, and four more years of school under more normal conditions should at least have been time enough to learn to read and write. Why it should not have been is a matter of some controversy. The blame is variously laid on large classes, modern methods of teaching, relaxation of discipline, too much visual entertainment, and homes in which serious reading is impossible; probably all these factors play their part. Whatever the cause, the army claims to overcome it where the schools fail, not only with its work among national servicemen but also with its five preliminary education centres for backward regular soldiers. The army considers itself successful in curing the backwardness of 97.7 per cent of these men; and from this it would appear that, whatever the defects of army education in other respects, its methods with illiterates are well worth studying by the education authorities.

Masters and Men

"There has been much less legislation of late than formerly to regulate the relations between employers and workmen. . . . When this kind of legislation was frequent and considered a matter of course, it was directed against the workmen. Its main object was to keep them in subordination and keep them dependent. . . . Debased or enslaved, however, as men may be, they cannot be deprived of power. No art has yet been discovered to render the master, however absolute, wholly independent of the slave. They are not and cannot be even independent of each other's good opinion. Of that general fact, the inevitable result of society, the continued or even the growing influence of the humblest classes amongst ourselves is a part. Their power makes itself continually felt, and, latterly, the tendency of all legislation between employers and workmen has been to impose restrictions on the employers. It is concluded, apparently, that the proper way to correct the restrictive laws formerly made for the workmen is now to make some similar laws for the masters. . . . That legislation ought not to interfere with industry, of which it can know very little . . . is now an axiom of statesmanship. But practice halts lamely after enlightened theory, and the fact that legislation has already interfered with industry, though admitted to be an error, is alleged as a justification for further interference. . . . A little extension of industrial freedom has opened many new roads to wealth, and they are increasing and enlarging day by day. . . . Everywhere services are in demand; wages of all kinds are rising; and there is now much more reason to apprehend, in relation to the demands of the capitalist, a scarcity than a redundancy of labour. Never, therefore, was there a time when legislation should more cautiously abstain from interfering with relations so rapidly changing, and when it should more carefully eschew placing restrictions on the capitalist about to be exposed to perfectly new and untried circumstances.

Letters to the Editor

Climax in Kenya

SIR—In your article of April 11th you ask: "Why does British policy in Africa tend to drive the educated ambitious African into opposition to it? Why do the natural leaders become extremists determined to oust British rule? Why do the colonial governments fail to rally the support of the African moderates?"

We in Kenya can only feel irritated when told by people at home that Mau Mau is a political and economic rebellion and that the correct and only cure is more politics and higher wages. The fact has to be faced that the tribe that has come to hate us with a hysterical loathing is the wealthiest in Kenya. It is also the tribe with the highest percentage of literates. It is the tribe most closely integrated in the economic life of the country and the most intelligent, enterprising and industrious of all the tribes. It is all the more interesting, therefore, that, instead of copying African so-called nationalism elsewhere and claiming to be civilised and demanding equality with Europeans, the Kikuyu have taken the opposite road, reverted to the primitive and to barbarism. The Kikuyu ask not for equality but for blood and black magic. Their hope for the future is to return to the past.

What we have done to this particular tribe, however, we are doing also to the other tribes. It happens that for a variety of reasons the pace was hotter in the Kikuyu Reserve and therefore the inevitable results have appeared there first. We have not governed these people. We have not even studied them. Hardly any one of us speaks their language. Our education, lacking any policy, has destroyed their tribal restraints and tradition and given them little in exchange except a moderate standard in the three R's. As far as one can tell, Government has never asked itself what happens to the African when he leaves school. There is no place in our society for the educated African. He has little hope of rising above head office-boy or what in Britain would be apprentice standard. There is not even "educated" housing for such Africans; most of them have to live in crowded slums on the fringes of the towns. Socially there is no place for them. Few ever see the inside of a European house. Hotels and restaurants where Europeans go are barred to them. They are the flotsam and jetsam of the African continent, and now suddenly it is realised that they hold power—great power—in their hands.

Occasionally from amongst the educated Africans arises a man of outstanding character and ability. What hope that he will be loyal? I watched Jomo Kenyatta at Kapenguria, where he was on trial. There sat a man obviously born to rule, a man of fascinating personality. He spent fifteen years in Europe, returning to Kenya in 1946. What scope was there for a man of his ability and character in Kenya? None whatever. He was offered a very lowly post in the bureaucratic hierarchy, and, more important, there was no community to offer him any social status. Men must fulfil themselves or become bitter. There are potential Jomos growing up all over Africa. They must inevitably take leading social positions or become agitators. As yet, the former positions are barred to them; the latter road is wide open.—Yours faithfully,

PHILIP S. MUMFORD

Malindi, Kenya

Egypt and Middle East Defence

SIR—From the statement that "It would be no easy matter for Mr Eden to go before the House of Commons with proposals which involved British evacuation and the handing over of base installations worth hundreds of millions of pounds . . .", made in your issue of April 18th, the misleading inference may be drawn that the Suez Canal base was built completely at the expense of the British taxpayer.

In point of fact, the Anglo-Egyptian Treaty of 1936 sets out in detail the extent of Egypt's responsibility for the building of roads, bridges, railway communications and the ancillary military installations, including barracks, sports grounds and a rest-camp for the use of British troops stationed in the Canal zone, at the expense of the Egyptian exchequer. In November, 1936, in the debates preceding the ratification of the 1936 treaty, the late Muhammad Mahmud Pasha criticised the treaty because it imposed upon Egypt expenditure of several million pounds for the installation of a military base over which the Egyptian Government would have no control. Mustapha al-Nahas, then Prime Minister, placated his critics with the argument that Egypt would have to incur both the responsibility for the erection of military installations in the Canal zone and for the financial outlay, if it wished to advance a valid claim for the physical ownership of the Suez Canal base in any future negotiations for the revision of the 1936 treaty. Doubtless Nahas feared that if the base had been built at Britain's expense, British troops would never evacuate the Canal zone.—Yours faithfully,

London, S.W.15 RANDOLPH GHERSON

Decision for Federation

SIR—Mr Gell implies that if Britain proceeds to establish Central African federation despite African opposition—he ignores the fact that the four Governments concerned have approved the scheme—it will impair its bargaining strength with South Africa when the next request is made for the incorporation of the High Commission territories. Does he seriously believe that any South African Nationalist Government would agree to a constitution between these territories and the Union which embodied similar safeguards for African interests as those in the federal scheme for Central Africa? I refer in particular to the retention of the protectorate status of the two northern territories, to the direct and indirect African representation in the Federal Assembly, to the fact that the powers of that Assembly are strictly limited, and to the African Affairs Board. To hold such a belief is sheer moonshine.

In any case, the assent of the inhabitants of the High Commission territories is not the *only* argument against South Africa's demand for their incorporation. On the contrary, the strongest argument is that the assent of the United Kingdom Parliament must first be obtained.—Yours faithfully, J. P. MCDONAGH

London, S.W.19

Self-Improvement and the State

SIR—Everyone, "on paper at least," may have nowadays, as you suggest, the opportunity of beginning liberal studies at school, and those intellectually capable may have the opportunity of pursuing these studies at university. Is the provision of facilities for further education after school age any the less necessary? Many believe that these facilities should be available at all ages, willy-nilly, but the need—by any measure—is scarcely less where 15-20 per cent of school-leavers are still "semi-illiterate" (the phrase is, I believe, Sir Cyril Burt's). The problem is, rather, how to encourage these and others to continue their education.

I cannot think that Albert Mansbridge would have disapproved the inclusion in this provision of something more than narrowly political and economic studies. An appreciation of the arts may be as important for democracy's vitality as the study of industrial history. Mansbridge was interested in providing facilities to enable the individual to develop himself—to "realise himself." He was quite as much interested in hobbies and crafts, for example, as he was in those subjects which, as a young man, he used to teach. "Anyone," he wrote, "who seeks, in his time off from work, to get knowledge concerning anything he is naturally interested in or to develop his skills in making or doing things becomes a happier man. His power increases even in his daily work." That was his faith.—Yours faithfully,

London, S.W.17 RONALD HOPE

**THE ELECTORAL SYSTEM IN BRITAIN
1918—1951**

By D. E. BUTLER

Ready 21st May 21*s. net*

In the last thirty years arguments over the franchise and the electoral system have not been so much in the forefront of politics as they once were. But they have not been absent or, indeed, unimportant. Significant sidelights on recent history may be found, for example, in a study of the struggles over the 'flapper' franchise in 1928 or the Alternative Vote in 1931, and an examination of the vexed question of whether the Labour Government were guilty of a breach of faith by their abolition of University Representation in 1948 is especially illuminating. These and other matters are fully explored in the first part of this book, which deals with all attempts at electoral legislation since 1918.

Parliamentary debates on the subject were often ill informed, however, and the issues sometimes assume a new aspect in the light of the facts about the working of the electoral system which are set out in the second part of the book. In this the effect of the university and business franchises, the cost of elections, and the way in which the voting system worked are examined statistically, together with the results of the last nine general elections.

British Public Utilities

An important new book

By J. F. Sleeman, Lecturer in Social Economics at the Glasgow University. An up-to-date, detailed and comprehensive study of interest to everyone concerned with economic and social studies, and everyone working in the nationalised industries and public utilities. It is divided into two parts: Part I deals with the general field of public utilities as a whole; treats in detail the distinctive economic characteristics; the principles of pricing and the historical development of the attitude of the State to public utilities in Britain. Part II deals individually with the various services, and their economic features, pricing policy, and history are discussed in turn. The author also draws conclusions from British experience in defining and controlling the various services in the public interest, and suggests problems which remain for future development. 20/- net.

Our line of country

For twenty years now, people with exacting ideas on bookcases have made their way to The Phoenix Gallery where they know they'll find clean, fresh design, the finest materials, and reasonable prices . . . PHOENIX are *the* specialists who make *only* bookcases. Model B (above), for instance, is made in Solid Oak, Nigerian Cedar or Mahogany, is glass-fronted and has 11 ft. 4 ins of shelf-space. It costs as little as £9 19s. 2d., carriage free in Great Britain. There are PHOENIX bookcases from £5 19s. 9d.

When Buying a new bookcase take a look at the PHOENIX selection (including the famous UNIX sectional bookcases)—they are the yardstick of value-for-money. Write, call or 'phone for catalogues of the complete range. If you are far from London you can order through the post with all confidence.

PHOENIX for Bookcases

Controversial Commander

THE ROMMEL PAPERS.
Edited by B. H. Liddell Hart.
Collins. 545 pages. 25s.

FROM the day in February, 1941, when he first landed in North Africa Rommel has been a controversial figure both in Britain and in Germany. It is a relief to find in this substantial volume the material on which a more dispassionate judgment can be based.

The most important of Rommel's papers are his narrative of the war in North Africa, written in 1943, and his account of his experiences in the French campaign of 1940. General Bayerlein contributes an interesting chapter, using such of Rommel's papers as survive, on the defence of the West in 1944, while Manfred Rommel, the Field Marshal's son, adds an account of his father's last days and edits his father's fragmentary diary of his appointment to Italy in 1943. The whole has been skilfully woven together and is illuminated by Rommel's brief but incisive letters to his wife, inserted at the appropriate dates, a very successful editorial device.

No one has ever denied that Rommel was an able commander in the field. His papers, however, show him to have possessed other and rarer qualities than those of a successful panzer-general, notably that reflective power of mind which is the hallmark of a great soldier. For this is never a wooden narrative of events, like Guderian's account of the campaign in Russia; nor is Rommel solely concerned with the most effective defence of his own record, although he is naturally not indifferent to his reputation. The distinctive quality is his interest in trying to hammer out new principles for the new conditions of warfare which he had to master. It is not only the personality of the man, vividly conveyed by his style and by his letters to his wife, but the intellectual power of his mind that holds the attention.

Rommel's success was founded neither on the erratic intuition of the Fuehrer nor on the conservative principles of the staff college—nor on luck. He possessed that same capacity to reason from his own experience and to think for himself as he reluctantly recognised in Montgomery. Nor was his interest limited to tactics or "operations" in the German sense of that word (best rendered, as Captain Liddell Hart suggests, by the phrase "grand tactics"); Rommel grasped far better than any of those responsible for the strategy of the war on the German side what was involved in the North African campaign and what could have been made of it. Like Raeder, he saw that it was in his persistent neglect of the Mediterranean theatre that Hitler missed his greatest opportunities.

Much has been written of Rommel's failure to recognise the character of the regime he served and to break with Hitler. There is often a touch of pharisaical self-righteousness about such criticism, but Rommel's part in the German opposition to Hitler can easily be exaggerated. The present volume adds little to what is already known: for obvious reasons any papers which may have shed light on Rommel's relations with the conspiracy against Hitler were destroyed at the time. They are not likely to have been extensive. Rommel was late in recognising the disaster into which Hitler was leading Germany, and although he was apparently ready to try negotiations for a separate peace with Eisenhower, he had no sympathy with Stauffenberg's attempt to remove Hitler.

Rommel was bred in the non-political tradition of the German Army. Constantly in trouble for his independence in the military sphere, he asked no questions about politics, about the origins and purpose of the war, nor until too late about its consequences for Germany. He was an honourable and upright man, but as Liddell Hart justly remarks, "dangerously unphilosophical." War was "the grand game for which, in his country's service, he had trained himself with single-minded devotion." The soldier of whom more can be said is rare in any army.

Up Hill and Down Dale

ROUND ABOUT INDUSTRIAL BRITAIN, 1830-1860.
By C. R. Fay.
Toronto University Press. London: *Geoffrey Cumberlege.* 227 pages. 40s.

THE publishers represent this work, originally delivered as lectures at Toronto, as "a description of a lively and unusual tour." Those who know Mr Fay's earlier works will expect a ramble rather than a tour, a vigorous discursive roving, without a well-planned route, but with lots of exciting conversation on the way. And in the chapters for which Mr Fay is exclusively responsible, this is what we get. He can travel the most well-worn tracks of history—Adam Smith or factory legislation—and still find fresh things worth seeing. He is a master of the art of startling jaded minds by juxtaposing facts which no other person would ever have suspected were related, and his chapters on social thought, Ireland and technology, though they are by ordinary standards badly arranged, and overweighted with extracts from contemporary sources, are full of sudden brilliances.

For the chapters on selected—and very aptly selected—industrial towns, Mr Fay has drawn on the help of experts in the local history, and here the work is better organised if more prosaic. Most of these chapters share the emphasis on technical change which is a characteristic of the whole work—a welcome emphasis, since technology is an essential part of economic history and one which most books deal with timidly and unintelligibly—but otherwise they vary considerably in scope. The section on Sheffield, for example, consists entirely of extracts from contemporary sources; that on Bradford is a well-considered and well-written study of the relations of technical and economic change. The section on Birmingham concentrates on the political and social repercussions of the economic structure of the town, a fruitful topic, which hardly figures at all in the other chapters. Some of these variations reflect differences in the problems presented by the history of the various towns; it is, no doubt, reasonable to devote more space to questions of location in a chapter on the Clyde than in one on Merthyr Tydfil. But the variations in the attention paid to social conditions, or to wages and output, seem to be quite arbitrary.

However, this book is not intended as a Baedeker for the tourist in a hurry; it is a book on places and people for those who have been this way before, and they will certainly find their revisits the richer for having read it. It has the great advantage, too, that it is written, as the economic history of this period ought to be written, with the emphasis on the region, and not in the form of generalisations intended to apply to all parts of the country and therefore true of none. After 1870, Alfred Marshall is reputed to have said, you cannot write *English* economic history, so deeply involved was England in the world economy. This work suggests that it is equally impossible to write it before 1870, but for the reverse reason—the enormous regional variations in the English economy.

American Dreyfus Case

THE STRANGE CASE OF ALGER HISS.
By Lord Jowitt.
Hodder and Stoughton. 279 pages. 20s.

THE Hiss trial is the Dreyfus case of modern America. The issues involved, the passions aroused and the interests affected make it a landmark in modern American history. In addition, it involved famous and striking personalities and raised several technical and legal points of unusual interest. At its conclusion, it is probably fair to say, there were few observers who escaped a feeling of un-ease at the verdict. It was all too reminiscent of a badly written detective story, in which the author had not contrived to make the psychology fit the plot.

In "The Strange Case o · Alger Hiss,"

Lord Jowitt has now taken this tangled skein, from the first hearings before the Un-American Activities Committee to the last page of Whittaker Chambers's autobiographical effusion, "Witness," and has unravelled it with the skill and the detachment of a legal mind far removed from the passions it originally aroused. The result will come as a surprise to those who had accepted as irrefutable the evidence of "the mute witness," the typewriter, and had consequently acquiesced in the verdict of Hiss's guilt. Lord Jowitt thinks otherwise. "My endeavour," he says, "is to present the facts fairly to the reader, so that he may become acquainted with the issues involved and form his own conclusions." His exposition is certainly clear and his analysis searching. But he hardly leaves the reader to form his own conclusion. The case against Hiss, he thinks, was never proven—and this not because, as is often alleged, the evidence from the typewriter was merely circumstantial but rather because it was not really fundamental. The fundamental documents in the case, Lord Jowitt insists, are the memoranda in Hiss's handwriting; if it can be shown, as he thinks it can, that they cannot be fitted into the picture of Hiss the spy, then they raise such doubts about the credibility of Chambers that they make it necessary to find some other explanation of the typescript. This Lord Jowitt thinks he has found in Chambers's admitted need for

> a life preserver in the form of copies of official documents stolen by the apparatus which, should the [Communist] Party move against me, I might have an outside chance of using as a dissuader.

These, and a wide range of supporting arguments, are set out by Lord Jowitt in a way that cannot fail to be impressive. How then did Hiss come to be convicted? Lord Jowitt finds the explanation in part in the climate of opinion which surrounded the second trial and in part in certain features in the trial procedure, notably the absence of any summing up on the facts by the judge, such as would have assisted the jury in assessing the evidence.
