For all the temperateness of language in which an ex-Lord Chancellor sets them out, these are startling conclusions and in the United States they will be explosive. To those who are already familiar with the case, however, their weight is inevitably somewhat reduced by a number of factual errors by Lord Jowitt, which suggest that his study of the evidence has not been as thorough as it might have been, and by his tendency to base judgments on a reading of the psychology of people he has never seen or heard. Moreover, though it is all very well for an English judge to dismiss from his mind evidence that would not have been admitted in an English court, the fact remains that it was introduced and may have been none the less true for having offended against the "judges' rules." If Lord Jowitt's verdict on the Hiss case is "Not Proven," the same judgment must be pronounced on his reading of it.

Town and Taipan

HONGKONG.
By Harold Ingrams.
Her Majesty's Stationery Office. 308 pages. 27s. 6d.

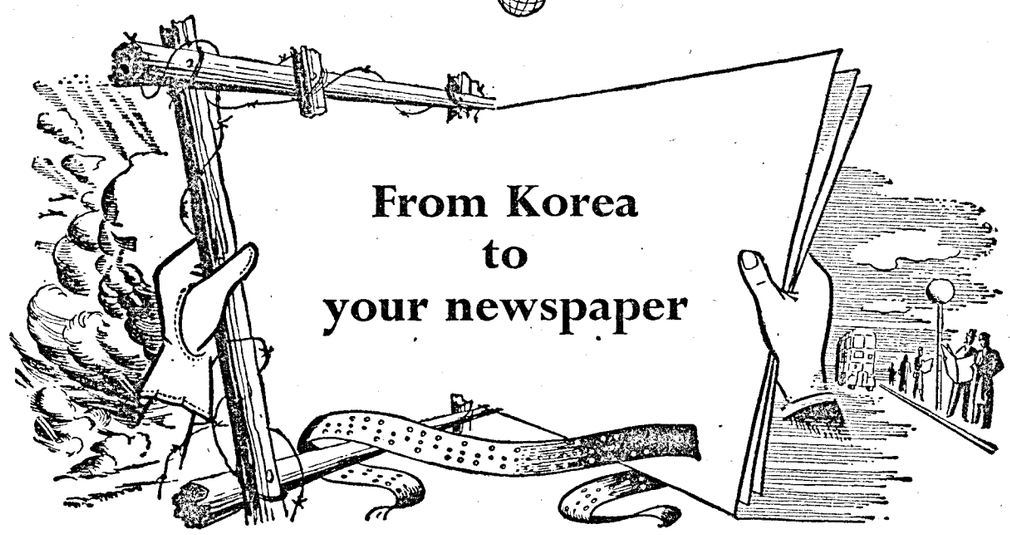
A WIDER and more informed knowledge by the British electorate of its colonial responsibilities was always desirable; today, when passports are endorsed "citizen of UK and colonies," it is more than ever desirable. The colonial empire is the next scene in the unfolding of the Commonwealth theme, for it is from the colonies that the next dominions will be formed. The decision of the Colonial Office to sponsor a series of books on these territories, of which Mr Ingrams's readable survey is the first, was a good one. Much has been written about many of the colonies, and something about them all; but much of it is out of date in the rapid postwar development of colonial affairs, while some is hardly suited to the general reader, and a good deal, unfortunately, is ill-informed or tendentious. This series aims at giving a balanced and factual picture which shall be something between the official blue book and the traveller's tale, for even if the traveller is an anthropologist or sociologist his or her picture is often partial or specialised.

Mr Ingrams's job was therefore to write a book from a new angle: a personal book based on eye-witness evidence and re-reading of the standard works of the past in the framework of present conditions, yet a book which was not wholly divorced from official purpose. The Colonial Office and the Hongkong government gave him keys to most of the doors, and evidently his own human sympathies took him everywhere else. The result is an educational experience; in the course of an urbane and contemporary account of the people, institutions, manners, customs and eccentricities of Hongkong, the facts about this extraordinary extension of Britain on the fringe of China sink in and create their own effect of mingled pride, wonder and premonition. Hongkong is one of the most exotic cities in the world, the unique product of British and Chinese genius in partnership over a hundred years—a genius which in both races remarkably blends the mercantile, mannered and poetic.

Mr Ingrams unfolds that story with skill, weaving it into his general description. Hongkong grew and throve over a century in which on the whole British and Chinese relations were (at least locally) cordial. But it arose out of conflict, and its present position is determined by conflict. For the past two years it has been useful to the rulers of Communist China simply as a British territory—but what of the future? Here Mr Ingrams writes with circumspection, perhaps too much; the shadow of official reticence for the first time blurs the page. Elsewhere, the book is remarkably outspoken, though always good humoured. A generous use of coloured and black and white illustration has put the price rather high, but it is to be hoped that this will not keep it out of the hands of those who need and will enjoy it most, the general reader at home and in school.

Money for the Mind

PROSPECTS IN PSYCHIATRIC RESEARCH.
Edited by J. M. Tanner.
Blackwell Scientific Publications. 197 pages. 21s.



THE Mental Health Research Fund was formed in 1949 to promote, encourage and finance research into mental health and disease. Just over a year ago, the sponsors of the fund organised a conference at Oxford to discuss the most promising lines along which research might advance. This stimulating book is the report of the proceedings of the conference.

The conference was addressed not only by those most immediately concerned—psychiatrists, sociologists and psychologists—but also by others representing the related basic sciences of anatomy, physiology and biochemistry. Many of the contributions will tax the general reader's powers of understanding; but they amply illustrate both how complex the problems are and the enthusiasm and interest which those problems are arousing among specialists in this field. The disagreement between the outlooks of various schools is evidently less fundamental than had been feared, and difficulties of language and communication can be solved.

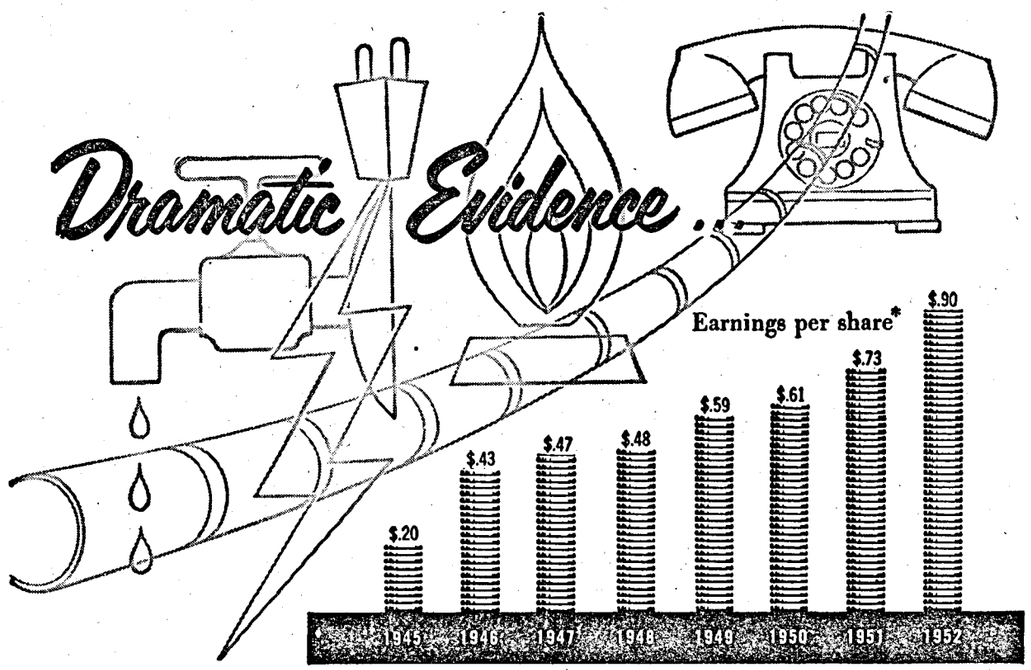
The general public appears to be quite ignorant of the amount of mental illness in this country. Nearly half the total number of hospital beds are in mental hospitals and institutions for mental defectives; and it has been estimated that one in thirty people will at some time occupy one of these beds. Minor mental ill-health is far more common, and the cost of all mental illness in money alone has been estimated at £100 million a year. In spite of this the resources available for medical research have not been devoted to mental illness in anything like the proportion its importance warrants.

The Mental Health Research Fund thus fully deserves the support it is now asking for. Part of its resources—as they grow—might fruitfully be devoted to other conferences like the one now recorded. Progress can then be assessed, and dark places illuminated. It is to be hoped, too, that the fund can find some way of making its purpose and progress known to a wider public than will be reached by this book. It would help thereby to bring home to people the size of the problem, which tends to be hidden by the isolation of mental hospital patients in huge groups away from the rest of the community. The right sort of publicity might also do something to dispel the lingering medieval fears of the insane and the social stigma of insanity, which make people willing to disregard what they would like not to exist.

WORDS ROUND THE WORLD

CABLE & WIRELESS LTD. has been operating a mobile wireless station in Korea since December 1950. It handles not only the despatches of Press correspondents but also personal messages to and from the troops in the field. Working in the closest co-operation with the armed forces, the operators of Cable & Wireless Ltd. transmit the messages to the Company's station at Hongkong. From there they are re-transmitted to the world's newspapers and to the Servicemen's families.

Carrying Press messages has always been an important part of the Company's daily operations. Speed and reliability are ensured because the system is so flexible: the undersea cable and the wireless telegraph provide alternative routes throughout the network, so that "the message gets through".



To be prepared to meet emergencies is routine for Cable & Wireless Ltd. It means constant maintenance of existing equipment and continued development to meet new conditions. In the face of ever rising costs of labour and materials the Company continues its efforts to provide a service in keeping with Britain's supremacy in international communications.

*Years prior to 1952 restated to give effect to stock split in 1952 and annual 3% stock dividends 1947-1952 inclusive.

The investor benefits from expansion only if there is an increase in *per share* earnings. It is this rather than just the trend in enterprise income which counts.

The **350%** increase in *per share* earnings of Citizens Utilities Company between 1945 and 1952 contrasts with a gain of **52%** shown by Moody's Index of per share earnings for electric utility companies in the same period. Between 1950 and 1952, Citizens' per share earnings increased **48%**; the Moody's Index for the industry shows **no gain** for this period. Citizens' per share earnings in 1952 were **23%** greater than in 1951, compared with an improvement of **7%** in the Moody's Index, representative of the industry.

This is indeed **dramatic evidence** of full participation by Citizens' stockholders in the benefits of profitable growth. Consumers and employees have enjoyed comparable benefits.

Citizens is the *only* operating company engaged in all *five* categories of the utility industry: electric, natural and manufactured gas, telephone, and water. Citizens is the *only* multi-service utility with *geographical* diversification. Through sixteen separate activities, Citizens serves more than 200 communities in Arizona, California, Colorado, Idaho, Maine, Vermont and Washington.

Results in 1952 emphasized again the established benefits which Citizens' unique, diversified operations provide for investors. Those interested in the productive investment of funds can learn more about Citizens Utilities through the Annual Report. A limited number of copies are available upon written request on your letterhead to:

ABOUT OUR ANNUAL REPORT...

As modern business has become more complex, it has required ever larger aggregates of capital. Thus, the corporation and its many stockholders evolved. They are the practical successor to what would otherwise have been a gigantic, unworkable partnership. Corporate stockholders are, therefore, the modern equivalent of partners.

Our Annual Report reflects this viewpoint. It is not just a short, impersonal "president's letter," supplemented by material on other aspects of the business written by others. It is a complete, personally written account of stewardship by our chief executive, addressed to his contemporary partners: the shareholders. It includes the relevant major and minor developments of 1952 and explains their significance. It discusses Citizens' affairs as a managing partner would at an annual meeting of partners—and tries to anticipate all the questions the vast number of partners would ask in such a meeting.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

The First Hundred Days

Washington, D.C.

BECAUSE Mr Roosevelt accomplished so much in his first hundred days in power—and never had such willing co-operation from Congress again—the end of the comparable period in the new regime has seemed to many people a good moment for taking stock of the accomplishments of General Eisenhower. The comparison with twenty years ago emphasises not only the differences between the two men, but also those between the worlds in which they took office. Nothing could be less like the spring of 1933, with its pyrotechnic display of experimental government, than the early months of 1953, with their cautious groping towards a set of policies. It would be a mistake, however, to assume that, by his caution, the President has lost a priceless chance to get his programmes through Congress without argument and with only nominal opposition. There is no reason to believe that he ever had such a chance.

In March, 1933, the banks were closing, the administrative system had largely broken down and Congress was scared. Anyone who was prepared to assert that "the only thing we have to fear is fear itself" in a voice that carried the conviction of confidence to the whole country was assured of support for anything he might do in the attempt to turn the tide. In January, 1953, despite campaign speeches that suggested the imminence of disaster if dramatic Republican policies were not immediately substituted for nearly everything the Democrats were trying to do, there was little sense of urgency in the country, except for putting an end to the Korean war. There was plenty of time for the new Administration to learn, to think and to develop its ideas without taking risks.

The Republicans in Congress were under no such pressure as the Democrats had been twenty years ago. Nor had they nominated and elected a master politician. Instead they had chosen a popular but unpolitical hero as, if a metaphor readily understandable in Washington at the moment may be permitted, a niblick to get them out of a bunker. Once on the fairway again, however, the one idea of many of them was to put the niblick back in the bag and take out instead some of the irons they had had in the fire for so long. They had not come back into power after many lean years for any other purpose than to give their traditional policies another run. The *Washington Post* called it astonishing that one of the most popular men who ever entered the White House should not have been "vouchsafed the traditional honeymoon of incoming Presidents" and found it even more extraordinary that "intransigence in his own party was responsible." But there was no honeymoon because there had never been any marriage.

There should, therefore, be no disappointment because a flood of new and exciting measures has not flowed from the White House up Pennsylvania Avenue to the Capitol and overwhelmed the legislators. Indeed, it is probably just as well that nothing of the kind did happen because some of the measures, if they had been based on campaign promises, would have terrified the rest of the free world. There is everything to be said for a cautious approach to the making of policy. There is considerably less to be said, however, for the President's view of his own role as the head of an administrative machine with the responsibility for carrying out the policies of Congress, but with no duty to do more than suggest what these policies should be. "To suggest is not enough," the *Washington Post* maintains; "in order to get consideration for his programme, the President will have to assert himself in Congress or face the prospect of Congressional government."

★

This is a moment, therefore, for being a little apprehensive about how long General Eisenhower will continue to hold his rather simplified view of the relationship between the three co-equal branches of government rather than one for deploring his failure to repeat Mr Roosevelt's performance. There is nothing inherently wrong about his refusal to drive Congress—even over important issues—if he can, in the end, get his way by his present tactics. There would be something inherently wrong, however, if he were to continue his refusal to exercise leadership—the kind of leadership that he showed, in his speech on disarmament last month, that he is capable of exercising—after it became obvious that Congress would not listen to his suggestions. The disparity between his majority and that of congressional Republicans showed clearly that it was the Eisenhower policies and the Eisenhower promise of leadership that the people chose on November 4th, not those of his party in Congress.

If it is too early as yet to judge the performance of the new Administration, it is not too early to suggest the directions from which its tests will come. As far as the rest of the world is concerned, the verdict on the Eisenhower years will presumably depend on the Administration's success in liberalising foreign trade policy, the steps it takes to minimise the effects of any recession that may

appear and the President's ability to dispose of Senator McCarthy.

Even if the Reciprocal Trade Agreements Act is extended without too many of Representative Simpson's constricting amendments, there are few people who believe that the new executive-legislative commission will produce a report along the lines of the Bell Report. This, incidentally, judging by the way one Cabinet officer after another denied knowledge of it during the hearings this week, must be the least read official publication of modern times. If restrictions on imports are no more onerous by 1956 than they were in 1952, those countries who are trying to earn dollars may have every right to be disappointed, but they will also have every reason to be thankful. They should also be thankful if there has been no depression because, despite Mr Humphrey's assertion that another must never be permitted to occur, there are some doubts whether he would be given power to prevent a recession from sliding into a depression.

About Mr McCarthy, the future is obscure. When the Administration arrived in Washington, there was general agreement that he must be neutralised within six months or it would be too late. Three of those months have gone and the Senator is stronger than ever. What seemed to be the great opportunity to deal with him, the Greek ship episode, was allowed to slip away and the unfortunate Mr Stassen, who stood up to the Senator, and is now said to have been guilty of "premature anti-McCarthyism," was taught a lesson by Mr Dulles and the President that will be remembered by others who might feel that the time had come to fight.

★

On the home front General Eisenhower's reputation will stand or fall on different issues. At the present time it stands higher than ever and the kind of worries that affect those on the scene in Washington—the choice of Assistant Secretaries, the attempt to dismiss Dr Astin and the appointment to the regulatory commissions of the representatives of those who are supposed to be regulated—have not yet spread to the country as a whole. If the American people are disappointed in the President and in his party by the next election, however, the blame will probably be shared between two of the best of the new team, the Secretary of the Treasury and the Secretary of Agriculture. It is impossible to say how a steady diet of disinflation will affect the country as a whole or whether the farmers will have learned by then to enjoy standing on their own feet for an hour or two at a time.

The death of Stalin was certainly a great piece of good fortune for the new Administration. But, by raising hopes of peace once again, it provided further opportunities for dashing them. It also provided a rational excuse for the announcement made by the President on his 101st day in office. It is not necessary to share to the full the pessimism of the Alsop Brothers to realise that his statement of April 30th could hardly be a description of a policy of "greater strength by less costly methods." It was much nearer to a policy of cutting the defence coat according to the amount of campaign cloth. Changed conditions in Russia have perhaps made the policy a good risk. If it proves otherwise, the Democrats may have been given an election issue of considerable proportions.

3-D Lifeline?

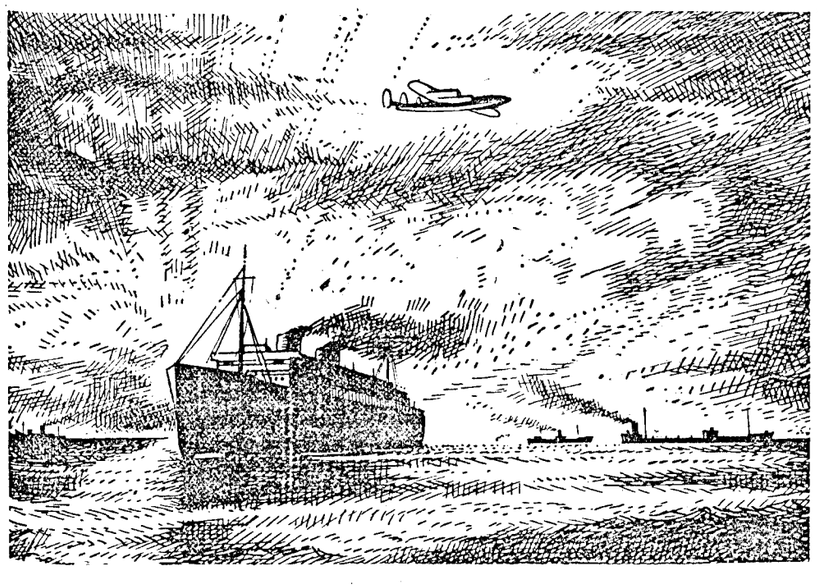
FROM A CORRESPONDENT IN HOLLYWOOD

SINCE the good days of 1946 Hollywood has been feeling its way through mists of uncertainty. Ever since the first whisper of failing box-office returns, the moving picture industry has been straining its ears to hear, over the trumpet sounds of its own publicity, the explanation of where it has gone astray. But in spite of the deepest soundings of audience research, the public has failed to respond with the clarity of condemnation or approval that the enquiry was expected to elicit. Do audiences want westerns, costume dramas or modern tragedy? If it knows, which is doubtful, the American audience has so far failed to say. With an excellent press "High Noon" was a disappointment at the box-office; with a bad press "Quo Vadis" has broken records and, with a press that seemed neither to like nor to dislike the picture, "The Bad and the Beautiful" may yet earn more than "Quo Vadis."

Pictures that are successful by no critical standards are providing good financial returns, while pictures that conform to formulas perennially acceptable in the past are failing to attract the cash customer. The lesson appears to be that audiences, unless they are stimulated by some or other imponderable attraction (and critical acclaim is the least of these), are "shopping" for their entertainment. In the light of the domestic box-office returns, it may even have to be admitted that it looks as if audiences were just staying away from movies—and staying away for good.

Such a conclusion is one that Hollywood could never entertain with any complacency. All hands have taken part in trying to solve the mystery of the diminishing returns. Mr Eric Johnston, who before he became the spokesman for the industry was president of the US Chamber of Commerce, has suggested that cinema attendances are suffering from the domesticity people wanted to recapture after the dispersals and separations of war; from the competition of the dollar steak and the new availability of cars and household appliances; finally, and maybe for ever, that they are suffering from television.

During the continuing doubt and self-examination about the disappearing American audience and the means by which it can be attracted back to the theatres, the importance of the foreign market has become more accentuated than ever. Before the slump it was a truism of the industry that an American motion picture recovered its production cost at home and earned its profit abroad. The latest figures from an industry in which statistics are notoriously unreliable show that in 1952 foreign revenue accounted for 42 per cent of Hollywood's gross receipts as against the 26 per cent earned abroad so recently as 1946. While the increase in foreign revenues has been welcomed as mitigating to some degree the disasters at home, the welcome is qualified because overseas earnings suffer from two grave disabilities—the uncertainty of remittances in a world short of dollars and the requirements that the major foreign markets exact, in the form of quota legislation. These necessitate a dispersal of Hollywood's production activities.



The International Alliance of Theatrical Stage Employees, the most powerful trade union in the motion picture industry, has for some time been casting jealous glances at the activities of American producers overseas. As long ago as July last year, at its general meeting at Indianapolis, a motion was tabled condemning all production abroad. It may have been no coincidence that Mr Johnston, with his professionally acute sensitivity to the importance of the foreign market, was the key-note speaker at the convention and that nothing more was heard of the resolution in its original form of a total boycott. However, since the beginning of this year a new drive by the Film Council of the American Federation of Labour has been instituted against "runaway" production; that is to say, production abroad which is not simply a means of unfreezing foreign balances, but which is designed to take advantage of lower wage rates and cheaper production costs. Simultaneously, influences are being exerted in Washington for some amendment of the tax measures that have fortuitously encouraged production abroad by exempting the earnings of stars and producers absent from the United States for eighteen months or more. With pressures such as these at work, foreign revenues—however gratifying—are more uncertain than ever and any recovery in the domestic market would be more welcome than ever.

★

It is not surprising, therefore, that film producers have leapt on the three-dimensional band-wagon with the gusto of gun-men jumping a stage-coach in an early western film. The prizes may be greater than anything ever carried by Wells Fargo. Historically, there seems to be good cause for optimism, since in the late twenties the general malaise afflicting cinema attendances was speedily dissipated by the advent of sound. Furthermore, the producers' hopes that the presentation of films may be more potent than their content seems to be sustained by the fact that the open-air "drive-in" theatres, in which the patron does not need to get out of his car to see the picture, are multiplying throughout the country under the trade name of "ozoners," and are doing a landslide business with precisely those films that are failing in the "hard-tops"—the conventional theatres.

But if 3-D seems to be the answer to the prayers of exhibitors and producers, its economics are at best uncertain. New processes are being announced almost daily which vary from the true three-dimensional of Natural Vision to the pseudo-three-dimensional of Cinerama. Costs of installation vary even more widely, running as they do from some $1,000 a theatre for Natural Vision to $100,000 or more in the case of Cinerama. And no reliable estimates have as yet been made about how greatly the costs of production will be increased. In all of this confusion the exhibitor has already raised a cry for standardisation and a committee of the Johnston Office has been appointed to examine that question. But the polished individualists—ruggedness is no longer an endearing quality—of the production industry are too busy in the pursuit of their own processes to hear the cry of the theatre-owners, whose divorce from production is now complete and who are possibly lamenting that fact for the first time.

A new avenue of future and possibly painful disagreement was opened recently by Mr Spyros Skouras when, in his annual report to the shareholders of Twentieth Century-Fox, he suggested that as soon as his company had established a sufficient back-log of pictures photographed in Cinemascope, the process owned by Fox, it might be throwing the nine hundred odd pictures made by it since the advent of sound upon the television screens of America. The outcry by the owners of the smaller cinemas, who claim they lack the financial resources to convert to three-

On the trail of trade

THE National City Bank of New York was the first American national bank to open a foreign branch. Since that day it has always been a leader on the trail of trade.

Wherever trade has been active, The National City Bank has opened a branch. Today the bank commands a world-wide network of 57 overseas branches, staffed by men with a first-hand knowledge of local business practices and regulations. In addition, The National City Bank has correspondents in every commercially important city in the world.

The London branches offer the facilities of this world-wide organization and are, as well, uniquely equipped to advise on trade with the dollar countries.

THE NATIONAL CITY BANK OF NEW YORK

(ESTABLISHED 1812)

Incorporated with limited liability under the National Bank Act of the U.S.A.

Head Office: 55 WALL STREET, NEW YORK. *London Offices—City:* 117 OLD BROAD STREET, E.C.2. *West End:* 11 WATERLOO PLACE, S.W.1

dimensional showing, has yet to be heard, but when it comes it is sure to be deafening.

There remains the question of the capacity of the American audiences to absorb entertainment. The public has shown that it can patronise its legitimate theatre, listen to its radio, stare at its television screen and visit its drive-in cinemas in sufficient numbers to keep these four major industries in production, although in uncertainty. Will the American audiences be capable of climbing into the third dimension in numbers great enough to support the new theatrical and productions costs entailed? Hollywood is gambling that the answer is "Yes," and Hollywood may well be right. The only prediction about the American consumer that has been proved consistently wrong has been the prediction which placed fixed limits upon his capacity to consume.

American Notes

Aid at a Minimum

PRESIDENT EISENHOWER'S request to Congress for $5.8 billion for mutual foreign aid for the 1954 fiscal year, beginning next July, is, as predicted, $1.8 billion less than Mr Truman asked for in January. But it is near the amount that has usually been spent in recent years and it is probably about the sum that Mr Truman would have got from Congress. President Eisenhower, with less experience of the need to insure against Congressional parsimony, has emphasised that his request is for the absolute minimum required for collective security and for achieving the essential objectives of the United States. But even so, Congress is already showing signs of being, as usual, in a mood to cut the final appropriations, if not the original authorisations. To prevent this will take sustained pressure from the President himself and from the high-powered team of Cabinet officers whom he sent to give the new programme a good send-off before a joint meeting of the Senate and House committees.

The following table gives details of the proposed division of the total amount requested. The new categories make comparison with other years difficult; "defence payments" seem to be the equivalent of last year's "defence support."

	$ million.	
Defence material and training:—		
Europe	2,534	
Far East	1,001	
Near East	469	
Latin-America	20	
		4,024
Defence payments fund:—		
Indo-China	400	
Supplies made in Britain and France	200	
Economic aid for Europe / Aid for Nationalist China	395	
		995
Special weapons planning		250
Technical, economic and development purposes		560
TOTAL		5,829

The emphasis on aid for France in the fighting in Indo-China had been expected even before the deterioration in the situation there had led Mr Dulles to promise that extra military supplies would be rushed to the defence of Laos. Altogether the United States is planning to bear 40 per cent of the cost of the Indo-Chinese war. The feeling that the Communist menace is now more threatening in Asia than in Europe accounts for the high share of the total that is allotted to the Far East, something which will also appeal to the Republican party. Similarly, the small proportion of aid for other than military purposes had been expected, as had the reduction, supposedly leading before long to the termination, of all direct aid for Britain. This will, however, be offset to some extent by the planned increase in offshore procurement, to be paid for out of the military part of the funds.

The completely new departure is the $250 million for "special weapons planning" which, in spite of the assurance that it does not involve giving the Nato countries access to atomic weapons, is generally taken to mean that they will be trained in the use of such weapons and of other new types of arms. This had already been found to be implicit in Mr Dulles's report on the Nato meeting in Paris.

Plateau, Not Peak

THE President used his message on foreign aid to disabuse those who were accusing him of over-confidence, of gambling on the peaceful tendencies recently shown by the Soviet Union. He insisted once again that, until Russian good faith was proved by deeds, the free world must continue to rely on military strength. He also repeated that, since it was impossible to forecast the date at which the danger of aggression would be at its greatest, it was only prudent to continue a steady military build-up at a pace which the economies of the countries concerned could support indefinitely.

The original criticism of the President had arisen from his rejection, at his press conference last week, of the Truman theory that the rearmament programme should be brought to a peak by a "critical year," usually said to be 1954, when the Soviet Union would be ready for an atomic attack on the United States, and that the programme should then be kept ticking over at a lower level. The new President and his advisers have decided that rearmament should rise steadily, if more slowly, to a plateau and should stay there as long as necessary. This, it is claimed, can be done without reducing the country's military strength and to the benefit of its economic strength. How high the plateau is to be and when it is to be reached has not, however, yet been revealed.

What has been revealed is that Mr Eisenhower's request for new appropriations for the 1954 fiscal year will be $8.5 billion below Mr Truman's estimated $72.9 billion. The foreign aid cuts account for part of this saving and another $5 billion is to come from the $41.5 billion that Mr Truman wanted for defence; further defence cuts are forecast for future years. Some economies will certainly result from better administration in the Defence Department itself, which will be facilitated by the reorganisation plan that Mr Eisenhower has now sent to Congress. How the rest of the saving is to be achieved is not yet known, but there is a suspicion that it may be at the expense of the 143-group air force so dear to Congress.

This warming evidence that the President intends to economise in fact as well as in fancy was accompanied by a cold shower in the form of a blunt statement that there was no hope of balancing the budget in 1954. This means that the Administration will go on trying to frustrate Congress's hopes of a tax reduction this year. For the cuts in appropriations will affect defence spending in 1954 very little; most of it is already fixed by long-term contracts for aircraft and other equipment, entered into by the previous Administration with appropriations approved by the previous Congress. President Eisenhower complained bitterly about his predecessor's legacy of $81 billion appropriated but not yet spent and of a "crazy quilt of commitments." Actual spending will in fact probably increase for a time, since the new Administration is going to speed up deliveries on some contracts, both for American and Nato supplies.

Tariff Standstill

PRESIDENT EISENHOWER'S invitation to Congress to appoint six of the eleven members of his trade policy commission underscores his anxiety to work with the legislature on the most controversial foreign issue dividing the Republican party. Originally it was thought that this broad study of foreign economic policy was to be assigned to Mr Lewis Douglas; it is now explained that his task is limited to following up the talks that took place between the American and British governments when Mr Eden and Mr Butler visited Washington in February. With protectionist-minded chairmen of Congressional Committees given a voice in selecting the members of this new bi-partisan commission, three from the Senate and three from the House, the changes in laws and procedures it is likely to recommend to increase international trade are hardly likely to be as vigorous, or to go as far toward substituting trade for aid, as those Mr Douglas might have favoured. But the President apparently believes that a modest programme, which Congress is prepared to accept because it has had a hand in drawing it up, is to be preferred to a more liberal charter which Congress might repudiate.

It is to give this commission time to formulate a trade programme which will fit in with other foreign policies that the President has asked for a one-year extension of the Reciprocal Trade Agreements Act without any changes. The first hearings, before the House Ways and Means Committee, however, have given precedence to a host of representatives of small business who, unlike the US Chamber of Commerce, not only oppose any further liberalisation of trade, but protest they are being ruined by concessions already made under the Trade Agreements Act. This is because the Bill under consideration, the Simpson Bill, is not an Administration measure but one which, while technically extending the Act, would take away the President's powers to ignore recommendations of the Tariff Commission, would make it more difficult for the Tariff Commission to resist demands for protection, and would impose restrictions on the import of oil, lead, and zinc. Representative Simpson seems willing, after the appointment of a protectionist spokesman on the commission, to consider softening his Bill somewhat, but even so Mr Eisenhower has been forced to declare that he could not accept certain changes the Bill would make in the Act.

What has been more disheartening to the advocates of "trade, not aid" than the outcry of business has been the lack of enthusiasm of two of the foremost Administration witnesses—Mr Dulles and Mr Weeks, the Secretary of Commerce—when they were finally permitted to speak. The Act may be extended without too many restrictions this year, but Mr Dulles's confession that next year he might favour something like the Simpson Bill, and Mr Weeks's admission that he was at heart a tariff man give an impression of wavering and divided purpose which may make the battle postponed until next year more difficult to win.

Professor Lattimore's Rights

PROFESSOR OWEN LATTIMORE, the Far Eastern expert whom Senator McCarthy three years ago called "the top Soviet agent" in the United States, was indicted last December on seven counts of perjury growing out of his twelve days of defiant testimony before Senator McCarran's sub-committee on internal security. At that time Professor Lattimore challenged the investigators to charge him with

THE HANOVER BANK
FIDE ET FIDUCIA
NEW YORK

Linking the two financial centres of the world, London and New York

THE HANOVER BANK
(Incorporated with Limited Liability in U. S. A.)
LONDON . . . 7 Princes Street, E. C. 2
NEW YORK . . . 70 Broadway

perjury. His faith in the courts seems to have been well-founded. Judge Luther Youngdahl, a former Republican Governor of Minnesota whom Mr Truman appointed to the bench, has dismissed four of the seven counts and revealed that he has "serious doubts" about the pertinence of the remaining three on which Professor Lattimore will be tried in October. He has ordered the government to state the "overt acts" on which these are based and to file a bill of particulars if it does not want to risk violating the Sixth Amendment to the Constitution, which guarantees to a man the right to know the accusations against him.

The congressional Communist-hunters believe that Professor Lattimore influenced American policy in favour of the Chinese Communists both through his advice to the State Department and through the Institute of Pacific Relations, a private organisation which has been the subject of many congressional suspicions and whose magazine he edited. Two of the counts dismissed by Judge Youngdahl charged that Mr Lattimore lied when he denied knowing that a certain contributor to the magazine was a Communist and denied publishing articles by other known Communists; the third that he perjured himself when he denied that he got into China in 1937 with Communist help. All these counts, in the Judge's view, were insufficient, and the remaining one deprived the defendant of the protection of both the First and the Sixth Amendments. This is the major charge that Professor Lattimore lied when he said he had not been a "sympathiser and promoter of Communism or Communist interests." The Judge found it "so nebulous and indefinite that the jury would have to indulge in speculation to arrive at a verdict" and declared that the First Amendment was designed to protect an individual in the expression of ideas though they are repugnant to the orthodox. Those who fear, with Senator Lehman, that McCarthyism is abridging the Bill of Rights will find heart-warming the Judge's insistence that

> Communism's fallacy and viciousness can be demonstrated without striking down the protection of the first amendment. . . . When public excitement runs high as to alien ideologies, it is the time when we must be particularly alert not to impair the ancient landmarks set up in the Bill of Rights.

SHORTER NOTES

The Treasury's new long-term bond issue, 30 years at 3¼ per cent, was even more successful than had been expected, being about six times over-subscribed. After excessive and speculative subscriptions had been eliminated, other subscribers were allotted 20 per cent of their requests, with subscriptions under $5,000 being met in full. Total awards of the new bonds amounted to $1,080 million.

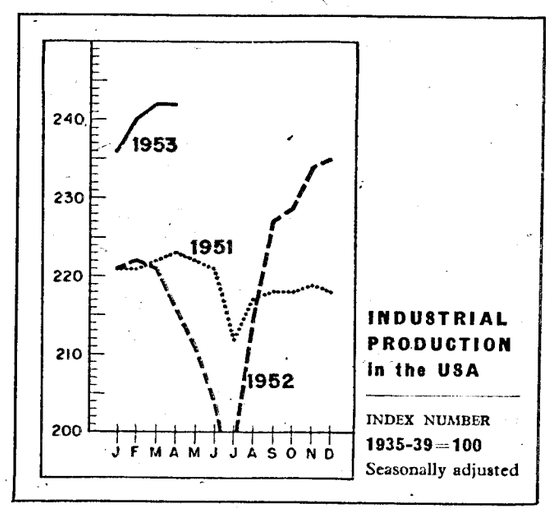
Statistical proof of the assumption that watching television is more popular than taking a bath or making a telephone call comes from America's second city, Chicago, which has 1,360,000 TV sets in use, compared with 1,320,000 home telephones and 1,260,000 bathtubs. For the nation as a whole, there are about as many television sets as private baths—close to 30 million—while home and business telephones together total nearly 50 million.

THE *First* SINCE 1784



The United States had only just become a sovereign power when in 1784 the First National Bank of Boston was founded. The bank has grown with the country — indeed helped the country to grow — and maintains important branches in Argentina, Brazil and Cuba as well as a wholly-owned foreign banking affiliate in New York City.

America's oldest chartered bank offers traditionally courteous and comprehensive financial service to bankers and concerns engaged in overseas trade with North and South America.

The Upheaval in Pakistan

FROM OUR CORRESPONDENT IN KARACHI

IT had been obvious for some time past that the tension in Pakistan had reached breaking point. The government of Khwaja Nazimuddin had lost its prestige, the morale of the nation had fallen to zero, and the "growing uneasiness" expressed by the Governor General in his communique was certainly shared by all sections of the people. The report of the Basic Principles Committee had given an impetus to provincialism and had caused a disagreement between the Punjab and East Bengal which threatened to split the country. The concessions made to the mullahs had alarmed progressive elements, and the sectarian agitation against the Ahmadis had produced ugly manifestations. The food grains situation was well-nigh desperate, and the government had incurred severe censure for failing to foresee the wheat shortage and take steps to meet it in time. The general economic situation, with particular reference to the exhaustion of the country's reserves of foreign exchange, caused equal anxiety.

There were widespread criticisms of the lack of decisive leadership in the country, and it was known that the cabinet was not pulling together as a team. Yet Khwaja Nazimuddin's government had not, to all appearances, been fully shaken out of its complacency. The problem facing the country was how a change of government could be effected constitutionally. Despite all the dissatisfaction, the government had not the slightest difficulty in obtaining the approval of the Constituent Assembly, in its legislative capacity, to any measures put before it, and the opposition was limited to a few voices crying in the wilderness. Admittedly, the Assembly had degenerated into a sort of "long parliament," no longer truly representative of the people, but the prospects of a general election continually receded with the interminable delay in reaching agreement on the constitution. In these circumstances, it was feared that a change in government could only be effected by some unconstitutional means. It had not occurred to anyone that the ailing Mr Ghulam Mohammad, the Governor General appointed on the advice of the cabinet, would be able or willing to play the part of the *deus ex machina* for which the country was looking. His action in dismissing the cabinet was courageous, timely and dramatic.

Whether it was truly constitutional will long be debated. The Governor General relied on section 10 of the Government of India Act as adapted for Pakistan, which lays down that his ministers should hold office during his pleasure. A literal reading of this does no doubt justify the action taken, but it can hardly be said that it was in accordance with the spirit of the constitution. Nevertheless, Mr Ghulam Mohammad deserves the highest praise for having made a realistic appreciation of the situation and acted on it. His action had at least the semblance of constitutional legality and, in the exceptional circumstances, was the only way of bringing about a change of government short of some sort of *coup d'état*.

It is very regrettable that the services of Khwaja Nazimuddin are, at least temporarily, lost to the nation, for none would deny that he is an honourable, disinterested and God-fearing man. If, indeed, he had been prepared to jettison some of the least successful and most unpopular members of his cabinet the crisis would never have arisen in its present form. He had, after all, only recently succeeded in surmounting a serious threat from the Punjab by dismissing Mr Daultana, the chief minister of that province. He had also dealt firmly with Mr Khuhro, the recalcitrant ex-chief minister of Sind who, despite his disqualification from public office on various charges of misconduct and maladministration, claimed to be still entitled to exercise the powers of the provincial Muslim League leader. These flashes of firmness did not, however, suffice to convince the country that Khwaja Nazimuddin had the situation in hand.

A Surprised Public

The choice of Mr Mohammad Ali, who was on a brief visit from Washington, to fill the office of Prime Minister, took the public completely by surprise. It had been generally believed that Mr Qayum Khan, the forceful chief minister of the North West Frontier Province, was the man who, in an emergency, would have to be called on to pull the country together. Mr Qayum Khan has, however, been persuaded to join Mr Mohammad Ali's cabinet, where his personality will certainly make itself felt. The desirability of maintaining the provincial balance perhaps made it necessary that a Bengali should succeed a Bengali as prime minister, and it is to this, in the general estimation, that Mr Mohammad Ali primarily owes his selection. The fact that he is well known and liked in Washington and Ottawa may also have carried weight, seeing that Pakistan now stands desperately in need of a gift or loan of a million tons of American wheat. He has, too, attractive personal qualities.

The change in the personnel of the cabinet has not served to allay provincial jealousies, and it will be necessary to bring another East Pakistani to the Centre. There is, however, reason to believe that the cabinet will no longer be

divided in itself. Not only will the Governor General, who will play hereafter a more influential part in public affairs, insist on this, but the Ministers themselves will surely realise that they are on trial and that they must hang together if they do not wish to hang separately, for the recent events have reinforced the ranks of the disgruntled politicians. The problems facing the cabinet are indeed of the greatest difficulty and complexity, and the mere removal of the two ministers who have most palpably proved failures—Mr Pirzada, the Food Minister, and Mr Fazlur Rahman, the Minister for Commerce and Economic Affairs—will not in itself provide the answer. It can, however, only lead to a more vigorous policy. It is significant that the Food and Agriculture Ministry has been entrusted to Mr Qayum Khan, who will certainly stand no nonsense from any quarter, and the Ministry of Economic Affairs to the other Mr Mohammad Ali, the reappointed Finance Minister, where it could not be in better hands. A new Commerce Minister is yet to be found.

The main political significance of the change of government, however, seems to lie in the ideological field. The past year has witnessed gains all along the line for the mullahs and those elements of public opinion which would impose a theocracy on Pakistan. The reconstitution of the cabinet has given the progressives, who deeply resented these tendencies but somehow seemed powerless to check them effectively, hope that the mullahs are finished as a political force. The Governor General himself is believed to have disapproved strongly of the reactionary provisions of the report of the Basic Principles Committee, and the new Prime Minister is also said to be a modernist. Had there been any desire to placate the religious extremists the opportunity of the reshuffle could so easily have been taken to drop Sir Zafrulla Khan, who, as a member of the Ahmadi community, has been heavily under fire from the orthodox camp. He has, however, been reappointed, and not a voice seems to have been raised in protest.

Better Relations with India?

Sardar Abdur Rab Nishtar, who was known to be the chief supporter of the mullahs in the Cabinet and was the author or at least the protagonist of the Basic Principles Committee's proposals for the setting up of advisory boards of mullahs, has been dropped and Mr A. K. Brohi, who has been in the forefront of the campaign of the intelligentsia against the forces of obscurantism, has been brought in as law member. It is generally thought that the new constitution will be given a more secular complexion, though the Objectives Resolution, which declared Pakistan an Islamic state, will probably be retained. This was passed in Liaqat's time, and was hardly more than a praiseworthy statement of aspirations, unobjectionable from the practical point of view.

It is also confidently expected that the formation of the new government will lead to better relations with India. The atmosphere had already become more favourable, for the trade talks between the two countries had been markedly successful, and members of the Pakistan delegation had spoken freely of the cordial spirit they had encountered in New Delhi. Everything was working up towards a fruitful meeting between Pandit Nehru and Khwaja Nazimuddin, and Mr Mohammad Ali is considered to be, if anything, more anxious to re-establish friendly relations than even his predecessor. In this he will be supported by Mr Shoaib Qureshi, another newcomer to the cabinet who has been serving as High Commissioner for Pakistan in India, where he has been reported to have established very friendly personal contacts with Pandit Nehru and other members of his government.

There is, moreover, reason to believe that foreign capital may be able to expect more co-operative treatment under the new government. During the past year Khwaja Nazimuddin's administration, while continuing to render lip-service to the need of encouraging the entry of foreign capital, has done much to deter it. Mr Mohammad Ali has made it plain, in his first press conference—though he was giving his personal views rather than the considered policy of his government—that he attaches great importance to foreign investment as an aid to the development of Pakistan and would deprecate any measures likely to discourage it.

Iconoclasts in Moscow

"They have cancelled him completely, we are living entirely without a Tsar. . . . Don't talk to our people about the Tsar, tell them what will happen about the local police officer."—From an early Soviet novel.

FOR the first time in a quarter of a century the Soviet papers did not carry Stalin's portrait on the first page in their May Day editions. True, his and Lenin's portraits were carried by marchers in the parade. Yet they were not, as in previous postwar years, alone: all the members of the present Party Presidium had their posters as well. What is more, in his speech and in his Order of the Day, Marshal Bulganin did not make a single reference to the "Great Founder of the Red Army." This is only one of the many recent signs that the cult of Stalin, which had been built up for years by an ever-growing propaganda, is now being played down. The ease with which the myth is being exploded is the more astonishing since Stalin did not, like Hitler, leave behind him a defeated country in ruins. On the contrary, he left the scene at the height of his power and glory. And yet within two months of his departure his apparently worshipping pupils and successors have proved themselves to be determined and effective iconoclasts.

Even before the war the cult was acquiring fantastic proportions. Stalin was being built up as all the Russian heroes rolled into one. He was Ivan the Terrible and Peter the Great, Suvorov and Kutuzoxv. He was also more than that. He aspired to a reputation as a thinker, a theoretician. His whims were canons for art. A chance remark in praise of the poet Mayakovsky was sufficient for the latter to be hailed as Pushkin's successor; an acid remark on another poet praised by Lenin—Demyan Byedny—was enough for the latter to fall into oblivion, grateful that no harsher penalty followed. At meetings, even when Stalin was present, laudatory telegrams had to be sent to him. His official biography ended with the words "Long Live Comrade Stalin." It was later reproduced in the Soviet Encyclopædia, which also contains a special map showing all the places where he had been during the Civil War. The history of the Revolution had to be rewritten to eliminate his competitors and victims and put him everywhere in the forefront.

Yet it was after the war that the cult showed itself in all its Byzantine folly. No treatise or article could be published

IF YOU WANT BUSINESS IN CANADA YOU'VE GOT TO BE QUICK!!

It's less than a day by **TCA**

CANADIANS engaged in developing the boundless resources of their country think in terms not of miles but of *flying hours*. Things must be done quickly—and you need to be there quickly if you want to do business in this great expanding market. That is why you should fly TCA—Canada's own Air Line, that takes you from London or Prestwick, not only to Montreal but to every industrial centre in Canada and major U.S. cities.

Your Travel Agent has details of TCA's new low trans-Atlantic fares.

FLY TCA

MAPLE LEAF SERVICE

KNOW YOUR CANADA?

EDMONTON, capital of Alberta, is said to be Canada's fastest-growing city. It is a great centre of both agriculture and industry. TCA flies you from Montreal to Edmonton within 10 hours.

My dear fellow

It doesn't matter tuppence whether you want only one new desk or furnishing for six office floors. Talk to Peter Catesby and his staff about it. They won't go so far as to suggest puce striped wall paper—but they do take great pains to give some individuality to your furnishings. They will adapt a piece of furniture to suit your exact physical needs. In short, they'll give you what you think you want—only a lot better.

on astronomy or medicine, biology or botany, let alone the social sciences, without quoting chapter and verse from the sacred works of the "greatest man of our times." The anniversary of each article or speech was duly celebrated in the Soviet press. Every few days the newspapers carried Stalin's portrait, and on each occasion he was looking younger, taller, nobler. One had the impression that, as in Tsarist times, the editors were getting a circular on how to present the ruler. His tiny pamphlet on linguistics gave rise to a special journal to comment on it. Dictionaries were to be rewritten on its basis. Never did so many write so much about so little.

The climax was reached at the last All-Union Congress. On its eve Stalin fulfilled his life-long ambition. He published a pamphlet on the Problems of Economics which, although crude in its theorising, was immediately hailed as a second *Das Kapital*. All the sections of the Academy of Sciences devoted special ceremonial sessions to it. The Institute of Economics promised to publish many textbooks and other works based on Stalin's "discoveries." There seemed to be no more heights to which he could climb. At the Congress he sat alone, separated from the ordinary mortals of his Politbureau. One began to wonder whether he was a mortal. The great fuss made in the Soviet Union about the possibility of extending life was clearly intended to create the impression that the "greatest genius" would not be allowed to depart. Yet on March 5th he was dead.

From Mausoleum to Pantheon

The speed and skill with which his successors set about destroying his legend is a proof that for some time already they had been impatient with their protector and had their plans ready. A move which preceded the funeral was a sign of things to come. It was decided that Stalin's body would be removed from the mausoleum to a pantheon. The mausoleum was a symbol of monocracy. Stalin created it ostensibly for Lenin, in fact for himself. Yet he himself is not to be allowed to lie in splendid isolation, like Tamerlane the Great in Samarkand. He will share the Pantheon not only with Lenin, but with all the dead revolutionary leaders. This is devaluation by inflation. At the funeral Malenkov's speech was businesslike, not moving. The mourning was unexpectedly brief. After Stalin's 70th birthday the *Pravda* went on publishing laudatory telegrams for at least a year. This time, after three weeks, all those who had sent condolences were officially thanked and the ceremony was over. Stalin's portraits disappeared. The quotations grew rarer.

Many examples could be given. For instance, the Constitution and the Five-Year Plans used to be preceded by the epithet "Stalin"; this has now been dropped. The article inaugurating the sowing season normally included a deep remark by Stalin that "sowing is a seasonal operation"; this year it appeared without it. The popular illustrated weekly *Ogonyók* used to be full of Stalin's portraits; in the last few weeks it has had none. The economic journal *Voprosy Ekonomiki* was filled, prior to Stalin's death, with analyses and commentaries on his pamphlet; its latest issue is devoted to the 70th anniversary of Marx's death and contains only an official communiqué about that of Stalin. On the anniversary of Gorki's death the ritual photograph of Gorki and Stalin was replaced by one of Gorki with the same Demyan Byedny whom Stalin once attacked.

In April *Pravda's* leader on Korea had only a single reference to Stalin. In the reply to Eisenhower he was not quoted once and even the denial of the beginning of a new era sounded only half-hearted. Indeed, in a May 1st article in *Pravda* entitled "Hope", Ilya Ehrenburg does speak of a new era, of the beginning of spring. True, he does not link it with Stalin. Yet is not the conclusion simple that his departure was needed for the "political winter" to end? This at least must be the view of the average Russian for whom Stalin's death means the calling off of a purge, an amnesty, the promise of greater freedom, of peace and a better standard of life.

Undoubtedly all the ramifications of the myth cannot be destroyed overnight. One can still find in the Soviet press appeals to study the life or the works of Stalin. But they usually come from correspondents in some remote area who are still as much behind the times as the foreign Communists. Besides, not all probably welcome the change. Some may fear that they will be the victims of this reversal of policy. Stalin was certainly not alone in launching the policy which led to the arrest of the doctors. In the *Komunist*, for example, the quotations from Stalin, though not plentiful, are more numerous than in the other journals. One of its chief editors—Chesnokov—rose to this post at the Congress on the wave of the vigilance campaign. He has just relinquished this job.

Why does it happen that a build-up so patiently and lavishly established over a quarter of a century should collapse so rapidly and with such ease? The answer lies probably in a paraphrase of Marx: Stalinism contained within itself the seeds of its own destruction. It changed the face of Russia. It taught the muzhik to read. True, he was then given panegyrics on Stalin to learn. Yet this was not all. The young Soviet school-children were brought up on the classics of Marxism, on the great Russian satirists and revolutionary writers. All this was dynamite. One cannot rely on whole generations having a split mind; they were bound to apply these tools to their own environment. The Stalinist cult grew on the fertile soil of backward Mother Russia. Things have changed after four Five-Year Plans. The official Soviet emblem is still a hammer and a sickle, but a turbine and a tractor would now be more appropriate. These have reploughed the Soviet land, but in the process they have sapped the bases of Stalinism.

Behind Japan's Vote

FROM OUR TOKYO CORRESPONDENT

THE Japanese have at least made it clear that rearmament by any other name would smell much sweeter. The dogged Mr Yoshida has scraped back into office, if only by an illusion of power, with 200 seats in a Diet of 466. He persists, straight-faced, in his insistence that Japan's slowly growing defence forces are an innocent constabulary body, and that Japan has not, cannot and will not in the foreseeable future consider rearmament.

Mr Shigemitsu, leader of the intermediary Progressive party, who had high hopes of ousting Mr Yoshida, was rash enough to call for open rearmament, following an appeal to the people for the necessary amendment to the MacArthur Constitution. He lost 12 seats and his crestfallen followers

are now vulnerable to the lures of Mr Yoshida. Mr Hatoyama's splinter Liberal party followed Mr Shigemitsu's rearmament example, lost six seats, and must reconcile themselves to being only a thorn in Mr Yoshida's side rather than strong timber to support a coalition government with the Progressives. On the pacifist side, however, the Left-wing Socialists, who both abominate rearmament and want the American garrison out of the country as well, increased their representation; so did the Right-wing Socialists, who had been toying confusedly with a compromise policy of both rice and guns. It is surmised that the lesson of the election will not be lost on the Right wing and that rice will definitely displace guns in their next election platform.

The American State Department blundered in the accidental, coincidental or deliberate timing of its sudden, election-eve pledge to maintain dollar spending in Japan, even if the "threat" of an armistice became a fact in Korea—a grisly prospect which haunts the thinking of Japanese industrialists. The State Department announcement, which rallied the sinking Tokyo stock market was, of course, immediately denounced by the Socialists as American interference in Japanese politics to help the return of Mr Yoshida's conservatives. The Americans still seem slow to recognise the extreme sensitivity of Japanese public opinion to even the most benevolent and sagacious advice from the old occupying power.

To many intelligent Japanese, the American dollar pledge at best smacks heavily of ingenuous Washington Danegeld. The less, indeed, the Americans have to say in urging Japanese rearmament—and they have had far too much to say openly already—the better for those Japanese leaders who know that rearmament must come but are pushed, politically, into subterfuge in order to get round the dead-letter Article IX, proscribing all armed forces for Japan, which General MacArthur once prematurely commended as an example to the civilised world.

Markets Not Militarism

On a long-range view, this burden of suspected US co-operation or interference is likely to weigh heavily against Mr Yoshida in particular and the conservative forces in Japan in general. Mr Yoshida held office thrice during the Occupation and, although the sturdiest and most patriotic of Japanese, who has been sniping heavily at Occupation "reforms" during his last tenure of office, he is becoming increasingly associated in the popular Japanese mind with open and concealed American influence in Japanese affairs. Repercussions may be even more unfortunate. A natural political reaction may well be reflex development of a strong anti-American policy and party outlook among the non-conservative forces.

The simple but overlooked fact is that the Japanese—denied or assured American armed aid—are not nearly as preoccupied with rearmament as they are with economic recovery. Just as American policy is concentrated on the challenge of Communism, so is Japanese policy concentrated on industrial expansion and the search for, and recovery of, markets. A world which remembers Japan as the old military aggressor tends to forget or miss this fundamental transformation. For the time being, at least, Japan has to think of living before fighting. If this changed outlook involves risks, the risks must be accepted with a shrug as unavoidable, while priority is given to what are regarded as more pressing national needs. Besides, the Americans have so heavily and earnestly emphasised their dependence on Japan that the risks seem to be perhaps not so serious.

If Mr Yoshida succeeds in forming a fifth uneasy administration, it is certain that his budget will not provide for increased armament spending. His first budget for a "sovereign independent" Japan ignored strong American pleas, led by Mr John Allison, the new American ambassador, for swifter and more extensive rearmament; it cut back last year's moderate arms vote of 182,000 million yen (£182 million) by 20 per cent. However strongly he is assailed on other and less important issues by new and old political foes in the Diet, no voice will be raised to criticise his repetition of this defence saving. The sundered Socialists might conceivably compel a closing of the conservative ranks if they could, by some prodigy of compromise, compose their differences and form a strong united opposition. Any such Socialist agreement would certainly be in conformity with the growing mood of "neutralism" now spreading in Japan.

Italy's Anglophobes

FROM OUR ROME CORRESPONDENT

THE arrival in Rome as diplomatic representative of the United States of a photogenic lady whose name, Clare Luce, conveys to the Italian reader "Clear Light," cannot but put on their mettle the occupants of the dimly suburban Villa Wolkonsky. This somewhat lugubrious building has housed the British embassy since 1946 when Israeli fanatics partly blew up the traditional British Embassy in its once pleasant park near Porta Pia. Villa Wolkonsky, which was the German Embassy in Hitlerian times, has had but one advantage. It is far too inaccessible for Rome's nationalistic youth to trouble to march against it. This is something in days when burning the carpets and curtains of the British Council premises is regarded by a section of that youth as the discharge of a sacred trust.

The Foreign Office would probably be ill advised to search round for a Clear Light of our own to send to Rome to compete in charm and brisk effectiveness with the American lady now taking up residence in the former Palace of the Queen Mother, in the heart of fashionable Rome. Nor, perhaps, should England ever be tempted to try and emulate France in the radiation of cultural influence to the "Latin Sister" from such magnificent Roman quarters as Michelangelo's Palazzo Farnese (the French Embassy) and the Villa Medici (the French Academy), providently acquired for French muses generations ago.

However else Anglo-Italian relations could be improved, the idea that public smiles and handshakes, or eloquent speeches and celebrations, could help much, seems to disregard experience. On what common memories can rhetoric draw? Dim recollections that Lord John Russell or Robert Browning encouraged Italy to acquire independence in defiance of the Papacy may have helped Britain in dealing with the Italy of Salandra and Sonnino. They are of little use with an Italy which is now engaged in examining its own Catholic conscience about that irreverent proceeding. Of small value are memories of comradeship in arms in the first world war when so little of the British part is remembered in Italy except Britain's repudiation of Italy's claims under the Treaty of London, and so little in Britain of Italy's part except a military disaster which became a by-word. The Mussolinian double decade is best forgotten altogether. The slender partnership of "co-belligerence" in the last phase of the second world war went a little way towards sponging the first phase off the slate. Yet even the fraternisation of British officers with Italian partisans in 1944-45 has become smeared by the Communist Party's attempted monopolisation of Italian partisan memories. There is nothing, in all this recent history, to form the argument even of an unembarrassed Anglo-Italian after-dinner speech.

Postwar developments are no more helpful. The chatter of the Italian dinner table is that England secured for Italy a punitive armistice and peace than America wanted to concede; that it drove Italy, save for a tiny Somali foothold, out of that great African estate first won by Rome for Europe; that it responded to Italy's need for a population outlet by taking in a few hundred Italian miners, and then dismissing them with some show of racial disdain; and that it has finally raised up, mainly by the agency of Mr Randolph Churchill, a modern counterpart of the Habsburg Empire at Italy's gates in the shape of Tito, the pan-Balkanist. These, of course, are not altogether the images of Britain which arise in the mind of an intelligent follower of Signor De Gasperi or Signor Saragat. An Italian liberal will still warm to admiration of the orderliness which British public life has preserved through the far reaching and resolute experiments in social reform. Nevertheless Britain will probably stand out even for him as the power which might have, but did not, shepherd the battered Europe of 1945 into unity. And then, of course, there is always Trieste.

Chocolates and Trieste

As always, the prevalence of an almost universal and at times, it almost seems, engineered and planned bitterness against Britain on the historical and political planes, unshared only by some select circles, is compatible with the most cordial personal relations between local Britons and Italians. The anti-British mood, though politically exploited by the Right, is in no sense whatever government-promoted or encouraged, and there are no complaints of Britons in any sphere of affairs being made to feel an Italian official cold shoulder. The public and private aid sent from Italy in our flood disaster was conspicuous. On the other hand Italian journalists increasingly preface remarks on British affairs with a protective "Far be it from me to wish to give any credit to the British, but. . . ." There is a diffused fear of an adverse public opinion against signs of pro-British feeling. The fashionable Rome grocery stores feels obliged to hide away British Coronation boxes of chocolates "because of Trieste." It would be absurd to compare the present diffusion of Anglophobia with the state of feeling in the thirties. On the other hand the mere fact that the sentiment was then being forced on by government agencies engendered a private reaction against it which is now missing.

The best method of working for an improvement in Anglo-Italian relations is probably to make sure that at no point shall they fall short of correctness. The Government presided over by Signor De Gasperi is one with which business can be done. It is a great deal that there should be seated in Rome a Ministry which does not bluff or bluster. The harm which could be done to British interests by an Italian Government which shared and exploited, instead of mildly withstanding, the vulgar Italian conception of a Downing-street weaving a mysterious Balkan policy in which to enmesh and frustrate Italy, might be considerable. The Pacciardi visit to Egypt and the Italian enthusiasm for Persian oil are examples of directions in which bad general relations could develop a long train of mutual mischief: naturally there are other directions in which Italy would be the more obvious sufferer. Indeed Italians perpetually think they are spotting things to their disadvantage in a supposed British sphere of influence across the Adriatic. Even a radiant Lady Ambassador could do little to make British policy, for a long time to come, charming in Italian eyes. It would be a great deal if a quite ordinary mortal could make it seem safe and unmysterious.

Holland After the Flood

ONLY eight of the 67 major gaps torn in the coast defences of Holland by the storm and high seas of January 31st remain to be plugged. The emergency operations are thus in sight of completion, yet in places sea-water still inundates and despoils the once rich farmland. Now that the immediate danger is over thought has turned to more permanent works to supplement or supplant the system of dykes which proved inadequate. An expert commission has been appointed to study the problem and to report on the ambitious project of enclosing the sea arms of south-west Holland.

Loss of life and damage to property was extremely heavy—the full cost has not yet been fully assessed but may reach 1,500 million guilders. Fortunately, the first estimates of the effect of the disaster on Holland's economy may turn out to be unjustified. The area affected includes 5.7 per cent of the total farmland and produces substantial proportions of the country's food crops, but is unimportant industrially. A large part of the 1952 harvest was salvaged and expansion in other areas will partly offset losses in the flooded districts, but increased food imports, particularly sugar, are expected later this year. Holland's export potential was only slightly affected. The trade gap in the first quarter of 1953 of 143 million guilders compares favourably with the 159 million guilders in the corresponding period last year, but must be expected to worsen when existing food-stocks, which are not excessive, are replaced by imports. Paradoxically a beneficial effect on Holland's perennial problem of structural unemployment has resulted. Registered unemployment of 111,835 in March, 1953, compares with 149,473 in the previous month and 145,386 in March, 1952. As temporary repair work is completed this trend may be reversed; but the disaster may herald the policy advocated in some quarters of compensatory spending by the government to reduce unemployment. The government's plans to meet the costs of the disaster have not yet been fully worked out, but there now appear to be second thoughts about using counterpart funds offered by the Americans. The original antipathy is said to have been due

QUARTERLY ECONOMIC REPORTS are now available on nearly seventy countries. These reports give information and opinion on matters of concern to exporters and investors; they are concise and have comprehensive statistical sections. A descriptive leaflet may be obtained from The Economist Intelligence Unit, 22 Ryder Street, London, S.W.1.

to the Finance Minister's apprehensions about the possible inflationary effects.

The magnitude of the disaster is not to be minimised, but there are some consolations for the stout-hearted Dutch. Providentially the flood coincided with a period of growing economic strength—gold and exchange reserves reached a new peak on April 27, 1953, of 4,207 million guilders, compared with 2,330 million guilders a year previously—and struck at a time when inflationary forces had diminished. Some deficit-financed reconstruction expenditure will now be not inappropriate.

Dr Adenauer and the EDC

HISTORY books sometimes describe important decisions as having depended on the whims and passions of a single man or small group of men. Although such a description often contains an element of over-simplification, Dr Adenauer's defeat in the *Bundesrat* over the ratification of the treaty for a European Defence Community offers a striking case in point. Up to a few weeks ago, Dr Reinhold Maier, the premier of the South-West German State (Baden-Wuerttemberg), was known outside Germany only to a few specialists and observers of its political scene. At present, it would be no exaggeration to say that it is partly on him and his small group of colleagues from Swabia that the future of EDC, and with it the future of European integration, substantially rests. How did this situation arise? Laws requiring the approval of the upper house (*Bundesrat*) have to pass with an absolute majority of 20 votes out of 38. Dr Adenauer's Christian-Democrats can muster 18 votes, whereas the Social-Democrats control 15. The balance of power is held by the South-West State, whose representatives are entitled to 5 votes. Each *Land* casts its vote in block form and it is up to its leader to determine what the wishes of his own *Land* are, and within each *Land* there may be complex coalitions which tie his hands. Dr Maier's decision to vote against immediate ratification and the resulting defeat of Dr Adenauer are, in effect, the outcome of just such a piece of complexity in local politics.

Within his own *Land* cabinet Dr Maier and three of his colleagues who are in favour of EDC are out-voted by five Social-Democrats. In order to come out in support of the Chancellor, Dr Maier would either have had to persuade these Social-Democrats to vote against their party line, or he would have had to take full authority on himself and destroy the coalition which at present governs the South-West State. There was no reason why Dr Maier should have taken this step. He is a Protestant of the old Weimar Republic stamp, and is a strong regionalist with little enthusiasm for the centralised methods of the Catholic Federal Chancellor. To Dr Maier the conflict with the Catholics over secular or confessional schools in Baden-Wuerttemberg is really more important than European integration, and this has led him into an alliance with the Social-Democrats. It is men like Dr Maier and President Heuss, moreover, who represent a genuine democratic tradition in Germany, and part of their opposition to Dr Adenauer stems from a legitimate distrust of imposed solutions and central authority.

The whole question of the constitutional struggle over the ratification of EDC has reached a stage of unbelievable complexity, partly because of the very nature of the federal system with its interplay of local and national concerns, and partly because of false moves and attempted short-cuts by the Federal Government. Dr Adenauer made his first grave error when he postponed, last December, the third reading of the EDC Bill in the *Bundestag*. He seems to have believed, moreover, and on no real evidence, that the Constitutional Court at Karlsruhe would rule EDC to be unconstitutional, and took the line that the legislature must make its political decisions before any judicial opinion is delivered. This has only led to further delay and confusion, and it is becoming increasingly clear that Dr Adenauer, if he tries to stick to his schedule, will run into fresh trouble.

The Chancellor's first reaction after his defeat was to consider bypassing the upper house altogether. After the lapse of a fortnight, in which the *Bundesrat* can express its views on laws not necessarily requiring its approval, the treaties could have been forwarded to the President for signature. This course would, however, have run Dr Adenauer into even deeper waters. It would have placed President Heuss in the difficult position of having to decide whether or not to sign after ratification by a simple majority in the lower house only. Many of Dr Adenauer's own party colleagues, moreover, would not have agreed to so cavalier a dismissal of the upper house, and it is by no means clear, as yet, whether or not upper house approval was or was not indispensable *per se*. An appeal might have been made to the Constitutional Court on this point and Dr Adenauer would have been back where he started.

Case for a Snap Election

It now seems likelier that the Federal Government will give the upper house a chance to change its mind. This does not mean that the Christian-Democrats are withdrawing their contention that the upper house is concerned, properly speaking, only with financial aspects of the EDC treaty, but it does mean that Dr Adenauer and his party still prefer cautious legality to any swift cutting of the constitutional knot. The one way in which to get the *Bundesrat* to vote differently is to break up one of the anti-treaty coalitions in the *Länder*. There is some hope that the coalitions in Stuttgart or in Hanover may disintegrate. Finally, it is just possible that Dr Maier may be convinced at long last of the importance of ratifying EDC instead of forcing Dr Adenauer into an *impasse* from which there would be no way out except by going to the country in a snap election.

Were it not for the fact that the electoral law is not quite ready, that is just what the Chancellor might have done in the last few days. The longer the delay between his triumphant return from America and the election, the more likely is he to lose his case and the fruit of his long perseverance. What is at stake, however, is not only the future of EDC and of the Adenauer government; it is also the belief of the German people—still only faint—in the processes of parliamentary democracy. Unless some way is found both to preserve the right of political opposition and to clear up this fantastic legal and constitutional muddle, the Germans will be tempted to write off the democratic experiment in their minds. That is what Dr Maier must realise when seeking to assess the respective importance of secular schools in Baden-Wuerttemberg and of a European Defence Community.

"The success of the policy I advocate will depend on the extent to which industry and the public respond to the call. I have confidence in the response of our people. So in this spirit we take a new direction. We step out from the confines of restriction, to the almost forgotten but beckoning prospect of freer endeavour and greater reward for effort."

Mr. R. A. Butler, Chancellor of the Exchequer in his Budget Speech, April 14th, 1953

BLACKSTONE & CO. LTD

HOME SALES DIVISION, DURSLEY, GLOUCESTERSHIRE

have pleasure in announcing

PRICE REDUCTIONS

of up to

25%

on their Horizontal and Vertical land engines

ranging from 10 h.p. to 600 h.p.

This is equivalent to a reduction of up to 40% in the year of purchase when taking into account initial allowance on capital expenditure, provided for in Mr. Butler's budget.

THE BUSINESS WORLD

Growth of Credit Insurance

WHEN the International Credit Insurance Association was celebrating its twenty-fifth anniversary in London last week one speaker bracketed credit insurance with the bill of exchange as "one of the few original ideas that has appeared in the realm of financial technique." This claim is not as far-fetched as might at first sight appear, though the comparison is between a surprisingly old and a surprisingly young member of the financial family. Most manufacturers have always had to deliver a substantial proportion of their products, whether at home or overseas, many months before their customers are ready to pay for them; the risks of default on those payments are measurable, and it might have been expected that insurers would have been early into this field.

In the event, however, credit insurance, as it now operates, is essentially a post-1918 development. The first attempts at credit insurance in Britain were made, with singular lack of success, in the 1890s. At that time serious difficulties were being encountered in trade with Australia. There had been a succession of bad harvests, superimposed on some speculative excesses, that had created a wave of insolvencies in Australia and a general atmosphere of uncertainty among British merchants shipping goods to that country. Some companies were established in London to insure credit risks in general and those to Australia in particular. They foundered almost at once on two rocks that were to be marked indelibly on the chart of those who were to navigate these waters in later years. The first was that policies tended to be asked for, and offered on, the most suspect risks. The second was that they often insured the whole of the loss and thus provided the insured firms with a positive encouragement to overtrade and to grant credit to the queerest sort of customer.

From this shaky start credit insurance in Britain made a slow but steady recovery. It soon became obvious that that recovery would have to be founded on two new basic principles of insurance of credit risks. The first was to allow the law of averages to operate, through providing cover not for selected risks (which when selected by the insured usually meant the most suspect risks) but for a firm's whole business turnover. The second was to call on the insured to bear part of the risk for his own account; this removed the temptation to overtrade, and gave the insured firm some inducement to apply sober standards in the selection of its customers and to pursue its debtors with reasonable commercial ferocity. These principles can be traced in the development of the Excess Insurance Company, established by Mr Cuthbert Heath in 1894, and in the later work of the Trade Indemnity Company which took over the credit insurance business of the Excess in 1918. The Trade Indemnity Company, together with the Government's Export Credit Guarantee Department (which now handles the vast bulk of export credit insurance), dominates the field today; part of its capital is held by some of the most important British insurance companies.

Around the turn of the century there had been a similar growth of credit insurance business in the United States—in part an invisible export from Britain effected by the Ocean Company of London, which transacted credit insurance in the United States between 1895 and 1934. But at an earlier date, in 1893, the American Credit Indemnity Company of Baltimore was established; this is now the oldest credit insurance company in the world. There were early echoes of this development of credit insurance in Germany, France and Switzerland; and after the end of the first world war they spread to the Netherlands, Belgium,

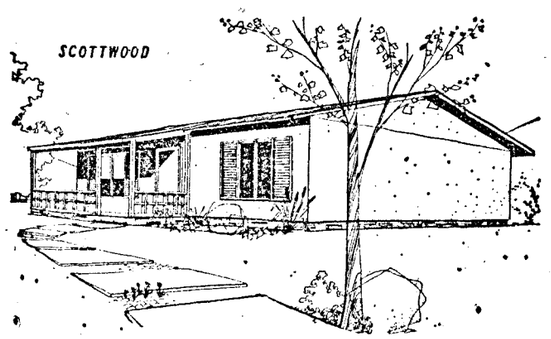
Scandinavia, Spain, Italy and Czechoslovakia. Some of these companies are linked by capital participation and interlocking directorates, and nearly all of them are allied through reinsurance arrangements.

The European companies cemented their alliance further in 1928 when they joined in the formation of an International Credit Insurance Association; later they were joined by the Mexican company that operates in this field. The Association provides a useful arena for discussion of common problems, but so far it has done little in the way of compiling composite statistics of premium income, policies issued and claims. This is an unfortunate omission. One of the main reasons why credit insurance has been so little discussed outside the narrow circle of the experts is that there are so few hard statistics for the lay analyst to bite upon.

★

The facilities that are offered by credit insurance companies naturally differ in matters of detail and technique from country to country, but the broad principles are now remarkably uniform. The risk covered is the insolvency or prolonged default of a buyer, and in all cases the insured is required to assume for his own account a certain proportion of the risk. The policies issued by credit insurance companies fall into two main categories. The first are global or "whole turnover" policies, under which a trader insures the whole of his business against the risk of insolvency or prolonged default of his buyers. The second is the specific policy that covers a certain part of a trader's transactions or, in some cases, may only apply to one specific operation. The "whole turnover" policy is, of course, more popular with the companies, since it allows the true principle of insurance—that is, the averaging of risks—to apply. The premiums quoted for whole turnover policies are therefore normally lower than those quoted for specific policies; they can be as low as 1 per mille, while rates for specific policies can rise—though they seldom do—above 1 per cent.

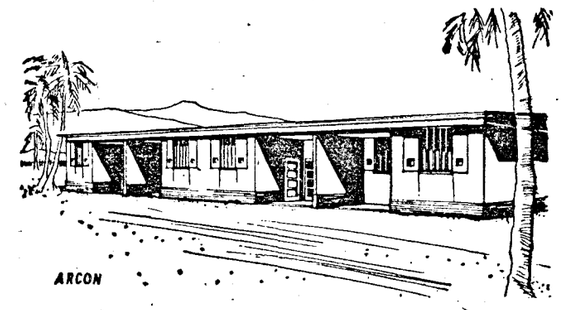
The business covered has expanded considerably in recent years. In Britain in 1951 the Trade Indemnity Company had a total premium income of £1,094,227, and in 1952 £1,064,055. Despite this slight diminution, the total risks covered last year increased from about £550 million to about £620 million—for more business was done at low rates of premium. Since the Government's Export Credits Guarantee Department covered about £500 million of business risks last year, over £1,100 million of the annual commercial turnover of the United Kingdom now seems to be covered by credit insurance policies in one form or another. This year's president of the International Credit Insurance Association, Mr A. N. Patrick, estimated last week that credit insurance turnover in Western Europe last year was in the neighbourhood of £2,000 million, of which over 50 per cent was covered by private insurers. The balance was covered by or for account of governments, whose intrusion into this sphere of credit insurance has been almost wholly restricted to covering risks arising out of international trade.



For the most part, the development of export credit business in Europe since the end of the first world war is the story of co-operation between governments and private enterprise. The general rule has been that while political and transfer (or "balance of payments") risks can most appropriately be covered by the state, commercial risks (that is to say, the risk of insolvency among individual foreign importers) can be covered partly or wholly by private enterprise. In Germany, for example, a private company acts for the government in arranging the whole range of export credit insurance and somewhat similar arrangements obtain in the Netherlands. In Belgium a private company covers the commercial risks in export credits while a state-owned undertaking covers the political and transfer risks (although it is also prepared to reinsure the insolvency risk covered by the private company). In France the state and private enterprise have joined forces in forming a mixed company that handles the whole of France's export credit insurance business. Britain and Scandinavia have stood apart from this system of wedlock between private and state enterprise. The Export Credits Guarantee Department here seeks to insure the (probably more profitable) insolvency risks on a single policy together with political and transfer risks. It has therefore secured the bulk of the export business, and left the Trade Indemnity Company to concentrate on the internal field.

The growth of credit insurance lies in the logic of modern commercial practice, and it would have occurred even if recent years of inflation had not created a dearth of capital, an increase in book debts, and therefore a larger demand by lenders for insurance protection. Moreover, credit insurance is viewed with particular favour by the banks. The cover provided under such policies is now often used as additional security for bank advances and for discount facilities. This was one of the technical subjects which was examined at last week's meeting of the International Credit Insurance Association. The use of such cover as security for bank loans can be achieved either by a general assignment to the lending bank of the whole interest in a credit insurance policy, or by a written guarantee from the insurance company to pay to the bank or discount house (within ninety days of the due date) the insured proportion of the amount taken by way of loan or on a discounted bill. There are certain technical difficulties attached to both of these systems, but they are gradually yielding to practice and experience. Certainly the credit insurance companies have every incentive to solve them, for when the businesses that they insure can secure a measurable concession in bank advances rates—simply because they hold a credit insurance policy—the premium charged can very nearly pay for itself.

Prefabs for Export

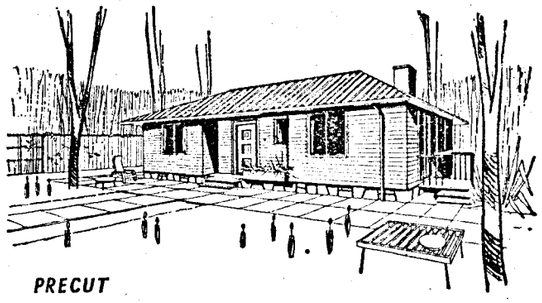


DURING the British Industries Fair at Earls Court, visitors have been able to inspect more than a dozen samples of Britain's newest export—prefabricated buildings. Though the score or more manufacturers of factory-made houses and other buildings have found a variety of solutions to the problems of prefabrication, and each extols the merits of his own over all others, all are agreed that this country has a marked lead in this technique. This is a deferred dividend from wartime work in providing temporary accommodation followed by postwar experience in the temporary housing programme that ended in 1949. In that year exports of "prefabs" amounted to a modest £80,000. Last year they reached nearly £7 million. Manufacturers are hopeful that sales will rise further, despite the import restrictions that have partly spoilt the best market, Australia—which in 1952 took over half the output.

The factory-built house in Britain initially proved dearer than houses built by traditional methods on site—dearer, too, than houses built on site of the main non-traditional material, concrete. In spite of this, more than 150,000 prefabs were put up to ease the housing shortage, and towards the end of the programme research, experience, better methods and mass-production had brought costs nearly into line with bricks and mortar. Today, the factory-built house can fully compete in cost with the traditional house, on a rough equation of space, standards and amenities. The cost of four of the houses of permanent wood construction shown at Earls Court, with areas of 680, 920, 948 and

1,000 square feet, worked out at £2,100, £2,100, £2,200 and £2,300 respectively, erected in this country under British conditions. A semi-detached local authority house, comparable in area, costs at least as much as this, and a bungalow would cost more. A single bungalow, built to the buyer's specification, would cost much more—between £3,000 and £4,000.

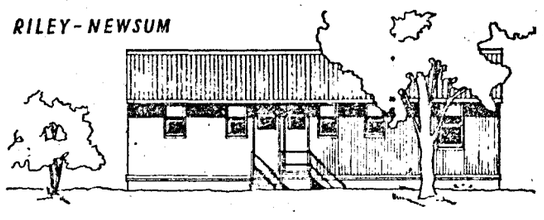
All these timber houses are "permanent" so far as solidity and durability are concerned, and are comparable to the British prefab in expected life. Most factory-built houses can be dismantled and moved to a new site. The extent to which a house is specifically built for easy portability depends on its purpose; a number of firms have developed light temporary structures for special uses—some have been carried about by camel on prospecting expeditions, for example, and others used in mountaineering. But wood and light alloy or steel-framed houses, though assembled from standard members and components, are in fact



permanent, and compare in exterior and interior finish with houses built in any other way. Though they are light, those that have been tested over a period both in this country and in Australia have proved efficient in terms of strength, insulation, resistance to damp and weathering qualities. Though Britain has a tradition of building in wood, such houses are not readily accepted in this country; but in overseas countries, wood construction can provide a distinctive "colonial" style, while aluminium and steel framed houses fit well enough into the broader vistas of Canada, Australasia and Middle East. Nor does prefabrication necessarily imply uniformity of design. The degree of uniformity depends to some extent on purpose and on manufacturer; but houses now being exported in quantity can be considerably varied in layout by the rearrangement of the basic units.

There are two main types of construction. One has load-bearing walls—the walls themselves carry the roof trusses and roof and are correspondingly strong. Even so they may be light—as in the case of the Scottwood design that makes use of stressed skin walls of laminated plywoods; at the other extreme solid timbers are not prefabricated in units, but are grooved and precut in standard lengths and are built on site one upon the other as in a log cabin. The second design makes use of a framework of wood, aluminium or steel to carry the roof, the walls being merely panels of insulating and waterproofing materials. There are advantages in both types. A particular advantage of the second is that it is possible

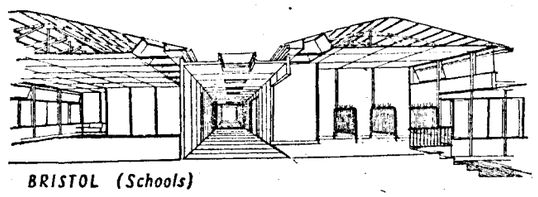
to supply the framework and roof alone to countries that have wall material locally that is cheaper or more suitable than imported material. The Arcon group has specialised in a variety of insulated roofs mounted on stanchions; prefabricated wall panels can be supplied, but local materials—ranging from wood or stone to matting in some hot countries—can be equally well employed. The Trusteel organisation supplies only the roof, steel framework and prefabricated joinery of a single or two-storey house; the outer wall of brick and the interior of plasterboard is applied locally. This system combines traditional appearance with the speed of prefabricated assembly on site.



The lightness of prefabricated houses reduces the need for site preparation and the weight of foundations; they are assembled dry, so that site man hours are further cut down. Site time for erecting the average permanent wood bungalow now being exported varies from 250 to 500 man hours compared with 1,000 to 4,000 hours for traditional building. Houses designed specifically as temporary for rapid erection and dismantling may be put up in a day by a couple of men. The principal technical problem in non-traditional factory-made houses is satisfactory jointing of the component members. In the case of wooden walls, great progress has been made in evolving tongue-and-groove joints that are completely weatherproof and stay tight even if the wood shrinks, or if subsidence occurs. Frame houses are designed with H-section stanchions which

PRECUT

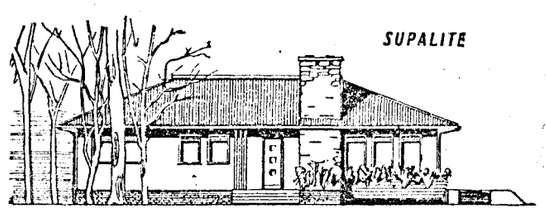
have the same effect, or with equally effective if less slightly cover strips that are impervious to damp.



Research upon layered combinations of fibreboard, asbestos, strawboard, woodwool, fibregrass, aluminium foil, and other materials, have enabled designers to achieve light, thin walling with the thermal efficiency that is normally obtained from conventional brick-

RILEY-NEWSUM

work. A house weighing 10 to 20 tons (or even 3 tons) is claimed to be as durable and warm—or cool—as one weighing 500 tons. The skill of the chemist has made these materials fireproof and termite-proof. Until some of them have been in use for 50 years it will not be possible to pass final judgment; but their comfort and convenience in the present is not to be denied.



In export markets the wooden house has been the most successful. One firm has supplied frame wooden houses worth over £4 million to Australia, and expects to increase its sales next year by 50 per cent. A number of firms are planning, in collaboration with the local

BRISTOL (Schools)

housing authorities, to expand in the North American market; sales have already been made to Canada. Most of the houses are made from Scandinavian timber; but it is asserted that production costs are so favourable that it would be possible to import Canadian cedar and re-export it in the form of prefabricated sections in competition with local construction. Although the transport charges would exceed £200 a house, they might still compete with locally-built houses, given the high costs of joinery and assembly in Canada. Using Scandinavian timber, manufacturers hope to attract Canadian and American custom with houses built to their requirements at £980 f.o.b. for 907 square feet, or, in another case, £1,263 f.o.b. for 948 square feet. A comparable Canadian house would cost $7,000. But the conquest of Canadian markets has yet to be made. While Government bodies waive the duty (15 per cent in Canada, 27 per cent in Australia) in reckoning costs, the private buyer will have to pay. Local building codes are exacting and force up costs for the British manufacturer. Again, Canadian plumbers insist that preformed plumbing, which does them out of a job, must be charged a 33⅓ per cent rebate, payable to them.

In designing a house for export, there is no restriction on the quantity of softwood used, since the Board of Trade issues permits for the necessary timber. A solid timber house uses about four standards, compared with the permitted maximum of 1½ standards in a British

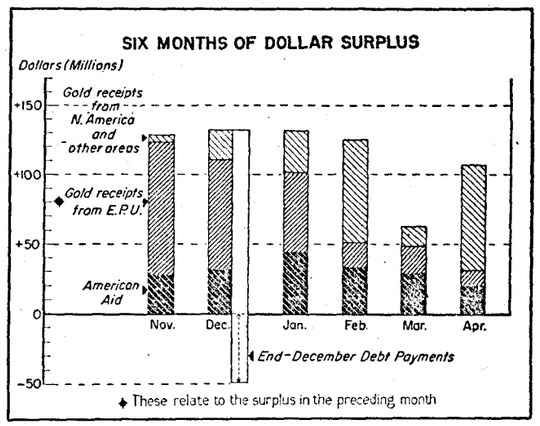
SUPALITE

house. Most forms of prefabrication use at least 1½ standards, many between two and three. The makers of prefabricated housing, however, have their eyes on the home market. A home market would assure them continuity of production and enable them to reduce prices. To sell on the home market, they must reduce the amount of softwood they use. This is now being successfully done by a variety of substitutions—largely by the use of hardwoods from sterling sources. The prefabricated house may therefore soon return as a direct competitor with traditional building. At a cost of 25s. to 36s. per square foot, it may prove a useful check on the cost of building by traditional methods.

The future, therefore, is not unpromising. It depends to a large degree upon continued development in the Commonwealth, and especially in Australia, where cuts in immigration and the achievement of lower costs in traditional building may make the going harder. A large part of the exports of prefabricated buildings has consisted not of houses, but of schools, hospitals, post offices and telephone exchanges, storage buildings of all kinds and, in the Middle East, labour lines and townships for oil companies. The research that has gone into the British building programme of non-traditional schools and which has produced such notable reductions in cost and improvements in design, has greatly helped the export trade. The Bristol Aeroplane Company alone have already provided schools and hospitals worth £5 million for overseas. The demand for such buildings is now increasing steadily in Africa and South America. If a movement towards better standards of housing asserts itself in many backward countries in Asia, Africa and South America, as some observers believe, there is good reason to hope that British prefabricators will play an increasing part in making such higher living standards practicable.

Business Notes

Liverpool Comes to the Market



THE new freedom that the Chancellor of the Exchequer gave to local authorities to come to the market, if they so preferred, and to end their exclusive dependence on the Public Works Loans Board for new capital funds has not produced a spate of Corporation issues; nor, on the Chancellor's own outline of the provision that he will be making for their borrowing from central sources, is any spectacular sequence of such issues in prospect this year. Liverpool's new loan (for which the lists closed immediately on Thursday against the background of a vigorous gilt-edged market) comes after an interval of nearly four months since Birmingham broke the ice in the cold January days. And the vernal feelings in the gilt-edged market are marked in a significant change of terms. Whereas Birmingham offered £6 million of 4¼ per cent stock with a life of 14-17 years at 98, Liverpool's loan of £5 million is at 4 per cent, with a life of 16-20 years, at 96½. This conspicuous success has restored the 4 per cent coupon rate.

On the eve of the issue, the Birmingham loan stood at 3½ premium over its issue price (with £1 of gross interest due on July 1st). The yield on the Liverpool loan, to latest redemption, is almost precisely 4¼ per cent, and the attraction of the discount coupled with a slight advantage over the nearest comparable gilt-edged stocks ensured a well-supported subscription even before the market carried it home on a flood tide. From the point of view of the local authorities, however, a certain hesitation to come to the market can be understood, given the present structure of interest rates and the readiness of the PWLB to lend on the longest term at 4¼ per cent. Both Birmingham and Liverpool will be paying appreciably more than that rate, when the costs of management and stamp duty are included, although the abatement of stamp duty to the "single rate" of £1 per cent (with corresponding abatement for the composition of duty, which will apply in these two cases) will give useful relief from August next. The choice between the market and the PWLB does not rest exclusively on the relative costs of the two alternatives; but where, as for Birmingham and Liverpool, higher cost is openly accepted for a market issue, it must clearly be in the expectation that opportunities will present themselves within the optional redemption periods of the loans to refinance them on more favourable terms to the borrowers—an opportunity that would not be open to them on sixty-year loans from the PWLB.

Reserves Still Rising

THE sterling area's surplus with both the dollar area and Western Europe in April was larger than most people could reasonably have expected for this season of the year. In all, the reserves rose by $107 million, to $2,273 million, in the month; this compares with an increase of $63 million in March and with increases of between $125 and $130 million that would have been achieved in each of the previous four months but for the end-December interest payments on the North American loans.

This latest increase is all the more satisfactory because it occurred in spite of the fact that both receipts of American aid and the mid-April transfer of gold from EPU (in part payment for the sterling area's small surplus with Western Europe in March) were both below the average of recent months; they amounted to $20 million and $11 million respectively. The residual dollar surplus—which, for the most part, reflects the direct current balance between the sterling area and North America—therefore rose to $76 million in April, compared with $15 million in March and $74 million in February. It was known that the dip in this residual surplus in March had been partly due to an exceptional British payment for American tobacco; but the rebound back to and beyond the February level in April is a pleasant surprise—especially in view of the recent fall in the prices of several staple sterling area commodities. Moreover, although American payments for cocoa were still

at a seasonal high in April and although the tail-end of the wool season also fell in that month, the flush season for dollar receipts should by now have passed.

The increase in the sterling area's surplus with Western Europe, from £7,500,000 in March to £15.2 million in April, was an even pleasanter surprise; many observers had expected that the Easter efflux of British tourists to Europe would have eaten and drunk this surplus away. Half of the April surplus—£7,600,000 or about $21 million—will be settled by a gold transfer from EPU in mid-May. It is probable, however, that part of the explanation of this increased sterling area surplus lies in speculation by French exporters against their franc; these exporters are now again delaying repatriation of any sterling earnings as long as possible, and this delay undoubtedly helped to swell France's EPU deficit from $19.4 million in March to $51.6 million in April. All of this $51.6 million will have to be settled by France in gold.

Prospect for American Aid

INEVITABLY, the possibility of a continuance of this satisfactory showing of the gold reserves is inextricably bound up with the prospects for American aid. The arithmetic of this prospect is complicated enough to deserve detailed analysis. It is embarrassing to tot up a cheque that the donor may not approve, but to shirk the embarrassment is to shirk examination of a crucial factor in Britain's position.

The first point that needs to be made is that it is only American economic aid that has any economic significance for this country; the gross figures for aid shown in the American budget include the sum of the (frankly rather notional) price tags attached to certain weapons and other "military end-items" that are switched around among the allied armies. The second point is that Britain started the current American fiscal year—on July 1, 1952—with about $616 million of promised American economic aid on which to draw. This comprised some $90 million left over from the "machine tools for defence" agreement of 1951, some $110 million left over from the Congressional appropriation for economic aid in 1951-52, and $416 million from the Congressional appropriation for economic aid in 1952-53 (which included the tail-end of the so-called Katz-Gaitskell money with which the United States had promised to compensate Britain for allowing existing sterling debts to be thrown into the EPU clearings).

The British Government had originally hoped that most of this $616 million of aid would be drawn in the year to June 30, 1953. In fact, because of accounting difficulties at the American end, only $352 million has been drawn to date. It is unlikely that more than $50 to $100 million will be drawn in the remaining two months of the American fiscal year, so that total aid receipts in this fiscal year will be somewhere between $400 and $450 million; perhaps the best guess is that about $175 million of the original $616 million will be left over on June 30th next. To this $175 million President Eisenhower has now asked Congress to add $200 million of appropriations for Britain in 1953-54. If his proposal is approved, $100 million of this $200 million will be disbursed in the traditional way—as re-imbursement for certain of Britain's dollar imports. In 1952-53 the only imports that have qualified for re-imbursement have been "defence-supporting" imports; it is largely because these have been defined in a rather disappointing way (with great emphasis on raw materials like sulphur that reek of gun powder and with which Britain is now comfortably placed) that drafts on the aid appropriations have lagged behind original schedule. For 1953-54, however, Mr Stassen reported this week that the $100 million appropriation would finance American exports to Britain of wheat, cotton and lard; it is still too early to say what this apparent change in emphasis about "eligible imports" implies, either for the dollar reserves or for American export policy.

The President has proposed that the other $100 million of the appropriation for Britain in 1953-54 should be disbursed in an entirely new way—as payment for the manufacture in Britain of military aircraft required by the RAF. The British Government would, of course, pay for these aircraft in sterling, but it would be re-imbursed in dollars—a system of aid that has been used in France before but not in Britain. Once again, it is too early to say what effect this new system might have on the lag between aid appropriations and aid receipts. The net effect, however, is that, if Congress disposes as the President proposes, Britain may start the next American fiscal year with some $375 million of aid in hand, compared with $616 million in hand at the beginning of the current year and with probably between

"We don't have to be colossal"

persisted the chief accountant.
"Powers-Samas make units exactly the size
for a business like our own—small,
but if I may say so, perfectly formed".
"Compact and progressive" agreed the chairman "And how crippling might the cost be?"
"The annual cost of Powers-One would be
no more than the salary of one ordinary
clerk", replied the accountant.
"We can buy the unit or rent it."
"Now that sounds like efficiency we can
afford" decided the chairman, "Make an
appointment with Powers-Samas right away".

There is a Powers-Samas System of accounting for every type of business

What, in fact, is

TREND?

Trend is a new kind of bulletin for British business, started a year ago, and already a resounding success.

Trend assembles facts, interprets them clearly, diagnoses current movements; in brief, it helps the business man to form his own judgment, and tries to anticipate for him.

Trend already has a respectable record of predictions. A year ago TREND accurately forecast the course of commodity prices, declared that the national gold and dollar reserves "might grow like a snowball as confidence increased".

Trend No. 5 (just published) offers provisional answers to such questions as What will the "peace offensives" in Moscow and Washington mean to the business man? Will defence production be cut back, commodity buying sag, and industry find itself short of orders?

Trend, in other articles, discusses the Budget, the motor-car industry, and the Commonwealth plan for convertible sterling. Regular features include a guide to regional changes in economic activity in Britain; notes on prospects for Retail Trade and Commodities; charts and diagrams showing at a glance the movement of personal incomes, retail sales, prices, wages, employment, etc.; and a table of Selected Indicators of Business Trends.

Trend is not a tatty set of loose leaves; it is superbly printed and documented, compiled and edited by a specialist group whose sources of information in all parts of the world and highly developed technique of analysis and exposition make it a flexible and expert reporting service.

Trend is issued to subscribers four times a year, and special supplements are produced when circumstances make them necessary. The annual subscription is eight guineas—a small sum measured by the resources that go into it and the unique service it renders.

Write for prospectus containing full details.

RULING THE WAVES

HOW DO YOU KNOW where to drill for oil when it is tucked away deep beneath the surface of the earth? One method of helping to discover this buried treasure is by 'manufacturing' miniature earthquakes. The explosive waves reflected from layers of underground rock are later interpreted in Anglo-Iranian's geophysical laboratories at Kirklington Hall, Nottinghamshire. From the pattern of these waves it is possible to tell where oil is likely to be located.

A large proportion of crude oil which Anglo-Iranian extracts from deep down in the earth is destined to provide fuel for ships. Today, more than eighty per cent. of the world's sea-going shipping is powered by oil.

UNILEVER LIMITED
AND
UNILEVER N.V.

The Boards of Unilever Limited and Unilever N.V. RESOLVED to-day to RECOMMEND to the Annual General Meetings of their respective Companies which will be held on 10th June, 1953, the DECLARATIONS of FINAL DIVIDENDS on the Ordinary Capital in respect of the year 1952 payable on the 22nd June, 1953, as set out below :—

In the case of Unilever Limited a DIVIDEND of 8¼% actual (1/8.4d. per £1 of stock) less income tax at 9/-d. in the £, making 13¼% for the year ended 31st December, 1952 (1951—13¼% for the year) PAYABLE to STOCKHOLDERS REGISTERED in the books of the Company on the 23rd MAY, 1953.

In the case of Unilever N.V. a DIVIDEND of 7½% actual (Fl.75 per Share of Fl.1,000) making 12% for the year ended 31st December, 1952 (1951—12% for the year) PAYABLE less 15% dividend tax.

The total dividends are equivalent in value under the terms of the Equalisation Agreement between the two Companies.

The combined trading profit on the Groups' operations throughout the World was £38,921,000 (1951 £53,933,000) and the combined consolidated net profit was £21,056,000 (1951 £18,838,000). The trading profits are after charging depreciation £11,542,000 (1951 £9,753,000) and reserve for replacement of fixed assets £5,283,000 (1951 £5,115,000). Consolidated net profit is arrived at after charging taxation on profits of the year £22,180,000 (1951 £32,984,000) and bringing to credit transfers from reserves for stocks £1,868,000 (1951 £3,000,000 was transferred to the reserves) and exceptional items including taxation adjustments relating to previous years £4,918,000 (1951 £2,438,000).

The results for the Groups separately were :—

	Consolidated Net Profit	*Profit of Parent Company*
Unilever Limited	£13,343,000 (£12,127,000)	£6,247,000 (£5,969,000)
Unilever N.V.	£7,713,000 (£6,711,000)	£4,141,000 (£3,657,000)

The Reports and Accounts of both companies will be issued on 18th May, 1953.

7th May, 1953.

$400 and $450 million of actual receipts during the current year. In addition, Britain should earn more—perhaps over $100 million more—in 1953-54 from progress payments for the manufacture of tanks and aircraft bought by the American authorities for the armed forces of continental countries. For 1954-55, Mr Stassen indicated, there will be another cut in aid appropriations to Britain, and "the early termination of all such assistance is contemplated." But 1955 is two years off.

End of Price Control

ON April 30th, the Board of Trade took off the last remaining statutory price control—on nylon stockings—and began to dismantle the machinery of the once powerful Central Price Regulation Committee; the Order in Council giving authority for these steps recorded that "the emergency which gave rise to the Goods and Services (Price Control) Acts came to an end yesterday." The Committee was brought into being early in the war to "advise and assist" the Board of Trade on the control of prices; the majority of consumer goods were at one time or another under the control of its seventeen regional committees which were responsible for the simultaneous operation of several hundreds of separate orders. The winding up of price regulation will save 125 staff and £75,000 a year.

The 1952 budget, by removing at one sweep from price controls most kinds of textiles and all clothing (except nylon stockings) took away much of the committee's work, which by then was largely involved in administering price controls associated with the utility schemes. More goods, from prams to sewing thread, were removed from price control during the summer and when, last December, furniture was liberated, only linoleum and nylon stockings remained to occupy the committee. Linoleum was freed at the beginning of April.

The administration of price control on manufactured consumer goods tends in its nature to fix maximum prices at a level that gives the marginal manufacturer a sufficient margin of profit to stay in business, and its 13 years of operation on this principle had profound effects on the competitive vigour of the British economy. It is a measure of how far common sense on matters of consumer prices has in recent years been obliged to yield to political expediency that the last item of all to be released from price control should be one with such essentially frivolous associations as nylon stockings.

More than Enough Steel?

THE Government's allocation scheme for steel has not made much difference to the home trade in most products during recent months, yet its belated abolition this week may bring about some marginal slackening in demand. When the earlier rationing scheme ended in May, 1950, steel consumers were able for a time to moderate their orders by running down the stocks that rationing had prompted and enabled them to accumulate. Last year's rationing scheme seems to have been even more inefficient than was the earlier scheme in its later stages. Consequently, the present stocks of steel in consumers' hands are probably much larger; Mr Sandys said in Parliament this week that at the end of 1952 stocks were about 200,000 tons larger than in June, 1950. The Minister had already explained that

> . . . before ending rationing, the Government felt it desirable to make sure there was not only enough steel but a little more than enough.

If steel consumers now begin to reduce these inflated stocks, supplies of steel this year may indeed become more than comfortably sufficient.

Home deliveries of steel last year represented rather more than 15½ million ingot tons (on a 52-week basis); but consumers probably used the equivalent of 15 million ingot tons of what they bought, some 2-3 per cent less than in 1951. From this lower level for 1952, according to the Government's reckoning, demand this year should rise by about 6 per cent—which implies a consumption of nearly 16 million ingot tons (in the form of more than 11½ million tons of finished steel). But the supplies in prospect are much higher; the industry itself expects to produce 17½ million ingot tons, and it should have no need to build up its own stocks further. Imports by the industry and by consumers, according to the best guesses at the beginning of the year, were expected to reach 1¼ million ingot tons; with re-usable material, total supplies of steel might exceed 19¼ million ingot tons. Exports seem unlikely much to exceed last year's; home deliveries might therefore be well over 16½ million tons. If steel consumers were to draw fairly heavily on their stocks, steel consumption in Britain could be increased not by 1 million ingot tons, as the Government expects, but by 2 million tons. The outlook for the British industries that use steel is not clear enough to suggest whether they could use all this extra tonnage; evidently, the projected imports of more than a million ingot tons could be recast in adjusting supply to demand.

Copper Market in August

ON August 5th the London Metal Exchange will be dealing in all four of the non-ferrous metals in which it traded before the war. On that day Government trading in copper will end; Commonwealth producers have been given the necessary three months' notice terminating the government's purchasing agreements; and private import and sale of copper will be permitted. Liberation has not been a hurried process, for the Metal Exchange resumed dealing in tin in November, 1949, in lead in October, 1952, and in zinc in January this year. But in the case of copper, particularly, it will be a welcome relief to have prices determined by an open market, instead of being fixed by Government fiat and by the not always representative prices posted in the United States.

The dollar shortage has delayed the freeing of copper; but given the improvement in supplies of copper from the sterling area, coupled with the recent reductions in price, and the safeguards of exchange control—the latter now

being assisted by the abating of speculation against sterling —the government is well justified in taking some small dollar risk. Imports of unwrought copper in various forms into this country amounted last year to about £90 million, of which imports from Northern Rhodesia cost about £55 million, while £9 million came from Canada and £12 million from the USA. International dealings on the London copper market should earn foreign exchange for Britain.

World prices of copper have been moving downward for some time. Last week the Ministry of Materials reduced its selling price by £27 to £253 a ton. Users of copper, who remember that a free market in the other three metals was followed by lower prices, are presuming a further fall in copper when private trade is resumed ; they have been buying hand to mouth for some time and are likely to do so until August. The Ministry of Materials is now considering the gradual liquidation of a large part of its stock of copper ; this is put at about 200,000 tons, equal to this country's commercial needs for almost a year. Part of the stock will no doubt be retained for strategic reserves, and it is expected that the liquidation can be contrived without disturbing the market. Chilean price policy will now be keenly watched ; hitherto the price of copper has been governed largely by the erratic course of bargaining between the USA and Chile. An open market in London is likely to be widely welcomed by consumers far beyond this country.

Japan's Sterling Shortage

JAPAN'S sterling balances are now down to such a low level—they are reported to be no more than £35 million, compared with a peak of about £135 million towards the end of last June—that it is having to resort to what are known as "swap" and "usage" facilities on the London market. The announcement that these facilities would be made available to it (through the ordinary banking mechanism) came at the end of the recent informal discussions on Anglo-Japanese payments, which brought further into the limelight the extraordinary decline in Japan's sterling balances in the last twelve months. There have been several reasons for this decline. One of them has been the payment by Japan of £20 million to a special account with the Bank of England as a token of goodwill in implementing the external debt agreement. But the most important reasons have been the severe restrictions on imports from Japan that were applied in most of the sterling area countries after the Commonwealth Finance Ministers conference of January, 1952 ; and the fact that Japan has been restocking its reserves of wool, copper, rubber and other sterling materials. In consequence, Japan has run into a heavy deficit in its balance of payments with the sterling area. The import restrictions aimed against Japanese goods are already being relaxed in some Commonwealth countries ; but this will not have an appreciable effect until the end of the year, and more immediate steps have therefore had to be taken to remedy the position.

In the main, the urgently required addition to Japan's sterling balance will be secured by swap operations against dollars. Japan has an adequate reserve of dollars but it is

unwilling to convert these dollars into inconvertible sterling outright. It is, therefore, buying sterling against dollars for immediate delivery and reselling the sterling, also against dollars, for delivery in three and six months' time. In this way sterling will be made immediately available but will be reconverted into dollars at an assured rate. The operation is, of course, based on the expectation that Japan's earnings of sterling will have grown appreciably between now and next November. In addition to these swap operations Japan is also seeking to raise sterling by discounting bills with a group of Eastern and other banks in London. For some time past Japanese banks have been drawing "sight" bills on banks in London against imports into Japan. Arrangements have now been made for extending these drawings to ninety day bills. With the help of these swap and "usance" operations, Japan may be able to mobilise nearly £30 million in the near future. But it will have to pay this back some time in the summer or autumn, and it will be interesting to see what will happen if its sterling accounts have not after all swung back by then into their expected surplus again.

Trade Talks with Brazil

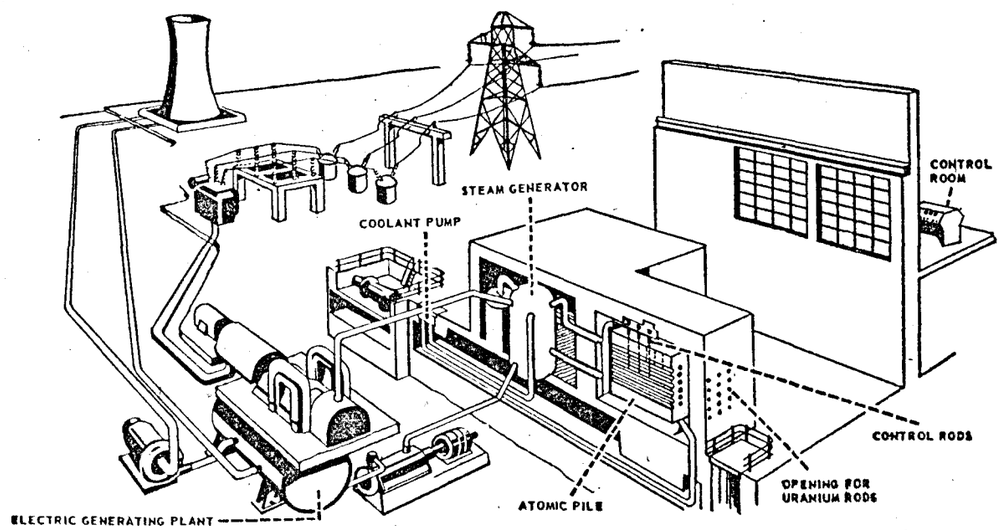
TRADE between the United Kingdom and Brazil has been grinding towards a standstill for many months ; it is at present running at a rate equivalent to an annual turnover of about £25 million, compared with over £100 million in 1951. It is, therefore, welcome news that formal trade talks between the two governments are to be held later this month.

Two major questions are likely to overhang these negotiations. The first concerns the settlement of the huge commercial arrears—amounting to some £60 million—already owed to this country by Brazil. It has been informally suggested that half the sterling earnings of Brazil due to any revival of Anglo-Brazilian trade might be devoted to repaying these arrears and half of them to increased Brazilian imports from the sterling area. Some traders in Brazil consider that such an allocation to the settlement of old debts would be far too great, and many people in the City consider that it would be far too little. Meanwhile, however, the British Ambassador has fortunately received a categorical assurance from the Minister of Finance that servicing of these trade arrears will not be affected by any devaluation of the cruzeiro. Hitherto anxious mutterings on this score had been met by the bland statement that the problem could not arise, since Brazil had no intention of ever devaluing the cruzeiro—and this despite the fact that sterling opened last February on the new free exchange market (on which certain export proceeds can be sold and through which many imports must be financed) at twice its official parity, and has been sky-rocketing since.

The second major problem will be whether Brazil will take internal steps to make it worthwhile for sterling area countries to buy its products ; so far, the operation of the free exchange market seems to have restored the prices of some—but only some—of Brazil's exports to somewhere near world levels. There seems, for example, to be a possibility—though not a very exciting one—of more United Kingdom imports of Brazilian sugar, iron ore, oranges and nuts. In the background to all this, there is an unhappy

story of falling business and mounting dismissals of staff among British trading concerns operating in Brazil ; it is not surprising that these circles have thrown their support behind any and every proposal to increase Anglo-Brazilian trade (if necessary on an uneconomic barter basis), and have been thoroughly exacerbated when external critics such as *The Economist* have suggested that Britain really cannot afford to pour new goods into Brazil when so many old goods have not been paid for. There is the additional complication that the Export-Import Bank has recently announced a loan of $300 million to clear off Brazil's dollar commercial arrears. The odd situation seems to have arisen, in Brazil as in Japan, that sterling is now a scarcer currency than the dollar ; and, as Brazil is unwilling to pay in dollars for its sterling imports, the competitive position of United Kingdom exporters in that market is being gravely undermined.

Atomic Power in Cumberland



WORK began this week on the site for the first atomic power station in this country. The project is a logical step in the expansion of the atomic energy organisation, for the new plant is likely to serve the dual purpose of developing electric power and increasing the supply of plutonium. It will adjoin the existing plutonium plant at Winscale in Cumberland and will, in essence, be a replica of the Winscale pile, operating at higher temperatures. This atomic pile turns a proportion of the non-fissile atoms of natural uranium (which outnumber the fissile atoms by 140 to 1) into plutonium, a fissile material that does not exist in nature and is used in atomic weapons. The simplest method of generating atomic power from a uranium pile, as foreshadowed by the Minister of Supply early this year, would be to enclose the pile in a pressure shell, and then to circulate pressurised gas over the pile from which it absorbs heat, thence through a heat exchanger converting the heat to steam which is fed to a conventional turbo-generator. The sketch gives an impression of the lay-out of such a plant ; the pile itself would probably be a concrete-encased cube roughly equivalent in size to a four-storey building. No indication has been given of the possible capacity of the new power plant.

To obtain enough heat to drive a generator, the atomic pile would have to be operated at much higher temperatures than would be needed for producing plutonium alone. Much has yet to be learned about the behaviour of the various materials at the temperatures that are thought to be necessary, which are higher than those at which atomic piles have yet been operated. The cost of such a plant would no doubt be high, though off-set by the fact that plutonium would be produced as a joint product. Extra plutonium is in fact needed to support the modest atomic weapons programme in this country and to spare some fuel for experiments in atomic propulsion. Plutonium can only be produced atom by atom and the capacity of the pile now working at Winscale is limited. Its new neighbour will be the first plant of its kind in the world—though perhaps not the first atomic plant to produce power, since the propulsion units of the American atomic submarine may be working before it is completed. A few days after announcing the start of work on this plant, Mr Sandys gave some new information about the organisation of work on atomic weapons. This is centred at Aldermaston, but it appears also to involve Woolwich Arsenal—a white elephant that now becomes a dark horse.

Demand and the Strip Mills

SINCE 1924, when the first continuous steel strip mill was laid down in the United States, the output of flat steel products there has more than trebled, rising from 46 per

LAYOUT OF ATOMIC POWER STATION

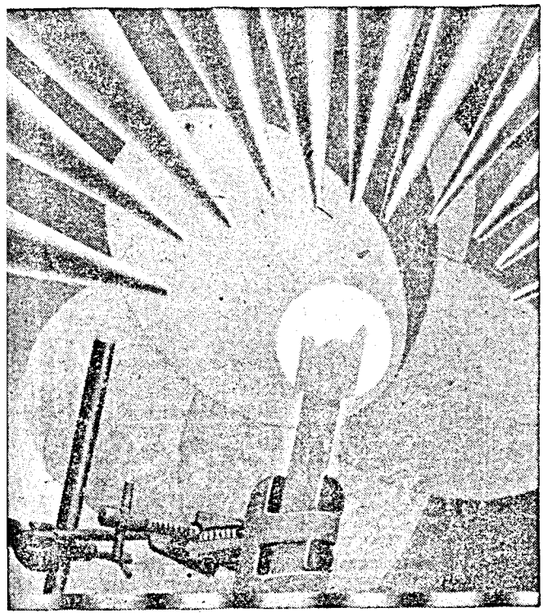
cent of America's finished steel production to 58 per cent; nearly 65 per cent of American flat steel is now produced on continuous wide-strip mills. The first European continuous strip mills were laid down in Britain and Germany in the late thirties; but it is only since the war that Europe has generally followed America into this technological advance in steel-making. Eleven continuous or semi-continuous wide-strip mills and four Steckel mills (which give a lower output but comparable quality) are now working or will be in operation in Western Europe by 1956; Russia has three, though no more appear to be planned in the Soviet orbit. The continuous strip mill, indeed, has been almost as fashionable in postwar industrial investment in Europe as oil refining; and the Economic Commission for Europe has recently been examining the market prospects for all the flat steel that these mills will soon be able to produce.

Under American conditions, the Commission estimates, the European mills would have a capacity of 17.2 million metric tons a year by 1956; but this calculation implies that other facilities would be balanced to the capacity of the continuous mill, that maximum operating rates would be achieved, and that large orders would prevail, with heavy price penalties for small quantities and special requirements. The "European capacity" of the 15 mills, given adequate steel supplies, would amount to 12.6 million metric tons; but among European producers, only Britain is proposing to raise production to this capacity by balancing its steel-making facilities at Margam, Shotton and Ebbw Vale. The strip mills in other European countries will probably still be short of steel by 1956; so the production in prospect from all the mills in 1956 is not likely to be more than about 9.6 million metric tons. In addition, capacity at other non-continuous sheet and strip mills (on present plans for scrapping) will still amount to about 7 million metric tons a year; including plate and narrow-strip mills, the total output of flat steel is expected to be about 24.9 million metric tons.

The commission has made detailed studies of the trend of flat steel consumption in the vehicle, shipbuilding, container, capital goods, and durable consumer goods industries. It guesses that home and export demand for flat steel from European producers may be about 21.5 million metric tons by 1956, though it might reach 25.7 million by 1960; this would follow the experience of the United States, where there was a lag of several years before the growth of demand caught up with strip-mill capacity. The Commission holds that demand for plates may grow faster than capacity, and that there may be a case for extra plate mills. But it suggests that old capacity for making thin flat products such as sheet, strip and tinplate will have to be scrapped faster than is now planned; otherwise the strip mills on the Continent may continue to run far below capacity and will be unable to compete with costs in Britain and the United States.

Rubber Doubts Continue

When the annual conference of the International Rubber Study Group opens in Copenhagen next Monday it will consider the proposals prepared by a working party earlier this year for an international agreement and the creation of a buffer stock. These arise out of the basic fact that since 1946 production of natural rubber has exceeded consumption. During the last three years, world production has been around 1,800,000 tons a year, exceeding consumption in 1950 by 155,000 tons, in 1951 by 375,000 tons, and in 1952 by 330,000 tons. Apart from considering the general consequences of a possible change-over from rearmament to peacetime demand, the conference will also have to take a view on the synthetic rubber situation in the United States.



The natural rubber industry must inevitably face economic difficulties—and political difficulties in Asia as well—so long as prices for comparable grades are lower than 23 cents a lb, at which GR-S general purpose synthetic rubber is pegged by the American government. Natural rubber has hovered near this figure for some weeks past. On the eve of the Copenhagen conference a suggestion towards an accommodation was voiced by Sir Sydney Palmer, the chairman of the Rubber Growers Association, Sir Sydney declared that since "the present rubber situation has arisen as a result of American policy," he would have thought it reasonable that "a slight revision of this policy might create a situation wherein artificial correctives were not required." There has always been room for argument whether the price that the American government has fixed for synthetic rubber reflects full costs; there are respectable opinions on each side. But Sir Sydney Palmer's statement suggests that a somewhat higher price for GR-S would be sufficient to encourage natural rubber producers to abandon their proposals for a buffer stock which many Americans (and others) view with apprehension. The test is whether the natural industry, given this slight amount of leeway, would be ready to improve its methods and lower its costs. The US government has already declared its intention to sell its synthetic plants to private companies and there are reports that the price of synthetic rubber may be raised, partly to assist these deals.

Germany's Exchange Market

The foreign exchange market in West Germany has been appreciably expanded and liberalised this week. Hitherto the Bank Deutscher Laender had bought and sold foreign currencies from and to German nationals at fixed rates. Now, however, market quotations have been introduced for a number of currencies—including Swiss, French and Belgian francs and Dutch guilders—and dealers are allowed to buy and sell these currencies within a range of from ¾ to 1 per cent on either side of the official parity. All new dealings will have to be strictly bilateral between the currency concerned and the Deutsche mark, and triangular dealings—for example, arbitraging between Belgian francs and Dutch guilders—are forbidden. So far no provision has been made for including sterling in these facilities but discussions on this subject have taken place with the Bank of England. There should be no difficulty in bringing them to a successful conclusion—unless indeed the whole project gets caught up with a more ambitious scheme for some extension of multilateral exchange dealings in Europe, which seems to be in the air.

THE ECONOMIST, MAY 9, 1953

I.C.I. Technical Service

THE chemical industry's ability to meet the needs of customers at home and to succeed against competition abroad is determined largely by the efficiency of its technical service—that is, the advice and assistance it gives to those industries that use its products. The man who buys heavy chemicals is not persuaded to do so by high-pressure salesmanship or intensive advertising. He buys them because they are the necessary raw materials of his business, and he tends to go to a concern which not only enjoys a reputation for quality but supports its products with technical service. Technical service works in two ways. It confers obvious and direct advantages on the consumer, and the chemical industry also benefits. Out of the experience of its technical service are born new products and new techniques, to improve efficiency in many trades. I.C.I. employs hundreds of qualified men in this specialist organisation, which covers nearly every branch of Industry and Agriculture at home and abroad, and costs over £1,000,000 a year. Such an organisation can only be maintained by a large-scale enterprise.

NOTICES

THE UNIVERSITY OF LEEDS

DEPARTMENT OF ECONOMICS AND COMMERCE

The Council invites applications for an Assistant Lectureship at a salary on the scale £500 x £25 to £550 a year. Preference will be given to candidates whose interest is mainly in Economic Theory and possessing some knowledge of mathematical economics or statistics. Applications (three copies), stating age, qualifications and experience, together with the names of three referees, should reach the Registrar, The University, Leeds 2 (from whom further particulars may be obtained) not later than June 8, 1953.

ST. HILDA'S COLLEGE, OXFORD

The College will shortly appoint a woman as Treasurer. The post is half-time and non-resident, but if a suitable candidate applies it may be combined with a Lectureship, in which case it may be resident. The person appointed will be eligible for election to an Official Fellowship. Candidates should hold an honours degree and have had some administrative and preferably some academic experience. Further particulars may be obtained from the Secretary. Last date of application May 31st.

ABLE and intelligent young Executive (32), Hons. Grad. in Commerce, broadly experienced in leading companies in industrial administration and commercial methods and management, seeks expanding enterprise.—Box 243.

WORK STUDY.—The Wool (and Allied) Textile Employers' Council proposes to establish a Work Study School and Consulting Service for its members. It requires:

(1) A PRINCIPAL AND CHIEF INSTRUCTOR to undertake the general administration of the school and give some instruction, including appreciations for directors and managers. His initial responsibility will be to direct the preparation of a syllabus for three months' courses in Work Study, each to be followed by extended practical guidance of the trainee. Organising ability is therefore essential. He must also have wide practical experience of Work Study application at consultant level, ability in giving instruction and considerable personal qualities. He must, in addition, have the ability and enthusiasm to lead a team. This is an important appointment and salary will be commensurate with the responsibility and the applicant's ability.

(2) A small number of CONSULTANT/INSTRUCTORS to help in training men and subsequently to guide and assist them in practical applications in their own factories. They should have wide practical Work Study experience and be capable of working at consultant level. Considerable emphasis is attached to high personal qualities and ability, for which commensurate salaries will be paid.

The Organisation covers some 1,000 manufacturing firms in a fairly compact area and the work would permit of settled residence. There is also a superannuation scheme.

Applications, marked "Work Study," should be sent as soon as possible and in any case not later than June 15th, addressed to the Secretary of the Council at Lloyds Bank Chambers, Hustlergate, Bradford. They should give a personal record, including details of education and experience, together with the names of two referees as to character and ability (to be consulted later and then only with prior notice). Strict confidence will be observed.

UNIVERSITY COLLEGE OF SOUTH WALES AND MONMOUTHSHIRE

APPLICATIONS are invited for TWO RESEARCH ASSISTANTSHIPS in ECONOMICS. Each is for one year, with the possibility of renewal for a further one or two years. Salary £450 per annum.

Further particulars may be obtained from the Registrar, University College, Cathays Park, Cardiff, to whom six copies of application, together with the names and addresses of three referees, should be sent not later than June 20, 1953.

(Signed) E. R. EVANS, Registrar.

Cathays Park, Cardiff. April, 1953.

PRODUCTION-ENGINEERING LTD., consultants in industrial and business management, require additional staff. Applications are invited from Chartered Accountants with industrial experience who are interested in the development of financial costing and administrative control. Technical ability is a prime essential, but great weight will be placed on personal attributes. Only first-class men will be considered and preference will be given to those with a university degree or service experience and a wide background. Before responsible work is undertaken, careful training within the company will be given which may last one year. Age should be between 26 and 38 years. The remuneration is high. These will be permanent appointments with excellent prospects for future advancement.—Applications should be sent in confidence to Production-Engineering Ltd., 86 Cross Street Manchester, 2.

DIRECTOR of merchant/manufacturing group (35), combining highest legal qualifications with considerable practical business experience, is seeking greater scope for activities. Widely businesstravelled throughout Europe, fluent French, German, Italian.—Box 242.

TRAINEE BUYER required by manufacturers of packaging materials. The Works is at Portsmouth but the successful candidate will first receive up to twelve months' training with the parent company in Lancashire. Young man in early twenties preferred. University education desirable but not essential. This vacancy has been notified in accordance with the Notification of Vacancies Order, 1952. Apply with full details to Box 244.

AN intelligent Advertising Executive, age 25 to 35 (Assistant to the Marketing Manager), with experience in advertising media, production and modern marketing methods, is required at the headquarters of Fisons, Ltd. The appointment will hold the prospect of an interesting career in a large and progressive company. An agricultural background an advantage but not essential. Salary commensurate with experience and qualifications but not less than £800 per annum. Apply in writing to Personnel Officer, Fisons, Ltd., Harvest House, Felixstowe, Suffolk.

THE CHARTERED INSTITUTE OF SECRETARIES.—Directors requiring the services of Chartered Secretaries to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute, 52-54, High Holborn, W.C.2.

IF YOU MUST TALK business at lunch, then quiet surroundings, good food and wines are essential.—Restaurant FRASCATI, Oxford Street, London, W.1. MUS. 7414.

OTHER NOTICES APPEAR ON PAGE iii OF COVER

The Bank Deutscher Laender also recently decided to permit the transfer to OEEC countries of current earnings and interest on capital invested in Germany by their nationals. This concession is being hailed in Germany as a modest step in the direction of convertibility for the D Mark, but it can perhaps more aptly be interpreted in the light of the Federal Republic's desire to attract more foreign capital. The movement of foreign capital into Germany has had to overcome many obstacles, not the least of which has been the uncertainty about whether—and how far—investors would be allowed to convert their dividends or profits at the official rates of exchange. The latest concession, it should be added, does no more than bring German Exchange Control practice into line with that followed by the British Exchange Control since its inception. As Germany, which had accumulated a credit of $270.6 million in the European Payments Union by the end of March, is now the largest creditor in intra-European trade, it is certainly making these modest advances to freedom from a position of strength.

Delivered Prices for Coal?

As long ago as 1949 the National Coal Board committed itself to a policy of delivered prices for coal, and two years ago it introduced "zone-delivered" prices for domestic consumers; but little has been heard yet of the similar system it promised industrial consumers. This week the board's Deputy Director-General of Marketing, Mr R. J. Moffat, expressed "some definite ideas" on delivered pricing to the Combustion Engineering Association. Mr Moffat emphasised that he was in no way committing the board, which had no scheme "nicely buttoned up" and was "still thinking" about the question. But his remarks deserve attention as the first public examination of the policy by one of the board's responsible advisers on the subject, much as other recent "thinking aloud" by members and high executives of the board on major issues of policy has been.

Under a delivered price system all consumers within a given area pay the same price for a given grade of coal, regardless of distance between them and the pit where the coal came from. A pithead price system—which the board still applies to most industrial and carbonisation consumers—is based upon actual costs at the pit, plus the cost of transporting the coal to the consumer who buys it. In the scheme already introduced for domestic consumers, a delivered price for a given grade of coal prevails in each of 60 zones in the country; and Mr Moffat pointed to this zoning in reply to critics who suggest that delivered pricing means "postalisation." He gave no hint of how many zones he would consider desirable for industrial coals, beyond admitting that "if a zone were too large, the averaging of transport costs would be oppressive on some consumers" and offering a singular comment that in some cases even one works or power station might be "an appropriate zone" for pricing. He said the transport element in zone-delivered costs would ordinarily be based upon the averaging of rail costs, with some adjustment to bring about "proper relativity" in the price of seaborne and roadborne coals. Mr Moffat stoutly maintained that "we are not minded . . . to work on marginal costs in the various coalfields"; but he felt that the National Coal Board must pay "more regard to the average costs of producing coal in the different coalfields—but not at individual pits—than we have done in the past."

Coal Grades and Transport Costs

SINCE nationalisation the Coal Board's marketing department has carried through an elaborate "scientific and commercial grading" of all the coals mined in Britain. The present pithead prices are based largely upon this grading, with coalfield adjustments to take some account of average production costs; but Mr Moffat's main criticism of them was that

> the relationship between price and quality which we have established at the pithead may well be distorted out of all recognition by the addition of transport charges.

The general level of delivered prices in each zone would be based upon "the costs of production and transport from the normally supplying coalfields," but the prices of particular coals would still be adjusted, in one way or another, to the quality grading.

This system, Mr Moffat suggested, would give a "proper price relativity" between different qualities of coal at the point of consumption. The board's problem is "to give consumers coal at a delivered cost which is as low as possible"; and if, "in the national interest," coal has to flow by different and more costly routes, "it does not seem right that the additional costs of transport involved should just fall on the particular consumers affected." He considered, incidentally, that a delivered pricing system would be "much facilitated" by a system of group railway rates from groups of collieries to zones, simplifying the present point-to-point rates—a suggestion that may or may not commend itself to those who are attempting to make railway charges more nearly correspond to costs.

★

The difficulties inherent in delivered pricing of a commodity where transport costs may average perhaps a fifth of the pithead price have been demonstrated by the Coal Board's prolonged and tentative approach to it. The broad economic objections—that it would blur the advantages of industrial location both for the coal industry and its customers—are well known. It is not altogether easy to discover from Mr Moffat's remarks the positive advantages that the board believes can outweigh these disadvantages. To suggest that it consciously desires to plan its operations with some insulation from the real pattern of demand, as and where that is exerted, might be unfair. A more likely reason seems to be the feeling that, under nationalisation, commercial policy must be suited to "planned development of the industry in the public interest," as though the public interest in the supply of coal is somehow distinct from the public's demand for coal—at different places, of different grades, and at different prices.

The Comet Crash

THE disaster that overtook a Comet of the British Overseas Airways Corporation near Calcutta last week-end (exactly a year after the Comets had been put in scheduled service) will be the subject of an official inquiry and report, which it would be improper, even if it were possible, to anticipate. From the facts so far reported, it would appear that the Comet encountered a localised but exceptionally violent storm; how it was destroyed—whether by extraordinary turbulence at the storm's centre or by a lethal accumulation of static electricity or by other causes—has to be determined. Monsoon storms are a common feature of the Bengal weather at this time of year, and they seem to have broken last Saturday, three weeks overdue, with accumulated violence. Without doubt, the inquiry will examine the procedure for issuing storm warnings, and whether it is possible to differentiate between flying conditions that threaten to be unpleasant, and those that may be downright dangerous—a task that would be doubly difficult for meteorological services in less developed tropical areas.

The report on the crash must be left to determine whether the storm was the sole cause of the accident, or whether there was any feature in the aircraft that made it more vulnerable in such weather conditions. The fact that BOAC, with its exceptionally good safety record in recent years, has kept its Comets in service suggests confidence in them. In general, the fast climbing rate of the Comet is thought to give it an advantage over other airliners because it can get through a danger zone at a higher speed. The bigger and faster Comet II left the de Havilland factory four days after the accident to begin its tropical trials in Africa, and in doing so cut the earlier Comet's record flight from Hatfield to Cairo by more than half an hour, flying the 2,182 mile journey in 4½ hours.

More Grains of Freedom

RICE merchants will once again be able to import on their own account from the beginning of July; and the Ministry of Food is to give up trading in rice at the end of July, when price control will also be brought to an end. Since state trading in rice has been done through merchants, acting for the Ministry of Food, this reversion to private trading should take place smoothly. However, as merchants well know, they are in a different world from 1939; not only are the sums concerned in the trade much larger, but markets in the Far East have been vastly changed by wars and revolutions. In one of the biggest rice markets, Burma, where many of the former merchants were British, buyers have now to measure their bargaining strength against a state selling monopoly.

World hunger for rice continues, particularly Asiatic hunger, accentuated by the failure of production—dislocated by wars, hot and cold—to keep pace with population, which in the rice-eating countries has increased by 120 million since 1939. But the government does not expect consumption in this country to increase as a result of the decontrol that is to begin in July. Rice imports into Britain, mainly from Burma and Italy, are at the rate of about 1½ million hundredweight a year, equal to about 3 lb a head of the population per annum. Britain's total imports, in any case, are less than one per cent of total world exports; and any slight variation in British consumption can have only an infinitesimal effect on the world rice problem.

A Simpler Schilling

THE unification of the exchange rate of the Austrian schilling at 26 schillings to the dollar (or 72.8 schillings to the pound) is equivalent to a devaluation of about 18 per cent for commercial transactions. Hitherto Austrian exporters had been forced to sell their foreign exchange to the National Bank at the commercial rate of 21.36 schillings to the dollar, and were finding considerable difficulty in competing in the world market at this rate. One consequence of this difficulty was that Austria had run up a cumulative deficit of $115 million with EPU by the end of March. The new rate is the same as the former "premium" rate, which was applicable mainly to tourists and capital transfers. The International Monetary Fund will undoubtedly welcome this final simplification by a country that a few years ago was one of the worst offenders for "multiple currency practices." But the OEEC would be wise to suggest to member countries that they should in future make any necessary exchange adjustments at a single step, instead of in a series of discriminatory shuffles of this sort.

Textiles in the Spring

THE wholesale textile trade can look back on its first quarter's trading with some satisfaction. Sales in March were 8.6 per cent higher in value than those recorded in March, 1952, while stocks, which were a serious embarrassment throughout the textile slump, were 30.6 per cent lower. Since prices have fallen by perhaps 30 per cent there are probably as many goods on the wholesalers' shelves as there were a year ago—but there is much less capital tied up in them. The fall in prices also obscures the fact that the trade is far more active than a comparison of the value of sales this year, and in 1951 or 1952 would suggest. The sales index (1950=100) records that from a figure of 143 in March, 1951, home sales fell to 108 in March last year and rose to 117 in the same month this year. The volume of goods sold this year may well be higher than in either of the two preceding years.

Spring buying appears to have got under way in March. Clothing sales rose by one-third, compared with February, and the rise might have been higher if sales of piece-goods had shared in the general recovery. This lag in sales of piece-goods is a surprising fact in the textile trade. In March, 1951, the index of piece-goods sales was 138; twelve months later, when trade was generally slack, sales had fallen to 99, yet last March they were even lower at 90. Stocks have been markedly reduced from 135 in March, 1952, to 82 this year, but wholesalers and retailers must be wondering whether a permanent change in demand away from piece-goods towards made-up clothing is not taking place. Sales of piece-goods responded to the shortage and rationing of made-up clothing; but these conditions no longer exist and the range and quality of ready-made clothes are ever increasing. The textile manufacturers as a whole are not likely to take the decline in piece-goods sales too seriously, for wholesale sales were 5.5 per cent higher in the first quarter compared with the same period in 1952.

SHORTER NOTES

The Peninsular and Oriental Steam Navigation Company is to increase its authorised deferred ordinary capital to £15 million by the creation of £5,071,223 additional deferred stock units. The present authorised capital has recently been exhausted and the directors state that "it is felt to be a distinct disadvantage to have no unissued available should the need arise at short notice." However, they make it equally clear that "no issue of stock is contemplated at present nor are any plans in hand which might call for it."

The promise of an early end of sugar rationing has given impetus to the alliances now being negotiated by a number of British and American companies for sharper competition in the soft drink market. Schweppes, Limited, which recently made an arrangement with the Pepsi-Cola Company for the distribution of the British products in the United States (and later in Canada and Mexico) has now agreed to take over the existing Pepsi-Cola factory in Britain through a wholly-owned subsidiary, Park Bottling, and to bottle and distribute Pepsi-Cola throughout London and the south coast. Eventually Schweppes, from other factories and depots, will distribute this American soft drink throughout most of Britain. The arrangement may be compared with the arrangements to market Coca-Cola in Britain made by Watneys and the Beecham group, and a new arrangement between Charrington Brewery and the Canada Dry company.

★

A committee has been appointed by the Board of Trade to consider future policy regarding censuses of production and distribution. The "full" census of production taken in 1948 has been followed by annual censuses on a more limited scale, providing continuous statistical series covering the main aspects of industry's activities; and a census of distribution and other services, the first ever taken in this country, was made for 1950.

Company Notes

DE HAVILLAND. By the tests of recent achievement and of future promise the British aircraft industry has made certain that its need for new money should receive a ready response in the capital market; and within the industry de Havilland, the home of the Comet, has very few rivals for pride of place. But the company's knock on the door of the capital market has come rather sooner than the market had expected. At the time of the rights issue of ordinary shares in June, 1951, the directors had declared that sub-contracting limited the group's need for additional capital equipment, and the market had therefore believed that de Havilland would be able to finance the expansion of its business by bank loans and by ploughed back profits. But the directors now estimate that in the next three or four years the group will need about £12 million to finance the further development and production of the Comet airliners and to meet in full the demands for other aircraft and equipment. Within the next two or three months de Havilland will therefore make a further issue of 1,200,000 5½ per cent £1 preference shares, together with 4,385,459 new £1 ordinary shares (by a rights issue on a one for one basis); the issue price of these new shares will be decided later in the light of prevailing market conditions. These issues should bring in well over half the sum of £12 million that the group needs; the remainder will come more from bank loans than from retained profits.

The de Havilland group is already leaning heavily on bank accommodation to finance its working capital commitments. In the year to September 30th last, the group's loans from the banks rose from £430,964 to £4,294,552. This was in line with an increase in the book value of stocks and work in progress (from £12,592,224 to £17,936,170) and of debtors (from £6,023,008 to £9,825,495); the rise in "customers' deposits with orders" (from £4,289,769 to £6,167,191) provided less than £2 million towards this need for over £9 million of new finance. Moreover, thanks partly to heavier charges for depreciation and interest on bank loans, net profits declined fractionally (from £639,290 to £597,108) last year. But in his report accompanying the full accounts Mr F. T. Hearle prepares the way for the new issues by giving a temperate but quietly confident assessment of the group's past record and future prospects. It is now clear why the directors failed to do anything more than to maintain the ordinary dividend at 7½ per cent; there should be no real difficulty in maintaining, though there may be in increasing, this rate after the new issue of shares. This, at any rate seems to be the assumption in the market, where the £1 ordinary stock units were marked down by 1s. 9d. to 28s. xd. when the news of the forthcoming issues had been digested.

Ordinary capital	4,385,459	4,385,459

£1 ordinary stock at 28s. xd. yields £5 7s. per cent.

BRUSH ABOE GROUP. In their clear and informative set of accounts the directors of the Brush Aboe Group have put the best face they could on a story of difficulties and misfortune. The group's net profits fell from just under £544,000 to just under £137,000 last year. The biggest setback, discussed in these columns on March 28th, was the loss of £504,000 on Indian tube well contracts. The group took the unusual step of venturing into this field of civil engineering in the hope that it would lead to orders for its main products, diesel engines and equipment. These hopes are apparently not yet dead, for the group has now entered into new contracts for tube wells—though on much more favourable terms than those of the initial agreements. But the task of securing and consolidating foreign markets for diesel engines and equipment is no longer an easy one. Last year, many of the group's "more important markets, including India, Malaya, Australia and Brazil drastically curtailed their orders" and as yet the group has not "fully recovered the ground lost." It seems to be particularly in these soft currency markets that the group is bumping its head into the familiar problem that foreign exporters are able to offer longer credit terms to their customers than British manufacturers can.

This recession in its export trade has inevitably added to the group's financial difficulties, which, in any case, were already serious enough. Unable to raise fresh capital in the market—which has been made an even more remote possibility by the passing of the final equity dividend—the group has had to rely on its own resources and on bank loans to finance the increase in unsold stocks of finished goods, or rather of stocks whose shipment was held up by import or currency restrictions. Last year the group borrowed about £2½ million more from the banks, bringing its total indebtedness to about £8 million (including bankers' advances against acceptances); about £500,000 of this £2½ million was spent on fixed assets, another £750,000 on reducing trade and taxation liabilities, another £700,000 in financing

trade debtors and transactions of associated companies and the remaining £550,000 in financing bigger stocks. The penalties of rapid expansion—indeed it may well have been far too rapid—can hardly ever have been so clearly delineated. But at the present depressed price for the 5s. ordinary stocks, Brush's 10,200 shareholders would still seem best advised to sit tight—and hope.

	Years to Dec. 31, 1951	1952

★

MONSANTO CHEMICALS. Like the report of Brush Aboe, the 1952 accounts of Monsanto Chemicals are overshadowed by the clouds of trading difficulties, lower profits and smaller dividends. But the 4,025 ordinary stockholders in Monsanto Chemicals may perhaps have a little more trust in silver linings in these clouds than the shareholders in Brush. As was noted in these columns on April 11th, Monsanto's profit margins were squeezed in 1952 between a further rise in costs and a fall in selling prices (forced on the company by more intensive competition, especially in overseas markets). Moreover, the minor recession in Britain's consumer goods trades, particularly in the textile and plastics industries, quite seriously disrupted production at the group's works in the middle of last year. But in spite of all these difficulties, the value of the group's sales (at £9,957,827) was only 3 per cent lower than the 1951 figure—and the actual tonnage of goods sold increased by as much as 10 per cent. Of even greater significance, exports in 1952 represented 39 per cent of total sales, compared with 33 per cent in 1951. By the end of the year the group's activities appear to have been well adjusted to the new conditions of a buyers' market. For example, after all adjustments for changes in price, the book value of stocks (at £3,202,398) was about £600,000 lower than at the end of 1951; and, following the receipt of £1,500,000 from the issue of the 5 per cent loan stock, the group had ample cash balances to meet its immediate capital commitments, which are estimated at £715,000.

	Years to Dec. 31, 1951	1952
Consolidated earnings :—	£	£
Trading profit	2,889,330	1,476,400

Cash	658,328	1,464,420
Reserves	2,121,424	2,136,011
Ordinary capital	2,700,000	2,700,000

5s. ordinary stock at 20s. 6d. yields £4 9s. per cent.

* Including capital works in progress, etc. (1951: £861,505; 1952: £931,200).

In fact, Monsanto's directors have budgeted for an increase in sales and productive capacity this year, including the introduction of some new products. The chairman, Mr Edward O'Neal, does not minimise the dangers of expansion in present conditions. He believes that costs in this country will continue to rise, while competition will become even keener; and he sees no sign of immediate relief from the restrictions placed upon imports into Britain's traditional export markets, for there is every indication that the trend towards local manufacture will become more pronounced. But, in spite of all this, he looks forward to an improvement in trading results in the current year. If profits do improve, the directors are not likely to be slow in restoring the ordinary dividend to the old rate of 22½ per cent.

★

RUGBY PORTLAND CEMENT. The only discouraging feature of the full accounts of Rugby Portland Cement is that a bigger bill for taxation has prevented the directors from doing anything more than to maintain the ordinary dividend at 20 per cent. As the group has been continually growing this means that the rate of return on the capital employed in the business has been becoming smaller over the last three years; it was 4.54 per cent in 1952, compared with 5.04 per cent in 1951 and 5.33 per cent in 1950. In line with yet another increase in production and deliveries, the group's trading profits have risen by £133,966 to £655,974 but, after an increase in the provision for taxation (from £250,000 to £357,000), net profits have risen by a mere £9,875 to £177,117.

	Years to Dec. 31, 1951	1952
Consolidated earnings :—	£	£
Trading profit	522,008	655,974
Total income	541,356	675,752

Stocks	411,174	431,915
Cash	769,296	710,778
Reserves	1,484,616	1,701,639
Ordinary capital	500,000	500,000

5s. ordinary stock at 27s. 0d. yields £5 8s. per cent.

* Excluding tax free special distribution of 5 per cent from capital reserves.

Last year's increase in sales took place both at home and abroad. The first stages of the development of the new plant in Trinidad, which should be in production by the middle of next year, have been completed; and work will soon start on the building of a new factory in Western Australia, which is expected to come into production in 1955. It was to finance these overseas developments that the company made the £1 million issue of a 4½ per cent loan stock last year. Much of this new money has apparently already been spent, for in the consolidated balance sheet the gross book value of fixed assets has risen from £3,271,713 to £3,591,030 while investments in the share capital of subsidiary companies have risen from £33,333 to £393,333 (of which £360,000 relates to the Western Australian company). The costs of these plants both at home and overseas are very heavy, and in Mr Halford Reddish's words, domestic profit margins, though they have recently improved, are "still insufficient to support in isolation the building of new works." Shareholders' hopes for an increase in equity payments may therefore hinge very largely on the success of the group's overseas ventures (as well as on the coming cessation of EPL); but since most overseas countries will almost certainly seek to counter any depression by an increase in domestic construction activity, the present yield of 5¾ per cent—calculated on the assumption that the 5 per cent tax free bonus will again be paid with a 20 per cent dividend—seems not unreasonable.

COMPANY MEETINGS

CANADIAN PACIFIC RAILWAY COMPANY

GOLDEN AGE OF CANADIAN COMMERCE

TREMENDOUS ADVANCE IN PRODUCTIVE CAPACITY

CORRESPONDING GROWTH OF RAILWAY TRAFFIC

CAPITAL PROGRAMME TO PROVIDE NEEDED TRANSPORT

MR W. A. MATHER'S ADDRESS

The seventy-second annual general meeting of the Canadian Pacific Railway Company was held on May 6th at Montreal, Mr George A. Walker, QC, chairman of the company, presiding.

Mr W. A. Mather, the president, addressing the meeting said: Today the event foremost in our minds is the forthcoming Coronation of Her Majesty Queen Elizabeth. On this occasion of supreme importance all who are associated with your company recall with profound gratitude the devoted service to the British Commonwealth already rendered by Her Majesty and desire to convey most respectfully to their Sovereign a reassurance of their continued loyalty and affection to Her Majesty's Throne and Person.

DYNAMIC GROWTH SINCE 1945

It is perhaps significant that this historic and happy ceremony should coincide with what by all standards appears to be a golden age of commerce for Canada. The spirit of progress and adventure which now grips the imagination of Canadians appears to differ but little from that which characterised the outlook of the people of England in the period known as the Elizabethan age. The dynamic growth of Canadian enterprise in the years since 1945 would, of course, not have taken place but for the confidence of the many investors whose savings have provided the capital necessary to put to practical use our extensive natural resources.

The fact that in each of the last eight years savings invested in new productive facilities have exceeded the preceding year is a clear manifestation of public confidence in the ability of private enterprise to develop the rich natural resources of this country. Impressive is the capital investment programme for the present year, an official estimate of which indicates outlays of the order of $5,421 million, or some 23 per cent of the anticipated national output.

CAPITAL INVESTMENT PROGRAMME

The capital investment programme of your company designed to meet the need for transport facilities adequate to serve this growing productive capacity is an indication of our confidence in the future and of the extent to which we participate in giving new shape, depth and perspective to the national economy. Almost daily we read of the progress being made throughout Canada; in British Columbia there are the new hydro-electric undertakings and the vast Kitimat aluminium project, in Alberta are the substantial petroleum and petro chemical developments, in Saskatchewan the oil and uranium discoveries, in Quebec and Labrador the iron ore and titanium developments and in New Brunswick there are the recent discoveries of new mineral resources.

Against such a background, the prosperous growth of agriculture and the forest industries, together with the expansion in manufacturing, provide a far greater measure of diversity and stability to the Canadian economy than at any time in the past. These are but some of the outstanding factors which have been responsible for the tremendous increases in productive output. Their significance for the well-being of the national economy is reflected in the fact that the real income of Canadians has increased by more than 50 per cent between 1939 and 1953. Happily, the prosperity of the industrial worker is being shared by agriculture, as is indicated by the increase in farm cash income, which in Saskatchewan, for example, in the period between 1939 and 1952 more than quadrupled.

TWO IMPORTANT FACTORS

The Minister of Finance in his last Budget speech referred to certain factors which constantly affect in one way or another the level of economic activity in Canada. Prudence indicates I believe the importance, especially in a basic industry such as transportation, of keeping at least two of these factors constantly in mind. They are first the investment in new capital goods and second the foreign demand for the products of this country. They are closely related and both have an important bearing upon economic welfare. The Minister at the same time pointed out that the total of salaries and wages earned by Canadian workers during 1952 rose by 12 per cent, an increase which is considerably larger than the rise in gross national output.

His qualifying phrase would seem to constitute a clear warning that the foundations of prosperity and expansion might be quickly undermined should people persist in anticipating the benefits the economy is capable of bestowing by reaching for them before they have been earned. For should demands upon the economy in terms not only of wages and salaries but also in terms of those services, which it has become fashionable to assume are the responsibility of government, outstrip the growth in productive capacity there would undoubtedly be a revival of inflationary pressures. If that should take place the competitive position of Canadian exports, so important to the prosperity of the people, would be seriously prejudiced in the markets of the world.

CHANGE IN POPULATION TRENDS

Dependence upon export markets is happily somewhat less marked than was the case in the thirties because of the notable change in population trends since the end of World War II. During the last few years the number of immigrants entering Canada greatly outnumber the individuals leaving for the United States. This change in long term trend indicates a growing confidence in the opportunity for the individual initiative afforded by the expanding economy of today. This expansion is creating a new railway problem, a problem of major importance both to the railways and to the nation. Early railway construction was in large part to link together our sparsely settled and widely separated territories.

The railways were built far in advance of traffic needs. They opened up new territory and were dependent upon immigration and the development of large unsettled areas for their traffic. In some areas traffic was slow to develop and therein was the root of many of the railway problems of earlier years. Now railway capacity has in large measure been used up. In fact many facilities are being severely taxed and an increase in capacity is required. In essence the problem now is for the railways to keep pace with Canada.

GROWTH IN RAILWAY TRAFFIC

Looking back over the years it is interesting to note that the growth in national output, what economists call gross national product, has in the long term been matched by a corresponding growth in railway traffic. The increasing service required of the railways is revealed by the growth in the volume of freight transportation per capita. In the early years of the century when there were but 6 million people in this country freight service rendered by the railways was equivalent to the transportation of 2,000 tons of freight a distance of one mile for each man, woman and child. Today the railways serving a population of nearly 15 million are hauling the equivalent of 4,000 tons of freight a distance of one mile for each individual. Thus in this interval the volume of freight service has not only kept pace with the gain in population but in addition has increased two fold per capita, despite the competition which has arisen from other forms of transportation. In the United States, where such competition is much more intensive, there has been a similar long-term increase in railway traffic per capita.

The increase in freight traffic in recent years has indeed been striking. In 1952 Canadian Pacific handled 29 billion revenue ton miles of freight, a volume greater than ever before. This was an increase of 8 per cent over 1951, of 6 per cent over the war-time peak of 1944 and of 60 per cent over the interwar peak of 1928. While the volume of traffic has increased the man hours to handle it have decreased. In 1928 there was an average of 3 man hours of labour per thousand gross ton miles as compared with 2 hours in 1952, a decrease of one-third. The number of cars and locomotives required has also decreased. The alltime peak load of traffic carried in 1952 was handled with 12,700 fewer cars and 360 fewer locomotives of greater capacity than were available for the much smaller volume of traffic in 1928.

GAINS IN EFFICIENCY

Operating statistics point up many of the gains in efficiency that have been made. The

tonnage per car-mile rose from 27.9 tons in 1928 to 33.2 tons in 1952. During the same period the average daily mileage made by all freight cars increased from 34.9 miles to 48.4 miles. Locomotive and train performance has shown quite marked improvement. Measured in gross ton miles per freight train hour, the work performed in 1952 was 50 per cent greater than in 1928. Not all of the progress shows up in statistical averages however. Improved services to shippers such, for example, as a scheduled transcontinental freight service providing fourth morning delivery from Toronto to Calgary and fifth morning delivery from Toronto to Vancouver which commenced March 3rd for this year have been introduced.

This progress has been possible because your railway, so far as its financial ability permitted, has adopted the latest technological improvements available. In so doing your company has made very substantial capital expenditures. Since the end of World War II over $345 million has been thus spent. As your directors state in their report which is now before you it is estimated that further outlays of $475 million will be required during the next five years. This programme will insure the necessary additions and improvements for your railway to keep pace with the demands upon it. The problem which this programme presents is of a financial nature. To quote again from the report "it is essential that investors should have confidence in the future of your railway. The return of 2½ per cent earned on railway investment in 1952 and the low returns in each of the postwar years do little to create such confidence." To obtain the new capital necessary your railway must offer the investor a fair prospect of getting a reasonable return on his investment. In my opinion this can be done only if the railways are given reasonable managerial freedom in the pricing of their services.

RAILWAY FREIGHT RATES

The present freight rate structure has evolved from one originally designed to serve a very different economy from that of today. The historic pattern established at a time when railways were the only effective means of overland transportation was intended to encourage the opening up of new land areas and to develop the commerce of a young nation. It is, therefore, understandable that a dominant consideration should have been to insure that the products of the farm, the forest and the mine would be moved to the market place at minimum rates. It is not surprising, in view of the fact that competition was a relatively insignificant factor in those days, that supervision and control of railway freight rates by Public Authority should then have been so important an element in the transportation policy of the nation.

The practical application of this early policy found expression in what is known as the value of service principle. Relatively low rates were granted for low valued and raw commodities, higher rates governed the movement of processed commodities, and those of high value when first established. The low rates for low value primary products covered the direct costs of rail haulage and made a relatively small contribution towards overhead. Rates on processed goods and high value commodities, while intended to offset the relatively low return on unprocessed and low value products, were nevertheless not so high as to prevent or discourage their movement.

GROWTH OF COMPETITION

Such in essence were the historic considerations which shaped the freight rate structure for many years. No circumstances of sufficient magnitude arose to justify re-examination of the underlying principles governing that structure. It met the transportation needs of producer and consumer alike, and at the same time served the financial requirements of the railways. Today, however, the situation is vastly different from that which hitherto has prevailed. No longer are railways the exclusive means of transportation for the high value traffic upon which they relied to offset the marginal revenues derived from the haulage of primary commodities. The growth of other modes of transportation has rendered high value traffic vulnerable to competition. Highway trucking, of course, offers the major competition confronting the railways. No one would wish to deny that the trucking industry has an important place in the economy. The relative flexibility of operation and the initiative and enterprise of that industry have combined to develop new trade and traffic, which, in part, might not otherwise have come into existence.

Truck competition has, however, become more intensive because, unlike railways, the trucking industry is not required by law to carry all types of traffic at published scales of rates, enjoys the privilege of using public highways at low cost and is relatively free from regulation. In other circumstances the railway industry would be in a strong position to meet the emergence of truck competition, because the average of truck costs is probably three times the average of rail freight costs. Averages, however, are often misleading. In 1952, while the average cost to freight shippers using your railway was only 1.3 cents per ton mile, railway freight rates ranged from about one-half cent per ton mile on a large volume of traffic to ten cents and more per ton mile on certain high value commodities. It is, of course, the latter commodities which are most vulnerable to truck competition.

PROBLEM OF RATES

The serious problem confronting the railways is that of meeting truck and other competition while they themselves remain bound by a pattern of rates designed at a time when competition was a relatively unimportant factor. It is natural that those areas where development in the first instance was dependent upon those early transportation policies governing the freight rate structure, should be reluctant to see any change in the principles which then underlay such policies. Yet fears that such areas might be adversely affected by any change in the basic principles of the freight rate structure designed to make that structure serve better the future development of all of Canada are, I believe, ill-founded. Such changes would, I am confident, not only leave unimpaired the prosperity of the areas affected but would at the same time react to the benefit of the entire country.

The need for greater freedom in rate making is not felt in Canada only. In the United Kingdom recognition of this need has found expression in the repeal by Parliament of legislation which had hitherto deprived British railways of equality of opportunity to compete with highway transportation. Important new principles aimed at bringing about greater flexibility in rate making have been adopted. In the United States, too, there is a growing awareness of the need of the railways for relief from outmoded regulations. Action to remedy the situation is being taken which it is expected will find expression in legislative proposals to be presented to Congress later in the year.

OIL

In the oil fields of Western Canada 1952 was a year of record activity, with expenditures on exploration and development estimated at $280 million, the completion of more than 1,000 new oil wells and an increase of approximately 30 per cent in crude oil production. Impressive progress has been made by the Western Canadian oil industry since the discovery of the Leduc field amounted to 7½ million barrels as compared with some 60 million barrels in 1952. With the completion of additional transportation and refinery facilities further substantial increases in production may be expected of the 200 million acres under exploration and development in western Canada.

Some 11 million acres are lands in which your company holds title to petroleum rights. The income to your company from the development of these rights is in the form of reservation fees, rents and royalties and, as you will have noted from the annual report, amounted to $3.6 million for the year 1952. This was an increase of $1.4 million over the previous year and present indications are that a similar increase may be expected in 1953.

BRITISH COLUMBIA COAST STEAMSHIPS

Following the destruction by fire of Pier D at Vancouver in 1938 temporary accommodation for your coastal services was provided at the deepsea Pier BC. The need to release this pier for ocean shipping and to provide more satisfactory facilities for your coastal services became urgent. It has therefore been decided to construct modern coastal facilities on the site of the old pier D. Work on dredging and filling will be started this year and completion pressed as rapidly as possible.

To improve further and to augment the services between the mainland and Vancouver Island tenders have been called for the construction of a self-propelled train ferry capable of carrying 800 passengers as well as 115 automobiles and trucks or 28 freight cars. This vessel will be placed in service between Vancouver and Nanaimo. Special new berthing facilities will be built at both ports for its efficient operation.

OCEAN STEAMSHIPS

The prospects for your ocean steamships in 1953 are not too bright. While the Coronation Ceremony has attracted good bookings for passenger traffic, the volume of both trans-Atlantic and trans-Pacific freight traffic is expected to be low. In addition, cargo rates are depressed because of a surplus of ships on world trade routes. The new passenger cargo liner, of which details are given in the annual report, is to be built by the Fairfield Shipbuilding and Engineering Company, Glasgow. The cost of this liner is estimated at $16 million, which amount will be financed with funds available in your steamship replacement fund and from the United Kingdom Government tonnage replacement account.

The destruction by fire in January of the "Empress of Canada" while undergoing overhaul at Liverpool was a severe loss to your passenger fleet. To replace this ship, the steam-turbine vessel "De Grasse" of 19,665 gross tons has been purchased from the French line. She has been renamed "Empress of Australia," and is nearing Montreal after her first westbound Atlantic crossing.

AIR LINES

Completing their first decade of operations, your Air Lines in 1952 provided a greater volume of transportation service than in any previous year. On routes extending over 25,000 miles, 207,000 passengers were carried a total of 145 million miles. Cargo traffic

amounted to 1.5 million ton miles and mail traffic to 1.2 billion pound miles.

The five Convair airliners purchased for use on mountain routes have been delivered. In addition to providing modern air service, the increased capacity they provide will enable your Air Lines to re-institute a tri-weekly service from Whitehorse to Fairbanks, Alaska. To cater more adequately to the needs of the vast aluminium project at Kitimat in addition to the existing service out of Vancouver a new tri-weekly service is now provided between Edmonton and Prince Rupert. It is intended to extend the present Winnipeg Flin Flon route to the important nickel and copper mining area at Lynn Lake as soon as an airport is completed. Another route is planned to serve the important mining development at Pine Point on the south shore of Great Slave Lake.

PROJECTED NEW CARGO SERVICE

Hearings have been concluded on the application made to the Air Transport Board for permission to operate an air cargo service between Montreal and Vancouver via Toronto, The Pas and Edmonton. If approved, the service will provide overnight delivery of goods across the country and should be an important addition to the transport system of Canada. Three Douglas DC 6B passenger airliners have been received and a fourth is expected in June. These airliners will provide the fastest and most luxurious service linking North America with the Orient and the South Pacific.

COMET PROGRAMME AWAITS COMMITTEE'S FINDINGS

A setback in the plans to inaugurate jet passenger service in the South Pacific was encountered when the first Comet 1-A crashed at Karachi Airport while on its delivery flight to Australia. The unfortunate loss of crew and technicians is most regrettable and suitable expressions of sympathy have been conveyed to those affected. This accident has been the subject of a detailed investigation by a Board of Inquiry nominated by the Government of Canada, the United Kingdom and Pakistan. After a careful study of the findings and of those in connection with the loss of a BOAC plane at Calcutta a few days ago, your Comet programme for the future will be determined.

Bilateral government agreements have been signed authorising an air service from Vancouver to Mexico City, Lima and Rio de Janeiro. This route, adding 7,500 miles to the Pacific network of your air lines, will provide the fastest service between the Orient and South America and is expected to be in operation in the fall of 1953.

RESULTS FOR FIRST QUARTER 1953 AND PROSPECTS FOR YEAR

Net earnings from railway operations for the first quarter have declined by $630,000. This is attributable in part to a decline of 4.8 per cent in volume of traffic from the peak level of the first quarter of last year and in part to higher wage rates which were not compensated for until March 16th, when an increase in freight rates of 7 per cent became effective. While it is as yet too early to make an accurate prophecy for the year, studies by your traffic officers have not indicated a continuation of the decline in traffic and the results of your railway for the remaining quarters should show an improvement.

On the other hand a reduction in other income seems definitely indicated. I have already pointed out that the prospects for your ocean steamships do not appear too bright and income from other sources is likely to be lower.

NEW EQUIPMENT TRUST AGREEMENT

As you will have noted from the annual report, your approval will be requested at this meeting for a substantial capital programme of which $55.6 million pertains to new rolling stock. It was deemed advisable to acquire certain of the new units under an equipment trust. For this purpose the Royal Trust Company as trustee entered into a trust agreement dated April 1, 1953, under which $25 million principal amount of 4 per cent equipment trust certificates were issued bearing the guarantee of your company as to principal and interest.

CONCLUSION

The builders of your railway had great faith in the future growth of Canada. The traffic volume in recent years has justified their belief and that of their successors. In general your railway facilities are now fully employed. The extensive programme of capital expenditures now being undertaken is further evidence of belief in the continuing development of the country. I am not unmindful that your railway is an industrial enterprise that it is subject to the same economic considerations that affect other private undertakings. Assuming only that your company is afforded the opportunity to earn a fair return from its railway investment, I am confident it will continue to play its part in providing efficiently the transportation needs of Canada.

The report and accounts were adopted.

MOSS' EMPIRES LIMITED

LARGER PROFIT

The fifty-fourth annual general meeting of Moss' Empires Limited was held on May 7th in London.

Mr Prince Littler, the chairman, in the course of his speech, said: A further distribution of bonus shares is to be made, subject to the necessary resolution being passed at an extraordinary general meeting to be held immediately at the close of the proceedings of this meeting. This will involve a transfer from capital reserve of £47,462, to be applied in paying up in full at par the amount in new ordinary shares for distribution amongst the members holding ordinary stock at April 22, 1953.

The profit on trading after charging renewals of furnishings shows an increase from £379,394 in 1951 to £400,589 in 1952. The directors regard this as satisfactory, looking to the difficulties of the present time, with rising costs in many directions. The profit carried down to the appropriation account is £113,797 against £95,922 for 1951.

It is proposed to maintain the dividend on the Ordinary stock at the same rate as for the year 1951, namely, 20 per cent on account of which an interim dividend at 7½ per cent, less income tax, has been paid, the final dividend being at the rate of 12½ per cent, less income tax, on the increased capital.

Both the parent company's balance sheet and the consolidated balance sheet again show a strong financial position. The consolidated balance sheet discloses fixed assets of £2,456,670 and current assets of £1,193,575, with total assets of £4,050,529. The mortgage debenture stocks are £1,071,026. The current liabilities and provision are £675,140. The consolidated profit and loss account shows total income of the group for the year of £459,962, against £456,903 for 1951.

The report was adopted and the proposed issue of bonus shares was sanctioned.

INSTITUTE OF CHARTERED ACCOUNTANTS

ANNUAL MEETING

The seventy-second annual meeting of the Institute of Chartered Accountants in England and Wales was held on May 6th in London. Mr T. B. Robson, MBE, the President, in the course of his address, said:

THE CORONATION

By Her Majesty's grace and invitation I am to be privileged as your President to be present in the Abbey during the Coronation ceremony.

As a body whose creation and corporate existence are due to a charter granted by the Crown, our Institute owes Her Majesty a special debt of affection.

ANNUAL RELIGIOUS SERVICE

Many members of the council feel that the decay of religion throughout the world has done much to bring about the present state of world affairs. The council has decided to indicate its own attitude by attending officially a service at a City church once a year in future on the day of a council meeting.

GROWTH OF THE INSTITUTE

Today we have over 17,000 members. Thirty years ago, when I was myself admitted to membership, the total was only 6,000. Every member has to undergo the rigorous training under articles and pass the examinations which our charter and bye-laws prescribe. But the rigours do not appear to discourage new entrants. Contrary to the impression which still persists, no young person of character and reasonable ability who goes through our system of training and works hard need have fears about his prospects of qualification.

SYSTEM WORK AND MANAGEMENT ACCOUNTING

Members of our Institute have in special degree the qualifications for giving advice and assistance on the development and adaptation of accounting systems. Trained as we are in the fundamentals of accountancy, we are able far better to appreciate what is needed than many of those who have invaded this field of activity without our basic accounting training to assist them.

Similar considerations apply to the production and presentation of information which will be of assistance to management in its day-to-day conduct of business. The field of system work and management accounting presents to our members real opportunities of service to industry and thus to the nation as a whole.

Much has already been done and much is in progress in our Institute in regard to this matter.

EXCESS PROFITS LEVY

I was profoundly glad to hear the news that the excess profits levy is to disappear from the fiscal scene at the end of this year. My regret is that it ever appeared and that, having appeared, it has to stay with us so long. It is a thoroughly bad tax, inequitable in its incidence, a deterrent to efficiency and bold and adventurous planning, a discouragement to initiative and enterprise.

The profits tax is another unsatisfactory tax which we accountants would very much like to see withdrawn.

ROYAL EXCHANGE ASSURANCE

233rd ANNUAL REPORT

A YEAR OF GREAT ACHIEVEMENT

INCREASED PREMIUM INCOMES AND SUSTAINED PROFITABILITY

LORD BICESTER'S STATEMENT

The two hundred and thirty-third Annual General Court of the Royal Exchange Assurance will be held at the head office of the Corporation, in the Royal Exchange, London, on May 27th.

The following is the statement by the Governor, The Right Hon. Lord Bicester, which has been circulated with the report and accounts:

I have decided to continue the policy which I initiated last year of issuing a statement in advance of the Annual General Court explaining and amplifying the report and accounts of our group of companies for 1952. Before doing so I would like to refer to Mr Michael Hamilton's acceptance last year of our invitation to become a director of the "Royal Exchange" and to express my confidence that he will prove a valued member of the Court.

1952—ITS ECONOMIC BACKGROUND

British insurance, with its vast world-wide business, is from the very nature of its operations especially sensitive to financial and economic changes.

At the beginning of 1952 the United Kingdom was beset by two major economic problems, the unbalance of its overseas payments coupled with the apparent inability of its population to provide adequately out of savings the capital needs of industry and commerce. Both these economic ills flowed directly from inflationary policies of former postwar years, but there is encouraging evidence that HM Government has inflation under control and may soon be able to eliminate many of its dangerous effects. Certainly today the United Kingdom holdings of gold and dollar reserves are continuing to improve and the "terms of trade" have moved in our favour.

GROUP OPERATIONS

You may recall that at this time last year I made the suggestion that 1952 might mark the end of the postwar economic era which had been so notable for severe inflation. That prediction seems to be proving substantially accurate in much of the free world in which we operate.

We have continued our policy of developing and consolidating the organisation of the family of companies comprising the "Royal Exchange" group. In order that you may the more readily realise the success which has attended our efforts and the real progress made, I give below the published figures of the annual aggregate premium income of the fire, accident and marine accounts in recent years.

1945	£9,671,152
1946	11,436,973
1947	13,691,978
1948	14,874,860
1949	16,729,156
1950	19,131,829
1951	22,019,017
1952	24,917,487

I am sure you will agree that these figures represent an eminently satisfactory measure of our group's great postwar effort. Especially creditable is the record increase of almost £3 million in 1952, despite the disturbed economic and financial conditions encountered during that year. I am confident that you will find the individual records of our underwriting departments for 1952 equally satisfactory.

FIRE DEPARTMENT

The fire department, I am pleased to be able to report, again enjoyed an excellent year in 1952. The premium income of £9,300,241 again constitutes a record and shows an increase of more than £1 million over 1951. I am, however, doubtful whether the high rate of growth shown in recent years can be maintained now that postwar economic conditions are becoming more stabilised.

Although the claims experience on the whole has been rather less favourable, an excellent surplus has once more been derived both from our operations at home and our very much larger activities overseas. This surplus, amounting to £895,819, being 9.6 per cent of the premium income, is little short of the record figure a year ago.

In a year of heavy fire wastage at home reference should also be made to the disastrous loss by storm and flood which occurred in the Lynmouth area in the summer of 1952. Although in the home field such occurrences have hitherto been regarded as abnormal, it was disturbing to find 1953 opening with storm and flood damage of even greater severity in the East Coast area.

Appreciating as we all do the value to our country of invisible exports, it is very pleasing to me to be able to tell you that our large overseas business has made a substantial contribution to the national economy.

In the United States we have, as you know, a very important business and during the last two years considerable re-organisation of our operations has been undertaken. This work is continuing to our satisfaction, and we feel that our business in that great country is on a sounder basis than ever before.

MARINE DEPARTMENT

Aggregate marine income for the year was £2,242,256, being an increase of over £150,000 as compared with 1951. In respect of the underwriting years prior to 1951 we are transferring £202,112 to profit and loss account, thus leaving the fund at the end of 1952 at £3,828,651, being 170.7 per cent of that year's premium income.

A most disappointing feature of the 1952 hull underwriting account was the very considerable number of serious liner casualties which the marine market encountered. Cargo business remains very competitive and there can be no doubt that the reduction in cargo rates has been very much overdone. Whilst generally the incidence of claims for theft and pilferage of cargo has not shown any great tendency to grow, except in certain black spots, there has been a marked increase in claims for damage to cargo.

GENERAL ACCIDENT

This department incorporates, as you know, the underwriting of a very wide range of risks throughout the world. The aggregate premium income for 1952 at £13,374,990 exceeds that of the previous year by £1,740,000. After making provision for unexpired risks we are able to transfer £558,847, being 4.2 per cent of premium income, to the profit and loss account.

The employers' liability account is still proving very difficult owing to the high level of awards for damages, but, as a result of increased rates in certain territories, the outlook is now somewhat more favourable.

The general claims experience of the motor insurance market continues to be unfavourable, and our own account is no exception, although last year's figures show some improvement over those of the previous twelve months. In an effort to remedy the position, premium rates have been increased in a number of territories, but it takes time for the application of increased rates to have a material effect upon the result.

While, of course, the cost of settlement of personal injury claims and of repairs to vehicles remains very high, the root cause of the problem in motor insurance throughout the world is the large number of accidents that occur. It is true that since the war much has been done to make roads safer, but a great deal still remains to be accomplished, and the extent and urgency of the problem is brought home to us when we remember that close on 5,000 people are killed and about 200,000 injured every year as a result of traffic accidents in the United Kingdom alone.

We trust that the suggestions of the conferences which have been presided over by Lord Llewellin, the president of the Royal Society for the Prevention of Accidents, will be fully implemented because we believe they will help to reduce the enormous annual wastage caused by road accidents.

There could be a great improvement in the present position if only all drivers would realise that by the manner in which they drive and by the courtesy they extend to other road users they can play a very large part not only in reducing the number of accidents and consequent financial loss to the country, but also in reducing the cost of motor insurance to themselves.

LIFE DEPARTMENT

During 1952 new life policies were issued with net sums assured of £6,100,000, an increase of nearly £600,000 upon the record figure achieved in the previous year, and there was a corresponding increase in the total income, which is now over £2,200,000. Claims by death continued at a level well within the expectation.

A notable item is the gross interest income which exceeded £1 million for the first time in the history of our life fund. The gross yield for the year was £4 16s. 1d. per cent, or 3s. 3d. per cent more than in 1951.

Continued progress of our life department during 1952 has been reflected in our decision

to quote lower rates of premium. More recently we have also decided to increase the rate of interim bonus allotted to policies becoming claims in the current year. It is now to be 36s. per annum for each £100 sum assured in respect of premiums due after 1952, as compared with a rate of 32s. in earlier years. The next triennial investigation of the position of the Corporation's life fund with a view to a declaration of bonus is due to take place as at December 31, 1954, and I am happy to say that present indications give every hope of a further improvement in the bonus declaration.

INVESTMENTS OF THE "ROYAL EXCHANGE" LIFE AND ANNUITY FUNDS

One of the three most important elements in calculating the rates of premium to be quoted for life assurance and annuity contracts is the future yield of interest which can be expected to be earned upon the policyholders' funds.

Proper regard must of course always be paid to the investment channels which from time to time are known to be likely best to serve the interests of the United Kingdom and Commonwealth, and because commerce and industry provide the very lifeblood of the nation's economy, we have in the past invested and continue still actively to invest a substantial part of our funds in the prior charges and equities of the leading joint stock companies in the United Kingdom.

Generally the yield to be obtained from long-term investments materially exceeds that from short-term securities of similar quality. Over the years it is only by earning the long-term rate upon the major part of its funds that a life office is likely to be able to continue to quote competitive rates of premium.

It will be recalled that only last year I revealed that we had been following an ultra-cautious investment policy designed specifically to safeguard capital values at the temporary and moderate cost of a relatively low income return upon our life and annuity funds' investments. In the hope that as from the latter half of last year the nation might be about to enjoy the benefits of a healthier economic climate your directors replaced some part of its cash and short-term holdings by longer-term securities.

The effect of our earlier financial policies is well illustrated by the annual gross yields obtained upon the "Royal Exchange" life and annuity funds since the end of the war:

	Life Fund per cent			Annuity Fund per cent		
	£	s.	d.	£	s.	d.
1945.....	4	5	3	4	14	4
6.....	4	6	2	4	9	6
7.....	4	1	8	4	6	1
8.....	4	4	4	4	14	0
9.....	4	2	10	4	14	7
1950.....	4	4	9	4	13	8
1.....	4	12	10	4	19	0
2.....	4	16	1	4	19	8

Without in any way abandoning our former insistence upon very high quality in the choice of individual investments I am not unhopeful that 1953 may show a continued improvement in the yields earned upon these funds.

The further deterioration in the quotations generally for marketable securities during 1952 had relatively little effect upon the overall valuation of the investment portfolios of our life and annuity funds. You will, I know, be pleased to have my assurance that at the year end the Stock Exchange securities of both these funds represented, at mid-market values, substantial aggregate margins in excess of the figures printed in the balance sheets.

TRUSTEE AND EXECUTOR DEPARTMENT

It is generally recognised today that the function of trusteeship requires a high degree of skill and judgment, and in conducting such business there is little doubt that experience gained over the years is a most valuable asset. It is interesting to recollect that the Royal Exchange Assurance was a pioneer amongst corporate trustees, having obtained authority by Special Act of Parliament in 1901 to undertake trustee business. This, coupled with the fact that the Corporation has, over two-and-a-quarter centuries, acquired on its own account an exceptionally wide experience in investment and other business spheres, is one of many advantages to be gained by appointing the Corporation as executor or trustee of private funds.

The Royal Exchange Assurance also acts as trustee for debenture and bond issues of every description and I think it is fair to add that over the last 30 years or so the Corporation has acquired a knowledge and experience in this type of trusteeship which is second to none.

Before leaving the subject I would like to refer to the retirement upon pension of Mr W. Bidwell at the end of October, 1952. He entered our service in 1911 and devoted over 40 years to the affairs of the Corporation's Trustee Department, of which he had been manager since January, 1939. He carries with him in his retirement our thanks for his good work and best wishes for his future happiness. To succeed Mr Bidwell we appointed Mr B. S. Latham and Mr A. H. B. Rodyk, MA, LLB, both of whom have also spent many years in the department, to be joint managers.

TAXATION

As you will see in the "Governors' and Directors' statement" which precedes the revenue accounts, there is a note to the effect that we have carried directly to the profit and loss account all overseas taxes on profits payable in territories where double taxation agreements obtain. Previously these taxes have been charged in the departmental revenue accounts where the profits were earned and the 1951 figures have been adjusted to produce a fair comparison.

Although some proportion of such overseas taxes is accepted in relief of UK taxation, we cannot expect to make anything like a full recovery. Furthermore, some time elapses before our claims are agreed and the estimating of such relief in advance is, in many cases, quite impossible, so that I am sure you will agree that the new method gives a much truer picture of our underwriting results.

It is interesting to note that in respect of 1952 the provision for UK taxation amounts to over £1,238,000, which, coupled with overseas taxation of almost £267,000, makes our total tax burden for the year £1,505,000.

So that you may appreciate the great weight of taxation which we bear it can be stated that the Inland Revenue alone has, in the last five years, levied taxation of some £5,600,000 upon the general funds of our group as compared with the aggregate net amount of £1,047,615 which the stockholders will have received in dividends covering the same period.

CONSOLIDATED PROFIT AND LOSS ACCOUNTS

On the income side of this account are assembled generally the fruits of our efforts for 1952. Gross interest earning upon our general funds amounted to £962,542: the substantial improvement compared with 1951, although partially attributable to the larger funds at our disposal, is more particularly due to our greater readiness to invest moneys which we had, formerly, by design kept liquid.

The departmental transfers at the year end aggregated the record figure of £1,654,829 to which falls to be added miscellaneous items of £80,757 largely representing a one-third instalment of the proprietors' share in the 1951 life valuation surplus. Total income accordingly amounts to £2,698,128, a figure some £340,000 higher than in the previous year.

On the other side of the account you will see, *inter alia*, the very large provision for taxation to which I have already referred and also aggregate transfers of £196,100 to pension and staff allowances funds. £56,244 has been applied in the reduction of book values of individual investments of certain of our associated companies although, in the aggregate, the marketable securities of our general funds possessed a value very substantially in excess of the figures appearing in the balance sheet.

The remaining balance of £857,000 is transferred to the consolidated profit and loss appropriation account making, with the sum of £2,312,696 brought forward from 1951, a total disposable sum of £3,169,696.

DIVIDEND

The general picture presented by our accounts for 1952 is, I am confident you will agree, one of great achievement: each of our principal underwriting accounts shows increased premium collections and sustained profitability. Furthermore, despite heavy taxation we were able to increase our reserves and surplus during the year by nearly £2 million.

The Court of Directors considers that some further modest increase in the dividend in respect of 1952 will be no more than consistent with the eminently satisfactory account of the Corporation's affairs which I have been able to present to you. Accordingly it was recently decided to recommend *the payment of a final dividend of 35 per* cent, making, with the interim of 15 per cent, a total dividend of 50 per cent—the comparable total for 1951 was 45 per cent.

It is our present intention if circumstances are then favourable to increase the rate of the interim dividend for 1953, so as to bring it more nearly into equality with the final payment. I should, however, stress the point that any such alteration must not be taken as implying that the total distribution for 1953 will be greater than for 1952.

EQUIPPED TO MEET ANY DIFFICULTIES

I am now in my sixtieth year as a member of the Court of Directors, and over that long period, which includes almost forty years as your Governor, I have seen the Corporation and its family of associated companies gradually become welded into the present great organisation. We can be proud of our strength and of the loyal and devoted individuals who are the backbone of our worldwide business, and I have no hesitation in assuring you that our organisation is well equipped to meet any difficulties which are likely to arise in the foreseeable future.

Finally, I am sure you will agree that our annual general court is the appropriate occasion to express the thanks of the stockholders to our general manager, Mr Phelps, to his executive assistants, to the managers of our associated companies, as well as the branch managers and the staffs, both at home and overseas, for their combined achievements last year. I would also like to convey to the directors of our associated companies, the members of our local boards, as well as our agents and representatives throughout the world, an appreciation of the loyal support we continue to receive from them.

ROYAL INSURANCE COMPANY LIMITED

107th ANNUAL REPORT

OUTSTANDING EXPANSION

RECORD PREMIUMS EXCEED £50 MILLION

COL A. C. TOD'S SURVEY

The annual general meeting of the Royal Insurance Company Limited will be held on May 27th in Liverpool.

The following statement by the chairman (Colonel A. C. Tod, CBE, TD, DL) has been sent to stockholders with the 107th annual report and accounts.

Our report and accounts set out the essential facts regarding the "Royal's" worldwide operations during 1952 and require little elaboration.

The central feature is undoubtedly the progress and increasing strength which the accounts continue to reflect.

Our total fire, accident, marine and life premiums exceed £50 million for the first time in our history. They show an increase of more than £3,750,000 over the preceding year. In the past four years the *increase* alone in our premium income has exceeded £15 million, a figure roughly equal to the *total* premiums shown in our accounts for 1939.

A rise of over £1¼ million in our new life business brings new sums assured to a record amount exceeding £12 million.

These figures, of course, cannot be interpreted as a true measure of the economic tempo of the times, since inflationary factors have been persistently active. Nevertheless, they do in fact reflect a measure of real expansion and testify to the confidence which the insuring public has in the "Royal."

Underwriting profits amounted to £2,294,931, but this sum, although substantial, represents a modest percentage of only 4.98 per cent of the premiums, and this is before charging United Kingdom taxation.

INSURANCE COMPANIES AS INSTITUTIONAL INVESTORS

With taxation and living costs at their present high levels, there is little margin today for individual savings, except for what is put aside by way of insurance premiums, pension fund contributions, building society deposits and the like. The insurance companies are, therefore, regarded as one of the few remaining effective repositories for private savings. *All too frequently, however, in the press and* elsewhere, there is an undercurrent of criticism, either implied or overt: either we under-rate our responsibilities and fail to invest our available monies sufficiently in providing finance for industry, or, alternatively, we acquire such dominant financial interests in industry that we obtain an unhealthy control. I should like, in fairness, to analyse that situation a little further.

In the first place, let us concede that the vast sums collected annually in the shape of life assurance premiums are of real importance to the country's economy. The sum involved is of the order of £300 million annually. Much of those savings would probably be spent if they were not earmarked for life assurance premiums. Surely, in these days when a restraint on spending and a reasonable volume of personal savings are essential for the rehabilitation of the country's commercial life, the part played by the insurance companies should be generously acknowledged.

In the second place, as regards general business, let me remind you of the great volume transacted overseas by the British insurance companies. That business involves substantial obligations in the provision of reserves overseas, and must be kept in mind when measuring our investment potentialities at home.

Again, the boards of insurance companies —each according to their own judgment— must necessarily subject their financial policies to the over-riding consideration of their policyholders' interests and security. Their obligations to policyholders are of a quasi-trustee character, and it would be irresponsible to ignore that fact in any determination of investment policy.

I submit, however, that, with due regard to their responsibilities to policyholders, insurance companies make a fair contribution to the financing of industry in this country. I think not only of their investments in preference and ordinary shares; there are also their industrial mortgages and debentures, and the help that the companies give to house purchase, either indirectly by way of advances to building societies, or, alternatively, by direct mortgages.

So far as the "Royal" Group is concerned, almost two-thirds of our available monies in recent years have been invested in the directions just indicated, and I think we have an effective answer to the first of the major criticisms that are sometimes levelled against us.

In short, if insufficient money is finding its way into industry today, I think we must put that down to high levels of taxation and not to any failing on the part of insurance companies.

May I also, unequivocally, rebut the other criticism relating to control. Our business is insurance. There is sufficient in the successful conduct of our own business to claim all our attention, and the last thing we would want as a result of our investment policies would be to become involved—even in minor degree—with the management and control of other industries.

OVERSEAS

In the United States of America, our business continued to expand, and the year was fortunately free from major disasters.

The overall underwriting result was a very satisfactory profit, but difficult conditions in the Automobile Department, to which I have had cause to refer in recent years, persisted. Steps have been taken to remedy the position and it is hoped that benefit will be felt in the current year.

In Canada, our premium volume was the highest we have so far recorded and the results were excellent, although, here again, the automobile situation continues to call for the strictest vigilance.

In Australia, New Zealand, and South Africa, in India, Pakistan, Burma and Ceylon, *and in the many other territories—old and* new—where we operate, we have shown healthy progress and satisfactory trading results.

LIFE DEPARTMENT

Year	New Sums Assured £	New Annuities (per annum) £	Claims by death £	Matured Endowment Assurances £
1952	12,010,108	519,794	886,313	1,319,612
1951	10,663,180	414,705	880,157	1,352,568

One of the most notable features of the year's working has been the considerable rise in new life sums assured.

Claims by death were little more than in the previous year, and were again well below the mortality experience provided for in our rates.

The year shows a substantial depreciation in the values of Stock Exchange securities, but I am happy to tell you that the market value of the assets of our life and annuity funds, at the end of 1952, was in excess of the amount stated in the balance sheet.

It is pertinent to recall that the bulk of our life investments in British Government securities are in dated stocks so that temporary fluctuations in market value do not detract from their ultimate worth.

Nevertheless, we decided to strengthen our position further by transferring £1 million to life investment reserve.

FIRE DEPARTMENT

Year	Net Premiums £	Profit £	Percentage of Premiums
1952	20,148,442	2,018,327	10·02
1951	20,023,505	1,673,904	8·36

Our home fire income again expanded, but the increase was not so marked as in recent years, the levelling-off being in keeping with the wholesale prices trend. The loss ratio was again favourable.

It is worthy of note that fire losses in 1952 in Great Britain, in the United States of America, and in Canada, were, in each case, the highest ever recorded.

Fires occur in this country at a rate in excess of 200 a day. All classes of property are involved, ranging from dwelling-houses to industrial premises. Whilst the larger and more spectacular fires—there were twenty-one last year in each of which the estimated material damage exceeded £100,000—come to the notice of the public, the smaller fires are, in the aggregate, much more costly. The fire offices are doing all they can by research and dissemination of advice to reduce fire-wastage. Whilst much of the increased wastage was due to the rise in values, it is probable that the loss in terms of goods was greater than prewar.

In all these circumstances the continued profit-earning capacity of this account is a source of satisfaction.

ACCIDENT DEPARTMENT

Year	Net Premiums £	Profit £	Percentage of Premiums
1952	22,286,097	201,047	0·90
1951	18,545,687	25,709	0·14

Our accident business showed a profit which, although still marginal, was, nevertheless, an improvement on the preceding year.

Motor insurance throughout the world continued to be difficult, and one of the principal causes was inflation with its adverse impact on claims before rate levels have had a chance to catch up.

Much has been done in the last year or two to put premium rates on to a more realistic basis, and this, combined with strict attention to prudent underwriting, holds out some hope that we can look for some further improvement in results.

MARINE DEPARTMENT

Year	Net Premiums £	Fund as at Dec. 31st £	Percentage of Net Premiums
1952	3,686,473	7,166,239	194·39
1951	4,080,410	7,227,956	177·14

The 1951 marine underwriting account has been closed with a profit of £75,557, or 1·85 per cent of the 1951 premiums. Our profit is substantially less than in earlier years, the principal cause being deterioration of certain sections of our cargo account.

The lower premiums in 1952 reflect the fall in some commodity values as well as the contraction in the export trade.

There are no grounds for complacency in the marine market. Cost of ship repairs—both materials and wages—are still rising, and it was this factor which influenced the marine market recently to introduce an overall increase of 10 per cent on all renewals, although with certain changes in the Joint Hull Understandings in favour of those shipowners whose fleets show satisfactory results.

INVESTMENTS

During the year there was a further fall in the market prices of Stock Exchange securities at home and abroad, as disciplinary monetary measures were introduced to combat inflation. Despite this, the market value of our investments as a whole was in excess of the value shown in the balance sheet as at December 31st last, even prior to the transfer of £1 million to life investment reserve, to which I have already referred.

TAXATION

Provision has been made in the profit and loss account for United Kingdom taxation of nearly £1 million. But that is not the whole story. There is taxation borne by interest; there is overseas taxation (which is charged in the revenue accounts) arising in the various territories in which we operate; and there are the corresponding items in respect of our Associated Company, the "Globe," and its subsidiaries. It is interesting to note that, when we aggregate the tax liabilities of the whole "Royal" Group, including all our Associated Companies, we have incurred by way of taxation under all headings a total of no less than £7½ million.

FOREIGN EXCHANGE

Apart from the United States and Canada, currency figures have been converted at approximately current rates of exchange. In dealing with our business in the United States and Canada, we have continued to convert the dollars at approximately $4.86=£1. Actual remittances, however, from all countries have been taken at the sterling values realised.

DIVIDEND

In November last, an interim dividend of 4s. 9d. was declared, and the directors are pleased to be able to recommend an increase in the final dividend to 5s. 3d., making 10s. per £1 stock for the year.

LEGAL AND GENERAL ASSURANCE SOCIETY LIMITED

RECORD TOTAL OF NEW LIFE BUSINESS

ASSETS NOW APPROXIMATE £180 MILLION

The one hundred and sixteenth annual general meeting of the Legal and General Assurance Society Limited was held on May 6th at 188, Fleet Street, London, E.C.

The Hon. W. B. L. Barrington, the chairman, who presided, said:

LIFE ASSURANCE AND ANNUITY FUND

I am again happy to report that the amount of new life assurance business transacted during the year was eminently satisfactory. The total net new sums assured, including the group additions, totalled £72,347,021, compared with a total of £71,123,198 in 1951. In addition deferred annuities were issued providing for the payment of £4,033,214 per annum, compared with £3,422,948 in the previous year.

The total net premium income amounted to £25,820,036, showing an increase during the year of £3,422,100.

MORTALITY EXPERIENCE

I am pleased to report that following our investigation into the mortality experience the results under both the life assurance and annuity sections were favourable.

Rate of Interest.—The gross rate of interest earned on the life fund, excluding the amount invested in purchased reversions, was £4 9s. 1d. per cent, as compared with £4 8s. 4d. per cent in the previous year; the corresponding net rates being £3 19s. 2d. per cent, compared with £3 17s. 6d. per cent for the year 1951.

Expenses of Management.—The ratio of commission and expenses of management to the life premium income, excluding the contribution for staff pensions, showed a slight increase at 9.49 per cent, compared with 9.33 per cent for the previous year.

FIRE AND ACCIDENT ACCOUNTS

The net premium income of the fire insurance account, including the business of the "Gresham Fire," amounted to £2,076,500, having exceeded £2 million for the first time. Claims paid and outstanding, including contributions to fire brigades, absorbed 39.8 per cent of the premium income; commission, expenses of management, and overseas taxation, 48.53 per cent. Provision for unexpired liabilities required a sum equal to 2.95 per cent of the premium income, leaving an underwriting surplus of 8.72 per cent, or £181,040.

After adding interest on the fund amounting to £48,119, the gross surplus amounted to £229,159.

United Kingdom taxation paid and reserved, including the tax on the profit for the year of account, required the sum of £128,383, and the account has been charged also with £52,276, being its contribution to the staff pension fund.

The resultant balance of £48,500 represents the net profit on the account and has been added to the additional reserve, which now stands at £298,500.

In the accident insurance account the net premium income amounted to £1,275,132. The ratio of claims paid, together with adequate provision for those outstanding, was 47.58 per cent of the premium income. The cost of commission, expenses of management, and overseas taxation represented 42.83 per cent. After providing for unexpired liabilities, the underwriting surplus was £19,763.

To this sum has to be added an amount of £41,040 for interest on the fund, making a total surplus for the year of £60,803.

An amount of £2,900 was required for United Kingdom taxation and the account was also charged with £43,308, being its share of the contribution to the staff pension fund. The balance of £14,595, representing the net profit on the account, has been transferred to the additional reserve, which now amounts to £164,595.

The total net fire and accident premium income in the consolidated fire and accident accounts has now reached the sum of £3,351,632, on which the underwriting surplus in 1952 was £200,803 and the total net profit transferred to the additional reserves £63,095.

The claims ratio on the combined fire and accident accounts was 42.76 per cent, whilst the ratio of commission, expenses, and overseas taxation was 46.36 per cent.

MARINE ACCOUNT

The net premium income of the marine account for the year amounted to £413,725. As you will observe, the underwriting accounts for the years 1949 and 1950 have been closed, and after charging the account with expenses and making provision for taxation, the resultant surplus for the two years amounts to £97,500, which is retained in the fund.

PROFIT AND LOSS ACCOUNT

The balance brought forward in the profit and loss account amounted to £734,583, and you are aware that no transfers are made to this account during the course of the quinquennium for reasons which I have explained on previous occasions.

The directors recommend the payment of a final dividend of 4s. 3d. per share which, together with the interim dividend paid on January 1, 1953, makes a total dividend of 6s. 9d. per share. After allowing for the payment of this dividend, the balance carried forward in the account will be £608,506.

ASSETS

The assets of the society now total £179,571,640, an increase during the year of £20,012,717.

The general pattern of the society's investments is similar to that of the preceding year, the major changes being represented by additions to our holdings of debentures which were increased by £1,747,366 and to our ordinary shares which were increased by £2,255,293. The fall in security values has naturally provided us with a higher range of yields in the various investment groups, of which we have taken full advantage.

Mortgages on property increased during the year by £5,453,651 to £26,425,807, and substantial additions were made to our investments in freehold and leasehold property which, including rent charges and ground rents, now total £53,871,696, an increase during the year of £7,383,130.

We have now completed the first year of a new quinquennium, and the directors are fully satisfied that the accounts before you record a position of considerable strength.

The report and accounts were adopted.

PHŒNIX ASSURANCE COMPANY

IMPRESSIVE RESULT OF WORLD-WIDE OPERATIONS

COL J. J. ASTOR ON THE FURTHER EXPANSION OF BUSINESS

The one hundred and seventy-first annual general meeting of Phœnix Assurance Company, Limited, will be held on May 28th in London.

The following are extracts from the statement by the chairman, Colonel the Hon. J. J. Astor, on the directors' report and statement of accounts for the year ended December 31, 1952:

It was with deep sorrow that we heard of the death, on July 16, 1952, of Mr William Shearer. In June last Mr Shearer, who had been in ill-health for some time, relinquished the office of chairman of the board, which he had held with distinction since 1948. The records achieved during his period of office bear ample testimony to his sound leadership, and by his passing we were deprived of the services of a colleague whose high personal qualities had endeared him to all, and whose wide experience, particularly in relation to financial matters, had proved of inestimable value to the company.

To succeed Mr Shearer the directors were good enough to elect me chairman. I am indeed honoured to become chairman of this great company, and in expressing my gratification would assure you of my utmost endeavours on your behalf.

Further, we decided a few weeks ago to appoint a managing director. You are already aware that Mr E. B. Ferguson had been elected chairman of the British Insurance Association, and you will be interested to know that in July last he was re-elected to serve for a further year. This period will shortly be expiring, and your directors unanimously decided to ask Mr Ferguson to accept a seat on the board and, as our managing director, to continue to direct the operations of our extensive world-wide business. We are happy to retain his expert guidance and experience. I am also pleased to say that he will continue to be assisted by our former deputy general manager, Mr W. R. Moore, who will now act as manager of the company.

IMPORTANCE OF ADEQUATE RESERVES

Insurance from the standpoint of the policyholder enables him to make wise and sound provision against the uncertainties of life. On our part we endeavour to assess these uncertainties and turn them into reasonable risks for the company to assume, having regard to the rates and conditions obtainable and, most importantly, to the spreading of the risk by reinsurance. This has an important bearing on the establishment of adequate reserves by your company. Unless the free reserves can be systematically strengthened, your company would, in time, be debarred from assuming a proper share of the many heavy risks which insurance enterprises are required to carry. The process of building free reserves in proportion to the expansion of an efficient business is essential, although the present high world-wide rates of taxation make this difficult.

FIRE AND ACCIDENT DEPARTMENTS

The fire department has produced a very satisfactory profit of £900,000, a record amount, and it is particularly gratifying that over the past quinquennium this department has produced over £3,500,000, or an average of £700,000 a year, as compared with the previous quinquennium, when £600,000, or an average of £120,000 per annum only, was transferred.

The transfer from the accident department is £111,000, less than one-half of the 1951 figure, but in a notoriously lean quinquennium for accident business this department has transferred approximately £1,300,000, or an average of £260,000 per annum, to the profit and loss account.

Those who have followed the operations of the accident department for the past few years will be well aware that the motor section forms an appreciable part of it, and by no means a profitable one. I do not think I need reiterate that every effort is being made to obtain rates appropriate to the risk, but, as previously pointed out, there is the inevitable time lag between putting such rates into operation and receiving the benefit therefrom.

LIFE DEPARTMENT

The life department maintains its steady progress and business was completed for new sums assured of £6,550,000 net, which slightly exceeds the previous record amount obtained in 1951. Our experience as regards mortality, interest earnings, and expenses, continued to be favourable.

In view of the improved outlook for the long term rate of interest obtainable on new investments, the basis of our premiums for all the main classes of life assurance was reconsidered and, as a result, a general reduction was made in September last. The funds increased by well over £1 million.

In certain quarters the fact that the life and annuity funds of the insurance industry as a whole are large and constantly increasing seems to be a matter of criticism on the grounds that too much investment power is passing into the hands of the insurance companies and that this power could be more usefully employed in the national and public interest. We believe that we may justifiably maintain that whatever power does exist—and I may say that this does not extend nearly as far as some would have the nation believe—is used wisely for the benefit of our policyholders and with these wider interests in mind. For example, as you will see from our life funds balance-sheets, over £500,000 of the increase in funds has been invested in mortgages, reflecting the support which we, in common with other life and composite insurance offices, make available to those desiring to purchase houses for their own occupation.

MARINE DEPARTMENT

The marine transfer is £250,000, which brings the quinquennial figure up to £885,000, or an annual average of £177,000. The marine fund represents 149 per cent of the premium income and is ample to meet our outstanding losses and liabilities. It compares with last year's ratio of 140 per cent, and whilst the increased percentage relates to a reduced premium income, it is satisfactory to note that the actual amount of the fund is slightly higher than last year.

TOTAL PREMIUMS ANOTHER RECORD

Taking the fire, accident, and marine departments together, the total premiums produced another record and amounted to over £30 million, an increase of some £3 million on last year's figure. Claims keep pace with this rising income and it is necessary to set aside increased amounts as provision for unexpired risks. We are therefore unable immediately to reap the full benefit of this further expansion of our business. However, a total underwriting transfer to the profit and loss account from these departments of £1,261,000 is an impressive result of our world-wide operations during a difficult year.

Unfortunately, on the outgo side of the account you will notice that the principal item is the provision for United Kingdom taxes at no less than £1,050,000, reflecting the ever increasing burden which we are called upon to bear. As we anticipated when commenting last year on the effects of the excess profits levy, the additional amount required is entirely due to the incidence of this new tax and we therefore welcome the decision to repeal it as from January 1, 1954.

A pleasing feature is the increase of some £80,000 in respect of the gross interest, dividends, and rents. With this enhanced interest income particularly in mind, your directors were unanimous in recommending that the dividend should be increased by 2s. to 17s. per share. After making provision for the proposed dividend we are able to carry forward a balance of £1,670,000, which exceeds by £106,000 the amount brought forward.

CONSOLIDATED BALANCE SHEET

I would now draw your attention to the consolidated balance sheet, from which you will notice that the total assets of the company approach very closely to the substantial total of £75 million. As we have said in previous years, the total of the middle market values of our stock exchange securities in the general funds is still substantially above the values shown in our books, since our North American investments stand at the equivalent sterling cost at the time of purchase.

Before I close, I should like to express my appreciation of the help I have received from my deputy, Mr Tyser, and all members of the board during the year. In addition, I would not overlook the excellent work of the boards of our associated companies and the members of our local boards throughout the world. I have already expressed my gratitude to Mr Ferguson and I know that he is duly grateful for the support he has had from the other members of the executive at head office and from the branch managers, staffs, and agents, at home and overseas.

CAMP BIRD, LIMITED

MR F. C. HELEY'S SPEECH

The fifty-first annual general meeting of Camp Bird, Limited, was held on May 5th, in London.

Mr F. C. Heley, chairman, in the course of his speech, said: Once again, the year under review was a far from easy one. The profit for 1952 was approximately £48,000 less than the previous year, although the gross dividends received were £34,000 greater.

I wish to emphasise that 67 per cent of our investments are in gold and platinum mining. Some of these concerns have already entered the dividend list, and we had hoped that by the present time others would have followed suit, but such huge sums are involved in the development and equipment of new gold mines that the return to the shareholders by way of dividend is likely to be subject to considerable delay.

Nineteen per cent of our investments are in silver and base-metal mines and here the story is far from encouraging. The abnormal demand for these metals during the whole of 1951, together with the general inflation at home and abroad, were the chief causes of the high level of prices, aided by competitive bulk buying and Government control, and the cessation of this control has precipitated the heavy fall in the prices of both lead and zinc.

I regret that I have been unable to present a more favourable picture as regards our base-metal interests, but you will probably be interested to learn that the "break up" value of our assets at the end of the year under review was 20s. 7d. per share before making provision for the dividend.

The report was adopted.

NORWICH UNION INSURANCE SOCIETIES

ANNUAL MEETINGS

THE LIFE SOCIETY

Speaking at the Life Society's 145th annual meeting in Norwich on April 28th, the President, Sir Robert Bignold, said that the Society's new business was again a record at £47,383,310, an increase of over £3,200,000 on 1951.

In addition to the record volume of life assurances written last year, there had been another increase in pension scheme business.

During the year they had had nearly £11 million of money to invest and, once again, a considerable proportion, over 61 per cent, had been invested in first-class mortgages. The opportunity had also been taken to add somewhat to their holdings of British Government and Government guaranteed securities at the lower prices ruling recently, and those showed an increase of approximately £2 million in the balance sheet, the total holding forming some 12 per cent of their funds.

Over the year the total funds of the Society had increased by £7,820,033 to a total of over £94 million. The rate of interest earned was £4 0s. 4d. per cent after deduction of income tax, an increase of 2s. 8d. per cent over the previous year, reflecting the higher rates at which they were now able to invest their new money.

Once again he was glad to be able to tell them that the Society's mortality experience had been very favourable.

THE FIRE SOCIETY

At the 155th annual meeting of the Fire Society the chairman, Sir Robert Bignold, said the 1952 premium income reached a new peak figure at £14,558,960, an increase of £1,594,752. Fire premiums now totalled £6,604,715, the profit in the fire account being £801,516.

The accident income had advanced by £1,242,878 to a new record figure of £6,567,811, and against the previous year's loss of £82,000, the accident account now showed a modest profit of £120,042.

Marine premiums advanced by £199,062 to £1,386,434, and £75,000 had been transferred to profit and loss.

Net interest earnings brought in £242,807 compared with £217,173. Taxation was charged at £516,511 against £379,302; dividend required £161,700 net (same); £425,000 was transferred to the investment inner reserve.

Total assets had increased by £1,428,196 to £19,452,442.

The reports and accounts were adopted.

THE ROYAL LONDON MUTUAL INSURANCE SOCIETY

TOTAL ASSETS EXCEED £100 MILLION

MILESTONE IN SOCIETY'S HISTORY

92 YEARS OF HOME SERVICE

The ninety-second annual general meeting of The Royal London Mutual Insurance Society, Limited, was held on April 28th in London.

Mr C. H. Shuttleworth, FCII, chairman and joint managing director, who presided, said:

HOME SERVICE ESSENTIAL TO NATIONAL SAVING

It is worthy of note that by their home service, the industrial assurance offices increase by some £40 million yearly the savings of the people. Thus it can be said that the part they play in assisting the restoration of this country to financial stability, and, eventually, to prosperity is a major one.

TOTAL ASSETS PASS £100 MILLION MARK

The balance sheet now in your possession indicates a landmark in the history of the Royal London, for it shows for the first time a figure of total assets of more than £100 million.

PENSION SCHEMES FOR SMALL STAFFS

The Royal London has recently introduced facilities, in its ordinary branch, for the arranging of pension schemes for small staffs; such a scheme can be devised even in a case where only one employee is to benefit.

I must again refer to the introduction just over 12 months ago of two new tables in the society's industrial branch—the guaranteed cash bonus tables. These policies undoubtedly meet a public demand, for their success has already been quite remarkable.

ORDINARY BRANCH

The premium income in the ordinary branch amounted to £3,754,000.

In August last we were able to make a further reduction in the rates of premium charged for non-profit policies.

Interim bonuses will be maintained in respect of the current year on with-profit policies becoming claims, etc., at the rate of one pound ten shillings per cent per annum.

INDUSTRIAL BRANCH

In the industrial branch the premium income for the year amounted to £8,737,000, an increase of £208,000 over the previous year.

The sums assured under new policies issued in the industrial branch during 1952 amounted to £15,986,000, an increase of £2,113,000 over the figure for the previous year.

Interim bonuses will be continued during the ensuing year at one pound per cent per annum upon the sum assured.

The year 1952 was another year of progress in the society's long history of continuous expansion. The total income of the society during the year was £16,572,000, while benefits paid to policyholders amounted to £6,603,000. The total payments to policyholders since the inception of the society amount to more than £118 million, a very large sum, which is the measure of the value of the service and security rendered to the public.

The report was adopted.

THE EMPLOYERS' ASSURANCE

BETTER U.S. RESULTS

The seventy-second annual general meeting of The Employers' Liability Assurance Corporation, Limited, will be held on May 27th in London.

The following is an extract from the circulated statement by the chairman, The Right Hon Lord Courtauld-Thomson, KBE, CB, for the year 1952:

The combined premium income of our group of companies for 1952 was £25,728,823, an increase of £2,264,938. The Corporation's underwriting profit amounted to £353,566. After making a contribution of £265,000 to the staff pension account and charging sundry other expenses of £36,418, the total trading profit was £890,877. We provide £583,783 for United Kingdom taxation, and the net profit for the year is £307,094. The dividend costs £187,576, leaving the carry forward at £750,667, an increase of £119,518 on the year.

The fire premium income has again improved from £1,812,320 to £2,104,525. Results, both in the United Kingdom and overseas, have continued to be favourable and we have a profit of £120,395, or 5.7 per cent. Our fire business in the United States continues to develop in a satisfactory manner.

The accident and general premiums have increased by £1,695,042 to £20,871,508, and by reason of the considerable improvement in our United States results, we are able to show a profit of £233,171.

Motor business, as usual, was the largest individual class, with premiums of £9,284,198, and, although the overall results were better, they still do not provide a profit. In the United States, while the general experience was rather less unprofitable than it was in 1951, our own results were considerably improved. The cost of claims is, however, still high, and only by the most exacting standards of underwriting have we been able to keep within small proportions the loss on this large part of our business. In the United Kingdom the results of our motor business, although better than in 1951, were still unsatisfactory.

Our workmen's compensation premiums have increased from £5,032,765 to £5,418,446, and we have had a profitable year's trading in this line.

The remarkable improvement in our results in the United States has brought us an underwriting profit in another difficult year's trading there. Our United Kingdom premiums increased by about 10 per cent and the total business showed improved profit. We have to record another appreciable increase in our business from overseas territories other than the United States, although the poor results of motor business have had a noticeable effect upon the results.

The Clerical, Medical and General Life Assurance Society, our associate life office, again reports progress. Its net new business at £6,718,120 is an improvement of £1,004,122 on the 1951 record of £5,713,998. The life assurance fund of £21,110,777 is up by £1,135,443.

The business of The Merchants' Marine Insurance Company, Limited, our marine subsidiary, continues to develop satisfactorily. The net marine premiums of £619,476 show an increase of £61,704, and the marine fund at the end of 1952 amounted to £814,597.

The total investments amounted to £29,529,006, an increase of £1,773,481, and their total market values showed an appreciation over their total book values.

ALLIANCE ASSURANCE COMPANY, LIMITED

RESERVES STRENGTHENED

The annual general meeting of the Alliance Assurance Company, Limited, will be held on May 27th in London.

The following are extracts from the review of the year 1952 by the chairman, Mr Anthony G. de Rothschild:

Life Department: The net new sums assured completed during the year amounted to £7,911,269, compared with £7,774,286 in 1951. The purchase money for immediate annuities, at £43,546, and the amount of deferred annuities issued, £134,803 per annum, compared with the 1951 totals of £56,923 and £147,682 respectively. Claims by death amounted to £600,677, against £692,690 in 1951, and were substantially below the sum which would normally be expected. At the end of 1952, the "Alliance" Life and Annuity Funds amounted to £27,973,901, being an increase of £1,016,916 during the year.

Fire Department: The net premiums amounted to £5,526,055, or £69,330 more than those for 1951. There was an increase in the claims, which amounted to £2,018,181, which is £397,097 more than the figure for the previous year. The surplus for the year, after provision for unexpired risks, amounts to £911,836, which has been carried to the profit and loss account.

Accident Department: The net premiums amounted to £4,972,822, compared with £4,412,058 for 1951. The surplus, after providing for unexpired liabilities, was £407,990, which has been transferred to the profit and loss account. This figure compares with £362,227 for the previous year.

Marine Department: The net premiums amounted to £2,573,618, an increase of £43,726 over those for the previous year. The underwriting account for 1950 has now been closed with a balance of £515,573 and after utilising £190,047 of this amount in order to maintain the reserve for claims falling on previous years at £425,000, the sum of £325,526 has been transferred to the profit and loss account. This balance is the highest recorded for over thirty years.

Trustee Department: The fees received in the trustee department for 1952 amounted to £18,834, being approximately £2,500 more than those of the previous year.

Investment Department: The book values of the Stock Exchange securities held in the "Alliance" life and annuity funds at the end of the year exceeded their market values by a rather larger margin than last year. However, the great majority of the investments in these funds is in definitely redeemable securities, which, in the course of time, will more than cover the present depreciation.

Profit and loss account: The following appropriations have been made:

£200,000 to the staff pension trust funds, of which £25,000 relates to the fund of a subsidiary company.

£22,000 to the widows' and orphans' fund.

£45,000 to writing down the book values of Stock Exchange securities held by subsidiary companies.

In addition to these appropriations, it has been decided to transfer £250,000 to the additional reserve in the fire insurance account, making it up to £3,750,000. Part of this transfer, viz. £139,039, is made in the accounts of subsidiary companies.

The general reserve has also been strengthened and now stands at £3,250,000. The directors have decided to maintain the dividend at the rate of 22s. per share, to which it was increased last year.

THE RUBBER GROWERS' ASSOCIATION

EFFECT OF AMERICAN POLICY

The ordinary general meeting of The Rubber Growers' Association (Incorporated) was held on May 1st. Sir Sydney Palmer, CBE, the chairman, in the course of his speech, said:

The re-opening of the high-cost alcohol-based synthetic plants, the product of which is sold at far below cost, is in large measure responsible for the present disappointing off-take of natural rubber by US manufacturers. The consequential decline in price is creating a very serious situation in South-East Asia. In the urge to ensure national security, the USA Government has unfortunately overlooked the inevitable repercussions elsewhere.

THE COMMUNIST MENACE

I would remind our American friends that national security is not only dependent on military preparedness, but also on having friendly allies with a sound economy throughout the world. There are thousands of Communist agitators throughout South-East Asia pouring out a steady flow of propaganda against the Western Democracies, and the USA in particular. There is no doubt that every time the price of natural rubber falls, thereby lowering the Asian standard of living, the Communist agents tell the humblest worker in the most remote village that it is due to American manipulation.

If our American friends think I am painting an exaggerated picture, let them take note of what has already been happening. During the past few months the Government of Ceylon has made an agreement with the Government of Communist China to obtain rice in exchange for their rubber.

Natural rubber is certainly the most important dollar earner for the sterling area. During the seven years since the end of the war, natural rubber exports to the USA have earned the sterling area $1,350 million. Taking into account exports to other dollar areas it is estimated that in the postwar period rubber has earned the sterling area over $1,600 million. In 1951, when rubber prices reached their prewar relationship with US cotton prices, rubber is reckoned to have earned $400 million. In 1952 rubber's earnings dropped by half, and in 1953 it looks as if they may be less than $100 million.

When the US Government ceases to spoon-feed industry with supplies of synthetic at call, a new situation will arise, and it will then be necessary for manufacturers and the trade to increase their working stocks of natural which are at a very low level. One day, and perhaps soon, someone will wake up to the fact that natural rubber cannot for long be available at a price which for comparable grades is lower than the price of 23 cents at which GR-S is pegged by the American Government agencies.

REVISION OF POLICY NEEDED

As the present rubber situation has arisen as a result of American policy, I would have thought it reasonable to hope that a slight revision of this policy might create a situation wherein artificial correctives were not required.

As a starting point the governments of producing areas should surely endeavour to obtain conditions of free competition between natural and synthetic rubber on equal terms. For this purpose it will be necessary to ask the American Government first of all to dispense with all restrictive practices against natural rubber.

The report and accounts were adopted.

MONSANTO CHEMICALS LIMITED

HIGH LEVEL OF TURNOVER MAINTAINED

MR EDW. A. O'NEAL, JR. ON CHANGED CONDITIONS

The nineteenth annual general meeting of Monsanto Chemicals Limited will be held on May 27th in London.

The following are extracts from the circulated statement of the chairman, Mr Edw. A. O'Neal, Jr:

The results for 1952 fell short of our original estimates in respect of turnover, and profit was well below that of 1951. Economic changes within industry both at home and abroad resulted in an emphatic shift during the year from a seller's to a buyer's market in the chemical industry. Nevertheless, the total value of goods sold was well maintained at just 3 per cent below the 1951 level and the tonnage of goods sold showed an increase of approximately 10 per cent. Especially gratifying was an increase of goods exported from 33 per cent of total sales in 1951 to 39 per cent in 1952.

CAPITAL FINANCE AND EXPANSION

In my statement accompanying the last annual report I felt able, when dealing with the prospects for 1952, to express the hope that the Government would find the majority of our expansion plans justified under their economic policies. As stockholders have been advised, and pursuant to Capital Issues Committee consent, the first £1,500,000 of a total of £3,500,000 5 per cent Unsecured Loan Stock, 1982, was issued in August, 1952. The additional funds so made available to us are reflected in the increase in our total assets as at December 31, 1952, to the record level of £12,925,629. Part of the new moneys has been employed in new plant and equipment at Newport, Ruabon and Fulmer and for increased working capital for raw material and finished goods inventories.

A sum of £478,426 was used in taking up our proportionate share of a rights issue of additional ordinary capital by Monsanto Chemicals (Australia) Limited, our Australian subsidiary.

As earlier noted, the 1952 sales turnover at £9,957,827 was close to the £10 million milestone set in our record year of 1951. This high turnover, achieved in spite of lower prices and a decline in buying, reflects excellent work on the part of the organisation in securing an increasing volume of business in markets characterised by keen competition.

So far, we have successfully met what now appears to be well-established Continental, Japanese and American competition in many of our important foreign markets, although it remains as an ever-present challenge to our ability to maintain trading volume and profit margins.

Mr A. D. Daysh, a director of our company since 1940, retired for reasons of ill-health with effect from January 31, 1953.

At the December board meeting Mr D. R. Mackie was appointed a director—Mr Mackie has been with our company since 1924.

THE OUTLOOK

We expect some of the conditions which made 1952 so difficult a year to persist. Nevertheless, as a result of measures we are taking and unless economic conditions deteriorate substantially we look forward to improved results in 1953 in both the company and its subsidiary and associated companies. In viewing the future, I must again emphasise that if high taxation continues it

will make it more and more difficult to find the funds required to foster development and expansion to maintain our industry in a world competitive position.

I therefore welcome the reinstatement of the system of initial allowances and the ending in 1954 of the EPL as a step in the right direction.

HAMBROS BANK

CHANGED ECONOMIC SITUATION

MR R. OLAF HAMBRO'S STATEMENT

The forty-first annual general meeting of Hambros Bank Limited will be held on June 4th, at the offices of the bank, 41, Bishopsgate, London, E.C.

The following is the statement of the chairman, Mr R. Olaf Hambro, circulated with the report and accounts for the year to March 31, 1953:

I again enclose, as has been my practice for some years past, my comments on the year of account which covers the period from April 1, 1952, to March 31, 1953.

The figures themselves portray the changes that have taken place in the economic situation of the country. The year commenced with a budget which was designed to restrict credit expansion by raising interest rates coupled with deflationary measures in restricting imports and withdrawing foreign credit. In fact the government, wisely in my opinion, applied the brake on the machine with the inevitable slowing up of the wheels of industry and trade but, while brakes are meant to be applied to slow up too rapid a motion, they may permanently damage the machine if they are kept on too long and the Chancellor of the Exchequer has seen this and is wisely releasing them.

EFFECTS OF BUDGETARY POLICY

The effect of last year's policy on this bank is seen by a drop of approximately £2,400,000 in acceptances and £7 million in deposits. As a large part of our deposits are related to the credits which we are able to put at the disposal of our foreign clients, the drop in one naturally follows the other, aggravated as it is by the growing shortage of sterling abroad, a shortage partly created by the action of the government to which I have referred and by the drastic reduction of imports into the country. This has naturally had its repercussions on the trade between this country and the countries with which we are most closely associated, Norway, Denmark, Sweden and Finland, but I am happy to say that, in spite of these difficulties, our relations with our clients in these countries have remained active and still form the major part of our overseas business. We have also been able to increase our turnover with our good friends in Italian banking circles.

Other changes in the balance sheet are not important. The drop in gilt-edged results from the repayment of short bonds, against which there is a rise in the Treasury bill holding. The total of the loans and advances stands at about the same ratio to deposits as last year, and the cash, bills and gilt-edged, all of which are short and medium dated, produce a figure of 81.5 per cent of our deposits, showing again a strong liquid position.

BURDEN OF COSTS AND TAXATION

Although the total of the balance sheet is smaller, the margin of profit is slightly higher, but the present costs and taxation weigh very heavily and tend to reduce the amount available for transfer to inner reserves, which are, and I hope always will be, the great strength of British banking.

With regard to the consolidated balance sheet, Hambros Investment Trust, Limited, has had a successful year, and the valuation of the securities shows an increased reserve over cost. The Bishopsgate Trading and Export Company, Limited, has increased its capital during the year and drops out as a subsidiary company, but remains closely associated. The Hambro Trading Company of America Inc. has ceased its activities in some lines which were found to be unremunerative, and is concentrating on its automobile division and one or two smaller lines which are being successfully handled.

IMPROVING INTERNATIONAL RELATIONS

In the year ahead of us we are encouraged by signs of better international relations, bringing the hope that all the wasted effort at present being spent by the nations on armaments may cease and be diverted to peaceful construction. At the same time we must expect some difficulties in those industries which have, for many years, been geared to the production of armaments and ancillary products, the consequence of which may be considerable trade dislocation.

Certain changes in the management have taken place during the year. Mr Plucknett retired as manager, and I am glad to say has accepted a seat on the board, where his great knowledge and experience will be most useful. Mr Crawford also retired, but has agreed to continue to advise us on all matters connected with taxation. We have now appointed a team of managers, consisting of Mr Martens, Mr Clark, Mr Stone, Mr Purton and Mr Pennington, and I wish them all success in their new positions.

Once again I tender my thanks to the staff for their loyal co-operation and work on behalf of the bank.

The income of the group for the year was £1,481,716, compared with £2,892,987 in 1951. The group profit carried forward to the appropriation account was £261,785. After providing for parent company's dividends, there remains to be carried forward to 1953 £1,270,720 for the group, as compared with £1,272,371 at the end of 1951.

HAMBROS BANK LIMITED

Head Office: 41, Bishopsgate, E.C.2.

Statement of Accounts, 31st March, 1953

Liabilities	£
Current, Deposit and other accounts	45,375,675
Acceptances	15,629,427
Paid-up capital	3,000,000
Reserve	2,250,000
Assets	
Cash in hand, at bankers and at call	23,331,550
Bills of exchange	5,083,212
British government securities	4,104,063
Loans, advances and other accounts	11,762,589
Investments in subsidiaries	2,284,152
Liabilities of customers for acceptances	15,629,427

UNITED BISCUITS, LIMITED

SALES AGAIN LARGER

The fifth annual general meeting of United Biscuits, Limited, will be held on May 28th at Edinburgh.

The following is an extract from the statement by the chairman, Mr Peter G. Macdonald, WS, JP, circulated with the report and accounts for 1952:

It is now five years since the well-known household names of "McVitie & Price" and "Macfarlane Lang" were linked together as the "United Biscuits" group. Each have behind them more than one hundred years of experience in the making of biscuits and many advantages have been achieved by the amalgamation, as the figures in this report testify. Our programme of modernisation of plant and improvement of processes continues to the fullest extent permitted by the restrictions and shortages of the postwar years. The major extension to one of our Scottish factories, referred to in my statement last year, should be completed and in production within the current year. We are gradually building up and consolidating our export trade.

Our sales have again shown a considerable increase not only in money value but also in tonnage of output. Sales in 1952 amounted to £7,600,000, as compared with £6,200,000 in 1951 and with £3,850,000 five years ago. Cost of ingredients and expenses have risen but in spite of this there remains a satisfactory margin of profit. The profit before providing for taxation, as shown in the consolidated profit and loss account, amounted to £795,367 (1951—£654,672), and although the government is the chief beneficiary, this achievement affords satisfaction to directors and workers, as well as, I hope, to shareholders.

Income tax and profits tax in 1951 required the sum of £369,424. In 1952 the additional imposition of excess profits levy, a tax deplored by all business men, was added to the burden which a progressive company such as yours has to bear. In all, a total of £504,904 will have to be paid out of the year's profit of £795,367 to meet these taxes which are steadily draining the life blood of industry. The reliefs announced in the recent incentive budget proposals, including the abolition of excess profits levy at the end of 1953, mark, I hope, an encouraging start in the reduction of the present far too heavy load of taxation.

DIVIDEND RAISED TO 10 PER CENT

There remains after taxation a balance of £290,463 (1951—£285,248). Your directors recommend a final dividend on the ordinary shares at the increased rate of 7 per cent, less tax, making a total of 10 per cent for the year, as against 8 per cent last year.

It is satisfactory to record that 1953 has started well. We all welcome the announcement that the government is soon to take steps to end sugar rationing and allocations to manufacturers. Your directors hope that before the year is out the Ministry of Food will also find it possible to free fats from government control.

Wages and freight charges are above the level of last year and flour prices have recently been increased. Marketing conditions are becoming increasingly competitive and while the export trade is already a buyers' market the home trade is rapidly becoming the same. I feel sure, however, that with our experienced manufacturing and selling organisations we can look forward with confidence to the more competitive times ahead of us.

BABCOCK & WILCOX

RECORD VALUE OF EXPORT CONTRACTS

MR W. LIONEL FRASER ON THE COMPANY'S SOUND POSITION

The fifty-fourth annual general meeting of Babcock & Wilcox Limited will be held on May 28th in London.

The following is an extract from the statement by the chairman, Mr W. Lionel Fraser, CMG, which has been circulated with the report and accounts for the year ended December 31, 1952:

On behalf of my colleagues and myself, let me express, at the commencement of this review, our sincere thanks to the staff and operatives, men and women, in your company and in the subsidiary companies and branch offices, at home and throughout the world. Your directors acknowledge with gratitude their efforts and their support, and are ever mindful of the interests of all staff and operatives. Relations with all employees are very good, as they always have been.

After setting aside sums for depreciation, providing for UK taxation and making other necessary adjustments, the balance standing to the credit of the consolidated profit and loss account is £1,410,048. The preference dividends, less tax, required £49,955 and your directors now recommend that a final dividend of 7½ per cent, less tax, plus a bonus of 3 per cent, less tax, be paid on the ordinary stock, absorbing £289,689, making 18 per cent for the year. Your board further recommend that the sum of £600,000 be transferred to general reserve, which, together with amounts placed to reserve in the accounts of the subsidiaries, makes a new figure of £6,442,263 for general reserves. It is also recommended that the sum of £100,000 be transferred to research and development reserve.

The effects of present-day high replacement costs of plant and machinery and buildings, to which I referred last year, have continued to engage the attention of your board. As a further instalment towards making provision for these increased costs, the sum of £576,809 has been set aside before arriving at the trading profits of the group for the year and has been added to the capital reserves shown on the balance sheet.

TAXATION

Stockholders will be interested to know that United Kingdom taxation on the profits of the group, for the years 1946-1952 inclusive, exceeded the staggering figure of £12¼ million, and this during a period when your company was striving to re-equip its works to meet ever more testing business conditions: taxes in 1952 itself were particularly burdensome.

It is, therefore, an immense relief, and very enlivening, that the Chancellor of the Exchequer should have felt able in his Budget proposals to take the first bold step to reduce tax burdens.

BANK OVERDRAFT

Stockholders will recall that in my two previous statements mention has been made of the bank overdraft of the group. At the end of the year this had risen to approximately £3,200,000, and the matter has again claimed the special consideration of your directors. Having regard to the rising cash requirements involved in this period of inflation and high production at home and overseas, and to the probability that these conditions may prove to be abnormal, they have decided that it is in the best interests of the company that the position should continue to be financed by means of temporary bank advances. This decision has been taken despite the possibility that the level of output which your company is likely to reach during the next two or three years may well involve financial needs much greater than those which have been necessary hitherto.

PRODUCTION

The past year has been very trying, and those who are responsible for the management of your company have had many problems to meet, not the least being those caused by shortage in the supplies of steel and other components required for our manufacturing processes. This was especially felt in the first three quarters of the year, and it was not until the latter months that some signs of slow improvement were noticeable. Even then there was no appreciable betterment in the deliveries of certain types and qualities of steel, the lack of which still gives rise to anxiety.

In the circumstances, your directors regard the figures of turnover and trading profit as satisfactory.

RESEARCH AND DEVELOPMENT

Looking to future developments, there can be little doubt that the efficient utilisation of coal and other fuels will remain the predominant factor in steam generation, and research and development in combustion, as well as in all other methods by which power may be produced, continue to hold a prior place in the attention of all those responsible for the destiny of your company.

EXPORT

It is pleasing to note that contracts secured for export surpassed in value those gained in any previous year. This was accomplished in spite of keener world competition.

OVERSEAS INTERESTS

In many countries in which we already had well-established markets, a demand has developed, from time to time, to establish local engineering industries, and in such cases it is your board's policy to set up subsidiary works. Since my last review, it has been decided to commence manufacturing in both Brazil and Mexico, and in this way we expect not only to retain but to enlarge our markets in those countries.

Marine: The marine department has had some notable orders, and during 1952 boilers were commissioned in more than a quarter of a million tons of shipping.

GENERAL REVIEW AND PROSPECTS

It is manifest that the sellers' market for the products of your company has gone, as indeed it has for the greater part of British industry. Nevertheless, the volume of orders on hand, both in this country and for export, is very encouraging, and, needless to say, the new conditions are being tackled with the utmost energy. Your company's business extends over most parts of the world and the additional responsibilities and hazards which that must entail present a direct challenge to all concerned.

I am satisfied that your company is in fine shape. Stockholders can have confidence in the future and can anticipate a continuance of good trading figures for the years immediately ahead.

DARWINS

YEAR OF SUBSTANTIAL PROGRESS

The twenty-fourth annual general meeting of Darwins Limited was held on May 5th at Sheffield, Mr F. Thompson-Schwab (the chairman) presiding. The following is an extract from his circulated statement:

The year has been one of substantial progress throughout the group, a record tonnage of steel having been produced. Record outputs were also achieved by the cogging and bar rolling mills, forges, foundry and magnet department. The year has also seen the continuance of expenditure on much needed maintenance work. The cost of maintenance must, of necessity, always be a heavy burden in steel works such as comprise the Darwins group of companies, if production is to be kept up to its highest level. Any undue economy would be extremely hazardous and shortsighted. Undue economy would also be shortsighted with capital equipment. Quality of product must always be one of the main factors in meeting competition and our position in the field of quality can only be maintained by continuing to install the most modern plant. We are continually seeking for improved methods of production and new additions have been and will continue to be made so far as the resources of the group permit.

The other important factor which we must watch at all times is price. As is well known, market conditions during the last few years have been such that producers have enjoyed considerable advantages when fixing selling prices, but this state of affairs is changing rapidly. We shall discover this when the full onslaught of Continental and Japanese competition is felt in the steel trade. To meet such competition it is necessary to attain the highest possible degree of efficiency and you may be assured that your company is playing its part in this respect.

INCREASING DEMAND FOR ALLOY STEELS

This group of companies specialises in the production of all types of high-grade steels. In this connection it is interesting to note that the demand for alloy steels is steadily increasing and, in fact, in 1952 the country's output increased by 80 per cent., compared with the year 1946. Your company is contributing to this increase in no small measure.

Particular attention is being paid to export trade, the turnover of which increased by over 30 per cent in 1952, compared with 1951, in spite of the Government restriction on exports which, unfortunately, still continues.

DIVIDEND AND BONUS

From the profit figure we have to allow no less than £293,900 for taxation. We propose a final dividend on the ordinary shares of 8 per cent actual (less tax), making, with the interim already paid, a total of 12 per cent actual (less tax). The directors also feel justified in recommending an additional distribution in the form of a bonus of 2 per cent actual (less tax).

If these proposals receive the approval of shareholders, we shall be paying out a total of £43,373, which will enable us to augment our reserves by £50,000 and increase the carry forward to £37,608.

The year 1953 has started satisfactorily. There are signs of increasing competition and some diminution in demand for some of our products, but your board faces the future with confidence. We cannot promise that the 1952 profit figure will be maintained, but we see no reason to suppose that we shall not be able to present to you satisfactory results when next we meet.

The report was adopted.

BRITISH ALUMINIUM

IMPROVED PRODUCTIVE EFFICIENCY

The annual general meeting of the British Aluminium Company, Limited, was held on May 5th in London.

The Rt Hon Viscount Portal of Hungerford (the chairman) in the course of his speech, said: The consolidated income for the year after tax amounts to £676,705. This compares with £906,028 for the previous year.

As you will have observed from the accounts, taxation has taken an increasingly heavy toll, but it is encouraging that in his recent Budget the Chancellor has taken some steps to lighten the intolerable burden of taxation.

The very firm demand for our rolling mill products which had persisted throughout 1951 continued through the earlier part of the year under review, but during the second half trading conditions were by no means so easy or satisfactory. A number of factors contributed to the reduction of our business and eventually made it necessary towards the of the year to curtail production at our rolling mills.

So far as our own production of virgin aluminium is concerned, we have, as from January 1st this year, been released from the obligation to sell to the Government and repurchase. This decision not only does away with the somewhat cumbersome procedure which has had to be followed in the past 14 years.

Our production of virgin aluminium during the year under review was slightly greater than in 1951. This increase actually indicates considerably improved efficiencies which we are now obtaining from our work of modernisation at Lochaber and Kinlochleven, since two unavoidable factors operated to reduce output during the year.

CURRENT YEAR'S TRADING CONDITIONS

In the early months of 1953 trading conditions were more difficult than they have been for many years. There are recent signs that the recession in our industry is becoming less severe, and in order to stimulate trade to the greatest possible extent we have, since the recent decrease in the price of ingot, introduced considerably greater reductions in prices for basic and larger quantities of sheet and strip in pure aluminium and medium strength alloys. On the other hand, we have found it necessary to increase the differentials charged for small quantities, which remain unaltered since 1948, to compensate for the much greater cost of manufacturing small items. However, we have already absorbed other increases in the cost of raw materials and services outside our control and our profit margins are accordingly reduced.

Development work has continued actively, and we have every reason to be optimistic as to the long-term future of our metal. Perhaps one of the most encouraging features has been the great improvement effected in welding techniques.

The total consolidated profit for the year is £2,460,991 compared with the corresponding figure in the previous year of £2,549,068, a reduction of £88,077. We recommend a final dividend of 6 per cent on the ordinary stock which, with the 4 per cent already paid, makes 10 per cent less tax, for the year. We also recommend payment of a cash bonus on the ordinary stock of 2 per cent, less tax. This leaves £431,205 at credit of profit and loss account of the parent company; an increase of £7,388.

The report was adopted.

DOMINION STEEL AND COAL CORPORATION, LIMITED

MR L. A. FORSYTH'S SPEECH

The annual meeting of this company was held on May 1st at Montreal.

Mr L. A. Forsyth, QC, the president in the course of his address, said: The net profit, after taxes, amounts to $4,197,875.70, a decrease of $1,255,956.81. Regular quarterly dividends at the rate of 25 cents per share on the outstanding ordinary shares of the Corporation were declared during 1952, in a total amount of $2,079,666. Since the close of 1952 one quarterly dividend of 25 cents per share has been declared and paid.

The balance at credit of earned surplus account was $28,636,434.72, showing an increase over the previous year's balance in the sum of $2,118,209.70. This account has been increased by a total of $24,700,043.34 since December 31, 1941.

Notwithstanding this substantial addition to its surplus, capital expenditure absolutely essential to keep pace with operating requirements has, as the statements submitted to this meeting demonstrate, obliged the management to resort to borrowings for necessary funds from time to time and there is every indication that additional financing must be undertaken at an early date.

Production of steel ingots at our Montreal plant showed a slight increase, less than one per cent, over that of the previous year. At Sydney, where our principal steel-making operation is conducted, production of ingots was 8.5 per cent lower than in 1951. This decrease is wholly due to indifferent blast furnace performance during the last quarter of 1952. Total sales of our products showed an increase of about 4.5 per cent over the figures for 1951.

It is not difficult to extract from the course of current events, at home and abroad, signs and portents which justify a cautious, though not necessarily pessimistic, appraisal of future prospects for our industry. In the international situation as it has developed recently, there are indications of a lessening of tension, perhaps not altogether justified, which may have a significant influence upon steel demand.

Any reduction of the pressure of defence demands would undoubtedly make available additional supplies for civilian consumption. Whether the requirements of an undoubtedly rapidly expanding Canadian economy would bridge the gap created is a debatable question.

Whatever the answer to that question, there can be little doubt that all of us would welcome the opportunity to build the future of this industry upon the foundation of a sound and lasting peace. Competition from abroad in our domestic market is becoming daily a more significant factor in certain lines of our products.

Conceding the impossibility of trading with others unless we trade with them, we do, nevertheless, face problems arising from lower living standards in other countries. Difficult as these problems are, there are few of them that cannot be solved by greater efficiency and skill, concentration on quality, and lastly by industry at least as great as that practised in other lands.

This Corporation is rapidly approaching a stage in its history when it can be said that it now provides complete facilities for adequate performance of its functions. I believe, therefore, that its shareholders may, barring unforeseeable economic calamities, look forward with confidence to its future.

The report was adopted.

ASHANTI GOLDFIELDS CORPORATION

IMPROVED CURRENT OUTPUT

BUDGET TAXATION BENEFITS

The fifty-sixth annual general meeting of Ashanti Goldfields Corporation Limited was held on May 6th in London, Major General Sir Edward L. Spears, KBE, CB, MC, FInstD (chairman and managing director), presiding.

The following is an extract from his circulated statement:

From November 2, 1951, permission was given with effect from October 1st for 40 per cent of our production to be sold on the free market and from May 1, 1952, we were allowed to sell all the gold we produced in this way.

Though our profits subject to taxation have fallen by £224,999 to £850,927, the total charge to taxation is no less than £518,204 compared with £611,500. We recommend a final dividend of 1s. per unit of stock, making a total of 2s. for the year. This maintains the dividend at the same rate as last year.

I referred last year to the difficulties we had experienced in maintaining gold production. These difficulties were overcome by April, 1952, and we expected to produce 180,000 ounces of gold during the year. These hopes were frustrated by a series of unofficial strikes, the most serious of which occurred in July and lasted for twelve days. It was largely due to this that there was a drop of 22,426 gold ounces produced compared to the previous year. There has been a considerable improvement in recent months.

With the exception of continued good values on No. 27 Level, development work done during the past year did not produce outstanding results. Since the close of the year, however, we have had some encouraging news.

CHAIRMAN'S ADDITIONAL REMARKS

Addressing the meeting, the Chairman said: Thanks to the Budget, I feel considerably happier than when I wrote the speech which has been circulated. We shall not obtain anything substantial in the way of reliefs in the current year, but in 1954 we shall benefit considerably. For a long time I have been deploring the burden of taxation which falls upon mining companies operating abroad but domiciled here. I am grateful to the Chancellor for what he has done to help us, but I hope that this is only a first instalment.

The position at the mine continues to be satisfactory. Output is increasing steadily, and the rate of 25,000 tons a month is within sight. The amount of gold produced in the first six months, 89,500 ounces from 136,500 tons treated, is in accordance with our plans. Development results continue to be most encouraging.

The northerly zone in the region of crosscut No. 105 has been proved over a width of 250 feet at an average width of 44 feet, with values of 7.5 dwt. per ton. At the south end of the drive values have been exposed over more than 300 feet and over a width of 40 feet they average 10.5 dwt. In both cases the lateral development is incomplete, and no information is yet available as to how the values extend below No. 12 Level, but on No. 10 Level which is being driven from Ayeinm to cover these areas values averaging 10.7 dwt. over a width of 15 feet have now been reported in crosscut No. 23 North, which is directly above the northerly zone. The general indications are that a considerable tonnage of mineable ore will be developed.

The report was adopted.

THE TELEGRAPH CONDENSER COMPANY

TURNOVER AGAIN A RECORD

The twentieth annual general meeting of The Telegraph Condenser Company, Limited, was held on May 7th in London, Mr P. V. Hunter, CBE, Hon. MIEE (the chairman), presiding. The following is an extract from his circulated statement: Although the 1952 profit on trading was the highest yet achieved, profit after taxation showed a considerable reduction compared with 1951. The introduction of the Excess Profits Levy, which is not allowed as a deduction in computing income tax liability, has necessitated making provision for additional taxation out of all proportion to the modest increase in profits earned.

Completion of the extension at the Bathgate factory, at which production commenced during the second half of 1952, accompanied by a satisfactory rate of production at both main factories, enabled output to be maintained throughout the year at a high level. Increased production facilities, which helped us to overtake the backlog of orders which accumulated during 1951, now enable us to give very favourable delivery of all but a few of our products. Your directors are satisfied that the company's present production facilities are sufficient to meet any foreseeable demand for our capacitors.

SALES

Turnover exceeded 1951, itself a record year, by a substantial percentage. This increase is only reflected in the trading profit to a very modest extent, as higher labour and material costs, coupled with keener selling prices, narrowed the profit margin on many of our products. This trend is likely to continue during 1953.

This is Coronation year and, subject to the requirements of the defence programme, it can be expected that the sales of Television receivers will be very considerable. Your company's products figure largely in such equipment, but, unfortunately, due to competitive policies, the prices from such business are not likely to be remunerative.

A reduction in turnover during the current year seems inevitable. Many of our customers, particularly those manufacturing domestic electrical appliances, have been badly hit by closed markets abroad, and until these markets are reopened we cannot anticipate any substantial increase in demand for components.

Contrary to expectation, export turnover was maintained approximately at the record level of 1951, but this was achieved only by reducing substantially the value of our order book. Old-established and valued customers in some of our most important export markets were prevented from buying from us either because of lack of sterling or because of a restrictive import policy. Continuation of present conditions may well lead to the permanent loss of export markets which it has taken years to establish.

Your company is well equipped, both financially and technically, to endure temporary setbacks in trading conditions, and if the latter become no worse during the year, it should be possible to earn a reasonable trading profit.

Your directors propose to make a further issue of "plough shares" by capitalising £50,000 of the general reserve and applying this sum in paying up in full 100,000 new ordinary shares of 10s. each to be issued credited as fully paid up to ordinary shareholders in the proportion of one new ordinary share for every five ordinary shares held.

The report was adopted.

MAPLE & COMPANY

RECORD VOLUME OF EXPORTS

MR C. C. REGNART ON EFFECT OF BUDGET PROPOSALS

The sixty-third annual general meeting of Maple & Company, Limited, was held on April 30th, in London, Mr C. C. Regnart, the president, presiding.

The following is an extract from his circulated statement:

A year ago I told you that overheads were still rising, whilst profit ratios were static. These conditions continued to a great extent throughout the year, and have been largely responsible for reduced profits, in conjunction with the failure of the Board of Trade to implement until December the "D" Scheme for Furniture announced by the Chancellor in his 1952 Budget statement, resulting in eight months' uncertainty and confusion, and a considerable recession in trade.

However, now the scheme is in operation and our industry is freed, I am sure that the return to competitive buying and individuality in design will lead to better trading.

Like all other retail businesses the turnover for the first half of 1952 showed a sharp decrease. Unlike the general stores, however, this company did not have the advantage of a "bumper" Christmas trade as it appears was enjoyed by stores generally, thus enabling lost leeway to be made up which indeed, in several cases, was exceeded, although our January sale, the first since the war, was a great success and brought us many new customers.

Trade did improve, however, in the second half of the year and our present figures to date are showing a tendency in this direction.

Our difficulties, I must add, were also aggravated by the constant reduction in the cost of basic materials and also by the introduction of the "D" scheme on textiles last April, which necessitated important downward adjustments to selling prices, both in fabrics, linens and blankets, while a further reduction in the price of carpets had to be faced. I believe that basic prices are today more healthy and stable than they have been for some time.

I cannot emphasise too strongly that this business has been built up for more than a century by supplying the public with furniture of good value, and that no minimum standard is required to educate our buyers as to the quality required by this organisation. Our buyers are very zealous in their efforts to see that all goods displayed are well above these proposed new minimum standards.

Exports: Here I am more than pleased to record that our efforts have been nobly rewarded as these have proved a record, and we have sent goods during the past year to no less than 70 different countries, with a total figure far in excess of ever before.

CHAIRMAN'S ADDITIONAL REMARKS

Addressing the meeting the chairman said: You will no doubt be interested to hear from me how the recent Budget proposals are likely to affect your company. I should first like to emphasise that every reduction in Purchase Tax should result in a greater volume of business, as, whenever prices are reduced it enables an additional section of the community to become buyers. On the other hand, reductions under present condition involve companies such as yours in considerable losses. We, as you will see if you turn to the consolidated accounts, carry a stock of very nearly £2 million, and although this is considerably less than last year's figure, the difference is largely reflected by reduced costs.

It is our policy to give our customers the benefit of reductions in this tax whenever announced by the Chancellor, but I think you will agree it is nothing short of a public scandal that the retailer has to shoulder the whole burden of these concessions, which are intended to be collected from the public. It does not cost the manufacturer a penny, but falls exclusively on the retailer. I estimate that it will cost your company at least £20,000.

It is estimated that the recent Purchase Tax changes will cost retailers altogether £25 million, and I am glad to know that Mr W. Stevenson, the deputy secretary of the National Chamber of Trade, is taking up the matter once more on behalf of the 70,000 registered retailers, who are being made to lose this money unjustly.

There is no doubt that Customs and Excise should devise a scheme whereby the distributive trades should be protected from such unfair transactions.

With regard to the welcome proposal to reduce the standard rate of Income Tax to 9s. in the pound, I am pleased to report that your board has taken early advantage of this by deducting the tax from your dividend at the new rate.

It would be unwise for me to enlarge upon what I said in my statement with regard to the future, but I can say that since Easter the number of customers entering the store shows a considerable increase on the figure for the same period last year, and this gives me great confidence.

The report was adopted.

THE SEA INSURANCE COMPANY, LIMITED

MAJOR A. HAROLD BIBBY'S REVIEW

The seventy-seventh annual general meeting of The Sea Insurance Company, Limited, was held on May 5th in Liverpool. A statement by the chairman, Major A. Harold Bibby, DSO, DL, had been circulated with the report and accounts for the year ended December, 1952.

The chairman referred to the acquisition of the Beacon Insurance Company, Limited, which took effect as from January 1st this year and mentioned that while no startling results will be seen immediately, the managements of the "Sea" and "Beacon" have already achieved a large measure of integration which will result in economy of operation in the future. Dr C. E. Golding, LLD, FCII, chairman of the Beacon has joined the Sea Company board and Mr H. L. R. Matthews, a director, and Mr H. F. Jackson, general manager of the "Sea" have been nominated to the "Beacon" board. The "Sea" Midlands local board has been strengthened by the addition of Sir Wilfrid Martineau, MC, TD, MA.

Turning to the accounts, Major Bibby reported that the total premium income of the company amounted to £3,907,569, a small increase on last year.

The 1951 marine underwriting account has been closed after charging £582,885 to meet outstanding claims, and a credit balance of £155,936 has been transferred to profit and loss account, together with £50,000 from past provisions no longer required.

The premium income of the fire department amounted to £1,122,802 and the profit of £82,295 has been transferred to profit and loss account.

The accident department premium income at £688,056 shows a slight increase on the previous year though the year's working has resulted in a loss of £17,643.

In the profit and loss account £275,000 has been reserved for United Kingdom taxation as against £150,000 last year. The difference is mainly accounted for by the settlement of outstanding enemy debts and the tax payable thereon.

A final dividend of 15 per cent was approved, making 25 per cent for the year, against 22½ per cent last year. The total assets now stand at £6,963,528 and the market value of the investments is substantially in excess of the figures shown in the balance sheet.

Major Bibby paid tribute to the work done during the year by the company's agents at home and abroad and the meeting closed with a vote of thanks to the chairman and directors also officers and staff of the company.

ROLLS RAZOR LIMITED

ENTHUSIASTIC RECEPTION OF NEW RAZOR

MR A. COLIN KINGHAM'S REVIEW

The twenty-fifth annual general meeting of Rolls Razor Limited was held on May 5th at Cricklewood Broadway, N.W., Mr A. Colin Kingham, MC (chairman and managing director), presiding.

The secretary, Mr W. C. Stubbs, read the notice convening the meeting and the report of the auditors.

The following is the review by the chairman which had been circulated with the report and accounts:

The directors' report and accounts for the year ended December 31, 1952, are presented herewith. On October 11, 1952, the firm attained its 25th anniversary and special celebrations were held to honour everyone who had completed a quarter of a century's service with the company.

The consolidated profit and loss account for the past year shows a fall in trading profit and a consequent reduction in the net profit as compared with 1951 of £22,241 after provision has been made for taxation and all other charges. Apart from a small reduction in sales in the home market, the principal factors which have contributed to the profit reduction are rising costs due to wage and other increases, expenditure on research and promotion necessitated by the placing on the market of the new VICEROY DRY SHAVER, as well as the more recent introduction of a new model ROLLS RAZOR known as THE VISCOUNT, and the heavy expenditure attaching to the removal of our dry shaver staff, machinery and plant from the Cricklewood factory to our new factory at Hemel Hempstead.

The foregoing facts also partially account for the change which has taken place during the year in the cash situation shown in the consolidated balance sheet resulting in a net liability of £57,692. Additionally, however, there has been some heavy expenditure on plant replacement, and you will observe a substantial increase in our total stocks. This latter arises from an increase in the finished stock, trading having now returned to a more normal position compared with the past few years when demand outstripped production and stocks could not be accumulated.

After providing £76,638 for United Kingdom taxation and leaving £3,487 profit in subsidiaries we bring in £15,973 from the previous year making available for distribution £59,864, out of which the preferred ordinary dividend takes £7,875. Subject to your approval, the balance will be allocated by paying a dividend on the deferred shares of 33⅓ per cent which takes the same amount as in the past 7 years, transferring £10,000 to general reserve and carrying forward £15,739.

EXPORT SALES MAINTAINED

During the year under review, markets for most products such as ours changed from a situation in which consumer demand was continually ahead of production into a more usual state in which the goods were readily available for sale. Purchase tax and the high cost of production naturally have a considerable braking effect on sales, but our export markets have maintained their position admirably and we have every hope that this situation will continue through the current year.

I have previously referred to the removal which took place during 1952 of staff, plant and equipment for the manufacture of VICEROY ELECTRIC AND NON-ELECTRIC DRY SHAVERS from our Cricklewood factory to the new one at Hemel Hempstead. New houses and flats have been provided by the Hemel Hempstead Development Corporation and I am glad to report that the staff speak very highly of the healthy and happy conditions under which they are now living. In fact, it would be difficult to find more ideal working and living conditions.

I also referred earlier to the fact that a new ROLLS RAZOR had recently been placed on the market and this model, known as THE VISCOUNT, is now on sale in place of the Imperial model, which is being withdrawn after 25 years' service. The fundamental basis of the razor is unchanged, but its construction and appearance have been considerably improved. It is having an enthusiastic reception from all our markets and the favourable comments received to date lead us to believe it will have a great future.

The directors again take this opportunity of thanking the staff and employees for the excellent work they have done during the past year.

The report and accounts were adopted and the dividend as recommended was approved.

The retiring director, Mr Edward Hill, FCA, was re-elected and the other formal business having been duly transacted, the proceedings terminated.

POWERS-SAMAS ACCOUNTING MACHINES

The annual general meeting of Powers-Samas Accounting Machines Limited was held on May 4th in London.

Col. A. T. Maxwell, TD (the chairman), who presided, said:

The year 1952, in spite of its many and recurring difficulties, has proved reasonably satisfactory. After providing £44,800 more for taxation at £389,000 on pre-1953 Budget rates the available profit amounts to £284,300 as compared with £308,034 last year.

The not unfavourable trading results were made possible by record deliveries of punched card equipment and ancillary products from our factories. Equipment and services invoiced in 1952 in the home and overseas markets reached an all-time record.

This year has seen the successful culmination of special research which concentrated on combining the striking potentialities of electronic working with the needs of the office machine. This development has not been directed to the manufacture of "electronic brains" but to the production of machines which possess the high speed of operation afforded by electronic working and a full degree of adaptability. They must also be possessed of that accuracy and reliability which always has been—and is still—such a characteristic of the Powers-Samas punched card machines.

Powers-Samas punched card equipment is to be found performing essential functions and assisting managements in no less than 30 countries of the world.

The report was adopted and the total dividend distribution of 2s. 3d. per share was approved.

HER MAJESTY'S COLONIAL SERVICE

Applications are invited for the following post:

An Assistant Registrar of Statistics, Federation of Malaya, is required to supervise the collection and compilation and the analysis of statistical data. The appointment will be on three years' probation for permanent and pensionable employment. Salary $456 per mensem, rising annually by $36 per mensem to $1,200 per mensem, plus a pensionable expatriation allowance rising from $130 per mensem to $260 per mensem, and a temporary variable non-pensionable cost-of-living allowance. Government quarters are provided, if available, at rents varying between $15 per mensem and $60 per mensem according to class. ($1 = 2s. 4d.) Married officers may have their wives and children with them subject to the limitations of shipping conditions. Free passages are provided for an officer and his wife and children under the age of 10. Married officers are eligible for an additional non-pensionable allowance varying between $40 per mensem and $185 per mensem according to his salary and whether he has dependent children. Salaries paid in Malaya are subject to local taxation including income tax. Candidates should possess a First or Second-Class Honours Degree in Statistics or Mathematics, Economics or other appropriate main subjects combined with Statistics and should be under 40 years of age.

Intending applicants should write to the Director of Recruitment (Colonial Service), Colonial Office, Sanctuary Buildings, Great Smith Street, London, S.W.1, giving brief particulars of age, qualifications, experience, etc., quoting CDE.59/60/01.

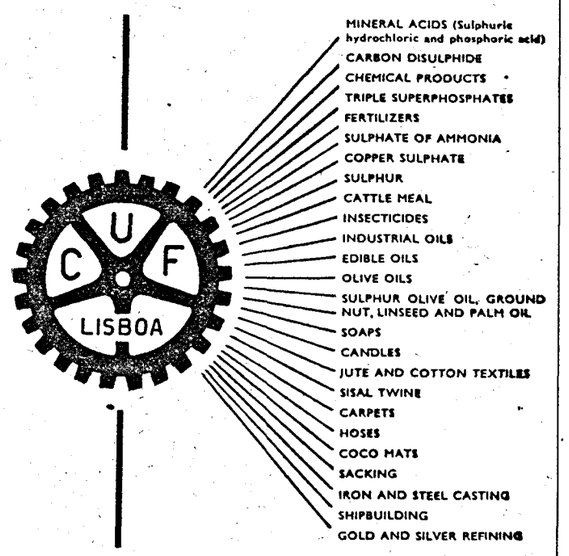
YOUNG Administrator (31), B.A. (Hons. P. and E.), ex-RAF pilot (F/Lt.), determined to proceed to Canada in search of broader horizons, invites employment by British concern in Montreal branch. Enthusiastic on scientific business method, versatile, cultured, energetic.—Box 245.

UNIVERSITY COLLEGE OF NORTH WALES, BANGOR

APPLICATIONS ARE INVITED for the post of Assistant Lecturer in Economic Statistics, with special reference to Survey Work. The appointment will date from October 1, 1953. *Twelve copies* of the application should reach the undersigned, *from whom further particulars* may be obtained, not later than May 25, 1953.

KENNETH LAWRENCE,
Secretary and Registrar.

SCHOOL OF ECONOMICS, DUNDEE



Director of Studies—J. K. EASTHAM, B.Sc. Econ., F.S.S.
SESSION 1953-54.

Courses of study are offered for:
B.SC. ECON. DEGREE OF LONDON UNIVERSITY
A four-year course for Honours Degree
GENERAL CERTIFICATE OF EDUCATION ADVANCED LEVEL OF LONDON UNIVERSITY
A one-year course in Economics, Economic History, Geography and British Constitution.

Copies of the Calendar of the School can be obtained from the Secretary, 17 Bell Street, Dundee.

PEP (Political and Economic Planning) invites applications for the post of Director, which will be falling vacant between now and the early autumn. The person appointed will be responsible to the Executive Committee for all sides of the organisation's work and, while the main requirement is ability to guide and inspire research, some weight will be given to administrative experience. The salary paid will be not less than £1,400 a year, plus an allowance for expenses.—Applications within one month to The Director, PEP, 16 Queen Anne's Gate, London, S.W.1.

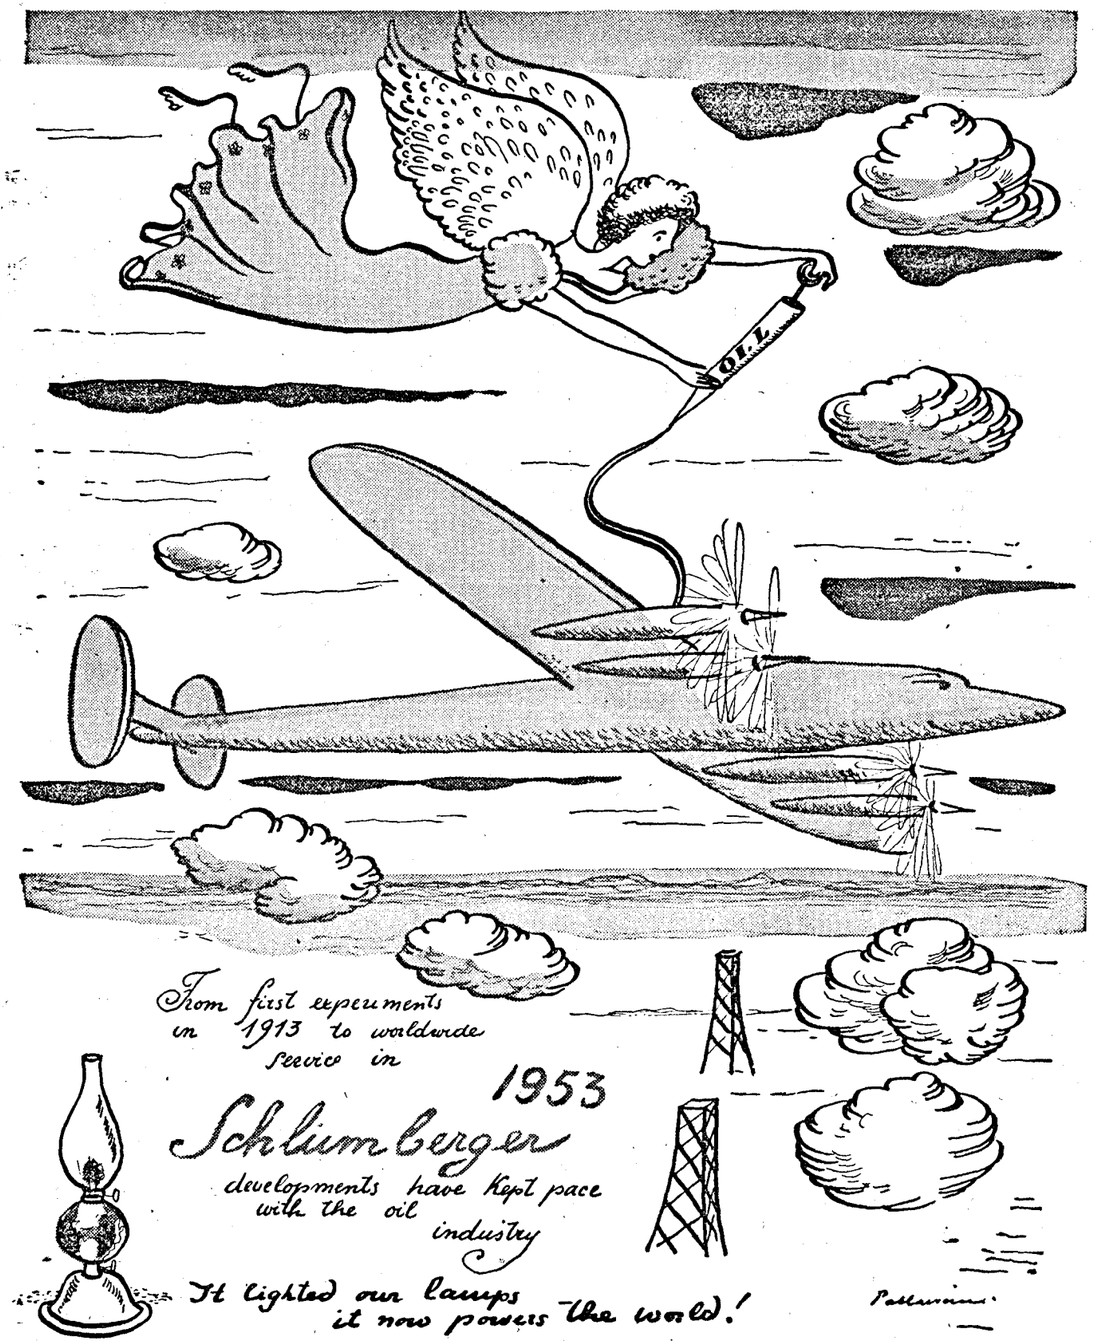
The kind of briefcase you NEVER see in the shops

It moves in exalted, exclusive circles . . . serves Ambassadors of State and Captains of Commerce . . . is easily recognised as the impeccable accompaniment to an immaculate appearance.

You won't see many " UNICORNS " about, and never in the shops. For these fabulous briefcases are as rare as the skill of the craftsmen who make them to individual order.

Yet a " UNICORN," slim but capacious, and hand-finished in English hide, is a surprisingly reasonable buy, because you pay only workbench prices. Two interior foolscap compartments and zip-sealed section for overnight things. Capacious exterior zip pocket for newspapers, books, etc. English lever lock and fittings of solid brass. All leather handle. Press studs in the base for slimming. Size 17" x 11½". In golden tan or Autumn tan pigskin at 12 guineas; or in smooth polished hide (golden tan, brown or black) at 9 guineas. Matching zip folio cases size 16" x 10½", available separately at £4.10.0 and £2.15.0 respectively. Post free and tax free in U.K. In U.S.A., $36.25, $27.25, $13.30 and $8.25 respectively, carriage and insurance free, 20% Customs duty payable in U.S.A.) Complete satisfaction guaranteed or purchase price refunded immediately.



Obtainable at the Unicorn Showroom, 39 Burlington Arcade, London, W.1, or by post from our works.

Magnificent—But Is It Policy?

OF all the great offices of state, the only one that Sir Winston Churchill has never held is that of Secretary of State for Foreign Affairs. On Monday, the country had a demonstration of what it has missed. It was a political performance of genius, impressive to read and so effective on those who heard it that it swept men of all parties along and set the tone of the best foreign affairs debate for many a day. Even the ranks of Tuscany did not forbear to cheer. Mr Attlee, on the second day, responded in the same key, with the result that a mood of alert hopefulness has been created in British public opinion where before there was too much cynical apathy. One would have to go back almost to Palmerston's day—certainly to Salisbury's—to find comparable examples of the way in which the buoyant and robust commonsense of a statesman can transform the departmental brief, and breathe into that collection of tentative expedients which at any time makes up a country's foreign policy a sense of momentum and purpose.

Sir Winston is, in fact, in a unique position. His authority is so great and his reputation so far-flung that his intervention in the course of international events can be decisive. He is the only western statesman of the first rank who can defy the charge of appeasement when he says frankly that the Russians and the Chinese, just as much as the Americans and the British, may have fears that are not unreasonable. He can state the problem of Germany and Central Europe as one of "reconciling the security of Russia with the freedom and safety of Western Europe," and so stand a little above the clashing pleadings of Mr Dulles and *Pravda*. He can suggest a conference on the highest level and admit that it might produce either "a generation of peace" or merely more personal contacts between the mysterious Malenkov and those who seek to do business with him. He is ready to take a chance which President Eisenhower finds it difficult to take, and he does not see "why anyone should be frightened of having a try for it." These are fit things for the British Prime Minister to do and say; and for this wise and eloquent contribution to the international debate—and to the Coronation mood—he has the gratitude of public opinion.

Mr Crossman, later in the debate, contrasted general welcome for this speech with the frigid reception of the Fulton speech seven years ago. It is an interesting comparison, though the moral of it was lost on Mr Crossman. The point about the Fulton speech is that, though it was at the time so generally unpopular, virtually everybody except the Bevanites and the Communists would now acknowledge it to have been correct in its diagnosis and sound in its advocacy. Is the opposite also true? Is it not a little dangerous for a far-sighted statesman to allow himself to say things with which there is such universal agreement—in domestic opinion, that is to say, for different foreign countries, for their differing reasons, have shown themselves less pleased? It would, perhaps, be going too far to suggest that the popular estimate of the situation is always wrong; but it very often is.

And it must in candour be said that the more the specific content of the speech is examined, the more doubts it arouses. Undoubtedly it was magnificent; but was it policy?

The general impression left upon the public mind—on those, that is to say, who never read beyond the headlines—is that Sir Winston Churchill thinks there has been a sufficiently radical change in the attitude of the rulers of Russia to make a personal meeting worth while, and that from it might flow a generation of peace and amity. That is not, of course, what he said. But it is what a great many people think he said, and the flood of wishful thinking can be seen rising day by day. The domestic political advantages of creating such an impression are clear enough: they have been demonstrated at Sunderland. But is it not going a bit too fast? Is it quite certain, or even more probable than not, that Malenkov and his colleagues want to start something new rather than to stop the West from getting stronger?

*

The evidence remains conflicting and unsatisfying. That something new is happening inside the Soviet Union is clear; its new rulers appear to be coming to fresh terms with the Russian people. But it is not known for certain whether there is—to use Sir Winston's phrase—a "profound movement of Russian feeling." If it is, in fact, profound one might expect the friendly gestures to the outside world to have been more convulsive and impressive than they have been. The Prime Minister himself described these gestures as taking the form of "leaving off doing things which we have not been doing to them." At best, therefore, it can be said that there is a strong case for inquiry, for sending out diplomatic patrols, for taking new soundings in waters where hitherto there have been only wrecks and sandbanks. It can be argued, too, as it was in this speech, that it is wrong to assume that nothing can be settled with the Russians unless everything is settled at a swoop. There is much more to be said for winning agreement piecemeal; and the Prime Minister was entitled to address this advice to the United States.

The question to be answered, therefore, is whether the proposal of a conference with Malenkov is a well-timed and essential part of the piecemeal approach. To the British Prime Minister it may seem politically desirable, perhaps even unavoidable. The demand for it could easily be fanned into flame both in Britain and in Europe; and it was both prudent and generous of Mr Attlee to say in the House of Commons that the chief value of a meeting would lie in getting personal contacts and understanding, not in clearing up dramatically all differences. But if it is politically undesirable—it looks now impossible—for the American President, then the proposal runs the risk of spoiling Anglo-American understanding at a time when it is being severely tested in Korea, in Egypt, and in the vital matters of economic policy of which Mr Butler spoke so bluntly last week. Sir Winston, it is true, is the last man to be careless about relations with the United States; and his speech stressed with the utmost gravity the need for "unity, vigilance and fidelity" in the western alliance. But the suspicion remains that he has not sensed the narrow limits within which the United States Government finds itself able to move, limits which appeared quite clearly in the great speech that the President had contributed earlier to this springtime debate. If in fact the only result of making the proposal is, not to get a meeting, but simply to embarrass General Eisenhower, was it worth making?

It has to be asked, too, whether the Prime Minister has correctly assessed the effect of his ideas in Europe, especially in Germany. To Dr Adenauer he gave as emphatic and carefully worded a pledge as could be given that a friendly settlement with the Soviet Union, or even an improved *modus vivendi*, would not cause the British Government "in any way to fail in the obligations to which we have committed ourselves about Western Germany." That means, or should mean, that German unity remains the purpose of British policy, that Western Germany can win the status of a power by joining the European Defence Community, and that the future of Germany's frontiers remains an open question in face of Soviet insistence hitherto that it is a closed question. It is not difficult to imagine the effect in France, and in Germany itself, on the whole movement towards the integration of Western Europe if the next few months were taken up with the preparations for, and the consequences of, an informal meeting between representatives of the Big Four. A venture which is already in distress might well founder.

*

Is it quite certain that Sir Winston, without Mr Eden by his side, can conduct simultaneously a policy of negotiation with Moscow and a policy which aims at winning the strength and loyalty of Germany for the West? And if he can do it, is it certain that the United States can co-operate so long as blood is shed in Korea; or that a French Prime Minister and the German Chancellor can keep steadily on one course while the Prime Minister steers on two? There is a risk, not yet generally perceived, that talks at the highest level this summer would bring down in ruins the Western defence structure on which Mr Acheson and Mr Bevin worked so hard, or kill all hopes of negotiation with Moscow. For what is known of Soviet terms for a German settlement suggests that they exclude any possibility of German membership of a European and Atlantic community. So long as Germans—and Frenchmen—believe this, advances toward Moscow mean retreats from Strasbourg and Luxemburg.

For this dilemma the Prime Minister appears to have his own solution. It is that there might eventually be a new Treaty of Locarno to establish confidence between the Soviet Union and a united Germany. This means quite simply that some or all of the western powers should guarantee Germany against attack by Russia or the satellites, and Russia (and the satellites?) against attack by a reunited Germany. It sounds attractive; but it begs every question at issue between the great powers in central Europe. In theory, no doubt, there is no reason why nations should not give specific promises not to attack each other, even if their mutual frontiers are not agreed. In practice, it has never been found possible. No freely-elected German government could possibly accept the permanence of the present German-Polish frontier, the Oder-Neisse line, and any western government that guaranteed it would be asking for trouble. But if not this line, what other? Further, does Sir Winston think that the American Congress would ratify such a guarantee? And would he have Britain give it alone? It is perfectly true that one of the basic elements of the European problem is the fear felt in the Soviet Union that German nationalism will feed on the frontier grievance, and it may be that the exorcising of this fear is the major contribution that the West can bring to the bargaining table. But there are no short cuts. Precisely because it is so all-important for both sides, the German problem can be solved only after a sufficient degree of confidence has been restored between Moscow and the western capitals. A Locarno treaty will not create this confidence; the confidence must first be created before either side will trust the signatures of the other on such a treaty. If there is one subject that will have to be the culmination, the last item on the agenda, of east-west negotiation, it is the future of Germany; its solution will have to be the climax of the *détente*, for it cannot be the beginning.

This is, perhaps, to take too seriously those passages in which Sir Winston gazed into the future and brought his memories to the aid of his hopes. But he was, after all, speaking as the Minister in charge of the Foreign Office; and what he has said is being minuted and discussed in every foreign office in the world. He may think of the high level meeting as nothing more than a way of getting to know Russians who peer at the world through arrow slits, of finding out what motives lie behind the faint, beckoning signals they have made. But those who do not go with him will expect more than that. Not one of the statesmen who would join Malenkov—or whoever it might be from Moscow—around a table would dare to return empty-handed. They could no more keep aloof from specific issues than a historian can keep aloof from facts. And when it comes to issues, the doubt must be expressed whether the West is ready:—whether its policy for Germany is concerted, whether it knows what it could concede (for concessions there will have to be); whether it could and would keep the problems of Europe separate from those of Asia; whether, as Mr Attlee asked in the House of Commons, its statesmen—especially President Eisenhower—would be given by public opinion the confidence and discretion without which they could not negotiate. If there is no such readiness, or if readiness varies from country to country, then to try to go too fast might well provoke such a display of disunity between allies as would make it unnecessary for Malenkov to stir a finger more.

Defence Without a Date

IN the higher military ranks of the Atlantic alliance there is now a remarkable conjuncture of new men and new ideas. President Eisenhower—now virtually Generalissimo of the West—has appointed new American chiefs of staff with a sailor, Admiral Radford, in the chair. General Gruenther, an outstanding staff officer with a mind of his own, succeeds General Ridgway, a great fighter and trainer of troops, as Supreme Commander in Europe for Nato. In London there have been less recent changes, bringing new men into the direction of defence. The bases of British strategic appreciation and planning have lately been re-laid, under exhortation from the Prime Minister; and in Nato itself preparations are being made to study and put into effect the doctrines that emerge from experiments with new weapons and scientific devices. It is not entirely coincidence that these changes have come about either just before or just after the death of Stalin, at a moment when economic strains have made necessary a revision or stretching out of defence expenditures, and in a period when staff officers are giving up the idea of preparation against the danger of war at some chosen critical date. It would be wrong to say that military planning is marking time; reasonable security against attack is still too far off for such a pause to be possible. But it is fair to say that men who have been working feverishly against time are now pausing to take breath.

It is, therefore, a moment when there might also be a pause for more radical thinking about defence policy than has been possible for some years in Britain, and perhaps in the United States, too. It is called for, not only by the development of new weapons, but even more by political and economic requirements that are difficult and unfamiliar in peacetime both to politicians and their military advisers. First, there is the fact that defence, for the predictable future, can be organised only through regional groupings of allies. Nato is one such grouping and by far the most important; the Middle East Defence Organisation, if it ever comes to birth, will be another; the European Defence Community could be another. Something may be created for the Southern Pacific. These groupings have—or would have—an intimacy and cohesion beyond anything attained, for example, by the Commonwealth in peacetime. They imply, even if they do not yet provide, peacetime co-operation in defence planning, in industrial production and in the bearing of economic burdens

such as was unthinkable when present high officers were at their staff colleges. They point inevitably towards a defence policy that will make the best possible use of national resources, produce a profitable division of burdens between allies, and have done with the principle that each member of the alliance must have a little of everything on land, in the air and at sea. Attractive though it may be to service chiefs in each country who have to hammer out compromises between their respective plans, the idea of well-balanced forces for each member needs the most careful scrutiny. If each of three great allied industrial nations has well-balanced national forces, their total joint forces are likely to be less well-balanced, more costly and less efficient than they might be.

The second political requirement is to recognise that in the free world of the next decades only three nations (unless Germany is allowed to make whatever it likes) can equip themselves with what the scientists have to offer: the United States, Britain and Canada. It is not easy for Europe to accept this fact, but a fact it remains. It is, therefore, essential that those three nations decide how and where their special technical skills and economic resources shall be applied to complement the military contribution of their weaker allies. The idea may seem new, but it is the idea that lay behind the maintenance and use of the British fleet for at least two centuries. It is also the idea that appears to lie behind the American policy of disengagement in Asia. Its implications are in the long run revolutionary, but they must be faced. If the cold war continues for a long time in its present form, these great industrial powers will seek more and more to substitute the products of the laboratory and the engineering industry for great concentrations of men.

★

The economic requirement is more complex. It is, in the first place, that national finance ministers should accept the view that it is both wiser and cheaper to allow the Services to plan over several years for a steady level of expenditure than to submit them to a policy of fits and starts in spending. If the welfare state is to be the armed state—and there is no reason to believe it can be anything else for some time to come—then it may be necessary to make reasonable costs for the defence services as inflexible as the costs of the social services. In the second place, the economic requirement is that an industrial nation like Britain should, so far as possible, make arms in the assurance that allies will buy them. For standardisation and all the economies it might bring will come only when it clearly pays to standardise. The cost of the latest aircraft, tanks, warships and their equipment is such that governments will sooner or later be forced to move in this direction; but the fact is not acknowledged.

In the third place the economic requirement for a healthy and alert state in this dangerous world is that its strategy should not frustrate its economy, whether by absorbing too much manpower, or by producing in miniature what could be produced elsewhere in mass, or by stimulating uncompetitive defence industries.

These and similar ideas are beginning to emerge from the immense labours that Nato has undertaken in reviewing and planning the defence contributions of its fourteen members; and they are beginning to penetrate the minds of those military men who have experienced Nato methods. But they have not made much impression on national governments and their advisers. There is, therefore, much cogency in what Lord Montgomery said on Wednesday in his speech to the International Press Institute. He urged that the governments of the Atlantic alliance should form a small group of political, economic and military consultants who would study at leisure and in privacy the problem of defence as he and other high officers of Nato see it. It is to give the allied nations the kind of military organisation that will keep them for a long time "so geared that they can spring to arms quickly in the face of aggression." The Field Marshal wants the planners to look fifty years ahead and to keep in mind a few vital principles.

★

One is that it is useless to build up large forces by a certain date without regard to the enormous cost of maintaining them in a state of efficiency after that date. That, apparently, is already being realised. Another is that defence budgets are bound to rise if present methods of preparation continue, whatever Congress may believe to the contrary. Another is that there must be in each country a proper balance between a "shield" of small, highly equipped forces acting together, and well-trained reserve forces that can be mobilised for almost immediate use in the field. That means less emphasis on large forces in front and more emphasis on the training of reservists behind.

To some extent this advice is a stimulus to what is already happening in some staff officers' minds rather than an anticipation of new doctrine. Some of it has already been expounded by Ministers in Parliament. But it is none the less important, coming from General Ridgway's deputy, who knows President Eisenhower's mind, and who has investigated mobilisation and training problems in every Nato country. Indeed, the advice at once raises a host of questions about what the British contribution to the shield is to be in the future. Present pledges to European allies point to the cream of the British Army remaining for some time in Germany. Commitments in the Middle East, Africa and perhaps the Far East appear to make further and inevitable claims on forces of the present type and size. But it is by no means certain that this must always be so. There is room for fresh thought, and if allies can contribute to British thinking, so much the better.

It would be a mistake, however, to think too much in purely military terms. The kind of strategic planning that Lord Montgomery has advocated demands difficult and unfamiliar decisions in industry. How, for example, is the equipment of highly trained reserves to be kept up to date? Is it to be regularly changed—which would be expensive—or are the risks of obsolescence to be taken? What is to happen as the latest aircraft, or vehicle, or gun is ready for production? Is it to be produced only in small quantities, while a reserve of machinery and skill is held ready to move into mass production? How is that to be done? It is clearly no simple matter to plan a long-term and limited use of industrial resources and, at the same time, maintain a nucleus for rapid expansion. Is it being studied by any body comparable to the joint war production staff of wartime?

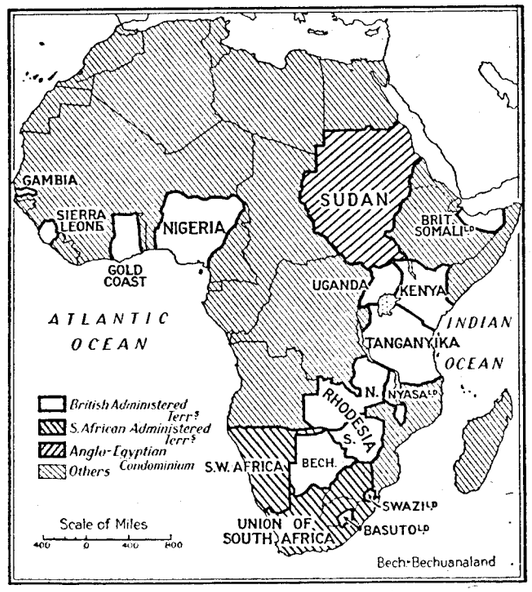
This is a field in which the layman gropes hopefully but blindly, wondering whether the experts are doing better. To him it seems obvious that a great alliance should eventually, not immediately, make possible, by division of labour, important economies in manpower and money; but he hears nothing of them. To him it also seems clear that the Communist bloc is in human resources much stronger and in technical prowess much weaker than the Atlantic alliance; yet it is only lately that the fighting men whom he pays to protect him have spoken guardedly of preferring quality to quantity. He need not apologise for asking whether they are not still too much influenced by the ideas of ten years ago to look clearly ten years ahead.

Who Rules in Africa: A Summary

NEWS from Africa has taken up considerable space in the world's newspapers in recent years, and this enhanced prominence of African affairs is not likely to recede. The stage is set for rapid change—and the pace is largely set by the advance of the British colonies towards self-government, whether African or communal. There are other forces at work, such as the pressure of Arab nationalism in North Africa, or the development of the former Italian colonial empire, under United Nations auspices, into independent states. But it is the changes in the British territories that are likely to bring matters to a head. If the Gold Coast can become a Commonwealth country, equal in status to Ceylon or Pakistan, can France withhold from Morocco a comparable recognition of capacity for self-rule? And can South Africa accept equality of status between itself, a Central African federation and a Nigerian federation?

In self-governing institutions, the awakening African self-consciousness finds expression. The extent to which local institutions of government are already in the hands of Africans, or of white settlers, or are jointly controlled, is therefore a measure of the change which lies ahead—and which may complicate world issues. It may be useful to take stock of the present position in British Africa, which contains 50 million out of the 60 million inhabitants of the Colonial Empire.

Representative self-government in British Africa is growing out of the executive and legislative councils that were set up long ago to advise the governors in all British territories—except Basutoland, Swaziland and Bechuanaland, which are governed wholly through chiefs and tribal authorities. The executive council was created to initiate action under the presidency of the governor, and the legislative council to propose new laws. In the earliest stage, both councils consist entirely of officials. The first development is for the legislative council to be extended by the nomination of non-official Europeans—usually local business men. Next, non-officials are nominated further to the executive council. At a later stage, some of the governor's nominations begin to go to Africans. The next step is to provide for the election, instead of the nomination, of the unofficial members. When, next, the unofficial members are allowed to form a majority, first of "Leg Co" and then of "Ex Co" also, something closely resembling parliamentary self-government comes into existence. There remains, however, the question of the governor's powers. In the Gold Coast, which has otherwise reached the first stage, the governor still has a right of veto and reserved powers of his own in defence matters. In Southern Rhodesia, the remaining checks on complete self-government are vestigial, and something very near to full dominion status exists.



POPULATIONS IN BRITISH AFRICA

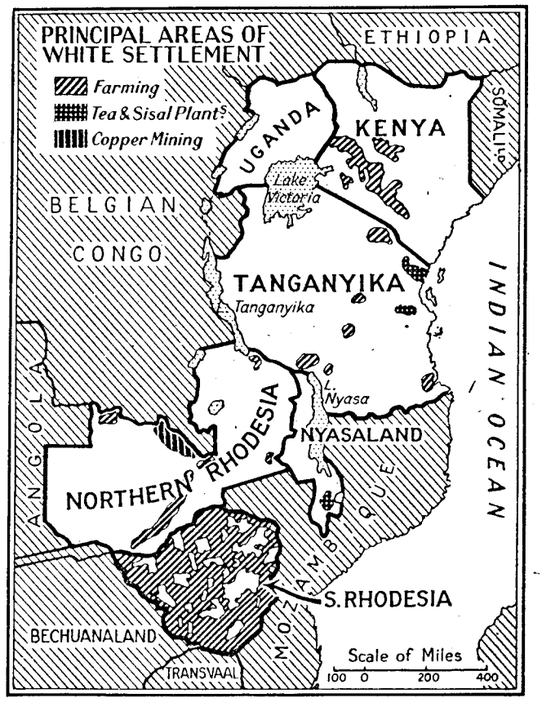
All these stages are to be found simultaneously in British Africa, from Somaliland at one end of the scale to the Gold Coast at the other. The form of representation, however, is conditioned by widespread illiteracy, by the tribal institutions through which local government—"indirect rule"—is exercised, and by the presence or absence of European or Asian communities. In particular, where European settlers are present in force, or have special interests, the social backward-

ness of African society seems to preclude a degree of representative government which is readily granted elsewhere. Are the natives of the Northern Rhodesian protectorates, for example, so much more backward than those of the Sierra Leone protectorate who elect through district electoral colleges their representatives to the assembly at Freetown ?

In West Africa, full parliamentary government by Africans is now being put to the proof. The *Gold Coast* Legislative Council has been transformed in five years into a single elective chamber, renamed the Legislative Assembly. Only nine of its 85 members sit *ex officio* as colonial civil servants, or are nominated by the governor to voice the interests of commerce. The rest are elected. Only the members representing the towns, however, are elected by ballot in single-member constituencies. The rest are indirectly elected ; 33 rural members are chosen by a series of electoral colleges, which are themselves elected by the districts on an adult franchise ; the remaining members are elected by tribal institutions, in which the influence of the chiefs and elders is considerable. These "territorial members" were expected to exert a conservative influence to balance the impetuosity of the as yet shallow-rooted "educated African"; but it is significant that the strength of Gold Coast nationalism, expressed through the party system, has reduced tribal power, so that the territorial members are amenable to party control.

The party system in the Gold Coast may be shaky, but it exists, and makes cabinet responsibility possible ; because cabinet responsibility is possible, the governor increasingly acts simply as the constitutional head of the state, his reserve powers falling into disuse. The executive council, it is true, contains three *ex officio* members, but as "Africanisation" proceeds, these white faces will disappear from cabinet meetings. Both Dr. Nkrumah's Convention People's Party and Dr Danquah's United Gold Coast Convention are committed to removing the last vestige of white control.



The goal of independence by 1956 has been set by the *Nigerian* nationalist parties also. But the checks to transfer of power here come from a federal constitution, from the strength and wealth of the Islamic northern region and from the smaller educated cadre. Building a unified national state of 30 million people has inevitably been harder than in the Gold Coast with 5 million people. There are three regional houses, the central legislature having all powers not delegated to the regions. But the federal House of Representatives has no electoral basis apart from the regional houses ; it consists simply of deputies *from* them—they are in a sense electoral colleges for it, or it is a committee of them. Election to the regional houses is indirect, as in the rural parts of the Gold Coast.

No national parties have yet emerged in Nigeria. The regions are therefore in effect represented communally, with the North's 68 members exactly balancing the 34 members each from the Eastern and Western regions. The strongest parties in these regions are Dr Azikiwe's National Council of Nigeria and the Cameroons (NCNC) in the East and Mr Awolowo's Action Group in the West. Hitherto rivals, in the issue of independence they have patched up a truce. But it remains impossible to develop cabinet government. The central Council of Ministers is nearer to a governor's executive council than a cabinet ; it is not selected by a prime minister, but consists of four members from each region and six *ex officio* members — including the three regional lieutenant-governors. The governor has reserve powers and a vote. Though Africans predominate on the executive they cannot combine, and this has produced the present crisis, since it is clear that the constitution must be considerably changed before it can lead with any despatch to a "Gold Coast solution."

No other purely African territories are so near to independence as the Gold Coast and Nigeria, except—and it is indeed a thought-provoking exception—the *Sudan*. Hitherto ruled by nine provincial governors with advisory councils under a governor-general responsible to Britain and Egypt, the country—as diverse as Nigeria—is being organised to elect a constituent assembly which is not only to take over sovereign powers but also to choose between association with the Commonwealth, Egypt or full independence.

Of the territories coming under the Colonial Office, *Sierra Leone* is the next most advanced. There are "unofficial" African majorities on both the legislative and executive councils ; the "unofficials" are elected by seven one-member constituencies in the colony, or coastal district (where one African in two is educated), and by fourteen electoral colleges in the protectorate, or hinterland. A majority nationalist party and an opposition have emerged, and though the Executive Council contains seven official members (not all of them Europeans) to eight unofficial, cabinet government is developing. In the *Gambia,* elected Africans control only the Legislative Council.

Though there are no white settlers in *Uganda,* and native political institutions are in parts as fully developed as in Northern Nigeria, Africans in the Legislative Council are still in the minority. There are six *ex officio* members (all Europeans), ten members nominated by the governor and sixteen unofficial members, of whom eight are nominated by the governor to represent equally the small European and Asian communities. The Executive Council is entirely official. The balance of power is similarly held in *Nyasaland* and *Tanganyika.* Thus in Nyasaland's Legislative Council there are two Africans and one Asian chosen from panels offered by the Africans in the "Protectorate Council" and by the Indian Chamber of Commerce ; the other 16 are Europeans. In Tanganyika, under the present constitution, which is about to be replaced, officials outweigh unofficials by 15 to 14, of whom four only are nominated Africans.

It is in Kenya, Northern and Southern Rhodesia that the white settlers exercise power. In *Southern Rhodesia* it is limited only by the powers reserved to the British Government to disallow legislation discriminating against Africans—powers which have never been exercised publicly. In *Northern Rhodesia,* 40,000 white settlers elect ten members to the Legislative Council, where they sit with nine officials and four members nominated to represent the 2 million Africans—two of whom are Africans. The Executive Council is all white, nine officials to four unofficials, of whom one is a European representative of the Africans ; but by a convention the Governor accepts the advice of the unofficial members when they are unanimous. In *Kenya,* the Legislative Council is composed of 26 official members and 28 non-officials, of whom 14 are elected by Europeans, six by Indians and one by the Arabs on separate rolls ; another Arab is nominated by the Governor and six Africans are nominated to represent the tribes—one of these sits on the Executive Council, though not as a member responsible for a department. Under these conditions, party groupings remain rigidly racial.

Throughout East Africa south of the Sudan, therefore, Europeans still absolutely dominate government, even though differences of opinion between officials and unofficials arise. Though the new constitution proposed for *Tanganyika* is cited as breaking this unity of white control, Europeans will still hold the power, so long as officials and white settlers' representatives vote together. For though there will be parity between the three races in the election of unofficial members—seven each—the official members will number 21 and most of them will be white. Only as power is handed over to the unofficial element by further modifications to the constitution will the Europeans find themselves in a permanent (if over - represented) minority.

This may happen, though it lies some time ahead ; it may happen under nationalist pressure in Uganda also. In Kenya, consideration of a new constitution is postponed until the emergency is over. There, however, as in Northern Rhodesia, settlers' representatives hold semi-cabinet office as "members" for particular departments, and hence possess growing power over the officials of the Colonial Service. Meanwhile, in Central Africa, the coming federation will decisively transfer power in the federal sphere into settlers' hands. Any future increase in African representation will depend, not upon London's willingness to reduce the official and *ex officio* weightings in the councils, but upon the readiness of locally elected politicians to make a voluntary surrender of power.

In these circumstances, African political organisation may not take, as in West Africa, a primarily parliamentary shape, which it can do only if parliamentary institutions offer real prospects of power. The most that can be said is that it may do so in Uganda and Tanganyika. Nevertheless, African political parties are developing fast in Nyasaland and Northern Rhodesia, and are showing their capacity, as in West Africa, to take control of the tribal organisations and authority, through which indirect rule has been exercised. Thus, in different ways, African nationalism is developing its strength in all parts of Africa ; and various projected pan-African political conferences will increasingly solidify its aims.

Notes of the Week

Breakdown in Cairo

EVEN Sir Winston Churchill has seldom been more successful in putting the mood of the nation into words than he was on Monday in that section of his speech on foreign affairs which dealt with Egypt. Indeed, one of the failures of those in Cairo, who encourage mob emotion in order to influence Egyptian relations with Britain, is to recognise that Egypt is not alone in having a public opinion. Where the Prime Minister may, however, have erred was in understating the problem. This was done no doubt deliberately, in order not to prejudice the slender hopes of renewing the talks on the Canal Zone base which have now been broken off. But the result has been, on the one hand, to do less than justice to the almost impregnable British legal case, and, on the other, to gloss over the grim realities which certainly now appear to lie ahead.

During the past three weeks an attempt has been made to open negotiations with Egypt by means of a pragmatic approach. It was characteristically British to try to go round the crucial issues of sovereignty and control, by discussing in committee the detailed organisation involved in a gradual British withdrawal and the technicalities of running the military base under joint British and Egyptian management. But this negotiation by evasion failed, because it was really sustained only by negative pressures on either side. The British were reluctant to let the talks break down because failure would immediately bring more fighting in the Canal Zone; ugly incidents have begun already. The Egyptians were kept going by the regime's fear—in spite of General Neguib's personal popularity—that it will maintain its tenuous hold on power only if "national aspirations" are achieved. Unless it can make it appear that it has got rid of the British, its support may melt away in the night.

An important part of the blame for failure lies fairly and squarely on the shoulders of Mr Caffery, the Irish American who represents the United States in Cairo. By exaggerating to the Egyptians the unwillingness of the Eisenhower Administration to act in support of the British, in their view that a properly run base in the Canal Zone is a *sine qua non* of adequate Middle East defence, he drove a coach and four through any chances of compromise. Mr Dulles's firm attitude when he visited Cairo this week accordingly came as a shock.

As Sir Winston Churchill made plain in the House of Commons, no further action can usefully be taken at present. Simply to withdraw at this stage would sacrifice not only British interests but those of all who are concerned with Middle East defence; it would create as many problems as it solved. Meanwhile, the 1936 treaty stands. Egypt's repudiation does not legally invalidate it; and, contrary to general belief, there is nothing whatever in the text to say that the British must leave in 1956. Article 16 only provides for arbitration if no agreement can be reached about revision. On the spot, however, the situation is by no means as clear. General Neguib and his cabinet have all been taking individual training in guerrilla warfare. He himself has declared that the Suez dispute can only be solved by force. And while the British forces in the Canal Zone, numbering over 80,000 men, are too strong to suffer defeat by Egyptian arms, they now seem likely to be subjected to a peculiarly bitter and bloody type of attack.

Truculence at the Truce Table

IN his references to Korea on Monday, the Prime Minister said that it was "our duty, without separating ourselves from our great ally, to express our opinion frankly and plainly." Many people in Britain have become increasingly critical and suspicious of the American attitude to the Korean truce talks. They feel that the American public has become so stubborn in its unwillingness to meet the Communists even part way, that the scope for bargaining is too limited to render a truce possible, in spite of the considerable concessions made in last week's Communist eight-point "peace plan." Sir Winston's significantly mild observations were followed on Tuesday by one of Mr Attlee's best and most outspoken speeches, which has now been answered with some caustic comment in Congress. These exchanges will have given pleasure to the men in control in Peking and Moscow, whose paramount aim is to crack the unity of the free world. If, in the course of driving as hard a bargain as they can over the Korean truce, they succeed in weakening the bonds between the United States and its allies, even a relatively less favourable truce might seem to them worthwhile.

In reality, of course, these allied disagreements strengthen rather than weaken the Communists' bargaining position. Their fresh bout of calculated truculence has taken the form of rejecting outright the thirteen points put forward this week by the Americans in reply to their own proposals of May 7th. The difficulty, both in dealing with the Communists and in keeping harmony between allies, is to decide what one can reasonably expect to get clearly agreed before, rather than after, an armistice in this extraordinary war. In favour of the rigid American attitude this much can be said: experience has shown the necessity of having everything possible set down in black and white when dealing with Communists. Furthermore, as Sir Winston pointed out, the negotiations at Panmunjom "no longer involve a difference of principle," and "if at any time there is a wish among the Communists to reach an agreement as between rational human beings the matter could be almost instantly settled."

On the other hand, there is a real danger that the Americans, because they are handling the truce negotiations virtually alone, will give due weight only to their own interpretation of their own interests, and that a considered allied view will have to yield to the unreasoning—but understandable—pressures of American domestic politics. Any wider political negotiations following a truce should be handled by a representative United Nations team.

Forgotten South Koreans

THE main point now at issue in the Panmunjom negotiations raises a question to which too little attention has been paid on the allied side. The Communists insist that the ultimate disposal of prisoners unwilling to return home must be made by the political conference after the truce. The Americans now propose instead to release them inside Korea, if at the end of a certain time—not yet agreed between the two sides—the neutral commission is unable to repatriate them. This proposal, however, appears to ignore the legitimate fears of the Communist leaders about the attitude and possible actions of President Syngman Rhee as head of the South Korean state.

Mr Syngman Rhee has already rejected publicly the whole idea of a truce based on a neutral commission and recognition that North Korea is not to be occupied by force of arms. While his intransigence is understandable, it can be overruled so long as control of the main events in the allied sector remains in American hands. But the South Koreans represent a factor in the situation which is bound to become increasingly important once the fighting stops. Men who still keep their eyes trained on the ambition of ruling all Korea are hardly likely to give Communist ex-prisoners anything but a rough handling.

Even now it is questionable how far the Chinese are genuinely held back from concluding an armistice by the knowledge that, desperately anxious as they are to get the Americans out, they cannot readily propose withdrawal of all foreign troops from Korea. To do so would be to leave the fifteen divisions of the South Korean army potential masters of the situation; North Korea has been shattered and broken by the struggle. For the Americans, too, withdrawal is a dubious objective. Korea is probably now of greater strategic value than Formosa. The rising tide of Japanese nationalism prevents the stationing of more than a skeleton American force in Japan itself. How is Japan to be guarded without American troops in Korea?

Vote of Confidence

THE Conservative victory in the South Sunderland by-election will change the mood of current politics as much as the Wycombe by-election changed it last autumn. Then the Government unexpectedly retained a marginal seat. Now it has gained a seat from Labour—which, once a Liberal had entered the field, few Conservatives retained much hope of doing.

This is, indeed, the first time since 1924 that the government party of the day has gained an opposition seat at a by-election. And the victory is in every way convincing. The poll—73 per cent of the electorate—was, for a by-election, heavy. Even if it is assumed that the Liberal candidate drew as many votes from the opposition as from the government candidate, the result is equivalent to a swing of 1½ per cent of the voters from the Labour to the Conservative side. If the same movement of opinion took place in all constituencies, a general election now would increase the Government's majority to eighty. A comparison of this by-election with the voting at Sunderland South in the general election of 1950, when also there was a Liberal candidate, is even more remarkable: three years ago Labour had a comfortable majority equal to 10½ per cent of the poll; now it is behind the Conservative by 2½ per cent of the poll.

It would, of course, be foolish to draw firm general conclusion's about the Government's popularity in the country from the voting of one constituency. But there were few special circumstances in its favour at Sunderland, though the Prime Minister's speech on foreign affairs, with its hopeful and pacific emphasis, may well have had a special influence on voters hovering between the Conservative and Liberal camps. What is more certain, however, is that Mr Butler's budget has been given an electoral endorsement. Above all, the most important single force working for the Conservatives is probably familiarity. They have now been in office for more than eighteen months, and not one of the disasters foretold by their opponents has happened. Many voters who had been persuaded to look at the Tories with trepidation now find them to be harmless and, indeed, successful. The support the Government has gained represents perhaps a vote of popular relief rather than of confidence, but whatever the motive the practical effect is the same. Sir Winston Churchill will certainly now be inundated with advice from those who want an election this autumn. For the Labour party, the Sunderland reverse will intensify the controversy about future policy; each side in the argument will no doubt claim that the need to adopt a policy more in keeping with its views has been proved. Both sides may, however, agree on the need to stop arguing before Labour's lack of a coherent policy helps the Conservatives to new victories.

A Ruler for the Bamangwato

THE Government has ended—temporarily, at least—the impasse in Bechuanaland. At their recent *kgotla*, the tribe failed to agree upon a chief to take the place of the excluded Seretse Khama, and the government has now decided to transfer the functions of the native authority to Raseboiai Kgamene, a senior member of the tribe, who was proposed as chief in the *kgotla* but failed to find sufficient support. He is not a government-imposed chief; but he will in fact wield the official powers entrusted to the chief under indirect rule, powers which for the past three years

have been exercised by European district officers.

The distinction may seem slender, and it is evident that, in view of Rasebolai's excellent war record, administrative experience and responsible attitude when first approached, the Government would be glad enough if in time the tribe came round to the opinion that he should be vested with the traditional dignities to go with his official powers. But that is for the tribe's decision. In any event, administration will return to African hands, and, providing that the tribe settles down under Rasebolai's authority, that will be a clear gain. Meanwhile, the decision should make it clear to Seretse's supporters, both in Bechuanaland and outside, that his exclusion from the chieftaincy is irrevocable, and that his return to Serowe will depend upon his undertaking to remain in private life, as his uncle Tschekedi is doing.

If the tribesmen accept the new arrangement, they will doubtless save themselves much frustration and internecine dispute. They will certainly be doing a favour to the Government, in its acute embarrassment over the Seretse Khama case. A possible point of friction with South Africa will have been eliminated. But whether African opinion will look on the decision so genially is another matter, and it is doubtful whether any critics of British colonial policy will be mollified. For the reasons why Seretse Khama was excluded have not yet been clearly and satisfactorily stated, and the tribe has made it clear that it now wants him as chief. The Government has staked very heavily on Rasebolai's qualities of leadership and diplomacy.

Four Puzzles for M. Mayer

THE tumour in French politics is malignant and grows only worse under partial treatment. Government after government has been unwilling or unable to cut to the heart of the financial and constitutional crisis in which France finds itself. Everyone admits that the present National Assembly represents combinations produced by private interests and by the skill of the political match-maker rather than the national will. But it displays tenacity in self-preservation, if in nothing else, and it is most unlikely that it will approve the latest proposals for reform that are being tabled this week by M. Mayer. The Prime Minister is asking for the right of dissolution, for the abolition of parliamentary immunity when the Assembly is not actually in session, for the restoration of an effective link between the upper and lower houses, and for the abolition of the separate investitures first of the prime minister and then of the cabinet over which so many cabinet crises have arisen. That is strong medicine and the National Assembly, rather than swallow it, may prefer to call in another opinion.

M. Mayer is vulnerable on at least four main issues: the grave financial crisis represented by a budget deficit estimated at some 800 billion francs, the wave of strikes in key industries such as the Renault works and the shipping lines, the situation in Indo-China, and the perennial deadlock over EDC and the Saar. The financial crisis is the most spectacular of M. Mayer's troubles and may prove to be the immediate cause of the next parliamentary revolt. The government proposes to make certain cuts in public expenditure and defence credits, to increase the tax on alcohol, to raise fares on the nationalised railways and to exercise tighter control over nationalised industries in general. The trouble with these measures, however, is not only that they will be most unpopular but also that they will cut the deficit by no more than 120 billion francs. By its bold devaluation of the Indo-Chinese piastre, the French Government will have done a good deal towards the re-establishment of a better currency in the Associated States and towards stopping the flow of "hot money" from France. There is little indication, however, that the cabinet will feel able to act equally drastically in France itself. A situation has been reached, moreover, in which financial reform is impossible without constitutional changes and the creation of a really strong government.

If M. Mayer holds together his uneasy coalition and obtains approval for what are essentially interim measures, it will be owing to a series of lucky accidents. The coming of the rains in Laos and, perhaps, a change in Communist strategy appear to have halted the threat of a major military disaster. The decision of General de Gaulle to dissociate himself from the parliamentary RPF has created a floating body of 87 deputies, some of whom may rally to the centre. The Soviet peace offensive, moreover, has reduced in many minds the urgency of the problem of German rearmament for Europe's defence. Most important, perhaps, is the fact that the post of prime minister is one of the least popular in France and that no one seems eager at this point to take over from M. Mayer.

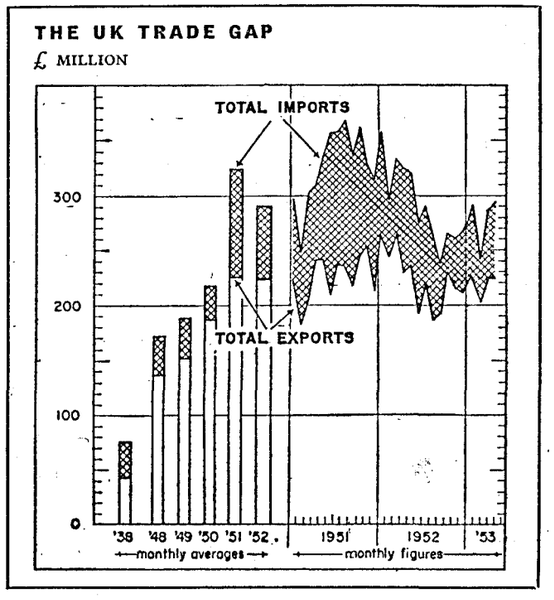
Foreign Service Changes

THE commentator who wishes to express a fair, but at the same time, candid opinion on the series of changes at the Foreign Office that have been announced this week —most of them precipitated by the coming retirement of the Permanent Under-Secretary, Sir William Strang—is in some difficulty. On the one hand, there is the old and valuable tradition that individual civil servants should not be criticised, since they have no means of reply—and that would seem to carry with it the corollary that they should not be praised either, since to do so might give an unbalanced result. On the personal side it must, therefore, suffice to say that an attempt, unusual in the Foreign Service, has been made to select men who have some special qualifications for their new posts and not simply to follow the system of switching men round at short intervals regardless of their particular experience.

Thus the new Permanent Under-Secretary, Sir Ivone Kirkpatrick (who is 56), has had, thanks to his spell as High Commissioner in Germany, practical and administrative experience of a kind that seldom comes to the head of the Foreign Office. Sir Frederick Hoyer Millar (52), who is to succeed him in Germany, will bring to his post an intimate knowledge of how Nato works and of the interaction of political, military and economic factors in western defence policy that will be invaluable in Bonn. Mr W. G. Hayter, who goes to Moscow from Paris at the early age of 46, will be able to explain as well as anyone to the Russians the meaning of the European Defence Community, of which they are so deeply suspicious; he has also a special knowledge of east-west trade problems as they present themselves to the allied committee in Paris which sees to it that strategic goods and materials do not go beyond the Iron Curtain. Sir Christopher Steel (50), who becomes the British Permanent Representative at Nato, has had arduous experience of Berlin and also of Washington; his place as second-in-command at Washington is to be taken by the Foreign Office's chief expert on China and the Far East, Mr R. H. Scott (47).

But simply to list qualifications in this way is to risk giving the impression that all is well, or about to be well, with the Foreign Office, and that would be far from the truth. It is quite unreasonable in these days to extend to whole groups of civil servants, such as the Foreign Service as a whole, or even to that more restricted body, the staff of the Foreign Office itself, the immunity from criticism which still rightly covers the individual. The sole responsibility of the political chief is no more than a convenient fiction when departments have grown so large that many things have to be decided, and policy brought at least to the semi-finished state, without more than the passing knowledge, let alone the active decision, of ministers. Those who have closely watched the conduct of British foreign policy in the postwar years can hardly have escaped the conviction that many of its defects and frustrations have been due to deficiencies in the personnel of the Foreign Office—deficiencies arising, it may be, mainly out of the very heavy pressure of overwork, but deficiencies none the less. The present set of changes shows a praiseworthy determination to make the best of the material that is available in the Foreign Office. The thorough reinvigoration of the Office and of its habits of thinking can hardly be begun without at least some fresh blood.

Labour's Municipal Victories



LABOUR has gained a good deal of ground in the local authority elections. The movement to the left was not, indeed, so pronounced as it was last spring, but it was still sufficient to bring Labour some important prizes. Labour councillors gained control of eight county boroughs, including Manchester and Leeds, and two metropolitan boroughs. In several other boroughs Labour became the largest single party, while it captured a number of smaller local authorities. Labour's net gain from the elections was over 360 seats, the Conservatives losing 250 and the Independents, who grow fewer each year, just over 100.

Although they cover the whole country, these results are far less significant, as a measure of the general state of public opinion, than one by-election result—in a marginal constituency such as Sunderland. The latest findings of the Gallup Poll, published by the *News Chronicle*, show the Conservatives retaining a comfortable lead—by two points —in popular favour. The seats at stake in this year's local elections were last contested three years ago, when Labour's popularity was at a low ebb, and the Conservatives had therefore been in a much stronger position on the borough councils than at Westminster. A typical case could be found at Leeds, where five of the seven MPs are Labour, yet until last week there was a Conservative majority on the city council. Here, as in other boroughs now regained by Labour, the latest elections seem to have made local politics a more accurate reflection of the balance of power at Westminster. In London, for instance, Labour captured two boroughs, but the Conservatives held four others considered marginal. In Birmingham the Conservatives lost four seats but held nine others which they had won three years ago.

There is, of course, no reason to think that the one-third of the electorate that votes in the local elections will shift its political allegiance in the same proportion as the 80 per cent that votes in a general election. But even with this restricted vote, a tendency for local councils to mirror the House of Commons ever more closely follows inevitably from the increasing participation of the national party machines in local elections and also from the greater dependence of local issues on central government policy. For the success or failure of his borough's housing plans, the elector is becoming accustomed, and indeed is encouraged, to praise or blame the Government of the day. It is notable, however, that the undermining of local political consciousness has not yet penetrated to all levels of local government. The Labour party claims to control only 25 out of 475 rural district councils. Even allowing for Labour's weakness in such areas, this suggests that among the smaller authorities the truly independent councillor is still of real importance.

Development—and Welfare?

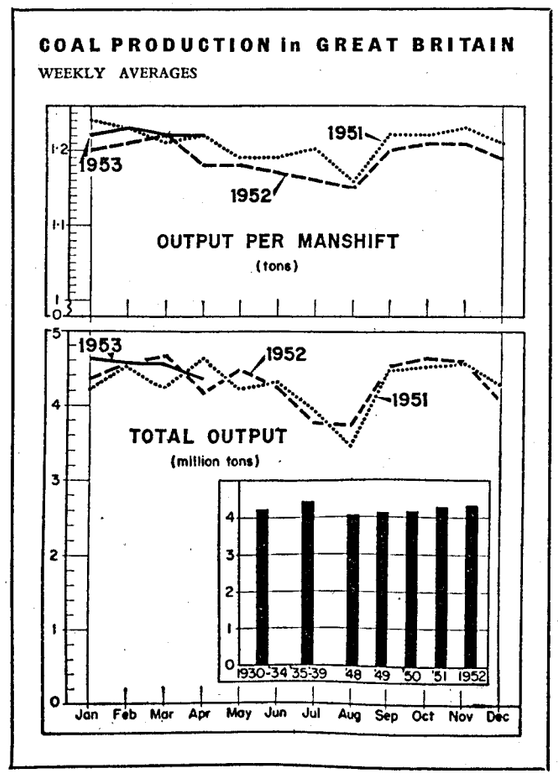
LORD REITH has not yet been able to pull the Colonial Development Corporation off the rocks. A year ago, the annual report expressed the cautious hope that "1951 should constitute the peak of Corporation loss; next year's story should be different." The story of 1952 has, in fact, turned out to be much the same. A further eight projects have been abandoned, and the provision made against actual

or possible losses has risen from £1,750,000 in 1951 to £3,965,232 in 1952. One of two conclusions must be drawn: either it needs more than one year of a new outlook and financial discipline to shake off the burden placed on the corporation by the mismanagement of its early years; or the task of profitable development by corporations is inherently more difficult than Lord Reith supposed when he became chairman. It is noteworthy that of the various corporations set up to fill supposed gaps in the work of private enterprise, the only one that has been both active and successful is the Industrial and Commercial Finance Corporation, which was the one designed to operate on a small scale (and whose annual report is discussed in a Business Note on a later page).

The question, indeed, arises whether the Colonial Development Corporation should be allowed to go on piling up losses, which now total £8,400,000, or whether it should be put to sleep like its manic sister, the Overseas Food Corporation. The right answer probably is that it should be given a somewhat longer chance. Some of its projects are proving financial successes. Others have been valuable —even essential—preliminaries to development schemes that would otherwise not have been undertaken. If generalisations can be made at all, it looks as if the worst failures have been livestock and agricultural schemes, especially in Africa and the Caribbean. The most successful appear to be the timber schemes and some of the general industrial concerns. Geographically, the Far East comes off best with no failures among the six projects listed. Significantly, perhaps, the report praises the local management of the two most successful concerns in that region; there might have been fewer failures elsewhere if the managers had been better and if there had been less pressure from London to show quick results.

There will be less support, however, for the proposal made by Lord Reith in the report that the corporation should be able to finance projects that are valuable but not profitable. These, he suggests, should be separately recorded in the accounts and their results judged on other than a profit basis. The mistakes and disappointments of the first years have compelled the corporation to undertake new projects on a strictly commercial basis. To allow it to finance uncommercial schemes would encourage it to trespass on the territory of the "development and welfare" plans of the colonial governments. Those are not the business of a supposedly commercial organisation.

Light on the Left



THE Labour Party discussion group known as Socialist Union has cut ruthlessly through the clouds of dogma and hoary prejudice that still obscure so much left-wing thinking on international issues. In its latest pamphlet,* the group pulls no punches and minces few words. It sweeps aside the pipe dream of a neutral third force in world affairs; speaks plainly to those who think that the rule of law can be established not by shedding blood in Korea but by drafting constitutions for world governments; and, while pleading for a "mutual aid" plan to help poorer countries, frankly admits that Britain could contribute to such a plan only within narrow limits. The group seems almost to go out of its way to take by the horns every unattractive dilemma that plagues Socialist consciences—including German rearmament, Syngman Rhee and Bao Dai ("the battlefield is no place for fastidiousness in friendships"), Malaya, and Central African federation.

In all this Socialist Union has shown something more than robust commonsense and refreshing boldness. It is developing the "reassessment of the basic principles of socialism" which it began in the pamphlet published last year. This second instalment is more positive than the first; there are some biting references to the "old beliefs"; but the main argument, starting from the simple proposition that socialism must rest on respect for the dignity of all men, skilfully constructs a set of guidelines for use not in an ideal future but in the distraught present. Principle and pragmatism are here well matched, and especially so in the treatment of two themes: first, the critique of American actions, which bluntly sets out certain "deep misgivings," but goes on to state the obvious but sorely needed maxim that

> a nation must be judged on the general lines of its policy, not on aberrations from it. . . . America is not, by and large, threatening the rights of other nations, or oppressing their peoples.

Second, the group shows a realistic grasp of what Britain can hope to achieve in the contemporary world: "the problem is not only to find the right form of partnership, but to act as a partner who commands respect." If the Labour party successfully digests this and the other lessons offered, not only its backbone of idealism but also its foothold on reality will be the stronger.

American Gibraltars?

AFTER two and a half years of tenacious bargaining the Madrid-Washington agreement is now ready for signature. By dint of sheer obstinacy and the kind of diplomatic Fabianism already displayed when he was negotiating with Hitler, General Franco has persuaded the Americans to sign on a line dotted by himself. Spain will receive about $200 million in MSA funds and a further $25 million from the Pentagon. This is nearly twice as much as the Americans offered initially; yet in exchange they have obtained from the Caudillo little more than a foothold in certain Spanish air and naval bases. General Franco has made sure, furthermore, that the development of his army and the expansion of road and rail facilities inside Spain form an integral part of the agreement. In peacetime Spain's precarious economy will receive a powerful stimulus, as American military interests tend to act as a magnet for private investment; in the event of war, Spain will have the strongest of allies right on the spot.

It appears that American naval forces will be allowed the use of Cadiz, Cartagena and possibly Corunna, but these ports will have to be expanded before they can berth large carriers and battleships. The Americans will also be allowed to build air bases, suitable for heavy bombers, near Burgos, Madrid and Seville, and possibly a number of smaller fighter bases in the north of Spain. But American use of these bases will be strictly controlled and limited until such time as both sides agree that a military emergency exists. On the other hand, the Pentagon is justified in feeling that this agreement with Madrid represents a major improvement in the Amercian strategic position in Europe. It will help to clear up the problem of getting a throng of admirals to be co-operative with one another at Malta, and it will ensure effective fighter cover for fleets operating throughout the Mediterranean. Moreover, it will make possible the creation of supply centres and the maintenance of ports for bringing in reserves in areas less vulnerable to bombers, and to the sabotage by local Communists that is feared, for example, in France.

Some will feel dubious not merely about the fact that Spain is now introduced into the democratic camp, but also about a private American venture outside Nato. In terms of immediate strategy, however, Nato forces will obviously benefit from this reinforcement of their sea communications and the greater depth of their air defence and supply system. Looking further into the future, one cannot help feeling that the existence of American footholds on the Continent outside the area directly involved in the Soviet-German problem may one day prove most convenient.

Ireland's Unchanging Taxes

SUPERFICIALLY, there was nothing new in the Irish Budget. Mr MacEntee did not change existing rates of taxation, while the programme of capital expenditure is to go on expanding. In response to the growing criticisms of the incidence of income tax, he is setting up a committee of enquiry. Our correspondent in Dublin points out that this will take its place in a long and seemingly endless procession of commissions and committees of enquiry into the Irish economy. In the meantime, its establishment is a suitable commemoration of the centenary of the extension of income tax to Ireland by Mr Gladstone.

After charging, as is the modern practice, a large number of objects of expenditure to capital account, the Minister could even then only reach a balance by promising to effect economies representing about 3½ per cent of the cost of public administration. If he succeeds in this venture, he will indeed earn the thanks of the community. He will also be thanked, with no less gratified incredulity, if he keeps his colleagues to the engagement, given in the budget speech, that £101 million is the limit of expenditure beyond which they will not go until the present pressure on resources is eased by an expansion of national output, and taxation has therefore been reduced to a more tolerable level.

It has recently become almost a convention of the Irish constitution that taxation cannot and must not be increased. It is a pity that the political parties, all of whom subscribe enthusiastically to this new doctrine, do not weigh the implications of the fact that even at present rates of taxation revenue falls short of expenditure. Nevertheless, schemes which must involve further outlay are being pressed, not least strongly by Mr MacEntee's colleagues; and the social services must become more expensive each year, if only because of the changing age structure of the population. The capital programme, for which the government borrows, is predominantly devoted to objects of social rather than of productive development. It is true that there are great reserves of financial strength and that the present embarrassment of the public finances has in part temporary causes. But it seems high time that all parties assessed the real chances of maintaining a structure of public and private costs that is increasingly out of line with world trends.

New Values for Houses

THE new Valuation for Rating Bill, which the Minister of Housing has introduced into the House of Commons, deals with only a small part of the problem of rating, and deals with that unsatisfactorily. The need it tries to meet is real; it replaces sections of the Local Government Act, 1948, which had proved to be unworkable. In order to overcome the distortion arising from rent control, that Act laid down two alternative methods of assessing the rateable values of houses. Houses not subject to rent control were to be assessed, for the new valuation lists, according to the rents they commanded or could have commanded in 1939; but rent-controlled houses built after 1918 might instead be valued according to the estimated cost of constructing them in 1938.

These two methods of valuation have proved to yield in practice incompatible results. Mr Macmillan has decided that they cannot be brought into line by altering the formula relating valuation to 1938 construction cost; any formula would produce serious anomalies as between one type of house and another. The new Bill therefore scraps the construction-cost basis altogether. The new valuations of all houses will be the rents either that they in fact com-

manded, or that they would have commanded, in a free market in June, 1939. This value may be hypothetical in one or more of three distinct ways. Besides the obvious cases—of houses that have been built since 1939, and of houses that either were not let in 1939 or were let at controlled rents—the amenities of the district, or even of the house itself, may have changed considerably since 1939. In this case, the officials of the Inland Revenue cannot estimate what a reasonable rent for a particular house would have been, given the known facts about rents in the district in 1939; they must estimate what the rent would have been if, say, there had been a better bus service and an estate of council houses at the end of the road. The Minister believes that the Inland Revenue has enough evidence about 1939 rents for houses to be fairly assessed in all such cases. But the process seems to leave a great deal to the judgment of the individual official, and public opinion will not easily be convinced that the results are reasonably fair—particularly when they will involve, in most cases, a considerable rise in the assessment.

★

There must, therefore, be some doubt whether the basis for valuation provided by the Bill is any more workable than that of the 1948 Act. Certainly the difficulties that caused so much trouble before the war are likely to crop up again, and in a more complicated form. The whole process of revaluation would, of course, be very much easier if domestic and commercial ratepayers had more confidence that the actual amount of their rates would be reduced, or at least not increased. The only way to make sure of that is to restore the rating of agricultural and industrial property; here the prewar policy has now entirely lost its point. Re-rating would be a sound economic measure, and while it would offend some people, it could hardly be on balance an unpopular measure. It should be—with the reform of the Rent Restriction Acts—the next stage in Mr Macmillan's programme.

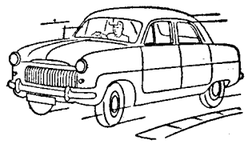
Two Rounds for the High Authority

Two recent events underline the gathering strength of the new European Coal-Steel Community and in particular of its executive organ, the High Authority. The first is the German Government's decision to back the High Authority, and not its own business interests, over the contentious question of taxes in the common market, which the six nations opened on May 1st. Last month the High Authority, on the advice of its experts, ruled by a simple majority that steel imported into Germany should carry only the low local German tax and not, for example, the high local French tax. German steel producers promptly asked their government to impose a special tax on steel imports, ostensibly to protect them from "unfair" competition, but in reality to protect the German home market for their own high priced steel. They also saw to it that the necessary enabling legislation was rushed through the *Bundestag*. But the Adenauer government has so far refused to use these new powers; indeed, it has promised to use them only with the High Authority's consent. This shows admirable loyalty.

The second development indicative of the new economic climate is the acquisition by a group of French steel concerns of a majority interest in seven German coal mines of the Harpener Bergbau AG in Dortmund. Previously the shares were owned by the Flick complex which, in accordance with the Allied plan for the deconcentration of the Ruhr coal and steel industries, was obliged to sell this portion of its holdings.

Some German comment has hailed the transaction as a welcome and practical expression, by private interests, of the principle of West European economic integration. Other German comment, inspired by the Federation of German Industry, bitterly resents the sale, largely on nationalist grounds. In justifying its resentment it argues that the Allies have merely succeeded in replacing a German concentration with a French one. It is at this point that the High Authority comes into the picture: for it alone now has the power in Schuman-pool Europe to decide what constitutes a new coal-steel concentration.

The Exclusive Service



There is another very striking difference between the Navy and almost every other service. Every other part of society is freely opened to talents. A cabin-boy, if he be careful and skilful, can become a shipowner—may enter Parliament, have much to say on legislation, and be elected to the peerage. A poor barber's son may raise himself, by the bar, to be Chief Justice or Lord Chancellor. There is no positive impediment to the humblest tradesman being Prime Minister of the country; but, however brave and skilful may be a seaman, he must quit Her Majesty's service ever to rise above the grade of a warrant officer with £120 a year. "It must be remembered," says Mr Osborne, "that these situations (those of warrant officers) are the highest to which the seamen and petty officers of the fleet can expect to attain; and it is important, in a corresponding degree, that they should be sought after and filled by the most active and deserving men. The importance of the duties performed by the warrant officers cannot be exaggerated." However important, and whatever degree of skill they require, they do not open the higher places in the fleet to the seamen who rise to fill them. These are reserved for the aristocracy. You must enter the Navy as a gentleman to have a chance of being a captain or an admiral. We doubt whether the situation of an officer is more effectually closed to a common soldier in the Austrian army than the situation of an officer of the highest rank is now closed against a common sailor in the Navy. Without the services of warrant officers, such as gunners and boatswains, the Navy could not exist; but while they have much labour—while from them is required all a seaman's skill, the post of a lieutenant, by which alone they can become captains or admirals, is exclusively reserved for gentlemen. In Austria or Prussia that might not be of much importance; but in our country, where other employments have no such artificial barrier, it is fatal to the popularity, and will in the end be fatal to the efficiency, of the Navy.

The Economist

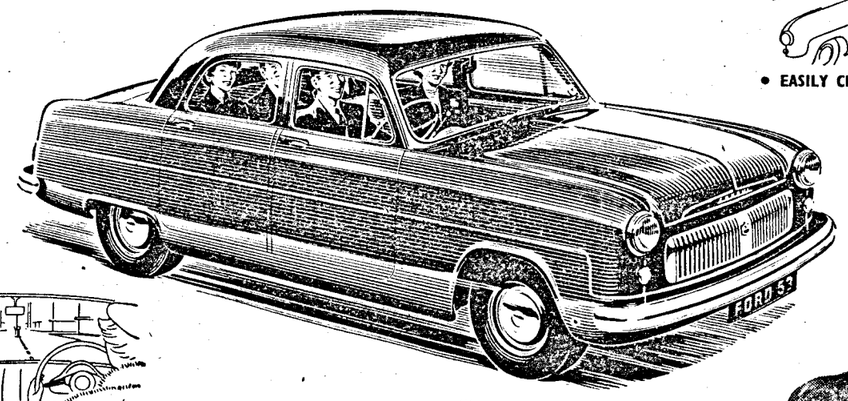
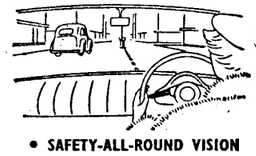
The SALES MANAGER buys a

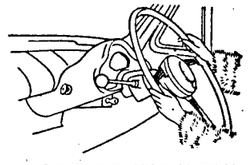
Consul

• 'OVER-SQUARE' O.H.V. ENGINE



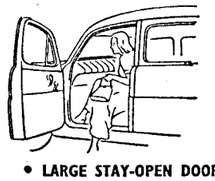


• 15 CU. FT. BOOT SPACE



• EASILY CLEANED IN 20 MINS.

THIS CAR, he says, has road-holding and cornering qualities that take the tension out of driving at 70 m.p.h. It has a new suspension system so good that it reduces fatigue. And the 'over-square' o.h.v. engine, remarkably economical to run, has a low stroke/bore ratio that adds years to its life. He sums up: all these qualities, at this price, make the Consul a new—a higher—*class* of car!



• SAFETY-ALL-ROUND VISION

• FINGER-TIP GEAR CONTROL

• LARGE STAY-OPEN DOORS

so does the STORES BUYER...

SHE FINDS everything about the Consul to her taste: its fresh and graceful lines, a sense of spaciousness on the bench seats, the refinement of detail, the full-width parcel shelf, the cool elegance with which the car behaves in traffic. The Consul has brought her a class of motoring better than she has been able to afford before.

Consul £470 PLUS P.T. £196.19.2

future imperfect

Wild animals depend for their food on what they can find.
It is a hand-to-mouth existence. Man, having evolved the idea of agriculture, sows to reap. He cozens nature, making her amenable, to produce his food *when and where he wants it.*
He asks only health and strength to work his fields, peace to enjoy the fruits of his labour and a stable economy to ensure that he can sell and buy and exchange.
The main product of the Fisons business has for a hundred years been chemical fertilizers, to enrich the soils of farms and gardens.
But they make chemicals for medicine and industry too.
Fisons contribute to Britain's harvests, health and wealth.

FISONS LIMITED • HARVEST HOUSE, FELIXSTOWE • SUFFOLK
Fertilizers • Heavy Chemicals

Fisons are also among the largest manufacturers in Great Britain of pharmaceuticals, medicinal food preparations and fine chemicals for Industry. Many of Fisons products in these fields are household names.

it's all in FISONS field

Letters to the Editor

Israel's Economy

SIR—The article in your issue of May 9th says that "A way of breaking the deadlock [between Israel and the Arabs] is provided by the hopeless economic weakness of Israel and Jordan . . ." and in discussing an imposed settlement, you continue: "What otherwise is the outlook for pauper Israel and pauper Jordan?"

The comparisons between Israel and Jordan are somewhat misleading and give no picture of development in Israel. Israel indeed faces grave economic problems accentuated by the Arab blockade. It receives substantial aid from the West. This aid is, however, being put to good use. Between 1948 and 1952, the land under cultivation has doubled from 400,000 acres to 850,000 acres; the number of trees planted has increased from 5 million to 15 million. The consumption of electric power for industrial purposes has increased from 71 million kilowatt hours in 1948 to 171 million kilowatt hours in 1952. Her Mineral resources are being developed. Last month saw the start of phosphate production in the Northern Negev and September, 1953, will see the start of potash production at Sdom on the Dead Sea. The pilot work for the mining of copper has been completed in the Southern Negev. Israel's scientific and technical facilities are being steadily expanded. During the same period, Israel has built five hundred miles of new roads and has improved five hundred miles of old main roads. A national air line and merchant fleet are growing steadily.

All these developments are on a comparatively large scale by Middle East standards; 750,000 immigrants have entered the state since 1948 and the total population has increased from 800,000 to 1,650,000. Israel is meeting with success in integrating its new immigrants into the life of the country. New permanent housing has been built for 400,000. Though living standards are affected by the blockade and the necessity to build up arms Israel is making basic economic progress.

Your article notes that the Western powers, through UNRWA, made available for the financial year 1952-53 $60 million to help resettle the Arab refugees but only $1,100,000 was actually spent. "The Arab governments, by sheer inaction, have made it politically impossible to spend more than one-thirtieth of the money available." Israel's development budget for 1952-53 was £I 115 million and the total amount was usefully spent. This is in striking contrast to its neighbours.—Yours faithfully,

MARCUS J. SIEFF
London, W.8

Farming Without Boards

SIR—There is one point which your article in your issue of May 2nd (page 280) did not bring out. The apple and pear marketing scheme bore no real resemblance to the milk marketing scheme. The Milk Marketing Board does take a hand in marketing the milk, but the Apple and Pear Board would have had nothing to do with marketing the fruit. In essentials this scheme did no more than define what could not be sold, yet it made no provision for the fruit thus excluded.

The big men turned it down because it would have done them no good, but would have piled another expensive bureaucracy on their shoulders. The small men supported it because they succumbed to the propaganda of the promoters, that any scheme was better than none, and that if this one was not adopted the Government might impose their own.

The same non-constructive approach by the National Farmers' Union to the question of marketing horticultural products was responsible for the drafting of the tomato and cucumber marketing scheme, experience of the operation of which has given rise to so much dissatisfaction among the producers.—Yours faithfully,

G. E. MITCHELL
St. Leonards-on-Sea

★

SIR—As one who has been to some extent concerned with the detailed opposition to the apples and pears marketing scheme perhaps I may offer a few comments upon your very pertinent article. The press generally has hardly noticed the existence of the scheme, and yet the implications of the whole procedure are of importance to the entire community. Some marketing scheme may or may not be desirable. With this I am not concerned, but we should all be concerned with two main aspects of the matter.

First, you mention very briefly the refusal of the Ministry of Agriculture and the NFU to allow the opposition access to the list of hard fruit growers. This refusal was, however, only one of numerous undemocratic aspects in the presentation of the scheme. For instance, any who wished to offer criticism of the scheme at a public inquiry had to do so entirely at his own cost. Moreover, the explanatory notes published with the scheme were most misleading in certain particulars, and so were the statements made by the promoters, some of whom had clearly little understanding of the legal effect of the involved clauses of the scheme itself. Few farmers could have understood the document without legal aid. I submit that if the scheme is to be sponsored by any government it should be made clear that the clauses have been drafted or approved by an absolutely impartial person or tribunal. Alternatively, the expense of criticising the clauses should be met out of public funds.

Secondly, the scheme itself was undemocratic in the extreme. You are mistaken when you refer to the board "consisting of 20 elected representatives. . . ." In fact, the first members of the board were not elected at all, but were nominated by the NFU and were in fact the promoters of the scheme. Under the scheme itself it would have been virtually impossible for the growers to turn them out, and still more difficult for any minority of growers to obtain representation. This point was made to the Commissioner and comparison was drawn between the rights of the shareholders in a public company and the virtually non-existent rights given to fruit growers under the scheme. The Commissioner even questioned whether in fact the board of a public company can be dismissed by a simple majority vote of the shareholders.

There are numerous other points of serious criticism. Parliament has not time to examine such matters in any detail, and they will not be properly examined by a heavily taxed public unless some means is provided for careful scrutiny at the public expense. This is not merely one of the evils of delegated legislation. It goes further. It amounts to a delegation of administrative power to persons who are virtually free from any public or private control or criticism.—Yours faithfully,

London, E.C.4 F. F. STUNT

350,000 Houses

SIR—In your issue last week you state that "each additional council house built means another £37 10s. from the Exchequer alone, in addition to the subsidies from the rates." It is difficult to see how you arrive at this figure. The standard Exchequer subsidy on new council houses is now £26 14s.

You are critical of Mr Macmillan's programme partly in terms of its cost to the taxpayer. The council-house tenant has been insulated from the government's own monetary policy of higher interest-rates by the compensating increase in the housing subsidy. This situation, however, is not altogether illogical for there is the supply as well as the distributional aspect to the subsidies. Were it not for the subsidies local authorities would not be building anything like the number of houses they are. At the same time, the government is seeking to redeem an election promise.—Yours faithfully,

SILVAN JONES
University College, Bangor

Books & Publications

Economic Morphology

THE PROCESS OF ECONOMIC GROWTH.
By W. W. Rostow.
Oxford University Press. 282 pages. 25s.

THERE are several senses in which a new book on a social topic may be called "important." It may reveal important new facts; or establish between them important new connections; or constitute an important step in the wider diffusion of a hitherto esoteric knowledge and understanding; or, whether possessing or lacking these qualifications, it may have a driving power of persuasion destined to exert an important influence on public opinion and policy. Professor Rostow's book is important, even very important, in the first two senses. It ought to be important in the last sense; but unfortunately any influence which it may exert is likely, thanks to the combination of intrinsically difficult subject matter with an unusually obscure and clumsy style, to be deferred and indirect.

"The Process of Economic Growth" is, in its author's words, "an historian's book about economic theory." No historian can be content with an economic theory concerned exclusively with the pure logic of choice in given circumstances. Circumstances are never given; they are evolving according to rules of their own, which include their relation with the very economic choices for which they provide a framework. To understand economic growth, as distinct from the conditions of momentary equilibrium, it is not enough for the economist to assume certain impacts (as of innovation, discovery, war, growth or decline of population) from outside his logical system, and trace their effects; he must study the genesis of those impacts themselves, the "long-period factors and the social and political framework of the economy." He needs "improved tools" for relating them to "the body of economics." To Mr Rostow economic action appears as "the outcome of a complex process of balancing material advance against other human objectives."

This is a much wider, and also a much more realistic, approach than that which assumes material advance to be the sole rational objective and analyses only the process of achieving a balance between its various components. "The Process of Economic Growth" is not a "Principles" written around this definition; its more limited and practical purpose is methodological, "an effort to introduce into formal economic analysis variables which incorporate the human response to the challenges and material opportunities offered by the economic environment." This response Professor Rostow sums up in six "propensities." One is the familiar Keynesian propensity to consume; the others are the propensity to develop fundamental science, the propensity to apply science to economic ends, the propensity to accept innovations, the propensity to seek material advance, and the propensity to have children. These propensities act through existing institutions of all kinds; and they constitute "the minimum gropings of social and political behaviour necessary to analyse the rate of change in the size and productivity of the working force and of the capital stock"—which in turn determine the rate of growth and its fluctuations.

By the use of these devices Professor Rostow opens up some extraordinarily interesting possibilities, here illustrated rather than fully exploited, in the study both of long-run trends and of cyclical fluctuations. The emphasis moves, in his analysis, away from the influence of changes in macro-economic aggregates—national income, investment, consumption—to that of shifts between different sectors of economic activities and lags between the phases of these shifts. Macro-economics is left still further behind when he comes to consider the processes of growth in backward areas where the "propensities" are radically different from those tacitly assumed in advanced economic societies. (Approaching this topic from almost diametrically different directions, the author and Professor S. H. Frankel would find themselves in illuminating agreement.)

Not only in underdeveloped areas, however, he concludes that "the pure Keynesian hope—that the interventions of governments in democratic societies might be limited in this century mainly to the maintenance, through remote and indirect controls, of an appropriate level of effective demand—has been belied by events. . . ." Policy must consider "the appropriate pattern of investment, as well as its scale." It is an uncomfortable conclusion for an essentially liberal thinker. But the fainter the hope that free enterprise will automatically achieve the "appropriate pattern," the greater the need that policy should be guided by a full understanding of that pattern's determinants.

Starsplitter

THE GREAT PALOMAR TELESCOPE.
By Helen Wright.
Faber. 176 pages. 12s. 6d.

UNDER the single word title of this review Robert Frost, a generation ago, wrote about an American farmer who

> . . . mingled reckless talk
> Of heavenly stars with hugger-mugger farming,
> Till having failed at hugger-mugger farming,
> He burned his house down with the fire insurance
> And spent the proceeds on a telescope
> To satisfy a lifelong curiosity
> About our place among the infinities.

There are probably more amateur astronomers today, per head of population, than ever. Mercifully for food production, they can satisfy their curiosity about heavenly bodies less drastically. Jeans and Eddington can be said to have started a wave of popular curiosity about "our place among the infinities"; but the real cause lies back in the nineteenth century, about the time of "The Origin of Species," when—after Halley's comet, and the amateur Lord Rosse's discovery that the nebula Messier 51 in Canes Venatici had a spiral form—in 1857 George Bond at Harvard took the first photograph of a star with wet plates. From that came the combination of spectroscopy with astronomy, the discovery of the elements of heavenly bodies and the recession of nebulæ (boring their way spirally at a prodigious speed), and the "expanding universe" with its challenge to astrophysicists and atomic physicists alike. Today, for about as much as the cost of a motor-assisted bicycle, one can get a good 3-inch or 4-inch refractor and, on most nights even in England, get good enough "seeing" to marvel at the great nebulæ in Orion or Andromeda, the tilting of the rings of Saturn, the red and topaz of Betelgeuse, the dizzy changes of the moons of Jupiter, the vast galaxies in and around the Milky Way, and the density of stars in what look (to the naked eye) to be only Seven Sisters or the Beehive.

But it is a far, and quick, cry from such a cheap and good refractor to the 200-inch reflector of Mt Palomar. Miss Helen Wright tells, with model clarity, the tale of trials and tribulations which led, through twenty-five years, to the installation of this giant. It is the saga of one man—George Ellery Hale (1868-1938). He devoted a life of enthusiasm for astronomy to finding funds to make, in turn, four big American telescopes: from 30 inch and 60 inch to 100 inch and the giant 200 inch, which he never lived to see erected. The story will appeal to economists for showing the hazards of economic venture in the scientific field—such hazards as have always constituted challenges to American private enterprise. The casting of the Pyrex disc for the 200-inch mirror at the Corning Glassworks, with its disasters "thorough flood thorough fire," and the transport across the continent of the eventually successful result at 25 mph by special train, and then up Mt Palomar by truck team, are adventure stories in themselves.

But the book is notable for other things; the beautiful diagrams by Milford Zornes; the remarkable plates, not only of the giant "starsplitter," but also of nebulae, and of the dedication at Mt Palomar with the giant brooding over a big audience of what seem pygmies; and fine maps. Despite a number of needlessly annoying misprints, this book is one worth putting on the family bookshelf. Seldom do information, education and high adventure come so cheap.

Lawyer Statesman

CARSON.
By H. Montgomery Hyde.
Heinemann. 515 pages. 25s.

MANY politicians have become prime ministers without leaving as definite a mark on the map of history as Sir Edward Carson. As Washington delivered what became the United States from the rule of London, so Carson delivered what became Northern Ireland from the prospective rule of Dublin. True, the thing might in each case have been done without the protagonist. *Il n'y a pas d'homme necessaire,* we are told. The American colonies might have scrambled into freedom without Washington and "Ulster" might have scrambled out of Home Rule without Carson; but just as Washington added dignity and distinction to the American scene, so, as the past recedes and animosities fade, on this side of the Channel anyhow, we can say the same of Carson on his smaller stage. He was a grand figure, truculent but heroic; and this is an excellent biography, vigorous and exciting. The author is an Ulster Unionist MP and there is no doubt which side he favours—and that is as it should be. You would never get a good life of John Peel from a man who did not like fox-hunting.

There are dangers of judgment in all historical restrospections, but it is difficult to avoid the conclusion that almost every sort of Englishman was very stupid about Ireland in those days. The Conservatives were stupid in supposing that the Union could be maintained; the Liberals were stupid in supposing that Gladstonian measures would satisfy Parnell's followers. The clear heads were in Ireland, the republicans on one side and the Carsonites on the other. Both survive whereas Gladstonism and Balfourism have gone to the rubbish heap.

Carson, of course, had another career, as a lawyer. He was not among the most learned, but he was probably the most formidable pleader and cross-examiner of his own or any other generation. In fact he liked the law courts much better than the House of Commons, where he was almost as much an Irish specialist as his Nationalist opponents. So the political narrative is frequently interrupted by the great cases: Oscar Wilde, Archer Shee, Archdeacon Wakeford and the rest. He also played an important part in destroying the Asquith government during the first war. But the Irish story is rightly the main theme of the book, reaching its sombre climax in the speech Carson delivered in the House of Lords on the occasion of the Irish Treaty of 1921—a devastating speech that grows not less but more impressive with the passage of time.

Impressive Record

THE BENGAL CHAMBER OF COMMERCE AND INDUSTRY, 1853-1953.
A Centenary Survey.
By Geoffrey W. Tyson.
Arthur H. Wheeler & Co. 215 pages. 15s.

MR GEOFFREY TYSON, for many years Editor of *Capital,* was asked to prepare a short account of the development and activities of the Bengal Chamber of Commerce and Industry, on the occasion of its centenary in February, 1953. A full-length history is under preparation.

The record is impressive. There was hardly an event or controversy of outstanding importance for India, during the century, to which the Chamber did not make some contribution. Its contributions took the forms of expressing the collective opinion of the mercantile community (Indian, as well as European) on commercial matters; of collecting and sifting economic data; of providing representatives on various public bodies; of stimulating the provision of facilities for co-operation between members of the various sectors of the trading or industrial community; or of formulating memoranda on topical questions.

> Company law, income tax, banking legislation, insurance practice, the taxation of inter-State trade, tariffs, import control, export policy, Indo-Pakistan trade, futures trading, the regulation of stock exchanges, reform of the judiciary, employee's state insurance, provident funds, factories acts, the Planning Commission, and workmen's compensation are some of the general subjects with which the Bengal Chamber of Commerce has had to deal exhaustively.

while the "particular" matters affecting individual industries or firms, and local interests, have been so numerous and varied as to elude classification. The Chamber's views were invited on many occasions by different Government Departments, whilst "senior members . . . have given untold hours of service on governmental committees or commissions." Oral and written evidence was given to, among others, all the Currency and Financial Committees and Commissions, the External Capital Committee and the Steel Tariff Board. The Chamber also had working arrangements with the chief specialised mercantile associations, such as the Indian Tea Association and the Indian Jute Manufacturers' Association.

No one could have been found better fitted to tell the story and explain the Indian background than Mr Tyson, with his wide knowledge and experience of Indian affairs. He deals faithfully and vigorously with the many relevant controversial subjects, and gradually builds up, before the reader's eyes, a picture of the various phases of economic and constitutional development through which India has passed during this eventful century. It has, naturally, proved possible to deal only lightly and superficially with some of the multitude of topics mentioned. These defects will, no doubt, be put right in the full-length history that is to come. On the whole, however, Mr Tyson has succeeded in presenting a well-balanced and just account of the activities and attitude of the leading members of the business community in Bengal. It is a record of integrity and public spirit of which the Bengal Chamber of Commerce can be proud.

A Colony's National Income

THE PATTERN OF A DEPENDENT ECONOMY: *The National Income of British Honduras.*
By N. S. Carey Jones.
Cambridge University Press. 162 pages. 21s.

NATIONAL income studies now appear with monotonous frequency. The methodology of national accounting has been well mapped out in recent years; standardised procedures have been laid down and explained by national and international authorities; only the specialist continues to be fascinated by the implications of differences

in definition or of their application to new geographical areas. The layman may be tempted to class the latest in the series as a work of reference, to be consulted in times of specific need but never read.

It would be a pity if this readable and sensible little book were left to grow dusty among the statistical digests and the Blue Books. For the author has a refreshing approach to the study of national income. He is the enthusiastic amateur writing for the interested layman, and he is not afraid to use his intelligence and a wide colonial experience as a basis for generalisations which take him far beyond the bounds either of a national income study or of the little colony of British Honduras. The tables were constructed in his spare time and he writes with two aims in view: first to show that the job could be done effectively and broadly without spending too much time on the details, and, secondly, to use it as a basis for a general consideration of the problems of a dependent economy.

As a member of the Colonial Audit Service with practical experience not only of British Honduras but also of West, Central and East Africa, Mr Carey Jones writes his "*intelligent man's guide*" with authority. The technical accounting problems are taken in his stride. He had official permission to draw freely on unpublished Government sources and was in a good position to do so. Moreover, in a small colony the government auditor is often the only resident auditor and by servicing local businesses in a professional capacity he gains considerable insight into the working of the private sector.

About two-thirds of the book is concerned with the description of the estimates. Here the treatment is concise without being dry, for it is within this framework that the necessary qualitative factual material about the economy is set. The more generalised analysis and the occasional digressions of a general nature which enliven the descriptive matter are stimulating, but they have their weaknesses. The argument is not sufficiently closely knit to maintain the impact of generalisations ranging over such a wide field. Hence the analysis is occasionally slight even by a layman's standards, although it is always lively and generally sensible.

Problem Area

WEST DURHAM. *A Problem Area in North-Eastern England.*
By G. H. J. Daysh and J. S. Symonds.
Basil Blackwell. 208 pages. 45s.

FOUNDED on the great basic industries of coal, steel and engineering, the north-east coast of England cannot escape the effects of changes in the fortunes of these industries. Depression in them cannot be made good by activities on trading estates, valuable as the light industries attracted to south-west Durham have proved. The certain decline of coal mining in north-west Durham over the next ten to fifteen years presents problems that form the basis of this investigation by Professor Daysh, Mr Symonds and others. Exhaustion of the coking coal seams is expected to result in a fall of 18 per cent in coal production by 1965 in spite of a projected further investment of £20 million by the National Coal Board in north-west Durham's pits.

The fundamental issue, which the authors face frankly, is a choice between the migration of population and the attraction of new industry. They believe that the economy of north-west Durham is worth sustaining but recognise that big incentives may be necessary to bring new industrial ventures to the area. It is also admitted that the attempt could be made at too great a cost. Remarking that large-scale migration must be regarded as a desperate measure and a last resort, the authors observe later that

> migration of population might be found to be the best solution in the national interest . . . but it is difficult to believe that such a decision could be regarded as anything other than an unfortunate necessity.

The immobility of labour in a changing economy is a handicap imposed both by tradition in Durham and by social and human considerations. They cannot be ignored by any government, but they can be given too much weight, and is not life full of "unfortunate necessity"?

No solution is offered by the authors whose inquiry was carried out under the auspices of the Northern Industrial Group and made possible by a grant from the Nuffield Foundation. Handsomely produced and supported by excellent maps and a great deal of statistical information, the book deserves to achieve its purpose of securing careful consideration by the appropriate authorities of a problem that will have to be faced in north-west Durham in the comparatively near future.

Shorter Notices

THE ENGLISH VILLAGE.
By W. P. Baker.
Oxford University Press (Home Univ. Library). 224 pages. 6s.

This is an informed, well-documented little book that deserves to be read closely by everyone who takes an intelligent interest in the countryside. An introduction and six main chapters discuss in turn the appearance of villages, employment, society, religion, education and local government. The author has made a careful and conscientious study of the subject, which he has presented with remarkable impartiality—so much so that the reader is encouraged to draw his own conclusions at the end of each chapter and therefore at the end of the book as well. This may detract from its value, for although there is great need for facts, few readers can profit by them unaided. The whole subject of villages and village life is so amorphous, so diverse, so charged with misrepresentation and sentimentality that something more than information and discussion is needed.

A thread to guide the reader is missing from this book because the author—although he discusses it—does not appear to appreciate fully the fundamental problem of country life today. With the virtual disappearance of handicrafts no substitute has yet been found to provide employment alternative to the primary occupations of agriculture and forestry. It is possible that light industry in small units located in large villages or small country towns will provide the answer; but little has so far been done, and the rural exodus continues. Without a choice of easily available employment, the countryside will not regain stability. Thus, all other aspects of country and village life, so ably and so fairly discussed by the author, are in the end beside the point.

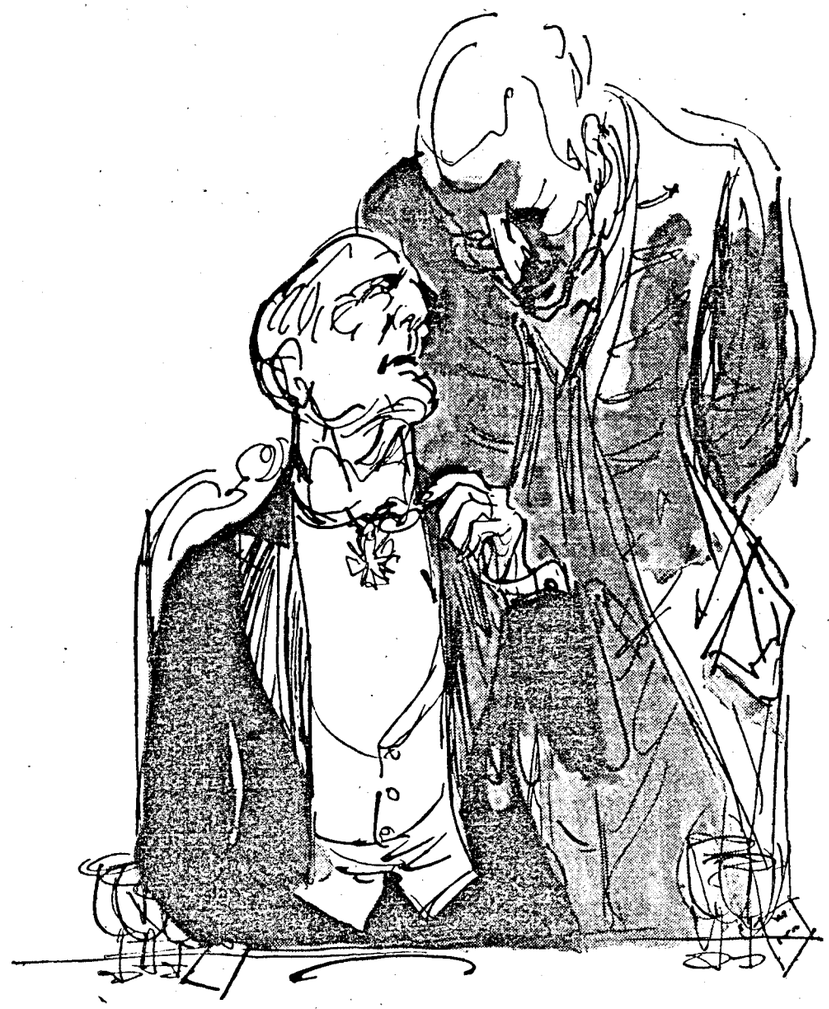
ESSAYS IN ECONOMIC ANALYSIS.
By Abba P. Lerner.
Macmillan. 394 pages. 28s.



Like the "grave dame" of a well-conducted Homeric household, Professor Lerner has in this book given freely of such things as he has by him, including some which he has "had by him" ever since his distant days as an infant prodigy at the London School of Economics. "I am a little disturbed," he says in his preface, "by the degree to which these articles still express my opinions." The reader, unless he is a specialist with his analytical faculties tuned to concert pitch, is likely to be disturbed for other reasons; am I, he will ask despairingly, am I really as dense as I feel? Combining as they do the pure zest in intellectual acrobatics and the inexperience in exposition to be expected in a brilliant young man addressing himself to keen fellow-workers in the same *atelier*, the earlier essays are, even when they do not soar altogether out of a non-mathematician's sight, appallingly difficult.

It is instructive, and also reassuring, to note how the difficulty decreases as the dates grow nearer and the brilliant student ripens into the professor. Considering the practical as well as theoretical importance of some of the subjects treated, notably Ideal Output (under the two headings of the Measurement of Monopoly Power and Statics *v.* Dynamics in Socialist Economics); various aspects of the Keynesian controversy; equilibrium in foreign trade; the nature, effects and cure of inflation, it seems a pity that the professor did not apply his maturer gifts of lucid and telling exposition to the task of editing the student's products.

FORMOSA: A PROBLEM FOR UNITED STATES FOREIGN POLICY.
By Joseph W. Ballantine.
Brookings Institution, Washington (London: *Faber*).
218 pages. $2.75.

Mr Ballantine was in charge of the American consulate in Formosa as early as 1912, and towards the end of a long career in the United States foreign service he became, in 1944, director of the Far Eastern office in the State Department. He was unusually well equipped to undertake this study of the past and present significance of the island to which the Nationalist government of China retreated in 1949. After a brief historical introduction, in which he deals fairly enough with both the successes and the sins of the Japanese administration of Formosa, Mr Ballantine describes the impact on the island of the Nationalists' arrival and gives chapter and verse for his contention that the economic situation has considerably improved since 1949. The heart of his book, however, is the analysis of United States policy as regards Formosa, and here, although his narrative of events is admirably clear and objective, he can do little more than point the dilemma and pose the obvious questions.

"Do you think I might have a little whisky instead: I should prefer White Horse if you have it."

MAXIMUM PRICES:— Bottles 35/-, ½-Bottles 18/3, ¼-Bottles 9/6, Miniature Bottles 3/8, as fixed by the Scotch Whisky Association.

Comment on crime

CRIME, violence, vice are with us more than ever before. It would be foolish for a newspaper to ignore them. The Manchester Guardian does not ignore—neither does it unduly emphasise.

There is nothing prudish about the Manchester Guardian. But it has a sense of balance. It is interested in good as well as in evil. It knows that not all the most important news comes from Old Bailey or the Divorce Courts.

Those who read the Manchester Guardian are kept well-informed and well entertained. The range of interests in the Manchester Guardian is indeed wide. The writing and reporting are clean and vivid.

For those who are justly weary of a surfeit of the Vicious Circle, we recommend the tonic of a change to the stimulating Manchester Guardian.

If you have any difficulty in getting your Manchester Guardian regularly, please write to: The Manchester Guardian, Manchester.

Yours faithfully

FAITHFUL service to the needs of agriculture, commerce, industry and the people of Britain is the objective of the Bank, in which all the advantages of intimate local knowledge of people and affairs are used to the benefit of customers and prospective customers.

Local Boards of Directors in important centres in association with resident District General Managers have, for many years, contributed much to the successful achievement of this objective in providing a distinctive banking service for everybody.

Enquiries will be welcomed and will meet with immediate and courteous attention at the local District Office or through any branch.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Mutual Security Devices

Washington, D.C.

FOR the past two months and more it has been easy to identify, from the hollows beneath the eyes, the air of a stricken deer, or the gestures of a man vainly trying to make his slide rule square the circle, the American officials concerned with producing the new Administration's budget. Now the struggle is over, the main portions of the new budget have been presented to Congress, and the officials are relaxing or in a mental home while their chiefs wrestle with Senators and Representatives over its provisions.

Despite the President's reduction of $8.5 billion in Mr Truman's request for $72.9 billion of new appropriations in the coming fiscal year, the Secretary of the Treasury, Mr Humphrey, has at last acknowledged that the impossible is impossible, that there is no chance of reducing actual expenditures in the coming year to a point where a balanced budget or anything like it can be achieved, and that the deficit in 1953-54 may run as high as $8.5 billion.

For the Administration the implications are serious enough; Mr Humphrey's statement means a denial of the easy assumptions of last year's campaigning season that a little common prudence and business sense would speedily lead to a balanced budget and eventually to a reduction of taxes. For the Republicans in Congress its implications are far more serious; for them it means that at the begining of next year's campaigning season—when most of them have to run for office and the President does not—the finances of the country will still be in the same state of chronic disequilibrium as in the "wasteful" days of Mr Truman, a fact which will take some explaining on the stump. Mr Humphrey may legitimately blame the situation on the enormous carry-over of committed but unexpended funds inherited from the past, but that is a sophisticated argument to use with the voters.

It is in this atmosphere that the latest mutual security programme has been launched with stern warnings on the part of the President and the Cabinet against attempts to cut it any further than they have done themselves. At first sight the new Act is difficult to understand, since it appears to be contrived on an entirely different basis from its predecessors. It is full of special devices which have been carefully worked out by the mutual security officials with the idea of including as much as possible under headings which will have the effect of economic (or "defence support") and technical aid, while appearing to ask for much less for these purposes. The accompanying table, which does not follow the classifications adopted in the Bill itself, but attempts to compare like with like, shows that the emphasis is much less on purely military aid than the official wording suggests.

It is true that the sum available for economic aid to Europe has been reduced by more than fifty per cent, but even so the reduction is not catastrophic. Thus France receives $100 million for fighter aircraft and $400 million for the supply and equipment of the forces in Indo-China, or a total of $500 million which will be channelled through the French budget, as against

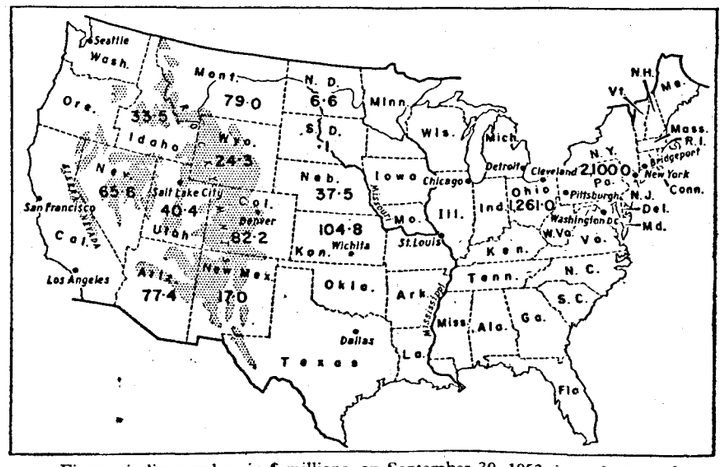
* Includes provision for Jugoslavia, for aircraft production in Britain and France, and for special British commodity plan.

$525 million in the current year. The United Kingdom is down to get an equivalent $100 million for aircraft (for its own, not allied, use), $100 million for commodities and the likelihood of at least another $100 million in offshore procurement contracts financed out of military aid funds. It is unofficially calculated that about $250 million will be actually paid up and available to help the British balance of payments during the coming fiscal year, in addition to the carry-over of some $120 million in unspent funds from the current year's grant of $300 million of economic aid. Unfortunately, owing to an obscure rider in last year's Act, the American wheat, cotton, and other commodities will have to be paid for at the world price and not at the much lower price they would fetch as unsaleable surpluses.

The $250 million set aside for "special weapons planning" is an intelligent scheme whereby a North Atlantic Treaty country can be encouraged to go ahead with the development of a new weapon which its scientists may devise but which it could not contemplate either promoting or producing from its own existing resources. As this scheme is designed to back up the impending overhaul of the plans for the protection of Europe with new and revolutionary weapons and defensive devices, it is a fair assumption that a substantial part of this fund may be devoted to the development of guided missiles in Britain, which has a clear lead in their design.

It is worth noting that, despite the pejorative statements which Mr Dulles has made from time to time about the value of Point IV for under-developed areas, and the generally anti-idealist approach of the Republicans to international affairs, the Bill proposes an appropriation for technical co-operation or Point IV which is larger than that granted last year. Indeed, the various forms of non-military assistance requested for the Middle East come to $234 million as against $181 million granted last year. Economic aid for India and Pakistan at $94 million is only a little less than the Democratic Administration asked for last year. There is no political dividend at this moment in extending a helping hand to India, since Mr Nehru is regarded as the most equivocal figure in the cold war. Despite the big shift of military funds from Europe to the Far East, it is clear that Mr Stassen, the Director of Mutual Security, has stood his ground in the detailed planning of the Bill both against the military and against those who would appease Congress at any price.



It is quite certain that Congress will cut the total figure requested, and the experienced prophets predict an eventual appropriation of about $5 billion, that is, a reduction of about $800 million. It will be very hard both to counter the argument for stringent economy and to explain away the existence of $11.9 billion of unspent funds voted in previous years for foreign aid, over $4 billion of which are still uncommitted to any particular project. The fact that the European army treaty, which Mr Dulles has encouraged Congress to look upon as a touchstone of European good faith, will not be ratified by the time the cutting process starts does not bode well for either the economic or the military requests for that continent, even if the two-year-old negotiations with Spain for bases are concluded in time to give Senator McCarran and Senator Bridges a faint feeling of warmth about Europe.

There is a distinct possibility that the new Administration may have been too ingenuous in its calculations. The Truman Administration, with hardly a blush, was in the habit of taking account of Congress's inability to resist wielding the axe, and to request about 20 per cent more than it expected to receive. President Eisenhower has asked in the gravest language for the full amount and no reductions, as have Mr Stassen, Mr Wilson and Mr Humphrey. Even Mr Dulles has adopted on aid a stiffness of back which unfortunately was quite absent from his testimony on freer trade. So far much the most effective Administration spokesman on both trade and aid has proved to be Mr Stassen, who has shown himself to be surer of his facts, quicker on his feet, and less easy to intimidate than any of his colleagues. He has combined a grasp of what he is doing with a humility about the role which his agency should play in the government hierarchy which is impressive, and it is possible that, as the Mutual Security Bill grinds its way from committee to committee through the summer, the foundations of a new political reputation may be laid.

Industry Stays Put

FROM A CORRESPONDENT IN COLORADO

ANYONE window-shopping along Main Street in any town between the Missouri River and the Sierras can see that nine-tenths of the manufactured goods offered for sale come from at least a thousand miles away. This applies to everything from automobiles to breakfast-foods; children in the great midwestern corn-wheat belt are fed on cereals made in Michigan. The qualification attached to prices, "slightly higher west of the Rockies," is familiar in national advertising. The region of the prairies and the mountain states has always been a supplier of raw materials and a buyer of finished products, a role which brings economic

Figures indicate value, in $ millions, on September 30, 1952, in each state of defence facilities for which tax amortisation certificates have been granted. The total value of these certificates for the whole United States on September 30th was $23,000 million.

inferiority, since it means that average incomes are lower while things bought are more expensive than elsewhere; an automobile which is priced f.o.b. Detroit costs from $100 to $200 more in the west than it does in Detroit or New York. It is this feeling of economic inferiority that has long made the region the most politically unstable in the country, one where popular upheavals such as the Nonpartisan League have flourished and where "Wall Street" is still a fighting word.

During and after the last war, it seemed possible that the atomic age might bring something approaching self-sufficiency to this central region, simply because of the danger of having most of the country's manufacturing capacity concentrated in the area between New York and the Great Lakes, where a few shrewdly placed bombs could paralyse its industry. The government actually went so far as to compel a few important industrial shifts; the Chance-Vought aircraft factory was transplanted from Bridgeport, Connecticut, to Dallas, Texas; and some of the facilities of the Boeing aircraft company were moved from Seattle, Washington, to Wichita, Kansas. Even the possibility of establishing an alternative national capital at Denver, or somewhere else in the Rockies, was discussed. But any more suggestions of compulsory transfers were quickly choked off by the angry protests of chambers of commerce in the industrialised regions, backed up by the local politicians.

Nor is there much to show for the efforts of chambers of commerce in the vast open expanses of the midwest, which banded together to preach the advantages of space, dispersal, climate, distance and a relatively plentiful labour force. A few of the smaller eastern industrialists were drawn by the elaborate brochures; a piston-manufacturer moved from Chicago to Pueblo, Colorado, a law-book company from New York to Colorado Springs. But the Nestlé company, which moved out tentatively from New York to Colorado Springs, went back again, and most of the bigger fellows appear to feel that decentralisation means leaving Manhattan Island for the suburbs of New York.

★

Even the government seems to have given up. At first most of its new atomic energy and other scientific activities were located in the empty spaces of the west, but now the big installations are being put up east of the Mississippi. More evidence of the government's backsliding can be found in the use being made in the mobilisation programme of the tax-amortisation device, under which companies are allowed, for tax purposes, to write off the cost of facilities considered essential to national defence in five years instead of twenty. At the end of April, certificates permitting such quick amortisation had been issued for new facilities valued at over $26 billion.

But about one-third of these were concentrated in the industrial north-east, in Illinois, Michigan, Ohio and Pennsylvania. Furthermore, these certificates are all designed to encourage the traditionally predominant activity of the region concerned rather than boldly to bring finishing and manufacturing industries into new areas. In the twelve western mountain and plain states, virtually all the tax amortisation permits that have been granted have been for the development of mining, or of preliminary processing of mineral and agricultural products. And these states, with a third of the nation's area and about 6 per cent of its population, have received in all only about 3 per cent of the national total of "certificates of necessity."

Since the last war the west has seen a steady absorption of locally begun industrial undertakings by their larger eastern competitors; promptly after this they become branch plants subject to orders from 2,000 miles away, or are perhaps closed down entirely. The same story applies to much of the raw material production and processing in the region. Mining enterprises, such as those for producing fluorspar and perlite, have passed almost entirely into the hands of absentee owners, who often shut them and keep them as a standby reserve. What usually happens is that a new regional enterprise is started by young men with an idea, courage and a scanty stock of capital; sooner or later they run into financial difficulties and find that money is much easier to obtain in the east, but that to get it they must surrender control. So most of them sell out and become branch managers of the enterprises they themselves started.

Over the years this has meant that local businessmen have become subordinates of eastern firms and are more interested in promoting their own enterprises than in building the community. For example, should Denver or Salt Lake City be chosen as a suitable place for making a new type of refrigerator, all the refrigerator dealers and wholesalers would immediately unite to preserve the area as their market, rather than to encourage a new industry. The big new buildings going up in Denver are financed by outside capital, from New York or Texas.

Yet in spite of this western cities still do have considerable home-grown and home-managed industry. In Denver, for example, there are the country's ninth largest rubber products company, its leading manufacturer (in units) of hand-luggage, several makers of equipment for mining (such as the world's chief manufacturer of froth-flotation machinery) with world-wide markets, and a small but thriving group of producers of specialised electronic and optical equipment. But the successful local enterprises either make small, light, highly fabricated articles that carry a low freight charge proportionate to their value, or spring from a traditional skill in producing special equipment for regional industries such as metal mining.

American Notes

Defence's New Look

THE general shape of President Eisenhower's defence programme is now becoming clear. The most striking change is the replacement of all four of the Joint Chiefs of Staff, the President's service advisers; even Admiral Fechteler, whose term had another two years to run, is to leave. If the reorganisation plan now before Congress goes through, the new chairman, Admiral Radford, will have more authority and influence than did General Bradley, and he is a man to make full use of his powers. Admiral Radford comes back to Washington from the Far East,

where he won the Secretary of Defence's heart when Mr Wilson accompanied General Eisenhower to Korea before the inauguration. More recently the Admiral won the Republican party's heart by advocating a blockade of Communist China as a way of hastening a settlement in the Far East. The appointment of this energetic and able man is made to order for Senator Taft; the Senator's distrust of the old Chiefs of Staff, particularly of General Bradley who was so closely involved in the Democratic Administration's policy of containment, is well known. But those who fear Admiral Radford's aggressiveness should remember that General Eisenhower was also closely involved in that policy and that final decisions rest with him.

Admiral Radford's earlier relations with Congress were not so happy, for he was the leading naval spokesman in the inter-service civil war fought between the Navy's super aircraft carriers and the Air Force's super bombers. It is a controversy that, in a different form, may soon be concerning Congress again, for the Air Force has taken the brunt of the President's cuts in the defence budget. These cuts are in plans for future spending rather than in actual spending in the coming fiscal year, which explains why they have fallen so heavily on the Air Force; its complicated and expensive equipment must be ordered far in advance and it has even more funds in hand than have the other services.

The cuts are apparently to be sold to Congress as a way of getting a stronger and more up-to-date Air Force more quickly, providing it with 114 fully equipped groups in a year's time, and 120 eventually, instead of building more gradually to the 143 groups which were once supposed to be ready in 1955. This is in fact the official new look of all features of the Eisenhower defence programme. Expansion is to be curtailed, temporarily at least, in favour of getting existing forces into fighting trim. But the promise of more immediate security for less money cannot conceal that the peak of rearmament is not only to be reached more slowly but is also to be lower—unless the new Joint Chiefs of Staff insist, as they may, on reversing this trend, about which their predecessors can hardly feel happy.

Almost the only way in which spending can be reduced quickly is by having fewer men to pay and feed; a slight reduction in the size of the forces is therefore coming soon. This will have the political advantage of lessening the number who have to be conscripted each month. President Eisenhower's request for funds for the Army, at $13.7 billion, is rather higher than Mr Truman's last January, but this is because provision for the Korean war is included; in the past it has been financed later by supplementary appropriations. The President is asking for $1.7 billion less for the Navy and $5 billion less for the Air Force, to which he allots $11.7 billion. Altogether the request for new defence appropriations for the 1954 fiscal year, beginning next July, is $36 billion, compared with Mr Truman's $41.3 billion; but actual spending in the year is put at only $2.3 billion below Mr Truman's estimate.

Tidelands—Third Time Lucky

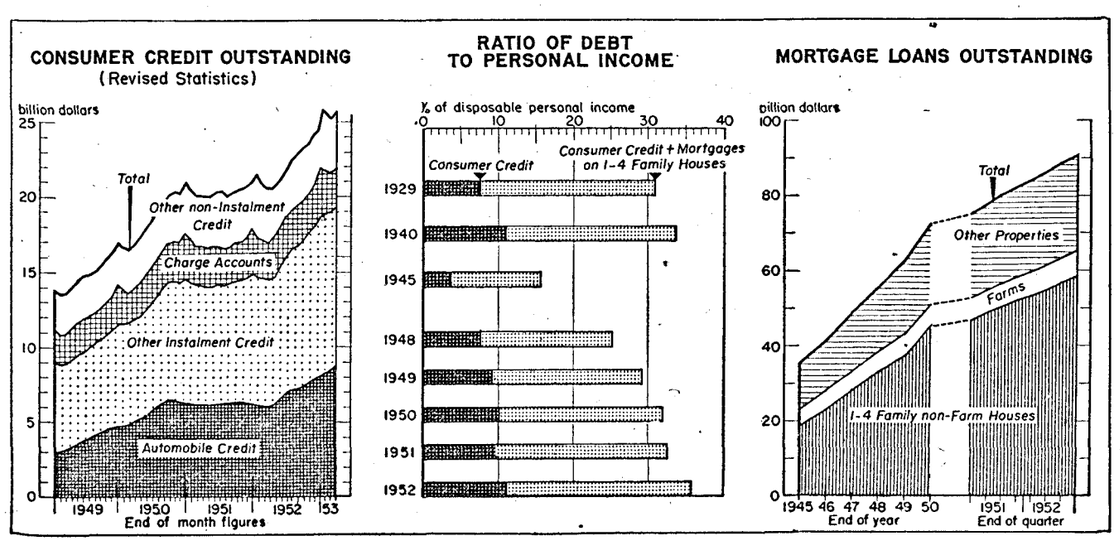
PRESIDENT EISENHOWER is about to fulfil one of his most specific election promises and sign the so-called Tidelands Bill, just approved by Congress for the third time but twice vetoed by President Truman. The present version of the Bill confirms the title of states to submerged lands off their coasts and gives them the right to develop the resources of those lands, which means the right to grant leases for oil drilling. The authority of each state under the Bill extends to its historic boundaries, usually three miles out to sea, but three leagues, or over ten miles, for Texas and Florida. There is some doubt in these two cases, however, and this doubt is only one of the many reasons why Mr Eisenhower will not end the offshore oil argument simply by signing the Bill.

The fact that Congress has confirmed the claims of individual states to rights outside the three mile limit is likely to encourage other countries, such as Mexico, to press claims beyond that limit. If, in an attempt to make the division of rights absolutely clear, the Senate follows the House's example and authorises the federal government to develop undersea resources between the historic boundaries of the states and the edge of the continental shelf, then there may be new legal disputes over the exact limits of Texas and Florida. For in the Gulf of Mexico most of the oil is well out to sea.

Finally, and most important, states with no offshore lands but with Democratic Governors are planning to appeal to the Supreme Court against what the *New York Times* has called "the greatest give-away programme in history." These states dispute the power of Congress and the President to reward the voters of California, Texas and Florida (Louisiana resisted the temptation to turn Republican) at the expense of the voters of the whole country. The argument is that the President ought not to hand over what is widely believed to be a national asset to a few states whose claims the Supreme Court has refused to uphold.

The attempt of a few determined Democrats to make the public realise what was happening held up the Bill for nearly five weeks in the Senate, one of the longest debates ever remembered, although there was never any doubt of its approval by a large majority. Senator Morse, the independent Republican, became the record-breaking hero of this "educational effort" (a filibuster to most of the Senate) by speaking continuously for 22 hours. He has announced that he will provide equally sustained opposition to any other attempt to give away the national resources, such as the proposal of Senator Malone of Nevada for presenting the states with the rights to mineral resources under federally-owned lands. If the Administration gives the Democrats further opportunities for exploiting this issue during the coming year, it may also give them, as they hope, a winning card for the 1954 election.

Drowning in Debt?



ABOUT the only element in the American economy that causes immediate concern is the rising flood of indebtedness. Not only is far more owed than ever before but commitments are also increasing, especially in the instalment credit, or hire purchase, field, faster than almost ever before. Those who feel that there is a danger that consumers will be unable to keep their heads above their debts, and will drag prosperity down with them, argue that the ratio of outstanding debts to disposable personal income (income after taxation) is higher than it was in 1929; for instalment credit, the present ratio is 6.8 per cent, compared with 3.9 in 1929.

But the Department of Commerce, in a reassuring article in the April issue of its *Survey of Current Business*, draws

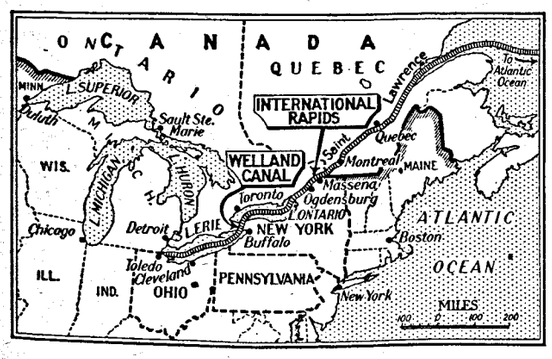
attention to the higher 1940 ratio of 7.1 per cent. This, the author points out, was the result of the great development in the nineteen-thirties of instalment buying, a practice which was hardly out of its infancy ten years before, but which has now become a habit. It is to be expected, therefore, that consumers will spend a growing proportion of their incomes on hire purchase payments. The buying of houses on mortgage, the other important factor in the present total of consumers' debts, is a long-established practice, but here also the trend is upward; an increasing number of people would rather own homes than rent them. Furthermore, the natural rise in mortgage debt was accelerated by the postwar demand for houses, once building began again. In the same way, instalment purchases have been stimulated by the recent abundance of automobiles and other durable goods which were for so long difficult to find.

But neither houses nor cars would have been bought if people had not had plenty of money to spend and the Department of Commerce admits that there would be a real risk of consumers drowning in their debts should the steady postwar rise in incomes be checked. The wholesale repudiations of the nineteen-thirties are not likely again, since today consumers are much better supplied with liquid assets; nor would such repudiations be as disastrous as they were then, for credit insurance is now general and the losses would thus be more widely spread. But if personal incomes begin to decline, the burden of capital and interest payments on hire purchase and mortgage commitments would accentuate the inevitable fall in direct new spending.

Here again the government study finds a silver lining; interest charges are lower, compared with incomes, than they used to be. But they are now rising and even the rate on government-insured mortgages has at last, belatedly, gone up to 4½ per cent. One of the reasons why these increases have been encouraged by the Federal Reserve Board has been the hope that the rise in consumers' debts would be checked as a result. But if it is, say labour leaders, the country will be pushed into a depression by the consequent slackening in the demand for houses and durable goods; 60 per cent of all cars bought last year were paid for, at least partly, with borrowed money.

Press Bites McCarthy

WHEN he summoned Mr James Wechsler, the editor of the left-wing but anti-Communist *New York Post*, to testify before his sub-committee several weeks ago, Senator McCarthy may have felt that he was on sure ground. Mr Wechsler had made a secret neither of his membership in the Young Communist League from 1934 to 1937 nor of his outspoken liberalism over the past few years. What actually happened when Mr Wechsler took the stand, however, may have been something of a shock. In the first place, the committee's Baker Street irregulars, Messrs Cohn and Schine, had not done their homework properly: they were unable to name the supposedly Communist books by Mr Wechsler which they claimed to have tracked down in American libraries overseas. The Senator himself flatly stated, moreover, that in one of these books Mr Wechsler had denounced that star informer and repentant Communist, Mr Budenz. The resulting exchange showed immediately that Mr McCarthy had never even looked at Mr Wechsler's books. More important still, Mr Wechsler has now succeeded in obtaining the publication of a transcript of his testimony and this reveals that at several points other members of the sub-committee, such as Senator Symington from Missouri and Senator Jackson from Washington, both Democrats, strongly disagreed with the grand inquisitor.



What is interesting is not only that such a clash between Senator McCarthy and one of his witnesses should have taken place at all (although that is heartening in itself), but also that Mr Wechsler is receiving so much support. This is the result of his appeal to the sacred principle of the freedom of the press. The *New York Times* actually bristled and the newspaper world has rallied against this attempt at intimidation. For Mr Wechsler and his paper have been outspoken in their criticisms of the Senator and it is difficult not to feel that the investigation was inspired more by a hope of muzzling Mr Wechsler than by a desire to track down Communist influences.

It has been particularly dismaying throughout this whole period of McCarthyism that the people who control

the media of public communication, though they have a vested interest in freedom of thought and expression, have on the whole refused to fight back. It seems to have taken Mr Wechsler to show that blood can be drawn even under kleig lights. In the face of a slump of the liberal mind such as McCarthyism represents, even as in the face of a slump in a liberal economy, what is most to be feared is fear itself. Mr Wechsler's courage should help others when they have to face the Senator.

From Toledo to the Sea

EVERY American President since Harding and every Governor of New York State since 1907 has come out in favour of the St Lawrence Seaway—the plan for opening up a deep water route between the Great Lakes and the Atlantic. But despite the obvious need for such a route and the fact that the project should be jointly undertaken by the United States and Canada, it has always up to now been lost in a maze of Congressional hearings. The Seaway has been stubbornly opposed by Gulf and East Coast port interests, by private power companies who fear the competition of the St Lawrence's hydro-electric potentialities, and by the Association of American Railroads. Now, however, the entire weight of the Eisenhower Administration has been placed behind the project. General Eisenhower has long believed that American security requires a relatively protected inland waterway; moreover,

the St Lawrence route would bring the now vital iron ore of Labrador directly to midwestern steel mills. But these new considerations were not enough to get the Bill through Congress the last time Mr Truman pressed it.

Under the Bill now proposed by Senator Wiley, a St Lawrence Seaway Development Corporation would be financed by government-guaranteed bonds to the value of about $100 million. The United States would limit its share in the project to the International Rapids section along the New York State boundary. This means in effect that sea-going vessels would be able to go up the chain of lakes as far as Toledo, at the head of Lake Erie. The original scheme had extended as far as Duluth in Minnesota; this would have been much more costly, since it would have involved the building of lesser canals and the dredging of more harbours.

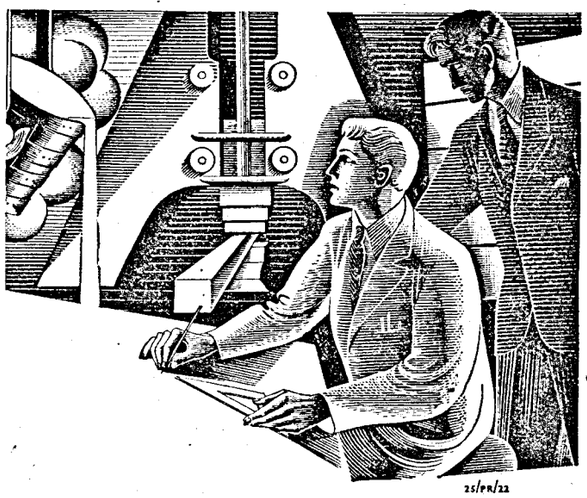
The hydro-electric side of the project, on which Canadian agreement to the project depends, would, under the new scheme, be left to a joint undertaking, already agreed between the State of New York and the Province of Ontario, both of which are short of electric power; it will involve a mammoth generating plant costing each of them about $315 million. In the past the Federal Power Commission has been reluctant to let New York State handle the matter independently of the federal government. This reluctance may, however, be modified, now that there is a President who believes in letting the states deal with as many of their own affairs as possible. A decision from the FPC is expected shortly.

Since the federal government will no longer be involved in the electricity development and since the new scheme will be cheaper, and should in any case cost the taxpayer little or nothing, it is possible that this time the President and Senator Wiley will succeed in getting the Seaway Bill past the pressure groups. An additional factor in favour of the Bill is that Canada is now definitely prepared to go ahead alone on its side of the St Lawrence if the United States again refuses to participate.

SHORTER NOTES

The official reason for the presidential reorganisation of the Export-Import Bank, the agency which makes loans to facilitate certain types of exports, is that it will make it more business-like. But in practice there is a danger that it will make the bank easier to influence by political pressure. For the present board of five directors, one of whom is the Secretary of State, is to be replaced by a single managing director under the scheme, which will go into effect at the end of June unless disapproved by Congress.

★



At last it will no longer be necessary for Congress to debate each year whether the national capital should follow the example of neighbouring cities and change to daylight saving time for the summer months. A Bill has now been passed leaving the decision to the Commissioners of the District of Columbia. But the opposition of rural Congressmen meant that this year Washington was several days behind other cities in changing its clocks, to the confusion of airline, railway and wireless schedules.

★

The special duty of 18 per cent that has been placed on wool tops applies only to imports from Uruguay and is intended to offset, under the anti-dumping laws, the subsidy which, according to the US Treasury, is being paid to exporters of wool tops by means of a manipulation of the rate of exchange by the Uruguayan government.

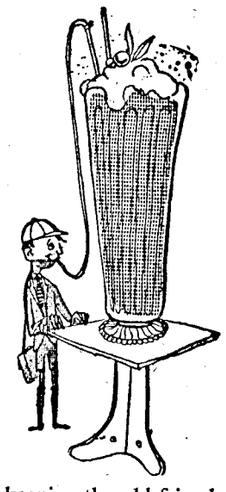
Collier's is a magazine intended to appeal to every member of the family, but nowadays people look at television so much that they have no time to read it. So from the beginning of August they are to have two weeks for each issue instead of only one. Bi-weekly publication is also intended to appeal to advertisers and to prevent the magazine from losing money next year as it did last.

But where's the alloy
THAT WILL DO THIS JOB?

New designs with higher standards of performance often require improved materials. It is the job of the metallurgist to see that these materials are available when required. He and the designer both have the same objective — the project which in a few years' time may be depending on materials not yet commercially developed.



Mond Nickel is working now on such problems in the field of nickel alloys. Now is the time for designers to . . .

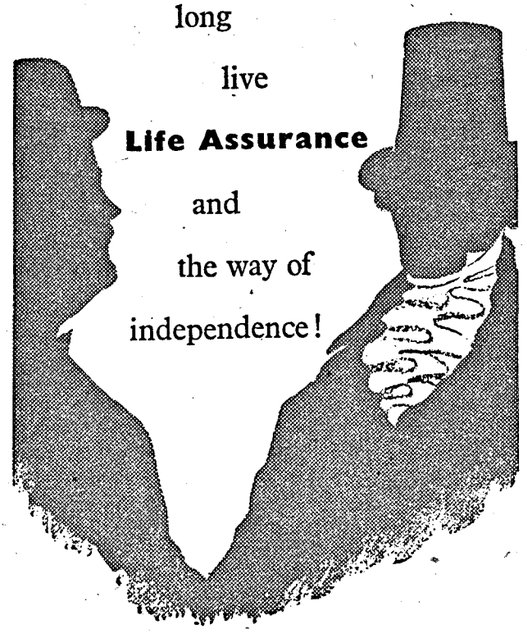
HEAVY CONSTRUCTIONAL ENGINEERING, EXCAVATORS, INDUSTRIAL AND DOMESTIC HEATING APPLIANCES, FUEL ECONOMISERS, IZAL AND OTHER CHEMICAL PRODUCTS.

Life Assurance is a bare couple of centuries old.



In two hundred years it has grown and flourished, accepting responsibility year after year for impressively large sums of money.

Why has it grown? Because it fulfils an obvious and urgent human need.

How has it grown? Under scrupulous direction and management.

How is it run? By some seventy competing offices — by men who have spent their lives in the business — to the benefit of all whose risks are covered, and especially all with-profit policy holders.

Then long live **Life Assurance** and the way of independence!

The World Overseas

Malan and the English

FROM OUR JOHANNESBURG CORRESPONDENT

A VICTORIOUS Bolingbroke who also happens to be a republican, Dr Malan after his sweeping electoral victory professes to find the English almost as much a problem as Henry found Richard. Politically relegated to Pomfret's Dungeon, the English are unlikely to make a quick comeback, but meanwhile they are also likely to prove an awkward captive. "In the election," said Mr Strydom, who is Dr Malan's probable successor at no distant date, "the English-speaking section voted virtually as one *bloc* against us." The *Burger* noted the same fact in almost the same words, though it pretended to find this "surprising and discouraging." The *Transvaler* lamented: "How was it that there were 18 genuine urban seats in which the Nationalist Party did not even dare to put up a candidate? Why were the majorities so great in the thoroughly urban seats that many candidates lost their deposit? The city people stood as a solid *bloc* just where they have always stood. Not a trace of Afrikaner influence could be seen. The wall of entrenchment about the English was nowhere broken through, and there is no hope that it will be penetrated within foreseeable time."

What the Nationalists are admitting is that they won a majority of seats with a minority of votes. They are in power, probably for a long time ahead. They did not carry even all the Afrikaners with them. But the solid core of resistance to them, more clearly visible now than ever before, is represented by about 1,000,000 English-speaking South Africans, whom the *Transvaler* sums up as "the unreachable Englishman." With the non-Europeans temporarily battened down under Mr Swart's Public Safety and Criminal Law Amendment Acts, the Nationalists' real political problem has become "what to do with the English."

Invitation

Dr Dönges lost no time in supplying, by implication, a simple answer. Addressing himself to the politically defeated English, he asked: "Do you want to exclude yourselves permanently from a share in the government of South Africa? If you want to be fellow-citizens, you must not exclude yourselves from the party which for many years in the future will form the government of the country." The *Burger* earnestly recommended the same solution. It urged the English to "overcome their vague fears of Afrikaner aggression in the most effective way"—by joining the Nationalist Party. For "no Nationalist Party would dare to violate the rights of the English-speaking people if it was dependent upon English-speaking support."

In the mouth of Dr Dönges, who has already made it more difficult for British immigrants to become South African citizens, the offer seems less a blandishment than a threat. So does the *Burger's* conditional offer of a non-violation of English-speaking rights. In fact, as the *Transvaler* frankly admitted, there is no prospect of any large number of English-speaking South Africans joining the Nationalist Party. If they did, South Africa would be well on the way to becoming a one-party state—which of course may be what Mr Strydom wants.

Dispensation

Meanwhile the country continues to be ruled by a party representing one white section only, with the English virtually disfranchised; and, as Dr Dönges said, the Nationalists are probably in power for a long time to come. Without some alteration of the electoral machinery, it is indeed difficult to see how the Nationalists can now ever be ousted. The Nationalists are quite likely to alter it, but only in a way that would further entrench their power: if they lower the voting age to 18, this will certainly bring in more Nationalist than anti-Nationalist voters. As the *Transvaler* piously remarked: "Is it not again a marvellous dispensation of God that English-speaking people are turning their backs on the teaching profession and that it is increasingly being left to the Afrikaners to man our schools?"

Out on a limb, the United Party shows distressing symptoms of being at sixes and sevens as well. Senator Heaton Nicholls thinks the political marriage between Boer and Briton which was solemnised but hardly consummated in 1910 has failed, and that there should be a divorce. United Party spokesmen condemn this as "preposterous." The *Burger* does not believe Natal's secession threat is real, and crows: "The Natal leader of the United Party, Mr Douglas Mitchell, will see to that. . . . It is proper that it is the United Party that has to handle this hot potato." However adept it may prove at handling the hot potato, the United Party shows no signs of being able in the future to preach more effectively that it has done in the past a "South Africanism" that would successfully counter the tribal appeal of the *Boerenasie*. Mr Nicholls's suggested cure may be impracticable, but his diagnosis can scarcely

be sneered out of existence. Given the existing electoral set-up, the facts surely support it.

Dr Malan is 79. Mr Strydom is 20 years his junior. Mr Strydom not only wants a republic, he wants one language instead of two. There seems nothing to stop him getting it, short of a split within the Nationalist camp, of which there is at present not the least sign. The English, and a minority of the Afrikaners, have already cast their votes unavailingly against "Strydomism." They are unlikely to be able to muster more votes in the future. On the contrary, their voting strength may already have passed its peak. Nothing succeeds like success, and it is not inconceivable that Dr Malan will get his two-thirds majority yet.

The United Party did not lose the election because it was too liberal in its approach to non-Europeans. As the political commentator of the Natal *Daily News* correctly pointed out, "the United Party wisely addressed itself to that broad mass of South African opinion which is as yet rather more inclined to diminish non-European rights than to extend them. . . . So far as the colour question is concerned, public opinion in South Africa is still overwhelmingly reactionary." But this did not avail Mr Strauss. A more "liberal" approach would, of course, have availed him still less. If some "liberals" now break away from the United Party, this will not make much difference, except to weaken the party further. But in any case the electoral dice are heavily loaded in the Nationalists' favour.

Full Circle

It now remains to be seen what the Nationalists will do with their victory. Their tone has so far been moderate. They would prefer to woo the English rather than keep them politically locked up. If the *Transvaler* is right, the wooing must fail. Since it is the Nationalists themselves who have rejected "South Africanism," the English could become good Nationalists only by becoming "good" Afrikaners. The English will instead become a large, disgruntled political minority in a house redesigned by Mr Strydom chiefly for the convenience of Afrikaners. Some of them may decide to leave, but the majority will surely remain, though in an unhappy, chafing state. In that case there will be no South African nation. All that will have been achieved will be that the wheel will have come full circle from the years immediately after the Boer War, with Mr Strydom taking the place of Lord Milner and the English in the place of the defeated Boers. The English are unlikely to produce a Hertzog to turn the political tide in their favour, any more than the Nationalists are likely to produce a Smuts or a Botha able to heal the wounds. As even Mr Strydom wants a South African nation, though on his own terms of total English capitulation, the Nationalist victory will to that extent prove self-defeating.

But before this melancholy repetition of history has had time to work itself out, a factor which can never be ignored may upset all calculations. Boer nationalism already stands opposed to a growing and hardening black nationalism. In the long run, "the unreachable Englishman" was never the real enemy. On the colour issue, the two white sections in South Africa do stand close together. But they stand close together only in reaction, and on the other issues that divide them they were never farther apart. This is the essential tragedy of white South Africa as a whole.

Cold Spring in Strasbourg

FROM A CORRESPONDENT

THE Continent has been having its coldest spring for years. Perhaps this weather affected the delegates to the Consultative Assembly in Strasbourg as they shivered last week on the steps of the House of Europe under the bleak sky. Their main task was to consider the draft treaty for a European Political Community (EPC) which has been compiled over the last six months in the hot-house atmosphere of the six-power *Ad Hoc* Assembly. (See *The Economist* of January 10th.) Last week's debate suggests that this exotic bloom has been transplanted too soon to face the rigours of a cruel spring.

Strictly speaking, the Consultative Assembly was asked to consider only the articles governing association between the six-power community and the other members of the Council of Europe, and the effect of EPC on the unity of Europe as a whole. In any case, the decisions of the Assembly are not binding on any one. But it has provided a valuable picture of parliamentary opinion in Europe, at least for those who recognise that enthusiasts for union are over-represented there; and the tone of its debate may have influenced the ministers of the six powers when they met in Paris to consider the treaty on Tuesday.

In December, 1951, when M. Spaak resigned as president of the Consultative Assembly in disgust at its timidity, a mood of exalted passion inspired most of the Continental delegates, who plunged into the task of building a six-power federation six months later with confident excitement. Very little of that mood survives today. Even the remaining enthusiasts seem moved more by obstinate determination than by heroic verve. And, oddly enough, some of the British delegates, who a year ago seemed to be encouraging the Continent to go ahead in the assurance that Britain would find a way of associating with their community, have now gone out of their way to attack it.

No Concept of Hegemony?

Last week, consistent support for EPC came only from representatives of the government parties in Germany—notably Herr von Brentano and Herr von Merkatz. But the impact of their support was weakened by an interesting dispute about Article 103 of the Draft Treaty. This article states that "When a member state regains jurisdiction over a territory which formed part of that state on December 31, 1937, the present statute shall *ipso facto* become applicable to the said territory." It had been accepted without discussion by the constitutional committee of the *Ad Hoc* Assembly, but it was strongly opposed by the German Socialists, who had boycotted the *Ad Hoc* Assembly, on the ground that it would prejudice the possibility of negotiations with Russia over German unity. Moreover, the legal committee of the Consultative Assembly held the article to be void in law. Nevertheless, Herr von Brentano argued strongly for retaining the article. In doing so he referred to Mr Boothby's point that the EPC was based on an unstable equilibrium between Germany and France which German re-unification would be bound to upset. Herr von Brentano replied that the concept of hegemony no longer existed for Germany; therefore the relative weight of the various members of the

EPC was less important, and a reunited Germany must be admitted without changes in the Statute other than an increase in the number of German seats. It can be imagined that this statement did not notably increase French enthusiasm. In the end the assembly decided to ask the six powers to reconsider Article 103 in the light of its criticisms.

Of the French delegates only M. Teitgen gave the EPC warm support, though even he qualified this by suggesting that the defence community might be abandoned if Russia showed a real desire for peace. M. de Felice (Radical) reiterated M. Bidault's demand that the Saar problem must be solved before the Continental community was built. M. Plaisant, the Left Republican chairman of the Senate Foreign Relations Committee, strongly attacked the EPC's projected supranational powers, and M. Saller, of the same party, claimed that France's seven extra seats in the Peoples' Chamber of the EPC were quite inadequate to represent the 78 million overseas members of the French Union.

The Divided British

Many British delegates also spoke in many voices. Despite the official neutrality of both Conservative and Labour parties—due to fear of taking the blame for the possible breakdown of the EPC—Messrs Boothby and Amery made impressive criticisms of the EPC treaty as likely to produce new divisions in Europe. Lord Layton and Mr Longden, however, warmly welcomed the treaty. Official British caution produced an amendment under which the Assembly, instead of asking the six governments to proceed to "the speedy conclusion of the task they have undertaken," simply requested a "speedy decision on the draft before them."

The attitude of the Continental delegates this time was very like that of a young man who, having run away from home in a mood of excited defiance, returns quiet and chastened in the hope that all will be forgiven. Thus the retreat from a six-power Little Europe is producing a new desire to make something of Big Europe, and in particular to find a real function for the Council of Europe itself.

This was very evident in the meeting of the Committee of Ministers which preceded the Consultative Assembly. M. van Zeeland, who presided in the absence of Mr Eden, made valiant attempts to take the initiative, and persuaded his colleagues to begin framing a "programme of action" for the committee. But its only decision of note last week was to appoint a personality of eminence to study and make recommendations on European problems of refugees and over-population. It had been hoped that the committee would finally sign a number of agreements submitted in the last year or so by the Consultative Assembly. It had failed to sign them before because France insisted that the Saar government should add its signature, while Germany refused to be party to any agreement signed by a government it does not recognise. It seems that last week France and Germany had reached agreement on an expedient for overcoming this obstacle, when the representative of the Saar government, though sitting only as an observer, managed to torpedo it.

Symptomatic of the general trend away from Little Europe was the ministers' decision to authorise the building of a new wing to the House of Europe in Strasbourg, in which to house the organisations of the Six. M. van Zeeland himself told the assembly that he favoured the establishment of a permanent committee of ministers' deputies in the Council of Europe analogous with those in Nato and OEEC. M. van Zeeland has already emerged as the most outspoken sceptic about EPC among the governments of the six powers. He told the Belgian Chamber last February that in no circumstances would he support entry into a Continental federation, and he warned the Consultative Assembly last week against over-ambitious conceptions which might weaken the unity of the Fifteen in the Council of Europe.

It seems possible that a general retreat from Luxemburg to Strasbourg will now get under way. But there is still no indication whether, even if the Continental countries do abandon their federal ideals, the Council of Europe will be able to provide a satisfactory alternative. It was the utter futility of the Council of Europe which originally converted many Continental politicians to federalism. Three years ago Britain welcomed the decision of the Continent to pursue federation without her as at least relieving her from the charge of dragging her feet. The threatened breakdown of the attempt to build a federal Continental community restores to Britain the embarrassing responsibility for making something of the Council of Europe. So far only one suggestion has been made in this field—the so-called Strasbourg Plan for a Commonwealth-Europe economic grouping. This plan was frigidly ignored by the last Commonwealth conference, but the stiffening of America's foreign trade policies has created a new interest in it which was evident in the economic debate with which the assembly concluded its sitting.

The Chinese Seat in Uno

MR ATTLEE, speaking for the Labour Party in the debate on foreign affairs on May 12th, declared that he was "more certain than ever" that "as soon as aggression had been halted China should take her rightful place on the Security Council." To the Prime Minister's interjection "Not while actual fighting is going on?" he replied that it should be "soon after the armistice." There is, indeed, every prospect that this question will come up again at once when an armistice is concluded. It will then not only become an issue in the peace negotiations, over which Britain and the United States will find difficulty in agreeing, but will also start off again that canvassing for votes in the UN which was becoming a serious threat to Anglo-American relations at the time when the British government desisted, on account of the Korean war, from its endeavours to seat the Peking delegates in defiance of American policy.

The political issue involved is complicated by the legal aspect of the matter. There may seem to be an advantage in reducing a political controversy to legal terms, but unfortunately the law itself is in dispute, and there is even a danger that the opposed policies will be made more rigid by the conviction of each side that it is legally in the right. The British official view, at any rate, is that international law definitely requires, as a matter of obligation, the course of action which successive British governments have thought it wise in the national interest to pursue; the Americans, for their part, are inclined to be irritated at the British assumption that all the world should bow to the legal authority of Professor Lauterpacht.

The question is not, of course, whether "China" should take her "rightful place" on the Security Council, for "China" is there already, but whether the delegates of the Peking government—at present recognised as the *de jure* government of China by Britain, India and the Soviet Union—should replace the delegates of the Taipeh government—at present recognised as the *de jure* government of China by the United States, France and Australia. Both Chinese governments exist with organs of administration and armed forces on Chinese territory, but whereas the whole mainland of China is effectively controlled by the government in Peking, the government in Taipeh only rules over an island less than half the size of Ireland, which, in the generally accepted view, it could not continue to hold without the aid and protection it has been receiving from the United States. If Britain and Russia, acting together, were to collect enough votes to produce a majority for seating the Peking delegates, with the United States in a minority, a very critical international situation would arise. America could not be compelled to transfer its own recognition to Peking; but the Peking government, having been recognised as the lawful government of China by the United Nations, could then appeal against American support of the "rebel" Taipeh regime as an act of aggression. In theory, Britain would then have to join in condemning America and perhaps even in coercive measures to force America to abandon Formosa.

The Fate of Formosa

The American policy of refusing to transfer recognition from Taipeh to Peking is inseparably bound up with the American view that Communist China is a hostile power and that Formosa is a position of such strategic importance that it should not be allowed to fall into the hands of a hostile power. If the United States were to recognise the Peking government, it would then be bound in international law to stop all aid to Formosa, for that would be support for rebels against the recognised government. The British view, however, is that every nation ought to recognise the Peking government simply because it has effective control of nearly all the territory of China. Mr G. G. Fitzmaurice, Second Legal Adviser to the Foreign Office, has stated the view, in an article just published in the "Year Book of World Affairs 1952," that "if a government in fact represents a Member State [of the United Nations], refusal to allow it to occupy the seat of that Member . . . must be regarded as contrary to the purposes and principles of the Charter."

The Americans incline towards an alternative legal doctrine whereby recognition is not automatically required by the control of territory, but should be conditional on evidence of intention to conform to certain standards of international conduct in new governments claiming recognition. Mr Fitzmaurice's reply to this is that such conditions of recognition cannot in practice be applied to already existing governments, but only to new ones which come to power by revolutionary violence, and that, a principle "capable of application only in very restricted and special circumstances cannot be said to be of universal validity." On the other hand, if the United Nations is to be based on moral principles at all, it certainly seems a strange idea that a government which for three years has been waging war against the forces authorised by the United Nations to curb aggression should have an unconditional legal right to take over representation on the United Nations organs. There is surely something in the American contention that Communist China cannot be allowed to "shoot its way into the United Nations," or even to push in immediately it stops shooting. It remains on record as a verdict of the United Nations Assembly that Communist China committeed aggression by joining North Korea, and there can be no obligation to seat its delegates before this little matter has been satisfactorily settled.

Indianisation for Foreign Firms

FROM OUR CORRESPONDENT IN INDIA

THERE has been a growing agitation in favour of increased recruitment of properly qualified Indians by foreign firms, combined with a levelling up of the conditions of service between foreign and Indian staff. In 1947 there were only 451 Indians in foreign firms drawing a thousand rupees or more per month, against 5,507 non-Indians. By 1952 the number of Indians had gone up to 2,137, while the non-Indians had increased by 1,154. These figures have been released by the Ministry of Commerce and Industry in answer to a general hue and cry for more "Indianisation." Last July, the Ministry requested all foreign concerns to report the number of Indians and non-Indians paid under Rs500 a month, between Rs500 and 1,000 and above Rs1,000. The percentage of Indians in the first group has gone up in the past five years from 96 to 99, and in the middle group from 58 to 85. But the public feels that the increase in the higher group, from 7 to 24 per cent, is not steep enough. Moreover, some bitterness has been created by the alleged failure of certain firms to reply. Since October some firms have been penalised, by a discriminatory use of import licences, for what the government considered a lack of good faith, but now most firms have sent in their returns.

The ratio of Indians in the higher salary bracket varies from industry to industry: in the case of plantations it is very low indeed, while in the case of oil firms it is as much as 25 per cent; and Lever Bros., for example, probably heads the list with as much as 51 per cent. The government's stand is that it expects foreign firms to Indianise as quickly as is compatible with efficiency, but that allowances will always be made where qualified Indians are not available. It is anxious for foreign capital to help train Indians, and is therefore reluctant to imitate Ceylon or Pakistan: in Ceylon it is practically impossible to import a foreigner, in Pakistan import of technicians is often suspended until at least 50 per cent of the jobs are held by Pakistanis. The Indian government feels that it can rely on the co-operation of the foreign firms to Indianise in their own as well as the country's interest, at a pace which will not rouse political hares. But unfortunately public opinion has responded with astonishing alacrity to a report written by disgruntled employees who claimed to be victims working in "1,200 little South Africas," although at no point of the report was it made clear why, in a free country, they had voluntarily entered those South Africas.

Indianisation is a must. Beside political considerations, there are factors beyond the foreign employer's control which operate in the west in favour of Indianisation: full

employment, free education, free health schemes, congenial climate, family ties, the wife's reluctance to expatriate herself in a country with a foreign language and foreign diseases; separation from children, the fact that taxation in India is practically as high as in Britain and higher than in the USA, and that the retiring age is much lower in the East; the cost of living away from home and of perhaps giving up one's house and losing one's friends. It becomes, therefore, difficult and expensive to find first-class people willing to give up their home prospects, even if they come out for their tenure of service. Moreover it is to the advantage of the foreign employer to have Indians in the higher levels because, in due course, they will carry more weight with the government.

Snobbery and Seniority

But the foreign employer is often faced with real difficulties in his endeavour to Indianise. Until 1947 many of the better people considered business beneath them and joined government service; and even today many young men consider certain jobs, in plantations or factories, incompatible with their social background. Time must be allowed for the years it takes to train a man to a senior position—whether in India or at home—and, since industry is still relatively new to India, there is often no alternative but to import. Seniority must take its course. The employer cannot promote men out of turn, nor can he sack good men simply because Indians have by now reached the same level. The natural process of wasting out must be permitted if business is to retain the loyalty of its staff. What was true of the Indian Civil Service is true of business, it takes time for people to acquire seniority; the process can only be accelerated at the expense of quality.

While it would be rash of foreign firms not to give full weight to the force of national sentiment, it could be equally damaging if Indians were to overlook two points. First, if there is any virtue, as a leaven or example, in non-Indian management, it should be allowed to retain its character, which means not only retaining non-Indian seniors in certain key posts, but recruiting non-Indian juniors to succeed them. Second, the actual number of senior posts in foreign controlled firms is small in proportion to the number of comparable posts now or later to be available in Indian private or state industries or government services. When all should be pulling together for the sake of India's industrial development, it is a pity to disturb a small but valuable element.

But one thing is certain: foreign employers must narrow the gap between the way they treat their local and imported staff. For equal work, they ought to give equal basic pay; facilities such as medical attention, educational grants and pensions should be given without discrimination. At the same time foreign employers should be quite ruthless in their weeding out of unsatisfactory staff, whether foreign or Indian—for the employment of one poor foreign recruit is far more damaging to the firm's labour relations than the sacking of a fairly competent Indian—and it is high time that they adopted a far-sighted recruitment policy instead of the haphazard methods which seem to have been used in the past. The government intends to ask for a yearly statement on the progress of Indianisation and this would facilitate matters greatly. Besides planning their Indianisation on a rational basis, foreign employers could further allay the suspicion of their own staff that to be an Indian is a handicap, by posting Indians abroad on exactly the same basis as westerners; if their training in the east does not equip them for a post in the west, they can be posted to Siam, Malaya, Burma, Hongkong, Japan, the West Indies, the Middle East, or Indonesia, where this objection does not apply.

Meanwhile, it would be politically wise to appoint a consultative committee of high level government servants and businessmen to review the programme and investigate complaints. Such a committee would lance the abcess and remove it from the public eye and the slippery terrain of politics. Already there has been a considerable amount of damage done. Some foreigners are going while the going is still good from the point of view of re-employment at home—and they are precisely the type who are most wanted to train their Indian successors. Even more important, incalculable damage has been done to the confidence of would-be investors. What the government has failed to appreciate is that private business rests upon the willingness of the general public to subscribe its shares; business confidence, therefore, rattles only too easily, and once it has begun to rattle, it rattles long, particularly when the base of the pyramid is miles away from the top.

There is one more important consideration that the government of India ought to keep in mind. India needs government-to-government loans desperately if it is to carry out the Five-Year Plan without drowning itself in deficit financing; but India needs private foreign capital quite as desperately, for along with it come—perhaps even more valuable than the actual capital invested—the men to train the Indian artisans, technicians and managers who will provide India's needs tomorrow.

Untidy Triangle in Italy

FROM OUR ROME CORRESPONDENT

AS soon as the general elections of June 7th became imminent, the question arose whether this nation-wide struggle would sort itself out into a fairly simple triangular pattern, or appear instead as a polygon with one or two greatly distended sides. In April, 1948, the general election appeared in the light of a duel between the Christian Democrats and their close associates and the Communist bloc, but last year the growth of the extreme right turned the local elections from Rome southwards into a three-cornered contest.

Now that the competing lists have been entered and the candidacies registered, the triangle can be recognised as the prevailing tendency, but it is untidily worked out in detail at each of the three ends. The strongest of the three broad groups, the Centre, looks outwardly tidy enough. The three minor parties which linked their fate with that of Christian Democracy, and brought it most valuable support, in 1948, are now tied up with it in a family compact (*apparentamento*) such as the new and violently controversial electoral law—broadly similar to the French—allows to be formed; and by a "correcting" device, if the centre parties, pooling the votes cast for them, obtain 51 per cent of all votes, then as the winning list their candidates get 65 per cent of seats in the Chamber, distributed within the family group proportionally to the votes won by the single parties. The minor parties, and most of all the exiguous Republican party, needed the prospect of sharing in a truly generous "majority

premium" if they were to face the elections with any confidence at all. Yet there was anxiety among these lest the majority premium should be so large as to procure for Christian Democracy by itself more than half of all seats; it would thus be in a position to cut adrift from and ignore its small allies in Parliament when the election was done.

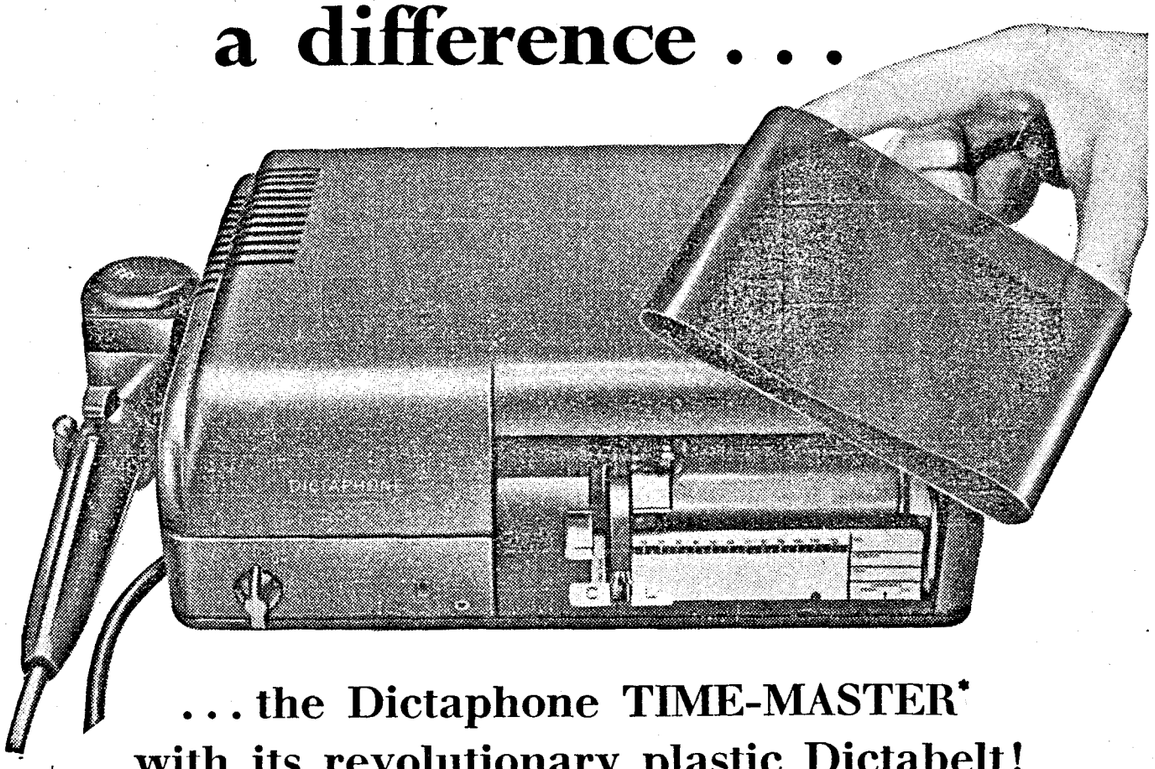
Eminent Deserters

Agreement having been reached on the terms of the law, the parties made their family compact, and on paper at least all was well. The principle of the electoral reform was, however, deplored by some men in all of the parties. Among the Christian Democrats there were those who thought the party strong enough to go to the elections alone; in the Left-Centre parties there were those who nurse the ambition of forming a Constitutional opposition against Christian Democracy, on the assumption that the Communists have practically put themselves outside the parliamentary state. In fact, the compact has been brought into being only at the cost of the desertion from the secular parties of some of their most eminent members. The votes they register may be few, but the Left-Centre, which at one time claimed the moral leadership of postwar Italy, is now divided against itself as never before.

In the triangular pattern, then, the constitutional family group represents one fairly sharply defined angle, though the definition has been won at a cost. The extreme Left angle exhibits no such formal unity. Communists and "Nenni" Socialists go into the election presenting separate lists, contrary to their proceeding in 1948. Thanks to a system of preferential votes, the Communist party took 131 out of the 183 seats won by the Popular Front in 1948. How the voting support of the Communists really compares with that of the "Nenni" Socialists has never been clearly tested since the latter lost their right wing through the defections, in recent years, of Saragat and Romita. Now, however, Nenni is going to the elections with separate lists. His programme speeches contain no hint of impatience with the Communists, or of infidelity to the pact of union which binds the two Marxist parties. His electoral campaign seems, however, designed for two ends: to strengthen its own relative position as one of the two Kremlin-blessed parties in Italy by a more graciously rhetorical appeal than the Communist doctrinaires are capable of launching, and to intercept malcontent Communist votes found to be drifting towards Social Democracy. Recent municipal elections afforded glimpses of a possible recovery of the Nennians at the expense of their Communist comrades. The failure of the extreme Left to form a family compact shows clearly enough that it entertains no hope whatever of winning more than half all the votes, and so qualifying for the premium.

QUARTERLY ECONOMIC REPORTS are now available on nearly seventy countries. These reports give information and opinion on matters of concern to exporters and investors; they are concise and have comprehensive statistical sections. A descriptive leaflet may be obtained from The Economist Intelligence Unit, 22 Ryder Street, London, S.W.1.

The third angle of the triangle, the extreme Right, displays still less of a definite unity. Joint lists of Monarchists and neo-Fascists won great municipal successes in the south last autumn. But neither of these two right-wing parties' leaderships can afford to estrange their respective devotees of Savoyard traditionalism and of Mussolinian quasi national-socialism. They have been forced to enter the lists separately. The Vatican has already told the faithful that it would be no more appropriate in 1953 than in 1948 to deflect anti-Communist votes from Christian Democracy to the right-wing parties, which have no conceivable hope of any greater success at the polls than would be sufficient to deprive Christian Democracy and its allies of the premium. Nevertheless, the Right wing expects to increase its representation in the Chamber (now a bare score of deputies) and would doubtless do so several times over were it not for the unkind operation of the electoral law which has the wonderland property (like Alice's mushroom) of diminishing stature wherever it does not augment it.



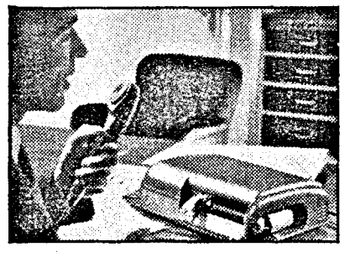
Since little doubt is ever expressed that the Centre family group will win 65 per cent of seats, the chief curiosity is what proportion the Right opposition will bear to the Left opposition; and whether inside each of these oppositions the more moderate of its components (Monarchists on the Right, Nennians on the Left) will put up a good show against the extremes.

Hasty Renewal of the Senate

The foregoing relates entirely to the election for the Chamber of Deputies under the new system of "corrected" representation. But the electorate is called upon to choose also a new Senate. The Constitution of 1947 set up the two elective chambers, differentiated in the main only by the requirement in both electors and candidates for the Senate of a slightly higher age qualification. There was, however, one deliberate diversity. The Senate's life was to last a year longer. In fact the present Senate could have continued until 1954. But after the riotous proceedings in the Senate in the early spring, and a succession of resignations of presidents and vice-presidents, President Einaudi used his prerogative to dissolve it. Consequently, against the intention of the Constitution builders, who believed that they had neatly secured continuity in affairs by ensuring that both houses should not suddenly and simultaneously change their political composition, both Chambers must be renewed on June 7th.

The Senate was dissolved in such a hurry that the electoral law as regards the Upper Chamber had to be left unchanged. The Senate will therefore be elected by "straight" proportional representation, giving the oppositions of both extremes a much better chance than in the Lower Chamber. In the Senate, in fact, the Government may have little hope of more than a very narrow majority. This is not altogether a new situation, as in the outgoing Senate, by a special postwar provision, there were 107 members returned unopposed; these were old parliamentarians who had been ejected, or distinguished figures who had been persecuted by the Fascists, and at least 46 of them were Communists or near-Communists. This provision now lapses. The outcome of the June elections may be a Senate with a considerably weaker centre and stronger Right wing than the Lower Chamber, and the Left is already representing Signor De Gasperi as doomed to depend on the vote of quasi-Fascists in the Senate.

Here's dictation with a difference . . .



. . . the Dictaphone TIME-MASTER* with its revolutionary plastic Dictabelt!

See for yourself the amazing Dictaphone Time-Master—the neatest, most compact, most time-saving dictating machine ever! This superb machine was only made possible by Dictaphone's invention of the revolutionary Dictabelt.

Hear for yourself what a difference these amazing little plastic belts make. Just slip in a Dictabelt and speak your notes and letters—your every word or whisper will be recorded crystal-clear. Each Dictabelt takes 15 minutes' flawless dictation, and there's no risk that your recording will be spoilt or damaged!

***Prove for yourself** how utterly simple the Time-Master is to operate. A few days' free trial or a demonstration at your local Dictaphone office, will convince you how revolutionary it is in design and efficiency! Full particulars at your local Dictaphone office.

Immediate delivery. Dictaphone can now offer you immediate delivery. Order your Time-Master now.

You'll find that the Time-Master faithfully records your every word! No time wasted, because controls are automatic.

Secretary transcribes easily, accurately using feather-light "Magic Ear." Controls are simple and recording is of constant quality.

DICTAPHONE *Registered Trade Mark* GREATEST NAME IN DICTATION

MADE IN GREAT BRITAIN. *Branch Offices:* BELFAST BIRMINGHAM BRISTOL CORK DUBLIN GLASGOW LEEDS LIVERPOOL MANCHESTER NEWCASTLE

GROWING MORE FOOD

Australia needs more fertilisers in order to grow more wheat—and in the manufacture of superphosphate fertilisers sulphuric acid plays an important part. Simon-Carves (Australia) Pty are building two large plants in South Australia and New South Wales to make sulphuric acid from Australian pyrites. These two plants—one of which will be the biggest single-unit sulphuric acid plant in the Commonwealth—will together produce nearly 150,000 tons of acid a year and will make a valuable contribution to Australian superphosphate production.

coal washeries · coke ovens · power stations · sulphuric acid plants · chemical plants · gasworks by-product plants · sintering plants · ore concentration plants · materials handling plants · industrial gears · flour and provender mills · and many other specialities

PROGRESS IN ELECTRONICS

ONE of the earliest electronic devices to strike the popular imagination was the photo-electric cell or "electric eye". The public became familiar with it as a gadget for mysteriously opening doors or sounding burglar alarms.

The modern emissive photocell continues to perform these tasks, but in addition it is employed in a wide variety of control and measuring equipments, which are already indispensable to industry.

The cell contains a photo-sensitive cathode which emits electrons when light radiations fall upon it. This emission, or current, corresponds in strength to variations in the light intensity, even when minute, and when the current is amplified it can be used to operate measuring, indicating or control instruments. With suitable photo-cathode materials and, if necessary, with the aid of filters, these photocells can also be made sensitive to colour.

Among the many applications of photocells are high-speed counting, batching and sorting of mass-produced articles; inspecting for variations in size or colour; control of temperature, smoke, liquid, position, printing register, or photographic exposure; safety devices in machines and furnaces; and sound-heads in modern cinema projection equipment.

Mullard photocells are used extensively for all these purposes, and research is constantly opening up new fields of application.

THE BUSINESS WORLD

Buyers for Steel Shares

WITHIN a day or two, the Iron and Steel Bill, which provides for the return of iron and steel undertakings to private ownership, will be law. Within a month or two, perhaps, the first of the major devesting operations may have taken place. Much preparation has already been made in advance of the formal setting up of the Iron and Steel Holding and Realisation Agency, which is to take over the steel securities now held by the Iron and Steel Corporation and dispose of them under the supervision of the Treasury. No time limit is laid down in the Bill for the process of disposal, and the Agency will continue in being as a holding company and as a vendor until the Treasury decides that its duty of securing the return to private ownership of the steel undertakings that it acquires from the Corporation has been "substantially" discharged.

Clearly, however, the Agency will be anxious to score one or two immediate successes—if possible, before the holiday season begins—and to dispose of several other big undertakings in the autumn. There are, for the sake of argument, half a dozen major concerns that would be eligible for an early place in this first phase of the timetable. Dorman Long, Stewarts and Lloyds, United Steel Companies, John Summers, Colvilles and Lancashire Steel should be among the early starters. Apart from the special case of Steel Company of Wales, this list leaves out of account the important steel undertakings of English Steel and Guest Keen Baldwins, formerly in special ownership. It would not be possible to claim that the re-selling of these six companies, and even a few more like them, would substantially complete the Agency's work; but at any rate it would make such a large hole in it that it would be possible to say that a major success had been scored in the first stage of denationalisation.

While there have been many signs of discussions in the City in preparation for offers of steel stocks, nothing can be started until the Agency is constituted and until it has accepted a bid for one or other of the steel securities that it holds. It is enjoined to secure "without disregard to other relevant matters, that the consideration obtained from the disposal of assets is financially adequate." It could, that is, accept less than was paid in compensation for the shares (based on their prices in October, 1948) or it could demand more. In some cases—Dorman Long and Stewarts and Lloyds are important examples—there has been a major reconstruction of capital since the Corporation acquired their shares; there may even be a pointer to the leaders in the steel queue in the fact that these two concerns now have a straight ordinary capital, with no loan or preference capital. "Private ownership" of steel must imply, first and foremost, private ownership of steel equities, and these two companies have no other classes of capital at present in issue. The Agency will have power to reorganise the capital of any company that it holds, and to amalgamate one company with another; it can also create new companies to which the assets of companies held by the Agency can be sold or leased. From this, it is clear that the Agency is being given most flexible powers, as is wise. Moreover, the Finance Bill contains provisions whereby any distribution or any capitalisation of a distributable sum in the form of redeemable preference shares may be disregarded for profits tax purposes, if the Treasury so signifies; this again may be an important advantage.

The ground once cleared of technical undergrowth, the main tasks of disposal become plainly visible. First, bargains must be struck between the Agency and the issuing houses on the prices to be paid for particular

undertakings. Secondly, if as many as half a dozen major offers are to be made before the end of this year, institutional investors must be attracted or cajoled into playing a big part in subscribing for them. There can be little hope, given the present paucity of personal savings, that individual investors will return to the industry on any major scale, though many will do so as their means permit.

It is probable, moreover, that the total stake of the institutions in steel securities (in normal times, and not when they were using them as a back door into the gilt-edged market in 1949) must have been appreciably less than the amounts that they are likely to be offered later this year. They will accordingly have to take careful stock of the economic prospects of the industry over the next few years, as well as of the adequacy of the current yields on the stocks that are offered. A certain amount of suasion and some emphasis upon co-operative purpose may be admissible in an operation of this nature and magnitude ; but, in the end, the tests should be economic—what the investor will pay of his own volition for a stake in a steel company. This may be affected by opposing pressures from outside—to secure the success or the jeopardising of the operation—but ultimately it will be market conditions in the steel industry and on the Stock Exchange that will determine the matter. Provided that the Agency keeps firmly in mind the concept of a fair long-term price in its negotiations for sale, and that the investor is neither excited nor bullied into miscalculation, the operations should proceed steadily. But if mistakes are made, if too much is expected of the issuing houses or of institutional investors, the result might be a freezing of the issue market that would take months to thaw.

★

One can illustrate the problems that may be involved from the particular case of Dorman Long—presumably one of the earliest of candidates. The compensation to this company was of the order of £12 million, the ordinary shares (then receiving 8 per cent) being paid out at 33s. 1d. The capital now consists of just over 7½ million of £1 ordinary shares, on which the earnings for the year to September last were nearly £2¼ million after tax. What are these shares worth ? The question is impossible to answer without taking account of the prospective cost of the next stage of development at Dorman Long. The company has found £14 million out of revenue in the last five years to finance the earlier stages of expansion ; now it has in prospect a series of major schemes costing perhaps £36 million in the next five years, of which a half might suitably be found from revenue. A burden of this order may not be beyond the company, particularly with the advantages of the initial allowances restored. And it should be able to count on support from the capital market to the extent of £3½ million a year during the period.

But much depends, in both respects, on the price at which the ordinary shares are marketed. The Agency would come out square if it sold them for 32s. each ; if that be taken as an assumed basic price (ignoring for the purpose of this argument the revenue ploughed back into improvement and expansion of recent years) some interesting calculations follow. First, an 8 per cent dividend (the former rate) would provide a yield of only 5 per cent—which no one would regard as adequate, under present conditions, on a steel share. Secondly, to provide a dividend yield of 6½ per cent the prospective dividend would have to be 10½ per cent at an issue price of 32s. Since the price might conceivably be somewhat higher, in the event, the required dividend would itself be higher, too. There is no lack of earnings to cover a dividend of this order, but every increase in the issue price and every increase in the prospective dividend that would be required could only mean that the task of financing a costly development programme would be more difficult, whether the money came from surplus revenue or from new issues. If, as seems probable, the emphasis in the early operations is upon the marketing of ordinary shares, there should be opportunities at a later stage for using loan capital or redeemable preference shares, at a lower cost, to give a more balanced capital structure—though the industry has a long enough memory to guard against excessive resort to prior charge capital.

Dorman Long is not the only case where it is possible to trace a sharp antithesis between the meanness of the price paid by a single buyer four years ago and the desirability of restraint on the part of the single seller if investors are to be attracted back to the industry and encouraged to take up the burden of financing the next important stage in its development (which may well cost £30 million a year in the next few years). There is, indeed, a sound economic case for many of these schemes, since they represent the logical completion of schemes that offer the prospect of increasing returns upon a relatively small further capital expenditure. For example, the work that has been done at Shotton by John Summers has already cost £17 million; the duplication of the large new blast furnace and coke ovens at a cost of £5 million will bring steel ingot production to a million tons a year and thus balance the capacity of the strip mill.

But the dilemma remains. The Agency, if it is too grasping, will make it difficult for the industry to proceed with its plans ; that would be a disaster for an industry newly restored to private hands. Yet it will be selling, in the first instance, the cream of the industry with good assets and earnings, and with capital costs per ton of ingot capacity of a distinctly modest size. The leaders of the industry will have to abandon any old ideas about 8 per cent dividends, which led them into trouble in 1948 and are plainly not capable of attracting investors today. Yet they have every good reason for keeping dividends within reasonable restraint. Here is an intriguing balance of forces, which could easily be tipped by misjudgment from several quarters. The test, to repeat, ought to be the test of the market. And the market is not likely to take an excited view of steel shares as " growth " stocks. It is much more likely to recognise that, on the threshold of a period of growing international competition, the industry's first duty is to complete its modernisation, to secure its efficiency, and to have something in hand to meet the possibility of harder times. It will be an industry, moreover, that is starting again under a new form of public control. How effective and wise will the Iron and Steel Board be in determining price policy ? How long can the various devices of cost equalisation be allowed to survive ? Are there good arguments for minimum prices if demand should fall ? Can the deeply rooted reliance on " cost-plus " be changed to a system that gives encouragement to efficiency and does not strangle demand still further when output is falling and costs per unit are rising ?

It is, in many respects, a new steel industry that will be on offer during the coming months. Many of the old yardsticks will no longer serve the investor to measure its prospects. It will be supervised under an Act that demands " the efficient, economic and adequate supply under competitive conditions of iron and steel products "—words of general rather than precise meaning. In the background lies the threat—for what it is worth, and perhaps not very much—of re-nationalisation. In all these circumstances, it may be possible to persuade the large investors into making a dutiful response to offers of steel shares, and to give them a reasonable promise of a satisfactory return. But it is difficult to conceive of any extravagant offers or of any wildly excited response.

Accounting for Coal

LAST year the National Coal Board " budgeted for a small deficit " and made rather a large one. The increase in home coal prices that it was allowed to make on December 31, 1951, was designed to bring in rather less than its expected increase in costs. In fact, costs rose more than the estimate, so that by the autumn—despite the expansion of exports at premium prices—the Board found its collieries as a whole in the red, for the first time since 1947. Moreover, it deliberately accepted a loss on opencast working (as a later note shows), though its profits from ancillary activities went up. Over the year, its net operating profits were £8,188,194 less than the £14,500,000 required by the Minister of Fuel and Power to cover interest on capital and interim income for former colliery owners. This deficit of £8.2 million compares with one of £1.8 million in 1951 ; and it contrasts with the three preceding years of profit-earning. Now, on the record of the six years since nationalisation, losses have exceeded profits by some £14 million. Over an undefined period of years, the board has an obligation at least to make good this cumulative deficit. It is showing no haste to do so ; its latest increase in coal prices is officially expected to do no more than enable it to break even in 1953.

The board's profit and loss figures are produced with great expertise and in immense detail, but each year it becomes more difficult to decide how seriously to take them. They contain, for example, far more detail than the annual accounts of the four large private enterprises examined on another page ; yet their real significance is far less easy to determine. Profit or loss is a meaningful index of performance in companies whose central principle must be to maximise the return on investment. But that is not a central principle in the nationalised coal industry.

What does last year's deficit in the coal industry signify ? It arose, leaving out ancillary activities, from an average (and insufficient) profit over the year of 6d. a ton on all coal produced. This in its turn arose from the fact that three NCB divisions—East Midlands, North Eastern and West Midlands—made profits of £22.8 million, whilst the other six divisions made losses totalling £17.1 million. It can be ascertained, further, that 375 collieries producing 121 million tons of coal made £45 million profit, whilst 516 collieries producing 91 million tons showed losses of £39 million. More than a hundred pits, indeed, lost more than £1 on each ton of coal they produced.

All of these individual results were governed by the fact that the board interpreted its duty as, broadly, to make neither profit nor loss over an undefined period " on an average of good and bad years." This by definition means producing rather more than half the coal at a profit and nearly half at a loss ; in practice, its odd results include the sale of all anthracite, the board's most desirable coal, at a loss. Upon such uncommercial principles, profit or loss may have some meaning at the centre of the industry, albeit a most esoteric one (should one judge the board by some such measure as the closeness with which its surplus or deficit approaches zero, so that last year's deficit of £8.2 million might denote better guessing than the surplus of £9.5 million in 1949 ?). But on these principles profit or loss can have no real meaning at the division or the pit, where the coal is got ; as Sir Hubert Houldsworth said this week about divisional finances, " I am far more interested in costs than in profits."

Costs, and physical indices of performance such as productivity, do indeed retain far more significance in such circumstances than profitability—for the present—and the year's figures show that the Board's performance continues to be disappointing. But national

averages of both are susceptible to the powerfully solvent advanced analysis that Sir Hubert himself initiated early this year. As the report says:

> Small year to year differences in the average productivity of the industry are difficult to analyse precisely, because they are made up of a great variety of changes . . . at individual pits. Even when the same change occurs at many pits, there may be different reasons for it in each case. . . .

Of last year's slackening in productivity as manpower rose, for example, the board can only remark that the divisions getting most new recruits and extra miners were, on the whole, those where productivity declined most. Costs, likewise, need elaborate interpretation.

Attention to costs alone is, of course, a rather lopsided form of financial control in an industry; it would normally be tempered by consideration of demand. But during the postwar period the Coal Board has been able to assume that it could sell far more coal than it could produce (at a price under *de facto* if not formal Government control). Last year's check to home demand for coal may have been simply an interruption in the upward trend. But it did present the Board with some reminder of the kind of problems it may have to reckon with as capacity overtakes demand. Today, in broad outline, the recipes may be simple if not easy: at the pit "Push up output—but try to keep costs down"; and at Hobart House "Charge a price that should about cover outgoings—provided you can get it past the Cabinet." Fairly soon, these recipes may not be enough.

When the question of demand—at a price—returns as a major factor, it is not easy to see how the board is going to ensure that coal is produced most economically—in the right amounts, of the right types, at the right pits—if its policy ensures that nearly half of all coal must be produced at a loss. More commercial pricing principles might present their own problems for the industry as a whole; but they would offer better assessments of real demand and simpler principles to enable each pit to play its part in fulfilling that demand. Given its present price policy, the board may have to adopt new methods to exercise adequate financial scrutiny and control—attempting to refine or adjust ordinary criteria of profit or loss to its self-imposed rules. But the requirements of effective commercial management for the Coal Board, as well as its duties of accountability, will eventually demand more effective methods of scoring—or perhaps a change in the rules.

The Giants Report

THE summer monsoon of company reports has broken earlier than usual this year. In the last ten days four of the biggest joint stock companies in Europe—Dunlop Rubber and Unilever among the great international trading concerns, and Anglo-Iranian and Royal Dutch-Shell among the oil companies—have issued their preliminary reports. For the first time since the war those reports are issued against the background of moderate and worldwide disinflation. Last year companies trading overseas were exposed far more to the rigours of the change in the economic climate than companies trading mainly in Britain; and it comes as no surprise that Dunlop Rubber and Unilever have reported that their trading profits in the full calendar year fell by more than the 7 per cent that the national income statisticians estimated as the average fall for British companies on a whole. It is also no surprise that the two oil companies have done so well, and that with an eye to the advantages as well as to the disadvantages of the curb on inflation—they have both increased their dividends.

Dunlop Rubber, seventy per cent of whose profits in 1951 came from overseas activities, has reported a fall in trading profits of £4.8 million to £13.1 million, or by nearly 27 per cent. This result does not necessarily imply a severe loss in sales in foreign markets, although import restrictions in Commonwealth countries undoubtedly hit the company hard. At home, too, the group had to follow in the wake of the motor industry through the rough waters in trade, but the decline in its profits probably owes far more to the fall in material prices. Average prices for raw rubber fell by 44 per cent in 1952 after rising by 53 per cent in 1951, and this must have caused a swing-round from profits to losses on stocks. Similar influences—a fall in prices and a drop in sales when consumers were liquidating stocks built up during the inflation—may be traced in the fall in profits earned by the Unilever diarchy by £13.1 million (or 19 per cent) to £55.7 million.

★

The story of profits trends is given a different twist in the accounts of the two oil companies. The fall in oil prices has been sedate compared with that of other commodity prices in the last eighteen months; the loss of supplies from Abadan and, perhaps, the tighter organisation of the international oil trade has seen to that. The fall in Anglo-Iranian's profits (from £75.9 million to £61.3 million) is not in contradiction to this more favourable trend, for this decline is probably merely a closing reflection of a complete year's trading without the Abadan refinery. The results announced by the Royal Dutch-Shell group put the experience of the oil companies last year in a truer economic perspective. Last year the volume of the group's sales rose by 11 per cent, while the value of these sales, together with other items of income received by the group, rose by £192 million to £1,616 million. This is a fantastic figure for a single operating group; it is, for example, three times the gross national income of New Zealand, and bigger than the gross national incomes of all but a handful of major world powers. The greater part of the increase in Shell's gross income last year was absorbed by higher operating costs and bigger charges for depreciation and taxation, but even so the net income of the group rose by £5 million to £125 million.

The fact that profits earned in 1952 were not whirled into fantastic shapes, as smoke whisks from an inflationary bonfire, meant that the companies could draw up their accounts in a rather less nervous manner than in 1951. The curb to inflation has had a marked effect on the amounts that have had to be provided for replacement of assets and for taxation, and also on dividend policy. Both Dunlop and Unilever have set aside slightly larger sums from taxed profits for the replacement of worn-out assets (in addition to the inadequate depreciation allowances based on historical costs); but, in so doing, they are making good a deficiency created in the past rather than a deficiency that is growing rapidly now. The directors of Royal Dutch-Shell, on the other hand, have felt strong enough to refrain from making any separate appropriations from taxed profits for additional depreciation, future exploration and other specific purposes; they show the total of their ploughed-back profits, amounting to about £103 million, as available for all purposes. Moreover, with a levelling off in prices, manufacturers no longer feel the need to set aside specific sums for the replacement of stocks, as they did in 1951 when capital gains made on stocks sold in a rising market were taxed as if they were true profits. In fact, the directors of Unilever have written back £1,868,000 from stock reserves, although only last year they transferred £3 million to these reserves.

Once adequate provision has been made for the cost of replacing worn-out equipment, net profits can be regarded as a trustworthy guide to the earning capacity of a business. Shareholders need not, therefore, be disheartened by a fall in their companies' net income in 1952; and, in any case, since the charge for taxation has fallen in line with accounting profits, these declines in net income are not alarmingly big. Of the four giants only Dunlop Rubber has reported a heavy fall in net earnings available for distribution; and even here, thanks to a reduction in the taxation provision (from £8.9 million to £5.3 million) this fall has been limited to £1.1 million compared with a decline in gross profits of £3.8 million. Anglo-Iranian's net earnings have fallen by only £450,000 as both the charges for depreciation and taxation have been reduced; while the profits available for distribution by the Unilever siblings have actually risen by £2.2 million, since a reduction in the

bill for taxation (from £33 million to £22.2 million) has been accompanied by the writing back of £1,868,000 from stock reserves and the incidence of exceptional credits of £4,918,000, compared with £2,438,000 in 1951. The Royal Dutch-Shell group has had to provide £38 million more for taxation than in 1951, but even so its net profits are £5 million higher. Once again, it is impossible not to lose a sense of wonder at the size of this group; the Group's total tax bill of £402 million in 1952 was two and a half times the total tax revenue of the British Government in 1913.

The curb to inflation has also made—or ought to have made—it much easier for directors to decide upon their dividend policies. For one thing, directors now have the chance of making a straight choice between paying bigger dividends or ploughing back profits to finance an expansion of their business, instead of having to make invidious guesses about how tight a rein they ought to keep on dividends so as to preserve the real substance of their businesses intact. For another, now that profitability has again become the test of efficiency and economic usefulness, there is no longer any sound case for a government-sponsored policy of artificial dividend restraint. It may have been the prospect of stability in prices—and in the economy as a whole—that has encouraged the directors of Dunlop Rubber to maintain the ordinary dividend at 17½ per cent, in spite of the fall in net profits; this was rather more than a nervous stock market had expected, and it was greeted by a rise in the price of the £1 ordinary shares from 45s. 6d. to 46s. 3d. (offering a yield of 7.55 per cent). Unilever, Ltd., and Unilever NV have also maintained their ordinary dividends, at 13½ per cent and 12 per cent respectively; there had been some hopes of an increased payment here—based perhaps on a misreading of the prospect for the group's profits—and the £1 ordinary shares of Unilever, Ltd., were immediately marked down 1s. 1½d. to 47s. 9d., to offer a yield of 5.65 per cent.

It was left to the oil companies to demonstrate fully that equity payments had regained their rightful place as rewards for risk taking. Anglo-Iranian led the way by raising the ordinary dividend from 30 to 35 per cent; an increase of this order had been anticipated in the market and after an initial flurry the £1 ordinary shares settled down at 5⅞, to give a yield of 5.95 per cent. Just over half of this dividend will be paid to the company's biggest shareholder—the British Government. Royal-Dutch is to pay a 16 per cent cash dividend for 1952, compared with a 13 per cent cash dividend and a 2 per cent stock dividend in 1951; and the equity distribution of "Shell" Transport and Trading has also been effectively increased by the repetition of the tax-free dividend rate of 15 per cent—payable this time on an ordinary capital of £54,514,696, as increased by last year's free issue of one share for every four held. This dividend came up to the most optimistic forecasts in the market and immediately after the announcement Shell's £1 registered ordinary stock units rose ⅛ of a point to 4¼, offering a yield of 6.4 per cent.

In general, therefore, the giants' reports have come out in very much the shape that the market had expected. The most obvious lesson from these four reports is that competitive power and the forces of demand are now in control. It is no longer possible, as it was in the age of inflation, to pick a probable winner in the wide field of industrial equities by sticking a pin in the Official List. Nevertheless, if the estimates about production that the Chancellor made in his budget prove correct, British company profits in 1953 should at least make good the 7 per cent decline that they showed in 1952. The logic of the remarkably unselective weakness of industrial equities in the last few weeks seems to be that the markets do not believe the Chancellor's estimates. They may well be right, but if—as is possible—the immediate trend of profits and dividend statements in due course turns upwards, some investors may begin to question their reasons.

Business Notes

Freer Exchange Dealings

ALTHOUGH no official announcement had been made at the time that this issue of *The Economist* went to press, it is virtually certain that the foreign exchange markets in six European countries—the United Kingdom, France, Belgium, the Netherlands, Switzerland and Western Germany—will take another step towards freedom at the beginning of next week. By a concerted move between the exchange control authorities in these countries it will become possible for authorised banks within this group to arbitrage between the six currencies concerned. At present the freedom with which banks in these countries can deal in their respective currencies is, with a few minor exceptions, restricted to bilateral deals. For example, British banks can deal in French francs between themselves and also with Paris, but they are not allowed to negotiate French francs in Brussels or Amsterdam. From Monday next it is expected that they will be allowed to negotiate any of these five foreign currencies in any of the five capitals—and French, Belgian, Dutch, Swiss and German banks will be accorded the same rights. This does not imply any relaxation of exchange control arrangements, nor does it mean that there will be any (at any rate any immediate) widening of the margins within which dealings will be allowed. So far as the United Kingdom is concerned, the provisions for the compulsory surrender of "scheduled currencies" will continue in force, while the Bank of England will remain prepared to deal at the upper and lower limits set for each of these currencies.

The new freedom will mean that the cross rates between the six currencies should henceforth be the same in all six markets. In anticipation of the move, therefore, the divergences of cross rates of exchange that grew up under the regime of bilateral dealings have tended to disappear in the last few days. Among the necessary adjustments in London there has been an appreciable marking up of the Belgian franc and a corresponding decline of the Swiss franc. The Netherlands guilder has also been appreciating against sterling. The one currency in which no anticipatory adjustment has been perceptible is the French franc, which remains grounded to its lower limit in terms of well-nigh every European currency and which presumably will continue in this sorry position when the freer foreign exchange facilities become available next Monday.

Effects on Sterling

The new move will have two interesting byproducts—indeed they can probably better be described as two main objectives. In the first place, the markets will take over a considerable part of the work of clearing intra-European payments that is now done once a month by the European Payments Union. So long as the private exchange markets were limited to bilateral dealings, the amounts brought into the EPU clearings tended to represent virtually the sum total of transactions between each set of partners in the Union. Now that arbitrage is to be allowed between the most important EPU countries, foreign exchange dealers will find it possible to marry balances arising out of intra-European trade—no doubt at a small profit to themselves but also to the considerable convenience of EPU. Under the new ordinance, the clearing of intra-European payments will tend to take place hour by hour and day by day, leaving the monthly clearings of EPU to deal only with the ultimate balances left uncleared by the activities on the market.

The second point is that the new exercise will do much to prepare the technical apparatus in various foreign exchange markets for the day when some sort of convertibility might be re-established and when exchange rates might have to be allowed to fluctuate by more than the present margin (of less than 1 per cent) on either side of parity. It is probably partly as a reflection of this—as well as a reflection of the immediate technical consequences of the move—that sterling has been weakening against the dollar in the last few weeks; by Wednesday's close, spot sterling, which so recently was bumping against the top permissible rate of $2.82, stood at $2.81⅛ in the London market. All this should not be taken to mean that any freeing of the rate, or any notable move towards convertibility or liberalisation of trade, is imminent. But inevitably it must be read against the background of the impressive series of broad financial discussions with European countries that are now in progress.

Talks with Europe

ALTHOUGH Government utterances in the past week, which may not be unconnected with the informal visit of Mr Lewis Douglas to Britain, have made it even clearer than before that the American response to the Commonwealth's "plan" for sterling convertibility was an extremely dusty one, it looks as if some sort of "second-best" plan may now be in course of hatching. Presumably it was not only trout that Mr Douglas came here to fish. The most probable course of British policy now would seem to be to work towards some system of freer payments and trade within Europe alone—while still holding out to the Americans hard and concrete proposals, in case they should ever pluck up the courage and sound sense to make a wider freeing of international payments possible.

In line with this probable course of policy, discussions have been taking place in London this week with a German economic delegation, led by the Vice-Chancellor, Herr Bluecher, and the Minister for Economic Affairs, Dr Erhard; the ministerial spokesmen on the British side have been the Chancellor of the Exchequer and the President of the Board of Trade, but they have also been attended by a bevy of experts. Although these discussions have dealt with certain technical payments arrangements, and particularly with the imminent scheme for freer dealings in foreign exchanges, they have also touched on broader matters of commercial and financial policy. They are quite plainly part of an ambitious series of such discussions. The first of the series was that with a French delegation in Paris on April 24th and 25th. Hard on the heels of this, a delegation from the Uniscan countries met in London on April 27th and 28th. This week's talks with Germany were the third in the series and they were followed almost immediately by discussions with a Belgian delegation at the end of this week. The Commonwealth Prime Ministers will bring some economic experts along with them when they attend the Coronation; and soon after the Coronation the Government wants to have discussions with Switzerland, Italy and the Netherlands.

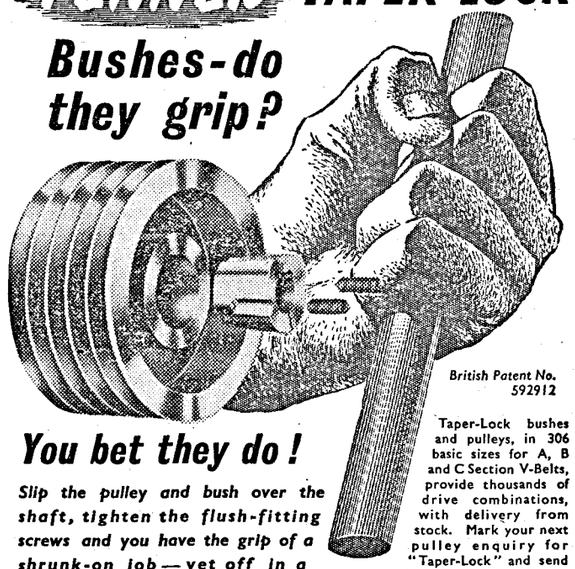
It might be unwise to lay too much emphasis on this very closely-packed timetable, for any change in the system of international payments surely cannot go very far in view of present American uncertainties and immobility. But it would be even more unwise to ignore the fact that, with a quiet and rather mysterious flurry of determination and good intent, these negotiations are proceeding.

ICFC and the Capital Market

THE experience of the Industrial and Commercial Finance Corporation is always an interesting mirror to the experience of the capital market as a whole, and its accounts for the year to March 31st last deserve specially close analysis. On the face of it, the corporation had what—in the cautious words of its chairman, Lord Piercy—"may appear in the near future as a bumper year." Its net profit rose from £388,032 to £417,931, and it paid its first dividend (of 4 per cent) to the clearing and Scottish banks that are its shareholders. Yet its loans and advances rose by only £2,597,000 (compared with rises of between £3 million and £4.6 million in each previous year) and its contractual (but not yet utilised) commitments outstanding fell from £2.9 million to £1,211,000; last year, there was a clear reduction both in the overall demand for loanable funds and also—at any rate at the height of the monetary squeeze—in the corporation's willingness to meet it. At the end of the financial year its loans and advances outstanding amounted to £26.3 million; it had financed most of these by calling up £7.5 million of its authorised share capital of £15 million and £17.7 million of its authorised loan capital of £45 million.

Of far more interest than these bare figures, however, is Lord Piercy's commentary that goes with them. The ICFC draws most of its resources by borrowing from its shareholder banks, and it lends on secured or unsecured loans, on preference or ordinary shares, to small businesses at rates that apparently carry a remarkably close (though accidental) correlation to the yields shown by the Actuaries' Investment Index. Last year's surge in bank advances rates and other short-term rates made the corporation's "profit margin on new business somewhat exiguous"; that, after all, is one of the things that high short-term rates in a time of economic crisis are meant to do. In addition, apparently rather to the corporation's chagrin, the banks raised their rates on "existing loan capital as well as on new amounts"; since there is no similar escalator clause in the corporation's own existing loan contracts, this cut sharply into the corporation's "fixed, and not extravagant, margins." The fact that the cut in margins was absorbed, and that the corporation's net profits actually rose, is a tribute to the soundness of the small ventures in which it has invested in recent years.

This cut in margins must clearly have been a very potent factor in causing the corporation to tighten its lending policy last year. At the time when the banks were looking most anxiously to their liquidity ratios, there was apparently an upsurge in the business that they wished to pass on to the corporation. Now, however, there has been a reduction in such passed-on business, and the corporation itself is apparently ready to look more favourably on some applications that it would have turned down, on grounds of the "national interest," twelve months ago. It is particularly anxious to make sound loans in the £5,000 to £20,000 range; last year 75 per cent of its loans by amount (and 34 per cent by number) were over £50,000. The impression emerges forcibly from these facts and figures that the general economic climate, rather than monetary policy, may now be the real barrier to increased investment—in very sharp contrast to the position a year ago. And it is worth recording too that, while in "the first week or ten days" after the budget—and particularly after the partial restoration of initial allowances—the corporation appeared to experience an increase in sound applications for loans, there have been signs since then that the initial increase may not have much follow-through behind it.



Cold Feet on Options

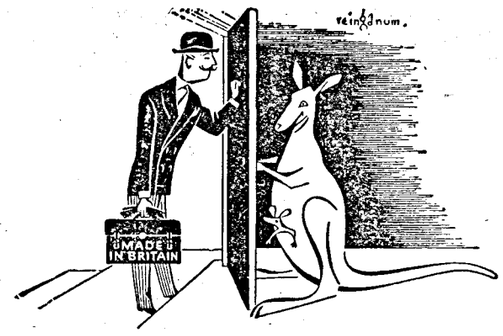
OPTION dealings on the London Stock Exchange, which have been suspended since the outbreak of war in September, 1939, are not to be resumed. A sub-committee of the Council of the Stock Exchange, which has been debating this matter for some time and which has also looked into the question of resuming unrestricted contangoes, has come out in favour of the present restriction. Presumably the chairman of the Council, Mr J. B. Braithwaite, will explain its reasons at the annual meeting of the Stock Exchange next Tuesday. It is to be hoped that he will be able to adduce some better reasons than the very poor ones that are evident on the surface—namely the desire of some jobbers for a quiet life, the lack of interest among the majority of ordinary investment brokers (who have never dealt in options anyway), and, above all, the Council's vague fear of public criticism of "speculation" in Throgmorton Street.

Very briefly, the prewar mechanics of option dealing were that investors were allowed to purchase—for a con-

FENNER TAPER-LOCK

Bushes-do they grip?

You bet they do!



Slip the pulley and bush over the shaft, tighten the flush-fitting screws and you have the grip of a shrunk-on job — yet off in a minute when a change is required.

British Patent No. 592912

Taper-Lock bushes and pulleys, in 306 basic sizes for A, B and C Section V-Belts, provide thousands of drive combinations, with delivery from stock. Mark your next pulley enquiry for "Taper-Lock" and send it to your nearest Fenner Branch or Distributor.

Opportunity knocks again!

There are renewed opportunities for British manufacturers in Australian markets. As from April 1, import restrictions have been partially relaxed and Australia has £A50,000,000 more to spend on goods from abroad. This could be a valuable opportunity for you — and the Australia and New Zealand Bank can supply the facts to enable you to judge the prospects. The Bank has branches in all parts of Australia and everyday experience of current commercial and domestic conditions. Enquiries will be welcomed at the Head Office in London.

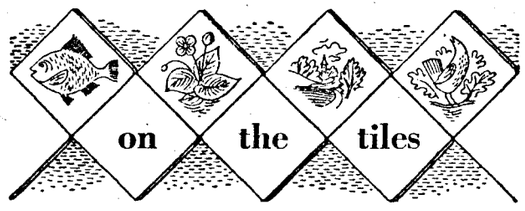
Time for Eastern trade

Ten-fifteen in Singapore and the city office of the Chartered Bank is already a hive of business activity. The Bank's branches in Japan began work an hour and a half ago but seven hours must elapse before the London, Manchester and Liverpool offices will be open for business; but wherever merchants and manufacturers are engaged in the Eastern trade the services of the Bank will be available to them at one point or another of its far flung branch system.



THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter, 1853)

Head Office: 38 Bishopsgate, London, E.C.2.

West End (London) Branch: 28 Charles II Street, London, S.W.1. Manchester Branch: 52 Mosley Street, Manchester, 2.
Liverpool Branch: 28 Derby House, Liverpool, 2. New York Agency: 65 Broadway, New York, 6.

Branches of the Bank, under British management directed from London, are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

A certain British exporter recently received an order for wall tiles from Guatemala City. Having had no previous experience of this market, he asked us what was the normal method of payment and whether any restrictions or delays were likely to be encountered. We were able to tell him at once that goods for Guatemala were widely covered by bills for collection and that payment could be expected after the arrival of the goods in the country. We could also assure him that no exchange control existed in Guatemala.

From few other sources, if any, could our client have obtained such prompt and reliable information.

The advantages of being here and there

As the only British Bank with branches throughout Latin America we can offer you special services—either direct or through your own bank. These services are set out clearly and concisely in our leaflet "The advantages of being here and there". We shall be glad to send you a copy on application to:—

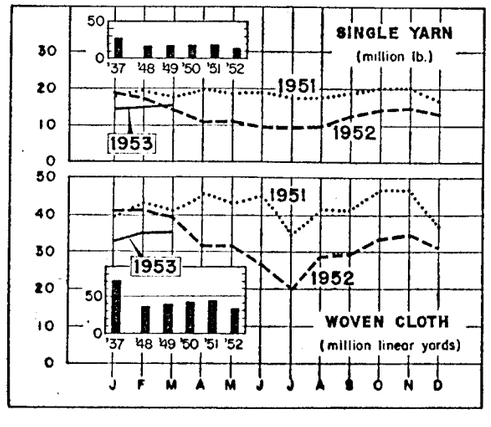
sideration—an optional right to buy or sell a specific security within a given period (usually of three months) at a fixed "striking price." This system provided valuable hedging facilities for investors against wide swings in security prices, and by so doing, it opened the door to more speculation. But this decision reinforces the impression that the Council has not been able to make a proper start in explaining to the general public the Stock Exchange's essential function in the national economy, mainly because it has no proper appreciation itself of what that function is. Far too many recent publicity statements from Throgmorton Street have muttered mildly that the Stock Exchange has a right to exist because it provides a mechanism through which widows, charities and others can invest their savings; they have failed to point out that there is a need for the Stock Exchange to exist because it is the best mechanism yet discovered that can help to divert savings towards investment in the most profitable (and therefore usually the most productive) development projects. Any such search for profitable investment outlets requires speculation, and the country needs much more of it.

Electronics for Nato

A DETERMINED effort has been made during the past two weeks to interest Nato countries in types of British military equipment other than aircraft, and the War Office and the Ministry of Supply have between them been demonstrating tanks, specialised vehicles and other weapons to missions from 16 countries. The sales drive culminated this week in a three-day exhibition of electronic equipment at the Royal Aircraft Establishment at Farnborough. If, as seems likely, the United States government decides to allocate a sum of about $100 million for the purchase of defence equipment for Nato from Britain during the coming year (in addition to orders already placed), electronic equipment and fighting vehicles are likely to figure prominently, since North America is the only other source of supply. The equipment on show is just going into service with the British forces, and consists of what this country can put on the counter. It did not therefore necessarily represent the most advanced technical developments. There were, for example, neither guided missiles nor guided bombs.

The electronics exhibition brought home dramatically the almost total dependence of a modern fighting force on radio aids of one kind or another. The operating efficiency of both tanks and aircraft must now rely on electronic devices not only for communication, but also for accurate aiming and firing. The conditions under which such equipment must work, with aerials buried under the surface skin of a high-speed aircraft to eliminate unnecessary drag, and with size and weight cut down to a minimum, has presented a severe challenge to the electronics industry. The increased height and speed of the aircraft has called for fresh developments in radar and for improvements in methods of automatically linking up to the fire-control radar of anti-aircraft guns. Metropolitan-Vickers and British Thomson-Houston are now providing the medium-range and long-range radar respectively; early this week British Thomson-Houston received a $4,250,000 order for the delivery of long-range radar and its ancillary equipment to Nato as part, presumably, of the $100 million orders contemplated.



As the use of radio aids becomes standard throughout all branches of the Services down to the infantry, the problem of maintaining this equipment promises to become the major stores problem of a modern army. This was demonstrated at the recent air exercises. The industry is meeting this difficulty where it can by assembling the equipment in standardised packaged units, so that a faulty section can simply be unplugged and sent back to base for overhaul. But this process has not gone very far, and there is still a real risk of vital equipment becoming immobilised while engineers probe through what resembles a mass of tangled knitting in search of a faulty condenser. British-built electronic equipment fell somewhat behind after the war, when little attempt was made to keep pace with developments in other weapons, and especially in aircraft. But in putting on this week's show the British industry can feel reasonably confident that most of this lost ground has been made up, and that its military products should find a ready market abroad.

Verdict on the Austin Strike

THE report published on Tuesday of the Ministry of Labour's Court of Inquiry on the serious strike at the Austin Motor Company's Birmingham factory that began on February 17th and ended only last week puts the blame for the long duration of the strike squarely on the shoulders of both parties, the company and the National Union of Vehicle Builders. It holds that both "adopted a regrettably inflexible attitude and neglected reasonable possibilities of compromise." But tracing the history of the dispute since last August, when Austin began to dismiss a total of 800 men as redundant, the court found that the company had honoured its undertaking to discuss the matter with the unions concerned, and to re-engage former employees where

OUTPUT OF THE BRITISH COTTON INDUSTRY

WEEKLY AVERAGES

possible when future vacancies occurred. Mr McHugh, one of the many shop stewards among the 800 men dismissed, had not, the court decided, been victimised. This is the central issue—the union made Mr McHugh's dismissal and the company's refusal to re-engage him the main issue of the strike. The court found, moreover, that the union's local organiser had asked for preferential treatment for Mr McHugh because he was a shop steward, "although such preferential treatment was not in accordance with the national policy of the NUVB."

The union agreed in advance to accept the findings of this court, so it will presumably no longer press for the re-engagement of Mr McHugh. The company made it clear during the course of the inquiry that it would under no condition consider taking him back, whatever the court recommended; but the actual findings do not make this attitude any barrier to the peaceful resumption of work. The fact remains that some orders have been curtailed; the company will probably want 300 fewer vehicle builders now than it was employing when the strike started in February. Production was then running at more than 3,000 vehicles a week, and during the greater part of the strike came almost to a standstill. The fact that the company was prepared to face so big a loss of output at a time when car sales are approaching their peak indicated that the management considered the strike to be just as important a test case as the union. The British Motor Corporation, of which Austin forms a part, has not found the re-organisation and co-ordination of operations in the various factories that it controls easy going. The mistake of adopting an excessively rigid attitude when the unions and the TUC were looking for ways to end the strike, for which the Austin management was criticised by the court, may have been due to a fear of making concessions that might in some way commit the corporation as a whole for the future.

Down with "Uplift"?

PURCHASE tax has proved a fertile breeding ground for fiscal anomalies—and for friction between traders who pay the tax and the Customs and Excise Department that collects it. One of these causes of friction, which is now likely to be modified as a result of the report made to the Government by the Grant Committee this week, is the notional concept of "uplift." Purchase tax is collected by the wholesaler from the retailer, and is assessed on the wholesale value of the article. But in the many cases where the retailer buys direct from the manufacturer, the tax authorities have added a certain margin to the manufacturers' selling price, in order to arrive at a token wholesale price on which to assess the amount of purchase tax. Traders have objected strongly to this practice on the grounds that a manufacturer selling direct to a retailer usually incurs some wholesaling costs himself, and that these costs are already included in his selling price. Twelve months ago a committee was set up under the chairmanship of Mr Frederick Grant, QC, to look into these complaints and see whether any improvements could be suggested.

The Grant committee has taken rather longer to publish its conclusions than Sir Maurice Hutton's committee (which was set up at the same time to examine the possibility of compensating retailers for losses incurred on tax-paid stocks when the rate of purchase tax is reduced), but its recommendations will be more popular with traders. The majority report suggests that "uplift" should not be applied when a manufacturer sells direct to a retailer, and so doubles his function of manufacturer with that of wholesaler. But it suggests that uplift should be added when individual retailers buy from manufacturers on specially favourable terms, usually because of the size of the order; the purpose of this addition should not be to include notional wholesaling charges, but to make certain that the goods are assessed for tax on the same basis as if they had been bought by a retailer without special trading advantages. Unless this is done, identical goods would be attracting different amounts of tax, according to the size and bargaining power of the retailer that bought them. In the case of goods subject to resale price maintenance, a total abolition of uplift would merely put the tax reduction into the big retailer's pocket. Nevertheless, two members of the committee dissented from this second recommendation and wanted to get rid of uplift altogether. They argued that the only satisfactory basis for assessing liability for tax and avoiding the confusions of a notional price was to use the actual invoice price to the retailer. They were prepared to admit that this would give a special tax advantage to the trader dealing in a limited range of standardised products, but not that it would necessarily put all small traders at a disadvantage. The Chancellor of the Exchequer has decided to wait to hear representations about these conflicting recommendations before coming to a decision.

Larger Trade Deficit

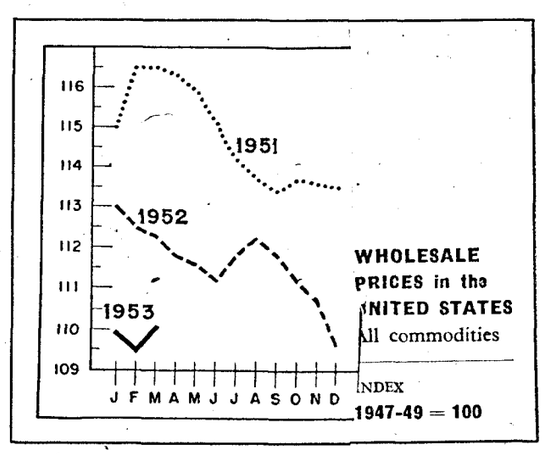
THE flow of imports into Britain continues to increase, although most of the stringent restrictions imposed at the end of 1951 and in the first half of 1952 are still in operation. The c.i.f. value of imports in April is provisionally estimated at £293.4 million; this is £32.0 million less than for April a year ago, but it is £21 million higher than the monthly average for the first quarter of 1953 and the highest figure for the past ten months. Exports in April, at £223.8 million, showed less buoyancy; they were only £5.3 million higher than the average for the first quarter, and still £5.4 million lower than for April, 1952. Fortunately, however, the lag seems to be wholly due to a decline in trade with soft currency areas; April exports to North America, at £29.8 million, were £5.7 million higher than the first quarter's average, and exports to Canada reached a new record of £16 million, contributing £4.7 million to this increase. Re-exports in April, at £9 million, were £1 million less than the average for the first quarter; and the month's excess of imports over total exports was therefore £69.6 million, or £15.7 million more than the average for the first three months of the year.

The daily rate of imports in April (again, reckoned c.i.f.) was £12.2 million, or £1.3 million higher than in March, while the daily rate of total exports was £9.3 million or only £700,000 higher than in March, despite the boom in trade with North America. After the harrowing experience of last year, analysts will be wary of trying to translate these monthly trade figures into balance of payments terms

(by striking out the insurance and it content in recorded import values and making allces for lags in payments and receipts). But if the rent monthly import excess of £41.5 million in the larter of 1952 was actually representative of approximaible balance at

UNITED KINGDOM TR
(MONTHLY AVERAGE OR CALENDONTH)
£ MILLION

	Imports cif	Exports fob	Re-ports fob	Excess of imports over total exports*
1952 4th quarter.....	263·9	213·1	9·4	41·5
1953 1st quarter.....	272·4	208·5	10·0	53·9
April	293·4	214·8	9·0	69·6



* After taking into account the newiation for exports through the parcel post.

that time (which is believed to be thee), the equivalent excess of £69.6 million in April suggesreal visible deficit of upwards of £20 million (or over o million a year). The country's usual surplus on invi: account may be covering this visible deficit, but prnably only just.

Weaker Canadian Dollar

SINCE the begiming of this monthe Canadian dollar has depreciated in terms of sing from $2.77¾ to $2.80⅛, and its premium on the Ulollar has narrowed from 1½ cents to under ½ a cent. Thieakening can in part be explained by the fact that Cana balance of current payments is normally unfavourable his time of the year. But it also reflects the recent reimition of quotas, and in some cases of outright bans, one import of several types of agricultural produce into tUnited States—as a byproduct of price-support regulats there. The latest available figures for Canadian tradre those for March. They showed an excess of imjts over exports of $47.4 million, compared with a surplus of exports over imports of $32.3 million in March, 1952.

Another—and perhaps the main—explanation of the weakness of the Canadian dollar can be found in the trend of capital movements. The recent rate of investment of United States capital in Canada has declined considerably, while a certain amount of short term money has flowed back from Canada to the United States. When the full Canadian balance of payments figures for 1952 are published, they will probably reveal a net outflow of capital from Canada to the United States—a sharp reversal of the trend in previous years. This reversal is probably not unconnected with the recent rise in discount rates in the New York market. The Treasury bill rate there has now touched a twenty-year peak of 2.35 per cent; this is much higher than the comparable Canadian short term rates.

Heights of Olympus

THE remarkable height of 63,688 feet (over 12 miles) reached last week by a Canberra bomber fitted with Bristol Olympus engines is likely to set a new official world altitude record for aircraft. The importance of the new record lies not in its absolute height, for other aircraft may have "unofficially" exceeded this, while manned balloons have gone considerably higher, but in its implications for future aircraft design and development. If modern engines can develop sufficient power to raise bombers to these altitudes—and the Olympus will power production versions of Avro's delta-winged Vulcan bomber—they present a formidable challenge to the designers of intercepting fighters. The higher a bomber flies, the longer it takes a fighter to climb up to meet it, and when the bomber is flying not far short of the speed of sound, the fighter must attack at supersonic speeds, which are at present reached only in a dive.

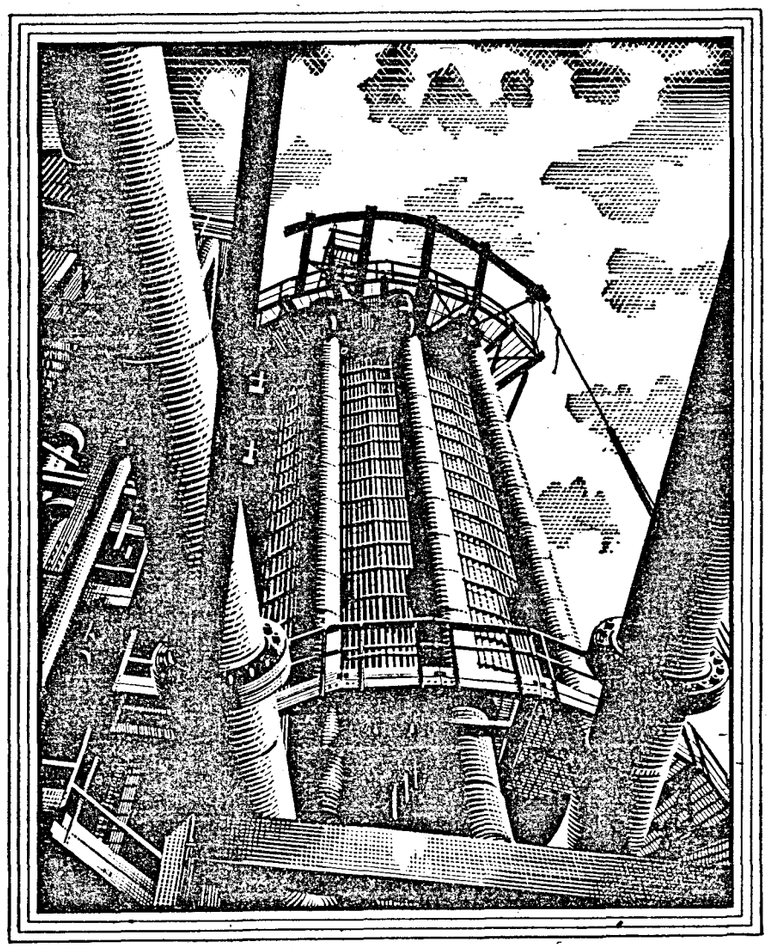
There is little doubt that engines going into service would enable fighter aircraft to reach such altitudes. Rolls-Royce has recently pointed out that the use of re-heat (burning more fuel in the hot exhaust gas of the engine) on the newer Avon engines means a "very considerable" increase in the maximum altitude at which a fighter can operate, but it is less certain whether existing airframes are suitable for flying in the rarefied air encountered in the region of 60,000 feet at the speed demanded of them. It seems likely, therefore, that provided the engine designers can give a fighter a rate of climb fast enough to bring it to within reasonable distance of the bomber, future attacking operations would be left to guided missiles released by fighters. But the efficiency of this method of defence, as distinct from reliance on supersonic high-altitude fighters, rests on the speed with which such guided missiles, and similar, bigger weapons fired from the ground, can be developed. This is a responsibility shared by the electronics industry and the aircraft manufacturers, and the complete answer has not yet been found. It is technical progress of this kind which throws one branch of air defence out of phase with another; that is the principal justification for switching the emphasis of rearmament from mass re-equipment to the continuous introduction of new types in more limited numbers.

Gold and the Gap

THE International Monetary Fund has in the past been in the forefront of those who have professed to see an indissoluble link between a fixed world price for gold and "sound money"—without ever very precisely defining what the latter phrase means. It is impossible to believe therefore that it is a very willing host—through the medium of the latest issue of its "Staff Papers"—to the report made to it by the Oxford economist, Mr Roy Harrod, who last year was temporarily attached to its research department as economic adviser. For Mr Harrod reports flatly that the main cause of the persistent lack of balance in world payments in the postwar world is that the dollar price of gold has remained fixed while the price of all other items entering into world trade has risen two-and-a-quarter times over. This uneconomic pegging of the price of gold has had all the usual crippling effects of price control in any field. It has caused a reduction in the volume of gold production. It has induced private hoarders to cash in with purchases of this bargain-basement commodity so that in recent years about half the value of the world's reduced gold output has disappeared into their hands instead of into the hands of central banks. It has inevitably meant that non-dollar countries have had to operate their trading policies on the basis of hopelessly inadequate central reserves—hence, as Mr Harrod sees it, their import restrictions. And it has borne especially heavily on Western Europe, which is now unable to earn sufficient gold from exports to South Africa and other "third countries" to pay for its imports from the United States, as it did before the war; even if inflation were wholly removed in Western Europe, Mr Harrod believes, this difficulty would remain. On the other hand, Mr Harrod points out, "if the value of newly mined gold becoming available for money outside the US and the USSR had borne the same relation to the value of world trade as it did in the 1930s, the rest of the world could have paid for the whole realised surplus of the US on goods and services account in 1950 to mid-1952 without loss of reserves and without aid (other than military items)."

Mr Harrod may be inclined to put too little weight on the other factors that have led to lack of balance between the dollar and non-dollar worlds since the thirties; he believes that it is mainly due to changes in the invisible account, above all to the loss of net dollar earnings from shipping, that the US surplus on current account expanded from 13.5 per cent of the value of American exports in 1936-38 to 19.6 per cent in 1950-52. This analysis may tend to disregard the extent to which the gap is artificially held down today by import restrictions—and to disregard too what would happen if ever the American boom was punctured. There is also a case for saying that there were certain absurdities in the prewar system, whereby America's surplus on current account was persistently financed by transfers of useless gold from the underground mines in the land to the underground vaults in Fort Knox. But the abolition of this system has not been a deliberate act of policy. *The Economist* has argued before that the question of the gold price may be one of several cases where "the exercise of America's monopoly buying power has had undesirable consequences that Americans have not realised or intended." The more frequently this point is hammered home in Washington, the better.

Coal on the Ground

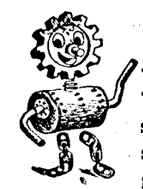


SINCE April last year, when the National Coal Board took over responsibility for the opencast working of coal from the Ministry of Fuel and Power, about 13 million tons of coal has been excavated from the surface workings; but the board had only about 11¼ million tons of it. This was a deliberate policy to deal with last year's slackening in demand for coal and probably a sensible one. But as a result of it the Opencast Executive completed its first nine months, the end of the board's financial year, £993,050 into the red.

The board's policy piled up stocks of opencast coal from about 400,000 tons when it took over to 3,100,000 tons at the end of last year. This was costly; the board says that the expense of stocking coal accounted for "virtually the whole" of the Executive's loss, though the Executive had stocks worth £6,100,000 in hand at the end of the year and may reap a windfall profit, when it sells them, from higher prices. The circumstances render the loss of 2s. 1½d. a ton on the 9,036 tons of saleable coal produced, and the "proceeds per ton saleable" of 47s. 9½d., quite incomparable with the colliery profits of 6d. a ton obtained from average proceeds of 57s. 3d. a ton of saleable mined coal. Broadly, production of saleable coal from the mines corresponded with actual sales, so that "proceeds" bear some rough relation to the average price actually obtained; but less than 7 million tons of the "saleable" opencast coal produced seems to have been sold. Average costs of production—49s. 11d. a ton opencast against 56s. 9d. a ton mined—are more comparable (the board estimates that it has fully provided for compensation and restoration of land). Both averages conceal wide ranges of cost, the largest element in the opencast figure being the price negotiated with each of the contractors now excavating the coal for the board; but the opencast average seems to have risen considerably less than the average cost of mining coal, apart from being absolutely lower.

*

To use opencast stocks as a buffer is logical. This coal is usually moved by road, and can be switched more easily to stocking grounds. The men who work the draglines know they have a contract to move a given amount of coal and overburden for an agreed price; the faster the better, for profits and earnings. Stocks piling up may cause some physical problems on the site; but not the psychological troubles that stocks at the pithead causes in some coalfields. Originally, too, opencast working was begun as an emergency operation to supplement insufficient output from the mines; the Ministry, indeed, was thinking of a time-limit on operation. The board's policy, however, may differ. It is at present talking blandly of producing "as much opencast coal as possible for a number of years to come": 10 million tons a year, it estimates, would mean 25,000 men employed at opencast production at any one time. Considering the high cost of opencast, by comparison with the 104 mines that the board reports are now producing coal at a loss of £1 a ton or more, this is logical enough, though restoration costs may well rise sharply in future. And the Coal Board, after all, is used to being unpopular.



There's a future in STEEL

On the Isle of Grain in Kent the centuries-old work of extracting salt from sea water has given place to the modern industry of oil refining. More than a hundred thousand tons of steel have been used in the construction of Anglo-Iranian's newest oil refinery there. Through the six hundred miles of steel pipeline now laid on this site four million tons of oil will pass each year for processing. The finished products will serve homes and factories throughout Britain, and land, sea and air transport in many countries.

Here in the towering columns of the oil refinery steel plays a vital part. The steel industry is supplying the material for this and many other new projects and is constantly developing new steels to meet the changing demands of modern industry, science and engineering.

'What about my future?' says JACK SCRAP

The steel industry still needs all the scrap which engineering firms and other steel-users can send back. Search out every ton of scrap on your premises. Your local scrap merchant will help with dismantling and collection.

Steel Output Steady

So far this year steel output shows every sign of fulfilling the industry's forecast of 17½ million tons for production in 1953. Output last month was at an average rate of 348,000 ingot tons a month, slightly lower than in March because of Easter holidays but still the highest ever recorded in any April ; over the first four months of the year output has been steadily achieving an annual rate of more than 18 million tons. Pig-iron output has been at the rate of more than 11 million tons a year. The steel industry expects to use about 9.7 million tons (750,000 tons of it imported) in making steel this year, with about 9¼ million tons of scrap—of which only half a million tons is expected from overseas. The industry's stocks of steel-making materials were built up last year ; there should be no reason to increase them during 1953.

Merchants' and consumers' stocks of steel, as well as steel and materials stocks inside the industry, rose during 1952 ; and in its current statistical bulletin the British Iron and Steel Federation estimates that no less than 610,000 ingot tons of last year's reputedly scarce steel was "sterilised" in this way. The federation casts a somewhat puzzled eye at the volume of complaints about steel shortage last year, from official as well as private sources. It finds the official view —that engineering production was hampered by steel shortage early last year but later picked up as allocation and steel supplies improved deliveries to consumers—"difficult to reconcile" with the statistics. These show that in the first half of 1952 output from the steel-using industries was above the corresponding level the year before, while steel deliveries were slightly higher ; in the second half of 1952 the output of metal goods was about 3 per cent lower than a year before, though deliveries of steel were markedly higher. The postwar relationship between deliveries of steel to the metal-processing industries (which take about 80 per cent of home steel deliveries), actual steel consumption by them, and their output is shown in the accompanying chart. "Whether there would have been the same emphasis on shortage is if steel could have been more appropriately distributed," comments the federation with justifiable sourness, "is an open question."

Buoyant Wool

Raw wool prices, which fell by 60 or 70 per cent between the beginning of 1951 and the beginning of 1952, have been remarkably firm (they have in fact risen slightly) throughout the past year. Contrary to some expectations, prices have again been well maintained both at the May series of London auctions (which ended this week) and at recent sales in Australia and New Zealand. At the London auctions better qualities were up to 5 per cent dearer than in March and lower prices were recorded only for some of the shorter staple qualities. Considerable business was done in top-making grades at 96d. a lb, while 66's touched a peak of 124½d. a lb. Demand for all qualities except the lowest was strong both from the Continent and Bradford, and there was brisk auctioning of Australian, New Zealand and South African clips.

As ample supplies have been coming on to the market, the well-sustained price level clearly results from genuine buying by mills that had let their stocks run low last year but that have recently been encouraged by steady buying of worsted and woollen goods by the public. Dealers seem confident that raw wool will continue at its present level till the end of the main wool selling season in a few weeks' time. The wool textile industry in Britain continues to be busy in all sections and at the end of March 161,890 workpeople were employed in it, the highest figure for two years and nearly 20 per cent more than a year ago ; the rate of consumption of raw wool in March was 49 per cent more than a year ago and higher than at any time since 1950. There are prospects of a larger wool clip next year but this is having no noticeable effect on this season's auctions.

Loss in the "House"

The Stock Exchange made a loss of £7,853 on its internal management in the year to March 24th last. Its total outgoings, which included the provision of £2,500 for profits tax and the transfer of £50,000 to the annuities redemption account as well as ordinary management expenses, fell from £601,616 to £568,496 ; but this was more than offset by the decline in gross revenue from £598,693 to £560,643. This decline in revenue was directly attributable to the fact that there were more old members who died or resigned than there were new members elected ; the total membership fell from 3,711 to 3,577, with a consequent reduction in members' subscriptions from £238,721 to £233,995 and in entrance fees from £62,475 to £30,450. At the same time subscriptions and entrance fees for clerks fell from £65,133 to £60,147.

The loss would have been even larger had not the Council of the Stock Exchange used its cash balances to increase its holdings of Government securities from £100,500 to £448,117, and so received £15,830 in interest compared with £3,800 in 1951-52 ; it would be intriguing to know whether it was before or long after the midsummer low point that the high priests of the House themselves turned from bears to bulls. With business at a low ebb, stockbroking looks like an uncomfortably overcrowded profession and there is little incentive for newcomers to join it. If it is to avoid a further loss, the Council may have to raise its subscription and entrance fees. After the fuss about commission rates, this may seem like putting a razor to its own throat ; but the demand for a seat, as distinct from for a security, is probably inelastic.

Company Notes

MARKS AND SPENCER. Dividend announcements by Marks and Spencer seem to be doomed to a churlish response in the stock markets. For the second year running an increase in dividends has been greeted by a fall in share prices. This time the "A" shares were initially marked down by 3s. to 51s. 6d., following an effective increase in the dividend from 40 to 50 per cent; this has been achieved by the recommendation of a full year's dividend of 50 per cent on a capital of £4,523,492 (as increased by last year's 100 per cent scrip issue), compared with the 1951-52 payment of 80 per cent on the original capital of £2,261,746. Encouraged by the Woolworth dividend, some investors had been looking for a bigger increase than this and had been hoping that the company would revert to the practice, suspended a year ago, of making a small annual bonus issue of shares as well.

This disappointment to over-sanguine dividend hopes should not obscure the fact that the company's preliminary profit figures for the year to March 31st indicate a remarkable recovery in trade. The company's gross profits in 1952-53 are returned at £8,223,081, compared with £6,513,877 in 1951-52 (when losses on stocks—particularly stocks of textiles—were written directly off profits) and, perhaps more significantly, with £7,335,900 in 1950-51. As the latest financial year was one of comparative stability in prices, this increase in earnings must mirror a very real expansion in sales.

	Years to Mar. 31, 1952	1953
Earnings :—	£	£
Profit, before tax	6,513,877	8,223,081
Depreciation	713,642	764,590
Repairs	804,545	717,351
Taxation	2,790,000	4,275,000
Net profit	*2,205,690*	*2,466,140*
Ordinary dividends	949,933	1,224,810
Ordinary dividends (per cent)	80	50
Stock contingency reserve	500,000	...
General reserve	883,198	1,500,000
Added to carry forward	*Dr157,066*	*Dr534,820*

5s. 'A' ordinary share at 52s. 3d. yields £4 15s. per cent.

The Inland Revenue Authorities are, of course, the first to benefit from this advance in profits, and the taxation provision has been increased from £2,790,000 to £4,275,000 (including £450,000 for EPL). Even so, net profits have risen—from £2,205,690 to £2,466,140—and the company has been able to appropriate substantial sums to reserves as well as to increase the equity dividend. It is a welcome sign of the times that the directors have appropriated nothing to stock contingency reserves, compared with the £500,000 transferred a year ago; instead, they have added £1,500,000 to general reserves, compared with £883,198 in 1951-52. The 5s. "A" ordinary shares, now at 52s. 3d., offer a yield of 4¾ per cent. Even for a growth stock such as this, in a business that should be more sheltered than most in the event of serious recession, this is a yield that will only attract the optimists.

★

GUEST KEEN AND NETTLEFOLD. Among the shares that were marked up when the Chancellor promised the death of EPL at the end of this year were the £1 ordinary stock units of Guest Keen and Nettlefold. The preliminary profit statement of the group for the 53 weeks to January 3rd last clearly shows why. The group's trading profits rose last year by over £1 million to £12.3 million; but, thanks to an increase in taxation from £6,059,782 to £7,031,757 (including £1,200,000 for EPL), its net profits actualiy declined—from £2,926,993 to £2,627,720. In the face of this decline in net earnings the directors could do no more than to maintain the equity dividend rate at 15 per cent while making approximately the same appropriations to reserves as they did in 1951. In the current year shareholders can look towards a further advance in gross earnings with a certain degree of confidence; but as EPL will still be mulcted from those earnings they cannot be at all confident that an expansion in the business will be immediately reflected in an increase in the dividend. It may therefore be another two years before the company's equities can resume their full status as a growth stock—and there is no guarantee that the engineering industry will be as prosperous in 1955 as it is now. In the more immediate future, shareholders will also be concerned to know whether the group intends to buy back its former steel shares after denationalisation. Perhaps some light will be thrown on this subject when the full accounts are published—but, if so, the group will have to break the precedent of cagey silence set by Vickers and others.

	Years ended Dec. 29, 1951	Jan. 3, 1953

£1 ordinary stock at 47s. 0d. yields £6 8s. per cent.

★

WHITBREAD. Like its most obvious rival, Ind Coope and Allsopp, Whitbread and Company controls a big chain of public houses in this country; but like Ind Coope, it is turning more and more of its attention and efforts to selling bottled beers across the counters of off-licences and of public houses owned by other brewers. As this market still appears to be expanding—though, perhaps, only at the expense of the market for draught beers—both companies seem to have enough elbow room for a slight but steady increase in business and profits. In the year to December 31st last, Whitbread's net profits improved from £866,323 to £903,015; these profits were struck after charging £1,064,192 (compared with £1,123,272 in 1951) for taxation and after crediting special profits of £179,153 (compared with £209,059). This advance has encouraged the directors to increase equity payments for the third year running. This time the ordinary dividend has been raised from 23 to 25 per cent, so that at the current price of 80s. the £1 "A" ordinary stock units yield 6¼ per cent. This yield is lower than that offered by most brewery shares; but the disparity seems just about justified by the company's proved willingness to adapt its business to changing demand and to pass some of the fruits of success to equity shareholders.

COMPANY MEETINGS

THE ANGLO-PORTUGUESE TELEPHONE COMPANY, LIMITED

BENEFIT OF NEW PLANT REFLECTED IN HIGHER REVENUE

OVER 10,000 TELEPHONES ADDED IN 1952

CONTINUED EFFORTS TO MEET GROWING DEMANDS

SIR ALEXANDER ROGER ON OUTLOOK FOR GOOD AND SOLID BUSINESS

The annual general meeting of The Anglo-Portuguese Telephone Company, Limited, will be held on June 4th at Strowger House, 8, Arundel Street, London, W.C.

The following is the statement by the chairman, Sir Alexander Roger, KCIE, which has been circulated with the report and accounts for the year ended December 31, 1952 :

Accounts.—The continued progress of your company during 1952 is shown clearly in the accounts. Total revenue at £1,640,952 showed an increase of £136,556, the increase arising largely from new plant which is being regularly installed for adding new subscribers.

The exchange rate has continued at Esc. 80.50 to the £ and all currency figures have been converted at that figure, as in 1951 and 1950.

Total expenses are up by £126,334, that is from £1,386,754 in 1951 to £1,513,088 in 1952. In total expenses are included renewals and depreciation, royalties, taxation, debenture and loan interest, debenture sinking fund instalments and the net cost of the issue of new ordinary share capital in June last. The rise in expenses was due partly to increased royalties out of the higher revenue and partly to the upward trend in costs generally. The company pays to the Portuguese Government in the form of royalties 7½ per cent of its annual gross earnings and in 1952 this amounted to the substantial sum of £122,816. The accounts also contain a full year's charge in respect of a 10 per cent supplement on basic wages effective from January 1, 1952. This, together with its effect on the company's pension scheme contribution, meant an addition of over £38,000 to wages and pensions for 1952, much the greater part of which being chargeable to revenue.

DIVIDEND RECOMMENDATIONS

The net profit of £127,864, compared with £117,642 in 1951, out of which we propose to pay a final dividend on the ordinary stock of 5 per cent which, together with the interim dividend of 3 per cent paid in November last, makes 8 per cent for the year. It is also proposed to pay a dividend of 8 per cent on the "A" ordinary stock. Dividends account for £110,362 and, after transferring £15,000 to the reserve for contingencies, the carry forward is increased by £2,502, bringing this up to £77,314.

The consulting engineers have made their annual investigation of the telephone plant and equipment and have again recommended that an additional allocation be made to the normal provision for renewals charged against revenue. The provision for renewals is now £1,679,677 and represents about 28 per cent of the cost price of installed plant, which the consulting engineers state in their opinion is adequate.

The replacement value of the telephone plant, land, and buildings is, in the opinion of your directors, considerably in excess of the balance sheet figure. As you know, it is the policy of your directors to invest the company's reserves in the business to the economic advantage of both stockholders and the telephone-using public in Portugal.

POST-WAR EXPANSION

The progress and expansion has accelerated rapidly since the end of the last war. From the beginning of 1947 to the end of 1952, telephone plant, cables, and other equipment has been shipped to Portugal to the value of £2 million, and out of this total £450,000 was shipped in 1952. In addition, 70,000 Contos, say, £800,000, of a variety of materials has been purchased in Portugal. The expansion of well-established industries and the development of new ones in Portugal, particularly in the last two or three years, enables our administration to make more purchases there and in 1952 alone the value of these amounted to some £187,600.

Portugal is not in a position to manufacture the highly specialised technical plant which a modern telephone service demands. This is understandable, as the present-day standard of electrical and mechanical efficiency of such intricate and sensitive equipment has only been evolved out of years of investigation and scientific research and the lifetime studies and skill of engineers and craftsmen. Nevertheless there is an increasing variety of accessory and ancillary equipment and supplies of a general nature which we can and are most happy to purchase in Portugal.

For one reason or another, therefore, our policy regarding purchases of materials is bilateral. The company helps in the productivity of both Great Britain and Portugal, which strengthens the industrial and commercial relationships between the two countries as a whole.

GENERAL PROGRESS OF THE COMPANY

Conversations by telephone go back to the days of Graham Bell, who invented the telephone in 1876. Your company does not date back that far, but it was only 11 years later, in 1887, when it began operations in Portugal by taking over the rights to do so from the Edison Gower Bell Telephone Company of Europe Limited.

The first few telephone conversations of those days in Lisbon have grown to 160 million conversations over our two systems in Lisbon and Oporto during the year 1952 and, at December 31st last, telephone stations had increased from only a few to 119,353. In 1952 alone we were able to add 10,160 new stations, a record for the company in any one year, and the growth goes on steadily.

In my statement last year, I said that work was well advanced on Graca, a new main exchange in the busy north-eastern area of Lisbon. The building was completed, enabling installation work to go ahead and, by the end of the year, final tests were being made. The exchange equipment, which was manufactured by the Automatic Telephone and Electric Company of Liverpool, and the cable plant by the British Insulated Callender's Cables of Prescot, was wholly installed by your company's engineering staff in Lisbon. On January 24th last, Graca was cut into service providing an initial number of 10,000 exchange lines and an ultimate capacity of 20,000. The cost of this new Lisbon exchange, together with its equipment for interworking in other existing exchanges, amounted to 38,000 Contos, about £472,000 sterling.

The importance of this new exchange created considerable interest in London and Portugal and the London *Financial Times* sent a representative to Portugal to report upon the country generally. A reprint of the article on Graca, as it appeared in the *Financial Times*, was circulated to all stock holders on February 18th last.

Once again the company was honoured by the attendance of the Minister of Communications, Colonel Manuel Gomes de Araujo, who presided at the ceremony. Supporting the Minister were the British Ambassador, Sir Nigel Ronald, KCMG, CVO, the Civil Governor, the President of the Camara, and senior representatives of the Portuguese Government Telephone Administration. Among the 150 guests were many other leading figures from government and municipal departments and banking and commercial and industrial circles. Before the ceremony many of the guests toured the exchange and inspected the equipment.

Excellent speeches were made by the minister, the chairman of your board in Portugal, and the general manager. The ceremony and the speeches were recorded and relayed later in the evening over the national broadcasting networks.

MOST CREDITABLE ACHIEVEMENT

The technical cut-over took place successfully at midnight, the whole operation taking only 45 minutes—a remarkably short time when it is considered that it involved the complicated operation of transferring to Graca from three other main exchanges some 6,300 telephone lines. The subscribers concerned were disconnected for only nine minutes, and at that hour most of them were unaware of this. It was a most creditable achievement, being the result of many months of planning and preparation and the application of long experience.

We are all users of most public utility services—water, gas, electricity, transport and telephones—and those of us in the business know all too well that the spotlight of public opinion is constantly centred on our activities.

Operating as we do in a foreign country, the utmost care was taken to prepare the public for the change-over, involving many alterations in the telephone numbers of subscribers, and among the precautions adopted were the publication of a new directory well in advance, together with public announcements in the press and cinemas and on the wireless.

Much to my regret, I was unable to attend the inauguration myself, but your London board and British technical specialists were well represented.

FULL OBJECTIVE NOT YET REACHED

Before proceeding to further matters, I quote the following translated paragraph from the speech of HE the Minister of Communications at Graca as reported in the official Government daily newspaper, *Diario da Manha :*

"The anxiety of Portuguese to have a telephone is clear evidence of the enormous economic impulse and civilising influences which have taken place in Portugal in the last few years, but it is not only a consequence of its relative economic prosperity but also of the political pattern and social calmness under which the country is governed, lives and works. The APT, like the Portuguese Government Telephone Service, conforming to the general rule to-day obtaining in many countries—even the most prosperous where the telephone has for very long been widely used—have been pursuing for years their objective to give prompt attention to all new applications. The truth is, however, for various reasons, among which stands out the setback provoked by five years of war after which it took time to reconvert industries, that they have not yet reached their objective."

We agree entirely with His Excellency the Minister that our company has not yet reached its full objective. A telephone operating company can never stand still, and we shall not be satisfied until we can meet the demand for service within a matter of days of the receipt of applications. In common with a great number of other telephone organisations in various parts of the world—Great Britain for one—the problem is a difficult one. The waiting list at December 31, 1951, was 22,527, and, after adding 10,160 new telephone stations during the year, which is the equivalent of 7,250 new subscribers, the waiting list at December 31, 1952, was still 22,020, which is a reduction of 507 only.

That is the degree of demand with which we are confronted and which we are strenuously and with the best advice of our telephone experts endeavouring to meet.

OUTLOOK FOR GOOD BUSINESS

There is no limit to the outlook for good and solid business for your company in the future years, the tempo of which, however, must be governed by engineering practicalities and the continuity of financial ability.

We have every sympathy with the waiting applicants and we can assure them and the Government that we fully recognise our obligations to provide service. As a measure of our activities we have since May 1, 1950, the date of the last tariff revision, to March 31, 1953, added 30,000 new stations and, since June, 1950, raised £2,250,000 of permanent capital.

For the benefit of the non-technical, however, it should be realised that while periods of acceleration are possible, to maintain these over several years creates problems involving land, buildings, operating standards and staffing of trained personnel, is uneconomic and costly to all concerned and can only result in a low level of service.

The ability to obtain finance from time to time can reasonably be expected provided that operating conditions are right, and that the national and international situation at the time is not adverse. It is quite another matter, however, to obtain money for a programme which cannot be proved in technically and economically, or to be in the interests of the telephone subscribers from the points of view of service and cost, and this is a situation we have successfully avoided.

We promise the Government and the public as heretofore that we shall continue to use all our considerable technical resources at home and in Portugal, and all the financial resources available to us to reduce the waiting list in the shortest time possible.

RECONSTRUCTION AND MAINTENANCE

The building and equipping of large modern exchanges is relatively spectacular and bears fruit for many years, but less spectacular although equally essential work must continue on reconstruction and maintenance. The skill of our engineers in the re-use of recovered plant is most commendable and our workshops staff in Lisbon and Oporto do a valuable job of repair and rehabilitation.

Among the work on inside plant undertaken and satisfactorily completed, in addition to the Graca development, was the installation of a 400-line extension at Olivais and the extension of Benfica and Estoril Exchanges, all in Lisbon. In Oporto extensions were made to Lapa, Boavista, Foz, Matosinhos, Gala and Espinho Exchanges. In addition there was in both areas extensive work carried out on outside plant. Each telephone connected to an exchange must be made readily available to every other telephone on every other exchange in the system.

In short, the capital expansion programme was satisfactorily completed within the time limit we had set ourselves and with very few additions to staff and workpeople.

The telephone rates paid by subscribers in your company's system consist of a fixed monthly rental, plus the cost of calls on a graduated and reducing scale, according to usage. It will readily be appreciated that the calling rate is of paramount importance as one of the factors in the total revenue earned by the company.

The calling rate fluctuates with the seasons of the year, but the average per day per subscriber is about 5.75 effective calls in Lisbon and 4.80 in Oporto.

We have to keep a close check on the figures, particularly as new subscribers coming on to the system, especially those of the residential category, are generally small users of the service, which tends to bring down the overall average of the calling rate.

Constant review of rates therefore is always necessary not only because of the rising heavy cost of telephone plant and general expenses but because of the average fall in revenue per subscriber, which becomes more noticeable with the increasing number of smaller users.

At the present time, however, it can be said that the Lisbon and Oporto subscribers are enjoying an efficient and inexpensive telephone service.

FINANCE

Last year I referred to the basis of finance which your company has adopted by which Telephone and General Trust provide the temporary unsecured loans for plant and equipment until such time as we can call for permanent capital. By June, 1952 the total borrowings from the Trust had reached £400,000, and it became desirable to make an issue of ordinary shares for the purpose of refunding the loan and providing a balance in hand. By the end of 1952 we had £73,967 cash on deposit, but this has been used and recently we have again recommenced temporary borrowings from the Trust.

It is therefore proposed at the forthcoming annual general meeting to create an additional 1,400,000 ordinary shares, bringing the total of unissued ordinary share capital up to £1,550,000 in readiness to issue in whole or in part at such times as the board may decide.

We have to consider constantly the future as the placing of orders must be made well in advance of service, particularly for exchange equipment which, owing to its intricate nature, requires many months of engineering and manufacture.

LONG-TERM PLANNING ESSENTIAL

Long-term planning is essential and the closest co-ordination between the operating company, the consultants, and manufacturers at home must be maintained throughout production if the finished equipment is to pass the stringent tests which must be made upon it.

Your board has authorised the placing of orders for materials of substantial value, and during 1953 it is proposed to carry out extensions to a number of exchanges and to develop and improve the service generally.

Fortunately, your company, through its group connections, can depend on the financial assistance of Telephone and General Trust Limited, and, on the manufacturing side, Automatic Telephone and Electric Company, Limited, and British Insulated Callender's Cables Limited for the supply of exchange equipment and cables. In addition, there is a service company, a subsidiary of Telephone Trust, which includes among its personnel qualified engineers and technicians and men with years of experience in other branches of telephone supervision and management.

The reputation and technical organisation of our British group is widely known in Portugal, inside and outside the Government, and they recognise and appreciate the advantages to be gained from the combined resources and services which the group is able to offer.

PORTUGAL

In Portugal's economic affairs the past year was marked by the announcement early in September of the six-year economic plan, the object of which is the industrial and agricultural development of Portugal and her overseas territories, while at the same time undertaking additional public works.

It is estimated that the cost of this plan when completed will be 13½ million contos, which at the present rate of exchange is, in round figures, the equivalent of £168 million. Of this, £93 million is allocated to Continental Portugal and £75 million to the overseas territories.

In Continental Portugal it is proposed to develop agriculture through irrigation, increase hydro-electric power, to complete industrial projects already begun and create others, and to improve all forms of communications.

Of the £93 million, £41 million will go to industry, including the largest single item of development, the production and distribution of electricity, to which £30 million has been allocated.

In the overseas territories natural resources will be harnessed through the development of electric power, irrigation, and land settlement. At the same time improvements will be made to roads, railways, seaports, and air communications.

This plan represents a mobilisation of the national wealth on a scale which is unique in the history of Portugal and is typical of the courageous government of the Estado Novo—the New State, which was instituted in 1933.

As the plan is gradually brought into operation it can be expected that Portugal will

benefit from greater productivity, which will be reflected in the additional demands on the public services, and in our case the telephones, with increasing business to them all.

FAVOURABLE BALANCE OF PAYMENTS

As a result of Portugal's favourable balance of payments in recent years, it became necessary early in 1952 for the Government to restrict exports to many countries in western Europe in an attempt to reduce the increasing credit balance which they held against other European Payments Union countries. By the end of the year these measures had met with success and many of the restrictions imposed earlier were lifted.

As a member of the North Atlantic Treaty Organisation, Portugal is playing her part in building up military and naval power sufficient for her needs and responsibility and, whilst making a substantial contribution, is happily in a position to achieve this end without serious disruption of her economic life.

This carefully devised economic plan is in sequence to the general reconstruction plan which has achieved successful results over a number of years.

On April 27, 1928, HE Dr. Antonio de Oliveira Salazar was appointed Minister of Finance in Portugal and four years later, in 1932, he became Prime Minister. Through all the subsequent years, which include those of the greatest World War, His Excellency's courageous and successful leadership of his country has been admired and respected by all Christian countries.

Portugal in size is a small continental country, but its geographical situation places it on the main air routes of Europe, Africa, and North and South America and, among its vast overseas territories, are the islands of the Azores, the strategic value of which is outstanding.

The importance, therefore, nationally and internationally of calm and unfaltering leadership in Portugal requires no emphasis.

In addition to his political leadership and social reforms, Dr Salazar has performed financial miracles with his successive budgetary balances, consolidation of national debt and in transforming the escudo into one of the hardest currencies in present-day monetary spheres.

I am sure that I have your endorsement of the cablegram I sent to His Excellency on April 27th last, paying tribute to his courage, high principles and self-sacrificing example and expressing the hope that he will be spared for a great number of years to lead and guide the destinies of Portugal.

VISITS

In October last I paid a visit to Portugal and during my stay was once again received most cordially by the Prime Minister, HE Dr Antonio de Oliveira Salazar. I was able to discuss with him many of the problems which confront an active company like ours, and I found, as always on the many occasions when he has received me, that His Excellency has a keen perception and understanding of our affairs and problems.

During my stay I had a series of meetings with a number of Ministers of the Government, namely, the Ministers of Communications, Presidency, Ultramar (Overseas), Foreign Affairs and Corporations and with the Director-General of the Ministry of Information.

In all the meetings I sensed an atmosphere of friendliness and good feeling towards the telephone company and I was gratified to have this further evidence of satisfaction with the earnest endeavour we are putting into Portugal in expanding and developing the telecommunications within the areas of our operations.

PERSONNEL

Your company has good friends in Portugal and is particularly fortunate in its advisers. The chairman of the board in Portugal, Engenheiro Antonio Branco Cabral, and our legal adviser, Doctor Antonio Bustorff Silva, in spite of their other business activities, do not spare themselves in the furtherance of the company's interests.

The other directors of the board in Lisbon are ever ready with their support and advice based on their specialised knowledge of the country.

In Oporto, we have Snr. Antonio d'Oliveira Calem, CBE, who is one of the leading industrial personalities of that city, and his wide business experience is available at all times.

Our general manager, Mr R. S. Thorp, has grown up in the company and is in his twenty-eighth year of service. He has mastered all sections of operating management, and he is a practical engineer and technician with long years of experience to draw on. He is invaluable to the company, has earned excellent standing in Portugal, and your London and Portugal directors have complete confidence in him.

In Oporto we have Mr J. C. C. Mitchell in charge, who has been with the company for about 23 years and who was appointed manager in January, 1951. He fits into the scheme of things there admirably. In these and the numerous senior executives and departmental heads, British and Portuguese, you can be assured that your company has a first-class team.

Good administration and organisation, however, is not alone sufficient; it requires the backing of specialised trained staff and able workpeople, men and women of good will and willing spirit.

Like all concerns at home and abroad, we have our staff problems, but in all sincerity I can state that our people of all ranks, and there are in Portugal some 3,300, respond most loyally to the maximum consideration which it is our policy to show to them all, within the limits of the company's economic and financial capacity.

I thank them for their services which have brought us through another year of activity, and in this I include my colleagues on the London board and the London staff, whose standard of efficiency, I can assure you, is maintained at a high level.

BRITISH OXYGEN COMPANY

INCREASED SALES IN ALL DEPARTMENTS

MR J. S. HUTCHISON ON THE OUTLOOK

The sixty-seventh ordinary annual general meeting of the British Oxygen Company, Limited, was held on May 14th, in London.

Mr J. S. Hutchison (the chairman), in the course of his speech, said:

The year 1952 benefited from an unusual coincidence of favourable circumstances resulting in an increase in consolidated profit after depreciation, of £732,000. This increase was composed firstly of profit accruing directly from development work of recent years, secondly of materially improved profits of overseas and home associated companies and thirdly, and to a less extent, of increased earnings from home business where a satisfactory and steady increase in sales helped to offset increased costs and still give modest additional profit.

The ordinary stock dividends this year absorb rather less than half the earnings of the year available for the equity capital and therefore take full cognisance of our particular need for retention of profit to assist in the capital development which is so prominent a feature with us. At the same time a modest increase is afforded to ordinary stockholders who have met several calls for additional capital in the seven years period during which their dividend has been static and in which our profits have increased materially and steadily.

INCREASED HOME TRADING

We experienced an increase in sales last year which was general to all departments, was above our anticipation and was of a very steady and gratifying nature. Despite further heavy increases in costs affecting the whole of our output, and largely as the result of plants operating steadily at full load, we have emerged with a margin of additional profit on home trading although that margin is not proportionate to the additional output.

I am glad to say that there has been a notable development in the use of Argon in the various manual and mechanised methods of welding of non-ferrous metals and certain alloy steels which cannot easily be welded in other ways.

TAXATION

The encouragement given by the Budget to industry and to individuals should have important practical and psychological effects in leading to a more settled position and in restoring incentive. On the all important matter of reduction of costs, a first step is taken with the Purchase Tax changes and this I hope may lead on soon to a position where we are once more enabled to pass on to industry the benefits of larger scale production which in recent times have been nullified by constant and heavy cost increases.

It is heartening indeed to find that the serious difficulties imposed by very high taxation on the development of industry for the benefit of the nation by greater exports, greater efficiency or greater employment, are being given the fullest measure of relief which it appears possible to give at present and that there is indication of the will to tackle the more fundamental problem of the pattern of industrial taxation which so very badly requires attention.

OVERSEAS INTERESTS

We had a propitious year overseas in 1952 in that the total of our profits from overseas sources increased materially and almost every individual unit, large or small, contributed to the increase.

PROSPECTS

I am glad to say that from the information so far available we have made a good start this year both at Home and Overseas despite any trade inhibitions still obtaining. I confidently expect that we shall finish 1953 with considerably enhanced group output and that it will be for us a year of considerable general advance.

Our profits come from many trading sources in many countries and are subject to many possible happenings. The field for variation is wide but nevertheless I am firmly optimistic as to the outcome for 1953 and I am very hopeful of being able to present good profits to you again next year.

The report and accounts were adopted.

SCOTTISH UNION AND NATIONAL INSURANCE COMPANY

YEAR OF CONTINUED PROGRESS

NEW LIFE ASSURANCES EXCEED £5 million

MR HUGH WATSON'S REVIEW

The one hundred and twenty-eighth annual general meeting of the company, was held, on May 13th, in Edinburgh.

The following is an extract from the statement by the Chairman, Mr Hugh Watson, WS, circulated with the report and accounts:

Since the last annual general meeting, Lieut Colonel the Hon Sir Piers Legh has been appointed to the London board in succession to Sir Ulick Alexander, who resigned on taking up residence in Southern Rhodesia. The chairman expressed gratitude to Mr Jackson Dodds, who had been chairman of the Canadian board since its formation and who has intimated his wish to retire, for the guidance and help which he gave to the company during the formative years of the Canadian branch and welcomed Mr L. S. Mackersy, the President of the Imperial Bank of Canada, who has joined the Canadian board.

Regret was expressed at the death of Dr Frank G. Donovan, who was, until recently, the chairman of the board in Melbourne, Australia, and of Mr David Roberts, who was the joint underwriter of the associated company, the Maritime Insurance Company, Limited, of Liverpool, with which company he had served over fifty years. The chairman also referred to the appointment of Mr Reginald H. Jones as underwriter of the "Maritime."

LIFE DEPARTMENT

During 1952 new life assurances exceeded £5 million for the first time in the company's history. Over 40 per cent of this total was connected with group or individual pension arrangements. In addition deferred annuities exceeding £550,000 per annum were effected in connection with group pension schemes. These figures illustrate the success which has attended the setting up of a special department to handle the growing and complex business of pension schemes, and they reflect the excellent service the company is able to offer the public in this connection. It can be said with confidence that the company is well equipped to handle all types of pension arrangements and to keep abreast of any developments in this class of business.

The life premium income increased from £1,182,607 in 1951 to £1,286,360 in 1952. These figures do not include single or annual premiums amounting to £790,447 in respect of deferred annuities which are included under the heading "Consideration for Annuities." During the year there was a small increase in the amount paid in respect of claims by death, but mortality experience continued to be favourable and the claims were well within the expected figures. At the end of the year the life assurance and annuity fund stood at £16,405,171 compared with £15,495,362 at the end of 1951.

FIRE DEPARTMENT

The fire premium income during the year 1952 exceeded £5,250,000, which constitutes a new record for the company.

The increase in the premiums amounted to over £161,000, and as it was not necessary to make such a large addition to the provision for unexpired risks as required a year ago, the very satisfactory profit of over £458,000 resulted in the fire account for transfer to the profit and loss account.

To provide for unexpired risks in respect of the substantial amount of our fire business in North America which is written for a term of years with the premium payable in advance, it was considered prudent to transfer £150,000 from the profit and loss account to the additional reserve in the fire revenue account. The result of this is to maintain a very strong fire fund, which now amounts to approximately £4,395,000 and represents over 83 per cent of the premiums for the year.

ACCIDENT DEPARTMENT

The premium income in the accident and general account increased by over £214,000, bringing the total to over £1,591,000. While part of this increase resulted from higher premiums for certain classes of business where the claims experience has been unfavourable (and in particular motor insurance) part is due to new business secured in sections of the accident account which have proved most satisfactory from an underwriting point of view during recent years.

Continuing efforts are being made to improve the experience in the motor account, and it is encouraging to report that our claims ratio for motor insurance in the home field has been materially better than during 1951. It is hoped that adequate rating and prudent underwriting will soon enable the company to feel the whole of the motor account is firmly established on a basis which will produce a reasonable rate of profit on the transaction of this class of business.

The increase of over £214,000 in the premiums made it necessary to set aside an additional amount of over £107,000 to provide for unexpired risks which as hitherto have been based on 50 per cent of the total premiums for the year. While a 50 per cent provision imposes a strain on a rapidly growing account, the board take the view that they should continue to follow the company's well-established practice and, to cover the consequent deficit, £55,222 has been transferred from the profit and loss account.

MARINE DEPARTMENT

The marine business is mainly handled by the associated company, the Maritime Insurance Company Limited of Liverpool. A year ago reference was made both to the keen rates in the marine market and also to the very careful selection of business which is exercised. These factors have resulted in a diminution in the premium income amounting to £23,804 compared with the peak figures of 1951.

A profit amounting to £95,000 in respect of the year 1950 and previous years has been transferred to the profit and loss account. Abnormal weather conditions and other factors have resulted in a series of quite substantial marine losses during the latter months of 1952 and the early months of 1953. While these naturally do not affect the results for 1951 and earlier years, it was felt prudent to increase the marine fund, which now exceeds £2 million.

INVESTMENTS

The year was distinguished in the investment world by a continued decline of British stock market prices in the earlier months until the Government's policy of higher money rates produced the effect of a freer economy and helped in the lowering of commodity prices. The recovery during the second half of the year did not restore market values to the levels of the 1951 year end, and the sum of £270,000 was transferred out of the life account to investment reserve. Most of the drop in market values has been recovered as a result of the further rise which has taken place since the end of the year. A large part of the depreciation suffered in recent years will be regained through the maturity of redeemable securities.

The yield on the life and annuity fund for 1952 amounted to £4 12s. 11d. per cent gross and £3 13s. 5d. per cent net. These figures constitute an increase during the year of 1s. 11d. per cent and 1s. 9d. per cent respectively.

DIVIDEND

The board have for some time had it very much in mind that the rate of dividend being received by the shareholders remained lower than it was before the war. A small increase in the dividend was made at the end of 1951 but this still left the dividend below the prewar figure. Having regard to inflationary trends and the raising of salaries, wages and costs generally, the directors have felt an obligation to restore, if not to increase, the prewar dividend as quickly as possible.

In keeping this matter in mind the conservative policy of the company has been continually observed with the feeling that an increase in dividend rate should not be made without some reasonable assurance it could be continued.

It is pleasing to report that the encouraging increase in interest earnings, coupled with the favourable fire underwriting experience and what is considered to be the inherent strength of the fire, accident and marine accounts, have convinced the board that the company can reasonably increase the dividend to 35 per cent, and the meeting was ask to approve the appropriate resolution.

CONCLUSION

Mr Watson concluded: "I wish to say a few words of thanks and appreciation.

We are indebted to Mr Geddes who, in the course of several visits to the USA and Canada in connection with other business, made contact with our representatives and was of considerable service to the company in consequence. Similarly our thanks are due to Sir John Gilmour who visited Australia, Canada and the USA. Visits of this kind are not only useful in connection with specific matters which may be under consideration, but also serve a valuable purpose in keeping the board and management closely in touch with the company's affairs overseas.

I also wish to make special reference to the services rendered to the company by our loyal and hard-working officials and staff at home and abroad. Accompanied by the general manager I have been able to visit most of the principal branches of the com-

ATLAS ASSURANCE COMPANY LIMITED

MR RUDOLPH E. F. DE TRAFFORD'S STATEMENT

The Annual General Meeting of the Atlas Assurance Company Limited, will be held at the Company's Offices, 92, Cheapside, London, E.C.2, on Friday, May 29th.

The following are extracts from the statement to shareholders by the chairman, Mr Rudolph E. F. de Trafford, OBE, on the report, accounts and balance sheets for the year ended December 31, 1952:

It goes without saying, of course, that the year 1952 was not without its problems but our results, though in some respects less satisfactory perhaps than in 1951, should not, I think, cause shareholders any disappointment.

One feature of immediate interest, and which I hope has fuller meaning, is that, in certain directions, a slowing down in the rate of expansion of our premium income seems to be perceptible and this is something that is not unwelcome. The truth is, of course, that whilst development, inspired by our own efforts, has played an appropriate part in the expansion which has taken place during the postwar years, it is circumstances beyond our control that have played the greater part. I have in mind, it will be understood, the fall in the purchasing power of money in terms of all other things—goods, property of all kinds and services. Whether the apparent change in momentum is no more than a pause, time alone will tell.

FIRE ACCOUNT

Our Fire premium income amounted to £6,049,628, as compared with £5,624,740 in 1951, and, after setting up the customary reserve to cover unexpired liability, there is an underwriting profit of £648,151 by comparison with £707,212 in the previous year.

ACCIDENT ACCOUNT

The expansion of our Accident Department premium income from £2,064,459 in 1951 to £2,472,946 in 1952 is due, I am glad to say, not so much to any inflationary trend as to rate increases, a general development of our business and a widening demand for insurance protection of one kind and another.

MARINE, AVIATION AND TRANSIT ACCOUNT

In the Marine Department our premium income at £807,042 was less by £84,549 than the 1951 total of £891,591. Chiefly responsible for this were lower prices in respect of certain commodities and an extension of import restrictions of one kind and another which naturally had its effect on the movement of goods.

As to claims experience, it will be noticed that claim payments amounted to £541,634, as against £521,475 in the previous year. The increase involved is due to heavier claim payments in respect of both hull and cargo business and, although this increase itself is of no particular consequence, it has, I suggest, its significance as indicating a trend not without its dangers.

The transfer of £75,000 to the credit of Profit and Loss Account is made largely in order to meet tax charges.

LIFE DEPARTMENT

The Life Assurance and Annuity Fund amounted at the end of the year to £23,450,446, an increase of £855,171 over the previous year's figure.

New business again constituted a record. Sums assured under new life assurances were £6,279,435 after deduction of reassurances, as compared with £5,641,967 for the previous year. Deferred Annuities amounted to £549,206 per annum, as against £482,546 per annum in 1951.

The premium income of £2,620,917 was £381,658 greater than in the previous year. The ratio of commission and expenses to premiums fell from £12 10s. per cent to £11 19s. 9d. per cent.

The gross rate of interest earned increased from £4 8s. per cent to £4 12s. 6d. per cent and the net rate from £3 12s. 6d. per cent to £4 1s. 7d. per cent.

The actuarial valuation at December 31st last revealed a surplus of £1,085,813. The sum of £375,000 was taken from surplus to provide for depreciation of investments and £125,000 was applied to increase the investment reserve to £325,000.

A reversionary bonus at the rate of 35s. per cent per annum, calculated on the sum assured and existing bonuses, has been declared for the three years 1950 to 1952.

The terms which we offer for all classes of assurance and annuity are attractive, but I would particularly draw attention to our with-profits contracts. As an illustration of the cumulative effect of a compound bonus I would mention that a bonus of 35s. per cent per annum compounded triennially is equivalent, over twenty years, to a simple bonus of 40s. 8d. per cent and, over thirty years, to a simple bonus of 44s. 6d. per cent.

PROFIT AND LOSS ACCOUNT

In my statement last year I explained the change which we had made in dealing with overseas taxes on profits and since it is the effect of this change and nothing else, which temporarily destroys a true comparison of our tax figures as between 1951 and 1952 there is not, I think, anything I need add to what I then said.

APPROPRIATION ACCOUNT

I am sure that shareholders will have received with pleasure the news of the increased dividend of 15s. per share, as compared with the 12s. 9d. per share paid for each of the past two years. After providing for this dividend, 6s. per share of which was paid in November last, and also setting up a provision for possible exchange losses (less United Kingdom tax relief thereon), the total carry-forward amounts to £1,037,288.

STAFF

To conclude, it is with pleasure that I place on record once more our appreciation of the good work of the staff, both men and women, who serve and care for our interests, whether those who so serve belong to the "Atlas" or to the companies which are of the "Atlas" family, or whether their duties lie south of the Equator, east of Suez, on the North American Continent, here in the United Kingdom or elsewhere in the world. The contribution of all these people to such success as we may achieve is a great contribution and we value it at its true worth.

CALEDONIAN INSURANCE COMPANY

SIR HENRY J. ROSS ON CONTINUED EXPANSION

The one hundred and forty-eighth annual general meeting of the Caledonian Insurance Company was held on May 14th in Edinburgh, the Deputy Chairman presiding.

The following is an extract from the chairman's circulated statement.

Life Department: Our net new life business for the year, including group business, amounted to £2,996,216 as against £3,019,036 for 1951. Deferred annuities amounting to £200,580 were issued as compared with £106,120 for the previous year.

Premium income increased by £53,094 to £977,502 and the net interest income by £14,798 to £363,900. The net rate of interest earned on the fund was £3 9s. 5d. per cent.

Outgo in the revenue account shows that the amount paid under death claims was similar to the amount paid in 1951 but our maturity payments are considerably less.

Surrender payments have increased, but this is due to withdrawal payments under pension schemes to some extent and to the financial stringency of the times. The expense ratio is 16.7 per cent as compared with 16.2 per cent in our last accounts.

The life assurance and annuity fund at £10,923,394 increased by £501,915 during the year. Our assets are fully of the value stated and the market value of our Stock Exchange securities exceeds the value at which they appear in the balance sheet. At the end of this year our triennial valuation falls to be made.

Fire Department: The premium income for 1952 was £3,181,799, a reduction on the record figure of £3,304,365 for 1951. This decrease was entirely due to certain revisions made in our portfolio of business in the United States of America. Our world-wide trading again produced very satisfactory results. After increasing the additional provision by £75,000, the sum of £269,553 has been transferred to the profit and loss account.

Accident Department: The premium income for the year was £3,141,046, the highest figure in the history of the company, being an increase of £689,321 over the record figure for 1951.

I am pleased to report a decided improvement in the motor department results. Our underwriting in the other departments was successful, and the sum of £17,912 has been transferred to the profit and loss account.

Marine Department: The sum of £70,000 has been transferred from the account to the profit and loss account. The fund at £898,225 represents 175.4 per cent of the premium income, which is a satisfactory increase on last year's percentage of 165.5.

TOTAL PREMIUM INCOME

The total premium income for all departments increased from £7,255,211 to £7,812,559 and indicates the continued extension of our business. The amount of interest, dividends and rents (less tax) not carried to other accounts was £134,568.

The balance for the year transferred to the appropriation account was £220,811 after providing for taxation and for bad and doubtful debts.

The directors recommend an increase in the dividend from 3s. 6d. to 4s. 6d. per share, and an allocation of £35,000 to the staff pension fund.

The report was adopted.

MINERALS SEPARATION, LIMITED

YEAR OF FURTHER PROGRESS

ENTERPRISE PENALISED BY TAXATION

MR J. N. BUCHANAN'S REVIEW OF PRINCIPAL INTERESTS

The forty-eighth annual general meeting of Minerals Separation, Limited, will be held on June 4th at Winchester House, Old Broad Street, London, E.C.2.

The following is the statement by the chairman, Mr J. N. Buchanan, which has been circulated with the report and accounts for the year ended December 31, 1952:

Last year's consolidated gross profits, which were the highest hitherto in the history of the company, have been further increased this year by £50,000 to a total figure of £341,000. While dividends bring in nearly the same figure, the profits on trading are up from £117,000 to £174,000. This increase is due mainly to our Birmingham interests, and also, in part, to three months' profit from our newly acquired subsidiary, J. W. Jackman and Company, Limited, Manchester, about which I shall have more to say later on. On the other side of the consolidated profit and loss account you will notice that the Government's share of our success has grown from £175,000 to £227,000, including provision for excess profits levy of £30,000. While accepting the need for taxation on a heavy scale as cheerfully as we can, we are entitled to criticise, I think, taxation that discriminates against those who show enterprise in new development or expansion. Excess profits levy does just that. It is, therefore, disappointing that we are to have a second dose of this levy which *The Economist* has aptly described as "a fabulous piece of fiscal nonsense." We propose to pay the same dividend as last year on the increased capital; with the reduction in income tax this will take a net figure of £95,000 as against £80,000 last year—surely a modest enough reward for the risk-takers in comparison with the Government's share.

BALANCE SHEET FEATURES

Turning to the consolidated balance sheet, the increases in assets and liabilities are mainly due to the acquisition last September of J. W. Jackman and Company, Limited, our new subsidiary; and also to the expansion in turnover at Birmingham. In our opinion the unquoted investments are conservatively valued. The increase of cash is of no particular significance, and is partly explained by an accumulation of funds for the purchase this year of further shares in Foundry Services, Limited, as explained later.

We are not a finance company, but since the control of the company passed into new hands five years ago, as outlined in my speech dealing with the year 1947, our policy has been to acquire, for long-term investment, the whole or part of the capital of manufacturing or trading companies which, in our judgment, hold promise for further development. The steady growth to date resulting from this policy can, perhaps, best be illustrated by comparison of the results disclosed by our accounts at December 31, 1948 and 1952. This shows an increase, during the period, in gross profits from £179,000 to £341,000, while the combined total of investment reserve and balance of undistributed profit carried forward has risen from £655,000 to £932,000.

REVIEW OF PRINCIPAL INTERESTS

In accordance with our practice, I will now deal with our principal interests:

Rhodesia.—The strike last autumn and constant interference with coal deliveries caused a considerable drop in the planned production. The higher price of copper received during this period, as compared with the last operative year, will help materially to reduce the effect of those difficulties. We look therefore for successful results in the current year, which finishes at the end of March last in the case of Nchanga, and at the end of June next in the case of Rhokana and Mufulira. In March this year the long-delayed official consent was given to the Rhodesian Selection Group for leave to move Mufulira and their other companies to Rhodesia. This action is, I think, greatly to be welcomed. While taxation relief, apart from the initial gain, may not result in as much advantage as some expect, much benefit may be gained both by the companies and Rhodesia as a result of the direction residing in that country.

Whilst we maintain our confidence in the Rhodesian Copper Belt as one of our long-term investments, it will be appreciated that, owing to the spread of interests in other industrial fields that has taken place during the past five years, our stake in Rhodesia has been proportionately reduced. Actually, that proportion now represents about one-third of our total interests, so that we are no longer mainly a "Copper Company" but are predominantly engaged, directly or indirectly, in a well-spread range of manufacturing and trading undertakings.

HOWARD POTTERY COMPANY, LIMITED

All three factories in the group were fully employed during the year, despite the fact that in March, 1952, Australia made a drastic cut in her imports. As Australia is our second largest customer, this caused a serious disorganisation in the flow of production. On the other hand, relaxation in August of the prohibition against selling decorated goods on the home market was a favourable factor. The overall profit of the group was maintained at about last year's figure. Import controls in some of the export markets still hamper trade, but at present the current year is running at about the same level as last year.

FOUNDRY SERVICES' RECORD TURNOVER

Birmingham—Foundry Services, Limited.—Another satisfactory year's trading was experienced by Foundry Services, Limited, with the highest turnover in the history of the company and considerably increased profits. During the second half of the year the development section was strengthened with a view to still further extension of the existing range of products. Progress was made in the development of the Drayton Manor Works, where the company owns sufficient acreage to look after future expansion. The long-term policy is to develop this site as the main manufacturing centre for all "Foseco" products, and gradually concentrate most, if not all, of the company's activities on this site. Export business was well maintained, and overseas manufacturing units developed steadily. The sales of the Canadian company increased, and the French company in particular made increased profits. The German company is moving forward, and new companies in Italy and South Africa have begun operations. Of late months there has been some falling off in sales in this country, reflecting the recession which the foundry industry is experiencing, and we may, therefore, see some falling off in these profits this year.

The profit sharing agreement made between Minerals Separation, Limited, and Foundry Services, Limited, in 1944 has still at least six years to run, but early this year an opportunity was taken to acquire a further interest in Foundry Services (Holdings), Limited, and Minerals Separation, Limited, now own 50 per cent of the equity of that company, which is the holding company of the group.

Brandeis, Goldschmidt and Company, Limited.—Good progress continued in the activities of this group, and we received the same dividend as last year, which was very adequately covered by the profits.

J. W. JACKMAN AND COMPANY, LIMITED

Over 98 per cent of the shares in this old-established company, manufacturing foundry equipment, was bought by us in September last year. The activities are to some extent ancillary to those of Foundry Services, Limited, and both companies have many of the same customers. We are glad to say that Mr W. Rawlinson, to whose work the growth of the business is largely due, remains on the board, thus securing continuity, and Mr Weiss and I have joined the board. The year of this company has been changed to December 31, thus enabling us to include the figures in our consolidated profit and loss and balance sheet; the profits for the three months brought into these accounts were satisfactory. The first quarter's figures hold good, but the company cannot expect to escape entirely the uncertainty and possible further recession noticed in Birmingham above.

The expansion of the business continues to throw increased work on our secretary and his team here in London, and we are sincerely conscious of our debt to them all for their good work and loyalty.

VINE PRODUCTS

RECORD SALES

The twenty-seventh ordinary general meeting of Vine Products, Limited, was held on May 14th at Surbiton.

Mr A. Mitsotakis (vice-chairman and managing director) presided in the absence of the chairman, The Viscount Marchwood, KCVO, from whose speech the following are extracts:

I stated last year that 1951 was a difficult year, but I must say that the year under review was even more so. We were again faced with rises in costs of raw materials—especially grape juice—wages, transport and expenses of all kinds. Nevertheless, the profit under these circumstances will, I hope, be considered very satisfactory.

Your directors did not think it advisable to counter these increased costs by increased prices which, under present conditions and the altered position from a "sellers" to a "buyers" market, might well have resulted in shrinkage of sales. As a result of this policy our business continued its buoyant career and during 1952 our position relative to the whole trade has been further enhanced.

Our sales, particularly those made under our proprietary brands (V.P. "Point" wines), have constituted a postwar record. Our export trade has also made a considerable advance. We have during the year introduced two new lower-priced British sherries and these are already firmly established with the public.

In the face of increased competition from the imported vermouths sales of our Votrix vermouth continued to be satisfactory.

The financial position of the company continues to be as strong as it ever has been.

The report was adopted and the proposed dividend of 17½ per cent and capital distribution of 2½ per cent were approved.

KEMSLEY NEWSPAPERS LIMITED

VISCOUNT KEMSLEY'S ANNUAL REVIEW

The twenty-ninth annual general meeting of Kemsley Newspapers Limited, will be held on May 28, 1953, at Kemsley House, London. The following is an extract from the statement of the chairman, The Viscount Kemsley, circulated with the report and accounts for the year ended December 31, 1952, to be submitted to the meeting.

The accounts for 1952 now in your hands reflect the upward movement of costs and show also the corresponding figures for the previous year. The consolidated profit and loss account reveals that the profit of the group for 1952 after meeting all expenses including debenture interest amounts to £1,434,000 as compared with £1,662,000 for 1951.

For the first time for some years I am pleased to be able to acknowledge a small reduction in the demands of the tax collector. This arises from the reduction by the Finance Act, 1952, in the basic rate of profits tax as from January 1, 1952, and the Chancellor's Budget proposal, recently introduced, for a reduction of sixpence in the £ in the standard rate of income tax. However grateful we may be for these concessions, it is, nevertheless, still true that the burden of taxation falling on our group of companies is far too heavy. The charge for the year of £824,000 represents over 57 per cent of the consolidated earnings. In my statement last year I made reference to the inequitable incidence of the profits tax levied in respect of the dividends paid to preference stockholders. I make no apology for referring to this matter again, as no less than £102,000 of the charge for taxation is due to it and the whole of that amount must be borne out of earnings which would otherwise be available to strengthen the working resources of the business.

THE NET PROFIT

The effect is that after providing for taxation and allowing for the profits (£8,000) attributable to the minority interests in subsidiaries there remains a sum of £602,000 which is our company's share of the net group profit for the year. To this we are able on this occasion, mainly as a result of the substantial agreement during the year of the group's liability for excess profits tax, to add an amount of £253,000 which has been released from provisions for taxation set aside in earlier years. After adding this sum and deducting £40,000 representing profits retained in subsidiaries the net profit of Kemsley Newspapers Limited, is £815,000. The net dividends on the preference stock require £267,750, leaving some £547,000 available for strengthening the resources of this company and for dividends on its ordinary stock. The corresponding amount for the previous year was £333,000 but in that year we had no large special tax credit to help us as we have on this occasion. But for the release of past taxation provisions the amount now available would be smaller than last year by £39,000.

It is relevant at this stage for me to refer to the sale during the year of the copyright and goodwill of the *Daily Graphic*. Your directors gave this step careful and anxious consideration as part of their general long-term policy, to which I made reference last year, of conserving the resources of the group and improving its economic and efficient operation. They unhesitatingly concluded that the step was in the best interests of the company as a whole and that, in spite of the long association between the group and the *Daily Graphic*, the time had come when it was expedient to make the change, even though short-term sacrifices were involved.

In giving effect to the transaction in the accounts the opportunity has been taken to write a substantial sum off the copyrights and goodwill of the group and, consequently, an amount of £2 million has been transferred out of general reserve for this purpose. The application of this sum more than covers the capital loss arising on the sale.

In view of this draft upon the reserve your directors feel that it is in the interests of the stockholders to continue to conserve the resources of the company. They, therefore, recommend that the sum of £400,000 should be transferred to general reserve and that a final dividend of 5 per cent should be paid on the ordinary stock, making 10 per cent for the year which is the same rate as in 1951. After these appropriations the sum carried forward will be increased by £13,000 to £325,000.

THE SUNDAY TIMES

I am particularly glad to be able to make a favourable report on the *Sunday Times*. During recent years the *Sunday Times* has had to suffer some loss in circulation as a result of restrictions in newsprint and of increases in selling price. To an extent this has been self-imposed, for the view that we have always taken is that the maintenance to the full of the size and quality of the paper must take precedence over any considerations of circulation. Yet on each occasion the circulation of the newspaper has recovered and I am glad to say that although it is the highest priced Sunday newspaper, its progress over the last year, as recently published figures reveal, has been steady and substantial. It fully maintains its leadership in its class. I believe that the esteem in which it is so generally held will still further strengthen that position.

LOOKING FORWARD

As I look forward, I am of the opinion I expressed last year to the effect that any material rise in the total circulation of newspapers is unlikely. This means that any particular increase for particular publications must be achieved as a result of very hard competitive effort. We are well aware of that and the keenest attention is being paid to the content and presentation of all our newspapers. At the same time we are engaged in a continual battle with costs to secure that so far as is consistent with the full maintenance of quality, they shall be kept in close control. Nevertheless, the final outcome of our year's work must depend to a considerable degree on a factor over which we have no control, and that is the cost of newsprint. In relation to other commodities the degree by which the price of newsprint has increased as compared with 1939 is far greater than in most other directions. Were I to know now that during the year we could look forward to a substantial decrease in the price of newsprint, I would be able to conclude on a note of greater optimism than I have been able to employ in the last year or two. It would, however, be foolish for me to do so. Last year you will remember I said in concluding my speech that "we must occupy ourselves in consolidation and economy." That task still remains with us but not until there is some reversal of the upward movement of costs can we hope to produce results as satisfying as consistent effort deserves and we should desire.

BRITISH-AMERICAN TOBACCO

INCREASED SALES

The fiftieth annual general meeting of the British-American Tobacco Company, Limited, was held on May 8th, in London.

Mr T. F. Winmill (the chairman), in the course of his speech, said:

This is the fiftieth annual general meeting of British-American Tobacco Company, Limited. The company was incorporated on September 29, 1902, and, therefore, completed its fiftieth year of trading on September 30th last. I will not attempt to review the history of the company but it is a remarkable one, showing continued progress.

The consolidated results for the past year reflect some measure of the slackened pace of inflation as it affects us and our associates. This is a trend which is of immediate practical interest to you as stockholders, as will be seen from the profit and loss account, where you will have noted that transfers to fixed asset and stock replacement reserves—computed on the same principles as for the previous accounting year—amount to £800,000 against £1,750,000 in the preceding year, the available net profit being £400,000 more in respect of the year under review. This available net profit is, in our view, the true profit and the reserves ought, under a properly constituted taxation system, to be allowed as a deduction for tax purposes. The improvement does allow us readily to recommend the increase in the final distribution to be made in respect of the year to September 30, 1952.

A HELPFUL SIGN

As recorded in the explanatory statement, no liability to excess profits levy arose in respect of the past year, but I nevertheless welcome the recent announcement by the Chancellor of the Exchequer to the effect that this form of taxation will cease to operate as from January 1, 1954.

This, together with the reduction of the standard rate of income tax to 9s. in the £1 and the re-introduction of initial allowances, is a hopeful sign that the Government recognises the necessity of easing the burden of taxation which weighs so heavily on industry to the detriment of the long-term interests of the country as a whole.

The additional amounts left to industry are modest dimensions compared with its real needs. Industry has been carrying a huge and rising burden of inflated assets for many years without sufficient relief from taxation for increased replacement costs. The need to do more than merely replace assets is increasingly pressing.

In so far as our business and that of our Associated Companies is concerned, the policies of disinflation pursued by certain countries have had, to a greater or lesser degree, the anticipated effects on sales of cigarettes and other tobacco goods but, nevertheless, I am happy to report that, for the twelve months ended on September 30, 1952, the combined sales of your company and its associates showed an increase in volume over the previous year. The figures for the first six months of the current year continue to bear witness to the steady demand for the products of your group, but the present pattern of world events may well impart a more rapid impetus to disinflationary trends.

You will, I think, share my view that the results of the past year as now presented to you can be regarded as satisfactory, and the figures for the first six months give hope that the results for the current year will not show any very marked change.

I am glad to be able to report that we have regained possession of Westminster House and we are hopeful of being reinstalled there before the end of 1953; this may well be the last occasion on which our annual meeting will be held here.

FUTURE DIVIDENDS

I think it only right and proper that I should say a word in regard to the rates of the second interim and final dividends in respect of the current year, assuming that the resolutions to be put at the extraordinary general meeting which will be held immediately after the conclusion of this meeting, are approved by you and by the holders of the 5 per cent preference stock of the company.

The first interim dividend on the present issued ordinary stock for the current year has already been paid at the rate of 1s. per £1 stock; to maintain the same total cash distribution in respect of the year to September 30, 1953, as is proposed in respect of the past year and subject, as I have said, to acceptance of the resolutions at the extraordinary general meeting, the second interim dividend on the issued ordinary stock for this year would be declared at the rate of 4d. per 10s. stock and the final dividend on the issued ordinary stock would be proposed at the rate of 5d. per 10s. stock. In a full year under the new capitalisation, this would mean two interims of 4d. per 10s. stock and a final of 5d.

The report was adopted and at a subsequent extraordinary general meeting resolutions were passed approving the capitalisation of £11,878,880 10s. of reserves and undistributed profits and its distribution as ordinary shares of 10s. each to existing ordinary stockholders in the proportion of one new 10s. share for every £1 of stock held.

RANGALLA CONSOLIDATED

DIFFICULT YEAR

The thirtieth annual ordinary general meeting of Rangalla Consolidated Limited was held in London on May 11th, Mr Eric Davenport, ACA (chairman), presiding.

The following is an extract from the chairman's circulated statement:

The year 1952 has been a difficult one for the tea producer, especially for mid-country estates such as ours, and the accounts show a working loss of £1,746 against a profit of £9,854 for 1951. The tea crop at 1,300,681 lb compares with 1,359,675 lb in 1951. The 1952 average of medium grown teas at Colombo auctions was 2s. 5.88d. against 2s. 8.4d. for 1951, or a decline of 2.52d. per lb, whereas the company's average records a drop of only 2.10d.; evidence that quality and manufacture were both well maintained.

In consequence of the settlement of taxation liabilities up to and including the year 1950, £8,000 is no longer required and has been brought back to the credit of profit and loss appropriation account. The disposable balance for the year is £7,876, being £10,842 less than a year ago. The appropriations include an interim dividend of 5 per cent for 1952 against 15 per cent for 1951. No further payment is recommended.

The outlook for 1953 is difficult to forecast, but we have commenced the new season well both as regards crop and sales. The crop estimate for the year is placed at 1,390,000 lb, and for the first quarter to March 31st 360,330 lb have been secured against 339,867 lb in 1952.

The report and accounts were adopted.

ANGLO-NEWFOUNDLAND DEVELOPMENT COMPANY

(Inc. in Newfoundland)

BENEFITS OF REHABILITATION PROGRAMME

MR ELLIOTT M. LITTLE'S REVIEW OF WIDESPREAD ACTIVITIES

The ordinary general meeting of Anglo-Newfoundland Development Company, Limited, was held on May 7th at the offices of the company, Grand Falls, Province of Newfoundland, Mr Elliott M. Little (the president) presiding

The following is the statement by the president which had been circulated with the report and accounts for the year ended December 31, 1952:

Trading results of our group in 1952 were generally less satisfactory than was expected at the beginning of the year. The vulnerable sulphite pulp market was an early casualty. Prices were forced down drastically, mainly by the action of the Scandinavian suppliers, and base metal prices settled to levels below those anticipated a year ago. The newsprint market remained firm, but the strong Canadian dollar, moving from a discount to a premium in relation to its US counterpart, cut sharply into income. This exchange factor also contributed substantially to the decline of our pulp and mining revenues.

ANGLO-NEWFOUNDLAND DEVELOPMENT COMPANY, LIMITED

The benefits of the rehabilitation programme are now being realised and our relative position with the industry is being steadily improved. Owing to the exchange factor, to which I have already referred, and to the continued upward pressure of wage rates, the net profit is down by about 9 per cent from the record figure achieved in 1951. It is believed that this relative stability will compare very favourably with the general industry trend.

Capital expenditure amounted to $3,853,281, the larger projects comprising this total being the conversion of a subsidiary groundwood mill to a power plant, construction of new acid towers and digesters and additional automatic grinders. Plans for capital expenditures over the next year or so will be influenced by the trend of the newsprint market with due regard being given to working capital requirements.

Newsprint consumption in the United States is steady at peak volume. It is reasonable to assume that the future trend will approximately follow the course of business generally. As regards the overseas markets there is a large but latent demand that could be activated by an easing of trade restrictions, particularly in regard to currency convertibility. It would appear that under conditions of unfettered international trade these markets could ensure capacity demand for Canadian newsprint for the foreseeable future.

GASPESIA SULPHITE COMPANY, LIMITED

The production for 1952 of 65,142 tons of unbleached sulphite pulp was 14,302 tons less than in 1951. This reduction was partly due to a drop in demand which caused a two-week shut-down and partly to the necessity of improving pulp quality.

A firmer demand, however, is expected for the bleached sulphite pulp to be produced after the bleaching plant, now being installed at Chandler, is completed about the middle of 1953.

The installation of the bleaching plant is progressing according to schedule, and an amount of $1,014,124 has been spent up to the end of 1952. This project is being financed to a substantial extent by certain customers who, by the end of 1952, had made advance payments of some $2,100,000 against pulp to be delivered in 1954 and subsequent years.

TERRA NOVA PROPERTIES, LIMITED, BUCHANS MINE

The mine operated continuously throughout the year, excepting legal holidays, and milled 334,000 short dry tons of ore—an increase of 10,000 tons over the total for 1951. Average grade of ore mined was slightly higher than that obtained last year, but decreases in price of metals throughout 1952 radically reduced total revenue and net income.

Ore reserves as of December 31, 1952, were estimated to contain 3,632,000 tons of assured and probable ore, a decrease of 245,000, as compared to reserve figures of December 31, 1951. During the year no development work or diamond drilling was carried out within the areas of probable ore to justify reclassification of tonnages in this category. There also remains a reserve of low-grade ore totalling 123,000 tons, which can be mined and treated as long as metal prices keep this type of ore within an economic bracket.

Mine development for the year totalled 9,003 ft, which compares closely with the 1951 total of 9,045 ft. A large part of the development work was done in the Rothermere ore-bodies, opening up areas for stoping, and driving No. 13 level towards R4 ore-body to permit further investigation and outlining of ore limits by diamond drilling. Both development and exploration phases will continue next year.

MONTMORENCY SHIPPING, LIMITED

This company operates a fleet of time chartered vessels for the freighting of the parent company's products to United States ports. It also carries bulk cargoes for other parties, largely as alternatives to ballast voyages. The shipping market slumped during the year with adverse effect on this outside business, but lower time charter rates will improve the parent company's delivery costs in 1953. The profit for 1952 has been carried forward in the books of the shipping company.

CONSOLIDATED POSITION

The consolidated profit, after depreciation and taxes, of $4,348,598 is equivalent to 79 cents per stock unit, compared with $8,227,382 or $1.50 per stock unit in the previous year. Your companies' fixed assets have been well maintained and the many improvements and additions will improve the group's earning capacity in the years to follow. Working capital has been maintained on a satisfactory level.

Once again I take pleasure in recording my appreciation of services loyally performed by officers, staff and employees throughout our organisation.

The report and accounts were adopted.

HIGHLANDS & LOWLANDS PARA RUBBER COMPANY, LIMITED

HEAVY TAXATION OF ESTATES

THE INDUSTRY'S SUCCESS IN HYGIENE AND WELFARE WORK

MR T. B. BARLOW ON MALAYAN SITUATION

The forty-seventh annual general meeting of the Highlands & Lowlands Para Rubber Company, Limited, will be held on May 27th, at Plantation House, Mincing Lane, London.

The following is the statement by the chairman, Mr T. B. Barlow, which was circulated with the report and accounts:

The accounts for 1952 carry with them a recommendation to pay a dividend of 10 per cent and a cash distribution of 2½ per cent, being a portion of the profit derived from the sales of land. This payment is not liable to income tax or surtax.

The year's working resulted in a profit of £242,800. The dividend of 10 per cent requires £25,800; tax reserve requires £95,000, and there has been transferred to replanting reserve £70,000 and to depreciation reserve £40,000, which leaves a carry-forward of £49,169.

Replanting reserve stands at almost £140,000, but our replanting programme with 2,690 acres in hand and a further 215 acres to be undertaken in 1953, is an indication of the necessity for a substantial reserve.

PROFITS AND COSTS

It is interesting to note that the profit derived from rubber was £108,000 as compared with £341,000 in 1951, and that from palm oil and palm kernels was £86,800 as compared with £84,300 in 1951, but these figures are exclusive of such necessary charges as provision for replanting and depreciation of buildings and machinery, and it is for this reason that £110,000 has been allocated to these reserves. The Rubber Growers' Association calculates that these items cost very nearly 4d. a lb on the basis of an annual yield of 400 lb per mature acre. In our case the calculation must of necessity be complicated by the dual cultivation and since we already have 48 per cent of our rubber replanted with high yielding trees the cost to us would probably work out at rather less.

Unfortunately special expenditure on account of the emergency was a serious charge costing £28,000 and that alone is more than stockholders receive by way of a 10 per cent dividend. Quit rents were raised to the maximum and export duty on rubber and palm oil amounted to £61,600 or nearly two and a half times as much as the 10 per cent dividend. But this has not prevented the company from continuing its high standard of welfare work for its labour.

Recently Mr C. R. Harrison attended a meeting of the International Labour Organisation held in Havana as the representative of the Rubber Growers' Association whom he also represents on the council of the Ross Institute. A most suitable appointment because he was a keen disciple and early colleague of Sir Malcolm Watson the great malariologist. Mr Harrison has been a leader in hygiene and welfare work for estate labour and he was appalled to find how backward the conditions are elsewhere.

AMENITIES FOR LABOURERS

We, the plantation owners claim to be the pioneers in the tropics in rural hygiene and sanitation. "Real wages" compare very favourably with agricultural workers the world over. The labourers pay no taxes and their basic needs are small. In addition, they are housed free in cottage type dwellings, fuel for cooking can be had for the trouble of collection from beneath the rubber trees, medical attention and, if necessary, hospital treatment is provided free to the labourer and his dependents, pre- and post-natal treatment is given to all women and working women get two months' full pay during the period of confinement. Communal wireless is laid on, estate villages are lighted with electricity, refuse disposal and a pure piped water supply are a charge on the estate. Sewerage disposal is by septic tanks, playing fields, drama halls, temples, schools, creches in which free milk is supplied, cattle grazing for labourers' herds and gardens are all provided by the company.

The health on estates is good and the vital statistics speak for themselves; on Highlands and Lowlands the 1952 death rate was: Labour 5.2, Dependents 14.0, and average for Malaya 75.02 per mile.

"IGNORANCE AND JEALOUSY"

Two simple facts emerge—(a) that Rubber Estates are heavily taxed, (b) that they are successful pioneers in tropical development and welfare work. The Malayan Government is said to be ignorant of the essential facts of the rubber industry. Great pressure is being brought to bear by some antagonistic journalists and educational leaders in Singapore for a fact-finding mission to inquire into the rubber industry. The only apparent reason for this campaign is ignorance on the part of its instigators and jealousy that the industry does not conform to their political ideals but has been brilliantly successful.

If estate companies, such as this, were not literally an open book or if Government lacked power to make inquiries through its health, labour or other officers, Sir Gerald Templer would have taken such power long ago. To press for a fact-finding mission now is a positive insult to His Excellency.

MALAYA'S NEED OF CAPITAL

Recently it was announced in Kuala Lumpur that Malaya needed more capital to develop its resources. All who know the country will agree with this and if the real object of the mission is to find out how to induce capital to go to Malaya it had better come to London and ask the Rubber Growers' Association, which includes survivors, successors and sons of the men who made the rubber industry.

For the last four years Malaya has suffered from banditry and communism, but at last the trouble has been checked and for this General Templer must be warmly thanked. He has re-established the prestige and authority of Government. It is noted with satisfaction that he has issued warnings against complacency, nor has he overlooked the danger that without continued firmness and justice the old racial strife, which was the reason the Malay rulers welcomed British help and guidance eighty years ago, may break out again.

We rely on a wise and strong Government, one of whose most important tasks must be the education of the Malays so that they can take their place with the other communities and thereby progress towards the ideal of a Malayan nation. There is proposed legislation, although strongly opposed in certain quarters, to make it compulsory for Malays to be employed in industry and trades. It is also significant that the wealthy, shrewd and powerful organisation, the Malayan Chinese Association, has offered Government the sum of $500,000 to assist in financing Malay trade centres. To sum up the Malayan position: the Government has its hands full as is to be expected in times of worldwide difficulty, but the outlook is better.

THE CURRENT YEAR

For the current year, 537,600 lb of rubber have been sold forward at 22.5d. per lb, and the palm oil is being sold in the open market. The present price is about £73 per ton c.i.f., so that unless rubber and palm oil rise in price or taxes fall, 1953 will show a further heavy decline in profits. But it may well be that if peace materialises in the Far East, countries which are now short of rubber will be able to buy, thus removing any surplus of production over consumption. If war continues, probably stock-piling will continue. In any case it is rumoured that America is about to raise the price of synthetic which would increase the demand and price of natural rubber. So that although the outlook is obscure there may be redeeming features later. In the meantime, every effort is being made to reduce costs.

Stockholders will wish to join with me in thanking the general manager, his staff and labour, together with the agents and visiting agent for the excellent work they have done.

ARMY & NAVY STORES, LIMITED

EXPANSION PLANS

The eighty-first annual general meeting of the Army & Navy Stores, Limited, was held on May 8th in London.

Commander S. C. Lyttelton, OBE, DSC, RN, chairman and managing director, in the course of his speech, said: In London net profits for the past three years have remained remarkably steady. The disappointment this year has been caused by the serious recession of trade in India. It is proposed to pay a dividend of 10 per cent, less tax.

There would appear to be an idea among some people that the day of the big departmental store is over. Your directors by no means hold this view, but have confidence in the future of your business provided that it moves with the times. We have felt for some time, however, that a store working from one point only in Central London is not, under modern conditions, in as good a position for successful trading as it would be with its business well spread over London, the suburbs and the provinces. We have definite plans. It is the intention to expand and develop your retail business here and elsewhere.

The removal of percentage price controls gives us freedom again to conduct the merchandise side of our business in our normal way; the reduction in purchase tax should benefit trading generally and the outlook is, on the whole, brighter than since 1950.

Owing to changed conditions, we have decided to dispose of our branches in Bombay and New Delhi.

The report was adopted.

UNITED GLASS BOTTLE MANUFACTURERS, LIMITED

CHANGED CONDITIONS AFFECT PROFITS

The fortieth annual general meeting of the United Glass Bottle Manufacturers, Limited, will be held on June 18th in London.

The following are extracts from the statement by the chairman, Mr L. A. Elgood, OBE, MC, DL, JP, CA, circulated with the report and accounts for the year 1952:

The year that has passed since issue of my previous statement has been marked by the tendency of industry as a whole to reduce stocks with resultant greater sales resistance, whilst inflationary conditions have persisted. These circumstances have caused a check to the hopes which I previously expressed of marketing to the full the increase realised in our productive capacity, and have rendered unfavourable, comparison of our trading results for 1952 with the record and exceptional results recorded in 1951.

The reduction in the group trading profit is due mainly to the following causes: (1) In January, 1951, and again in the month of May of that year, we were compelled by the incidence of ever-increasing costs to advance the selling price of glass containers, but no subsequent selling price adjustment was made until August, 1952, despite the continued and severe advance in costs in the intervening period; (2) The general change to more difficult trading conditions which developed early in 1952 resulted in a reduced demand in the home market for glass containers and closures, and the intensity of competition in export markets increased; and (3) Profit margins were drastically reduced by these events.

Notwithstanding these adverse conditions, the group trading profit of £861,473, although substantially less than the record profit earned in 1951, came within the range of earnings of the other postwar years.

TAXATION AND PRICES

I have previously stated that your company's policy is to maintain the glass container as the cheapest form of package for its many uses. To this end there is constant improvement of method of manufacture and handling of goods introduced in our factories and warehouses. However, the incidence of taxation at present levels and continuing advances in prices of coal, soda ash, stores and services impede our efforts to stabilise prices. Only reluctantly, and then to the minimum extent, shall we further increase our selling prices. In consequence of our continuing policy of modernisation and further mechanisation our annual provision for depreciation continues to increase and this year totals £407,720.

The total charge of taxation on profit for the year, £515,986, represents 60 per cent of the group trading profit and includes £2,500 liability to excess profits levy incurred by a subsidiary company. A refund of taxation relating to previous years and amounting to £20,000 results from the liquidation of certain of the subsidiary companies.

DIVIDEND AGAIN 17½ PER CENT

From the net group profit, £367,687, is deducted the minority interest in profits of a subsidiary company which, at £24,215, compared with £44,708 in 1951, reflects the reduced earnings of the company. The holding company profit for the year, £316,042, compared with £544,559 in 1951.

The directors have appropriated £152,471 to general reserve and £30,000 to staff benevolent account. The dividend on the preference stock for the year absorbed £47,303. Despite the contraction in profits the directors recommend a final distribution on the ordinary stock of 10 per cent, less income tax, which, with the interim dividend already paid, makes a total distribution for the year of 17½ per cent, less income tax, as paid for the two preceding years.

Accordingly there remains a balance at credit of profit and loss account of £302,243 to carry forward, compared with £321,394 at the close of 1951.

The balance-sheet and consolidated balance-sheet show further substantial additions to fixed and current assets. Deliveries of capital equipment speeded up during the year, with the result that outstanding contracts for capital expenditure at the close of 1952 were considerably less than at the close of 1951. The quicker rate of delivery applied also to stocks and stores, the level of holdings of which are under constant review. Balances in banks and cash in hand are increased, but the larger part of the proceeds of the unsecured loan stock issue was immediately employed in financing other assets.

A regrouping of the revenue reserves has been carried out by the merging in general reserve of those formerly under the separate headings of contingency, stocks and stores, plant replacement, and research expenditure, factory and office improvements. With a further appropriation from profits this year, the general reserve of the company is therefore now at a level of £2,150,000 and that for the group at £2,244,947.

EXPORTS

At the time last year I made reference to the need for the accelerated handling of exports and a reduction in the cost of export. At the time a ports' efficiency committee had only recently been set up to consider ways and means of ensuring a quicker flow of traffic through the ports of the United Kingdom once goods were assembled for shipping. From the point of view of speed, an over-all decline in the volume of exports has resulted in delays in despatch being so reduced that in the main goods, once ready, are now *en route* as quickly as was the case before the war. With the future in mind, these changed marketing conditions do not lessen the original purpose of the ports' efficiency committee.

The cost of exporting from our factories to overseas ports, however, does in no way compare with prewar charges, and for the maintenance of export trade this is an alarming condition. Not only are we faced with the full blast of competition from Western Europe, but also severe competition from the new or growing glass industries established within those countries to which we have regularly shipped in the past. Within the past year such local production has been aided by payments difficulties, a shortage of sterling resulting in the substantial curtailment of your company's traffic with such traditional markets as Australia, New Zealand, and South Africa.

Nevertheless, your company's export sales in 1952 were well maintained when compared with the record figures achieved in 1951. The outlook in the present year is not so favourable, but it is to be hoped that some measure of goodwill has been earned with our many customers overseas if only because of a steady and substantial diversion of production abroad throughout those years of acute shortage which, until recently, has prevailed since 1939.

BLAW KNOX

SUBSTANTIAL VOLUME OF ORDERS IN HAND

The annual general meeting of Blaw Knox Limited was held on May 14th in London, Sir Geoffrey Burton (the chairman) presiding.

The following is an extract from his circulated statement:

I must first of all refer to the great loss your company sustained last year by the death of Mr J. Theodore Goddard. Mr Goddard had been chairman of the company since its inception in 1921, and under his able guidance the company prospered and steadily expanded. Only a few weeks ago your company suffered a further loss through the death of another distinguished colleague—Sir Louis Greig. Both these gentlemen served your company loyally and unselfishly.

Referring to the balance sheet, fixed assets have increased by £31,000 and stock by £24,000, but cash and tax reserve certificates are lower by £126,600. This reduction in our cash resources is the direct result of increased turnover which has steadily improved over the last five years.

TRADING RESULTS AND POSITION

Trading profit is slightly up on last year and after providing for taxation of every kind the surplus available for appropriation is increased from £121,000 to £168,000. We have allocated £100,000 to general reserve and, subject to your approval of the final dividend, the carry forward of £290,000 will show an increase of £30,000.

Dealing with our trading position, new orders in all departments continued at a substantial level, although at a lower volume than for the previous year. We carry forward £5 million of uncompleted business which, in the present circumstances of contracting demand and consequently more competitive conditions, is a favourable factor.

The Tower Department has had a satisfactory year, but has been handicapped by shortage of steel. In addition to important contracts for high-voltage lines for the British Electricity Authority, we have during the year obtained orders for delivery to Uganda, Venezuela, New Zealand, and India. Our problem now is to meet world competition, which is increasing.

In other departments, too, considerable orders have been received, although there was some falling off towards the end of the year. There has been a slight improvement in the supply of materials. If this improvement is sustained a higher rate of production in our factories should be possible. An increase in turnover is essential, as it is necessary to reduce prices to meet competition both at home and abroad, and production costs have shown no reduction—rather the reverse.

Since the introduction of the B.K.12 Motor Grader and the "B.K.-Fifty" Excavator, orders for these new products to the value of over £3 million have been placed with your company, which I am sure you will agree is good evidence of their wide acceptance throughout the world and the progress that has been made. The company's policy of expenditure on research and development has been continued and a new motor grader, to be known as the B.K.10, is about to be introduced. The present position is therefore satisfactory, but our future prospects must be viewed with caution in the light of present trends in world trade.

The report was adopted and the dividend of 30 per cent for the year was approved.

POOL, LORRIMER & TABBERER, LIMITED

INCREASED TRADING PROFIT

The twenty-eighth annual general meeting of this company was held on May 14th, at Leicester, Mr W. J. Lorrimer, chairman and managing director, presiding.

The following are extracts from his circulated statement:

The profit on trading before taxation for 1952 has increased to £97,143, as compared with £64,290 for 1951.

Taxation for the year was 65 per cent of the company's income and at £63,000 compares with £38,000 last year, leaving a profit after taxation of £34,143, against £26,290. After adding two taxation adjustments and deducting the preference dividend and the interim ordinary dividend, there is an amount of £24,814 available for appropriation. Your directors recommend the payment of a final dividend on the ordinary stock of 15 per cent, less income tax, making 30 per cent for the year, leaving £16,939 to be added to the profits carried forward. The dividend on the ordinary stock for the year requires £15,750 net and is covered twice by earnings available for the ordinary stockholders.

BALANCE SHEET FIGURES

Regarding the balance sheet, the outstanding feature is the big improvement in our liquid position, net current assets having increased by £58,798 to £369,642. Stocks have been reduced from £531,663 to £305,425 and an overdraft of £93,475 has been replaced by cash balances of £103,205, while our creditors have also been reduced by some £30,000. Current liabilities are now covered over four times.

1952 has been a period of considerable difficulty following the 1951 collapse in prices of our main raw materials, wool and cotton, and aggravated by the reluctance of our customers to place their normal autumn requirements in the early part of the year. Wool, however, strengthened from its lowest point during the first week in April to a peak towards the end of July but then fell again at the opening of the sales for three weeks in September, only to recover by Christmas to a similar price to that ruling at the close of 1951. Our spinning mill and knitting plants were working at a very reduced capacity for the first nine months, but I am pleased to say that since that time full production has been restored and is being maintained.

Our export sales, although still high fell by £192,000 through the closing of world markets brought about by import licensing restrictions.

FULL ORDER BOOKS

Our order books for 1953 are now full for several months to come; a very different position from that obtaining at the same time in 1952.

All last year our high speed warp knitting plant was working overtime, but unfortunately this year we shall be affected by the serious cut in our nylon allocation, which is unlikely to improve until 1954, when it is anticipated nylon will become available in much larger quantities.

Your directors have under active consideration the recommendation of an increase in the authorised capital of the company with a view to making a bonus issue of ordinary stock, in order to bring the issued capital more into line with the actual capital employed in the business. I hope to lay before you proposals to give effect to this during the current year.

The report and accounts were adopted.

THE MILFORD DOCKS COMPANY

NO OFFER RECEIVED FOR STOCK

The seventy-eighth annual general meeting of The Milford Docks Company was held on May 13th in London.

Sir Felix J. C. Pole, the chairman, in the course of his speech, said: Last year I forecast some improvement in our position. There was improvement, but the tonnage of vessels entering the port was 18,600 tons below that of the previous year, due to trawlers being laid up owing to poor catches and the high operating costs. The quantity of fish landed was 30,127 tons—a decrease of 3,738 tons, compared with the previous year. I am pleased to say that the cargoes handled increased by almost 9,000 tons. Oil tonnage was down by 10,522 tons.

The gross profit for the year was £28,317—a reduction of £2,754. The income, however, was only £1,297 below that of 1951. Receipts from the hire of the dredger were substantially less, but this reduction was offset by the increased income from the cargo trade, particularly explosive traffic.

Every effort has been made to keep expenditure down to the minimum. We have set aside £2,177 more for depreciation and, therefore, our operating expenditure is less by approximately £4,100, which can be regarded as satisfactory.

The net profit, inclusive of taxation provisions of £4,128 made in previous years and not now required, increased by £1,099 to £13,411. The directors recommend a dividend of 3½ per cent, less tax, which will leave £6,747 to be carried forward.

Application has been made in this session of Parliament for a Bill to make permanent the authority for increased charges now sanctioned under the Defence Regulations, and to consolidate and modernise previous Acts. The Bill has passed the House of Commons and House of Lords and received the Royal Assent last Wednesday.

NO NEGOTIATIONS

Doubtless, however, stockholders are more interested in the extraordinary dealings that have been taking place in our stock than in the statement of last year's accounts. From the first I made it clear in response to inquiries that the directors were neither engaged in negotiations nor had they been approached.

On April 16th the following official statement was issued to the press:

"The directors of The Milford Docks Company state that they have received no offer for the stock of the company, nor is the company engaged in any negotiations outside the normal course of business. An official announcement will be made if at any time it seems necessary to protect the interests of existing stockholders."

Your directors are quite aware that the potentialities of Milford seem to have attracted attention in some quarters, and it is possible that certain suggestions for developing the dry dock have become known. I must make it quite clear that your board will not deal except with a principal or an authorised agent of a known principal.

We have only today received a new request for facilities to make detailed investigations and surveys in connection with enlarging and developing the dry dock. It would not be fair to read into this more than it says at this stage, but the continued interest of ship-repairers and shipowners in this project is most interesting.

The report was adopted.

MANGANESE BRONZE AND BRASS

RESULTS AN ALL-TIME RECORD

The fifty-fourth ordinary annual general meeting of the Manganese Bronze and Brass Company, Limited, was held on April 7th in London, Mr J. C. Colquhoun, MBE (chairman and managing director), presiding.

The following is an extract from his circulated statement: Output and earnings again continued at a high level. The profit for the year of £439,029 before providing for taxation and dividends, and after charging £80,680 for depreciation is an all-time record for this company. The comparable profit figure for the previous year was £327,292 after charging depreciation of £82,926. Provision for taxation amounts to £303,000 against £200,000 for the previous year. The cumulative effect of the changes in taxation introduced in last year's budget is to leave us with an increase in net earnings of £8,737 after an increase in profit before taxation of £111,737.

Your directors recommend that a final dividend of 7d. per share be paid on the ordinary shares, making 9d. per share for the year (same), plus a bonus of 1½d. per share (making a total of 10½d. for the year). If approved the surplus remaining for the year after payment of preference and ordinary dividends will amount to £92,312 against £89,535 for the previous year.

MARINE PROPELLER ACTIVITIES

The tonnage of propellers made and on order in our new nickel-aluminium-bronze alloy "Nikalium" has steadily increased and over 20 of the most prominent home and foreign shipping companies now have propellers of this material, many having placed repeat orders. Our design department continues to give valuable advice to our customers on all problems connected with propellers and an increasing number make the fullest use of our service by specifying "Scimitar" propellers on their orders to builders.

At your Handford works at Ipswich the volume of orders in hand, though not so large as a year ago, continues to give satisfaction, especially for all alloys for heat-resistance and other special requirements. Steady progress has been made in the production methods for such materials, while the laboratory is carrying out continual research on improvements in composition and metallurgical properties, with the result that we have maintained our premier position for the supply of such material now used to so large an extent in high-speed aircraft and for rearmament purposes. Despite a marked decrease in the orders for commercial materials, the works were able to maintain a high rate of output.

At your Elton Park, Ipswich factory, devoted entirely to products made from metal powders, the substantial improvement in trading reported a year ago was not sustained in the last few months of 1952, and this business is experiencing a definite recession at the moment bound up with the limitations in the export market. Nevertheless, the technical staff have in the meantime developed a number of new materials, chiefly iron and ferrous alloys, for which the sales organisation has found new outlets, so that once trade recovers from the present recession we believe that the previous output will be attained and possibly exceeded.

In regard to the prospects for the current year, we must be prepared, at least in certain sections of your business, for a reduction in output and a consequent reduction in earnings.

The report was adopted.

CROFTS ENGINEERS (HOLDINGS)

EXCELLENT PROGRESS

SIR ARTHUR CROFT ON OVERSEAS INTERESTS

The fifth annual general meeting of Crofts Engineers (Holdings), Limited, was held on May 8th at Bradford, Sir Arthur Croft (chairman and managing director) presiding.

The following is an extract from his circulated statement:

You will note from the accounts the excellent progress made by your company; the profits have increased to a record figure, but as these have been made with a considerably increased turnover, it will be realised that the increased profits have been secured on a reduced profit margin.

The trading profit for the year amounts to £661,476, against the previous year's figure of £630,707. Taxation again takes the major share of our profits, and you will note that an amount of £387,565 has been reserved for this purpose, leaving £273,911, which represents the net profit of the company and its subsidiaries.

Of the total amount retained in the accounts of the subsidiaries there has been transferred to general reserve a sum of £145,000, and a further amount of £25,000 has been allocated to stock reserve.

The directors propose a final dividend of 25 per cent on the ordinary shares absorbing £52,500, making a total distribution of 40 per cent, less income tax, for the year.

The fixed assets of the company have increased by £80,023, and the balance sheet reflects the strong financial position of the company.

PROSPECTS

Our order book at the end of 1952 was only slightly less than at the beginning of the year. In recent months there has been a slight falling off in the influx of orders, also trading conditions have become more difficult, so I would not like to attempt to forecast how matters will go. I can say, however, that we are intensifying our efforts to secure trade, and hope by this means to keep up our turnover and profits.

In general, we find that raw materials are now in better supply, but we still have difficulties in meeting our full requirements of rolled steel plate, bars, forgings, etc. It is hoped in the near future this difficulty will be overcome.

For the last three years only have we been able to concentrate again on building up a direct export trade and I am pleased to be able to report good progress. We have established our own branches where advisable, also appointed agents and representatives elsewhere. When these all get fully working we are hopeful of obtaining the maximum value of orders from overseas.

Canadian Subsidiaries—Crofts Canada, Limited, has had another successful year's trading, although it has not yet come up to expectations. Britenco, Limited, Canada, for the first time has made a profit, and it is hoped that the reorganisations effected in the selling and administration arrangements of these two companies, following my visit to Canada, will result in increasing their progress.

South African Subsidiary—on my recent visit I found the business had progressed at a much greater rate than anticipated, the turnover target had been surpassed and the profit earned was very satisfactory.

The extensions mentioned last year are completed and in use, and when the new machinery on order is delivered, the final target output set for this company should be reached.

The report was adopted.

JOHNSON & PHILLIPS

The forty-eighth annual general meeting of Johnson & Phillips, Limited, was held on May 14th in London.

Mr G. Leslie Wates, JP, CompIEE, chairman and joint managing director, in the course of his speech, said: Although the balance from trading account has not reached the high-water figure of the previous year, it is, at £706,365, the second highest in the history of the company and is higher than the average of the last three years, including the exceptional year 1951.

We have transferred to the revenue reserve £100,000; to research and development £30,000 and to dividend equalisation £25,000, leaving £154,313 to be carried forward to next year, substantially the same figure as that brought in. The balance-sheet shows that with these additions the general reserve now amounts to £500,000, a satisfactory figure; the research and development reserve exceeds £100,000, and the dividend equalisation reserve amounts to £125,000. In addition to these reserves, the capital reserve of £1,333,750 remains the same as last year.

The board are satisfied that the time has now arrived when we can properly and profitably employ a further £500,000 in the business, and accordingly provisional allotment letters in respect of 333,437 ordinary shares issued at 30s. each were sent to ordinary shareholders with the directors' report and the notice convening this meeting.

This company has for the last forty years always raised its new ordinary share capital from amongst its then existing shareholders so that such shareholders receive the entire benefits arising from each issue. We have followed the same procedure this time and shareholders will, I think, be satisfied that the benefit we offer in making the issue of shares at 30s. is a very real one.

The report and accounts were adopted.

ILLUSTRATED NEWSPAPERS

INCREASED TURNOVER

The twenty-seventh annual general meeting of Illustrated Newspapers Limited was held on May 14th in London.

Major H. Davenport Price, MC, JP (the chairman), presided and in the course of his speech said:

The trading profit of the group totals £515,827, showing a decrease of £85,000 odd on the previous year. Dividends and interest and the surplus arising from a war damage claim, bring the gross profit up to £534,401. Taxation accounts for no less than £267,837, and after deducting the proportion of profits attributable to outside shareholders of subsidiary companies, there remains a net profit for the year attributable to Illustrated Newspapers of £181,748.

Current assets exceed current liabilities by £1,084,601, which shows a strong liquid position.

Although the gross trading profit for the group is lower, the turnover has been higher than in the previous year. This is a reflection of the more severe competition now prevailing in the printing and publishing trades, and the narrowing of profit margins. There has, I am glad to say, been a tendency for the price of paper to fall, and I am hoping we shall feel some benefit from this in the current year. On the other hand, wages have continued to rise in step with the cost of living index.

The high standard of production of our publications has ben maintained and in the portrayal of the great events of Coronation year we are having an unprecedented demand for our journals. Our trade papers, *The Drapers' Record* and *Men's Wear*, have had a record year.

The report was adopted.

THE EVER READY COMPANY (GREAT BRITAIN) LIMITED

MANUFACTURERS OF DRY BATTERIES

MR E. N. ROWBOTHAM'S STATEMENT

The annual general meeting of The Ever Ready Company (Great Britain) Limited will be held on Thursday, June 4, 1953, at the head office, Hercules Place, Holloway, London, N.7.

The following is the statement of the chairman, Mr E. N. Rowbotham, which has been circulated with the report and accounts for the year ended February 28, 1953:

As you will see from the accounts the net profit for the year ended February 28, 1953, before taxation, slightly exceeds the profit of the previous year.

EXPORT AND HOME SALES

During the year difficulties regarding tariffs, import quotas, foreign exchange, etc., have resulted in some diminution of last year's record export turnover, although export sales were substantially above the figure for the year ended February 28, 1951. We are expanding and reinforcing our overseas sales organisation and provided we can overcome the difficulties to which I have referred we feel confident that our sales will again expand. Certainly the figures for the current year to date are encouraging.

Home sales also showed a slight recession due mainly to the fact that with the change-over from a sellers' to a buyers' market many of our customers reduced their stocks in the early part of the year. Fortunately, towards the end of the financial year we have benefited by substantial reductions in the cost of many of our principal raw materials which have enabled us to maintain our profits.

The reductions in cost of basic raw materials should produce considerable benefits to the company during the coming year.

REDUCTIONS IN SELLING PRICES

It has always been the opinion of your directors that high prices for our products, however justified by high costs, operate to the disadvantage of our business and tend to restrict its development, and I am particularly happy to inform you that following upon the reductions in the prices of our raw materials we reduced the prices of all radio batteries to consumers by 10 per cent on March 16, 1953. We shall continue our endeavours to reduce costs of manufacture by efficient and economic mass production methods so as to be able to offer to our customers, both at home and abroad, a first-class product at a fair and attractive price.

It is gratifying that after some years of representations the Chancellor of the Exchequer has removed the purchase tax on radio batteries—a tax which has always been unfair to the battery set user. None of your

npany's batteries is now subject to purse tax.

These two substantial concessions to conmers, together with the reduction in rchase tax on the company's "Alldry" dio receivers should stimulate the demand r our products.

STRONG FINANCIAL POSITION

The consolidated balance sheet shows that ie company's financial position remains strong. The surplus of current assets over current and deferred liabilities has increased from £805,914 to £847,191. Owing to the easier supply position which now obtains we have been able to make a considerable reduction in our stock-in-trade from £1,719,202 to £1,340,931, and this has favourably affected the figure of creditors which is reduced from £1,365,274 to £1,007,103. Debtors have increased from £676,790 to £814,478, entirely due to exchange restrictions which have delayed the payments from export customers. These outstanding debtors are covered by the export credits guarantee department.

After providing for taxation and dividends at the same rate as last year, we have allocated £130,000 to reserves and the carry forward has been increased to £149,866.

Staff.—I should like to express my appreciation to all the members of the Ever Ready organisation for the efforts which they have made during the year which have contributed in no small measure to the satisfactory results achieved.

VICTORIA UNIVERSITY COLLEGE
WELLINGTON, NEW ZEALAND
School of Social Science

The Council of Victoria University College proposes shortly to appoint a Supervisor of practical training with the status of Senior Lecturer in the School of Social Science, and invites applications from suitably qualified persons for this post.

The Senior Lecturer will be required to lecture in the theory and practice of social work with particular reference to case-work; to make suitable arrangements for and to supervise the practical training of students, and generally to assist the Head of the School with the administration of the department.

Applicants should hold a recognised qualification in social studies or social science and must have had experience as social workers. Knowledge of modern methods of casework theory and practice is essential and experience in the practical training of students is desirable.

Salary: The salary will be £1,000 per annum, rising by annual increments of £50 to £1,200 per annum. The initial salary will be determined according to the qualifications and experience of the appointee. Allowance is made for travelling and removal expenses. Further particulars and information as to the method of application should be obtained from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1. The closing date for the receipt of applications in London and New Zealand is June 30, 1953.

UNIVERSITY OF NATAL
SOUTH AFRICA

Applications are invited for:
(a) a Professorship, and
(b) a Senior Lectureship,
in the Department of History and Political Science, Pietermaritzburg.

The present salary scales, which are expected to be shortly increased, are:
Professor: Men £850 x £30—£1,180 x £20—£1,200.
Women £600 x £25—£900.
Senior Lecturer: Men £600 x £25—£900.
Women £550 x £25—£725.

In addition, cost of living allowances of £320 p.a. for married and £100 p.a. for single officers are paid. Commencing salary will depend on qualifications and experience.

Further details and information as to method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1. Closing date for the receipt of applications is August 15, 1953.

ORMOND COLLEGE, UNIVERSITY OF MELBOURNE
AUSTRALIA

Applications are invited for the office of Master (i.e., Head of the College).

Salary: £A1,575—£A1,775, according to qualifications and experience, together with superannuation and other benefits.

Full particulars and Paper of Information are obtainable from the Chairman, Ormond College Council, Ormond College, Melbourne, N.3, Victoria, Australia, or from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1.

The closing date for the receipt of applications is July 31, 1953.

WOMAN Graduate in Economics or Commerce sought for post of Marketing Assistant to Sales Director. The work will be at Head Office, St. Albans. Ability to handle and interpret figures more important than previous experience.—Full details of career and salary required to be addressed, in writing, to the Sales Director, L. Rose and Co., Ltd., Grosvenor Road, St. Albans.

DEPUTY to the Secretary of the company's pension funds required by large industrial organisation at the head office in London. Qualified accountant or Chartered Secretary, approximate age 35-40. Knowledge of pension fund matters desirable. Minimum salary £1,350.—Write, giving details of age, qualifications, etc., to Box N.8756, A.K. Advg., 212a Shaftesbury Ave., W.C.2.

"THE way to ensure summer in England is to have it framed and glazed in a comfortable room" or heat your house with unrationed oil, the cheapest form of clean, labour free, automatic heat. Your boiler can now be converted for about £200, including tank.—Nu-Way Heating Plants, Limited, Droitwich.

CHARTERED ACCOUNTANT wanted as Secretary and Chief Accountant of London manufacturing company. Four-figure salary. Initiative, drive and enthusiasm more important than long industrial experience.—Box 249.

GOOD FOOD AND WINES in dignified surroundings will be appreciated by your guests.—Restaurant FRASCATI, Oxford Street, London, W.1. MUS. 7414.

ACCOUNTANT, 25/35, wanted as personal assistant to the directors of an advertising agency. Knowledge of advertising not essential as his duties will be chiefly concerned with administration, and accounts. Prospects of secretaryship for the right man.—Please write giving details of qualifications, experience and salary required, to Mr. R. Plummer, 55/61 Moorgate, E.C.2.

TYPOGRAPHER (woman), National Diploma, well-educated, keen, intelligent, requires post in advertising or publishing firm.—Box 248.

ARE you interested in—Housing—Agriculture—Transport—Economics—Exports—or Shipping? If so, you will also be interested in our fortnightly Parliamentary Reports on these subjects. Trial 3 months' subscription 10s. 6d.—Industrial Advisory Bureau, 12 Buckingham Street, London, W.C.2.

QUALIFIED ACCOUNTANT, wide financial experience, combined with marked organising ability, desires progressive appointment with organisation of repute. Commencing salary £1,200-£1,500.—Box 247.

BANK OF THE GOLD COAST

A vacancy occurs unexpectedly in the post of Manager of this newly formed Bank (incorporated in the Gold Coast by Ordinance) and offers, for a suitable retired banker with overseas experience, a share in an interesting and constructive task. A three-year contract is contemplated in the first instance (terminable at three months' notice on either side) on the following terms:—

Salary £2,000 per annum;
Free furnished house;
Two months' leave a year on full pay, with air passages provided for self and wife.

Applications, giving full details of experience, age, etc., should be addressed to: The Managing Director, Bank of the Gold Coast, c/o Commissioner for the Gold Coast, Melbourne House, Aldwych, London, W.C.2.

Candidates will be interviewed in London during the month of June.

UNIVERSITY COLLEGE—CANBERRA
AUSTRALIA

Applications are invited for appointment to the post of LECTURER IN ECONOMICS

Salary £A650—£1,050 p.a., plus cost of living allowance (at present £A180 p.a.). Annual increments of £A40.

Further particulars, conditions of appointment, and the summary form which must accompany applications may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1, or from the undersigned.

Applications close June 6, 1953.

T. M. OWEN, Registrar, Canberra University College, Canberra, A.C.T., Australia.

OPPORTUNITIES IN AMERICA FOR ENGINEERS

Westinghouse Electric Corporation, the first company in the United States to design and produce a jet engine, is enlarging the engineering force of its Aviation Gas Turbine Division.

If you are interested in a challenging job with Westinghouse's fastest growing Division, this is your opportunity. The field is wide open for qualified men, preferably of B.Sc. or equivalent standard, to do research, development and design work on jet engines and components such as combustors, compressors and turbines, fuel systems and controls, ignition system, gearing and lubrication systems; in stress and vibration analysis, fluid flow research, metallurgical studies, project engineering, laboratory and engine testing.

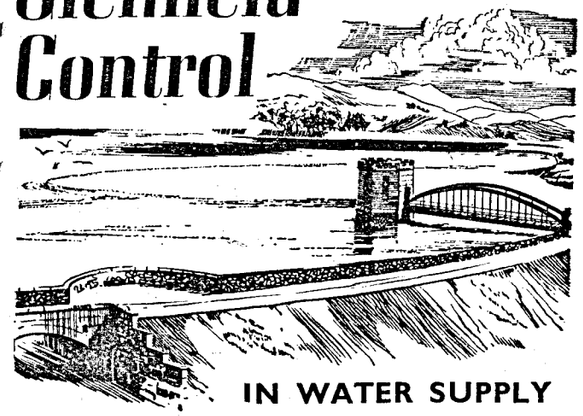
Applications, giving full particulars as to qualifications, etc., should be addressed to Mr. Geo. R. Northrup, Westinghouse Electric International Company, 1-3 Regent Street, London, S.W.1. Interviews will be arranged in Britain.

OPPORTUNITIES IN THE UNITED STATES FOR ELECTRONIC ENGINEERS

The Westinghouse Electric Corporation, a very progressive organisation, has in its Electronic Division a number of attractive positions open for Engineers with professional standing in either the Institution of Electrical Engineers or the Institution of Radio Engineers.

Applicants for these positions should have at least three years experience in design or development in one of the following fields of activity:

Circuitry	Telephone Equipment
Radar	Broadcast Equipment
V.H.F. and U.H.F. Equipment	Antennas and Waveguides
High Frequency Heating	Servo-Mechanisms
Computers	Missile Guidance Equipment
Communications Equipment	Aircraft Hydraulics

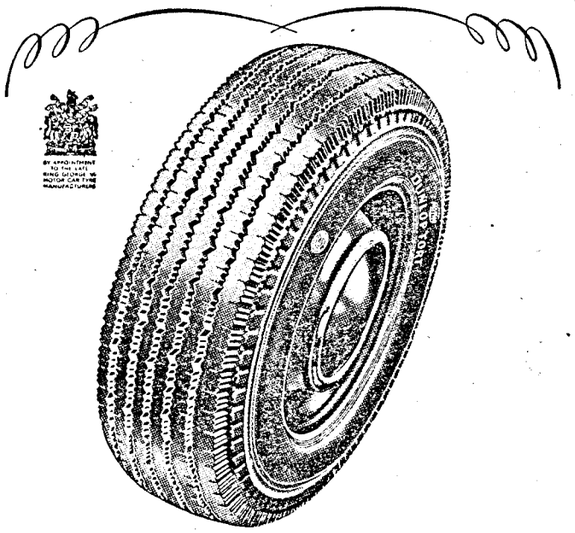


Plant is located in outskirts of Baltimore, Maryland, in beautiful Chesapeake Bay Area with splendid facilities for fishing and sailing. Generous relocation allowance is provided.

PLEASE REPLY PROMPTLY, giving full particulars as to qualifications, etc. Interviews will be arranged in Britain. Address enquiry to Mr T. M. Bloomer, Westinghouse Electric International Company, 1-3 Regent Street, London, S.W.1.

AMBITIOUS YOUNG MAN, 25, single, 4½ years Exchange Bank India/Malaya, Part I Institute of Bankers, thorough knowledge commerce, finance, economics, seeks administrative position with leading British Merchant House Central Africa or Far East. High references.—Box 251.

BOOKS on Market Research, Statistics, Economics, Management and long runs of periodicals for sale.—Box 246.



Glenfield Control

IN WATER SUPPLY

There can be no expansion without "pure-water," and there can be no "pure-water" without applying efficient methods of control in places of storage, in pipelines, in treatment plants and throughout distribution networks. In all these fields Glenfield Control Equipment has been in ever-increasing demand for over one hundred years.

Five Months or Thirty?

THE Government's two major Bills, denationalising steel and road transport, have been completed before the Coronation, and Parliament will return next month to a new political situation. The Government needs a new legislative programme. It cannot, however, settle a programme without facing another question. During the next few months, Sir Winston Churchill and his ministers will decide whether or not to put themselves to the issue of a general election in the autumn. With the by-election victory at Sunderland behind them, this decision can be made by weighing the relative advantages of the alternatives; for once, the choice is not of the lesser evil but of the more profitable course. It is not, however, on that account less difficult or less important. It requires frank discussion in the interest not of party but of the country.

Some Conservatives do not believe that, in these terms, the issue arises at all. They were elected, the argument runs, to give the country five years of sound administration; they have proved able to do so in spite of the narrowness of their majority in Parliament; and they therefore have no good reason to lay down the job before its allotted term. To inflict a general election on the public this autumn—the third election in less than four years—would be an attempt to snatch a party advantage; it would be the more severely condemned by the electors, some Conservatives say, because it would look like cashing in on the Coronation. The argument reflects a creditable sense of responsibility, even if it also owes some of its force to the common inertia of politicians in power. But it exaggerates the importance that the Coronation will retain in most people's minds by October, and politically it is not well founded. It overlooks the fact that the Conservatives were elected with a narrow programme as well as a narrow majority.

The people who returned a Conservative Government in 1951 expected it to lighten the burdens of taxation, rationing and controls, to denationalise steel and transport, and to pull the country through the dollar crisis of that winter. In these things, a fair measure of success can now be claimed. But the last election was fought in a mood in which few people on either side looked far ahead. It was a culmination of the controversies of the previous six years. The only different issue it introduced was that of "warmongering," and nothing could since have proved to be more demonstrably false and flat. The election campaign therefore provided no definite pointer to Conservative policy beyond the stage that has now been reached. Quiet administration, however excellent in principle, is plainly unsatisfactory as a detailed prescription. The needs of the country cannot, indeed, be expressed in grandiose legislation. But all legislation is not of the architectural character of 1945-50; the spring-cleaning kind is no less difficult, and it is urgently needed. The Government has no definite programme, endorsed by popular vote, for it. This does not mean that the Conservatives are morally obliged to seek

a new vote of confidence for new measures. The British parliamentary system does not confine governments to specific mandates. A realistic programme for the next two years can be based firmly on the general principles that the Conservative party has expounded in recent years, and which may fairly be taken to command democratic approval. But the question is whether such a programme can be vigorously undertaken by a government with only a slender majority, without a specific mandate, and with two years of its term already gone.

The necessary spring-cleaning will be a long job. It requires, for example, a thorough recasting of the taxation system, in order to make taxes less deterrent to saving, hard work, investment and risk-taking ; these reforms cannot be undertaken until the next budget (before which, presumably, the Royal Commission will have reported) but they certainly must begin then if this Government is to undertake them at all. Secondly, more liberal—but realistic—policies for foreign trade and exchanges have to be worked out. Thirdly, the policy of letting prices work in the domestic economy should be taken very much further. That involves removing such distortions as the remaining food subsidies and the housing subsidies ; it means relaxing controls in order to make rents more realistic ; and it requires also a genuine attack on monopoly and other restrictive practices. The promised policy for more freedom in agriculture has still to be devised and applied. The final, and perhaps the most difficult, stages of derationing for the domestic consumer also remain. The whole problem of local government areas, powers and finance urgently calls for radical reform ; so also do many aspects both of organisation and of policy in the social services and in the nationalised industries.

★

These are only some of the things that should be done within a coherent programme for the recuperation of Britain. Many are complex, all are controversial, and few are likely to bring any immediate rewards in political popularity. If the Government once sets its hand to such a task, there can be no breaking off part way. Ministers who are raising rents, upsetting vested interests in local government and defying the National Farmers' Union may in the end hold the hearts of the voters ; but during the process there will be many times when they are very badly placed to fight an election. Once the programme is undertaken, Conservative politicians will have to put out of their heads ideas of seizing on external circumstances favourable for an election—after a settlement in Germany, or before a threatened recession. If the Government sets out to do in this Parliament the things that now need doing, it should be determined to go through, if it possibly can, until the autumn of 1955 or the spring of 1956.

That, on a majority of eighteen, is a formidable undertaking. It can be done, as the past eighteen months have shown, but only by a stricter party discipline than is good for democratic government. It means suppressing political private enterprise and it is likely to lower the quality of politics ; many able men are losing interest when they are required to be so constantly at Westminster. Senior ministers should not be blind to the danger of draining ability and experience from the next generation of politicians.

The cost may, nevertheless, be worth paying ; to settle down to two years or more of comprehensive spring-cleaning and reforming may be the wise and patriotic course for Sir Winston Churchill's Government. But there is one—though only one—entirely honourable alternative. A general election this autumn would be a legitimate appeal for a bigger majority with which to carry out a new programme, a programme requiring more than the remaining life of this Parliament. Political action cannot always fit into a four-year or five-year pattern. The Conservatives have discharged their responsibility quite as far as people were looking ahead in 1951. They also have good reason to believe that the electorate would have given them a bigger majority if it had not been distracted by the warmongering charge. Now that the charge has proved to be beside the point, the Conservatives can properly ask for a new decision on new evidence. They are also, of course, anxious to be judged on what they have done before a recession or a new dollar crisis upsets the applecart. In both respects, Mr Attlee provided a clear precedent in 1951.

Sir Winston Churchill, like Mr Attlee two years ago, cannot make a firm decision before the holidays. There can be an autumn election only if the issues between the parties take, by the end of the summer, a form sufficiently concrete for election campaigning. That, however, will probably happen if either side wants it. The Government's task when Parliament has reassembled after the Coronation will be to weigh fully the two alternatives likely to be open to it in the autumn. It can prepare a political programme for four years, on which to fight a general election. Or it can prepare a legislative and administrative programme on which to govern for two years, a programme it will stick to until 1955 or 1956 even if it has to endure in 1954 such a shock as an American recession. Either of these courses would be reasonable. The third possible choice—to delay a decision—is not. It would mean waiting to see what the economic situation looks like at the end of the winter, and doing nothing much in the meantime. The modern world is not a place in which it often pays politicians to rest content with their laurels and wait for something to turn up or to fall down. And party interests apart, a winter's delay in policy-making certainly will not match either the economic or the political needs of a country whose prosperity and security are still so unsurely based. Sir Winston Churchill may appeal to the country in five months' time or he may settle his government down for another thirty months ; but he should not look for an opportunity in between.

Hard Choice for Europe

WHILE Britain prepares to bask in the sentiment of Commonwealth unity diffused by the Coronation, Europe moves towards a crisis in its effort to win unity. It is a strange and a sad coincidence that the year in which events must enhance so much Britain's feeling of responsibility and opportunity outside Europe should be the year in which Western Europe has virtually to choose between new forms and old ways. For it would be so much easier, say the Europeans, to choose unity if Britain would make the choice at their side ; and there are many among them who now bitterly regret that unity has been conceived in the form of closely defined institutions and tight commitments such as no member of a loosely-knit Commonwealth could accept. It is a pity, too, that the integration of the Germans in Western Europe—an end good in itself—has come to be regarded mainly as a way of rearming them and countering the blandishments that the Russians could so easily offer to Germany. It means that a policy of understanding with Moscow and a policy of uniting Western Europe are now regarded by many as conflicting and mutually exclusive purposes. If it is British policy to achieve both these aims simultaneously, as Sir Winston Churchill seemed to imply in his speech last week, then an enormous task of statesmanship lies ahead of him.

The outlook for European unity is gravely confused and uncertain. Much of the zest and idealism behind the conception have been quenched by practical difficulties. Weak French governments have made virtually no progress in recommending the European Defence Community to the people and its legislators. Instead, a new and vigorous sense of national identity and imperial prowess has been stimulated by the arguments used among Frenchmen against the EDC. M. Mayer's cabinet could easily fall before the month is out ; and about the future in Paris one thing alone is certain—that M. Schumann will not return to complete the foreign policy he started. The odds are that the treaty for the Defence Community will not come before the Assembly until the autumn ; and even then its fate will be uncertain. By the autumn, however, German elections will have taken place ; and in Bonn one of two things is likely to happen. Either Dr Adenauer and a coalition government will survive to continue their European policy ; or an alternative government, led by the Social Democrats, will wish to modify—even of it does not annul—the treaties giving Western Germany its independence and setting up the EDC. Those treaties have been provisionally approved by the Upper House in Bonn ; and the French have now lost the important advantage of being able to say "after you, please." Instead, the German Chancellor, thanks to his successful visits to the United States and this country, and to his deftness and determination at home, now stands pre-eminent in the movement to unite Europe.

That fact is doubtless regretted by many Frenchmen, in spite of the satisfactory relations that Dr Adenauer claims to have established with M. Bidault. They see in it a foretaste of what might eventually happen in the proposed defence community and in other institutions of a federal Europe. They fear the domination of Germany *tête-à-tête* with France especially if the western and eastern zones were re-united. These are forebodings that are well understood in this country ; but it is fair to ask whose fault it is that the German Chancellor stands where he does in Europe. Was it not the French who held the lead in M. Schumann's day, not so long ago ? Was it not they who pressed for federal solutions and proposed the formation of a European family at whose table France would take the head at one end and Germany at the other ? It is not without significance that one Frenchman—M. Monnet—who knows what he wants and has devoted himself heart and soul to getting it, has established in Luxemburg that vigorous European institution, the coal-steel community. Why must it always be assumed that Germany, weakened as it is by the presence in Europe of the Americans and the Russians, must dominate France, with its security guaranteed fivefold, with its natural wealth and overseas partners, with all its vigour and brilliance ? How much longer is this fear to paralyse all advance towards a new organisation of Europe ? Questions such as these lie behind the Prime Minister's blunt references last week to the difficulties of the French.

★

Successive French governments have placed their allies in this dilemma : granted that Western Germany—however relations with the Soviet Union may develop—must make some effort for its own defence, how can it be safely and efficiently made except in a European defence organisation ? A defence community will provide the benefits and economies—as well as the restraints—of common training, common supplies, joint planning and integrated command. About the desirability of such things there can be no argument ; for neither France nor Germany alone can afford effective defence with modern equipment. So much is clear to German as well as to American and British defence experts. The days of covert rearmament with the aid of Schachtian economics are over. The question therefore is : what kind of a defence community ? A tight and small one, or a loose and large one ? A tight one excludes the United States and Britain, for reasons that are well known and accepted in Europe. A loose one can include the United States and Britain. Clearly a

loosely knit organisation like Nato offers great advantages to the French: the presence of two world powers, each well placed to influence German policy, and the retention of an independent French army and defence organisation. But they have refused for three years even to discuss German membership of Nato. Why? Because Germany in Nato would receive precisely what the French want for themselves and fear to give the Germans—an independent national army and defence organisation. In short, France will not accept Nato as the harness of German rearmament because it has no bit. If Nato were a stronger organisation, with political powers of the kind that neither Congress nor Parliament in this country seem yet disposed to give it, then France might agree to Germany joining it.

Yet there is in this case an element of absurdity. If France really wants a united Europe, with institutions of a federal kind, how can it exclude institutions for common defence? A European federation without powers over military policy and defence expenditure would be no federation. Can it be that French statesmen, having seen all the implications of federation, are now harking back to complete national independence? Do they now see federal Europe as a Frankenstein that would annihilate them? If that is the way they are thinking—and there are millions of French voters who would support them—then for the sake of honesty and clear thinking let them say so. For a situation in which Germany is willing to surrender sovereignty in defence to a European body while France hesitates to do so is not one that can continue indefinitely without danger. To make Dr Adenauer look foolish by ensuring the collapse of his European policy is a sure way to encourage the German nationalism that is now being mobilised for elections in September.

★

These hesitancies on the part of France—and also of others—were clearly revealed at Strasbourg earlier this month. There was a general disposition among the delegates to the Consultative Assembly to back away from the idea of a six-power "little Europe," as its critics call it, and to entertain vague hopes that more might be made of the much larger Council of Europe. And in Paris, this week, too, there is every sign that efforts to produce a European Political Community, which would preside over the coal-steel and defence communities, are faltering. Here again, it is impossible to acquit the critics and conveners of irresponsibility; for what alternatives do they offer? Do they propose to give executive functions to the Council of Europe in matters of defence and economics and finance? If so, six members at least will wish to resign, among them possibly British. Do they propose nothing more than political consultation and functional co-operation (Mr Bevin's much-despised advice) on the model of the British Commonwealth? If so, France will object that such an organisation is too loose to contain a resurgent Germany—not without reason, for the Commonwealth is quite unable to restrain members who act contrary to its interests and ideals. Or do they propose the extension and development of the idea of the Atlantic Community? If so, there is little future for the Council of Europe.

There is another alternative that attracts many French minds. It is that France—with, if possible, its allies—should give up the whole policy of integration in return for an agreement with the Soviet Union. This would allow the unification of Germany and the creation of a small *Wehrmacht*, but would forbid the Germans to ally themselves with either the Communist or the western group of powers. Behind such hopes lies the conviction that Germany is the real enemy and that French and Russians have a common interest in treating it as such. But surely no French statesman who has worked for European unity and the present allied policy towards Western Germany could consider such a solution without personal dishonour. Every consideration of military security and political good sense excludes it, and the Prime Minister's pledges last week to Dr Adenauer close the door to it so far as Britain is concerned. The choice therefore remains: either a tightly knit European community in which France and Germany work together because they have to; or a loosely knit Atlantic Community in which an independent Western Germany will dispute with France the right of access to Great Power counsels. The latter solution might mean the end of the movement for European integration; the former could bring some, if not all, of the benefits that the European movement has promised itself. To hesitate between the two decisions is pardonable; it is a terribly difficult choice for Europe. But to hesitate about the former while refusing to consider the latter—which is what France appears to be doing—is to have no policy at all. Nothing could suit the Soviet Government better.

The Toleration of Slavery

"The natives of the Gold Coast," says Mr Cruikshank, confirming the statements of other authors . . . "may be emphatically termed a race of slaves. . ." There, as in the early ages, men buy their wives and regard their offspring as property. This is very much in accordance, as Mr Cruikshank points out, with many passages in Scripture; and that condition of society on the coast of Africa is the origin of the slave trade and of that slavery which yet pollutes some of the West India islands and the Southern States of America, after the bulk of civilised society in Europe and in the Northern States has outgrown it. These things, though remote now in space, are connected as cause and effect, and there would be no slavery in the States had there been none in Africa. An institution or a practice so very general both in time and space must be considered consistent with the order of Nature at one stage of society, though inconsistent with it at that stage which society in Europe and in North America has now reached. But it can no more be put down than serfdom can be restored. Our reason and our hearts call on us to abhor it and to strive against it, and we hope to improve it. We ourselves will have none of it, as corrupting and degrading all alike; but it is a different question whether our abhorrence is a justification for making common cause with the enthusiasts of the Northern States in a crusade against slavery in the Southern States. The party in the North feels the pollution and the degradation which afflicts the whole society; but we have no more business, as a nation, to take up the cause of the Abolitionists in the United States, and declare a war of opinion against the Southern planters, than we have to take up the cause of Mazzini and Kossuth, and assail the Governments and people of Austria and Russia.

The Economist

May 21, 1853

Strings to the Hospitals' Purses

IT is significant that in this week's debate on the national health service Mr Macleod put the method of financing the hospitals first among the objects of the Guillebaud Committee's inquiry. Something like three-quarters of the cost of the health service that is borne from central funds is made up of advances to hospital authorities, and from the outset doubts have been felt whether these advances—now amounting to £300 million a year—have been estimated and spent economically. In the early years of the service, hospital authorities were given a fairly free hand, partly because there were no real standards of comparison against which the costs of the hospitals could be judged. This carefree period was followed, in the last years of Labour's administration, by strict central control that maintained a limit on total hospital expenditure but by no means ensured that the money spent within that limit was being put to the best use. Later, this central control was partly relaxed, and hospital authorities now have fairly wide powers to spend their money as they wish provided they do not exceed their budgets. What they still cannot do is to retain any savings on their budgets that they have made either by careful management or through unforeseen circumstances like a shortage of labour and materials.

Throughout these first five years of a nationalised hospital service, the recurrent theme has been: could not the hospitals be financed like the universities—that is, by a system of block grants for a period of, say, five years? The hospital service, it is argued, is not one for which financing on an annual income and expenditure basis is appropriate. Developments need to be spread over a period of years and priorities laid down. Under the present system, proper planning is impossible, and money tends to be spent on inessentials in the last months of the financial year because it cannot be saved for more worthy objects later.

In the last year or two, however, a new theme has been heard. Even if it were assumed that Parliament would agree to give up its annual control of so large a sum, there would be considerable objections to handing it out for so long a period when so little is known of the real cost of treating a hospital patient. At present, the hospitals' budgets are calculated from the estimated expenditure under various headings—salaries and wages, food, fuel, drugs and so on. The drawback of this system is that it prevents fair comparisons between one hospital and another. One hospital may have a much larger out-patient department than another, otherwise comparable, hospital. Its staff and food bills are consequently bigger, and the effect will be to inflate the estimated cost of maintaining an in-patient. The Ministry of Health has tried to overcome this difficulty by making arbitrary allowances for out-patient expenditure. But it is widely held that the only true basis for estimating the cost of treating a patient is a system of unit costing. This would allocate to each ward—or to each medical and surgical unit—its share of the total maintenance costs of the hospital. The estimated cost of each unit would, therefore, reflect a proportion of administrative costs as well as the cost of the staff, including their food, directly concerned in running the unit, and the cost of treatment.

★

Investigations into costing on these lines have been carried out in recent years by the Nuffield Provincial Hospitals Trust and King Edward's Hospital Fund for London; both bodies published reports on the subject last autumn. In favour of costing, it is urged that the system would give the Ministry a much more realistic basis for determining the size of the block grant, should such a step be taken. Even without this, it would enable valid comparisons to be made between various hospitals and help the authorities to see likely items for economy.

Against these advantages, it is argued with some force that a costing system could not be introduced into the majority of hospitals without an increase in staff which at the moment is quite out of the question. The pilot investigations that have taken place were, after all, made in selected hospitals. Changes in the method of financing the hospitals cannot wait for the adoption of an elaborate accounting procedure. Secondly, it is argued that costing, which in industry is used to determine the market price of a product, is inappropriate to the hospital service. Let it be supposed that an accurate costing system could be introduced overnight. The cost of maintaining each hospital bed and of providing for each out-patient attendance would be calculated and then multiplied by the total number of beds

a hospital expected to have at its disposal and the total number of out-patients it expected to serve. This process would be repeated on a national scale, and the Ministry of Health would present the bill to the Treasury. But it does not follow that the Treasury would agree to it. No matter how elaborately and scientifically the cost of the hospital service is estimated, it still has to conform to the total health service budget, the size of which depends in its turn on the state of the national finances. It is the Treasury that determines the "market price" of the hospital service—that is the price the country can afford to pay for it—and the hospital authorities have to make their costs fit the price.

This does not mean that costing will not eventually have a place in hospital financing. But there is a danger of its becoming an end in itself instead of a useful tool—for those capable of handling it. There are, moreover, two much simpler ways of encouraging economy. First, hospitals should be allowed to retain their unspent balances; it is fantastic that authorities who are able to cut their costs below the market price—so long as they meet the specification and do not provide a shoddy service—should derive no benefit from their economies.

The second method is by more flexible capital budgeting. It is well known that the maintenance expenditure of most hospitals could be reduced by the installation of modern equipment in, for instance, boiler rooms, kitchens and laundries. It is not so well known, however, that in carrying out work of this sort hospital authorities have to take part in an annual obstacle race. The work forms part of their capital programme together with the installation, modification or extension of telephones and lifts and a host of similar pieces of equipment. There are many hospitals today where the wards are still heated by old-style open coal fires, and where manpower is wasted carrying patients up and down stairs from the operating theatres to the wards because there are no lifts or they are not big enough to take the stretchers.

★

In August, 1950, the practice of allocating a capital sum to the hospitals for only a year at a time was modified. The authorities were then told by the Ministry of Health that they could rely on certain capital advances to spend in the two succeeding financial years and that in 1953-54 and later they could expect to have sums "not disproportionate to" those for 1951-52 and 1952-53. A year later the allocation for 1952-53, originally put at £10 million, was reduced by a quarter.

But uncertainty over the future capital sums available is by no means the worst hurdle that hospital boards have had to surmount. Until last March, when the limit was raised to £10,000, a board had to submit for detailed scrutiny by the Ministry every capital project costing more than £1,000. (The Ministry will still have to be consulted about projects costing less than £10,000 if they "present special problems.") Then comes the authorisation by the Ministry of each board's total capital programme. But when this has been received boards must still obtain from the Ministry of Works a starting date for schemes costing more than £2,000 (until recently, the limit was £1,000). The starting date may, however, be too late for the allocation in the estimates to be used, and the money is either unspent and returned to the Treasury at the end of the year or, more likely, used on hastily devised small schemes which may not be of great importance.

It would be an obvious advantage, therefore, if the hospitals' capital budgets could be spread over, say, five years. Works could be dovetailed into each other and should as a result cost less to carry out. Nor would there be the same objections to a surrender of Parliament's control over the comparatively small capital budgets as there are to a surrender of annual control over recurrent expenditure amounting to nearly £300 million.

★

The fact remains, however, that it is this large and growing maintenance expenditure that causes anxiety. More efficient equipment should certainly produce worthwhile economies; but they could not make a big impression on the total expenditure because nearly two-thirds of it is made up of salaries and wages, which are outside the control of the hospital authorities. It is true that hospital boards are represented on the Whitley Councils; but there are more Ministry officials on the employers' side, and management committees, which employ all hospital staff except the senior doctors, are only indirectly represented.

If the Whitley machinery were used solely to fix minimum rates of pay its influence would not be so widespread, for hospital budgets now contain a provision for increases in wages and salaries. But the worst effect of Whitleyism in the hospitals is its undermining of the responsibility of those who run them. Hospital authorities must not pay more than the Whitley rates. They cannot, therefore, reward hard work and efficiency within their hospitals. Nor can they, for instance, pay commercial rates for a first-class caterer or cook who can usually reduce the cost of institutional feeding as well as improve it.

Nor is this all. Along with Whitleyism has gone a growth of restrictive practices to an extent unknown in the days before the hospitals were nationalised. By a recent Whitley decision skilled labour must be used for cleaning paint work even when there is to be no repainting. Formerly, the hospital porter did a variety of tasks that are now the exclusive preserve of others. Nearly two years ago the Select Committee on Estimates recommended that urgent consideration should be given to the application of the Whitley system to the hospital service. Even more than block grants, it should receive the prior attention of the Guillebaud committee.

Block grants, five-year capital budgets and the like are contrivances that might well produce economies but hardly go to the heart of the matter. Is there something inherently wrong with the organisation of the hospital service? Is it sensible that financial control and responsibility should be so firmly fixed at the centre and so little real power delegated to those on whom the successful running of the hospitals depends? Is the price of uniformity in standards of service too high? Questions of this sort need to be answered before vested interests in the present organisation become too firmly entrenched and the rheumatism now afflicting the service becomes chronic. If the Guillebaud committee merely helps to answer these questions about the hospital service, its appointment will have been fully justified.

Plot and Counterplot

NOW that the fantastic episode of the Moscow doctors' plot can be seen in perspective, it is worth analysing some aspects of it in detail. The whole ugly story throws a very clear light not only on Communist methods in the Soviet Union itself, but also on the habits and tactics of the Communists in the free world. Moreover, they themselves have provided all the evidence. There is no need to cite any allegation brought against the Communists in this matter from quarters opposed to them. It suffices to compare what the Communists themselves said at the two crucial points—the moment when the arrest of the doctors was revealed, and the time, nearly three months later, when most of them were declared innocent.

It goes without saying that the Communist parties in the West instantly accepted, without the least hesitation, the story issued in Moscow on January 13th. It provided the main news headline in the next day's issue of *l'Humanité*, the *Daily Worker* and all other party organs. Even before readers of these papers were given the facts as issued by *Tass*, they were told that the "doctors' conspiracy" provided "irrefutable proof of an Anglo-American attempt to create a fifth column in the USSR." The *Daily Worker's* front page story, written by its foreign editor, began:

> The medical conspiracy against Soviet leaders revealed in the early hours of yesterday morning has shown the world the absolutely unprincipled and barbarous nature of the cold war waged by the western powers.

The writer went on to state categorically, without even ascribing his information to any Moscow source, that

> Five of the nine doctors who have been arrested and confessed their guilt got their orders from "Joint"—the American Joint Distribution Committee. Under cover of organising relief for poor European Jews, this body has acted for years as a cloak for US espionage agents.

This, and the parallel declarations in *l'Humanité*, *Unitá* and all other Communist newspapers in the West, provide an enlightening contrast with the same newspapers' arguments in the first week of April, when they were compelled to print—in relatively obscure positions—the news that the whole "plot" had been fabricated by the Soviet police. Three days later the *Daily Worker* produced its first comments, beginning with this delightfully self-revealing sentence:

> The capitalist press does not know what to say about the release of the Moscow doctors, but feels impelled to say something.

It went on to deride another daily paper for having described as "appalling cynicism" the fact that "men from whom confessions had been extorted were found guilty of crimes they had not committed." The Communist paper's editorial retorted—with much truth—that

> the doctors had not been found guilty, for the simple reason that at the time of their release they had not yet been brought to trial. There had been a preliminary examination, which decided that there was a case to go to trial. Further examination, however, disclosed that the evidence was falsified and that methods of examination had been employed which were repugnant to Soviet justice. . . .

Details of these "repugnant methods," to which the Communist press thereafter referred under the nice name of "irregularities," were not given by any Communist source in either east or west. But all party organs hastened to claim that the release of the doctors showed the swiftness with which the Soviet government could exculpate the innocent (or at least the survivors) and bring their persecutors in turn to justice. This, despite the fact that nearly three months had passed since the first announcement, which in turn had indicated that the doctors had been undergoing "irregular examination" for no little time.

★

No Communist organ has yet explained why, if no more than a *prima facie* case had been made against the accused, their guilt was not merely taken for granted but used as the "irrefutable proof" which justified a monstrous witch-hunt throughout Russia and Eastern Europe. The *Daily Worker* was content to declare that "the innocent have been released, and those who blackened their names are now awaiting trial." In any civilised country, "those who blackened their names" would be assumed to include all the journalists who denounced the accused doctors without waiting to hear their defence and while the case was still *sub judice*. It is not impossible that the editors of *Pravda* and *Izvestia*, who called the innocent men "killers, professional spies and terrorists from Joint," may yet in fact be brought

to trial for their errors. But the editors of *l'Humanité*, who dubbed them saboteurs, bandits, and assassins, and the editors of the *Daily Worker*, who called them "wreckers of peace" and "incendiaries seeking to light a new world war," and declared that "the whole of peaceful mankind should be glad when they are stamped out," seem neither to have withdrawn these "vile calumnies" (*Pravda*) nor to fear the wrath of Soviet justice. Presumably, the "civic rights" which, *Pravda* now tells us, are guaranteed to every citizen by the Soviet constitution do not extend to redress for libel.

Of course, it is now known, on the authority of the Moscow Press, that the whole case against the doctors was fabricated by the "adventurer" Riumin, until recently deputy Minister of State Security, who, with his associates, were out to "fan enmity between the peoples of the Soviet Union" by "abusing their own arbitrary power in a racialist manner" (the fact that the Communist Press in the West reproduced this damning admission of the "arbitrary power" wielded by Russian police chiefs was some measure of its confused mood). It is comforting to learn, again both from *Pravda* and from the party Press in western Europe, that although Riumin carried on his insidious campaign "for three or four months, the Soviet people strongly resisted it. . . . They were shocked whenever they detected the racialism of Riumin." No doubt the Russian people did resist it; they probably agreed wholeheartedly with the "anti-Soviet propaganda chorus of the millionaire Press" that the whole story about the doctors was a cruel lie. But the masters of the Soviet Press did not even try to resist it; the extent to which they accepted Riumin's "racialist fabrications" may be judged, for example, from a January issue of the Ukrainian *Pravda*, which declared that

> the profound hatred of the people is aroused by all these Kahns, Greensteins, Pers, Kaplans and Polyakovs.

In the West, moreover, not only the Communist Press, but also many individuals swallowed the "adventurer's" tales in one gulp. Mr Ivor Montagu called the doctors "a handful of criminals"; Mr Andrew Rothstein rushed into print to term them "terrorists and traitors"; Mr Jack Gaster, Mr Solly Kaye and a group of other Jewish members of the British Communist party issued a joint statement praising Riumin's machinations as "a direct defence of world peace." The British-Soviet Friendship Society warned the western world that it had called the Soviet trials of the 1930s fantastic, but that the true nature of those trials had eventually emerged. The truth about Riumin's charges has also now emerged, but the society has fallen silent.

Silence is, perhaps, the only safe course for the western Communists. Certainly the *Daily Worker's* comments on the exculpation of the doctors showed signs of haste and indiscretion. The paper's Moscow correspondent reported that

> The release has deepened public conviction that the ministerial reorganisation put into effect by Malenkov has led to greater efficiency.

This might easily be taken to mean that throughout the Stalin era ministerial inefficiency made it a normal thing for Russians to be arrested and subjected to "repugnant methods of examination." It can hardly be supposed that the Communist paper intended to give that impression.

★

What conclusions can be drawn? First, it is now clear that the picture of popular indignation at some supposed wrong or support for any particular cause presented by the Communist press can at any time be a complete fabrication. For example, *l'Humanité* of January 15th printed on its front page the banner headline: "The Soviet people demands exemplary punishment for the criminal doctors," under which it told of thousands of Muscovites rushing into the streets and exclaiming "Wretches! Assassins!" as they eagerly bought their newspapers. Now, however, we are told that the Russian people firmly rejected Riumin's lies from the start.

Second, we have confirmation from Communist sources that the western press is sometimes correct in treating Soviet propaganda as completely false. In January, the *Daily Worker* wrote editorially:

> The capitalist press in Britain pretends that the conspiracy is a fantasy. . . . It would like to see the British people waxing indignant not against the conspirators but against those who are punishing them.

The same paper now reveals that the free press was not only perfectly correct, but also in agreement with the feelings of the Russian people themselves—which the Communist press had scorned.

Third, it is demonstrated that the Communists in the West will accept without question, and base their policy on, whatever fabrications are handed down to them by any group of "adventurers" who are temporarily in control of the Soviet police and propaganda apparatus.

Fourth, the same western Communists are willing to swallow their pride and repudiate everything they have been saying the moment new directives arrive from Moscow. No such acrobatic *volte-face* has been performed in full view of the free world since the Nazi-Soviet pact of 1939 and the subsequent dropping of the pro-Nazi line in 1941; but the party has shown that it has lost none of its former agility.

Finally, the case of the doctors not only reveals the ease with which skilled Soviet policemen can extract false "confessions," and thus destroys all credence in the countless other judgments passed on unfortunates in Eastern Europe, from the time of Mr Vyshinsky's pre-war prosecutions to the recent execution of Slansky. It also shows the force and conviction, the wealth of detail and plausible argument, that the Communist propaganda machine can put into any campaign of falsehood. If the doctors were not Anglo-American agents after all, are we still expected to take seriously such parallel charges as that of germ warfare?

Notes of the Week

McCarthy Sails the China Seas

THE accusations and threats launched against Britain and other allies of the United States by Senator McCarthy in the past fortnight have been graver than any that preceded them. Since Mr McCarthy's committee began to investigate trade with China and other Communist countries on May 4, the Senator has alleged that Britain has been selling China chemicals with which to manufacture explosives, that British ships have carried Communist troops along the Chinese coast, and that British aid to Mao Tse-tung has more than offset Britain's contribution to the United Nations cause in Korea. In a passionate outburst in the Senate last week, he cried: "Let's sink every cursed ship carrying material to our enemy."

If these accusations could be duly substantiated, Mr McCarthy's wrath would be justified. Britain is clearly bound by the United Nations resolutions which require that no war material should be supplied to China or North Korea while they are engaged in aggressive war. However, as a recent leading article in *The Economist* pointed out, this obligation has been loyally observed. The "evidence" to the contrary so far presented by Mr McCarthy and his young minions has been unconvincing. The Senator's technique in this particular investigation—as in all others—has been to accept without examination every vague and damaging allegation, to silence any witness whose testimony appeared to conflict with his preconceived ideas, and to obscure as far as possible the distinction between trade in strategic and non-strategic goods. The damage that can be done to allied solidarity by these unscrupulous methods must not be underestimated, and it is probably an unhappy fact that no amount of painstaking rebuttal will remove all the smears.

Dr Adenauer and Locarno

DR ADENAUER'S first act on returning to Bonn last week was to explain away Sir Winston Churchill's suggestion that a treaty might be concluded with Russia on the lines of the Locarno Pact of 1925. There are good reasons why he should do this; for Germans are always ready to assume—quite wrongly—that British statesmen have subtle and well-laid plans for dealing with Germany to the advantage of Britain. The Chancellor is also extremely anxious to assure himself, as well as others, that the western powers are not contemplating an agreement with Moscow in which abandonment of the western defence system would be the price for peace with Malenkov.

Dr Adenauer also needed to interpret Sir Winston's remark mildly because some German politicians regard Locarno as a model for a settlement that would give Germany, as they think, the best of both worlds, eastern as well as western. These men have studied the Locarno negotiations, and they have noted that Stresemann was able to secure a guarantee of Germany's western frontiers, without granting western troops the right to march through Germany, and without the Soviet government raising objections. In spite of its pact with the West, Germany was free, a year later, to conclude a treaty of friendship and economic collaboration with Moscow. This feat appears to some champions of German unity to mean that Stresemann was a greater statesman that is Dr Adenauer who is fighting a historic fight to get Western Germany linked with the Atlantic powers.

Sir Winston certainly did not intend his suggestion as an alternative to the European Defence Community; but to Germans that is the way it is likely to be regarded. To some of them outside the Adenauer circle it seems clear that a price will have to be paid to Moscow if tension is to be relaxed and the Russian forces are to withdraw from the Soviet zone. That price appears to some to be either the abandonment, or the drastic modification, of Germany's part in western defence, and a western acceptance of the Oder-Neissse frontier. Sir Winston's suggestion, therefore, raises the prospect, dreaded or welcomed, of an agreement with Moscow that would involve three things: a virtual end to the budding German-Western alliance, liberation of the Soviet zone, and temporary abandonment of the lost territories across the Oder-Neisse line. It can be easily understood, in view of these far-reaching deductions, why the Federal Chancellor should hastily explain, after reading through the text of the Locarno Pact, that Sir Winston was referring only to its spirit and not to its clauses.

Labour Policy Decided

THE Conservative victory in the South Sunderland by-election has provided the Labour party with conclusive evidence that it cannot rely on an inexorable swing of the electoral pendulum to bring it back to power. Recent by-elections and the current public opinion polls both indicate that the Conservatives now command a majority of popular support, and—unless some such disaster as mass unemployment comes to its aid—Labour will have to make positive efforts to regain the lost ground. That must require

a new, constructive policy. Whether Labour is yet able to offer anything of the kind will be seen from the policy document due to be published soon after the Coronation.

This declaration will be submitted for the approval of the party conference in the autumn, but immediately it is published it will be accepted by the country as the platform on which Labour would fight a general election. It will be compared with the earlier policy statements which began with "Let Us Face the Future." Whatever may have been the weaknesses of those 1945 proposals, they amounted to a coherent programme based on a philosophy that commanded wide acceptance throughout the political left wing. Since then, each Labour policy statement has carried increasing marks of division and uncertainty, and there is no reason to believe that the new document will be any more convincing. When the party's national executive considered it this week there was last-minute trouble only over matters of drafting. The last outstanding question—whether or not to propose the nationalisation of large parts of the chemical industry—seems to have been resolved by a woolly compromise. The proposal is left in but the suggested method for implementing it is taken out; that will be left to some sort of enquiry when Labour has won a general election.

This approach seems to have been typical of the whole course of discussion within the party's executive and between the party and the TUC. Tortuous efforts have been made to reconcile two views which are fundamentally distinct, and as a result no one is satisfied. The Bevanites have openly threatened to start a national campaign to get the party conference to propose the nationalisation of rented land which the executive has rejected. The right wing fears that the half-hearted revival of stale nationalisation will obscure its new ideas for the social services. The programme proposes, for example, in some way to adapt the theory of the comprehensive school to existing school buildings. It also suggests that local authorities should make greater use of their powers of compulsory purchase in order to buy up houses in poor repair, renovate them and re-let them as council houses or flats. This at least steals a march on the Conservatives who have as yet produced no plan for helping the over-burdened private landlord. And while such ideas may be no more acceptable than nationalisation, they have something to do with current problems.

The Unfree Health Service

THE debate in the House of Commons on Monday did not produce a full-scale attack on Mr Macleod's committee of inquiry into the health service. Mr Bevan had failed to get his party's support for a motion of censure. Had not a trade unionist agreed to serve on the committee? The sting was therefore taken out of Mr Bevan's speech and the whole debate, which took place on an ordinary supply day, was milder than had been expected.

Mr Macleod was therefore able not only to justify the appointment of the Guillebaud committee but also to give a review of the working of the health service charges. When defending the charges imposed by the present Government, Mr Macleod has always maintained that they were intended as much to direct health service resources

where they were most needed as to save money. Thus, the charge for dental treatment to adults would, it was hoped, enable dentists to give more time to treating children. In the debate Mr Macleod was able to show that the charge is having the desired effect. In 1950-51, before there were any charges at all, dentures cost 63 per cent of the total expenditure on the dental service. This meant that 44 per cent was spent on the treatment of people over the age of 45 and only 9 per cent on children and adolescents. By the second half of last year, the proportion of expenditure on treating children and adolescents had risen to 27 per cent. At the same time there has been a flow of dentists back to the school dental service.

The effect of the prescriptions charge has been much less satisfactory. It may, indeed, have reduced some unnecessary calls on doctors' time. The fact remains that the total number of prescriptions dispensed is still rising and is now running at the rate of 241 million a year. Further, the average cost of a prescription is rising, mainly because of the greater number of proprietary drugs that are now prescribed. There is no easy solution to this difficulty. As Mr Macleod pointed out, it is largely out of the sales of their proprietaries that pharmaceutical firms finance the research that has produced so many successful drugs in the last fifteen years. But here is certainly another question for the Guillebaud committee.

M. Mayer on the Brink

IT is uncertain, as *The Economist* goes to pr[ess], whether or not France will have a government next [w]eek. By asking for a vote of confidence on his programme [o]f limited financial reform, M. Mayer may have provo[ked] the nineteenth major parliamentary crisis in postwar [F]rance. In fact, M. Mayer had no choice if he was to go [g]overn at all. The budget deficit amounts to nearly £800 [mi]llion, France's EPU deficit is reaching fantastic proportion[s] after a further sharp deterioration in April, and the [w]hole economy is suffering from stagnation and a wave of [i]ndustrial unrest. M. Mayer proposed to cut governme[nt ex]penditure by some £112 million and suggested a [n]umber of new taxes, including a levy on home-distilled [a]lcohol. Although these measures are a tiny part of what [c]ould be needed to stop the rot in French financial life, M. [Na]. Mayer has had to ask for special government powers bef[ore he] could even think of carrying them through. As wa[s shown] in the case of the overthrow of M. Pinay five mor[ths ago,] the National Assembly simply will not allow a gova[ernment] the margin of independence it would need in extr[order to] survive the changing whims and moods of the ce[various] parties.

Although M. Mayer's fall may be caused by a lac[k of] confidence in his budget proposals, there are other [issues] on which opposition to his cabinet has been mou[nting.] Though it has no precise remedies in mind, the N[ational] Assembly feels that the Mayer government is [partially] responsible for the present setbacks in Indo-China [and for] the continued deadlock over North Africa. What [many] Frenchmen really have in mind is a drastic reductio[n in] France's defence commitments and possibly a withdra[wal] from the Far East. But no one, except the Communis[ts]

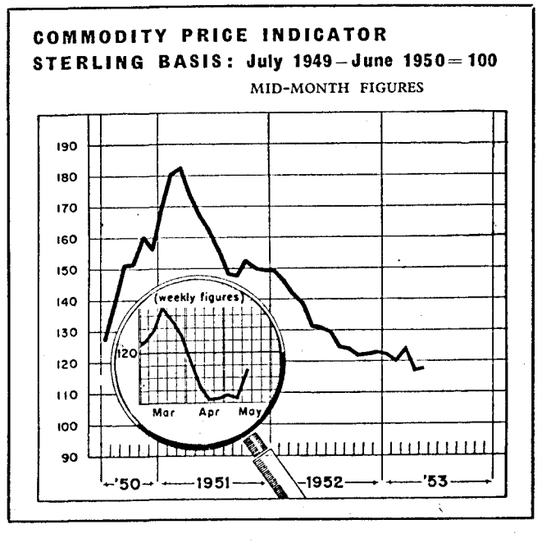
is prepared to say this openly and successive governments have been blamed for what is, in many ways, a tragic and insoluble problem.

If M. Mayer survives this week, it will simply mean that he will find himself in the same situation next week when he will demand further votes of confidence. Any slight shift in the parliamentary wind can swamp him and the expected split in the ex-Gaullist bloc (discussed elsewhere in this issue) may lead to a thorough reshuffling of the parliamentary pack. In view of this it is a pity that M. Mayer has not chosen to fall in style. It is high time that a French prime minister should speak frankly to the nation and put before it the need for a profound constitutional and financial reform. As it is, the public feels that this continuous series of parliamentary crises merely stems from the personal bickerings and infidelities of its deputies. Hence the paradox that the French people take the lack of stable government far less seriously than the rest of the free world, which recognises in it a symptom of real decay.

Mr Dulles in Delhi

DURING the next few days Mr Dulles will be in Delhi, an unfamiliar destination for an American Secretary of State, though perhaps no stranger than the Middle East capitals he has been visiting in the last two weeks. What makes Delhi different, however, is the size and prestige of India, and the fact that Indians and Americans each represent in their own way the opposite poles of the free world. For this reason their relations have not always been harmonious; certainly, they have never been close. Although Mr Chester Bowles, the recently retired American Ambassador in Delhi, did remarkable work in winning friendship and regard, Mr Dulles, as the maker of new policies, may have a rough passage. For the Indians he has personified something they have regarded with suspicion and dislike: the American "imperialist" attitude to the other leading Asian power, China; though there is now no love lost between the Indians and the Chinese. India has hitherto ranked relatively low in Washington's policy planning, and Americans in general have looked with keen disfavour on Mr Nehru's neutralist attitude in the cold war.

Mr Dulles has just been preceded in Delhi by a uniquely prominent compatriot, Mr Adlai Stevenson, who is touring Asia during the Republicans' honeymoon in Washington. His speeches during the presidential campaign had already won him high esteem in Delhi, as elsewhere; but his visit has been an outstanding success and may have a considerable effect on Indian thinking. Mr Stevenson, nevertheless, is not in power, and it is for Mr Dulles to turn these favourable developments to good account. He will doubtless have noticed the importance now attached in Moscow to building up the industrial strength of China, a project which might decide before the end of this century the leadership in Asia. What is less certain is whether he has noticed the important scope of India's economic plans, in which there is a financial gap estimated by the retiring American Ambassador at between $600 and $700 million. Many will think that $94 million of aid for India and Pakistan together compares unfavourably—even grotesquely—with over $2,000



144349

allocated to other countries which are to play their
the containment of Chinese Communist expansion.
in the next few years will depend on how American
-operates with India led by Mr Nehru, and on the
with which other Indian leaders appraise the
of Communism abroad as well as at home. We
d will certainly hope that Mr Dulles's visit will
ew start in relations between Delhi and Washing-
an historic opportunity not to be missed.

Mr Lyttelton Sees for Himself

IN going to Kenya to form a firsthand impression Mr Lyttelton was no more than according the situation there the attention its urgency demands. A short tour of "the front" may not in itself help to give a profound understanding of the cause and cure of Kenya's condition, but it was important for more reasons than that of improving the morale of the local community. The Secretary of State should have been able to size up people on the spot. That needs doing. Allegations of considerable laxity and of considerable brutality in the conduct of operations continue to be made. Both the Asian and the loyal African communities have complained of being cold-shouldered in defence measures. Some leading settlers have been asserting that a number of senior colonial officials are incompetent. The officials themselves no doubt have views on the leadership provided by the settlers, which Mr Lyttelton's visit will have enabled them to pass on discreetly.

Mr Lyttelton's comments in Nairobi closely followed those of General Sir Cameron Nicolson, the commander-in-chief of the Middle East land forces, who found the strength of Mau Mau formidable; he thought the movement capable of spreading if it was not speedily suppressed by more vigorous operations. The Secretary of State dwelt on recent improvements, particularly the steady growth of

the information reaching the police. Justice is becoming more effective. On the other hand, Mau Mau gangs are operating in larger companies. This may be their last fling, but they still attack troops and, above all, still inflict heavy losses on small loyalist Kikuyu outposts which are undermanned, under-equipped and unable to call reinforcements to their aid before being overwhelmed.

The outstanding issue at the moment is British power to support and protect the loyal African; until this has been demonstrated beyond question the mass of the Kikuyu will waver. Mr Lyttelton paid the loyalist Africans a well-deserved tribute, and he evidently considers that the Government is winning the waverers over. His qualified optimism is encouraging, but there have been many setbacks in Kenya and the roots of Mau Mau go deep. The emergency remains, and the longer it goes on the more formidable the problems of reconstruction appear.

The Wages Magnifier

THE claim for a 15 per cent increase in wages was on Wednesday approved by the general council of unions belonging to the engineering and shipbuilding confederation. It would cost the industry some £120 million a year, and plainly it will not be granted. The unions who are making the claim are, indeed, perfectly well aware that three shillings in the pound is more than they will get. Do they really help themselves by pretending to think otherwise? It has become conventional for unions to name a figure and accept a fraction of it. Last year, after nearly six months of bargaining, the engineers were given 7s. 2d. instead of the £2 they had asked for—and which was, they said, the minimum necessary for the maintenance of their accustomed standard of living. It is all a far cry from collective bargaining as it was conducted in the days of the docker's tanner—when union claims generally won public sympathy.

Last year the engineers accepted the 7s. 2d. for what it was—the outcome of a bargaining process that is reasonably fair but which always begins with a good deal of shouting and much pretended defiance. This year members of the Amalgamated Engineering Union, the most important in the confederation, have been frank enough to admit, even before the bargaining begins, that they find themselves compelled to ask for more than they can hope to get. They must also pretend that what they are demanding is the least that will satisfy their members, a pretence that they have seldom been able to sustain. The problem is, of course, that union leaders are often elected because they seem to be more militant than the men they lead, and it is their reputation for brave talk which compels them to keep on talking bravely. Even when it is obvious that they are asking much too much, they have to insist on calling it a minimum. Mr Jack Tanner, the president of the AEU, recently reminded its national committee of the consequences of this attitude last year. "It took much longer to effect the final agreement than would have been the case had we been a little more sensible and matter-of-fact in our approach to the question of amount. But you must all now admit that too many of our members considered the £2 claim up in the air."

The same thought may already have occurred this yea about the 15 per cent. One member of the committe posed the question: "How are we to convince them in th workshops?" Another insisted that the union must "mak the strength of our new case known to our members," an Mr Tanner summarised all their hesitations with th rhetorical (or at any rate unanswered) enquiry ". . . how far will the membership be prepared to go to get 15 per cent?" Last year the union's leaders had to spend time and money on trying to convince their own followers that they deserved £2. This year they will have to pretend, at least, that the workers deserve 15 per cent. National committee men have to be militant, or they would not be national committee men. But it is, as Mr Tanner said, a situation "bordering on the farcical."

Cut and Thrust on the Radio Front

RECENT political developments on both sides of the iron curtain have introduced a good deal of confusion into the picture of the cold war of the air. Thus, at the moment when *Pravda* was reproducing the text of President Eisenhower's recent speech, several hundred Soviet jamming stations were busy trying to prevent the Voice of America from conveying the same speech to the same public. Has the Russian taxpayer no redress against this monstrous waste of his money? On the other side of the Atlantic, the Bureau of the Budget, ever watchful over the American taxpayer's welfare, has succeeded in paring $4 million off the cost of US information services to other countries; and one result has been a decision to stop all broadcasts to Siam, taken just as the Vietminh offensive through Laos reached that country's borders.

Other moves recently made on the radio front have been less paradoxical, but scarcely less intriguing. Last month, after the first post-Stalin doves had been flown from the Kremlin, a brief directive was issued for Communists in Britain which called for action to lift the embargoes on strategic exports to China and other Communist countries, to stop BBC broadcasts to those countries, and to prevent the formation of a European army—in that order. The prominent place thus given to the radio front can hardly have been accidental. Can it be that the Kremlin's new tactics have emboldened more of its subjects to listen to the western radio, or emboldened Moscow's listener-research departments to report more truthfully on the western radio's successes?

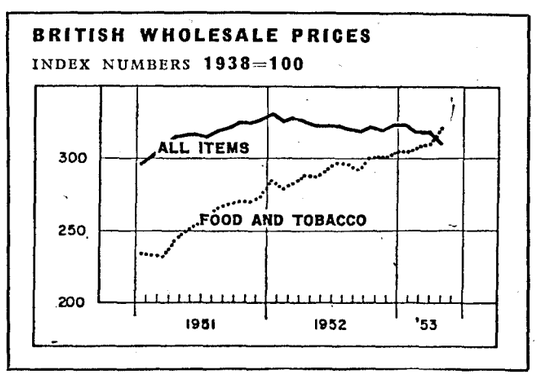
No Respite for Jugoslavia

REPORTS that the Soviet campaign of threats and pressure against Jugoslavia has ceased seem decidedly premature. It is true that Mr Djuric, the Jugoslav Minister in Moscow, has been received by Mr Molotov, and that this was the first occasion of its kind in four years. But their exchanges appear to have been brief and formal. Although Belgrade has been encouraged to hope that its representatives in Moscow may in future be somewhat less harassed by Mr Beria's police, it has also noted that its representative in Bucharest was recently insulted and its representative in Vienna virtually arrested in the Soviet Zone of Austria. Again, it is encouraging that Rumania has at last come to terms over navigation on the lower Danube; but the Jugoslavs are fully aware that the deadlock as regards this part of the river has hurt Rumania much more than them, and they will be readier to believe in the Soviet bloc's alleged change of heart when the Hungarians and Czechs cease to obstruct their more valuable traffic upstream to Austria, Germany and the West.

Moreover, the flood of threats, abuse, and calls for the overthrow of Marshal Tito's government continues to pour from Moscow radio and the satellite propaganda centres without any measurable diminution. It is small consolation to the Jugoslavs that the Russian domestic press has scaled down its diatribes against them in the same way that it has reduced its attacks on the West. Broadcasts in Serbo-Croat from Moscow still denounce "the hated Tito-fascists," and incidents along the satellite frontiers continue to occur. The Jugoslavs have, naturally, every reason to welcome any genuine easing of the economic and political warfare that has been waged against them since they were expelled from the Cominform in 1948; but they have equally good reasons for keeping their guard up while the intentions of the eastern colossus remain obscure.

Reprieve for Mr Menzies

IT looked at one time as though Mr Menzies might formally represent Australia at the Coronation but that the leader of the Opposition, Dr Evatt—who is coming with him—would do business thereafter as prime minister elect. Had the Senate election gone against the Government—and it was a near-run thing—Mr Menzies would have been Dr Evatt's political prisoner. But, although the protracted process of redistributing preferences in Queensland is still not complete, it is almost certain that the Government has kept control of the Senate by one vote, after providing a chairman.



The voting for the Senate confirms, nevertheless, the swing to Labour which has put that party in control of all the State legislatures except South Australia; the same swing, repeated in an election for the federal House of Representatives, would have converted the Government's majority of 18 into a minority of comparable size. But Senate elections are extremely complicated, and minimise the effect of the swing of the political pendulum, so that even a six per cent swing leaves Mr Menzies in power. Moreover, unless a seat changes hands at a by-election, he will remain in control of the Senate till 1956, even if he loses—as it is widely predicted that he will lose—the election for the lower house in 1954. This situation, arising out of the double dissolution in 1951, is one that the framers of the Australian constitution hardly envisaged. It may lead to yet another double dissolution—thus facing the irritated Australian elector with a seemingly endless series of trips to the polling station to get stable government.

Mr Menzies's Government, however, professes to believe that the steady improvement in Australia's fevered economic condition since last year's deflation will enable it to win the election next year. It is true that primary producers have enjoyed a good season while during the past year consumers have suffered the smallest rise in retail prices—under 3 per cent—of any year since the war. Unemployment, still only 27,000 in a working population of 3 million, is declining once more. But sentiment will have to change very fast to justify Mr Menzies's political hopes, and it is as well that Dr Evatt should be in London if any long-range policies with which Australia is concerned are discussed next month.

The Education Debate

THE Education (Miscellaneous Provisions) Bill received its third reading in the House of Commons last week. It is a valuable and, to a considerable extent, an agreed measure, but it has not always had an easy passage and it has given rise to some notable debates as well as frank avowals of party and sectarian viewpoints. It deals with a wide range of matters arising out of the working of the 1944 Act; it covers such widely separated subjects as rules about endowments and the power of the Minister of Education to encourage experiments with comprehensive schools. It is, as members pointed out in the House of Commons last week, something of a rag bag, but a useful and capacious one.

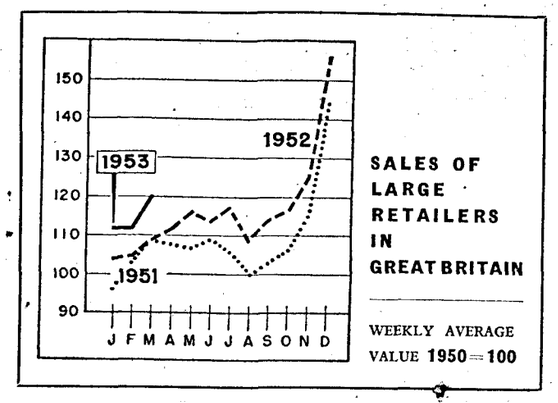
Controversy, however, is never far below the surface in educational matters, and strong feelings were manifested, at the report stage of the Bill last week, over an amendment which at first sight seemed to be merely verbal. But its elucidation produced some remarkable hair-splitting, and the Minister found herself in hot water, accused of making too many promises to the religious denominations and trying to wriggle out of a difficult position by putting up divergent explanations. The argument arose over the provision of grants for a number of Roman Catholic schools which were opened after 1944, and which may, or may not, be eligible under the new Act. It is everyone's intention that these schools shall be treated fairly, but the House found itself entangled in definitions of retrospective legislation of "proposed" schools, and of "displaced" pupils, and its temperature rose. In the end, an amendment was

carried whose precise meaning seems to be somewhat in doubt, but which it is hoped will cover the hard cases among the Catholic schools.

The Bill may do something to put the denominational controversy further to rest, but its operation will raise new issues ; no education act lasts for any length of time. Labour members have made it clear that while they are thankful for the religious compromise, on the "class" issue—the private and state sectors of education—they still have much to propose to the disadvantage of the former. Much, however, will depend on the experiments with comprehensive schools, and these will take some years to work out.

Mr Oatis Regrets?

THERE are many curious features about the case of Mr William Oatis. It is over two years since the Prague correspondent of the Associated Press was arrested for "espionage" by the Czech police, who thought him—in the words of the prosecutor at his trial—"particularly dangerous because of his insistence on obtaining only accurate, correct, verified information." It is six months since his wife addressed to the late President Gottwald an appeal which apparently left him unmoved, but which is now cited by Mr Zapotocky, Gottwald's successor, as the reason for Mr Oatis's release. General Eisenhower, however, has revealed that he lately intimated to Mr Zapotocky that, if Mr Oatis was freed, the United States would be willing to discuss the restrictions on trade between the two countries imposed after his arrest. The Czechs have also linked the release with their recent amnesty, although this had specifically excluded "enemies of the state" ; indeed, the fact that Mr Oatis heard nothing of the amnesty before he reached freedom suggests that its proclamation had little impact on the community of political prisoners.



The prisoners of Prague, moreover, had apparently heard nothing of the execution of Slansky or the death of Stalin. After two years of such insulation, it was hardly surprising that, faced with a barrage of questions immediately after his release, Mr Oatis preferred not to discuss at once the "confession" made at his trial. His cautious statements have now been seized upon by the Communists as tantamount to an admission of guilt. This seems, to say the least, a rather hasty conclusion, and it will perhaps be worth waiting to hear what Mr Oatis has to say when he has got his breath back and seen—probably for the first time—the full text of his "confession."

German Aircraft Plans

IT is generally assumed that Germany could never build an arms industry without the help of western capital, because of the enormous cost of modern weapons. But a speech made this week to the club of the Ruhr industrialists and bankers in Duesseldorf by Professor Messerschmidt should serve as a useful reminder that the Germans may still be capable of confounding such logic. According to a report in the *Frankfurter Allgemeine Zeitung*, the famous designer told his audience that production of aircraft could start without much time for running-in, and without too great initial cost. (A figure of £5 million to £7 million has been mentioned elsewhere.) Preparations had already been made for the day when the present ban would be raised. Professor Messerschmidt mentioned as one step—which is only part of the intensive work that has been going on in German designing rooms and scientific research institutes for some time past—that he has a contract with a foreign aircraft manufacturing firm by which his new inventions and new designs are put to practical tests. The German aircraft industry could take over these inventions as soon as it started operations.

In spite of destruction by war and dismantlement, declared Professor Messerschmidt, a new German aircraft industry could soon reach the level of foreign countries. The foreign lead was only a slight one and the Germans could make use of the experience of other designers in the last few years. Construction under licence, however, was only a temporary solution. "In a short time a completely new German machine could be built." The Professor pointed out that, as a start, Germany would construct sport and small civil transport aircraft ; at the same time, it would prepare the ground for building large four-engined civilian aircraft using the best elements of all foreign machines. The next aim would be to construct an "entirely new" large type of machine that would cross the Atlantic at supersonic speed in three hours.

Finally, Professor Messerschmidt forecast that the German industry would be able to produce more cheaply than foreign countries, and would enter the export market in a big way. One point which he does not appear to have dealt with was the vital question of aircraft engines. But here, too, it can be assumed that the Germans will not be content to be dependent upon the British or other foreigners. At present, Rolls Royce Nene and Derwent engines are being imported into Argentina for use in prototype machines that have been built under the direction of the German designer, Kurt Tank. Professor Messerschmidt may have some similar arrangement, or he is perhaps associated with the same enterprise as Herr Tank. In any event, the engines that Herr Tank is using are not very important by present standards, and will not satisfy any ambitious new German industry.

Parliament AND THE PRESS

BOTH SIDES SPEAK

DURING the debate in the House of Commons on Friday, which led to the withdrawal of the Press Council Bill, May 8, 1953, striking tributes were paid by both Tory and Socialist M.P.s to Lord Beaverbrook and his newspapers.

MR. TOM DRIBERG (Soc., Maldon):

I am with the hon. Member in what he says about sensationalism, and I said something similar in my speech. But since he has mentioned the Sunday Express and at the same time has said that mass circulation cannot be obtained without sex sensationalism, surely he will agree that the Sunday Express is one paper which has shown that mass circulation can be achieved without these sordid contents?

MR. BEVERLEY BAXTER (Con., Southgate):

I am grateful to the hon. Gentleman for mentioning the Sunday Express. Whatever charges may be made against the Express newspapers for being too harsh, or too critical or anything like that, there are one or two things about them in respect of which I am very proud to be associated with them. One is that we may say anything against Lord Beaverbrook, and it is published. He would never side-step anything said against him. Another thing is that with his background of the manse—which has produced some very great financiers—he has said, **"We will publish lively newspapers and vigorous newspapers, and papers which appeal to the popular taste. But we will not go in for pornography."** And I am proud to have been associated with him throughout his career.

HANSARD EXTRACTS FROM PRESS COUNCIL DEBATE

Letters to the Editor

Suez Canal Zone

SIR—I imagine that although Britain saved Egypt from becoming a German vassal it is alleged she is still owed a sum in the neighbourhood of three hundred million pounds, possibly more.

Why not strike a financial bargain—Britain to vacate the Canal in exchange for cancellation of all indebtedness?

In an atomic age the ability to defend such a spot as this is highly problematical so why not cash in and at the same time effect a real cut in our overseas payments—it would be interesting to observe Egypt's reactions to such a proposal.—Yours faithfully,

Amersham N. G. HOGARTH

[Egypt's actual sterling balance is now down to £187 million.—EDITOR.]

The South African Attitude

SIR—On several occasions during the last few months you have carried rather scathing articles relating to the traditional attitude of the average South African towards the African native. It is a fact that not one of the serious riots in the Union of South Africa took place in an area where native affairs were being dealt with by Afrikaans-speaking people. In the centres where these riots occurred, the communities were predominantly English-speaking and as such, had an uncertain approach to what is generally called the traditional South African point of view.

It is also a fact that there is a big concentration of Afrikaans-speaking farmers in the Thomsons Falls area of Kenya. Although the Thomsons Falls area has been subjected to extensive Mau-Mau activities, not a single Afrikaans-speaking farmer has been attacked, while English-speaking farmers over a wide area have suffered.

Does this not indicate that the personal attitude of the Afrikaans-speaking South African towards the African is such that a situation of trust and respect is developed? As a result of having been born and bred amongst the peoples of Africa for generations, the average Afrikaans-speaking person knows exactly where he stands in his personal relationship with the African. This also applies to English-speaking people who have been here for several generations. Can it be that the old fashioned but traditional attitude represented particularly by the Afrikaans-speaking people is more successful with the average African than the more idealistic approach that you seem to favour?—Yours faithfully,

P. E. ROUSSEAU

Sasolburg, OFS

Will M. Pinay Return?

SIR—The author of this article is woolgathering. "In many communes the complex system of proportional representation will necessitate a second ballot"! The second ballot takes place only in those communes that do *not* use proportional representation, and one glance at the second ballot results will show that this is so.

Starting at the beginning of those results as printed in *Le Monde* of May 5th, it will be seen that each of the first eight communes has elected a council consisting entirely of one party (17 to 23 seats), and the same clean sweep recurs frequently among the other results. Even in the absence of any figures for the votes cast, it should be perfectly obvious that there is nothing proportional about this.

The second ballot does not give a proportional result and is not intended to. It is simply a clumsy form of the alternative vote, whose function is to give representation only to an absolute majority of the voters in any constituency, not to share representation proportionally between majority and minority.—Yours faithfully,

London, S.W.1 ENID LAKEMAN

Culture under Survey

SIR—The charts with which you illustrate the Unesco pamphlet "Basic Facts and Figures" serve only to emphasise the dangers of putting overmuch reliance on statistics issued by that organisation.

One at least of the figures quoted in the pamphlet is a gross over-simplification. A total of 12,244,000 is given as the "number of radio receivers" in the UK at March, 1950. This figure is at least 2 million in error, and is in fact not what it says but the number of broadcasting receiving licences current, a very different thing. It does not include either those sets (certainly more than a million) which ought to be but are not licensed, or "second" sets (at least another million) which do not require a separate licence. Further, a footnote adds that this figure includes licences for television sets, which suggests that without TV the total would be smaller. In fact it would not: virtually all TV owners have ordinary sound receivers as well, which are covered by the TV licence.

It is true that a preamble to the Unesco table states that the figures quoted "often fail to account for all radio receivers in use." But a statistician cannot absolve himself from the responsibility for publishing a figure known to be false or irrelevant by slipping in a footnote to that effect: his duty is to make a reasonable estimate or, if his knowledge of the background to the statistics is inadequate for this purpose, to keep out of print. This is all the more necessary when, for example, the enormous United States figure is shown as an estimate with no indication whatever of who made the estimate or on what it is based.

By any reasonable standard, the figure shown in your chart for the United Kingdom should be nearer 290 sets per thousand inhabitants than 240.—Yours faithfully,

London, W.1 HARRY HENRY

★

SIR—The charts showing the competitive position of various countries in the race for literacy and culture flatter the reading inhabitants of the United Kingdom. The London publishers do in fact publish more titles than their friends of Paris and New York or of any other city. But this is not because the people of Britain read more books.

Australia and South Africa have modest places in your chart, yet they import many books from London and export hardly any. The London publishers' market is, however, much greater than the Commonwealth. It includes Europe and overseas countries such as Egypt. London (and not New York) is able to be the book cultural capital of the world because of the world-mindedness of several of the London publishers, because the London prices are cheaper, and because there are more books to choose from.

Indeed, as Unesco charts show that the inhabitants of the British Isles go to the pictures and read the newspapers more than anyone else, and more than they should, how could they find time to read all their books?—Yours faithfully,

Brentwood, Essex MAX KENYON

Indianization for Foreign Firms

SIR—Your correspondent's admirable analysis of this problem makes clear the need for India to "hasten slowly" in this matter (as in the matter of industrialisation itself) if the long period national gains in quality are not to be sacrificed. This need becomes even more imperative in view of the educational changes in the country in recent years. That there has been a steady decline in educational standards at every level, is being deplored on all sides. Recent legislation affecting the autonomy of universities, and the reported intention of the government "to dispense with insistence on university qualifications for service employment" have come as a great shock to all concerned with quality. In a land of fifteen per cent literacy, how else are the standards indispensable for high level jobs to be ensured except through academic avenues?—Yours faithfully,

NW1 SHANTHI RANGARAO

Books & Publications

The Challenge of Productivity

WE TOO CAN PROSPER.
By Graham Hutton.
Allen and Unwin. 248 pages. 12s.

THE despatch of observers to study American industrial methods is a recurrent British habit that is said to date from the middle of the last century; in this book, Mr Hutton quotes one report issued by a British team nearly fifty years ago. But the teams set in motion by the late Sir Stafford Cripps and Mr Paul Hoffman in 1948 enjoyed great advantages over their forerunners. They were picked experts in the particular industrial techniques that they set out to study; their path was made smooth in administration and finance by that remarkable organisation, the Anglo-American Productivity Council, which also assured them of the widest dissemination of their conclusions on returning home; and they had to hand improved yardsticks for industrial comparisons. The particular yardstick that most of them used, and which their reports made famous, was the comparison of productivity (expressed almost exclusively in terms of labour productivity) between similar industries in the United States and Britain.

These comparisons are significant, and undoubtedly dramatic. Moreover, they have had the power to fire the imagination—and sting the self-esteem—of people throughout industry. Since the war, several themes have served their turn in economic exhortation; productivity is almost the only one that retains its meaning—and its challenge.

This challenge of productivity, its inner promise—and, by contrast, the penalty if it should generate insufficient response—form the theme of Mr Hutton's book, and never have they been so effectively and succinctly expressed. He accepted the unenviable assignment of crystallising the general implications, within Britain's straitened situation, of the 66 productivity teams' reports, in a form that the ordinary citizen could appreciate and that a committee representing both sides of industry could broadly support; and he has carried it off with remarkable success. The result, Mr Hutton suggests, is "something between the report of a special inquiry and the statement of a personal view"; the compromise, it may be added, has produced a trenchant and readable essay in persuasion.

Its theme is starkly outlined; then limned with detail. American industrial productivity per man-hour, Mr Hutton points out, is today from two to five times that in Britain or Western Europe; fifty years ago, he believes, it was roughly the same. But there is no peculiarly American "secret" of high industrial productivity; the familiar principles and practices behind it can be carried out "just as productively" in any other country, given the will and the flexibility within industry.

Mr Hutton looks at the succession of Britain's "ten per cent crises" since the war and concludes that "the rise in industrial productivity required to solve Britain's chief social and economic problems" is about 10 to 15 per cent within two to three years; and that, he holds, is more feasible in Britain today than in America. Even in default of more extensive re-equipment in British industry, this short-term rise in productivity can readily be achieved by reorganisation of work, "without any extra strain on Britain's resources, human and non-human," given the maximum co-operation between management and labour.

Some reservations about international comparisons should perhaps be entered. Although labour productivity is one useful meter of a country's "industrial climate," it is an incomplete measure of industrial efficiency, since it ordinarily measures output in physical terms against only one factor of input. Total costs, for example, would be a more ideal index; so would profits, if only these could be made both true and comparable. All estimates of the long-term curves of comparative productivity in manufacture do not tell the same story. Some suggest that American labour productivity considerably exceeded British as early as the seventies, and these may indicate a need for more research into the alternative costs of different factors of production as a significant factor in transatlantic comparisons.

The conclusion, again, is provocative—deliberately so. Not all who accept Mr Hutton's "recipe for the millennium" as a task to aim at would be as hopeful that "all the ingredients of that recipe . . . could be met" from a 15 per cent rise in productivity in three years, followed by "a programme for the substantial expansion of productive capital apparatus per worker." As the paradoxes of last year emphasised, many external influences must always affect "the solution of Britain's chief economic problems"; the book, indeed, explicitly recognises this. One of its conclusions, moreover, is at once unquestionable and of surpassing importance: "unless the rise in productivity occurs, every one of Britain's strategic, political and economic problems must become more intractable." No more effective single presentation of that blunt fact to the British people is likely to appear.

A Timely Study

BRITAIN AND THE UNITED STATES: *Problems in Co-operation.*
Royal Institute of International Affairs.
224 pages. 8s. 6d.

CHATHAM House's report on Anglo-American relations could hardly have come out at a more opportune moment. Relations between Britain and the United States are never static; their temperature rises and falls with events. Unfortunately, the extent to which they are reported to have deteriorated during the past few months has been amply emphasised during the past fortnight.

This report is a brave attempt to present, in as fair and friendly a spirit as possible, the complex attitudes and emotions which may provoke explosions like the present. It is a joint report drawn up by groups of the Council on Foreign Relations in New York and of Chatham House. Twenty-one Americans and fourteen Britons have here agreed on what are the main differences in the two points of view on foreign affairs and the reasons for them. No one could imagine that the task was easy. Indeed, if there is to be criticism of the result, it is that so much effort was made to bring out a joint report; the need to compromise has clearly removed the sting. "Not every member agrees with every word. . . . But all are satisfied that it represents a general consensus." For so turbulent a subject, the result is thus a trifle flat.

That being said, the authors and sponsors of the report have proved that they can be relied upon to produce a workmanlike survey, and it would be no bad thing to make it compulsory reading for transatlantic travellers. The report starts with a general statement of views. For instance: "Because of the great preponderance in strength of the United States . . . the British . . . regard their relations [with it] . . . on an entirely different footing" from those with other powers; the Americans "do not and cannot see their relations . . . in exactly the same light." Moreover, methods differ; in general, "the British favour secret diplomacy, the Americans open covenants openly arrived at."

Then, the authors deal with specific problems by giving the British and American approach to each. They include relations with Russia and with Uno, problems of general and economic policy, Western Europe, the Mediterranean, the Middle East, South and South East Asia, and the Far East. Not the least valuable aspect of the report is the brief summary it provides of developments since the war in each case; the chapter on Western Europe is one of the best.

Anglo-American differences on these

subjects may be always with us. But, as the survival of the free West depends on their being kept within bounds, this careful appraisal is itself a welcome and worthwhile contribution to removing them.

Good Rough Usable Economics

ECONOMICS FOR YOU AND ME.
By Arthur Upgren and Stahrl Edmunds.
Macmillan Company, New York. 246 pages. $4.00.

WHETHER the pattern of economic science laid up in Heaven is a deductive discipline—an elaboration of the pure logic of choice—or an inductive study—a natural history of observed human behaviour—remains an unsettled question. Academic syllabuses are apt to embody the first alternative; the man in the street undoubtedly prefers the latter. The authors of this book have set out to give the man in the street part, at all events, of what he wants.

"Economics for You and Me" does not come within shouting distance of being a comprehensive natural history of the American economy, let alone of the economic order in general; it is almost exclusively concerned with macro-economics, with the magnitudes of the national income and its major components, and hardly at all with such equally factual matters as business organisation, wage determination, or the distribution of personal incomes. Within its limited scope, however, it is singularly—indeed uproariously—successful. Its style may be illustrated by the following quotation concerning the statistical determination of the Gross National Product: "Instead of throwing all the stuff on a big pile, they measure the output of America in dollars. This is a good idea. It saves everyone a lot of trouble. But it also louses up the works." It administers to the professional reader a series of salutary shocks as one esoteric point after another is hammered home in terse and homely metaphor. (The parable of the consumer in his bathtub—typically illustrated by a doodle of a bald but hairy-chested individual wielding a bath-brush—is particularly highly recommended; it deals faithfully with that piece of mystification the Accelerator.) It imparts that first necessity of realistic economic thinking, a sense of statistical proportion. It is, in fact, admirable. To find an English equivalent, one would have to imagine a harmonious collaboration between Mr George Schwartz of the *Sunday Times*, the Old Codgers of the *Daily Mirror*, and the draughtsmen of the late Bureau of Current Affairs.

Admiration is not quite unqualified. Even American readers may find such determined folksiness, such relentless high spirits, hard to take through 250 pages. Occasionally a metaphor takes the bit between its teeth and bolts into utter confusion. More frequently, some massive unsolved problem is treated not even by looking it firmly in the face and passing on but by a quick, now-you-see-it-now-you-don't, verbal pirouette. The argument abounds in rough-hewn first approximations, sometimes conscientiously labelled, sometimes masquerading as established and sufficient truths. The authors nevertheless deserve hearty congratulations on having produced, in their own words, a "good, rough, usable economics" for a public which would apathetically shun the subject in its usual subfusc dress.

The British Museum's Progenitor

SIR HANS SLOANE AND THE BRITISH MUSEUM.
By G. R. de Beer.
Oxford University Press. 192 pages. 18s.

HOW many people know that Sloane Square and Sloane Street commemorate the virtual founder of the British Museum, Sir Hans Sloane (1660-1753), a Scots-Irish physician from County Down who won fame and fortune in London? This year is the bicentenary of his death and that of the British Museum's birth. In his will Sloane projected a national museum, with his large collections of natural history, antiquities, and books as its nucleus. Parliament sanctioned in 1753 a scheme embracing the acquisition of Sloane's private museum for the nominal sum of £20,000. The natural history section was transferred from Bloomsbury to South Kensington in 1881. This urbanely presented account of Sloane's career and the origin of the world's greatest museum is by the Director of the British Museum (Natural History).

Sloane emerges from Dr de Beer's survey as a very human specimen, illustrating the high degree of scientific distinction attainable by a man endowed with nothing more extraordinary than an alert mind, shrewd common-sense and application. His very long life—he was ninety-two when he died—adds much to the interest of this commemorative tribute. A Fellow of the Royal Society for the record period of 68 years—14 as president—he was in touch with eminent men belonging to widely separable eras: Wren, Pepys and Newton; Benjamin Franklin and Horace Walpole. In his last years Sloane was acquainted with Thomas Martyn, the botanist, who died as late as 1825.

Sloane's range of scientific interests typifies that of the seventeenth century savant. In 1687 he sailed to the West Indies as physician to the Duke of Albemarle, Governor of Jamaica, where he spent fifteen months. The experience introduced him to enthralling field-work in a new world of fauna and flora. It also inspired a health food, "Sir Hans Sloane's Milk Chocolate," which enjoyed more than a passing vogue.

This book, a series of short essays rather than a narrative biography, contains many interesting ana. The "fascinating power" ascribed to venomous serpents was investigated in the garden of the Royal College of Physicians where a helpless dog was confronted with a live rattle-snake. There was a dramatic sequel to the wetting which Sloane's herbarium at South Kensington suffered owing to a fire caused by an air-raid in 1941. The Keeper of Botany "observed an outgrowth over an inch long from one of Sloane's seeds which must have been two-and-a-half centuries old." This constitutes a record for calendar-dated germination to add to that created by Sloane's 68 years with the Royal Society.

Problems of Liberalism

FREEDOM: A NEW ANALYSIS.
By Maurice Cranston.
Longmans. 177 pages. 12s. 6d.

"WORDS," said Hobbes, "are wise men's counters, they do but reckon by them; but they are the money of fools . . ." The author of this little book, like Hobbes, uses techniques of verbal analysis to deflate the pretentiousness of metaphysicians and obscurantists; but he is never mesmerised by the analysis of words. He exposes real difficulties and incoherences in the liberal tradition and is not embarrassed about making clear where he himself stands.

In the first of the book's three sections the author maintains that the word "freedom" means absence of constraints but that it is always incompletely descriptive until the absent constraints are specified. As voters we may be moved by the injunction "Set the people free," but as philosophers we must ask for further information. The second sec-

tion deals with ambiguities in the liberal tradition. There is no one sort of liberalism because, as was shown in the first section, there is no one sort of liberty. English liberalism became gradually identified with the Locke-Mill tradition of the minimal state. French liberalism, on the other hand, came to rest on a positive conception of liberty deriving from Rousseau; in this liberty was seen as something to be realised through the state on the model of the *Landesgemeinde* cantons of Switzerland rather than on that of the constitutional monarchy of England. In Germany, the *Naturrechts* tradition culminating in von Humboldt was swamped by *étatiste* liberalism imported from France, in which nationalism and metaphysics combined to eliminate the individualism and exalt the *étatisme* of the French tradition. In America "liberalism" meant first of all democracy in church and state government; then augmented government on the Rousseau model to bring about democracy and equality while retaining *laisser faire* in economics; and finally the "liberalism" of the Left—a term whose emotive meaning has been reversed and whose descriptive meaning has been radically altered.

This section, though it inevitably oversimplifies historical development, is clear, ingenious, and forceful. The third section deals neatly and clearly with various facets of the problem of the freedom of the will which have been clarified by modern philosophers. The author refutes the suggestion that the problem is unreal, discusses its relevance to ethical questions of praise and punishment, and enters boldly into the controversy about the possibility of predicting human behaviour. He ends, rather hesitantly, on the side of the libertarians.

The main value of this book is that it brings to bear modern techniques of analysis on ancient problems, in a way which the non-specialist can understand, without distorting either the problems or the techniques. In so doing, however, the author overburdens the book with records of what others have said. Perhaps this is because the first and third sections were originally part of a B.Litt. thesis; perhaps it is because the author is more conscientious than most in recording his indebtedness to others. Whatever the explanation, the result is too often like the summing up of a competent chairman. Although the philosopher has been compared to a judge, to a pontiff, to a journeyman, and to a psycho-analyst, he has not yet been compared to the chairman of a committee of experts; and one would like to see the author's independent comments developed in more detail. For they are often ingenious and interesting, and it would be refreshing to consider a more detailed treatment of the problems of liberalism by a liberal as convinced, cautious, and clearheaded as Mr Cranston.

The Imperial Tradition

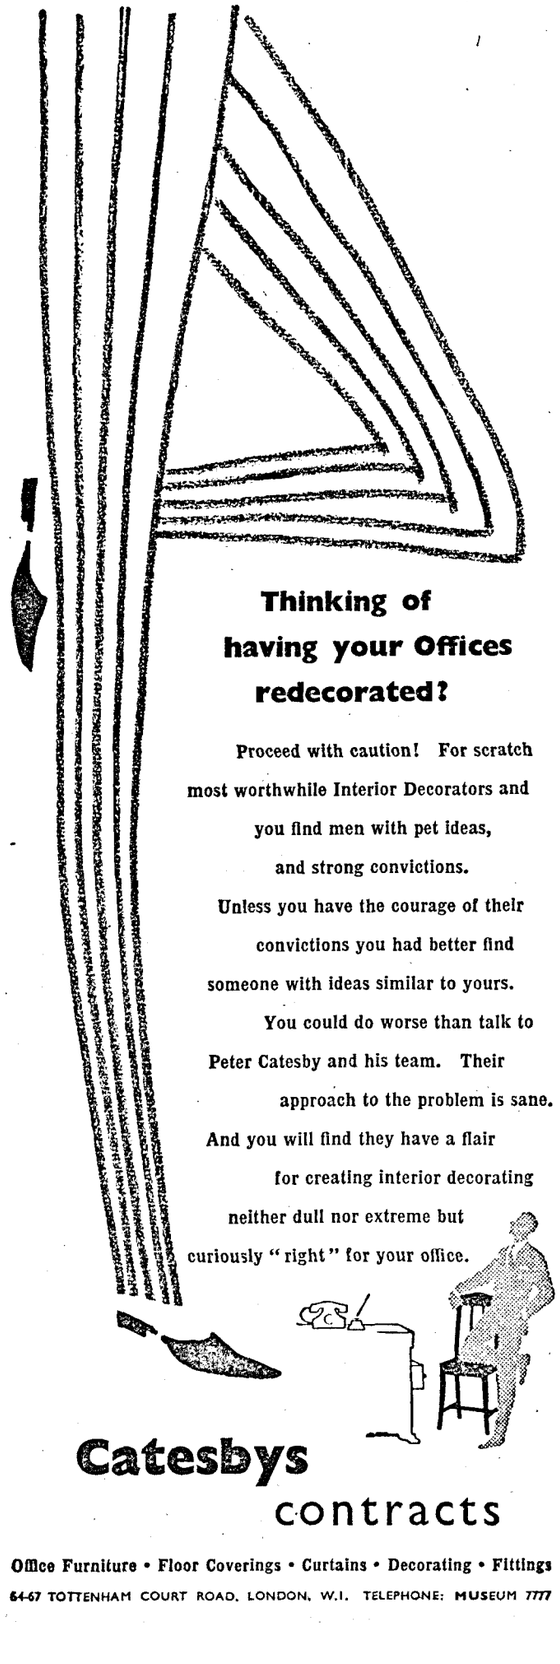
THE CONCEPT OF EMPIRE; BURKE TO ATTLEE, 1774-1947 (*British Political Tradition Series*).
Edited by George Bennett.
Adam and Charles Black. 434 pages. 18s.

AMONG the many things Mr Gladstone did say in 1878 was this: "the sentiment of empire may be called innate in every Briton . . . [it is] interwoven with all our habits of mental action upon public affairs." So ingrained, indeed, is the imperial tradition that it has been left to a Dane and some Americans to point out its importance in British political thinking. Thus a book which allows us to hear what Britons themselves have said about empire during two centuries makes fascinating reading. Here speak the Broughams and Cobbetts, who held colonies to be worth nothing, and the Salisburys and Chamberlains, who feared that, without them, England would never survive; those who gloried in the empire on which the sun never sets—and those who retorted bitterly, "in our alley it never rises."

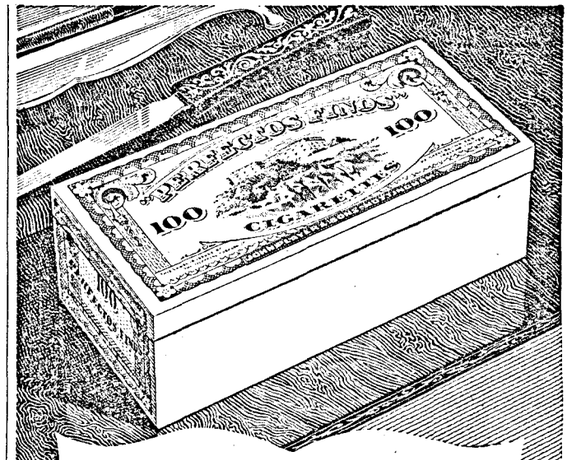
Nevertheless the book falls short of its title. In his somewhat muddled introduction, the editor has hardly anything to say about different ideas of empire, and there is more than a hint that his own concept of it is restricted to colonies coloured red on the map. The passages selected as a result are almost all from statesmen talking about the formal empire, and they are better illustrations of periods of so-called "separatist" and "imperialist" opinion than of changing concepts of empire. A collection of opinions that are narrowly about colonies and colonisation in the strict constitutional sense provides a lopsided view of the modern imperial tradition, because it refers to only one element in it.

Within that tradition since mid-Victorian times two concepts of empire have been continually at war: a legalistic notion of an empire bound together by formal constitutional ties and a measure of central authority, making, actually or potentially, a viable, organic whole; and a broader idea of an empire held together, not by authority, but by invisible bonds of good will, trade and mutual advantage and by informal British paramountcy—an empire thought of, not as a whole in itself, but merely as a part of the total pattern of British overseas trade. The first is easily recognised as mercantilist in origin, and the second is obviously a free traders' approach to empire. The one inspired Gibbon, Wakefield, Disraeli, Seeley, Rhodes and Chamberlain, while the other moved Cobden and Gladstone, Bright and Morley.

What has not been recognised is that both concepts are equally imperialistic. In this book the advocates of the liberal idea are misnamed "separatists" or "anti-imperialists." Although they pinned their faith on informal ties of association wherever these could be relied upon, they nevertheless believed in the necessity of empire as an auxiliary of commerce. Few advocated the separation of the Indian empire or opposed the extension of an invisible British empire in China, Latin America and the Middle East. It was Goldwin Smith who remarked that even if Canada were made an independent nation, it would still remain a colony of England. It is because this book misses the importance of the concept of informal, commercial empire that it provides only a partial introduction to the subject.

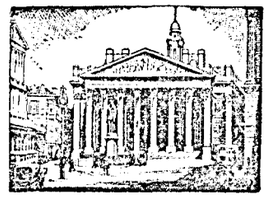


A Traveller's Tale



CITIES AND MEN.
Sir Harry Luke.
Geoffrey Bles. 252 pages. 25s.

THIS is the first volume of an autobiography and covers the years from 1884 to 1914. In it, Sir Harry Luke establishes himself as one of the most inveterate and charming travellers of his generation. Known most recently for his work as the King's representative in the far Pacific, Sir Harry has done many jobs in many different parts of the globe. But he started life in London and it was in the measured stateliness of Hapsburg Vienna that he first wandered abroad. There, in the *kaiserlich königlich* atmosphere of his mother's native Austria, he learned to note and remember people, incidents and stories.



Enriched by his own erudition, his observations are never dull. It is easy to travel on with him as he goes to Italy, France and Greece, to the United States and Canada in 1903, to the countries of the Middle East and above all to "the enchanted island," Cyprus. From all these lands he draws the best of travellers' tales. Anyone who recalls the world as it was in the early years of this century will enjoy seeing it again through his eyes. For those who do not, Sir Harry is a rich source of delightful information.

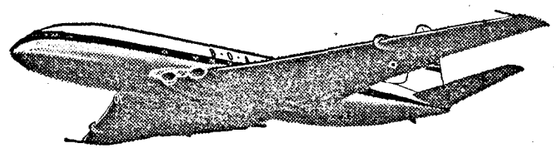
higher mileage

is a REALITY!



HIGHER MILEAGE
Avon's thicker and deeper tread gives many thousands of extra miles.

GREATER GRIP
The wider Avon tread gives more road contact and extra 'bite'.

BETTER BRAKING
Centre traction bars and multiple slots give extra stopping power.

The verdict of the thousands of motorists who have already fitted AVON H.M. tyres is unanimous—they have proved and acclaimed higher mileage to be an absolute fact which saves pounds every year. You, too, should enjoy this saving. Lower the cost of *your* motoring. Fit AVON H.M. all round and enjoy the real economy of this remarkable higher mileage tyre. Write for the fascinating illustrated folder "The Story Behind the Greatest Development in Car Tyre Construction", sent free on request to The Avon India Rubber Co. Ltd., Melksham, Wilts.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Between Churchill and McCarthy

Washington, D.C.

SUDDEN transatlantic squabbles are not unusual enough to justify treating the one that developed last week too seriously. But, under existing circumstances, neither should it be treated too lightly. It is, after all, impossible to tell for certain how the Anglo-American alliance—or, for that matter, the alliance between the United States and the rest of the Nato countries—is going to fare under a Republican regime. For that reason, all indications of strain must be watched with some anxiety. Indications of strain have been visible in Washington for some time, as they apparently have been in London, and the speeches of the Prime Minister and the Leader of the Opposition at Westminster were only the occasion, not the cause, of the strange outburst in the United States Senate.

The system of alliances built up by the Democratic Administration—and, in particular and for particular reasons, the alliance with Britain—have always been alliances between the Executive and foreign countries. Their greatest strength has often arisen from intimate consultation and exchange of ideas between officials on all levels rather than from public announcements of solidarity. Congress has never taken a very active part in these alliances but, at least until now, the vocal opposition to them has come from the minority party. Last week's performance in the Senate came from what is now the majority party, and it provided a disturbing illustration of the problems that face a Republican President who wants to maintain the alliance with Britain as well as to cement one with Congress.

President Eisenhower, after all, has had plenty to say, since his inauguration, on the desirability of an improvement in relations with the Soviet Union and on the methods by which it could be achieved. On February 25th he announced that he would meet anybody anywhere if he thought there was the slightest chance of doing any good. And a week later, after it was known that Stalin was ill, he repeated that, if there was any way to promote the cause of peace, there was no personal sacrifice that he would not make.

A month later he made his famous address to the American Society of Newspaper Editors ; Senator Wayne Morse, during last week's debate, said that he had welcomed it but regretted that it was not being implemented :

> It does no good merely to announce the great principles of the President's speech. . . . We ought to undertake some international negotiations with the foreign ministers of the free nations.

The Senator was only saying publicly what many people have been saying privately in the last month. When the President's speech was studied at leisure it was seen to contain a number of sentences that were out of character with the main body. Among the prerequisites for a real peace that he mentioned were free elections in a united Korea and the full independence of the East European nations, conditions desirable in themselves but utterly remote from any realistic hope of successful negotiations. The absence of any attempt to follow up the speech has spread the suspicion that the whole occasion was no more than a field day for the psychological warriors. If not, some people are asking, why was the Prime Minister's speech in the House of Commons not recognised as an invaluable next step ?

After the President's speech of April 16th, he had only to wait 24 hours for the typically Churchillian phrase of welcome—" massive and magnificent." But he himself delayed three days before a question at his press conference elicited the answer that he had no objection whatsoever to Sir Winston's proposal for a high level meeting but that he must have indications of good faith before he could commit the United States to participation. This seems a somewhat ungenerous response from the General Eisenhower who is so familiar in Europe and it can only be explained by the delicacy of his relations with Congress.

★

Mr Eisenhower's decision not to be a " strong " President and fight Congress for what he wants, as the two Roosevelts did, has done nothing yet to make these relations easier. On the contrary, his determination to be a " constitutional " President, and let the Congress wander where it will, has got him into trouble with all those who seem to be inciting him, consciously or unconsciously, to quarrel with his legislators. It is said that, after one of his early press conferences, he demanded angrily why the reporters seemed bent on getting him into a row with the Senate by asking him to comment on some aspect of Senator McCarthy's current behaviour. And lately it has been the British who have made it hard for him to live in peace with Capitol Hill. They tactlessly persist in being the lowest bidders for electrical equipment required by the army engineers, they ask for more than pious platitudes about the expansion of world trade and now they are carrying his own statements a little too far for his present comfort.

It should be remembered that the situation at the moment is being made particularly difficult by the tactics of the McCarthy group in their careful, but determined, campaign for power, enough power to get the Republican presidential nomination in 1956. The President must endeavour to whittle away their strength by raising with them only issues on which they will draw support from no more than a hard core of the party. An example was the argument over the appointment of Mr Bohlen to the Moscow Embassy and the hard core remained uncomfortably large. No further reduction is likely to come until Mr McCarthy seems to be facing final defeat, so that even those who now seem eternally faithful decide that the time has come to run for cover. The Senator's strategy, on the other hand, is to find issues on which he can appeal to the prejudices and emotions of a majority of his party.

British perfidy is just the kind of topic in which Mr McCarthy revels. When he can say that Britain is " trying to blackmail us into accepting armistice terms that mean defeat " and then assert that " the United States should tell Britain to withdraw her troops from Korea and follow that up by sinking any merchant ship carrying material to Red China," he not only gets a burst of applause from the public gallery. He also gets the support of a sizeable number of middle western Senators who know on which side their electoral bread is buttered. The misreporting of Mr Attlee's speech last week gave the Senator an excuse for one of his performances but he hardly needed the excuse. He could have given of his best, on the basis of his investigation of British shipping, even if Mr Attlee had never spoken at all.

Mr McCarthy's gradual move from the domestic to the foreign field in his investigations is no accident. He has still some months in which to make hay at home among government employees appointed by the Democratic Administration but, by the time the congressional elections of 1954 come along, no Republican will appreciate him if he is still finding Communists in Washington. But Communists in the governments of allies will always be useful discoveries ; they will have the added attraction of durability because it is unlikely that the British or Canadian governments will dismiss their employees at the Senator's behest. A man who has been successful in creating doubts about the loyalty of General Marshall in the minds of quite a number of Americans would not shrink even from the task of proving that the Prime Minister is a Communist agent. It will be interesting to watch his progress over the next few months, and also the progress of the Administration in its attempts to corner him. As long as he is loose the Anglo-American alliance will continue to suffer and the President will suffer too for trying to give it substance.

Self-Pushing Buttons

FROM A SPECIAL CORRESPONDENT

ALMOST before this new half-century had been dubbed the push-button age, the name was out of date. Buttons to be pushed or turned for the releasing of electric energy which would then set machinery in motion to sweep floors, dig ditches or weave new winter suitings had in fact been commonplace for decades, but they had to be pushed by men. What really marks the nineteen-fifties are the buttons that push themselves, the self-regulating controls, the automatic factory, even the automatic industry. But it is easier to talk of robot factories and push-button wars than to grasp the intricacies and implications of feedbacks, servo-mechanisms, thermocouples and binary systems.

Meanwhile the problems multiply and the progress already made seems far too slow for those who know what can be done. Dr Wassily Leontieff of Harvard said recently that to make all the new plants built in the United States in 1950 as fully automatic as existing knowledge would permit would have required some $600 million worth of control instruments. Instead, only $67 million worth of such instruments were made in that year, which seems to mean that even in new factories only about ten per cent of the possible degree of automatic control is being installed. That is not, however, due to lack of interest on the part of industry. Much of the best work now being done is for the government, and is kept secret for political and security reasons. Things which can be advertised, such as Univac, the electronic computer, are immediately hailed as bringing the United States nearer to that heaven in which machines do the work and men can go fishing.

★

The Ford Motor Company has just opened in Cleveland what is described as the first automatic factory in the automotive industry where, it is claimed, electronic devices enable 250 men to turn out twice as many engines as 2,500 men could make in a factory of the older type. Remarkable as that record is, a factory which requires 250 men for its operation has not yet reached the fully automatic stage ; it is commonly predicted that this will not happen for five or ten years. But large sections of the communications industry are already self-controlled. In metal working, in the production and distribution of electricity and gas, in machinery manufacturing and in the chemical, petroleum, ceramic, textile and food industries great strides have been made in the past two years in the use of instrument control. The unattended oilfield, the electricity generating station, the " cat-cracking " plants which have revolutionised petroleum refining, have become familiar sights, working quietly along with only an occasional man to check the dials.

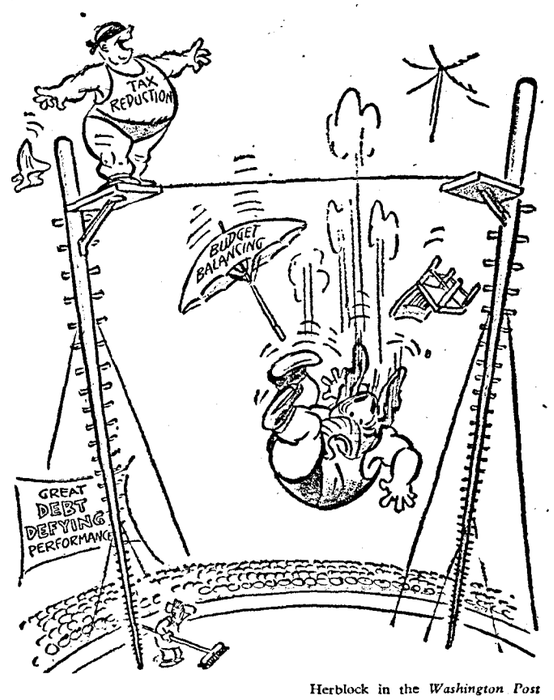
Even in offices which seem better supplied with workers than are many industrial operations, electric typewriters, accounting machines, electronic counters, sorters and computers and microfilm file systems are beginning to help in the task of dealing with the ever-mounting paper work which accompanies this new phase in the continuing industrial revolution. These machines need not be bought: some of them work so much faster than is necessary in the ordinary office that their makers set up service units where firms can bring computation troubles, or a month's bookkeeping to be done in a day. A new electronic typewriter is said to be able to type five million names in six hours. An increasing number of corporations handle by electronic process the whole job of sending quarterly dividend cheques to shareholders, and on the other side of the counter the Bureau of Internal Revenue is cutting down with electronic help the lag in checking income tax reports. The Census Bureau, which collects valuable information every ten years but has been unable to collate and release it until it was out of date, is now supposed to be so well equipped with electronic aids that it could handle a census every five years.

Only an electronic engineer can understand the processes involved, and say whether they represent a revolution or merely improvements of things already known. For the lay mind, prepared in an age of atomic and hydrogen bombs for almost any departure from accepted reality, this substitution of control by ion for control by man looks like a logical development of the production-line technique which Henry Ford started in 1909. Ford employed mechanical and electrical devices to carry the work along, but left their control in the hands of men who pushed buttons and pulled levers. This newest step moves the work along by automatic controls. Men now feed their orders for this width of sheet steel or that balance of crankshaft into delicate instruments which in turn push the necessary buttons for the pulling of the necessary levers. These instruments, which measure size, temperature and speed as they go along, do their work without human hesitation, and as fast as light. Very expensive to instal, they are put in for the always valid American reasons that they increase accuracy, cut waste, reduce labour costs and speed up production.

So intricate are the instruments, so much do they appeal to man's love of magic, that it is necessary to add that they do not " think," nor will they ever free all men from work. They are expected to bring about changes in the composition of the labour supply, by decreasing the already shrinking number of unskilled jobs, and adding to the dial watchers and repair men. Engineers must still design the instruments which control the machines that make the end products. They are already planning the factories in which these instruments will perform their various controlling functions in properly related sequence. Ideally the process should reach the point where a self-controlled shovel will bite into a hill of iron ore at the start of an automatic process while fully equipped motor cars pour out at the end. " Automation " in the distributive trades would then take over.

★

What all of this will do to people is the question that interests political economists. A long procession of mechanical aids has helped to shorten the average American work week from 67.2 hours in 1870 to 42.5 hours in 1950. Part of the leisure thus acquired has been spent on education meant to equip the American people for life under the rapidly changing conditions around them. With creaks and strains the pace of education and the pace of invention have more or less kept step ; in their optimistic moments most Americans do still feel themselves to be the masters of their fate, even though it includes television sets and income tax computed electronically.



But those who go to backward countries to instal great automatic machines for exploiting natural resources amid mediæval social conditions find the opportunities for trouble even greater than when spinning mills were first set up in India. The dweller in an industrial society who throws a monkey wrench at the control panel knows what he is doing. The Brazilian Indian who sees an integrated steel plant rise in his native forests, the Arab beggar who watches an oil refinery take the place of a desert mirage—these people can neither comprehend the mechanisms nor cope with the resultant economic changes. " Automation " in countries not previously industrialised may free people from ancient drudgery or it may prove the handiest tool yet come to the slave-driver's hand.

American Notes

Budget Balancing

PRESIDENT EISENHOWER'S broadcast to the nation on Tuesday told the businessmen who have been calling the tune for his Administration that the time had come for them to pay the piper. The President recommended that the excess profits tax should be extended for six months, to the end of the year, and that the reductions in corporate income taxes and in excise taxes, scheduled for next April, should be repealed. He also, however, recommended that the social security tax paid by wage earners should not be increased as expected next January and that

"Ready For Me, Partner?"

Herblock in the *Washington Post*

the reduction in personal income taxes planned for the same date should be permitted. Since there are far more individual taxpayers in the electorate than there are businessmen, these last provisions will make the recommendations more palatable to Congress. Even so, Representative Reed, chairman of the House Ways and Means Committee, is refusing to swallow them. This is mainly a retaliation for the dashing of his hope of pushing through reductions in personal income taxes this July, and it may force the Republican leadership in the House to take emergency measures to bypass his committee.

By postponing indefinitely the fulfilment of one of the Republican election promises—that taxes would be reduced—Mr Eisenhower can at least hold out hope that it will be possible to keep another of them—that the budget would be balanced—sooner than had seemed likely. Congressional experts, whose forecasts have in the past proved trustworthy, recently put the deficit for the year ending on June 30th at $7.3 billion and for the coming 1954 fiscal year at $5.9 billion. In both calculations receipts are lower than Mr Truman estimated last January, because revenues are not coming in as well as he expected. President Eisenhower said that if his tax recommendations were approved and if further economies could be achieved in the coming months, as his Administration intends they shall be, in addition to those already planned, then a balanced budget would be in sight—provided there was some improvement in the world situation. If not, he added ominously, he would be obliged to ask Congress for additional sources of revenue.

The President did not, however, answer another question which is much discussed. He gave no details of what the saving on defence, where most of his economies are being made, will mean to the rearmament programme. All he did to soothe Congress's fears in this respect was to emphasise that in the coming year 60 per cent of the money spent on defence would be for air power and that lasting security depended on economic strength, and therefore on a balanced budget, as much as on military strength.

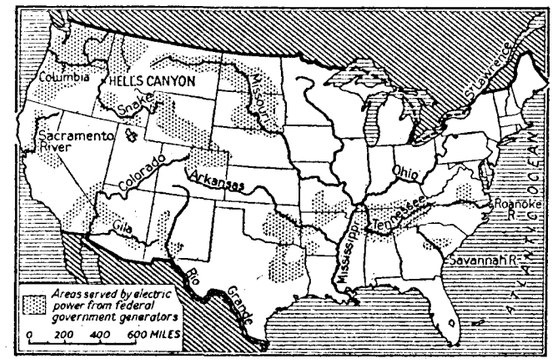
Squeeze on Credit

THE Treasury's much-praised new issue of long-term bonds, 30 years at 3¼ per cent, has turned sour on the government. It accomplished its main purpose, to raise $1 billion of new money, without any difficulty, but it was selling below par before it was even issued and has dragged other government securities down with it. The chief explanation seems to be that a large proportion of subscribers were looking only for a quick profit. Both these speculators and the Treasury have learnt a lesson, but hindsight is suggesting to many critics that the government's alleged mishandling of the new issue extended also to its timing. They argue that the appearance of such a bond when the demand for loans already outstripped the supply has made credit excessively tight and that there is a real risk that the economy may be squeezed into a recession. One of the most ominous signs is that businessmen and local governments are finding it difficult, and sometimes impossible, to borrow the money they need for the industrial expansion and the highway and other construction projects on which the present boom largely depends.

A group of Democrats in Congress is already building a political issue out of the tight money and the rising interest rates for which the Republicans can, not entirely justifiably, be blamed. With their eyes on the places where the most votes are to be found, these Democrats are naturally stressing the discomfort caused to small business borrowers, to people buying houses on mortgage and to farmers who now have to pay more for their crop support loans—little men who, it is said, are being forced to suffer in order that the big bankers may make more money.

It is more significant, however, that automobile manufacturers are reported to have told the government that, if the squeeze on credit is not loosened, they will be unable to sell all their output and will have to reduce operations during the second half of the year. And the influential magazine *Business Week*, which has always supported the tight money policy, is now warning the government that the time to relax has come, that the danger today is no longer inflation but deflation.

Apart from reassuring speeches from both the Deputy Secretary of the Treasury, Mr Burgess, and the chairman of the Federal Reserve Board, Mr Martin, there have recently been encouraging indications that practical notice is being taken of this danger. Last week the Federal Reserve System went into the market for the first time for weeks and bought a small quantity of Treasury bills; such purchases add to reserves of banks and thus to their supply of loanable funds. A further and more specific indication came this Tuesday when the Treasury announced that it would refinance the $5.6 billion worth of certificates and bonds maturing during the first two weeks of June with a 2⅝ per cent one year certificate. While this is the highest interest paid for short-term government borrowing in the last 20 years, it is not as high as would have been necessary if the Treasury had continued its earlier efforts to shift the public debt into long-term securities. If this slight relaxation by both the Federal Reserve System and the Treasury is maintained, as it is expected to be, during the coming months, a period of seasonal expansion in business loans and of substantial Treasury borrowing, then both the supply of money and the price that has to be paid for it should benefit.



McKay in Hells Canyon

HELLS CANYON, through which the Snake River rushes along the border between Oregon and Idaho, is one of the last great undeveloped sources of power in an area that needs not only electricity but also flood control and irrigation. The Democratic Administration had long planned a huge project, costing nearly half a billion dollars, to provide all three, but in the past Congress always refused to authorise it. It was therefore highly unlikely that money would be found for it by the present Congress, which has already been chipping away at the new Administration's request for funds for dams and power transmission lines, even though it is much lower than Mr Truman proposed in January.

In these circumstances Mr McKay, the Secretary of the Interior, had some justification for withdrawing the department's opposition to the development of Hells Canyon by private interests, the Idaho Power Company, which wants to build three small dams instead of one large one. This scheme would be cheaper and would supply the wanted electricity more quickly than would the government project; but it could not, in the long run, provide so much electricity nor apparently ensure such adequate irrigation and flood control facilities—and it would make it practically impossible for the comprehensive government scheme ever to be undertaken. Mr McKay argues that all he has done is to leave the Federal Power Commission, which must still authorise the private project, free to make its decision

in the light of these considerations. But there is little doubt what that decision will be, for the commission looks favourably on private companies.

But in any case Hells Canyon goes deeper than this, for it had been regarded as a test of what the new Administration's attitude towards the whole question of public power would be. Mr McKay himself denied that a precedent was being set: each project would, he said, be judged on its merits and government construction of multi-purpose dams was certainly not ruled out. But he admitted that the government's withdrawal from Hells Canyon was in line with

its policy of letting private industry build dams wherever such a move would not interfere with the orderly development of natural resources. Actually, private industry is not so interested in generating electricity as it is in distributing it, but there is every prospect that Mr McKay will be equally amenable when it comes to checking the spread of government-owned transmission lines. Here, too, there will soon be a test case, on the question of whether the privately-owned Georgia Power Company should be allowed to buy electricity from federally-owned generators and serve consumers now supplied by the government.

Taft on Labour's Side?

LABOUR legislation is yet another field in which President Eisenhower is discovering the difference between campaign promises and obstinate realities. Over the past months the labour committees of the House and Senate have held hearings on fifty-two separate Bills intended to improve the Taft-Hartley Act. They have listened to about one hundred and fifty witnesses and sifted testimony running to many thousands of pages. But after all this it looks as if the question of amending the Act would be dropped for this year and left at least until the next session of Congress.

The main difficulty has been the lack of agreement on what form the amendments should take. The committees heard suggestions ranging from the pugnacious nihilism of Mr John L. Lewis—who wished to repeal all labour laws including the New Deal's Wagner Act—to a number of important proposals put forward by the chairman of the Senate committee, Mr Alexander Smith, a New Jersey Republican. The Smith amendments would exempt from Taft-Hartley legislation some six million workers in construction trades, public utilities, and small businesses employing less than ten persons. Senator Smith argues that the impact of strikes or lockouts in the construction industry is primarily local and that they should be dealt with by state labour relations boards. Management, however, has shown little interest in the Smith proposals and the Congress of Industrial Organisations opposes them in the belief that they would open the door to compulsory arbitration. The CIO feels, with some justification, that federal courts give a better guarantee of equity than state boards which are often influenced by local prejudices.

An even more controversial amendment has been put forward by Senator Ives, the New York Republican. Under its terms, which have the backing of all but two members of the Senate Labour Committee, it would be illegal for a union to refuse to grant equality of status and opportunity to Negroes or workers from any other minority group. Employers, moreover, would be subject to court injunction if they were proved guilty of discrimination. This would put real teeth into the whole Fair Employment Practices legislation and the Southern Democrats have made it plain that they will talk the Ives amendment to death in the Senate if ever it gets there.

Congressional confusion on what should be done about the Act has been aggravated by the absence of leadership from the Secretary of Labour, Mr Durkin, the lone Democrat in the Eisenhower Cabinet. Before becoming the "plumber among the millionaires," Mr Durkin had fought for complete repeal of the Act and he is now understandably reluctant to fight for its amendment. The one

man who is both enough of a Republican to influence his colleagues and enough of an expert to face labour on its own ground is Senator Taft. But he is not pressing for changes in his own law during the present session and as a result he may find himself in the unexpected position of earning the thanks of labour for delaying the changes in the Act. Already during the hearings he has often moderated the right-wing enthusiasm of his colleagues and in the present mood of Congress the only amendments that would have a chance of passing are the ones which appeal to management —for example, those granting greater power in labour matters to the states.

Government on the River

ALONG the Mississippi River and its tributaries, the 12,000 miles of inland waterways, through the heart of the middle west, that link the Gulf of Mexico with the Great Lakes, the federal government is in direct competition with private companies, and has been ever since a Republican Administration set up the federally owned barge line, the Inland Waterways Corporation, nearly thirty years ago. It was intended to stimulate interest in water transport, in order to provide competition for the railways ; in this it has been successful for today there are over one hundred privately owned barge lines. But it must be a comfort to orthodox businessmen that in recent years, when inland water transport has been booming, this socialist enterprise has shown a profit only once, in 1951. Taxpayers have, however, not been aware of this drain on the exchequer, since the losses—$325,000 last year—have been met out of revolving funds, not by direct appropriations.

Source: President's Water Resources Policy Commission.

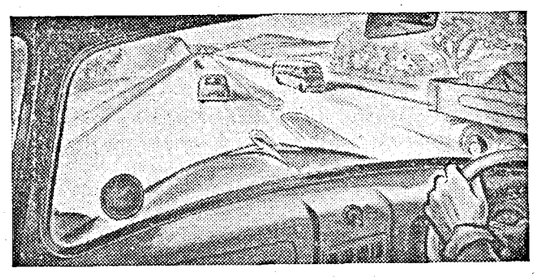
Nevertheless, it is hardly surprising that the new Secretary of Commerce, Mr. Weeks, is even more anxious to get the government out of this particular business than out of the others in which it is involved. Mr Weeks is trying to sell or lease the lines, which own 270 barges and 20 towboats, mostly old-fashioned types, and operate on the Mississippi, Missouri, Illinois and Warrior Rivers. It may, however, be difficult to find purchasers, since Congress has stipulated that provision of the same services must be guaranteed. This presumably includes the carriage of less than barge-load lots, which private companies do not usually transport, and continuation of the barge service to Omaha, the only one on the Missouri River.

It is partly because the government provides these useful but not necessarily profitable services, and partly because its equipment is obsolete, that private firms are more successful. Their business has been increasing fast, much faster than has that of the railways ; freight traffic on the Mississippi system, 36 billion ton-miles in 1951, has more than doubled in ten years. Water freight rates are of course substantially lower than rail rates ; the railways complain that this is possible because the barge companies are subsidised, since the government is responsible for the upkeep of river channels, but not of railway tracks. The huge modern barges, carrying over 1,000 tons each, with as many as 15 being pushed (not pulled on the Mississippi where the current is too strong) by a diesel tow-boat, are also more convenient than smaller freight cars for the bulk cargoes such as coal, steel, grain and petroleum, which provide most of the traffic.

SHORTER NOTES

The Administration's hopes of adding a new star to the flag this year, by making Hawaii the 49th state, have been dashed by a Republican opponent of statehood in the Senate, who voted in committee for the inclusion of Alaska, a more controversial territory, in the Bill granting statehood to Hawaii which has already been passed by the House. Unless this committee decision is reversed, the Bill's chances of passage at this session are remote.

★



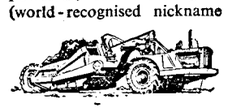
The Department of Justice is appealing against the dismissal by a Federal District Judge of four of the seven charges against Professor Owen Lattimore, under indictment for perjury during his testimony to the McCarran Committee on Internal Security. The verdict on this appeal will probably be taken to the Supreme Court which would mean a further long delay before Professor Lattimore has the benefit of a trial by jury.

★

An early beginning to warm weather is blamed for the great number of tornadoes in the United States this year ; the rate is almost three times that of an average year, and the peak of the season, in May, has been far more violent than usual, as last week's disaster in Texas demonstrated. However, meteorologists maintain that, contemporary superstition notwithstanding, the atomic explosions cannot be held responsible for the twisters.

★

There is some chance that the new Customs Simplification Bill, on which hearings are to begin in the first week in June, will be passed during this session of Congress. Most of the controversial sections that delayed a similar bill in the last Congress have been changed, and two provisions requested by the Administration, on countervailing duties and anti-dumping measures, have been omitted. And free entry is asked only for goods valued at not more than $3 ; last year, when a free entry limit of $10 was suggested, there was strong protest from retailers who forecast that foreign mail order companies would benefit from this exemption.



YOU'LL *FOLLOW THE TRACKS*

Of The BIG Yellow 'CATS'

Many people on the east coast of England have been astounded at the speed with which Caterpillar earthmovers have helped to rebuild the shattered sea defences.
One day — perhaps soon — you'll be travelling the new roads which such Caterpillar equipment as this has helped to build. They'll be fine roads, a credit to Britain ; the ultra-powerful, fast-working 'Cats' (world-recognised nickname for world-famous machines) will have done an incomparable job, going a long way towards solving the country's transport problems.

BUSINESS EFFICIENCY EXHIBITION

It's the last year I'm coming here

Not enough trout?

Not enough cash. Business is terrible. So few people can afford products like mine these days.

Oh, I don't know. We make things in the same price range and we're on the up and up, especially after the budget. Mind you, we're doing a lot of advertising.

So are we. Spending a lot of money, too.

In mass market papers?

Well, no. Ours is hardly a mass market product.

And that's just where you're wrong. Whether we like it or not, times have changed and you and I make mass market products. The ordinary man is buying the sort of things which were once exclusive to the executive classes. Go round any working class estate and see for yourself.

What papers are you using?

The Mirror principally. It has the biggest daily net sale on earth.

Pretty expensive then?

No. On a square inch per thousand basis it's the cheapest in the market.

Daily Mirror

THE BIGGEST DAILY NET SALE ON EARTH

BRITAIN'S BEST ASSET

YET WE STARVE IT OF CAPITAL!

The Prime Minister has said: "It is just as important to wring the last ounce of food from our land now as it was during the dark days of the war." Yet our farmers are today unable to increase output through lack of capital.

Something must be done, if we are to raise our food production to the 60% above pre-war target set by the Government. Capital is urgently needed, not only for better mechanisation, but also for electrification of farms, building of roads and building of houses for farmworkers. Long-term loans at low interest—not the extremely high 5½% at present demanded—must be made to farmers. Greater incentives are needed to encourage greater efforts on the land. If we take these steps now, we can make certain of that extra food we need so urgently to establish a sound economy.

Arab Collective Security

FROM A CORRESPONDENT IN CAIRO

THE Treaty of Joint Defence and Economic Co-operation signed by the states of the Arab League, popularly known as the Arab Defence Pact, has acquired in recent weeks an importance that must surprise the man who, more perhaps than any other, developed the idea. He is Kerim Tabet, formerly press counsellor to King Farouk and for some years the power behind that tottering throne. He is one of the first two people to be indicted by Egypt's new "graft courts" and is in danger of having to watch the evolution of his brain child from prison.

Early in 1950, when the scheme was put forward at a meeting of the Arab League in Cairo, Kerim Tabet sat for some days in the lounge of the Semiramis Hotel quietly "selling" the plan to the delegates. He had, no doubt, the backing of King Farouk, Abdel Rahman Azzam Pasha, and the Egyptian leaders, and so was not alone in his efforts; but possibly he was the only one realistic or cynical enough to see the scheme's true intention at that time. This was no less than to sidetrack a developing relationship between Syria and Iraq. Syria was hesitant; the Christian half of Lebanon viewed with distaste the prospect of a dominant Moslem power at its side; King Farouk did not want the Hashemite kingdom of Iraq exalted; and King Ibn Saud feared that a greater Iraq or Jordan might encourage the Hashemites to try to recover the Hedjaz. It was therefore not difficult to secure the approval of an agreement which, on paper at least, made closer Syrian-Iraqi links unnecessary. At this point, Nuri Pasha el-Said was content to underline the impracticability of the pact by saying that it must, of course, be made strong enough to resist Russia as well as Israel.

Three Years' Delay

The drafting of the treaty was completed on April 13, 1950, and it was signed by five of the states in June of that year. Iraq and Jordan did not sign until February, 1951, and the necessary four ratifications to bring the treaty into force were not deposited at Arab League headquarters in Cairo until March, 1952; the treaty came into force the following month. Even now, after three years, the Joint Defence Council and Permanent Military Commission for which it provided do not exist. Nor have the economic clauses of the treaty been applied.

The treaty provides that the signatories will attempt to settle disputes between themselves or other powers by peaceful means, but will go without delay to the aid of any signatory state or states subjected to aggression and take steps to repel that aggression, by armed force if necessary. The Arab League Council and the United Nations Security Council will be informed of the aggression. Consultations will be held when it is reasonably believed that a threat of aggression exists and, to prepare themselves to fulfil their obligations, the signatories will co-operate to consolidate and co-ordinate their armed forces and resources.

A Permanent Military Commission composed of representatives of the general staffs of the armies will be formed to draft plans of joint defence and assist the Joint Defence Council, consisting of the defence and foreign ministers of the states, which will be established to implement the treaty. The commission will "prepare plans to deal with anticipated dangers or armed aggression"; submit proposals for organising the forces of the member states, stipulating the minimum force for each state; make proposals for increasing the effectiveness of the forces and "for the exploitation of natural agricultural and industrial resources of the Contracting states in favour of the inter-Arab military effort and joint defence"; arrange exercises and training; and prepare data on the military potentialities of the states and the contribution they would be expected to make in case of aggression.

"Nil Plus Nil"?

All this is mandatory on the signatories—except that article 6 states that the Joint Defence Council shall be under the supervision of the Arab League Council; and the Arab League Charter does not compel any of the member states to accept the decisions of the Council. It may possibly be held that, by this loophole, the states, compelled to go to war in case of aggression, would not be compelled to accept the joint plans drafted by the Permament Military Commission for the Joint Defence Council.

There is little question that as it stands the treaty is quite ineffective. It has been described by a hard-headed Arab politician as "nil plus nil." Perhaps its greatest danger is that in time it could be strengthened to create a threat to Israel which the Arab states, if still lying outside the influence of the western system, might one day in desperation attempt to implement. But even this is doubtful.

Nevertheless, the Arab joint defence treaty should not be wholly written off because of its shortcomings. The best statesmen in the Middle East are as conscious of its ineffectiveness as anyone, but they have come to regard it as the

political instrument which might be used to break the isolation into which years of extreme nationalism have thrust the Arab states.

The argument for using the Arab pact as the basis for regional defence is that the pact itself would become dependent on the support which the West gave it. Psychologically, the Arabs would be more susceptible to eastern Mediterranean planning if they had their own independent organisation, and their leaders believe that in time the liaison between their defence system and that of Turkey, Greece and Jugoslavia might progress to actual integration. Mr John Foster Dulles is said to have come to the conclusion that this would be worth trying, and that the Middle East Planning Organisation should be established at Cyprus in parallel with the Arab pact, in the hope that the planning centre would be used, in time, by the Arabs.

In a sense, it is the facilities granted to the big powers to use the territories of the Arab states rapidly in time of war that are important. The Arab forces could be built up to become useful auxiliaries in action; the labour forces would be valuable; the absence of sabotage, if not actual co-operation, on long exposed lines of communication, would be important. Even more vital would be the existence of air and other bases, occupied by the Arabs in peace time, which would be available for the rapid deployment of stronger forces in time of war. This is not a western commander's idea of good strategic arrangement; but it may be the best he can get.

A Third Gaullism?

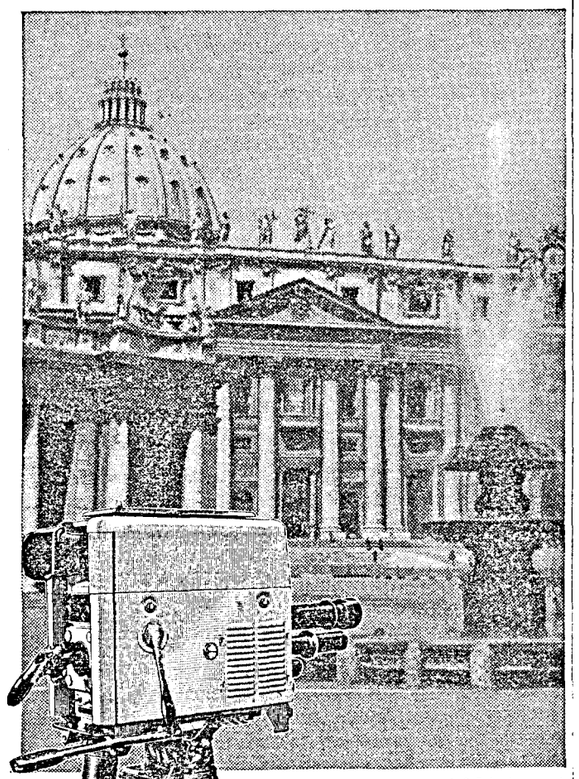
FROM A CORRESPONDENT IN PARIS

GENERAL DE GAULLE'S great services during the war put him at the head of liberated France. He has now admitted, however, that Gaullism as a postwar parliamentary force has failed. Is there a third form of Gaullism in the offing? The immediate practical question is whether or not the 87 ex-Gaullist deputies in the National Assembly will survive as a coherent unit. Few people in Paris believe that they can hold together for a very long time. In fact they would already have split in January if General de Gaulle had not reluctantly allowed them to vote for M. Mayer's cabinet. Now, however, many of them must realise that their only chance of re-election lies in joining a conservative or radical grouping.

It is expected, therefore, that sooner or later about 30 or 40 of them will go over to one of the many right-wing or radical groups, including the *Action Républicaine et Sociale* (ARS)—a splinter group formed of Gaullists who broke away from their party in order to support M. Pinay. That would leave about 40 or 50 ex-Gaullist deputies, and it is very likely that at first these may merely change their parliamentary label without giving up their individual allegiance to Gaullism. They are hoping to form a group sitting no longer on the extreme right of the Assembly but somewhere in the centre between the Radicals and the Catholic MRP. This party might become a flexible parliamentary force.

On the whole, any new split among the Gaullists should consolidate the right and centre coalition which now governs France. This may not immediately benefit M. Mayer, but in the long run it may give M. Pinay the kind of majority he wants and with which he would agree to return to power. What makes this paradoxical is the fact that it was M. Pinay who really destroyed the Gaullist RPF. But he did so by the very fact that his sane views attracted many of its members, and showed them that Gaullist ideas might play a part in parliamentary life.

Eddies and Flirtations



The dislocation of General de Gaulle's parliamentary group will cause a great many eddies in the political pool. Two possible combinations are already being predicted. The Radicals are flirting with the left-wing Gaullists and some of the right-wing Independents in order to create a new "republican centre," leaving on their extreme right only the die-hard conservatives and perhaps the ARS. On the other hand, the Catholic MRP is also trying to entice stray Gaullists into its camp. The MRP, M. Bidault's party, has never been happy in the recent governmental coalitions. Some of its leaders have long been trying to woo the Gaullists, and in fact made alliances with them in many constituencies during the municipal elections. The MRP might now try to ally itself with whatever Gaullists it can gain and with the Socialists. This would mean a new coalition, but one to the left of centre. Whatever may come of all these political machinations, the French parliament will no longer be squeezed hopelessly between the hammer of the Communists and the anvil of the Gaullists.

The aims of General de Gaulle himself, however, remain unchanged. Although he is now a leader without a parliamentary party, he still wishes to change the whole French political system. By withdrawing from this system he is, in fact, trying to show that it is inadequate for the present grave needs of the nation. But how will the RPF survive without parliamentary representation? This survival may take several forms. There will no doubt be a brains trust in which intellectuals and politicians of Gaullist conviction such as M. Soustelle and M. Malraux will try to influence public opinion and create some form of contact with the working class. The general himself shows every sign of continuing his personal crusade against the European army and in favour of drastic social reform. His major ambition at the moment is to create a link between capital and labour along Gaullist lines, not too reminiscent, one hopes, of Mussolini's ideas on the same subject. The recent Renault strike has shown that a handful of trade unionists under Gaullist guidance can be a major factor in a key industry. The difficulty with Gaullist plans for the working class is that the RPF lacks the native roots that Communism possesses. Shortsighted employers, moreover, will fight Gaullism if it departs from traditional rightist proposals.

A Spiritual Force

Although General de Gaulle's political life since 1946 has not increased the prestige he won during the war, it would be foolish to rule him out as a force in French political life. Prophets are often stronger alone, and by not being involved in day-to-day political conflicts the general may emerge as the only figure to whom France can turn in a final crisis. In other words, the "third Gaullism" will most probably be a spiritual and symbolic rather than a political force, and it is within this framework that General de Gaulle may finally reap some of the fruit of his great services to France.

Marconi Television for Italy

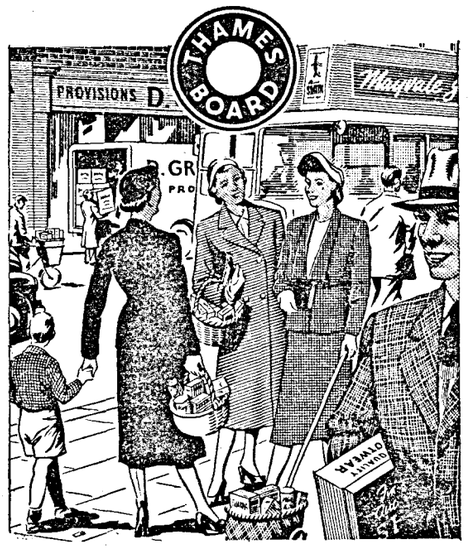
A B.E.A photograph

Equipment purchased by R.A.I. through Italian Marconi Company includes:

- 7½ kW vision transmitters
- 2½ kW sound transmitters
- Marconi Image Orthicon Cameras
- Complete studio installations
- Two mobile O.B. television units, complete with microwave links

The largest export order for television equipment placed in Britain has been awarded to Marconi's Wireless Telegraph Co. Ltd., by the Italian State Broadcasting Corporation.

The order includes large complete studio centres at Milan and Rome, O.B. units for Rome, and medium power transmitting stations at Rome and Pisa.



This order follows those for television installations in the U.S.A., Canada, South America and Thailand.

Marconi high power or medium power transmitters and high power aerials have been installed in every one of the B.B.C.'s television transmitter stations.

BRITISH PLASTICS EXHIBITION Stand No. B7

Whose Favourite Dolly?

Far from being pampered, this BAKELITE Laminated pile driving dolly has to stand up to forty-five blows from a 4-ton hammer every minute. Yet it is certainly the constructional engineer's favourite, for it outlasts the elm and oak dollies formerly used. The unusual toughness of the fabric-based BAKELITE Laminated Materials is one result of the continuous process of experiment and development that goes on from day to day. The story of plastics is already a long one, but new pages are being written every day — by the organisation whose pioneering efforts were mainly responsible for the general adoption of these versatile materials.

Greece Under Papagos—I.

A Trading Nation in a Shrunken World

FROM A SPECIAL CORRESPONDENT

THE devaluation, announced last month, of the Greek drachma to half its previous dollar value, was long overdue. The previous exchange rate was universally admitted to be unrealistic; but as long as Greece was importing much more than it was exporting, and living on large-scale American aid, it was to her advantage. With the prospect that the aid would substantially decrease, it became a matter of greater urgency to increase exports. The devaluation ought to make things a good deal easier for farmers. Fresh and dried fruits, olives and oil, long important items in Greek exports, should be able to find more buyers. The prospects for tobacco, which in the 1930s was by far the largest single export, will also be improved, but the tobacco industry's special problems of high production costs and lost markets will still be far from solution.

Those Greek industries which use home-produced raw materials will benefit, but those which import raw materials face a bleak future. In recent years Greece has operated a large woollen industry, based on imported wool, imported machinery and imported technicians. Its cotton industry was relatively less developed, and some of its home-produced cotton—of which there is a much larger supply and of much higher quality than before the war—was being exported raw rather than in manufactured form. In the new situation the wool industry will be hard hit—though orders for military uniforms will keep some firms going—but the cotton industry may do well, and even find some export markets.

Calling a Spade a Spade

Criticism of the devaluation has stressed the blow to public confidence in the drachma. It is true that for the last few years the relative stability of the official rate has been beneficial. It is an old Greek habit to hoard gold, and the grim events of the 1940s reinforced the habit. Bank deposits hardly existed, and loans were made on gold at exorbitant interest, 2½ per cent per month being not unusual. One of the aims of financial policy for years past has been to induce savers to convert their gold hoards into drachma hoards, and, ultimately, to put their hoards into bank accounts. In the last year some progress had been made towards the first stage; hoards were being converted into currency. Now there is a danger that they may go back into gold. Mr George Kartalis, Minister of Co-ordination in the previous government, had developed a complicated system of import licences and export premiums which in fact created, for many commodities, an exchange rate not very different from that which now exists, both in fact and in name, after devaluation. He claimed for his policy the merit that by maintaining the fiction of a stable currency, it preserved the confidence of Greek savers in the drachma. This advantage, he argues, has been thrown away by the government.

The argument undoubtedly has some force. But Mr Markezinis, Marshal Papagos's Minister of Co-ordination and effective economic dictator, decided that it was wiser to do away with so ingenious and confusing a system, and to call things by their real name. Markezinis is rightly anxious to attract foreign capital and tourists, and to persuade Greek shipowners to return to the Greek flag. That he is in earnest is shown, for example, by the rather more favourable terms of compensation finally given to the British owners of the nationalised Lake Copais estate. In present conditions it may be argued that the confidence of the potential foreign investor is more important than the confidence of the Greek hoarder. Meanwhile, inflationary pressure can be at least temporarily checked as a result of the large purchases of foodstuffs from the United States which Mr Markezinis arranged shortly before devaluation.

An Important Visit

There can be little doubt that devaluation pleases the Americans, and Mr Markezinis was understandably anxious to create as favourable an atmosphere as possible for his visit to the United States this month. The visit is of importance for the future both of the Greek economy and of Mr Markezinis's career. It is hardly a secret that the minister would like to hand over the conduct of economic affairs, in good order, to a successor, and then be free to devote his talents and energies to those major problems of international policy that have always been of greatest interest to him.

The present government is determined to continue the improvement in public finance that has taken place in recent years. Lack of exact knowledge of the distribution of wealth is still a principal reason for the relative inadequacy of income tax revenue and the prevalence of indirect taxation. None the less there has been real progress. Direct taxes formed 18 per cent of ordinary revenue in 1948-49 and 27 per cent in 1951-52. In the same period income tax receipts increased from about 250 billion drachmas to 1,000 billion.

Greece has made an impressive recovery since the civil war ended in 1949, and levels of output and consumption are now appreciably higher than in 1941. But the basic problem which faced Greece before the war is still there, the problem of overpopulation. Greece is naturally a poor country. Its people have largely lived by the skill which they have brought to other lands, as seafarers and traders all over the world. Few nations depend so much on a free international market. In the age of high tariffs and immigration barriers the Greeks are precariously placed. Their exclusion from the Black Sea and from the Danube Basin is another blow. The country never recovered from the expulsion of more than a million Greeks from Asia Minor in the 1920s, a human catastrophe curiously regarded by many western liberals as a "triumph of the Geneva spirit." The immigrants of course enriched their new homeland with much talent and labour. But a sudden increase of the population by 20 per cent placed a terrible strain on a backward economy. It was, for example, a greater strain than that created by the expulsion of the Germans from the East, of which much more has been heard. Tens of thousands of Asia Minor refugees still live (after thirty years) in tumbledown shacks without light, sanitation or heating. The civil war brought a further influx of refugees —probably about three-quarters of a million. Most of these have now returned, but a considerable proportion, having acquired a taste for city lights, have contrived to linger on. To extricate them from the sprawling agglomera-

tions of Athens-Peiraeus and Salonika seems beyond the power of any human agency.

Greek experts estimate the effective unemployment in Greece at 960,000 out of an employable population of about four million. This figure consists mainly not of industrial unemployed but of agricultural underemployed. In fact few Greek peasants are completely unemployed: everyone has too little to do. The wastage of manpower from underemployment is estimated as equivalent to a wastage of 800,000 fully unemployed. Behind these statistical estimates is a reality of misery and despair.

New Shoots in a Cold Wind

Everybody knows that this problem can be tackled only by a combination of agricultural improvement and industrialisation. New industries have been created. Some, such as cement and fertilisers, are doing rather well. Others are fragile, and will not easily withstand the cold winds that devaluation will bring. Of the major investment projects the most important are the electric power stations. The largest of these, at Aliveri in Euboea, based on local lignite deposits, ought to be in action during the summer, and though it might have been organised in a more economic manner, it will certainly prove a valuable asset. Possibly the most useful of all American help has been that given to agriculture. Land has been reclaimed and irrigated, and there is more that can be done. The American advisers have not been doctrinaires: they have adapted their ideas on mechanisation to the conditions of Balkan smallholdings, very different from those of the prairies. Cultivation of rice and cotton have been very successful. Some progress has also been made with agricultural co-operatives, particularly of olive-growers.

Admirable as these improvements are, they have not removed the basic weaknesses of the Greek economy. American experts now speak more cautiously than some years ago. They show less enthusiasm for new industrial projects—for example, the government plans for a large sugar plant and a petrol refinery. They lay more stress on long-term improvements to agriculture. They argue that, despite present population growth, hard work will enable the Greeks to preserve their present standard of consumption. This is hardly an inspiring prospect, for income per head in Greece is among the lowest in Europe.

Military expenditure is, of course, a crushing burden. This the Americans recognise. They argue that their aid to Greece should in future be limited to the margin between the present cost of defence—with permanent cold war along most of the northern frontier—and what would be the cost of defence in normal peace conditions. This sounds not unreasonable. But the interpretation of the margin can provide scope for endless argument and recrimination.

After long years of sweat and toil, and a good deal of blood, the Greek people face the probability that, unless the cold war is ended, or the trade and immigration policies of the great industrial countries become startlingly more liberal, or private foreign capital can be induced to invest on a large scale, their wretched standard of living will not rise. How they will take this will depend on the quality of their political leadership.

(To be concluded)

INDEX NUMBERS showing changes in the replacement cost of various classes of plant and machinery are available on subscription to companies wishing to adjust their depreciation provisions in accordance with fluctuating price levels. Details of this and other services of interest to industry can be obtained from The Economist Intelligence Unit, 22 Ryder Street, London, S.W.1.

Sweden's Economic Prospects

FROM OUR SCANDINAVIAN CORRESPONDENT

LAST year, for the first time since the war, industrial production in Sweden failed to rise. It fell, it is true, by only 2 per cent. But this setback, together with other factors, is symptomatic of a new and harsher economic climate. Without necessarily discounting the dirges of industry or endorsing the rather glib prescriptions of official spokesmen, one may, nevertheless, suggest that, on balance, things are better than they are usually made out to be: for the emphasis is now on the losses and dangers ahead, not on certain factors of strength which sustain Sweden's relatively favoured position.

Compared with 1951, exports last year fell by 12 per cent (from kr. 9,225 million to kr. 8,091 million), imports by 3 per cent (from kr. 9,184 million to kr. 8,936 million). But 1951 was an unnaturally and unhealthily prosperous year; and a comparison with 1950, when exports were worth kr. 5,707 million and imports kr. 6,102 million, shows that 1952 was, by normal standards, a good year. Its pattern of declining exports and deteriorating terms of trade, however, is continuing this year.

Caution is thus the watchword now. But there is a fundamental difference between the opposition—industry, banking, commerce—which appeals for help to maintain its level of activity and profits, and the Government, which points out that, after a run of highly satisfactory years, business must be ready to accept some setbacks and that, in any case, the situation now is far from being so serious that emergency measures are called for. Nevertheless, government economic policy formally recognises the changing position both in the so-called "National Budget," —the annual economic survey—where exports for 1953 are estimated at only kr. 6,990 million and imports at kr. 8,105 million, and the budget proper, which envisages a deficit on current account of kr. 50 million.

It is worth noting that the "National Budget" foresees a further fall in the value of forest industry exports —to 38 per cent of the total, as against 40.7 per cent in 1952, 54.6 per cent in 1951 and 42.4 per cent in 1950. On the other hand, exports of iron ore, iron and steel are expected to increase—to 28.1 per cent of the total, compared with 25.2 per cent in 1952, 15.9 per cent in 1951 and 18.6 per cent in 1950. Net income from shipping is not expected to cover the deficit on visible trade, as it has done in recent years, and is put at kr. 775 million. On the import side the largest increase should be in textiles which, it is estimated, will rise from 10.9 to 13.5 per cent of the total (but during 1949-51 they formed an average of 17 per cent of total imports); and there should be lesser increases in machinery, means of transport and chemicals. Sweden's terms of trade are put at 92 points for 1953 as against 102 for 1952.

Achilles Heel

It is a curious fact that more tends to be heard of the difficulties of the Swedish engineering industries in the face of German and Japanese competition than of the much more important deterioration in the position of the forest industry. Perhaps this is because the former more nearly epitomises the weaknesses of Sweden's present position. In the absence of competition it has profited from marginal markets; and as a result of continued prosperity, it has raised its level of fixed costs in terms both of high wages and of large expenditure on welfare services, too high for its resources and prospects. It is thus obliged to spend on existing commitments, mainly of a public nature, money which would be better employed in other ways.

The high level of public expenditure is the Achilles heel of Sweden. This prime weakness, moreover, is accentuated by various secondary ailments apparently inseparable from the original fault, notably an obstinate refusal to increase the bank rate so that the supply and demand of money are brought into equilibrium. Thus the budget proposals for the next financial year (July 1st to June 30th) envisage a deficit of 50 million kronor on current expenditure (income kr. 8,168 million, expenditure kr. 8,218 million) in addition to a capital expenditure of kr. 1,290 million. In short, as was pointed out in the well-argued and reasonable address of the managing director of *Svenska Handelsbanken* to the annual meeting in March, the government claims to be embarking on a restrictive policy but, largely owing to its prior commitments and "automatic" increases, is in fact acting expansively. It requires about kr. 1,500 million more than it proposes to collect through its own machinery. Some monetary expansion is thus inevitable and, on the worst interpretation, there is a possibility that Sweden may in consequence again experience inflation at home while exports decline.

Dread Word

Some such developments have been implicit in Sweden's policies for many years: but a sellers' market has enabled their implications to be avoided—or so exaggerated by those affected that it has not been difficult to discredit their claims. The whole attitude to unemployment illustrates this point. One of the more satisfactory features of the present situation is that the level of unemployment has remained much lower than expected—2.3 per cent of trade union members in 1952 as against 1.8 per cent in 1951. Nevertheless, any mention of the dread word produces an almost pathological state in which a cold appraisal of the facts is hard to make. Readjustments are necessary and are being made, but, so far, it is the too high level of employment rather than unemployment that makes them difficult.

Nevertheless there are several real factors of strength in Sweden's position—even if wages are too high, the rate of interest too low, foreign exchange reserves too small, government expenditure too big and the mental legacy of the easy years a handicap to efficiency. The fiscal policy which has led to such a marked redistribution of incomes has simultaneously led to the modernisation and re-equipment of industry. Industry, it is true, could well use a larger part of the available resources than it now gets. But a case can also be made out for giving priority to the establishment of those utilities without which workers cannot be attracted to the new factories. Further, various taxes which bear hard on industry—the investment tax or the electricity tax—could always be lightened or abolished, as in the case of the export tax on forest products. There also seems to be plenty of fat to take off somewhat lavish costing methods as an alternative exercise to forecasting imminent ruin. Finally, if costs are kept under control, Sweden's staple exports should always be able to count on a satisfactory, if no longer a lucrative, market.

Bolivia under Paz

FROM A CORRESPONDENT

THE Nationalist government of Dr Paz Estenssoro has much to look back upon in its one year of power in Bolivia. It has got under way a social transformation which may be as important as was the Mexican revolution. Like Mexico's upheaval, it has three basic objectives: an assertion of economic nationalism, fuller use of natural resources, and integration of the Indians into the life of the country.

The government's first move was the nationalisation of the tin mines. It wanted this important tool to use in the furtherance of the rest of its programme. It also feared that after the first shock of last year's revolution had worn off, the tin companies would bring down the Paz government, as they have allegedly brought down every other regime hostile to them. At the same time, the elimination of the tin companies was immensely popular, and assured the government of much support.

The principal problems presented by the nationalisation of the mines are technical and international. There has been a considerable exodus of foreign technicians, and many others have remained only on condition of being paid higher salaries. The government has re-engaged many engineers and is making strenuous efforts to train Bolivians; but if the Mexican oil nationalisation is any guide, it will be some time before the Bolivians can run their mines as well as the companies were doing.

No satisfactory method of paying off the foreign investors in the mining companies has yet been evolved, and there is considerable fear that the government may by one stratagem or another refuse to reimburse them, in spite of specific pledges to the contrary. This is one of the causes for the hesitancy of the US authorities, which have been buying ore only in small dribbles on a monthly basis. The Paz government is anxious to get a five to ten year contract as an assured source of foreign exchange.

Tin nationalisation is, however, the least important of the government's long-term objectives. More significant is the plan to develop agricultural and mineral resources. Bolivia imports 50 to 75 per cent of its food, an outlandish situation for a mainly agricultural nation, and the government is anxious to develop the fertile valleys east of the

great central plateau, where all sorts of products, both temperate and tropical, could be grown, making the country self-supporting in food. It also wants to exploit minerals other than tin, which are known to exist in the great ribbon of rock in which the country's tin and silver have been found. Finally, it wants to develop manufacturing industries, and in particular to process in Bolivia some of the tin ore which now goes to refineries in Britain and Texas; some rather unsatisfactory negotiations to this end have taken place with an Argentine group.

Bringing in the Indian

Both members of the Paz government and outside observers agree that Bolivia's economy can never be fully developed unless the Indian is brought into the nation's economic and political life. Ever since the coming of the white man, the Indian has been virtually a slave, doing the work while his white and mestizo masters took the benefits, and from time to time striking back blindly at his oppressors. The first necessity for bringing the Indian into the nation's economy is an agrarian reform. Most of the arable land has been in the hands of large landowners, and the Indians have worked either as sharecroppers, tenants, or wage workers on the large estates. Only in the more remote parts of the plateau and high up on the steep sides of the mountains have a few Indians been able to maintain their old type of communal cultivation.

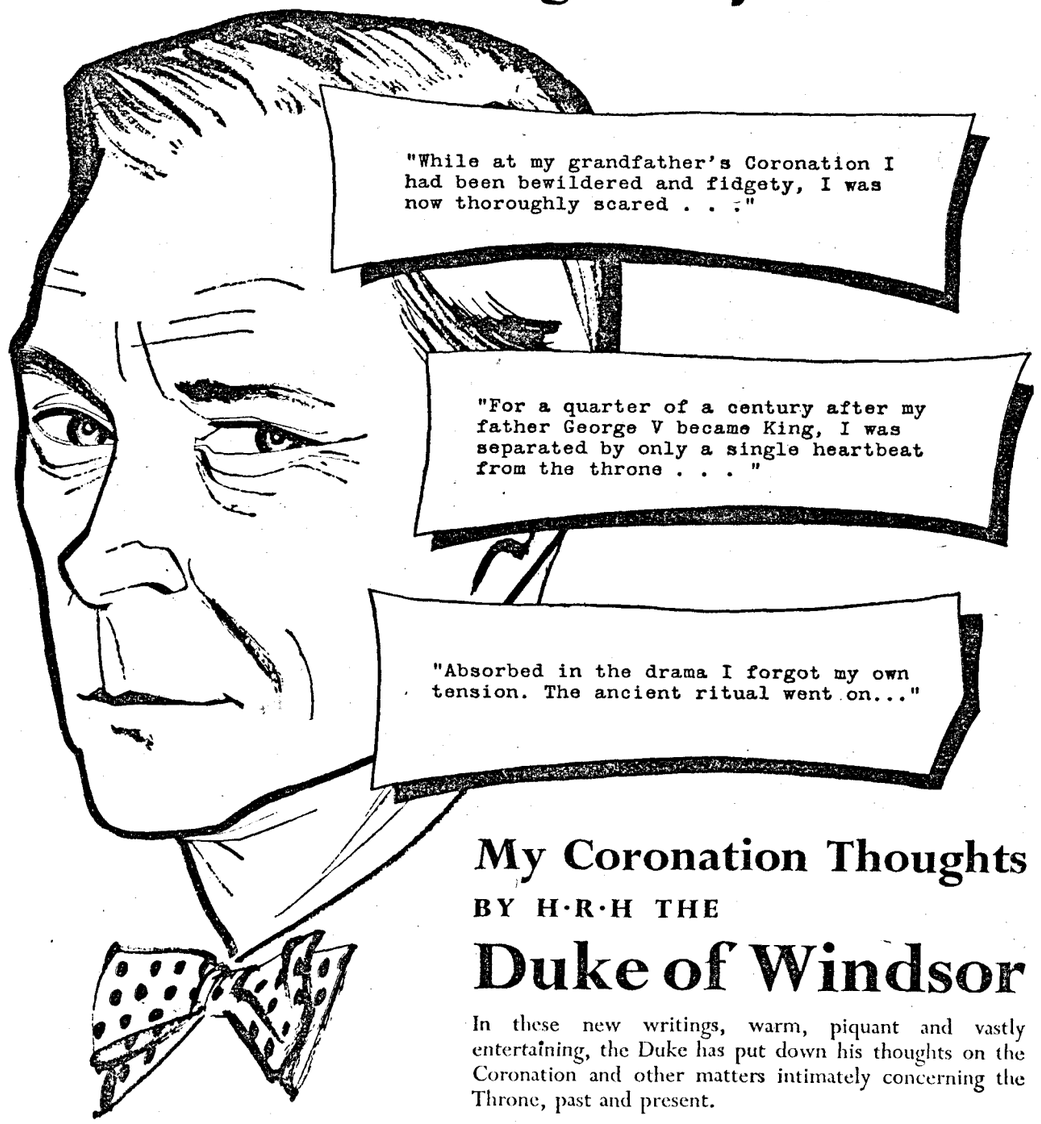
The Nationalist party (MNR) has always made land reform one of its main objectives. During the only previous government in which the MNR had some influence, that of Major Villarroel (1943-46), the first steps were taken towards enlisting the support of the Indians. Government backing was given to unionisation of the Indian miners—many of whom were also agricultural labourers or tenants—and an Indian Congress was organised a few months before Villarroel's downfall. However, certain elements in the MNR were fearful both of the agrarian reform and of the integration of the Indians into political life. They attempted an unsuccessful *coup d'état* against the Paz government early this year. The suppression of this revolt paved the way for a serious attack on the problem of land reform, and soon afterwards a commission was appointed to survey the problem. It is scheduled to report in July or August, though it may take longer. In addition to studying the problems of legal transfer of the land to the Indians, the commission must decide upon the most economical way to organise the lands taken from the large landholders, and find ways of substituting modern techniques for the millennium-old wooden digging stick still used by the Indians.

Falangists and Trotskyites

Agrarian reform will be the key to the future of the Paz government. If it hesitates too long it will be lost. Either the landowners will bring about its overthrow, or its Left-wing opponents will use the discontent of the Indians to seize power. The chief opposition groups are the *Falange Socialista Boliviana*, upon which the Right seems to place its hopes; the POR, one of the world's few important Trotskyite parties; and the remnants of the former PIR party, more or less of a Stalinist stripe.

The *Falange* has always been small. Avowedly pro-Nazi during the war, it was never taken too seriously by either Nationalists or their opponents. However, it is the only group openly opposed to the Nationalist regime which was not associated with the governments in power beween 1946 and 1952, and so now has prestige enough to become the rallying point for the remnants of past regimes. It has been seeking influence in the weakened army as well as among civilians. Most observers think that if the Paz government is overthrown from the Right, it will be the *Falange* that does the trick.

On the Left are two other groups. The *Parido Obrero Revolucionario* (POR) is a member of the Trotskyite Fourth International. It is a little vague on doctrine, and some of its members now see little difference between Trotskyism and Stalinism, while others tend to follow a Socialist rather than a Communist course. The POR existed for a decade as an appendage to the Nationalist Party, and in particular of its labour wing, headed by Sr Juan Lechin, now Minister of Mines. Lechin is a man of limited political education, and the Trotskyites' great value to him has been that they could write impressive programmes for his union, documents which gave the movement some standing in the eyes of the intellectuals.



Their loyalty to Lechin paid off after the revolution of April 1952. The Trotskyites were then able to emerge as the only party which had stuck to the Nationalists in their difficult days, and now virtually their partners. They took a leading part in establishing a central labour group, the COB. Although the titular leaders of the group were Sr Lechin and the Minister of Labour, its real managers were the Trotskyites, skilfully led by Edmundo Moller, and they used it to put pressure on the government. However, in January Lechin apparently realised what damage could be done to the regime if the COB was left in the hands of the Trotskyites, and he suddenly insisted on a reorganisation which put loyal Nationalists in charge.

Communist Factions

The other Left-wing opposition group consists of the remnants of the *Partido de la Izquierda Revolucionaria* (PIR). Some time before the 1952 revolution this party's youth group broke away to form a *Partido Comunista*, which was soon afterwards recognised by the Cominform. A few weeks after the revolution the PIR decided to convert itself also into a *Partido Comunista*. A group of leaders, including its chief, José Antonio Arze, and its theoretician, Ricardo Anaya, held aloof, saying that they were anxious to bring about the unity of all Marxist groups. But all factions of the former PIR are discredited with the supporters of the present regime, since they helped to overthrow the MNR-backed government in 1946 and co-operated with the succeeding regimes. They are now trying to make up for this by supporting the MNR, particularly in the trade unions, but they have not yet had much success.

If the MNR succeeds in pushing forward its social revolutionary programme, it may stay in power for a long time, kept there by popular opinion and by its armed supporters among the workers, students and middle class. If it fails, Bolivia is unlikely to return to the monotonous military dictatorships of the past, serving to a greater or lesser degree the interests of the white and mestizo powers-that-be. More probable alternatives would be a fascist-like regime under the *Falange*, or some sort of Communist dictatorship.

"At 1.15 there was a most alarming family lunch..."

My Coronation Thoughts

BY H·R·H THE

Duke of Windsor

In these new writings, warm, piquant and vastly entertaining, the Duke has put down his thoughts on the Coronation and other matters intimately concerning the Throne, past and present.

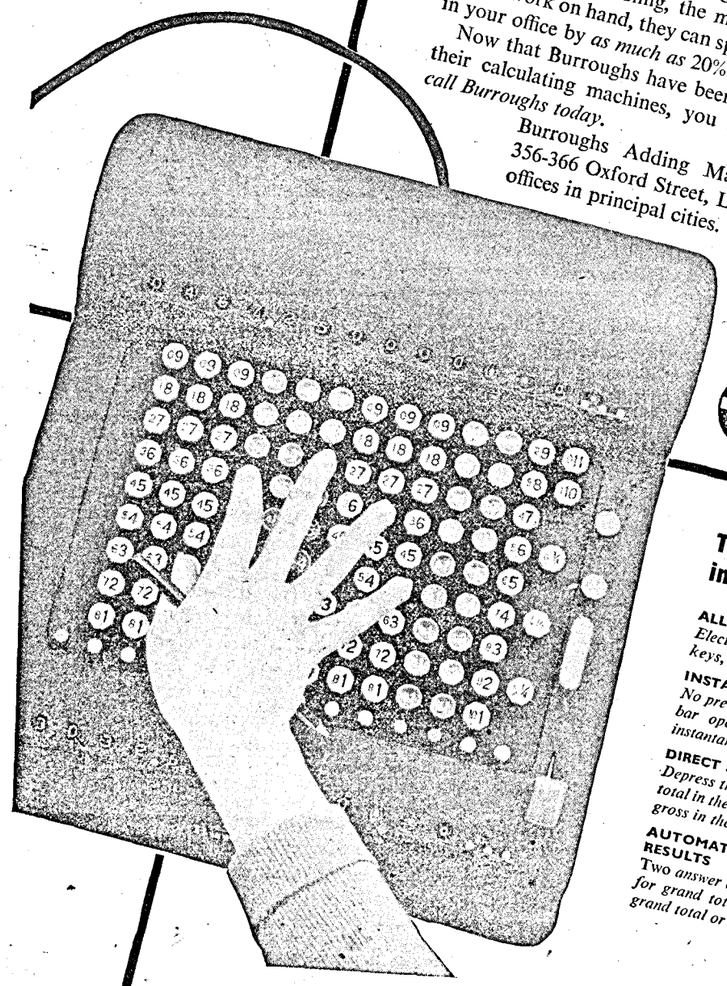
It is the calculating machine that gets through routine figures faster that serves your business best



FORGET THE FRILLS—
get down to the facts

95% of the calculating done in a normal business will be a matter of simple arithmetic—adding, multiplying, and subtracting. On payroll, invoicing, stock records, and the great volume of routine analysis, there's no place for a calculating machine that will do trick computations.

What *is* needed is a calculating machine that gives the very maximum output of facts and figures for the hours it is in use. This is where Burroughs calculating machines excel. Operating with the minimum of rehandling, the minimum number of key-depressions for the work on hand, they can speed up the rate of figure-production in your office by *as much as* 20%.

Now that Burroughs have been able to reduce the initial cost of their calculating machines, you have one more good reason to *call Burroughs today.*

Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1. Sales and Service offices in principal cities.

The how and why of speed in operation

ALL-ELECTRIC OPERATION
Electrification gives light uniform key stroke for all keys, controls registration, safeguards accuracy.

INSTANTANEOUS RESULTS
No pre-setting of amounts, no control key or motor bar operations. Addition and multiplication are instantaneous.

DIRECT SUBTRACTION
Depress the subtract key. The single amount or the total in the front dial is instantly subtracted from the gross in the rear dial for the net amount.

THE BUSINESS WORLD

European Arbitrage Again

LAST Monday the foreign exchange market left behind it another milestone in its march towards freedom and normalcy. It was not, by itself, a very important milestone ; but it was passed by no less than eight countries marching abreast—Belgium, Denmark, France, Germany, Holland, Sweden, Switzerland and the United Kingdom. Since Monday authorised banks in these countries have been allowed to arbitrage freely in their respective currencies. What is involved by this can best be explained by reference to the system that has now been supplanted. Until this week the exchange markets in this group of European countries had operated with bilateral blinkers. A British bank in possession of French francs could sell them in Paris for sterling but not for guilders. A Belgian bank requiring guilders had to obtain them in Amsterdam, even though the cross-rates concerned showed them to be cheaper in London. The foreign exchange balances arising from this rigid bilateralism—to the extent that they were passed on by each bank to its central monetary authority—were converted once a month into a truly intra-European multilateral system by the compensations of the European Payments Union. But this was multilateralism at central banking level ; since May 18th it has been effective at commercial banking level as well.

This arbitrage is restricted for the time being to authorised banks. Individual traders must continue to obey the directives of exchange control in their own countries. A British trader, for example, still has to settle in French francs or sterling if he is dealing with France, and he is still required to deliver the proceeds of any exports to France to the Exchange Control. The structure of Exchange Control remains unchanged. The trader, however, should secure the advantage of a somewhat closer range of dealing prices in European currencies and of an integrated structure of exchange rates. Under the previous bilateral system, considerable discrepancies in cross-rates of exchange could and did occur. As soon as arbitrage became possible within this group of countries the operations of the authorised commercial banks secured an immediate correction of these discrepancies—for each bank naturally seeks to buy exchange in the cheapest market.

In order to achieve the conditions necessary for such arbitrage, completely automatic transferability has had to be granted between the balances held on account of authorised banks within the circuit. This has not had much effect on Britain. Most of Britain's trade is done in sterling ; and automatic transferability of sterling had already largely been conceded to these seven foreign countries, either by prior membership of the transferable account group or by the extension to them of the very liberal administrative transferability that is enjoyed by all EPU countries. But this automatic transferability has now been reciprocated and extended by all countries within the group. This, in itself, represents a significant advance in the multilateral freedom of exchange dealings within the group.

For the present, this arbitrage will be limited to spot transactions. In due course—provided the new system works—it will almost certainly be extended to forward operations. When that happens it will once again be possible to mobilise banking facilities in Europe in truly international syndicates—syndicates whose activities used to be a normal feature of international banking before the war, but that have been placed out of court since the war by the bilateral lines on which exchange operations have been conducted. Moreover, even now, in the field of spot transactions, there is one reservation to the applicability of the new arrangements. This

relates to Switzerland. Under Switzerland's peculiar foreign exchange system, the official Swiss Compensation Office is prepared to pay out Swiss francs at the official rates only for foreign exchange that arises from visible and invisible Swiss exports. All other foreign exchange earned by Swiss nationals—for example, from financial transactions—goes into free accounts and must be dealt with in the free market (although there is now an exception in the case of US dollars, which are bought by the Compensation Office at the official rate whatever their source of origin. If arbitrage facilities had been extended to Swiss free accounts a commodious vehicle would have been provided for the conversion of European currencies into dollars. By keeping foreign exchange in Swiss free accounts outside the scheme and by careful vetting of the list of authorised Swiss banks, the eight governments hope that they have closed this loophole; certainly it will take a great deal of ingenuity for any malefactor to wriggle through it.

For the London foreign exchange market, an important corollary of the new arbitrage scheme has been the admission of the Deutsche mark to an official quotation at the Bank of England; similarly, of course, sterling is now quoted in Germany. Hitherto the Bank had intended to refuse a quotation for the mark until Germany had ratified last year's debt agreement. Another important change affecting the London market has been the adjustment of the official rates at which the Bank of England undertakes to buy or sell exchange for approved purposes to authorised banks. No exchange parities have been changed, but a general and uniform realignment of buying and selling limits has been agreed between the eight countries. As far as possible these limits have been placed at ¾ per cent on either side of parity. That is well within the range permitted by the International Monetary Fund and approximately equal to the $2.78 to $2.82 spread in the sterling-dollar rate. The changes in buying and selling rates quoted in London, together with the new range fixed for the Deutsche mark, are listed in the appended table. This table also shows the adjustment of dealing rates that followed the introduction of the new arrangements.

THE NEW PATTERN OF RATES

	Official rates		Closing rates	
	Old range	New range	May 15	May 19
Belgium	139–141	138·95–141·05	139·70	139·97½
Denmark	19·20–48	19·19½–48½	19·34	19·35
France	972–988	972·6–987·3	987½	984
Germany	...	11·67⅜–84⅛	...	11·73

Under the new system the turnover of compensations handled by the European Payments Union should show some contraction. So long as exchange operations between EPU countries were conducted on bilateral lines, the gross amounts brought into the monthly compensations by central banks bore some resemblance to the sum total of transactions between each set of partners. Now that arbitrage is possible between these eight countries, much of the clearing that used to be done monthly through EPU will be done instead day by day and through the market. But the net position of any country in EPU will not be altered except to the extent that commercial banks hold larger amounts of European currencies in their working accounts. There have already been some changes in this respect; for example, British authorised banks have been informed this week of an increase in their permitted holdings of currencies included in these arbitrage arrangements. These increases in working balances may have a distorting effect on the figures announced at the beginning of next month for the May clearing at EPU. But apart from this—and apart from the fact that the pattern of market rates will now be a daily barometer to the probable state of these end-month clearings—there are no notable implications for the balance of payments in the new system.

The London market has taken the new freedom in its stride. The re-establishment of arbitrage facilities led to an immediate flurry of activity in the early part of the week. On Monday, the first day of dealings, the market enjoyed its most active session for a very long time. It handled a large turnover, enjoyed a welcome profusion of international telephone calls, and renewed acquaintance with the old techniques of sizing up and reacting to the minute margins on which foreign exchange arbitrageurs operate. But once the rates had been aligned, the volume of business again dwindled to very modest proportions. This week's experience has re-emphasised how large a part of the activity of the foreign exchange market in prewar days was in fact of a speculative character—fed by hot money operations that are now largely barred by exchange control. It has also reinforced the impression that many European foreign exchange markets—perhaps most of them apart from London and Switzerland—are still in a rather embryonic state.

How far can this return to genuine arbitrage operations be regarded as a preparation of the market mechanism for the day when it will be able to apply itself to the much more formidable task of dealing with really free and convertible currencies? It is true that a genuine European foreign exchange market is being recreated and that in due course it will almost certainly be called upon to intrude on the still forbidden ground of arbitrage in forward exchange. There is also good reason to hope that the new system will lead to some easing of procedure in export formalities in the relatively near future. Under present export control regulations, trade between any set of partners in this group must still be conducted in one of their two currencies; under the so-called "CD3" form procedure in Britain, for example, trade can be invoiced and paid for only in sterling or in the currency of the foreign buyer or seller. There is now no reason why these restrictions should not be eased, so as to allow the whole group of EPU currencies to rank jointly and equally, irrespective of the particular country with which the trade is done. But apart from these relatively minor relaxations, it would be unwise to assume that any concrete further steps are necessarily in prospect. In particular, evidence that has accumulated in the past week suggests that too much emphasis should not be laid on the obvious fact that the new arrangements would make it easier to set exchange rates floating within wider margins in Europe. Although floating rates of this kind would probably be a necessary concomitant of any surge towards convertibility and a necessary defensive measure in the event of American slump, it seems—in cold fact—that preparations for this week's experiment were put in hand before the Commonwealth Conference and America's present restrictive financial and monetary policy brought talk of convertibility and slump into fashion.

In these circumstances, perhaps the most surprising thing is that this week's very minor move to freedom was not made long ago. The move, after all, merely amounts to giving authorised European banks a little more rope to play with. Perhaps the pessimists had feared that the Swiss banks, with their tradition of free exchange dealings, might use that rope to tie other people in knots; that the German banks, with their depleted and still sketchy foreign departments, might use it to hang themselves; and that the French banks, operating against their perennially unstable currency, might use it to garrotte their perennially unstable governments. But there was no sign that any such lurid forebodings were still harboured when this week's cautiously-planned experiment went into operation.

Matches under the Microscope

ON the average, each adult in Britain spends about twelve shillings a year on matches, and buys most of these in single twopenny boxes. That is a lot of matches—perhaps 2,750 million boxes of them—but not a large share of personal spending. More than a penny a box goes in Customs and Excise duties, which take about £13 million from total sales of perhaps £22 million, and distributive margins take about £3 million more. So the industry that makes and imports these matches, employing about 3,400 people in twelve factories, with a yearly turnover of less than £6 million, is a small one. But during the past four years it has provided the Monopolies Commission with perhaps its most difficult problem. The Commission's recommended solution was duly forwarded six months ago, with its concomitant embarrassments, to the Board of Trade.

The inquiry into matches and match-making machinery that the Commission began in March, 1949, and completed in October, 1952, differed fundamentally from the five other cases so far investigated in that it concerned an industrial combine, not a trade association or a cartel. The strength of this British combine, moreover, depended largely upon comprehensive arrangements for the sharing both of home and export markets with its largest shareholders, a Swedish match combine with worldwide connections. This raised international issues of some delicacy, not unlike those caused by the recent American anti-trust proceedings against a number of oil companies. The Swedish Match Company could not be examined; and, like the British oil companies, it exercised its undoubted legal right to decline information requested through its British associates by the Commission.

This made the Commission's task of inquiry and report the harder. In its turn, the Board of Trade sat upon the report for six months before publishing it last week, presumably to decide which "information relating to overseas markets" it would be "contrary to the public interest" to publish. Its deletions may account for certain apparent lacunæ in the report as published. Even so, the mass of detail this does contain is too intricate to admit of adequate summary; in sketching the present conditions upon which the Commission has reported, it is hardly possible even to touch upon the historical background its members had to bear in mind in reaching their conclusions.

★

The facts of monopoly in this industry are hardly in dispute. About two-thirds of the matches used in Britain are produced here and one-third imported. The British Match Corporation—a holding company set up in 1927 to unite the manufacturing and importing organisations in this country controlled by the leading British companies and by Swedish Match—control with its associates about 95 per cent of home match production and distributes about 85 per cent of imports, these coming from Swedish Match and its subsidiaries. The group also buys about 86 per cent of the match-making machinery supplied here. Its shares of total sales, exports and imports during 1949-50 are shown in the table, and do not appear to have altered significantly since. It is not this position of dominance, but the way in which this power is maintained and used, that the Commission has concluded "operates, and is likely to operate, against the public interest."

Swedish Match holds 30 per cent of the ordinary stock of BMC (another 5 per cent being held by Diamond, the largest American match producer). But the partnership between BMC and Swedish Match is regulated primarily by trading agreements signed in 1938. The key provision of these lays down that each producer shall compensate the other if its proportion of their joint sales in Britain exceeds an agreed percentage—55 per cent for BMC and 45 per cent for Swedish Match. Compensation is generally at the rate of 1s. per gross of boxes on excess sales; there is a limit of £37,500 on the compensation payable in any one year. At present BMC's share of joint sales is about 67 per cent, and the net profit on its excess sales far exceeds the £37,500 a year it has to pay Swedish Match on this account; BMC does not expect to increase its sales much further. Swedish Match and its subsidiaries sell to Britain only through BMC, which sets the retail price of these imported matches and is in any case

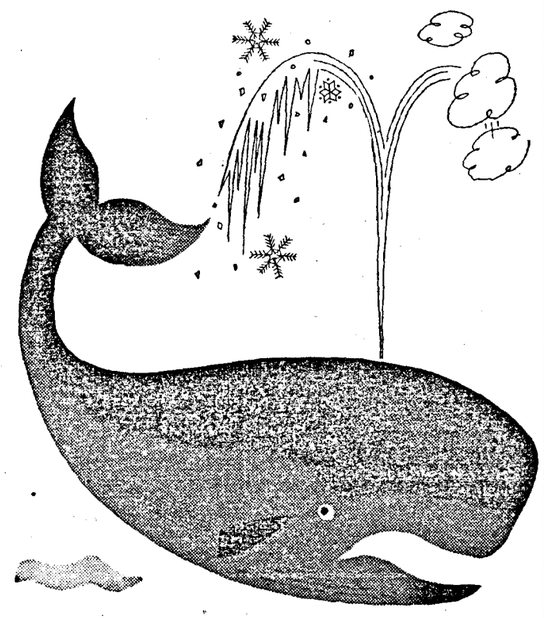
guaranteed a fixed profit on them plus payments in respect of any excess by which their average purchase price exceeds an agreed figure.

Swedish Match has not since 1927 manufactured matches, materials or machinery in Britain (though since 1933 the agreement would not have prevented this). The bulk of BMC's basic matchmaking machinery comes from manufacturers in Sweden controlled by Swedish Match, these supplies and technical co-operation being guaranteed by the agreement. A parallel agreement on overseas trading grants BMC and its subsidiaries the sole right to make and sell matches in Canada and Brazil, and the right to make and sell in certain other Latin American countries; provides for co-operation between the two "partners" in other parts of the overseas Commonwealth outside Asia; and precludes BMC from making and selling matches elsewhere.

The trading agreement about sales in Britain seems likely to ensure that the division of the home market between imports and home production will continue in roughly the present proportions. The Monopolies Commission recognises that some advantages flow from this—at a price:

> ... it provides a supply of good quality matches for the consumer and gives BMC an assured market for which it can plan its production. For this stability, however, a price has to be paid—first, the obligation assumed by BMC ... to continue to import a substantial part of the home requirements of matches and to make payments to Swedish Match in respect of BMC matches sold in excess of its quota; secondly, the absence of the stimulus to improve efficiency in production and distribution which competition would provide; and, thirdly, the price which the United Kingdom consumer is charged for his matches and which BMC is able to fix at a level that provides a comfortable profit for its highest cost plant. ...

The Commission is not prepared to say that the agreement about overseas markets is, in itself, contrary to the public interest (of the United Kingdom). Moreover, it feels that the features of the trading agreements it considers objectionable could probably not be nullified without leading to their termination; and it is not satisfied that on balance any proposals that would involve a serious risk of this termination would be justified.



★

The principal ways in which the Commission holds this "complete and integrated monopoly" to have operated or to operate against the public interest consist mainly of parts of the agreements of which it is not prepared to risk the termination, and in particular of the arrangements for regulating the two combines' sales here. Competitive imports of matches, mainly from Eastern Europe, have in fact been resumed since the war and are increasing, though in 1951 they were less than a fifth by volume of imports from companies controlled by Swedish Match. The refusal to allow independent British match manufacturers to buy machinery from companies controlled by Swedish Match continues as a consequence of the trading agreements, which also took account of the system of underselling competitors in particular areas that BMC at times adopted before the war. The British match combine has large interests in certain suppliers of matchmaking materials in this country; it has never caused them to be withheld from its competitors, though these have been charged more than its own subsidiaries have to pay.

Lack of competition in the supply of matches in Britain, the Commission further finds:

> has resulted in profits and prices being higher than they would otherwise have been, and at certain times this has also been true of costs.

Judgment of rates of profit must depend to a large extent upon the definition of capital employed; the second table shows rates of return on capital for BMC's three main manufacturing subsidiaries in 1949 and

"I'm blowing hot and cold today," wailed the whale

"I wish I could exercise closer control over my temperature. There are factories with heating systems even bigger than mine and they manage it all right. Of course, the most efficient of them use oil fuel, and take advantage of the technical service provided by Shell-Mex and B.P. Ltd. No wonder everything goes swimmingly in their works."

DONKEYS: In England nowadays the humble 'moke' is mainly a feature of the seaside, though he still occasionally appears in our cities drawing little carts for street traders. But throughout the Mediterranean the position is very different; here, wherever there are mountain tracks to be climbed and loads to be carried, the donkey comes into his own. In the island of Cyprus, for instance, it is estimated that there are no less than 53,000 donkeys—one to every seven rural inhabitants. The Cyprus donkey is famous for his strength, endurance and freedom from disease and for his peasant master he ploughs and threshes, fetches and carries and even helps to pump water to the little terraced fields. He forms too a part of the island's exports—for trade statistics show that no less than 3,434 donkeys were exported from Cyprus in 1951.

Our branches in Cyprus are particularly well placed to answer your questions on market conditions or local commercial undertakings.

Please address your initial enquiries to our Intelligence Department, 54 Lombard Street, London, E.C.3.

BARCLAYS BANK
(DOMINION, COLONIAL AND OVERSEAS)

1950, calculated in three different ways. The Commission defined capital employed as assets at cost, less depreciation where appropriate (generally at Inland Revenue rates), less current liabilities and provisions; BMC proposed the inclusion of fixed assets either at replacement cost, calculated from insurance values, or at original cost without deducting depreciation. Whether profits are "higher than they would otherwise have been" involves, again, arbitrary decision; the Commission is satisfied that they were.

In 1950, the Commission reports, the costs of Bryant and May, the largest of the BMC manufacturers, were roughly 1s. a gross higher than those of the lowest-cost BMC company; since Bryant and May earned about a shilling a gross on home sales, the other company could show a profit of more than 2s. a gross. This reflected the comparative rate of modernisation in the companies' plants: it may be noted that since the war the two main independent manufacturers had the highest costs of any producer. The manufacturers' price was then of about 6s. 6d. a gross. In the last two years, BMC told the Commission, independent imports have been offered at a landed cost here varying from 2s. 11d. to 4s. 8d. a gross, mainly from Eastern Europe.

RETURN ON CAPITAL EMPLOYED—THREE BRITISH MATCH MANUFACTURERS, 1949 AND 1950

Manufacturer		Commission's computation	BMC's computations: At current replacement prices	BMC's computations: Original cost without deducting depreciation
		%	%	%
Bryant & May,	1949..	22	9	15
	1950..	17	6	11
Moreland,	1949..	51	31	33
	1950..	46	23	30
Masters,	1949..	51	18	34
	1950..	51	15	33

The retail price of a single box of matches can vary only according to the coinage; before the war packets of a dozen boxes were sold at competitive prices, but this type of sale is only slowly returning. The price can still be varied, however, by changing the average number of matches to the box.

★

To the consumer the extra cost of monopoly in matches can hardly be counted as very large; and many consumers, comfortably if erroneously, might count it worth while to get matches that usually light first time. Neither consideration affects the principle, but they may have rendered the Commission's task of recommendation slightly simpler. Such points presumably led it to judge that on balance, in this industry, the repercussions of radical modifications that might cause the termination of the trading agreements with Swedish Match would not be justified. The Commission held, moreover, that to sever the connection between BMC and Swedish Match would not obtain effective competition here without breaking up BMC into two or three competing concerns. Here it had the example of the American consent decree, under which in 1946 certain large match companies in the United States agreed to divest themselves of stockholdings in other match companies and to have in common neither officers nor directors. The Commission, however, was not concerned to follow or to set examples. It was not satisfied that to break up BMC, even if practicable, would be beneficial on balance or likely to prove lasting Its broad recommendation is "only a partial remedy": to regulate the monopoly in the public interest—primarily by a strict price control.

Two of its members doubted if this would be enough. Price control, they agreed, would provide some safeguard, but they doubted if it could be administered to stimulate improvement or to "disturb the entrenched position of this monopoly." They feel that the quota arrangements between BMC and Swedish Match should be abolished; and that internal competition should be promoted by setting up an exclusive purchasing agency under public control, empowered to buy either all matches supplied in Britain, or all matches imported.

These minority proposals have a certain intrinsic attraction. The purchasing agency idea, for example, would suit the fashionable doctrine that "countervailing power" is an adequate substitute for competition, and may appear preferable to a rigid apparatus of Government price control. But such a monopoly buying agency, at any rate if its rights covered home-produced as well as imported matches, might in practice develop into little more than a price control authority itself—and probably a costly one. Nobody—and particularly no Tory—will find the alternative of rigid price control attractive; and this Government obviously cannot follow the course that might appeal to its opponents—the acquiring of a sizeable holding in BMC, investing the combined arrangements with the dubious sanctity of State participation. As the Monopolies Commission admitted, there is some force in the argument that a monopoly, in some form or another, is probably the natural organisation for the match trade. But whether the stability of the *status quo* in the international market is so valuable, and BMC's technical dependence upon Swedish Match so considerable, that the quota arrangements with Swedish Match cannot be interfered with, is perhaps still an open question. It is for the Government, not the match manufacturers, to decide whether their industry needs protection from foreign competition—even the competition of a powerful foreign combine. Measures that might make imported matches more generally and genuinely competitive with home-produced, whatever the shape of the British industry, might offer an alternative to strict and everlasting Government control, and at the same time benefit the consumer.

Business Notes

High Noon for Company Reports

THIS is the time of the year when the investor who seeks to keep informed about the underlying security of his shares has to burn the midnight oil. In the last two weeks he has been assailed from all sides by a flood of reports from the whales and minnows of British industry. The preliminary accounts of four of these leviathans were analysed in an article in last week's issue of *The Economist*. Now the full reports of five more of them—Unilever, ICI, Anglo-Iranian, Dunlop and United Molasses—are discussed in detail in Company Notes on page 550 of this issue. All of these companies have reported a contraction in profits. Profits earned by Unilever, ICI and Anglo Iranian fell by between 17 and 19 per cent; while United Molasses and Dunlop stand on either side of this bracket, by reporting declines of 11 per cent and 27 per cent respectively. Clearly the minor recession in trade and the curb to inflationary pressures have bitten far more deeply into the earnings of the big international trading organisations than into those of companies trading at home, whose aggregate profits declined last year by about 7 per cent. Fortunately, taxation charges have fallen too and, as the problem of replacing stocks is no longer exacerbated by soaring prices, the directors of four of these companies have felt confident enough to pay out the same dividends; whilst the fifth, Anglo-Iranian, has actually increased its ordinary dividend from 30 to 35 per cent.

★

Last year's downward swoop in prices led to quite considerable losses on stocks—in direct contrast to the experience of these companies in 1951, when capital gains were made on stocks in the wake of the steady increase in prices—but at the same time it has reduced the working capital that had to be locked away in stock commitments. The book value of stocks held by three of these companies—Unilever, Dunlop and United Molasses—fell last year, while a reduction in the value of stocks held by the parent company in the ICI group was taken as an opportunity to increase the volume of stocks held abroad by subsidiaries. The lightening of this burden led in turn to a welcome reinforcement of the companies' liquid resources; they were only too glad, in view of the high cost of short term borrowings, to take the opportunity of paying off some of their temporary loans. The general impression given by these reports is, therefore, not a dismal one. Profits mean much more than they did in the years of inflation; in most cases they are now rising again after last year's setback, and—provided no trading recession is wafted in from the west—they seem likely to continue to do so throughout 1953.

Coal After the Winter

DISTRIBUTED coal stocks at the beginning of May—the end of the "coal winter"—amounted to about 12½ million tons, more than a million tons lower than a year before. The Ministry of Fuel and Power appears still to feel that distributed stocks should be built up to more than 19 million tons for the beginning of next winter. This will not be easy. During the coal summer last year, only about 5½ million tons were added to stocks; to reach the same level this year would require an addition of about 6½ million tons. But this year the miners have an extra week's holiday during the summer, and in addition the extra public holiday for the Coronation. There is no reason to count upon any considerable improvement in output, since productivity seems as yet to be showing little response to the appeal of the industry's leaders and absenteeism continues to be at a higher rate than last year. The Board has admittedly more than 2 million tons of opencast coal in stock compared with about half a million tons at this time last year, though about 600,000 tons of this is "second quality" and not ordinarily classed as saleable.

★

Exports so far this year have been nearly 5 million tons, nearly 1½ million tons higher than by this time in 1951; whether this rate of increase can be maintained if the winter safety level of stocks is to be reached seems a little doubtful. Within these total figures, the prospects for domestic coal in particular are causing some anxiety in the industry and the coal trade. Last year, despite adequate stocks at the beginning of the winter, the early onset of cold weather nearly brought about a coal crisis. This year, Sir Eric Coates, Deputy Chairman of the National Coal Board, told the merchants last week "supplies to the house coal market will be no higher and may well be less than in recent summer periods." The merchants whom he was urging to build up their summer stocks have to bear in mind that consumers are reluctant to accept the poorer qualities and smaller sizes of coal that the Board is supplying to the domestic market. Sir Eric mentioned that the Board had suggested, as a way of dealing with this market resistance, that the price of the better coal should be put up and the prices of the lower grade coals substantially reduced. When the Government allowed the general increase in the price of coal in the spring, it decided that this widening of the price range for domestic coals should not be allowed. The Coal Board says that it has not abandoned its ideas; it seems a pity that the Government should have caused their postponement. On the few occasions when the Board does show signs of employing what Sir Eric called "the age-old use of the price mechanism" it should certainly not be discouraged.

£27,000 Million of Investments

THE annual statistical return from the Stock Exchange (which is reproduced in detail in this week's issue of the *Records and Statistics* supplement) shows that the aggregate market value of all securities quoted on the London Stock Exchange was £27,130 million at the end of last March. This was £1,687 million higher than a year before, but it was still nearly £1,000 million less than the postwar peak of £28,078 million recorded in April, 1947. About half of last year's increase seems to have been due to a genuine increase in values, since the winter recovery in prices exceeded the summer slump. The other half was merely a reflection of last year's crop of new issues and placings. The Council granted 847 applications for quotations for securities with a total nominal worth of £1,922 million (compared with £1,534 million in 1951-52). After allowing for securities that were repaid or fell by the wayside, net nominal values of all securities rose by £730 million to £25,624 million.

A Bank rate of 4 per cent did not prevent the market value of British Government securities from rising from £11,841 million to £12,369 million and that of Guaranteed and Nationalisation stocks from £2,040 million to £2,414 million; these movements reflect a slight but definite accretion in capital values over the year, for the nominal value of these securities rose by less than these amounts (from £13,771 million to £13,940 million in the case of British Government stocks and from £2,578 million to £2,859 million in the case of Guaranteed and Nationalisation stocks). Similarly, the increase in the market value of securities quoted in the Commercial and Industrial list (from £4,304 million to £4,846 million) was bigger than the rise in their nominal value (from £2,323 million to £2,496 million); this is perhaps the last spadeful of earth thudding on the coffin of the policy of dividend restraint. Following in the wake of this increase, stocks in oil companies, banks and discount houses, breweries and distilleries and investment trusts also chalked up quite notable advances in market values. On the other hand, there were sharp falls in the shares of plantation companies and overseas railways, while in the mines group only South African and Rhodesian shares put up any resistance to a bear market. Of all these statistics perhaps the most telling is that the number of bargains marked in the year to March 24th fell from 2,077,421 to 1,701,690; this was only 135,410 higher than in 1949-50, the idlest postwar year of all.

This meagre annual return of Stock Exchange statistics always raises far more questions than it answers. How many individuals now buy securities through the Stock Exchange? How many of them—they must be precious few—are adding more to their portfolios than they are selling off? How large a proportion of this £27,000 million of securities is held by institutions that cannot venture far into the field of risk investment? How does this proportion compare with before the war? The statistical difficulties set by nominee holdings and so on mean that no exact answers to any of these questions could be secured even after hard and co-operative digging by the Stock Exchange and the Central Statistical Office; but until there is enough co-operative digging to carry the uninformed at least part of the way along, there will be no real public understanding of the emerging risk capital problem—which, more than anything else, represents a serious threat to Britain's future standard of life.

King Log in Throgmorton Street

THE Council of the Stock Exchange, unfortunately, still seems chary of pinning its mounting and welcome publicity campaign to this all-important problem of risk capital. It still regards itself as on the defensive against misrepresentation instead of on the offensive against a grave if long-term danger to the nation's prosperity—and to its own existence. And in that defensive battle it is willing to accept quite pointless restrictions on its own efficient working in order to avoid "provocation" to the more ignorant of its enemies. At this week's meeting of the Stock Exchange, the chairman of the Council, Mr J. B. Braithwaite, again explained that the Council had decided against the resumption of option dealings because of its fear of "misrepresentation." He declared that only a minority of jobbers thought that option dealings would lead to increased business and that most brokers would never deal in options anyway, but that a large majority of brokers and a smaller majority of jobbers still wanted option facilities to be restored. Nevertheless, the Council has decided against them, although it is going to give further consideration to the question of allowing free contangos between brokers. As an appendage to this unhappy story of restricted enterprise, Mr Braithwaite announced that he did not think that there was much hope that "new members will come forward in sufficient numbers to balance the loss by death or resignation"; that the Stock Exchange must expect that its working deficit in the present financial year will be "considerably larger" than last year's deficit of £7,853; and that "members must be prepared to provide an increased revenue from subscriptions for 1954-55."

A pressure group of dissenting members of the House is being set up to try to combat the Council's decision on options; but it is not internal pressure of which the Council is now afraid. The real misfortune is that it is to nobody's interest—so long as a Stock Exchange exists—that it should perform its functions in a freightened and restrictive manner. Could not Mr Gaitskell, or some other responsible Opposition member, drop a remark in some public utterance to this effect? On a relatively minor but essentially silly issue—for the ban on option dealings is nothing if not that—this would be a statesmanlike utterance. It would also be political horse-sense.

Timber at the Treasury

ALTHOUGH restrictions on the private importing of softwood were removed last year, the Government deliberately retained consumer licensing as a device to restrict imports and so curtail expenditure of foreign currency. The battle to get this final shackle removed is now being carried on by the representatives of the Timber

Development Association on an inter-departmental committee, which was set up by the Government early this year to estimate how much more softwood would be used if consumer licensing were abolished. Treasury planners, who in past negotiations have remained aloof and sinister behind other ministries, sit on this committee and can now be confronted by trade representatives to whom they are being obliged to reveal the workings of their minds.

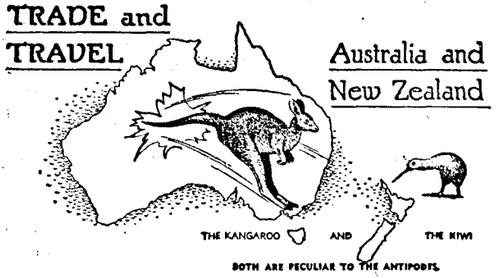
They would do well to explain these workings to the general public as well. The bare figures behind the debate are that in 1952 timber imports, at £164 million, ranked third behind fats and oils and wool among Britain's raw material imports. Of these total timber imports, imports of softwood accounted for a little over half: they amounted to just under one million standards by volume and £89 million by value, of which £47 million came from the dollar area and £24 million from Finland and Sweden. Consumer licences in 1953 are expected to amount to about 1.2 million standards and imports consequently to be only a little above this quantity. The Timber Development Association, which has just published its annual report, estimates that removal of consumer licensing would lead to increased consumption of about 250,000 standards a year. This might cost about £18 million in foreign exchange.

If the inter-departmental committee confirms this estimate, the Treasury will have to decide whether it is prepared to face increased foreign currency expenditure of this amount. But it will also have to face up to the fact that by denying softwood to the building trade and to industry generally, it is hampering production, sending up costs, and enforcing the use of expensive substitutes. What is the Treasury formula for measuring increased building costs against reserves of foreign exchange? In a recent publication sponsored by the Ministry of Housing, as Mr Graham Hutton has pointed out in a letter to *The Times*, the Government has actually recommended the use of substitutes that would apparently cost about £177 million for every £61 million of softwood saved. Even if the effects on Britain's exports to timber-producing countries are ignored —and Germany is already ousting British chemicals and motor cars from Scandinavia—it is quite absurd to base economic planning on the assumption that the true exchange value of sterling is about ninety-seven US cents to the pound.

The Doctor's Dilemma

THE Minister of Health's complaints in the House of Commons on Monday of the cost of proprietary medicines is evidence of his Ministry's dislike of the practice of giving brand names to drugs. In the sense in which it was used on Monday, the term "proprietary" embraced not only patent medicines that are advertised and sold direct to the public, but also the so-called "ethical" preparations that are advertised only to doctors and the trade. By definition, these drugs, too, are "proprietary" whenever the maker's name, or his brand name, appears on a prescription. The industry considers that the heavy risks peculiar to the manufacture and especially to the development of drugs justifies the use of branded names as a device for attracting prescriptions. But the Ministry of Health accountants see them as a means of keeping chemists' shelves overstocked with near-identical preparations that are sometimes more expensive than the unbranded "national formulary" compound would have been; regardless of the fact that a chemist will often supply the first branded product to hand for an open prescription. It is for this reason that the Minister, who had already invited doctors not to prescribe drugs that Sir Henry Cohen's Committee has decided are "not of proved therapeutic value," is now going to tackle the 4,000 proprietary preparations that the committee has declared are "not superior to standard preparations but should be prescribable subject to satisfactory price arrangement"; he is going to look into these and in due course to circulate to doctors another little list, showing those "proprietaries concerning which the Government is unable to reach satisfactory agreements on price." Doctors, however, always retain the right to prescribe what they think fit.

As a general rule, any sign that a Conservative Government may be willing to use the weapon of publicity to break down the barriers of consumer ignorance—which litter the whole field of retail trade, especially in price maintained goods—is to be welcomed. But it is not going to be at all easy to find out which manufacturers are in fact making high profits merely "by wrapping up standard preparations in pretty packages," although some certainly do exist. Research costs in the industry are heavy, and the outcome frequently uncertain. The big companies spend well into six figures a year apiece, and a single qualified worker, with his assistants and equipment, may cost £10,000 a year. Even when a product is successful, it does not inevitably repay its research costs, which become a charge on overheads. Another product, if it becomes the recognised form of treatment for a wide range of ailments, may cover costs several times over but much of the profit must be charged with the costs of unsuccessful projects. The industry treats its research expenditure as an overhead expense, without attempting to relate it in too much detail to the individual projects; and the way in which these overheads are distributed between the various products in production is very much a matter of individual company policy.



The cost investigations that are to be undertaken by the Ministry of Health into some of the seemingly expensive proprietaries may find that prices appear high in relation to unit costs of production; but the Ministry will then be faced with the difficult task of telling the company how much of the overhead research charge it is entitled to add to those production costs in reaching a fair selling price. This is likely to be particularly pertinent in the case of the small companies that specialise in a limited range of products. These companies play a vital role in the industry, but since a project may take four or five years to mature, they have often to wait a long time for results. It will, as the Minister admitted, be difficult to distinguish such cases from "firms who batten on the health service."

Improving Terms of Trade

THE impending reversal of the improvement in the terms of trade, which Government economists were talking about at the beginning of this year, still shows no signs of materialising. The price of imported food, drink and

TRADE and TRAVEL

Australia and New Zealand

Whether your activities entail long distance travelling or concentrated investigations, we can assist you in AUSTRALIA and NEW ZEALAND

Our TRADE INTRODUCTION SERVICE and TRAVEL DEPARTMENTS will gladly:

1. Make a SURVEY to meet your trade requirements.
2. Prepare a suitable ITINERARY.
3. Book TRANSPORT by air, rail, road or sea.
4. Secure Hotel ACCOMMODATION.
5. Arrange business INTRODUCTIONS.
6. Issue TRAVELLERS CHEQUES and TRAVELLERS LETTERS OF CREDIT.

Inquiries welcomed either through your own Bankers or direct.

The oldest inhabitant

Somehow, he seems always to have been part of the village. None can remember it without recalling him, for his wise advice and local knowledge have helped both young and old.

For many businessmen, it is equally hard to think of Australia and New Zealand without recalling the Bank of New South Wales. For, as the oldest public company in the South-West Pacific, its experience and knowledge of local conditions are unrivalled. And as the largest commercial bank there, with over 850 branches and agencies, it can give every assistance to its customers.

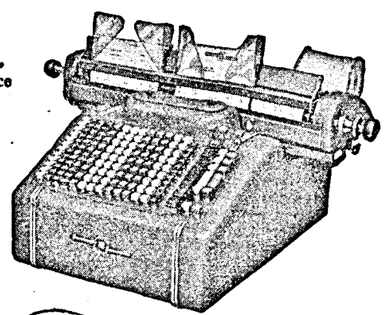
THE PURPOSE AND RESULT OF SENSIMATIC CONTROL



Here's the secret of the Sensimatic's astonishing versatility. Each panel (or sense-plate) like this guides the machine through any four different *accounting jobs in any combination. There is no limit to the number of panels you can use.*

From *one* accounting machine— *countless* applications

NOW THERE ARE FIVE VERSIONS of the Burroughs Sensimatic Accounting Machine, giving you the registers or combinations of registers you need for the jobs you have on hand. All are based on the completely new principle of Sensimatic Control, which directs the machine automatically through every mathematical function and carriage movement during a posting operation. Just as there is no practical limit to the number of different accounting applications the Sensimatic will handle —switching instantaneously from one to another at a turn of the selector knob—so there is no limit to the economies in time and labour which its use will effect in your office.

Call Burroughs about the Sensimatic today. You'll be surprised at the low cost of this multi-purpose accounting machine.

Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1. Sales and Service offices in principal cities.

Burroughs Sensimatic

tobacco rose a little in April, but the price of imported raw materials continued to fall more sharply. The Board of Trade monthly index (1952=100) shows an increase in April for imported food of one point to 98, but the index for raw materials fell by two points to 84, making a drop of five points since January ; the index for imported manufactured goods, at 89, showed no change on the month. The resulting total index for imports is 90, or one point down since March and three points down since January. The index for export prices in April shows a fall of one point for textiles (to 91) and a fall of two points for other manufacturers (to 93); but metal and engineering exports, at 101, are one point dearer, so that the total index for exports remains unchanged at 97. With total export prices unaltered and import prices down one point, the terms of trade for April improved one point on the month to 93—the same index figure as in February ; but no less than 10 per cent better than a year ago.

★

The detailed trade figures for April show that the month's increase of £6.3 million in exports (compared with the monthly average for the first quarter of the year) was all in shipments of manufactures ; indeed exports of engineering products alone increased by £6 million. The equivalent increase of £21 million in imports compared with the first quarter of the year was mainly in food, drink and tobacco, but there was also a further decline, of £2 million, in the import of manufactures ; in April manufactured imports were at only three-quarters of the rate at which they were running in the first half of 1952—before the import restrictions of November, 1951, and March, 1952, had taken full effect.

Three Creditors in Europe

THREE countries dominated the creditor side of the compensations at the European Payments Union for April. They were Germany, the United Kingdom and the Netherlands—in that order. The United Kingdom surplus of $42.7 million had been announced in London earlier this month. It was settled as to one half in credit and one half in gold ; the credit repayment reduced Britain's overdraft with EPU to $542.4 million. At the rate of surplus maintained last month, it would take the United Kingdom just on two years to repay this overdraft and to start going through its quota on the creditor side of the account. Germany is in a much happier position. Last month it achieved a surplus of $43.3 million, of which one half accrued in the form of gold. Germany has now built up a credit balance of $292.2 million with EPU and has ousted Belgium-Luxemburg from first place in the list of EPU creditors. On balance Germany has secured $192.2 million in gold from EPU, which makes it the largest recipient so far. The Netherlands last month had a surplus of $14.2 million. It too has crept up into remarkable surplus with EPU in the last year. Its accumulated credit with the Union now stands at $221.5 million, which is within striking distance of the Belgian credit balance of $228.2 million (and Belgium had a deficit of $17.9 million last month).

On the debit side, the latest EPU compensation, as is now usual, was dominated by France, whose deficit for the month amounted to $51.6 million. The whole of this was payable in gold, for France's cumulative deficit has now exceeded its quota in the Union by more than $150 million ; but the $51.6 million needed has been met out of a special and unexpected receipt of $60 million from the United States. This was ostensibly transferred to France in respect of military expenditure in Indo-China. The fact that it was necessary to use this windfall to make the payment to EPU shows how desperately France is now living from hand to mouth.

Wait and See for Rubber

THE International Study Group, which recently concluded its annual meeting at Copenhagen, had before it a draft plan for the creation of a rubber buffer stock, but it has decided that the moment is not opportune for inviting the United National to summon an international conference on this draft plan. Instead it has made arrangements to re-convene itself, at a special group meeting in the autumn, to reconsider the rubber situation as it may appear then. This is a sad but sensible compromise. It would have been useless to push on with plans to create a buffer stock in face of the opposition of American interests and the indecision of some other countries ; but it would have been still sillier to have thrown out of the window, in a fit of despondency, a plan that will become more urgent—and may become more popular—if worldwide recession returns.

At the moment, although the London spot price of rubber is still hovering around the very low level of 21d per lb, rubber producers seem less anxious about over-production than they were a year ago. The group estimates this year's world production of natural rubber at about 1,788,000 tons, and it believes that consumption should amount to about 1,600,000 tons ; this projected surplus of about 188,000 tons looks less menacing now that there are signs that increasing American commercial demand may take up the slack that the end of stockpiling threatened to create. The group estimates synthetic rubber production in 1953 at 989,000 tons and probable demand at about 909,000 tons. Rubber producers are notoriously apt to bounce wildly between extreme pessimism and unjustified optimism at the slight shimmer in market conditions ; if world recession holds off and demand picks up, there is a real danger that the buffer stock scheme may have faded further into the background by the autumn. But by then more will be known about the Americans' plans for disposal of their synthetic plants. The interval should be used wisely and determinedly to amend the draft buffer scheme still further, the better to stand the test of international scrutiny on a more propitious—or still more rainy—day.

Car Prospects

HAD it not been for the twelve-week strike at the Austin works, car production during the first quarter of the year would have shown an increase more in keeping

with the rising tempo in the rest of the industry. As it is, the 129,176 cars then produced outnumbered those for either the preceding three months (123,725) or for the first quarter of 1952 (113,505). The effect of the strike was to reduce the rate of output for the industry from 10,213 cars a week in January, when some factories were on short time, to 9,617 in March—when, with the exception of Austin, most plants were turning out more cars than at the beginning of the year. The Ford Motor Company produced more than 20,000 units (including tractors) during the month, the highest figure yet reached at Dagenham. In Coventry, the Standard Motor Company has been steadily raising production from the levels to which it sank early this year, when import restrictions in some of the best foreign markets for tractors coincided with a disruption of car schedules caused by model changes. By April, tractor production was back to 265 a day—normal two-shift output being around 300 a day—and the company's combined daily output is at present running at more than 500 units. With the new Vanguard in production, but tooling barely completed for the small car that is eventually expected to account for roughly three-quarters of the company's car output, Standard is relying rather more heavily on tractors than on cars.

The recent modest relaxations of the restrictions on imports of tractors into Australia and certain other markets suggest that exports will rise during the summer. But in the first quarter of this year they were down to 22,998, compared with 31,370 in the same period last year. This decline, like that in car exports, was of course chiefly brought about by the trade restrictions. Shipments of cars to commonwealth markets fell from 74,234 in the first quarter of 1952 (when 34,000 went to Australia in an attempt to beat the import ban) to 37,492 in the first quarter of this year. Canada, which is included in this total, hardly functions as a market during the winter months when the ports are icebound; yet deliveries during the period increased from less than 550 last year to more than 5,000 this year.

Sales to other overseas markets increased slightly, from 26,000 cars last year to nearly 30,000 this year—including a rise of from 4,286 to 9,798 in exports to the United States. Given the same rate of output, British factories appear able to produce more cheaply than American; Coventry-built Ferguson tractors sell in Canada for less than the American built, but in the car industry, where total British output amounts to only one-eighth of that of a single American model, the story is, of course, very different. Seasonal influences are likely to ensure a continuing rise in car exports during the next few months, but the industry may sustain a set-back in the autumn and winter unless a relaxation on import restrictions in Australia makes it possible to increase deliveries to the Southern Hemisphere.

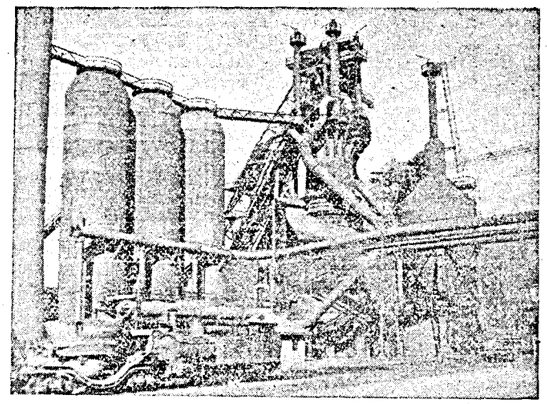
Pre-Budget Sales

THE shops were generally busy in the month before the budget except in those departments where the goods carried heavy amounts of purchase tax. Sales in general, as measured by the index (1950=100) rose from 112 in both January and February to 120 in March, compared with a rise of 4 points, to 109, between February and March last year. In the majority of cases, the rise in sales between the two months appears to have been far more marked this year than last. Food is one exception; the index moved here only two points in both years, and now stands at 132 compared with 119 in 1952. Another exception was chemists' sales, which showed a seasonal decline. Clothing sales reported by the big shops rose from 83 to 104, whereas last year, when prices were considerably higher, they rose by only 12 points, to 96. Sales of furniture and household textiles also rose, the big shops and the independent retailers recording improvements of 13 and 11 points respectively between February and March. Compared with last March, the big shops' sales have risen one point and the independents' 7 points. This slight improvement bears no comparison with the sudden jump in furniture sales shown by the multiple stores (presumably led by Great Universal Stores' furniture chain), the index for which moved from 125 to 156 between February and March, bringing it 41 points above the figure for March last year.

Except on the more expensive types of furniture, the amount of purchase tax on household goods and clothing is rarely high enough to carry much weight with the consumer. But it falls especially heavily on household electrical equipment and on radio and television sets. Sales of these goods, which are recorded separately only by the independent shops, fell noticeably, from 159 in February to 136 in March, compared with 149 the year before. Since television sales might have been expected to reflect the dual stimulus of the expanding transmission area and the coronation, the decline in this heavily taxed group suggests that buyers did tend to postpone purchase until the budget. In April, manufacturers delivered nearly 200,000 television sets to retailers (including sets already in the shops on "sale or return"), the highest monthly delivery so far.

Stocks of non-food merchandise are in general down in value by 7 per cent compared with March last year, those of men's and boys' clothes, which were slow to move, are down by 20 per cent. Hardware, radio and electrical goods as a group show an 11 per cent fall in the value of stocks, while sports goods, toys and bicycles, once heavily stocked because of a fear of shortages, are down by as much as 16 per cent. The biggest fall in stocks, one of 17 per cent, is recorded in the west end of London, where sales for the past year have lagged behind those of the rest of the country. With a high concentration of luxury shops, this area of London has been hit hardest by buyers' resistance to high prices last year, and probably also by a decision to wait for tax changes. In the first two months of the retail year, when sales over the country as a whole rose by 8 per cent compared with the same period of 1952, those in central London rose only 5 per cent, the second lowest increase in the country.

Still Profitable Copper



THE Rhodesian copper belt has recovered remarkably quickly from the setback it suffered last winter when production was brought to a standstill by the African labour strike. The March quarterly reports of two of its most

ABRIDGED REPORT OF THE DIRECTORS

For the year ended 31st December, 1952

CAPITAL.—There has been no change in the Authorised Capital.

During the year the Issued Capital was increased to £6,082,153 10s. 0d. by the issue of 6,984 Deferred Shares of 5s. each in exchange for 5,589 Ordinary Shares of 10s. each in The Consolidated Diamond Mines of South-West Africa, Limited.

FIXED ASSETS

The book value of your Company's fixed assets at 31st December, 1951, was ...		£15,703,822
During the year 1952 the following shares were acquired:		
5,589 Ordinary Shares in The Consolidated Diamond Mines of South-West Africa, Limited, in exchange for 6,984 Deferred Shares in your Company... ...	1,746	
14,715 Ordinary Shares in The Consolidated Diamond Mines of South-West Africa, Limited, purchased for	61,103	
8,000,000 Shares in The Diamond Corporation, Limited, received as a scrip dividend	8,000,000	
52 Deferred Shares in Premier (Transvaal) Diamond Mining Company, Limited, purchased for	27	
		23,766,698
Less: Sales—		
60,000 Shares in The Diamond Trading Company, Limited... ...	60,000	
150,000 Shares in The Diamond Purchasing and Trading Company, Limited	150,000	
Landed Property sold	1,166	
	211,166	
		23,555,532
Add: Nominal Value of Mining Stores previously included in the item "Machinery, Permanent Works, Buildings, Stores and Livestock," but now shown separately		1
As per Balance Sheet as at 31st December, 1952		£23,555,533

PROFITS AND APPROPRIATIONS.—The following is an analysis of the Profit and Loss and Appropriation Accounts for the year ended 31st December, 1952:—

Diamond Account		£7,694,555
Interest and Dividends on Investments		7,077,612
Profit on Realisation of Trade Investments		220,489
Sundry Revenue		2,454
		15,995,110
Deduct: Mining and General Expenditure		3,087,711
Profit for the year		£11,917,399
Appropriations:—		
Provision for Taxation	1,825,000	
Provision for Depreciation of Government and Local Authority Securities	500,000	
Preference Dividends	800,000	
Deferred Dividends	8,164,282	
Directors' Additional Remuneration	20,000	
	11,309,282	
		608,117
Add: Scrip dividends received from the Diamond Corporation, viz.:—		
8,000,000 £1 shares in The Diamond Corporation, Limited ...	8,000,000	
1,200,000 £1 shares in De Beers Investment Trust, Limited ...	2,400,000	
	10,400,000	
Less: Funds Appropriated for expenditure on Fixed Assets in excess of Issued Capital...	7,849,966	
Transferred to General Reserve	2,500,000	
	10,349,966	
		50,034
		658,151
Add: Adjustment in Diamond Stocks previously shown in the Balance Sheet at the nominal value of £1 but now shown at cost of production		311,946
Add: Unappropriated Profit at 31st December, 1951	7,437,552	
Less: Appropriated for De Beers Pension Fund	942,713	
		6,494,839
Unappropriated Balance at 31st December, 1952		£7,464,936

PROFIT AND LOSS ACCOUNT.—The total revenue for the year as per the Profit and Loss Account was £15,995,110, which is £783,455 less than the previous year's figure of £15,788,565. The credit to Diamond Account was £7,694,555—a decrease of £1,156,171 compared with the previous year's credit of £8,850,726. During the year there were smaller deliveries of diamonds due to the fact that in 1951 Dutoitspan Mine worked eleven hour daily shifts whilst as from the beginning of 1952 normal daily shifts of eight hours were resumed with a consequent drop in production. Furthermore, there was a decrease in production and deliveries from Jagersfontein Mine and Kleinzee, due to a drop in the grade at these properties, and similarly a decrease from the working of sundry old surface dumps at Kimberley, where the diamond content varies considerably.

Interest and Dividends on Investments were higher by £155,429 and amounted to £7,077,612. The amount of £220,489 being profit on the realisation of trade investments is the profit on the sale of shares in The Diamond Trading Company, Limited, and the Diamond Purchasing and Trading Company, Limited, to which further reference will be made herein. The total expenditure for the year was £3,087,711 which compared with £2,850,010 during 1951. As in the previous year the increase in Mining Expenditure is mainly due to the continued rise in the cost of wages, stores and sundry services.

In summary, there was a decrease in total revenue for the year of £783,455 and an increase in expenditure of £237,701 resulting in a decrease of £1,021,156 in the profits which were £11,917,399 as compared with £12,938,555 for 1951.

APPROPRIATION ACCOUNT.—There was an unappropriated balance of £7,437,552 brought forward from 1951 from which has been deducted the sum of £942,713 which, together with the sum of £272,989 transferred from Reserve for Allowances to Retired Employees, has provided the Company's initial contribution to De Beers Pension Fund, which fund as stated by the Chairman in his address to Shareholders last year, was inaugurated as from 1st January, 1952. To the remaining unappropriated balance of £6,494,839 has been added the year's profit of £11,917,399, a credit of £311,946 in respect of an adjustment in diamond stocks, and a credit of £10,400,000 representing scrip dividends received from the Diamond Corporation, giving a gross credit to Appropriation Account of £29,124,134, against which appropriations were made totalling £21,659,248.

DIVIDENDS.—During the year dividends totalling £1 per share were declared on the Preference Shares. On the Deferred Shares an interim dividend of 4/- per share was declared payable to shareholders registered on the 30th September, 1952, and a final dividend of 6/- per share has been declared since the close of the year under review, making a total of 10/- per share on the Deferred Shares in respect of the year ended 31st December, 1952.

FINANCIAL POSITION.—After providing £8,964,282 to meet dividends declared in respect of the year 1952 and £20,000 payable to your Directors as additional remuneration in terms of Clause 82 (j) of the Articles of Association and after providing £1,825,000 for taxation, current assets at 31st December, 1952, exceeded liabilities by £7,415,701.

This excess compares with £8,546,593 at the end of 1951—a decrease of £1,130,892, which is chiefly due to the payment of £1,215,702 to the De Beers Pension Fund as the Company's initial contribution. In addition to these cash resources of £7,415,701 your Company, apart from the investments shown under "Fixed Assets," has quoted securities with a book value of £5,397,732 and a market value, at 31st December, 1952, of £7,350,960. It also has 1,200,000 shares in De Beers Investment Trust, Limited, valued at £2,400,000. It will thus be seen that the Company's financial resources, apart from its fixed investments, and after allowing for all liabilities, amounted to £15,213,433.

THE DIAMOND CORPORATION, LTD.—During the year the authorised capital of The Diamond Corporation, Limited, was increased from £5,000,000 to £29,000,000 by the creation of 15,000,000 new shares. 10,000,000 of these new shares were paid for by the capitalisation of £10,000,000 of unappropriated profits of the Diamond Corporation and issued to shareholders. Your Company received 8,000,000 shares and The Consolidated Diamond Mines of South-West Africa, Limited, and that Company's wholly owned subsidiary, the South-West Finance Corporation, Limited, received 2,000,000 shares.

Arrangements were then concluded between The Diamond Corporation, Limited, and Anglo-American Investment Trust, Limited, whereby the Diamond Corporation acquired from the latter its holdings of 1,008,826 shares in Consolidated African Selection Trust, Limited, 16,620 shares in Societe Miniere du Beceka and 13,375 shares in Companhia de Diamantes d'Angola in exchange for 2,500,000 shares in The Diamond Corporation, Limited. The three Companies whose shares as stated, have been acquired by the Diamond Corporation are among the leading non-Union producing companies with which the Diamond Corporation, as the link between the producers of diamonds in the Union of South Africa and the non-Union producers, has contracts for the purchase of their production.

Since the close of the year the Consolidated Diamond Mines of South-West Africa, Limited, has subscribed for a further 1,625,000 shares in the Diamond Corporation at a price of £2 per share and the Anglo-American Investment Trust, Limited, for 875,000 shares at the same price. The Consolidated Diamond Mines of South-West Africa, Limited, also acquired from the South-West Finance Corporation, Limited, the latter's holding of 937,500 Diamond Corporation shares. The issued capital of the Diamond Corporation is therefore now held as follows:—

De Beers Consolidated Mines, Limited	12,000,000	shares.
The Consolidated Diamond Mines of South-West Africa, Limited	4,625,000	"
Anglo-American Investment Trust, Limited	3,375,000	"
	20,000,000	shares.

The contracts which the Diamond Corporation has with the producers of the Belgian Congo, Angola, Sierra Leone, the Gold Coast and French Equatorial Africa for the purchase of their production continue until 31st December, 1955, and the provisions thereof have been satisfactorily carried out throughout the year. During the year contracts, which continue to 31st December, 1955, were entered into with Williamson Diamonds, Limited, a producer of diamonds in Tanganyika Territory, and with Akim Concessions, Limited, a producer in the Gold Coast, for the purchase of their production. In addition to the scrip dividends already mentioned a satisfactory cash dividend was received from the Diamond Corporation during the year.

DE BEERS INVESTMENT TRUST, LIMITED.—In his address to Shareholders at the Annual General Meeting last year the Chairman referred to the contemplated development and expansion of the Diamond Corporation's activities. Subsequently it was decided to divide the Diamond Corporation into two companies by forming a new company called De Beers Investment Trust, Limited, and the new company was registered on the 10th December, 1952, with a nominal capital of £12,000,000 in 12,000,000 shares of £1 each. The Diamond Corporation subscribed for 11,000,000 shares at a price of £2 per share and subsequently distributed 1,750,000 of these shares to its shareholders as a dividend as follows:—

De Beers Consolidated Mines, Limited	1,200,000	shares.
The Consolidated Diamond Mines of South-West Africa, Limited	300,000	"
Anglo-American Investment Trust, Limited	250,000	"
	1,750,000	shares.

The new Company then purchased from the Diamond Corporation its interests in various undertakings not connected with the diamond industry leaving the Diamond Corporation to confine its activities to the diamond trade and as in the past to devote its energy and resources to the continued stability and well-being of that trade. The principal interests taken over by the new company are in the following concerns:—

African and European Investment Company, Limited.	Orange Free State Land and Estate Company (Pty.), Limited.
De Beers Industrial Corporation, Limited.	President Brand Gold Mining Company, Limited.
Ellaton Gold Mining Company, Limited.	President Steyn Gold Mining Company, Limited.
Freddies North Lease Area, Limited.	Stilfontein Gold Mining Company, Limited.
Freddies South Lease Area, Limited.	Welkom Gold Mining Company, Limited.
Loraine Gold Mines, Limited.	Western Holdings, Limited.
Orange Free State Investment Trust, Limited.	West Rand Investment Trust, Limited.

For the most part these interests are in loans to the companies mentioned, and with the exception of certain short-dated loans, by far the larger proportion of the loans carry valuable conversion rights. In this way an immediate and satisfactory return is being received on these investments with the prospect in due course of substantial profits, and by following this policy De Beers Investment Trust, Limited, should develop into a large and influential financial Corporation which will play an active part in the development of the Union of South Africa and in turn be a source of strength to De Beers Company and its associates as well as to the economy of the country generally.

THE DIAMOND PRODUCERS ASSOCIATION.—The Diamond Producers Association agreement and the agreements which the Association has with the selling companies—all of which agreements have a currency until 31st December, 1955—functioned satisfactorily throughout the year. With a view to strengthening further the link between the producers in the Union of South Africa and the non-Union producers, and following the principle adopted when the latter acquired share interests in the industrial diamond selling companies, arrangements were made whereby the principal non-Union producers have now acquired share interests in the Diamond Trading Company, Limited, and the Diamond Purchasing and Trading Company, Limited, which companies handle the sale of all gem diamonds sold by the Diamond Producers Association. The necessary shares were provided by the existing shareholders in these Companies and were purchased by the non-Union producers at a fair and satisfactory valuation. Under these arrangements your Company was required to provide 60,000 shares in the Diamond Trading Company, Limited, and 150,000 shares in the Diamond Purchasing and Trading Company, Limited.

DIAMOND SALES.—The proceeds realised in 1952 from the sale of diamonds effected through the Central Selling Organisation, on behalf of South African and other producers, and diamonds drawn from the stocks held by the Diamond Corporation once again constituted a record and were as follows:—

Gem Diamonds	£45,769,857
Industrial Diamonds	23,892,069
Total	£69,661,926

The total sales in 1951, a record up to then, were £65,057,965.

Copies of the full Report and Accounts (which are to be submitted to shareholders at the Sixty-fifth Annual General Meeting to be held in Kimberley, South Africa, on Wednesday, 10th June, 1953, at 11 a.m.) may be obtained from the London Transfer Office of the Company, 11, Old Jewry, E.C.2.

important producers, Roan Antelope and Mufulira, show a welcome increase both in the volume and value of sales and in profits. Compared with the previous quarter Roan Antelope's profits have risen by £1,339,000 to £3,063,000, while Mufulira (a "wetter" mine whose output is put in greater jeopardy by the shortage of fuel) has reported a smaller increase, by £462,000 to £2,116,000. In the first nine months of this accounting year Mufulira's profits have risen by more than a third and Roan Antelope's by more than a quarter; although the Rhodesian copper producers have recently had to accept a cut in the Ministry of Materials' buying price for copper, and although they will have to face a full year's burden of EPL on this year's earnings, their accounts for the full year to June 30, 1953, now seem certain to make a cheerful showing. And on July 1st both Roan Antelope and Mufulira will transfer control to Rhodesia, with all the tax advantages that that implies.

★

There are, however, two clouds over the copper-belt. The first is the continuing rise in the costs of capital development. It has just been announced, for example, that the cost of developing the Chibuluma Mine, a subsidiary of Mufulira, will be about £6 million, compared with the original estimate of £3.6 million; much of the additional finance now needed will come from the Defence Materials Procurement Agency of the United States, which will increase its original loan of £3 million by an amount not exceeding £2 million—as soon as Mufulira increases its shareholding in Chibuluma by £400,000 to £1 million. The second cloud is the uncertainty about what will happen to the price of copper when private trading in the metal in London is restored in August. Copper producers may be hoping, however, that this week's decision of the Chilean Government to maintain its price for copper at 35½ US cents a lb (fob Chilean ports) may delay a fall in world prices. The Chilean Government has, in effect, narrowed the world market, by the simple expedient of quoting a price that no consumers—except the fabricating subsidiaries of American concerns that have a direct interest in Chilean copper mines—are willing to pay.

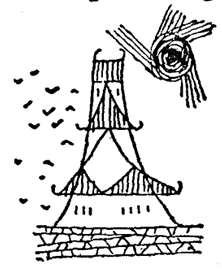
Floral Engineering

THE Chelsea Flower Show, held in London this week by the Royal Horticultural Society, is going the way of all agricultural shows: machines fast threatening to take pride of place over living exhibits. This year there are slightly more exhibitors of "horticultural sundries" than of plants and gardens. Many of these are showing traditional garden equipment; lawnmowers, greenhouses, tools and wrought iron gates, but a number specialise in power-driven implements designed and built as miniature versions of farm machinery scaled down in size to fit small-holdings and private gardens. The standard wheeled and tracked horticultural tractors of 6 to 10 h.p. are too big and also too unwieldy for confined spaces. The garden cultivators that manufacturers are producing in increasing number are intended to fill the role vacated by the employed gardener, now rapidly becoming extinct. About 16 different makes were shown at Chelsea, in addition to several power-driven scythes, electric mowers and at least one battery-driven grass cutter and hedge trimmer. In all there were about 23 firms showing mechanised equipment of a type that would never have been associated with gardening a few years ago.

PRODUCTION OF GARDEN CULTIVATORS, 1952

	Two-wheeled Tractors				Self-propelled grass cutters and hoes
	5-6 h.p.	3½-4½ h.p.	2-3 h.p.	1½ h.p. and under	
Home	1,413	188	3,726	1,847	5,870
Export	3,701	195	3,744	1,270	5,420
TOTAL	5,114	383	7,470	3,117	11,290

These are expensive toys. The cheapest cultivator, of 1½ h.p., and with a limited number of attachments, costs about £44. Cultivators of 4 and 5 h.p. capable of working heavy soils and gradients can rarely be obtained for less than £100; with a full range of attachments, they cost nearer £150. That the market is expanding is shown by the scale of production—nearly 30,000 of these small cultivators were produced last year—as well as by the increasing number of new designs. There is little doubt that they do their work quickly, efficiently, and in the long run more cheaply than it can be done by traditional methods. But in future a mechanic's finger may have to be joined to the green thumb.



Lower Basic Material Prices

IN April the Board of Trade's index for basic material prices fell by 1.2 per cent, mainly because of substantially lower prices for non-ferrous metals. During the month the average price of tin fell by about 16.7 per cent, of zinc and lead by 9.2 per cent, of aluminium by 3 per cent and of copper by 3.3 per cent (the cut of nearly 10 per cent in

NOTICES

SENIOR SCIENTIFIC OFFICERS; SCIENTIFIC OFFICERS; PATENT EXAMINER AND PATENT OFFICER CLASSES.—The Civil Service Commissioners invite applications for permanent and pensionable appointments to be filled by competitive interview during 1953. Interviews will continue throughout the year, but a closing date for the receipt of applications earlier than December, 1953, may eventually be announced. The Scientific posts are in various Government Departments and cover a wide range of Scientific research and development in most of the major fields of fundamental and applied science; in Biology the number of vacancies is small. The Patent posts are in the Patent Office (Board of Trade), Admiralty and Ministry of Supply.

Candidates must have obtained a university degree with first or second class honours in an appropriate scientific subject (including engineering) or in Mathematics, or an equivalent qualification; or for Scientific posts, possess high professional attainments. Candidates for Senior Scientific Officer posts must in addition have had at least three years' post-graduate or other approved experience. Candidates for Scientific Officer and Patent posts taking their degrees in 1953 may be admitted to compete before the result of their degrees examination is known.

Age Limits: Senior Scientific Officers, between 26 and 31; for Scientific Officers and Patent Classes, between 21 and 28 during 1953 (up to 31 for permanent members of the Experimental Officer class competing as Scientific Officers). London Salary Scales: Senior Scientific Officers (men), £812-£1,022; (women) £681-£917; Scientific Officers (men), £440-£707; (women) £440-£576; Patent Examiner and Patent Officer Classes (men), £440-£655; (women) £440-£576. Somewhat lower rates in the provinces.

Further particulars from the Civil Service Commission, Scientific Branch, Trinidad House, Old Burlington Street, London, W.1, quoting No. S.53/53 for Senior Scientific Officers and S.52/53 and S.128/53 for the other posts.

PRODUCTION-ENGINEERING LTD., consultants in industrial and business management, require additional staff. Applications are invited from Chartered Accountants with industrial experience who are interested in the development of financial costing and administrative control. Technical ability is a prime essential, but great weight will be placed on personal attributes. Only first-class men will be considered and preference will be given to those with a university degree or service experience and a wide background. Before responsible work is undertaken, careful training within the company will be given which may last one year. Age should be between 26 and 38 years. The remuneration is high. These will be permanent appointments with excellent prospects for future advancement.—Applications should be sent in confidence to Production-Engineering Ltd., 86 Cross Street, Manchester, 2.

BARRISTER, 37, old Etonian, at present Assistant Secretary to leading industrial company, seeks a legal or executive post which would afford greater scope to his qualifications, experience (both commercial and industrial), and proved abilities. Highest credentials.—Box 253.

ECONOMIST/STATISTICIAN required for new shipping business. First-class opening for well qualified and ambitious man. Age preferably 23 to 30. Commencing salary £700 to £1,000 per annum according to age and qualifications.—Apply in writing to W. G. Weston Ltd., 47 Piccadilly, W.1.

THE UNIVERSITY OF LEEDS

SENIOR AGRICULTURAL ECONOMIST

Applications are invited for the post of Senior Agricultural Economist to be largely concerned with liaison work between the Provincial Agricultural Economics Service and the National Agricultural Advisory Service. Salary: men—£900 rising to £1,070; women—£800 rising to £930. There is at present a bonus in addition. Applications (three copies) stating age, qualifications and experience, together with the names of three referees, should reach the Registrar, The University, Leeds, 2 (from whom further particulars may be obtained) not later than June 22, 1953

BALLIOL COLLEGE, OXFORD

Balliol College proposes to elect an Official Fellow (or appoint a Lecturer) in Politics as from September 29, 1953. Applications should be sent not later than June 13, 1953 to the Master, from whom further details can be obtained.

NATIONAL COAL BOARD invite applications for the superannuable appointment of an ASSISTANT TO THE INVESTMENTS MANAGER OF THE SUPERANNUATION AND PENSIONS FUNDS at London Headquarters.

Candidates must have a sound knowledge of finance, investment and Stock Exchange procedure, backed by some years' practical experience in a stockbroker's office covering all aspects of institutional investment work, including statistics and analysis of accounts.

Salary on appointment will be within the inclusive range of £1,250 to £1,600 per annum, depending on qualifications and experience. Increases within the range will be considered periodically in the light of work carried out and responsibility undertaken.

Write, giving full particulars (in chronological order) of age, education, qualifications and experience (with dates) to National Coal Board, Establishments (Personnel), Hobart House, Grosvenor Place, London, S.W.1, marking envelope TT/635. Original testimonials should NOT be forwarded. Closing date June 12, 1953.

AN opportunity occurs for a large firm selling their own branded lines to the Hardware, Chemists and Grocery Trades to acquire, without capital outlay, the selling rights and goodwill of two famous nationally advertised household products. These enjoy a dominant position in their field and are sold everywhere. Annual sales exceed £200,000 and £150,000 has been invested in advertising. These lines are capable of considerable further expansion. Present owners wish to devote their time to the development of other projects and will maintain only a Royalty interest.

Interested firms must have a very strong direct selling organisation and promote other nationally advertised products. Replies, which will be treated in confidence, should be only from such firms.—Box 255.

SALES OFFICE MANAGER required by a large company in the Midlands, engaged in the paper and allied industries. Applications invited from men with good educational background, preferably Economics degree, and at least three years' post-graduate commercial experience in Sales Office management and selling.—Box 252.

ADVERTISING of technical products calls for specialised knowledge and experience—which is why so many famous industrial concerns have learned to value the services of Geoffrey Dadd Ltd., Technical Advertising Practitioners, of 90 Epsom Road, Sutton, Surrey. Derwent 4444 (4 lines).

OTHER NOTICES APPEAR ON PAGE iii OF COVER.

the copper price on April 25 was only partially reflected in the average for the whole month). Among other basic materials, the price of raw rubber came down by 7.9 per cent in April, raw cotton by 0.9 per cent and palm oil by 13.3 per cent. Among the few materials that rose in price during the month, raw wool went up by 3.6 per cent and

PRICE INDEX OF MATERIALS FOR INDUSTRY
(June 30, 1949=100)

	1952	1953

Building and civil engineering materials	137·3	131·2	131·0	131·0	130·7
House building material	133·4	129·0	129·0	129·2	128·9

Source : Board of Trade.

imported hardwood by 0.5 per cent. In all, the index for materials used in mechanical engineering fell by 1.4 per cent, while that for those used in electrical machinery fell by 2.4 per cent (owing to the heavier weight carried in it for non-ferrous items). The falls in the indices for building materials were mainly due to the fall in the price of lead.

Sterling Area Statistics

ONE of the most glaring deficiencies of the official statistical service since the war has been the lack of adequate and up-to-date figures on the trade balance of the sterling area. Hitherto the analyst has had to rely either on the annual Statistical Abstract for the Commonwealth (which is usually nearly a year out of date) or has had to search around for himself in the monthly trade returns of a score or so of different countries (which arrive in this country at widely differing dates after the period to which they refer). The decision to publish a summary of these trade statistics in a quarterly supplement to the *Board of Trade Journal* is therefore a real step forward.

There are two major snags in the new supplement. The first is that while some sterling area countries value their imports c.i.f., others value them f.o.b. The result is that the figures give a misleading impression of who is contributing most to any current surplus or deficit in the accounts of the area as a whole ; for example, the United Kingdom's trade balance will always be cast in an unfavourable light in these statistics, because between 10 and 15 per cent of its recorded import values are due to freight and insurance payments (which are usually merely payments by a British importer to a British shipping, insurance or banking concern). The figures should therefore only be adjudged as showing trends (not absolute levels) in each country's balance ; the first of the accompanying tables, which sets down the relevant figures for the disastrous fourth quarter of 1951 against those for the much better fourth quarter of 1952, shows that nearly all members of the area (except the Far Eastern colonies) contributed to last year's recovery.

The second major snag is that these figures only go a very small part of the way towards forging one of the most urgently needed tools for current economic analysis—namely an estimate of the terms of trade for the sterling area as a whole. The supplement provides price indices for

sterling area imports—or, for that matter, of other sterling area exports. To compile a terms of trade index for the whole sterling area would require some bold estimation and not a little guesswork. But the time has come when the Board of Trade, which must have many more of the relevant statistics than are available to private readers, should be encouraged to attempt one.

Company Notes

UNILEVER. In its world-wide orbit of activities—from soap through sawmills to a shipping line—the Unilever diarchy has amassed over £1,200 million of sales in each of the last two years. The vast range of goods sold by the group in all the free markets of the world would make for stability in profits were it not that almost all its products satisfy the immediate wants of consumers, so that the group's fortunes can be swiftly affected by any fall in consumers' demands or a decline in raw material prices. In the first half of 1952 the group had to withstand both these buffets, and profits fell sharply. In the last six months of 1952, however, raw material prices rose again and sales (although only at a lower level of profit margins) began to improve. This improvement has continued into the current year and the directors reveal that the volume of sales and profits earned in 1953 have so far been satisfactory.

The most encouraging feature of Unilever's accounts for a year in which inflation was curbed is that the value of the diarchy's sales rose from £1,205 million to £1,227 million. As prices were lower last year than they were in 1951, this increase must reflect a real expansion in the volume of goods sold; and, in fact, the accounts (which must be the envy of many other international trading organisations) show an increase in the volume of sales of margarine and edible fats, of other oils and fats, of animal feeding stuffs and of tropical produce; while the volume of sales of soaps and other detergents has been maintained. The fall in trading profits (from £69.1 million to £56 million) can therefore be attributed to lower profit margins (forced upon the group by the return to more competitive conditions) and by losses made on stocks when prices fell from their heady 1951 levels. In any case, as was noted when the group's preliminary statement was discussed in *The Economist* last week, lower charges for taxation and an easing of the problem of replacing stocks have led to an actual increase (from £18.8 million to £21.1 million) in net profits available for distribution. The diarchy has therefore had no difficulty in maintaining equity payments.

Like many of the major trading concerns, Unilever has found that the decline in stock investment has led to a welcome improvement in its liquid balances. In the consolidated balance sheet, the fall in stock values from £212 million to £182 million—which is due rather more to a fall in prices than to a decline in the volume of inventories—has been accompanied by an increase in cash balances (from just under £25 million to just over £43 million) and by a fall in short-term borrowings (from £55 million to just under £30 million). Further calls would be made upon these resources if the markets in edible fats were to be freed from Government controls; it is estimated, for instance, that about £15 million might be added to Unilever's stock values if the British Government were to remove the controls on margarine. Moreover, the group's capital expenditure still appears to be running in excess of the amounts set aside for depreciation (even though the group carefully sets aside a sufficient margin out of taxed profits to cover genuine replacement costs). The directors must therefore keep a wary eye upon liquid balances in deciding upon the size of the ordinary dividends, which are, of course, tied to the equalisation agreement between the British and Dutch partners. On the basis of the latest dividend of 13½ per cent the £1 ordinary stock units of Unilever Limited at the current price of 47s. 3d. xd. yield 5.7 per cent; for a group whose profits would probably suffer sharply but temporarily in a recession, but that has vast reserves of strength to draw upon, this yield seems reasonable enough.

★

IMPERIAL CHEMICAL INDUSTRIES. In contrast to the experience of Unilever, the fall in the profits of Imperial Chemical Industries last year (from £51.6 million to £42.3 million) seems to have been due more to an actual decline in sales than to a fall in prices. In money terms the value of ICI's sales rose again last year—from £262.8 million to £276.3 million—but there was a slight fall in the volume of these sales; indeed, the Billingham nexus and the Nobel explosives division appear to have been the only divisions to have sold more in 1952 than in 1951. Despite the worldwide clutter of new trading restrictions, the value of direct exports also increased—from £58 million to £62 million—thanks partly to a revival in Far Eastern purchases of alkali and fertilisers in the second half of the year. The value of sales rose while their volume fell because, in the words of the directors, ICI was forced by an increase in operating costs to "make some increase in the prices of many of the company's products." But this increase in selling prices apparently did not go far enough to maintain profit margins intact—and for a very good reason: the directors note in their report that "competition from Germany and Japan was severe during the year in a number of products, and European producers also competed strenuously, particularly for United States Government fertiliser tenders."

The fortunes of the ICI group were not, of course, immune from last year's decline in raw material prices and some £2 million was written off stock values to reduce specific items to market values. This cloud, however, had a silver lining, for the directors go on to say that "the profits for 1952 do not contain any significant amount due to inflation of price levels as did the profits of 1951." As a direct result the directors have found it necessary to appropriate only £700,000 to a stock replacement reserve, compared with ten times that amount—£7 million—in 1951. A reduction in the volume of trade at home led to a slight fall in the value of stocks held by the parent company (from £56.4 million to £54.5 million), but the opportunity was taken to build up stocks held abroad so that overseas subsidiaries could offer quick deliveries in their increasingly competitive markets. As a result, the book value of stocks in the consolidated balance sheet rose from £84.4 million to £91.1 million, and the group as a whole did not experience the welcome reinforcement of liquid resources that many other industrial giants have been able to report.

ICI's fortunes were plainly at their lowest ebb in the middle of last year, when a fall in demand led in some cases to a reduction in output. Since then, however, demand has revived and the value of the company's sales in the last quarter of 1952 was higher than in the same quarter of 1951. On present indications, therefore, shareholders can reasonably hope for an increase in profits this year.

★

ANGLO-IRANIAN. The report of the Anglo-Iranian Oil Company for 1952 is a story of sturdy resilience in adversity. In 1952, the company sold 32 million tons of crude oil and refined products, or only 3 million tons less than in 1951 when 14 million tons came from Iran. Its production of crude oil in Kuwait, Iraq and Qatar, rose from 16.6 million tons to 25.6 million tons, with Kuwait's share alone rising from 13.3 million tons to 19.8 million tons. Similarly, the throughput of 17.5 million tons in the company's refineries in 1952 compared with a throughput of 24 million tons in 1951 (of which half came from Iran).

Nevertheless, to a very large extent, the fall in consolidated profits (from £71 million to £59 million) reflects a full year's trading without Abadan, compared with the benefit of six months' trade from there in 1951. The expropriation has also added to the company's costs by forcing it to make outside purchases of oil. But in spite of this, and of the high level of tanker freight rates that ruled throughout most of last year, the directors seem to have had no hesitation in raising the ordinary dividend from 30 to 35 per cent. Indeed Sir William Fraser suggests that a "study of the accounts will point to the conclusion that a more substantial distribution would be warranted." But he then covers up by adding that "in view of the abnormal conditions affecting operations and the extra capital commitments these entail, the directors consider that it is not yet wise to relax the policy of conserving the company's financial strength."

* Parent company's net profits only, which are shown in 1952 after the credit of £770,868 from subsidiary companies' reserves; in 1951, £606,749 was retained by these subsidiaries.

That financial strength is greater than the balance sheet figures show; for the report reveals that a claim for relief from British taxation in respect of Kuwait taxes (which, at £26.8 million, have been charged before striking trading profits) is outstanding. But there are grounds for caution about the immediate prospect. For one thing the company's profit margins are smaller than those prevailing in 1952; and Sir William's forecast that profits this year should run at their 1952 levels appears to be based on the assumption that "the encouraging expansion in the volume of trade" that has been achieved in recent months will be maintained and that there will be no severe drop in oil prices. For another thing, the company hopes to raise its annual refinery capacity to about 30 million tons by the end of 1954 and to raise production from Kuwait, Iraq and Qatar to 35 million tons by the end of this year. This emphasises the need for money to finance capital development, on which the company spent about £57.4 million in 1952 and expects to spend about £75 million this year.

★

DUNLOP RUBBER. Since the price of raw rubber fell by over a third in 1952, it is not surprising that the trading profits of Dunlop Rubber fell by over a quarter. The decline in raw material prices, together with a fall in the volume of sales, led to a reduction in the value of the group's sales (which include services and supplies within the group) from £284 million to £250 million; and the ratio of profits (before tax) to turnover was reduced from 6.5 per cent to 4.7 per cent. The decline in prices was, of course, accompanied by considerable losses on inventories, all of which have been absorbed by drawing on profits. In the upshot, the group's trading profits have fallen from £17.9 million to £13.1 million; but, thanks to a reduction in the charge for taxation, the fall in net profits has been limited to about £1 million.

Losses on stocks and a reduction in the volume of stocks held by the group have reduced the book value of inventories in the consolidated balance sheet from £61.2 million to £50.9 million—a level that the directors consider to be "satisfactory for the efficient operation of the factories." The fall in stock values has in turn reduced the need for temporary finance; the group's total borrowing on bills and from the banks has been reduced from £20.4 million to £13.5 million. This has enabled the directors to maintain the dividend of 17½ per cent without any real difficulty. On present indications, the current year should witness a greater stability in prices and profits, and shareholders will confidently expect the same dividend again.

★

UNITED MOLASSES. Last autumn, in one of the most startling price reductions of 1952, producers of molasses were forced to slash prices to less than one-third of the levels at which they had been standing through the sellers' market earlier in the year. Yet the directors of United Molasses, whose recorded stocks of molasses fell from £3,061,401 to £1,061,953 in the calendar year, are able to report that this massive fall in prices to the "comparatively safe level of today" did not involve the group in inventory losses of any consequence. It seems, therefore, that the group must have been successful in running down its stocks before the big price cuts were made.

The fall in the group's trading profits (from £8,033,794 to £7,103,914) can therefore be attributed mainly to the decline in shipping freight rates and to a rise in operating costs. The chairman expects that profits will again fall quite substantially this year because of lower shipping freights; but he reports that the sudden cut in the price of molasses has already led to an impressive expansion in American demand for molasses for feeding stuffs and distilling purposes, and that the group's American subsidiary has recently been handling a larger volume of trade than at any time in its history. A similar improvement has not yet taken place in Britain, but the directors hope that the decontrol of animal feeding stuffs will help sales later on. Another encouraging sign for the future is that the fall in the burden of stock investment has led to a very strong improvement in the group's liquid resources. Last year the combined total of British Government securities, short-term loans, tax reserve certificates and cash balances rose from about £8.6 million to nearly £14 million. The chairman opined that profits in 1953, although they would be lower than those earned last year, will be "comfortably cover dividend requirements." The gross equity distribution of just over 20 per cent—which gives the 10s. ordinary stock units a yield of 7½ per cent at their current price of 27s. 3d. seems, therefore, to be well assured.

Statistical Summary

EXCHEQUER RETURNS

For the week ended May 16, 1953, total ordinary revenue was £70,296,000, against ordinary expenditure of £88,024,000 and issues to sinking funds £565,000. Thus, including sinking fund allocations of £3,422,000 the deficit accrued since April 1, 1953, was £26,224,000 compared with a deficit of £60,077,000 for the corresponding period of the previous financial year.

COMPANY MEETINGS

ANGLO-IRANIAN OIL COMPANY

RESULTS OF FIRST FULL YEAR WITHOUT SUPPLIES FROM IRAN

PRODUCTION AND REFINING DEVELOPMENTS

SALES VOLUME EXPANDING

COMPANY'S ATTITUDE IN IRANIAN DISPUTE DEFINED

SIR WILLIAM FRASER'S STATEMENT

The forty-fourth annual general meeting of the Anglo-Iranian Oil Company, Limited, will be held on June 11th at Britannic House, Finsbury Circus, London, EC.

The following is the statement to stockholders by the chairman, Sir William Fraser, CBE, LLD, which has been circulated with the report and accounts for the year ended December 31, 1952:

Since the last annual general meeting Sir Hubert Heath Eves, Mr J. A. Jameson and Mr F. G. C. Morris have resigned from the board, and Mr H. E. Snow, Mr J. M. Pattinson and Mr W. E. V. Abraham have joined the board; the two first named have been appointed managing directors. On the recent retirement of Sir Thomas Gardiner, who has been our valued colleague since his appointment as an ex-officio director in 1950, Her Majesty's Treasury has appointed Mr F. E. Harmer to succeed him on the board.

Sir Hubert Heath Eves was a managing director from 1924 to 1950 and deputy chairman from 1941 to 1950, since when his profound knowledge of our shipping and sales activities which he so long and successfully directed has continued invaluable in our councils. Now that he has decided to retire, we pay tribute to a colleague who has been for nearly thirty years in the front rank of those who have built up your company's organisation, in which his ability and personality have long been regarded with respect and affection.

In Mr Jameson we lose an outstanding pioneer of the company's operations in Iran, where he served from 1909 until 1927, finally as general manager. He then returned to London as a deputy director, becoming a managing director in 1939. During this long service of 43 years with the company he has seen, and himself been a major contributor to, its development from the first stage in Iran just after oil was originally struck there in 1908 to its present world-wide organisation. For his achievements on your company's behalf, we owe him a deep debt of gratitude.

Mr Morris was first associated with the company in 1921 in connection with the formation of our associated company in France. From then onwards his energies were concentrated on our distribution and marketing activities, and he became a deputy director in 1927 and a managing director in 1946. He has played a prominent part in the extension of the AIOC group's sales organisation and he will be greatly missed from our deliberations.

Mr Snow and Mr Pattinson have both had more than 30 years' service with the company and have been deputy directors for the past few years. Mr Abraham is managing director of The Burmah Oil Company, Limited.

BALANCE SHEET AND PROFIT AND LOSS ACCOUNT

The accounts for 1952 have been prepared in the same form as those for the previous year.

Owing to the continuance of the dispute with the Iranian Government regarding our rights and properties in Iran, no operations of the company or its subsidiaries took place in that country during 1952, and our assets and liabilities there have been included in these accounts at substantially the same figures as for 1951. It is not at present practicable or advisable in the stockholders' interests to alter the form of items relating to Iran in our accounts which, together with the contents of this statement, it is your board's desire to make as fully informative as possible regarding the company's business.

The consolidated trading profit for 1952 was £45,354,732 after provision of £14,198,946 for depreciation on fixed assets, allied companies and other trade investments, and oil exploration interests. The gross trading profit thus totalled £59,553,678, comparing with £71,377,882 for 1951, from which depreciation and other write-offs totalling £23,682,949 were provided. **1952 was the first full year during which we had no oil production from Iran and the effect of this deprivation on our business, despite the greatly increased supplies which we obtained from other sources, is reflected in the reduction in our trading profits.**

Provision for depreciation in 1952 was £9,484,003 less than in 1951, partly because of the discontinuance as from March 31, 1952, of initial allowances on capital expenditure, and partly because no further amounts have been written off capital assets in Iran.

The item land, oil wells, pipe lines, refineries, etc., in the consolidated balance sheet shows an increase of £36,876,204, compared with 1951, mainly because of expenditure on our refineries in the United Kingdom and at Aden. This item also includes for the first time the company's capital assets in Kuwait because, as I informed you last year, our interests there have been held since December, 1951, by a subsidiary company instead of through an associated company as formerly.

Investments in subsidiary companies not consolidated and allied companies show an increase of £7,631,419 attributable mainly to larger needs for distribution in Australia, New Zealand, India and Pakistan.

After providing £22,666,344 for taxation on profits, the amount available for reserves and dividends is £25,165,966, compared with £24,233,050 for 1951. Your directors have allocated £1 million to preference stock reserve, bringing the total to £10 million, and have placed £16 million to general reserve, which now stands at £97 million. They have recommended a final dividend on the ordinary stock of 25 per cent, and in addition a cash bonus per £1 stock of one shilling, both less income-tax. The total distribution for the year would approximate 7 per cent on the ordinary stock plus general reserves.

Study of these accounts will, I am sure, point to the conclusion that a more substantial distribution would be warranted. However, in view of the abnormal conditions affecting our operations and the extra capital commitments which these entail, your directors consider that it is not yet wise to relax the policy of conserving the company's financial strength which has enabled it to withstand the most damaging actions of the Iranian Government.

The company's issue of £20 million 5 per cent debenture stock in January last was largely oversubscribed. Preferential treatment was accorded to existing preference and ordinary stockholders applying for the new stock, of which the total number of re-registered holders is at present about 25,000. **The purpose of this issue was to supplement the company's existing resources in financing the current programme of capital expenditure, mainly on construction and extension of refineries and building of tankers. This large programme on which expenditure during 1952 was approximately £57,400,000 and during 1953 is estimated at £75 million is designed to maintain the company's position in the forefront of the highly competitive and progressive world petroleum industry.** As indicated in the prospectus of this debenture issue an alteration in the company's articles of association to increase the present borrowing powers of the directors will be proposed for your sanction at the annual general meeting on June 11th.

In that prospectus the opinion of your directors was stated to be that the company's consolidated gross profits for the year ending December 31, 1952, before provision for depreciation, would be of the order of £50 million; that the profits of the group in future years should be favourably affected by the increase in its crude oil supplies and the expansion of its refining capacity and tanker fleet, but that it should be remembered that profits must always be affected by variations in the general level of world oil prices: and that provided no severe drop in prices occurs and in the absence of other circumstances beyond the company's control, the consolidated gross profits before depreciation for the year 1953 should be not less than the estimate for the year 1952. So far as 1952 is concerned that opinion has been confirmed by the year's results set out in these accounts. Although profit margins are currently smaller than in 1952, this has so far been compensated for by an encouraging expansion in the volume of our trade.

THE COMPANY'S INTERESTS IN IRAN

Events regarding the company's interests in Iran since my last statement to you have been so extensively reported in the press that they can be dealt with here in summarised form.

It will be recalled that Her Majesty's Government had referred the dispute with the Iranian Government to the International Court of Justice at The Hague in May, 1951, at the same time as the company applied to

the President of the Court, under the terms of its 1933 Agreement with the Iranian Government, for the appointment of a sole arbitrator to settle the differences which had arisen. The Court had also, in July, 1951, made an Order indicating certain provisional measures which would apply pending the Court's final decision in the proceedings instituted by Her Majesty's Government. The Iranian Government for its part refused to consent to the Court or its President acting upon the applications which had been made to them, and claimed that, without this consent, the applications must fail. The procedural objections of the Iranian Government were upheld by decisions given in July and August, 1952, but neither the Court nor the Vice-President of the Court, who replied to the company's application, were concerned in any way with the merits of the dispute. **The validity of the company's claims against the Iranian Government remains unaffected by their decisions.**

MAJOR ATTEMPTS TO SETTLE DISPUTE

There have now been no less than five separate major attempts to settle the dispute. Three missions—from the company in June, 1951; from Her Majesty's Government in August, 1951, following discussions by the special representative of the President of the United States, Mr Averell Harriman, and from the International Bank for Reconstruction and development early in 1952—have visited Tehran and have tried to reach a settlement (in the case of the International Bank of an interim nature) through direct negotiations. **On each occasion their proposals were rejected by the Iranian Government. Despite this, efforts have continued through governmental channels, and these led to the submission of further proposals to the Iranian Prime Minister in August, 1952, and again this year.**

The proposals communicated on August 30th last were joint Anglo-American proposals, and were delivered under cover of a message to the Iranian Prime Minister signed by both the Prime Minister of the United Kingdom and the President of the United States. The main points were that the question of compensation for the loss of the company's enterprise in Iran should be referred in its entirety to the International Court for adjudication; and that agreement on this procedure should be followed by negotiations for the movement of oil from Iran to world markets, and by an immediate grant to be made by the United States Government to the Iranian Government to assist the latter in meeting its budgetary problem.

In its reply on September 24th the Iranian Government put forward counter-proposals regarding the basis on which the issue of compensation should be referred to the International Court. The counter-proposals included the demand that the claims of the company for compensation should be restricted to the property which belonged to the company in Iran at the time of the passing of the Nationalisation Laws, and that the company should have no right to make any further claims whatsoever. This would have expressly excluded all possibility of a claim by the company for the loss of the 1933 Agreement which was terminated unilaterally by the Iranian Government, regardless of the procedure laid down in the agreement for the settlement of differences by arbitration, and regardless, too, of the explicit undertaking contained in the agreement that it would not be so terminated. The fact is that the company has been deprived of the benefit of extracting and disposing of Iranian oil for the remaining period of the agreement, and an award of compensation based on the loss of the company's installations alone would quite fail to recognise this fact.

Her Majesty's Government rejected the counter-proposals on October 14th, reiterating that the International Court should be asked to consider all claims and counter-claims of both parties without limitation. Furthermore, they rejected a demand for payment, in advance of the hearing by the International Court, of a sum of £49 million which the Iranian Government alleged, quite incorrectly, to be owed it by the company; and pending agreement on the terms for adjudicating the question of compensation, Her Majesty's Government, on their own behalf and on behalf of the company, reserved their full legal rights.

Shortly afterwards, on October 22, 1952, the Iranian Government formally severed diplomatic relations with Her Majesty's Government.

PROPOSALS EARLY THIS YEAR

Proposals were again submitted early this year, through the good offices of the United States Ambassador in Tehran. **The negotiations were entered into on the understanding that Dr Musaddiq would be willing to have the question of compensation settled by the International Court of Justice on the basis of any United Kingdom Nationalisation Law which the Company might select, whatever the provisions of that law might be.** Had there been formal agreement on this point and on the methods for the actual payment of the award of the Court, the United States Government was prepared to make monetary advances to the Iranian Government to be repaid in oil. This oil purchase contract would have included an undertaking by the Iranian Government to enter into negotiations with an organisation of an international character, in which the company would have participated, for the purchase of large quantities of oil over a period of years. **Iran would thus have had control over its oil industry, subject only to the prior obligation to pay such compensation as the Court might adjudge proper.** This obligation could have been discharged either by payment of 25 per cent of the proceeds from Iran's future oil sales or, if agreed by the Iranian Government and the company, by deliveries of crude oil or oil products. And, under an alternative proposal, if the payments from proceeds were less in any year than five per cent of the amounts due to the company from the Court's award, Iran would have made up the difference by delivering oil to the company. **The award could thus have been discharged largely, and perhaps entirely, in the form of oil from the enormous reserves discovered by the company in Iran, and by means of the highly developed production facilities it had installed there.**

In the Anglo-United States communiqué of March 7, 1953, the United States Government described these proposals as "reasonable and fair," but once again no agreement was reached with the Iranian Government. Broadcasting on March 20th a rejection of the proposals, Dr Mussadiq set out what were reported to be his Government's proposals regarding a settlement. These were that the company should agree on a basis for the assessment of compensation which must be acceptable to the Iranian Government, or alternatively that the company should state a maximum figure for compensation which would have to be considered just by the Iranian Government. The Iranian Government would then be ready to allow the compensation issue to be submitted to the International Court of Justice and, within the limit, in effect, of the Iranian Government's own arbitrary maximum figure, would be ready to pay any compensation subsequently awarded by the Court out of the proceeds of sales of Iranian oil or by delivery of Iranian crude oil or products. As an alternative to referring the issue of compensation to the International Court, Dr Musaddiq finally suggested direct negotiations for a settlement with representatives of the company and of Her Majesty's Government.

In his same broadcast Dr Musaddiq not only refused again to allow the loss of the company's 1933 Agreement to be taken into account in the framing of terms of reference for the International Court of Justice, but he went further and asserted, not for the first time, that the Agreement itself was invalid. It is against this background, involving the company's prior acquiescence in his contentions, that Dr Musaddiq's latest proposals have to be viewed.

OBSERVANCE OF CONTRACTS A FUNDAMENTAL FACTOR

The proper observance of contracts is a fundamental factor in international trade, and Her Majesty's Government and the company have stood on the principle, well established in international law, that compensation for losses resulting from expropriation must be prompt, adequate and effective. Whilst the company would be ready to accept payment by instalments the Court must, if the principle regarding compensation is to be preserved, be free to give unfettered consideration to the company's claims in respect of the loss of the 1933 Agreement. **That Agreement remained the unchallenged legal basis for the company's operations in Iran for eighteen years, the company, on the strength of it, being encouraged to make an investment in a foreign country of unprecedented magnitude.** It had been fully discussed with senior Ministers of the Iranian Cabinet before it received the signature on April 29, 1933, of the Iranian Minister of Finance acting on behalf, and with the full authority, of his Government. The Agreement was then presented to the Iranian Majlis in full open session and ratified by that body on May 28th following, thereafter receiving the Imperial Assent. Earlier in the same year the issues which had arisen with the Iranian Government had been referred to the Council of the League of Nations, the latter appointing a rapporteur. When, on October 12, 1933, the rapporteur reported to the Council on the new Agreement which had been negotiated between the Iranian Government and the company, the Iranian representative at the Council announced his Government's entire approval. **These facts speak for themselves and entirely contradict Dr Musaddiq's contention that the 1933 Agreement was never valid.**

ILLUSORY COMPENSATION PROVISIONS

On the matter of compensation I should also make plain that the Iranian Nationalisation Laws of 1951 do no more than provide that the Iranian Government can deposit in a bank "up to 25 per cent of current revenue from the oil after deduction of exploitation expenses in order to meet the probable claims of the company," and that the Government should examine both its own claims and those of the company and submit suggestions for the approval of the Iranian Majlis.

From the outset the company has regarded these compensation provisions as illusory, and so far events have proved this view to be correct. They are not concrete measures for the effective payment of adequate compensation; they merely empower the Government of Iran, if it so chooses, to deposit in a bank up to 25 per cent of very uncertain future net revenue for payment of such compensation as it may itself judge to be rightful and as the Iranian Majlis may approve, after deduction of the Government's as yet unspecified counter-claims against the company. **Iran would become the sole judge both of its own claims and of those of the company.**

No reliance could be placed on the award and payment of compensation by methods so conjectural and so completely non-commital as those provided under the Nationalisation Laws. The company is at present dispossessed of its property, rights and interests in Iran, thereby suffering grievous losses. The Iranian Government has neither paid compensation nor agreed a satisfactory basis and procedure for the future assessment and payment of compensation, and the practical effect of the laws has thus amounted to confiscation.

ACTION TAKEN TO PROTECT RIGHTS

The company, therefore, continues to claim the title to all oil derived from the area of its operations in Iran, and has accordingly published announcements in many countries stating that it will take all such action as may be necessary to protect its rights should any concerns or individuals participate in transactions affecting such oil. Legal proceedings, as briefly described hereunder, have already been taken in Aden, Italy and Japan.

In May, 1952, a shipment was made from Bandar Mashur of a small cargo of crude oil on board the tanker *Rose Mary*. When this ship called at Aden the company instituted proceedings before the Supreme Court at Aden for ownership of the oil, and judgment in the company's favour was delivered early in January last. The defendants have a right of appeal to the Court of Appeal for East Africa in Nairobi and notice of appeal has been served on the company. In the case of a small cargo of fuel oil shipped from Abadan on board the tanker *Miriella* and discharged at Venice in February, 1953, the company applied to the local Italian Court for an order for the physical impounding of the cargo. The object of this application was to prevent the shippers from selling or removing the cargo pending a decision in the main proceedings which the company has initiated in Rome in order to determine the ownership of the oil. This preliminary application to the Venice Court was unsuccessful, but this does not involve any decision on the merits of the company's case in the Rome Courts. The company has also initiated legal action in Rome, regarding further cargoes of Iranian oil landed in Italy, and in Tokyo regarding a cargo shipped by a Japanese company.

PRODUCTION AND EXPLORATION

Crude oil production in Kuwait, Iraq and Qatar was largely increased during 1952, when our offtake from those sources of supply totalled some 25,600,000 tons, compared with 16,600,000 in 1951. During 1953 we expect to have available some 35 million tons from Kuwait, Iraq and Qatar.

Kuwait was our major source of supply in 1952, our offtake from the Burgan field being 19,820,000 tons, compared with 13,287,000 tons in 1951. The northerly extension of the Burgan field at Magwa was developed during the year and came on production in February, 1953. A test well on a subsidiary structure east of the Burgan field has indicated a further addition to the field on this flank also. Production, pipeline and tanker loading facilities are being actively developed to allow a further increase in production.

Our offtake from the Iraq Petroleum Company's production was 4,295,000 tons, compared with 2,316,000 tons in 1951. This increase in offtake has been made possible by the commissioning of the new 30-in. pipeline from the Kirkuk oilfield to the Mediterranean in April, 1952.

The Ain Zalah field of the Mosul Petroleum Company commenced production in October, 1952. The present offtake from the field approaches the capacity of the 12-in. pipeline from Ain Zalah which has been built to join the main Mediterranean pipeline system from Kirkuk. Exploration in this area is proceeding.

The company's offtake from the Basrah Petroleum Company's Zubair field was 547,000 tons. This field is being actively developed and production and pipeline facilities to the shipping terminal at Fao are being extended.

In Qatar our offtake was 775,000 tons, compared with 592,000 tons in 1951. Production facilities are being installed to increase still further the offtake from this field. A revised agreement was signed on September 1, 1952, with the Ruler of Qatar by Petroleum Development (Qatar), Limited, whereby profits from that company's operations within Qatar will be shared equally with the Ruler. You will recall that your company has a 23¾ per cent shareholding in Petroleum Development (Qatar), Limited.

The Khanaqin Oil Company produced 492,000 tons, which were sold to the Iraq Government in accordance with the new agreement described in my last statement, from the Naft Khaneh field in North-East Iraq, compared with 437,000 tons in 1951. A new well was started at Chia Surkh at the close of the year and preparations are also in hand to drill below the present producing zone in the Naft Khaneh field.

In the United Kingdom our crude oil production was 55,400 tons, compared with 45,100 tons in 1951. This increase is due to an extension of our secondary recovery operations by water injection, which is proving a most successful means of maintaining production. The search for deeper sources of oil at Formby has continued to be unsuccessful.

In Scotland, production of shale-oil in 1952 was 106,500 tons, being 2,000 tons more than for the previous year. Higher costs of supplies, principally coal, pitwood and chemicals, and increased wages and salaries, and a substantial reduction in revenue resulting from lower prices of paraffin wax, were together responsible for the shale industry operating at a loss in 1952. Conditions have, unfortunately, continued to deteriorate this year, with further increases in costs and reduction in revenue due to decreases in product prices, so that the industry is faced with an exceedingly difficult situation.

EXTENSION OF EXPLORATION ACTIVITIES

Our exploration activities in other parts of the world have been extended. In our joint undertaking **in Papua** with American and Australian interests, no commercial production has yet been found; a deep well at Hohoro was completed as a dry hole at a depth of 10,642 ft; another well at Omati has reached 13,060 ft without finding oil in commercial quantities. Geological and geophysical exploration continued throughout the year and as a result of their findings exploration is now being concentrated in the western part of the territory.

In Nigeria, in partnership with the Shell group, the first deep test well was completed without finding oil and two more are now drilling. Extensive geological and geophysical surveys have added greatly to our knowledge of the region.

In Tanganyika and Zanzibar, in association with the Shell group, concessions for exploration have been obtained and geological and geophysical surveys, including an aeromagnetic survey, have begun.

Exploration rights have been obtained by **Trinidad** Northern Areas, Limited, in which we hold a one-third interest, over a substantial marine area in the Gulf of Paria, and preparations are being made for test drilling. Preparations were also made for drilling in the Central Range Reserve.

In Sicily, preliminary geological and seismic surveys have been encouraging.

We have obtained exploration rights over two marine areas off the Trucial Coast **in the Persian Gulf;** one at Abu Dhabi and the other, in which we are associated with French interests, at Dubai.

REFINING

At our refineries in **Great Britain,** throughputs were considerably increased during 1952. Llandarcy refined 4,254,000 tons, against 3,671,000 tons in 1951, and Grangemouth 2,375,000 tons, against 1,512,000 tons. At the end of the year work was completed on the new catalytic cracking units at both Llandarcy and Grangemouth and these plants were commissioned in January, 1953. Good progress was made on the new lubricating oil plant at Llandarcy; it is expected to be in service by the middle of this year.

At Pumpherston refinery, which operates on Scottish shale oil and crude petroleum produced in the United Kingdom, throughput was 159,000 tons.

The new Kent refinery commenced operations early this year, and by March a crude throughput corresponding to an annual rate of 3 million tons was being processed, which it is hoped to increase to 4 million tons per annum by December. The catalytic cracking unit is expected to be commissioned during the second half of this year, followed shortly afterwards by the lubricating oil plant.

The company's postwar programme for increasing its refinery capacity in the United Kingdom is thus being brought to fruition. The result will be to have expanded this capacity over tenfold, from under 1 million tons per annum prewar to 10,500,000 tons per annum by the end of this year, with a corresponding improvement in the diversity and quality of products.

The British Petroleum Chemicals, Limited, plant at Grangemouth encountered the troubles often occurring in the early operational stages of complicated plant, but since the second quarter of 1952 has operated satisfactorily. The construction of the adjacent plant of Forth Chemicals, Limited, for the production of monomeric styrene had not been completed at the end of the year, but it is now in commission.

In Belgium, the refinery at Antwerp, which we own jointly with the Petrofina Company, processed 1,718,000 tons, as against 318,000 tons in 1951. Plans have been approved for a catalytic cracking unit to be installed and certain modifications to be made to existing plant which will increase the capacity of this refinery to 2,700,000 tons per annum.

In France, the refineries of Société Générale des Huiles de Pétrole BP showed a substantial increase in throughput. At Dunkirk, 1,697,000 tons were processed, as against 617,000 tons in 1951, and at Lavera 2,061,000 tons, compared with 1,814,000 tons. During the year a new lubricating oil plant was brought into service at Dunkirk, where a platforming unit for improved motor spirit production is also to be installed.

In Germany, our Hamburg refinery processed 663,000 tons, compared with 620,000 tons in 1951. Construction has commenced of additional plant, which will increase refining capacity to 1,250,000 tons per annum and improve the quality of the motor spirit production. The Oelwerke Julius Schindler refinery processed 177,000 tons of crude oil, against 150,000 tons in 1951; plant is being installed to increase the output of lubricating oils.

In Italy, the Marghera refinery of Industria Raffinazione Olii Minerali, which we own jointly with Azienda Generale Italiana Petroli, refined 1,167,000 tons of crude oil, as against 687,000 tons in 1951. The new thermal reformer was commissioned in October. A catalytic polymerisation plant, for the manufacture of high-grade motor spirit components, is at present under con-

struction, as well as plant for the production of industrial lubricants.

In Israel, the refinery at Haifa is still only working at under one-quarter of its total capacity of 4 million tons per annum, the 1952 throughput being 843,000 tons for local consumption.

The **Kuwait** refinery processed 1,272,000 tons, an increase of 115,000 tons over 1951.

In Australia, Laverton refinery at **Melbourne** throughput was 161,000 tons, against 143,000 in 1951.

Work is proceeding satisfactorily at our two large new refinery projects at Aden and at Kwinana in Western Australia. Both these refineries, of 5 million tons and 3 million tons throughput capacity respectively, are expected to be in operation in 1955.

PIPELINE AND SEA TRANSPORT

The Iraq Petroleum Company's 30-in pipeline from the Kirkuk oilfield to the Syrian terminal at Banias was completed and the first tanker loaded at Banias in April, 1952.

The Mosul Petroleum Company's 12-in pipeline connecting the Ain Zalah field to the main pipeline system at K2 pumping station was commissioned on October 1, 1952.

When I last addressed you, the British Tanker Company's fleet numbered 155 ships totalling 1,950,000 deadweight tons. Since then five old ships totalling 48,000 deadweight tons have been disposed of and one 32,000 tons ship has been added to our fleet, making its present total 151 ships of 1,934,000 deadweight tons.

Further orders have been placed for seven 32,000-ton vessels, so that we now have under construction or on order 27 ships totalling 618,000 deadweight tons, comprising twelve of 32,000, twelve of 16,000, and three of 14,000 tons. Two of the ten 16,000-ton ships on order for the Lowland Tanker Company for our service are expected to be commissioned this year.

In addition to our own fleet, we continue to have about 2 million deadweight tons of tanker shipping on charter.

The written-down value of the British Tanker Company's fleet in service at December 31, 1952, was £4 14s. per deadweight ton, and the average age per deadweight ton of the vessels was just under nine years. While the cost per deadweight ton of building tankers varies according to the size of the vessel, an average figure is now of the order of £65.

DISTRIBUTION AND SALES

Following successive annual increases of around 12 per cent in world demand (excluding the Iron Curtain countries) for petroleum products in 1950 and 1951, the expansion in 1952 slowed down to about 5 per cent, which even so necessitated the production and refining of some 30 million additional tons of oil. As there were no exports from Iran in 1952, against 14 million tons exported during the first half of 1951, the increase in world demand in 1952 involved an increase of 44 million tons from other sources. Not only was this provided, but before the end of the year there had been built up a considerable margin of production capacity.

In the eastern hemisphere, with which we are mainly concerned, the increase of consumption in 1952 was at a higher rate than the world average, being approximately 8 per cent.

The difficulties which we have been facing due to the denial to us of supplies from Iran were accentuated in the earlier part of the year by a world scarcity of tanker tonnage available for prompt chartering. This forced up the rates for the extra chartering needed to supplement our own fleet and period chartered vessels to very high levels, and further restricted our activities. **Nevertheless, the AIOC group's sales of crude oil and refined products in 1952 totalling just over 32 million tons showed a decrease of only 3 million tons, or 8.6 per cent, compared with 1951;** this comparison excludes sales made internally in Iran, and the sales of our products in Iraq which are now made on Iraq Government account. In order to achieve this volume of business we have supplemented the maximum use of our own resources both by hiring refining capacity, through which means we had some 3 million tons of crude oil processed, and by purchasing a total of nearly 7 million tons of oil mainly in the form of refined products.

Our position improved as the year progressed. We were able to discontinue purchasing crude oil early in the year, as increased supplies became available from our own group resources. Our sales in the second half of the year exceeded those for the first six months by 1½ million tons, our purchases were reduced by 1 million tons and we were able to show an increase in sales, compared with the second half of 1951, of just over 11 per cent. This increase occurred mainly in crude oil, sales of refined products being only marginally above those for July-December, 1951.

MAINTENANCE OF MARKETING POSITION

We have been principally concerned to maintain our marketing position by providing our marketing associates with supplies adequate to maintain their activity, and I am glad to be able to say that whilst we could not keep pace with the whole increase in consumption, **our sales of refined products in the markets supplied through our subsidiary and associated marketing companies were above those for 1951, though only by some 2½ per cent.** Both diesel oil and fuel oil were particularly difficult for us at the beginning of the year, resulting to our regret in some contraction in our bunkering supplies.

The commissioning of our Kent refinery early in 1953 has effected an important increase in our availability of products of our own manufacture. But the problems of supplying economically our market outlets east of Suez will remain considerable until we can bring into operation the refineries now being constructed at Aden and at Kwinana in Western Australia. These are large undertakings; construction work is being pressed forward as rapidly as possible, but we cannot expect these new plants to be on stream before the end of 1954. When they are completed, we shall, in conjunction with the expansion of our other refineries, have a total refining capacity of some 30 million tons per annum. Not only will this allow for an appreciable extension of our group's sales of products, which in 1952 amounted to just under 23 million tons, but also we shall have a chain of refineries well placed to supply our markets throughout the eastern hemisphere.

World market export prices for refined products and crude oils remained substantially unchanged throughout 1952, apart from a fall in the price of heavy fuel oil about the middle of the year. Selling prices in the consuming markets were advanced for all products in the early part of the year, due to the increase in freight rates, but as the latter declined again it was possible to reduce selling prices, which stood at the end of the year below the levels ruling at the beginning.

REINTRODUCTION OF BRANDED PETROL

In the United Kingdom, the total inland consumption of petroleum products showed only a modest rise during 1952. The consumption of motor spirit showed no increase compared with the previous year; this occurred despite there being a greater number of vehicles on the roads, and is a reflection of the high level of taxation on motor fuel, which affects all users. The oil companies, too, have a heavy burden to bear in financing the duty payments, a burden which they are not called upon to carry in such an onerous manner in other countries. We are very glad that the reintroduction in this country of branded petrol and premium grades was, after the very long gap of thirteen years, authorised to take place on February 1, 1953, thus again giving the motorist the opportunity of purchasing, if he so desires, the better quality petrol for which manufacturing facilities had been provided. The response to the reintroduction of premier grades, which represent a substantial improvement beyond the qualities obtainable before the war, has shown conclusively that this development has been welcomed. **BP Super has been exceedingly well received by the public, and I hope that our motorist stockholders have found full satisfaction from it and from our BP Energol motor oils, which, too, are winning excellent reports.**

DEVELOPMENTS IN AUSTRALIA

In Australia, we have become wholly the owners of our associated company, The Commonwealth Oil Refineries, Limited, as a result of our acquisition of the Commonwealth Government's shareholding. This acquisition came about in consequence of the Commonwealth Government finding it had not the necessary constitutional powers to contribute its share of the additional capital required to finance the necessary development of CORs distribution facilities in a rapidly expanding market. I take this opportunity of expressing our regret at the severance of a long and happy association extending back to 1920. The Commonwealth Government, together with the Government of Western Australia, have given us every possible help and encouragement over the construction of our Kwinana refinery, for which we are most grateful.

In all our markets supply difficulties have been resolutely tackled and constant effort is being applied to still further increasing the efficiency of our distributing and selling operations.

As we are at present dependent on purchases for our supplies of aviation gasoline, it has not been possible for the BP Aviation Service to continue its expansion in this field, and our efforts have been concentrated on the maintenance of our existing business and in catering for the rapidly expanding demand for aviation turbine fuel.

The BP International Bunkering Service is now represented at some 150 ports on world shipping routes. The cordiality of our relationships with so many of our shipowning friends whom we have continued to serve for very many years is a matter of particular satisfaction to us, and the bunkering business remains a most important branch of our activities.

INCREASING LUBRICATING OIL BUSINESS

Our lubricating oil business is increasing steadily. The first of the group's new lubricating oil plants came into operation, at Dunkirk, in the summer of 1952, and during the year 1953 our supplies will be augmented on the completion of the plant extension at Llandarcy. It is expected that by the early part of next year supplies will be coming also from the Kent refinery, where a large lubricating oil unit is under construction. Our BP Energol brand lubricants are now on sale in nearly all our European markets and in North Africa; plans are well advanced to introduce them in those not so far covered, and in Australia and New Zealand.

The volume of our sales during the early months of 1953 has shown an encouraging expansion. On the other hand, market conditions are more difficult. Selling prices have been reduced as a result of lower freight levels and, in addition, the more ample availability of refined products has led to very competitive conditions. Consequently, profit margins today are smaller than was the case in 1952.

RESEARCH

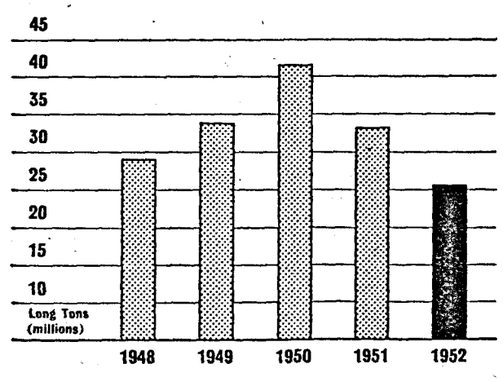
Research and development activities have been fully maintained and have resulted in important contributions towards efficient and economic operations.

Comprehensive investigations have been made at Sunbury Research Station to ensure that our new premium grade motor spirit, BP Super, is most suitable for the United Kingdom climate and for the types of motor in general use. Much research effort has also been directed towards methods of manufacture of a wide range of high-grade lubricants, for which two additional lubricating oil refining plants will shortly come into operation in our British refineries. These investigations have also been of assistance to our associated company in France, whose new equipment for the large-scale manufacture of lubricating oils was recently commissioned.

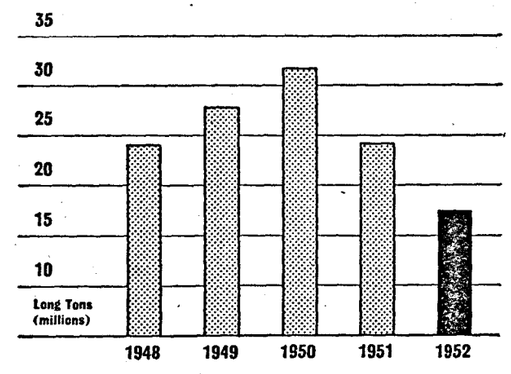
The qualities of other products such as gas turbine fuels, kerosines, tractor and diesel fuels, and fuel oils are under continuous scientific study not only in the laboratory, but in various types of equipment under practical operating conditions. Apart from the value of this service to consumers, it is of assistance to manufacturers of engines and other oil-consuming equipment.

The latest refining processes and developments are extensively tested in the laboratory and on the pilot plant scale to establish their value.

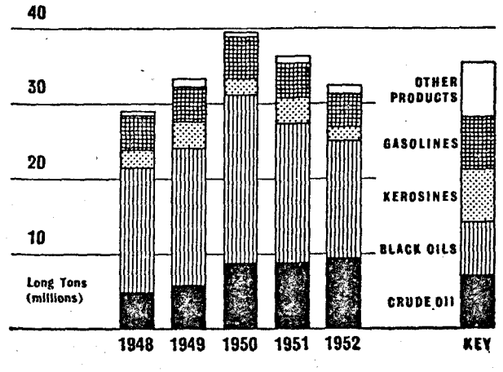
Our new "autofining" desulphurisation process, which I mentioned last year, has proved successful in operation at Llandarcy refinery, and similar plant is to be installed at Aden.



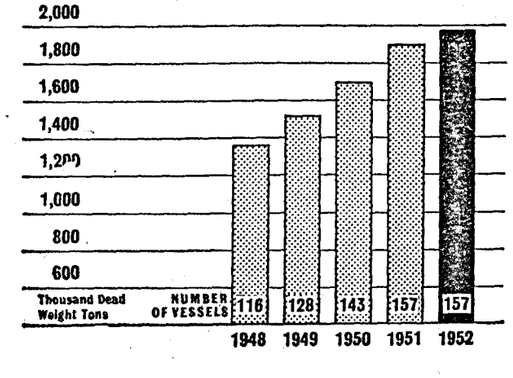
At the Kirklington Hall Research Station further progress has been made in the development of seismic survey equipment. Improved detecting and recording equipment has been designed, and is now being issued to our field survey parties. Petroleum engineering investigations have resulted in a better appreciation of the underground conditions in the oilfields in which we have interests.



ANTI-TRUST LITIGATION IN THE USA



In September, 1952, the company, through its representative in New York, received a subpoena commanding attendance before a Federal Grand Jury convened in the District of Columbia to investigate alleged violations of US anti-trust laws, and requiring the production of documents for submission to the Grand Jury. The documents required were specified in such wide and general terms as to cover, broadly speaking, every aspect of the company's business. Several United States oil companies received subpoenas in similar terms. This investigation could have resulted in the initiation of criminal proceedings against the companies or their officers.



The company applied to the District Court of Columbia to have the subpoena quashed, and in support of this application produced a letter signed by the Minister of Fuel and Power and a further document signed by the Secretary of State for Foreign Affairs, which made it clear that Her Majesty's Government considered it contrary to international comity that the company should be required, in answer to a subpoena couched in the widest terms, to produce documents which were not only not in the United States, but which did not even relate to business in that country. On December 15th the District Court granted the company's application, thus freeing the company from further participation in the case.

On April 21, 1953, the United States Attorney General announced the filing of a civil suit against five United States oil companies, charging them with conspiring to violate United States anti-trust laws. This civil action takes the place of the above-mentioned Grand Jury investigation, whose discontinuance has been announced together with the quashing of the criminal subpoenas and the discharge of the Grand Jury. The United States Attorney General stated that the question of joining other companies, United States or foreign, in the suit would be considered should examination of the

documents to be produced by the defendants warrant amendment of the initial complaint.

In this connection I hope that it is unnecessary for me to tell you that your company's position is, as it was in connection with the previous proceedings from which it was freed in December last, that its operations are conducted in strict accordance with all laws applicable to the company or to companies through which it operates.

PERSONNEL

The company seeks to promote in every way the well-being of its employees, and gives special attention to training personnel with a view to developing their maximum capabilities. This includes a programme of executive training and inter-centre transfers to provide opportunities for wider experience of the many different aspects of the company's business.

I am glad to say that a substantial proportion, nearly one-third, of the 2,500 British staff expelled from Iran at the end of 1951 is now employed in other spheres of the company's organisation and those of its associated companies. The special arrangements, to which I referred last year, for assisting those employees whose services we have been unable to retain in consequence of cessation of our operations in Iran, have resulted in suitable employment elsewhere being found for over 90 per cent of those concerned. Similar assistance has been given by our Bombay and Karachi offices to Indian and Pakistani employees from Iran.

The company's personnel at home, afloat and overseas have continued to give zealous and efficient service, for which I am sure you will wish me to thank them on your behalf. The large and widespread developments described in this report reflect the skill and success of their efforts.

J. BIBBY & SONS, LIMITED

LARGER SALES OF ANIMAL FOODS

REMOVAL OF SUBSIDIES

MR H. P. BIBBY ON THE OUTLOOK AFTER DECONTROL

The thirty-ninth annual general meeting of J. Bibby & Sons, Limited, was held on May 15th at the registered office of the company, 21, King Edward Street, Liverpool, Mr H. P. Bibby, JP, the chairman, presiding.

The secretary (Mr Angus Morrice, FACCA) read the notice convening the meeting, and Mr E. T. Denton, FCA, read the report of the auditors.

The following is the chairman's review, which was circulated with the report and accounts for the year to December 31, 1952:

It will be observed that the profit shown in the consolidated profit and loss account is a little less than last year; there has been a fall in the profit of our subsidiary, Henry Cooke and Company (1932), Limited, due largely to a sharp decline in the price of paper and also to a serious recession in trade during the summer months. A small loss was incurred by Joseph Thorley Limited, a new subsidiary to which I refer in another paragraph.

The possibility of profits being adversely affected by a drop in the value of stocks held is one that has to be faced and the fact that the prices of many of our products are still five or six times above their prewar level suggests that reductions may be expected. The brighter side of the picture is that every decline in the price level eases the difficulty of providing finance.

The consolidated profit and loss account includes the profit of Twyford Mill Limited for the half-year January-June only, as the accounting year of this company ends, so far as 1952 is concerned, at June 30th. Joseph Thorley Limited enter into the consolidated profit and loss account as from July 1st. The accounts of all the companies in the group will in future be closed at the end of December each year.

ALTERATIONS TO SHARE AND LOAN CAPITAL

An issue of £1,450,000 5 per cent debenture stock 1966/81 was made in June for the purpose of providing capital for the purchase and financing of Twyford Mill Limited and Joseph Thorley Limited, and for providing capital of a more permanent nature to reduce the bank overdraft.

A bonus issue of 1 million fully paid ordinary shares was made to the ordinary shareholders in July with the object of bringing the equity capital of the company into closer relationship with the value of the assets owned by the company.

THE YEAR'S TRADING

The year's trading has been reasonably satisfactory and our sales of animal foods have increased slightly, in line with national sales. We are still acting as manufacturing agents for the Ministry of Food in seedcrushing, oil refining and the manufacture of compound cooking fat; the total national crush has remained at about the same level as last year and we were allocated approximately the same share of it. In oil refining and compound cooking fat our allocations were considerably less than in 1951 owing to the import by the Ministry of Food during the year of large quantities of lard.

The soap industry still remains highly competitive and vast sums are being spent on advertising by the large soapmakers. However, the reorganisation of our soap department, which took place in the latter part of 1951, is now having some effect and we are hopeful that our trade in soap will again become a profitable side of our business.

SUBSIDIARY COMPANIES

I have already referred to Henry Cooke and Company (1932) Limited under the heading of accounts, but it will be of interest to shareholders to know that new plant is in course of installation, which will substantially increase this company's output and also allow of a greater variety of paper to be made. The new development will come into operation in 1954.

Twyford Mill Limited, whose ordinary shares were acquired in January, 1952, has increased sales during the year and much work has been done in bringing the parent company's sales organisation into full employment for the sale of seeds and reorganising the Twyford sales force so as to combine the selling of seeds and animal foods into one organisation. The prospects for 1953 are good and we can reasonably expect a further increase in trade.

In June of this year our company bought the ordinary shares of Joseph Thorley Limited, the well-known and old-established firm of cattle food manufacturers in London. This company has premises at King's Cross and Wandsworth, and the latter are situated on the south side of the Thames and have excellent rail and water facilities; it is our intention to equip them as a modern mill for the manufacture of animal foods, thus putting into further effect our policy of dispersing this manufacture so as to reduce to a minimum the transport charges between the mill and the farmer.

When this work has been completed we shall be manufacturing feeding stuffs at Liverpool, Dunball in Somerset (which was in partial production during the year and will be in full production during 1953) and London, thus giving a more economical deployment of manufacturing resources. The new directors of Joseph Thorley Limited are J. W. Bibby, chairman; C. T. Higgins, managing director; J. K. Bibby, H. Mason Bibby and N. M. Bibby.

PROSPECT

Members will have already read in the press that on April 1st of this year the subsidies on animal foods were removed and that at the end of July rationing will be abandoned. There will still be some control over the buying of raw materials, especially from hard currency areas, but the industry will, after thirteen years of strict control, be virtually free from August 1st of this year.

We are therefore entering upon a new phase so far as animal foods are concerned, but with confidence that we can meet any difficulties that may come with it and that free enterprise will in every way be more satisfactory both for the consumer and for the industry.

Control over seedcrushing and oil refining will still remain, but within the next twelve months there may be a partial decontrol of compound cooking fat and in that case branded cooking fat will again be on the market. Preparations are well advanced for marketing "Trex" which, as will be remembered, was a household word before the war.

The decontrol of animal foods will bring with it a new financial burden and the high prices ruling must always involve the danger of incurring a stock loss, to which I have referred in another paragraph. For the latter reason alone I feel it would be rash to make any forecast for 1953.

PERSONNEL

It has been truly said that the highest end of government is the culture of men, and it would be equally true to say that the highest end of industrial management is to produce men of enterprise and initiative, and men having a keen and critical sense of good workmanship. If this end is kept well in view, industrial efficiency and industrial progress tend to follow as a matter of course.

With these few words I am glad to refer, as I have in the past, to the happy atmosphere which pervades our organisation and to express my keen appreciation and that of my co-directors, of the work of all those who have contributed, wherever they may be, to the success of our undertaking.

The report and accounts were adopted; the proposed final dividend of 2½ per cent, less tax, making 5 per cent, less tax, on the ordinary shares for the year was approved; the retiring director, Mr J. K. Bibby, was re-elected and the remuneration of the auditors, Messrs Edward Denton & Son, was fixed.

THE PRUDENTIAL ASSURANCE COMPANY LIMITED

In the course of his remarks at the annual general meeting, Sir George Lewis Barstow, KCB, chairman of the company, said:

THE RISE IN INTEREST RATES

During 1952 the measures which the Government took to deal with the country's serious overseas trading situation have gradually become effective and, aided by a favourable movement in the terms of trade, have produced a welcome improvement in our balance of payments. A higher level of interest rates was one of the measures adopted in support of the credit restriction policy, and it was to be expected that these higher rates, with their corollary of lower market values, would persist for some time. This, indeed, has been the case.

In these conditions we decided that it would not be desirable to continue to value our liabilities on the basis which was adopted in 1947, when very low interest rates were current. To have done so would have been to retain the imprint of those abnormal conditions upon our affairs. Therefore, on the advice of the Actuary, the valuation of our assets and liabilities has been made in a way which is more in keeping with current circumstances. This results in what I may call a realignment of our accounts.

The changes in the valuation bases have been made effective, as from the beginning of 1952. The whole of the amounts released—nearly £10 million in each of the Life Branches—have been transferred directly to the respective investment reserve accounts, where they have been employed to reduce the balance-sheet values of the assets. Therefore, no part of these amounts has fallen into surplus and the effect of the changes has not been to weaken the company's position.

INVESTMENTS

As chairman of the largest life office in this country, I feel it is my duty from time to time to remind you of the care we devote to our investment responsibilities. The investment of accruing funds is a vitally important part of the conduct of the business of life assurance, and the careful scrutiny and investigation of every proposition put to us is in the hands of officials of long experience in these matters. The control and direction of investment policy is the aspect of our business to which your directors devote the greater part of their time and thought.

The basic criterion which governs our financial policy is that investments must be made in the interests of our policyholders. We cannot ourselves create opportunities for investment; we can only take advantage of such as present themselves. We do seek, however, to maintain a widely spread distribution of investments yielding the highest rates of interest compatible with security to our policyholders. The success we achieve is a major factor in improving the bonus additions to our with profit policies.

Owing to the heavy burden of taxation on private incomes, an increasing proportion of private savings is canalised through the life offices. It is in the national interest that capital should be provided for the expansion and modernisation of the industry of this country. We are ready and anxious to play a full share in the finance of productive enterprise provided it is financially sound. No industry can be the worse for being on sound financial lines. In fact, any undertaking which is not operated on a sound economic basis must prove detrimental to the true national interest.

Our readiness to support productive enterprise is evidenced by our investments in ordinary shares in particular in 1952. These largely arose out of the new issues which were made by important industrial companies. We continued our policy of giving support to such issues, although some of these were made at times when market conditions were difficult, owing to the uncertainties arising from the nation's financial problems.

The great majority of the cases where we provide new finance must have received the approval of the Capital Issues Committee and must therefore be assumed to conform to the national interest. It is important to realise that the Government, through the Capital Issues Committee, exercises a considerable measure of restriction over the purposes for which new money can be raised. Should, however, the Government seek at any time to exercise positive control over the investment of insurance funds, a real danger to policyholders' interests would arise.

Bearing in mind the growth of life insurance funds, it may be asked whether the terms which industrial and other borrowers may be required to accept for the capital they wish to raise will not be unduly onerous. It must be remembered that these funds are distributed amongst approximately 80 offices which compete amongst themselves in seeking suitable investments. The industrial borrower is much better placed in dealing with this number of competing investors than he would be if this large section of the funds available for investment were combined in one State-controlled organisation. The need for life offices to invest their funds is strong and pressing, probably as strong as is the need which industry has for raising money. In these circumstances there is no reason to suppose that the terms negotiated tend to be more favourable to the lender than to the borrower. I assure any who do not know, that the City of London provides an active and competitive market for capital. This competitive market applies whether new capital is issued to the public or placed privately. The borrower is always free to pursue the method which suits him best and he only chooses a private placing if he is satisfied that such a course is to his advantage.

There appears to be a widespread belief that because of the admitted shortage of national savings there must be a lenders' market in the investment world; that too much investment potential must be chasing too little savings. Our own experience as long term investors is rather the reverse. At no time in the last few years have we been in the position of turning away sound offers of investment because of a shortage of funds on our part.

This experience does not necessarily conflict with the fact that savings have been inadequate, as a considerable amount of capital expenditure has been financed out of liquid resources or by short term borrowing by the Government and others. Greater savings are needed not only to keep inflation in check but also to make possible a larger amount of capital expenditure on the expansion and modernisation of industry so necessary to the future prosperity of the country. Our experience does, however, dispel any illusion of a queue of would-be borrowers at our door.

ORDINARY BRANCH

For the year 1952 the directors have declared for with profit policies issued in the United Kingdom (other than group pension policies) a reversionary bonus at the rate of £1 14s. per £100 sum assured—an increase of 4s. per cent over the rate for 1951. In respect of with profit group pension policies a compound reversionary bonus has been added to pensions which have not yet commenced at the rate of £1 10s. pension per £100 deferred pension—an increase of 5s. per cent over the rate for 1951—and the special final bonuses, added when pensions are commenced, are maintained at £9 pension per £100 pension in the case of males and £11 pension per £100 pension in the case of females.

It always gives us pleasure to increase the rates of bonus, particularly when the increases are as substantial as those I have just mentioned. In this tangible way we demonstrate that life assurance is a business in which the consumer shares directly in increased prosperity. I would like here specially to commend to employers our group pension scheme with participation in profits. This Prudential innovation was launched two years ago in the belief that it would prove to be highly advantageous to the public.

This scheme has the fundamental advantage of a sound basic principle which operates in the interests of both the policyholder and the company. It may be insufficiently realised that it is completely adaptable to varying pension requirements. For example, it is equally convenient to arrange a scheme of fixed and guaranteed benefits wherein the profits serve to reduce the cost to the employer as it is to arrange a scheme under which the cost is fixed and the profits augment the pensions. Whichever of these arrangements is adopted, we believe that our scheme is unrivalled as a means of providing pensions through insurance contracts and we welcome all inquiries.

OVERSEAS LIFE BUSINESS

For the twelfth successive year a record volume of new life business was written overseas. The expansion of our overseas life business in recent years has been rapid and new sums assured written overseas in 1952 were more than double those written as recently as 1947. Sums assured, including bonuses, in force overseas now exceed £270 million.

INDUSTRIAL BRANCH

In speaking to you a year ago I had to report an unfavourable mortality experience in this branch for the year 1951, mainly as a result of the severe influenza epidemic in the early part of the year. On this occasion I am glad to be able to tell you that last year the mortality experience was particularly satisfactory. Our nation-wide business in this branch naturally reflects both the stability and the fluctuations in the mortality rates of the population as a whole.

The directors have declared a reversionary bonus in respect of the year 1952 at the rate of £1 8s. per cent on all participating policies. This is an increase of 2s. per cent over the rate for the previous year.

The allocation to policyholders in this branch from last year's surplus was over £7½ million. Since the inception of the profit-sharing scheme 45 years ago these allocations have amounted to over £114 million. The amount of bonus paid on claims by death and maturity in this branch last year represented an average addition of over 19 per cent to the sums assured payable under the policies.

APPORTIONMENT OF PROFITS IN THE LIFE BRANCHES

When the proposals for the revised Articles of Association were submitted to the shareholders in January of last year, your directors informed the shareholders that it was not expected that profits in either branch

would expand sufficiently in the immediate future to permit appreciably more than 90 per cent to be allocated to policyholders and at the same time to enable proper provision to be made for shareholders, but that it was expected that in the course of time some increase in the policyholders' participation would be appropriate.

In the event, we have already been able to announce such an increase. The distributable surpluses for 1952 in both the life branches have been allocated in the proportions of approximately 90.6 per cent for policyholders and 9.4 per cent for shareholders.

GENERAL BRANCH

The underwriting results for 1952 were slightly less favourable than those for the previous year, but the fire, sickness and accident and miscellaneous accounts continued to show satisfactory profits. In the motor account our experience has been satisfactory at home, but has unfortunately again proved adverse in a number of overseas territories. The small reduction in our total underwriting surplus was offset by an increase in our interest earnings and the net surplus, excluding the amount brought forward, has increased from £414,000 for 1951 to £448,000.

Although the severe floods of last February are in the strict sense outside the scope of a review of 1952, there is one aspect on which I would like to comment while the incident is still fresh in our minds. Because of the country-wide spread of our staff, we had representatives in all the affected areas who, notwithstanding personal difficulties, were able to make contact with many of our insured within a few hours of the occurrence. Where necessary these local representatives were reinforced by experts from other areas, and together they gave all help possible in the settlement of claims. We have much evidence that the promptitude with which our staff acted and their willing help in other ways added greatly to the company's reputation.

INSURANCE PUBLICITY

You will, no doubt, have observed that press advertising by the insurance industry collectively is continuing. These advertisements aim primarily at maintaining and enhancing the prestige of British insurance.

For some time we have had a growing realisation of the need for a great collective effort to combat misunderstanding and insufficient knowledge of our business. The only satisfactory background to the extension of our usefulness to the community is a wider understanding of the contribution made by British insurance, in all its branches, both to the national economy and to the welfare of the individual and of industry.

I may perhaps remind you that we as a company also advertise extensively. Our field staff themselves—the actual Men from the Prudential—are our best advertisement, but the printed word has its own valuable part to play in making our service in all its varieties more widely known. I cannot claim that it makes the name of the Prudential more widely known, for that, I am sure, would be impossible.

STAFF

During the past year we have undertaken a careful and detailed review of our field staff organisation in this country. It was becoming clear that the time had arrived when a measure of reorganisation was essential in the interests of the low level of expense at which we strive to conduct our industrial business. The cost of providing home service insurance had risen because of inflationary conditions and of the attendant increases in the remuneration of our staffs in recent years.

Briefly, our plan is to increase the standing and remuneration of our field staff by a redistribution of responsibilities and a reduction in their numbers as vacancies arise. The resultant economies will have important long-term advantages both for the staff and for the company, and will do much to offset the effects of inflation on our expense ratio. I am glad to be able to tell you that negotiations have now been concluded, the plan is beginning to operate, and increases in salary for agents and section superintendents took effect as from May 4th last. Further increases in salary have been promised at successive stages in the development of the plan.

I am sure you will wish me to express our thanks to the management, officers and staff who have ably sustained the standard of the Prudential both at home and overseas.

APPOINTMENTS: The Directors have recently appointed Mr H. Proctor and Mr N. P. Harris to be Agency Managers in Great Britain and Northern Ireland.

RETIREMENT OF DIRECTORS

I must now refer to the changes which have taken place and are to take place in the personnel of the board. Last autumn, Sir George Stuart Robertson indicated that he wished to retire, and Sir Donald Fergusson was appointed in his place. As from today Sir Nigel Davidson and Mr Crump are also to retire from the Board and you will be asked to elect Sir Thomas Barnes and Mr Maurice Petherick to fill the vacancies.

Sir George Stuart Robertson was appointed to the board in 1937 soon after he retired from the offices of Chief Registrar of Friendly Societies and Industrial Assurance Commissioner. Sir Nigel Davidson came to the company in 1936 after a distinguished legal career in the Near East, where he had held a number of important appointments including that of Legal Secretary to the Sudan Government. Both were valuable and agreeable colleagues and the board is exceedingly sorry to lose their services.

Mr Crump has given a lifetime of service to the company. He joined us in 1895 as a junior clerk and was early transferred to the investment department. He was appointed assistant secretary in 1925 and joint secretary in 1931. His appointment to the board on his retirement from that post in December, 1942, has enabled the company to retain the advantage of his great experience in all matters pertaining to investments. Mr Crump's decision not to offer himself for re-election is due to a severe illness. His retirement will be regretted not only by his fellow directors but by all those members of the staff with whom he has been personally associated both at work and at play.

REVIEW

And now, although I draw to the end of my speech, I must detain you a little longer to make a personal statement.

I am now entering upon my eightieth year. I have therefore decided to resign my chairmanship and my membership of this board as from tomorrow. Today will, therefore, be the last occasion on which I shall address you as your chairman and I should like to give in a few sentences an account of my stewardship.

I succeeded the late Sir Edgar Horne after his death in September, 1941, in one of the darkest periods of the World War.

During the war, with minor exceptions, we met war claims in full on pre-war policies: we declared only mortuary bonuses: nearly the whole of our investment was in support of Government loans. However, at the end of the war we were able to declare retrospective reversionary bonuses in respect of the war years.

When, in 1948, the National Insurance Scheme was introduced we lost the Approved Societies. Our own loss was not financial, but, besides occasioning us difficult problems of reorganisation of our field staff, the abolition of our Approved Societies deprived the members of a valued home service for their health insurance.

A much more serious threat came in 1949 and subsequent years with the Socialist proposals to nationalise, or as it was later called to mutualise, our industry. These proposals were accompanied by distorted and unfounded attacks by some of our critics—a painful experience to anyone who, like myself, had intimate knowledge of the care we devote to the interests of policyholders. The danger was averted, temporarily at least, by the vigorous steps taken at that time by the whole industrial assurance industry.

Last year there came the alteration in our Articles of Association whereby we further increased the participation of policyholders in the company's profits. This was another and a major step in our tradition of advancing the interests of our policyholders.

A few figures will give you some idea of the growth of the company's business during my chairmanship. Our assets at the end of 1941 were £375 million and at the end of 1952 were nearly £665 million. Our income from all sources was £56 million and is now £120 million. In some directions our expansion has been particularly striking. The premium income of our General Branch has grown from £2½ million to £11 million and that of our group pension business from £1½ million to £7½ million. In our overseas branches the combined Life and General premium income has grown from less than £3 million to £15 million.

You must not think that I am claiming for myself an undue share of credit for the expansion of our business. This has only been achieved by the combined efforts of the very large number of Prudential men and women all over the globe, but as you would be entitled to blame me for any failures, so I can hope to share, however little deserving myself, in some of the credit. These have been exciting, critical and I hope decisive years in the company's history. Although its size may always render it a tempting target for attack, the quality of the service it renders will prove its best defence, and I hope that it will be increasingly recognised as a bulwark of our national economy. I feel I am handing on to my successors a company whose achievements are not only to be measured by size and strength; it also retains the vigour and adaptability to changing conditions which are our best hopes for the years to come.

I must end these remarks with an expression of my gratitude to all who have served the Prudential during my time, not least to you shareholders who have invariably supported proposals from this platform. Next I must thank the great body of Prudential workers to whom I have already alluded. Finally, I thank my colleagues on the board of directors.

In proposing a vote of thanks, the deputy-chairman, Mr E. J. W. Borrajo, said that the news of the chairman's retirement would be received with general feelings of regret.

He paid tribute to the distinction with which Sir George had occupied the chair during one of the most memorable and progressive periods of the company's history.

He concluded by expressing, on behalf of the company, appreciation and grateful thanks to the chairman for the valuable services he had rendered over many years.

At a meeting of the board which took place after the annual general meeting the directors elected Sir Frank William Morgan, MC, to be chairman.

THE BRISTOL AEROPLANE COMPANY, LIMITED

RECORD POSTWAR GROUP SALES

AIR TRANSPORT A STAPLE NECESSITY

"ONLY AT THE BEGINNING OF MAJOR DEVELOPMENTS"

SIR WILLIAM VERDON SMITH ON THE FUTURE AND ITS PROBLEMS

The forty-third annual general meeting of The Bristol Aeroplane Company, Limited, was held on May 21st at Filton House, Filton, Bristol.

Mr W. R. Verdon Smith, MA, BCL, presided in the absence of the chairman, Sir William G. Verdon Smith, CBE.

The following is the chairman's speech.

The chairman said: Ladies and Gentlemen,—The report of the directors and the annual accounts for the year ended December 31, 1952, have been circulated and, with your permission, I will take them as read.

BOARD CHANGES

As you will have seen from the report, two additions have been made to the board since we last met. At the beginning of this year Mr W. Masterton and Dr S. G. Hooker became directors. Mr Masterton, who joined the company in 1939 and who has been secretary of the company since the beginning of 1947, has for many years played a leading part in the management of our financial affairs, and we are confident that his appointment as financial director will be of the greatest value to the company. Dr Hooker, the chief engineer of our engine division, will bring to the board invaluable technical knowledge, and we have welcomed both Mr Masterton and Dr Hooker most warmly to our number. Mr J. F. Harper, previously chief accountant, has succeeded Mr Masterton as secretary of the company.

ACCOUNTS

In dealing with the accounts today, I shall refer mainly to the consolidated accounts which cover the combined trading results and financial position both of the parent company and of our expanding group of subsidiary companies at home and abroad. These consolidated accounts now include a full year's operation of our newly formed Australian subsidiary and also of Bristol Aeroplane Engines (Eastern) Limited in Canada.

PROFIT AND LOSS ACCOUNT

All our subsidiary companies have traded profitably and sales of the group reached a higher level in 1952 than in any year since the war. The consolidated profit and loss account shows that the trading profit less depreciation for the year amounted to £1,455,631, an increase of £105,686 over the 1951 figure.

There is no exceptional item of income corresponding with the award of £125,000 for the use of designs which was credited in the 1951 accounts. The charge for taxation at £922,921 compares with £941,455 in the previous year and, after the inclusion of miscellaneous items of income and expenditure, there remains a net profit of £563,829 against a corresponding figure of £566,573 in 1951.

The taxation charge of £922,921 reflects the recent reduction in the standard rate of United Kingdom income tax but this relief is counterbalanced by the sum of £50,000 which we have provided for excess profits levy. As a result the proportion of our profits absorbed by taxation is, at 62 per cent, almost exactly the same as in the previous year.

BALANCE SHEET

The consolidated balance sheet shows several significant changes compared with a year ago. The net value of fixed assets has increased by £1,329,528 to £5,232,755 and outstanding contracts for capital expenditure amounted to £1,579,250, reflecting the continued heavy capital expenditure which we are incurring in order to be properly equipped to deal with the programmes to which we are committed.

At the same time stocks have increased by £3,206,603 to £9,354,835 and debtors are up from £3,207,610 to £4,947,235. These increases reflect both the growth of our output during 1952 and the expectation of further growth in 1953 and later years.

As a result cash balances and tax reserve certificates have fallen from £3,381,791 to £740,258, and there is a bank overdraft of £682,120 compared with nothing under this heading at the end of 1951. You will also note that we have raised in Canada during the year a sum of $1,200,000 (£449,754) on 5 per cent mortgage bonds in order to finance the construction of a new factory in Montreal.

It is to be expected that obligations under our expanding manufacturing programmes will involve a high and increasing level of investment both in fixed assets and working capital, and we expect our indebtedness to our bankers to be considerably greater in the future than it was at the end of 1952. Your board have the position under constant review but the present is not in their opinion an appropriate stage at which to seek additional permanent capital.

APPROPRIATION OF PROFIT

It is against this general background that your board have had to consider the appropriation of profits. They have decided to transfer the sum of £249,914 to general reserve, bringing the total at the credit of that account to £2,750,000.

You will see from the report that we are recommending a final dividend of 6½ per cent on the ordinary capital of £4,620,000 which, with the interim dividend of 5 per cent on the old capital of £3,300,000, makes the total dividend for the year the equivalent of approximately 10 per cent on £4,620,000.

The gross sum of £459,525 to be distributed as dividend in respect of 1952 compares with an amount of £445,500, representing the total dividend paid in respect of 1951. When making these comparisons it should be noted that the 660,000 5 per cent preference shares distributed by way of bonus issue to the ordinary stockholders on January 1, 1953, will be entitled to a gross distribution of £33,000 per annum from 1953 onwards.

REVIEW OF THE COMPANY'S ACTIVITIES

In the years since the war we have been concentrating largely upon transport aircraft and their engines, since it is clear that adequate and efficient air transport is a staple necessity of our country in peace and war alike. We are only at the beginning of the major developments to which we look forward but we are already reaping the fruit of our endeavours as you will readily observe by reference to our several projects.

THE BRITANNIA AIRLINER

Since our meeting last year the Bristol Britannia has made its first public appearance, the prototype having first flown on August 16, 1952, and having been exhibited at the SBAC Flying Display in the following month. All who saw her flying were greatly impressed by her attractive lines and her quietness: the progress of flight development justifies our belief that in Britannia we have obtained the qualities of economy, range, payload, and performance, which were the criteria of the specification which we evolved in co-operation with BOAC and with the support and assistance of the Ministry of Supply. The widespread interest which is being shown by the leading airlines of the world has already caused us to arrange a 40 per cent increase in the rate of production from our Filton Works.

Further evidence of the confidence felt in and importance attached to Britannia may be found in the "super priority" classification accorded by the Government early this year to its production. The assembly line is now taking visible shape, and we are planning to make our first deliveries to BOAC for flight development work in the autumn of 1954, followed by certification and use on their trunk routes in two years' time. Orders have also been placed by other airlines, and more are in course of negotiation.

THE PROTEUS TURBO-PROP ENGINE

As so often in the aviation field, the possibilities of developing an aircraft of inherently sound characteristics turn on engine capabilities, and in this respect we have had a most encouraging year's progress with the Proteus turbo-prop engine. In the last two years extensive experience with turbo-props has been gained by practical achievement on the test bench and in the air, our test equipment has been vastly augmented, and a policy of concentration on the development of the Proteus III—an extensive redesign of the earlier Proteus II—has yielded brilliant results.

Not only has the first phase of Proteus III development been successfully realised in the Proteus 705 now going into production, but we are already well forward with the second phase of development with the series 750 from which we are obtaining substantially increased power. On the strength of the Proteus 750 we have been able to announce a new series of Britannia aircraft possessing further noteworthy increases in payload, range and speed. The new series includes a freighter version—Mark 200, a larger passenger version—Mark 300, and a mixed passenger and freight version—Mark 250.

FUTURE OF TURBO-PROP ENGINES

These developments of the Proteus have a further significance beyond securing the immediate, and so far unparalleled, performance of Britannia. They are practical evidence that the far-reaching merits of the

turbo-prop engine can in fact be realised. It is plain that many airline operators who have been ready enough to admit the many theoretical advantages of turbo-props over turbo-jets have hitherto regretfully dismissed turbo-props as only "paper" engines, but recently the picture has changed dramatically, and the progress of Proteus development is being eagerly watched by operators all over the world. And our turbo-prop developments certainly do not end with the Proteus 750.

We are ourselves fully convinced that the turbo-prop, while retaining its economic supremacy by a wide margin, will soon be capable of providing long-distance air travel at speeds of the same order as are likely to be practicable with turbo-jets in normal airline operations.

FREIGHTERS

Production of the Bristol Freighter, with its two Bristol Hercules piston engines, goes steadily on, the rate of output having in fact been doubled during the year: valuable orders have been secured in recent months from old and new customers, notable among the latter being Trans Canada Airlines.

A new version with extended fuselage has been introduced to meet the special requirement of Silver City Airways for their cross-Channel car ferry service. New possibilities for the use of these versatile aircraft constantly present themselves and we look forward to continued sales for some time to come.

HELICOPTERS

Stockholders will be aware that for short-range operations—that is, under 300 miles—we have for several years now concentrated our attention upon helicopters. It will be recalled that our "Rotor-coach," the twin-engined, twin-rotor Bristol Type 173, made its first public appearance at the 1952 SBAC Flying Display. The Type 173 created a big and favourable impression, and has resulted in many interested enquiries. Its development is now proceeding. Meanwhile, the Bristol 171 five-seater single rotor helicopter—already familiar in Service roles as the Bristol Sycamore—will be appearing this summer in BEA colours on their London-Birmingham service, while our collaboration with BEA has also extended to the submission of design studies for much larger craft.

Development of the helicopter demands an effort which is by no means negligible and ultimate success requires the support of the services on a substantial scale. It is commonly accepted that helicopters possess unique advantages, both in peace and in war. This being so, it is unsound to depend too much upon other countries for such essential equipment when it is in our own interest as a nation to depend upon ourselves. In view of the excellent impression which the Bristol Sycamore has created wherever it has been used, we hope to see wider recognition accorded to British-designed equipment in the placing of future orders.

THE OLYMPUS TURBO-JET ENGINE

Our engine division has been making extremely good progress with the development and early production stages of the Bristol Olympus two-spool turbo-jet engine, which is currently one of the most economical as well as the most powerful aero-engine known to be flying anywhere in the world today. Evidence of the capabilities of the Olympus has just been provided by the world's altitude record of 63,668 feet, accomplished on Monday, May 4, 1953, by Wing-Commander Walter Gibb, our assistant chief test pilot, in the English Electric Canberra aircraft, with which we first demonstrated the Olympus at the last SBAC Flying Display. Stockholders will, I am sure, join with me in extending warm congratulations to Wing-Commander Gibb and all those concerned in regaining this important record. Wing-Commander Gibb's success recalls a previous altitude record gained for Bristol 21 years ago by Mr C. F. Uwins.

The Olympus engine—the first British two-spool turbo-jet—promises to be the first of a classic series which will have a long and important future: it will power the Avro Vulcan Delta-wing bomber, and thus make a major contribution to the striking power of the Royal Air Force; its development to considerably higher thrusts than those so far disclosed is, of course, proceeding at high pressure; its use and application will, we believe, extend further and further both in this country and, through our licensees, the Wright Aeronautical Corporation, in the United States of America.

GUIDED WEAPONS

Both aircraft and engine divisions have made encouraging advances in our important guided weapon programmes, and progress to date has amply justified your board's decision in 1948 to engage in this type of work, provision for which has absorbed a large part of our recent outlays on buildings and plant. At home, the scale of our effort has greatly increased during the year, whilst overseas the stage was recently reached at which we took possession of premises at Salisbury in South Australia as the base for trials at the Long Range Weapons Establishment situated at Woomera.

MOTOR CARS

The Car Division continues to progress. No doubt you have seen in the press the recent announcement of our new model known as the Bristol 403. I am glad to report that this car has been well received both at home and abroad. In the autumn of last year your company announced its intention of engaging to a limited extent in racing the 2-litre car during 1953. It is our opinion that the experience gained will prove an invaluable addition to the research and development programme already in hand.

I cannot leave the motor-car side of our interests without mention of the Chancellor's action in reducing purchase tax. While this is a welcome relief to the industry as a whole, I must remind you that even at the new rate of 50 per cent we are still carrying a heavy burden.

OTHER ACTIVITIES

In addition to the great projects to which I have already referred, we continue in the aviation field to produce the Bristol Centaurus and Hercules piston engines and to contribute to the Defence Programme one of the production lines of Avon turbo-jets; we have a large programme of aero-engine overhauls and by repairing Sabre fighters and their J.47 engines we are assisting the Royal Canadian Air Force in their admirable Nato task on behalf of the defence of Western Europe. In the armament field we have a substantial programme for each of the Services, equipping Bofors guns with Bristol control mechanisms and carrying out a number of other interesting projects.

Our subsidiary company at Weston-super-Mare had a successful year with its aluminium buildings both at home and abroad and, although the future for these buildings is likely to be affected by credit restrictions, especially in Australia and by the present cost of aluminium, the reputation of our school and hospital buildings continues to bring in new and repeat orders, whilst the activity of the plant has been increased by aircraft sub-contracts and other important Government contract work.

ROTOL'S EXPANSION

During the year our associated company, Rotol Limited, continued to expand its works to meet growing programmes for aircraft and engine accessories; the demand for Rotol propellers was sustained at a useful level despite the growing use of turbo-jet engines, and Rotol, by acquiring the remainder of the share capital of British Messier Limited, became wholly responsible for that vigorous and enterprising company's growing volume of work in the field of landing gear and aircraft hydraulics.

I cannot leave this review without referring to the recent termination of one of the company's earliest activities. On March 31, 1953, as a result of the Air Ministry's policy decision affecting many Flying Schools run on a civilian contract basis, our Flying School at Filton ceased operations after 30 years of continuous and successful work. We started training pilots before the first World War, and the Bristol schools at Larkhill and Brooklands are still remembered with affectionate regard by those who years ago learnt their flying with "Bristols." From 1923 onwards the Filton School carried on that tradition and its disappearance is a matter of regret to us all.

OVERSEAS BRANCHES

Canada: The Bristol Aeroplane Company of Canada Limited has had an extremely active year of development: aircraft exports to Canada were encouraging and our two-engine-overhaul companies expanded their turnover satisfactorily. During the year we started to build a new and up-to-date engine overhaul plant for our Eastern company; excellent progress has been made by the contractors and we have already started to occupy the plant, which will be brought into full use during the next three months. We look forward to progressive expansion of our activities in Canada.

Australia: In Australia, the newly established Bristol Aeroplane Company (Australia) Proprietary Limited has made an effective start in the development of Bristol activities in that important continent. I have already mentioned our guided weapon work at Salisbury in South Australia. In addition, as a result of further steps now being taken to consolidate aircraft and engine overhaul facilities in the Sydney area we shall be in a good position to support our aircraft products with first-class after-sales service. During the past year Bristol Sycamore helicopters went into service with the Royal Australian Navy—the latest of many links between our company and Australia stretching back to "Box-Kite" days.

Europe: Our associated company in France, SECA, continues to develop on sound lines, and parallel developments now taking place in Spain are designed to support and maintain the increasing amount of Bristol equipment in service in that country.

PROSPECTS AND PROBLEMS

You will probably agree that the picture we have presented to you today is impressive both in achievement and in prospect. Orders on hand and in negotiation: developments and expansion schemes now being or about to be initiated: longer term projects on which we are working with great confidence—all these promise a colourful future for your company. But the scale of the effort which we are making is not without hazards and problems and it is right that you should be reminded of them too.

First there is the problem of continuing

to provide the technical resources requisite for success. This is primarily a matter of money. To be internationally competitive in the aircraft industry—and it is to be hoped that our would-be nationalisers will realise that this is no sheltered "service" industry but one in which hard international competition is a dominant factor—a large company must nowadays spend a million pounds or more each year on research and development equipment alone. We need to set aside large sums to provide, for example, for engine testing in altitude conditions, for improving our knowledge of the aerodynamics of supersonic speeds, for obtaining additional development and testing of new materials and new structures, and for countless other urgent developments.

Continuing expenditure on this scale is vitally necessary if the aircraft industry in this country is to maintain the advantageous position which it has now reached as a result of the courageous and intensive research and experimental work which it has carried out in the past. Much is said, and rightly, of the technical supremacy of British engineers, but they cannot work without the best obtainable tools and resources. This is possible only if companies are allowed to retain from profits a sufficient sum after taxation to provide the funds required to meet such expenditure, which is recurring and does not by itself directly yield higher production and higher earnings.

TAXATION

Nor are the resources for research and development our only major outlay. The changing character of aircraft and aero engines requires even larger and more complex manufacturing plant, whilst the need to range ever more widely round the world in our export effort necessarily increases selling, servicing and administrative expenses, and adds further demands to working capital. It must be a matter of anxiety to all that the high level of taxation, continuing year after year, should have deprived industry of so much of its earnings.

The recent Budget concessions are welcome, but even more important is the spirit which has prompted them, for relief is needed yet—with the emphasis on incentive for industrial re-equipment—in order that the British aircraft industry may not only retain the competitive position vital to our survival, but may also forge ahead to the high achievements which we know to be possible within the next decade.

MANPOWER

A further problem is skilled manpower. We have used every fair and reasonable means at our disposal both to increase the number of our skilled men and to open a wider range of jobs to the semi-skilled. To bring men to the work local authorities have assisted us with housing schemes for key workers: to bring the work to the men we have opened two factories in Sunderland and we have recruited there a valuable group of skilled men whose output is supplementing the Patchway Works of our engine division. To bring in younger skilled men we have increased the number of our trade apprentices. Each of these measures is getting results slowly—and it is no small factor that the work itself is some of the most interesting and worthwhile in the whole of engineering—but the increase in numbers is far too slow.

This search for skilled men of course is only part of a national problem. We live by our skill—not merely by "increased productivity"—and we do not have enough of it. Employers and employed alike, each individual one of us, has a responsibility to raise the proportion of skill in our factories far higher than it is today. With this in mind your board are doing all they can to strengthen and improve our recruitment and training programmes: in particular we have started building the new Apprentices Training School to which I referred in my address to stockholders last year.

In this connection it is gratifying to report that the last few years have seen a steady rise in the standards, scholastic and general, of our trade and engineering entrants—a vital factor since we rely for skilled men to an ever increasing extent upon our own training schemes.

RISING COSTS

No review of prospects and problems in this industry today would be complete without reference to the anxiety which we, like so many others, feel regarding the rising costs of production. Whether it is the basic rates of pay in the engineering industry itself (let us hope that wiser counsels will prevail over those who are so determined to press another unrealistic claim), or the ever rising costs of the services upon which we depend, the engineering industry cannot in the competitive markets of today earn a major share of the country's bread and butter if costs are constantly forced higher and higher. The time has come for much wider realisation of this fact and for the exercise of the restraint which common sense demands.

Each of these matters—the availability of technical resources and of plant, the search for skill and the need for stability in the costs of production—is a familiar theme. But each is vital to achievement and none can be too often stressed. We have a great task ahead, and there are many risks inherent in it, but we also have a great opportunity. I hope, and indeed I believe, that we shall be worthy of the trust which has been placed in us.

TRIBUTE TO EMPLOYEES

It is my custom to conclude with an expression of thanks to our employees for the willing and enthusiastic service which is so vital in bringing success to the company. I do on your behalf express those thanks—not just to all for the work they are paid to do, but more particularly to those—and I am glad to say they are many—both on the staff and in the works who really care about the achievements of the company and who will always put out on its behalf that last ounce of effort that is the secret of success. We try to see that they get their material rewards. We hope they also know that the company is as proud of them as I believe they are of the company.

The report and accounts were unanimously adopted; the proposed dividend was approved and the retiring directors, Sir G. Stanley White, Bt, Mr C. F. Uwins, OBE, AFC, FRAeS, Mr Brian Davidson, Mr William Masterton, CA, and Mr S. G. Hooker, OBE, DPh, DIC, FRAeS, were re-elected.

The proceedings terminated with a vote of thanks to the chairman, directors and staff.

BEYER, PEACOCK AND COMPANY

(Locomotive Builders and General Engineers)

RECORD ORDER BOOKS

The annual general meeting of Beyer, Peacock and Company, Limited, was held on May 20th in London, Mr Harold Wilmot, CBE (chairman and managing director), presiding.

The following is an extract from his circulated review:

The consolidated balance sheet shows a liquid balance of £1,191,676, as compared with £1,099,171 at the end of the previous year. It will be observed that revenue reserves, which at December 31, 1951, were £1,045,239, have increased to £1,176,322.

The group profit and loss account for 1952 shows a profit of £448,364 before tax. This is a reduction of £56,374 gross, as compared with the previous year. It will be remembered that in reviewing the accounts for 1951 it was stated that steel supplies in the first quarter of 1952 were disappointing, but had subsequently improved. This improvement was maintained during the year and rationing of steel is expected to end in the near future.

In view of the disappointing conditions in the early months of 1952 the results for the year may be regarded as satisfactory. Provided there is no deterioration of essential conditions it is reasonable to expect better results for 1953 and, indeed, the profit budget for the current year indicates a modest improvement. It is gratifying again to report group order books at record high levels.

ADDITION TO GROWING RANGE OF PRODUCTS

In the summer of 1952 all the shares of Fyna Industries, Limited, were purchased by our subsidiary company, Richard Garrett Engineering Works, Limited, out of its own liquid resources. Fyna Industries, Limited, are well known for their range of hammer mills (agricultural and industrial) and protein extractors. It is the opinion of your directors that we have secured an eminently suitable addition to the growing range of products of our group. The operations of Denings of Chard, Limited, the assets of which were purchased from receivership at the end of 1951, were hampered in the early part of 1952 by steel rationing and also by the necessity for the rehabilitation of the name of the company with local sentiment, with suppliers of materials, and with buyers. Under all the circumstances it is satisfactory to record that the reorganisation and rehabilitation of the company were accomplished in 1952 without loss. Production at Chard is being stepped up as fast as balanced supplies can be procured. Progress so far in 1953 may be regarded as satisfactory. During the summer of 1952 a further small factory (Anchor Works) at Deal was acquired. It is now being tooled for special production and full output should be achieved by the end of this year. Our associated company, Metropolitan-Vickers—Beyer, Peacock Limited, operated throughout 1952 mainly on electric locomotives for Brazil, and made a reasonable profit.

It is the intention of the board to seek your approval of a resolution to increase the authorised capital of the company from its present level of £1,300,000 to £2 million. The necessity for ample liquid resources is obvious. During recent years considerable expansion has been undertaken. The cost of consolidation and development is not yet at an end, and further expansion may well be found desirable. Some new machinery is needed to improve productive processes at Leiston and Chard, as well as at the locomotive factory at Gorton. Stocks of materials and work in progress must be carried at prices which are much in excess, volume for volume, of what they were some years ago. An increase of the authorised capital in terms of the resolution will enable the board to take such steps as may be considered necessary to increase the issued capital of the company should occasion so require.

The report and accounts were adopted and the proposed final dividend of 3½ per cent, plus a bonus of 4½ per cent, making 12 per cent, less tax, for the year, were approved, and the proposed increase of capital was sanctioned.

SUN INSURANCE OFFICE

EXCELLENT RESULTS

MR C. G. RANDOLPH'S STATEMENT

The chairman opened his statement to the shareholders by a few words by way of appreciation of the high value of the services rendered to the Office by Mr W. M. Pryor, DSO, DL, during his nine years in the chair, following twenty years as vice-chairman. He referred with deep regret to the death of their director, Commander Sir Robert Micklem, CBE, RN, and to the further loss by death of a number of loyal friends who had served the Office as members of local boards or advisory committees, mentioning particularly Sir Montague Burton, LLD, FRSA, a member of the Yorkshire board, Mr James Wilson, OBE, a member of the Canadian advisory committee, and Mr F. J. Smith, of the West End board.

Premium income had again advanced as would be seen from the figures given below:

	1952	1951
	£	£
Fire	6,762,364	6,445,516
Accident ...	7,138,669	6,465,686
Marine	1,548,648	1,345,600
	£15,449,681	£14,256,802

FIRE BUSINESS

Much of the year's increase in premium income, amounting altogether to £316,848, came from connections overseas. In the USA there was, however, some recession. The claims experience was again good, although showing an upward trend, at 42.83 per cent of the premiums, compared with 40.72 per cent last year.

The unprecedented disaster on the eastern sea-board of this country, with its counterpart in Holland and Belgium, on January 31-February 1, 1953, was still too recent to be able to assess fully the resulting loss, but the Office had dealt with 1,500 claims. The figures naturally did not appear in the accounts, but it was bound to have a marked effect upon the total fire and accident transactions for 1953.

As a result of the transactions of the year, there remained a margin of profit of £864,677—again a record for the Office—and all sections of the fire organisation helped to secure this satisfactory achievement.

ACCIDENT ACCOUNT

Premium income in the accident account was buoyant, with an increase of £672,983 over the total for 1951. A large part of this was directly traceable to the application of higher motor insurance rates. Although this had had a material influence in checking the adverse experience in this section of the business, results were not yet by any means satisfactory. Employers' liability insurance results in this country, although somewhat improved, were still substantially adverse, notwithstanding an increase in rates.

In other sections of the accident business the outcome of the year's trading had been eminently satisfactory. The aggregate accident profit amounted to £217,094, or 3.04 per cent.

MARINE ACCOUNT

Marine premiums advanced by £203,048 to £1,548,648. Claims paid had risen from £933,554 to £1,058,720. The outlook in regard to hull settlements being so obscure, it had been felt wiser to make no transfer this year to the profit and loss account, and the fund at the end of the year stood at £2,136,739, representing 137.97 per cent of the year's income.

PROFIT AND LOSS ACCOUNT

The transfers from the two Revenue accounts totalled £1,081,771. Interest dividends and rents, less income tax, increased to £404,173. The total cost of taxation in 1952 amounted to over £1,300,000. Overseas taxes accounted for £568,923, of which only £85,710 appeared in the profit and loss account, as it was the practice of the office to charge overseas taxes to the individual revenue accounts, except in so far as they related to interest. United Kingdom taxation, inclusive of taxes on interest, absorbed more than £745,000. Contributions to the staff pension fund and the staff widows' and orphans' fund together called for £225,591.

There had been definite indications for some time that a number of currencies, if not already falling, were showing a tendency to fall in value in terms of sterling. The directors had, therefore transferred £150,000 to the Foreign Exchange account against this contingency.

An interim dividend of £136,500 had already been paid, representing 2s. 2d. per share, less tax, and the directors now declared a final dividend of 2s. 10d. per share, less tax, at a cost of £187,000. The book value of the investments amounted to £17,166,339, an increase of £1,352,575. The market value of these investments in the aggregate was substantially higher.

The chairman concluded the statement by extending thanks to all staff at home and overseas, and to the advisory committees, local directors and other representatives throughout the world, for the splendid way in which they had contributed to the very satisfactory accounts now before the shareholders.

EQUITABLE LIFE ASSURANCE

RECORD NEW BUSINESS

Sir William Elderton, the President, was in the chair at the one hundred and ninety-first annual general meeting of the Equitable Life Assurance Society held on May 20th in London. The following are extracts from his speech:

New business is once again a record for the Society. New assurances for £4,600,000 were written in 1952, an increase of about £100,000 over the figure for the previous year.

I may mention that we have introduced a new type of contract called the "personal pension policy" which should appeal to those wishing to provide for their retirement; also we have been able to reduce our rates of premium for term assurances and "family income" policies. Claims by death at £419,000 were nearly £75,000 higher than in the previous year; nevertheless the cost is at present running at less than two-thirds of what would be expected from the tables of mortality used. The funds are now little short of £25 millions. The Stock Exchange securities are carried in the balance sheet at middle market prices on December 31, 1951 (the date of the last valuation) or at or under purchase price if bought since that date. Their market value on December 31, 1952, was £400,000 lower but the value of the assets as a whole was in excess of the value at which they stand in the books. Our subsidiary companies continue to prosper. The rate of interest earned by the funds shows some improvement at £4 18s. 4d. per cent before, and £3 19s. 8d. per cent after, deduction of tax. The ratio of expenses to premiums fell to 6.3 per cent. This is the first occasion on which the Society's total premium revenue has exceeded £2 millions.

THE LONDON ASSURANCE

MR R. OLAF HAMBRO ON YEAR OF FURTHER PROGRESS

The annual general court of The London Assurance will be held on June 10th in London.

The following is an extract from the statement circulated by the governor, Mr R. Olaf Hambro:

Once again it is my pleasure to report a substantial increase in the aggregate volume of our business, the premium income for the year from all sources having amounted to £17,714,000 as against £16,269,000 for 1951. The year 1952 saw a marked check to the inflationary trend which has prevailed since the end of the war, and it is fair to say that the increased revenues earned during the year reflect genuine expansion and consolidation of the progress made during previous years.

Of the individual accounts, the fire account remains much the largest, with a total income of £7,797,000 as compared with £7,298,000 for the previous year. The profit of £538,399, or 6.9 per cent of the premium income is not quite so good as that for the previous year, which amounted to £541,722, or 7.4 per cent.

In the accident account, there has again been a large increase in income, the figure being £4,452,000 as against £3,718,000 for 1951. For 1952 the accident account as a whole again shows only a modest profit, the amount available for transfer being £105,096, or 2.4 per cent of the premium income.

Marine Account: With premiums virtually unchanged at £3,597,000, claims paid have risen by no less than £300,000 showing a percentage of over 70 per cent as against 63 per cent for the previous year. The amount transferred to profit and loss account is £250,000. After making this transfer, the balance remaining in the fund at the end of the year will amount to over £5 million or 139.7 per cent of the premium for the year. We have been able to transfer £250,000 from the marine account to the profit and loss account, while at the same time strengthening the fund by more than 10 per cent.

Turning now to the profit and loss account. The net result for the year is a profit of £767,000, as against £560,000 for 1951, of which £487,000 is dealt with in the accounts of the London Assurance, and £280,000 retained by the subsidiaries. The directors propose to make a total distribution of 12s. 6d. per share on the ordinary capital as compared with 10s. last year.

LIFE DEPARTMENT'S EXCELLENT YEAR

I will now turn to the life account, in respect of which I am glad to be able once more to report an excellent year, the new business written having again exceeded all our previous records. For 1952 the total sums assured written during the year amounted to £6,048,000 as against £6,024,000 for the previous year, and the total premiums for the year showed a substantial increase at £1,845,000 as against £1,708,000. Interest earnings again showed a satisfactory improvement, the net income being £583,000, which represented a gross rate of interest of £4 11s. 7d. against £4 10s. 11d. for 1951, and a net rate of £3 8s. 3d. against £3 7s. The fund at the end of the year, at £17,894,000, shows the very substantial increase of over £1 million as compared with last year.

The balance sheet shows that in the aggregate, after bringing into account the life funds, our assets amount to the very substantial total of £45,574,000.

NEWTON, CHAMBERS AND COMPANY

ALL-ROUND INCREASE IN TURNOVER

SIR SAMUEL ROBERTS ON THE CONTINUED PROGRESS

The ordinary general meeting of Newton, Chambers and Company, Limited, was held on May 14th at the Royal Victoria Hotel, Sheffield, Sir Samuel Roberts, Bt (the chairman), presiding.

The secretary (Mr R. J. V. Wheeler, TD) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended December 31, 1952:

The gross profit for the year was £671,973, compared with £577,292 for the previous year: the net profit, £152,696, comparing with £201,992. This substantial reduction in the profits available for distribution is due to greatly increased tax liabilities and a higher reserve for the replacement of fixed assets.

While profits before deduction of depreciation, etc., were £126,909 greater than the previous year, taxation was £143,977 higher—that is, £17,068 more than the increase in profit.

The amount added to the replacement of fixed assets reserve has been increased from £67,773 to £95,390 and accounts for £27,617: this, unlike ordinary depreciation, is not allowed as a deduction from taxable profits, resulting in both income tax and excess profits levy being chargeable thereon.

This reserve, as in the past, has been deducted from the gross profit as I think it is more realistic to show it in this way. While it emphasises the inadequacy of the present wear and tear allowances permitted by the taxation authorities, the final results would have been exactly the same had the amount of £95,390 been transferred from the profit and loss account balance.

Taxation liability for the year increased by £143,977 (from £375,300 to £519,277), due to the excess profits levy—now, I am glad to say, withdrawn as from the end of December next—and taxes on the amount put to the replacement of assets reserve already alluded to, the result being that of the net profits, before taxation, of £671,973, no less than 77 per cent goes to the Collector of Taxes. In these circumstances it is satisfactory that we can maintain the dividend and increase the carry forward by £45,754. The present Finance Bill will give us considerable relief and encouragement for future efforts.

CURRENT ASSETS

The current assets, at £3,222,742, exceed current liabilities by £1,420,563.

Allocation of Profit: Employees' Profit Share Bonus—Once again the trading results reflect a noteworthy achievement of the management and workpeople of your company. Your directors have, therefore, once more provided in the account an extra week's wages, £27,669 (distributed at Christmas as before), as a profit share bonus for all employees of the company.

Dividend—Your directors recommend a final dividend of 17½ per cent, making 25 per cent for the year, which amounts to a little less than 6 per cent on the capital employed in the business. This dividend will be paid, after deduction of income tax, at the rate of 9s. in the £, in accordance with the Budget proposal.

CAPITAL

The difficulties of agreeing our subsidiary companies' claims to compensation for the nationalised collieries and coke ovens have not yet been overcome, and I cannot yet say when the capital structure of your company can be revised. Your directors, however, feel justified in recommending that a further £50,000 of the reserves shall be capitalised and distributed among shareholders in the proportion of one new share for every 15 now held and the necessary resolutions will be submitted at the meeting.

Still further progress has been made in the re-equipment of our excavator works, and a second mechanised foundry unit in the light castings department is nearing completion. Expenditure on works, plant and machinery during the year is shown in the accounts as £115,992 and included the cost of providing the new college for apprentices and the foundry baths which, you will recall, were opened by the Minister of Labour in April last year.

We were committed to capital expenditure to the value of £152,039 at the date of the accounts, the bulk of which is for increased production facilities at our excavator works.

CHEMICALS DEPARTMENT

Increased sales of Izal, Zalpine and Izal toilet paper, together with the successful introduction of Zalpon, the new soap for use with our patent dispenser, have once again achieved a record turnover in this department. Reductions in the price of paper were immediately passed on to the public in the form of reduced prices for our toilet rolls and packs and we believe that this policy has been appreciated by our distributors and the general public.

The profits for the year were appreciably higher than last year and once again we can congratulate the excellent sales and production teams which, under the direction of Mr P. J. C. Bovill, are making year after year profitable use of the new buildings and equipment which have been provided.

HEAVY CONSTRUCTION DIVISION

The previous records of turnover and profit were both surpassed in 1952 in the face of anxieties and difficulties occasioned throughout the year by shortages, particularly of steel. Despite the increases in national steel production the available supplies of steel plate are still considerably short of industrial requirements. It is, therefore, all the more creditable that these excellent results have been achieved by the combined efforts of managers, foremen and craftsmen under the leadership of the general manager, Mr G. G. Ibbotson.

LIGHT CASTINGS DEPARTMENT

Commendable efforts on the part of Mr F. H. Hoult and his staff have secured a very substantial increase in turnover. The popularity of "Redfyre" stoves and similar products has shown itself in greatly increased sales which have been met by the achievement of higher rates of both production and assembly. An additional mechanised foundry unit is nearing completion in this department which, when in operation, should further reduce the costs and thus increase the overall profit. Although the profit for the year did not quite equal that of the preceding period this was in a large measure due to expenditure on improvements from which the benefit is expected to accrue in succeeding years.

MOBILE ENGINEERING DEPARTMENT

Our excavator business has had a most successful year and both turnover and profit exceeded the results of previous years. Our new 1½-yard machine has been in the field for nearly 12 months and is steadily enhancing our reputation as excavator builders. Substantial progress is being made with the extensions of the works and it is expected that by the end of the year a ¾-yard model will be in production to meet the demand for a smaller machine. A very satisfactory export market is being developed and the general manager, Mr R. J. Palmer, and all associated with him in the works, office and sales organisation have done an excellent year's work.

THORNCLIFFE SERVICES DEPARTMENT

The co-ordination of the headquarters services departments under the general managership of Mr L. Godber has been fully justified and there is no doubt that the reorganisation of these many ancillary activities under a unified control has resulted in greatly improved services being rendered to the production departments.

SUBSIDIARY COMPANIES

Thorncliffe Coal Distillation, Limited, has paid the full preference dividend and the customary ordinary dividend of 1s. per share for the 12 months ended December 31, 1952.

N.C. Thorncliffe, Collieries, Limited, showed a small profit for the year ended December 31, 1952, which has been carried forward in the books of that company.

GENERAL

Mr S. C. Tyrrell, our chief accountant, has this year had the great honour of being elected the national president of the Institute of Cost and Works Accountants.

Mr A. W. Grogan, who has been our efficient and respected secretary for 22 years, retired at the end of March, and we would convey our good wishes to him and his family for a happy retirement.

In his place we have appointed Major R. J. V. Wheeler, TD, a solicitor, as secretary of the company.

During the year our managing director, Sir Harold West, was elected the 315th Master Cutler of the Company of Cutlers in Hallamshire, an ancient and honourable public office traditionally carrying the right to speak for industry in Sheffield and district. After a lapse of 18 years we are thus once more able to entertain at Thorncliffe the guests from all over the country attending the Master Cutler's Feast.

Sir Harold West has also been appointed chairman of the Board of Governors of the Loughborough College of Technology, an institution specialising in engineering technology and management.

We tender our congratulations to Sir Harold on these appointments and wish to thank him for all that he has done in bringing about the excellent results disclosed by the accounts.

We also would desire again to thank our local directors, managers, staff and workpeople for another year of most successful endeavour.

The reports and accounts were adopted and the dividend of 17½ per cent, making 25 per cent, less tax, for the year, was approved.

MANAGING DIRECTOR'S REMARKS

Sir Harold West, managing director, proposing the adoption of the dividend, said it had been a successful and happy year from every point of view including that of the Chancellor of the Exchequer. Those who had been busy "making the thought come true" must have had special satisfaction. One sensed a change of economic atmosphere to which the traditional strength of those firms with a great variety of operation was best able to accommodate itself.

The steel position was difficult, ranging from super abundance of tin plate to shortage of steel plate, but normally such difficulties righted themselves over a reasonable period.

Newton, Chambers tried to provide at least one surprise a year and this year it was the Exhibition, by means of which it was possible to show Thorncliffe to Thorncliffe and of course to the shareholders and guests of the company. Sir Harold added that it had been a strenuous year for himself. He had tried to be a good Master Cutler and hoped that in the process he had become a better managing director.

Major Peter Roberts, MP, seconded, remarking that the company had tried hard to meet the views, as to limitation of dividends for instance, of the Chancellor of the Exchequer, who for his part had certainly been helpful with a reduction of 6d. in the income tax.

Mr L. W. Bickford Smith and Major Peter Roberts, MP, were re-elected directors and Messrs Blackburns, Robson, Coates and Company were re-appointed auditors.

Resolutions were passed increasing the capital of the company from £750,000 to £800,000 by the creation of 50,000 new ordinary shares of £1 each; capitalising £50,000 of the general reserve and distributing same in the proportion of one new share for every 15 held.

INNS & COMPANY

GRATIFYING INCREASE IN TURNOVER

The eighteenth annual general meeting of Inns & Company, Limited, was held on May 15th in London.

Mr Walter Wallace (joint managing director) who presided, said: For the second year in succession it is a privilege of the directors to put before the shareholders accounts constituting all-time records of the company in respect of trading profits and net profits, those for the year under review amounting to £310,184 and £242,690 respectively.

Shareholders will also note with pleasure the directors' recommendation of a bonus of 5 per cent actual on the ordinary shares, being an increase of 2½ per cent over last year's distribution, and making a total net distribution for the year of £50,885, which is another record in the history of the company.

To this I would also like to add that our total turnover shows a very gratifying increase over that of 1951, and that so far this year the business of all departments is running normally.

Taxation lays a particularly heavy hand on this company. For this year the company is liable for excess profits levy in the sum of £30,000, and as liability for this tax will not be taken off until the end of the current year, there is likely to be a large liability under this heading to be included in this current year's accounts. The charge for taxation for the year covered by the accounts amounts to £182,000, which sum is equal to approximately 15s. per £1 on the net profit of £242,690.

In 1935, the first year of this company, for each £1 which the shareholders received in dividends the Exchequer received 8s. 4½d. in taxation. In the year under review shareholders will see that for each £1 they receive in dividends, the Exchequer will be paid £3 10s. in taxation.

Your company also suffers from the injustice that in ascertaining its profits for taxation purposes, no adequate depletion allowance is made in respect of the shrinkage of its capital assets.

Last week it was intimated by the Chancellor of the Exchequer in the House of Commons that for the purposes of the excess profits levy a small measure of relief may be extended to sand and gravel pits. It is regretted that following the evidence given by your directors before the Millard Tucker Committee and the strong and clear recommendations of that Committee's Report, the Chancellor has not granted adequate and proper relief from all forms of national taxation in respect of wasting assets.

The report and accounts were unanimously adopted.

F. PERKINS LIMITED, PETERBOROUGH

(Diesel Engine Manufacturers)

RECORD TURNOVER

MR F. A. PERKINS ON OVERSEAS BUSINESS

The twenty-first annual general meeting of F. Perkins Limited was held on May 11th in London, Mr F. A. Perkins (chairman and managing director) presiding.

The following is an extract from his circulated statement:

In my statement last year, I said that the Iron and Steel Distribution Scheme would curtail our manufacturing activities during 1952. In spite of these difficulties, we were able to expand our turnover to a record figure of £11,374,203 in 1952, an increase of £2,025,219; being 22 per cent over the 1951 figure.

This increase in turnover was obtained without raising our prices above those obtaining in March, 1952, despite the increases in wages, services and commodities which have taken place during the last nine months. The net profit for the year after charging all working expenses and depreciation was £710,433, as compared with £926,875 for the previous year.

As I have said before, it became obvious that our output would suffer seriously owing to the shortage of steel and cast iron components from our suppliers in this country. In order therefore to keep our promises of deliveries with our customers, we were obliged early in 1951 to place orders on the Continent for large quantities of such components, and in particular for crankshafts, for which we are restricted in England to one supplier of finished crankshafts. These continental purchases were at a considerably increased cost, to which had to be added freight and duty. During the year, the extra cost of these components was £256,249, after crediting such duty drawbacks as we were able to obtain.

It will be apparent to you, therefore, that if we had been able to obtain these materials from British sources, our profits would have been as good as in 1951.

For the first six months of this year, at least, we shall still be dependent upon certain components coming from the Continent at increased costs, and as some provision against this, we have made a reserve of £65,000 in the accounts.

The directors recommend a dividend of 15 per cent for the year.

EXPORT TRADE

Our exports have again increased and have reached nearly £8 million, distributed over some 118 countries. Our percentage of exports, as last year, is approximately 70 per cent of our turnover.

1952 has been a year of great progress in the development of the manufacturing capacity of the company. The doubling of our capacity, to finance which the ordinary capital was increased in 1951, is nearly completed. We believe that our equipment and methods of low cost and quantity production of Diesel engines are unequalled by any manufacturer of component Diesel engines anywhere in the world.

The most interesting export order received during the year was the order for $1¼ million from the Canadian Government for 1,355 P6 engines. These engines were for installation in Canadian Ford vehicles for use by the Bombay State Authority in India under the Colombo Aid Plan. With these and other additions the Bombay State fleet of Perkins engined vehicles will shortly exceed 2,500 in number.

At this date it is difficult to forecast 1953 results but our order book stands at the same figure as this time last year. In spite of difficulties, our monthly output is above the average of last year.

OVERSEAS MARKETS

During the year, we have opened new markets where we are doing a satisfactory volume of business in Germany, Italy, Switzerland and Spain.

Germany is of particular interest, because from our enquiries there is no record of a British Diesel engine ever having been sold in Germany, the home of Dr Rudolf Diesel.

During the last few months of this year we have introduced two new Diesel engines. The L4 engine, giving 53 h.p. at 1,800 r.p.m., is specially designed for industrial and agricultural applications. This engine is, at its output, the lowest-priced Diesel engine manufactured anywhere in the world. The second engine is the R6, giving 108 h.p. at 2,700 r.p.m., and produced as an engine to enable trucks and buses carrying a 7-ton load to maintain the high speeds called for in overseas markets.

We have continued with the development of our subsidiary companies in Australia, Canada, France and South Africa. They are proving of great assistance in the sales and service of our engines in those countries.

A great part of the credit for the success of the company is due to our employees of all ranks, both in offices and works. Without co-operation and hard work it would have been impossible to maintain and improve our standard of good craftsmanship in design and production. We believe that men are valuable just in proportion as they are able and willing to work in harmony with their fellow men. We try to do everything in our power, in sickness or in health, to make their lives harmonious, and their association with the company one of which they can be proud.

The report and accounts were adopted and the payment of the dividend as recommended was approved.

RAND MINES, LIMITED

MR W. H. A. LAWRENCE'S SPEECH

At the fifty-eighth annual general meeting of shareholders, held in Johannesburg on May 15th, Mr W. H. A. Lawrence, the chairman, in the course of his remarks said:

Dividend receipts, which are the chief source of revenue for your company, decreased by £188,304 and, due to this and other variations in items of revenue and expenditure, the profit and loss account balance was lower by £130,612. Reductions of £107,550 in dividends declared for the year and of £54,875 in other appropriations and transfers were responsible for a further increase in the amount added to the unappropriated balance, which stood at £1,878,008 at the end of the year. The net liquid surplus, however, was reduced by £508,703 to £852,196, mainly through the acquisition of a further substantial holding in Harmony Gold Mining Company, Limited, and investments in shares and debentures increased by £446,776 to £6,015,278. The amount written off investments and freehold properties, less a net credit from sales of certain investments, was £211,745. Following our usual practice, this amount was deducted from investment reserve account, which was reduced to £4,747,003. Expenditure on prospecting ventures amounting to £30,468 was debited to exploration reserve, which stood at £316,205 at the end of the year.

GOLD MINING INDUSTRY'S RESULTS

As I have already stated, your company's chief source of revenue arises from dividends received mainly from gold mining companies. The fall in revenue is therefore symptomatic of the deterioration of the financial results of operations of the producing mines of the gold mining industry. The working profits of the industry, excluding additional revenue from sales of gold at enhanced prices, decreased from £44,220,743 in 1951 to £38,791,794 in 1952. The decrease in profits occurred in spite of the higher price for gold resulting from exchange rate fluctuations, the increase in yield and the improvement in the total tonnage milled, and is therefore due entirely to an increase in working costs, which rose by 2s. 4d. per ton milled. Further, the additional revenue from sales of gold at enhanced prices decreased by £2,993,877, and thus the total working profit for 1952 was £8,422,826 lower than for the preceding year. The increase in working costs was in the main due to the higher prices of stores and materials and to increases in cost of living allowances paid to European employees. It is difficult to forecast the future trend of these two important items of costs.

LABOUR PROBLEMS

Another problem of far-reaching importance to the gold mining industry is the shortage of labour which is seriously restricting the tonnage output at the individual mines and therefore tending to reduce revenue and to raise unit working costs. The increase in the industry tonnage milled, to which I have already referred, is due entirely to the advent of four new mines to the production stage shortly before or during 1952. The tonnage milled by the industry mines producing at the beginning of 1951 actually decreased by 211,300 tons in 1952. The labour requirements of the industry are increasing rapidly as the many new mines in the Free State, Klerksdorp and Far West Rand areas approach and reach the production stage. For some years past steps have been taken to increase the labour supply by recruiting further afield, by providing more attractive working, living and transport conditions and by increasing minimum rates of pay, incentive bonuses and service increments. At the same time steps have been taken to economise in the use of labour by increasing mechanisation wherever economically possible and by better training and use of employees in order to increase productivity. The success of the latter measures may be judged by a comparison of the results for 1946 and for 1952. In 1946, with an average underground non-European labour force of 223,947, 56,927,500 tons of ore were milled, equal to 254 tons per boy, whereas in 1952 the average underground labour force was 199,193 and the tonnage milled 60,069,500, equal to 302 tons per boy. In spite of these efforts, however, the labour supply, particularly non-European, is falling increasingly short of requirements and in an attempt to meet the position it has been decided to introduce further improvements in conditions of employment for non-Europeans, the most important of which is an increase of 4d. a shift in the minimum rates of pay applicable to underground workers. It is hoped that these measures will improve the position, but unless the supply improves to the extent not only of meeting the requirements of new mines but also of increasing the labour strengths of the existing mines, there must be a tendency for unit costs to increase further and therefore for the pay limit to be raised.

ENCOURAGING RESULTS AT DEVELOPING MINES

On the brighter side of the industry balance sheet are the encouraging results at various developing mines in the three areas mentioned above, and the preparation for and commencement of uranium production at some mines. Your company holds shares of several Free State mines, but its principal interest in the area is centred in the Harmony Gold Mining Company. As a result of the many boreholes drilled on and around the Harmony property it is considered that mining conditions will be good and that very nearly the whole of the property is underlain by Basal Reef. The results disclosed in the shaft intersection and in the limited amount of reef development so far undertaken have tended to strengthen this optimism regarding the prospects of the mine and the return on your company's large investment in the Harmony company. The list of mines accepted as producers of uranium already totals about twenty and may increase further. That this important new industry will benefit the gold mining industry and South Africa is well known to you. I should, however, like to add that in addition to improving the profit position of the mines concerned uranium production should favourably influence the life prospects of a number of them.

The power supply position deteriorated further during 1952, but the erection of new power stations and increases in generating capacity should enable the Electricity Supply Commission to meet the requirements of new mines and the uranium plants without imposing further power cuts. By the end of the year there should actually be an improvement in the position.

In general, then, it will be realised that although the gold mining industry is faced with some very serious, if not unprecedented, problems there are also certain grounds for modest encouragement.

OTHER INTERESTS

Your company also holds shares in companies whose various interests centre on coal mining, timber growing and exploitation and on the manufacture of cement, lime and concrete and steel pipes. Although the coal output of South African collieries again reached a record level in 1952, the scale of profitability of operations of the individual collieries was adversely affected by the country's overall shortage of transport. There was some improvement in the allocation of railway trucks, but the supply could not meet the demand and was too irregular to allow a steady flow of coal from underground, with the result that mining operations had to be curtailed from time to time. A certain amount of welcome relief has been granted by way of an increase in the inland price of coal, but there is still neither real recognition of the important principle of a price differential based on calorific values nor adequate recompense for the loss of the major part of the highly profitable export trade which may be difficult to recapture when the transport position improves.

The cement industry encountered a year of difficult conditions due to shortages of coal and transport, and profits decreased at most factories. Prices of cement are considered to be unrealistic in relation to present-day working costs and also to the cost of replacing items of capital equipment. It is therefore encouraging to note that the Cement Commission appointed by the Government made recommendations regarding price adjustments which would assist the industry.

The demand for lime which has risen steadily in the past is being, and will continue to be, substantially increased as a result of the requirements of the new uranium industry. The Northern Line Company in which your company has a large interest has recently decided to exploit the extensive deposit discovered at Silverstreams in the Hay district, Northern Cape, which contains large reserves of high-quality limestone.

The forestry, sawmilling and mining timber concerns in which your company is interested had a successful year and continued to expand.

POLICY OF CONSOLIDATION

During 1952 there was a slowing down of the overall rate of increase in economic activity in South Africa. This is not an unhealthy sign and under the present conditions of financial stringency and labour shortage it is in fact considered that the safe course for the Union would be to place emphasis on consolidation of the rapid progress made in recent years rather than on new development. Such a policy should enable the Government and other public bodies to catch up with the backlog in public services and works which has been hampering both production and development already in hand.

It is the intention of your directors to follow this broad policy of consolidation in the direction of the affairs of your company which has drawn heavily on its cash resources in the past year and is committed to further drawings in the near future in order to follow up its investment in the Harmony Gold Mining Company and in various other companies of the Central Mining-Rand Mines Group. In the meantime, however, investigation into various ventures is continuing and the sound financial position of your company will enable it to take full advantage of favourable opportunities for new investment at the appropriate time.

The report and accounts were adopted.

CROWN MINES, LIMITED

MR W. H. A. LAWRENCE'S SPEECH

At the fifty-seventh annual general meeting of shareholders, held in Johannesburg on May 13th, Mr W. H. A. Lawrence, the chairman, in the course of his remarks said:

Last year in my annual address I drew the attention of shareholders to the sharp deterioration which had taken place during 1951 in the position at the mine and to the resultant shortening of the profitable life remaining to it. I mentioned the steady and persistent decline in values and percentage of payability on the Main Reef Leader which had taken place in previous years with increasing depth and explained that the general position and prospects at the mine had deteriorated rapidly during 1951 as a result of the large increase in working costs, the continued decline in yield, the substantial decrease in values exposed on the Main Reef Leader and the disclosure of the serious proportions and extent of the reef dislocation at the bottom of the mine. I shall therefore confine my address today to comments on the more important developments that occurred during 1952 and their probable effects on the future of the mine.

DEVELOPMENT OPERATIONS

You will have seen in the reports to which I have already referred that it was decided to cease work south of the large Vierfontein dyke. The results of exploratory operations were disappointing and it was considered that there could be no economic justification for incurring the heavy capital expenditure that would be necessary to open up the deep level area. Sinking was therefore stopped at the incline shafts, which would normally have been advanced south of the dyke now proved to extend over two-thirds of the mine from the eastern boundary. The present and prospective reserves of ore north of the dyke are comparatively limited and development was accordingly started in shaft pillar areas in order to prepare them for extraction in the near future.

This alteration to the previous balance of operations coincided with a steady decrease in the labour force, but it was nevertheless possible to transfer personnel released by the curtailment of off reef development to operations making a more direct contribution to the development and extraction of ore. In consequence of these transfers it was possible steadily to increase the footage developed on reef. On the Main Reef Leader, which is the only reef on the company's property of major economic importance, development in the eastern section was concentrated in the more promising areas including shaft pillars, and as a result both grade disclosures and payability were better than in the preceding year. In the central section, although the development was selective, values continued to be generally low. Present indications are that few areas remain to be opened up in these two sections of the mine, where development operations are likely to be completed within the next year or two. In the western section, where the dyke has not yet been encountered, normal development operations were continued, and although the overall values disclosed were better than the previous year's figures, there was nevertheless a continuation of the declining trend in values with increases in depth.

IMPROVING OPERATIONAL RESULTS

You will have noted from the quarterly reports that there was a steady improvement in the operational results. These furnish convincing evidence that the rapid deterioration of the mine's position in 1951 has been arrested, albeit only temporarily. Provided costs can be held at about their present level and provided there is no undue decrease in the labour force, the extraction of shaft pillars on the eastern side of the mine is unlikely to commence until about mid-1954, that is one year later than anticipated last year. However, as a precautionary measure, and as a form of insurance against possible labour inadequacies, the preliminary work in the shaft pillars is being continued in order that the ore may be in an advanced stage of preparedness for immediate exploitation. It is considered that the position can be maintained until all the payable ore in the lower levels of the eastern half of the mine has been removed. At that stage the ore remaining in the upper levels of the eastern half of the mine in shaft pillars and certain scattered blocks will be mined in conjunction with ore from the western half of the mine. These operations may enable the grade to be maintained, but the tonnage milled must be expected to decrease substantially due to the contraction in the available ore reserves.

The results for the first four months of the current year are as follows:

Tons milled	1,039,000
Yield per ton milled—dwt.	3.229
Working revenue	£2,078,334
Working revenue per ton milled	40s. 0d.
Working costs	£1,927,104
Working costs per ton milled	37s. 1d.
Working profit	£151,230
Working profit per ton milled	2s. 11d.
Additional revenue from sales of gold at enhanced prices	£47,696
Development footage	21,838

The report and accounts were adopted.

CITY DEEP LIMITED

MR G. V. R. RICHDALE'S SPEECH

At the fifty-second annual general meeting of shareholders held in Johannesburg on May 13th, Mr G. V. R. Richdale, the chairman, in the course of his remarks, said:

The net profit in 1952, at £466,540, was lower by £623,498 than in the previous year. This unexpectedly sharp decline in the profit-earning capacity of the mine was due to a rise of 5s. 4d. per ton milled in working costs, together with a fall of 9d. per ton milled in revenue. The increase in working expenditure was mainly attributable to the decrease in tonnage, to the payment of higher cost of living allowances to employees and to a further rise in the cost of stores; the fall in revenue, which occurred despite a slight increase in the yield per ton milled, was due to a decrease of 19,075 ozs in the output of gold, brought about by a drop of 104,000 tons in the quantity of ore milled compared with 1951. Furthermore, the premium on gold sold for non-monetary purposes realised only £119,121, which was a little less than half the amount received in the previous year. The decrease in the tonnage was mainly due to the serious shortage in the supply of non-European labour, which persisted throughout the greater part of the year and which still continues. This is a vitally important matter which constantly receives the closest attention of all concerned and which has been the subject of particular consideration by the Gold Producers' Committee in recent months. As a result certain steps have been taken with the object of improving the supply of native labour to the mines, but it is as yet too early to judge how successful these measures will be.

SHAFT-SINKING PROGRAMME

During 1952 the programme of sinking the K line of sub-incline shafts from the 8,500 ft horizon was continued with the object of opening up the deep level areas on which the future life of the mine depends. Towards the end of the year it was decided to abandon the top-cut resue method of stoping. This system, first introduced in 1928, aimed at reducing the number and severity of pressure bursts. In top-cut resue stoping a cut of waste is first taken above the reef, and the latter is then blasted and trammed. The method results in a higher grade than with normal stoping, but also in higher costs per ton milled. Some shareholders have at times been critical of resue stoping because of the high working costs per ton milled which result therefrom, but I would emphasise that this system has been in operation over a large area of the City Deep for the last 24 years and that until very recently it has proved satisfactory and well suited to the peculiar conditions of the mine. Towards the end of last year, however, it was decided, because of the increasingly difficult conditions arising from rock pressure and inadequate ventilation, to change to a longwall system of mining which enables air flow to be concentrated and which has proved successful in other deep level mines in lessening the troubles caused by rock pressure. It is hoped that this system will result in improved working conditions and thus have a beneficial effect on working costs.

CAPITAL EXPENDITURE

Capital expenditure was expected to absorb £360,000 last year, but owing mainly to the shortage of labour the actual sum spent was only £271,926. During the current year, capital expenditure is likely to be of the order of £200,000 or £250,000, mainly on winding and pumping equipment and the installation of an electric haulage system underground. I must, however, warn you that adequate ventilation of the deep level areas of the mine is likely to prove difficult and costly and it must be expected that heavy additional expenditure will be incurred in this connection during the next few years. As I informed shareholders last year, the capital expenditure programme will be financed from profits, but it is clear that so long as the margin between the price received for gold and the cost of producing it from areas 8,000 ft. or more below the surface remains as small as it is to-day, the profits which the mine is capable of earning must be severely restricted. While every effort is being made by the mine management and all concerned to reduce working costs to the lowest possible figure and at the same time maintain the grade of ore sent to the mill at the highest level compatible with the ore reserve position, your board can see no prospect in the near future of maintaining dividends at their present level.

The difficulties through which your mine is passing are, as I have explained, directly related to the problems of pressure and ventilation at depth and to the serious shortage of native labour. These are all difficulties which have been forced on the mine management through circumstances beyond its control, but every effort is being made to tackle them energetically and on sound technical lines. Already some success has been achieved, but the cost of the capital programme which lies ahead is considerable and must, as I have indicated, involve a heavy encroachment on the dividend position during the next few years. On a long-term view the future is not entirely discouraging and there is reason to hope that it will be possible to continue profitable operations for a relatively long period. I must emphasise, however, that the best that can be hoped for in the near future, unless there should be a favourable revision of the gold price, is that it will be possible to maintain annual dividend distributions on a very modest level.

The report and accounts were adopted.

LONDON BRICK COMPANY

ATTAINMENT OF NEW PRODUCTION RECORD

MR A. T. WORBOYS ON THE CONTINUED PROGRESS

The fifty-third annual general meeting of the London Brick Company, Limited, was held on May 21st, in London.

Mr A. T. Worboys (the chairman) presided and, in the course of his speech, said: The trading profit and sundry income for the year amounted to £1,703,350, as compared with £1,440,581 last year. After providing £250,000 for normal and £150,000 for special depreciation, a total of £400,000 for depreciation of fixed assets, and £1,035,877 for taxation and other charges, including £220,000 excess profits levy, there remains a net profit of £267,473.

After deducting the net dividend for the year on the 8 per cent Cumulative Preference Stock and the net interim dividends totalling 17½ per cent on the Ordinary Stock, there remains a balance of £11,798, which has been added to the amount brought forward from last year of £272,270, thus increasing the balance to be carried forward to £284,068. The directors do not recommend the payment of any further dividend for the year 1952.

UNFAIR INCIDENCE OF EPL

You may recall that last year I felt it premature to express any opinion as to the effect of excess profits levy, but I did say that it would affect most adversely those businesses which have shown the greatest enterprise. From the accounts now presented, which were made up prior to the Chancellor's statement on April 14th last, you will observe from the sum that has been provided that my comment was justified.

For the purposes of excess profits levy, our standard years are 1948 and 1949, unfortunately for us, the two years immediately following the crisis year of 1947, and having followed a progressive programme of production since 1949, we are now thrown back on to the results of two weak years. This is unfair. It is unjust because, as a manufacturing concern, any increase in production of bricks means that we extract more clay, thereby exhausting our mineral reserves at a greater rate and we contend that results arising out of the more rapid exhaustion should be allowed to remain with us in full.

I know that we are to be freed from the injustice of Excess Profits Levy as from January 1, 1954, but bear in mind that we have to sustain a partial infliction of the tax for two years—1952 and 1953.

BRICK SUPPLIES

During the past two or three months the subject of brick supplies has figured frequently in the newspapers and stockholders will expect some comment from me. It is true that since the war, which necessitated the closure of a great deal of the brick industry's manufacturing capacity and a dispersal of its labour force, the reinstatement of production has lagged behind the growth of building and the demand for bricks, with the notable exception of the greater part of 1948 following the sudden and severe cut in building by the Government of the day. The effect upon our production build-up was serious and lasting. The demand for bricks suddenly was halved just when we had rebuilt our labour force and just when all our works had struggled back to day and night production. The enforced closing down of our night shifts in but a matter of weeks after their restarting scattered once again our labour. Small wonder that when the Government again reversed its building policy and we started again to build up production, our second recruitment of labour was much more difficult than the first.

I am not competent to judge whether or not that ten-month cut in building by the Government of the day was necessary or wise; I do know that the loss of confidence in the brick industry which was engendered in the minds of labour and of many of the smaller brickmakers has been a serious and persistent deterrent to production ever since. I believe that but for that cut there would have been little need to talk about brick shortages today.

It is also true that the pressure of the demand upon our company has never been heavier, but it is difficult for us to assess accurately its real weight because undoubtedly it has been swollen to false proportions. Mere rumours that a commodity is likely to be in short supply will produce an increase in the size of individual orders beyond what is actually required and a duplication and worse of orders placed through several different channels of supply. There is, however, the concrete fact that, whereas the pace of building has quickened during the last few months, the brick industry as a whole still lags behind its prewar annual production, and this increases the pressure upon the larger companies, and particularly upon our own, with its country-wide area of distribution. Again, the widening of the price gap between the most efficient makers and those of higher cost production further concentrates the demand.

We dislike the present situation. As I have suggested before to stockholders, a seller's market is very far from being all honey to a manufacturing business, especially to one such as our own, which has been built up over the years upon efficient service to its customers. The circumstances under which the delivery service which the Building Industry had come to expect of us has sadly deteriorated, have been quite beyond our control, but that does not prevent a resulting loss of hard-earned goodwill. Our prewar standard of service could only be given by ensuring that our productive capacity was always equal to the demand, and the only certain way of combating present difficulties is to continue to build up our productive capacity as far as postwar difficulties and financial prudence will allow.

RECORD ACHIEVEMENT

With all this in mind, we have been glad to record in the directors' report that during the year we achieved a long-sought target—the attainment and the betterment of our best prewar production figures. Last year's output of bricks, blocks and othe. clay products, when translated for convenience of comparison into brick equivalents, beat the record of 1938 by sixty-five millions.

By last September our weekly output figures were well in advance of those before the war. As a further step, we then embarked upon a programme of providing additional kilns at certain works, which hitherto have been single-shift units, to enable them to work the day and night shifts which are our standard practice. Already we are getting a useful further increase from this programme which will be completed during the next few weeks.

Further extensions of productive capacity during this present year will be influenced by the result of our claims for relief from the full impact of the excess profits levy to which I have made earlier reference.

In all our extensions we have had well in mind the necessity of maintaining the company's productive efficiency to ensure that when demand returns to what we must consider the norm of a buyer's market, it can maintain its output at an economically effective level: also we take every opportunity to increase the efficiency of existing production. A measure of our progress in this direction is the fact that the year's increase in output over the previous record of 1938 was produced not only in reduced working hours, but also with a smaller labour force. The money and effort which we are expending upon increased mechanisation are producing already their return in an improved productivity per man-hour and in a lightening of heavy tasks. I am satisfied that our competitive position has at no time been better and that it is steadily improving.

PRICE OF BRICKS

In a previous address to the stockholders I deplored the necessity for increases in the price of bricks arising out of heavy and all-too-frequent rises in the cost of most of the materials and services which we buy, particularly solid and liquid fuel, power and transport. I am all the more pleased, therefore, to report that we were able to bear the last increases in railway rates, coal and motor fuel out of our increased efficiency and as some small contribution to the stabilisation of prices. Two years ago I had hoped that our growing output would enable us to start brick prices upon a downward path, but we were caught inevitably in the general upward spiral. We can feel some small satisfaction in having been able to hold our prices level during the past eleven months.

As I have confessed to stockholders upon a previous occasion, I dislike the role of prophet, but with nearly five months of steady progress behind us in this current year, I look forward with sober confidence to the results that I shall place before you when next we meet again in annual general meeting.

Mr Worboys concluded with a cordial tribute to all of the company's 8,000 employees who had co-operated so well to obtain the results achieved.

The report was adopted.

RANSOMES SIMS & JEFFERIES, LIMITED

FACTORS AFFECTING RESULTS

The sixty-ninth annual ordinary general meeting of this company was held on May 20th at Ipswich, Sir Reuben Hunt, the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts:

The trading results of the parent company and its subsidiaries for the year to December 31, 1952, amount to £454,563, compared with £625,690. The total monetary value of the company's dispatches to both home and export markets corresponds closely to the total dispatches of the year 1951.

The fall in the trading results is due to three major factors. First, towards the end of 1951 a substantial increase in salaries,

wages, materials and bought-out stores took place, which was not fully recoverable in our selling prices.

In export markets licensing difficulties and many interferences with trade made it impossible to conduct our business as satisfactorily as in previous years. Nevertheless, by being able to offer prompter deliveries we were able to obtain our fair share of the trade which was offering.

Taxation absorbs five and a-half times as much of our cash balance as does the net dividend paid to the proprietors. The position remains extremely unsatisfactory,

We are of the opinion that our strong reserves and our ability to obtain a fair share of any trade which is passing should enable us to maintain the dividend on our ordinary share capital when increased by the proposed new issue.

The report was adopted.

GALLAHER LIMITED

LARGER SALES DESPITE COMPETITION

BRANDS IN STRONG DEMAND

SIR EDWARD DE STEIN ON PRICES AND COSTS

The fifty-seventh annual ordinary general meeting of Gallaher Limited (Incorporated in Northern Ireland), was held on May 21st at Winchester House, Old Broad Street, London, E.C., Sir Edward de Stein, chairman of the company, presiding.

The secretary (Mr George Iliff, ACA) read the notice convening the meeting and the report of the auditors.

The following is the chairman's statement circulated with the report and accounts for the year to December 31, 1952:

In presenting the accounts for the year 1952 I would like to make it clear that nothing is included in our figures in respect of Cope Brothers and Company, Limited, which we have acquired as from January 1, 1953. The figures in our printed accounts differ slightly from those appearing in the press in the month of March, due to alterations in the tax provisions following the 1953 Budget. I would also like to welcome as a director of your company Mr Clarence Parker, the chairman of Copes, who joined your board on January 1st this year. He is, unfortunately, unable to be here today as he is on a business visit to Canada.

POPULARITY MAINTAINED

Once again I am pleased to be able to say that we have increased our tobacco sales in spite of keen competition throughout the trade. Your company's brands, particularly "Condor Sliced," remain in strong demand. Your cigarette brands have more than maintained their popularity with the smoking public and supplies of the two main brands, "Park Drive" and "Senior Service" are still far short of the demand. Your filter-tipped "du Maurier" cigarette is still gaining in popularity.

In my statement last year I referred to the fact that in 1952 we would have twelve months' revenue from the increase in cigarette prices as compared with the four months of increased prices in 1951. As you will see from the accounts, this has not had a material effect on the trading results, as the profits of the company before taxation are only slightly up at £1,505,000. Costs have continued to rise throughout the year and leaf tobacco costs—in contrast with the prices of many other commodities—are still increasing. It is as yet early to forecast what will happen to prices in the tobacco buying markets during the 1953 season, but information to date suggests there may well be a further rise in leaf costs generally. Other expenses have also increased, but we now see some reduction in the cost of our packing material—a welcome change in trend which, however, has not yet extended to other items. Duty is, of course, by far the largest item and it is one over which your directors have no control: it represents 85 per cent of total costs.

APPROPRIATIONS

The burden of taxation falls a little less heavily on us this year, mainly due to the changes in the profits tax provisions in the 1952 Finance Act and the change in the income tax rate recently announced. As I told you last year, we have a good standard for excess profits levy: the company and its subsidiaries have no liability to this tax on the 1952 profits. As a result of the reduction in the tax liability on our current profits, the amount available for appropriation is increased by about £117,000 from £553,000 to £670,000. We have used £100,000 of this figure to strengthen our contingencies reserve, which had been reduced by £44,000 in 1952 for writing off certain expenditure referred to in Note 2 on page 9 of the report and accounts. A further £70,000 has been transferred to provision for employees' pensions and the carry forward has been increased by £50,827.

After making the appropriations mentioned above and increasing the carry forward, your directors recommend the payment of a final dividend of 12 per cent on the ordinary stock of the company, making a total of 17 per cent. If last year's distribution had been payable on the capital as increased by capitalisation of part of the share premium account the dividend would have been at the rate of 16¼ per cent. This year's final dividend is not payable on the £437,500 ordinary stock issued in exchange for the ordinary stock in Cope Brothers and Company, Limited, acquired by the company since December 31, 1952.

Turning to the balance sheet of the company there are only two points which I wish to mention. Firstly, there is the transfer of £2,250,000 from share premium account to ordinary share capital account following on the resolution passed at an extraordinary general meeting last year which authorised the capitalisation of £2,250,000 out of share premium account. Secondly, there is a reduction of £500,000 in the value of stock in trade. In my statement last year I mentioned that our dollar allocation for 1952 would be reduced considerably and that we would have to eat into stocks in order to maintain output. It is the reduction in our purchase of dollar tobaccos which is responsible for this decrease in our stock in trade.

MERGER WITH COPE BROTHERS

The merger with Cope Brothers and Company, Limited, and their Richard Lloyd and Sons branch has been the outstanding event of the year. The business of this old-established company, consisting mainly of brands of pipe tobaccos, is complementary to the existing business of the parent company and its other subsidiaries. Since the end of March these brands have been distributed through the Gallaher sales organisation thus effecting economies in overheads on a considerable scale. By using the Gallaher sales organisation we are confident we will obtain a much wider distribution for the Cope's and Lloyd's brands, which will, we believe, lead to increased sales, especially of "Old Holborn," "Bondman" and "Skipper." For some time past the demand for "Old Holborn" in particular has been expanding very rapidly and the Richard Lloyd and Son factory is being quickly and efficiently re-organised and will shortly be in a position to meet the demand.

I should like to take this opportunity of recording our satisfaction at the enthusiastic co-operation we have received from the members of the Cope and Lloyd organisations. I feel confident that the combination of the two companies is sound and will have satisfactory results.

RECORD SALES OF "MANIKINS"

So far as J. R. Freeman and Son, Ltd., is concerned, I am glad to report that the sales of "Manikins" for 1952 have again created a record for the company.

As regards our other subsidiary companies, I should like to make particular reference to Mono Pumps, Ltd., our engineering subsidiary. They have further expanded their business in 1952 and have made a valuable contribution to the profits of the group. Acquired in 1944 mainly to ensure that we could equip our cigarette factories after the war, this business has proved to be a sound investment apart altogether from the protection provided to us for cigarette machinery.

Immediately at the conclusion of our annual general meeting we will be holding an extraordinary general meeting for the purpose of adopting new Articles of Association. There are no material changes in the new Articles. A reprint is now necessary and the opportunity has been taken to bring our Articles up to date.

"REASONABLE CONFIDENCE"

The expansion of our cigarette business is still mainly dependent upon the allocations of dollars, but the continued popularity of our brands, both in the cigarette and tobacco fields, and the efficiency, loyalty and enthusiasm of our staff and workers, encourage us to believe that, notwithstanding the difficulties and problems of the present day, we can meet the future with reasonable confidence.

The report and accounts were unanimously adopted; the proposed dividend was approved; the retiring directors, The Rt. Hon. Lord Ampthill, CBE, Sir Edward de Stein, Mr W. A. Edmenson, CBE, DL, and Mr Clarence Parker, ACA, were re-elected and the auditors, Messrs Hill Vellacott and Bailey, were reappointed.

At a subsequent extraordinary general meeting a resolution was passed adopting new Articles of Association.

BRUSH ELECTRICAL ENGINEERING

SUBSTANTIAL VOLUME OF ORDERS IN HAND

SIR RONALD W. MATTHEWS ON CHANGED TRADING CONDITIONS

The sixty-fourth annual general meeting of the Brush Electrical Engineering Company, Limited, was held on May 21st in London.

Sir Ronald W. Matthews, DL, MInstT (the chairman), presided.

The following is an extract from his circulated statement:

It will be apparent to you from the directors' report and the accounts that 1952 has been a difficult year in certain directions. All branches of our business, however, have not been affected to an equal extent.

Dealing first with electrical engineering, our factory at Loughborough has had a reasonably successful year. Its productive resources have operated at full capacity throughout and a satisfactory order book has been maintained. It has, indeed, been necessary to restrict still further our coachwork business to provide more factory space for electrical products. At Cardiff, both production and sales have maintained a reasonably satisfactory level.

Our Staines and Leeds factories were most seriously affected, but the managements of both factories made valiant and successful efforts to cut their coats according to their cloth. At our Stockport factory there has been an inevitable drop in output during the changeover from the old HF and TL engines to the modern J and K range. This operation has now been successfully completed and I feel we may look forward to satisfactory results from Stockport in the coming year.

ASSOCIATED TUBE WELLS LIMITED

It is in regard to Associated Tube Wells Limited, that we have had our most serious problems. Although the newest development, the operations carried out by this company provide an important market for the products of our electrical and engine factories and should in due course yield a substantial profit from the civil engineering operations themselves. Unfortunately our first contracts have not proved entirely satisfactory, largely because the prices agreed in 1950 proved inadequate in the face of rising costs throughout the world, and in the early stages we experienced some difficulty in settling certain technical and procedural problems with the Indian provinces, for which the work was being carried out.

We have found it necessary to provide a substantial sum towards the losses already experienced on these first contracts. This matter has had most careful investigation and consideration has been given as to whether operations of this kind should continue. Your directors, after a thorough examination of the whole question, consider that though these first contracts have resulted in substantial losses, there is now in existence a large organisation with the necessary skill, experience and equipment to enable future tubewell projects to be tackled in an efficient and economic manner and to the benefit of the group as a whole. Accordingly a further contract has been undertaken on more favourable terms, thus ensuring continuity for employees and equipment and, we trust, turning to good account the invaluable experience we have so dearly gained.

Two other important factors contributing to the reduction in net profits are the increase of £189,010 for bank, mortgage and other interest arising from the temporary increase in stocks to which I have referred, and an increase in the depreciation charge of £115,234. There has, however, been a substantial reduction in stocks since the peak reached in July, 1952. Finished products have been cleared with the improvement in trade conditions, while the introduction of a uniform system of material and stock control throughout the whole group should achieve a reduction in stocks of raw materials in the forthcoming year, and thus save considerable sums in bank interest.

So much for the past, which, as you will have realised, has been full of difficulties, many of them arising from circumstances beyond our control.

As for the future, we are not yet out of the wood, but as a result of the determined steps taken by the management during 1952 the closing months of that year were more successful and more profitable than the spring and summer.

SALES

Having dealt at length with the widespread manufacturing activities, the statement referred to the recession in the export trade experienced during the middle of the year and continued: Some of our more important markets, including India, Malaya, Australia and Brazil drastically curtailed their orders and although strenuous efforts were made to sell elsewhere the setback was serious for some months and we have not yet fully recovered the ground lost. Notwithstanding the drop in order intake during 1952 the group as a whole still has a substantial volume of orders in hand and a number of encouraging orders both from home and abroad have been received.

The importance to the national economy of exports of capital equipment is well known; unless the heavily industrialised countries export their products to the primary producing countries there can be no hope of raising and equalising the standard of life throughout the world. The Brush Aboe group is exporting capital goods which have a life of many years and our customers would like to pay for them over a number of years. This is one of the services they are getting from our competitors in other countries, but we cannot pay our suppliers and our work people over a number of years; they want the food and clothing they have earned now. I feel most strongly that this question of extended credits can only be solved with government assistance.

The future development of the group continues to receive very close attention to ensure that the programme is based upon the most modern scientific knowledge and is in harmony with the world economic trends. One of the world's foremost technologists in thermo-dynamics has been appointed our consultant on this subject.

Considerable study has been given to the technical development of our engine types, both in the improvement of existing engines and the study of new designs to meet the requirements of anticipated future markets. In the smaller ranges of engines considerable work has been done in extending the range of air-cooled engines for which there is an increasing demand and air-cooled designs up to 100 b.h.p. have been developed and are being thoroughly tested before being put into full production. These are the largest air-cooled Diesel engines produced in this country.

The report was adopted.

UNITED MOLASSES COMPANY, LIMITED

SATISFACTORY PROFITS

The twenty-seventh annual general meeting of this company will be held on June 9th in London.

The following is an extract from the circulated statement by the chairman, Sir F. Michael K. Kielberg, KBE.

The combined gross profits of the company and its proportion of subsidiary companies' profits amounted to £7,226,449 compared with £8,007,055 for the previous year. This bears out my forecast of twelve months ago to the effect that while profits for 1952 were unlikely to reach the high peak of 1951, indications were that, barring some catastrophic happenings in the months ahead, profits would prove entirely satisfactory if compared with those of any year prior to 1951. Taxation again absorbs by far the greater part of the year's earnings and amounts to about 67 per cent of the total net profits.

Trading conditions in 1952 were at most times difficult and became as the year progressed increasingly competitive. It is pleasant to be able to report an almost complete reversal in the position of the world's Molasses markets and the return to more normal and much healthier conditions. Consumption is again expanding and our own stocks had by the end of the year been reduced to the absolute minimum.

As far as prospects for the current year are concerned, present indications are that earnings will show a substantial decline compared with last year's profits, but they should compare favourably with the profits earned in any year prior to 1951 and comfortably cover dividend requirements.

LIMMER & TRINIDAD LAKE ASPHALT

IMPORTANCE OF ROAD MAINTENANCE

The eighty-first annual general meeting of the Limmer & Trinidad Lake Asphalt Company, Limited, will be held on June 12th in London.

The following is an extract from the circulated statement by the chairman, The Rt Hon Lord Courtauld-Thomson, KBE, CB:

The trading profit and investment income of the company and its subsidiaries for the year was £449,188 against £391,877 for 1951. The company's net profit amounts to £122,592 against £107,959. The total distribution for the year is 15 per cent, paid on the capital increased by the issue of free shares in 1952 compared with 13½ per cent in the previous year.

The nation's highway system should be one of its most precious assets. Roads are of vital importance. The surfaces of many roads are good, but a member of the Government has said that in road maintenance we were "just about rock bottom." It would require large sums of money to remedy this unfortunate and uneconomic situation. It is urged, therefore, that the Government should release some of their lion's share of motor taxation receipts, to be expended on better surfaces and maintenance. When the Government allocates increased funds to highway authorities, your directors are satisfied that our organisation with its modern equipment and ample reserves will be in a position to undertake any additional work which may be entrusted to us.

AGRICULTURAL MORTGAGE CORPORATION, LIMITED

NEW LOANS EXCEED £4 MILLION

The twenty-fourth annual general meeting of the Agricultural Mortgage Corporation, Limited, was held on May 20th in London, Mr E. J. Bunbury, CBE, MC, the chairman, presiding.

The following are extracts from his circulated statement for the year at at March 31, 1953:

The genial weather of the spring and summer of last year resulted in a bountiful harvest, gathered in straightforward conditions. Production of sugar-beet fell considerably. Root crops which at one time were backward owing to the summer drought, made a remarkable recovery after the rains of early August.

Winter conditions set in rather earlier than usual with severe frosts and substantial snowfalls in many districts, with heavy drifting and stock losses on the high ground in Northern England and in Wales. A good February, however, enabled farmers generally to get well forward with spring cultivation.

THE DISASTROUS FLOODS

The disastrous floods which caused such widespread damage along our eastern seaboard at the end of January, inundated large areas of agricultural land and it has been estimated that some 150,000 acres of productive land have been more or less seriously affected.

During the year new loans for £4,474,819 were completed, and at March 31, 1953, loans amounting to £573,789 had been approved by the directors and are awaiting completion. Both these totals fall short of the corresponding figures for the previous year which constituted an all-time record in the Corporation's history. A variety of causes have contributed to this. For the first time for several years, prices of farms generally have tended to decline and fewer farms have changed hands during the past twelve months. This, as might be expected, affected our loans for farm purchases, which declined by over £400,000 compared with the previous year.

The fall in values of farms may be attributed partly to the effectiveness of the disinflationary policy of the government.

HIGHER AVERAGE LOAN

It is of interest to note that the average amount of loan granted during the year was £4,686, which compares with £3,766 for the overall average loan outstanding. The total of loans outstanding is £24,089,656, being an increase of £3,249,321 over the corresponding total last year. The security for these loans is represented by freehold agricultural or horticultural properties in every county of England and Wales.

We have transferred £11,200 from revenue to contingencies account, and after making provision for bad and doubtful debts, and setting aside the sum necessary to cover all interest payments due from borrowers up to December 31, 1952, and not received by the end of our financial year, the amount available on profit and loss appropriation account is £38,182, 16s. 10d. Of this £7,376 has been transferred to special reserve, £20,946 13s. 4d. has been written off the items for expenses of issues of debenture stocks, £8,083 has been written off the discount at which 4½ per cent, 3 per cent and 3½ per cent debenture stocks were made, leaving a balance of £1,777 3s. 6d. which the directors propose to carry forward.

The report and accounts were adopted.

THE RHODESIA BROKEN HILL DEVELOPMENT COMPANY

SIR ERNEST OPPENHEIMER ON THE YEAR'S RESULTS

The forty-third annual general meeting of The Rhodesia Broken Hill Development Company, Limited, will be held on June 12th in Nkana, Northern Rhodesia.

The following is an extract from the statement by the chairman, Sir Ernest Oppenheimer, dated April, 1953, circulated with the annual report and accounts for the year ended December 31, 1952:

Members will recollect that in the statement which I made in May, 1952, I emphasised that the results of that year's operations, which established new records, were not likely to be repeated in 1952. This has proved to be the case as the operating profit for last year, at £2,800,000, is approximately half that earned in the previous year. This decrease is due to the fall in selling prices of metals produced. Production and costs were satisfactory throughout the year. The net profit after taxation amounted to £1,800,000, from which £500,000 has been appropriated to capital reserve. This appropriation is made in pursuance of the board's policy to finance capital commitments primarily out of profits.

In addition to the proved ore reserves at December 31, 1952, it is estimated that 290,000 short tons of recoverable sulphide ore and 160,000 short tons of recoverable oxide ore have been indicated below the 650 ft. level in No. 5/6 ore body; the previous figure was 238,000 short tons and related only to sulphide ore.

The consulting engineers in their report refer to the strike which took place on the Copperbelt in October/November, 1952, in support of a demand by the Northern Rhodesia African Mineworkers' Union for an increase in wages of 2s. 8d. per shift, or 80s. per ticket of 30 shifts. This strike did not extend to Broken Hill, but since the company's policy is to pay its African employees the same basic wages as those on the Copperbelt, they have received the benefit of pay increases ranging from 35s. to 50s. per ticket awarded at the arbitration proceedings which followed the strike, and additionally they now get extra pay for Sunday work and for afternoon and night shifts.

RHOANGLO GROUP BILL

An extraordinary general meeting of members was held on January 28, 1953, to give formal approval to the presentation to the United Kingdom Parliament of the Rhoanglo Group Bill, which may well be enacted by the time this statement is in the members' hands. If the Bill is passed this company, together with Rhodesian Anglo American Limited and its allied copper companies, will become reincorporated in Northern Rhodesia, thus finalising the move from the United Kingdom which took place at the end of 1950. It is anticipated that re-registration will be effected early in 1954. Thereupon the company's principal share register will be maintained at Kitwe, but the company proposes, for the convenience of members, to set up branch registers in London and Johannesburg in substitution for the principal and branch registers now maintained there.

In conclusion, I consider that the past year's results have been satisfactory—and I regard the company's future prospects with confidence.

Copies of the annual report and accounts may be obtained from the Head Office, Kitwe, Northern Rhodesia, or from the transfer offices at 44, Main Street, Johannesburg and 11, Old Jewry, London, E.C.2.

HANDLEY PAGE

THE VICTOR BOMBER

The annual general meeting of Handley Page Limited was held on May 20th in London, Sir Frederick Handley Page, CBE (chairman and managing director), presiding.

The following is an extract from his circulated review of the year 1952:

It ended with the first flight of the Victor, our new four-jet crescent-wing bomber. This was the culmination of a long period of research, design and development.

The revolutionary performance of this bomber owes much to the crescent-wing which your company's research and design staff has developed and which combines the merits of the razor-thin wing, the swept wing and the delta design, without their shortcomings. So impressive is its performance, that the Victor bomber has been ordered for super priority production direct from the drawing board.

Your company, in addition to its development and production of military aircraft, has also plans for new civil aircraft, large and small.

Our new 150-seater HP97, an intercontinental jetliner, which is foreshadowed has profited greatly from the evolution of the Victor bomber and its crescent-wing. It is capable of three Atlantic crossings between London and New York in a day at a direct operating cost of less than £15 per passenger.

There has long been a need for a modern aircraft to replace the old prewar foreign types, which form a large part of the world's feeder-line equipment. Your company is interested in the potentialities of this requirement.

ASSOCIATED FISHERIES

DIFFICULT CONDITIONS

The twenty-fourth annual general meeting of Associated Fisheries Limited was held on May 19th in London, Mr W. A. Bennett, chairman and managing director, presiding.

The following are extracts from his circulated statement:

The year's trading started off full of promise, but after the first few months conditions began to deteriorate and remained very difficult for the rest of the year apart from occasional short-lived improvements. Lack of demand, due to a recession in the consumption of fish, has been most marked.

It is difficult to ascribe a definite reason or combination of reasons for this reduction in consumption, though we should keep in mind the widening of choice to the housewife of alternative foodstuffs now available, many of which are still subsidised.

The total turnover of the group for the year was £6,770,000 resulting from the employment of fixed assets costing almost four million pounds. After covering all costs and depreciation, the profit remaining out of every 20s. turnover is just under 9½d., of which taxation absorbs 6d. Profits retained to meet increased replacement cost of assets account for a further 1d. and 2½d. is paid out in dividends, after deduction of tax—surely a very modest reward to the stockholders.

The adverse conditions ruling at the close of our financial year have continued to date. Under such circumstances you will appreciate that it is quite impossible to give any indication of prospects for the immediate future, but our results for the current year to date compare very unfavourably with the corresponding period of last year.

We can face the future with the knowledge that the business is soundly based in all essentials.

The report and accounts were adopted.

In 53% of

DAILY HERALD

homes, no other

national daily

newspaper

is seen!

The DAILY HERALD is one of the greatest selling powers behind the marketing of mass-appeal branded products today.

A recent survey showed that on 12 *product groups alone*, the cash-over-the-counter from DAILY HERALD homes exceeds £62,000,000 a year! *

DAILY HERALD familes are one-third better off than pre-war (despite increased cost of living) . . . more than half of them enjoy two or more wage packets every week . . . and their total combined income exceeds £1,000,000,000 per annum.

To all who think that any other national daily paper or combination of daily papers already covers this tremendous market may we point out that *in the homes of 53% of DAILY HERALD families only one national daily newspaper—the DAILY HERALD—is taken and read.*

DAILY HERALD

THE 600 GROUP

For the Elizabethan era

Without chemicals, standards of living everywhere would soon slip back into the Dark Ages; few modern industrial processes would be completed, farm crops would dwindle and our daily surroundings would be far less attractive. In our chosen field of enterprise — the distribution of the chemical products of the vast Shell organisation, in the United Kingdom — we do in some measure serve the community beyond the mere bounds of being in business for a living. This service we shall try to sustain and strengthen for all who can make use of it throughout Her Majesty's reign.

Happy and Glorious

A CORONATION is the most magnificent ceremony of that most magnificent ceremonial institution, the British Crown. Emphasis has rightly been laid on the religious aspect of Tuesday's service. But in this twentieth century it is as a secular sacrament that the Coronation will be regarded by the great majority of those who are flocking into London to see it. As the peers of the realm in the Abbey, so the people in their hundreds of thousands in the streets, and in their millions upon millions on the radio, are come to recognise their undoubted Queen and to return loyal homage for her solemn oath. All this, of course, is symbolism. But every society has its symbols, and the believers in constitutional monarchy (who include many of the most intelligent and cultured peoples of the world) can at least claim that their symbols, being alive, are more natural for a human society.

This particular coronation, by a unanimity of instinct, is a very special one. Everything conspires to sustain the hope and belief that it formally inaugurates a long and glorious reign. Queens have been lucky for this country, and young queens especially. By name, Her Majesty recalls the magical springtime of Elizabeth I. But the parallel is closer—and equally happy—with Victoria, and either augury gives ample reason to salute Queen Elizabeth II with high hearts and hopes. There is something more than wishful nostalgia in these attempts to recall great ages by echoing great names. For forty years the British people, more than almost any other in the world, have lived in constant crisis and under constant strain. Undoubtedly there is a certain spiritual fatigue. But nothing vital has been lost and if for a generation they could be granted a surcease of alarm, there could be a great resurgence of spirit from a people still basically at one, still rich, still proud and still free. If there is nothing in the present posture of the world to warrant any confidence that such a respite is likely, the events of the last few months have equally shown that there is nothing to forbid the belief that it is possible. And in so doing they have shed their own shy ray of sunshine on the pageantry.

Lost in the Coronation excitement, there is an anniversary this weekend that is not wholly irrelevant to the theme. Friday was the five-hundredth anniversary of the fall of Constantinople. And in a few weeks' time, on July 17th, it will also be half a millennium since the battle of Castillon finally drove the English out of France and brought the Hundred Years' War to an end. Both events were more the recognition of facts already accomplished than decisive in themselves. But they are none the less serviceable to mark the formal end of the Middle Ages in the eastern and the western marches of Christendom.

Indeed, a pretty historical theory can be built around the abundance of anniversaries in these mid-century years. There is, the theory would run, a periodicity in human affairs that lasts about a hundred years, but begins about the middle of the calendar century. About that

time, it appears, a new line is struck out, a new guiding principle takes command. For a generation, or sometimes two, it develops in relative tranquillity. But gradually the contradictions, the inner conflicts, the contentious children of tranquillity, begin to appear. The tensions build up, in the early decades of the calendar century, into a time of troubles. But by the middle of the century, the issue that has provoked the conflicts is resolved and the cycle begins again.

Thus the Renaissance, after fifty years during which the human mind opened like a gigantic bud, led straight to the Reformation and to the first dreadful round of religious wars. Both in England and on the Continent, a settlement was reached in the 1550s. It took the form of strong national monarchies, which assured enough stability to give England and Spain and (in some respects) Germany their golden ages. Strong monarchies, however, declined after the turn of the century into civil conflict, and the 1640s, with civil war in England, the *Fronde* in France and the Thirty Years' War in Germany, were a period of despair. But once again, in the 1650s and the early 1660s, a settlement was reached and though it was on different lines in different countries, it everywhere made possible a great forward surge in human arts and sciences. In the eighteenth century, the pattern is a little less clear. But Watt and Voltaire stand out as the markers of the new direction that the human spirit took, once again, in the middle of the century; indeed, few revolutions have been more decisive than that of which free thinking and technology were the parents. The time of troubles followed very promptly and was prolonged. But it was, once more, in the 1840s and the 1850s that the long liberal summer began. This, in turn, bred its time of troubles, through which we have been living.

So we stand once again at the watershed of a century. Of the forces that have been at work in its first half —in the reigns of the four kings who divide the century and separate the two queens—the supplement included with this issue of *The Economist* attempts to give some account. Of what is still to come, only this can be said with assurance : that the uncertainties and the apprehensions are surely no greater than they must have been at the mid-point of those other centuries, which yet blazed forth so splendidly.

This pattern weaving, it will be said, is no more than a piece of historical fiction. That can readily be granted. But is this the day to question the validity of historical fictions, when one of the most transparent of them is about to parade through the streets of London its power to captivate the minds and stir the emotions even of that disillusioned cynic the mid-century Briton ? Give us leave to base our aspirations on whatever fancies we may, if they give us joy and courage to face the future. Let us wrap them up in the familiar prayer and cheer ourselves hoarse for the symbols and the fictions, for the banners and the emblems, for the pride of the past, for the warmth of the present and for all the hopes of the future. Send Her Victorious. Happy and Glorious.

God Save the Queen.

The Meaning of Bermuda

RUSSIA'S rejection of the western proposal to renew negotiations on the Austrian treaty has changed the complexion of the Bermuda meeting. It seems at present to have ruled out any imminent possibility of a high level conference with the Russians, and emphasises the fact that the task at Bermuda will be to bridge the gap between friends rather than foes. In suggesting, a fortnight ago, direct personal contact with the new Russian leaders, Sir Winston Churchill was reflecting the great yearning for peace throughout the west. But, while his genuine and heartfelt suggestion has met with no response from the Kremlin, its very popularity has since created a fresh bout of suspicion and recrimination within the Atlantic alliance that cannot be ignored. And it is primarily this new situation that must be dealt with at the proposed meeting in Bermuda next month between President Eisenhower, Sir Winston and the French prime minister—whoever he may be—before there can be any real question of a satisfactory approach to Russia.

Besides the recent disarray in western thinking, a Big Four conference now also seems impossible for two specific reasons. The Americans, who never liked the idea at this stage, had insisted that progress on the Austrian treaty should be one of the prime tests of Russian good faith; and without good faith they see no point in seeking a conference. The Russians seem in fact to be reverting to the attitudes and actions of the Stalin era; there is now plenty of evidence to suggest that the softening after the great man died was for tactical reasons of even shorter range than had generally been hoped.

By refusing to discuss Austria the Russians have done much to chill even the limited optimism that survived the columns of *Pravda's* important leading article last Sunday. It is true that the article was phrased in a conciliatory tone which would have been almost inconceivable a year ago. But the contents did little to suggest that the Russians were prepared to make any concessions of substance. And their attitude over the Austrian treaty, knowing in particular the importance publicly attached to it by President Eisenhower, has confirmed this view of their intransigence. They have, moreover, now gone further. By pointedly reminding the western powers that the Austrian negotiators were no more than deputies for the Council of Foreign Ministers, Moscow has given yet another hint that what it wants is a return to Potsdam, to get back, that

is, to the situation which existed in Germany just after the war. Four-power control of Austria has continued until long after the call for it has gone. Now, the Russian attitude is to seek its restoration in Germany. To put the clock back may sound a simple solution for an exceedingly complex situation. But events have gone too far to make it feasible. To allow a Russian voice in the running of Western Germany would be intolerable at this stage, not only to the whole community of Nato but to the Germans themselves. A four-power conference with that end in view would merely be a bargaining platform for Russian propaganda. It would widen rather than bridge the already yawning chasm between east and west.

★

Failing progress on Austria, the other criterion set by President Eisenhower for talks with Mr Malenkov and his colleagues has been progress at Panmunjom. But in view of the Communists' general attitude, both at the truce table and elsewhere in the world, it hardly seems likely that such progress will now be rapid enough to affect the issue. Indeed, if the Bermuda meeting between the American, British and French heads of government were to be regarded as in any way a preparation for a Big Four conference, there would have to be a remarkable change in the whole Korean picture during the next three weeks. The further adjournment of the truce negotiations on Monday for another week was not exactly a promising start.

Whatever is on the agenda for Bermuda, the fact is that the meeting will largely be dominated by the problems of the Far East, and its success or failure may certainly be judged by the extent of agreement reached about them. For when President Eisenhower took the initiative in proposing a meeting with the British and French Prime Ministers, he did so because he was alarmed at the differences which had arisen between the United States and its allies. And those differences really sprang from the divergence of mood promoted and sustained by emotions which have found their focus in Korea. Although the President's initiative in fact followed Sir Winston Churchill's suggestion that a meeting with the Russians might be profitable, his eyes were fixed more on the consequences than the contents of Sir Winston's speech. It was because of the twist given to the Prime Minister's words and even more to those of Mr Attlee, rather than because of the words themselves, that the President acted. But, although the extreme form in which much American opinion has lately been expressed represents a danger to the unity of purpose of the free world, the rightness of the American approach as taken by President Eisenhower is now being proven by the Russians themselves; they have rejoiced at the breaches in allied ranks and are afraid only that the coming three-power conference will heal them.

If, then, Bermuda is to be primarily an occasion for closing the gap between America and its allies in order to fight the cold war more effectively, in what will the task mainly consist ? One aspect, perhaps the most important, will be to estimate how far European opinion may move towards America on the Far Eastern problem, and how far some modification may take place in American attitudes. For President Eisenhower this will be a matter of crucial concern, if he is to give successfully the kind of national lead which he has so far declined because he risked opposing Congress and the right wing of the Republican party. And in Washington at any rate the chief barrier to a unified Far Eastern policy is recognised to be the difference of views about China. What are Peking's real intentions ? How far is China rather than Russia now the main expansionist power ? How can it be contained ? How much control does Moscow have over Peking ? If Korea is settled, should Communist China join Uno, and how soon ? These are the questions on which some consensus of allied view is essential if anything lastingly useful is to come out of the Bermuda meeting.

The problem may well be stated quite simply: while there no longer seems to be any real possibility of Bermuda laying the groundwork for an allied conference with Russia, it should clear the ground for dealing with China. It is, however, one thing to know and state the problem, and another to solve it. No one supposes that, after the long history of disagreement on Far Eastern policy, a short conference is going to heal all differences. But only a positive public and agreed approach by the three governments, can cut the ground from under the feet of those in both Britain and America who accuse their allies of not playing fair. It is just as necessary to rob Senator McCarthy of ammunition for firing at British ships trading with Chinese ports, as to refute those who genuinely believe that the Americans rather than the Communist leaders are preventing a truce in Korea.

Above all, some solution is overdue on the problem of how Americans are to talk politics with Chinese Communists. All negotiations in Korea have so far been on a purely military basis; but the next step, if there is to be one at all, must involve formal negotiations between governments. They in turn imply an agreed and recognised plan, not only for containing Chinese expansionism but for establishing a workable relationship with Peking if it does behave. Now that the Russians have shown that, in spite of the internal changes after Stalin's death, they are not prepared for a real settlement, this drawing up of an allied plan for China comes long before chasing the mirage of a meeting with Mr Malenkov. Indeed, to agree on how to handle China is an essential step towards any ultimate talks with the Russians. To recognise and act on this fact will be the key to making the Bermuda meeting a success. For unless the three major western powers can first compose their own differences, they will be in no position to negotiate successfully with Moscow. That is the true purpose of the conference.

East and West over Five Centuries

ON May 29, 1453, the Ottoman Turkish Army began the general assault upon Constantinople, which it had besieged for more than seven weeks, and before the evening the Sultan Mohammed II entered the city and took possession of St Sophia. It is one of the principal historical boundary-dates. Historians of the Renaissance and the Enlightenment marked the end of the Middle Ages by the fall of the Roman Empire in the East, as they marked the end of antiquity and the beginning of the Middle Ages by the fall of the Roman Empire in the West. The capture of Constantinople was the prelude to the Renaissance, to the Discoveries, and to five centuries of the greatest material progress that mankind has known.

In a longer retrospect, 1453 is a memorable point in the fluctuating struggle between East and West, which goes back at least to Xerxes's invasion of Greece, and is continued in Soviet Russia's occupation of Eastern Europe since 1945. It is tempting to see the principal theme of history in this conflict between Asia, limitless, uniform and despotic, and Europe, small-parcelled, various and free—tempting because it suggests that Europe has always hitherto shown the greater social vitality and endurance. In 1453 the West did not possess even the technical superiority which it now regards as its birth-right. Mohammed the Conqueror took Constantinople because he disposed of the heaviest train of artillery the world had yet seen.

But the Turks struck terror in the West by effecting conquests of a radically new kind. The Ottoman standing army, the Janissaries, was an institution that seemed to pervert and condition human nature. Recruited from children who were taken as tribute from subject populations and educated in Islam, this *élite* was without any bonds of family or country, devoted only to a Sultan who would lead them in war-like enterprises. Constantinople was stormed by warriors of Greek, Slav and Albanian blood, fighters who truly had no fatherland; and the Ottoman dominions were likewise administered by statesmen of Christian and European birth. Thus the Turks turned the strength of every conquered people against itself, and transformed those who might have been liberators of their countries into instruments of the oppressor. Historical parallels are always dubious, but the illusion of Communist invincibility may be dispelled if the Communist party is seen in the perspective of the recurring institutions of human slavery—against the record of the Janissaries' organisation, their changing relationship with the Sultan whom they served or ruled, and the purges and massacres that punctuated and finally ended their history.

The Ottoman invasion of Europe transcended the political category: its significance was religious, ideological, a clash between civilisations. The West regarded the Turk with fear and disgust as a barbarian intruder; the Ottomans believed it was their mission to conquer the world for Islam. Then, as now, there were two embattled worlds with hostile religions. But the Turks were not only the spearhead of Islam; they were also, perhaps like the Communists, the political representatives and avengers of Orthodox Christians against their Catholic rivals. It was not the Turks who destroyed the Byzantine Empire and broke the millennial inviolability of Constantinople. That had been done by the Westerners themselves when they sacked Constantinople on the Fourth Crusade. And a year before St Sophia was turned into a mosque it witnessed the greater desecration of a Catholic Mass; the first minister of the Byzantine Empire declared that he would rather see Mohammed's turban in Constantinople than the Pope's tiara. The Orthodox Church is a shade-loving plant; an infidel secular power has been so recurrent a feature in its political ecology that it may be particularly well adapted to a totalitarian age.

★

The politics of the defence of Europe against the Turks were religious politics. Religious motives overrode political ones, and political grievances found ideological expression. The West regarded the Ottoman Empire in Europe as a Christian *terra irredenta*, especially after the middle of the eighteenth century when Turkey was in decline and became known as "the Eastern Question"—that is to say, no longer a mortal threat, but a problem which the West could formulate in its own diplomatic terms, even if it was not agreed upon the answer. It was not until the Ottoman Empire had collapsed that the possession of Constantinople ceased to be an acute issue of international politics. To men like Gladstone and Freeman, the possession of European provinces by the Turk was a disgrace to Christians, and May 29, 1453, was the darkest day in the history of Christendom. They regarded the West and the Ottoman Empire as rival descendants of the Christian Roman Empire, whose coexistence was in the long run impossible; and they would have seen the fulfilment of a historical destiny when the two countries which had formed the core of the Ottoman and Byzantine dominions, Greece and Turkey, together became members of Nato.

Although Turkey was not formally admitted to the Western community of nations until the end of the Crimean War, the Ottomans had become a weight in the Western balance of power as soon as their position in the Balkans was consolidated by the capture of Constantinople. The infidel Turk was transformed diplomatically into the Grand Signior, successor of the Byzantine Emperor. Even before the notorious alliance of Francis I with the enemy of Christendom, the Italian governments had conspired freely with him against one another. France or the England of Elizabeth I could call in the Sultan to attack the Habsburgs in the rear, and the Habsburgs could invite the Sophy of Persia to attack the Sultan in the rear. The ideologically self-sufficient worlds of the sixteenth century were units in a wider, fluid, multiple arrangement of power. In the twentieth century the Communist bloc and the West are engaged in ideological conflict within the pre-existing framework of a single world-wide society of states, which they divide between them and where there are no available counterweights. This helps to explain the greater cohesion of the West in 1953 than in 1453. In 1453 the European states were materially and psychologically incapable of concerting even such resistance to the Turks as they later managed against Louis XIV. Crusading zeal was dead, and the prudential argument for collective security had not yet taken its place. The various athletes of Christendom, from Scanderbeg and John Hunyadi down to John Sobieski, were admired but not given much help. The same was still true of the age of Hitler. The greater degree of integration that the West has achieved against the Communist threat may perhaps be explained by the pressure with which each bloc grinds against the other in a bipartite world that can be flown round more quickly than Don John of Austria could sail from Naples to Messina.

The contraction of the world, and therefore of the scope for political manœuvre, is one of the greatest of the political changes that have occurred in five hundred years. Another is in the realm of political mood and temper. The fifteenth century saw the Ottoman menace through the haze of heroism and piety engendered by the crusading ideal. Foreign politics were romanticised: every prince was a martial Neville Chamberlain, wanting to meet the Grand Turk in single combat, or a chivalric MacArthur, yearning to smite the infidel and reconquer Jerusalem. This indeed is one of the reasons for their meagre success in resisting the Turks. In the twentieth century policies have on the whole become cooler and more pragmatic, reflecting the spirit of Machiavelli, who advocated a rational approach to politics even more clearly than an economical use of unscrupulousness.

But there is a deeper contrast: political empiricism has replaced religious belief. When Mohammed the Conqueror entered Constantinople in triumph, he dismounted at the doors of St Sophia, and kneeling on the ground poured dust upon his hair in token, at that supreme moment, of abasement before Allah. This is not the custom of contemporary war-lords and revolutionaries on entering their conquered capitals. In a religious age, even hostile and irreconcilable religions were united in recognition of human finitude and a transcendent power. Mankind has for the most part lost this primeval piety in the past five hundred years; in the end it was not a counter-offensive by Christianity but the secular force of nationalism that destroyed the Ottoman Empire. Whether men are freer and nobler in consequence is a question to which history itself gives no clear answer. Perhaps it is not in the nature of history to do so.

Soviet Satellite Seas

BY A CORRESPONDENT

WHEREVER it can, Russia has always sought to control a chain of satellite countries around its borders; and now they surround it like a layer of fat mitigating the rigours of the cold war. Soviet attacks on Swedish and American aircraft in the Baltic and Bering Seas, well outside territorial waters, encourage the belief that the Russians have now decided to complete the ring by the creation of satellite seas.

The First Lord's recent disclosure that the Soviet Navy is already the second largest in commission shows that such a policy need not fail through lack of adequate force; and it is no longer possible for a naval power like Britain to go on finding consolation in the complacent and unjustified view that Russia has always been and must remain a land power. Former Russian rulers have, in fact, been quick to grasp the essential principles of sea strategy. Indeed, the Volga-Don canal lately built and heralded as a triumph of "socialist construction" was the realisation, 250 years afterwards, of Peter the Great's intention to link the two rivers so as to be able to transfer his Caspian flotilla to the Black Sea.

What has usually been lacking in Russia has not been the will to exercise sea power. The Russians have been handicapped by restricted access to the sea and the competition of leading naval powers. They have also lacked industrial strength, adequate communications between their squadrons, and the easy familiarity with the sea that comes from possession of a sizeable merchant marine.

Most of these traditional obstacles are disappearing. Victory in the late war gave Russia a coastal perimeter of unprecedented scale. Its production of steel, coal and oil is now more than adequate for its naval aims. The handicap of poor communications is being overcome by development of the northern sea route along the coast of Siberia, and by a system of deep-water canals connecting the Black, Baltic, Caspian and Northern Seas and usable by naval units up to the size of destroyers. But the troubles caused by a largely landlocked and queasy human material still persist. They are reflected in a picture in this year's exhibition of self-taught painters of the Soviet Navy. It bears the

title of "Distribution of pickled cucumbers during a storm"—a recognised method of fighting seasickness.

Russia's intention of becoming a great naval power despite such obstacles has not been generally realised because on three occasions in this century—in 1905, 1914 and 1941—war has interrupted the programme. Thus the growing size of the postwar Soviet Navy does not so much break new ground as return to an old, though never fully effective, tradition. This time, however, an intensive programme of cruiser, destroyer and submarine construction is backed by a completely new industrial and strategic strength.

The political aims, too, are largely traditional, and much of Russia's effort may be seen as the pursuit of its basic naval objectives: the neutralisation of the Korean Straits, and the closing of the Black and Baltic Sea entrances to all powers who do not possess any coastline there. In the Black Sea, Russia overreached itself at the end of the war by asking for joint bases with Turkey on the Straits. The flanking operation of a civil war in Greece failed, and the Truman doctrine threw Russia on the defensive in the Black Sea. But in that new context the situation is not wholly unsatisfactory to Moscow, whose local primacy is not seriously challenged; and it is now Turkey that is prevented from making full use of its membership of the Atlantic Pact by the very Montreux Convention against which an expansionist Russia was so recently complaining.

The Baltic situation is much less satisfactory for the Russians and is clearly worrying them. Any attack on western Europe would be handicapped without control of this sea. Hence the sharp Notes sent in recent months to Denmark, the Nato power controlling the entrance to what the Soviet press now calls the "home waters" of the Baltic. Hence, too, the careful watch on movements of opinion in neutral Sweden, and the growing reports from Germany of Soviet naval and air developments in the Rügen Island and Szczecin areas. The attacks on Swedish aircraft well outside even the distended territorial waters claimed by the Russians speak for themselves. In the Russians' view, as stated in their "Handbook of International Law," the "Baltic powers" have the right to define the status of the whole of this "closed sea," including the Danish narrows, and specifically to exclude the naval vessels of all other nations.

In the Far East, the Okhotsk Sea became virtually a closed Soviet sea when Japan lost South Sakhalin and the Kurile islands after its week of war with Russia in 1945. Air and surface control of this sea is rigorous, and continues, as a result of Russian occupation of the Habomai Islands at the end of the Kurile chain, up to within a mile or so of the Japanese coast.

The Sea of Japan is, however, much more important for the defence of the Maritime Province, for overawing Japan, and for easy access to China and East Asia. The key to its control is the Straits of Korea. The Russians were quick to realise this and they have never forgotten it. They had no sooner reached Vladivostock in 1860 than they attempted to erect a base at the straits. The Russo-Japanese war of 1905 was essentially fought to decide who would control them, and was fittingly won and lost there.

Stalin said in 1945 that people of his generation had waited forty years to see the day of victory over Japan; but it was not until 1950 that he felt the time had arrived to take the substance as well as the trappings of victory and achieve the Tsarist aim of control of the northern shore of the Korean Straits. The Korean War can thus be seen as an attempt to gain a major objective of naval strategy, and it is perhaps a misfortune that, in the west, it has so completely been explained and dealt with in terms of regarding the Russians as mere "land animals."

Between west and east lie the seas of the Arctic, where the Russians as long ago as 1926 claimed "every discovered or undiscovered land" in a sector between the North Pole and the Norwegian frontier on the one hand and the North Pole and the easternmost tip of Siberia on the other. Lately the Russian lawyers had added to this an alleged Russian right to sovereignty over all the water and ice in this area. Four Arctic Seas —Kara, Laptev, East Siberian and Chukchee—are declared to be "closed seas" and the northern sea route is described as an inner waterway, and not an international highway. The only breaks in this chain of monopoly are the Barents Sea where, however, the Northern Fleet is being built up; and the Bering Sea, where American Alaska comes to within about fifty miles of Soviet territory.

Alaska has not unnaturally become something of a sore tooth with Soviet strategists; and Soviet press articles and comment leave no doubt that the sale of this province for seven million dollars in 1867 is now greatly regretted. It was the new Soviet Ambassador to China, V. V. Kuznetsov, who was reported by the Jugoslav Zujevic as being affected, during their return from the United Nations meetings in San Francisco, by a sight of a map of Alaska. "Kuznetsov began to curse the Americans, and I remember he said: 'That is ours, it's Russian: they took it from us, we'll take it from them.'"

Russia's present urge to surround itself with a belt of satellite seas is a natural reaction to a situation in which its potential enemies are sea powers. It is more economical to defend 15,000 miles of sparsely populated coasts by closing the adjoining seas and meeting opponents at their approaches, rather than by building vast and economically unproductive networks of strategic roads and railways, and dissipating manpower in isolated military settlements all over the Soviet Union. Behind these preparations lies the Russians' shocked discovery, in reports of the Normandy landings and Far Eastern operations, of the striking power that modern navies can deliver. As the implications have been absorbed, preparations to deliver or parry such blows have been speeded up; and published discussion of the subject has diminished with equal speed.

Notes of the Week

Commonwealth Assembled

After the Commonwealth premiers have drawn and acknowledged the plaudits of the crowds as they ride in their carriages along the Coronation route, they will get down to other business. They will have plenary meetings, and also, and possibly more usefully, informal discussions. There will be much to discuss. It has already been announced that Mr Nehru and Mr Mohammed Ali are to talk about Kashmir. African and Australasian problems suggest more than one regional *tête-à-tête*. New Zealand's candidature for the Security Council will give special importance to Mr Holland's talks with other premiers. Any indications which Dr Malan may give of Nationalist policy in South Africa, and towards the Commonwealth, will now be received with particular interest, and perhaps dread, by everybody else. Mr Nehru will be a key figure in discussions of the Russian reaction to the proposals for a four-power conference. The neighbour's view of the balance of forces in Republican Washington, which Mr St Laurent can give, will be of unusually close interest to his colleagues. Both in the affairs of its individual members and in those of the Commonwealth as a whole, the conference takes place at a critical moment.

★

It looks as if the premiers will have to steel themselves to some disappointments. While Mr Butler can certainly report a better state of health in the Commonwealth balance of payments, there are some individual exceptions to the rule; aid to Pakistan may well be put forward as an essential interest of the Commonwealth. On the economic programme agreed at the last Commonwealth conference six months ago—the so-called plan for the convertibility of sterling—Mr Butler must report negative results. This programme was built round the proposition that the United States would quickly back a realistic scheme of self-help; since it is now plain that there must be, at least, a waiting period before the policy of the new Administration is at all precise, large modifications of Commonwealth policy will certainly be suggested. Trade expansion will be thought of more as a matter of relations with the European Payments Union, rather than as something that depends directly and immediately on American policies for trade liberalisation, aid, and overseas investment. The internal problems of Commonwealth development have become even more important than they seemed when the convertibility plan was being formed. But it is perhaps the issues of foreign policy that will command most attention—and on which the extraordinarily diverse group of men who are responsible for the destinies of 600 million people are likely to be at their best.

The Liberals' Future

It would be sad if history had to record that the last serious hopes of reviving the Liberal party disappeared during the festive summer of 1953. But time is not softening the blow administered at the Sunderland South by-election on May 13th. Here, if ever, there seemed to be a real chance of the Liberal party demonstrating its marginal importance: its intervention could reasonably be expected to deprive the Conservatives of a seat they otherwise had an opportunity of winning. Whether, as the Liberals hoped, the Conservatives would then have been sufficiently chastened to lend a more favourable ear to the case for electoral reform is a question that is now hypothetical. In spite of Sir Winston Churchill's sympathy, most Conservatives have argued for a long time that anything like the alternative vote would merely save the Liberal party from an otherwise inevitable and early demise. They regard the Sunderland result as a complete vindication of this view.

The Liberal poll fell from 5,604 at the general election of 1950 to 2,524 this month. It is a reasonable guess that of the surviving Liberal voters, some represent a hard but small core of people who would otherwise have abstained. No one can guess how the others would have divided between the two main parties if there had been a straight fight, but it seems most unlikely that their influence either way would have been considerable. If the Liberal candidate had not stood, the Conservative majority would probably have been very little different.

The Liberal party's realists have for long appreciated that it can become a Parliamentary force again only by inducing one of the big parties—which means, in practice, the Conservatives—either to grant a measure of electoral reform or else to make an electoral pact on somewhat self-effacing terms, giving the Liberals a batch of fairly safe seats without greatly circumscribing their freedom of action. The weapons by which the Liberals might gain either objective never looked powerful: they are now very weak indeed. Something could be done by the present Liberal members in Parliament, but for a variety of reasons they sadly fail to make their influence felt. The party is thus thrown back on its resources in the country. After Sunderland it will be even less anxious than before to fight by-elections. Yet the error lies not in fighting Sunderland but in the party's failure long ago to launch a systematic "nuisance" campaign carefully directed to the marginal areas. At the worst, this would have helped to keep Liberal voters steadfast; at the best, it might have attracted new support. Even now it conceivably could revive both the confidence of the Liberal rank and file and the fears of the Conservatives. But the obstacles are now bigger than ever, the Liberals' resources—human and financial—have fallen desperately low, and time has run terribly short.

Minuet in Paris

SINCE the war French politics have been desperate if not always serious. Seventeen governments have succeeded one another, ranging from M. Queuille's record-breaking tenure of office from September, 1948, to October, 1949, to the same premier's three-day regime in July, 1950. The fall of M. Mayer last week has started yet another round in the formal and quite meaningless game of finding a prime minister. One after another, M. Mollet of the Socialist party and M. Diethelm of the Gaullists have refused to try to win a trip to Bermuda. As *The Economist* goes to press, M. Paul Reynaud is testing the very sticky wicket with the determined air of a man who would like to change the rules altogether. M. Reynaud brings with him terrible memories of the 1940 disaster, during which he was in office, and his present task shows how little France has learned from the recent past.

The unexpected fact that M. Mayer was overthrown by an absolute majority, and that a repetition of this event would entail the dissolution of the National Assembly, makes the problem of finding a new government particularly difficult. The deputies disagree on everything except the desire to keep their jobs, and this means that they may have to bear with the next premier for some length of time. No prospect could be more dampening to the French political mind. Few people in France care in the least about what goes on in the Assembly; the latter therefore tends to consider the practice of government as a private and occult game. Now, however, it is facing the possibility of dissolution and of having to appeal to a bored and ironic electorate. Every attempt will be made, therefore, to find a government with some chance of survival.

Whether or not this can be done is fundamentally of little importance. It is increasingly clear that France is ungovernable in the normal sense of the word, and that a parliamentary body which cheerfully dismisses a government on the day of the announcement of the Bermuda meeting is little more than a debating society. Indo-China continues to be an open wound and the North African situation is a powder-keg. It is doubtful whether the European Defence Community treaty will ever come up for consideration in the Assembly, yet no alternative has been proposed by a country which still claims a share of leadership in Europe. Instead of trying to face these immense problems and presenting them clearly to the nation, the Assembly has brought down successive French governments over the question of taxes on home-distilled alcohol or fractional cuts in an ever-mounting budget deficit. Rarely has a great, if somewhat anarchic, people been so badly served by its representatives.

Communist Germany's Strategy

THE optimists who believed that Stalin's successors would make concessions in Germany have been confounded by the latest statements made by Soviet German leaders, as well as by the most recent declarations in *Pravda*. While *Pravda* declares in familiar phrases that Russia "still intends to establish a "united, peace-loving, democratic Germany," Ulbricht and Grotewohl have removed any hopes that this might mean something less than a Marxist Germany, attached to the Soviet Union. There is no sign in any of the recent German Communist speeches that Malenkov might abandon the East German regime and agree to genuinely free elections as proposed by the western powers in their Notes of last year. The indications are indeed all in the other direction.

On the occasion of Marx's birthday anniversary and other celebrations, the Soviet German leaders have reiterated that the future "democratic" Germany is to be established by the violent overthrow of the Bonn regime. And the Pieck Republic is intended to be the model and operational base for the revolution in Western Germany. Far from slowing down the sovietisation of the Russian Zone, this process is being urged on, with intensified persecution of class enemies and the Churches. Ulbricht has repeated that the first stage—the dictatorship of the proletariat—has already been achieved in the Pieck Republic and that everything must now be done to accomplish the next stage, that of transition to a socialist state modelled on the Soviet Union.

This state is to be "the centre of the patriotic education of the German people and the strong base of the National Front," that is, to win Western Germany. It is affirmed that "friendship with the Soviet Union is an inseparable part of genuine patriotism," and Grotewohl, the East German premier, declares:

> The decision to create the foundations of socialism in the Democratic Republic has raised the struggle for German unity to a higher level. In this gigantic conflict, the German working class, led by its Marxist-Leninist party, is executing the will of the great German scholars and revolutionaries, the valiant champions of a united and indivisible Germany, Karl Marx and Friedrich Engels, as well as the leaders who developed their idea, Lenin and Stalin.

The German Communists envisage that their struggle for Germany will be a long one, and they constantly reveal that they have two great tasks to overcome. These are to combat the Social-Democrats and to force progress in the economic field. It is worth recalling as evidence of the direct effect of western restrictions on trade with the Soviet bloc that the German Communist leaders, revealing that industrial production has fallen in the zone by 10 per cent during the first quarter of this year, quote Stalin's dictum that "political work without economic successes is purposeless."

Investigating the Investigators

PUBLIC impatience with the Monopolies Commission is generally concentrated upon the unconscionable time that the commission takes to investigate and report upon the subjects referred to it by the Board of Trade. The Select Committee on Estimates—which may be said to be in somewhat the same line of business—concerned itself mainly with this question of time when it examined the operations of the commission early this year. But the recommendations appended to its report do not offer much hope of speeding up the highly respectable slowcoach.

No monopoly report has so far taken less than eighteen months to complete, and the average period has been something over two years; the latest report, on matches and match-making machinery, was incidentally delayed for an additional six months before being published by the Board of Trade. The investigations of the commission have tended to fall into three sections: a general study of the industry; an investigation by accountants of its finances and costs; and consideration by the commission of "the public interest aspects of the case" (which usually involves hearings at which the industry is represented, often by counsel). The factual study is carried out by the commission's staff, which is mainly drawn from civil servants, and the costing inquiries by its own accountant, sometimes assisted by accountants from the Board of Trade. Each process of factual inquiry is supervised by a panel of commission members; but consideration of the public interest is, necessarily, the responsibility of the commission as a whole.

This function of judgment is, inevitably, the bottleneck in the commission's present procedure; and the Select Committee's suggestions—that one full-time member might be appointed and that private firms of accountants and perhaps industrial consultants might be employed—hardly affect it. These might speed up the fact finding; they would perhaps deploy rather more familiarity with business practice, and knowledge of what to look for, than the present staff can bring to bear. But any radical increase in the speed of judgment—without reducing the care the commission can give to this task—would probably necessitate a radical change in the constitution of the commission, perhaps separating the judicial function from that of fact-finding. These are, however, difficult decisions; and the new type of inquiry into exclusive dealing practices, which the commission's chairman thinks "is very much simpler" than studies of single industries, may suggest alternative forms of improvement for British legislation against monopoly.

Remaking Nigeria

THE inevitable sequel to the crisis in Nigerian politics—a round-table conference to redraw the 1951 constitution—was announced by Mr Lyttelton in the House of Commons last week. Nigeria's federal constitution, following a forty-year period of administrative centralisation, gives to the centre all powers not reserved to the regions, and in that respect is far more centralised than the federal organisation planned for the Caribbean or Central Africa. This, it is now clear, presupposed a degree of mutual trust among the Nigerian peoples and creeds that does not yet exist. It might have worked, and proved a unifying influence, if the nationalists of the Eastern and Western regions were prepared to move more slowly towards full self-government: it is their eagerness to grasp sovereign powers which has produced what may fairly be called northern Pakistanism—though their own explanation is that the separatism of the North is simply a British device to perpetuate imperialism.

The Northern province has equal representation in the central legislature with East and West combined, but it is educationally backward and fears that self-government would therefore merely replace British by southern Nigerian, principally Ibo, rulers and administrators. Its instincts are the same as those of the Nyasas faced with the prospect of settler rule, or the southern Sudanese faced with the prospect of Muslim rule; it prefers by far the Colonial Office it knows. Since the southern nationalists resigned from the Council of Ministers upon their failure to force through the "self-government by 1956" resolution, Northern tempers have been rising, and the attempt by Mr Awolowo's nationalists to preach their doctrine in the North itself touched off the recent violence in Kano.

But a breakaway by the North would be a bad augury for British policy in Africa, which is to build viable modern states from separate peoples, cultures, creeds and even colours. Partition is, indeed, a confession of failure in the federal solution of this problem. The round-table conference has been proposed, but it is by no means sure that the invitations will be accepted. Perhaps, however, it will weigh with Africans of all parties in Nigeria that if they cannot work as a team, and build up what would be the largest black state in existence, they will give much pleasure farther south.

Benelux at Breaking-point?

PUBLIC demonstrations in Belgium against the tariff union with the Netherlands reflect the underlying tensions in this cold courtship. At present the Belgians are the unwilling partner; yet there does not seem to be any overwhelming national reason for their present reluctance. It is true that Belgium has had an adverse trade balance in the past nine consecutive months, but foreign exchange reserves remain adequate. The balance of payments with Holland, on the other hand, continues to run in Belgium's favour. Business conditions are satisfactory and unemployment at less than a quarter of a million is below the yearly average. The objections have come from sectional interests: high-cost manufacturers troubled by Dutch competition and agricultural interests already receiving special consideration in the Benelux agreement.

The advantages of Benelux are appreciated by both sides. A steady expansion of mutual trade has raised the proportion of Belgium's share of Holland's total imports from 11½ per cent in 1938 to 17 per cent in 1952. The respective proportions for Holland's trade with Belgium are 8.9 per cent in 1938 and 13.5 per cent in 1952. The critics point to two considerable problems: the divergent wage-price levels in the two countries, and the absence of a co-ordinated fiscal system throughout the area. The Belgians complain that Dutch Crippsian austerity has battened wages at a level below what is tolerable in the predominantly free-enterprise Belgian economy. The Dutch point out that it is the Belgian wage level which is out of step with the rest of Europe. They maintain that the Belgian failure to modernise and re-equip their industries since the war accounts for the greater competitive strength of Dutch industry. The juxtaposition of the two countries' wage levels since the war is remarkable—in 1938 Dutch wages were half as much again compared with Belgian wages; the position is now almost exactly reversed. The Belgians would like to see Dutch controls lifted in the belief that the Dutch wage-price level would drift up towards Belgian levels; but—astonishingly enough—Dutch trade unions

are against a general increase in wages, for fear of the effect on exports and thus on employment.

The Belgian government, while favourable to the idea of Benelux, has had to bow to public pressure. With the reluctant agreement of the Dutch, the transactions tax on a range of imports was increased on March 11th, and adjustments made to the luxury tax. In effect this change gives concealed protection to a number of Belgian industries. The Dutch are in the mood to make concessions to help their limping partner over the stile; but they are anxious for tangible evidence of Belgian self-help. Should the unfavourable balance of payments trend continue, Belgium will, in any case, be forced to face some unpleasant medicine.

Atomic Bertha

On Whit Monday the first atomic shell was fired in Nevada, and observers in Las Vegas, seventy-five miles away, debated just what shape the cloud had which ushered in the new artillery age. The atomic cannon, an eighty-five ton self-propelled affair with a forty foot barrel and the capacity to fit into a landing ship, is obviously a triumph of military engineering. It is the development of an atomic shell, however, which has raised the most problems. Every time such a shell is fired, moreover, $3 million goes up in smoke and 90 per cent of the fissionable material goes to waste. The prototype fired this week explodes with a force equivalent to about fifteen thousand tons of TNT, which is less than that of the two atom bombs dropped on Japan and only about half of the force unleashed by more recent types of atom bombs. The Army claims, however, that the atomic cannon is extremely accurate up to a distance of twenty miles.

Is this the strategic weapon which western commanders have been calling for as the logical means of defence against enormous numerical masses of infantry? That depends on just how mobile such a large cannon is—at present very few bridges could carry its weight—and on whether or not the problem of crossing a belt of radio-activity has been solved for ground troops. The answers to both these questions are, of course, secret, but there are hints that atomic weapons, at least those wielded from the air, are not the conclusive response to the challenge of mass infantry attacks. The development of an American atomic cannon poses two further questions: will the Pentagon be willing to send some of these guns abroad short of an absolute emergency, and if so, will the other members of Nato be allowed in on its secrets? Decisions will have to be made about common training and planning before atomic artillery can be reckoned in the actual balance of opposing forces.

State of the Roads

Questions to the Minister of Transport on the state of the roads, and the need to improve trunk roads or build new ones, produced the stock answer last week: the work will be ultimately carried out as planned, and "ultimately" means when the economic position of the country improves. The state of the roads represents, in fact, the largest backlog of potential pump-priming activity in the country. The Select Committee on Estimates has recently reported upon the strict control of expenditure which limits both new construction and repair, and has repeated the opinion of the chief engineer to the Ministry of Transport that "the trunk and first class roads are probably at least as good as they were before the war"; second and third class roads were deteriorating, though not dangerously. Other authorities, however, took a much gloomier view.

Payments out of the Road Fund for trunk roads and in grants to highway authorities (for other road maintenance) have in fact increased in recent years—from £25,987,000 in 1947-48 to an estimated £33,594,000 for 1953-54. But costs have also risen considerably, and so has the rate of wear. According to the Ministry of Transport's new report on London traffic the number of vehicles in the country—which must include a growing proportion of heavy commercial lorries—has risen from 3,000,000 in 1938 to 4,500,000 this year, and is now increasing at the rate of 250,000 a year. There are, in fact, 25 vehicles for every mile of road, trunk, second and third class, and 1½ vehicles are added per mile of road every year. It is, indeed, very clear that the road system is becoming gravely inadequate for the traffic which the country is loading on to it.

The Select Committee could do no more than make suggestions which might palliate the situation, more especially suggestions designed to avoid waste of land and money and give highway authorities more elbow-room in making minor improvements. But the cost of a congested road system is heavy. The accident rate has recently risen again. Traffic delays, though hard to cost, must be a growing expense. In inner London itself the Ministry's report predicts that traffic may come to a complete standstill unless major road improvements (the last were done in 1905) are undertaken. It can do no more than list further palliatives although "almost every conceivable palliative has been suggested and tried." In all this there is nothing new; but it is increasingly clear that a large investment in road improvement would bring a large return in national efficiency.

Saving the Houses

The Minister of Works has announced that the Government is preparing a Bill to authorise his Ministry to pay grants to the value of £250,000 a year to maintain historic buildings; a further £500,000, spread over five years, is to be used to buy such houses as would otherwise fall down. This latter sum is to come from the National Land Fund. These two actions are welcome signs that the Government has taken seriously both the Gowers report and the concern voiced by the House of Commons in February's debate—a concern which was recently expressed once again by the House of Lords.

Unfortunately, as Lords of all parties had no difficulty in demonstrating, such sums will save a mere fraction of the national works of art which are now perishing at a

Under two Queens

WHEN the name British Thomson-Houston was first heard, in 1894, the main developments in electricity still lay ahead. But progress was rapid. As the Boer War ended, BTH was electrifying the Central London tube railway. Bleriot crossed the channel in his rudimentary aeroplane—and manufacture of Mazda tungsten-filament lamps began.

The first World War brought a halt to most non-armament development work, but by 1921 the first vessel fitted with BTH turbo-electric propulsion machinery was putting to sea. The 'flapper' fashions came and went, and in 1930 the first steel-tank rectifier in Britain was installed at Hendon by BTH.

In the second World War BTH research in the new science of electronics, begun many years earlier, gave vital assistance in devising radar warning devices, just as the jet engine—developed at the Rugby Works—altered the course of design in aviation as peace approached.

In this Coronation year, the British Thomson-Houston Company looks back proudly over its record during five reigns, and applies itself anew to the ever-urgent task of supplying industry with the most efficient and reliable electric equipment that can be devised.

ESTABLISHED 1844

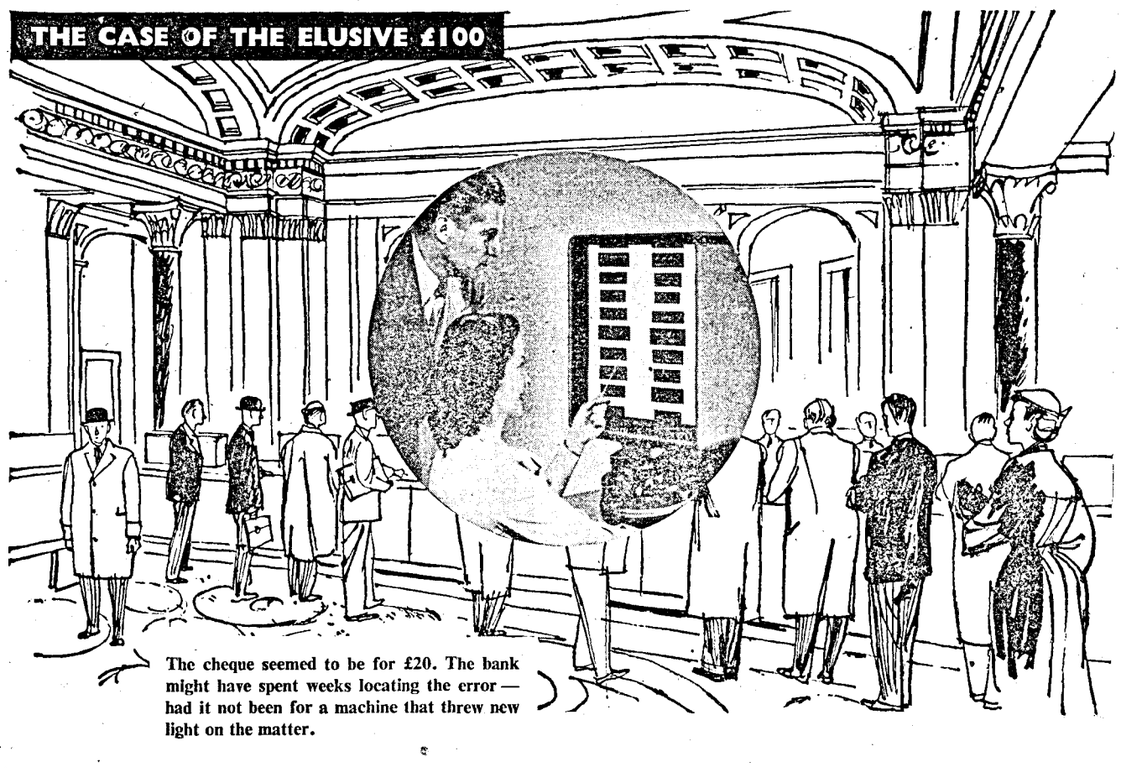
EQUITY & LAW
LIFE ASSURANCE SOCIETY
HEAD OFFICE: 20, LINCOLN'S INN FIELDS, LONDON, W.C.2

IF YOU LIVE . . .
to age 65, you will receive £1,000 together with bonuses which, *if maintained at present rates*, would then amount to a further £836.

IF YOU DIE . . .
before age 65, your family will receive £1,000 with accrued bonuses immediately and, in addition, £200 a year until you would have been 65.

These figures relate to a life aged 35 next birthday and represent a Family Provision Scheme for the maximum term of 30 years at a premium of approximately £60 a year.

To: The General Manager,
Equity & Law Life Assurance Society,
20, Lincoln's Inn Fields, London, W.C.2.



Please forward, without obligation, an illustration of this Family Provision Scheme with full details.

.....DATE OF BIRTH.....

The cheque seemed to be for £20. The bank might have spent weeks locating the error — had it not been for a machine that threw new light on the matter.

Of all the cheques—*one* was to blame, but which?

MODERN BANKING works at high speed. Nothing can be allowed to interrupt the smooth flow of business. From the Commercial Bank of Scotland comes a story that illustrates the value of one of the methods used to detect errors—without loss of handling-time or inconvenience to their customers.

Among the millions of cheques banks handle, many are badly written, and, recently, the Commercial Bank received one in their clearing that seemed to be for £20. In accordance with banking practice this cheque, with many others, was listed and added in its appropriate batch and promptly forwarded to the Branch concerned. On attempting reconciliation with the in-clearing total, an error of £100 was revealed. The Head Office then had the problem of tracing it without holding up the daily work.

Normally, this would have entailed reference to all amounts of £100 or over, and, if that failed, the examination of every cheque for amounts of under £100. The search would have to be conducted after hours.

The Bank's method was less complicated, far faster. Knowing the day the error occurred, they simply ran off on the Reader of their Burroughs Microfilm Equipment the film of their clearing for that date. Within minutes the "guilty" cheque appeared on the screen, and scrutiny showed that, in its typing, the hundreds figure of £120 had merged with the printed £ sign—leaving a clear amount of only £20 showing.

Result: By such use of their Microfilm Equipment, this Scottish Bank, which photographs and retains in their original order some thousands of cheques a day, has been able to save hours of after-closing labour and time. In this unusual case, the search for the "two-faced" cheque might have taken weeks.

What about you? In any business, document-storage must be considered in terms of time and cost—the time it takes the staff to trace important records, and the cost of the space that is needed to keep them safe. By transferring all statistical information to compact, non-inflammable spools of Burroughs Microfilm, the saving in storage-space alone will be greater than 99%.

Burroughs offer, from their great range of modern record-keeping machines, the finest Microfilm Equipment in the world, British made by G.B.-Bell & Howell. Call Burroughs about Microfilm *today*. Burroughs Adding Machine Ltd., Avon House, 356-366 Oxford St., London, W.1. Sales & Service Offices in principal cities.

Seen here at the Recorder of Burroughs Microfilm Equipment is Mr. R. M. Thompson, the Burroughs Representative who supervised the installation of this equipment at the Commercial Bank of Scotland Ltd. With the Reader, and the Automatic Processor, this machine offers you a complete storage-system for all your documents. For clients who don't want to process their own film, Burroughs operate a fast Processing Service.

rapidly increasing rate. The annual grant has been estimated by the Ministry of Works as sufficient to preserve the best 50 or 100 of the 2,000 houses whose preservation was urged by the Gowers committee. To save them all would cost perhaps £10 million a year, and in those circumstances most of them must be regarded as doomed as hopelessly as the House of Usher. Lord Silkin was prepared to go as far as £2 million—the interest on the Land Fund. Other suggestions included exemption from rates; there seems little hope, however, that any government would dare to grant tax reliefs for the upkeep of these houses, the decay of which is directly related to the £184 million a year which the Exchequer is drawing in death and estate duties.

The upkeep of these houses, of which only a few have alternative uses or could be suitably converted, represents in fact a large private and public investment in art. The difficulty in finding the money is simply an expression of the nation's preference for other forms of recreation than the enjoyment of art. It should surely be possible, by a variety of provisions, to keep the best of the historic houses in existence, but until the electorate evinces a marked preference for admiring them to other forms of amusement or amenities, large sums of money will hardly be forthcoming.

University of Salisbury?

THE report of the Commission on Higher Education for Africans in Central Africa marks one more stage in the process of setting up university institutions in the colonies. This process has been going on steadily since the Asquith Commission reported in 1945; in Central Africa, the need for a university suddenly became urgent because of the Union Government's decision in 1950 to admit no Africans from outside the Union to South African universities after the end of this year—a decision which arose from the shortage of places for Africans resident in the Union.

The Carr-Saunders commission was thus solely concerned with matters affecting the successful establishment of a university in Central Africa. It was not a by-product of the federal scheme, and its recommendations were so framed that they could be accepted whether or not federation of the three territories came about. But quite independently of its own appointment a trust had been set up in Southern Rhodesia to found a university there, and last year an Act was passed establishing an inaugural board and prescribing the university's constitution. The commission had, accordingly, to determine whether this project, for which a great deal of local enthusiasm had been generated, could be fitted into its own conception of a university for Central Africa. With one exception, the members decided that it could, provided that it conformed to certain principles considered essential by the British university world: freedom from government control, and the admission of students without regard to race and without racial segregation in the use of academic facilities.

It is in the light of this report that the statement made by Mr Lyttelton in the last federation debate should now be judged. Does Sir Godfrey Huggins's willingness that the Central African university should be multiracial mean that those responsible for the Salisbury institution accept the full implications of the Carr-Saunders report? If so, they will evidently have to seek an amending Act, since the present one does not give the university full autonomy. They will also have to choose a new site, for the one granted to them would not be practicable for building a university to take eventually 2,000 students with full racial equality. But if the full implications are not accepted, presumably the future federal government will then accept the commission's alternative proposal—that an institution conforming to British university traditions should be founded at Lusaka. One member of the commission is pessimistic enough to suggest that energies should be concentrated at once on an institution at Lusaka. Besides wasting resources, this policy would mean abandoning a fine opportunity to break down racial boundaries. The Carr-Saunders commission was naturally not concerned with this. But all those who wish the new federation well must hope that the commission's Salisbury proposals will be adopted.

Russian Sales

A SIGNIFICANT feature of *Pravda's* latest *tour d'horizon* was the inclusion of the Soviet public as an interested party in the negotiations now taking shape. At several points in the article, reference was made to those passages in the Prime Minister's speech that have aroused interest or expectations among Russian readers, and their stake was stated plainly at the beginning:

> Any step forward towards the settlement of disputed problems would reduce the danger of war, assist the reduction of the arms race which is ruinous for the nations, and relieve the situation of millions of people. Conversely. . . .

Thus the new Soviet rulers are now beginning to make it clear to their subjects that the promised improvement in their standard of life is largely dependent on the success of international negotiations.

Meanwhile, in addition to the recent cut in retail prices, the Russian housewife has now been offered two welcome presents. One is the announcement of cut-price sales throughout the Soviet Union. Slightly soiled or outmoded consumer goods are to be sold at 25 per cent below the normal price. This is news indeed for Russia, where sales have been unknown hitherto. Consumer goods have been too scarce for the whims of fashion to have any influence on the purchaser. Another move which also shows either the availability of large stocks or expectations of increased production is the freeing of sales of wheat flour. Housewives will now be able to buy it every day at official prices in state-owned stores. Previously wheat flour was sold in state stores only four times a year, and otherwise it could only be obtained from collective farmers at much higher prices on the free or so-called collective farm market.

These moves are clearly in keeping with the promises of the new regime, but they are based on past achievements rather than on radical changes in the structure of production. The new rulers seem to be waiting for a clearer international picture before binding themselves to radical

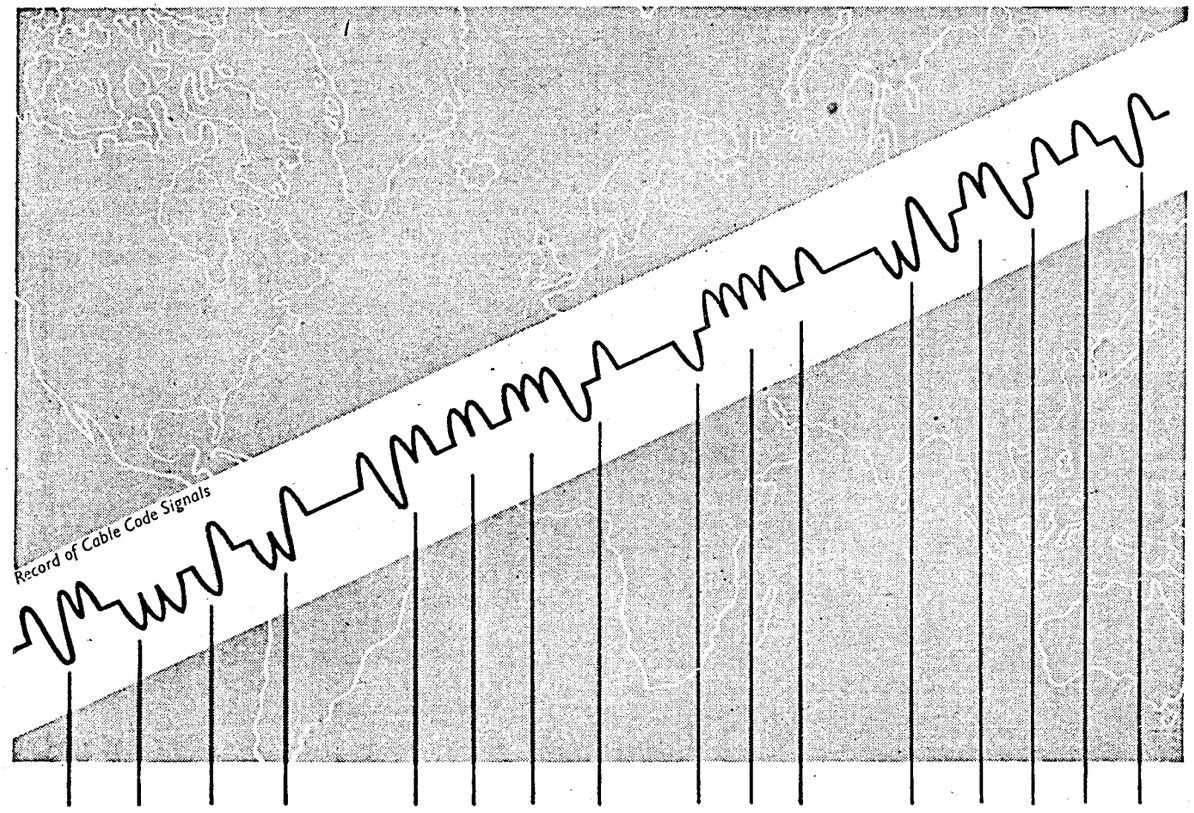
changes in economic policy. For the moment they have neither proclaimed the budget for the current year, nor announced the results of plan fulfilment for the first quarter. They may well be preparing spectacular surprises.

Help for Children

THE forthcoming meeting of Uno's Economic and Social Council will discuss the future of the International Children's Emergency Fund (UNICEF), whose present mandate ends this year. This fund was set up in 1946 primarily to help restore and expand the child welfare services of Europe's war-devastated countries. Its record of practical achievement since that time has been impressive: over 60 million children in 84 countries and territories have benefited from one or more of its campaigns against tuberculosis, malaria, venereal and other diseases, or from its emergency feeding programmes. The fund is financed largely through governmental contributions, but on a voluntary basis ; the assisted countries, moreover, subscribe matching sums as great as, and often greater than, those provided by UNICEF. By this means the direct interest of each receiving government has been engaged, and the evident benefit to its country's economy as well as to the health of its children has stimulated further independent action.

Since 1950, emphasis has shifted from emergency relief in Europe to long-term aid for children in the underdeveloped areas of Asia, Africa, the Eastern Mediterranean and Latin America, whose needs have become the prime reason for UNICEF's continued existence. It has been suggested that the fund should now be transformed into a fully fledged specialised agency of the United Nations, in line with Unesco, the Food and Agriculture Organisation and others. This, however, would involve an expensive administrative and budgetary reorganisation, and, if the previous experience of other agencies is any guide, would risk the aggrandisement of its present modest international staff of 120 persons at the expense of its practical work. The fund's merited reputation for efficiency and economy would surely be best rewarded by continuing it on the present basis, if not indefinitely then at least for another three-year term.

Perón, Plots and the Press



WHOEVER has been responsible for the numerous bomb explosions in Buenos Aires in recent weeks—explosions which for the most part have been singularly, almost pointedly, innocuous—there is no doubt that they have come at a very convenient moment for General Perón. If, as the Argentine police now claim, the bombs were jointly planted by opposition groups ranging from Socialists to Radicals and ultra-conservatives, it would seem that the anti-Peronist forces have not only proved able to co-operate to a degree never before recorded, but have also chosen to unite on a plan of action which could hardly be more advantageous to the government. The explosions have been followed by a sweeping round-up of opposition leaders of almost every political shade, with, apparently, the interesting exception of the Communists, and the excitement they generated has effectively served to distract public attention from the country's continuing economic difficulties. Thus, within a fortnight of the now famous mass meeting on the Plaza de Mayo, at which the President was supposed to explain his plans for dealing with rocketing living costs and scarcity of food, General Perón was able to announce that the economic crisis had been overcome.

However, his simultaneous action against the offices in Argentina of the American news agencies gave a fairly precise indication of the real state of affairs. The charge levelled against the agencies by the Peronistas was that they had not merely disseminated false reports about Argentina's economic problems, but had done so in order to "prevent our sister nations from signing treaties of union." This goes very near to the bone. It is undoubtedly true that several smaller South American republics, which at one time looked like being sucked into General Perón's orbit, have drawn back in recent months because they saw only too clearly the straits to which the General's economic policy had reduced his country. Attacks on independent sources of news are not, however, likely to revive their confidence ; indeed, newspapers in various parts of Latin America are already prophesying that an "iron curtain" will soon be lowered around Argentina—and drawing the appropriate conclusions.

Government and Press

The Press is simply the voice of the family, the council of the aged, the opinions of the assembled barons, a mere mechanical contrivance as suitable to the present large boundaries of States and their numerous populations as assembling the whole family in a hall to consult was in the patriarchal times, in order to learn what all had seen, and what all knew, and what all advised. To suppress the opinions of one class, is to shut out a part of necessary knowledge ; to lay restraints on the expression of the opinions of all classes—to place fetters on the Press—as is proposed by Santa Anna [in Mexico], as is done by Louis Napoleon, and . . . the Government of Austria—is simply for the Government to shut out knowledge from itself, and endeavour to carry on administration without learning the means by which it can be done. Nobody doubts for one moment that society in France, in Austria, and in Italy, as well as in England, is different from what it was a century ago ; and that difference has been gradually made known, as it arose, by journalists, scientific men, and observers of all kinds. Society will continue to grow and to change. It grows differently and changes differently in different countries, which can only be known by communication. The Governments under which the Press is free, as in England and the United States, being better informed of the condition of their own society and of other societies, are the most successful, both in preserving tranquillity at home and extending friendly relations with all nations abroad. Thus, self-interest—the wish to do their duty and to acquire the means of doing it—should make Governments anxious to promote and confirm, not restrict and destroy, the freedom of the Press.

The Economist

The true BP Superman also uses BP Energol—the oiliest oil.

BP is the trade-mark of ANGLO-IRANIAN OIL COMPANY, LTD., whose world-wide resources are behind it.

Letters to the Editor

The Unfree Health Service

SIR—I fear the quickness of Mr Macleod's hand has deceived your eye in the matter of dental charges, which have done far more harm than good.

It is true that the number of children seen by private dentists has increased by 180,000 a quarter. But if you examine Mr Macleod's recent statements carefully you will find, not exactly displayed but at least imperfectly concealed, that this has been accompanied by a reduction of 493,000 in the number of adult cases (or courses, as Mr Macleod prefers to call them). For every 4 extra children brought into the surgeries, 11 adults have been pushed out.

Are we really to put out more flags to celebrate this example of rationing by price? Surely it is obvious that this sudden and massive reduction in adult courses must have inflicted much hardship.

For this exclusion by cost has been selective in a most undesirable way. None of it has fallen on the relatively well-to-do, who are used to paying for treatment. Most of the victims are:—

(a) Middle-aged people in the lowest income groups who cannot raise £4 5s. for dentures; or

(b) Young workers in their twenties who grudge £2 a year for conservative treatment, and are now letting their teeth rot.

Are not these two groups also priority cases, or very near it?

Maybe the charges might be defended on grounds of pure economy, but it is ridiculous to claim that their main if not their sole effect has been to guide, as by a hidden hand, little children into the surgery. I would not say that Adam Smith would be surprised, for what did he ever expect of Ministers except folly and presumption?—Yours faithfully,

Liverpool L.D.S.

Gold and the Gap

SIR—It is unfortunate that your note in your issue of May 16th on Mr Harrod's paper for the IMF comments only upon the question of the gold price, because by dealing exclusively with his weakest point justice is not done to his otherwise excellent paper.

Indeed, the importance of the price of gold is somewhat overstressed in Mr Harrod's paper. He points out that if gold production outside USA had increased in line with production and trade generally, and if the dollar price of gold had been raised in line with the dollar price of goods entering international trade, the annual value of gold production would have exactly covered the recent annual US surplus on goods and services. However, it should be added that in the late thirties the annual value of gold production covered this annual surplus more than threefold. It follows that other factors have been far more important in causing the gap than the lag in the gold price in relation to goods.

Mr Harrod also does not take account of the fact that South Africa, the major gold producer, is no longer a member of the sterling area as far as gold is concerned. Its gold contributions to the sterling pool are a result of special arrangements with Britain and have recently amounted to only 50 per cent of its annual gold production. It is likely that in return for British support for a rise in the gold price South Africa would be willing to increase its gold contributions, and that larger dividends of British-owned South African gold producing companies would facilitate the transactions. But its gold contributions would in the long run mainly depend upon a considerable increase of British exports to South Africa. Even if allowance is made for such an increase in British exports it seems unlikely that South Africa's contributions to the sterling area's gold and dollar pool would exceed 50 per cent of the increased value of its gold production.

Admittedly, even this would alleviate the British dollar position considerably. But it still seems doubtful whether the subject of the gold price should be "hammered home in Washington as a case where American monopoly buying power has had undesirable consequences." The prewar situation was indeed absurd, and an increase in the gold price would lead to continued useless accumulation of gold in Fort Knox, while increased exports from the United Kingdom to South Africa might be at the expense of British exports to the dollar area. It is certainly questionable whether American aid in the form of a higher gold price which would mainly benefit the gold producers is better than an equivalent sum devoted to facilitating the necessary real adjustments in Europe's economies. Moreover, since other factors have been more important in causing the gap than the decline of the gold price in real terms, an increase in the gold price would merely act as a palliative. It would seem better to hammer home in Washington more "economic" measures, such as tariff reduction and foreign investment—although prospects are rather hopeless at present—than to deplore that an absurd situation was abolished in the course of events instead of by an act of deliberate policy.—Yours faithfully,

S. TALMA STIEEMAW

Cambridge, Mass., USA

Prefabs for Export

SIR—In your article you have concentrated primarily on the part played by wooden buildings in the export drive; to balance the picture, may I point out that metal framed buildings are playing an equally important part and have several advantages?

The bungalow with an aluminium framework and walls of aluminium sheet, glass silk and hardboard, has an insulation value greater than a normal 11 inch cavity brick wall; it is light in weight and, packed "piece-small," occupies little space in transit; the simplicity of the bolted construction means that unskilled native labour can be employed in erection and the metal is completely impervious to termite attack. Also, in hot climates, the reflectivity of the aluminium sheet is of great value in maintaining cool interiors and, if desired, the whole building may be dismantled and moved to a new site.—Yours faithfully,

Slough PETER STEVENS

New Reign in Iraq

SIR—I find myself completely in agreement with your special corespondent on the subject of the Development Board. What is needed is a board with the imagination to "waste" a certain amount of money—and are there not millions to spend?—on schemes which will prove to the citizens of the big cities that things are happening that are benefiting them. At present the masses have no reason to doubt that the oil royalties are passing into the pockets of the privileged classes.

But is your special correspondent not unjust to the Creator in the story which is quoted in the opening paragraph? Surely the Creator, however senile and out of touch with the atomic age, must remember that it was in Mesopotamia that He created the Garden of Eden? It is more likely that He said: "Yes, this is just what the country was like after Adam had been farming it for a bit."—Yours faithfully,

Limassol, Cyprus RALPH POSTON

The English Village

SIR—Your review of the book "The English Village," by W. P. Baker, is liable to give an erroneous impression about the "virtual disappearance of handicrafts." If by this is meant blacksmiths, wheelwrights, thatchers, saddlers, basket makers, potters and a host of similar craftsmen, it may be of interest to your readers that the Rural Industries Bureau knows of no fewer than 13,000 such businesses in England and Wales alone. We have estimated the total of employed people somewhere around 35,000 men and women and their total gross output is in excess of £30 million per annum.

Most of these small country businesses are prosperous and are successfully endeavouring to keep pace with the times by technical modernisation.—Yours faithfully,

London, S.W.19 O. W. LIPTON

Books & Publications

Neither Marxist nor Liberal

THE BOLSHEVIK REVOLUTION, 1917-1923. Volume III.

By E. H. Carr.

Macmillan. 614 pages. 36s.

FOR the student of Soviet Russia's history there is now a hard and straight road where before there were only tracks. It is a narrow road, but there are magnificent views from it. Mr Carr, one hopes, will go on clearing and laying and rolling; for he has stopped at 1923 and there is fascinating country ahead. It is important that one day the teachers, thinkers and journalists of the West should be able to travel fast and freely in Soviet history between 1940 and 1917—and back. The achievement is already memorable; but it could become outstanding.

This volume, which completes the first part of Mr Carr's "History of Soviet Russia," deals entirely with foreign policy. It reads more easily than the previous volumes, but it is still a severe test of memory and concentration. One is taken along remorselessly, rather as if a judge were summing up at the end of a long and difficult trial. The judge is neither Marxist nor liberal; he is a Carrist. The facts are assembled, the pattern of events appears, and the motives of personalities and parties are elucidated; and yet, from the story of this fascinating period, beginning with German brutality to Russia at Brest-Litovsk and ending with hard-headed Soviet-German handshaking at Rapallo, the people and the events emerge with no voice or colour. One thinks of what Carlyle would have made of the first meeting of the Comintern, or of such characters as Trotsky, Chicherin and Radek. For Mr Carr keeps his imagination—and his political and moral judgment—on a tight rein. He has no word of reproof for Lenin's deviousness; he states as ice-cold facts the hypocritical attitudes of the Comintern, the Russians' fumbling policies with the German Left, the stubborn misunderstanding of what trade unionism meant in the western working-classes. Perhaps he feels that so much of what is happening today has its roots in the events of 1917-23 that each reader will bring to bear enough contemporary emotion to make his cold narrative more dramatic.

Mr Carr is clearly sympathetic towards — sometimes sorry for — the tough, brilliant and tireless men who consolidated the revolution. Within six years they brought their country from mortal danger and weakness back to the company of the great powers. They learned their job quickly and in hard circumstances. When Trotsky took up the post of People's Commissar for Foreign Affairs he said: "I will issue a few revolutionary proclamations to the peoples of the world and then shut up shop." Yet within three years Soviet foreign policy over a wide range was being handled with the stubborn cunning of Elizabeth Tudor. Facts forced its masters into a dual policy: "to attempt to hasten the downfall of capitalist governments and to attempt to negotiate with them." By March, 1920, Chicherin was telling the Party congress:

> At present the capitalist system exists, so that a *modus vivendi* must be found in order that our socialist states and the capitalist states may co-exist peacefully and in normal relations with one another.

Yet that was the year in which the prestige of the Comintern as a leader of world revolution was at its height. It all sounds a little familiar.

Indeed, again and again in this book coming tactics cast their shadows before, and one wonders why the Soviet Union when it is so strong has to go on with the tactics that saved it when it was so weak. It is economic facts that push Lloyd George into opposing continued support for the regime in November, 1919; and the Soviet Government makes promises (not kept, of course) to desist from propaganda against the British Empire in order to get the Anglo-Soviet trade agreement of March, 1921. It plays with ideas of getting foreign capital and equipment to help the New Economic Policy; but it shies away from the European economic project that led to the Genoa conference. Having used every device to ensure that the Comintern should have a clear and rigid party line to oppose to the Second International, it is telling national Communist parties three years later (1922) to follow popular front tactics shoulder to shoulder with the accursed bourgeois Socialists.

It is in the study of policy forming that Mr Carr is at his best. His analysis of the moves that brought the Germans and Russians together in 1923 is masterly and convincing, though he forgets that nobody under 40 remembers what Briand and Stresemann stood for. (Indeed, the volume would be better for short chapters recalling the sequence of events outside Russia and for a couple of maps.) Likewise, he has sorted out most clearly the ideas and motives of the Russians in the Comintern. This scholarship will not be easily undone, and those who wish to assess its quality can turn to page 505 where he tracks down the truth about Soviet undertakings to China regarding the Chinese Eastern Railway. It will be most interesting to see whether the alleged liberalism of Malenkov and his colleagues will allow this work to be read and reviewed in Moscow. It should certainly be read in both Houses of Congress.

Political Player

CALL BACK YESTERDAY: *Memoirs* 1887-1931.

By Hugh Dalton.

Frederick Muller. 330 pages. 21s.

MR DALTON'S entertaining book, the first of a trilogy according to his plan, achieves to the full at least one of the purposes of political biography. It tells us a great deal about the author. Although the period covered by this volume ends in 1931, with the narrator still a junior politician, only 44 years of his life behind him, we have no difficulty in recognising in the story almost all the characteristics of the post-1945 senior minister. On the credit side there are quick intelligence and instinctive loyalty, a philosophic acceptance of the rough as well as the smooth of politics and a fundamentally good-tempered, unjealous attitude towards life and affairs. On the other side there are obvious prejudices constantly referred to with an air of pride; a curious habit of standing aside and watching (but not criticising) his own gesticulations upon the stage; and a certain lack of proportion in his judgment, resulting in too similar a treatment for the small and the big. The consequence has been a strangely uneven politician: a man capable of risking everything to make the Labour party more sensible on defence in 1937, but incapable of going down with all his flags flying when the Bevanites were closing in upon him at the Blackpool conference last year; a political player who has frequently shown a most attractive verve upon the field, but sometimes with a little too much of the professional in his manner for the English taste.

About his period, Mr Dalton also tells us a good deal, although less revealingly. What a pity he was not a member of the Cabinet of 1929-31, as in many ways he deserved to be. With his profuse diary keeping and his keen ear for political scandal, he would then have been able to tell still more about the fantastic jealousies which rent the leadership of the Labour party in the Macdonald era and about the still clouded story of August, 1931. As it is, some of his information on these subjects is secondhand. He was Henderson's devoted henchman, as well as his Under-Secretary at the Foreign Office, and much of what we are now given came to Mr Dalton from that dour Methodist politician, the most unlikely but far from the least successful of British internationalists.

Two impressions of the Labour party in the twenties stand out. The first is the breath-taking lack of discipline, not so much among the rank and file, about whom Macdonald was always complaining, but at the top. Mr Bevan behaves with iron self-restraint compared with many of his forerunners. The second is the extent to which the party then encouraged "carpet-bagging," much more than it does today and more too than either of the traditional parties. Mr Dalton himself successively wooed the electors of Cambridge, Maidstone, Cardiff East, Holland-with-Boston and Peckham, all within the space of two and a half years, and Henderson, electorally most unfortunate, was continually moving from one northern seat to another. It was the "men from Headquarters" rather than indigenous leaders who won the partial victories of 1923 and 1929.

The form of Mr Dalton's book is not quite so satisfying as the substance. Mr Dalton writes as he speaks, in a very loud voice, and the effect is at times exhausting. And he is much too fond both of inundations of initials and of the platform phrase, to be rolled around the mouth and repeated with rhetorical relish. But these faults (which, indeed, do not appear in the excellent early chapters) do not spoil a most readable book. With three volumes Mr Dalton is offering a big ration. The first instalment will make us await the others with interest.

Americans and Clearing Unions

STRENGTHENING THE FREE WORLD ECONOMY. *A report by Klaus Knorr for the Princeton University Centre of International Studies.* 45 pages.

THE Centre of International Studies at Princeton University is performing a real service with its present series of quietly authoritative memoranda on international economic problems. Its latest memorandum is of special interest because it contains a summary by the Princeton Professor Klaus Knorr of a conference on America's foreign economic policy which was attended by sixteen leading government and academic economists last December. Most of these economists said most of the right things about the direction in which American policy ought to move—for instance, as regards tariffs, foreign investment and stabilisation of raw material purchases. Most of them also—at any rate in European eyes—seemed to underestimate the structural disequilibrium in trade between the dollar and non-dollar worlds; there seemed to be a tendency to forget how far the recent narrowing of the dollar gap had been snatched at the cost of discriminating import restrictions and how fearfully any American recession would react on the non-dollar world.

But the really interesting feature of the conference was that it reflected the growing realisation among American economists that "the so-called European dollar gap is no longer the product of European deficits on current account, but of the attempts of Europe to finance the deficits of its associated overseas areas." To put the matter baldly: American economists are swinging round to the realisation that the failure of the sterling area to attain a secure postwar dollar balance, even under conditions of discriminating trade, does not lie so much at the door of the United Kingdom as of the overseas dominions. Professor Robert Triffin, of Yale University, recognised openly that international financial policies since the war have fallen down because they have "concentrated each country's attention on the solution of its dollar deficit rather than of its overall deficit." His proposed remedy was that the International Monetary Fund should aid the slow march towards genuine convertibility by acting as a modified sort of clearing union. It should stand ready to buy the currencies of extreme debtors and sell the currencies of extreme creditors; and it should seek to influence these extreme debtors and creditors into more appropriate internal economic policies.

In effect, of course, this would go about three-quarters of the way towards transforming the IMF into the sort of payments union that has been advocated in *The Economist.* It is apparent that Professor Triffin's estimate of the extent of the cushion that would be needed is considerably smaller than the estimates that have been put forward in these columns; but this difference would come out in the wash, provided that a modified clearing arrangement of the Triffin sort was not expected to lead to any great removal of discriminatory import licensing, and provided that America does not experience a slump. It is also apparent that some of Professor Triffin's colleagues at the conference were innately suspicious of what they called "gimmick solutions" of this kind. Nevertheless, the general impression that emerges from the report of this conference is an ardent wish that the new administration in Washington would listen more attentively to the views of its own economists—and then act upon them.

European Manpower

ZUR INTEGRATION DER EUROPAISCHEN ARBEITSKRAFT.

By Herbert Studders.

August Lutzeyer, Frankfurt - am - Main. 158 pages. 20 DM.

DR STUDDERS rightly claims that this book is the first contribution to an analysis of the manpower aspects of European integration. He has indeed performed a service in bringing together the principal (though not the latest, for the 1951 British Census data are not used) statistics on the age, sex and occupational distribution and recent migration of the population of Europe, with the sole exception of the Soviet orbit. He provides, in fact, 80 pages of statistics to 50 of text.

His analysis is, however, not so complete as his statistics. A preoccupation with the Schuman Plan countries, and with Germany in particular, has led him towards conclusions which do not appear to take sufficient account of conditions in other parts of Europe. In his enthusiasm for European integration, he has followed the chance grouping of political alignment (the Schuman Plan, the Council of Europe, the OEEC, and "Western" Europe), and consequently obscures the wide variations of economic and demographic conditions: at one extreme there are the industrialised countries with static or declining labour forces (Belgium, Luxemburg and France), and at the other, the insufficiently industrialised countries with rapidly growing populations (Italy, Turkey, Portugal). It would seem that Dr Studders adopts the political grouping not because he sees the solution in large-scale migration—for this, in line with official German policy, he firmly rejects—but because he envisages a co-ordinated effort to raise industrial productivity. This would be attained both by training those at present unemployed and by limited transfers of skilled personnel, for which purpose he strongly advocates the creation of a European Labour Office. Accompanied by limited industrial development—clearly thinking of Germany, Dr Studders emphasises the expansion of defence industries—this would undoubtedly help to eliminate sectional unemployment.

AGATHA CHRISTIE

"At the top of her form once again. She keeps us guessing—and guessing wrongly —to the very last page."

—GERALD BULLETT

Collins. 10s. 6d.

AFTER THE FUNERAL

WE TOO CAN PROSPER

GRAHAM HUTTON

The well known economist welds together the experience of the 66 Productivity teams which have visited America. Simply, and logically, the book shows—with a wealth of fascinating examples and comparisons—that, if the British people want to overcome recurrent economic crises and raise their standards of life, they can do so quickly, provided they organise to do so.

"This is a provocative book. It is also a necessary one, because it clearly points out upon what our economic survival as a nation depends . . . If anyone is not clear about the relation of higher productivity to living standards, this book provides the answer."—*Daily Herald.*

When in London

The Economists' Bookshop **would welcome a visit from any of its clients who will be in London this summer. The range of the Bookshop's interests is not confined to British publications, or to books on economics and the social sciences although it specialises in these subjects. At** ***The Economists' Bookshop*** **you will also find the world's leading books on art, geography, history, and many other topics.**

The Economists' Bookshop

11-12 Clements Inn Passage, Aldwych, London, W.C.2.

Even if his solution were fully practicable in western and northern Europe—skilled immigrants are unwelcome to British trade unionists and postwar immigration to France and Sweden has been small—it is not the answer to southern Europe's underemployment. It would surely be better to give occupation to the unemployed or underemployed than to increase capital intensity to raise the productivity of those already working. Moreover, the investment needed, which cannot be made from domestic resources alone, must be directed not only to industry but also to agriculture—people eat more when they are working.

Dr Studders is right to see no solution in mass migration and to place considerable hope in European co-ordination, but his own solution is only half an answer.

More Paternal Wisdom

LETTERS FROM A BANK PARLOUR.
By W. S. Hill-Reid.
Falcon Press. 200 pages. 9s. 6d.

READERS of Mr Hill-Reid's "Letters of an Economic Father" will be delighted to hear that "Letters from a Bank Parlour" is even better. There are certain pitfalls in the epistolary method, particularly when the writer puts on, for the purpose, a personality not his own. The "Economic Father" was a little hazy at the edges, a little thin, a little uncertain, sometimes, whether he was Mr Hill-Reid's creation or Mr Hill-Read himself; here he has acquired a racy solidity which makes his advice, instruction, anecdotes or conversational generalities both more memorable and more entertaining. Even the suspicion that his son John occasionally exchanges with his crony Antony—over Papa's latest piece of wisdom—a look of deep and wordless mutual understanding, or that his niece Dorabella probably refers to him as a priceless old pet, helps to build up the picture, and to give unity to what might otherwise convey a slight impression of rag-bag.

For these "letters" deal not only with the elements of personal economic wisdom and with the institutions and practices through which it can be exercised by the ordinary citizen, but with subjects as diverse as golden retrievers, American manners, marriage, letter-writing, the characteristics and functions of various professions, and town and country planning. They are not arranged in any particular order, except where a single topic proves too long for a single letter. Some are more practically useful than others, some more generally instructive, some are primarily an expression of the writer's own feelings, opinions or interests. There is none, however, with which the reader would willingly dispense.

Young people just launching into financial independence, counterparts of John and Dorabella, are the obvious recipients for Mr Hill-Reid's good sense and wisdom. But the social historian of a later day, speculating, perhaps, on the habits, the values and the ethics of the British professional class on the eve of its disappearance, might do much worse than consult the "Letters from a Bank Parlour."

Shorter Notices

AN ESSAY ON THE THEORY OF PROFITS AND INCOME DISTRIBUTION.
By B. S. Keirstead.
Basil Blackwell. 110 pages. 10s. 6d.

This stimulating essay in dynamic economics is mostly a piece of bridge-building, an attempt to draw into a coherent whole the neo-classical theory of income distribution and the various modern theories of the rôle and reward of the entrepreneur from Schumpeter to Shackle. The practical thesis at which, after considering both long-run trends and the effect of cyclical fluctuations, Professor Keirstead arrives is that the tendency of income distribution in a dynamic society is in favour of organised labour and of corporate profits and the entrepreneurial incomes depending on these, and against rentiers and passive equity holders. This tendency is reinforced by the political power of both the favoured groups, the one as a large voting block, the other as a strategically placed lobby.

Professor Keirstead, while drawing his most general examples from the United States and from Canada, turns in his last chapter to an analysis of British experience. Here, in the interpretation of recent historical fact, he is less successful than in pure theory. It is not his fault that the year's delay between the completion of his book in Montreal and its publication in this country has given an out-of-date appearance to his data (the latest Economic Survey which he uses is that of 1951). But his complacency about the level of postwar savings in Great Britain does not do much credit to his percipience, and when he ventures from the economic to the wider political and social field he is often, though in a way difficult to define, just plain wrong. (It is, for instance, doubtful whether anyone, of any party, would recognise what he describes as the guiding motive of the British educational system.) This element of amateurishness in social matters, however, does not detract from the interest and value of his purely economic work. It only offers one more demonstration of the difficulty of drawing practical conclusions from even the most impeccable analysis.

★

INDUSTRIES OF NORWAY.
Edited by Olge J. Adamson.
Dreyer's Forlag (Oslo); (London: *Edward Stanford*). 392 pages. £5 5s.

This survey of the current industrial resources of Norway provides a background story of their development and includes agriculture, shipping, trade and finance, as well as industry.

One of the country's greatest natural resources is its abundant water power, which has resulted in a high degree of electrification. In turn, electricity has helped and speeded up the development of other natural assets—particularly forests and minerals. There are thirty-seven illustrated articles on different aspects of the Norwegian economy, each written by an expert. They contain a good deal of statistical material, although, unfortunately, this is not very up to date.

THE COST OF DRYING THINGS

Millions of tons of fuel are used in Britain every year in drying processes, many of which are inefficient and wasteful.

When coal was cheap no one worried unduly, but today the cost of fuel used in drying is a serious expense item which tends to get buried in general overhead without receiving the close control given to economy of raw materials. Furthermore, many drying processes are as ineffective as they are extravagant.

Eight years ago, we started a specialised service to the Metal Goods Industries by providing Gas Infra-Red Tunnels for drying paints and varnishes. Today our techniques have wide application as varied as those employed in fish curing and textiles.

We are ever looking for new drying problems to solve. Nearly every industry has one. Send yours to:

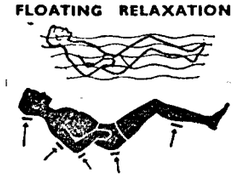
CHAIR DESIGNED FOR men and women OVER 40

(or for very very busy people of any age)

- ONLY CHAIR WITH COMPLETE ARTICULATED ACTION
- TAKES UP ANY POSITION AUTOMATICALLY



- SUPPORTS BODY IN POSITION OF FLOATING RELAXATION
- KEEPS FEET UP AND HEAD PILLOWED
- TAKES STRAIN OFF HEART SCIENTIFICALLY
- EASES NERVOUS TENSION · LOOSENS TENSE MUSCLES.

Probably you have never thought that a chair could make a significant contribution to health and well-being... For years the medical profession has recognized the need for a simple means of relaxing the body, especially for those who, for one reason or another, have to try to take life a little easier. The story of research by scientists and designers to find the completely relaxed position and fit a chair to it is a long one, crowned with the successful BodiLine Chair.

To rest in this chair is an entirely new experience. When you sit back the angle/ratios of seat and back change and the front moves out slightly to support your feet. As you recline the chair's body line ratios vary automatically, gradually easing muscular tension and lightening the heart's burden until complete relaxation is obtained in the full reclining position. Highest grade manufacture with latex foam over deep springing, from **£31-19-6** at good furnishers.

FLOATING RELAXATION

It was discovered that the body is most perfectly relaxed when floating in water. Notice how the five most vital spots of the body are correctly supported by the "BodiLine" Chair.

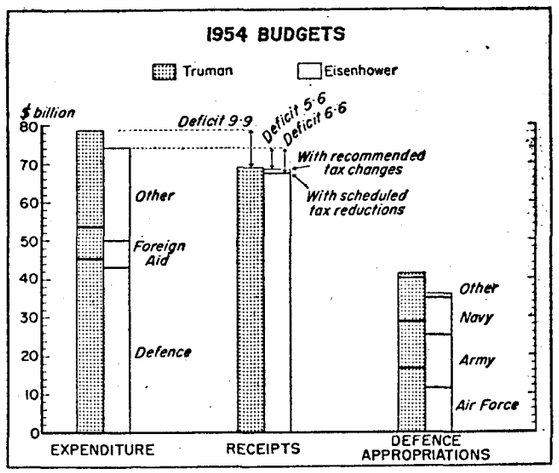
American Survey



AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Defence—Enough for Less?

Washington, D.C.

WHEN the President delivered his first "fireside chat" last week he spoke under something of a strain. His task was one that few would envy him; he had to explain why, even with a reduced military programme, it was not possible to balance the budget or lower taxes. The simple explanation—that it never had been possible without crippling the armed forces—was not available to him after last autumn's election campaign and therefore much of the speech was necessarily of a partisan political character. Some of the complaints he made about the past Administration were undoubtedly true but others displayed little more than exasperation with the facts of life.

His lament, for example, at the discovery that there will be outstanding, on June 30th of this year, $81 billion of congressional authorisations to spend money, mostly on armament for which contracts have already been placed and for which cash must be found out of the tax revenues of the next few years, has not yet, even after several repetitions, achieved a ring of authenticity. It is hardly believable that General Eisenhower, who had been Chief of Staff of the Army, and Mr Charles Wilson, the Secretary of Defence, who had been president of the General Motors Corporation, to mention only two of those involved, did not know, before they came to office, that guns, tanks and aircraft must be ordered years in advance, particularly at the beginning of a rearmament programme, and that a long period of building new factories and equipping them with machine tools had to precede even the production of prototypes. If it were believable it would be terrifying.

As an example of a justified complaint, on the other hand, there was the passage about the two stubborn financial facts that faced the new Administration: under the former Administration, expenditures for the future were so scheduled as to reach their peak during 1954 and 1955 while "these are precisely the years when, under existing tax laws, federal revenue from taxes, under scheduled reductions, will fall sharply downward." It is possible for the Democrats to argue that this was a mere coincidence and that the timing of the decision to rebuild the armed forces was responsible for the first of the stubborn facts while the second was caused by the action of a stubborn Congress. But, while it is true that Mr Truman never failed to preach the desirability of higher taxes, it must be admitted that, latterly, his preaching became perfunctory, to say the least, and he did not fight with his usual pugnacity to get the increases.

It is more important, however, to find out what the new military and fiscal programme will mean to the United States than to try to apportion blame as between Republicans and Democrats for a financial condition for which the Soviet Union might well be allowed to shoulder the entire responsibility. The budget for the 1954 fiscal year beginning next July, which was submitted by Mr Truman to Congress a few days before he left office, forecast revenue, under present tax laws, of $68.7 billion, expenditure of $78.6 billion and a deficit of $9.9 billion. President Eisenhower's revised budget puts revenue, if his recommendations for continuing existing taxes, instead of allowing them to expire, are followed, at $68.5 billion, expenditure at $74.1 billion and the deficit at $5.6 billion.

One reason why all the hard work of the new team, and some of its debatable economies, have not had more effect on the deficit is that what seems to be the prudent course has been taken of providing for the Korean war in advance rather than of hoping that it will end during the next fiscal year, and asking for supplementary appropriations if it does not.

The other reason, which was mentioned by the President last week for the first time, was that "the past Administration over-estimated tax collections for the next fiscal year by some $1.2 billion." Nobody, obviously, can say for certain how much will actually be collected between next July 1st and June 30, 1954, and he presumably meant

that a mistake was made according to the usual methods of estimating. This in itself is interesting as most Administrations tend to be, and the last one always was, pessimistic in their estimates of revenue. This is no more than a natural precaution on the part of those who have to face Congress and hope either to prevent dangerous cuts, or get vital increases, in revenue. Anyone who attended Mr Truman's seminar on the budget a week before he left Washington may now have an inkling of why he looked, on that day, as if he had swallowed a whole cageful of canaries.

However difficult the new President's position may have been made by his own tendency to overpromise and his predecessor's inclination to set booby-traps for him, the country is left, when the mists of battle have cleared away, with a deficit that has been reduced by $4.3 billion and an Air Force whose future, although not its immediate, spending authority has been reduced by $5 billion. It can hardly have given President Eisenhower much pleasure to have to announce such a fact, even in a speech that wrapped the information up in a homily on the importance of national security and that pointed out that 60 per cent of the money available for defence next year would be spent on air power and air defence. The defence of the United States, the President said,

> must, first of all, be one which we can bear for a long—an indefinite—period of time. It cannot consist of sudden, blind responses to a series of fire-alarm emergencies, summoning us to amass forces and material with a speed that is heedless of cost, order and efficiency.

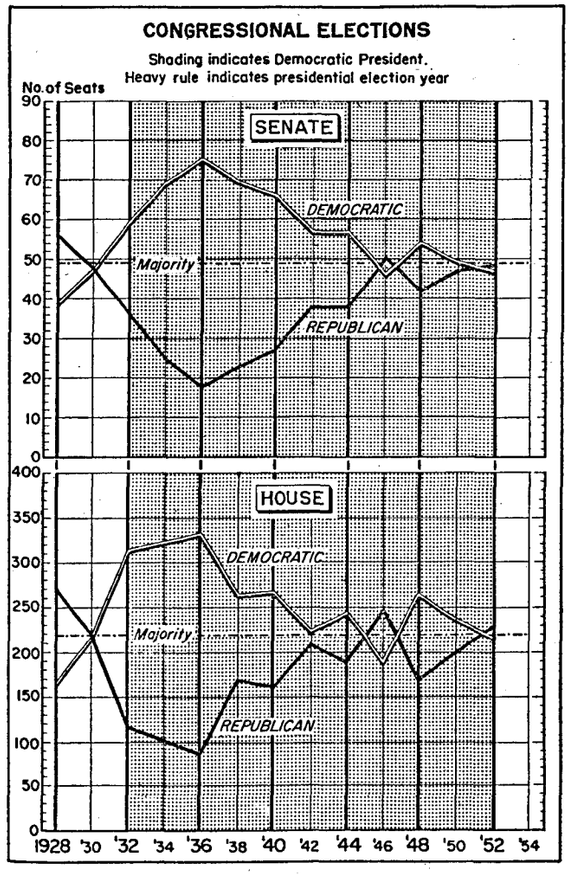
This is no more than the plea that General Marshall made for a military posture no stiffer than could be supported permanently—a plea that he had to make, after the outbreak of the Korean war, in the face of demands from Senator Lodge for an Air Force of 150 combat groups and from Mr Dewey for an Army of 100 divisions. Under General Marshall and Mr Lovett it seemed that a satisfactory programme had been achieved and one that did not jog, as Senator Symington (who, as an ex-Secretary of the Air Force, knows what he is talking about) said, "up and down and then up and then down again in step with political demands but not with the security needs of the times."

★

There is clearly no way by which the expert, let alone the layman, can assess what is the exact amount of strength, in the air, on the ground or on the water, needed for the defence of the United States. The new Administration may be right and the old one may have over-estimated. But those who have watched the development of the new programme would have more confidence if they were less aware of how it had been developed. Some weeks ago it became known that the Secretary of Defence had decided on an amount by which the military budget was to be cut and had told the Joint Chiefs of Staff to divide the loss among themselves. Nevertheless, Mr Harold Stassen found himself able to describe the new programme as "more defence more rapidly for less dollars lasting longer," a statement which contrasts with that of Mr Hanson Baldwin, the military expert of the *New York Times*, who reported that "our ultimate strength will be less and our progress toward that strength slower."

Mr Wilson himself did not do much to clarify the position at a recent press conference at which his answers to scattered questions seemed, when assembled, to tell his version of the story. This was, he said, a defensive budget, one which would make it possible to defend the country during the period of build-up after the outbreak of war but would not provide forces which other countries would consider a challenge. When asked how it was possible to gauge what constituted a sufficient defence he made the comforting reply that that was the $64 question. And, to a later inquiry as to the view of the Joint Chiefs on the new budget, his answer was that, as far as he knew, they thought it about the best compromise, adding that they would have liked, in the phrase he now uses almost daily, "the little old pocketbook" a little more open. Mr Wilson's disclosures, however, appeared to be an adequate account of what had happened until the President explained that

> we did not set any fixed sums of money to which our defence plans had to be fitted. We first determined what is truly vital to our security. We next planned ways to eliminate every useless expenditure and duplication. And we finally decided upon the amount of money needed to meet this programme.



American Notes

Preparations for 1954

PRESIDENT EISENHOWER'S recent call to New York Republicans for freer foreign trade, his broadcast explanation last week of the reasons why lower taxes are not yet possible, the speeches he will be making in various sections of the country during June, are all evidence that he has decided to take a stronger line with Congress, to mobilise popular pressure behind those of his policies which his nominal supporters in the House and Senate are reluctant to implement. He wants to remind the Republicans that the voters last November showed much more affection for the party's presidential choice than they did for its congressional candidates.

Such a reminder should be all the more effective because the Republicans in Congress are already thinking of the popularity test which they, but not the President, must face in November, 1954, when there are elections to fill all the 435 seats in the House of Representatives and one-third of the 96 in the Senate. The early attention, premature even for America, which is being paid to these contests is explained by the unusual narrowness of the Republican majorities over the Democrats—some eight votes in the House and one in the Senate. In 1954 the Republicans cannot afford the losses which, as the chart shows, the party in power expects to suffer in mid-term elections when it has no presidential candidate to arouse the voters' enthusiasm. The danger that the Republicans may lose their majority altogether is particularly great in the House. In the Senate several of the Democrats running next year, Mr Humphrey of Minnesota, Mr Douglas of Illinois and others, are liberals who were swept in on Mr Truman's tide in 1948 and should not be difficult to sweep out now they are on their own.

In these circumstances congressional Republicans might be expected to be particularly anxious to collect as large an advance store of reflected popularity from the President as possible. But in fact some of their reluctance to support the President's policies stems from the fact that it is they, not he, who will be the first to answer to the electorate for his probable failure to keep his campaign promises of balancing the budget, reducing taxes or perhaps even of ending the Korean war. For this reason the Republicans want to be able to prove that at least the promise to cleanse the government of inefficiency, corruption and Communism

has been fulfilled. This may be one explanation of why the President has hesitated to crack down on Senator McCarthy. The appeal which the Senator's ostensible objectives, although not his methods, is supposed to have for many voters also explains why the officials of the Democratic party may not take the advice of Senator Lehman and other liberals and make an all-out attack on McCarthyism the main issue of the 1954 campaign.

Democrats Do It Too

BUT at present the Democrats feel that the Republicans are handing them issues on a platter. For the President's major policies—international co-operation, foreign aid, heavy appropriations for defence, lower trade barriers—are all ones which were initiated by the Democrats and which so far he seems unable to get through Congress without Democratic help. On these questions, therefore, the Democrats think that it is they, not the Republicans, who will be cashing in in 1954 on the voters' approval of what the Eisenhower Administration has done. On domestic matters the Democrats feel that they are being even better served by the Republicans. They hope, perhaps over-optimistically, that the cuts in public housing funds, in government power developments and rural electrification, in the protection given consumers against exploitation, and so on, are tit-bits that will be followed by more far-reaching "give-aways" of national assets to private interests.

The particular advantage of such issues is that they appeal to people in places which tended to desert their long-standing Democratic allegiance last year—in the western mountain states and the cities, to southern farmers and housewives everywhere. By fighting congressional elections on local issues, the Democrats can avoid the arguments over such national questions as civil rights which divide their party in presidential elections. The desirability of putting up at least a facade of unity may also make it difficult to exploit in the 1954 campaign what is so far the most obvious of the Republican give-away programmes, the handing over to the states of the right to develop the under-water oil off their shores. For this is one of the issues on which the Democratic party has long been split and the Bill was pushed through Congress with the help of southern Democrats. The practical purpose of the Democratic National Chairman's recent trip through the South, waving an olive branch, was presumably to collect funds; generosity would hardly be encouraged by a continued harping on the wickedness of giving off-shore oil to Texas, Lousiana and Florida.

Still on the Wage Escalator

THE unauthorised wild-cat strikes, mainly against parts manufacturers, which have been holding up automobile output lately, are exceptions to the statesmanship that nowadays characterises labour negotiations in the motor car industry. This was demonstrated last week when the General Motors Corporation and the United Automobile Workers reached an agreement which proved the faith of the union in its unusual long-term contract, and of the company in a continued high demand for its products. The union's faith had been shaken by the recent fall in the cost of living, which meant a fall in automobile wages because of the escalator clause which was the outstanding feature of the union's five-year contract, under which wages moved up or down with the cost-of-living index. A change in the basis on which that index was calculated gave the union an excuse earlier this year for demanding that the contract be reopened, even though it still had two years to run.

Now a formula for adapting the agreement to the new index has been worked out, and it seems that, if the cost of living goes up again, automobile wages will climb the escalator rather faster than they used to do. More important in present circumstances, the General Motors Corporation has agreed to put a floor under any possible falls by adding to the basic wage, and thus making permanent, 19 cents (the union asked for 21 cents) of the 24 cent-an-hour increase so far achieved under the cost-of-living clause. Finally, the annual wage rise, to cover improvements in

productivity, which falls due at the end of this month, has gone up by 1 cent to 5 cents an hour.

This is in line with the emphasis on increased productivity which has become fashionable in this year's labour negotiations, now that increases in the cost of living are no longer providing an argument for higher wages. But the General Motors rise, which is expected to set a pattern for the rest of the automobile companies, is far less than has been usual during the postwar years and will hardly be enough to satisfy the United Steel Workers, next to the automobile workers the largest union in the country.

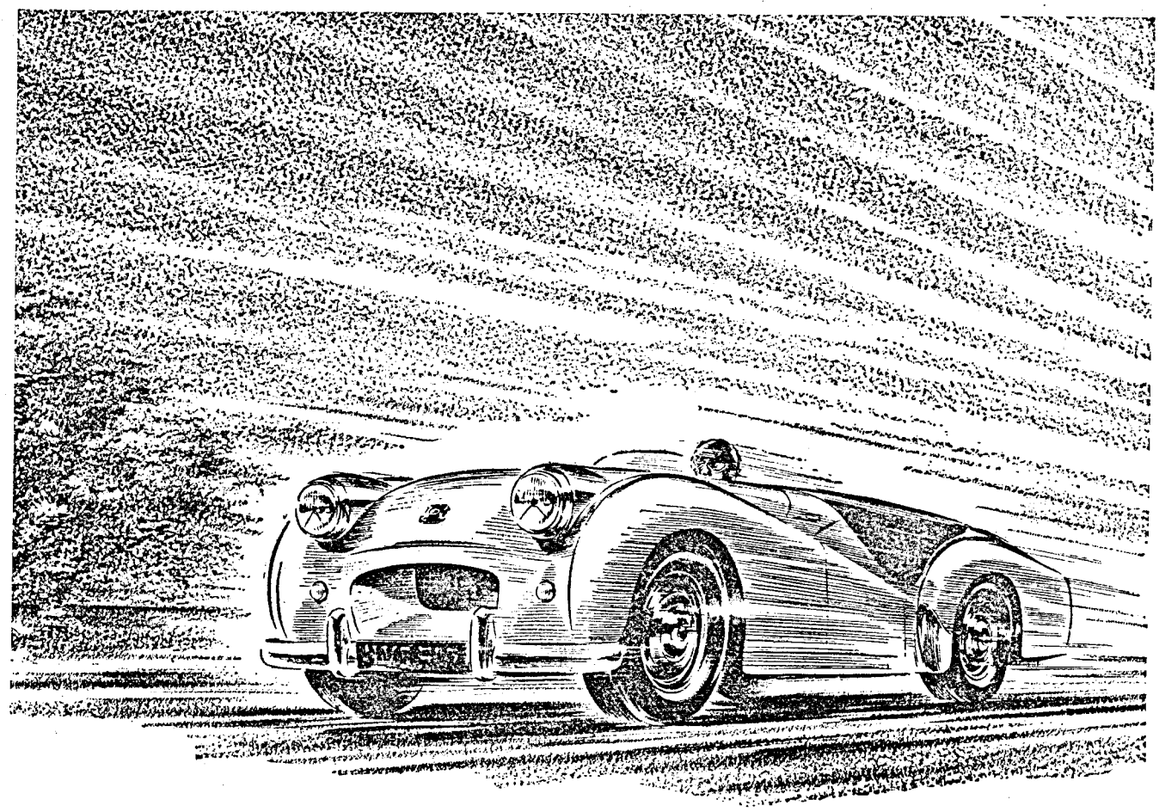
The steel contract can be reopened only for wage changes this year but the union is reported to be hoping for at least an additional 15 cents an hour, almost certainly more than it will get. However, a repetition of last year's long and bitter strike in the industry is not expected, partly because the union wants to save its strength for the more far-reaching negotiations which will be possible when the contract expires next year. Furthermore the steel companies are not altogether averse to a wage rise since they are seeking an excuse for price increases, while the union knows that for the first time in its existence it cannot hope that the Administration in Washington will press for concessions on its behalf.

Clearing Out the Waterfront

In the jungle of the New York and New Jersey docks, infested with "Arsenal Gangs" and creatures such as Alex (the Ox) Di Brizzi, crime and extortion have become a daily routine to which shipping companies have to conform, more or less, if they want their cargoes unloaded. Much of the trouble arises from the hiring system, or "shape-up," under which the dockers are selected arbitrarily each morning by a hiring boss. Unless a man is ready to buy protection or do favours to the "strong-arm boys," he has no chance of steady employment. As a result gangs have had entry to the piers and some $5 million a year have been lost through pilfering of cargoes.

The abolition of the shape-up was one of the conditions set by the American Federation of Labour last February when it delivered an ultimatum to the International Longshoremen's Association, telling it that it must clear out its New York jungle or be evicted from the federation. In spite of a rigged vote, in which the waterfront bosses tried to prove that the dockers were in favour of the present hiring system, the ILA has now agreed that some less objectionable method will be found in the new contract which is to be negotiated shortly with New York employers. But the association's report to the AFL's executive council did not propose any satisfactory democratic means by which the many honest longshoremen could rid themselves of corrupt or criminal leaders. The president of the whole ILA, who is also head of its New York branch, Mr Joseph Ryan, is one who has recently been indicted for stealing union funds.

The AFL council has rejected the ILA's report but has given it a fast opportunity to put its case at a further meeting in August. However, even if the ILA does not then come into line, it is doubtful whether its complete expulsion will be approved by the AFL's convention in September. It is more likely that another union will be allowed to enter the field, for the AFL will hardly want to leave such an important body of workers free to go over to the rival Congress of Industrial Organisations. But however this question of labour politics is decided, it means a long period of disturbance on the waterfront with no assurance of a satisfactory settlement at the end.



Better, although by no means certain, hope of restoring order to the sinister chaos of the nation's greatest port is contained in the final report of the New York State Crime Commission. This group, whose revelations were responsible for Mr Ryan's indictment, has now sent a series of radical proposals to Governor Dewey, including a suggestion that a state authority should be given wide powers over the New York waterfront. Now, moreover, the Department of Justice has convened a federal grand jury to investigate the whole dock situation and this may also help to sever the tenacious links between waterfront and underworld.

More Scalps for McCarthy

Now that Mr Raymond Swing, the well-known political analyst of the Voice of America, has resigned, scalps from most of the more enterprising heads of the overseas information services are hanging from Senator McCarthy's belt. An example of the extent to which he is frustrating the agency's work is the fact that only 300 books, instead of 120,000, are now being sent to overseas libraries each month as a result of the difficulty experienced in checking them for "suitability," which means freedom from anything that smells of Communism to Mr McCarthy's minions. And the cut in the funds available for overseas broadcasts has reduced the Voice of America to "relative impotence," in Mr Swing's opinion.

But the main reason for his departure was the "spineless failure" of the State Department to stand by its staff when they were the victims of "slanderous attacks" on their integrity. The final straw was evidently the forced resignation of Mr Kaghan, the able deputy director of the US Information Services in Germany, who was made to pay for having dubbed Senator McCarthy's two young investigators "junketeering gumshoes," and for having stood up to the Senator when summoned back to Washington to answer allegations about his youthful contacts with Communism.

Another recent example of the State Department's present readiness to make any sacrifice for the sake of peace with Mr McCarthy has been its failure to push through the nomination of Mrs Mildred McAfee Horton to be a United States representative at the United Nations Social Council. Only when the meeting was over was it discovered that the investigation of the loyalty of someone who had not only been head of the women's branch of the Navy during the war, but also president of a leading women's college, on the governing board of the National Council of Churches and a strong supporter of General Eisenhower's candidacy, had taken so long that there had been no time for the Senate to approve her nomination. This is so absurd, and there is so much uncertainty over what really happened, that a much more probable explanation of the case seems to be that the State Department found that there might be some difficulty over the appointment in the Senate and preferred to let it drop. Nothing could better illustrate the ridiculous lengths to which the process of investigation has now been driven.

IF YOU BUY POWER

Power from the firms that make up THE BRUSH GROUP

Turbo-alternators, transformers, generators, switchgear, and electric motors from BRUSH

Diesel and petrol engines from 1½ to 44 b.h.p. for agricultural, industrial and marine use from Ashor

Diesel engines, power units, alternator sets, marine propulsion and auxiliary units from 37 to 200 b.h.p. from McLAREN

Diesel, gas and dual-fuel engines from 5 to 2,000 b.h.p. for marine, industrial and heavy-duty applications from National

Industrial diesel engines and marine propulsion and auxiliary engines, ranging from 135 to 3,000 b.h.p. from Mirrlees

Power from the most closely-knit organisation of its kind in Britain, THE BRUSH GROUP

you should know about THE BRUSH GROUP

IF YOU BUY POWER. If you are a commercial attaché, in charge of an irrigation project, a mining engineer, a shipowner . . . if you buy engines for power stations, trains; if you buy power to light a city or pump oil, excavate a building site, or do the hard work on a farm . . . you will be interested in THE BRUSH GROUP.

Here we have gathered in one group the leading British diesel and electrical equipment manufacturers. Within this Group are a shared knowledge, an extensive range of manufacturing experience, world-wide servicing facilities, and a company of designers, engineers and craftsmen with a unique variety of technical skills. With this Group organisation and experience, it is certain that we can help considerably in any problems you may have connected with the supply and maintenance of power for your special needs.

Israel: The Problem of Productivity

BY OUR SPECIAL CORRESPONDENT

THERE are two slogans about Israel that now seem to some Israelis, and to your correspondent, to present more snags than advantages each time they are uttered. One is Mr Ben Gurion's dictum that, where Israel is concerned, "there is no such science as economics"; in a word, miracles can be relied on. The other is: "Look what we have invested and at the changed face of our homeland." Both slogans are powerful, for both are truths; their drawback is that they are truths proclaimed without a full context. Mr Ben Gurion is right when he claims that manna has so far always fallen; Mr Marcus Sieff, who elaborated the second theme in a letter to *The Economist* of May 15th, justifiably points to more acres ploughed, trees planted, roads built and kilowatt hours made available. Yet these success stories, repeated in isolation, create a state of mind that is dangerous to Israel's future as a self-supporting nation. Their drawback is that they conceal from its people the disquieting fact that, despite investment on a scale unparalleled in our generation, their country is still farther from earning its own living than any other nation.

In the three years 1949-51—its three peak years of immigration—it earned by its own efforts only 15 per cent of the foreign currency that it spent, obtaining the rest from loans (40 per cent) and donations and capital imports (45 per cent). Comparable figures for 1952—the first year of greatly reduced immigration—are not obtainable owing to differences of official opinion as to how to assess the different exchange rates at which transactions must be calculated. But enough data are available to show that the earned percentage still lagged well below 20 per cent. The present year promises slight but not yet substantial improvement. Over five years, loans, gifts and investments from abroad have exceeded the $1,000 million mark; about half of this immense sum has melted into consumer goods, but half has been lodged in supposedly productive investments. Would it not by now be legitimate to expect a greater measure of national productivity and self-support?

"Somebody Will Pay"

Of course there are some good reasons for the shortfall. The best is that a population now composed as to 45 per cent of oriental Jews coming from sedentary jobs cannot at once produce hands good for work in fields or even in factories. But there are other factors that were or are avoidable. The complacent slogans already quoted have produced two attitudes of mind that are damaging wherever they prevail. One is the sentiment that help is Israel's due and that it is therefore unnecessary to count the cost of any venture, since someone will surely pay. Unconsciously, large sections of Israel's population have been allowed to think this an axiom and to fall into habits that leave no room for effort towards greater economic independence. The other is the belief that a level of social security that was the pride of mandatory days can still be afforded by a people now burdened with calls upon a national purse that include a huge bill for national defence.

Many sober Israelis see, and say, that these attitudes and practices must be abandoned. The President of the Bank Leumi, for instance, has said so at the bank's last two annual general meetings. But this realism has not yet reached the lips of cabinet ministers because publicly to broach it leads to party quarrels. Complete social security and a system wholly free from caste were the ideals of the pioneer settlers of the Histadruth and of the majority party, Mapai. The emotional appeal of both doctrines is immense; who is brave enough to proclaim that they must be—indeed, are already having to be—abandoned?

Tractors, Not Spades

A crux of Israel's problem is the immediate need to reduce the foreign exchange element in its costs of production. So far this has been unduly high for reasons that were at least partly avoidable. In industry, the high level of wages set in accordance with pre-state standards has led to the instalment of much labour-saving machinery. In agriculture, for which far too few people show an inclination, development has taken place on a basis of tractors, not spades, and of pump-driven sprays bought in America that can be operated at the turn of a cock. In a word, Israel has produced patterns of life that would be logical in a country in which manpower was short and funds for buying gadgets were ample, but which are unsuitable when conditions are the other way about.

If, in the interest of earning the nation's living, the Israel leaders are to alter the course so far set, a few new practices are necessary. One is bolder and franker explanation to the people of the values at stake. Another is the application of some new and horrid disciplines, among them, abandonment of the doctrine that wages and the cost of living index are indissolubly linked. Judging by the history of the last twelve months, the prospects of exercising discipline are by no means hopeless. During that period, inflation has been

checked by turns of the economic screw which have successfully reduced internal purchasing power. Incomes now lag behind supply, thanks to the expedient of taking the lid off prices and promoting a system of rationing by the purse that is contrary to old and cherished doctrine. Has the country the moral courage to jettison another ? If maximum prices have disappeared, what about minimum wages ?

In its economic dilemma, Israel today gives the impression of a country that is endowed with unlimited ingenuity and is therefore ready to try endless economic devices for earning more and spending less in the field of foreign exchange. At the same time, it gives an impression of timidity in the psychological field. It has stopped inflation, but is nervous about taking the next steps towards self-support since these entail a move out of the realm of mere mechanics and into that of politics. Deflation, for instance, has of course brought unemployment. At the moment, the published volume is small ; the actual volume is probably larger because many semi-idle industries prefer to employ workers part time rather than to lay them off. It is likely to grow for a while on account of the falling off in home demand for goods. It is causing a very natural emotional upset in a country which induced immigrants to enter a land of promise. But how will that upset be met ? No politician, so far, has had the courage to say that a wage freeze would help to meet it. Members of Mapai who, in private, recognise the fact, are afraid of the accusation from the ranks to their left that they are selling out, stage by stage, to the conservatives. Therefore, they are meeting the emergency with devices that are in fact reductions of wages called by other names—advance levies of income tax, new and low rates of pay for the emergency works on which the unemployed are engaged. Meantime, the public is confused as to the real issues at stake both by out-of-date slogans and by the noise of wrangling.

Need for a Churchill ?

In an emergency, it is wisest not to underrate a people's capacity for responding to unpalatable news. The hard fact is that costs of production must be forced down ; that Israel's industry must become competitive abroad, not only by less of the mechanisation that is so costly in foreign exchange, but by lowering its wage bill ; that, in agriculture, there must be less abhorrence of manual methods and more readiness to found a peasantry that is not above doing jobs that have been undone since the Arabs fled. In a word, the standard of living must go down before it can hope to go up again. At the moment Israelis are setting great store by the new team of American planners whom they have engaged, but what is really needed is not planners. These are locally plentiful ; the missing link is the man or team of men with the tenacity to execute the whole of a plan. Many Israelis now speak of their craving for a lead from someone possessed of qualities that have never yet appeared in conjunction. These qualities are: a conviction that reliance on quality must be stifled if a sturdy nation is to be built ; the moral courage to proclaim that certain treasured doctrines must be shelved during the years of national construction ; the golden mouthed capacity to appeal to the people's imagination. "If we are all to change our ways, we need someone like your wartime Churchill to tell us so," remarks your companion in the express on the new coastal railway. But he does not enjoy your retort which is that the wartime Churchill was not only an orator but a dictator.

Rights of the Soviet Citizen

THE new Soviet rulers inaugurated their reign by proclaiming a large-scale amnesty. The number of persons benefiting from this amnesty has never been revealed ; nor was it to be expected that the official organs would disclose these figures, since, at best, this would have been an open admission of the severity of the police regime prevailing up to Stalin's death. The first official reference to liberated prisoners was made this week by the Vice-Minister of Justice, who urged local authorities and trade unions to find employment for persons released under the amnesty.

Meanwhile, the new regime has used other methods to proclaim to the people that an era of greater freedom has begun. Since the freeing of the doctors the "constitutional rights of the Soviet citizen" have become one of the main themes of the Russian press. A recent *Pravda* editorial reiterated that "the workers of the state apparatus should watch over these rights" and that officials are "the servants of the people."

These abstract declarations of the leading articles are backed by concrete examples in the *feuilletons*. This is not entirely new, since to attack abuses has always been the chief task of the *feuilleton* writer. Yet, whereas recently he had attacked the civil servant for endangering the state by lack of vigilance, he now upbraids him for ill-treating the citizen. From acting as assistant to the prosecuting attorney, the *feuilleton* writer is becoming the advocate of the wrongly accused victim. The party and government have openly attacked the "criminal activities" of the prosecution in the case of the doctors and of the Georgian leaders. The newspapers now reveal similar abuses by the judicial organs in less important cases.

Thus *Izvestia*, under the title "Strange Logic," attacks the security organs and judges of Vinnitsa in the Ukraine. There a young woman, a member of Communist Youth, was condemned to ten years' imprisonment for stealing coal from the electrical works where she was employed. Her husband made inquiries and was told cynically to seek a divorce. His petitions for a retrial were simply ignored. It turned out in the end that the security services had prepared their indictment without a shred of evidence, and based it on the "strange logic" that the accused had stolen because she had the opportunity to do so. Even when the verdict was finally rescinded by a superior court, the security and judicial organs of Vinnitsa continued to defend it. Their legal tricks, their defence of the prestige of the uniform—*Izvestia* concludes—show that this was not merely a judicial error but a "violation of rights."

The Case of the Selfish Judge

Another strange case is reported from another Ukrainian town—Kamenets Podolsky. There a woman with children was expelled from her flat immediately after the war to make room for a judge. Nobody dared to risk the enmity of the powerful judge, who was a friend of the regional representative of the Ministry of Justice. When it was finally decided that the judge should leave the premises, it was only in order to move him to a better apartment, while the poor woman did not recover her flat but was put on a waiting list. "All this because this man is no ordinary mortal but a judge" comments the *feuilleton* writer, adding: "Is there in addition to Soviet law another one for Kamenets Podolsky ?"

All this may sound trivial. Yet, repeated regularly to the refrain of editorials, it must undermine the confidence of the security officials and also encourage ordinary Russians to stand up for their nominal rights. The Russians, particularly the intelligentsia, are quick to discern changes of policy and they must find food for thought in many details that look insignificant to the western observer. Thus *Mosbukniga*—Moscow's main second-hand bookshop—is putting out advertisements that it wants all sorts of Soviet and pre-revolutionary books and that it has for sale sets of the Great Soviet Encyclopaedia. Under Stalinism many books could not survive changes in the party line and often had to be withdrawn. This was the fate of the Great Encyclopaedia, of which many volumes had to be re-written or cancelled. How could a book like that be tolerated when it included among its contributors traitors like Trotsky, Tukhachevsky, Bukharin or Preobrazhensky ? Does *Mosbukniga's* advertisement imply that some of the anathemas of the Stalinist regime will now be lifted ?

One of the forgotten and disgraced leaders has already unexpectedly reappeared before the public eye. I. G. Petrovsky, the first Soviet People's Commissar for Internal Affairs and a former President of the Ukraine, disappeared from the scene during the purges in the late thirties. His son had been shot, and there were rumours that the father had committed suicide ; at all events, there was no trace of this old Bolshevik until a few days ago. Then it was suddenly announced that for his 75th birthday he was being awarded the Red Banner of Labour. In fact, he was 75 years old last year, but he had to wait for the death of his one-time friend Stalin to be rehabilitated and rewarded.

But the most striking change in the Soviet press, already noticed in these columns, is the almost total disappearance of quotations from Stalin. Now the Russians are told openly to speak for themselves and stop hiding behind other people's words. A witty, satirical poem in *Pravda* mocks Mitrofan Lukich, PhD, who can write on any subject with the "appropriate" quotations from "Chernyshevsky, Dokuchayev, Kluchevsky and Tolstoy" and uses them again when he is asked to explain the Five-Year Plans. Yet everyone knows well that it was Stalin, and not Chernyshevsky and the others, who was quoted *ad nauseam* on this and so many other topics.

Canada and the Republicans

FROM OUR OTTAWA CORRESPONDENT

THE contrast between a society with a revolutionary tradition and one with an evolutionary tradition is a fundamental one, and every week's events in Canada and the United States seem to prove it. This contrast goes a long way towards explaining the dismay and dislike which so many Canadians feel at the spectacle of United States processes of government viewed from their ringside seat. It also goes a long way towards explaining the lack of comprehension and the implicit suspicion with which so many Americans regard the monarchical and parliamentary government of Canada.

If any of the western powers should be an expert on how to live with the Republicans, it should be Canada. Canadians are more directly subject to all the enthusiasms and revulsions which sweep the United States, because they read more US magazines, hear more US radio programmes, and now see more US television than do any other people except the Americans themselves. By the same token, Canada must be more tolerant of the United States than any other of its allies. It gets two-thirds of its imports from, and sells more than half its exports to, the United States. It relies on US risk capital and technical skill to carry out a large part of its development programme. Its territorial defence is so closely integrated with American defence that war would inevitably see it under a single command. The United States actually has its own military installations in Newfoundland—a relic of wartime, when Newfoundland was not part of Canada, and a status which is granted nowhere in "Old Canada," though there are now a few US-manned radar stations.

No Illusions

It may be possible in Britain or Europe to cherish illusions about a "third force" and the idea of being independent of the United States. It is not possible in Canada. But it does not follow that it is easy for Canadians to live so closely alongside the United States. At the present stage in the development of US policies it is not easy.

When Mr Attlee made his recent speech about the difficulties of the United States constitution, and brought down the familiar wrath of Senator McCarthy, he was saying the things that many Canadians feel. Indeed, the theory has been advanced in private discussion here that, though it might take a hundred years, the most practical thing for the allies of the United States is to start now to foster a campaign for a drastic overhaul of the US Constitution.

The Canadian Government is usually very careful to avoid any open criticism of United States policy. Such influence as it does exert in Washington is exercised privately ; and it is usually quite unnoticed by the US public, press or Congress. Mr St Laurent, the Prime Minister, paid his first official visit to Washington early in May. He took the opportunity in frank and private discussions with Mr Eisenhower and members of his cabinet to speak with some vigour on two main points which had been causing anxiety to the Canadian government: the conduct of the truce negotiations at Panmunjom, and the trend of United States trade policy. His speech to the National Press Club seemed in the Canadian tradition to be extremely outspoken, particularly about trade policy. The joint communiqué issued after the talks mentioned these points in the usual turgid phraseology of communiqués. At the insistence of Mr Dulles it also included one sentence, of very little interest to the Canadians, about the war in Indo-China. This one sentence of Mr Dulles' devising was virtually the only part of the whole business which attracted any attention in the United States press. Canadians are coming to the conclusion that the only way to be noticed at all in the United States press is to be so stridently critical as to be offensive.

Unnoticed Protests

It is in fact all very trying. This period of Republican gestation in Washington is putting some strain on relations with Canada as well as with more remote countries. For reasons which seem good here the disagreement about the Korean truce talks has been kept largely under wraps. But

the disagreement about trade policy is vocal and urgent. Before Mr St Laurent's visit to Washington the government took the unusual step of accepting an opposition resolution in the House of Commons which urged him to "make further vigorous efforts to bring about the removal of US restrictions on the importation of Canadian agricultural products." The government also applauded a private member's protest against the Simpson tariff bill, now before the House Ways and Means Committee in Washington, which would impose progressive duties on lead and zinc imports into the United States. All these Canadian protests went unnoticed in the US press, and according to report they came as something of a surprise to Mr Eisenhower's cabinet members when Canadian ministers recounted them.

This is one reason why the forthcoming meeting of the Big Three has been welcomed here with relief. Relations with the United States had seemed to be reaching the point where the deterioration had to be halted somehow. It is obviously futile for any foreign country to enter into arguments with the irreconcilable wing of the Republican party. No one can win in a public slanging match with McCarthy. The President alone, it seems here, can right the present unhappy situation by speaking up for the things he professes to believe in. The great Canadian hope is not so much that the Bermuda meeting will lead to a further meeting with the Russians ; the more urgent requirement is that it should re-establish peace and harmony on our own western street. And from this "window on Washington" it seems that the only way to do this is for President Eisenhower to make up his mind that he cannot delay any longer the great choice which faces him. It is the choice between the unity of the Republican party and the unity of the western alliance.

Greece Under Papagos—II.

The Rally and its Rivals

FROM A SPECIAL CORRESPONDENT

THE government party in Athens, the Greek Rally, possesses the great advantage of an enormous majority in parliament. The opposition are powerless unless the government *bloc* disintegrates from within, and this does not appear likely. The rank and file government members are a docile lot. Some are new men, many are former members of parties of the right or centre, but almost all are passive and obedient. They owe their position to the prestige of Marshal Papagos, and have little future without his ticket. There seem to be no would-be founders of new splinter groups within their ranks.

The Marshal is represented by opposition cartoonists as permanently asleep, while power is wielded on his behalf by Mr Markezinis, the Minister of Co-ordination. But the Marshal is no puppet. He is important for three reasons. First, he certainly takes an active interest in defence and foreign policy. Second, it is his immense prestige that brings in the votes, and retains the confidence of the Greek people, especially of the peasants. Third, it is he that keeps together his principal lieutenants. Of these Mr Markezinis is without doubt the ablest. Energetic, ambitious and immensely self-confident, he has taken pains to give himself a public build-up that impresses even some of those whom it annoys. But his flamboyant personality invites criticism as well as admiration. The Marshal's authority can make him and the other leading members of the cabinet work as a team ; without this authority, things would be precarious. The Rally's impregnable position is thus due to the Marshal. If he remains strong and well, the Rally can look forward to several years of stable government.

Greek politics have always been personal. Not programmes but leaders have counted. Each leader had his clientele. Office for the leader meant jobs for the boys. The bureaucracy of Greece is swollen with them, for incoming governments have always brought more in than they pushed out. The same principle applies in the trade unions, where various bosses reward their followers with shares from the pork barrel. It is easy to condemn this system. But, like Tammany Hall in its great days, it performed a social function. It took care of the needy, if not always of the most deserving. Parties of ideas go well with modern social services, parties of personalities with old-fashioned Balkan individualism.

Pruning the Departmental Tree

The Greek Rally, though built around an eminent personality, is not, in its theorists' view, just another personal party. On the contrary, it has declared war on the old party system. Inspired by an unusual combination of Balkan-style nationalism and American thirst for efficiency, it proposes to modernise the body politic of Greece. Its most difficult task will be to reduce the numbers of the bureaucracy. That there are far too many government officials, and that they do far too little even for the very modest salaries that they receive, has been admitted by almost everyone for years past. All recent governments have promised, both to the bureaucratic-ridden Greek public and to the economy-minded American advisers, that they will take firm action. Mr Markezinis's bank merger is expected to dispense with some hundreds of superfluous bank clerks. When the decentralisation of the administration and transfer of funds and powers to local authorities have been in operation for some time there should be some further saving of personnel.

But this is only a beginning. Rhetoric is no substitute for measures. It is easy to denounce parasitic idlers, and to contrast them with those patriotic civil servants who really do a full day's work. It is easy to inveigh against corruption and extol honesty. The problem is not so simple. With the exception of the highest civil servants—who are probably as able, as overworked and as harassed as their counterparts in Western Europe—Greek bureaucrats are idle not so much from inherent laziness as from lack of real work to do. Since the war—or even longer—jobs in the public service have been treated as a dole. The inflation of the bureaucracy is one consequence of the basic overpopulation and economic weakness of Greece. Corruption, too, has economic causes. Underpaid officials, who possess little chunks of power over the lives of citizens, are under pressure to sell these at their market price. It cannot be expected that all will resist the pressure. The remedy seems obvious: dismiss a large number of bureaucrats, and pay those who remain a decent salary. But to decide who shall be dismissed is not simple, and to throw people on the streets is not easy.

The same inflation of the labour force exists in a large part of industry. The preposterously high harbour dues of Peiraeus are caused by the large number of employees. The high price of Greek tobacco is partly due to the excessive labour force, maintained by the pressure of the trade unions, which in this case are under strong Communist influence. The government has recently passed legislation to retire elderly tobacco workers and to increase the proportion of women workers. This will reduce the labour force of the Kavalla area from about 20,000 to 12,000. But it is not so easy to apply such measures elsewhere, at the expense of persons of unimpeachable orthodoxy.

It seems likely that the government will nevertheless make a real effort to reduce the bureaucracy, even at the cost of hardship. But the fundamental dilemma remains. If the defects of the old system are to go, a substitute must also be found for its merits. The old system of patronage and "protection" must be replaced by twentieth century welfare services that work. But for these Greece's resources remain slender.

The Weak and the Weary

The Rally has a programme, and some of its leaders have ideas. The opposition, now miserably weak in parliament, is rent by personal quarrels. The party of the moderate left (EPEK), nominally led by the elderly and frail General Plastiras, is divided between those who would like to reunite with the Liberals led by Sophocles Venizelos, and those who wish a more radical policy. The most able radical leader, Mr Kartalis, has now formed a new group.

The Communists, of course, have a policy, the same as always and everywhere. Their illegal organisation is at present ineffective, but they enjoy a good deal of passive sympathy among the working class, especially in Peiraeus and Kavalla. They are helped by the poverty and wretched housing in the industrial centres. They can exploit certain abuses and scandals in the official trade union organisation, and make some use of anti-American slogans. The Papagos government has been careful not to make martyrs of the Communists. The Greek police is efficient, and can stop subversive activity. But it does not waste its energies on indiscriminate persecution of leftists. The atmosphere has grown a good deal calmer since the end of the civil war. There is surprisingly little "McCarthyism" in Greece. (Mr Cohn and Mr Schine paid a brief visit to Athens on their European tour, but they confined their attention to their own compatriots.) There is, however, little likelihood that the Communist party will be allowed to operate legally in the near future. Perhaps the main argument against is that it would provoke rowdyism on the extreme right, of which there has been little for some years.

One more feature of the Greek scene deserves a few words. It is hard to define, but not less important for that reason. It is a certain intellectual weariness. In a country of the social structure of Greece, the political influence of the intelligentsia, and especially of students and young graduates, is much greater than in a western country. Between the wars Greek intellectuals gravitated towards the left. During its prime the Communist movement enjoyed the sympathy of many intellectuals, particularly of school-teachers, from whom indeed a large part of its cadres was recruited. The civil war deprived Greece of thousands of educated people. Some were killed, some fled to Soviet satellite territory, some lost their jobs in purges. They have not yet been entirely replaced. Among the rising generation many are bewildered and aimless. They are disgusted with Communism, but there is little new to capture their imaginations. They demand something better than the nationalist eloquence of Rally spokesmen, or the oft-repeated slogans of the liberal opposition, or the charms of a prefabricated American way of life. It is, of course, utopian to expect that their intellectual needs can be quickly supplied. Their best hope is that, as the Rally's policies are carried out, a new atmosphere may be created, one in which their intelligence, their effort and their courage can be used.

The Greeks have toiled and suffered in the last decade as much as any people in Europe. Their troubles are not over. Their economy is still weak and vulnerable. Their country is geographically exposed. The dangers which threaten it may not diminish for a long time yet. But in the last five years the change and the improvement are striking. The Greeks can face the future without false optimism but with a fair amount of sober self-confidence.

(*Concluded*)

Economic Integration in Eastern Europe—I

The Satellites' Linked Economies

THE change over in the Kremlin has made this a good moment at which to survey the progress made towards the closer economic integration of eastern Europe under the control of Moscow. It is a subject on which the Communists have been noticeably reticent, although since last October there have been several glowing accounts in the Soviet and satellite press of the "relations of a wholly new type" that now link the economies of the Communist bloc. Whereas—so the story runs—the "socialist market" is based on full equality, mutual respect and close co-operation, the "capitalist market," where "predatory laws, anarchy and savage rivalry" prevail, is subject to disastrous fluctuations and to the economic dictatorship of Wall Street. But the work of the Council for Mutual Economic Aid (Comecon) set up four years ago to control and co-ordinate the economic activities of the Soviet bloc (including, it now appears, China as well) is still kept very much in the background.

In his "Economic Problems of Socialism in the USSR," Stalin said that as a result of its rapid industrial development the Communist bloc would soon have no need to import, but would itself be seeking markets for its surplus products. In the meantime, however, the bloc certainly needs equipment from the West for its industrial development plans, and will more and more need new raw materials from the underdeveloped territories ; and this is probably why it still seems anxious to preserve and even enlarge its trade links with the outside world. At the same time Communist spokesmen in eastern Europe frequently congratulate themselves on the growing extent to which their trade is concentrated within the bloc, including China.

According to a tentative estimate by the Economic Commission for Europe, trade between the countries of eastern Europe was by 1951 ten times greater than in 1938 (when it was admittedly very small). Communist sources give the proportion of each satellite's foreign trade within the bloc in 1951 as follows: Albania 100 per cent ; Bulgaria, 92 ; Hungary, 67 ; Czechoslovakia, 60 ; Poland, 58 per cent. And, according to a provisional Communist estimate, trade

within the bloc last year was 22 per cent above the 1951 level. If the actual volume of this trade is still comparatively small by western standards, the reorientation is none the less striking. It has perhaps been most drastic in the case of Czechoslovakia. Mr Zapotocky pointed out last December that, whereas in 1948 70 per cent of his country's foreign trade was with the West, and the remaining 30 per cent with the eastern bloc, in 1952 the proportions had been exactly reversed.

Kicking Heels in Moscow

The Soviet Union is now openly linked to the satellites (including Eastern Germany but excluding Bulgaria and Albania) by a network of long-term trade agreements, lasting for four, five or six years. In addition, the existing bilateral trade agreements between the satellites are being gradually replaced by similar long-term agreements; nine of these have already been signed. Within the framework of the Soviet-satellite long-term agreements, supplementary protocols, usually for one year, are concluded. Each year, the satellite ministers for foreign trade make pilgrimage to Moscow, where they are often kept kicking their heels for months before they can complete the detailed arrangements for the year's exchanges—and no doubt make satisfactory excuses for any failings during the previous year. They also receive instructions on the exact extent and nature of their permissible trade with the West. At the time of Stalin's death it transpired that most of the satellite foreign trade ministers were already conveniently on hand in Moscow to attend the funeral.

It is obvious that the control established by Moscow over so much of the foreign trade of its satellites also helps it to direct their industrial plans. It can hardly have been an accident that the conclusion of the long-term agreements has generally coincided with the inauguration of each satellite's five-year industrial development plan. How much co-ordination of these plans has been achieved, and how much specialisation attempted? On the face of it, not much; for each country is planning to build up its own set of basic industries, and, as the ECE has pointed out, many of the planned increases in production are strikingly similar in each country.

Yet satellite ministers repeatedly insist that co-ordination and specialisation are definite aims. In the words of Mr Szyr, the Polish Minister of planning:

> "the production plans of the different countries are interrelated so that each can specialise in the production of export commodities most advantageous for its economy."

Early this year, Mr Dvorak, the Czechoslovak Minister of Foreign Trade, wrote in *Rude Pravo* that inside the socialist camp "the first schemes of the co-ordination of production programmes are already being carried out." Concrete evidence of this co-ordination, however, is hard to come by. The upward revision (on instructions from Moscow) of the Czech, Polish, Hungarian and East German five-year plans in 1950 and 1951 evidently provided an opportunity to introduce some specialisation between the four countries; the production of railway trucks, for instance, was stepped up in Poland and decreased in East Germany. And last November Mr Laszlo Gay, the Hungarian Deputy Foreign Trade Minister, writing in the Cominform journal, spoke of a series of inter-satellite agreements under which each country undertook to specialise in the production of certain types of rolled metal.

On the other hand, co-operation between the satellites for the joint exploitation of their economic resources, which seems to have got off to a slow start, increased noticeably last year—or was given more publicity. Last June, for instance, Hungary and Rumania agreed to build a chemical combine in Rumania using Rumanian natural gas and Hungarian machinery and equipment; to build a pipeline between the Rumanian gas fields and a Hungarian chemical plant; to develop the Rumanian sodium nitrate industry with the help of Hungarian machinery and equipment; to connect the high tension electric grids of the two countries; and to set up a mixed company, concerned apparently with the operation of all the above projects. Similarly, Czechoslovakia has agreed to take a hand in the production of aluminium from Hungarian bauxite. Czechoslovakia is supplying Hungary with power station equipment, and Hungarian workers and equipment are being used in the construction of aluminium processing plants in Czechoslovakia. (Aluminium for the construction of aircraft is no doubt in great demand.) Under a third agreement concluded last year, a mixed East German-Rumanian company is being set up for the development of Rumania's chemical industry.

There have also been a number of reports, whose exact significance is hard to assess, of inter-satellite co-operation in specific projects; the Czech Skoda works and the Hungarian Mavag enterprise, for instance, are said to be collaborating in building river ships. A plan to merge Czech and Polish iron and steel works into a huge "Oderbass" combine has been revealed. And although most technical help comes from the Soviet Union, there is evidence that the satellites also recruit experts from each other. At Dimitrovgrad, the new industrial centre in Bulgaria, Czech and Polish specialists have been supervising important constructional work; and in Poland, Czech experts are helping to manufacture crystalline penicillin.

This east European trend towards closer economic integration might, in other circumstances, be altogether praiseworthy. But unfortunately, all this activity is designed not to promote the welfare and prosperity of the countries of Eastern Europe, but to serve the aims and ambitions of the Soviet Union. How the Soviet Union controls and exploits the satellite economies will be described in a further article.

(To be concluded)

Poppy Juice

FROM OUR UNITED NATIONS CORRESPONDENT

THE calling of two United Nations conferences on narcotics within two months should not be construed as meaning either that the smugglers have got newly out of hand, or that drug addiction has taken on extra dimensions. The Korean delegate to the present Opium Conference did indeed quote press reports that New York youth spends millions of dollars a year on drugs; but the charge, like the Egyptian complaint that British occupation of the Suez Canal Zone makes it harder to control illicit drug traffic, was more of a political feint than a disclosure calling for international action. It is, however, being said more seriously in the UN corridors that the situation in Persia, where illicit trade in opium is supplying income lost when licit trade in oil ceased, is causing Britain and the United States both worry and embarrassment.

These are, however, side issues. The two conferences were called to consider two quite separate attacks on the old problem of controlling world drug production and trade in such a way that medicine can get the supplies it needs while addicts are deprived of the narcotics they crave. The first of these attacks is long-term, the second is a stop-gap attempt to hold postwar production and trade in check until adequate modern control measures can be framed. Only in the view of Russia is there conflict between the two. The Soviet Union has, with some reason, preferred to devote all its energies to long-term attack. No Soviet or satellite representatives are attending the second conference.

The long-term attack takes the form of a single proposed convention which will codify the eight existing international agreements on drug control, and plug holes not yet covered by international documents. This convention was drafted in 1950 for the United Nations Narcotics Commission, the successor to a similar body created by the League of Nations. It was this commission, composed of narcotics experts from fifteen nations, observers from six others, and representatives of the Permanent Central Opium Board and the Drug Supervisory Body (both of prewar vintage) which met in March. Working at the speed of a fast glacier, it has since 1950 approved 33 out of 51 sections of the proposed convention. Several more years will probably elapse before the document is in force.

Meanwhile a second effort had been started in the postwar rush to tidy up the world. Alarmed by a 1946 report that "raw opium production far exceeds the legitimate requirements," and that "any unnecessary delay in the limitation of raw opium production may result in a dangerous situation for the whole world," and rightly foreseeing long delay in finishing the single convention, certain nations drew up an interim agreement proposing that a new international monopoly be created for the purchase, sale and distribution of narcotics. When this idea withered under opposition, the French framed as a substitute a "draft protocol for regulating the production of, international and wholesale trade in, and use of opium." It is this document that is now under consideration in the "big glass house" in New York by the representatives of the nations—including Western Germany, making its first UN appearance.

700 Legal Tons

The object of their concern is 700 tons of legal opium—the amount now used for medical and scientific purposes throughout the world—plus whatever additional amount finds its way into illicit trade. The present cost of legal opium is about $16.50 per kilogram, which means that the total licit supply is assessed at about $11,550,000. The cost of whatever additional supplies the smugglers handle makes diamonds seem cheap.

Most opium is grown in seven countries, Bulgaria, Greece, India, Persia, Russia, Turkey and Jugoslavia. To the Permanent Central Opium Board the critical figures are those of production, export, import, use and stocks, and the board has for years reported difficulty in getting accurate replies on all these items. The figures for 1951 are shown in the accompanying table.

To this counted treasure must be added the unreported opium produced in China, the amounts which countries produce but do not fully report, and such dramatic finds as have been discovered in Mexico, where many remote mountain fields were sown and harvested until airborne inspectors enlisted the army to rout them out.

The newest attempts at control, as embodied in the draft protocol, continue in the main along accepted lines. Use, export and import of opium are to be limited to medical and scientific needs—a provision implied in earlier documents, but not so clearly stated. National opium monopolies are to be established in producing countries and to control through a process of licensing, buying and trading. Such monopolies exist in the principal producing countries, but all are not yet equally effective.

On the other hand, two features have come under general attack. One would limit the legal exportation of opium to countries which exported in 1950. No one wants to increase the number of countries which produce the drug, but it has been pointed out that since each of these countries has a national government monopoly, limitation by protocol might lead to the kind of international monopoly and price-fixing which was frowned on when the interim agreement was refused. It might also boost synthetic production.

RAW OPIUM RETURNS, 1951
(Kilograms)

Country	Production	Import	Use in country	Export	Stock at year's end
Bulgaria	940	...	...	6,058	1,967
Greece	15	...	...	...	151
India	526,677	...	162,149	303,461	381,510
Persia	32,238	...	186	265,541	225,370
Turkey	357,750	...	...	172,955	184,527
USSR	93,800	11,351	110,660	560	11,270
Jugoslavia	21,958	...	9,507	5,410	12,359

Source: Permanent Central Opium Control Board.

The other controversial feature is an attempt to limit opium stocks. The balance as between crops, exports and stocks is delicate, and it is generally believed that if international control is to reach into one, it must have a hand on the others. Charges that selling countries were limiting stocks so as to manipulate prices would be as inevitable as charges that buying countries were trying to increase them for the same purpose.

Meanwhile, there hangs over the whole conference a certain air of unreality, stemming in part from the absence not only of Russia but also of the great opium producing country, mainland China. Experts have been heard to wonder what it may be worth to bring together the representatives of seventy countries, two-thirds of them laymen in this complicated matter, for the purpose of persuading a handful of careless or recalcitrant nations to live up to promises already made. It is significant that the delegates' first act was to pass a resolution meant to lessen irrelevancies by specifically confining their labours to the particular protocol under discussion.

No less productive of scepticism is the feeling that while the postwar opium situation may demand even stronger controls than now exist, the industry in its present form is a dying one. The labour cost of producing raw opium would be intolerable in countries further along the road to industrial development than are the seven big producers. Already the use, for medical manufacture, of poppy straw rivals that of the sticky juice produced by hand incision of each poppy cap. Synthetic narcotics are in their infancy, but the rapid pace of laboratory manufacture of other drugs leads one to wonder how soon the whole system of control of opium as an agricultural product may have to be modified in order to handle it as a coal tar derivative.

THE BUSINESS WORLD

Power and Steel

THE Minister of Supply has lost no time in appointing an Iron and Steel Board under the new Steel Act to exercise a "general supervision over the iron and steel industry" (though a petty hitch appears to have prevented the Treasury from announcing the membership of the steel realisation agency at the same time). And one has only to compare this board with any of the existing boards of nationalised industries to see that it promises to be exceptionally strong and expert. Certain disadvantages are inherent in the form of a representative Board, but the part-time membership here comprises an impressive array of skill and knowledge from steel and other industries; moreover, trade union participation has been successfully achieved. However, the main nucleus of strength lies in the three full-time appointments to the Board. It had been known for a long time that Sir Archibald Forbes would become its chairman, provided that "full-time" could be interpreted with reasonable latitude, and Mr Sandys had for months been expressing his private confidence that he could also recruit Sir Lincoln Evans, who has become vice-chairman. So perhaps the most significant news last week was that Mr Robert Shone had resigned his post as director of the British Iron and Steel Federation to become the board's third full-time member.

It was not until early last week that this appointment to the new board began to be generally discussed in the industry. It has occasioned some surprise and much conjecture. Mr Shone's great capacity and his unequalled knowledge of the central direction of the British steel industry are not in question; it is the transfer of that capacity and knowledge from the traditional nexus of power in the industry to the new organ of public supervision that has impressed steelmakers.

Whether the British steel industry, restored to private ownership, could be supervised in the public interest has always depended essentially upon the balance of power that might come about between the British Iron and Steel Federation and any new body set up to supervise the industry. The latest Steel Act charges the Iron and Steel Board with large responsibilities, "with a view to promoting the efficient, economic and adequate supply under competitive conditions of iron and steel products." The board has to review the industry's productive capacity; the procurement of raw materials; iron and steel prices; research and training; safety, health and welfare; and joint consultation (except over terms and conditions of employment). The board's powers, too, are in form fairly comprehensive. But the only existing organisation in the industry that has ever commanded the knowledge, the acceptance, and the skill to exercise so sweeping a degree of supervision—it goes almost without saying that the nationalised corporation never did—is the British Iron and Steel Federation.

This practical concentration of power and administrative ability in the industry has been recognised in all government dealings with steel since the thirties, whatever the formal pattern laid down. The federation commanded the approval of the Import Duties Advisory Committee; it staffed the wartime control; it drew up the industry's postwar development plan and, with some reference to the first postwar Steel Board and subsequently to the Iron and Steel Corporation, supervised its successful completion. It collected such statistics as the government required for the purposes of price control and steel allocation; it arranged the imports of raw materials for the industry and managed the complicated levy and subsidy arrangements within the steel price structure; and yet it remained a highly effective spokesman for the industry, even in controversy with

the governments as whose agent it was acting. The 1953 Steel Act provides that the board may "arrange for the compilation of" steel statistics instead of collecting them itself; and this had generally been interpreted to mean that the actual work would once again be left to the federation. It appeared, too, that the main executive responsibility for detailed price administration might have to remain in Steel House, since the price structure is inextricably linked with the levy arrangements operated by the federation's agencies for buying raw materials.

It always seemed open to question, therefore, where power and initiative would really be exerted in the denationalised industry, whatever the appearances. During the months of preliminary discussion of steel de-nationalisation, further uncertainty was created by the death of Sir Andrew Duncan, the federation's independent chairman. Sir Andrew, it is worth noting, was in effect appointed to his dominant position in the steel industry by a coalition government during the thirties, not by the industry itself; and that fact gave him, and the federation under his leadership, a certain degree of independent strength that an appointee of the steel companies might never have been able to wield. The federation has not yet appointed a successor to Sir Andrew—partly, it appears, because of the changes pending in the structure of the industry; and the existence of this important vacancy was probably not without its bearing upon the appointment of the new Iron and Steel Board. Whether an independent chairman of calibre comparable to the last will now be appointed by the federation remains to be seen.

Whatever the full implications of the appointments to the new board, it seems beyond doubt that Sir Archibald Forbes and Mr Shone, even alone, might constitute perhaps the best-informed independent authority upon steel pricing arrangements ever assembled outside Steel House. The board's powers to fix maximum prices for iron and steel products do not come into operation while the Minister of Supply is controlling steel prices under defence regulations; but it may be that the Minister will hand this responsibility over to the board at an early date. It seems possible, too, that the board may now decide to discharge its duty of compiling statistics of the industry by doing the work itself.

Even if the board were to do this, very large responsibilities would remain with the federation. It controls the central buying agencies for imported iron ore and steel-making scrap. The board's powers to import materials itself could be put into practice only if it (and the Minister) considered existing arrangements were not satisfactory; and at present, obviously, the federation's arrangements are. These functions of the federation are in addition to its broad operations as a highly organised trade association, working through conferences that cover particular groups of steel products. A further additional responsibility that remains in its hands is the control of the "industry fund" and the levy-subsidy arrangements. This would, of course, remain with the federation; but the board's powers of price control would obviously limit the flexibility with which these arrangements could be varied. The levy can, of course, be changed without altering prices; but it is subject to the scrutiny of the Minister—and of the board.

★

Any changes of executive responsibility for such matters are questions yet to be decided—by the Minister and the board, presumably after consultation with the federation. But the appointments to the new board tend to strengthen the conclusion voiced in these columns last August when the board's functions were first outlined in a white paper on steel denationalisation—the conclusion that the board has been given

> power to take over every significant function of the federation; from the time that the Bill becomes law, the federation will exist and work only on sufferance of the board and the Minister.

Whether this result is considered desirable may depend upon different opinions about the degree of central control this industry needs and the extent to which such supervision should be public supervision. But it must certainly be said that the board seems admirably equipped to bring about the ends that the Government desired—and indeed perhaps some of the ends that the less doctrinaire among its opponents would consider advisable for British steel.

Mr Strauss often used to talk of steel nationalisation as a way of curbing the power of Steel House; but his way failed utterly. It would not be fair to infer that the views of the present Minister of Supply about Steel House differ from those of his predecessor only in degree: Mr Sandys has the federation to thank for an entirely successful delaying action against the nationalised state corporation, ensuring that the industry suffered little botching during its nine months of public ownership under a Socialist government (before the present Government directed the corporation to "hold the position"). But in discussions on the Steel Bill, the present Minister's view appears to have been that the federation should simply be considered as an ordinary manufacturers' trade association; and some of the most level-headed people in the federation have long argued that if steel denationalisation was to be given a fair chance of enduring, part of the real as well as the formal power would have to be transferred to the new board. The eventual balance of power in the British steel industry may take a long time to decide. Nor, with the return of the industry to private ownership under the supervision of a board convinced of the value of private enterprise, is there any reason to look for any considerable—and certainly not any public—conflict of interest within it. It might seem ironical if it should appear, with the years, that Mr Sandys has succeeded by consent where Mr Strauss failed with *force majeure;* but it might, also, promise a more hopeful and less political answer to the problem of British steel.

Business Notes

No Queue at the "Pru"

SINCE it owns a portfolio of securities with a book value of £530 million—and with a market value greater than that—the Prudential Assurance Company stands in the van of institutional investors in this country. In his valedictory address to shareholders, the retiring chairman, Sir George Barstow, could therefore speak as one of the few people in the City with money on hand to lend. Sir George emphasised, of course, that a life office must always put the interests of its policyholders first, and that its participation in venture capital has perforce to be limited; at the end of last year, for instance, the "Pru" held only £75½ million, or 11.4 per cent of its total assets, in equities. It has recently been increasing its proportion of equities—although only at a moderate pace. Last year it divided its new investments almost exactly in fifths between ordinary shares, gilt-edged securities, debentures, properties and mortgages, and miscellaneous investments. The company took up most of these new equity shares by subscribing to new issues by leading industrial companies; on the scale on which it transacts business, purchases of existing equities on the Stock Exchange would often turn the market against it.

But, whilst recognising the shortage of private savings, Sir George emphatically denies that there is a lenders' market in the city. "At no time in the past few years," he maintains, "have we been in the position of turning away sound offers of investment because of a shortage of funds on our part." Sir George agrees that this experience "does not necessarily conflict with the fact that savings are inadequate"; and finds part of the explanation in the fact that "a considerable amount of capital expenditure has been financed out of liquid resources or by short term borrowing by the government and others." But surely, behind this, lies another and even more vital point—that Britain, which is not saving enough to make adequate provision for the future, has had to cut down demand for investment (by taxation and other means) until it matches the supply of savings that is available? It would be a pity if this vicious circle led anybody to underestimate the gravity of the country's risk capital problem today.

Banning Export Bonuses?

THE communiqué issued at the close of the recent Anglo-German economic discussions emphasised the importance that Britain attaches to the subject of export bonus arrangements such as the dollar retention scheme that Germany has operated until recently. At the end of the talks both delegations condemned these schemes on the two-fold ground that they tend to distort the pattern of international trade and that they have the effect of impairing free competition. The campaign that the British Government has been waging against these schemes is now to be supported by more vigorous action on the part of the International Monetary Fund. A statement issued recently from Washington announced that the Fund is about to begin discussions with member countries with a view to agreeing on a common programme for abolishing export bonus schemes involving the retention of a proportion of the hard currency proceeds of exports. The Fund attitude on this issue should be absolutely clear-cut. Dollar retention schemes, with their implication that there are free markets in which the retained dollars can be sold at a premium, offend against many basic tenets of the Fund's philosophy. They encourage unofficial markets and, therefore, multiple rate practices; they involve discrimination; and they undermine the official parities of the currencies concerned.

Now that Western Germany has agreed to abolish its dollar export bonus schemes, the main European survivors of this type of arrangement are those operated by France and the Netherlands. The French scheme, however, can at present be regarded merely as a small but essential factor in correcting the gross overvaluation of the franc in the exchange market. It gives French exports to the dollar markets an advantage that only partially offsets the weighty handicap represented by the present artificial parity of the currency. It would be unreasonable, therefore, to expect France to abandon its dollar retention scheme until the whole exchange situation has been dealt with by more radical methods, involving some realignment of the exchange value of the currency. The Dutch dollar retention scheme is less justifiable; in view of the extreme creditor position of the Netherlands in EPU, it ought to be abandoned forthwith. The Dutch authorities, conscious of the importance of entrepôt trade to their country may, however, be expected to put up the strongest resistance to any demand for the abolition of this scheme.

Prospects for Steel Exports

IN 1951 the total volume of world steel exports amounted to about 22½ million metric tons of steel (ingot equivalent), which was the highest on record; the countries now comprising Schumania controlled 62 per cent of this trade, the United States about 17 per cent, and Britain about 11 per cent of it. The United States, Russia and Japan, which have at times been fairly large importers,

must be counted somewhat erratic markets for European steel. Certain rapidly developing countries, such as the more advanced British Dominions, have been regular importers but seem likely fairly soon to cut down their steel imports from Europe. So it is "the rest of the world"—primarily the much discussed under-developed countries—that must constitute in future the main steady market for European steel. The Economic Commission for Europe has just completed a characteristically painstaking market survey of prospects for "European Steel Exports." Its heavily qualified general "projections" of possible levels of export during the next seven years are of considerable interest—though the main usefulness of the report perhaps lies in its convenient summary of the steel market and potential production in some of the individual countries now buying European steel.

The Commission thinks that Europe's "irregular markets"—Eastern Europe, Russia, China, Japan, the United States, and Canada—which together bought 3½ million metric tons of steel from Western Europe in 1951 (though less than a million tons in 1949) can be expected to buy nearly two million tons a year in future and might

STEEL EXPORTS FROM WESTERN EUROPE

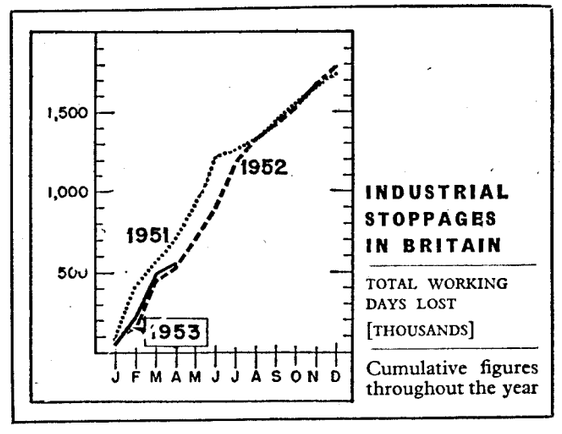
TOTAL	6·1†	10·2	10·5	7·7	11·9	7·2

* Estimate. † Includes small tonnages exported from Eastern Europe.

even buy as much as in 1951. Its estimates of possible European steel sales to "regular markets"—the under-developed countries and parts of the Commonwealth—have been made within two limiting sets of assumptions. The first assumes that steel consumption there might increase on the average by 6 per cent each year, and the second that the rate of increase might average no more than 3 per cent.

These "projections" for 1956 and 1960 are shown in the table. The Commission has not joined to them any detailed estimates of production levels; it says only that "on the basis of present planning, production capacity would appear to be capable of meeting, in full, both export and home demands." In present circumstances, this may seem to put it rather mildly. The question may rather become whether export and home demand will be capable of employing adequately and economically the capacity that may be available; and this question may be an anxious one in areas such as Benelux, where exports take about two-thirds of total production. The Commission holds that present trends in costs should enable European steel producers to remain fully competitive with American and perhaps with Japanese. But any slackening in the domestic employment of a vast and expanding steel capacity in the United States might alter the traditional policies of American steel makers towards more aggressive marketing.



More Freedom for Cotton

COTTON spinners have been given until July 11th—eleven days beyond the original date—to make their second annual choice of whether to buy their raw cotton through the Raw Cotton Commission or on their own account (as about 30 per cent are already doing). The postponement is designed to give millowners a longer time in which to consider the report of the Hopkins Committee on the importation of raw cotton; this report has now been completed and presented to ministers, and will be published in about two weeks' time. The proposals of the committee, which was under the chairmanship of Sir Richard Hopkins, may decide—and will certainly influence—the future of the Raw Cotton Commission. But, as there is already freedom to "contract out" of buying raw cotton through the commission, there does not seem to be any strong case for throwing this body on to the bonfire that has consumed so many other official trading organisations. What the industry will particularly look for in the Hopkins report, therefore, is some scheme for providing cover in the continued absence of a futures market.

One small step towards greater freedom was taken recently when the government permitted unrestricted imports of raw cotton from non-dollar and non-sterling countries—mainly Egypt, Brazil, Peru and Turkey. This concession is not a major one, because demand for this sort of cotton—especially at the prices that Brazil and Turkey are asking—is not abundant. Its motive is probably to be found in pressure on the Treasury to make it possible for these countries to earn a little more sterling if they quote the right prices, rather than in pressure from Lancashire for a little more freedom from import controls.

Cars on the Move

THE rate of production in the motor industry rose sharply in April, owing no doubt to the gradual resumption of work at the Austin factory. Although the month's production of cars, at 44,000, was 4,000 less than in March,

the drop was more than accounted for by the difference between the numbers of working days in the two months. The weekly rate of output rose from 9,600 cars in March to about 11,000 in April, an improvement that spurred the industry to publish its estimate of the April total with more despatch than is usual; the figures appeared within a few days of those for the first quarter of the year, discussed in these columns last week.

This improvement in car production reflects a return to the normal seasonal pattern, and was apparently common to the principal car producing countries in Europe. German output rose from 24,677 cars in January to 26,248 in March, and French from 30,026 to 32,631 during the same period. In the first quarter, Germany exported about 27,000 cars, France 19,000, and Italy 7,000, making a total of 53,000 for the three countries, compared with the British figure of 67,000 for the same period. Last year the comparison was strikingly different: the British industry then shipped nearly 101,000 cars abroad during the first quarter and the European producers less than half that number—actually 48,000. British exports in April, estimated at 25,600 cars, are about 1,300 fewer than in April last year, although 9,000 more cars were produced. This is a measure of the industry's growing dependence on the home market. The warning that "inevitably the waiting list on the home market for some models will be lengthened," which was published with the April production figures may not portend a condition that is likely to persist for long—if, indeed, it occurs at all. Now that supplies of materials are freely available, the individual manufacturers must surely have lost their business acumen if, with spare capacity available, they run the risk of losing orders to competitors who can offer early delivery.

Sorting the Lorries for Sale

THE first responsibility of the new Road Haulage Disposal Board, whose members were announced in Parliament last week, will be to help the Transport Commission decide on the "transport units" in which the commission has been directed to sell its lorries. This is obviously a task requiring knowledge of the haulage industry as well as financial experience, and the appointments to the board, which will be headed by Sir Malcolm Trustram Eve, seem well suited to the purpose. Little indication has yet been given of the principles upon which this sorting out of units will be based. It does not seem to be clear whether the main intention will be to dispose of operating services, and the lorries employed on them; of depots and such lorries as are now based there; or of separate groups of lorries, large and small. No doubt the principles adopted will vary from place to place; but the task of arrangement will obviously be a somewhat complex one, even before the process of actual resale begins. It was said at the outset that the Government would not expect to get anything for the combined goodwill of the Road Haulage Executive (as against the large sums paid for goodwill of the individual haulage firms bought by the executive); but there have been references to the value of the operating licences that are bestowed, as a matter of right, on the purchasers of state lorries. The question of finding the money now appears less formidable than it did a year ago—partly because of the hire purchase arrangements now being offered by certain finance companies.

Wheat Prospects Good

PRESENT estimates of wheat harvests in the main producing countries, taken together with estimates of the carry-over from the current season, suggest that supplies will be ample in 1953-54. This prospect is of special interest to Britain, which did not enter the proposed new International Wheat Agreement that gives a guarantee of wheat supplies up to a prescribed quantity at $2.05 a bushel, in place of the current guarantee of $1.86. The American winter wheat harvest is estimated at 729.8 million bushels, compared with a final return of 1,053 million bushels of winter and spring wheat for the current year. If only 280 million bushels are added for spring wheat, the year's harvest will amount to about 1,010 million bushels; with the estimated carry-over from the present year of about 550 million bushels, this would total 1,560 million bushels of available American wheat—a little more than the total harvest available this year, when the price has had to be supported by the American Government. It seems almost certain, now, that acreage restrictions will be imposed in the United States for the 1954 harvest.

Good harvests are also expected in other important wheat producing countries. Spring rains have been satisfactory in most of the Canadian wheat provinces, and after some delay in seeding in the west on account of low temperatures, warm weather is now reported. In Argentina last month's weather was satisfactory for working the seeding-beds for cereals, and a slightly increased acreage is expected, though labour shortage may limit supplies. A more conservative view is taken of the prospects in Australia, where in the east there was a dry spell, although in the west rain has been sufficient so far. In India a larger harvest and smaller imports next year than this are indicated; on the other hand Pakistan may have a small harvest and may have to import wheat. Reports from the Middle East and North Africa are fair, as are also those from Western Europe, with possibilities of a large crop in France. These harvest prospects, taken in conjunction with a total carry-over at July 31, 1953, for the United States, Canada, Argentina and Australia, estimated by the *Corn Trade News* at 1,076 million bushels, compared with 503 million bushels last year, suggest that there will certainly be more wheat available in 1953-54 than there has been during 1952-53.

The Price of Gold

WHILE an American spokesman at the Vienna meeting of the International Chamber of Commerce was proposing—strictly on his own private initiative—that the dollar price of gold should be doubled, the free market price of the metal was nearing its lowest level since the end of the war. The dollar quotation in the most

Coronation Tea Party

The band and the sack race, the jam buns, the curate, the Boy Scout, the disapproving aunt—they are all here in this preview by artist Illingworth of a scene which will be enacted in thousands of British villages during Coronation week. And afterwards, for millions of homes in every part of the free world, the splendid happenings of a great day will be drawn, photographed, described—on paper. Through paper their memory will be treasured for years to come. And that is just one more happy proof of the important part paper plays in our lives. On great days and ordinary days alike we are dependent in some way on one or more of Bowater's products.

Granny's knot

Mrs. Lily Whittle's thirty years at Vantona have been devoted to the craft of reeling—a key stage in the production of Vantona quality household textiles. At this point, the tying of one small knot can either make or mar the performance of the yarn in the loom.

The reeler takes the newly spun yarn from the bobbins and forms it into hanks, ready for the dye-house. Each hank is secured by a 'ring tie' or knot precisely tied to a certain tension which, if varied in the slightest, would result in uneven dyeing.

An expert reeler, such as Lily Whittle has become over long years of experience, makes a world of difference to the job, upholding at all times Vantona's proud claim of 'quality first'. Following in her mother's footsteps, Mrs. Whittle's daughter works as a carder in Vantona's Emlyn Mills—and there is little doubt that her grandchildren too, will follow her in a life of 'cotton'.

No Vantona dyes are absolutely permanent—they are only as fast to sun and wash as modern science can make them.

WORKERS IN THE TEAM
Number 2 in a series

At eighteen, Robert Halsey has his foot on the bottom rung of the ladder and likes the feel of it. He is half way through his apprenticeship.

He sees all sides of construction work on the site and learns how everyone, himself included, fits into a team. His foreman and the others, are as pleased as he is when he does well. Head Office too takes a practical interest, so there is really a great organisation behind Bob's training.

One day and an evening every week he works for the next examination in bricklaying, and after that he intends to tackle costing and measurement.

In the future he wants responsibility. There is plenty of that, for all who are fit, in the very big team to which Bob belongs. He would like to move around, to take a job overseas, but, he says, it must be a job with the firm. No reason why not. Bob is on a road that can lead far and high.

We've waited YEARS to be able to offer you

DEXION 25% CHEAPER —and IN STEEL!

Now that Steel Control is finished, Dexion Steel Angle is at last freely available on the home market. Bonderised against rust, stove-enamelled, and 20% stronger than the aluminium alloy, *it costs only £15 per two hundred feet* (less for orders of 1000 feet and over).
For almost any kind of equipment in factory, office or stores, Dexion Slotted Angle can save you time, labour and money. With Dexion STEEL you can save even more!
With both Steel and Alloy to choose from you can be sure that DEXION will do your job.

Build your own equipment with

DEXION
SLOTTED ANGLE

Just cut it and bolt it that's all!

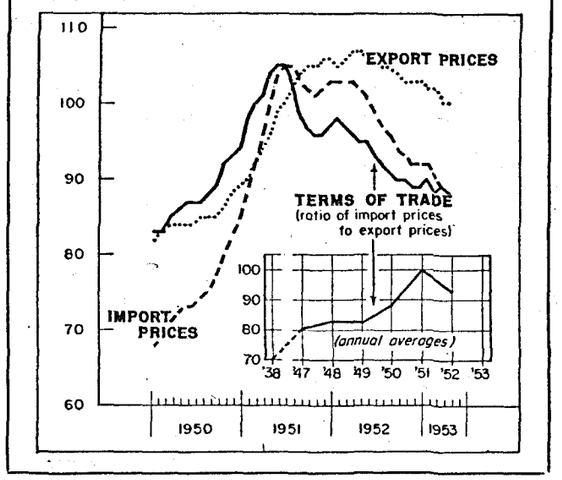
important Continental market has recently touched $36.75 per ounce, and is now hovering in that neighbourhood without sizeable business passing. The two dominant factors in the market are the peace moves, which have inevitably reduced the hoarding demand for gold in the Middle and Far East, and, on the supply side, the persistent offers of newly-mined metal that have to be absorbed by the premium market week after week. Even the smuggling demand for India is now at a low ebb by reason of the spread of the monsoon, which effectively prevents the small smugglers' ships from making their voyages from the traditional transit ports on the Arabian coast and which also damps down the activity of the bullion market in Bombay.

The mounting uncertainties in the French monetary and political situation might have been expected to stimulate the demand for gold in the Paris market, but the response so far has been meagre. This is not altogether surprising. The gold sent or smuggled into France has ultimately to be paid for in hard currency—dollars or Swiss francs—and supplies of such currencies that can be made available through the various black markets in French francs are limited. Moreover, France has provided the main demand for free gold for about two years and there is a limit beyond which the canalisation of French savings into gold bars and coins cannot readily expand. That limit has been nearly reached. These tendencies suggest that the free market price of gold is unlikely to recover appreciably beyond the present level unless unforeseen developments occur in the international political situation.

Hudson's Bay Hits Back

At the annual general meeting of the Hudson's Bay Company, the new Governor, Mr W. J. Keswick, made a spirited reply to the numerous criticisms that have been levelled at the company in the last two years. The critics have ranged over a wide field; they have attacked the British domicile of the company, the composition of the board and of the Canadian committee, the alleged lack of "aggressive management," the rate of expansion of the company's wholesale and retail activities, the pace of the development of the company's oil interests, and the hiving off of these oil interests from the company. It would be interesting to know whether most of these criticisms have come from British shareholders, who hold 67 per cent of the company's issued capital, or from Canadian shareholders, who own 16 per cent, or from the "non-British" (presumably almost entirely American) shareholders.



In general, Mr Keswick answered these attacks by pointing to the figures in the latest accounts, which show 1952 to have been one of the most successful years in the company's long trading history. But he also devoted specific attention to refuting the charge that the pace of developing the company's oil interests—"that speculative and glittering carrot"—has been too slow. He deprecated any suggestion that the company "should be hived off in bits" and then suggested that his remarks would appeal much more to the long-term investor than "to the speculator seeking quick capital gains or to those who see profit in tearing the company limb from limb." For some time now the market has scented the smoke of dissension among Hudson's Bay's shareholders. Mr Keswick's remarks suggest that there is a good deal of fire behind this smoke, probably almost wholly from across the Atlantic and mainly from below the 49th parallel.

Building Societies Confer

Among the spate of pre-Whitsun conferences that sniffed at the air of increasing freedom—and then pronounced it invigorating, but not strong enough—was the annual meeting of the Building Societies Association at Scarborough. The general summary of building society statistics for 1952, which was published in time for the conference, is only marginally different from the estimates made previously by the *Building Societies' Gazette*—and discussed in *The Economist* of March 14th. For example, the total increase in building society assets in 1952 (by £113 million to £1,470 million) is £9 million less than the previous estimate; while, as the main counterpart, the societies' shares are now estimated to have risen by £120 million (not £130 million) and their deposits to have fallen by £10 million last year. Similarly, new mortgage advances in 1952, at £267½ million, are now estimated to have been almost exactly the same as in 1951, instead of some £3 million less. But the general picture—of an increased flow of savings through the movement (partly as a consequence of transfers from savings banks accounts) and of a tight hold on lending policies—remains unchanged.

The keynote to the conference, however, was struck in the address of the chairman, Mr Hubert Newton, when he welcomed what he called "the *rapprochement* between our association and the Government"—with particular praise for the abandonment of the development charge—but declared that the building societies "have some excuse for impatience" about the Government's policy of concen-

UK TERMS OF TRADE
1951 = 100

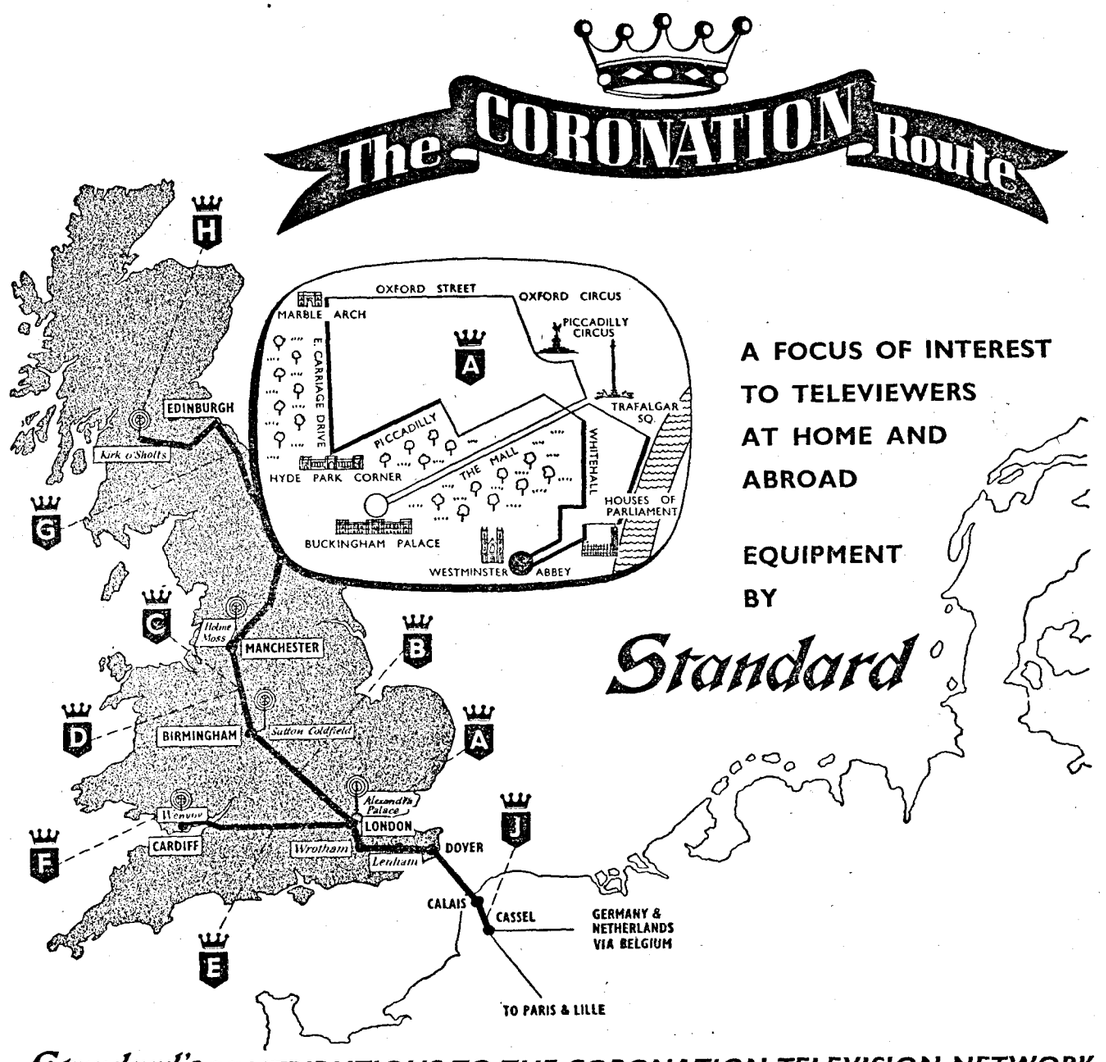
trating subsidies only on local authority houses that are built to let. "The 1952 subsidy on flats with lifts, where land is £10,000 to £12,000 an acre," he pointed out, "is worth over £2,000 per flat. On a normal house, the standard subsidy of £35 12s. based on 60 years at 4½ per cent, assuming an average cost of £1,525 a house, is worth £769." Mr Newton believed that these figures, together with the growth of incomes of potential small house-owners (in the income group below £2,000 a year) "underline the urgency of transferring more savings into housing with a corresponding reduction of subsidies. Many of our potential mortgagors want only some further assistance in the initial stage of ownership, such as a guarantee of at least part of the down-payment needed before they can secure a mortgage loan."

There are, of course, dangers in a policy of disguised or open subsidies on houses for sale—this can lead merely to the erection of comfortable weekend cottages for the well-to-do; and in any case, the main need at the moment is to find out what the real demand for housing would be if so many people were not enjoying squatters' rights on privately and publicly owned houses at grossly uneconomic rents. But, if and when the Goverment plucks up its courage to tackle the problem of rent restriction, then the question of whether more encouragement should not be given to the building of new houses for sale (provided there are safeguards to ensure that each new house built releases accommodation for rent elsewhere) will deserve more attention than frightened politicians are at present giving to it.

New Broom for Brush

If that over-expanded maid of all work of the British engineering industry, the Brush Aboe Group—which has how been rechristened more simply the Brush Group—is to pull itself up by its own bootstraps, it will need to keep its weight down. That, at any rate, seems to be the policy of the new chairman, Mr Miles Beevor, who acceded to his chair on the death of Mr A. P. Good last autumn. Mr Beevor has announced that Brush will not add any further interests to its already widespread activities (though, well in the spirit of the Coronation, it has recently provided an engine to drive Mr Rowland Emmett's Hogmuddle All-Purpose Rotatory Niggler and Fidgeter).

In the future the group will also place greater emphasis upon the production of electrical equipment and less upon the manufacture of diesel engines. This certainly seems to be the right policy for Brush shareholders, who received no final ordinary dividend last year. For some time now the group has had virtually no liquid resources and has had to rely on loans from the banks. It made considerable losses when it ventured into contracts for tubewells in India in 1950, in the hope that these would lead to orders for diesel engines and equipment; and last year, while the electrical engineering business of the group remained reasonably satisfactory, the group lost ground in the sale of diesel engines, particularly in its export markets.



As a logical feature of its new policy the Brush Group has decided to turn its close association with the Associated British Engineering group into a looser *entente cordiale*. The sweep of this new broom, which has probably already caused some dust to fly in the group's managerial set-up, may have to be cruelly vigorous if Mr Beevor's aim of building up and consolidating the business is to be secured. Only when this is achieved can the group hope to appeal to the public for new money, which it will "certainly require in the years to come."

Looking for Natural Gas

The Gas Council's decision to prospect for natural gas during the next five years arises from a wistful desire to find a way out of the impasse created by the rising costs of making gas from coal. During each of the past two years, the Council's coal bill has risen by £9 million. The selling price of gas is now 50 per cent higher than it was in 1939 and according to the council's chairman, Sir Harold Smith, "the total increase is tending to make gas non-competitive with other fuels not derived from coal, particularly for industrial purposes." The rewards of success are distinctly alluring; they were painted in glowing colours by an Anglo-American productivity report on American gas supplies a few days before the announcement. A team from this country described how natural gas accounts for 93 per cent of thermal gas sales in the United States and has "revolutionised the economics of gas supply in America." The growing use of natural gas during the period has resulted in a rise of only 5 per cent in American gas prices since 1939, compared with the British 50 per cent; and since 1934 American sales have quadrupled while British have only doubled.

The cost of natural gas, which is 91 per cent methane, is limited to the expense of prospecting and of piping off the gas once it has been discovered. Distributing it in a small country such as this would not call for such marathon engineering as the American gas pipe-lines stretched across vast areas; and the Gas Council would therefore be unwise to neglect the possibility of discovering natural gas deposits here. The process of prospecting and drilling for gas is very similar to that for oil, so Anglo-Iranian, whose subsidiary, D'Arcy Exploration, has been operating small oil wells in this country since 1939, is expected to give the Council a considerable amount of technical assistance. No serious search has yet been made for natural gas, and the most that there is to work on is the "sufficiently encouraging" report prepared by Anglo-Iranian's chief geologist on which the Gas Council has based its decision to go ahead. Some gas may certainly be found, but it remains to be proved that it is available in economic quantities. The life of some of the reserves found in this country has been too limited to make exploitation worth while.

The difference in the price of gas in Britain and in America may not, however, be wholly due to the advantage conferred by the availability of natural gas in one country and the dependence on manufactured gas—74 per cent of it produced from coal—in the other. The American distributive systems may be more efficient. Some coal gas is produced in the United States, but all of it in coke ovens, whereas with a few exceptions, British town gas supplies are obtained from vertical retorts of a type that has been abandoned in the United States. These technical differences are too big to be overlooked; and they must have some bearing on the competitive efficiency of the two industries.

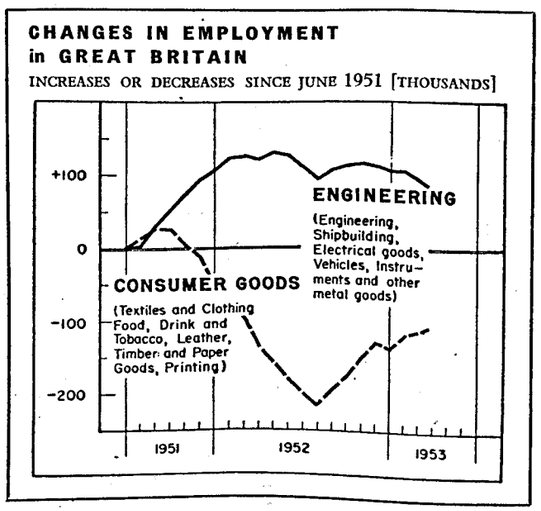
Less Active Shipyards

THE shipbuilding returns compiled by Lloyd's Register of Shipping for the first quarter of the year reveal a decline in the tonnage of merchant ships under construction at home and overseas. The total work in hand declined by 113,828 tons gross, of which 13,499 tons was attributable to United Kingdom yards. The reduced rate of construction in Britain (imposed mainly by the shortage of steel plates) is shown by the decline in ships fitting out afloat from 586,287 to 498,535 tons and the increase in vessels on the stocks from 1,560,115 to 1,634,368 tons. Compared with the previous quarter, ships completed declined from 324,438 to 310,821 tons, ships launched from 373,177 to 227,691 tons and work begun from 389,800 to 305,343 tons.

For the second quarter in succession there has been a decline in the number and tonnage of ships for which plans have been approved or materials ordered, but which are not yet started. These numbered 288 ships of 2,454,894 tons



on March 31, compared with 306 ships of 2,606,478 tons at the beginning of the year. Six months ago the figures were 327 ships of 2,684,263 tons. This is no doubt a reflection of the decreasing order book; there have been few new entries in recent months. Tankers form a yet higher proportion of the total than in previous quarters, accounting for 57.5 per cent of the total in hand and 62.6 per cent of the total preparing. The proportion of tonnage for export, however, has continued to decline. Work in hand for foreign registry now totalling only 27.1 per cent of the total, compared with the peak of 40.4 per cent reached in September, 1950.

American Advice for BEA

THE full views of 17 men from American power utility companies upon a state-owned electricity monopoly that covers a complete country might well be colourful. But the American team that last year, under the auspices of the Anglo-American Productivity Council, made a "field study" of the British Electricity Authority's power system tactfully confines itself in the report it recently published to technical, managerial, and commercial questions. The only major recommendation it makes that affects the administrative structure of nationalised electricity is its feeling that the separate purchasing organisations of BEA's generation divisions and of the Area Boards may involve some unnecessary duplication.

Some of the team's recommendations need translation, but are sensible and to the point. The suggestion that the industry might "liberalise the concept of equipment loadings," for example, concerns the possibility of getting more out of existing equipment. In electricity supply, as in other industries, American engineers customarily run their plant "in excess of capacity"; that is to say, in excess of the rating that the manufacturer guarantees on the nameplate. This is seldom done in Britain. It was suggested to the team that, in turbo-generators at least, few British turbines have a greater capacity than the nameplate rating; this suggests more accurate but less conservative rating by British manufacturers than American. The suggestion that these equipment ratings should at least be rechecked with the manufacturers, to enable greater loading of generating plant where possible, is worth consideration. Other suggestions with the same emphasis are that the law requiring thorough inspection of power station boilers (which takes a week and much labour) at fixed intervals might be amended to allow the stations to fit in yearly inspections as convenient (for example, over weekends); and that the period between turbine overhauls might, with care, be increased from three years, as in Britain, to four and even six years. Such measures would reduce the amount of plant idle in the generating system at any one time; in the transmission system the American team feels that the installation of power-factor correction and control equipment might enable the line capacity of the grid to be "increased rather quickly and at reasonable cost" (perhaps even enabling delays in the completion of the new 275-kV grid system to be considered).

This emphasis upon getting the best out of existing capacity extends to the team's views upon BEA's use of personnel. It considers that the existing wage structure

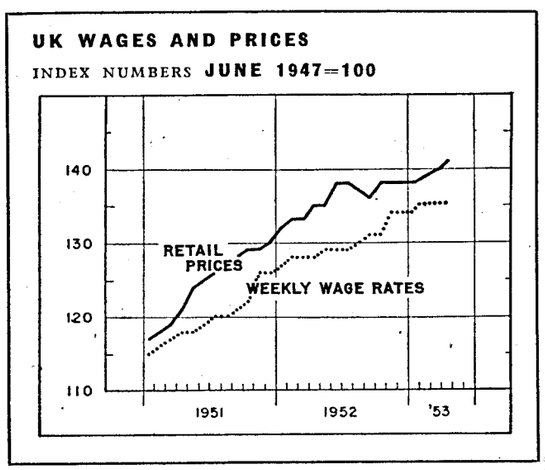
does not provide a sufficient differential in wage rates to make skill worth acquiring, though the structure has recently been improved in this respect; and that some of the jobs for which BEA considers technical qualification of university standard necessary might well be filled by men with practical experience from grades below, saving the more highly qualified man for more exacting responsibilities.

Petrol Sales Level Off

LAST year was the first one since the war in which consumption of motor spirit failed to show an increase. Deliveries to commercial consumers went down by about 43,000 tons, rather more than deliveries to dealers and garages went up; and the total consumption, 5,440,552 tons, was about 14,000 tons less than in 1951. The slight increase in the deliveries of motor spirit to garages did not match the increase in cars on the road. Both the garage sales and the deliveries to commercial consumers, therefore,

UNITED KINGDOM PRODUCTION OF PETROLEUM PRODUCTS
(in tons)

	1951	1952
Motor and Aviation Spirit	2,923,181	4,935,418
Industrial Spirits	3,239	2,316
White Spirit	51,641	53,046
Burning Oil	226,594	568,764
Vaporising Oil	18,507	39,277
Gas/Diesel Oil	3,055,076	3,865,481
Fuel Oil	7,649,982	10,097,836
Refinery Fuel Consumption (ex own production)	852,863	1,240,586
Bitumen	746,227	715,080
Paraffin Wax, Scale and Slack Wax	15,117	14,633
Lubricating Oil	412,154	369,720
Propane and Butane	19,838	24,954
Miscellaneous Products and Loss	479,233	563,256
TOTAL	16,453,652	22,490,363



are indicating the effect of the increase in fuel taxation; in the commercial field, this has increased the switch to diesel power units, and consumption of "derv fuel" showed an increase of about 5 per cent.

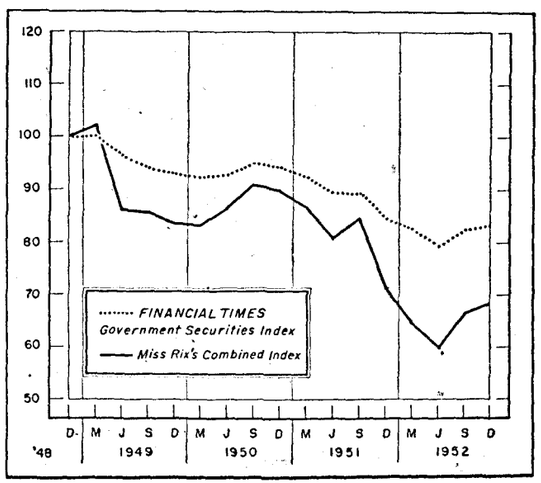
On the production side, the petroleum industry almost doubled its output of motor and aviation spirit, and its total refinery production rose in tonnage by about 38 per cent. One notable change, among the non-petroleum products distributed by the industry, was in the home sales of refined benzole, which rose from about 79,000 tons in 1951 to about 175,000 tons last year. This reflected a progressive reduction in exports of benzole to the United States for such uses as explosives and synthetic rubber, after the period of very high American demand early in the Korean war.

INDEX NUMBERS showing changes in the replacement cost of various classes of plant and machinery are available on subscription to companies wishing to adjust their depreciation provisions in accordance with fluctuating price levels. Details of this and other services of interest to industry can be obtained from The Economist Intelligence Unit, 22 Ryder Street, London, S.W.1.

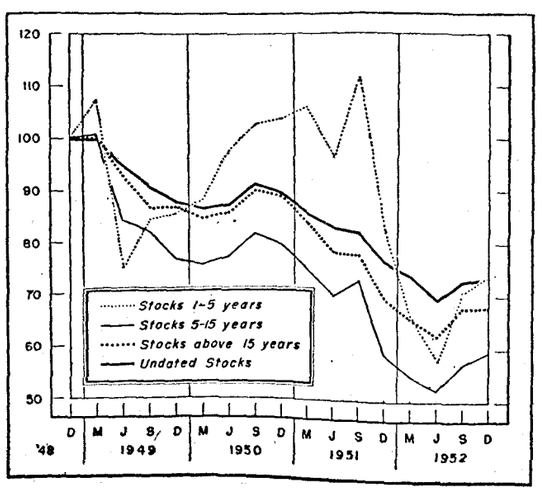
Repatriating AEI Shares

REVERSING the now customary order of trans-Atlantic transactions, the London bankers, Morgan Grenfell and Company have arranged to repatriate to this country the 24.8 per cent equity shareholding in Associated Electrical Industries owned by the General Electric Company of America. This deal, which springs from anti-trust legislation in the United States, has involved over $22 million, since Morgan Grenfell has bought the shares at 72s. 2½d. each; it is thus the biggest deal of this kind since the war. The 2,205,000 £1 ordinary shares now repatriated will be offered as a three for one rights issue to the present British holders of the AEI equity—at 75s. each free of stamp duty (which, after allowing for underwriting expenses and stamp duty payments, will give Morgan Grenfell's a minute profit of not more than 1½d. a share); subscribers will therefore be buying these shares on a yield basis of just under £5 7s. per cent. At the current (and surprisingly low) price of 74s. 6d. the existing AEI shares would cost a prospective shareholder about 76s. 9d. after he has paid stamp duty and commission fees; the price of the new shares therefore offers shareholders a turn that may be sufficient to ensure full subscription lists. In any case, the institutions that are underwriting the issue (for a commission of 1s. a share) may be willing to add this expanding equity to their portfolios in a somewhat roundabout way—at a true cost to them of 74s. a share.

A New Gilt-Edged Index



THERE is no satisfactory general index of price movements in the gilt-edged market. Indeed, the problem of finding one may always defy solution. Miss Margaret Rix, in an address to the Royal Statistical Society that will be published in the Society's Journal this autumn, has, however, braved the impossible and has suggested an ingenious—although not entirely satisfactory—solution to the problem. She argues that institutional investors base their decisions on comparative yields and not directly on market prices, and, she has, therefore, calculated a chain series of index numbers based on the reciprocal of gross redemption yields. The results of these labours are summarised in the two charts at the bottom of this page. In the first chart her "final composite index" is plotted against the *Financial Times* index of government securities, which is based on net market prices; in the second chart the four indices which go to make up her final index, and which are grouped according to the redemption dates of the stocks, are plotted against each other.



It is immediately apparent from these charts that the new indices give a remarkably clear visual impression of *the fluctuations in the gilt-edged market. It is true that* Miss Rix's final composite index—like other composite indices—will not necessarily be of great use to institutional investors, who usually base their investment policies on the recognition that the gilt-edged market is not a composite and homogeneous whole. For this reason Miss Rix's four constituent indices—which show broadly when it has been most advantageous to switch out of the "longs" into the "shorts," or vice versa—may attract more attention; but even here it can be argued that the span of 5 to 15 years in one of these indices is too wide. There is, however, a much more serious criticism of the indices than this. Invariably in chain indices of this kind the constituents in each group have to be altered, and a more or less arbitrary decision has to be made on whether to take the earliest or latest date of redemption. Miss Rix has relied largely on the simple rule of thumb that redemption at the earliest date can be assumed when the stock stands above par and at the latest date when it stands below par; but she has implicitly recognised that this rule is far too unsophisticated by departing from it when circumstances clearly show it to be absurd. The conclusion is inescapable that under this method of compilation the choice between redemption dates, and even more the choice of whether to include a stock in one group or another at a particular point of time, can vary from person to person, so that only the compiler of the index numbers can really understand and explain the movements that have taken place. In Miss Rix's indices, for instance, the changing constituents in each group seem to have exaggerated the fall in medium-dated stocks since December, 1948, compared with the fall in the "shorts."

★

Is it, then, possible to find an alternative method of compiling gilt-edged indices? One solution might be to seek representative yields (according to the length of the life of the stocks) over the whole range of gilt-edged securities, instead of relying on a rather arbitrary selection from the list. This can perhaps best be done by graphical methods. At any one moment of time a continuous graph can be drawn showing the redemption yields on the whole range of government stocks; indeed, gilt-edged jobbers already compile these graphs to see whether any yields are out of line. A simple type of curve can usually be drawn on these graphs and then yields taken from these curves can form the basis of a series of index numbers. There are weighty problems of statistical technique here, but it certainly seems that some such method might be used to abstract from Miss Rix's enterprising indices the distortions that result from "freak" movements in individual securities—usually securities that are on the margin of being entered in her index at one particular redemption date or in one particular group of "shorts," "mediums" or "longs."

GILT-EDGED INDICES

Company Notes

MARKS AND SPENCER. The full accounts of Marks and Spencer strengthen the impression that this closely integrated chain of stores came through the year to March 31, 1953, with its colours flying. Even its subsidiary companies, which supply the bulk of the textile requirements of its stores, made a net profit of nearly £79,000 last year; in 1951-52, when the company had to provide for losses on stocks, these subsidiaries made a net loss of about £162,000. For the parent company, as was reported in these columns on May 16th, trading profits rose from £6,696,194 to £8,401,193 last year and the ordinary dividend was effectively increased from 40 to 50 per cent.

Other signs of last year's success can be traced in the company's full accounts. In the first place, the parent company's advances to subsidiaries have been reduced from £4,249,316 to £1,990,958. Secondly, the stock in trade of the parent company has also been reduced slightly, from £5,832,458 to £5,738,234. These reductions, coupled, of course, with last year's appropriations to reserves, have strengthened the company's liquid resources in no uncertain manner. A combined total of tax reserve certificates and cash balances of £6,247,873 at the end of this March compares with a meagre cash balance of £547,758 at the end of March, 1952.

Earnings	Years to Mar. 31, 1952	1953
	£	£
Trading profit	6,696,194	8,401,193
Total income	6,887,042	8,531,757
Depreciation	713,642	764,590
Repairs	804,545	717,351
Taxation	2,790,000	4,275,000
Net profit	*2,205,690*	*2,466,140*
Ordinary dividends	949,933	1,226,997
Ordinary dividends (per cent)	80	50
Stock contingency reserve	500,000	...
General reserve	883,198	1,500,000
Added to carry forward	*Dr157,066*	*Dr454,820*
Balance sheet		
Fixed assets, *less* depreciation	10,945,578	11,593,470
Net current assets	3,827,956	7,899,874
Stocks	5,955,673	5,831,312
Cash	547,758	3,247,873
Reserves	11,054,413	9,935,619
Ordinary capital	2,261,746	4,523,492

5s. 'A' ordinary share at 52s. 3d. xd. yields £4 15s. per cent.

Clearly, then, the growth possibilities in Marks and Spencer's "A" ordinary stock *units* have not been exhausted. But growth possibilities are clearly needed in a stock that, at the current price of 52s. 3d. xd, yields only 4¾ per cent. Investors in Marks and Spencer (some of whom had been hoping for a dividend of 55 or 60 per cent for last year) would do well to remember that even with such a sturdy incubator, it is wise not to count chickens before they hatch.

★

J. AND P. COATS. Inventory losses have become commonplace in the reports of British companies this year, but very few company accounts—even those from other textile manufacturers—have been so devastated by these losses as those just published by J. and P. Coats for the calendar year 1952. The company has had to write no less than £5,652,289 off its stocks, and this has been the main factor in reducing its gross profits from £12,033,180 to £3,919,038. The other £2½ million odd of this £8 million drop in profits must have been mainly due to a sharp fall in sales.

It is, however, the tax collector and not the equity shareholder who has suffered in this debacle. The provision for taxation has been cut from £5,170,617 to £842,769; after allowing for this shock absorber, the group's net profits have fallen from £6,529,820 to £2,624,868. As £2,136,868 (compared with £1,871,762 in 1951) has been retained by subsidiary companies, the parent company's net profits have borne more than the whole of this decline; they have slumped from £4,658,058 to £488,136. Even so, the directors have maintained the ordinary dividend—as in many years past—at 12½ per cent. If the transfers to subsidiary companies' reserves are regarded as non-distributable earnings, then the repetition of this dividend has been made possible only by the writing back of £500,000 from general reserves (compared with an appropriation of £3,500,000 to these reserves in 1951) and the withdrawal of £180,739 from the carry forward. But, paradoxically enough, this decision adds weight to the criticisms that have been levelled in the past at the company's ultra conservative dividend policy; if the directors can afford to pay this dividend in a year of recession what could they have afforded to pay in the years of boom? The recent recovery in the textile trades explains why the £1 ordinary stock units stand in the face of this calamity at 44s. 6d., offering a yield of only 5⅝ per cent.

★

HARLAND AND WOLFF. Future prospects for Harland and Wolff—the company with the largest shipbuilding output in this country—are much brighter than a first reading of its accounts for the calendar year 1952 might suggest. At first sight last year's trading profit of £1,189,815 (compared with £1,733,907 in 1951) looks like a small return for a year that witnessed the launching of 17 vessels from the company's shipyards. But, apart from a shortage of steel, last year's decline in profits appears to be due to one factor alone—and one, fortunately, that has now disappeared. In 1950, the company *accepted several large contracts* at fixed prices (for the very good reason that at that time orders for new ships were hard to come by); while completing these contracts the company's profits have been squeezed between these fixed prices and continually rising costs. Most of these contracts were completed last year and a provision for losses on the remainder has already been made.

In view of the large number of orders, which are not at fixed prices, now on the company's books, shareholders can confidently look towards a recovery in earnings this year. They may also look forward—

Consolidated earnings	Years to Dec. 31, 1951	1952
	£	£
Trading profit	1,733,907	1,189,815
Total income	1,753,696	1,277,481
Depreciation	412,676	413,109
Taxation	613,767	380,201
Net profit	*583,407*	*363,355*
Ordinary dividends	161,556	169,249
Ordinary dividends (per cent)	7	7
Replacement reserves	200,000	100,000
Added to group carry forward	82,373	46,098
Consolidated balance sheet		
Fixed assets, *less* depreciation	7,172,894	7,475,987
Net current assets	5,397,404	5,191,040
Stocks	7,126,529	8,288,790
Cash	878,686	1,151,975
Reserves	4,685,966	4,832,196
Ordinary capital	4,396,082	4,396,082

£1 ordinary stock at 17s. 6d. yields £8 per cent.

though with somewhat less confidence—to a break with the company's traditionally conservative dividend policy; for last year a dividend of 7 per cent is again to be paid. The main barrier in the way of a dividend increase a year hence may be the strain that increased working capital commitments will put upon the company's liquid resources—together with fears of vulnerability to any future recession.

Statistical Summary

EXCHEQUER RETURNS

For the week ended May 23, 1953, total ordinary revenue was £55,767,000, against ordinary expenditure of £74,756,000 and issues to sinking funds £310,000. Thus, including sinking fund allocations of £3,732,000 the deficit accrued since April 1, 1953, was £45,522,000 compared with a deficit of £79,521,000 for the corresponding period of the previous financial year.

	Estimate, 1953-54 £'000	April 1, 1952 to May 24, 1952	April 1, 1953 to May 23, 1953	Week ended May 24, 1952	Week ended May 23, 1953

COMPANY MEETINGS

THE UNION-CASTLE MAIL STEAMSHIP COMPANY

HIGHER OVERALL REVENUE OFFSET BY INCREASED OPERATING COSTS

PROBLEM OF REPLACEMENT AND REBUILDING

SIR GEORGE P. CHRISTOPHER'S SPEECH

The annual general meeting of The Union-Castle Mail Steamship Company, Limited, was held on May 28th in London, Sir George P. Christopher (chairman and managing director) presiding.

In the course of his speech the chairman said:

I imagine that none of those who heard or read my predecessor's speech at last year's annual meeting thought any more than I did that within twelve months he would have passed on and I would have been called on to take his place at the next meeting. However, things have worked out in this way. It is therefore my first duty today in this place so often occupied by the late Sir Vernon Thomson to pay a public tribute to the great and rare qualities brought to bear by him on his highly successful chairmanship during fourteen memorable years. In that time, indeed throughout the whole of his association with the company even prior to his chairmanship, his outstanding qualities of mind, character and experience were given unsparingly in the best interests of the company's affairs, and it is no exaggeration to say that his hard work, coupled with his unique powers, made for a period of unexampled progress.

I am deeply sensible of the heavy responsibilities which have been placed upon me, not only because of the high importance of the position itself, but because of the great example it will be my aim in some measure to follow. I shall unhesitatingly call upon and am confident of receiving the advice and support of my colleagues on the board as well as of an alert and able management.

In this respect it is with particular pleasure that I look upon the elevation to a seat on the board and to assistant managing directorship of Mr John Sage Bevan, whose long and loyal service to the company with the experience gained therefrom will be of invaluable help to us in our work of framing its policy in the days ahead.

Moreover, I am happy to pay here and now a very grateful tribute to the ready co-operation spontaneously displayed from the very outset of my appointment by executives and staffs, ashore and afloat, in head office and in branch offices, in passenger ships and cargo ships alike. I would assure you and them that this is no perfunctory passing reference in a chairman's speech, but a deep recognition of a very moving response, augurring well for that spirit of teamwork and joint endeavour in which we are determined to embark upon this great adventure. I shall rely upon the continued efficiency of these staffs.

PROFIT AND LOSS ACCOUNT

Although the past year has brought to the company an overall increase of £1,801,000 in revenue from both passenger and cargo traffic combined, the increase in operating costs has in the aggregate not only kept pace with but surpassed the revenue increase by a considerable margin. So much so that our total expenses, constantly rising as they have done in recent years, showed an increase of no less than £2,654,000 over those of 1951 and were the heaviest in the history of the company.

It may be of interest to note the following figures of a few of the salient items in our expenditure for the year. Fuel cost us £3,370,000, crew wages and expenses £2,536,000, victualling of crews £489,000, cargo expenses £2,650,000, and port charges £896,000.

This is all reflected in the accounts now before you in the form of a reduction of £842,470 in the operating profits, before providing for depreciation or taxation, in comparison with the figures for 1951. I am referring to the operations of the Union-Castle Company itself. The group which we embrace has had the benefit of very good earnings by our important cargo-carrying subsidiary, the King Line, the dividend from which is included in the figure of £275,543 under the heading of income from investments.

We have felt it necessary to strike a note of warning in our report in this connection, seeing that tramp freights, which are the basis of the King Line earnings, are now much less favourable than they were in the period under review. This being so, we cannot hope to see in the current year a continuance of the high level of profits contributed by the King Line to the present group accounts. The dividend received from this subsidiary was largely responsible for reducing to £601,225 the diminution in the total of the credit items of our profit and loss account compared with the previous year.

Depreciation on the Union-Castle fleet and its other properties, including the equivalent of income tax relief on initial allowances in respect of the year's expenditure on new tonnage, accounted for £1,781,235, and estimated taxation for £415,154. The company's net profit, after payment of interest on debenture stock, amounted to £1,010,889, or £277,037 less than in 1951.

Adding the carry forward, we had a total of £2,910,321 to deal with. Preference share dividends accounted for a net sum of £84,420; we have adopted the prudent course of transferring £740,000 to general reserve, bringing that reserve up to £3,500,000, as compared with the figure of £5,500,000 at which it stood prior to the capitalisation transfer a year ago.

PARENT COMPANY DIVIDEND

The board has given very careful thought to the question of making a somewhat more generous return to the ordinary stockholder of the parent company. We have decided to do this by recommending a dividend of 7½ per cent on the increased capital, as compared with the equivalent of 6¼ per cent on the same capital a year ago, representing an increase of 20 per cent. The outlook for shipping is uncertain. There is no sure indication that running costs have yet in all respects reached their peak. While fuel prices have shown welcome reductions from the abnormal height to which they had soared, costs of virtually everything else are up. Nevertheless we are desirous of making stockholders a payment which could be regarded as a reasonable draft on the profits of the past year, as indeed all dividends should be, whilst by keeping it within bounds there is better hope of our being able to repeat it than would be the case were we to be more liberal in our recommendation.

In this, and in regard to some other measures concerning which I am about to speak, we look upon our duties of trusteeship as involving an unceasing watchfulness over the stockholders' best interests on the long view.

GENERAL

The position facing us possesses some peculiar features. The difficulties encompassing commerce at the present time are such as to preclude any reference back to past records for guidance, the problems of these disjointed days being in many respects without precedent.

Shipbuilding costs have reached fantastic levels outstripping the bounds of contemplation, and this has induced the board to the conclusion that, for the time being, there must be no embarking on a further building programme beyond the two cargo ships presently under construction. It would be extremely unwise for us to commit the company to the enormous outlay that would be represented by the ordering of further mail and intermediate passenger ships at prices on which it would, to say the least, be difficult to meet the necessary depreciation, let alone provide a profit thereafter.

Let me give you an illustration of the immensity of this problem of rebuilding which the boards of all shipping companies must ever have in view, although our tax gatherers for too long ignored it in their efforts to collect as much as they could from industry regardless of the ultimate effect. The total cost—in revenue parlance, the historic cost—of the Union-Castle fleet as it presently exists amounted to approximately £33 million. To replace that fleet with modern vessels of the type of those now in service, at today's building prices, would cost at least £82 million. This is a staggering figure, but it does not complete the picture. With the many advancements of shipbuilding and engineering science since even the newer units were constructed, it would be necessary for a considerable additional sum to be spent in order to embrace these advances.

EFFECT OF PENAL TAXATION

There has not been much imagination in the mental processes of those who have governed us in regard to the conundrum as to how industry is going to find the money for the necessary replacing of old plant, seeing they have prevented us from making anything like adequate provision to meet that requirement by refusing to relieve us of the penalising effect of taxation on moneys set aside for that purpose. The nation's policy of late years has been to provide for current needs at the expense of proper provision for the capital equipment essential to the country's future prosperity.

A great volume of evidence has rightly been poured out by the leaders of industry in regard to the depressing effect of high taxation and the unimaginative way in which it has been levied on sums transferred to reserve. This predatory policy has been the "worm in the wood" rapidly eating away

the fabric upon which our future existence as a trading nation depends. It surely cannot be over-simplification to suggest that sums definitely earmarked—frozen if need be—for rehabilitation of shipping fleets should be free from all taxation, on the clear understanding that the moment they are used for any other purpose they become subject to the full measure of taxation at the rates then currently ruling.

We are very grateful for the pattern disclosed in the Budget recently presented to Parliament, demonstrating a new approach in the matter of industrial taxation. The relief in the basic rate, the reinstatement in part of initial allowances and the decision to bring excess profits levy to an end are all signs of a fresh outlook. These are reliefs so far as they go, but it must not be forgotten that initial allowances are not a gift or a remission, but merely a loan which has to be paid for in later years, while the reduction in the rate of income tax still leaves a burden, albeit a slightly less heavy one, on provisions for these great future requirements.

We are fully alive to the demands of progress upon an undertaking such as this company, demands which must be continuously kept in mind, seeing that upon the meeting of them the future of our organisation as a great line depends. We realise that these demands can only be postponed for a time and must sooner or later be faced. We will watch this position with the utmost care. There are, however, in the affairs of business organisations, as in all phases of human endeavour, times when a temporary pause is not merely justified but imperative, while uneconomic costs, both of construction and of trading, are allowed to run themselves down through the pressure of sheer necessity to levels more favourable to progress. We feel that the present is such a time to halt for a spell, particularly as the company is in the happy position of having behind it the results of the progressive policy pursued by my predecessor in the years since 1945.

MEETING CHANGED CONDITIONS

So far as the great industry of shipping is concerned, it should be plainly and fearlessly said that these times of transition invariably call for review of many of the methods which may have served well enough in the past. We cannot expect to go placidly on shackled to all the old ideas. We must adapt ourselves to new conditions, and this applies alike to the operative side as to the administrative. Greatly intensified efforts will be needed from both management and labour if the new era is to be tackled successfully. Among other factors, the competition of Germany and Japan will have to be reckoned with, two countries arising anew from the ashes of a world that has passed away. They are already showing plentiful signs that they do not intend to be encumbered by out-dated ideas and restrictions in any sphere of their activity.

The power of British shipping to compete in the world's markets will undoubtedly depend more than anything else upon the efficiency and personal interest in the job of everyone among us. I believe this is the key both to competitive capacity and to the desirable retention of a high standard of living—indeed these are but facets of the same thing, for one hinges upon the other. I am convinced that a determined spirit of individual and corporate endeavour will bring the reward it deserves.

In this centenary year of the great shipping company which has grown up from the fusion of the old Union Castle Lines, we have a tradition behind us which cannot fail to be a magnificent inspiration to everyone connected with the concern to preserve intact all that has been handed down to us. Included in this will be the desire and intention of myself and my colleagues, as it has been of our predecessors through the years, to work in the closest collaboration and harmony with Ministers and their officers in the seats of Government in South and East Africa and Southern and Northern Rhodesia, as also with their representatives in this country, in serving the best interests of those great countries. I feel that in this way we will also be serving the best interests of the Union-Castle Line.

The report and accounts were adopted and the retiring directors were re-elected.

At an extraordinary general meeting held after the annual general meeting, a special resolution was passed adopting new articles of association based upon the Companies Act, 1948, and modern practice.

The proceedings terminated with a vote of thanks to the chairman and directors.

CEREBOS LIMITED

The forty-ninth annual general meeting of Cerebos Limited was held on May 28, 1953, at Cerebos House, Willesden, London, N.W.10, Mr. W. Arnold Innes (the Chairman) presiding.

The following is the Chairman's review which was circulated with the report and accounts for the year ended December 31, 1952:

The year under review has not been without its difficulties, but I am happy to report results which I feel you will consider very satisfactory.

PRODUCTION

The various reconstruction and re-equipment programmes to which I referred in my review last year, have continued to make good progress. That at Greatham is now substantially complete, and that at Middlewich, which includes the provision of an entirely new vacuum plant, is making satisfactory progress. Apart from the increased efficiency which is bound to ensue from the completion of these schemes, it is our object to have, in all factories, a reasonable reserve of capacity. This will ensure not only a substantial degree of flexibility, enabling orders to be dealt with expeditiously and distributed from the most economical centre, but will also create a reserve which can be brought into operation should there, unfortunately, be anything in the nature of a major breakdown at any one factory. We shall not rest content until we are in a position to despatch every order within 24 hours of the time of its receipt at the factory. The new buildings and greater warehousing capacity for finished stocks have enabled us to make satisfactory strides in this respect.

The higher degree of all-round efficiency which we are able to achieve because of our various reconstruction schemes and of careful management, has enabled us to offset to a fairly substantial extent, increasing costs of labour, raw materials and fuel. Throughout the year, the supply of most raw materials, including packing materials, has improved, and at the present time, we have to contend only with what, in these days, must be considered as normal problems of production.

During the year our Middlewich factory and the three factories owned by our subsidiary, Henry Seddon and Sons Limited, have been brought under unified control. The legal entity of the two companies concerned will be preserved and we anticipate being able to effect substantial economies by this reorganisation.

HOME SALES, MARKETING AND ADVERTISING

Again I am happy to report that both in tonnage and in sterling our sales for 1952 were higher than any previously recorded, an achievement the importance of which I feel will be fully appreciated, particularly when due regard is paid to the economic difficulties prevailing at the present time and to the keen competition with which we have to contend. In this connection, we have found the various types of market research undertaken to be of considerable value, particularly in enabling us to direct our sales and advertising activities with a maximum effect commensurate with the most economical expenditure. Our various advertising and sales promotion campaigns have once again proved very successful and I would like to express my appreciation to our friends in the grocery trade for their co-operation and help in furthering these various projects. The degree of mutual trust and confidence which exists between the company and its customers is one of the many satisfactory features of the business.

Since the war, it has unfortunately been impossible not to increase to some extent the retail prices of our products, but it is noteworthy that over the course of the last thirty years the overall increase in the retail price of Cerebos Salt has been no more than 33 per cent and in the case of Bisto, where the purchase of expensive ingredients in the open market is involved, only some 60 per cent.

The fact that we have been able to confine these increases to such modest proportions is unquestionably due to the substantial increase in the volume of our sales. In this respect monetary figures are inclined to be rather misleading. It is probably therefore sufficient to say that in volume the sales of the Group as a whole have increased threefold between 1939 and 1952.

EXPORT

Our export sales continued to increase until March of last year, when, without warning, the Australian Government imposed very drastic restrictions upon all imports, thereby making it impossible for us to maintain, let alone increase, our total overseas turnover. However, our trade in other overseas markets showed an improvement of about 10 per cent compared with 1951.

For the past 40 years business in Australia has been conducted by our Sydney Office and since 1945 we have had under consideration various plans for establishing ourselves inside the tariff barrier, one of these being the merging of our business with that of an old-established company manufacturing "Gravox," a product very similar to "Bisto." Negotiations have been successfully concluded and I am glad to say that we have now purchased the whole of the share capital of Klembro Pty. Limited, the manufacturers of "Gravox." We are satisfied that this investment will prove a sound one, as we are now well placed to meet the ever-increasing demand in Australia for gravy powder.

Eventually we shall pack our proprietary brands of salt in the Commonwealth and to prepare the way for this we have formed a new subsidiary, Cerebos (Australia) Pty. Limited, which will take over all our interests in that country, including the Klembro Company. The new company has a nominal capital of £A250,000, of which £A50,000, in cumulative redeemable preference shares, have been placed with Australian Investors; we shall subscribe for all the remaining capital, consisting of 200,000 ordinary shares, which will be taken up as and when required.

I have just returned from an extensive visit to Australia and am glad to say that our new subsidiary has been placed upon a very sound basis. We have been successful in forming a strong local Board and I am satisfied that we are well placed to play our part in the wonderful future which lies before Australia with its increasing population and great natural resources. I had the privilege of meeting many Australians prominent in political and business circles and was greatly impressed by the warmth of their reception and their willingness to assist me in every way.

We continue to make special efforts to increase our trade with North America and I am glad to report encouraging progress in Canada. Our sales in that market last year showed an increase of one-third compared with the previous period. We are convinced that this progress can be accelerated considerably by the application of those sales methods which have proved so successful at home; accordingly, we have sent one of our senior sales representatives to Canada to assist our agents in their efforts to increase turnover. At the same time, we are strengthening very considerably our advertising for the purpose of bringing the merits of our products more prominently before the Canadian housewife.

In many other markets and despite the efforts of the government departments responsible for assisting British exporters, there is still little sign of any relaxation of the restrictions which have been in force for so long. A great deal is heard of the liberalisation of trade, particularly amongst the member countries of the European Payments Union, but many of these countries continue to apply restrictions which prevent us from meeting the demand for our products built up at considerable expense over many years. We continue to hope, however, that our Government will succeed eventually in inducing these countries to allow the import of those consumer goods which, in the past, represented a far larger proportion of the Country's export trade than is the case today.

DISTRIBUTION

I referred last year to the possibility of substantial increases in our fleet of motor vehicles. After due consideration of all the factors and particularly the rising cost of distribution and the unsatisfactory nature of the service we have been receiving under Nationalised transport, this policy has now been accepted. We are therefore in course of enlarging our fleet with a view to providing as far as possible a distribution service which will not only be more speedy and economical, but will also be under our own control.

One feature of this programme has been the introduction of trunk services—long distance services of heavy vehicles between factories and depots. The results so far have been encouraging and it is our intention to develop these services and to extend our local delivery services from our depots, thus enabling our products to remain under our own control from the factory to the customer.

An integral part of this development is the extension of our chain of depots. For many years we have operated depots in various parts of the country, for the most part in rented premises, many of which have been subject to numerous and irksome restrictions. It is our intention to acquire depot premises of our own at strategic points. We have recently acquired premises near Birmingham and have secured a valuable site in Nottingham, where, but for licensing restrictions, we should already have commenced to build. Other premises or sites will be acquired as opportunities offer.

INVESTMENTS

It is to be regretted that we have had to write off a further sum from the value of our gilt-edged securities. Nevertheless, it is satisfactory to note that since this was done at December 31, 1952, the investments in question have appreciated in value to the extent that they are now worth some £16,000 more than the written down book value. In total, a sum of £88,326 has been written off these holdings, but they are medium-term securities and we may reasonably hope to hold them to redemption and thus avoid any loss.

The trade investments continue to yield satisfactory returns and our holding of 50 per cent of the ordinary shares of Scott (Midlothian) Limited is proving to be very sound. We have every reason to be satisfied with the progress of this company to date. Scott's command the largest sale of porage oats in the British Isles, a position which is due to the high quality of Scottish Oats, scientific marketing and enterprising and essentially honest advertising. Porage is still the most nutritious and the cheapest cereal breakfast food.

SUBSIDIARY COMPANIES

Again it is satisfactory to be able to report that all our subsidiary companies have enjoyed a satisfactory year's trading and have made substantial contributions to the results of the Group.

STAFF AND EMPLOYEES

On behalf of the Board, I wish to place on record our warm appreciation of the excellent services again rendered throughout the year by all our employees. Such results as are disclosed by the accounts have been achieved only with their loyal support and devoted efforts, for which we are most grateful.

TAXATION

The reductions in taxation announced by the Chancellor in his recent Budget are very welcome and should provide a useful stimulant to industry generally. Nevertheless, it has been necessary to make provision for taxation on the profits of the year under review to the extent of no less than £683,607. Over the last six years the aggregate provided amounts to £3,228,000.

In this connection it should be remembered that the incidence of profits tax and excess profits levy, together with the inadequacy of the allowance for wear and tear of fixed assets, which in the long run is not affected by the reinstatement of initial allowances, welcome though this concession is, all mean that the effective rate of tax is much higher than is generally realised. In point of fact, almost two-thirds of the profit made by the company still goes to the Exchequer in taxation. We can only hope that the improvement in the general financial condition of the Country will continue and that future Budgets will successively reduce the heavy burden of taxation which is a brake on enterprise in all its aspects, the impact of which on future generations it is quite impossible to measure. The enthusiasm of the younger people is being sapped and the inducement for them to accept positions of responsibility is being steadily diminished. Only when a really substantial reduction can be made in the present level of taxation can continuous employment and real progress be assured.

ACCOUNTS AND DIVIDEND

The accounts for the year to December 31, 1952, are presented with such clarity that comments on them are probably superfluous.

The value of the fixed assets of the Group, including trade investments and after making adequate provision for depreciation, is £2,440,298, an increase of £148,910 on last year. This is attributable for the most part to new buildings and machinery at certain factories and additional motor vehicles. Net current assets at £1,292,954 have increased by £215,762. The note on the balance sheet shows clearly how the capital has been increased to £2 million and the effect of the bonus issue made in July last year on the group's reserves.

The net profit of the Group for the year after providing £683,607 for taxation is £418,923 (as against a comparable figure of £356,611 last year) which, together with the amount brought forward of £231,417, gives a total available of £650,340.

Your directors have given very careful thought to the question of the distribution to be made to stockholders and have decided that the results achieved justify their recommending a final dividend of 20 per cent, which, together with the interim dividend of 5 per cent paid in November last, makes a total dividend for the year of 25 per cent. As the capital has been increased from £1 million to £2 million since the last final dividend was paid, the rate of 25 per cent this year is comparable with 20 per cent for 1951.

In conclusion, I would like to express to my colleagues on the Boards of both Cerebos Limited and our subsidiary companies my sincere thanks for their support and co-operation throughout the year.

The report and accounts were adopted.

Mr R. V. Townsend, the director retiring by rotation, was re-elected. The proceedings terminated with a vote of thanks to the chairman.

YORKSHIRE INSURANCE COMPANY LIMITED

RECORD FIGURES

The annual general meeting of this company was held on May 27th at York.

The Rt. Hon. Lord Middleton, MC, the chairman, in the course of his speech, said: We are able to present to you a very satisfactory picture. The considerable expansion which has been revealed in the accounts of the last few years has continued, and in the life, fire and accident departments record levels of business have been attained.

Life and Annuity Account.—In the life department 6,648 new policies were issued for a total of over £16 million, being £1½ million more than in 1951. The premium income was £400,000 higher at £2,600,000, and the fund rose by £2 million to over £24 million.

Fire Account.—At £4,084,513, our fire premium income again increased by more than £500,000, and is now something over twice the 1948 figure. The increase in premium income has been well distributed over the whole of our activities at home and overseas, with the exception of the United States.

Accident and General Account.—This account records another remarkable year of expansion.

Marine Account.—In the marine account the premium income, although over £2 million, fell slightly short of the corresponding figure in 1951, and claims were notably higher.

Profit and Loss Account.—Having satisfied ourselves that all prudent provisions had been made, we then turned our attention to the question of dividend. We have deemed it equitable not only to complete the restoration of dividend to its former level, but to go further and recommend to you that it be raised to 16s. per £ of paid-up capital.

The report was adopted.

HUDSON'S BAY COMPANY

A SUCCESSFUL YEAR

The two hundred and eighty-fourth annual general court of the governor and company of Adventurers of England trading into Hudson's Bay was held on May 22nd in London, Mr W. J. Keswick (the governor) presiding.

The following is an extract from his circulated statement for the year ended January 31, 1953:

The year under review was one of the most successful in the company's history. Consolidated gross earnings before taxes were £2,764,095, or £845,091 more than the corresponding figure last year. Taxes reduced these earnings to £1,114,104, compared with £758,703 last year.

Canadian production continued at a high level in nearly all fields, and the year saw new records for output, employment and income. The trading results now under review reflect these conditions, but they are also the result of reinvestment of earned profits in the business in recent years.

Retail stores.—Sales were this year £32,260,284 (last year £27,971,893); profit (before taxes) this year £1,776,115 (last year £884,683).

Fur stores.—Sales (turnover including fur, consignments and merchandise) were this year £26,442,906 (last year £22,730,688); profits (before taxes) this year £332,971 (last year £508,829).

Wholesale department.—Sales were this year £12,655,794 (last year £11,518,731); profits (before taxes), this year £333,247 (last year £290,136).

GOVERNOR'S ADDITIONAL REMARKS

The Governor, addressing the meeting, said: Ladies and Gentlemen,—This is the first time I have had the honour of being in the chair at an annual general court. I feel I cannot let this occasion pass without referring to the retirement of Sir Patrick Ashley Cooper and to his long and successful governorship of over 21 years, during which time he devoted himself unremittingly to the company's interests. Fittingly enough his last year of office proved to be one of great success for the company as a whole, and I should like to call your attention to some of the items of progress in the report and accounts which have now been in your hands for some time.

The sales in our retail stores rose by over £4 million. The sales in the wholesale department have increased by over £1 million. The collections from our land department, although now in the process of being wound up, exceeded expectations. The fur trade continued to do good business.

POINTS RAISED BY SHAREHOLDERS

I feel there is no need to apologise for these results. But I assure you that we feel in no way complacent about our good fortune. In fact, we have recently, as in the past, received in the course of the year from shareholders—some with substantial holdings—various suggestions and constructive criticisms on the conduct of the company's affairs. I am very grateful for these and for the spirit in which they were given. Admittedly they were received before the publication of the annual report which is before you today. I hasten, however, to make it clear that the board is always receptive to representations from shareholders and willing to hear constructive views from proprietors—large or small.

Perhaps it would be helpful if I enumerated some of the points raised. They ranged over a varied field, such as:

1. Domicile of the company.

2. The composition of the board and of the Canadian committee, which some consider as out of date and lacking "career" men, and without aggressive policies.

3. Demand for more aggressive management and expansion of our stores, and doubts whether adequate finance is available.

4. Expansion of our wholesale activities on a greater scale in North America.

5. Oil—inadequate finance and insufficient speed in exploring and development of our large acreage.

6. Divesting the company of its gas and oil interests.

THE REPORT A POSITIVE ANSWER

Many of these problems naturally are under discussion at our meetings from time to time, both in London and in Winnipeg. All receive careful consideration. I believe, however, that this annual report, together with the published figures setting forth one of the most successful years in the history of this company, is as positive an answer as any to most of these criticisms.

Surely the figures of the retail stores—both sales and profits—do not support a charge of sluggish and unimaginative management. The wave of prosperity in Canada alone did not, I submit, produce these results. Let us remember, too, that during this boom period since the war $30 million has been ploughed back into the company in extensions to buildings and replacements. Look at the balance sheet and the reserves.

OIL INTERESTS

In oil—that speculative and glittering carrot—we are reminded that our acreage is large and are asked if we are holding back development through lack of funds or lack of sufficiently aggressive exploration. It is hinted that an oil company with our advantages should be second to none and could do much better. These thoughts are a study in boom psychology. I confirm that up to the present the Hudson's Bay Oil and Gas Company has never to my knowledge been kept short or embarrassed by lack of funds for development. I confirm, too, that the Hudson's Bay Company's contributions to advances to the oil company have been well within our capacity without in any way prejudicing our other trading interests. I repeat, our complete confidence in our partners—the Continental Oil Company. We are, in my opinion, extremely lucky to have their technical knowledge, staff and resources in partnership with us. We are still in the stage of putting in more than we take out. But we share with our partners—and indeed with many others—the belief that we are moving along at a measured pace and on a well-balanced programme. We as yet have no reason to alter our belief in its eventual success.

I deprecate strongly the thought that either in trading or in oil we have developed in a timorous way our various interests or that our present method of financing is calculated to keep each interest moving at the pace of the slowest—or all at the pace of their venerable parent. The facts do not bear this out.

THE COMPANY A UNITED WHOLE

In our good fortune in Canada's discovery of oil and in our undeniable success in retail and fur trading I obstinately believe that those responsible for management and policy as trustees for shareholders should keep both feet firmly on the ground; that they should keep the company as a united whole—not hived off into bits; that they must keep pace with Canada's prosperity, but not through over-expansion in this time of boom get out of their depth; that, hand in hand with their oil partners, they should march boldly along with their planned programme for oil, providing or raising additional finance as and when necessary, with the avowed intention of preserving the equity in this oil venture for our proprietors, and which they feel confident is possible; but that they should not segregate at this particular time and should not fling money—borrowed or otherwise—on the table in speculation or at increased speed.

I appreciate fully that all that I have said is more likely to appeal to the long-term investor than to the speculator seeking quick capital gains or to those who see profit in tearing the company limb from limb. But I believe it to be the right policy and one which will be supported by a large majority of present shareholders of this company, which for 280 years as part of the history of both of London and Canada has acquired a public name and public responsibility. Respectability is a middle-aged aim, but it is also a long-term virtue.

NO LACK OF VITALITY

Any company which remains for nearly three centuries the centre of controversy, envy and criticism, as the Hudson's Bay Company has been and still is, is, I believe, unlikely to lack vitality or to become drowsy for the want of aggressive management.

No doubt there will be those who remain convinced that with more "enlightened" policy and a less conservative attitude we could do more and better and quicker things. I assure them we welcome their help. We do not spurn or ignore their suggestions. But I must frankly state that if these are allowed to develop into mere irresponsible comment and attack upon the whole direction, management and staff, they must have a detrimental effect on the morale of the staff to whom we owe so much and also upon the general well being of the company.

TRIBUTE TO MANAGEMENT AND STAFF

The board and the Canadian committee can well stand these general attacks. But I would not like to think that the staff and management who have given us such convincing and successful returns in recent years are included in these attacks.

I am sure that proprietors will be interested to know that the percentage of shares held by various nationalities on May 8, 1953, the date on which the share transfer books were closed, were: 67 per cent of shares were held in the UK, compared with 68 per cent in 1952; 17 per cent in Canada, compared with 16 per cent in 1952, and 16 per cent by non-British shareholders, compared with 16 per cent in 1952.

The report and accounts were unanimously adopted.

AMALGAMATED ROADSTONE CORPORATION

ROADS — CINDERELLA OF GOVERNMENT SPENDING DEPARTMENTS

NEW SHIPPING SUBSIDIARY

REVIEW OF ACTIVITIES

The seventeenth annual general meeting of Amalgamated Roadstone Corporation, Limited, was held on May 27th in London.

The following is an extract from the statement circulated by the joint managing directors (Mr D. W. Cleaver, DSO, and Mr W. H. Gatty Saunt): It is with great regret that we have to record the death of our late chairman, Mr J. S. Killick, CBE, MInstCE, MInstHE, on December 8th last. He had served this company as deputy chairman from September, 1946, to October, 1948, and as chairman from October, 1948, to the day of his death. We and our colleagues on the board, as well as all the employees of the company, will miss greatly his genial presence and his never failing advice and guidance.

Trading profits, depreciation, initial allowances and taxation are again all higher than in the previous year's accounts.

During the six years ending October 31, 1952, capital expenditure, less sales, on plant, equipment and transport within the group (excluding the new shipping subsidiary referred to below) has amounted to £1,769,000, of which £1,116,000 has been contributed out of profit by way of initial allowances and depreciation.

The value of the fixed assets shown in the consolidated balance-sheet at £2,575,000 includes £1,608,000 for plant, equipment and transport. This latter figure is approximately £161,000 less than the new capital expenditure of the last six years above mentioned.

DISTRIBUTABLE CAPITAL PROFITS

You will note in the consolidated balance-sheet an item, "capital profits account," totalling £23,241 resulting from sundry tax-free capital profits made in previous years. It is from this capital profits account that your directors now propose the payment on the ordinary stock of a capital dividend of 1 per cent, which will normally be free from both income tax and surtax. This should not be regarded as a special distribution, because it is intended to repeat such distribution whenever justified by the year's accounts. The incidence of distributed profits tax is such that it costs the company considerably less than a 2 per cent gross dividend and, at the same time, it is worth considerably more to any surtax payer.

Certain developments are now materialising which we believe should result in the earning of distributable capital profits, and from the accounts of the new subsidiary, Williamstown Shipping Company, Limited, which are enclosed together with the accounts of your corporation, you will note that in the year ended October 28, 1952, the capital profits earned amounted to no less than £42,525, to be added to previous similar capital profits exceeding £160,000.

The fleet comprises nine ships aggregating 18,100 tons deadweight. Only two—7,500 tons—are prior to 1946, and are due to be sold this year and next. Seven ships aggregating 10,600 tons are all postwar, the last two having been commissioned in 1952. One new ship under construction is due before the end of 1953 and another is under contract for delivery in 1954.

This shipping company, in which, at a net cost of £321,600, your company has acquired 105,250 £1 shares—just over 59 per cent of the 178,000 issued—earned for the year ended October 28, 1952, after profits tax and excess profits levy, but before income-tax, £85,817, and paid a dividend of 20 per cent, less tax, absorbing £18,690. The carry-forward was increased by £47,045 and the capital reserve by £42,525—together equal to 50 per cent of the issued capital. Earnings for the first six months of the current financial year are estimated to be in excess of those of the corresponding period last year.

Your company has for many years been well served by this shipping company in the shipment of a substantial proportion of its seaborne deliveries of stone. When the opportunity occurred to acquire a controlling share, we had the benefit of an up-to-date professional valuation of every ship in the fleet and of a most thorough investigation of its accounts by our auditors, who gave a net "break-up" value per share approximately 80 per cent higher than the price we paid.

AMALGAMATED LIMESTONE CORPORATION

You will remember that three years ago Amalgamated Limestone Corporation, Limited, was formed to take over from your company all "non-roadstone" limestone interests. The Limestone Corporation accounts to October 31, 1952, together with directors' report and joint managing directors' statement, are enclosed herewith for the reason that your company holds somewhat more than half its issued share capital and is therefore materially interested in its position and prospects; consequently, we need not here recapitulate what is included therein.

We should mention, however, that in connection with cement works in Kenya Colony initiated by your subsidiary, Amalgamated Limestone Corporation, Limited, your company is guaranteeing as to principal and interest, up to £170,000 of 6 per cent Unsecured Redeemable stock of the British Standard Portland Cement Company, Limited, to which reference is made in the statement accompanying the accounts of Amalgamated Limestone Corporation enclosed herewith. The last note under the heading "Contingent Liabilities" shown at the foot of the balance-sheet of your company relates to part of this commitment.

You will note from the report and accounts that £38,600 has been provided for excess profits levy, a burden which is unfortunately still with us until December, 1953, and that the appropriation to income tax on current profits, £49,500 (£29,500 more than last year), covers all income tax due up to and including January 1, 1954.

CURRENT YEAR'S PROSPECTS

The results for the first five months from November 1, 1952, to March 31, 1953 (excluding, of course, the Williamstown Shipping Company and Amalgamated Limestone Corporation), have been disappointing when compared with the very satisfactory results achieved during the corresponding months in the year 1951-52, due mainly to the fact that in addition to exceptionally unfavourable weather conditions, the Government failed to make available the additional road grants to local authorities, which have, in past years, been made available during the winter months.

Prospects for the remaining months of the company's year are encouraging and, even if the seasonal falling off were not wholly made good within the financial year, the effect on retainable profits could only be insignificant, as there will inevitably again be a substantial liability for excess profits levy.

Your directors are satisfied that a dividend at a rate of not less than 10 per cent and a capital dividend of not less than 1 per cent can be maintained on the ordinary capital as proposed to be increased, barring, of course, the occurrence of any unforeseeable major calamity.

Roads have for years been the Cinderella of the spending departments of the Government. That situation cannot persist indefinitely and every year that passes brings increased expenditure inevitably nearer. If expenditure on rearmament were to be curtailed, the claims of an extended road programme, in the interests of time and money saving as well as of safety, could hardly be ignored by any responsible administration.

As usual, we have had throughout the year under review the loyal and helpful service of the staff of the company in all its ramifications and undertakings. For their assistance, we tender to them, not only on your behalf but for ourselves as well, our most sincere thanks.

The report and accounts were adopted and a total dividend of 10 per cent and a capital dividend of 1 per cent was approved.

BRITISH ROPES, LIMITED

RECORD SALES

The thirty-first annual general meeting of British Ropes, Limited, was held on May 27th in London.

Mr Herbert Smith, the chairman, in the course of his speech, said: The trading profit of the group before taking into account exceptional items is approximately £500,000 less at £1,868,000 than the £2,365,000 recorded for the previous year, despite an increased turnover. After taking into account the exceptional items the group profit at £1,399,000 is down considerably when compared with the £2,592,000 recorded in the previous year.

The net dividends paid and proposed to be paid are at the same rates as for 1951, but following the bonus issue of ordinary shares last year the amount required to meet the net dividend on the ordinary stock is £206,000, compared with £149,000 in the previous year. The net distribution is £206,558, which is almost identical with last year.

During the year 1952 the value of our total sales reached a record figure, and we recovered in our wire and wire rope sections from the shortage of steel wire which curtailed our activities in 1951. In the aggregate our export sales recovered to some extent from the low level of 1951, mainly on account of the improved supplies of steel during the latter part of the year. The aggregate value rose very considerably. Competition has now become very much more intense.

Wire, wire ropes and cordage are essential to the prosperity of this country either in peace or in war, and we can be quite certain that if trade generally is good then we shall be busy.

The report was adopted.

P. & O. STEAM NAVIGATION COMPANY

RECORD RESULTS

The 113th annual general meeting of this company was held on May 27th in London, Sir William Crawford Currie, GBE, the chairman, presiding.

After paying tribute to the late Lord Cromer and referring to the election of Sir John Hathorn Hall to the board the chairman, in the course of his speech said: Contrary to the view I ventured to express in this room last year, the results for the year to September 30, 1952, have exceeded those of the previous year, which, in their turn, had exceeded those of any year since we began to publish group accounts. Our thanks for this result are due to certain of our subsidiary companies, in the main those engaged either in the tramp trades or in trades closely affected by the tramp market. As is well known, a steady demand for tramp tonnage sprang up soon after the outbreak of the war in Korea and continued unabated until the beginning of 1952. The resultant high rates of freight and the high time-charter rates obtainable by tramp ships sustained their level of profits for longer than had been expected.

In a recent Press commentary on shipping results the name of the P. & O. and its favourable experience was linked with passenger lines, and it was suggested that the fall in freight rates had had no significant consequences. It is important that stockholders and the public at large should clearly understand that the results shown in our accounts are not those of a passenger ship company, nor indeed those of the P. & O. Company itself. They are the combined result of a great variety of trades and of tonnage which ranges from a small coaster to a large passenger ship.

REPLACEMENT COST

The cost of new tonnage gives your board and the boards of our allied companies the greatest anxiety. It is traditional that the shipping companies of this country should be built up by ploughing back profits in good years so that they may be able to weather the storms of the lean years. This policy the group so far has been able to follow, despite the war and the restrictions that accompanied it, and seven years of crippling taxation never before experienced in times of peace. This has only been achieved by a conservative dividend policy and by setting aside cash for the replacement of ships.

The size of the problem which faces us and how we are meeting it can be judged from the figures of the past four years. Out of operating profits of £70 million no less than £47 million has been set aside for renewing the fleets and £2 million for improving staff pension funds, all of which and more has actually been spent. Of the £21 million net profit remaining, £17 million has been absorbed in taxation at home and abroad and £4 million has been paid out as dividends to stockholders of the parent and subsidiary companies.

One hesitates to say very much more than has been said already about taxation, but I must confess to a feeling of alarm about the taxation burden in the years to come when, through the operation of initial allowances which we are receiving now, there will be no annual wear and tear allowances on ships which will still have one-third of their useful lives to run. The report of the Royal Commission on Taxation is anxiously awaited by the business community and by none more than the shipping industry.

The report was adopted.

SCHWEPPES, LIMITED

INCREASED SALES AND PROFITS

The fifty-sixth annual general meeting of Schweppes, Limited, was held on May 28th in London, The Hon R. Hanning Philipps, MBE (the chairman), presiding.

The following is an extract from his circulated statement:

For the first time in the history of your company, the consolidated profit on trading has passed the £1 million mark. In the Home and Ships Stores Trades the combined value of sales of Schweppes, Kia-Ora and Quinnette products has shown an increase of 21.7 per cent over 1951. This has been achieved with practically no increase in our selling prices since 1948. Our export trade, including sales under franchise arrangements, has shown an increase in value of 20 per cent.

In view of these satisfactory results, and after transferring £118,114 to general reserve, the board have thought it only reasonable to raise the dividend from 15 per cent to 16 per cent.

In South Africa, sales of Schweppes' products have again been a record and we would like to congratulate our South African board on their excellent results. During the year the new Durban factory started production and we are confident that it will in due course earn good profits.

In Australia our trading experience has been somewhat mixed. In Sydney and Adelaide sales have remained poor as a result of the economic factors mentioned in my report a year ago.

In Melbourne, however, partly as a result of the temporary weakening of competition, we have done exceptionally good business; and the advantage gained has so far been well maintained.

FRANCHISE ARRANGEMENTS WITH PEPSI-COLA COMPANY

In the autumn of last year we entered into negotiations with the Pepsi-Cola Company of America, for two franchise arrangements. Under the first one the Pepsi-Cola Company will be responsible for the bottling and selling of Schweppes' products in the United States and Canada. The instrument for carrying out the American agreement is a new company which has been formed under the name Schweppes (USA), Limited, a wholly owned subsidiary of Schweppes (Overseas), Limited. This new company has now completed its plans for Pepsi-Cola to commence bottling Schweppes' Tonic in New York in May.

Under the second one it is proposed that Schweppes shall be responsible for the bottling and sale of Pepsi-Cola in specified areas in England, beginning with London and the South. With the end of sugar rationing in sight, we hope shortly to complete these negotiations with the Pepsi-Cola Company, after which a new company will be formed to provide the entirely separate organisation that will be necessary, to bottle, sell and distribute this product.

In order to be in a position to exploit these two projects your board have come to the conclusion that fresh capital will be needed. Permission has been obtained in principle to the raising of this capital and we are accordingly applying to the Capital Issues Committee to make a rights issue of £250,000 nominal capital in ordinary shares.

As regards the progress of our business during the current year, I can only tell you that sales in the first quarter of 1953 showed a consistent increase over the same period in 1952, and subject to world conditions remaining stable, there is every reason to hope for another successful trading year.

The report was adopted.

G. & J. WEIR, LIMITED

SATISFACTORY PROGRESS

The fifty-ninth annual general meeting of G. & J. Weir, Limited, will be held on June 23rd at Glasgow.

The following are extracts from the statement by the chairman, The Rt. Hon. Viscount Weir of Eastwood, GCB, LLD on the accounts for 1952:

It is a pleasure to report once again another year of satisfactory progress with new and encouraging levels of achievement.

The trading balance brought into the Group consolidated profit and loss account, together with other credits, has risen by £260,614 to £1,683,061, and after making provision for all charges, the net surplus has risen by £75,905 to £570,398. The interim dividend for 1952 of 5 per cent less tax on the company's new capital was paid on November 26, 1952, and it is now recommended that the final dividend to be paid on July 24, 1953, should be 12 per cent less tax.

Last year I made it clear that so long as the penal rate of taxation persisted, the finance we required could no longer be provided out of net earnings and that our policy would be to secure this finance from increased bank borrowing powers. This course has been followed, and the result is reflected in the higher bank loan and overdraft of £980,725. The severity in growth of taxation, its relation to our output and to our net dividend distribution is again shown in the following progress table:

Year	Index of value of group's output	Total taxation £	Net Dividends paid £
1946	100	256,559=100	148,009=100
1947	129	329,787=129	148,009=100
1948	143	483,226=188	148,009=100
1949	160	605,922=236	148,009=100
1950	197	621,626=242	166,510=112
1951	242	763,507=298	158,942=107
1952	308	873,471=340	180,134=122

It is now seven years since the company became a public one, and its progress is reflected in the index output value shown on the progress table. In 1946 the index group output was 100; it has risen to 308 in 1952, and we have every faith in achieving in 1953 a still greater rate of increase. Justification for expansion, particularly in the engineering division of our activities, is based not only on the ever-growing magnitude of our order book but also on the nature and composition of these orders in terms of national importance.

SURVEY OF PERFORMANCE

Once again the output achievement at Cathcart is a record in value in both the domestic and export fields. During the year we secured two exceptionally large contracts for evaporating and distilling plant, both of dollar saving character.

Drysdale and Company, Limited, had a new record year in 1952 inasmuch as the order book and the output figures were the highest in their history, including the war years.

On balance we have to congratulate ourselves on a very strong export order book, appreciably increased over that of the previous year.

The output of houses from Weir Housing Corporation, Limited, continues to increase. The target of 4,000 houses of brick or concrete construction was reached in 1952, thus providing a record year.

We start 1953 in a definitely better situation in regard to material supplies; we have fewer fixed price contracts to fulfil and our manufacturing facilities are steadily increasing.

BRITISH INSULATED CALLENDER'S CABLES

TURNOVER OF £85 MILLION

The eighth annual general meeting of British Insulated Callender's Cables, Limited, will be held on June 18th in London.

The following is an extract from the circulated statement of the chairman, Sir Alexander Roger, KCIE:

During 1952 the parent company enjoyed the benefits of a full order book, enabling us as materials became more freely available to plan production on the most efficient basis and to achieve record figures both in the volume and value of our turnover. Profit on trading increased by £1,435,183.

Of this improvement, after allowing for decrease in receipts from investments, 63 per cent is absorbed by taxation, the total requirements of which amount to the enormous figure of £3,368,492.

Out of the profit left available after taxation, we propose to transfer £500,000 to contingencies reserve and £1 million to reserve for replacement of fixed assets; to bring the total distribution on the ordinary capital for 1952 up to 10 per cent less income tax; and to add the £178,030 left unappropriated to the balance carried forward to 1953.

From an output point of view the experience of practically all members of the BICC group has been similar to that of the parent company and many substantial increases have been achieved.

Since the end of the war up to December 31, 1952, the BICC group have had to provide some £23 million in their accounts for taxation. Favourable trading conditions, a conservative dividend policy, and, I think we can claim, good management and personnel, have enabled us, one might almost say in spite of taxation, to build up reserves. But think what could have been done in still further increasing our efficiency and strengthening our world-wide position had even one-third of our taxation requirements been left with us. Think, too, of the possibly delayed effect of those crippling taxation payments as we face the much more difficult trading conditions which now lie ahead.

The world-wide turnover of the BICC group for 1952 (admittedly a period of high copper prices and great activity) was some £85 million.

It is impressive that this has been achieved notwithstanding the continuance of import and currency restrictions in many of our main markets and in face of growing international competition.

THE OUTLOOK

Some months ago there was a noticeable change from a sellers' to a buyers' market and competition, especially in overseas markets, is now particularly keen. This, with the general shortage of finance, very marked in certain overseas countries, and almost everywhere a varying lack of confidence in the immediate future, has resulted in a substantial falling off in the rate of intake of new orders.

Conditions during 1953 are not likely to be as good as in the record year of 1952, which, in retrospect, was undoubtedly a year of very favourable trading. But over any reasonable period the demand for our products must continue. We have a wide base both in the variety of our products and in the world-wide spread of our activities. We are constantly improving the efficiency of our plant and machinery. And, above all, we have in the BICC group an organisation and a body of loyal and competent men and women who will, I am confident, be equal to the problems which may confront us.

DAVIS AND TIMMINS

POSITION OF FINANCIAL STRENGTH

The fifty-fourth annual general meeting of Davis and Timmins, Limited, was held on May 26th in London, Mr F. Le Neve Foster (chairman and managing director) presiding.

The chairman, in the course of his speech, said: The group trading profit is £332,594, as compared with £308,521 for last year, while the net profit, after a larger allowance for depreciation and provision for taxation and directors' emoluments, amounts to £97,912, compared with £115,928.

The directors recommend a final dividend of 15 per cent and a cash bonus of 5 per cent on the enlarged ordinary share capital, resulting from the bonus issue made during the year, making with the interim dividend of 5 per cent already paid on the smaller capital a total distribution of 24⅄ per cent on the present issued ordinary capital. The appropriations for dividends and other items leave the sum of £151,884 to be carried forward, as against £145,181.

Turning to the consolidated balance sheet, it will be seen that the company is in a strong financial position. Notwithstanding the bonus issue, the consolidated balance sheet discloses capital and revenue reserves of £504,335 (including £136,776 for future income tax).

METAL SUPPLIES

Today there is no shortage of metal supplies and the price of brass has fallen by 36 per cent, 2s. 4d. per lb in May last year, 1s. 10⅄d. per lb at the end of last year, and today 1s. 5⅄d. per lb.

Our stocks of and forward commitments for metal can be regarded as being "clean" at the end of the year, and were at a lower level than might reasonably have been expected. We are pursuing a policy of caution to meet a continuing fall in prices.

We have taken steps to strengthen our sales organisation by the addition of more representatives in the field and by ensuring prompt and keen attention to inquiries and quotations. At the same time we are investigating new markets and our technical staff are redesigning for the benefit of our customers many of our standard products to enable us to meet competition.

We have devoted particular attention to our stock sales department, which covers a large proportion of our total turnover. This department is a stabilising influence in our business and we are making every effort to ensure that it gives the service on which its success must depend. For the first time since the war we now have adequate finished stocks on which to base this service and I am pleased to report that our prewar twenty-four hours' delivery service ex-stock is once more operating successfully. Great emphasis is being given to this important aspect of our business and the first of a series of new price lists is now available.

During the latter part of 1952 there was a general slowing down of business in our trade following the fall in metal prices and, as mentioned in our report, highly competitive conditions developed. These have become accentuated during the current year.

Stringent steps have been taken to meet the need for lower operating costs, and it has been found possible to make economies in overhead expenditure and non-productive labour without impairing efficiency. Other measures are also in hand which should, when trade improves, place us in a favourable position for the future.

The report was adopted.

THE GROOTVLEI PROPRIETARY MINES, LIMITED

MR P. M. ANDERSON'S SPEECH

Mr P. M. Anderson, the chairman of the company, in addressing stockholders at the annual general meeting held at Johannesburg on May 19, 1953, said that the fall in the working profit for the year of almost half a million pounds was due to three major factors of approximately equal incidence, namely, the average price received for gold was lower; the yield of ore milled decreased; and working costs were higher. Under normal conditions these three factors could have been offset to a large extent by the milling of more ore. This was not possible, however, due to the shortage of native labour.

He stated that the average price received for the whole output of gold was 255s. per oz fine, or 5s. 6d. less than in 1951.

The tonnage milled at 2,316,000 tons was a little below the record figure achieved in 1951 and thus was still below the mill capacity. The average yield at 4.33 dwt was lower by 0.12 dwt in keeping with the lower average value of the ore reserves. The working revenue at £6,411,481 was £381,539, or 2s. 9d. per ton milled lower than in 1951.

There was a further increase in working costs of £114,667, or 1s. 2d. per ton milled, so that the working profit fell by £496,206 to £3,375,694.

Provision for taxation amounted to £1,759,448 and the net profit was £197,373 lower at £1,621,425. Two dividends totalling 2s. 6d. per unit of stock were declared, absorbing £1,429,852. The balance unappropriated was £663,210.

As the ore reserves of the mine were well ahead of requirements and the main haulage system was nearing completion, it had been possible to curtain development footage by 8,182 ft to 49,845 ft. 37,450 ft were sampled and 18,590 ft, or 50 per cent, proved payable, averaging 15.1 dwt over 14 in.

The recalculated ore reserve increased by 500,000 tons to 16 million tons, averaging 4.6 dwt over an estimated stoping width of 47.5 in. The value and the width were lower by 0.1 dwt and 0.5 in respectively.

During the first quarter of 1953 the ore milled was 545,000 tons and the working profit £698,530. In addition, revenue from premium gold sales amounted to £36,268. Development footage totalled 10,378 ft and of the 8,200 ft sampled 3,640 ft, or 44 per cent, proved payable, averaging 13.9 dwt over 13 in.

A member asked whether the three reasons given by the chairman in his report were the only reasons for the fall in working profit. He also inquired why the Gold Producers' Committee did not take steps to sell the entire industry's gold output on the open market as was done in other parts of the world.

The chairman in reply stated that he was not aware of any reasons, other than those given in his report, for the fall in working profit. As far as the sale of gold for artistic and industrial purposes was concerned, this was entirely a matter for the Treasury. The Minister of Finance, who had been instrumental in arranging the sales at enhanced prices, had set a limit of 40 per cent of the industry's output, and accordingly the matter was out of the hands of the industry.

The report and accounts were adopted and the retiring directors, Messrs C. B. Anderson and J. Boyd were re-elected. The special resolution amending the Articles of Association in regard to the length of notice of meetings was passed unanimously.

MARIEVALE CONSOLIDATED MINES, LIMITED

MR P. M. ANDERSON'S SPEECH

Mr P. M. Anderson, the chairman of the company, in addressing members at the annual general meeting held at Johannesburg on May 20, 1953, said that the average price received for the output of gold during 1952 was 255s. 4d. per ounce fine, or 5s. 1d. less than in 1951.

Due to the shortage of native labour the tonnage milled decreased by 6,000 tons to 723,000 tons. As the yield was a fraction higher the output increased slightly to 181,249 ounces. The working revenue declined by £44,767 to £2,320,212, due to the lower average price received for gold. Working costs rose by £16,439, or 9d. per ton milled, so that the working profit decreased by £61,206 to £947,849.

Provision for taxation absorbed £430,302 and the net profit was £506,819. Two dividends, totalling 1s. 8d. per share, were declared, and absorbed £375,000. Provision for capital expenditure was £115,838, and the carry forward was increased slightly to £469,234.

The development footage driven totalled 32,475 feet. Of the 22,522 feet on the Main Reef Horizon 13,915 feet were on reef and sampling disclosed 6,330 feet, or 45 per cent, payable averaging 19.8 dwt over 16 inches. 9,953 feet were driven on the Kimberley Reef Horizon and 6,075 feet were on reef and sampled, disclosing 1,290 feet, or 21 per cent, payable, averaging 12.4 dwt over 18 inches. On the same reef horizon the No. 6 Level East Drive from No. 5 Shaft was advanced a further 2,915 feet inside the farm Bloemendal No. 19, but no values of consequence were encountered and the drive was stopped. In view of the values near the eastern boundary the company had decided to purchase the precious metal rights over a strip of ground measuring 157 morgen on Bloemendal adjoining the north-east boundary of the company's property.

The ore reserve recalculated as at December 31, 1952, increased by 300,000 tons to 3,500,000 tons averaging 5.5 dwt over an estimated stoping width of 46 inches, the value and width remaining unchanged.

A new rod mill and ancillary equipment, which are expected to increase the capacity of the reduction plant by about 9,000 tons a month, were installed and ready for use by the end of 1952.

During the first quarter of 1953 the ore milled was 178,000 tons and the working profit £195,429. In addition £11,700 accrued to the company from premium gold sales. 4,429 feet were driven on Main Reef of which 2,745 feet were on reef and sampled and 1,660 feet, or 60 per cent, was payable, averaging 22.6 dwt over 14 inches. On the Kimberley Reef Horizon 3,231 feet were driven and of the 2,000 feet on reef and sampled, 620 feet, or 31 per cent, was payable, averaging 14.9 dwt over 13 inches.

The chairman referred with regret to the deaths of Mr R. Bowman in July, 1952, and of Sir Robert Kotze in March this year.

In reply to a question by a member, the chairman stated that there was no immediate prospect of uranium production.

The report and accounts were adopted, and the appointment to the board of Maj. Gen. F. H. Theron, CB, CBE, was confirmed. The retiring directors, Messrs M. W. Richards, G. V R. Richdale and T. P. Stratten, were re-elected. As the necessary representation of capital to pass the special resolution amending the articles of association of the company was not present, the meeting was adjourned until May 27, 1953, at 11.15 a.m.

ST HELENA GOLD MINES, LIMITED

MR P. M. ANDERSON'S SPEECH

Mr P. M. Anderson, the chairman of the company, in addressing members at the annual general meeting held at Johannesburg on May 19, 1953, said that the tonnage milled in 1952, the first full year of production, amounted to 598,000 tons with an average yield of 3.96 dwt per ton. The working revenue, which included a premium of £36,993 received in respect of sales of gold for artistic and industrial purposes, amounted to £1,513,929, or 50s. 8d. per ton milled. Working costs amounted to 46s. 6d. per ton milled, or a total of £1,390,642, so that the working profit for the year was £123,287.

He stated that the net profit was £129,581. From this profit £48,150 was appropriated to cover loan account expenses, £35,640 to write off the debit balance brought forward, and after making provision for the other items specified in the appropriation account, a balance of £8,359 was carried forward.

Expenditure of capital funds during the year totalled £673,900, which included £267,613 in respect of development footage in excess of that charged to working costs. While it was still necessary, in order to strengthen the ore reserve position, to carry out a substantial amount of development and to charge a portion of the cost to capital account, it was anticipated that total capital expenditure during the current year would be well below the 1952 figure.

The development footage driven during 1952 was substantially higher at 65,604 feet. Of the 33,520 feet on Basal Reef and sampled, 14,485 feet, or 43 per cent, proved payable with an average value of 14.1 dwt over 22 inches, equivalent to 311 inch dwt. Although the value was somewhat lower, the greater development footage on reef, combined with the higher percentage payability, resulted in the payable footage being trebled as compared with 1951.

The ore reserve recalculated as at December 31, 1952, was 1,250,000 tons, or double the amount at the end of 1951, and averaged 5.3 dwt over an estimated stoping width of 50 inches, the value being 0.6 dwt lower and the width 2 inches more than at the end of the previous year.

During the first quarter of 1953 the scale of milling operations continued to increase. The ore milled totalled 181,000 tons and the working profit was £49,769, to which must be added £10,702 from premium gold sales; 16,099 feet were driven on Basal Reef, of which 7,015 feet were on reef and sampled, disclosing 2,870 feet, or 41 per cent, payable averaging 10.3 dwt over 27 inches, equivalent to 277 inch dwt.

In concluding, Mr Anderson said that, while the stope face position had shown progressive improvement resulting in a regular stepping up of tonnage milled, working results had been adversely affected by a number of factors. The chief of these were insufficient supply of labour, increases in the cost structure, continued need to carry out extensive cementation work to seal off water-bearing fissures, and a shortage of electric power. In the light of these difficulties, the gradual but steady improvement in the mine's position and in operating results was encouraging for the future.

The report and accounts were adopted, and the retiring directors, Messrs W. H. A. Lawrence, T. P. Stratten and J. S. Walker, were re-elected.

VAN DYK CONSOLIDATED MINES, LIMITED

MR P. M. ANDERSON'S SPEECH

Mr P. M. Anderson, the chairman of the company, in addressing the members at the annual general meeting held in Johannesburg on May 20, 1953, stated that the average price received by the company for the output of gold during the year under review was 255s. 3d. per ounce fine, or 5s. 7d. less than in 1951.

He stated that the tonnage milled increased by 42,000 tons to 1,246,000 tons, so that while the yield at 2.95 dwt was 0.07 dwt per ton lower, the total output increased slightly to 183,649 ounces fine. As a result of the lower price received for gold, however, the working revenue decreased by £26,544 to £2,349,650. Working costs rose by £47,396 to £2,160,904. The working profit for the year thus amounted to £188,746. Capital expenditure which was largely in connection with work in the No. 5 Shaft area absorbed £68,835, which was substantially less than in 1951. After providing for the other items mentioned in the appropriation account, the carry forward was increased by £90,808 to £162,268.

Development footage decreased slightly to 50,004 feet, of which 28,435 feet were on reef and sampled, disclosing 10,230 feet, or 36 per cent, payable averaging 9.9 dwt over 23 inches, equivalent to 228 inch-dwt.

Of the total footage advanced, development from No. 5 Shaft accounted for rather more than half at 27,973 feet, 11,170 feet being on reef and sampled. 4,345 feet or 39 per cent proved payable, averaging 10.2 dwt over 24 inches or 244 inch-dwt.

The ore reserves decreased by 200,000 tons to 1,500,000 tons, averaging 3.5 dwt over 41 inches, the value being 0.1 dwt lower and the width 1 inch more than in 1951.

The inadequate and reducing ore reserves resulted during 1952 in the mining of an increasing proportion of marginal ore not included in the reserves, thus adversely affecting the yield. Owing to the shortage of native labour, which had become accentuated during 1953, it had not been possible to maintain the mill tonnage and the mining of some lower grade ore had been discontinued. The result was an increase in the yield of about a quarter of a pennyweight, but unfortunately this had been more than offset by a rise in working costs. Hence the ore milled during the first quarter of 1953 decreased to 274,000 tons and the working profit was only £17,414. In addition £12,246 accrued to the company from sales of gold at a premium.

DEVELOPMENT WORK

In the No. 5 Shaft area, up to the end of March 1953, development work had totalled just over 56,000 feet, much of which had been off reef due to the faulting and folding of the formation and the need to carry twin headings for ventilation purposes. Of the 18,170 feet on reef and sampled 5,830 feet or 32 per cent had proved payable, averaging 10.6 dwt over 22 inches, equivalent to 234 inch-dwt. The work done to date was small in relation to the area to be explored and so far the values had been sporadic with little in the way of continuous payable stretches.

Expressed in another form, the position in the No. 5 Shaft Area, on which the future of the mine depends, was that reef exposures occurred in two areas—the one in the syncline at No. 5 Shaft, dipping South and East; the other 6,000 feet to the West near Borehole V.S.6, and dipping to the West. In the former area, 9,990 feet had been sampled, of which 31 per cent was estimated to be payable, averaging 7.8 dwt over 25 inches, or 196 inch-dwt. In the West Area 7,220 feet had been sampled, of which 36 per cent was payable, averaging 16.0 dwt over 18 inches, equivalent to 288 inch-dwt. To illustrate further the erratic distribution of the values, scattered throughout the area near the borehole about 4 per cent of the samples were over 750 inch-dwt in value, as compared with the 769 inch-dwt disclosed in the borehole.

Exploration work done so far had been confined to the 48th Level Horizon, and before stoping could be undertaken connections would have to be made with the 44th Level. A crosscut from the shaft on this level had recently picked up the Reef in the syncline area and was being continued to intersect the reef about 5,000 feet to the West in the borehole area where it was hoped to make the connection with 48th Level about the end of 1953. Stoping on a small scale might therefore be possible in about a year's time but until more was known about the faulting and folding of the reef and the distribution of the gold values it was not possible to forecast to what extent No. 5 Shaft could contribute to the replacement of low grade ore coming from the upper mine.

In summary, owing to the slender ore reserve and the inadequate native labour supply, the mine was passing through a difficult time. There were now only 3,300 natives at work underground compared with 5,800 in the peak year of 1942.

The report and accounts were adopted and the retiring directors, Messrs C. B. Anderson and J. S. Walker, were re-elected.

GEDULD PROPRIETARY MINES, LIMITED

MR P. M. ANDERSON'S SPEECH

Mr P. M. Anderson, the chairman of the company, in addressing members at the annual general meeting held at Johannesburg on May 19, 1953, stated that the average price received by the company for the output of gold during the year under review was 255s. 1d. per ounce fine, or 5s. 8d. less than in 1951.

He stated that the ore milled at 1,253,000 tons and the average yield at 2.90 dwt per ton showed small decreases compared with the previous year. As a consequence of this and the lower price received for gold, the working revenue at £2,332,506 was lower by £79,777, or 1s. 1d. per ton milled. Working costs increased by 1s. 11d. per ton milled and absorbed £1,863,773, so that the working profit at £468,733 was £189,663 less than in 1951.

Income from investments, principally from the company's holdings in East Geduld Mines and in Grootvlei Proprietary Mines, amounted to £726,005, or £46,828 less than in 1951.

Provision for taxation absorbed £126,253 and the net profit was £1,054,735. Two dividends totalling £913,036, or 12s. 6d. per share, being a decrease of 2s. 3d. per share, were declared. Capital expenditure absorbed £123,617, and the balance carried forward was £376,948.

Development footage on Black Reef totalled 17,542 feet, and of the 11,390 feet on reef and sampled, 2,450 feet, or 22 per cent, was payable, averaging 3.5 dwt over 62 inches.

The ore reserve recalculated as at December 31, 1952, showed a decrease of 400,000 tons to 3,100,000 tons. The value remained unchanged at 3.40 dwt, whilst the estimated stoping width at 52 inches was 1 inch more.

During the first quarter of 1953 the ore milled amounted to 293,000 tons and the working profit was £97,481. Additional income from premium gold sales amounted to £14,380. Development work on Black Reef totalled 3,603 feet, of which 3,290 feet were on reef and sampled, disclosing 820 feet, or 25 per cent, payable, averaging 2.6 dwt over 77 inches.

The chairman referred with deep regret to the recent death of Sir Robert Kotze, who had been a director of the company since 1927.

The report and accounts were adopted, and the retiring directors, Messrs T. P. Stratten and J. S. Walker, were re-elected. As the necessary representation of capital to pass the special resolution amending the articles of association of the company was not present, the meeting was adjourned until May 26, 1953, at 11.15 a.m.

EAST GEDULD MINES, LIMITED

MR P. M. ANDERSON'S SPEECH

Mr P. M. Anderson, the chairman of the company, in addressing members at the annual general meeting held at Johannesburg on May 19, 1953, said that the average price received by the company for the whole output of gold during the year under review was 255s. per oz fine, or 5s. 8d. less than in 1951.

He stated that the tonnage milled in 1952 at 1,725,000 tons was slightly less than in 1951 owing to the shortage of native labour, and as the yield was unchanged at 6 dwt per ton the output at 517,544 oz showed a small decrease. As a result of this and the lower price received for gold, the working revenue at £6,616,635 was lower by £194,494 than in 1951. Working costs rose by 1s. 9d. per ton milled and absorbed £2,342,282, so that the working profit at £4,274,353 was £329,760 less than in 1951.

Provision for taxation amounted to £2,313,720, and after taking into account income from investments amounting to £71,068, and the other items detailed in the profit and loss account, the net profit was £2,029,231. Dividends totalling £1,837,500, or 4s. 1d. per unit of stock, were declared, being 3d. per unit less than in 1951. Capital expenditure absorbed £140,381 and the carry forward was £573,494.

The total development footage driven at 14,674 feet was 1,352 feet more than in 1951. On the Main Reef Horizon 11,526 feet were accomplished, of which 7,535 feet were on reef and sampled, disclosing 3,780 feet or 50 per cent, payable with an average value of 8 dwt over 23 in. 3,148 feet were accomplished on the Kimberley Reef Horizon, but of the 2,675, feet on reef and sampled only 175 feet proved payable.

The recalculated ore reserve decreased by 400,000 tons to 12 million tons, the value and estimated stoping width remaining unchanged at 5.7 dwt and 51 inches respectively.

During the first quarter of 1953 the ore milled amounted to 400,000 tons and the working profit was £888,321. Premium gold sales brought in an additional £33,531. Development work on Main Reef totalled 1,463 feet of which 790 feet were sampled disclosing 480 feet, or 61 per cent, payable averaging 8.2 dwt over 28 inches. Of the 1,095 feet accomplished on the Kimberley Reefs, 790 feet were sampled disclosing 130 feet, or 16 per cent, payable averaging 4 dwt over 43 inches.

The chairman referred with deep regret to the recent death of Sir Robert Kotze, who had been a director of the company for twenty-six years.

The report and accounts were adopted and the retiring directors, Messrs P. M. Anderson and J. S. Walker, were re-elected. The special resolution amending the Articles of Association in regard to the length of notice of meetings was passed unanimously.

H.P. SAUCE LIMITED

RECORD TURNOVER

The twenty-eighth annual general meeting of H.P. Sauce, Limited, was held on Wednesday, May 27, 1953, at the Queen's Hotel, Birmingham; Sir Patrick Hannon, the chairman, presided, and in the course of his speech, said: "I am proud to report that the popularity of our products is such that notwithstanding intensified competition, accompanied at the same time by some measure of business recession, the turnover of both the parent company and the group reached record totals.

In contrast with proximate preceding years, 1952 was marked by a full return to competitive conditions, both at home and abroad, occasioned largely by the greater availability of a larger variety of consumer goods and more discriminate purchasing. Operative costs fluctuated during the year within moderate limits, but the net increase was borne without occasioning any increase in selling prices, so that in common with the recent experience of most companies in most industries, the percentage of profit margin showed a small decrease.

The net effect may be judged from an examination of the consolidated profit and loss account, which shows an increase in the trading profit before taxation of £6,225. The actual figures are: in 1951, £992,205; and in 1952, £998,430. An outstanding feature of the consolidated profit and loss account is the charge of £652,626 for United Kingdom, Dominion and foreign taxation, compared with £632,022 for 1951. This represents over 65% of the gross trading profit, the increase of £20,000 being mainly due to the imposition of excess profits levy, to which I called attention in my speech to stockholders last year. The accounts under review do not give effect to the announced taxation remission, which will amount to approximately £16,000, but in my formal submission to stockholders, I shall ask you to approve the payment of the final dividend after deduction of 9s. in the £, which will have the effect of increasing the net dividend to stockholders by £6,500, and increasing retained profits by the balance of £9,500.

The burden of taxation which the H.P. Sauce group has had to carry is wholly responsible for the reduction in net profit as represented in our accounts. The net profit figure for 1951 was £252,908, and £236,980 in 1952. I submit, therefore, with full confidence, that apart from the provision for tax, the result of the year will be regarded with satisfaction.

All the subsidiary companies show increased turnover with the exception of the Albion Bottle Company Limited, which in common with all glass container manufacturers, has experienced a recession in demand, with the result that a reduction in profits compared with the exceptional figures of the preceding year has been recorded.

The world-wide reputation of Lea and Perrins Limited has been fully upheld by the increased turnover and profits last year.

Lea and Perrins Inc. has maintained in the United States the full measure of our long-established prestige and abiding quality. Turnover has been enlarged, but net profits, owing to heavy taxation in the USA, have been slightly lower.

Norfolk Canneries Limited has had a satisfactory year, the expectations entertained

when the company was acquired having been fully realised.

During the year we experienced a gratifying increase in the sales of Lea and Perrins and H.P. Sauce in Canada, where Messrs E. D. Smith and Sons continue to handle the manufacture and distribution with characteristic energy and enterprise.

I should like to call particular attention to the development of our export trade; notwithstanding restrictions of import licences and the difficulties of access to overseas markets, we show a new record for 1952.

The recommendations of the board to stockholders comprise the maintenance of the dividend on ordinary stock at the same rate as last year, and the retention of reserves of £49,912 in the parent company, and £47,590 in subsidiary companies.

The report and accounts were adopted and the retiring directors, Lt. Colonel C. F. D. Perrins and Sir Patrick Hannon, were re-elected.

ROCK INVESTMENT COMPANY, LIMITED

DIVIDENDS RESUMED

The thirty-fourth annual general meeting of this company was held on May 22nd in London, Mr C. W. Black, JP, MP, FRICS, FAI, the chairman, presiding.

The following is an extract from his circulated statement:

During 1952 further substantial progress has been made in rebuilding the fortunes of your company. The last distribution on the stock of the company was a dividend of 1 per cent less income tax in 1928, so that for twenty-five years the stockholders have been without a return from their investments. The re-establishment of our fortunes has been brought to such a state as to justify dividend recommendation. Therefore your directors recommend a resumption of dividends with a distribution of 2 per cent less income tax.

Various properties owned by investment companies in the group and other investments have been sold during the year.

The progressive relaxation in building restrictions which is taking place should prove much to our advantage. In certain of the companies now owned there are substantial shop sites which were acquired in or before 1939 and have remained undeveloped for about 14 years. As a result a considerable amount of capital has been locked up on which virtually no income has been received. These sites are ripe for immediate and profitable development, and we are now finding it easier to obtain building licences. We are already engaged in the erection of a parade of 15 shops and upper parts, nearly all of which are let on long leases at satisfactory rents. We anticipate an early start in building upon the other sites.

The report was adopted.

UNIVERSITY COLLEGE OF HULL

RESEARCH STUDENTSHIPS

The College proposes to award a Post-Graduate Studentship in the Faculty of Arts for full-time research in Arts, Commerce, Economics or Law. The value of the award is £250 for one academic year, renewable for a second year. Further particulars may be obtained from the Registrar, to whom applications in triplicate should be sent not later than June 10, 1953. C. MEGGITT, Registrar.

UNIVERSITY COLLEGE OF SOUTH WALES AND MONMOUTHSHIRE

Applications are invited for TWO RESEARCH ASSISTANTSHIPS in the Department of INDUSTRIAL RELATIONS. The posts are open to Graduates who wish to study for a Higher Degree or to qualify as specialists in the teaching of Works Study and Industrial Relations, or both together. Candidates may be qualified in any branch of Social Science or of Natural Science and Technology relevant to their proposed field of study. Each post is for one year with the possibility of renewal for a further one or two years. Salary £450 per annum.

Six copies of application with the names and addresses of three referees should be sent to the undersigned not later than June 27, 1953.

E. R. EVANS, Registrar.

Cathays Park, Cardiff. May, 1953.

REQUIRED for important company dealing with general and technical publications, an assistant to the managing director. Applicants must have solid publishing background, first-class experience in both book and magazine publishing. Write, stating age, qualifications, experience and salary required, to Box 258. Applications will be treated with the strictest confidence.

GOOD FOOD AND WINES in dignified surroundings will be appreciated by your guests.—Restaurant FRASCATI, Oxford Street, London, W.1. MUS. 7414.

PLANT ENGINEER required for large, light electrical engineering factory in London area. Must be capable of taking charge of steam, bulk electricity, generation and main supplies and of organising all maintenance work with staff of approximately 125. Age: 30-40 years. Full membership of Institution of Mechanical or Electrical Engineers or equivalent qualification. Not less than five years' experience in responsible position. This is a senior post and will carry a four-figure salary, according to qualifications and experience.—Apply to Central Personnel Department, Philips Electrical Industries, Ltd., Century House, Shaftesbury Avenue, London, W.C.2.

THE Economists' Bookshop, 11-12, Clement's Inn Passage, London, W.C.2, invites you to submit lists of books on Economics, History, and Social Sciences, you may wish to sell (periodicals excluded).

INDIA HOUSE, Aldwych—an exhibition of Commerce and Industry and Tourism, May 28th to June 27th. Monday to Saturday 10 a.m.-6 p.m. Admission free.

NORTH-WESTERN POLYTECHNIC, PRINCE OF WALES ROAD, LONDON, N.W.5

Full-time courses: G.C.E. Advanced Level (for Inter. B.A. and B.Sc.(Econ) Prelim.). Business Executives (Inter. professional quals.). Secretarial.

Part-time courses: G.C.E. Advanced Level. Shorthand and Typewriting. Management, Commerce. Cost Accountancy.

Enquiries: Department of Commerce, Room G.16, GUL. 1154.

AN opportunity occurs for a large firm selling their own branded lines to the Hardware, Chemists and Grocery Trades to acquire, without capital outlay, the selling rights and goodwill of two famous nationally advertised household products. These enjoy a dominant position in their field and are sold everywhere. Annual sales exceed £200,000 and £150,000 has been invested in advertising. These lines are capable of considerable further expansion. Present owners wish to devote their time to the development of other projects and will maintain only a Royalty interest.

Interested firms must have a very strong direct selling organisation and promote other nationally advertised products. Replies, which will be treated in confidence, should be only from such firms.—Box 255.

ASHRIDGE.—Course 41, July 3rd-6th. The Standard of Living; how can it be maintained and raised. Lectures will include: The Changing Pattern of World Trade and Production, Neil Caplan, Esq.: Britain in the Changing World Pattern, Professor F. W. Paish, M.C.: Future Prospects, Roy Harrod, Esq. Inclusive Fee: £3 15s.—Applications to Secretary, Ashridge, Berkhamsted, Herts. Tel.: Little Gaddesden 3191.

YOUNG EXECUTIVE (35) requires responsible general management post with good potentiality. Qualified accountant, cost accountant, secretary, economist with extensive knowledge and experience of general industrial problems. Salary £1,500.—Box 256.

FOR SALE.—Keesings Contemporary Archives, 1946 to date. What offers?—Box 254.

Introducing
THE LONDON OMNIBUS

When Shillibeer's omnibus first clattered its way through the city streets in 1829 the citizens of London realised that here indeed was a public service worth knowing and using.

Likewise, the London Assurance offer the public another kind of useful service by journeying into print with selections from their own omnibus collection of insurance policies.

"Life" is what you make it

What kind of Life Assurance you need depends, of course, on you (not forgetting your dependants). Our booklet "How to be Well Assured" can help you to choose the policy that suits you best. Would you care to read it?

Aftermathematics

After a fire on business premises the reckoning must include not only material losses but also reduced earning power and trading profits. An ordinary Fire Policy *plus* our loss of Profits Policy sums up what is needed.

Injury and Innocence

However innocent of intent to injure a fellow-being, you may be held liable for heavy damages quite accidentally caused to someone's person or property. Our Personal Liability Policy provides indemnity up to £5,000 for any one accident—which is a lot of indemnity for 10/- a year.

and please remember . . .

If you would know more about any of the policies outlined here, if we can provide information about any other particular policies or about insurance problems generally—pray make what use of us you wish. Our address is 1, King William Street, Department S6, London, E.C.4.

Recessional

FOR a dazzling week, London has seemed to be the capital of the world. What other occasion than the crowning of a British monarch could bring together from the ends of the earth people of every race and every creed, of every colour and every culture—Gurkha soldiers, sheikhs from Trucial Oman, warriors from the Solomon Islands, Red Indian chiefs, African emirs, Sudanese tribesmen, all to mix with their feathers and turbans and robes and saris in the vast metropolitan crowds? Nor is the impression they have helped to make of London's universality simply a matter of physical presence. The Coronation has filled the imagination of all America and most of Europe. It is as though the Queen were not only a symbol of unity for her own peoples, but a wider symbol of community between free peoples everywhere. No trick of publicity could have created a world-wide explosion of absorbed interest if profound human emotions were not at work. Let London, then, accept its honour and enjoy its role. For a week, it has been the capital city of the free.

But now decorations, floodlights, bonfires and parades will soon be memories. And what will be left behind after the most glorious festival this century has seen? The question is not a frivolous one. London and indeed all Britain have received a tremendous psychological stimulus, but one that could work for evil as well as for good. To be the centre of the world's attention and to receive the homage of so many nations could give just the extra margin of pride, confidence and effort needed to set in motion the much-heralded but still awaited new Elizabethan age.

But equally, the preoccupation with a British occasion of so many millions could confirm the most dangerous trend in postwar Britain—the tendency to look inwards, to concentrate upon London's problems from a London point of view, to indulge in maladive self-attention, to sit brooding with introverted hypochondriac eye upon the disorder of the British body economic. If the magnificence of the Coronation serves only to increase Britain's instinctive turning in upon itself, if the sincerity of the world's interest is mistaken for a willingness to treat Britain as a permanent pensioner, then the new Elizabethan age will never dawn.

In the midst of the triumphs of these days, when prime ministers from the four corners of the earth ride in procession before their Queen and the rulers and flags and regiments of a score of Commonwealth countries join in the general homage, it is hard to remember what a testing time must lie ahead for these nations linked together by the headship of the Queen. The first phase of Empire has long since passed; given the desire to trade and the power to back the trader, that first phase of acquisition did not impose any too great strain. The second phase—the transformation from a centrally controlled empire to a commonwealth of independent states—is all but over; and where it still has stages to run, their goal is decisively set. This phase, too, given benevolent realism at the centre and vigour at the

circumference, has not in most places presented impossible tasks to statesmanship. But the third phase has opened—the phase in which, with links only of common interest and common sentiment, the infinitely variegated community of the Queen's peoples has to be held together over the years. The difficulties of this phase are really daunting, just as driving a coach and six needs infinitely more skill than hacking on a single horse. Nor, in this case, can the shafts and reins be made of anything heavier than spun silk. In this crowning but most arduous phase, the mood and skill of Britain will be decisive.

There is no other possible centre of co-ordination. No other conductor is conceivable to the great orchestra of independent realms and races. If the initiative for Commonwealth policies is not taken regularly in London, it can only come most fitfully from anywhere else. It follows that the first requirement is for this island realm itself to recover some of the imaginative vigour that has been missing in these recent years, to awake from what to many people has seemed to be a stupor of spiritual exhaustion. Unless there is a re-invigoration, a recapture of initiative here at home, at the centre, there cannot in any real sense be a Commonwealth of nations throughout the world associated with the British name.

But island vigour, though essential, is not by itself sufficient. If it implied an attempt to return towards domination of the Commonwealth from London, it would destroy more than it fostered. With initiative there must go a sensitive imagination. There is a world of difference between imaginative initiative and intervention. Imagination implies the capacity to see Commonwealth interests from a wider than a purely British angle, it implies a constant readiness to go out and consult with Commonwealth colleagues, it implies a steadiness of interest in their problems and a sustained effort to relate them to the general picture of the Commonwealth. In concrete terms, it implies that British politicians must not always expect their Commonwealth colleagues to come to London to discuss their problems. It implies conferences that are held not only in London but in other Commonwealth capitals; it implies regarding the office of Secretary of State for Commonwealth Relations as something more than a convenience of Westminster politics; it requires a radical reconsideration of the role of the civil service in Commonwealth relations. And since it cannot be expected that Westminster and Whitehall will adjust themselves to the needs of the Elizabethan Commonwealth without some movement in public opinion, the new phase that is opening requires greater interest by the people of this island in the world-wide community of which they are at present the surprisingly indifferent core. A people aware of their kinship with the associated realms will not grudge their Queen to them or stand in the way of those longer royal "progresses" through the Commonwealth and even those periods of royal residence in other dominions which will surely become the strongest link of Commonwealth sentiment in the years to come.

A Commonwealth always remarkable for its flexibility is now to be put to its most trying test. Of success or failure, only one certain thing can be said today. Achievement depends first of all upon a sloughing off of the recent mood of introspection and self-concern. There will be no imagination without interest, no generosity without the desire to know and learn. If the Coronation has stirred in British minds the sense of how wide is the community to which they belong, the first necessary movement of imagination may be very near. But if London's festivities have only anchored it more firmly in self-interest and self-absorption, then, however magnificent, however moving, this week's pageant of Commonwealth may be the last of its kind.

Temptations of Taftism

SENATOR TAFT, for all his sincerity and periodic good sense, is becoming the Mephistopheles of the Atlantic alliance. When he and his friends speak with such appalling frankness of how much better American policy would work if the United States could "go it alone," they raise echoes not only among their own people but in almost every nation of the free world. There are Taftites everywhere: French Taftites who believe in a strong France and an understanding with Russia, or resign themselves to a weak France and neutrality towards Russia; German Taftites who believe that Germans, left to themselves, could reunite their country and make their own terms with Moscow; Scandinavian Taftites who see security in a neutral bloc of their own; British Taftites who say—even if they do not entirely believe—that Britain in the Commonwealth can stand alone as a world power and snap its fingers at Congress and the dollar gap. They are, like butterflies, creatures of spring and summer; when the sun shines from Moscow they dart and hover gracefully in all directions, tempting the bored and the discontented to pursue them. When it is winter in Moscow they are forgotten.

The power of the Senator outside his own country lies in the lead that he can give to thinking that looks, on the surface, courageous and realistic but is in fact defeatist and sentimental. The United Nations, he said a week ago in Cincinnati, does not in fact prevent aggression. Such strength as the free world possessed was embodied in Nato, an old-fashioned military alliance which had the defect of involving American infantry in the defence of Europe. If negotiations for a truce in Korea failed, "then let England and our other allies know that we are withdrawing from all further peace negotiations in Korea." It was foolish of the Americans to attempt to fight the Russians or the Chinese on the continent; that kind of defence was a job for allies. Asians should fight Asians, Europeans should resist Europeans, and Americans should be content with their bombers, their carriers and their Marines. In each of these ideas there is something tempting—the temptation of a quick and easy way to national independence and security, the illusion that western governments could have freedom of choice to negotiate or arm or to do business independently of one another. It is a temptation that Stalin's successors, by a few deft gestures, have enhanced to the point where it seems to have attractions even for the British Prime Minister.

★

It is natural that the Republicans, impatient with the costly deadlock in Korea and impatient with the restraints and advice imposed on them by America's alliances, should attack the policies of their predecessors and the commitments they entered into. It is natural, too, that they should ask how long those Democratic policies must be maintained and to what final solution they lead. Yet, the fact that stands out in the present situation is that so much of what was done by Mr Marshall and Mr Acheson was right and successful. They planned to get strength from which to negotiate; they set up deterrents to aggression far more powerful than anything the United Nations could provide; they worked patiently, stubbornly and coolly to frustrate the main aim of Soviet policy which is, and always will be, to keep the free world divided.

It is forgotten now how dangerous that policy seemed at the time to so many people, who warned Mr Acheson that by proposing German rearmament, by bringing Turkey into Nato, by limiting east-west trade, he was merely provoking the Russians into attack. And it is also overlooked now that the gestures from Moscow that followed Stalin's death—actions which suggest a certain nervousness in the Kremlin, if not actual fear—are as much the effect of the western counter-offensive in the cold war as of events in the Soviet Union which we can only half understand. Is it merely coincidence that these gestures were made as power changed hands in Washington, as the moves towards west European integration approached their climax, as the full burden of rearmament by the West was revealing itself? And is it mere chance that Stalin, in the last months of his life, saw the Communist parties of western Europe in disarray, collective security against aggression working as it has never worked before, and the satellites of eastern Europe clearly suffering far more than the allies of western Europe from the restriction of trade in vital raw materials and capital equipment?

It is impossible to believe that Senator Taft and his friends do not understand or do not know these facts, or that they have forgotten the part played by their late colleague Senator Vandenberg in bringing them about. Likewise it is impossible to believe that men like General de Gaulle, the French Socialist leaders, the German neutralists and the men around Mr Aneurin Bevan are ignorant or stupid. It may be in their political interest to decry the successful Bevin-Acheson policies, but there is a limit beyond which they cannot fly in the face of the facts. If they find it pays to echo, each group in its own way, the temptations of Taftism, then it is because there are in each nation interests, motives, aspirations which have not yet accepted the closeness and permanence of the Atlantic alliance. The American isolationist has his counterpart in the French nationalist; the German nationalist has his counterpart on the back benches of the Conservative and Labour parties. All refuse to admit that the central problem of international politics has changed and that security—and prosperity, too—henceforth lies in the working of regional groups which demand from each national government some restraint on its freedom to do what it likes. The European who resents what he calls American domination is in very much the same mood as the American who resents what he calls the timidity and caution of his country's allies. He is attracted to nationalism because he finds the price of internationalism higher than he had bargained for; having accepted the protection of the Atlantic Community because he felt frightened, he wants to contract out of its obligations now that he feels less frightened.

★

In the past these crises of misunderstanding have been overcome—by the voice of reason in the United States, by frank argument in the House of Commons, by the sheer pertinacity of a Schuman or an Adenauer and, above all, by the stubborn unfriendliness of Stalin. Now it is less certain that these antidotes will work. The voice of reason has been slow to make itself heard in Washington; Sir Winston Churchill has taken up an attitude which suggests, even if it does not in fact mean, that he might, if the worst came to the worst, "go it alone"; M. Schuman is out of the arena and Dr Adenauer has done, for the moment, all that he can do. And in Moscow there is an obvious resolve to be conciliatory on those matters that might divide the allies, and to be stubborn on those matters in which they have clear common interests. The state of the alliance is critical and nothing that has happened in these last hopeful weeks should be allowed to obscure the fact.

Yet if one thing is certain, it is that this same alliance is and must be the sheet anchor of policy in every one of its members—and that everybody knows it. Even in the United States, where the absurdity of going it alone is not self-evident, the voice of reason has had no very great difficulty, at each reprise of the great debate, in deciding the issue in favour of the policy of co-operation. And if this is so in America, how infinitely much more so is it among the European members of the

alliance. Those who play with the notion of going it alone do so only in what they believe to be the security that they will not be called upon to do so. If Britain were ever left in reality to go it alone, everybody in the whole spectrum of politics, save only the pacifists and the Communists, would be desperately frightened. Nobody wants 1940 back again.

Is it not therefore time to insist that everybody should pay a small price in verbal currency for the immense, the incomparable boon that the alliance represents? This is not to suggest that anybody should suppress his genuine feelings, but that he should try to relate them to the main object of foreign policy, which is to maintain the alliance. Let there be no less bluntness in pointing out how others are endangering the alliance, but a little more thought on what we could do to sustain it. It is, for example, very easy to point out the stupidities, the blindness, the selfishness of Senator Taft's views—and let that by all means be done. But let there also be an effort to understand why he seems to so many Americans to be right, and instead of exacerbating the differences that make his appeal dangerous, to think what could be done to reduce them. This is not a moment for Americans to concentrate on telling other Americans how stupid the British are; or for the British to vie in finding methods of ridiculing the views of Congress. It is a moment for remembering the real risk that we shall all hang separately.

There will be those who think such an attitude is mere moral cowardice. There will be those who will call it sacrifice of principle to refrain from shouting their own particular views from the house tops. There will be those who think it their duty to accuse the British of wanting to lose the cold war or the Americans of wanting to start the hot. All these, in democracies, are within their rights. The point is whether they are wise to exercise their right of mutual abuse. Let them, one and all, in every country, stop to ask themselves one question: in what form can the free nations hope in the future to co-exist peacefully and safely with the Russian-Chinese bloc, powerful already and growing more powerful each year ahead? It is not a matter of tiding over five or ten years, but of finding the means of co-operation imposed by the prospects of the next half-century. The surest way to disarm Senator Taft is not to try to shout him down but to try to understand him. That is by far the more difficult task of the two. But it is likely to be the more effective.

Dr Adenauer and the Parties

CAMPAIGNING has now begun in the German Federal Republic for the momentous general election that is to be held next September. The election is the first since the Federal Republic was established in 1949, and will decide whether the course set by Dr Adenauer and his Minister of Economics, Dr Erhard, is to be pursued. For four years, Dr Adenauer has governed in the knowledge that he could not be unseated, owing to the provisions of the temporary constitution framed in 1949. It may, or may not, in future be desirable for a German Chancellor to have this security of office; but in the hands of Dr Adenauer it has certainly proved a blessing for Europe. He has used it in a determined effort to change the whole trend of Germany's development from a nationalist, predatory, eastward-looking power, dominated by Prussia, and without a real friend in the world, into a firm base for a free, federated Western Europe. The division of Germany gave Dr Adenauer the chance to use his power in this direction; but four years are too short a time to accomplish so great a mission.

What are the chances that Dr Adenauer's Christian-Democratic party will be given another four years' mandate? One factor is still uncertain. This is the new electoral law, which has been drafted by the government but not yet passed by the Bundestag; it is, therefore, not yet clear how far the scales are, in the fashion now current all over the Continent, to be weighted in favour of the present coalition. It is, however, already certain that the parties of the present government—Christian-Democrats, Free Democrats and *Deutsche Partei*—will not enter the elections on a combined list. It is not, therefore, a foregone conclusion that the Christian-Democrats, if they again emerge as the strongest party, will look to their present partners to join them in the government. There are, indeed, many politicians who would prefer to see a bargain struck between the Christian-Democrats and the Socialists, even though the price would be disastrously high, namely, Dr Adenauer's retirement and an opposition conducted by extremists.

As the big parties enter the campaign, it can be seen that they are divided on two broad issues. These are the conflict between free enterprise and socialism (in which, in its German version, must be

DIVISION OF SEATS IN THE BUNDESTAG

† Including 9 from Berlin.

incorporated the trade unions' claims to equal management of the country's private and public enterprises); and the dispute over the treaties setting up the European Defence Community, reshaping Western Germany's relations with the occupation powers, and creating the Coal-Steel community. On a mass of other questions, the main electoral programmes vary only in emphasis. All the parties are anxious to attract the votes of former Nazis, though without being branded as ultra-nationalist. The *Deutsche Partei* takes the lead on the right, championing former Nazi party members, and the Social-Democrats are to the left on these matters; but the moral leadership rests with the Christian-Democrats under the strong religious influence of Dr Adenauer.

In economic and social issues, the predominantly Catholic Christian-Democrats stand in the centre between the fiercely anti-socialist Free Democrats and the Socialists. The philosophy of the Christian-Democrats tends towards partnership between capital and labour, and they have sponsored a proposal for part-ownership by the workers in the firms that employ them, with the double purpose of providing an alternative to the trade unions' demands and also, by a wide dispersion of share holdings, of undermining the socialist doctrine that all private industrial property is wicked. The Christian-Democrats have a left wing which is not opposed to a form of public ownership for basic industries. In action, however, the Government of which the Christian-Democrats are the senior partner has championed private enterprise and restricted the economic power of the state to the minimum. In this it sees eye to eye with its coalition partners, the Free Democrats.

★

The Social-Democrats, in deference to the general unpopularity of State control, have watered down their programme of nationalisation, which now includes only the basic industries. The party is no longer Marxist, but attempts to appeal to the middle-class and to the craftsmen as well as to the workers. It supports a planned economy with State direction of investment, and at the same time promises that self-financing by business enterprises will be encouraged. Its hostile attitude to dividends and shareholders brings it into direct opposition to the current effort to raise capital in the public market. It advocates full employment, together with increased expenditure on housing and relief to all and sundry. The mixture is the familiar one of most pre-election Socialist programmes and suggests that a Social-Democrat government in Germany would be better suited to a period of depression than to the present comparative prosperity. Whatever happens in the elections after next, the Socialists will in the coming campaign be handicapped by the fact that the country has made its astonishing recovery, and workers are earning higher real wages than before the war, under the system of free enterprise and international liberalism created by the present government.

On the issue of the European treaties, the picture is somewhat confused by the fact that the term "united Europe" is good form in Germany today, and is used by everyone, from genuine western federalists to neo-Nazis. But it can be said that only the Christian-Democrat Party is a really firm and explicit advocate of the present European treaties as a series of practical and realistic steps towards western European federation. From the start these treaties have had their strongest support in Bonn, and the Federal Minister of Economics, Dr Erhard, is now maintaining the German lead by pressing for a fully free market in all west European goods, together with co-ordinated fiscal policies and convertibility of currencies. Though Dr Adenauer's party is the main champion of a United Europe within the coalition, the fact should not be under-estimated that individual leaders among their partners are also forthright in the belief that Germany—West Germany first and all Germany later—must be integrated with the West.

★

The Free Democratic Party is in the throes of a struggle between its liberal, internationalist wing, led by its chairman and Federal Vice-Chancellor, Herr Blücher, and the nationalist group in North Rhine-Westphalia, which has continued to argue that a political home must be offered to former Nazis, even after the exposure by the British of the ways in which the former head of Dr Goebbels's Ministry, Naumann, and his associates, were infiltrating the party. A conference of the party will shortly decide whether the nationalist "German programme" of the right wing, which contains no reference to west European federation, shall be adopted for the elections, in place of the much more liberal programme sponsored by the branches in Hamburg and South Germany. The chance of defeat for the nationalist section has grown since evidence has convinced the Minister of Justice (who is a member of the party) that the Naumann circle were indeed dangerous company for a democratic party to keep.

The *Deutsche Partei*, the third and smallest of the present coalition government, is, by and large, more nationalist in outlook than the Free Democrats as a whole (as distinct from their right wing). It has many former Nazis in its ranks and demands an end to all discrimination against those of them who support the present state. Recently, it led the way in claiming the "right to the homeland" of refugees from the former German territories, including East Prussia and the Sudetenland. Though saving phrases about "united Europe" are thrown in to such claims, there can be no doubt about the strong revisionist spirit inside the *Deutsche Partei*. It has adopted the black, white and red colours of Imperial Germany, and might some day assume the mantle of Hugenberg's *Deutsch-Nationale Partei*, which, by concluding a pact with the Nazis, paved the way for Hitler to seize power.

The Social-Democrats proved themselves in the 1949 elections to be the second largest party. Since the death of its implacable leader, Dr Schumacher, the

party has mellowed in its internal policy and still more in the language it holds. But the party programme still declares uncompromising opposition to the Western treaties and to the Coal-Steel Community, on the grounds that they discriminate against Germany and stand in the way of the country's reunification. The party also attacks the government for its weakness in the Saar question, arguing that any arrangement with France compromises Germany's claim to the lost lands east of the Oder-Neisse line. Though the SPD has adopted this strongly patriotic party line, two points need to be stressed about the German Socialists. They stand staunchly for a democracy of a western type, and for all their emphasis on German reunion (by which, incidentally, they stand to gain as a party) they will never accept a Soviet offer of reunion that does not give a complete guarantee of free elections. The Socialists remain, as always, the Communists' most hated and formidable enemy. Furthermore, the present Social Democratic party does not reject in principle either the rearmament of Germany or a west European federation. It proposes as an alternative that Germany should take part in a general, loose system of collective security and political collaboration, including Britain and the Scandinavian countries. Fearful of too strongly Catholic and Conservative influences, the Social Democrats denounce the "Little Europe" of Dr Adenauer, Signor de Gasperi and—when he was in office—of M. Schuman. If their statements mean what they seem to imply, the Socialists, if in power, would work for German unity first, and secondly for a German national army inside an enlarged Brussels pact. Dr Adenauer's vision of a new age of Franco-German collaboration would fade, perhaps for ever.

★

In 1949, the coalition parties and the Socialists had the field to themselves. Since then, the so-called Refugee party, now named the All-German bloc, has risen in prominence, and is now in a position to make terms for supporting either the Socialists or the Christian-Democrats in the next Federal government. Dr Adenauer secured the votes of this party for the European treaties, but its policy must be regarded with misgiving. Any future government that has to rely on its votes will probably be committed to press Germany's claims for the return of the Oder-Neisse territories.

The numerous small parties are not likely to attract much support in the September poll. This applies to the Communists, who still demand somewhat forlornly mass action to overthrow the Bonn regime, and may be banned in consequence. It applies still more to the "National Rally" formed by an elderly ex-Chancellor, Dr Wirth. Despite its weakness, this rally has the blessing of the Soviet German government. More dangerous to the cause of the European Defence Community, because it denounces both Eastern and Western German rearmament, is the neutralist party led by a Herr Heinemann, who holds high office in the Evangelical Church, and by Frau Wessel, a former leader of the small Centre party. The Heinemann-Wessel party has sufficient support to have attracted Communist denunciation for splitting the ranks of the opponents of the European Defence Community.

On the whole, it will be seen, the coalition parties form a very powerful force in support of the European treaties. Moreover, the chances for a government victory are enhanced by comparative prosperity and the Germans' habit of voting for a regime in power, as long as it shows itself to be strong. Dr Adenauer's personal prestige has grown since his recent visit to the United States. Instead of being regarded by many as a satellite of the victors, the Chancellor is now seen to be a national leader who has restored the status of the Federal Republic. It is increasingly realised that, with an army, inside or outside a European force, Germany will be able to play a still more important role in world affairs. Former critics of the Chancellor who prophesied that ratification of the treaties by Germany might well bring a Russian attack have been silenced by the fact that Soviets were more conciliatory after the ratification than before. With a modicum of conciliation from the French on the question of the Saar, it is therefore likely that Dr Adenauer would be given another four years in which to turn the course of German history to the benefit of the world.

Rumours of War

Now, menacing as is the aspect of affairs in the East, we do not expect the peace to be broken, if Turkey is firm, and if her allies are prompt, decisive, and united in their action;—since it is the characteristic of Russian diplomacy to be as pliant as it is encroaching, and always to recede before a resolute front and an enterprise of doubtful and hazardous result. Russia never abandons a design, but is always ready to postpone it, if need be, till a more convenient season; she is as patient as she is pertinacious; and will never risk her plum by endeavouring to gather it before it is ripe. The question, therefore, whether she will now persist in her demands, will depend entirely on the nature and degree of the resistance she may meet with: this resistance will be measured by the unbending determination and bold attitude which the Sultan may display; and this, again, will in the main depend upon the cordial and united aid on which he may be authorised to rely from France and England. . . . But this is not the only dispute which threatens to disturb the tranquillity of Europe. The insolent and overbearing conduct of Austria to Piedmont and to Switzerland has led to a withdrawal of Ambassadors and a cessation of diplomatic intercourse with both those states. She has long been seeking an occasion of quarrel, and at length seems resolved to make it. . . . Both in the East and in the West, then, a case has arisen to test—prospectively at least—the fidelity of England and France to their several engagements, their power of sincere and cordial co-operation, and the courage, vigour, and capacity of their respective Governments.

The Economist

Citizens of Colour

THE presence of so many visitors from Commonwealth countries at this time is a reminder that the Commonwealth is in no small degree the product of interchanges of peoples; migration is not, and should not be, a one-way traffic. Britain has always been a country of settlement as well as of emigration. This inter-weaving continues, but there is now a conspicuous new thread in the pattern: in many big provincial cities, as well as in the seaports, there have recently grown up coloured communities, mainly of West Indian and West African origin.

In the past Britain has absorbed immigrants mainly in the top or middle strata of society. Not to be fanciful about Normans or Huguenots, it is still true to say that Canadians, South Africans, Australians, and even Americans who have taken up permanent residence here have come because Britain offers economic opportunities for administrative, commercial, artistic, scientific and professional talent, in precisely the way that the countries of overseas settlement offered opportunities for personal betterment to British farmers or artisans. This is partially true even of the settlers who have come here from the Asian members of the Commonwealth; there are over a thousand Indian doctors, for example, on the British medical register.

With West Indians and Africans the case is quite different. Apart from students, whose sojourn is short, they are drawn by the standard of living offered at working-class level. It is true that many have been misled by false ideas about the ease of getting high pay, and that a sense of disappointment pervades many coloured communities. But even when employment is chancy the standard of welfare is superior to anything experienced in their own countries; unemployment assistance is often better than a job at home.

Before the war, small coloured communities were well established in such ports as Cardiff, and their offspring had reached the third generation. They increased slowly by immigration and by marriage with British women. They were poor, especially subject to unemployment, concentrated in single slum districts, and attached to the seagoing community. In the war, however, there were jobs for all, and coloured troops from the colonies received a vivid if fallacious picture of British working-class comfort and security. After the war, settlers began to arrive on the strength of the reports thus widely spread; in conditions of overfull employment, they got fairly good jobs at good pay. In other ways they met discouragement, but inflation in Britain and the growth of floating populations in the colonies produced the conditions for a steady flow. The number of fare-paying passengers has been about 2,000 to 2,500 a year, supplemented by some hundreds of stowaways and of seamen taking their discharge in Britain.

The fare from the West Indies is £70 to £100, so that immigrants have not come, in the main, from the poorest and least literate class. Many West Indians put their capital into the enterprise. Some stowaways are illiterates from West Africa who find it hard to adjust themselves to British life and have scant command of the language. But to balance them, there are many West Africans who were originally sent by relatives or tribal authorities as "students," but whose money has run out, or who find academic standards in Britain beyond their powers; they stay and work rather than face their sponsors again without a certificate or diploma to show for the money spent on them.

All, however, share the experience of disappointment: the unofficial "students" at the hands of universities or technical colleges, the illiterates from unfamiliar surroundings, the fare-paying passengers from lack of skilled jobs. Virtually all have to come down to unskilled and often casual work, because even if they call themselves carpenters or joiners at home, their apprenticeship and qualifications are not such as any British craft union would recognise. Most join the Transport and General Workers' Union.

★

The employment exchanges have certainly been indefatigable in their interests. The railways have taken them as porters and track maintenance gangers; the post office has taken some as postmen. Private employers vary in their attitude, but many have been induced to try coloured workers and found them satisfactory. They work well alongside white workers, though most employers prefer to keep them in the minority; as their number rises, jealousy begins to manifest itself. The work available to them remains relatively unskilled, and few have proved capable of benefiting from training. Labour exchanges note the greater readiness of coloured workers to change employers; their preference is for an easy-going, casual existence.

It might be thought that Britain, with a tendency to be short of manpower (and to export it), should find this source of labour welcome. But in fact there is no shortage of unskilled labour. It is skilled labour, or semi-skilled labour which requires a period of training, that is in demand. To meet these shortages—where local unions permit—European immigrants who are, or can be, trained are far more suitable, and, as aliens, can be controlled. The coloured peoples do not meet the shortage of coal miners, of agricultural workers, or of domestic workers.

These circumstances have greatly contributed to their tendency to coalesce into distinct communities, instead of being scattered through the population and

becoming merged with it, as for example did the Irish navvies in the last century. Though they make use of all the facilities of the welfare state, especially employment exchanges and national assistance, they run their own friendly societies and other organisations. This is thought necessary because of the difficulty of getting accommodation, which indeed exists, just as colour prejudice exists; but the first is faced by many other people and the second is magnified by lively myth-mongering. But whether it is necessary or not, the upshot is that miniature "Harlems" have grown up in many big towns. They are largely run by coloured landlords, and their concentrated exoticism makes the local population increasingly aware of the frontiers of colour.

It is an unfortunate development. No distinction is made in law between British citizens. Colour is irrelevant. No obstacles are placed in the way of a colonial with a valid passport who wants to come to Britain. And communications are becoming easier. The British standard of living and welfare beckons, while population pressure at the other end encourages emigration. But social and economic circumstances then combine to produce the very conditions that the law ignores and which current social theories, as well as national traditions, strongly deprecate. Coloured workers congregate and, convinced of discrimination, practise their own *apartheid,* save for finding such marriage partners as they can. The separate coloured community stretches from the changing ranks of the students down to a criminal substratum.

★

Their sense of grievance, of apartness, and of self-pity represents a serious failure by a welfare and egalitarian society to meet a challenge arising out of postwar conditions. It is particularly a failure to live up to this country's professions of political aims. It might not matter if Britain were not a colonial power. As it is, this country is involved in justifying, before the bar of world opinion, political and constitutional schemes designed to achieve, on a vast scale in Africa, inter-racial harmonies that have not been achieved in Coventry. The future of the Commonwealth is beginning to turn upon questions of race and colour, and it seems necessary for the British people to demonstrate their ability to answer those questions where their power is complete—in their own cities.

For this reason, the problem is important although it is small. Statistics are wanting because the coloured community has no separate legal existence. Officials guess that it is about 50,000, which may well be a considerable underestimate but may be measured against the postwar immigration of some 250,000 workers from European countries. These, however, can "disappear" into the landscape, visually if not always audibly, while coloured communities of 3,000 to 8,000 in cities like Cardiff or Birmingham remain conspicuous.

If there were no further recruitment, they would no doubt be absorbed in time. The children of mixed marriages today have the same educational opportunities as other children; even if their tint is perceptible, they are being put in the way of acquiring all the skills or professional trainings their immigrant parents lack. They become reasonably well equipped to look after themselves.

Immigration has, indeed, somewhat slackened since the middle of 1952. Disinflation made it so much harder for coloured people to get jobs that many wrote and discouraged their friends instead of, as in 1947, encouraging them to follow. The colonial authorities have wisely begun to warn emigrants of the difficulties when issuing passports. Some of those now travelling are, however, wives and dependants of coloured settlers who have made good; they show that coloured people sometimes can rise in the economic scale—even if, in some cases, it is by slum landlordism or less reputable means.

★

In any event, immigration will not cease, even if colonial development provides more local employment. Nobody wants to see any barriers to freedom of movement in the area covered by the phrase "citizen of UK and colonies." Such barriers would merely emphasise Britain's inability to absorb a tithe of the coloured people that other multi-racial societies must deal with. If the West Indies and many African territories are to become self-governing dominions under the Crown, some interchange of people is inevitable, and indeed might do good. It is immigration to a separate and sub-standard community that is harmful. That can be prevented only by some dispersal and greater social acceptance of the coloured citizens who are already here. Education, housing and slum clearance can be instruments to this end. Trade union practice has a part to play; unions will have to resist the feeling among British workpeople that when unemployment exists "foreigners" (an elastic term) should not hang on to their jobs even on grounds of seniority. Many sensible suggestions have been put forward—notably by the Conservative Bow Group—for overcoming colour consciousness in day-to-day social intercourse. Certainly everything that can be done to train coloured people for semi-skilled jobs will help to reduce the growing impression that these people are inevitably labourers, unless they are dance band performers.

These remedies are worth pursuing by men of idealism in both political parties. They should reflect both Labour's attitude to a multiracial Commonwealth and the evolution of the new Tory imperialism. The immediate problem is to find means of reversing the social and economic spiral which concentrates lower-paid coloured workers in defined enclaves where their contacts with the white population tend to be limited to the least desirable part of it. The numbers are still small, in terms of heads and of streets, but the importance of the principle involved may be hard to overstate.

Notes of the Week

A Great Performance

CORONATION DAY was a triumph for all responsible for organising its many intricacies. In the Abbey itself, dignity combined with beauty—to the eye and the ear—to make the ceremony uniquely impressive. In the streets, the procession was most successfully administered, and the spectators were given all practicable aid. The transport arrangements appeared over-elaborate in prospect, but they in fact allowed vast crowds to assemble and disperse with less than the usual rush-hour discomfort. With the customary patient help from the police, the hordes of people lining the pavements showed good humour and tolerance under the most trying conditions. They endured many hours of intermittent drenching, and yet kept the heart to cheer lustily.

The procession with its Cinderella coach was more than a delight to the eye and an escape into fairyland. The welcome given to the colonial rulers and to the Commonwealth Prime Ministers showed that the crowd found a living significance in the ancient pageantry. And in no other coronation in history have the people taken part as they did in the coronation of Queen Elizabeth II. She made her vows to an unseen audience of millions who were following the ceremony on television; and as one splendid tableau succeeded another like a series of mediæval tapestries, the spectacle was no less moving because some of the vows are unreal for a constitutional monarch. How right it was to let television bring the nation to the Abbey; how groundless were fears that the solemnity of the occasion would be lost. The links that bind the Commonwealth cannot but be strengthened by the witnessing of this act of dedication.

No Shuffling

THE Coronation honours have not been used as a preliminary to Government changes; no one having moved to the House of Lords, Sir Winston Churchill will presumably face a reassembled Parliament on Tuesday with his team unchanged. This is, no doubt, the principle of not altering a winning combination. The last by-election and the public opinion polls provide plenty of justification, especially for a Prime Minister deeply engrossed in world affairs. But the principle, applied to governments eighteen months old, is nevertheless questionable. It presupposes that the current standing of the Government is all that matters. It ignores individual weaknesses; and it assumes that the present group of senior ministers will remain impervious to the ravages of time and ill health.

To take the lesser point first, Sir Winston's contact with both the performance of his colleagues and the opinion of Tory backbenchers must be singularly faint if he is not aware that three or four of his senior ministers and about half a dozen under-secretaries have proved unsatisfactory, either administratively or politically. This is no cause for shame. A modern government contains some ninety men and women, and in 1951 half of them were without previous ministerial experience. They have now had ample time in which to show their worth, and those who have fallen short should go or be moved down. This is by no means irrelevant to Sir Winston's international statesmanship. He has himself publicly recognised before now how much Britain's standing abroad, and therefore the influence of the Prime Minister, hinges on confidence in the government as a whole. If he wishes to pursue his diplomatic initiative to a successful conclusion he must maintain confidence not only for these summer weeks but for months ahead.

Here Mr Eden's illness is a warning. Almost all governments rest on a few senior men, and it is a Prime Minister's duty to ensure in good time that there are sufficiently experienced replacements. The initial strength of the 1945 Labour Government lay in the richly diversified quartet of Attlee, Bevin, Morrison and Cripps. When the two most creative minds were removed, the whole structure crumbled. Mr Attlee failed to nurse adequate successors, with the possible exception (eventually) of Mr Gaitskell, and today his party is still suffering for it. This was, admittedly, an extreme case; the loss of Bevin and Cripps was massive in its effect. But Sir Winston is far from free of the danger. Apart from his own gifts, he could until recently point to the abilities of Mr Eden, Mr Butler, Mr Macmillan, Sir Walter Monckton and Sir David Maxwell Fyfe. One gap has already appeared, for a period at least, and more ill health could now quickly disrupt the balance of the team. Where are the potential successors? Among the new men on the Treasury bench only Mr Iain Macleod is quite outstanding. But on the backbenches, and among the Parliamentary Secretaries for the more obscure ministries, there are promising men who should be tried in posts which can provide real tests of ability. At least one or two should prove worthy of joining a short list of first reserves, on which the future of the Government and of the Conservative party may well depend.

Korea for the South Koreans?

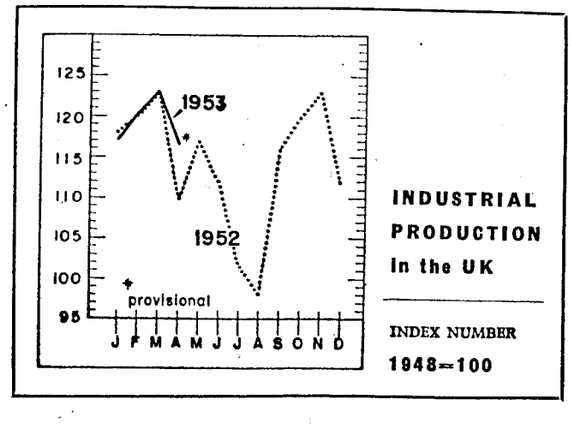
FEW countries could be in less of a position to "go it alone" than South Korea. For three years it has been dependent on American military support for its very existence; its shattered economy could not possibly carry

the inflated load of its present huge military forces without extensive and cohtinuing American economic aid. Politics, nevertheless, have a way of riding roughshod over even the most self-evident military and economic propositions, and the attitude of the South Korean president, Mr Syngman Rhee, has lately provoked a fresh crisis in the truce talks. He declared, as he had declared before, that he would not accept a truce without the conquest of the whole of Korea, and that he rejected the terms put forward at Panmunjom on behalf of the United Nations by the American negotiators ; he would, in particular, resist the landing in South Korea of any Communist troops from Czechoslovakia and Poland as part of the proposed international truce commission.

The intransigence of the South Korean attitude had not been taken nearly seriously enough. The free world feels that it has sacrificed so much in the Korean war that the question of bringing the war to an acceptable end had become separated from the local problems in Korea itself. But President Syngman Rhee and the other South Korean leaders have it in their power to create an exceedingly awkward situation if they refuse to accept what the allies are doing. If, as the South Korean field commander recently threatened to do, their army went on fighting after the United Nations had agreed to cease fire, the South Koreans could get into a military situation in which it would be difficult, if not impossible, not to go to their rescue. For, although they could not "go it alone" successfully, their failure would involve the whole world in its consequences.

★

This was the problem which last week caused President Eisenhower to summon a special emergency meeting of his advisers. What followed is not yet fully clear. But it would appear that, for the moment at least, Mr Syngman Rhee has responded favourably to a personal message from the American President. As a result, a further compromise plan is being worked out for presentation to the Communists ; Mr Syngman Rhee is understood to have put a curb on some of the more outspoken statements of his field commander and his prime minister ; and the possibility has been removed that even the arrival of Indian troops for the proposed international truce commission might be opposed by South Korea.



All this has played a special part in holding up progress in the armistice talks. The Communists have, no doubt, watched the serious split in allied ranks with predatory eyes and have been unwilling—on thoroughly practical grounds they might well argue—to come to an agreement with negotiators who are unable to speak for the whole UN side. Few would blame the South Koreans for their bitter determination to drive the Communists from the whole of Korea, but they must recognise the true nature of the allied effort. This terrible war has been fought only as a lesson to aggressors. If it had been allowed to remain merely a struggle between one Korean faction and another, the South Koreans would have been wiped out within a month of its outbreak. At the same time, the forceful assertion of President Syngman Rhee's views has drawn fresh attention to the gallantry of his country's own efforts, and it is a timely reminder that no truce that fails to take into account the realities of the position in Korea itself is likely to lead to a durable political settlement.

French Bevanism

If the French National Assembly had voted in the early morning hours of Thursday, it is probable that France would have woken up the next day to find itself with a neutralist government, a completely new foreign policy and a cabinet headed by the Radical leader, M. Mendès-France. The latter's speech on Wednesday presented lucidly many of the dreams and illusions that French politicians have harboured in secret. Although he did not commit himself on the question of direct negotiations with Ho Chi Minh, M. Mendès-France made it clear that he would seek an armistice in Indo-China. With respect to North Africa, the Prime Minister-designate courageously asserted that the first steps should be to restore political liberties. He has never made a secret of his views on French misrule in Tunisia and Morocco, and his words electrified the leftist benches in the Assembly. With regard to the ratification of European Defence Community treaty, M. Mendès-France spoke with cautious reserve, emphasising that his cabinet would not regard defeat on this matter as a reason for dissolving parliament ; and he demanded once again the closest possible ties with Britain in order to neutralise German strength.

On the key issue of the budget, the Radical leader urged a cut in rearmament together with a planned investment programme calculated to stimulate production and stop the increase in unemployment and underemployment. He proposed a complex and novel contract between his government and the Assembly, under the terms of which the government would be allowed to rule by financial decrees subject to specified limitations and for a given term. This would avoid the passing of laws giving a blank cheque to any subsequent government. Throughout his brilliant speech, the Prime Minister-designate tried to show that France could not hope to emerge from its present state of decline and confusion unless it gained a measure of economic independence from America. Only if France, by dint of great sacrifices, regained a measure of economic autonomy could it make its views felt on such issues as the recognition of China, a four-Power conference and the future of Germany.

If France were a small power without vital commitments in the defence of the free world, M. Mendès-France's programme would be admirable. Strasbourg, however, is less than 150 miles from the Soviet armoured divisions and

Hanoi is 90 miles from the armies of Mao Tse-tung. M. Mendès-France's fair picture of a kind of wise neutralism simply overlooks the realities of the present situation, and it is difficult to conceive what would happen in Bermuda if a French prime minister arrived with this version of Bevanism. Such thoughts will probably prevail in the Assembly, together with more sordid motives of party manœuvring and the Socialists' reluctance to do anything but sit in opposition. As *The Economist* goes to press it is not yet known whether M. Mendès-France will be defeated in his attempt to gain the investiture. But it seems likely that France will have to look in more traditional directions after this brief but significant flirtation with neutralism.

Nothing New from Mr Dulles

American listeners on Monday to Mr Dulles's nation-wide broadcast about his Middle East tour must have received the impression that it is easier to bowl along in the Arab countries than Americans on the spot find it to be. To the British reader, the very general conclusions that he put forward seemed to have little basis in the evidence he gave. For he appeared to deduce that the United States has somehow slipped out of the role of honest broker between the Arabs and the West, that it must cease to look as if it is pushing its own interests, and that it must not expose itself to the charge of supporting the old colonial powers.

If his tour is to fulfil the expectations it has raised he must offer solutions to two main problems. One is to decide whether Middle East defence is to be organised with or without western participation. The other is to bring about military and economic peace between Jordan and Israel. On neither of these had Mr Dulles anything new to say. He believes in a "phased withdrawal" of British forces from Egypt ; so do the British. But he thinks Cairo must first recognise that to keep the Canal Zone base in order "has an importance which goes beyond Egypt, for the base serves all Near Eastern and Western security." Yet Cairo's objection to this view all along has been the main difficulty. As for peace between Jew and Arab, he proclaims—like so many before him—that it "will require concessions from both sides." Mr Dulles should have added that such concessions will not be attainable unless strong pressure is brought to bear on both parties.

A broadcast of this kind would hardly be the occasion for announcing policy decisions ; but there are at least three points on which a clear statement of American views is urgently needed. First, does Mr Dulles propose, after the phased withdrawal of the British has taken place, to leave the area a virtual military vacuum ? If not, how well armed would he help the Arab states to become, in view of the fact that they are "more fearful of Zionism than of Communism ?" Then how, without forces on the spot, does he propose to "stand fully behind" the Anglo-Franco-American declaration of 1950 about the way Israelis and Arabs should behave on their common frontier ? And there remains a more subtle but no less difficult question: How can the Americans act as honest brokers in countries which find the commercial enterprise of Point IV no less intrusive than such faint shreds of British colonialism as still survive?

The Steel Knights

Sir Lincoln Evans, with the two other trade union leaders who have agreed to serve on the Government's Steel Board after denationalisation, came last weekend under the expected attack from the Labour Left. The journalists, indeed, surpassed themselves in bitterness. They thereby made plain how acutely the Labour movement is embarrassed by this co-operation between trade union leaders and the Government, and that impression has merely been strengthened by the rather tentative defence of Sir Lincoln which has come from some leaders of the Trades Union Congress. In fact, a spirited reply would be easy to make. The trade union members of the Steel Board are making the best of the denationalisation policy that, whatever the Labour party may think of it, the electorate has voted for. If this entirely proper (and foreseeable) action is a blow to Labour, there is plainly something wrong with the political tactics of the party.

Under the pressure of its left wing, the Labour party has persisted in representing denationalisation as black reaction. The Tories are supposed to be handing the country over to exploitation by the bad barons of steel monopoly. When the trade union knights (Mr Naesmith becomes Sir Andrew in the Coronation honours) sit on the supervisory board for the industry they help to show that this picture is unreal. But they are harming the Labour cause precisely because the party had chosen to paint, for purposes of propaganda, a picture that would in any event have been unreal. The error is of the same kind as was made in the famous warmongering charge against the Conservatives at the general election. In both cases the facts have overtaken the propaganda and it is that, not the personal decisions of individuals, which really hurts the left-wingers. The particular merits of the steel case quite apart, Sir Lincoln and his colleagues will in the long run be serving the Labour movement well if they help to show it that unrealistic propaganda often does not pay.

New Appointments for Kenya

The gravity of the situation in Kenya has been underlined by the two new steps taken to deal with it. The appointment of General Erskine as Commander-in-Chief, East Africa, with direct responsibility for all military measures necessary to restore law and order, means in effect the adoption of what has become known as a "Malayan solution" for Kenya. It does not mean that the peculiarly dangerous feature of the Malayan campaign—the fact that it is a campaign in the cold war—has any part in Mau Mau terrorism ; but it does mean that the emergency is now to be treated, for the time being, as a military operation rather than one that can be handled by a committee of soldiers and civilians. Priority is to be given by the Kenya administration to the measures General Erskine considers essential for success. These arrangements, it is said, will be reviewed when success has been achieved ; but the new command is apparently to be permanent. Its establishment may well reflect the situation in Egypt as much as that in Kenya.

The other appointment is on the civil side. Mr Frederick Crawford, Governor of the Seychelles, is to return to East Africa as deputy Governor of Kenya. The purpose of the appointment is to relieve Sir Evelyn Baring of the heavy load of administration he has been carrying ever since he went to Kenya last year. It is possible—it is certainly desirable—that Mr Crawford, who received a knighthood in the Coronation honours, will be chiefly concerned with the long-term plans for economic reconstruction that must be made even though law and order have still to be restored. As a former director of development in Northern Rhodesia, he has had more experience in the economic side of administration than falls to the lot of most colonial governors.

Wrong Move in Nyasaland

LITTLE comfort can be drawn from events farther south in Africa, from Northern Rhodesia and Nyasaland. In Northern Rhodesia, some Africans in the copper belt have been entering hotels and restaurants reserved for Europeans. By demonstrating against the colour bar in this way, they are using the same tactics as the Africans of the Union when they began their campaign against *apartheid*. No violence has yet taken place; but there is always a danger of ugly incidents if the demonstrations continue and spread. The Europeans have, in fact, been warned, and they would be foolish to think that ejection of the demonstrators is the only or right answer to them.

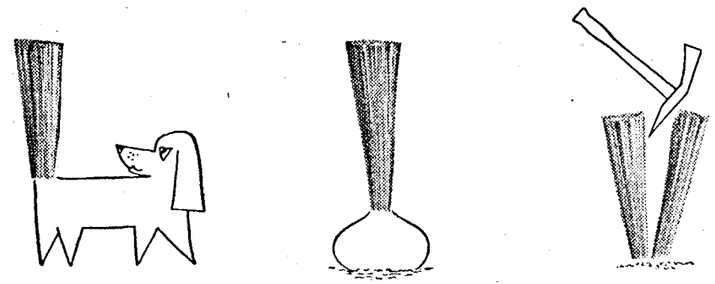
In Nyasaland, demonstrations have taken place against Central African federation, and have culminated in two deportations: the deportation to another district of Chief Gomani, a native authority, and the deportation from Nyasaland of the Reverend Michael Scott, who has spent some weeks in the territory speaking against federation. Chief Gomani was suspended from office and deported, it is said, because he had told his people, among other things, not to pay their taxes, and Mr Scott for helping him to escape when the deportation order was being served.

This is the official version of the affair; it will be interesting to see if Mr Scott denies it. In any case, the Government of Nyasaland has made a bad mistake. If Chief Gomani and Mr Scott have broken the law, they should be arrested and tried in the normal way. By ordering their deportation, the Governor has given the impression that he wants to get rid of them because they are a public nuisance and are opposed to federation. This is the worst sort of impression to leave on the Africans. It may well harden their opposition to federation at a time when all efforts should be directed towards breaking it down.

Rocks on the China Coast

THE argument about shipping on the China coast seems in the past few days to have moved on to an almost rational basis. This lull in the sound and fury may last only as long as Senator McCarthy's temporary withdrawal from the public eye; but, if so, there is all the more reason to take advantage of the moment of relative calm to establish the facts clearly and firmly. So far, the evidence has been presented only in fragments, but a picture is beginning to emerge. The "hundred ships, many of them British, still carrying strategic supplies to Communist troops in Korea" appear to have been whittled down to a smaller number of foreign-owned ships that have made a hundred voyages to Chinese ports, often in ballast to collect cargoes. As far as the British ships are concerned, there is still no evidence that they have carried anything "strategic" to China. As for the "two British ships carrying Chinese Communist troops," which, in Senator McCarthy's eyes, outweighed all the fighting done by British forces in Korea, it now emerges that one had been seized by the Chinese, while the other had been forced to carry Communist soldiers between Hainan and Canton.

Senator Mundt clearly made a fair point when, commenting on the latter case, he argued that foreign ships entering Chinese ports were offering themselves as victims to blackmail of this kind. But the fact that no similar event has occurred since June, 1951, suggests that the risk is very small; the Chinese have clearly realised that they cannot have their cake and eat it. It would be easy, however, to indulge in an unprofitable exchange of Anglo-American *tu quoque* on all these points. At the present stage it is much more important to remove the distortions caused by the wild and irresponsible methods of Mr McCarthy's committee, and to get the facts straight and in perspective.



A Gloss on Stalin

THERE was an important reassurance to Russia's peasantry in last week's *Pravda*. An article entitled "Soviet Trade" criticised numerous writers who are solely or mainly preoccupied with the transition to a moneyless economic system based on the exchange of products, and who therefore neglect the vital problems of trade in its present form. "Objectively," says the author, "this means an underestimate, which in theory is wrong and in practice harmful, of the enormous role trade plays in the Soviet economy." The Soviet government and Communist party will "in the coming historical period" continue to develop trade, that is to say exchange based on money.

The writers now rebuked were, in fact, only echoing Stalin. In his "Problems of Economics," published last year, he analysed the problem of how to bridge the gap between state property in the towns and collective property in the countryside, and he recommended a switch from normal trading to the direct exchange of products in dealings between town and country. This could not be done overnight; but Stalin stated that a beginning had already been made in transactions with collective farms producing industrial crops and that the system must be extended

> unswervingly and without hesitation, step by step contracting the sphere of operation of commodity circulation and widening the sphere of operation of products' exchange.

Those who followed and elaborated the master's advice are now told that this is a question for the future, and that to plug it as a theme of discussion is harmful.

animal, vegetable or mineral?

When you think of thousands of tiny fibres which can be teased away in the fingers, you don't usually think of a rock. With asbestos rock it's different. Asbestos is one of nature's freaks: a mineral, yet made up of gossamer-light fibres. These fibres, which never burn, can be spun, woven or moulded into a variety of materials. Hardly an industry, today, is not using Asbestos in one form or another. For the fullest information on its possibilities in your own branch of industry, consult

The difference between Stalin and his successor in this matter is, however, probably one of tactics and terminology. While pointing the path to Communism Stalin himself spoke of many things unattainable in the near future, such as the halved working hours and trebled real wages. His successors prefer to limit themselves to the tasks immediately in hand. They know they cannot for the moment introduce "products' exchange," for the simple reason that they cannot afford to cause discontent among the peasants by forcibly extending this system; nor have they enough consumer goods to induce collective farmers to accept this form of barter without coercion. The new regime therefore judges it "harmful" to provoke peasant antagonism by advocating goals that are unattainable at this stage. For the present—impressively called the "coming historical period"—the new rulers seem to prefer to lay stress on the other aspect of the same problem, namely, the improvement in the supply of consumer goods to the countryside.

Welfare and the Family

A RECENT debate in the House of Lords on the welfare of the family—more exactly, on the impact of social legislation on the family—was outstanding. Anxiety about the declining sense of family responsibility, the instability of modern marriage, the increase in juvenile delinquency, and the inadequate birth-rate, is apt to be voiced in terms suggesting that what this country really needs is to get back to the nineteenth century—to the respectable nineteenth-century world, that is, of Anthony Trollope, not the horrible sub-world in which, as a matter of hard social statistics, most nineteenth-century families had their being. No such irrational hankerings marred the impressive opening speech of the Bishop of Sheffield. Its general theme was that the social services should work with, through and for the family as a going concern, not as a means, alternative or actually rival to the family, of securing individual welfare—a theme that was generally accepted and underlined by subsequent speakers. Indeed, the spectacle of local authorities spending £30 or £40 a week on maintaining the scattered fragments of a family which could perhaps have been kept intact by a couple of pounds' worth of home help provides an argument likely to penetrate the most unsentimental of legislators.

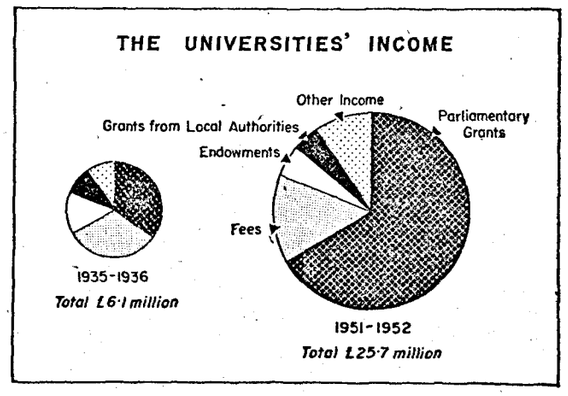
To embody this general aim either in amendments to the law or in rules of executive practice will not be easy. Lord Beveridge emphasised one danger: the fall in the real value of social insurance benefits, and the consequent insidious return of the means test with all its disruptive possibilities. Lord Salisbury put his finger on another deep-seated trouble-spot. Noting the cost of the social services to the ordinary families they are supposed to benefit, he questioned whether its effect in driving mothers of young children to supplement the family income did not sometimes produce "undesirable results" of just the sort that the services were supposed to prevent.

It would, indeed, be surprising if a social structure run up so hastily and in circumstances so unfavourable to the judicious weighing of alternatives should not have got some of its priorities wrong and proved in some respects self-frustrating. But if reform is carried out in the spirit of the Bishop of Sheffield's speech and those that followed, it should not be impossible to preserve the gains, while getting rid of the handicaps, which the welfare state has brought to family life.

Propaganda by Picture

A SOBERING thought accompanies the impressive news that the Coronation ceremonies were successfully brought into thousands of Continental homes by television. Only a few days ago an English viewer accidentally received on his set a reasonably clear programme from Moscow. Such events are still mere freaks, caused by unusual natural conditions; but the six-nation link-up on Tuesday, which extended as far as Berlin, marked a decisive stage in the advance of television as an international medium. The production in one country of films for the use of television stations in another is already an accepted technique. How long will it be before the direct reception of programmes originating on the other side of Europe becomes a normal occurrence?

When that day comes, it can hardly be expected that the studios of Moscow and Prague will be content to regale western viewers with glittering performances of "Swan Lake" or "The Bartered Bride." If their use of sound radio is any precedent, it can be presumed that they will mount a massive campaign of propaganda by picture, while using jammers or other devices to prevent their own peoples from seeing transmissions from the free world. The unpleasing prospect opens up of victims in some future purge making their macabre confessions under the eyes of every family in Birmingham or Battersea as it sits round the supper table.



Moreover, it is no disrespect to the best craftsmen in television to point out that their art offers peculiar advantages to the unscrupulous propagandist. It is not easy to show the blessings of liberty on a flickering screen; but it is all too easy to use the medium to play on the crudest of human emotions—fear, revulsion and hatred. With the air already thick with spoken propaganda in almost every language, the approach of transcontinental television can hardly be viewed with enthusiasm.

Academic Account

THE latest report of the University Grants Committee, published last week, shows that in 1951-52 there were nearly 2,000 fewer full-time students in British universities than in the previous year. This is the second year running that has shown a slight fall, after five years of rapid and unbroken expansion. It does not mean, of course, that the clock is being put back. Until 1950 the permanent postwar expansion of the universities was exaggerated by the influx of demobilised servicemen. The 1952 figure of 83,458 students—of whom nearly a quarter are women—still repre-

sents a large increase over the prewar student population of 50,000.

The biggest organisational change that growth has brought to the universities continues to lie in their finances. The chart shows how dependence on the parliamentary grant has grown out of all proportion to the increase in

total income; and it will grow still more in the quinquennium that began with 1952-53, when the grants are due to rise from £20 million to £25 million. But this certainly does not represent public extravagance; with rising costs, the grants seem barely sufficient to enable the universities to maintain their existing activities.

Waiting for the Soviet Budget

It might be considerably easier to judge what is happening inside the Soviet Union if the budget had been made public. Normally it appears in March and in previous years it has never come later than June. It is not, it is true, a very revealing document, especially on such vital matters as expenditure on arms and research; but it has in the past shown significant trends. And it is those trends that will be eagerly looked for when the first budget of the post-Stalin era is available.

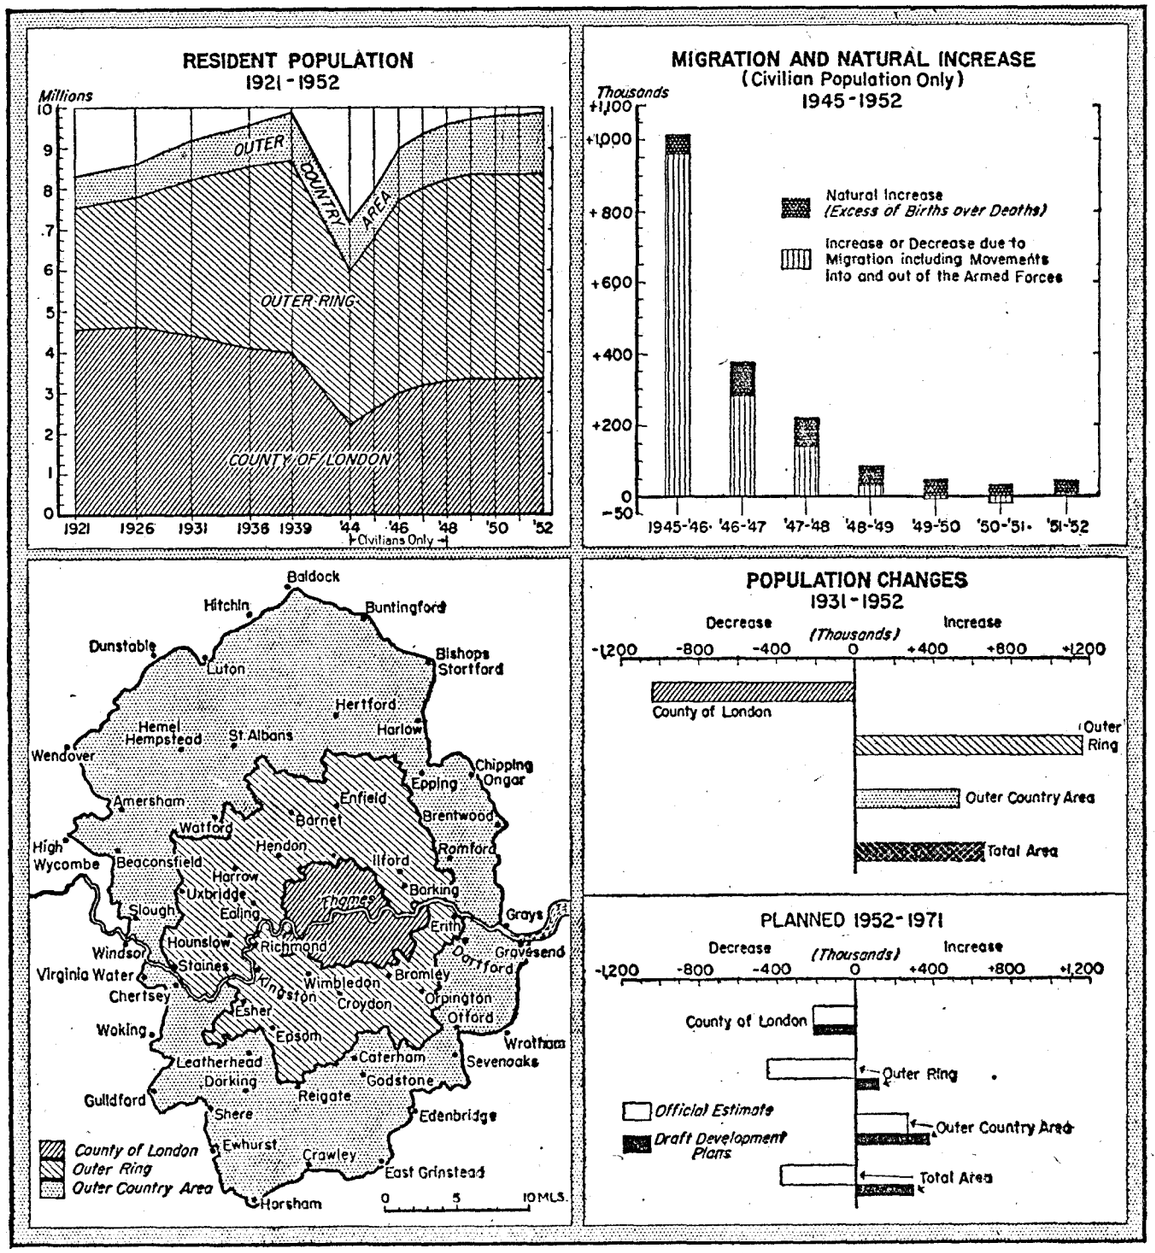
It is reasonable to assume that the triumvirate faces the same arguments with its military advisers as do President Eisenhower and Sir Winston Churchill. If any serious attempt is being made to catch up with the United States in atomic armaments, or even in research into the production of these and other weapons, the demands on Soviet resources must be severe. They must impinge on just those sectors of the economy that are most important for progress in heavy industry and for the promised aid in the industrialisation of China. The Five-Year Plan now awaiting the formality of approval by the Supreme Soviet was drawn up under Stalin, and provided that engineering output should be doubled and consumption increased by only 35 per cent within the period of the plan. If Malenkov, Beria and Bulganin are as eager as they are said to be to improve the lot of the consumer, they might well think it necessary to modify the emphasis of the plan. Such a decision would be reflected in the budget and could make possible a little more intelligent guesswork about what is going on inside the Kremlin.

Congress in Vienna

THE five silent Soviet observers who sat in on the recent Congress of the International Chambers of Commerce in Vienna must have gone away impressed with the external contradictions between western capitalist countries. Just when the advocates of protectionism in the United States appeared to be predominant, the leader of the American delegation in Vienna was declaring his belief in the coming victory of the low-tariff school. At the same time as the virtues of European integration were being extolled in Luxembourg and Strasbourg, a German speaker at the conference, Dr Boden, was launching a tirade against the Coal-Steel Pool. A conference intended to discuss the laudable purpose of convertibility with the dollar derived much of its animation from private talks aimed at increasing East-West trade.

The conference, attended by more than a thousand businessmen, heard speeches by such eminent personalities as Mr Ivar Rooth, managing director of the Monetary Fund, laying stress on the length and hardness of the road to convertibility; according to Mr Rooth, the Fund does not at present propose to take a decisive part in progress along it. When the American delegation report to President Eisenhower, they will no doubt stress the growing frustration in Europe at the absence of clear-cut American economic policies. All Europe will await with anxiety evidence that this team of leading businessmen carries weight in Washington.

The Magic Mountain



THE first ascent of Everest, like the breaking of the sound barrier, is superb proof that in this second Elizabethan age men can still burst into silent seas. The conquest of the summit by E. P. Hillary from New Zealand and Tensing Bhutia, the famous "tiger" of the Sherpas, is a triumph of individual endurance and collective planning. Behind the success of Hillary and Tensing lie thirty years of experience gathered by other parties, sometimes at the expense of lives and always at the cost of tremendous effort and courage. Where Hillary and Tensing succeeded Mallory and Irvine died, and the expedition's route, up to the final assault stage, grew out of the inspired guessing and reconnaissance of Eric Shipton. This victorious British expedition, moreover, stands out for its caution and careful preparation. The French conquest of Annapurna ended in a terrible ordeal and the renewed German attempts on Nanga Parbat have taken tens of lives; but there is every sign that Colonel Hunt will bring his men back in good shape. Where the earlier Elizabethans excelled in feats of individual dash, their modern successors work as teams and behind a vanguard of science.

One other aspect of this great achievement merits attention. That Tensing should have been one of the first two men to stand on the summit of Everest is not only a tribute to the invaluable role of the Sherpas in every expedition; it is also a symbol of co-operation between an Asiatic and a white man. It is to the heroism of a New Zealander and a Nepalese within a British venture that Coronation day owed its final touch of glory. Nothing could have been more fitting.

London's Population

SINCE the evacuees returned, the population of London has been creeping slowly back to its prewar size. But there has, of course, been a striking redistribution; far more people today live near the outer boundaries of the London Transport area and far fewer within its centre. And by now it seems that London is neither losing nor gaining population from the rest of the country. Its numbers continue to grow only by the natural excess of births over deaths.

What is likely to happen to London's population in the next twenty years? According to estimates made by the London Transport Executive, the official plans for 1971 would reduce the population of the built-up area by over 600,000 and increase that of the outer country zone by 250,000. With the expected natural increase, some three-quarters of a million people would have to be moved out of the area—an impracticable undertaking on most reckonings. More likely estimates are derived from the draft development plans, which foresee an expansion in the population of the London Transport area by some 300,000, to well over 10 million, in 1971.

Books & Publications

Set Book for Socialists

BRITAIN'S ECONOMIC PROBLEM.
By C. A. R. Crosland.
Jonathan Cape. 224 pages. 12s. 6d.

IT is a pity that this book will inevitably be read largely for its political interest. Mr Crosland is an Oxford economist, who went into Parliament in 1950 and has established his position during three troubled years in the Labour party's history. He stands on the Right of the party, with the ex-ministers who during these years have been retreating under pressure, making practical and ideological concessions to the Left. But Mr Crosland himself makes few concessions. He firmly condemns many traditional Labour ideas. But he believes that

> there are grounds for hope that the party may now realise that it has not a single, but a dual role: to remain the party of social reform, but at the same time to put before the country a bold long-term policy, whatever the sacrifices entailed, for the economic regeneration of Britain.

The grounds are not easy to see, but Mr Crosland certainly performs one important political service. He shows what has seemed, of late, regrettably doubtful: that a reasonable man can still reconcile economic realism with Labour politics.

But this is a subsidiary aspect of "Britain's Economic Problem." Books of its kind—extended essays on the factual rather than the philosophical or social bases of economic policy—have remained surprisingly rare through the years of crisis. Mr Crosland puts between stiff boards the subjects of contemporary discussion in periodical literature. The result is inevitably more exposition than original study. But the economists and informed politicians should read this book, because it organises familiar facts and arguments unusually well. And for either the intelligent layman or the economics student, the exposition is excellent. Mr Crosland avoids jargon; and though his writing is not always elegant, it is clear and to the point.

One-third of the book is occupied by a competent, light and generally fair-minded sketch of British economic history since the war. The remaining two-thirds, which Mr Crosland calls "The Future," is an analysis of the British problem under three heads: the world shortage of food and raw materials; the disequilibrium between the dollar and non-dollar worlds; and the instability of the American economy. On almost every point, Mr Crosland's judgments fall into a moderate school. He believes, for example, that the world economy is reverting to a chronic state of great pressure on natural resources, but he does not carry this view to neo-Malthusian extremes. Again, he emphasises the difficulties for the rest of the world that arise from an American recession, without in any way suggesting that the United States is unchanged from the thirties. Nor does he deny, as Socialists have often seemed to do, that it is the rest of the world's job to learn to live with considerable fluctuations in American imports, arising from the moderate cycle in activity that the United States can well afford. Throughout, most people will disagree with some of Mr Crosland's judgments, but few will ever disagree violently.

Yet the policy that emerges from all Mr Crosland's good sense is by no means convincing. He gets into serious difficulties with the question that exposes so many of the dilemmas of British policy: if the fifties and sixties are decades of an expanding world economy, can the structural dollar shortage (for the rest of the world in general) possibly remain as serious as it looks? Mr Crosland recognises that it cannot, but he adds that it will be many years before American imports greatly increase; so the dollar problem will continue. That is fair enough, as an academic answer. But it makes an unsatisfactory basis for the policies that the book advocates—for intensified discrimination against dollar goods, with the sterling area bossed about more firmly from London. Are other countries going to stand for that, in the sort of world he anticipates?

Mr Crosland feels the need to show that he is not just a liberal economist in Labour clothing; he attacks those whose policies boil down to disinflation and nothing else. To avoid inflation is, he very properly says, "a necessary, not a sufficient, condition of solvency." But he does not add much about the other conditions. Controls over imports and export production have certain negative uses, but they will not take Britain far towards earning its living in the expanding world economy Mr Crosland believes we are dealing with. A large part of his conclusions might be summarised by saying that Britain will be all right provided that the economy is flexible; but the necessary changes that he discusses are merely the major, set-piece shifts to more coal, steel and engineering output. The author's defence is that this book sets out the external problem and it would need another book to do more than lightly sketch "the internal policies that will be needed." If this is really Mr Crosland's only difficulty, one may hope that he will write the second book quickly. As it is, the reader may have difficulty in believing that the policies are by any means as clear—at any rate in terms of practical Labour politics—as Mr Crosland asserts.

The Writer's War

IDEAS AND PLACES.
By Cyril Connolly.
George Weidenfeld and Nicolson. 280 pages. 16s.

THIS book, mostly made up of Mr Connolly's "Comments" in *Horizon* between 1944 and 1949, is an official history of his war against his enemies. He rules with spirit over a large ivory fortress, inhabited by those to whom literature is a serious business; and within the walls is a spacious glacis, composed of foreign parts. On one side the fortress is attacked by totalitarians, usually communists; but there the escarpment is steep, fifth columnists are apprehended and flung over the battlements, and molten lead falls with a satisfying plonk on the attackers' heads. The real danger comes from the other side, where the enemy is the vast indifferent British public; they may never capture the citadel, but they can starve the defenders out. The commander is at his best when he dispenses justice among his subjects, or surveys his glacis; but his sorties against the enemy deserve special notice, since they are designed not merely to break heads, but to reprovision the garrison, which needs it now more than ever.

Mr Connolly constantly defends the right of the creative writer to a livelihood, and he illustrates his thesis by replies from some twenty authors to a questionnaire sent out in 1946. The danger is not that writers cannot support themselves at all, but that they can do so by activities like journalism, broadcasting, editing and publishing, which are so like their real work that their energy gets drawn off from the serious writing which is their task. Of course, the problem is not a new one; but there are fewer private patrons and East India clerkships about these days, so the familiar question is asked: should the state subsidise them? Some of *Horizon's* correspondents reject the idea indignantly; others ask for the sky. He himself asks for something near the clouds. Let us hope, he continues, perhaps for something a little more modest. It is just because there are so many approximate but distracting resources open to authors, that literature (except for some modest help for poets) is the one art which the state, through the Arts Council, has not yet had to support. No such expedient is available for grand opera: either it is subsidised, or we do not have it. Authors have no inherent claim to special treatment; but in literature, as in the other arts, the country might gain by some experiments in patronage.

Guide to Economic Doctrines

A REVIEW OF ECONOMIC DOCTRINES, 1870-1929.
By T. W. Hutchinson.
Oxford University Press. 456 pages. 30s.

THE history of economic doctrines has been written in various ways. Some scholars have taken them up one by one and pursued their chequered course from their origin to the present day. Others have tied them to economic history, especially to the more spectacular events that have given birth to the most important doctrines.

The author of this learned book has started from several angles. In the first part he deals with the systems of the leading economists from 1870-1929. Jevons, Sidgwick, Marshall, Wickstead, Edgeworth, Hobson, Manger, Wieser, Boehm-Bawerk, Walras, Pareto, Wicksell and Cassel, Clark and Veblen, Simon Newcomb and Irving Fisher, and even Schmoller get a chapter or part of one. A succinst, though not always exhaustive, analysis—with a sort of biographical tilt—enables the reader to familiarise himself with their main ideas, and an appendix draws attention to their most important statements. This method inevitably involves repetitions, overlappings and cross-references; nor does it clearly show the unfolding of each doctrine.

The second part, "From Static to Dynamic Analysis," deals with Welfare Economics and Socialism; Consumers, Firms and Markets; Profit, Uncertainty and Expectations; Interest, Money and Macro-economic Analysis. The chronological - biographical arrangement is abandoned, and these several topics are strung together round "the increasing importance of the distinction between static and dynamic analysis." The author is conscious of a logical flaw in this arrangement; for the writers discussed in the first part saw in static analysis not the end of all economic research, but a prerequisite of dynamic analysis. Although socialism is dealt with, the controversies arising from the publication of Marx's second and third volumes in 1885 and 1894 respectively, are not mentioned; nor are the Neo-Marxists and the Austrian Marxists like Hilferding. This is a little perplexing, especially as the third part of the study—"Instability and Disturbance"—concentrates on "Crises and Cycles," the Marxist analysis of which deeply influenced economic thought and economic policy. The author should have given his reasons for leaving out these writers with whose works he is certainly conversant. The book has the merits of a first-class textbook and none of its customary shortcomings—guide book might perhaps be a better term, for the author is an excellent cicerone. His study is, however, rather depressing. One feels that the best brains who have been at it since Jevons and Marshall have made us more knowledgeable in many ways and more cautious in expressing views, but have not yet brought us much nearer to a complete understanding and successful mastery of the economic process.

Organised Politics

THE PARTY SYSTEM IN GREAT BRITAIN.
By Ivor Bulmer-Thomas.
Phoenix House. 328 pages. 25s.

NO more surprising gap exists in the literature of political institutions than the British party system. Besides those magisterial volumes which so comprehensively inform us about parliament, the cabinet or local government, there is nothing about the working of British parties that is not either out-of-date, partisan, jejune or monographic. This is a serious deficiency, not only for students but also for the layman, since it is upon a popular awareness of the realities of party government that democratic health largely depends. Party is organised power in modern Britain and, as power, it needs to be measured in order that it can be controlled.

Mr Ivor Bulmer-Thomas's book falls some way short of remedying this deficiency. It is a prefab, not a mansion. But at least it provides some shelter for the scattered, unassembled pieces of information on this topic which have nowhere else been afforded the protection of cloth covers since the late President of Harvard, A. L. Lowell, finished his "Government of England" in 1912. Since Lowell's day there have been many far-reaching changes, some of which have been described and analysed by specialists in different fields. Mr Bulmer-Thomas, though he has attempted no research of his own, has arranged in a convenient and readable form a great deal of this previously unassembled material. This task he has performed with an obvious relish derived in part, no doubt, from his unusual experience first as a Labour MP and later as a Conservative candidate. Such a dual involvement might indeed create problems of its own, tempting the author in succession to the *schadenfreude* of the disillusioned and the complacency of the convert. To Mr Bulmer-Thomas's credit it must be said that he has been highly successful in maintaining an impartiality which only very rarely cracks beneath the strain of his own political pilgrimage.

Here and there the book reveals in minor errors of fact and crudities of expression some evidence of haste in its composition. In the main, however, it is a clear, sensible, persuasive and thoughtful presentation of the party system. It begins with a description of its historical origins, then deals with present-day structure and workings, touches on some marginal topics such as the press and the churches, and finally explores some of the problems which our new Leviathans present for the democracy they serve.

Labour and Love

LELIA. The Life of George Sand.
By André Maurois.
Jonathan Cape. 482 pages. 25s.

THE George Sand who was an incredibly prolific writer, has largely been eclipsed in the world's mind by the boldly unconventional mistress of Chopin and Musset. The fact that her collected works comprise more than a hundred volumes presents a different picture—one of a novelist writing with Scott's speed and Trollope's regularity.

Thirty years have elapsed since M. Maurois made his debut as a biographer with *'Ariel, ou La Vie de Shelley.'* Lytton Strachey's sprightly Gallic disciple has been succeeded by an industrious student of unpublished documents, entrenched behind abundant footnotes. This substantial volume, in a very readable translation by Mr Gerard Hopkins, is less an appreciation of George Sand (1804-1876), the artist, than a brilliantly persuasive analysis of her complex nature, with its markedly feminine and incongruously masculine elements. Something was missing. Vitally attractive, she had, none the less, to retire defeated from her prolonged pursuit of a satisfying love. A fearsome egotism may have contributed to her failure. Lélia is the title of one of her novels, which has for its theme a pre-

dominantly maternal woman who cannot share the raptures of a series of lovers.

Sand's heredity—she was born Aurore Dupin—accords with her extraordinary life. She was descended on her father's side from an illegitimate son of Louis XV and an illegitimate daughter of Marshal Saxe, who was himself the illegitimate offspring of Augustus the Strong of Saxony and the lovely Countess Königsmark. Her mother, however, was the daughter of a bird-fancier. The family estate was Nohant, in central France. Our own pseudonymous George, Marian Evans, drew on her early memories of rural Warwickshire. Aurore Dupin was to till a similar field and to reap a far more voluminous harvest.

An incompatible marriage broke up after two children had been born. Aurore Dupin departed to Paris and successful authorship. In later years she became increasingly attached to country life at Nohant, an industrious matriarch, enjoying her grandchildren and dispensing much hospitality. A procession of illustrious names moves through this book: Balzac, Flaubert, Mérimée, Sainte-Beuve, Delacroix and Turgeniev, among many others. "The only two genuine passions of my life," she declared, "have been motherhood and friendship." Chopin and Musset were the victims of her maternal possessiveness.

At the seventy-fifth Annual General Meeting of the Institute of Bankers on May 20th the President announced the award of the Institute Prize to Mr. D. R. Marsh for his book

CORPORATE TRUSTEES

This is the first time since 1939 that the Institute Prize has been awarded, and on this occasion the award was made for *a work of outstanding merit published within the two years preceding the close of entries* for the Prize.

"The first serious attempt to describe the functions and organisations of the corporate trustee. . . . Mr. Marsh's book is admirable."—The Economist.

Letters to the Editor

Four Puzzles for M. Mayer

SIR—You say in your Note of May 16th that the devaluation of the Indo-Chinese piastre is "bold"; indeed it is a bold mistake. There can be no good currency in Indo-China as long as the war goes on prohibiting large exports of rice, rubber, coal, maize and dried fish, and as long as the rebels need francs to buy, directly or through other currencies, medicines and arms. Moreover, all the exchange of francs against piastres is done with the permission of the "Office indochinois des changes" and through the channel of this government agency. Only the enforcing of its controlling powers will put an end to the "traffic" of piastres. That traffic still goes on, with the rebels offering 1 piastre against 6 francs (the new parity is 1 to 10); they can afford it because they get their piastres cheaply by fleecing the population. Who will argue that a new devaluation to this parity is necessary? But the traffic, morally shameful, is economically unimportant. The truth is that the rising trend of imports had to be curbed, but there were better ways to achieve this than by a devaluation, which brings much economic and political trouble in the Associated States, without curing the traffic.

As to the true parity of the piastre, we cannot judge it during the war and in a shattered economy. If peace returns, exports will regain their prewar level and will largely pay for imports. The piastre could well then be worth more than the old parity of 17 francs, if it had a worldwide quotation.—Yours faithfully, P. BORDES

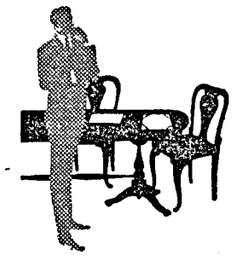
Saigon

[The devaluation should help to stop the flow of "hot money" from France to the Associated States. This means stepping on some wealthy toes; hence our epithet "bold."—EDITOR.]

When Italy Votes

SIR—On the eve of the elections, may I suggest that the note in your issue of April 11th was seriously short-sighted. Nobody is denying that clericalism is a substantial social force in Italy; but practically to identify it, as you have done, with the present Governmental coalition, which does represent the third choice, after communism and fascism, is something else again.

For historical reasons, democracy in Italy is still too tender a plant. But it does have a base. That base is represented by the present Governmental coalition, around which have gathered all those individual and social forces which are loyal to the democratic way of life. That base must be strengthened and extended if we want to prevent the return of any kind of authoritarian regime—communist, fascist or theocratic. I think it can be, provided that the present democratic coalition has the opportunity to continue its work of rehabilitation which, in time, can win increasing support for it. But if you characterise it as clericalistic, especially during a pre-election period, you discourage support of it at the very beginning.

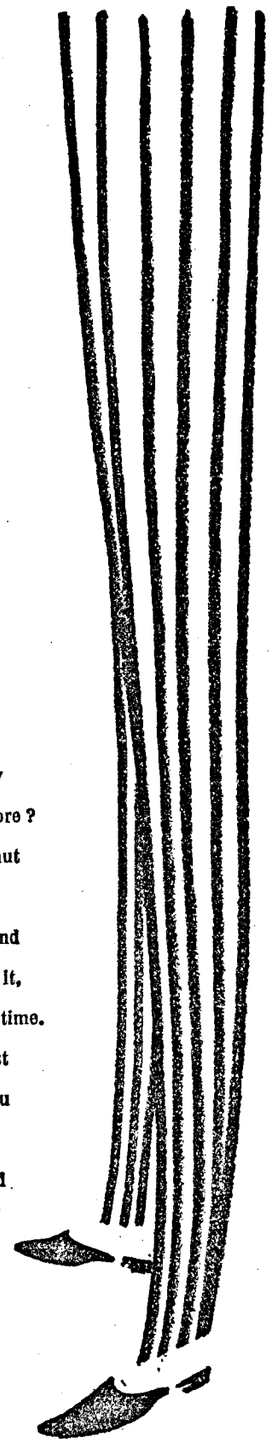


No Government of the centre is possible today in Italy without the Christian Democratic Party. The present coalition is moulding its followers in the direction of a more conscious recognition of the worth of democracy. In that sense, therefore, the specific dialectic of the present experiment in democratic political coalitionism ought to be recognised for what it is: a struggle against clerical authoritarian control. It ought to be encouraged, instead of having cold waters of scepticism thrown upon it, as you have done. The threat to democracy in Italy today does not come from the Catholics, but from the brutal political totalitarian movements, especially of Togliatti-Nenni.—Yours faithfully, HARRY GOLDBERG

Rome

The English Village

SIR—In your issue of May 30th Mr Lipton comments on the review of Mr Baker's book. It is true that in aggregate there is still quite an impressive number of craftsmen and small craft businesses left in the countryside, and that the Rural Industries Bureau is doing good work assisting them technically and financially. The contribution of the crafts towards the rural labour problem is, however, but a drop in the ocean. What has to be found in nearly every rural area is one or more small works, employing up to, say, a hundred persons each, which will absorb all the wage earners surplus to the needs of agriculture and forestry and of small ancillary industries. At present, not less than one third, probably one half, of the working population of the countryside is having to travel to the nearest large town to find employment, and that does not make for stability. In fact, commuting is the first step towards leaving the countryside altogether, for it is natural that a man or woman should wish to live close to his job. Unfortunately very little is known about the economics of small industries located in the countryside, and it is here that a great deal of research and experience is needed, but the problem will have to be solved if the drift out of the village is to be stopped.—Yours faithfully,



YOUR REVIEWER

HAVE YOU

NOTICED IT TOO?

How one grows out of office furnishings? How, suddenly they simply aren't your style any more? You detest tubular steel (or walnut panelling or neo-classical-contemporary-what-have-you) and Great Scott! come to think of it, you have detested them a long time. At this stage, some men must only grin and bear it. But if you are a V.I.P. in your firm, get on to Mr. Peter Catesby and his staff at Catesbys. They have a knack of surrounding eminent men with eminently suitable furnishings — adapted to suit them.

How Much is Enough in the Air?

Washington, D.C.

THE season of late spring and early summer, when the friction between the Administration and the Congress over budgets and appropriations begins to become acute, is always an unhappy period in Washington, whatever the weather. It is the time when relations wear thinnest between the two ends of Pennsylvania Avenue, when Administration officials prepare to fight their last ditch stands against cuts in their appropriations. It is the time when members of congressional committees are most prolific of irresponsible remarks about the allies, the Administration, and the armed forces.

This year, in spite of President Eisenhower's efforts to promote a better understanding between the two ends of the Avenue, the chorus is as strong as ever, and became considerably shriller when he dashed all hopes of a balanced budget or of reductions in taxes. Moreover, this year an unusual counterpoint theme has sprung from the fact that the largest single reduction in the appropriations for the fiscal year beginning in July falls on the United States Air Force, the favourite service of the United States Congress and the American people.

That the new Administration did not intend to build up the Air Force on the same basis as had its predecessor, or to as large an eventual size, had been apparent for over a month before Mr Charles Wilson, the Secretary of Defence, announced it to a congressional committee on May 11th. It was implicit in the demands for a substantial reduction in defence appropriations which had been made since February by the Bureau of the Budget, for as the largest spender of military funds the Air Force was obviously going to have to bear a heavy share of this reduction. What did take Washington by surprise was the announcement that almost the whole of the $5 billion cut in the defence appropriations would be borne by the Air Force. When it was revealed, partly by the President in his radio address of May 19th and partly by Mr Wilson in his testimony before the Senate Appropriations Committee, that the Air Force would be reduced by this amount of new spending authority for the coming year, and that its eventual size would be 120 wings instead of 143 wings (which had been established as the goal for the past eighteen months and more), Congress flared up.

The Administration's presentation of this politically contentious decision was complicated by the fact that Mr Wilson and the President spoke with two voices, the one claiming that the military targets had been adjusted to the framework of a reduced budget, the other that the targets had been decided on first and the money needed to meet them afterwards. But what drew the wrath of Congress was Mr Wilson's characteristically unfortunate remark to a Senate committee that the new programme would provide more defence at less cost. This attempt to assert that Republicans can have the best of both worlds must have brought home to him the truth of the great American homily: "Never underestimate the power of a woman." For it goaded Senator Margaret Chase Smith of Maine into addressing thirty-two pointed written questions to the hapless Secretary, one of which was:

> How has the nature of the Communist threat changed so that we need only 120 instead of 143 wings, and yet we still need the same number of Army divisions and Navy combat ships?

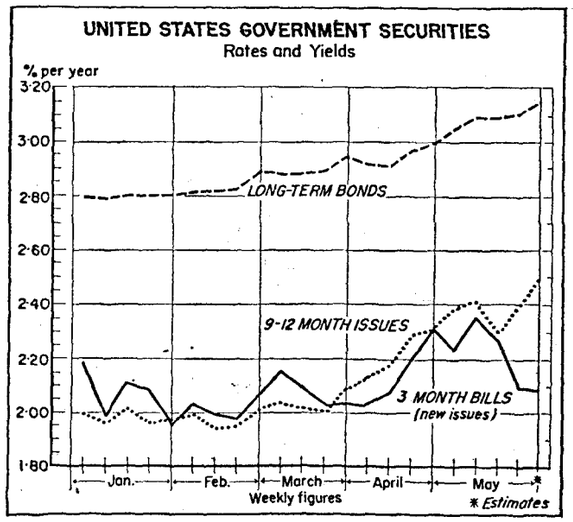
Representative Yorty of California, a Democrat, inserted into the *Congressional Record* a statement by a senior Air Force officer that the new limitations on Air Force expenditure and manpower would have a drastic effect on the aircraft industry, and on the ability of the Air Force to man even a reduced number of air formations.

The present strength of the Air Force is about 106 wings.

An American wing is roughly the equivalent of an RAF group and varies from a strength of about 75 aircraft for fighters to about 30 aircraft for bombers. The new Administration's plan, which abandons the idea of working towards an exact target, will achieve its reductions by eliminating five of the 57 wings which were to be the final strength of the Strategic Air Command, and a further eighteen troop-carrying, transport and fighter-bomber wings. Exact comparison between two such sets of estimates is certainly an unfruitful exercise. No one disputes Mr Wilson's contention that there had been considerable waste and overlapping in the old programme, or that ten per cent of the wings supposed to be in existence now lacked either bases, aircrew or aircraft. And there is much to be said for his belief in the importance of equipping a smaller number of formations with newer planes, and thus reducing the factor of obsolescence; this is similar to the change in emphasis that has occurred in the RAF programme.

★

What is hard to accept is Mr Wilson's contention that, if the strategic situation alters in the future, more aircraft can be put into production to compensate for those eliminated from the drawing board by the reduction of $3.4 billion in aircraft procurement funds this year. Mr Wilson and Mr Kyes, the deputy secretary who is emerging as the more effective figure of the two, are expert industrial engineers, but the whole of postwar experience with complicated jet aircraft disputes this contention. There is no doubt that a shift in professional American thinking about the use of strategic air power is taking place: greater reliance is now placed upon the medium range bomber, operating from overseas bases or from carriers, than on the very long range bomber based on the United States.



But this decision was taken for budgetary, not professional, reasons without the agreement of the outgoing Chiefs of Staff and before the new ones were in a position to make their own recommendations. Consequently the decision on the Air Force has had a very uncertain reception even by those members of Congress most anxious to see a reduction in total expenditure. Mr Kyes and Mr Wilson have explained that they have merely asked for somewhat less money to be set aside for expenditure on the Air Force in future years, while they concentrate on improving current production, and await the strategic recommendations of the new Chiefs of Staff. But they have explained it in the complicated jargon of the Detroit engineer, and have not yet got their point across to Congress.

The Air Force itself is also thoroughly alarmed: the favoured position which it acquired three years ago, when the concept of "balanced forces" was abandoned, seems to be in jeopardy; and the force is more than nervous at the prospect of having an admiral as chairman of the Joint Chiefs of Staff. Genuine unification and co-operation between the three services has never got further than skin deep; the battle between the aircraft carrier and the strategic bomber, between the Army's anti-aircraft guided missiles and the interceptor fighter, over whether the fighter bomber should be a support weapon for the army or an independent operator, still rages in the Pentagon. In consequence the Air Force has built up in self-defence a lobby in Congress which Jay Gould or the Robber Barons would have envied, and it has receptive material on which to work. Not only do many of the leading Democrats see in this question an issue on which they can defend the late Administration and probably strengthen their standing for the next election, but even the midwestern Republicans have always had a kindly feeling for the Air Force. In the present atmosphere of recrudescent irritation with allies, the Air Force, in particular its strategic bombers, represents the best way in which the United States can confront Russia without having to station American boys in degenerate foreign parts or heed the views of its friends. The danger, since no politician will dare to suggest reducing the total of the already unsatisfying cuts in the new budget, is that the Air Force will have some of its funds restored at the expense of foreign aid, offshore procurement or some other vital part of the programme.

Pinching Money

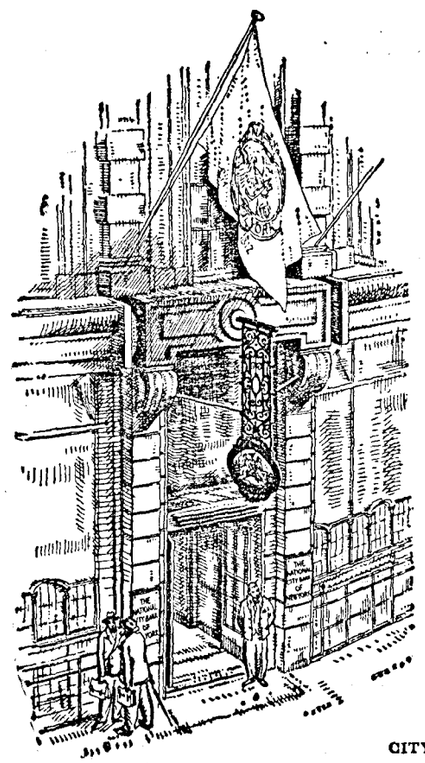
FROM A CORRESPONDENT IN NEW YORK

ALTHOUGH it was to be expected that a restrictive monetary policy would be ineffective unless it pinched at least some borrowers and lenders, the fact that it actually does pinch has come as a great surprise to even the most sophisticated investors. Their cries of outrage and anguish are now re-echoing in Washington. When the case for using indirect monetary measures to check inflation, in preference to direct wage and price controls, was being argued, the opponents maintained that indirect action could not be made to work effectively. Now it seems that the scoffers are

protesting that such action works all too well, while those who had urged the use of monetary controls are protesting they did not mean them to be used so much.

As the result of these political complaints it is the Department of the Treasury and the Federal Reserve Board, the central bank, that are being most severely pinched by the restrictions on money for which they are themselves responsible. They have to carry out the monetary and debt management policies designed to keep the inflationary results of the present budgetary deficit within the tightest possible bounds, and yet avoid precipitating a deflation that would ruin Republican chances in the next election, or would make it impossible to continue using monetary measures in the

future. Thus far, almost all of the criticism from the left is centred upon the Treasury, which is accused of pushing interest rates up. But the Federal Reserve's comparative immunity cannot last for long, for the fire from the right is now being concentrated on it and the direction of the shelling will soon show the left where the target really is.



Under these circumstances, it is unfortunate that Mr Humphrey and Mr Martin, who respectively head the Treasury and the Federal Reserve Board, have not chosen to counterattack swiftly by emphasising to their critics what is the alternative to their policy. It should be easy to deal with the twenty members of Congress who want the Federal Reserve to support the prices of government securities at par by stressing that such action would have the effect of providing investors with interest-bearing currency. Nor should it be too difficult to explain to expert critics that the creation of an additional supply of money at a time when virtually all manpower, plant and equipment, and natural resources are employed will do little but push up prices, and thus make it more difficult to help the economy through the period of readjustment which these critics are forecasting for the immediate future.

But little has been done along these lines, although recently there have been several articles in the press, quoting "well-informed sources" to the effect that the central bank's policy is one of applying a degree of pressure to bank reserve positions, not a policy of denying funds absolutely to the money market. These inspired stories have apparently been intended to reassure that market, which has been fearing that it may have to face the mounting demands for credit from consumers, business and the government completely unaided. To lend force to its words, the central bank put more than $200 million of new funds into the market during the latter half of May.

Neither words nor works seemed to produce the desired result, however. In the same weeks the bond market steadily degenerated through weakness to near disintegration, with the longest term issues under the heaviest pressure. The Treasury's new 30-year 3¼ per cent bonds dropped almost a full point below the issue price of par, most of the decline coming within two days. Other offerings of Mr Humphrey and his deputy, Mr Burgess, have fared no better: the more recent one-year 2⅝ per cent certificate sold fractionally under par before its June 1st issue date. The earlier 2¼ per cent certificate due in February, 1954, sold at prices to yield more than 2½ per cent, while the 2½ per cent 1958 maturity, sold in February at par, fell below 97½. The experience of investors who have bought these products of the Humphrey-Burgess partnership is hardly calculated to build an attractive reputation for the future output of the concern, yet it is quite apparent that the firm will have to increase production in the months ahead.

★

Probably one of the more significant phenomena of recent market developments has been the way the rate on 3-month Treasury bills has tended to remain low, and even to decline at times, in spite of a steady increase week by week in the quantity being offered for sale by the Treasury. Already nearly $1,000 million has been raised in this way and another $800 million by a sale of special tax anticipation

Trade follows this flag

In every corner of the world, wherever trade is possible, the flag of The National City Bank of New York symbolizes the march of commerce.

The National City Bank provides the means of making trade easier, safer, and more profitable. In a world of complex and changing regulations it offers business men an invaluable service: up-to-the-minute knowledge of trading conditions in all parts of the world.

The National City Bank provides this service through its network of 57 branches in 19 countries, and through its banking correspondents in every commercially important city in the world. The London branches of the bank offer, as well, an intimate knowledge of trade with the dollar countries.

A visit to The National City Bank of New York will always ensure the speedy and successful transaction of your business.

THE NATIONAL CITY BANK OF NEW YORK
(ESTABLISHED 1812)
Incorporated with limited liability under the National Bank Act of the U.S.A.

series, and the Treasury has publicly announced its intention to get another $900 million during June. It would seem that much of the money being frightened out of long-term issues, or being frightened away from going into them, is seeking a temporary haven in the comparative security of a short bill from which a shift can be made without risk of significant loss if the times should become propitious for long-term investment.

At the moment, however, the market is staring, fascinated, at the prospect for the latter half of the year. In those six months the Treasury will have to raise perhaps $8 billion, state and local governments will continue their heavy demands for financing road, school, water, hospital and other improvements, and a seasonal demand for bank credit will be added to all the rest. It is perfectly clear that even the record peacetime rate of savings now being accumulated will not satisfy the demand, and the money market has apparently convinced itself that the central bank has so completely withdrawn that it will not provide a single dollar of reserves to enable the banking system to create the necessary deposits. Furthermore the market insists on interpreting Mr Martin's hailing of the return to free markets as a firm commitment that the Federal Reserve Board will never intervene to influence the course of interest rates, no matter where they go.

The market can hardly fail eventually to come out of its present state of nerves, shivering severely with every passing rumour, but it is doubtful if the criticism it has brought down on the Treasury and the Federal Reserve will pass as quickly. For the rate increases that began in the money market are now spreading out in the form of rising costs for business borrowing, real estate mortgages, and Stock Exchange collateral loans; there are some indications that consumer credit rates will also soon be increased. All of these rises bring more and more cries for easy money, more and more pressure on President Eisenhower to relax his insistence on a "sound" dollar. And, of course, Mr Humphrey and Mr Burgess wonder how they are to raise the billions of dollars they will need before the year ends, and how they are to refund almost $20 billion of maturities that fall due before December 31st in a market that seems ill prepared even to handle the volume of securities already outstanding.

It is, perhaps, the most ironic of all developments in the first few months of the new Administration that Mr Burgess's severest critics are neither the Fair Deal Congressmen nor the pundits of the press, but his former associates in Wall Street. They complain bitterly, and probably shallowly, that lack of adequate technique has helped to put the market in the dumps; they point to an opening of subscription books for the new 3¼ per cent bonds on a day when banks were closed in three states, to a failure to prevent speculation in these bonds in order to enable "true" long term investors to buy them, and to a disturbing habit of breaking the bad news of large additional financing to come in anything but the gentlest manner. This, however, is the kind of surface analysis that any market specialises in. The hard core of the problem remains the unquestioned need of the Treasury for deficit financing at a time when the private sector of the economy is doing more than enough deficit financing of its own, and at a time when it has been decided to rely on monetary measures to contain the boom within reasonable limits. No technical skill would avail wholly to resolve these contradictions.

The Hanover Bank maintains banking offices in London and New York, the financial centres of the world. An international network of correspondent banks is available for every type of banking transaction.

Who Makes Foreign Policy?

THE Senate has had second thoughts about its Appropriations Committee's attempt to limit the President's freedom to negotiate a Far Eastern settlement, by withdrawing the American financial contribution to the United Nations should Communist China be admitted to membership. But the price the President has paid for the compromise may turn out to be steeper than he realises. He agreed to the inclusion in the Bill of a clause stating that Congress believed that Communist China ought not to be admitted to the United Nations, and he gave Congress to understand that he could be relied on to oppose any proposal for admission. But what Congress understood, or what some members will later maintain that they understood, is that the President was permanently committed to this opposition, while he himself almost certainly implied that his undertaking was qualified by "in present circumstances."

This is assumed from the answer Mr Eisenhower gave to questions on the matter at his press conference last week, when he also put obstacles in the way of two other manifestations of the isolationist movement which is gathering speed in Congress, if not in the country. He said that he did not think it would be desirable to cut off all trade between the free world and Communist countries, thus indicating that he would be prepared to take a firm stand should Senator McCarthy press this issue to a conclusion. And, more important, the President answered in detail the challenge of Senator Taft's Cincinnati speech, making it clear that if it came to a choice between the alliances of the United States with other countries and his own alliance with Mr Taft, he would put international co-operation first.

When read in full the Senator's speech is not so frankly isolationist as it seemed from the first reports of his suggestion that the United States should withdraw from the Korean peace negotiations if the present talks broke down. But his sceptical remarks about both the United Nations and the North Atlantic Treaty Organisation came at a time when they could do most harm, not only to the hopes of peace in Korea and of a constructive outcome to the Bermuda conference, but also to the spirit in which Congress will consider appropriations for foreign aid. This week's compromise over Communist China and the United Nations provides the clearest possible example of how Congress, through its ultimate financial authority, can frustrate the President's constitutional responsibility for the foreign policy of the United States. For this reason the President cannot "go it alone" without Congress any more than the United States can "go it alone" without allies. But the feeling has been growing that President Eisenhower has been too ready to make concessions to Congress in general, and to Senator Taft in particular, and that he is forgetting why he, and not Mr Taft, was given the Republican presidential nomination last year. Last week's evidence that the President is prepared to exert his authority, when forced to do so in defence of his principles, was therefore greeted with much relief, not least among the many internationally-minded Republicans.

Congress Counts the Days

WITH Senator Taft away from Washington last week, the other Republican leaders were playing with the idea that Congress might not only go on holiday at the end of July, but might actually adjourn until next January, thus abandoning the Senator's plan for an autumn session. The proposal will hardly appeal to Mr Taft, for his influence on the Administration will be less when he cannot call on Congress to back him up. Moreover, he is commendably eager that this Republican Congress should make a record of which the party can be proud. Next year Congress will be caught between the usual spring rush of appropriation Bills and the November election; a session in the coming autumn now offers almost the only opportunity for constructive work.

For in its first five months this Congress has accomplished very little; only 41 public bills have been sent to the White House, just half as many as Mr Truman's 1948 Congress had dealt with by this time; of these only one, the offshore oil Act, is a major piece of legislation. And now that Congress is counting the days until it can recess, it is obvious that much of even the modest programme that President Eisenhower set for it will have to go back on the shelf. Something may be rescued from among the plans for statehood for Hawaii, changes in the immigration laws, customs simplification and so on, but it will be very little. The President will even have to exert himself if he is to get the excess profits tax extended, although here the obstacle is not lack of time, but obstinate opposition in the House Ways and Means Committee.

Both the House Appropriations Committee and the Administration have done their best, or worst, to put the principle of economy into practice, but now that the appropriation Bills are getting on to the floor of the House, constituents are, as usual, coming before principles. A dam is being added here, a school there, although not perhaps as liberally as in the past, and consciences are being soothed by the thought that money can surely be saved on foreign aid. The authorisation for this aid is one of the Bills that the Republican leaders are agreed must be dealt with before Congress goes home; others are the extension of the Trade Agreement Act and of the excess profits tax; and of course the twelve Appropriation Bills. The House has finished with half of these, but the Senate has hardly begun.

The Administration is, however, apparently prepared to excuse the Legislature when this minimum has been finished, for it is as anxious to have a holiday from Congress as Congress is to have a holiday from Washington. Relations with Capitol Hill have been more difficult than had been expected, partly because of the political inexperience of many of the new officials. And heads of executive agencies, like their Democratic predecessors, have been spending far more time in congressional committee rooms than they can spare from their desks.

More Power for Mr Dulles

THE President's two schemes for reorganising the administration of the foreign assistance and international information programmes, which will come into force at the end of July unless disapproved by Congress, are only stop-gap measures to remedy the most pressing inefficiencies. A complete reorganisation of the conduct of foreign affairs, which will require specific legislation, is promised next year. The chief purpose of the new proposals, apart from concentrating related activities in single agencies and thus improving co-ordination, is to confirm the Secretary of State's ultimate responsibility for foreign policy under the President's control, but to take away from him the immediate responsibility for administrative details

INDEX NUMBERS showing changes in the replacement cost of various classes of plant and machinery are available on subscription to companies wishing to adjust their depreciation provisions in accordance with fluctuating price levels. Details of this and other services of interest to industry can be obtained from The Economist Intelligence Unit, 22 Ryder Street, London, S.W.1.

which has so often involved him in congressional controversy.

This has, of course, been especially the case where the overseas information programme is concerned, since it has recently been under constant fire from Senator McCarthy. Whether the new system will work any better than the old in this field depends mainly on whether the Senator lets it. But at least the opportunity for a completely fresh start will be provided by the establishment of a new United States Information Agency, separated from the Department of State and taking over the international information activities of other departments as well. The new agency is to report to the President through the National Security Council, which should ensure that it does not work at cross-purposes with American undercover activities in foreign countries, and the Secretary of State is to supply "full guidance concerning the foreign policy of the United States."

It is also provided that the heads of both the Information Agency and the new Foreign Operations Administration are to be men who have the full confidence of the Secretary of State, which means that Mr Dulles will have veto power over these appointments. This, and the fact that the Director of the Foreign Operations Administration is to be guided in policy matters not only by the Secretary of State but by the Secretaries of Defence and the Treasury, means that the holder of this new office will have less independence than the Director of Mutual Security whose functions he is taking over. But that Director was made immediately responsible to the President by a Congress which distrusted the then Secretary of State, Mr Acheson; there is not now likely to be much objection to making Mr Harold Stassen subordinate to Mr Dulles. And the new Director will have more operational responsibility than the old; for he is to be in charge of all programmes related to foreign aid, such as technical assistance and help for refugees which have until now been administered by the State Department.

THE *First* SINCE 1784

The United States had only just become a sovereign power when in 1784 the First National Bank of Boston was founded. The bank has grown with the country — indeed helped the country to grow — and maintains important branches in Argentina, Brazil and Cuba as well as a wholly-owned foreign banking affiliate in New York City.

America's oldest chartered bank offers traditionally courteous and comprehensive financial service to bankers and concerns engaged in overseas trade with North and South America.

Petroleum Seeks Protection

THE chances that the Reciprocal Trade Agreements Act will be extended for one year, in substantially its present form, as the President wishes, rather than with the restrictions contained in the unsatisfactory Simpson Bill, have been much improved by a compromise version which has been worked out between the White House and Republican leaders in Congress and which it is hoped can be pushed through quickly. This does not, however, mean that the last has been heard of the drastic quota restrictions which the Simpson Bill would impose on imports of both crude and refined petroleum. These have long been demanded on every possible occasion by the so-called independent oil companies, who have no overseas interests, and on this occasion additional fuel for their arguments was provided by an unusually mild winter and the expansion of domestic petroleum capacity. Together these have meant that, although the demand for oil products continues to grow, it has been temporarily overtaken by supply; domestic production has been cut by 350,000 barrels daily since January, and imports have also been reduced, voluntarily.

Many of the sessions of the House Ways and Means Committee, when it held hearings on the Simpson Bill, were devoted solely to arguments for and against restrictions on oil imports. Evidence was given on the one side by independent oil producers, by coal interests and by railway officials, and on the other by the major petroleum companies, who are not only producers but also refiners, overseas as well as at home, by industrial users of fuel oil, by farm groups and others concerned with foreign trade, and by government spokesmen. Domestic oil and coal producers said that development of the country's fuel reserves was being held back because cheap imports depressed prices, while the major oil companies replied that a reduction in imports would eat into reserves, raise prices, harm foreign trade and endanger national security. They pointed out that the United States has been a net importer of oil for several years and now consumes close to 8 million barrels daily, but has a productive capacity of under 7 million barrels a day.

The basic argument over whether it is better to concentrate on developing America's own limited reserves of petroleum at full speed, or on an orderly programme of "supplement but not supplant," combining foreign imports with a gradual increase in domestic production, is not a new one. Independent producers have, however, received little encouragement in their demands for restrictions on imports from either the past or the present government, for both have been mindful of the repercussions on wider issues of foreign economic policy, and of the continually growing American need for raw materials. But the Eisenhower Administration seeks to soften its opposition by advising domestic producers who can prove they are being damaged to seek relief from the Tariff Commission, and by urging importers to use "industrial statesmanship."

The World Overseas

Japan's Economic Prospects

FROM OUR TOKYO CORRESPONDENT

THE State Department's pledge to maintain dollar spending in Japan "at a relatively high level" for another two years, even if peace does break out in Korea, has infused fresh hope and life into the always Micawberish philosophy of the Tokyo politicians and the Osaka industrialists. Presumably this continued aid—or Washington Danegeld, as some cynical Japanese call it—will take the shape of procurement orders for the rehabilitation of Korea, off-shore defence purchases, and Point Four buying from Japan for South-East Asia. No one can pretend, however, that the first will adequately replace the demands of war, while the second remains a highly speculative quantity, vulnerable to the changes of American policy. The scope of the third is unknown, although the Japanese are suspicious of a diffusion of American aid throughout the Orient, on the theory that the same amount of butter may be spread more thinly. They are, for example, frankly disturbed at reports that the Americans have just placed a munitions order for $5,800,000 with the Chinese Nationalists to help the economy of Formosa and, for the same reason, are considering placing relatively small similar orders in Siam and the Philippines. Some non-American Western observers here suggest bluntly that the shock of competition would do more to shake Japan into realistic efforts to cut costs, rationalise methods and stand on its own feet than open-handed American offers of aid that smack of anxious bribery.

The first draft of the long-awaited Nathan Report on Korea has estimated that an expenditure of $1,700 million would be needed to make South Korea self-supporting by 1959-60, with an expenditure of $400 million "in the immediate future." On paper the UN Korean Reconstruction Agency (UNKRA) has now a budget of $70 million up to the end of June (of which half has already been disbursed) and of $130 million for the year beginning in July. Only a proportion of this will be spent in Japan—on orders, it is calculated at the moment, amounting to $40 million. This is small beer beside the $800 million now being spent yearly in Japan on goods and services for the UN forces in Korea, on the American security forces in Japan and on other American purchases.

Japanese leaders of heavy industry hope that, by some miracle, the Communists will agree to elections for a unified Korea. Should Korea be unified and elections be conducted by the existing or a reshaped UN commission, the tremendous task of rehabilitating North Korea's shattered industrial complex—estimated to cost at least $10,000 million—would presumably become a responsibility of the United Nations, instead of the Chinese (as under repartition), with consequent heavy pickings for Japanese heavy industry.

Japan's Economic Counsel Board is still uneasily uncertain of the amount of rearmament which it must yield in response to impatient American urging. It has high hopes of securing American technical aid in advice and modern equipment, as well as dollars, for a general switch-over of its expanding munitions industry from Korean war orders to the needs of Japan's own defences. A request has been made for permission to send a large Japanese team of technicians to the United States to study American techniques in arms production and to organise technical liaison between the armament industries of both countries. This request is not without its embarrassments for the Americans, who are pressing for swifter Japanese rearmament but remain dubious about entrusting Japan with some highly specialised technical secrets which are revolutionising American weapons and production.

The Economic Counsel Board has succeeded in angering both the influential Federation of Economic Organisations (Keidanren) and the militarists by heavily cutting down their respective blueprint proposals for rearmament. The table below gives the competing blueprints in rough outline:

BLUEPRINTS FOR REARMAMENT

	Militarists' 3-year plan	Keidanren 6-year plan	Economic Board 6-year plan
Army	300,000 men (with equipment for 600,000)	300,000 men (with equipment for 600,000)	175,000 men (with equipment for 250,000)
Navy	220,000 tons (three light cruisers, 96 destroyers)	300,000 tons (based on destroyers)	220,000 tons (based on destroyers)
Air Force	2,500 fighters and 500 medium bombers	2,800 fighters and 900 medium bombers	1,200 planes, "mostly fighters"
Estimated cost	No estimate available	2,900,000 million yen	1,222,000 million yen

By the operation of some esoteric and undisclosed formula the Keidanren proposes that the United States should contribute 1,270,000 million yen to its plan; the Economic

Counsel Board puts the contribution, on its more modest scale, at 270,000 million yen. A final decision on the competing blueprints has been postponed by party intrigue and wrangling.

Fundamentally, Japan's difficulties, of course, are simple and back-breaking: costs are too high, hungry mouths are too many, markets are too few. These difficulties are not remedied, but rather obscured and worsened, by disguised charitable handouts, which encouraged the honourable Micawbers in the Treasury to postpone realistic action. Costs, however, can be cut only if equipment is modernised, with consequent incitement—never very necessary in Japan—to staff retrenchment, which in turn must provoke industrial unrest, already strong and mounting.

The Lure of China Market

Finally, if "trade not aid" is even more applicable to Japan than to Britain, the Osaka signposts point with strengthening persuasion to Communist China. There have been several recent indications of the evergreen appeal of the China market. A special survey of China's Five-Year Plan by the Economic Counsel Board points out that Japan can contribute, heavily, swiftly and continuously, the capital goods and industrial equipment needed for that plan in exchange for cheaper raw material supplies than are now available from the non-Communist world. Envious notice has been taken in Osaka of Britain's recently increased trade in non-strategic goods with Red China. There have been record applications, now totalling 300, from manufacturing concerns for representation at the series of China-Japan trade exhibitions which are being organised for display in China in the autumn by the China-Japan Trade Promotion Association. There has also been a temporary withholding of orders for coal from the United States, while the "Big Three" iron and steel manufacturers—Yawata, Fuji and Japan Steel Tube—seek to place preliminary orders for 610,000 tons of Kailan coal with China, at an estimated cost of less than $11 a ton, in exchange for galvanised iron sheets.

Meanwhile, South-East Asia remains a glittering disappointment to Japan. Heavy industry has not recovered from its shock at the abrupt breakdown of the ambitious plan to build a joint iron mill in co-operation with the Indian Government at Orissa. Despite Delhi's denials, the conviction persists that wicked British machinations were directly responsible for this surprising setback to an experiment in Oriental partnership which Japan hoped would set a popular precedent throughout Asia.

The Sick Man of Europe

FRANCE is one country where to become prime minister is neither a difficult nor a happy achievement. At present, in fact, there is a shortage of eligible suitors in the house of the political Bluebeard, for each candidate knows that the National Assembly has already buried seventeen of his predecessors. Whatever his party or programme, a prime minister in the Fourth Republic faces the same fundamental problem: on national and foreign affairs the French are nearly anarchists, but when it comes to local politics or vested professional interests, their political passions run deep and with a short-sighted tenacity. France is very much the homeland of Proudhon, a political theorist with a distrust of the state and a belief in the role of the local political unit and commune which are equally fierce.

The French parliament is an assembly, but not properly a national one. It represents complex alliances of local interests, of professional groupings or religious affinities. The centre is shifting constantly and subtly from a non-existent political pole either to the traditional Jacobin left represented by the Communists, or towards the right with its disordered Gaullist ranks and its memories of a royal and Catholic past. The coalitions which have allowed successive cabinets brief spells of office do not represent a real coherence of views but rather a temporary armistice between traditional opponents. As a result, the French parliamentary system does not work.

Although the disunity of France under the Nazi occupation was obviously due to military defeat and the tragic failure of prewar foreign policy, it also reflected a genuine national state of affairs. This is a very unpopular view but it corresponds to the facts. Since the time of the Commune, and, much later, of the Dreyfus affair, France has been a house divided against itself. Instead of trying to do something about it, moreover, the constitution of the Fourth Republic has given every advantage to the French instinct for political levity and fickleness. It has allowed the National Assembly to hold a whip-hand over a feeble executive, and at the same time it has allowed the executive to interfere frequently with impunity in financial affairs, giving a political adjunct to inflation. In its traditional fear of Bonapartism, the French constitution has left little power with the President of the Republic and it is entirely M. Auriol's personal gifts that have restored prestige and significance to the Elysée. Finally, the French electoral system is a triumph of ingenuity over good sense and is calculated to produce anything but a clear expression of the national will, even if the latter existed.

Plain Speaking From M. Reynaud

Many French politicians know these things, but few are prepared to say them, and often the Communists have had a monopoly of frankness. If it has done nothing else, however, the present crisis has provoked the refreshing spectacle of the National Assembly being told off by one of its most experienced leaders, M. Paul Reynaud. When he was asked to form a government last week, M. Reynaud had few illusions about his chances of succeeding. He preferred to use his brief appearance on the stage for a severe and brilliant set piece on the state of the Fourth Republic. M. Reynaud postulated that it was no use trying to govern France until the constitution was revised so as to guarantee a cabinet a minimum of eighteen months in office. In the event of a crisis before this term expired, the government would have the right of dissolving the Assembly. To a thunderstruck house M. Reynaud also asserted that France was in need of an overhaul comparable to, if not greater than, that of the French Revolution. He alluded frankly to France's economic stagnation, particularly in housing and agriculture. Throughout his analysis, M. Reynaud implied that the British political system was a worthy goal for French reformers, and in a noble tribute he spoke of the English as a people to whom no one could give lessons in democracy.

Unfortunately, M. Reynaud's analysis was an academic rather than a practical exercise. As soon as he had concluded, it was clear that the Assembly would not allow him to carry through his programme. Furthermore, M. Reynaud's eloquent voice recalled memories of a terrible past more than it invoked hopes for a sounder future. It was the voice that had spoken far less clearly in the hour of France's defeat in 1940 and to many Frenchmen M. Reynaud is not a prophet but a grave-digger. Moreover, as his parliamentary opponents were quick to point out, M. Reynaud did not deal concretely with France's social and economic illness. To do so would have meant giving a description of present-day France. Half the population lives by agriculture, presses for high food prices and stores its money in the cellar. The other half clamours for every form of social security benefit and subsidy in order to offset high food prices. Neither half pays taxes if it can in any way avoid doing so. And if the government suddenly wished to puts its fiscal house in order, it would have to haul a major fraction of the population into court. There, moreover, French legal practice would see to it that years elapsed before a case was ready for hearing. A point has been reached in French political life where there is a dangerous choice between two unsatisfactory roads: either an insufficient measure of executive power is left in lawful hands, or a real executive is created unlawfully. This implies the possibility of a *coup d'état* and seems remote indeed. Nevertheless, observers agree that France is very much in search of a "strong man."

The present crisis has come at a particularly awkward moment for the rest of the free world. The Bermuda meeting may have to be delayed for lack of a French participant and there is no one to deal with the grave Indo-Chinese problem. In addition, the French Treasury is in desperate straits. Once again, France is jeopardizing not only itself but also its allies and invalidating its own claim—so justified on many counts—to be reckoned among the great powers and a leader in the life of Europe.

Birth Pangs of a Nigerian Nation

FROM OUR CORRESPONDENT

THE recent Kano riots in northern Nigeria were not riots at all. They were in no sense popular demonstrations against authority, but pitched battles between thousands of people—civil war, not window-breaking or stone-throwing. The main facts make this clear. Sabongari is the strangers' quarter outside the walls of Kano; it is customary in Nigerian towns for northern and southern peoples not to mingle. Twenty thousand people live there, predominantly Ibo, the thrusting, vigorous eastern peoples who, driven by land-hunger and lack of opportunities in eastern Nigeria, are rapidly overrunning West Africa. This community came into violent conflict with the adjacent quarter of the town proper, the Fagge area, mainly populated by Hausas. In a series of engagements nearly fifty people were killed, over two hundred injured and detained in hospital, and an unknown but very large number injured but not anxious for hospital treatment. Later there was an "exchange of prisoners" totalling several hundred men between the two sides. This means real fighting, and it was not pleasant. All sorts of weapons were used—firearms, bottles, sticks, stones, arrows, axes—and of the bodies recovered some had been partially burnt and sixteen castrated.

Already the casualties are the heroes of Nigerian nationalism, the victims and martyrs of imperialism. The southern politicians are trying desperately hard to impose on Nigeria and as much of the world as they can reach the view that the Kano events are the first engagement in the struggle with Britain for self-government. They suggest that the episode was engineered by a coalition of imperialism and feudalism in the north, and that the violence was organised by agents of the present northern political leaders with the connivance of the British administration and at the instigation of the Governor himself, in order to cover up his failure to control the pace of Nigerian nationalism, to prove that Nigeria is not ready for self-government, and to prepare the way for a separate British North. This is what will probably be taught in the Nigerian history textbooks of tomorrow.

Mr Awolowo's Campaign

But the occasion of the fighting was a proposed meeting in the political campaign being carried out in the north by leaders of the Western Action Group party. This is not a campaign to win people over from another political party, but one with the avowed object of undermining the present system of government by chiefs. It is a political Jameson Raid, with Mr Awolowo in the role of Cecil Rhodes.

But the able lawyer Awolowo is rapidly becoming the astute Bismarckian politician, and as he can alternatively blame the British and the northern rulers for what has happened, the fighting is not a setback for him. He and Dr Azikiwe are turning the emotion it has engendered against Britain. The result is a growing demand for direct action. Nigeria is bursting at the seams, and with the country not impossibly on the verge of a colonial war of independence plus civil war, far too few Nigerians are working for peace. The situation is likely to remain tense, as the Coronation festivities are to some extent acting as a provocation to nationalist and anti-British feeling. Moreover, the Moslem fast of Ramadan (due to end on June 13th) is always a trying time in this tropical environment and involves concentrations of Moslems and northerners all through southern Nigeria.

Against this background it was wise of the Colonial Secretary to try to transfer discussions away from Nigeria, and his announcement that talks would be held in London did to some extent place the initiative back in British hands. But the manner of the announcement was maladroit, since the Colonial Secretary is no longer in a position to say that discussions "will be held," to discuss federation or any other solution; he can only *invite* Nigerian leaders to put their views before him without assuming those views will be what he wants to hear. The invitation will probably be accepted on conditions not yet fully known. They can hardly be less than a pledge of self-government, in some shape or other, by 1956. Even if the representatives were prepared to go to London without making this plain, they could not return to Nigeria empty-handed. The south wants complete autonomy from Britain; the north requires its own national self-identification against the south. The easiest bargain to strike would be a free hand for Nigerians in southern Nigeria, in return for guarantees on the status of the north that will satisfy both the north and Britain.

This is not an ideal solution, as it is less than the south's total demands and would still leave fruitful causes of dissatisfaction there. It is, moreover, based on what may prove

to be merely an impermanent combination of the political kaleidoscope—the gap between north and south is not much greater than that between east and west. But to people on the spot, it seems too late for Britain to try to hold up the march of events. The discussions in London, if they take place, should, ideally, lead to a slackening of tension and pave the way to more detailed consideration here of the future machinery of government of an independent Nigeria.

Eve of Poll in Italy

FROM OUR ROME CORRESPONDENT

THE atmosphere on the eve of the Italian elections indicates that the result will be a close thing. By "result" is meant not who will come top of the polls, but whether Christian Democracy and its friends will do so with more or with less than 50 per cent of the votes in their pockets. This feeling is borne out by the history of the past five years. In 1948, the Centre combine got approximately 60 per cent of the votes; in the local elections in 1951-52 it got 52 per cent. Comparisons between national and local contests are of doubtful validity since each calls forth different sorts of response. In any case, however, the local elections do show that five years in office in Rome have lost the Centre parties (and this means above all the Christian Democrats and the little band of Republicans, the only two parties to stay in the government throughout the course) a good deal of favour.

The Centre candidates display a rather forced lugubriousness, predicting at best a very near shave. This is their way of whipping up the 30 million strong electorate to turn out in full force—elderly rentiers, pillion-girls, playboys and all, besides such reliable elements as nuns of the enclosed orders. They are afraid lest the peasant and small middle-class and partly working-class backbone of the Centre be left unsupported to cope with the all-too-disciplined flocks of Togliatti and Nenni. The opposition parties, Right and Left, incline on the contrary to minimise their own hopes. They would far sooner that the electorate widely believed the Centre block to be too well-assured of its 50 per cent prize to need the suffrage of the tired, the bored, and the lazy.

Church Support for Centre

Forgetting some disappointments with Signor De Gasperi's policy and some hankerings after a strengthened Right Wing in the person of the Monarchist Party, the Church, through all its organs of persuasion, has once again done the Centre proud. One Episcopal Congress after another has issued resounding admonitions to the faithful to vote, and not disperse their votes, that is, not to give them to anyone outside the Centre combine. There is a general feeling that the new look in international affairs has helped the Nenni Socialists, who are this time presenting separate lists from the Communists, by encouraging an impression that a connection with Moscow, especially if it does not go quite the whole Communist hog, is no longer tantamount to rebellion against an ideologically united western world. If the extreme Left and its hangers-on get nine million votes it is thought conceivable that more than half might go to Nenni's party. If the extreme Right get as much as three or four million votes, the greater part, it now seems, will go to the Monarchists. (The main direct opponent of these last, other than the Christian Democrats, are the Liberals.)

If 27 million or more go to the polling stations and do not spoil their papers, this would still give the Centre room for overtopping fifty per cent of the total national electorate. Italy would then be set for a further term of Signor De Gasperi's somewhat haphazardly reforming centre administration, with continuity in home and international affairs. But should the result be a mere 49.9 per cent of the national vote for the Centre, there would be a prospect of what Carlos Levi, the novelist, has called "fruitful instability"—that is, of negotiations for a collaboration of Christian Democracy either with Nenni or with the Monarchists, and a likely disruption of all the parties concerned, doubtless with a new election round the corner. The elections simultaneously taking place for the Senate are far too inscrutable—if only because of the extreme complexity of the senatorial electoral law—to give ground for any predictions at all here; and a certain instability, fruitful or tumultuously barren, is all too likely to emerge on that sector.

Calm and Caution in New Zealand

FROM OUR WELLINGTON CORRESPONDENT

MR HOLLAND departed for the Coronation leaving an outward appearance of political calm behind him and with the knowledge that New Zealand's immediate problems could fairly safely be left to look after themselves until he returns some time in July. In order to clear the way for the departure of the Coronation delegation the House of Representatives met early for a three weeks' session in which it disposed of the Address-in-Reply debate, passed the necessary votes to carry on the affairs of government, and dealt with a very modest measure of strictly non-controversial legislation. Mr Holland and Mr Nash will return to face a re-assembly of the House in August, when it may be expected that the first ranging shots in the pre-election year battle will be fired.

The New Zealand Labour party recently concluded its annual conference with a vigorous reiteration of its confidence that it will win the next election in November, 19[illegible]. But, although there is no doubt that the National Party government has lost a good deal of its popularity, it has no reason to be unduly disturbed by the Opposition's sound and fury. Mr Holland has a very comfortable majority of 20 in a House of 80, and though this is certain to be reduced, Labour will have to score more points than it has done so far if it is to return to the Treasury benches. The present Opposition is over-weighted with veterans and there is, at the moment, little sign of either new men or new policy to give it fresh vigour. Mr Holland has profited accordingly.

The measures taken by the government to restore New Zealand's balance of payments position and build up overseas reserves are now bearing fruit. The last published figures show a favourable balance of £26,323,000 for the January-March quarter, compared with a deficit of £8,221,000 for the corresponding months of 1952. Net overseas assets rose from £66,800,000 in December to £94,800,000 in February and to £103,000,000 by mid-April. The rationing of overseas exchange and other restrictive measures brought the value of private imports down to £10,700,000 in February, the lowest level recorded for several years. In February last year they were running at the rate of £23,100,000.

Currency rationing and the general tightening of bank credit has not endeared Mr Holland's government to sections of the business community. Nevertheless, it is doubtful whether many of these critics will carry their opposition to the length of voting for Labour at the next election. The same may well be true of a number of the government's farmer critics. The Land Settlement Act, passed last session, which gave the government increased powers to enforce the subdivision of land and which enforced residential qualifications for landowners, caused considerable resentment on the grounds that it interfered with the rights of private property owning and that it had been imposed arbitrarily on the farming community. In the final outcome the powers involved in the measure were considerably reduced, and although the bitterness it aroused has not been forgotten, it is mellowing.

Mr Holland has been at some pains, behind the scenes, to allay the irritations of farmers. The government has now agreed to step out of the coming season's meat price negotiations with the United Kingdom and to leave them to representatives of the producers. It has also skilfully kept the ball in the air as regards the producers' demands for greater control of their own accumulated reserve funds.

Labour and Labour Party

One of the government's most pressing problems is the growing restiveness of the Federation of Labour over the disparity between farming incomes and trade union wages. The powerful leader of the federation, Mr F. P. Walsh, made it quite plain, at the recent annual conference of his unions, that they expect a revision of the present stabilisation regulations in order to give the Arbitration Court more freedom in fixing wages without regard to general economic factors. Mr Walsh's complaint is simply that the farmers are receiving too large a share of the national cake and that the trade unions are entitled to more of it.

The rift between the Federation of Labour and the parliamentary Labour party over the divergent policies pursued by the two sections towards the 1951 waterfront strike has ostensibly been closed, but it is still evident that the federation has no intention of being dragged at political Labour's chariot wheels. It is carrying out its own bargaining with the present government and doing it fairly successfully. Mr Holland knows that so long as he plays ball with the federation, the present unusual industrial peace in New Zealand will continue.

There are, however, danger signs on the horizon. New Zealand wool producers are well aware of the possible effect of a Korean peace upon world prices. American measures to shut out imports of New Zealand dried milk, the United States' total prohibition of imports of New Zealand butter, and the obvious misgivings of the Americans about accepting even small imports of New Zealand meat have all underlined New Zealand's dependence upon the United Kingdom market.

The farming community does not appear to have made up its mind whether, when the present bulk purchase contracts with the United Kingdom expire, it wants them revived on substantially the same terms. There is, however, a very strong allegiance to the principle of stabilised primary produce markets and it is likely that when the New Zealand negotiators go to London this year to discuss new arrangements for dairy products and meat they will make security of markets their first consideration. New Zealand's ambitions to break into the North American market have been diminished by recent developments. This does not mean, however, that the United Kingdom will be able to deal with New Zealand on its own terms. The opinion that Britain has bought New Zealand farm produce cheaply, by world standards, and sold its own manufactured goods in New Zealand at advantageous prices is strongly held. New Zealand will expect some correction of the terms of trade when it goes to the conference table.

Intrigue in Jakarta

FROM OUR CORRESPONDENT IN INDONESIA

THE fall of Dr Wilopo's government in Indonesia this week is a fresh symptom of the struggle between the supporters of President Sukarno and the growing strength of the opposition, of which the Masjumi and Socialist parties form the core. The President and the Nationalist party (PNI) have so far been the main elements behind each of the governments of the past three years. One of the most direct but so far abortive attempts to undo this influence sprang out of the intricate tangle of intrigue around the half-hearted and only half-intended attempt at a *coup d'état*, known as the "October 17th affair" which took place last year. This was followed in January by the resignation of the Minister of Defence, the Sultan of Jogjakarta, a man who had played a leading role in the war of independence against the Dutch.

There has, however, been no decline since January in the activity of those concerned in the affair—and on the part of those who seemed to have no concern in it at all. A further crisis developed when Lt-Col. Sudirman, self-appointed army commander in East Java, presented an ultimatum to the cabinet demanding positive steps against the sponsors of the October 17th coup and the handing over of the investigation and the prosecution to the supreme military court. Yet if any persons deserve to feel the strength of the law it is Sudirman and those other officers who mutinied against their properly appointed commanding officers and seized power themselves. Sudirman installed himself as commander of the fifth territory (East Java) by deposing and arresting Lt.-Col. Suwondo. Similar coups took place in Macassar and Palembang. Secret couriers passed to and fro between the mutineers and their friends in Jakarta. The government took no action save to appoint Col. Sadikin as commander in Macassar, a hollow appointment since he has not been to his new post and has no intention of so doing. The mutineers installed themselves and received, apparently, *de facto* recognition from the central authority. They tasted power and enjoyed it. They feel that any investigation directed against those who held command before October 17th will strengthen their own position. Sudirman appears to have thrown in his lot with the PNI but both he and Col. Warouw in Macassar are pursuing a purely opportunist policy.

It is vain to look for a pattern of events in the October 17th affair and for a persistent and subtly pursued policy.

Most of the participants have been prompted by individual fear for their position and authority and have grasped at the first helping hand. But the roots of the affair can be said to lie in the following factors. First there is a fundamental difference of opinion as to the function of the army between those (the Sultan of Jogjakarta, Major-General Simatupang, and others) who want a small, skilled and disciplined force and those (among them the President) who favour a large, ill-disciplined " People's Army " based on guerilla methods and organisation. Second, there is the President's fear of the Sultan of Jogjakarta's power. Third, there is the fear of a group of army officers that, under the Sultan's schemes, they would lose their jobs. To this must be added the fear of the undesirables among the rank and file that they too would be " rationalised " and lose a profitable occupation of near-banditry. And fourth, there is the PNI's fear of the influence of Sutan Sjahrir, head of the Socialist party, in the Ministry of Defence and of his friendship with the Sultan.

The aftermath of October 17th gave the PNI and the Communists the opportunity to attack four persons whose positions they had long desired to undermine. These four were the Sultan of Jogjakarta ; Ali Budiardjo, Secretary-General of the Ministry of Defence ; Major-General Simatupang, and Sutan Sjahrir. Taking full advantage of these developments and manipulating quietly behind the scenes was the President, intent on reviving his dwindling influence and not unhappy to see political forces ranged against the potentially powerful Sultan and against Sjahrir, whose pungent criticisms he has long disliked.

Resignations and Inquiries

As a result of prolonged intrigues, both the Sultan and Ali Budiardjo have resigned from their posts and the latter has departed to England for a short period of study. Simatupang remains in his post although surrounded by a new clique of staff officers. All three have voluntarily appeared before the Attorney-General to make statements on the October 17th affair, though rumour has it that Ali Budiardjo's interview bordered on the farcical since he merely wished to inform the Attorney-General that he knew nothing about the matter. Sutan Sjahrir remains aloof, unperturbed and unexamined ; assailed and slandered in the left-wing press, accused and denounced by the army mutineers but, none the less, unperturbed.

The issue lies at present between the cabinet and the army (or rather some of the factions and territorial commands which constitute the army), with parliament as a bystander. During the parliamentary recess there were rumours that the cabinet would resign. But after parliament reassembled on May 4th only one minister, Tjokroaminoto, relinquished his post. There seems indeed, no logical reason why the Wilopo cabinet should now have fallen. It was not efficient, it was making little headway in tackling the country's problems, its policy often appeared singularly inept. But almost all the political parties were quite happy with it, and that is what counts in parliament.

The Communists have done rather well out of October 17th. Several of their most able opponents have been forced out of office, and their influence in the PNI has given them increased power in the new army set-up. This must be a considerable comfort to set against the apathetic display by the massed workers on May 1st. But the Communists have not shown themselves very expert at exploiting the favours flung to them from the PNI ranks and, at present, they are in some confusion. The cries for a popular front mingle discordantly with execrations against the Socialists and, though their political pickings have been tasty, they are still only a nice cut of the PNI's joint. Any directly pro-Communist measure comes to grief or runs up against Indonesia's most highly developed technique, that of eternal delay.

Steel Prices in the Community

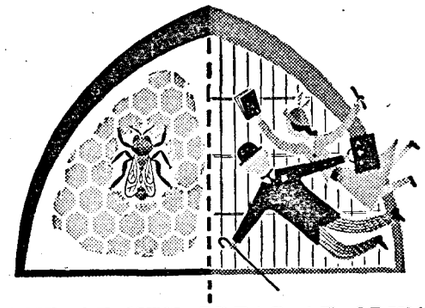
WHEN the Coal-Steel Community opened its common market in steel on May 1st there were appreciable differences between steel prices in the six countries, and many people watched with interest to see if the *gleichschaltung* would take the form of equalising prices upwards or downwards. In fact, nothing quite so simple as either of these extremes has occurred. In some countries prices have risen and in others they have fallen, but even where the general tendency is upward some reductions have taken place for certain qualities of steel. By and large it is probably fair to say that average steel prices are a little higher than they were. The High Authority does not regard this movement as incompatible with its long-term aspiration to reduce prices, since many of the present adjustments would have happened even in the absence of the new Community.

Until now French steel was among the cheapest in Europe, but it was generally agreed that this was largely due to the fact that French prices did not contain an adequate allowance for depreciation and replacement. This short-sighted policy sprang from the immediate political needs of the French economy. At the insistence of the French government every possible step was taken to hold down the French price level. Belgian home prices, too, were held at an artificially low level in order to benefit the domestic user, a subsidy that was paid for by the consumer abroad in the shape of high export premiums. These premiums have now disappeared because foreign markets have softened and because the articles of the Community forbid " double pricing " among members. German prices, on the other hand, were among the highest—the result mainly of a conviction on the part of German industrialists that investment resources would not be obtainable on the open market and that the necessary funds would have to be provided out of company profits.

The new price schedules, published on May 20th, represent a compromise. French steel prices have risen by from $3.00 to $5.45 per ton. The Germans have lowered prices by from $1.60 to $6.50—although German consumers protest that the addition of special premium charges have all but wiped out these reductions. Belgian, Luxemburg and Dutch prices have risen, while Italian have fallen.

At the same time the Community has adopted a modified system of basing point prices. Under this arrangement the steel consumer is no longer quoted a single selling price. He can take his choice of steel from any basing point (there are over 20 of them) in the common market. Another novel and competitive feature of the new system is that any producer can lower his prices in order to compete with any other producer, even when the latter is better placed from the standpoint of delivery costs.

Shrink Fit



AT an engineering works in the Midlands, a 2,000 ton hydraulic forging press had to be overhauled because of wear. The firm decided that a good way of effecting repairs would be to " shrink fit " new parts in place of worn ones. A metal part to be fitted by this process is deliberately made a precise amount too large. When extreme cold is applied the part shrinks and can be fitted into another. The metal expands as the temperature rises to normal and a very tight fit is thus ensured.

The firm therefore consulted I.C.I. Billingham Division who make " Drikold "—a solid refrigerant which, with a temperature of minus 110°F., is a convenient means of producing extreme cold. The main part of the problem was to shrink a hollow steel cylinder weighing 7 tons and fit it into the body of the press. The firm made the necessary preparations and provided lifting tackle, whilst an I.C.I. man supervised the shrinking. This was done by closing the cylinder at one end and filling it with 80 gallons of methylated spirit and 1,400 lb. of " Drikold." Five and a half hours later, at a temperature of minus 95°F., the cylinder had contracted by 30 thousandths of an inch. It was then hoisted into position. This completed one of the biggest shrink fitting jobs ever undertaken.

Strategy for Sterling

AMONG the hoary revivals of the present time is the story that whenever four or five economists are gathered together, there will be at least six or seven conflicting expressions of opinion on the future of Britain's foreign exchange policy; and that at least three of them will represent the considered view of Her Majesty's Treasury. This may be an unfair commentary on the way in which the Commonwealth's famous "plan" for sterling convertibility has had to be steered since it was launched at the Prime Ministers' Conference exactly six months ago. But when those Prime Ministers met again this week, at a more informal conference in which economics no longer took the high order of precedence of last December, the prevailing atmosphere among the delegates must have been one of friendly bewilderment. The mood of the conference can perhaps best be summed up by a metaphor from the recent military past. Last December it was argued in these columns that the Commonwealth conference was meant to be "a Casablanca, not a Dunkirk" for foreign exchange policy; six months later it looks instead as if that policy is at the intermediate stage of Lofoten, North Africa and (though the parallel is an unhappy one) Dieppe.

This, therefore, seems to be the right moment to look again at the rather confused mosaic that emerged from last December's conference—in so far as the incomplete information available allows one to do so—and to consider why and how the pattern has changed since. The process involves re-tracing some familiar ground, but that is a small price to pay for any diminution of bewilderment. And in the recent series of financial discussions with European countries—the French, Scandinavians, Germans and Belgians have been here in the last six weeks, and the Swiss, Dutch and Italians will follow them in the next four—bewilderment over the British Government's strategy for sterling has clearly been the order of the day.

December's Decisions

Three main groups of decisions seem to have been taken last December. The first was that the long-term problem of the dollar gap could be solved only by increasing the sterling area's production both of things that the dollar area was likely to demand in increasing volume and also (perhaps undue emphasis was laid on this) of things that the sterling area traditionally bought from dollar countries; in the latter category, special attention was given to increasing production of wheat, copper, zinc, aluminium, cotton, paper, pulp, and engineering products. Quite apart from the difficulty of releasing resources for increased production of these things, there was the problem that many of these products would necessarily be more expensive to make in the sterling area than in the dollar area. Since nobody could guess at what exchange rate production of these things (and of some existing sterling area staples) would be economic, it seems to have been decided that any significant advance towards lifting payments restrictions would have to be accompanied by the establishment of a floating exchange rate for sterling.

The second main decision at last December's conference was that any move towards freer trade should concentrate first on the lifting of payments restrictions rather than of import restrictions—in other words that the Commonwealth should concentrate on convertibility of sterling rather than on liberalisation of trade. It is important to make clear what was meant by "convertibility" in this context. Thanks to the extension

of the Bank of England's system of "administrative transferability" in the past three years, the sterling countries are now faced, in effect, by three different currency areas. First, there are the dollar countries of North and Central America that have to be paid for their exports wholly in dollars or gold. Secondly, there are the thirteen OEEC countries (and their associated overseas territories) that are paid for their exports in sterling, but can use that sterling either to purchase goods virtually anywhere in the non-dollar world or to reduce their net debits (or expand their net credits) in the monthly clearings at EPU, where settlements are partly effected in gold. Thirdly, there are some thirty non-dollar and non-EPU countries (which, for the purpose of this article, can perhaps most conveniently be called the "rump") that also receive payment for their exports in sterling and can use that sterling to purchase goods virtually anywhere in the non-dollar world. Convertibility would mean that the countries in OEEC and in the "rump" could use their current accumulations of sterling to buy goods in the dollar area as well as in non-dollar countries; but it would not mean that the sterling countries would lift their import restrictions sufficiently to enable these countries to earn more sterling to convert into dollars in this way.

This decision to emphasise convertibility rather than liberalisation of trade had at least one strain of sound logic behind it. If the countries of the non-dollar world removed restrictions on their mutual trade, while maintaining or intensifying restrictions on payments with the dollar area, there would be a danger that they would soon find themselves comfortably but unprofitably employed in taking in each others' washing; with easy markets in any and every non-dollar country (fed by a suffusion of sterling credits) delivery dates to the harder dollar markets would soon lengthen, sales in these dollar markets would be lost, and the dollar gap grow wider than ever. Allied to this sound and sensible apprehension, there was also a (probably chuckle-headed) belief by the British Government that "convertibility" would not hurt it much, because Europe and the "rump" would not have much current sterling to convert. By last December, the sterling area was back to solid current surplus with Western Europe—as the monthly EPU settlements showed—and it had also reached a state of record surplus with the "rump"; indeed in 1952, the sterling balances of these thirty countries in the "rump" ran down by £172 million, to £399 million—and nearly half the remainder consisted of the blocked balance in Egypt's account. There are grounds for suspecting, however, that in projecting these cheerful figures forward the British Government has consistently under-estimated the extent to which a dollar-hungry world would switch its imports from the sterling area to North American suppliers as soon as convertibility made sterling imports just as "hard" as dollar imports are.

Fears about the dangers of convertibility were, however, sufficient to bring about a third major decision at last December's conference. This decision was that sterling could move towards convertibility only if certain assurances and helpful actions were forthcoming from Europe and the United States. There is still some mystery about what was to have been required from Europe; in essence, OEEC countries were to be asked to ensure that they did not switch away from sterling to dollar imports on the immediate morrow of convertibility—but it is not clear how this safeguard was to be achieved (except that some OEEC countries were apparently to be asked to make their currencies convertible, too). The requirements from the United States are better known. They included liberalisation of American trade policy, arrangements for greater stability in American purchases of raw materials, and specific steps for encouragement of American foreign investment; in addition, the Commonwealth experts hoped that America would throw its decisive weight behind a campaign for more liberal "stand-by" credits from the International Monetary Fund and that it might agree to an increase in the dollar price of gold.

Three Dusty Answers

Such, then, was the famous "plan" of last December. In the past six months it has been mightily and perhaps irreparably buffeted from three sides. In the first place the Americans met the proposals pitched up to them by Mr Eden and Mr Butler with a disappointingly dead bat; the Eisenhower Administration has referred these proposals to two committees, neither of which will report until next year and one of which is almost certain to come out against any effective American action at all. Secondly, the "United Europe" school that has lately come to prominence in EPU attacked the proposals for convertibility from the outset; if sterling was made convertible, they argued, no European country would turn current accumulations of sterling into the EPU clearings, and the most important single instrument of European economic integration would thereby be smashed.

Thirdly, the governments in charge of the countries of Western Europe and of the "rump," who were supposed to gain most from convertibility, showed a singular unwillingness to welcome it. "A system of convertibility implying the continuation or tightening of trade and payments restrictions," said M. Mayer's Finance Minister last January "is not wanted." In view of growing fears of unemployment, almost all these countries are now more eager to be able to sell their products in the sterling area than to be allowed to purchase other products in the dollar area; in other words they are now much keener on trade liberalisation than on sterling convertibility—although this does not mean that they would not switch their imports from sterling to dollar sources if convertibility came about.

The British Government would hotly and justifiably deny that these three set-backs have obliged it to turn tail and flee from the "plan" of last December. But

they have obliged it to apply the brake on progress towards convertibility, and to press softly on the accelerator towards trade liberalisation; and under these two divergent impulses, the "plan" has certainly veered sufficiently to make it very difficult to interpret what the strategy for sterling is now. It is only in the light of this forced veering that recent British moves in the field of trade liberalisation, multilateralisation of payments and Commonwealth development can be even approximately understood.

Trends of Policy Now

In the field of trade liberalisation with Europe, the import relaxations announced at the end of last March raised the proportion of Britain's imports from Europe that are free from licences from 44 to 58 per cent; this compares with the minimum proportion of 75 per cent liberalisation recommended by the OEEC for solvent countries and with the 90 per cent liberalisation of imports from Europe that Britain had in fact achieved before the autumn of 1951, so that British imports from Europe are still much more restricted than they were before the last crisis. Moreover, the fact that fewer manufactured goods are now on open general licences than in 1951 has restricted manufactured imports from some of the countries in the "rump" as well. On the other hand, the re-opening—or schemes for the re-opening—of so many commodity markets in London has effected a greater liberalisation of British imports from non-European countries than is generally realised. For example, when the markets in grain, copper and sugar are in full operation, well over half of Britain's permitted imports from the dollar area will be "liberalised" in this way. The importance of this figure must not be exaggerated; the arithmetic is distorted by the fact that many imports of manufactured goods from the dollar area are totally banned, and the arrangements for free commodity markets are such that excessive imports into them (e.g. for speculative purposes) could swiftly be truncated from Whitehall. But the fact remains that a much larger proportion of Britain's imports from dollar countries is now dependent on the laws of supply and demand rather than on physical controls than at any period since the war; and since many of these dollar commodities can be re-purchased by European or "rump" countries through London with sterling, there has already been a significant move towards convertibility of a sort. And imports of raw materials from "rump" countries have been liberated at a swifter pace still; for example, just before the Coronation, it was announced that imports of raw cotton from non-dollar countries no longer required a licence.

This speedier liberalisation of non-European than of European imports (which previously had been well in the van) accords fairly well with the good intentions about "multilateralism" enunciated last December. Britain's influence in the field of exchange policy, as distinct from trade policy, has been exerted in the same direction. It is believed that the British Government has recently (albeit unsuccessfully) come out in favour of a higher proportion of gold payments, and a lower proportion of credit, in the monthly settlements at EPU; if ever American economic activity receded, and it became advisable to whip up discriminatory intra-European trade as a counter-cyclical device, Britain might rightly reverse this pressure—but that time is not yet. The reported refusal to extend bilateral lending and trading arrangements with Brazil (discussed in a Business Note on a later page) accords with the same policy of hard money in international trade; and the Government's refusal to create some special mechanism for encouraging long-term credits to soft currency countries is another case in point. Finally, the resumption of arbitrage dealings in the foreign exchange markets of Europe, in the preparation of which Britain has played the leading role, is another nail in the coffin of rigidly bilateral trade.

The schemes for development of the right type of production within the Commonwealth — and the question of whether these can be economic only if the sterling exchange rate is set free—are still in an embryonic stage, but Mr Butler's recent budget was designed (or at any rate meant to be designed) to encourage engineering production here. There have been heartening signs that the countries of the Commonwealth now find it profitable to buy British rather than American capital goods even at the present exchange rate; Britain's delivery dates are now much more competitive, largely because of the easing of pressure on order books that has followed from the downturn in world demand. The schemes for development of primary production in the overseas Commonwealth are still partly on the blueprints and partly in the air; but the damping down of inflation and of the most stridently uneconomic forms of industrial investment in the overseas dominions may make them easier to carry through.

All in all, therefore, the British Government—hampered by an original "plan" that can now be seen to have been too ambitious, and greeted by an even dustier welcome from America and Europe than it had expected—seems to have been making the best of a rather bad job. The Commonwealth Prime Ministers can return to their respective countries in a bemused but not despondent state of mind. The substance of last December's "plan" may have been changed almost out of recognition, but the spirit is still there. If ever world recession returns, present schemes for re-establishing international trade on a less discriminatory and "harder money" basis may have to be abandoned; it will then become much more logical to increase trade so far as possible, even if bilateral trading pacts have to be drawn up and substantial "soft credits" extended as part of this sad retreat. But the great danger has always been that harassed politicians might dump last December's good intentions about "sound trade," in favour of employment-generating "soft trade" before recession makes reflation desirable; the British Government has not done that at the moment—though the emphasis must be on "at the moment."

Business Notes

Gold Out of Season

THE summer months—when tourist expenditure rises and sales of several staple primary exports of the overseas Commonwealth fall out of season—are nearly always the worst period of the year for the sterling area's balance of payments; that is why payments crises have a habit of reaching, and then suddenly passing, their peak in early autumn. There need be no surprise therefore that the central gold reserves, which had been gathering grist fairly steadily at over $100 million a month since the beginning of last winter, rose by only $48 million during May.

The main reason for the slackening in the rate of growth was that the sterling area's gold and dollar surplus with non-European countries (which means, for the most part, its surplus with North America) fell from $76 million in April to $14 million in May; it would not be surprising if seasonal factors caused this account to relapse into the red some time in the next few months. On the other hand, there does not seem to be any real reason why receipts of American aid should fall below their very low May figure of $13 million in the next few months; Britain still has some $250 million on which to draw from past congressional appropriations, whatever happens to President Eisenhower's request for $200 million more for 1953-54 (and whatever accounting procedure is adopted in respect of it). The final factor in the rise in the reserves last month, the receipt of $21 million from the European Payments Union in mid-May, is also likely to be adversely affected by seasonal factors between now and next October. The mid-June receipt of gold from EPU will be only $10 million, as the sterling area's surplus with Western Europe (half of which is now settled in gold) fell to just over £7,100,000 last month. Unfortunately, too, more than half of this sterling area surplus with Europe was in trade with France, which incurred another intra-European deficit, of $37.4 million, last month—and which will have to take stern remedial measures soon. The general conclusion must therefore be that the sterling area will do very well if it manages to keep its reserves rising at the same rate as in May during the off-season for primary exports; but, equally, there is no sign yet of any real danger of a payments crisis this year.

Coronation Spending

THE Coronation has certainly loosened the nation's purse-strings. In the week to last Wednesday a further £11¼ million of notes were withdrawn from the Bank of England into active circulation, reducing the reserve in the banking department to only £6½ million; the fiduciary issue has accordingly been raised by £50 million to £1,600 million. Withdrawal of notes has amounted to fully £20 million in the last two weeks—a sharp increase over the steady weekly expansion of £3 million or so of earlier weeks. But exact measure of the public's demand for cash over the Coronation period can hardly be gleaned from the published statistics. The Bank return was made up on Wednesday, after the "peak" of Coronation demands; the outflow of notes it shows consequently understates the true Coronation demand to the extent of Wednesday's reflux. The position is further confused by the fact that the figures apply to withdrawals not by the public from the banks but by the banks from the Bank of England, and hence may either understate or exaggerate the public's demands to the extent of any change in the banks' till money. But the outflow of notes into the hands of the public was clearly substantial—and further evidence of increased spending has been given in the sizeable dip into "small" savings.

It is doubtful, however, whether the high level of spending should be put down to the influence of the Coronation alone. The expansion in the active note circulation has for many months exceeded that of comparable periods in previous years; there has been a rise of no less than £94 million since the seasonal "low" of last January—£22 million more than in the corresponding period last year and £45 million above the 1951 increase. Moreover, the excess over 1952 was most marked in the early spring, when the influence of the Coronation on spending can hardly have been decisive. Together with the recorded improvement in retail trade, this suggests that the increase in spending over last year is something more than a Coronation spree—whether caused merely by the psychological stimulus of the Budget or, as seems more likely, by less ephemeral factors as well. The note circulation has now reached £1,543 million—only £7 million below the Christmas peak. Such an expansion is not usually reached till the holiday season is in full swing, and it constitutes an all-time record for this time of year.

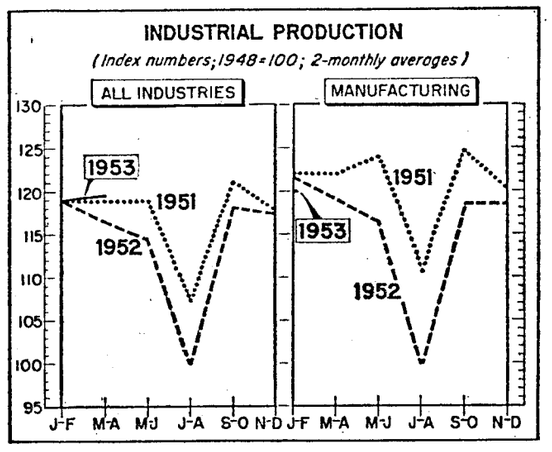
New Loan for Tanganyika

THE gilt-edged market absorbed the news of a new issue of £4,410,000 for the Government of Tanganyika this week without the slightest ripple of disturbance, and the steady advance in prices continued without even a momentary check. The sponsors of the new issue have played exceptionally safe. Only £2,750,000 of the issue is to be raised by public subscription on the London market; of the remainder £910,000 has been taken up for Colonial Government funds and £750,000 has been reserved for East African subscriptions. This new trustee stock is dated 1967-72 and is therefore six years shorter than the successful Jamaican loan (1973-78) issued at the beginning of April; but it has the same coupon rate of 4¼ per cent and the same issue price of 97½. With a gross redemption yield of £4 9s. to the latest date, the new stock offers a 1s. turn on the issue terms of the Jamaican loan, which now stands at a premium of 1¼ on its issue price.

When the Jamaican issue was made its yield was only about 3s. more than that offered by comparable British Government stocks; but the sponsors of the Tanganyika loan have cautiously offered a yield that is just over 10s. more than that on the 3 per cent Transport and 3 per cent Electricity stocks, both with the same redemption dates of 1968-73. All the indications are therefore that the new loan should command full subscription when the lists open on Tuesday. If the recent demand for gilt-edged securities by the institutions is maintained—and it is being fed at the moment by funds that are waiting for, and perhaps looking for a cheap way into, the shares of the denationalised steel industries—other Colonial governments may take the opportunity to make second line issues of this sort.

The Measure of Recovery

STATISTICAL evidence is accumulating to confirm one of the assumptions, at least, upon which Mr Butler presumably based his Budget—that even without fiscal stimulus industrial production this year would recover to the level of 1951. Over the first four months of the year industrial output as a whole appears to have been roughly at the level of two years before, with manufacturing output in the first quarter rising towards the 1951 level.



These generalisations—which necessarily imply a certain improvement over last year, in total output—are perhaps the most that should be drawn from the revised official indices of output in February and March and the forecast for April issued by the Central Statistical Office last week. Last year began with industrial output higher than the comparable figures for 1951, but output declined sharply in April. The revised figures for this year, shown in the table, suggest that in February and March total output and manufacturing output were level with or even higher than the corresponding months in 1952, and total output in April seems likely to be several points higher than in April last year. Interpretation of the index in the early months of the year is always made difficult by the varying incidence of public holidays. Various methods of correction have been devised from the postwar figures to eliminate seasonal variations from the index; perhaps the simplest effective way is to take the months two at a time. The index averages for total output in January-February and in March-April for this year would be 119 and probably 120 respectively (1948=100), which are roughly the same as in 1951. Last year the January-February average was also 119, but it was down to about 117 for March-April. Comparisons of these two-monthly averages for 1951, 1952 and early 1953 are shown in the chart.

Common observation suggests that the improvement indicated by these statistics has been continuing. The tex-

† Provisional * "Expected," from information so far received.

tile industries are continuing to increase their labour force and thus their output; car production has shown a marked recovery; steel is being produced at record rates and coal output is higher than last year—though by a disappointingly small margin. Employment figures would suggest that output in many sections of engineering has been slackening while the recovery proceeded in consumer goods manufacture; but delivery dates for equipment have consequently improved, and recently there have been reports that the flow of orders has quickened once more. The improvement so far observed, it hardly needs to be said, preceded Mr Butler's stimulus to home demand; the effects of that stimulus in taking up industrial slack and in drawing the accrued benefit of industry's extension of productive capacity since 1951, will hardly be seen for some months yet.

Rising Bank Deposits

THE clearing banks' figures for May emphatically confirm last month's supposition that the decline shown in bank deposits in April was merely an aberration from the trend. Although in the five-week period to May 20th the banks felt the first effects of the £125 million BEA loan, net bank deposits rose by £43 million, whereas in the similar period last year they dropped by £19 million. The April statement, it will be recalled, showed an unseasonal decline of £20 million, in contrast with a 1952 increase of £31 million. The latest deterioration from the 1952 trend therefore more than offsets the previous month's apparent gain. This deterioration was evidently caused in some degree by the trend towards relaxation of the banks' grip upon advances to the private sector of the economy. During the period, £56¼ million was paid up on the BEA loan, compared with £60 million on the similar loan issued in the Spring last year, and presumably in both periods the greater part of these receipts was promptly applied in reduction of the BEA's indebtedness to the banks. Yet in May this year total bank advances dropped by only £42 million, whereas last year they dropped by £62 million, which suggests that advances to other borrowers rose last month by £10 million or so. There was, however, a slight contraction in the volume of credit extended by the discount of commercial bills, but the decline of £5 million in the banks' holdings of these contrasted with one of no less than £31 million in the similar period last year.

As these comparisons show, the main reason for the renewed uptrend in the volume of credit has been the demands of the central government, which appears to have increased its indebtedness to the banking system by some £85 million, or by rather more than the increase recorded in May, 1952. This is a distinctly bigger demand than might have been expected. It is partly attributable to "departmental" subscriptions to the BEA loan, but official participation was almost certainly smaller this year than last. The overall Exchequer deficit in the periods most nearly comparable to those covered by the banking figures was likewise smaller this year. There remains, therefore, an appreciable discrepancy between the two sets of figures, unless it can be assumed that the surplus on the external balance of payments is running substantially above last year's level. Since that is improbable, it may be that the comparison is being distorted to some extent by fortuitous influences probably arising from the difference in the periods covered by the two sets of figures. If that is so, part of the deterioration shown last month may be corrected in the figures for June.

Grain Futures Again

THE Government, which so resolutely refuses to give facilities for reopening the Liverpool cotton futures market, is arranging to give facilities for reopening the Liverpool and London grain futures market. The chief hindrance to reopening both markets, from the Government point of view, is the risk of losing foreign currency. The number of transactions and degree of risk are perhaps different in the wheat futures market from those in a cotton futures market, but it is worth noting that the total value of imports of the two commodities in 1952 was not vastly different. Wheat imports cost £125 million last year and cotton imports £128 million. Of the wheat imports about £111 million worth came from non-sterling sources, and of this no less than £101 million from dollar sources, mainly Canada. In addition, imports of maize in 1952 were valued at £52 million, of which about £50 million came from non-sterling countries and no less than £26 million from the United States. Of the imports of raw cotton, costing £128 million, about £100 million came from non-sterling sources, including about £40 million from dollar countries, mainly the United States. Taking maize into account, the Government is willing to allow foreign exchange to cover the import of grain to the value of £177 million, but is alarmed at granting facilities for covering import of £128 million of cotton. These comparisons leave out of account international business, but a free grain futures market, like a free cotton futures market, would seek to regain its important foreign business.

Import of grains on private account will be permitted after August 31st, and already buying for delivery after that date is authorised. Naturally, the trade hopes that cover facilities will be permitted before the end of August. Meanwhile private grain business has been small pending the completion of the arrangements for futures and the clarification of arrangements for marketing home-grown grains; the trade is also watching to see what happens when British buying under the International Wheat Agreement comes to an end on July 31st, or earlier, if Britain should have completed its guaranteed quota before then.

Brazil's Arrears

AT the Anglo-Brazilian trade talks now in progress at Rio de Janeiro, the British Government has put forward a detailed "plan" for the settlement of Brazil's sterling arrears. According to unofficial reports from Rio, the British proposal is that Brazil should pay off at once about one-third of the £63 million it owes; it has been

Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

suggested that it might be able to raise the foreign exchange for this by purchasing sterling from the International Monetary Fund. Thereafter, Britain proposes, Brazil should lay aside some £10 million a year from its gross sterling earnings (which in normal circumstances should exceed £50 million annually) for settlement of the rest of the debt.

If the proposals do indeed take this form, it is probable that the Brazilians are not too happy about them. The Brazilians are said to have hoped that the centrepiece of the negotiations would be a series of bilateral deals, under which Britain would agree to take a wide range of Brazilian products that it does not want—on the understanding that half of these additional products would be paid for by the export of British products that Brazil does want (possibly under hocus-pocus pricing arrangements) while the other half would be paid for by British payments into a fund from which the commercial arrears would be settled. But Britain has apparently let it be known that it will start to talk seriously about measures for increasing trade only after a "plan" for the sterling arrears has been agreed upon; and it has also started to make all the proper noises about the evils of bilateral trade and the possibility that, if Brazil cannot pay for its imports from the sterling area in sterling, then it might pay for them in dollars instead.

One of the difficulties up to now, of course, has been that Brazil has been as short of dollars as it is of sterling. Its backlog of debt to the major New York banks alone stood at $208.3 million at the end of April, although these dollar arrears should now be covered out of the recent loan of $300 million from the Export-Import Bank at Washington. That loan, incidentally, has raised some justifiable misgivings in London; it can be represented as a type of subsidy to American exports to Brazil, for the Brazilians may now be drawing the conclusion that if they continue to buy dollar products (instead of sterling products) they will not be driven into too uncomfortable a corner if and when they find that they have not got the exchange to pay for them.

Choose Your Partners for Contango

After its disappointing decision to continue the ban on option dealings, the Council of the Stock Exchange—and its chairman, Mr John Braithwaite, who receives a knighthood in the Coronation Honours—deserves commendation for the prompt decision to allow broker-to-broker contangos. But the new freedom is a relatively minor one. The Council remains so anxious to avoid "misrepresentations" about speculation that it would not have restored these facilities unless it had been confident that—partly because of the continued ban on option dealings—most of the speculative steam that once existed in the market has been dispersed. The new freedom will remove some of the elements of imperfect competition that have marred dealings in contangos since facilities for broker-to-jobber contangos were restored in May, 1949. But it will not do much more than that.

The main disadvantage of the system of purely broker-to-jobber contangos in the past three and a half years has been that it has tended to put too much power in the hands of the jobbers. Under it a broker who was a "bull" of a particular security and wished to postpone payment for the purchase of it informed the jobber that he was willing to pay a small sum—decided by the play of market forces—for arrangements to carry the transaction over to the next fortnightly account; he could do this from one Stock Exchange account to another so long as the cost of the successive contangos remained below the stamp duty that would have to be paid on the completion of a cash transaction. Similarly, a "bear" who wished to postpone delivery of a stock that had already been sold told the jobber of his needs. The jobber then married these two transactions and earned a minute turn for his trouble—from the difference between the sum charged to the "bull" (which nowadays on well-known stocks would be the equivalent of about 5 or 6 per cent per annum on the market price) and the sum paid to the "bear" who took the stock in.

Effectively, this system gave the jobber some degree of monopoly in these dealings, if only through the simple process of inertia; brokers automatically tended to approach the jobbers who specialised in the stock for which the contango facility was required. The jobbers could refuse to deal, they could limit dealings or they could deal only at high rates; at the end of the account some brokers could be—and very often were—left out in the cold, and they were thus forced to accept the additional expense of selling at the end of the old account and buying back at the beginning of the new. Moreover, the system cut right across the established custom that a broker need not disclose to a jobber whether he is a buyer or a seller.

New Pattern of the Dance

Under the new system of broker-to-broker contangos, this element of imperfect competition should disappear from the market. A broker will still be able to approach a jobber for contango facilities; and if he is dealing in large blocks of shares he will probably continue to do so. But he can also go directly to another broker, if he can find one, either by inter-office dealings or, as was usual before the war, by attending a market in Throgmorton Street before normal dealings start on contango day. Presumably, the efficient running of this market will be ensured by a return to the old practice of posting lists of contango rates in the market. With such a widening of the market, fewer members should be left out in the cold, odd lots of stocks should be disposed of more easily and contango rates may become slightly cheaper. The new freedom may also bring the "backwardation" charge into more prominence in the market; backwardation has been possible under the system of broker-to-jobber contangos, but it has been very uncommon. The charge can arise when such a heavy "bear" account has been built up that the "bears" become willing to pay for the privilege of delaying delivery of the stock; in this case, of course, the sum is paid to the "bulls."

The resurrection of free contangos means that, apart from option dealings and completely free dealings for future accounts, the market will again possess all the dealing facilities it had before the war. But this old-fashioned look is only a surface one, for—with option dealings still banned—the market in contangos will certainly be much smaller than

in the 'thirties. It may tend to be largely concentrated upon dealings in "take-over" shares and in Kaffirs, where the professional investor and the "shop" still loom large. It may also do a little elsewhere to smooth out price movements between one account and another, since it will reduce the amount of selling on the old account followed by buying for the new (a practice that has frequently jolted prices—especially, for example, in Japanese bonds—in the last few years). The Council will, however, continue to keep a stern eye on all these transactions; brokers, like jobbers, will henceforth be required to make a confidential return in March and September of the total amount they have open on contango account.

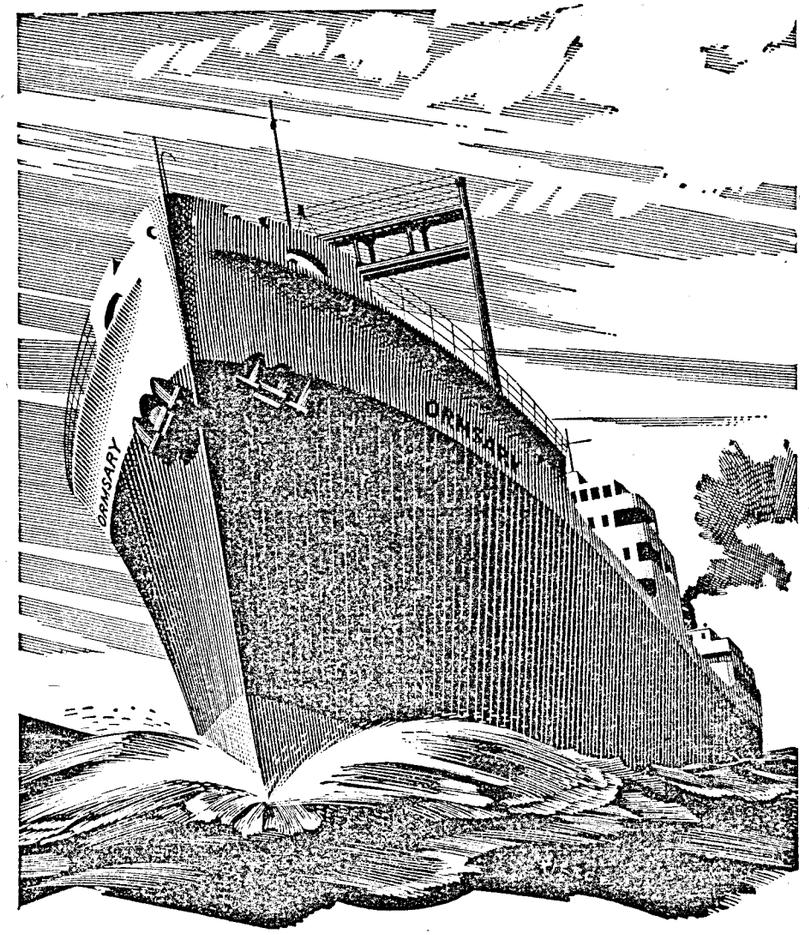
Exchange Arbitrage at Work

THE London foreign exchange market is adapting itself rapidly and satisfactorily to the new freedom for arbitrage within the group of eight EPU currencies that it has enjoyed since May 8th. The first few days of this freedom witnessed an immediate burst of activity, both in contacts by international telephone and in actual dealings. Much of this activity, however, was ephemeral. It was the result of disparities in cross rates that remained from the era of bilateral dealings. These disparities were rapidly eradicated. Some of the initial activity was also due to the natural desire of dealers in London to "show the flag" to their overseas correspondents and customers. After this initial flurry the market settled down to a much slower tempo of activities, with costly overseas calls reduced to a level more consonant with the modest volume of available profitable business. But although the trade is modest, it is nonetheless satisfactory. In particular, London dealers have been reassured by their ability to attract much business that in recent years had been the virtual monopoly of Zurich.

The question of the limits upon the amounts of the EPU currencies concerned that the Bank of England allows each authorised bank to maintain is coming under discussion. Contrary to earlier impressions, no general increase in these limits has been sanctioned. In this, as in most issues with which it concerns itself, the Bank of England maintains an essentially elastic and empirical attitude. There are no hard and fast rules, but the convenience and genuine requirements of the market are sympathetically considered. If these suggest that the authorised banks' limits for francs, guilders, marks and other currencies concerned should be raised, they will be raised. For the moment the initiative in this matter must come from the authorised banks themselves and few of them have hitherto found themselves inconvenienced by the restrictions of the existing limits. In the past, if any bank was left unwittingly with holdings of a currency that exceeded its limit, it notified the Bank to that effect and corrected the situation with the minimum of delay. This kind of *ad hoc* procedure is likely to be followed in the future. But if, in the light of the experience that will thus be gained, it is found that the existing limits are inadequate to cater for the volume of business that can be transacted under the new arbitrage facilities, there will no doubt be a general readjustment of limits. Few people will be any the wiser, since these limits are carefully guarded secrets between the Bank of England and each authorised bank.

Ecuador Offers to Settle

THE International Bank for Reconstruction and Development has recently been very properly forbidding in its attitude towards would-be borrowers who are in default on their existing debts to foreign bondholders. It is reported to be very largely because it wants to borrow from the IBRD that Ecuador has agreed to resume payments on its external debts. All of these debts are owed to British holders of the $10.7 million issue of the 5 per cent Guayaquil and Quito Railway Dollar Bonds, and of the two tiny issues of the 4 per cent Salt Dollar Bonds and the 4 per cent Condores Sterling Bonds. It is over twenty-four years since payments were made on any of these bonds, and, even then, the coupon paid in 1929 on the railway bonds was fifteen years overdue. The Council of Foreign Bondholders (which advises stockholders to accept the settlement) is therefore to be congratulated on squeezing a little juice out of this ancient lemon.



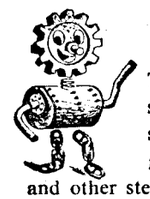
Unfortunately, however, the juice is still a little sour. The Council has had to accept the resumption of current payments at the expense of the outstanding arrears of interest. On the railway bonds—and the terms of the settlement for the two other issues are on the same lines—interest payments will be resumed in 1954 at 2 per cent; this coupon rate will be raised to 2½ per cent in 1955, to 2¾ per cent in 1956, and to 3 per cent in 1957 and following years. An annual cumulative sinking fund (which will allow the bonds either to be drawn or to be purchased in the market at par) will be established in 1954; in the first four years this fund will be operated at a rate of ¾ per cent each year and after that at a rate of 1 per cent. As some compensation for losing the arrears of interest (and for effectively postponing redemption) bondholders are offered a 5 per cent cash bonus on the nominal value of the bonds; but this bonus will only be paid in five equal instalments between 1954 and 1958.

The treatment of the accumulated interest arrears and the rather paltry size of the sinking fund have disappointed the stock markets; immediately after the terms of the settlement were known the Guayaquil and Quito bonds were marked down 9½ points to 39, compared with a price of 29 a year ago. These terms are not a very happy augury for the settlement of Peru's and Costa Rica's debts to British bondholders. Peru has already settled its debts with the United States, but its government is still seeking to pay off British stockholders in sterling at $2.80 to the pound (although its bonds carry a specific option under which stockholders can demand payment in dollars at the old rate of exchange).

More Aviation Spirit

THE addition of a "platforming" unit to the already formidable list of installations at the Shell Petroleum Company's Stanlow refinery promises an increased output of high octane aviation spirit in this country. Fuel for piston aero-engines—not gas turbines, which use special turbine fuels—ranges from 100 to 130 octane compared

There's a future in STEEL

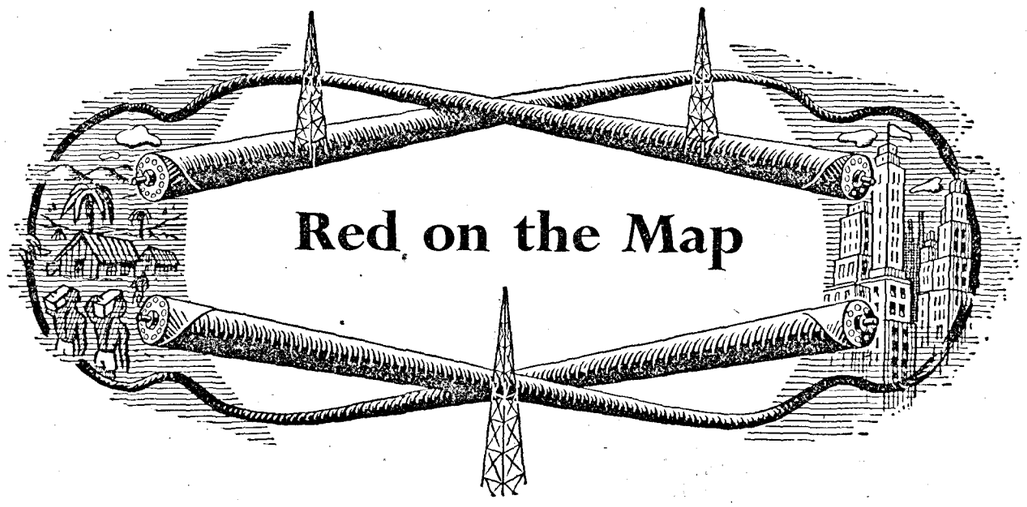


ANOTHER 8,000 tons of iron ore from the newly developed field in French West Africa leave Conakry in the "Ormsary", bound for British blast furnaces.

The "Ormsary" is the first of a fleet of fifteen specially designed ore ships. Their cargoes will help to feed the new blast furnaces that British iron and steel firms are steadily bringing into production.

Their special design has already enabled new records for speed of unloading and turn round to be set up.

This is only one of the ways in which steel firms are providing the raw materials to meet the future needs of modern industry, science and engineering.



'What about my future?' says JACK SCRAP

The steel industry still needs all the scrap which engineering firms and other steel-users can send back. Search out every ton of scrap on your premises. Your local scrap merchant will help with dismantling and collection.

● Issued by the BRITISH IRON AND STEEL FEDERATION, Steel House, Tothill Street, London, S.W.1

WORDS ROUND THE WORLD

YOU MUST LOOK at a map of the whole world to realise how extensive are the operations of Cable & Wireless Ltd. On it, across the blue of the Seven Seas you will find the red lines that indicate 150,000 nautical miles of submarine cable and 195 wireless circuits, arteries of communications carrying messages between the 74 different countries where the Company operates. Not only do they link the units of the Commonwealth with one another; they stretch to foreign lands where the Company has concessions.

In the United Kingdom and the Dominions the governments administer the terminals of the overseas telegraphic services. Cable & Wireless Ltd. are entrusted with maintaining and developing the cables and wireless relay stations. In most of the Crown Colonies and in other countries the Company are responsible for external cable and wireless services, and they carry out a variety of other technical operations including telephone systems, broadcasting, shore-to-ship and ground-to-air radio communications and phototelegraphy. International message carrying is the Company's business, and it is the biggest organisation of its kind in the world.

Operating on a trading basis, the Company's staff and its equipment must keep pace with the current load and be alert to anticipate new developments, however much the costs of labour and materials increase. The Company will continue its efforts to earn foreign currency, to link the Commonwealth, and, in world communications, to keep Britain supreme.

Part of Britain's Business...

CABLE & WIRELESS LIMITED

Electra House, Victoria Embankment, London, W.C.2

with 80 octane for motor spirit. It is not obtained during the course of any single refinery operation, but from the blending of the highest octane constituents of the motor spirit fractions yielded by various distillation and cracking processes, together with chemicals obtained from the petroleum gases released during refining. Shell has been producing limited quantities of aviation spirit by importing some of the high octane constituents for blending with high-grade gasoline produced at Stanlow. When the "platforming" unit is completed at the end of the year, it will produce these special constituents on a scale that will make possible a considerable increase in the present British output of about 2,300 barrels daily of aviation spirit, without any dependence upon imports of blending ingredients.

The decision to invest some £3.5 million on this plant may seem to be in contrast with the reduction at present and in prospect of piston aero-engines in service. But the replacement life of refinery equipment is not long—it is sometimes put at about five years, and over this period, the demand for aviation spirit is expected to rise steadily. Estimates made by the Petroleum Administration for Defence in Washington indicate that consumption is running at about 82,000 barrels a day outside the United States and the Iron Curtain countries, while production amounts to only 38,000 barrels, of which 32,000 barrels are produced in Canada, Mexico and the Caribbean and 4,300 barrels a day in the Far East. Europe is therefore almost wholly dependent on imported spirit, for daily consumption during this year is estimated to be 31,000 barrels and it is expected to rise to nearly 33,000 barrels by 1955. As far ahead as 1962, consumption of aviation gasoline in Europe is not expected to fall below 27,400 barrels a day. The American Deputy Petroleum Administrator had expressed some concern over the apparent absence of any plans to increase the production of aviation gasoline, particularly in Europe, where the deficiency arising from the loss of Abadan's 18,000 barrels a day has been particularly marked. This view would presumably be modified by the news of the Stanlow development.

Cars and Politics

WHAT the British motor industry has just gained on the swings through a new agreement with Western Germany it seems likely to lose on the roundabouts in India. A few days after the Board of Trade announced that an import quota for £2.7 million worth of British cars had been granted by Western Germany, the government of India revealed its own plans for progressively cutting down the import facilities at present available to car manufacturers established there. Although more than 2,000 British cars are shown as having been exported to Germany last year, these were taken over under various special arrangements, and the new quota represents the industry's first opportunity to reopen ordinary commercial exports to Germany. In return, £2 million worth of German cars are to be imported into Britain. Since these will attract customs duty at 33 per cent and purchase tax of 50 per cent (assessed on the wholesale price, plus duty), even the redoubtable Volkswagen may find it difficult to make an impression on British manufacturers' hold of their home market.

The prospect facing car manufacturers and importers in India is not at all clear. Reports suggest that the government is prepared on determined steps to establish an Indian motor industry. Most of the major British and American companies have plants in India that assemble cars exported there in "knocked-down" state; but British shipments dropped significantly from nearly 12,000 cars in 1951 to 6,456 last year and are at present running at no more than 4,000 cars a year, while American shipments are even smaller. To stimulate local assembly, the government has now cut the duty on imported components from 65 to 40 per cent, leaving the duty on crated cars at 72 per cent for British and 75 per cent for other makes. During the next three years, the government of India intends, apparently, to secure the concentration of all car production into five factories, which will have to buy at least half their components within India. Other producers, it appears, will have to quit the car business by the end of the period. Of the British firms affected, Austin, Nuffield, Standard and Rootes each have agreements with certain of the five chosen producers and presumably could retain a place in the Indian market. Among American manufacturers, Chrysler, through its subsidiary Dodge, and Studebaker have agreements with two of the favoured firms, but Ford and General Motors are among those with factories scheduled to cease car production. This affects the Ford and Vauxhall companies in Britain, and promises to deny them any access to the Indian market. Most companies with extensive export connections have been accustomed to the need, in many parts of the world, to take a large dash of politics with their trading; even so, this brand of discriminating nationalism seems exceptional. The political manœuvring is no doubt not yet at its end; while Ford and General Motors have apparently not yet been able to come to terms with the Indians, there is no reason to believe that they may not do so eventually. These first steps toward India's avowed desire to produce an "Indian" car, do not hold out happy prospects even for those British and American companies that have—so far—been accorded limited approval.

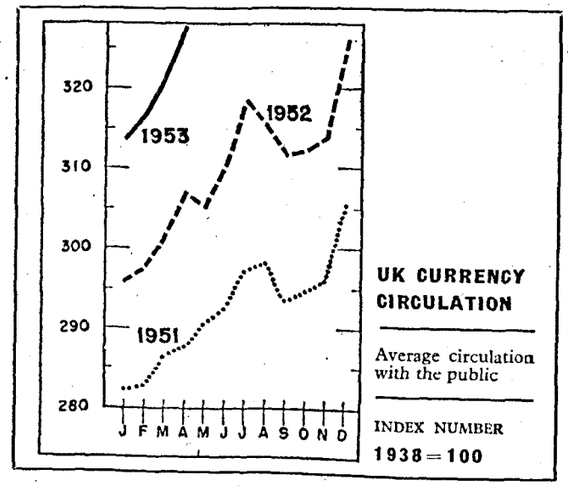
New Nickel Contract

THE International Nickel Company of Canada has entered into a contract with the Defense Materials Procurement Agency of the United States for 120 million lb of metallic nickel and 100 million lb of electrolytic copper, delivery to commence in December. The chairman of International Nickel states that it has become possible to undertake this contract because of an entirely new project in the Sudbury District of Ontario, the result of several years of mining and metallurgical research, which permits the additional production of 2 million lb per month of nickel. Under the contract nickel will be delivered at that monthly rate and the copper at the rate of 1⅓ million lb a month. Deliveries are to be completed in 1958. The price for nickel under the new contract is not revealed, but the company states that it reflects current prices, plus an allowance for amortization and additional costs of production; the price for electrolytic copper is stated to be 2/ Canadian cents a lb. Both prices are subject to movements on an agreed index of changes in specified economic factors.

Meteors and Brazil

THE exchange of Gloster Meteors against Brazilian cotton entered into some months ago attracted considerable comment in these columns and elsewhere. Deals of this kind do not usually escape political repercussions and the opposition in the House of Deputies in Rio de Janeiro has made much of the allegation that Brazil has paid an excessive price for the aircraft. Certainly the information originally given about the deal suggested that seventy aircraft would be sold at a price, excluding technical services, of £3½ million. It is now learned, however, on unimpeachable authority, that the ten Mark VII Meteors (which are trainer aircraft) cost Brazil £40,310 each, and the sixty Mark VIII's cost £42,810, excluding cannons, which cost several thousand pounds. These prices include assembly and flight testing in this country. The costs of dismantling, re-assembly and making the aircraft ready for flight in Brazil are not included in these prices, but are comprehended in the total contract.

These figures are a good deal lower than the first information, dating from November last year, originally suggested. They correspond to a total of rather less than £3 million for the aircraft themselves and set a different complexion on the comparisons of prices that were suggested earlier in these columns. It is understandable that until the Gloster Company is tooled up to produce the new Javelin it would be anxious to keep its Meteor production lines and staff in being; what is less certain is whether the company will emerge from the deal with a significant profit—as distinct from the useful contribution to overheads that the Meteor orders will obviously make. Equally, it is understandable that the company should be anxious, if it can, to secure similar business, whether from Brazil or elsewhere. Bilateral barter deals of this kind with countries that have not shown much readiness to reform their exchanges and repay their creditors are open to strong objections of principle that have often been set down in these columns—but it would be difficult to blame any individual company for entering upon them if it sees no opening for normal means of trade.



Strikes in 1952

FEWER strikes began in 1952 than in 1951, but the amount of idleness they caused in industry—so far as this can be measured—may have been slightly greater. The number of "working days lost," which in the United States is rather more correctly measured in "man-days," amounted to 1,792,000 for strikes in progress during the year, compared with 1,694,000 during 1951. About 416,000 people appear to have been involved. but probably 112,000 of these were involved indirectly (at the same factories or places of work where strikes happened). Some workers—especially in coal mining and in building—were involved in industrial stoppages more than once in the year. Thus the "net number" of individuals concerned in 1952 was about 330,000 (compared with 310,000 in 1951). The total represented about 1½ per cent of the total population in civil employment—and the amount of idle time, which amounted to about 5 days in the year for each of the workers involved, would have represented a much smaller proportion of the total time worked in industry.

By far the largest amount of industrial unrest occurs in the coal industry. Roughly 58 per cent of all the people concerned in strikes were miners, and in this industry the time lost amounted to 660,000 days. The National Coal Board, which compiles figures independently and includes "go-slow" operations, has calculated that last year these interruptions may have lost the industry 2 million tons of coal. Such measures of the "cost" of industrial unrest are interesting (though it must be borne in mind that a considerable proportion of the coal "lost" was in areas where a substantial financial loss was incurred on all coal mined, and also that the NCB last year mined or excavated about 3 million tons more coal than it was able to sell). But in very few industries can estimates as vague even as these be made. Obviously, the "cost" to the economy will vary with business circumstances in given industries and factories; in firms where "concealed unemployment" existed last year, for example, and men retained with insufficient work to do and their products going into stock, a dispute over redundancy might conceivably have benefited at least the individual employer. Industrial disputes are perhaps easier to measure (though very approximately) than other interruptions of industrial production; and this can lead to exaggeration of their direct effect upon output, though their full indirect effects, and their significance as an index of labour relations, may be considerable. It seems fairly clear, for instance, that strikes hamper the smooth running and total output of the economy far less than absenteeism does; some attempt to compile statistics of absenteeism throughout industry, such as already exist for coal mining, seems overdue.

Commonwealth Sugar Discussions

THE return to private enterprise of all sugar importing, which is now expected to take place before the end of the year, will put on private importers considerable

responsibility for implementing the Commonwealth Sugar Agreement negotiated by the Government and at present carried out on behalf of this country and certain other importing countries of the Commonwealth by the Ministry of Food. Discussions are now taking place between the Ministry and the trade to see how this transfer of obligations can best be carried out. The dual object of the sugar agreement is to assist sugar producing areas in the Commonwealth with development and to increase the supply of non-dollar sugar to the Commonwealth countries that import sugar, even though at present such sugar costs about 70 per cent more than dollar sugar. Under the arrangement made in 1948, the Ministry of Food undertook to buy the whole of the Commonwealth exportable sugar surplus up to 1952 at prices to be negotiated annually. In 1952 the available surplus amounted to 1.6 million tons. In the renewed arrangement negotiated in December, 1951, it was reckoned that Commonwealth annual exports would eventually rise to 2,375,000 tons, of which Britain was to buy 1,640,000 tons at prices to be agreed annually. The remainder was to be bought by Britain or Canada at world prices—presumably lower prices.

Private trade in this country should have little difficulty in absorbing all the Commonwealth production, and the Ministry of Food may be able to withdraw from its contract with an easier conscience than when it pulled out of its banana agreement with the West Indies. It takes just over 2 million tons to meet the present sugar ration and it is generally agreed that when rationing ends in a few months time—a preliminary step to handing the trade back to private enterprise—public consumption may, after rising sharply at first, settle down to about 2.5 million tons a year. In recent years a little over half Britain's sugar imports have been coming from dollar sources, mainly from Cuba, but allowing for re-exports the trade should be able to handle the 1,640,000 tons of purchases guaranteed to Commonwealth producers. The difficulty will be to persuade the trade to buy this sugar at prices higher than world prices, especially as the Government is anxious to withdraw the present sugar subsidy of about 1¼d. per lb. But even after the Ministry of Food goes out of business, the Government will still have the whip by the handle—it can refuse foreign currency for purchases until traders have bought the agreed quantity of Commonwealth sugar; but on this score the trade, for its part, requires certain assurance and present discussions are not proving too easy.

SHORTER NOTE

The Actuaries' Investment Index, that well-known statistical stand-by of the institutional investor, will have a new look by the end of this summer. Its compilers have recognised the fact that an attempt to preserve continuity in the index over an indefinite period can be misleading, and they have now decided to calculate a new index that will incorporate a much wider selection of ordinary shares and will segregate preference shares into groups according to the nominal rate of dividend paid on each security.

Company Notes

GUEST, KEEN AND NETTLEFOLDS. The former big shareholders in the iron and steel industry are being very discreet about what they intend to do when the steel companies are put up for sale. In his speech accompanying the full accounts of Guest, Keen and Nettlefolds, Mr J. H. Jolly goes to considerable pains to avoid saying anything that might tend to spoil the market. He refers shareholders to one of his earlier statements that the group would "be interested in purchasing the Iron and Steel Works previously connected with the group subject to fair financial terms on re-acquisition and the extent to which free enterprise may be allowed"; and declares that re-acquisition will be decided "in the light of the terms offered" and "the conditions as they affect the iron and steel trade today." In a recent speech to the shareholders of Cammell Laird, Mr J. C. Mather made rather similar remarks; he declared that any re-purchase of English Steel will depend upon what interest in it can be acquired and what terms are offered.

Like many other former big shareholders in steel, Guest, Keen and Nettlefolds has ample liquid balances—but also a large investment programme on hand. The group's cash balances and tax reserve certificates amount to over £7.3 million (against £8.8 million a year ago) and its quoted investments still total over £14.6 million; but these resources could be quickly eaten away between the re-purchase of the group's steel interests (for which it received about £18.5 million on vesting day) and an outstanding programme of £10.7 million for capital expenditure. And although, as was pointed out in a note on the company's preliminary statement in these columns on May 16th, the death of EPL will benefit the company a great deal, there is no assurance that trading profits in the engineering industry will remain at their present high levels. Indeed, Mr Jolly, while pointing out that the subsidiary companies trading at home did rather better than those trading overseas last year, has already informed shareholders that in the latter part of the year "several sections began to feel the effect of customers' decisions to drastically reduce their stocks in trade." This, in turn, reduced profit margins; and, in these circumstances, the increase in the group's own stocks from £15.9 million to £21.3 million cannot be taken simply as a sign of healthy expansion in trade.

	Years ended Dec. 29, 1951	Jan. 3, 1953
Consolidated earnings:—	£	£

★

ASSOCIATED PORTLAND CEMENT. The Blue Circle group of cement companies is able to look back on 1952 as another year of steady expansion. Its directors have celebrated this by raising the ordinary dividend from 27½ to 30 per cent, and by deciding upon a capitalisation of reserves that will double the existing ordinary capital of £4 million. Last year, its deliveries of cement rose by over 700,000 tons to 7,400,000—the greater part of the increase going directly to the home market—and, despite a reduction in prices, profit margins in Britain showed a slight improvement. As cement prices have recently been raised again, these margins may look even more comfortable now. In all, the group received a total income of over £42.1 million from the sale of its products and from its investments last year, and its trading profits advanced from £8,514,725 to £11,096,318. Another satisfactory sign is that these increases were achieved without adding any significant amount to the value of stocks; but this, of course, was partly a reflection of last year's reduction in prices.

The annual address of the chairman, Mr George Earle, exudes confidence about the future as well as good cheer about the past. At home demand is still outstripping supply and the group has had to import cement from the Continent—and then to sell this cement at a loss—to fulfil its delivery commitments; but as there is no slackening in

overseas sales and as (in Mr Earle's words) overseas prices are "good," the group is perhaps squaring the Circle on these losses on imports from the Continent. In any case the need to import cement may shortly disappear when the group's new kilns in Britain come into production; in the consolidated balance sheet expenditure on capital works in progress is entered at £3,956,275 and outstanding capital commitments are estimated at £2,440,201. The low (but not excessively low) yield of 5.4 per cent on the £1 ordinary stock units at the current price of 111s. 3d. xd suggests that investors may be looking forward to another increase in equity payments soon; and in the back of their minds there is, perhaps, the longer term consideration that in these days of planning for public works, the cement manufacturers might not be hit as hard as some other industries in any future world recession.

	Years to Dec. 31, 1951	1952

INTERNATIONAL PAINTS (HOLDINGS). The directors of International Paints (Holdings) have set their shareholders a puzzle by deciding to raise the effective ordinary dividend from 17½ to 20 per cent for a year in which trading profits rose by less than £5,000 to £1,557,570. The only reason for this decision that can be deduced from the statement made by the chairman, Mr C. R. Pètrie, is that the group's factories in Britain were kept "reasonably busy" last year—even though its trade (particularly at home for sales of decorative and industrial paint coatings) was adversely affected by economies and some de-stocking by consumers. In company with its customers, however, the group itself was careful to keep a tight rein on stocks in 1952; and in the consolidated balance sheet the book value of stocks is shown to have risen by less than £100,000 to £3,054,692. This has been accompanied by a slight strengthening of the group's liquid resources.

	Years to Dec. 31, 1951	1952
Consolidated earnings :—	£	£
Trading profit	1,572,647	1,577,570

Ordinary capital	1,069,000	1,603,500

4s. ordinary share at 13s. 0d. yields £6 3s. per cent.

So far—apart from the splash of colour for the Coronation—there have not been any encouraging signs that trade in paint is once again improving. For the immediate future, therefore, the group appears to be concentrating its efforts at home on re-equipment and technical developments, and on expanding its trade with the shipbulding concerns; overseas it appears to be attempting to counter quota restrictions and exchange control regulations by adding to its manufacturing interests abroad. It should be noted, however, that despite the plethora of new import restrictions in many world markets last year, the group's export sales were only fractionally below their record level of 1951. All in all, therefore, the directors of International Paint have had a happier story to tell than might have been expected; but, with costs still rising, they seem most unlikely to be able to extend their traditionally liberal dividend policy to yet another increase in the dividend for the current year.

★

BRITISH INSULATED. There is more than a hint of nostalgia in Sir Alexander Roger's review of British Insulated's activities in 1952. It was a year of records. The volume of production rose by 12½ per cent, the value of sales rose to £85 million, the group's trading profits advanced from £7,966,464 to £9,423,182 and the ordinary dividend was raised from 9 to 10 per cent. But what Sir Alexander calls the recent "substantial falling off in the rate of intake of new orders" means that these records will not be broken again this year. In these circumstances perhaps the most satisfactory feature of last year's successes is that they have enabled the group to replace its bank overdraft of £1,997,377 at the end of 1951 with a cash balance of £3,492,308 at the end of 1952. This swing-round was mainly due to the receipt of £3,340,000 from last year's issue of ordinary shares; but it was also helped by profit retentions and by the fact that, thanks to a reduction in raw material prices, the value of the group's stocks in a year of record trading was actually reduced by about £1 million to £21.3 million. There may now, however, be some danger of losses on these stocks following in the wake of further reductions in prices (particularly of copper).

The improvement in the balance sheet has come at a time when the group is in need of liquid resources to meet heavy future commitments. In the first place a special loan of £2 million is due to be repaid not later than 1955. Secondly, the group still has a considerable programme of capital development to complete; its outstanding commitments are estimated at over £1 million, even though £2.2 million was spent on capital account last year. Thirdly, since the end of last year the group has purchased the wire and cable business of Phillips Electrical Works in Canada. Lastly, in meeting the growing threat of foreign competition, the group may have to make greater efforts to meet the demand for extended credits from its overseas customers. All these factors, coupled with a falling off in orders, suggest that a further increase in equity payments is unlikely. The yield of 5.55 per cent on the £1 ordinary stock units, at the current price of 36s., needs to be judged in the light of this presumed stability of dividends.

COMPANY MEETINGS

CAMMELL LAIRD & COMPANY, LIMITED

ANOTHER SATISFACTORY YEAR

SHORTAGE OF STEEL AND SKILLED PERSONNEL RETARDS PRODUCTION

SUBSTANTIAL VOLUME OF ORDERS IN HAND

MR J. C. MATHER ON MAINTAINING COMPANY'S FUTURE WELL-BEING

The eighty-ninth annual general meeting of Cammell Laird & Company, Limited, was held on May 29th, at Birkenhead.

Mr J. C. Mather, JP, the chairman, who presided, said:

Ladies and gentlemen,—Before proceeding to the business of our eighty-ninth annual general meeting, I would like to extend a welcome to Mr J. H. Bromfield, who has recently been appointed to the board and therefore comes before you for election. Mr Bromfield brings experience and qualities of mind which I am sure will be of great help to us in the direction of the company's affairs.

I am glad to be able to report that we have again had a satisfactory year, and before going any further I would like to pay tribute to all those who have worked together to produce these results and maintain the reputation of the company, the managing director, the management, staff and workmen. Too much is heard these days of the two sides of industry, but it is only by real team work, such as generally exists in this yard, that success can be achieved.

During the year Mr Bernard Jones, our secretary and Mr James Watters, our shipbuilding manager, were awarded the OBE; and in the New Year's Honours List this year, Mr Robert Smith, our head foreman electrician, received the MBE. I am sure you will share our pleasure at this recognition of the long and loyal service which these gentlemen have given to the country and to your company.

BALANCE SHEET FEATURES

Turning now to the accounts for the past year and dealing first with the assets shown in the balance sheet, it will be noted that whereas for some years additions to properties have been more or less equalled by depreciation written off, thus stabilising the net total at about £1 million, the additions for 1952, at £178,000, are £90,000 more than the year's depreciation figure. Two of the factors contributing to this are the inflated costs of capital expenditure and the suspension, as from April, 1952, of the initial allowances on such expenditure. In spite of these adverse circumstances we must keep our shipyard well equipped on modern lines in order to meet growing competition, especially from abroad. The increase in trade investments of about £40,000 represents instalments paid on account of two tugs (being built by us for local owners) in which we have taken a financial interest. Under current assets, stock in trade and work in progress again show a substantial increase over last year, due to further rises in costs and delays in the delivery to us of essential components. A corresponding increase is shown in the total of instalments received on account of work-in-progress.

You will remember that in my statement last year, I mentioned that we had decided to reduce our bank balance and add to our investments, and this is reflected in this year's accounts. During the year, advantage has been taken of favourable opportunities to sell a large proportion of our long-dated Government securities and re-invest in shorter dated stocks. Apart from the advantage to us of holding the latter, an appreciable gain in the comparative market value of the stocks has, in fact, resulted, and with the improvement in market values since the end of the year a considerable amount of the book loss referred to in Note 1 on the accounts has now been recovered. The balance sheet shows a difference of about £350,000 between the book value and market value of quoted securities: since the end of the year with improved market values, the deficiency has almost disappeared.

Turning to the other side of the balance sheet, you will notice that we have transferred the EPT postwar refund, which is no longer required, to a new capital reserve for the increased replacement costs of fixed assets: a transfer is also made to this reserve from the appropriation account in order to bring the total to £500,000. Further additions will be made to this reserve as circumstances dictate and as profits allow. General reserve has been increased to £2,150,000 by the transfer of £65,000 from appropriation account and £60,000 from tax provision no longer required.

PROFIT AND LOSS ACCOUNT

In the profit and loss account, the increase in trading profit is again due principally to the inclusion of a proportion of profit earned on work-in-progress, for the same reasons as those mentioned last year.

The increased profit results in a corresponding increase in the provision for tax, but we welcome the reduction in income tax made by the Chancellor in his recent Budget as a step in the right direction. It is a step—and we are told that it is part of a three-year plan—towards the recognition of industry, and the individual, as responsible people, because it makes it a little easier for all of us to put on one side the savings by which alone the future can be safeguarded. It is strange that in this country the function of profits should be so misunderstood. They should be regarded in part at least as a means of keeping plant and equipment up-to-date and so help to maintain employment. Although your company was not affected by the Excess Profits Levy, its abolition will be generally welcomed; but I personally cannot raise much enthusiasm for the restoration of initial allowances. They are, at best, a substitute for the savings which industry ought to be allowed to retain from its operating profits.

NET PROFIT AND DIVIDEND

The net profit for the year, after again appropriating £60,000 for depreciation in the value of trading stocks, amounts to £655,227 and your directors recommend that approximately 55 per cent of this sum should be paid to the stockholders, the remainder being put to reserve. Were it not for the substantial reserves of the company, to which I shall refer later, we would regard 45 per cent of the net profit saved for the future as too low a proportion, but in the present circumstances we believe that it is reasonable. There has been a general tendency to restrict dividends in the hope of restricting wage demands, but this policy does not appear to have had much success. Stockholders and workpeople alike should have as much return for what they put into the business as is compatible with maintaining the health of the undertaking for the benefit of both. The dividend this year has been increased to a total of 15 per cent, a figure which your board hopes it may be possible to maintain for the next two or three years. In addition, a special bonus of 2 per cent, tax free, is recommended for the current year.

ANALYSIS OF EACH £1 OF REVENUE

Last year I gave details of the way in which each pound of revenue earned by the company is accounted for, and I think you may be interested to know the equivalent figure for 1952. This year the increased cost of materials raised this item from 8s. 10d. to 9s. 5¼d., leaving 10s. 6¾d. to pay those engaged in the business, put something on one side and pay the stockholders a dividend. Wages this year accounted for 5s. 10½d. and overhead expenses and depreciation for 2s. 2d. Both these items are relatively lower than last year, due to the inflated cost of turnover. The resultant gross profit amounts to 2s. 6¼d., of which taxation takes slightly less at 1s. 5¾d., and the remaining 1s. 0½d. is divided between savings (5½d.) and dividend (7d.).

STEEL INTEREST

The liquid resources of the company, to which I have already referred, are, of course, being retained in that state pending a decision in regard to the reacquisition of our holding in the English Steel Corporation. I had hoped that by this time I should have been able to give you some information, but as you know, the Iron and Steel Bill has only just received the Royal Assent and the Realisation Agency responsible for returning the steel industry to private ownership has not yet been set up. The possession of a substantial interest in a concern such as the English Steel Corporation has obvious advantages to a company of this kind. Until it is known what interest can be acquired in the English Steel Corporation, and upon what terms, your board cannot decide whether the reacquisition of such an interest is desirable or not. I very much hope that we shall obtain the information upon which to make a decision without much further delay, for until

this is decided, it is impossible to know how much is available for other requirements.

SAFEGUARDING COMPANY'S FUTURE WELL-BEING

Whatever may be the position in regard to English Steel, or any other possible trade investments, you will appreciate that the first duty of your board is to ensure the future well-being of the company. This means that provision must be made to keep the yard, with all its plant and equipment, in the most efficient and up-to-date state. Only by doing this will we be able to weather the economic storms which may be ahead. It is clear that heavy capital expenditure will be necessary, and in fact your board is already considering plans for this. These cannot, however, be implemented immediately without interfering with the very full shipbuilding programme which we have on hand. The industry of this country, so far as one can see, is going to be short of capital for many years to come; owing to good fortune or good management, as you like, in the past, we are more fortunate than most in this respect. It seems to me that it would be unwise to throw away this advantage and stockholders will, I am sure, realise that any future application to the public for further capital might well be very expensive and in any case would mean more stockholders to share in the profits of the company. The maintenance of the future health of the company is, I am sure, of more interest to the stockholders than any immediate distribution.

METROPOLITAN-CAMMELL CARRIAGE AND WAGON COMPANY

The Metropolitan-Cammell Carriage and Wagon Company, Limited, started the year with a record order book but—owing to continued difficulties with steel supplies—has been working under uneconomic conditions. Production has constantly been held up and the number of men employed has had to be reduced by some 800 since 1951.

The value of deliveries has actually been higher than in any previous year, but this is rather an indication of the rise in costs and prices than of increased production.

Most of the large wagon shipments were for Commonwealth countries and considerable numbers of passenger coaches were shipped to Rhodesia, Ceylon and Egypt. To British Railways the company supplied bolster wagons for steel traffic, hopper ballast wagons, and a number of the new standard steel coaches.

OVERSEAS ORDERS

More than 70 per cent of the value of orders at the beginning of 1953 was for export. The production programme for this year includes passenger coaches and goods wagons for railways in Africa, Rhodesia, Australia, New Zealand, India, Pakistan, Egypt, the Sudan and Argentina, as well as for British Railways.

The intake of orders has fallen off during the last three or four months, due very largely to the lack of purchasing power and exchange difficulties in a number of countries. Foreign competition has also been increasing.

In spite of these difficulties there are still many unfulfilled demands in the world for rolling-stock and big export opportunities exist. To take advantage of these opportunities British builders will be faced with increasing demands for prolonged credit and some priority in steel supplies is going to be essential to enable them to quote satisfactory and competitive deliveries.

Large shipments of "Olympic" integral type buses were made to South America from the Company's Bus Body factory. Output of chassis-mounted 'buses also was maintained for London Transport Executive and other public transport operators.

SHIPYARD ACTIVITIES

At out shipyards here in Birkenhead we launched nine ships totalling 67,170 gross tons and delivered eight ships totalling 69,744 gross tons. One of these vessels, the *British Crown*, owned by the British Tanker Company, Limited, is the largest tanker yet to be built at our works, having a gross tonnage of 18,600 tons and a deadweight capacity of 28,572 tons. We also had the privilege of constructing the *Manchester Pioneer* and the *Manchester Explorer* for Manchester Liners, Limited. These ships were specially designed and built for initiating a new service between Manchester and the Great Lakes, and were, in fact, the first British ships regularly to be employed between the United Kingdom and the ports of the Great Lakes.

Apart from merchant work, we were also busily engaged on a number of contracts for the Royal Navy, and I am pleased to report that steady progress has been made on the fitting out of HMS *Ark Royal*.

Our Ship Repairing Department has again been fully occupied, and repairs and refits were carried out on some 112 ships for both merchant owners and the Royal Navy.

We were very pleased to be associated with the atomic experiment in the Monte Bello Islands, since the aircraft carrier *Campania* and the tank-landing ship *Narvik* were fitted out by us to enable them to take part in the operation. We understand that both vessels gave a good account of themselves.

Our greatest difficulty in 1952 was the acute shortage of steel and the fact that steel deliveries were at times out of sequence with the work we had on hand. In addition to this, we were also handicapped by a deficiency of skilled engineering personnel which has been common to most industrial undertakings in the past eighteen months. These difficulties had a retarding effect on our production, which we hope will be remedied.

THE OUTLOOK

As far as the future is concerned, we have orders on hand which should keep us busy for some time to come, and many of you will no doubt have read in the Press in recent months that your company has been entrusted by the Anglo-Saxon Petroleum Company, Limited, with an order to build a tanker with a gas turbine machinery installation. This, in all probability, will be the world's first merchant ship to be propelled exclusively by this type of machinery.

I have referred also to the possibility that difficulties lie ahead. Competition from abroad, both here in Europe and in Japan, is growing fast. Freight rates have fallen sharply, and as they fall the readiness of shipowners to commit themselves to building contracts diminishes. Already new orders are scarce. In the face of these facts, it is your Board's duty, both to the nation, to the stoekholders and to the workpeople, to ensure as far as lies in its power that costs are kept down to the absolute minimum. I very much hope that the trade unions and those responsible for the present demands for further wage increases will reconsider them in the light of this overriding duty.

The report and accounts were adopted.

The retiring directors, Mr J. H. Bromfield, JP, Mr P. B. Hunter and Mr C. L. Mason, MIME, were re-elected.

The remuneration of the auditors, Messrs Cooper Brothers and Company, was fixed, and, the other business of the meeting having been transacted, the proceedings terminated.

GUARDIAN ASSURANCE COMPANY, LIMITED

ANNUAL GENERAL MEETING—JUNE 3, 1953

CHAIRMAN: THE RIGHT HON LORD BLACKFORD, DSO, DL, JP

Extracts from the Directors' Report:

LIFE DEPARTMENT

Net new sums assured amounted to £9,008,230, being a slight reduction on the previous year. Immediate annuities were issued in consideration of single premiums of £385,983 and deferred annuities for single premiums of £405,968.

The net rate of interest earned on the fund was £4 5s. 5d. per cent and the fund increased during the year to £20,487,931.

REDEMPTION ASSURANCE ACCOUNT

A valuation at the end of the year revealed a surplus of £20,677, of which £10,000 has been transferred to profit and loss. The fund at the end of the year after the transfer was £2,949,069.

FIRE DEPARTMENT

The net premium income increased during the year by £607,670 to £4,344,935. The loss ratio was 42.1 per cent, and after providing for unexpired risks on the usual 50 per cent basis the surplus transferred to profit and loss was £484,827.

ACCIDENT AND GENERAL DEPARTMENT

The net premium income increased during the year by £766,729 to £4,635,791. The loss ratio was 55 per cent against 56.8 per cent in 1952, and after providing for unexpired risks on the usual 45 per cent basis the surplus transferred to profit and loss was £193,420.

MARINE DEPARTMENT

The net premiums amounted to £1,508,917 and the first year's claims to 26.1 per cent of the premiums. £225,000 has been transferred to profit and loss, leaving the fund at £1,899,187, representing 125.8 per cent of the premium income.

PROFIT AND LOSS

After making full provision for taxation, including that on the profit for the year, and after transferring £258,000 to investment reserve and £85,756 to general reserve, and after providing for the increased final dividend recommended by the directors of 3s. less income tax (2s. 6d. in 1952) on each ordinary share and meeting the cost of the preference dividend for the year, the balance carried forward was £269,321.

BALANCE SHEET

The total assets of the company and its subsidiaries increased during the year by £3,644,387 to £42,896,740.

ALL THE PRINCIPAL CLASSES OF INSURANCE TRANSACTED

The company undertakes the office of trustee, executor and administrator.

Head Office:
68, King William Street, London, E.C.4.

THE NORTHERN ASSURANCE COMPANY, LIMITED

117th ANNUAL GENERAL MEETING

FURTHER REMARKABLE PROGRESS

OUTSTANDING NEW LIFE BUSINESS

The one hundred and seventeenth annual general meeting of The Northern Assurance Company, Limited, was held on May 27th, at Aberdeen, Mr George Francis Collie, MBE, chairman of the Aberdeen board, presiding.

The following is an extract from the chairman's statement which had been issued with the report and accounts:

If an institution such as ours has one especial duty, it is to bring an informed judgment to bear on long-term policy, to build to a design without yielding to the distraction of passing events. Often in recent years it has seemed that there were few virtues, and fewer rewards, in taking the long view. Expedient followed recurring crisis; thrift was frustrated; and inflation made responsibility for other people's money a thankless task. No peace-time year in recent memory has shown such marked—and such welcome—changes in economic conditions as occurred in 1952. Britain was again paying its way; the convertibility of the pound into dollars became a subject of practical discussion and no longer merely a pious aspiration; a new sense of the value of money and savings has attended the rebirth of old faith in the virtues of monetary discipline and in the efficiency of the open market.

These are developments of great significance, capable of exerting a profound effect upon the insurance business. We should be ungrateful not to welcome them, for in the long run nothing is more inimical to sound insurance business than the ever-expanding pressure of inflation and the unceasing depreciation of the value of money. It is, indeed, entirely salutary that these dangerous trends have been checked, even though they may not have been decisively halted.

PROBLEMS CREATED BY ECONOMIC CHANGES

The economic changes of the past year have inevitably created special problems in the management of a great institution like the Northern. But for the exercise of the foresight to which I have referred, they could have confronted us with considerable embarrassment. For example, the market values of the main classes of Stock Exchange securities again fell last year, as interest rates rose. But you will be glad to know that the inevitable depreciation which occurred to the Northern's growing investment portfolio was relatively modest, and you will observe from the accounts that the aggregate market value at the end of the year was in excess of the book value. I think that shareholders will agree that this is a most satisfactory outcome for a difficult year. More important, however, are the new opportunities for wise investment that the new basis of interest rates has given us; in due time, they can be expected to enhance the security that policyholders and shareholders already enjoy.

THE YEAR'S RESULTS

During the past year the Northern and its associated companies have made further remarkable progress. Every department of the Northern achieved new record figures in 1952, and the company's total income increased by no less than 20 per cent over the previous year. In the life department, the rate of expansion is dramatic: new life sums assured in 1952 jumped to £10,491,955, compared with £7,385,921. Our figures show the truly impressive increase of 42 per cent, whereas the total new business of all insurance offices in Great Britain in 1952 showed a relatively modest gain of about 5 per cent. It is gratifying to record such outstanding success in the life department, which reflects the greatest credit on the management and staff.

Our special pensions department is handling a steady flow of new pension schemes, and its advice is sought in an ever-increasing volume of inquiries. If, one day, the law allows self-employed persons to provide pensions for themselves with tax advantages comparable to those enjoyed by employed persons, they will find our pensions department ready and eager to help them.

AN IMPORTANT STEP IN RATIONALISATION AND INTEGRATION

Service to the public must always be our first principle, and we have been anxious to knit the Northern group of companies more effectively together in this task. An important step in rationalisation and integration was taken at the end of last year, when the London and Scottish Assurance Corporation, Limited, ceased to transact new life assurance; as a result the London and Scottish organisation now issues Northern policies. The necessary administrative adjustments have been made smoothly, and there has been no interruption to the flow of life business that the London and Scottish obtains.

Other re-arrangements, which are purely internal in character, have been made to secure greater efficiency in the marine and motor business. From the beginning of this year the control of our own Northern marine underwriting has been passed to our associate, the Indemnity Marine Assurance Company, Limited, and a joint motor underwriting department has been established with the White Cross Insurance Company, Limited.

The development of our widely ranging organisation throughout the world has continued during 1952. We welcome in particular the formation during the year of our new United States Committee, which will undoubtedly be of the greatest value to our interests in that important and expanding market.

DEPARTMENTAL RESULTS

The fire account has yielded a profit of £727,183; this represents 8.3 per cent of the premiums, showing an improvement over the 1951 ratio, which was 6.7 per cent. Our claims experience was again generally favourable at home and in overseas countries, and we secured a modest profit from our fire business in the United States.

In the accident department, the results are dominated by motor insurance. For some years past, motor business has been generally unprofitable, and there are continual difficulties in adjusting premium rates to the cost of claims, particularly in overseas markets. There has been some improvement in our motor experience, but not sufficient to turn losses into profit. It should be borne in mind that we conservatively set aside 50 per cent of the year's premiums to cover unexpired risks; this eminently desirable strengthening of the reserves places a heavy burden on the account, particularly when, as last year, it shows an expansion in premium income of more than 20 per cent. In these circumstances the loss of £153,086 for the accident department as a whole makes a better comparison than at first sight appears with the loss of £162,852 shown for 1951.

Marine experience in 1952 at first gave promise of an improvement on 1951. But there were heavy losses later in the year, including the *Klipfontein*, the *Champollion* and soon after the year end the disaster to the *Empress of Canada*—fine ships insured for approximately £4 million. Our proportion of such losses is bound to be costly to our hull account; meanwhile the cargo market remains highly competitive. The substantial profit transfer of £434,377 from the accounts of underwriting years now nearing completion can be regarded as satisfactory; it is lower than the record figure for 1951, but those results were exceptional as the chairman's statement showed twelve months ago. I must refer to the great expansion in the marine business of the group; premiums have increased to £6,558,981 and the fund itself now stands at the impressive figure of £7,833,177.

PROFIT AND LOSS ACCOUNT

These departmental results are brought together in the profit and loss account. Together with gross investment income of £801,845 earned by the shareholders' funds (against £740,475 for 1951) they produce a total profit of £1,837,644. Of this sum, no less than £1,303,974 is absorbed by taxation at home and abroad, leaving us a net profit of £533,670, which is £80,433 higher than in 1951.

The weight of taxation lies heavily on investment income, severely limiting the net sum from which shareholders derive their dividend. The gross investment income of their funds rose by more than £60,000 last year, but after British and overseas income taxes have been paid, the net sum left is £395,586, an increase of less than £16,000 over the net investment income of £379,946 in 1951. Even this comparison is too favourable, for it does not allow for the incidence of profits tax and excess profits levy.

Shareholders may feel that this is a modest gain for a year of such outstanding progress. But it is right, in the view of the Board, that they should participate—to the extent that the security of the company and the depredations of the tax-gatherer permit—in the fruits of the Northern's growth. Your directors therefore recommend a final dividend on the ordinary shares of 10s. making with the increased interim dividend already paid a total distribution of 18s. per share. This will entitle the holders of the 6 per cent participating preference shares to a further dividend of 8s. 0.716d. per share, payable with the usual half-yearly dividend on July 1 next.

TRIBUTE TO MANAGEMENT AND STAFF

The expanding strength and high reputation of the Northern and its associated companies rest in the hands of the men and women who devote their thought and endeavour to its service. To our new general manager, Mr T. W. Haynes, on who the primary weight of responsibility hasfallen, and to the whole of the Northe team throughout the world—boards, managent, staff and representatives—we expres our warmest gratitude and thanks.

The report and accounts were adopte and the special resolution adopting th new articles of association was passed.

THE DAILY MIRROR NEWSPAPERS LIMITED

INTENSIFIED COMPETITION

STRONG POSITION OF "DAILY MIRROR"

MR CECIL H. KING'S REVIEW

The thirty-third annual general meeting of The Daily Mirror Newspapers Limited was held on May 29th, at the Memorial Hall, Farringdon Street, London, E.C. Mr Cecil H. King, the chairman and managing director, said:

As you have seen from the accounts, the net profits before taxation decreased by about £61,000 from £1,676,708 to £1,615,672, the previous year having been, as you recall, an outstandingly good one.

The position at the close of the financial year was quite substantially affected by the severe floods which in February did much damage to our newsprint stocks at Purfleet. That month we received over £275,000 from the underwriters on account of the cost of some of our newsprint which was definitely rendered useless. This made our stock position lower than it would otherwise have been, and our cash position prettier.

But the condition of the remaining part of our stocks at Purfleet remained uncertain. In the circumstances, we thought it prudent to regard this part as undamaged, and to provide some £66,000 out of the year's profits to write it down to market value. Now that more information has come to light, we anticipate that a substantial proportion of the written down stock will be found useless, and that its full original cost will consequently be recovered from the underwriters.

The figures reflect as usual the massive financial strength of your company. The dividend is being maintained; the reserves and carry forward are increased by £238,892. I will not harp on this theme, but give you a quick survey of the company's business and prospects as I see them.

LARGEST DAILY SALE

Our sale, the foundation of any newspaper's prosperity, is running around 4½ million, the largest of any daily newspaper in the world and an appreciable increase on last year. In the course of the year a reorganisation of the editorial department was effected and Mr Silvester Bolam, our editor for the last five years, resigned in January. It was with deep regret that we learned of the very sudden death in April of this sincere and distinguished journalist. We now have as acting editor Mr Jack Nener, with Mr Hugh Cudlipp as editorial director. The new arrangement is working well, and in spite of increased competition I am hopeful that we shall more than hold our own.

We are still printing on much the same plant that we had before the war, though in the interval our sale has nearly trebled. This is making it more and more difficult to publish our paper—and in addition we have leased our premises at Back Hill to the London County Council for use by the London School of Printing, and they are pressing us to vacate them.

Through an associated company a long lease of premises in Stamford Street by Waterloo Station has been acquired, and it is our hope that we shall be able to operate from there some time in the coming twelve months. We have had delays over building licences, but when we do finally print the paper there we shall have the finest newspaper printing plant in the world.

ECONOMIC TRENDS

The principal changes in the economics of newspaper publishing in the last twelve months have been a decreasing price for newsprint, larger newspapers, higher wages and more competition. At one time the resultant of these forces was that three of the national newspapers were losing money. As competition warms up—and with the advent of sponsored television which may eat into their advertisement revenues—it is likely that our weaker sisters will be hard put to it to survive.

Though I hope there is no question of Fleet Street returning to the ludicrous antics of the thirties, we have recently had two national newspapers offering motor cars in entry-free competitions as an inducement to the public to become readers. And it is well known that some newspapers make a larger profit from paid-entry competitions—so-called tests of skill—than they do from the newspaper itself.

COST OF NEWSPRINT

The most important single factor in the trading sheet of a newspaper is the cost of its newsprint and there has recently been a recession in the cost of this our raw material. It is still, however, over five times its prewar cost. Newsprint in this country has been rationed since the early days of the war, but nowadays rationing affects very few newspapers. In a recent period only 3 per cent of all British newspapers took their whole ration. We have not taken up our full quota for a long time.

The price is still high, but so is world demand, and it is not thought that the price will decline further to any appreciable extent, unless there is a recession in trade in the United States.

PAPER MAKING INTERESTS

Your company, as you know, has large interests in paper-making both here and in Canada. Our great Canadian subsidiary, the Anglo-Canadian Pulp and Paper Mills of Quebec, paid the same dividend of $2 a share, but the profits were lower and only just covered the dividend. The decline in profits was due to two main causes, the substitution of a premium for a discount of the Canadian over the American dollar, and the decline in general consumption and in the price of unbleached sulphite pulp of which your company's subsidiary is a large producer. The current year's earnings of the Anglo-Canadian company are expected to be more than 50 per cent above those of last year.

Our other big paper interest is our shareholding in Albert E. Reed, one of the big five paper and board making companies in this country. The results of the past year are not yet available, but it is well known that the sharp drop in pulp prices involved all English paper mills in severe stock losses, and it is not to be expected that Albert E. Reed will prove an exception. Demand in this country has now picked up, pulp prices have stabilised and current earnings are generally believed to be satisfactory.

THE PRESS COUNCIL

For the last three years or so there has been much talk about the Press Council and interminable discussions in which your representatives have played a part. The result seems to us an entirely unacceptable compromise. It was never very clear what the idea of this Council was, but as time wore on, it has evolved as a body on which the Mrs Grundys of the stodgy press will make disapproving noises at their gayer and more prosperous contemporaries.

On the body as at present proposed, it is likely that the popular press, which numerically is the press, will be represented more or less adequately by about five spokesmen, while their more dreary competitors, London and provincial, will enjoy the support of the remaining twenty. When this body comes into existence it is therefore likely that it will frown on "sensationalism," which usually only means big type, on pin-up girls and crime stories, while passing lightly over their own sins of timidity, snobbery, political bias and inaccuracy. Personally, I would judge that the Council is doomed to futility before it starts, and it was with that conviction that we voted against it when it came before the Newspaper Proprietors Association.

During the year a Defamation Act was passed which has slightly ameliorated some of the more flagrant injustices of the law. But still the relationship between the damages awarded in a libel action and the damage done to the plaintiff is hard to discern, and the element of uncertainty remains as great as ever.

SPONSORED TELEVISION

What may prove to be the biggest development of the past 12 months for your company is the decision of the Government to introduce commercial television into this country. We immediately applied for a licence and are in active communication with various people who may participate with us in this new development.

You may recall that your company is interested in a group of radio stations in Australia, and it is likely that there too commercial television will be introduced in due course.

What steps we can take in this regard, and when, is not too clear at the present time, but we feel that this great new force in instruction and entertainment is one in which we can play an effective part—and we mean to do so. In the public discussions on the subject it is often stated that the British public would not stand for commercials in its radio entertainment. This, I maintain, is nonsense. The British public, like any other, prefers amusing entertainment to the dull kind, and the former is what commercial TV would certainly provide.

It is interesting to note that our friends at 2 GB, the most popular Sydney radio station, reckon to get about 30 per cent of the radio audience, while the Australian Broadcasting Commission, the equivalent of the BBC, gets about 15 per cent between its two Sydney stations—the balance being made up by several commercial radio stations. In the United States, where practically all television stations are commercial, the newspapers are often part owners of stations which are highly profitable. Though it is only fair to say the worst American programmes are the worst in the world, their best are the world's best.

ATTITUDE OF LABOUR PARTY

At the moment the Labour Party is opposed to commercial TV, though it is

possible that if it were established before they returned to office, they would find it preferred by the viewer and would leave it alone. Their opinion seems a mixture of Socialist doctrine, Puritanism and a fear of the political bias of commercial programmes. It is natural that a Socialist Party would dislike seeing private enterprise re-entering any sphere that has been nationalised, but this argument cannot be considered very weighty. The puritanical outlook is presumably at bottom opposed to all entertainment and prefers the smug qualities of the BBC to the livelier indiscretions of the commercial world. It is likely that many of the radio advertisers would be anti-Labour, but doubtful if they would let their political bias seep into their programmes and still less likely that any such bias would prove effective.

FUTURE PROSPECTS

However, I dare say you would like to know what are the prospects for your company in the coming year. Your newspaper is likely to have another good year, probably not very different from the one just past. The same applies to the *Sunday Pictorial* and *Reveille*. Your paper-making interests are likely to do better than last year, and this is also true of your interests in Australian radio and in West African newspapers. The *Argus* in Melbourne is still losing money but we have hopes of getting this great Australian enterprise into the black in the not so distant future.

Clearly the excellent results of the past year could not have been obtained without the co-operation of all members of the staff. And I should like to close with a note of thanks to all our employees both here and abroad who are contributing to maintain this as the leading British newspaper enterprise.

The report and accounts were adopted.

INTERNATIONAL PAINTS (HOLDINGS)

OVERSEAS ACTIVITY

The forty-fifth annual general meeting of International Paints (Holdings), Limited, will be held on June 22nd in London.

The following are extracts from the circulated statement by the chairman, Mr C. R. Petrie, for the year 1952:

Our paint exports for 1952 were only a fraction short of the record created in the previous year. Quota restrictions and financial regulations continue to hamper the British exporter and in the past year there have been further increases in duties and in other restrictions which have made our trading abroad more difficult, particularly with the South American countries. For this reason we formed recently in Venezuela Pinturas "International" C. A., a company to produce at Maracaibo our requirements for that country. We hope that by the end of the present year this company will be in production and prove yet another safeguard to our world-wide trading interests.

The Consolidated balance sheet records the total assets of the group at £7,772,069, comprising fixed assets of £1,364,124, trade investments at £90,471, and current assets at £6,317,474, whilst current liabilities are £1,988,995, leaving a group worth of £5,783,074. Deducting the outstanding debentures of our Canadian subsidiary £66,176 and the Minority Interests £797,926, there remains a sum of £4,918,972, representing the interests of shareholders of International Paints (Holdings), Limited, in the group undertakings, as compared with £4,449,100 a year ago.

TATE & LYLE

SUGAR DE-RATIONING

LORD LYLE'S SPEECH

The fiftieth annual general meeting of Tate & Lyle, Limited, was held on May 28th in London.

The Rt Hon Lord Lyle of Westbourne (the President) in the course of his speech, said:

Sugar has been rationed for thirteen and a half long years. But now at last it is to be freed. The Minister of Food has negotiated the purchase of a very large amount of sugar to supplement an ever increasing flow from the Empire. Together these supplies are adequate to meet the unrationed requirements at home and the remarkable increase in demand of the rest of the Sterling Area. Major Lloyd George has left nothing to chance; he has tackled the problem in such a way that rationing and controls can be swept away at one fell swoop and he is to be congratulated for his breadth of vision. The speed with which he is liquidating his Ministry has our admiration.

LARGE INCREASE IN SUGAR CONSUMPTION

Before announcing the derationing of other things the Ministry has been able to arrange that consumption will not increase greatly. This has not been so with sugar. The minimum average increase in consumption cannot be less than 25 per cent. The time of year and the possibility of a buying spate will temporarily produce an even larger increase. Obviously, therefore, if we are to avoid empty shops there must be some degree of caution. The increases which took place on May 17th brought the rate of consumption approximately to what it can be expected to average when things settle down. Only a short experience at this level of distribution while transport and other things adjust themselves to a temporary higher rate of working, should be necessary before the next steps are taken.

Our own refineries, by good fortune—and if I may say so, by good foresight—are absolutely ready to meet the increased demand and any enforced delay will not be due to inadequate capacity. While continuing to do more than 10,000 tons a week of export, we have already stepped up home trade output by thirty per cent over January to March production. In July, when an extension to one of our London Refineries comes into operation, we can increase this to fifty per cent if the demand requires it.

As soon as rationing is out of the way and the present restraints on trading are removed, the question of buying raw supplies through normal channels instead of by Government agency must be tackled with determination.

THREAT OF NATIONALISATION NOT OVER

I am not one of those people who believe that all threats of nationalisation are over. I marvel at the attitude of some industrialists who are most certainly vulnerable, yet who seem to consider that the best policy is to hide one's head in the sand, hoping that by keeping very quiet indeed they will not be noticed. I have heard it said that one must not introduce politics into business. I fail to understand the amazing attitude that to defend one's property against the despoilers is to indulge in politics. The same people advocate that we should wait until we are attacked; the attack has already opened, and we have been amply warned that if the boys ever get back with a sufficient majority, further large schemes for nationalisation will be introduced. Now is the time to make the people of Britain realise what nationalisation means—unhappy conditions under impersonal rule for the workers, bad service and inefficiency for the general public, resulting in loss of overseas' trade and higher prices for consumers.

Following the practice of recent years, we have included with the report and accounts a statement showing the breakdown of the company's income and this will be widely published in cartoon form in tomorrow's Press. I do feel, however, that it is important that I should mention here that out of every £1 of income only three halfpence went to stockholders in the form of net dividends, a point which may be conveniently forgotten by the ignorant and malevolent who might desire to criticise the size of the profit figures.

CAPITALISATION OF RESERVES

You will, I am sure, approve of the step we have taken to bring the issued capital of the company more into line with the capital employed in the business. A proposal will be put to you later in this meeting to capitalise £1,750,000 out of the sum standing to credit of general reserve and apply it in restoring the nominal amount of the company's ordinary stock units to £1 each. The capital now employed in the business has to a great extent been built up out of undistributed profits put to revenue reserves.

On the basis of the balance sheet of September 27, 1952, total assets amounted to approximately £13,300,000. This compares with a total issued and loan capital of £6,394,000 which will become £11,144,000 after bringing into the accounts the proposed capitalisation of profits of £1,750,000 and the increase in loan capital resulting from the recent issue of £3 million debenture stock.

TURNOVER EXCEEDS £95 MILLION

In assessing the company's present financial position we should remember the change which has occurred in the volume of the company's trade over the last few years. In the year to September, 1947, the company's turnover was approximately £56 million, and at the end of that year stocks of raw and refined materials amounted to just over £4 million. For the year to September, 1952, the value of turnover exceeded £95 million, and stocks at the end of the year exceeded £7 million. The stock figure reflects the higher value of raw and refined sugar stocks consequent upon the higher price paid by the company for raw sugar purchased from the Ministry of Food from April 1, 1952.

Although the total of bank and short-term loans was only £2,342,000 at September 27, 1952, these two items had increased to nearly £5 million by the end of March, 1953, and trading stocks also showed a further increase at nearly £8½ million.

Taking all these circumstances into consideration, your directors came to the conclusion that it was essential to increase the permanent working capital of the company by the issue of the new debenture stock. The debenture was for three million pounds issued at 98½ and bearing interest 4½ per cent. The public and our shareholders found the terms sufficiently attractive to apply for over one hundred million pounds.

The report was adopted and the capitalisation of reserves was approved.

SUNDAY PICTORIAL NEWSPAPERS (1920) LIMITED

WORLD-WIDE INTERESTS

PROGRESS AND EXPANSION

MR CECIL H. KING'S STATEMENT

The thirty-third annual general meeting of Sunday Pictorial Newspapers (1920) Limited was held on May 29th, at the Memorial Hall, Farringdon Street, London, E.C. Mr Cecil H. King, the chairman and managing director, said:

You will have seen from the circulated accounts that the trading profit of your company is somewhat down: the investment income somewhat up. On balance there is a drop of about £44,000 before taxation. The decrease in trading profit was partly due to the extra pages we were able to publish, larger newspapers being less profitable owing to the price of newsprint.

During the year the editorial side of the newspaper was reorganised. Mr Hugh Cudlipp, editor of the *Sunday Pictorial*, who joined the board during the year, was made editorial director of both the *Daily Mirror* and *Sunday Pictorial*. Mr Colin Valdar, assistant editor of the *Daily Express*, who was with us for some years during and after the war, accepted the post of editor and joined us early in May.

INCREASED CIRCULATION

The circulation of a newspaper is the essential foundation on which all else depends, and I am sure you will be glad to know that your paper increased its sale by 200,000 over 12 recent months and is now in the second place in this country and in the world. We are not, however, resting on our laurels and I hope to be able to report next year an even higher figure.

The higher sale enabled us to effect a small increase in our advertisement rate in February this year. In spite of this increase our columns are fully booked—perhaps because our square inch per thousand rate still shows a smaller percentage increase over prewar than that of any other Sunday paper.

THRIVING NEWSPAPER INTERESTS

As you know, your company has a large interest in the *Daily Mirror*. This interest was reduced during the year by the sale through the Stock Exchange of a million or so non-voting *Mirror* "A" stock units. This was due to a desire to improve your company's liquidity and to enable us to take advantage of any opportunity for profitable investment that might be offered us. The *Daily Mirror* sale is up and has touched its highest level since the increase in price to 1½d. We are hopeful that this increase can be maintained in spite of increased competition both from the rejuvenated *Sketch* and from our ever-brilliant and resourceful contemporary, the *Daily Express*.

Our interests include, as you know, a third main newspaper property in *Reveille*, which has grown since 1947 from a sale of under 100,000 to something over 3,600,000. In the past year its profits were lower because of increased publicity costs. This was due to the lively efforts of the *Weekly Overseas Mail* and of *Tit-Bits* to muscle in on our market. That *Reveille* has no cause for complaint at the measure of success which its competitors—or shall I say imitators—have had is evident from the circulation figures I have quoted, which represent an increase of 550,000 on the year.

RISING SALES IN WEST AFRICA

In West Africa we are now interested in three newspapers. The first acquisition was the *Daily Times* in Nigeria. This paper increased its price to 1½d. during the past year and this led to a temporary set-back in the sale, but now the sale is rising again and in March showed an increase of 2,000 a day over last year. The sale is now round about 50,000 and that company seems to be on a steady profit-making basis. It is building a newspaper office in Central Lagos in three stages, of which the first is nearly complete.

On the Gold Coast the *Daily Graphic* has come up from 3,000 to 41,000 in 2½ years. It has given us great pleasure to welcome Sir Leslie M'Carthy, the distinguished Gold Coast jurist, on the board of the *Daily Graphic* company. Sir Leslie also recently became chairman of the new Gold Coast government-sponsored National Bank. Our hope that the *Daily Graphic* company would by now be earning steady profits has not been realised, though it got out of the red in two recent months for seasonal reasons. Here, too, building is taking place and here, too, I am confident that we have a fine investment that will improve with the years. Both in Lagos and in Accra a Sunday paper is being planned and this should hasten the day when steady profits are made.

During the past year the *Daily Mail* in Freetown, the leading paper of Sierra Leone, was acquired. It had only a very modest sale, but this has increased under the new management from 1,200 to 5,500 and it is our hope that, when a suitable office has been built and the necessary plant has been installed, we shall have an interest in another West African newspaper able to hold up its head in the company of its flourishing contemporaries in Nigeria and the Gold Coast. In each of these territories our newspaper has a sale greater than that of all other newspapers put together.

INVESTMENTS IN AUSTRALIA

In Australia our main investment is in the Melbourne *Argus*, which was doing very badly when I reported to you last year. But since then there has been an increase in the newspaper's selling price and a reorganisation of the management, and the outlook is a lot better. The sale has remained steady, in spite of the increase in price from 3d. to 4d., and has latterly shown a tendency to increase.

The *Argus* radio stations are very profitable; so is the job printing, but the main newspaper property is still losing money. This is mainly due to the catastrophic drop in advertising revenue that set in early last year and which still persists. It is likely that this will right itself in the coming months and, if it does, the profit and loss account will once more be out of the red. In the meantime everything possible is being done to reduce expenses and expand the advertising revenue.

PICTURES IN FULL COLOUR

Before we acquired our interest in this property the former board had ordered offset colour presses to feed into the newspaper presses. So, in spite of many difficulties and teething troubles, we are now able to print full offset colour in the *Argus*, and do so three or four times a week. This development has caused much interest all over the world and has been favourably received by the newspaper-reading and advertising public of Victoria.

Our other Australian investment is in a chain of broadcasting stations, mostly in the state of New South Wales. During the past year and at the request of the Australian Government we reduced our holding in this group. A proportion of our shares were sold at a small profit to the *Sydney Morning Herald* and to several prominent Australians so as to bring our holding in this group to something under 45 per cent. The group is doing very well and made more money in the first six months of the current financial year than in any full year in its history.

PAPER MAKING IN CANADA

Our paper interests had a set-back last year but are now doing well. The profits of the Anglo-Canadian Pulp and Paper Mills were slightly over $2,100,000 after taxes last year and look like being more than 50 per cent better in the current year. The company is a large manufacturer of unbleached sulphite pulp, in which the market has been none too good. It has also entered the paper board business and has a capacity of about 21,000 tons a year of various grades of board. It has now an interest in a company making semi-transparent glassine paper and is always on the lookout for new opportunities for expansion.

During the year the share interest of your company, and of the *Daily Mirror*, in the Gulf Pulp and Paper Mills was sold for £75,000 to the Amalgamated Press, and your company bought the shares held by the Amalgamated Press in the Anglo-Canadian Pulp and Paper Mills. Our Gulf shares constituted a 30 per cent holding which we have held dividendless since 1920. The cost was originally £300,000 and some of your company's preference shares were issued at 22s. 6d. to pay for this unhappy investment. However, it was long ago written down in your company's books to £1 so it only represents the final end of a venture that did not come off.

BRITISH PAPER MILLS

Our other big investment in the paper industry is in Albert E. Reed, the big Kentish paper makers and converters. Like all English mills they suffered severe stock losses last year but the company is so sound that you have every reason to hope that the annual accounts, when they are published shortly, will still further enhance the reputation of this great enterprise. In the last year it acquired control of the Empire Paper Mills from Associated Newspapers and this has enabled it to extend its interests in the fine paper field. The disastrous floods earlier in the year looked threatening at one time, but in the outcome no appreciable damage was done to any of the Reed properties.

I hope this summary will give you an idea of the many enterprises in which your company is interested. I myself have travelled over 50,000 miles in the past twelve months inspecting the various companies of this group. Anything may happen in this uncertain world but, as far as we know how, we mean to maintain your company's position as a partner in the largest and soundest newspaper enterprise in this, or perhaps any, country.

During the year our relations with our employees have been better than ever and I should like to take this opportunity of thanking all of them for their efforts, without which the results before you would not have been obtained.

The report and accounts were adopted.

THE CONSOLIDATED ZINC CORPORATION

MR JOHN R. GOVETT ON CHANGED PRICE LEVELS

The fourth annual general meeting of The Consolidated Zinc Corporation Limited will be held on June 25th at 37, Dover Street, London, W.1.

The following are extracts from the circulated statement of the chairman, Mr John R. Govett:

The trading balance for the year shows a severe decline compared with 1951 and reflects mainly the fall in the prices of lead and zinc. The net profit for 1952 amounts to £1,671,150, compared with £2,404,708, a reduction of £733,558. We are recommending a final dividend of 2s. per share which will give a total distribution of 3s. per share. In all, the total sum retained by the group out of revenue and capital profits for the year amounts to £1,308,366, which compares with £1,747,302 in 1951.
