A few months later Radio Moscow said that for the “partisans of peace” the proposed conference was of “no less importance” than the notorious Stockholm appeal. It soon became clear, however, that such a function, under the auspices of the World Peace Council, would not meet with the support of “industrialists, businessmen,” etc. Invitations were then issued for a meeting in October, 1951, of the Initiating Committee for an International Economic Conference. This is the Copenhagen meeting usually quoted by spokesmen of the BCPIT as having originated the Moscow conference. Such initiating committees have been used by Communists on other occasions, and their true purpose was candidly described by M. Astier de la Vigerie at a meeting of the World Peace Council on November 1, 1951. Referring to the plan of organising a conference against German rearmament, he said: “Many people . . . share our views on the German problem without accepting any of the other tenets of the Peace Movement. They would not yet be ready to support a step initiated by the World Peace Council. We, therefore, propose that an initiating committee should be formed on a broad basis.”

As for the objective character of the information disseminated by the BCPIT I should like to draw attention to a “Study of the Markets for British Engineering Products,” published in February, 1953. On page 11, the reader is informed that in the countries with a planned economy, as a result of industrialisation, “the scope for foreign trade today is on an immensely larger scale than before the war.” And on page 23, we are told that “the Eastern countries represent a *limitless market* (my italics) for British engineering products and are capable of supplying this country with essential and non-dollar fodder, food-stuffs and raw materials.”

To a student of the economy of Eastern Europe this appears to reflect very poor market research indeed.—Yours faithfully,

A. N. PARKER

London, W.11

On Israel's Frontier

SIR—In your issue of October 24th, you wrote of the Arab villagers on the Jordan side of the border now cut off from their lands across the frontier: “Their inhabitants are not refugees in the UN sense of the term, because they have not lost their homes; therefore they do not receive UN rations.”

I can speak only of the action of the UN Children's Fund. From 1948 to 1952 UNICEF contributed supplementary food for the mothers and children of the refugee population. Early in 1952, when the situation of the border villagers in Jordan became acute, UNICEF provided in addition emergency supplies of milk for the mothers and children of these sixty or more villages. These supplies are to be continued through 1954.—Yours faithfully,

UNICEF, W.C.1 DUDLEY WARD

Books & Publications

Sense About Fuel Policy

THE PRICE OF FUEL.

By I. M. D. Little.

Oxford University Press. 197 pages. 12s. 6d.

THIS contribution to a political argument employs a degree of economic sophistication that is already irritating the technocrats. Mr Little, an academic economist who since completing this book has entered temporary Government service, here joins the debate on national fuel policy, which has mainly been left to experts in thermodynamics, electrical engineers, and believers in what Mr Little aptly calls “a coal theory of value.” He shares some of their anxious premises, but not their conclusions: his own approach to national fuel policy is through a pricing policy. No approach is more sensible—and none so unpopular.

Mr Little holds that the Ridley Committee's views on fuel policy last year were too moderate, and points out that, in any case, its recommendations have largely been ignored. He thinks the committee's estimate of some 260-270 million tons, as the likely total demand for British coal in 1959-63, was too low, mainly because it incorporated the Coal Board's estimate of 25-35 million tons as the amount of coal Britain would then be able to sell abroad. Mr Little thinks Britain could hope to export twice as much. He believes, moreover, that present trends in the use of different fuels are causing an uneconomic diversion of the country's investment resources into the building of extra power stations—arguing that the undistorted demand for power at economic prices might require no more than half the extra generating capacity over the next 5-6 years that is now planned.

His remedies are logical (in some aspects perhaps more so than certain details of his diagnosis), but unlikely to suit the enthusiasts for national fuel policy by fiat. He proposes, as did half the Ridley Committee, a sharp increase in coal prices—15s. a ton—and demonstrates interestingly how limited an effect upon general industrial costs this rise might have, even at second remove. He incidentally leans over backwards to prove that this is not a price based on marginal cost, or tending towards long-term marginal cost, as the Ridley Committee and other proponents of an increase have thought it was. His own guesses at true marginal cost, both now and towards the end of the NCB's National Plan are ingenious but not wholly convincing.

In coal pricing policy, he also advocates the further opening of the “coal concertina”—i.e., the widening of the

price range between the best and the worst coals sold. Mr Little, incidentally, appears to be a believer in delivered coal prices, though his views are not stated conclusively; so that the Coal Board may find some comfort in his argument. It may be less hopeful of his proposal for division of the £150 million annual surplus that it would reap from such a rise in coal prices—10s. a week more for the miners, £3 million a year more for NCB training, and £129 million a year for the Treasury, for use in subsidising better domestic grates and in pensions and family allowances for people hit by the increased price of coal.

No such shreds of sympathy for Mr Little are likely to come from the British Electricity Authority. For reasons not unfamiliar to readers of *The Economist*, he advocates the introduction of time-of-day tariffs for all electricity consumers who take more than 2,500 kwh a year, and “seasonally-tilted” two-part tariffs for all others—to be combined with a gradual move towards the two-part tariff in gas pricing. His attribution of all capacity costs to peak hour demand, though shared by most economists who have written on the subject, would be challenged by much sophisticated opinion even outside the BEA; and his assumption that economical tariffs would save large quantities of coal may be even more questionable. The estimates of contribution to peak demand on which this conclusion is based may be out of date and inadequate, as BEA spokesmen often argue; but since BEA took over research into diversity and utilisation it has ceased to publish the results from which independent criticism could be adequately informed.

Mr Little would combine such reforms in fuel prices with public subsidy of really efficient domestic grates, as against the somewhat improved ones installed by many people recently; when the social cost of smoke, plus the possible savings of some fuel and much wasted warmth, are considered against cost and individual incentive, this may fit the classic conditions for subsidy. All the measures he advocates, he believes, might save some 13-18 million tons of coal in domestic and power station use, against which would have to be set off the carbonisation of more coal to meet the transfer of space heating demand from electricity to gas that result from more economic prices for electricity.

This book, as has been said, has immediately caused some irritation among what is called “informed opinion” in and around the fuel industries. It is open to some effective criticism on points

of detail, and not even all those who broadly agree with its proposals may quite accept some of its more strained calculations. But such intrusions of the professional economist into areas of controversy that are too often parcelled out between the new monopolies of technical opinion is entirely to be welcomed. The consumer, and the public interest, need daily more protection from these vast, well-meaning organisations that were set up to serve both.

Jet-Propelled Politics

JET.

By Sir Frank Whittle.

Frederick Muller. 320 pages. 16s.

GAS TURBINES AND THEIR PROBLEMS.

By Hayne Constant.

George G. Harrap. 160 pages. 17s. 6d.

WAS it coincidence that these two books, written by life-long rivals, were both published on the same day? Dr Hayne Constant was doing research into jet engines at the Royal Aircraft Establishment during the critical years that Sir Frank Whittle's small company, Power Jets Ltd., short of money and almost as short of friends, was building its first engines. Dr Constant was one of Sir Frank's early supporters, but their paths later divided. After Sir Stafford Cripps nationalised Power Jets in 1945 and stripped it of all responsibility for designing the engines for whose development the company had been wholly and solely responsible, Sir Frank left the company, severing all his connections with the aero engine industry; and it was Dr Constant who took his place at Power Jets and who is today head of the National Gas Turbine Establishment. His book is what one would have expected it to be, a cool and balanced account of the development of gas turbine technology, describing in not too great or too technical a detail the problems that designers can expect to meet in designing the separate components of a gas turbine and the kind of steps that are being taken to overcome them.

Sir Frank's book is, by contrast, almost wholly non-technical and intensely dramatic. He kept a record of all letters, memoranda, notes and telephone conversations during his time at Power Jets, and, after reading his book, a good many people will wish that he hadn't. He and a few friends founded the company in 1936, on £2,000 borrowed from the bankers O.T. Falk and Company. The British Thomson-Houston Company made the engine components for them on a cost-plus basis; bills were paid monthly; and every time the fiendish looking engine ran on its test-bed in the BTH plant, engineers fled for refuge inside the huge casings of BTH's more conventional turbines while Frank Whittle stayed paralysed watching his monstrous brain-child spurting flame. Mechanical difficulties there were in plenty, constant financial worries, and towards the end a total break-down of

Sir Frank's health. But the real theme of the book lies in the company's relations with the government. Sir Frank was a serving RAF officer; the Crown had user rights on all patents he took out; and he was allowed to work on engine development only by gracious permission of the Air Ministry. He wanted to build engines, and the civil servants who controlled his destiny intended otherwise.

Gradually, Power Jets' designs were handed over to other companies to build, and it was made increasingly clear to him that decisions were being taken to stop Power Jets from building engines and eventually to prevent the company even from designing them. Sir Frank would have no truck with a proposal that Power Jets should do "research" into gas turbine problems and leave design to other, established companies and in 1946, aged 39, he left Power Jets and the gas turbine industry for good.

The wisdom of the decision to anaesthetise Power Jets and deprive the country of any subsequent work that Sir Frank might have done is far from proved. One of his last designs has since become the starting point for development of the Rolls-Royce Conway engine, still on the secret list and widely believed to be one of the most important of recent advances in engine design. This is a painful and disquieting book to read, with something of Kafka's dream-world frustration translated into human experience. As a social, rather than a human, document, it suggests that the existing Government machinery for sponsoring development—especially as it affects small companies—is far from perfect.

Superficial Biography

METTERNICH.

By Constantin de Grunwald. Translated by Dorothy Todd.
The Falcon Press. 334 pages. 21s.

IN the absence of any other indication one may infer from the dates in M. de Grunwald's bibliography that this work was published in French about 1937. Its appearance in English sixteen years later hardly justifies the extensive claims made in the too ebullient preface. The one-sided views of Metternich's character and policy adopted by Stendhal or Sorel have long ago been corrected by later historians, and it did not need the detachment of a Russian émigré to "consider the Metternich question objectively." M. de Grunwald was not the first to examine the archives at Paris and Vienna. There is nothing new, though there may be something unfashionable, in his thesis that the Metternichian "system" was necessary for Europe after its *bouleversement* by the Revolution and Napoleonic wars. Nor does this book always satisfy strict standards of history or literature. The fall of the French throne in 1792 is put before the declaration of the war which brought it about. "The Beresina pass" is apparently a mistranslation for "passage"; the battle of Navarino should not be "Navarin" for English

readers; the Carbonari were not a "Union of Coal-heavers."

Nevertheless this book may be consulted for the new light it throws, by the use of hitherto unpublished documents (but without such references as might enable other historians to check them), on the negotiations preceding Napoleon's marriage to Marie-Louise, and the famous interview at the Marcolini Palace; though this new evidence does not really diminish Napoleon's initiative in the first case or settle what happened in the second. Apart from these elements too much of the body of the book is devoted to superficialities—frocks and functions, wives and mistresses, "Congress dances" and the Blue Danube. It is what the French call *petite histoire*, with some contributions to serious learning.

The Unconscious Mind

PHILOSOPHY AND PSYCHO-ANALYSIS.

By John Wisdom.

Basil Blackwell. 282 pages. 22s. 6d.

THERE have been two main traditions of critical philosophy in this country. The one, deriving from the positivists and Russell, used scientific method and language as its model and tried either to eliminate other kinds of discourse as meaningless or, by dubbing them expressions of emotion, to rid them of rational criteria. The other, deriving from Kant and Moore, was more catholic in its approach and tried to show that scientific discourse is not the only kind of rational discourse and that "every sort of statement has its own sort of meaning." Professor Wisdom belongs to the latter tradition. This book is a collection of articles and book reviews published in various periodicals between 1934 and 1948. It includes "Is Analysis a Useful Method in Philosophy?", "Philosophical Perplexity," "Metaphysics and Verification," "Gods," "Things and Persons."

In these articles there are no explicit theses which are rigorously defended, no clear conclusions which are eventually reached. Professor Wisdom is like a guerilla fighter sidling amiably and anxiously along a tortuous path with a shotgun. At frequent intervals he looses off both barrels at a modern metaphysician—a logical positivist or a naïve scientist who thinks that evolution has something to do with ethics—or he expounds riddles about souls, being in love, or horse-racing. He is guided only by the conviction that very little can be said clearly and that we can only come to understand what we mean by seeing how like, and yet how unlike, it is to something else we might say. There thus emerges a technique for dealing with problems. In his famous article on "Gods," for instance, instead of setting out in a ponderous way the arguments for and against religious belief, he graphically compares the question "Is belief in gods reasonable?" to questions like "Do flowers feel?", "Did she love him or did she hate him?", or

"Did the driver exercise reasonable care?" At the end of his treatment we are not exactly clearer about the status of religious beliefs, but we know better whether or not we are religious.

It is this technique for dealing with problems that justifies the rather misleading title of the book. It is true that there are three articles which suggest the title, and there is also a critical review of four books of psycho-analytic interest. But more important is the similarity between doing philosophy in Professor Wisdom's way and being psycho-analysed. In both methods of treatment familiar things are looked at in unfamiliar ways, and one seeks a decision about which way to jump by making explicit latent opposing forces. In both psycho-analysis and philosophy we try to become aware of the unconscious models lying beneath the vagueness of our ways of describing situations. And in both cases we come to see the deep forces at work beneath the play of argument.

This is a fascinating book to explore. It is written by a man of broad human sympathies and great analytic ability. But it makes rather tortuous reading. Like psycho-analysis it must be taken in small doses.

Stalin, Hitler and the West

SOVIET DOCUMENTS ON FOREIGN POLICY, Vol. III, 1933-1941.

Edited by Jane Degras.

Oxford University Press. Issued under the auspices of the Royal Institute of International Affairs. 522 pages. 42s.

THIS volume concludes the monumental undertaking by Mrs Degras on behalf of Chatham House. The series will be indispensable to serious students of world affairs between the world wars, and of considerable value to all who wish to understand the world of today. The editor has shown, as usual, great resourcefulness in assembling her material. It includes not only speeches by Litvinov and Molotov and subordinate Soviet diplomats, and TASS communiqués, but also occasional important articles from the Soviet press. Among these may be mentioned one by Tukhachevsky in March, 1935, on Germany's war plans, and one by Zhdanov on June 29, 1939, accusing Britain and France of undertaking negotiations with the Soviet Union solely as a manoeuvre to "make easier for themselves the road to a deal with the aggressors."

These pages cover the years of Hitler's threat to European peace and the first phase of the Second World War. There is little left, in Soviet pronouncements from this period, of the exalted revolutionary tone of the régime's first years. But it would be too much to say that the style of Soviet statements in the mid-1930s was that of traditional diplomacy. There is a strong undertone—at times more than an undertone—of moralising self-righteousness, which suggests not so much a

To a young man with ideals

THE SENSITIVE and intelligent youngster of today may well wonder at the world. To what newspaper can he turn for truth, for idealism, for the sane view? Let him—before he dismisses modern journalism as vulgar or corrupt—try reading the Manchester Guardian.

In the Manchester Guardian he will, to begin with, find clear, crisp writing. He will find accuracy and conscience; tolerance to temper judgment. He will be mixing with minds which have kept, if not their illusions, at least their ideals.

This young reader will in fact be joining the company of a newspaper whose fame has stood long and spread far. The Manchester Guardian is a newspaper of modest circulation—which you will nevertheless find on the desks of intelligent men and women all over the world.

If you have any difficulty in getting your Manchester Guardian regularly, please write to:
The Manchester Guardian, Manchester.

revolutionary régime as a rising bourgeoisie, gifted with a more than Victorian pomposity and self-complacency. It may indeed be that this is precisely what was happening in the Soviet Union in these years. The tone and style, of course, vary. The statement of June 29, 1940, on the ultimatum given to Rumania, demanding the immediate cession of Bessarabia and Northern Bukovina, is in the most orthodox imperialist tradition, though more crudely expressed than its nineteenth century prototypes. But the following passage from Molotov's speech of August 1, 1940, on the annexation of the Baltic states, has a flavour all of its own.

We note with satisfaction that the peoples of Estonia, Latvia and Lithuania voted solidly for their representatives, who unanimously pronounced in favour of introducing the Soviet system and of the incorporation of Lithuania, Latvia and Estonia in the Union of Soviet Socialist Republics.

The editor warns her readers that these documents "present only the surface aspect of one part of the total picture." This is perhaps especially true of the years 1937 and 1938. Between the years of co-operation with the Western powers in international policy and of Popular Front in Comintern policy (1935-1936) and the years of co-operation with Nazi Germany through both diplomatic and Comintern channels (1939-1941), there is an ill-defined intermediate period, characterised especially by the Yezhov purge which decimated the ranks of the Red Army and the Soviet diplomatic service, as well as most branches of the Communist Party and the government apparatus. During this period the attitude of Stalin to the Western powers and to Germany is extremely obscure. No public statements can throw much light on it.

Subject to these limitations, whose causes are beyond the control of Mrs Degras, her book deserves the highest praise. Readers will look forward to the promised

selection of annotated documents issued by the Communist International, that equivocal stepchild of Soviet foreign policy on which work has already begun at the Royal Institute of International Affairs.

Centuries of Science

A HISTORY OF THE SCIENCES.

By S. F. Mason.

Routledge and Kegan Paul. 520 pages. 28s.

TO write a complete history of science from the earliest times to the present day is a formidable task for anyone to tackle. It involves a clear understanding of a wide variety of different sciences ranging from astronomy to genetics and an ability to explain their salient principles in simple language to the layman. One might expect to find at least some unevenness in the treatment and the developments in certain sciences stressed to the detriment of others. Dr Mason, however, seems equally at home in all

branches of science, and gives no indication of his special interest in chemistry. To maintain a fair balance in emphasis between the parallel progress in different subjects throughout so long a book is a remarkable achievement, and the author should be congratulated on a fine piece of work.

But this book is something more than an extremely lucid and well-written history of science. It is better described as an account of the development of scientific thought through the ages. In the earlier chapters the author has been particularly successful in linking the growth of scientific understanding with contemporary history and religious thought. He also manages with great skill to separate the threads of progress from the mass of superstitious nonsense which engulf the writings of the earlier experimenters. In the old days theories were advanced as much for religious as for scientific reasons. Dr Mason has, in fact, made a special study of the connection between the Protestant Reformation and the scientific revolution of the sixteenth and seventeenth centuries which resulted in the fruitful alliance between Protestant theology and science that lasted until the publication of Darwin's theory of evolution.

The book is packed with interesting and unusual information, and there is a fascinating chapter on early Chinese science. Inevitably the chapters on modern science have had to be greatly condensed, but the selection of the most important lines of advance has, for the most part, been well done. Indeed, each of these later chapters gives an admirable summary of recent advances in a particular branch of science, and could well be read as a separate account.

While it is unlikely that the whole of this book could be completely understood by a non-scientist, the reasoning throughout is given in such simple language that the bulk of it should be perfectly comprehensible to the intelligent layman. But it is of necessity tightly packed and requires slow reading.

Uncommon Men

MEN OF DESTINY.

By H. C. O'Neill.

Phoenix House. 240 pages. 18s.

THE late Mr O'Neill ("Strategicus") hit on a first-class idea for a book, but failed to put it into effect. His *Men of Destiny* are Churchill, Roosevelt, Stalin and Hitler, "the Four" (to quote his title page) "who rode the war and made this precarious landfall." Here was a promising opportunity for an illuminating comparison of those four contemporaries, each in his own way a master of politics, national leaders with the most widely varying gifts and aims, brought to a common denominator by the events of the war. Mr O'Neill, however, having whetted our appetite fails to satisfy it. He was content to print four brief self-contained biographies (competent enough without adding anything new) and to leave the comparison almost entirely to the reader. There is not even

a concluding chapter to draw the threads together.

The nearest Mr O'Neill comes to stating his view is in the introduction. After making much of Henry Wallace's "Century of the Common Man," he writes:

Stalin, and to a lesser degree Hitler, came from the ranks of the common man in the sense of being cast upon the stream of life deprived of almost every initial advantage, unlike Roosevelt and Churchill, who lived sheltered lives with an assured future. These four men, in their origins, broadly represent two different traditions: the "ordinary men and women" and the "privileged" class.

Beyond this superficial characterisation Mr O'Neill does not advance very far, preferring to stick to conventional biography. The result, like the *Century of the Common Man*, is disappointing.

Shorter Notices

ENGLISH LAW AND THE MORAL LAW.

By Sir A. L. Goodhart.

Stevens. 151 pages. 12s. 6d.

THE QUEEN'S PEACE

By Sir C. K. Allen.

Stevens. 192 pages. 12s. 6d.

These two volumes contain the fourth and fifth Hamlyn Lectures, lectures delivered at the Universities of Manchester and Wales respectively, under the terms of a trust established by the late Miss Hamlyn for the furtherance of knowledge of comparative jurisprudence. Their titles are a clear guide to their contents. Meditations upon a theme would be a fair description of them, the theme being the English common law and its varied excellencies. Each volume is fluent and enriched with learning and experience, but at the end one is left with a faint sensation of having been cloyed. Perhaps Miss Hamlyn's love of the common law could best be furthered by an occasional lecture more astringent than the first five. Has not the time come for the trustees to emphasise the word "comparative" in their charter and ask, say, a Dutch lawyer to survey the common law of this country from without?

*

WHITE MAN'S COUNTRY: *Lord Delamere and the Making of Kenya.*

By Elspeth Huxley. 2 Vols.

Chatto and Windus. 648 pages. 36s.

THE appearance of a new edition of Mrs. Huxley's study of Kenya's development through the life of the man who did most to foster white settlement in the Highlands is particularly welcome at this time. The settlers' attitude is the result of the history of the colony, which was largely shaped by Delamere; and the settlers' case—which is a strong one—can be made only against a comparison of what Kenya was and now is. The reasons why Kenya has in the past ten years developed so differently from the way Delamere expected are also only to be appreciated from history. Delamere saw himself building the last of the white dominions; his dynamism carried the settlement far—but the hour was late and world events unpropitious. In the end he set the terms of a far more difficult and as yet unsolved equation: the working out of racial co-operation in a plural society.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Clouds Over Bermuda

Bermuda

OF the three participants in the Bermuda conference, none had been more reluctant to attend than President Eisenhower; and no government had breathed a deeper sigh of relief than did the American when the delivery of the Russian Note last week made it certain that the conference was going to have questions of substance to ponder. The reasons for the lack of American enthusiasm about this conference are straightforward enough. In the first place, it was not called in response to American initiative but at the insistence of Sir Winston Churchill; he is deeply admired in the United States, but not when he takes the initiative in world affairs.

Secondly, the month of December is for any American Administration an extremely busy time during which the elaborate process of budget making reaches its climax and every day is precious. Moreover, with the Congress about to reassemble, it is a very difficult time for the Administration to make any far-reaching decisions. Even after the delivery of the Russian Note it was strongly believed in Washington that, in so far as the main business of the conference was to be a reassessment of Russian intentions and of the strategy of the Western powers to meet them, the conference had been held too early and would have served a more useful purpose, say, next spring.

Thirdly, there has been a generalised fear throughout the American press and opinion that President Eisenhower, the younger and less experienced man, would be unable to

resist the wiles of Sir Winston. Bermuda could very easily have joined Yalta and Potsdam in the rogues' gallery of editorial infamy.

Most important of all, President Eisenhower and Mr Dulles came to Bermuda with the dust of their battle with Senator McCarthy still eddying across the length and breadth of the United States. Mr McCarthy had,

in fact, challenged the authority of the President and Secretary of State to take part in the kind of general discussion of Allied policy for which the Bermuda conference was intended; throughout its duration the mounting score of his much disputed "Write to Ike" campaign was the principal item of news.

Consequently, it was clear even before the conference started that the American attitude at Bermuda would inevitably be a rather inflexible one since the political imperatives under which the President was labouring were stronger even than those dictating the position of M. Laniel and M. Bidault. In fact, however, the President's speech on Tuesday before the United Nations, with its strong idealism and proposals for international co-operation on atomic energy, intended to capture the world's imagination, has either by accident or design

virtually eliminated the Bermuda communiqué from the front pages of the American newspapers and has clearly given a strong fillip to Mr Eisenhower's domestic position.

The policy of extreme secrecy which both the President and the Prime Minister imposed upon their deliberations will make it very hard to arrive at any conclusion about the

Herblock in the Washington Post

decisions of the conference for several weeks. Clearly the reference in Tuesday's communiqué to "intimate and durable co-operation between the United Kingdom and United States forces and the forces of the European Defence Community on the continent of Europe" represent the farthest that the President and the Secretary of State were prepared to go in giving the assurances, sought so urgently by France, that there would be no withdrawal of American troops in Europe in the foreseeable future, despite the pressure to reduce the American military budget.

It is still not clear whether President Eisenhower's recent public guarantee, that the "effectiveness" of American forces in Europe would be maintained, applies to the numbers of troops and divisions or to firepower, including the substitution for actual ground forces of tactical atomic weapons. This idea seems reasonable enough to the new leadership in the Pentagon but is not accepted with anything like the same equanimity in France or Western Europe.

What is clear, however, is that the United States is not prepared to abandon the European Defence Community as the principal objective of its European policy. There is less talk in American official circles about an alternative to EDC or of methods by which Western Germany can be inducted into a tightened version of the North Atlantic Treaty Organisation than there appears to be in similar British circles. Apart from the President's continuing belief in the virtue of European federation as an end which is good in itself, there remains a strong reluctance in Washington to face the alternatives to EDC, at least until it has become certain beyond any shadow of doubt that its instruments will never be ratified by France. Among other factors the Pentagon, which is generally credited with being insistent on the speedy transaction of any arrangement which will enable twelve German divisions to be mobilised, has acquired such a strong vested interest in its supply route through France, in which it has invested billions of dollars, in pipelines, roads and airfields, that the Joint Chiefs of Staff are now among the principal enthusiasts for EDC.

Moreover, the isolationism of at least one-third of the members of the President's own party in the Senate has made it virtually impossible to contemplate American ratification of any tightened version of the North Atlantic Treaty. On the date to be suggested in the reply to the Soviet Note—that is, January 4th—Mr Dulles won his point. He argued that the meeting should be held early in January, in order that it should not be dragging on when the crucial part of the Congressional timetable arrives, while M. Bidault wanted to defer the meeting until late January. The American political situation has had as much effect upon the deliberations at Bermuda as the French one.

★

Behind the barbed wire and amid the hideous Tottenham Court Road décor of the Mid-Ocean Club, the meeting of minds between President and Prime Minister appears to have been achieved successfully. The phrase that sounds so banal in a communiqué, "an exchange of views," denotes a process that is actually of the highest importance to statesmen. The conference has, on the whole, had a reasonably generous and sympathetic treatment from the American press; this is the more creditable as nearly two hundred journalists from all over the world arrived to find that they were going to be given virtually no direct news whatsoever.

There were roughly a score of journalists representing the five New York newspapers which had suspended publication because of a strike.

Sir Winston's self-denial when he refrained from raising the question of high level talks with Mr Malenkov appears to have sent a sigh of relief through American public opinion; he was greatly assisted in this discipline by the timing of the Soviet Note. With a government as much in travail both politically and constitutionally as that of M. Laniel, it was obvious that no great decisions on western policy were going to be taken. The important thing to determine is whether President Eisenhower and Mr Dulles, having finally made a stand against Senator McCarthy, are going to abandon their French view of the powers and functions of the American Presidency when Congress reassembles next month, and give that body the strong lead and the firm hand which it needs.

Cotton's Kingdoms

FROM A CORRESPONDENT IN CALIFORNIA

AWKWARD problems of farm policy will once more confront the Eisenhower Administration, on December 15th, when the nation's cotton growers vote on a proposal to restrict their plantings in 1954. The cotton farmers are expected to approve the proposed quotas on acreage and marketing, as the wheat growers have already done. If they reject them, the federally-guaranteed minimum price will fall from about 32 cents a pound to almost half that. And then, with this year's crop now estimated to be the largest since 1937, the market price, which for almost a year has approximated the government support price, would be certain to fall farther.

The need to apply controls on production is in itself distasteful to the Republicans, with their belief in less government interference in business. But the cotton situation in the west presents other complications. In California and Arizona, where agriculture is still the major industry, cotton has become the leading cash crop. In the five years between 1947 and 1952, both states almost tripled their cotton acreage. Over half of Arizona's irrigated desert lands and more than a fifth of the acreage in California's fertile interior valleys are planted to cotton. When production must be reduced a conflict of interest arises between the western cotton-growing areas and the traditional Cotton Belt states of the deep south—a conflict with serious political and economic implications.

The immediate issue is how the restricted acreage in 1954 is to be allocated among the various cotton-growing states. Under the existing law, each state's quota is determined by its average cotton acreage in the years 1947, 1948, 1950, 1951 and 1952. But since the western states had substantially smaller acreages in the early years of the base period than they now have, their share of the 1954 acreage would be reduced much more drastically than that of the long-established cotton states, where cotton plantings have been more stable. Under the present law, cotton acreage as a whole must be cut by 27 per cent to bring demand and supply into balance in 1954. But Arizona would lose 55 per cent of its present acres and California would lose 52 per cent, compared with a 24 per cent reduction in Texas, the leading cotton state.

It is generally agreed that any of these reductions—in the south as well as in the west—would be too harsh to absorb in a single year. Last June, therefore, the House of Representatives voted to increase the total acreage to be permitted for cotton in 1954, so that the cut, over the country as a whole, need amount to only 13 per cent. But although the House acceded to western demands and stipulated that no state should be required to give up more than 27 per cent of its cotton acres, no such agreement could be reached in the Senate.

West includes: California, Arizona and New Mexico. South-east includes: Virginia, North Carolina, South Carolina, Georgia, Florida and Alabama. Delta includes: Missouri, Arkansas, Tennessee, Mississippi, and Louisiana. South-west includes: Texas and Oklahoma.

Repeated attempts to reach a compromise between the west and the south have been made since Congress adjourned and have failed. Late in November, farm leaders in California and Arizona angrily rejected a final proposal advanced by Senator Anderson of New Mexico and Senator Eastland of Mississippi, cotton state members of the Senate Agriculture Committee.

It is suggested that Senator Anderson, a Democrat and a former Secretary of Agriculture, did not promote the interests of all the western cotton states as impartially as he might have. The Anderson-Eastland compromise reduced the prospective cuts in western Texas and New Mexico (both cotton areas similar to Arizona and California) to 8 per cent and 29 per cent, respectively. But Arizona and California, the only cotton states with Republican Governors and Senators, were left with reductions of 43 per cent and 35 per cent. And they are states in which cotton is extremely important to the economy and in which economic distress might be exploited by the Democrats.

A similar deadlock between the west and the south was easily broken in 1950, when the two areas agreed on an equitable formula for distributing restricted cotton acreage. Now, although less than 1 per cent of the national cotton acreage is in dispute, neither side will make further concessions. The reason, it is said, is that in 1950 the Democratic Senators from southern cotton states, as part of the majority party, were firmly in control of national farm policy. Now that the Republicans are in power, and may propose basic changes in the farm programme at the next session of Congress, the south is determined to demonstrate its strength by winning the cotton-allocation dispute. And western Republicans are equally determined to maintain their newly won control, even if it comes to a showdown inside the Administration and in Congress.

In addition to the purely partisan aspects of the dispute, some important issues of agricultural economics are

involved. The western cotton growers assert that discrimination against them in the matter of cotton acreages is indirectly an attack on efficiency, since the distinguishing feature of western cotton growing is its productivity. Yields in California and Arizona are twice the national average: 606 pounds an acre against 315 pounds nationally.

It is such productivity that led the west to go into cotton so heavily after the war, when cotton prices were high, and to stay in cotton this year, although the price had fallen to the level of the federal supports. And the seriousness of the cotton cutback in the west is due to the fact that no other crop to which the farmers might turn their lands can equal the income and profit that cotton brings, even at minimum support prices. It is estimated that California would lose perhaps \$150 million in cotton income if the proposed restrictions are not modified—and perhaps more, from other crops, if increased plantings of alfalfa, grains and sugar beets on the diverted acres were to add to the already excessive supplies of those crops.

It may be wondered why the western cotton growers should not vote against the quotas on December 15th, relying on their superior efficiency to maintain their profits in an entirely unsupported market. For one thing, they would be outvoted. The programme will apply to the entire nation if two-thirds of all cotton growers approve it, so the west could not defeat the quotas even if it wished to. Moreover, the west, despite its productivity, is even more dependent upon federal price supports than is the south, and therefore can hardly reject the acreage restrictions which are a condition of guaranteed prices.

The efficient western cotton producer has high costs. His extra productivity depends on extensive acreages (10,000 acre ranches are common in California), but also on costly irrigation and pumping systems, copious use of fertiliser and insecticides, and a high degree of mechanisation. Most cotton seeding, fertilising and spraying is done from the air, and 75 per cent of the crop is picked by huge mechanical harvesters.

The demand of the west for a farm programme that will encourage efficiency, through large economic units and mechanisation, brings the retort from the south that such a programme would involve greater federal support—and control—of agriculture. So far the Administration has avoided taking sides. But Mr Benson, the Secretary of Agriculture, will be under heavy pressure to do so when he submits to Congress, in January, his proposals for increasing the cotton quotas.

American Notes

Segregation Back in Court

THE Supreme Court is once more face to face with the explosive issue of racial segregation in the schools of seventeen states—states in which more than 10 million of the country's 15 million Negroes live. Five cases have been brought, in all, against the states of Virginia, South Carolina, Kansas, Delaware, and the District of Columbia in the hope that the colour bar, which has gradually been worn away in the universities and professional schools by the Court's insistence that Negro education must be the equal of white, may be overturned outright throughout the educational process.

The Court postponed a decision last June to secure the views of both sides, and of the Attorney General, as a friend of the court, on questions on which it sought further guidance: whether, when the Fourteenth Amendment was passed in 1868 to safeguard the rights of Negroes in the defeated southern states, either Congress or the states understood it to allow segregation in the schools; whether the Supreme Court has the authority to order what amounts to a social revolution; and finally, if segregation is to be outlawed, how quickly the explosive change should be required to take place.

The views of Mr John W. Davis, the distinguished counsel for South Carolina, and of Mr Thurgood Marshall, the leading counsel for the National Association for the Advancement of Coloured People, were not hard to predict. More interest has been aroused by the Administration's ranging itself on the side of those who contend that, whatever Congress may have had in mind nearly a hundred years ago, the Fourteenth Amendment, with its insistence that no state "shall abridge the privileges of citizens of the

United States" or "deny to any person the equal protection of the laws," must be interpreted as part of the living and evolving Constitution and therefore as prohibiting discrimination in the schools. The traditions of the Republican party, as well as the dangers involved in alienating northern Negroes and liberals made any other decision impossible, even though Republican hopes of consolidating President Eisenhower's inroads in the South are now gone with the wind.

The brief of the Department of Justice went on to suggest that, if segregation were outlawed, the transition to a single school system might take place within a year. Kansas has already given up its dual schools in Topeka, and the District of Columbia, where segregation has been practiced under the eye and the authority of Congress since 1864, is ready to co-operate provided that it is given reasonable time and adequate funds to train its teachers for their new problems. Virginia, however, contemplates shutting its schools for a year, and further south more intransigent states are preparing to transfer their funds to private institutions which can continue to put up a colour bar.

New York Behind the Times

ON Wednesday the reappearance of New York's seven daily newspapers brought the city back to an era from which it had been cut off for eleven days by a strike of the 400 photo-engravers who prepare the illustrations. The people who normally read 5½ million papers a day—only London has a bigger press circulation than New York—had to rely on such specialist publications as the *Wall Street Journal* and such news as could be snatched from the air waves. Business men, looking under-dressed without the protection of a paper, were even seen reading books on their morning journeys.

Suburban newspapers, of course, sold well (and their advertising revenues also profited from the strike). So did such out-of-town newspapers as were available, but their owners, in order not to embarrass their New York colleagues, seem to have refrained from flooding the city with their publications. To visitors from abroad who have been repelled by the size of American newspapers, it is surprising to hear that when the *Herald Tribune*, in an attempt to serve the public, printed 2½ million copies of a special eight-page issue, without advertisements, instead of its normal 360,000 copies of ten times as many pages, a large proportion went unsold because the paper was thought to be too light to be worth buying. Radio and television stations did their best to fill the gap, by greatly extending both their news bulletins and the time available for advertising. But this was not enough to prevent a substantial falling-off in retail trade at a time when Christmas sales should have been rising to their peak. The New York shopper does not like to buy until she has compared the printed offers of competing stores.

This loss of trade may be made up now that advertisements are appearing again in more than full force. But permanent loss has certainly been suffered by the newspaper proprietors; they estimate that the additional \$3.75 a week being paid to the 400 photo-engravers will eventually cost \$3,750,000 a year, because it will have to be

extended to the 20,000 employees who belong to the eight other newspaper trade unions. Other contracts are coming up for renewal; this explains why a dispute which was in itself of minor importance was nevertheless allowed to assume such major dimensions that the *New York Times* failed to appear for the first time in over 100 years. Members of the other unions refused solidly to cross the photo-engravers' picket lines, because they felt that this was their battle too, and the final settlement was approved by leaders of the other unions before it was accepted. On the publishers' side the *Herald Tribune*, which farms out its photo-engraving and was therefore not involved in the strike, decided after one day to suspend publication in order not to weaken the employers' front. The strike was in the end settled on their terms—the union had begun by asking for a \$15 increase—but a fact-finding board is to report whether the rise of \$3.75 is adequate and neither side is committed to the acceptance of this report.

Propping up the Prop

ONE of prosperity's strongest supports, the amount of new housing started, has been weakening every month since April, and the President's Advisory Housing Committee, which was appointed in September to remodel housing policy to Republican tastes, will be expected to recommend ways of halting the decline. Construction in general has been holding up well this autumn and the official forecast is that, thanks to the demand for new schools, roads, pipelines and other utilities, it will fall next year by only 2 per cent. But the number of new houses started, which account for about a third of all construction, is expected to decline from about 1,100,000 this year to 975,000 or less in 1954. This is a prospect which can hardly be welcomed when industrial production has fallen for the third month in a row and unemployment is showing slight increases.

The conservative cast of the committee, most of whom are bankers, together with the President's instruction to it to find a more economical, as well as a more effective, housing role for the federal government, makes it unlikely that it will recommend putting any more flesh on the bare bones of public housing. Congress grudgingly authorised 20,000 public dwellings at its last session and a similar number may have to be authorised next year, to meet commitments to local authorities. Instead, if the hints from officials and the leaks to newspapers are any guide, the emphasis will be on ways of encouraging local authorities and private enterprise to do the job. Last September Mr Cole, the Housing Administrator, warned the bankers that they must provide money for housing if they wanted the government to stand aside; and today mortgage money is easier to find, although this is due more to the drop in other interest rates than to Mr Cole's threat.

The chief federal instrument in the housing field is the insurance of private mortgages; 40 per cent of a total private housing debt of \$60 billion is federally insured. Among the proposals now being studied for presentation to the White House before Congress meets are lower down-payments and more time (40 instead of 30 years) to repay mortgages (if private lenders can be persuaded to make loans on these terms); the extension of insurance to com-

mercial construction, a higher level of insurance for old houses, and more latitude in the permitted design of new houses. Much more controversy is likely to be aroused by proposals to let tenants in public dwellings buy their houses and to encourage private slum clearance by more generous loans for modernisation. Both of these steps might lessen the need for federal subsidies, but they are already being condemned by Democrats as methods of "burying the remains" of the public housing and slum clearance programmes inherited from the New Dealers.

Natural to Congress

THE Supreme Court, by its unexpected refusal to review a decision of a lower court on natural gas regulation, has given Congress an opportunity, which some of its members will naturally try to take, to make the oil companies as handsome a present during the coming session as it is commonly supposed to have done during the last, when it handed over control of the offshore oil-lands to the states. This time, as a result of the Supreme Court's decision, the representatives of the oil-producing states will want to take away from the Federal Power Commission control over the rates charged by producers of natural gas to the pipeline companies which buy and transmit the gas to consumers. Congress did this once before, in 1950, but President Truman vetoed the Bill, only to have the FPC itself decide that it did not have jurisdiction over gas producers; in its view, their operations did not enter into interstate commerce and were therefore subject only to state, and not to federal, regulation.

The court action, however, now obliges the commission, unless Congress comes to its rescue, to determine whether the rates charged by natural gas producers are reasonable. The Phillips Petroleum Company was the one concerned in the test case, and most of the natural gas involved is produced by a few big companies. But since there are altogether over 2,000 natural gas producers who sell to interstate pipeline companies, the task of establishing principles for judging whether rates are reasonable and then applying them in each case might be almost endless. There have already been complaints about the FPC's delays in allowing increases in the rates charged to consumers by the gas transmission companies. There are 50 or so of these applications now before the commission, all based on rising costs. In particular most of the applicants emphasise the increased prices that they are having to pay to gas producers.

If Congress takes away from the commission the power, which the courts have forced upon it, to rule on whether these prices are reasonable, then the legislators may find it embarrassing when the voters ask why they are having to pay more for the natural gas which is becoming every day more vital as a domestic and industrial fuel and as a raw material for industry. The gas comes from only a few states, of which Texas is by far the most important, but it is now used by some 40 million consumers in a majority of the states. The producers of natural gas, on the other hand, argue that before long these consumers will be without gas, or at least without the additional supplies they want, if the oil companies are not encouraged to risk their money on exploratory wells by higher prices and the certainty of freedom from federal regulation. This, the producers say, cannot justify-

NEW YORK . . .

Gateway to U. S. Markets

New York is administrative headquarters of many industries which play important roles in Anglo-American trade. Through its New York and London organization the Chase National Bank offers banking facilities geared especially to the needs of British exporters and importers.

THE CHASE NATIONAL BANK OF THE CITY OF NEW YORK

Incorporated with Limited Liability under the Laws of the U.S.A.

LONDON

6 Lombard Street, E.C. 3 • 46 Berkeley Square, W.1.

THE NATIONAL CITY BANK OF NEW YORK

Incorporated with limited liability under the National Bank Act of the U.S.A.

HEAD OFFICE: 55 WALL STREET, NEW YORK

LONDON OFFICES—CITY: 117 OLD BROAD STREET, E.C.2. WEST END: 11 WATERLOO PLACE, S.W.1

Banking circles the globe

BUSINESSMEN with foreign interests need a bank whose services circle the globe. The National City Bank of New York, with 57 overseas branches and banking correspondents in every commercially important centre, is well equipped to offer such services.

The London branches of The National City Bank are staffed by men who are experienced not only in British banking but also in the financing of overseas trade. They are, also, uniquely equipped to advise on trade with the dollar countries.

Wherever your interests lie, the world-wide organization of The National City Bank is at your service.

ON YOUR TRIP TO
NEW YORK
YOU CAN FLY TO

Bermuda

AT NO EXTRA COST!

Something extra special lies ahead of you on your flight to New York. Your first-class fare, via any international airline, can include a trip to Bermuda—and at no extra cost.

When business is over, refresh yourself with a delightful week-end in Bermuda. Stay longer, if you wish, for Bermuda is in the sterling area. Bermuda's less than three hours from New York, and there are frequent daily flights.

And there's nothing like Bermuda for sunning on pink sandy beaches . . . for leisurely living far from bustling routine . . . for rest and utter contentment.

ably be applied to natural gas until it enters the pipelines of the transmission companies, which are public utilities, with certain exclusive rights for which they pay by accepting certain restrictions.

Chill from Chile

NEW YORK copper traders are shivering in anticipation of the resumption of supplies from Chile; they have long realised that once that happened, as it was bound to do, they could no longer count on the steady warmth of a price of 30 cents a pound, but would have to go through the readjustment that has already made lead and zinc traders so uncomfortable. Last week the Chilean Senate belatedly recognised that it was unrealistic to insist on a price of 36½ cents a pound for the country's copper and authorised the American-owned companies, which are responsible for 90 per cent of Chilean output, to sell their current production at competitive prices. The strike against the Anaconda company, which had cut output by two-thirds, had just been settled; this perhaps explains why the Chilean Senate dared delay no longer.

Most of this Chilean copper—about 30,000 tons a month—will presumably go to the United States, which has been getting along very satisfactorily without it, with the help of imports from other countries, especially from Northern Rhodesia under a long-term contract. The depressing effect of the Chilean supply on prices will be accentuated by the fact that the Chilean Senate also approved the sale of the stocks, 120,000 tons or more, that have piled up as a result of the old inflexible policy. These are, however, not to be dumped, but to be sold at 30 cents a pound, the price the US government was understood to have offered when negotiations were going on for the purchase of this copper for the strategic reserve.

Those negotiations were broken off last month, but the Chilean Senate now seems to have accepted the American conditions. It has stipulated that the copper must not be sold to countries behind the Iron Curtain; the threat that this would be done has repeatedly been hung over American heads by Chileans when negotiations were going badly. More important, the Senate has agreed that the American-owned copper firms in Chile should be taxed differently and that they should be given more satisfactory currency exchange rates. The American negotiators have been demanding that the companies should be taxed not on the amount of copper they mine, but on their profits, and that, like Chilean firms, they should be allowed the rate of 110 pesos to the dollar instead of 19.37 as at present. If the Chilean capitulation turns out to be complete, then it should not be long before the surplus that is casting a chill over the copper market disappears into the American stockpile.

Small Business Helps Itself

MR WILLIAM MITCHELL, who, as head of the Small Business Administration, inherited the lending functions of the Reconstruction Finance Corporation, took to heart the conservative complaints about that

agency: that it made "political" loans, that it was too lavish with government money, that it competed unnecessarily with private banks and undermined local initiative. Congress, full of virtue, had allotted only \$55 million for the needs of small business. Mr Mitchell announced that preference in making loans would be given to defence manufacturers: "petrol station operators and grocers need not apply." Direct loans were to be subordinated to the encouragement of local credit pools and participation in loans by banks. The chief function of SBA, in his view, was to supply management with advice, for small business needed "know-how" more than cash. The interest rate on loans, after some backing and filling, was fixed at 6 per cent, 1 per cent more than the RFC had charged.

Suddenly, several weeks ago, without any warning, Mr Mitchell resigned for "personal reasons" which seem to have become pressing only after a midnight telephone call to the President from Senator Thye, chairman of the Senate Small Business Committee. His going has made a wonderful change at SBA. All firms, it is announced, will have their claims for loans considered on an equal footing whether they are manufacturers or retailers, in defence work or not. The earliest beneficiaries may include farm implement dealers whose plight, as farm income fell, was worrying the White House even before Mr Mitchell resigned. Mr Barnes, his temporary successor, is "de-emphasising" private credit pools and talks boldly of asking Congress for more money when his \$55 million runs out. The investigation of the agency's "ultra-conservative" lending policy which was once promised by the Senate Small Business Committee may be postponed. In office, it seems, the Republicans, whatever their private beliefs, are no more able than the Democrats to turn a deaf ear to the small businessmen, whose political skill and influence are anything but trifling.

SHORTER NOTES

After many months the President's Council of Economic Advisers is at last complete, with the appointment of a third member, Professor Walter W. Stewart, an economics professor, once of the Institute of Advanced Study at Princeton University and before that Adviser to the Bank of England.

★

Mr Wicks, the acting Lieutenant-Governor of New York and majority leader of the State Senate, resigned the offices which Governor Dewey declared him unfit to fill after it was discovered that he had paid repeated visits in jail to a trade union racketeer convicted of extortion. But the Governor's victory in this party house-cleaning was not complete, for the Republican Senators refused to vote to oust their old colleague, if he promised to go quietly, and in his place they elected Senator Mahoney, known for his independence of Mr Dewey.

★

The Federal Reserve Board this week dropped its charges of monopolistic practices against the Trans-America Corporation, the huge west coast banking concern, after the Supreme Court had refused to review the decision on this case of a lower court which went against the board.

The World Overseas

Conflicts at Luxembourg

AT a first glance it seems that the new coal-steel Community is causing more headaches than it is curing. This is probably the inevitable result of aiming, as the Community does, at imposing unpopular, unfamiliar and sometimes painful changes for the sake of benefits which may not become obvious for years.

But for those who demand quick results, officials at Luxembourg can already point to at least one decisive and positive achievement since they opened the common market for coal last February and for steel in May. All tariffs and quota restrictions on the coal-steel trade between the six members have now effectively disappeared, and so have the most flagrant cases of discrimination in transport charges. Following these steps—and presumably as a consequence of them—the exchange of coal between the six has shown a substantial increase; in the first ten months of this year the members exported to each other nearly 20 per cent more than in the comparable period of 1952, and the rise is continuing steadily. During the same period French exports of iron ore to Belgium have gone up by 30 per cent.

The common market for steel, on the other hand, has so far failed to produce any notable increase in trade between the members, and moreover, it is now plain that the new market is far from being the competitive arena that its founders intended. Price policy is the core of the problem. Unlike coal prices, for which the High Authority fixed maximum limits, steel prices were set free and sellers were called upon to publish price lists in order that every consumer should be able to look around, on equal terms with his competitors, and buy from the cheapest source. The High Authority intended, too, that sellers should constantly adjust their prices—mostly downwards, it was hoped—and make corresponding alterations in their published lists.

Two things happened to upset these expectations. In the first place it was soon discovered that the price list system was highly inflexible, since there was no way for producers to alter prices frequently and to transmit the information rapidly throughout the Community. To remedy this defect the High Authority has now proposed that steel firms be allowed, in any individual transaction, to deviate within a margin of 5 per cent above or below their officially listed prices. However, if at the end of two months the steel producer finds that the general average of his total sales differs from his published prices by more than 4 per cent in either direction, then he must modify his price

list. The Consultative Committee will consider this proposal at its next meeting on December 14th.

A second and closely related discovery was that, under the impact of the softening market on the Continent, steel firms have been giving price reductions, but only to certain favoured customers and not to the public at large; their published prices have remained unaltered and these are the prices usually offered to those users, such as government agencies, who are in a weak bargaining position. This practice of discrimination has made nonsense of the Treaty's principles and of the Community's whole price policy. Under the Treaty producers are permitted to deviate from list prices only in clearly defined circumstances—they may charge a customer the prices prevailing at any other basing point in the Community, provided that this means lowering and not raising their own prices. In such cases the producer bears some of the delivery charges involved in going after distant business.

In order to curb the violations of its price policy, the High Authority recently announced that it would conduct "spot checks" designed to catch offenders red-handed and thus provide evidence for legal action. For the first offence it can impose a fine of up to twice the value of the "irregular" sales and for subsequent violations the fine can be up to four times this value. The threat has outraged steel producers in the Community, who argue that the essence of a free market is that they should be allowed to do as they please and that what they please to do at the moment is to soak weakly placed buyers for the benefit of their more strongly situated rivals. They are bitterly attacking the High Authority as a "supra-national police force." Their outcry underlines the intrinsic problem of the Community—to convince its producers that a system of "controlled competition" is preferable either to monopolistic cartels or full State control on the one hand, or to cut-throat competition on the other. But until the Community does settle on a loyally accepted body of rules, the countries at present outside its ranks will not be eager for membership. Possibly it is because of this unsatisfactory state of affairs that M. Monnet has month after month delayed presenting his formal proposals for Britain's closer association with the Community. The latest word is that they cannot be expected before the New Year.

Another task that the High Authority has just begun to tackle is the question of cartels. Until the domestic cartels are dissolved or compelled to abandon their restrictive and discriminatory practices, the common market will remain

anything but free. In the public mind the most prominent of these combinations are those based in the Ruhr, but in fact equally restrictive cartels are scattered by the dozen throughout the Community. The High Authority is now arming itself with detailed information about the workings of these organisations so as to be in a position to move simultaneously against all of them.

So far the High Authority's most conspicuous overt move against monopoly has been directed at the steel export cartel, formed privately last spring in Brussels by the Community's steel producers. While the Treaty gives unequivocal and substantial powers to the Authority to deal with domestic cartels it says nothing at all about export cartels. Recently the activities of the Brussels group have attracted American criticism. Partly in response to this stimulus, the High Authority ordered the cartel to disband and suggested to the Consultative Committee that the Authority itself might fix minimum export prices. The Consultative Committee voted overwhelmingly against the proposal—a position that the High Authority will probably ignore, since the Committee has no right of veto on this issue and since no other provision of the Treaty gives the Authority such clear powers to control the cartel's activities.

Another storm is brewing within the Community over investment—a question that perhaps in the long run will prove most important of all. The High Authority has no power to prevent anyone from investing his own money where he wishes. Its job, as the Treaty defines it, is to provide the missing component for deserving investment schemes—either by investing some of its own funds directly or by using them as a guarantee for obtaining loans from outside sources. It also has the power to give an opinion on investment programmes, and any recommendations it may make are strengthened by the knowledge that any American investments will be funnelled through the High Authority. Indeed, the lure of American capital may provide the cement that, in these early days, will bind producers to the Community.

A Loan from America?

Inevitably, the producers of each country have begun to convince themselves that their needs and merits will be neglected when the largesse comes to be distributed. To date the Authority has gone no further than to suggest broad production targets for the Community as a whole—50 million tons of steel and 285 million tons of coal by the end of 1957. But it is known that the High Authority would like to devote the bulk of any funds at its disposal to the coal and iron ore mines, the object being to raise productivity and lower costs so that the Community's raw materials can compete with comparable imports and also with other fuels. It is on the basis of this general programme that the High Authority will open negotiations, probably next month, for a loan from the United States.

By and large, the Council of Ministers has already approved this broad statement of principle. But when the Authority begins to single out specific candidates for help, it will be compelled for the first time in the history of the pool to favour some members at the expense of others and it will have to reach its decisions on a plane of reasoning that treats the Community as a fully integrated whole. When this happens, member governments will be brought face to face with a fundamental issue. Can the Community succeed without the creation of a European Political

Authority with an overriding responsibility for executing a common financial and economic policy? How can there be agreement on a genuine common market for steel and coal while one country has an over-valued currency, another pursues deflation and still a third fails to make adequate provision for new investment? These are questions that M. Monnet recently put to his Council of Ministers. The Ministers have not yet replied.

Canadian Tories—I

FROM OUR OTTAWA CORRESPONDENT

THE twenty-second Parliament of Canada, which recently started its first session in Ottawa, looks very much the same as the twenty-first which was dissolved last summer. Some seventy individual members have changed; the opposition parties have gained a few seats here and there. Four women, more than in any previous Canadian House of Commons, have been elected. Apart from these individual changes and a new Speaker, a casual observer would find the present Parliament indistinguishable from the last. The Liberals still fill all the seats on the Speaker's right, and overflow about halfway down the rows on his left. They have 173 members out of the new House of 265. The Conservatives have 50; the Co-operative Commonwealth Federation has 25. The latter, a theoretically socialist party, made gains in the August general election, but they came from the rural wheat-growing province of Saskatchewan rather than from the labour constituencies. The attempt to combine an agrarian with a labour movement is still, therefore, a relative success among western farmers but, in general, a failure among trade unionists. In the bottom corner on the left sit, finally, 13 Social Crediters (so-called) and a few independents. Social Credit retained its firm hold on Alberta, the province of its birth, but it did not make good its threat to sweep British Columbia too.

The hopes of an effective opposition and the chance of developing an alternative government still centre in the Conservative party. But it is a chastened and puzzled group. Under its present leader, Mr George Drew, it has fought two general elections in 1949 and 1953. In 1949 it gained only 41 seats. It increased them through by-elections to 47, and the run of by-election successes led to higher hopes for the general election of last August. The result, only 50 seats, was a disappointment not only to Conservatives but to many other Canadians who have been lamenting the absence of a strong Opposition.

According to their past record it is time for the Conservatives to try a new leader; this has been their usual reaction to defeat. But fortunately there seems little present inclination to change Mr Drew. When he took over in 1948, after being Premier of Ontario, the Conservatives were shouting for a "fighting leader." Mr Drew responded by conducting an aggressive, indeed a truculent, campaign which almost certainly rebounded against him. This time he was much quieter. Although the public reaction was not expressed in the return of many more Conservative members, it was markedly less hostile than four years previously. Mr Drew and his followers at least seemed to be making more friends than enemies, which was more than could be said of the 1949 campaign.

In particular—and it was largely Mr Drew's own small triumph—they made a somewhat better impression on the voters of French-speaking Quebec. Mr Drew had found time during the busy weeks of the last Parliament to improve his French enough not only to read speeches in that language but to answer questions and converse in it. He won only four seats out of the 75 in the province, but he did achieve a marked increase in the popular vote.

An old-time candidate of many years ago is supposed to have been rebuked by his friends for making his promises quite so high, wide and handsome. His answer was: "Oh, it's an awful mean man that won't give a promise." By this criterion the Prime Minister, Mr St. Laurent and his party were "awful mean." He has come back to power bound by no election promises whatever except to "continue to do his best for Canada." The Conservatives were in no way mean. They promised, first and chiefly, to reduce taxes by \$500 million, or one-eighth of the federal budget. They were right in supposing that that was something everyone would like; but they were wrong in supposing that the public would believe they could do it, specially since they also offered a variety of other things which were bound to cost money.

A Benevolent Uncle But No Tip

The overwhelming success of the Liberal policy of making no promises seems to emphasise the vital importance of personalities in winning or losing Canadian elections. Mr St. Laurent, a corporation lawyer with no political experience until after the age of 60, has turned out to be a vote-winner of almost uncanny charm. All he had to do was to tour the country and talk to people, in the manner of a benevolent uncle, about the greatness of being a Canadian. No one ever thought to ask him for the tip which benevolent uncles are supposed to dispense. Following this lead with whatever gifts nature had provided, the Liberals managed to present an impression of calm and confident commonsense. It was a veneer of sweet reasonableness which looked as though it could not stand up to a good battering from opponents. But the more the Conservatives battered, the better the Liberal veneer looked. There was more than a hint in Canada's last election campaign of the 19th Century aristocrat turning his condescending gaze on the shouting and vulgar proletariat. Since Mr Drew himself and many of the more prominent Conservatives are accustomed to be on the aristocratic side of the fence, they must have been particularly galled by the Liberals' calm and successful assumption of superiority.

The Liberals have carried the day now ever since 1935, and with the exception of the period 1930-5 and a few weeks in 1926, they have been in power since the first world war. It is so long a run of success that people ask when, if ever, and by what means they may be assailed. In the early years after the second world war there were fears that the CCF might emerge as the second major party, and that the "old-line" Conservatives and Liberals might be driven into coalition or union. Subsequent events make this development seem less probable. But still the Conservative party fails to present the alternative government that most Canadians want to see. People are beginning to ask if this is going to be a permanent state of affairs. In a subsequent article reasons will be suggested why this need not be so.

(To be concluded)

Central Africa at the Polls

WHEN about 67,000 electors in the new Central African Federation go to the polling stations next week they will need to have their wits about them if they are not to be confused by the intricate electoral procedure. Whatever may be the other merits of this constitution of ingenious checks and balances, it has certainly made the job of choosing the 33 elected members of the federal assembly unnecessarily complicated. But future elections should be more straightforward, as the federal parliament has power to make a uniform electoral law. The total assembly consists of 35 members, but as two are nominated to represent African interests, one each by the governors of Northern Rhodesia and Nyasaland, only 33 seats are at stake. Of these, 26 are directly elected by common-roll franchise in the three territories; six are for Africans elected by special procedure; and one is for a European specially elected in Southern Rhodesia to watch over African interests.

In Southern Rhodesia each voter on a common roll which numbers something over 50,000, including about 1,500 Asiatics, Coloured and Africans, will have three votes to cast. A vote on a white form will go to the ordinary constituency candidates; there are 29 contestants, all Europeans, fighting 14 seats. Each elector can also vote on a red form for one out of the four candidates standing for election as the European member representing African interests.

And each voter will have a third vote, on a blue form, for one of the four Africans contesting the two constituency seats. As if this were not a surfeit of vote-making the unfortunate Southern Rhodesians must face the territorial election six weeks later on January 27th.

Northern Rhodesia has, for the purpose of the federal election, been carved into eight constituencies, and here 18 candidates are in the field. In addition two Africans will be elected by indirect means through the Northern Rhodesia African Representative Council. Northern Rhodesia also has a territorial election in sight, in the middle of February.

Nyasaland, with its common roll containing only 1,508 names, including 75 Asiatics and few, if any, Africans, has not been divided into constituencies for its first plunge

Could more accounting work be done ... with fewer machines?

Sensimatic Control* means limitless adaptability in one machine

BUSINESS NEVER STANDS STILL, and sometimes, accounting routines are not flexible enough to cope with heavy new commitments. But this doesn't mean that the office need get in arrears with its work, nor that a variety of different accounting machines must be installed.

There is one machine—the Burroughs Sensimatic—which can be switched in a flash to any kind of accounting operation. A single control-unit directs the Sensimatic through any four posting operations—and there is no limit to the number of different units you can use.

What does this mean? Simply, that a small business needs only one of these versatile machines to handle all its accounting jobs; that a large organization, as the need arises (perhaps, for the "peak-period" preparation of payroll), can switch every one of its accounting machines to one kind of work.

LOW INITIAL COST

The value of a limitlessly adaptable business tool like the Sensimatic is incalculable—but even its initial cost is far below that of any comparable machine. You owe it to your business to see it demonstrated in relation to your particular figuring problem. Call Burroughs today.

Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1. Sales and Service Offices in principal cities.

THE BURROUGHS SENSIMATIC

is now produced in 5 versions giving as many registers, or combinations of registers, as you may need.

* THE MEANING OF SENSIMATIC CONTROL

This sense-plate (the Sensimatic Control unit) guides the machine automatically through every mathematical function and carriage-movement of a complete routine. Every unit—there is no limit to the number you can use—controls any four different accounting operations in any combination.

For expert advice on business figuring

CALL IN **B**urroughs

into democracy. Each elector will have four votes which he must use singly to elect four members from the seven candidates, five Europeans and two Asians, who are standing. As in Northern Rhodesia, two Africans will be elected through an electoral college consisting of the district and provincial African representative councils. There was no shortage of candidates, despite the earlier hesitations, and no less than 13 people have offered themselves for election.

Many people will be disappointed no doubt that the European element predominates both among the candidates and on the common roll, where, indeed, the ratio is about 33 to 1. But these are early days, and even at the present election it is fair to say that no deliberate attempt was made to keep non-Europeans off the roll. The main reasons for the small numbers are apathy, unfamiliarity and lack of organisation. Another controversial question is the election in Southern Rhodesia of African members on a predominantly European vote. But in the circumstances to do otherwise is to grant the case for a separate roll, which most liberal-minded people firmly reject. And, furthermore, it is a novel and, indeed, educative development for white people to cast a vote for the election to parliament of a black representative.

No Truce on Colour Problem

As the campaign has developed it has become increasingly clear that the fight would be between Sir Godfrey Huggins's Federal party and the Confederate party. By nomination day all the other minor parties had withdrawn, leaving straight fights in all but two of the constituency seats, where independents chose to enter. In Nyasaland, four candidates support the Federal party and one the Confederates; the two Asians are nominally independent. The Federal party, which upholds the principle of partnership and the common roll, has the advantage of having the big names, Sir Godfrey Huggins, Sir Roy Welensky and Sir Malcolm Barrow; but at times it has appeared to be equivocal about its native policy. On the other hand, the Confederates, led by Mr J. R. Dendy Young, has a positive policy towards colour which sounds very sweet to the white settler's ear. An appeal to both parties to call a truce on racial questions was turned aside, and as the campaign has warmed up it has become increasingly bitter and personal.

With so little from past experience to go on it is almost impossible to forecast the outcome. In some places the Confederates are known to have gained ground, and it is generally expected that they will command a strong vote

For Exporters

Our quarterly reports are keeping many exporters informed about conditions and prospects in their markets. Competition, trade policy, payments outlook, import licences, political influences and many other factors affecting sales abroad are dealt with in these concise reports. Fifty reports on seventy countries are published every three months.

Experienced overseas correspondents and unrivalled sources of information assist The Economist Intelligence Unit to produce these regular reports, and to carry out special investigations into matters of concern to individual companies.

Particulars of these and other services from

THE ECONOMIST INTELLIGENCE UNIT
22 Ryder Street, St. James's, London, S.W.1

on the Copper Belt in Northern Rhodesia, where the Afrikaner influence has been growing. The two seats in this area and the Sebakwe constituency of Southern Rhodesia, where Mr Dendy Young faces Mr J. L. Smit of the Federal party, are thought to be the key centres. But with the almost certain assurance of four Nyasaland seats, plus the passive if not active co-operation of the African members and the three Europeans representing African interests, Sir Godfrey could afford to lose a dozen seats, and still command a majority in this small House.

Nationalisation In China

FROM A CORRESPONDENT IN HONGKONG

THERE was no doubt some pretty straight talking in committee and behind the scenes at the National Congress of the All-China Federation of Industry and Commerce, which was "victoriously concluded" after a session lasting three full weeks. It may be assumed that there was more criticism than self-criticism when the vice-chairmen and vice-premiers had said their allotted piece and withdrawn. It is quite possible that some of the more daring contrasted the anarchy and chaos of an inexperienced state industry and commerce with the superior results and infinitely better management of the private entrepreneurs. But about such things the official press and news agencies are generally silent. They criticise others and themselves, but they do not allow the barbed arrows of the contemned bourgeoisie to penetrate outside the four walls.

The entrepreneurs got their orders, all laid down in detail by the Party leaders. There was a general acceptance of the relative inevitability of gradualness, but the five Party apostles, of whom Li Wei-han (Vice-chairman of Financial and Economic Affairs) was the chief, told the manufacturers and merchants that they must now prepare to pass into the second stage, that of state capitalism. The general line in this transitional period on the path to Socialism is the steady development of the Socialist elements in the national economy, the gradual reform of the non-Socialist elements, and the gradual Socialist industrialisation of the country, "on the basis of which a great Socialist China will be established."

The policy of the People's Government towards private industry and commerce, said Li Wei-han, is to put it to good use, to keep it within proper bounds, and to transform it. As there are nearly four million workers and shop assistants in private employment, private enterprise is an important element in the national economy. It could supply products to the state, promote trade, accumulate capital and train technical and management personnel for the state. But it must be re-formed and develop into state capitalism. Under this, enterprises must function in accordance with the demands of the state. Their profits are divided "on a reasonable basis," part going to the state in taxes, part being earmarked as funds for workers' welfare and future expansion, and part in payment of dividends. State capitalism is varied in form and new forms will yet emerge. Often the state steps in and takes over half the enterprise on its own terms, which are often tantamount to confiscation.

Actually this is the halfway stage to complete nationalisation and state ownership. The chief form of these transitional enterprises is called in Communist jargon the "jointly operated public-private" businesses. In Shanghai alone

there are now scores of large factories in this category—iron and steel, machine-making, chemical, electric power, textile, cigarette and pharmaceutical industries. They are in effect state-owned and they work for the state under centralised plans. On the whole they have done pretty well, perhaps better than any of the fully state-owned industries, which have suffered badly from bureaucracy and have returned results which shattered the government's expectations of large profits for national construction. Most of them have been forced to "overcome their conservative tendencies" and to do precisely what the government directs them to do.

The emphasis on gradualism in all things was accompanied by strictures against the functioning of state trading organisations internally. There was, in fact, over a large part of the year so unprecedented a breakdown that in many of the larger centres the available supplies, even of essential commodities, fell to a mere fraction of the need and normal volume. The people often had to go without such necessities as sugar, kerosene, paper, hosiery, soap and towels, and cooking oil. This was due, not so much to a real shortage, as to the appalling inefficiency of the inexperienced cadres posted to these new state bodies. The officials themselves preferred to attribute it to defective interpretation of the economic accounting system, which has figured largely in the abracadabra of Communist verbiage during the past year.

The new trading bureaucracy also disliked the handling of all these petty things; they preferred to deal only with major commodities. In one large city the supply centre has an inventory of over 1,400 articles, of which less than half were available in the state shops. In another town the municipal shops' volume of business dropped by two-thirds. These are presumably typical, and it is admitted that the poor service of the state General Goods Shops, together with the "slackening leadership" over the markets, led to unfavourable reactions from the masses. Co-operatives and private stores were unwilling to buy from the state shops because of the limited range of their supplies, and "profiteers" stepped in. In some cases local industries had to open their own retailing departments to sell their products, "thus causing confusion in certain commodity prices." In other instances the state commercial enterprises neglected processing or purchasing, thus plunging local and private industries into trouble.

Brazilian Pride and Petroleum

FROM A CORRESPONDENT LATELY IN BRAZIL

IN October President Vargas signed the law establishing *Petróleo Brasileiro S.A.—Petrobrás*—as a monopoly to prospect, exploit, refine and transport Brazilian oil. While providing, hopefully, for the participation of private Brazilian capital, the new measure prohibits all foreigners from owning shares in the monopoly. Here one sees the contradiction in Brazil, as elsewhere in Latin America, between on the one hand the growing need for foreign capital and technique, and on the other the deliberate selection of policies designed to baffle the foreign investor.

Brazil's present balance of payments difficulties derive mainly, it is true, from deliberate overvaluation of the cruzeiro in the recent past and from over-buying abroad. But petroleum provides a unique and crucial problem. Brazil's average imports of petroleum products in the two prewar years were 1.23 million tons; in 1952 it imported 6.11 million tons. In each year since the war, it has used

about one fifth more petroleum than in the previous year; at the present rate of growth—arising out of the continuous penetration of Brazil's vast area by road and air transport—the import of petroleum would cost, in 1960, as much as Brazilian coffee now earns in world markets, or some 60 per cent of the country's total export earnings.

Apart from its need for foreign exchange as such, Brazil is faced with the task of diverting money and resources over the next few years to meet a public investment programme estimated at about £500 million, of which a fifth would be devoted to petroleum development. The chief reason for the current inflation has been Brazil's inability, by any other means, to secure the application of resources to productive investment in competition with sumptuary expenditure and the contagious American way of life. That this harmful situation is likely to continue provides a strong argument for allowing private capital, at a price and on certain conditions, to shoulder that part of the burden which it is anxious to bear. But no attempt was made to discuss such conditions with foreign capital.

Colonel Bramble in Rio

Some sections of public opinion are aware of the dilemma and the danger; the National Economic Council, a consultative body, called attention in its report for 1952 to "the enormous damage that lack of foreign capital has caused the country." Senator Assis Chateaubriand has also lost no opportunity of plugging this theme in his chain of newspapers. Nevertheless the Chamber finally rejected two Senate amendments designed to allow prospecting to be done under contract, and removing the ban on the expansion of private refining capacity. It is hard in this matter, as in others, to gauge the personal view of President Vargas, whose silences are as legendary as those of Colonel Bramble. But on sending the first draft of the petroleum law to Congress in December, 1951, he had explained that

The Brazilian Government and people desire the co-operation of foreign enterprise in the development of their country, but prefer to reserve the petroleum sector to national enterprise; it is well known that the tendency of this industry to international monopoly is such as to cause friction between peoples and between governments. True, therefore, to the nationalistic spirit of existing petroleum legislation, this enterprise will be genuinely Brazilian, with Brazilian capital and administration.

It is doubtless true that stakes, risks and feelings are all higher in the case of mining generally than in that of other foreign investment, and highest of all in that of oil. Perhaps the real essence of Latin American emotion in this matter is to be found not in any economic text, but in D. H. Lawrence's picture of "The Greedy Ones" in his fourth hymn to Quetzalcoatl. The very term "extractive industry" connotes the removal from the earth of a resource that can never be restored, and from which wealth will be created in distant lands for the benefit of the foreigner. And a dark folklore surrounds the activities of oil companies; they are deemed to have promoted revolution and counter-revolution in Mexico and the war between Bolivia and Paraguay. In Brazil they are accused of buying politicians, restricting the sale of modern equipment to the National Petroleum Council, and of suborning foreign technicians who knew the location of Brazilian deposits.

And here is a final reason why the public and the politicians have proved so stubborn; it is popularly believed that oil will be easy enough to find, or even that it has

already been found in quantity. When people read that a third or more of Brazilian territory consists of sedimentary formations of the kind in which oil has been found in other Latin American countries, they conclude that small effort will achieve the same result in Brazil; the hazards of oil exploration are not understood, nor the extent of the resources which the companies deploy, and sometimes lose, in their search.

Democracy is without doubt at that stage of sophistication in Brazil at which public opinion is entitled to be a determinant of national policy. Yet it is hard not to feel that, in striking their balance, Brazilians have on the one hand somewhat overdrawn the sinister power of oil companies in the postwar world, and on the other failed to give due weight both to the crucial importance of petroleum in their national economy and to the size of the total investment burden of which they have refused to share a significant part. In their legitimate desire to protect their national pride, they will have paid a higher price, in the slowing-up of their development, than most of them appreciate. Meanwhile the Brazilians, who are rightly renowned for their sense of humour, have recently signed an agreement with Bolivia for the joint exploitation, with Brazilian capital, of Bolivian oil in the Amazon basin.

The Danube-Black Sea Canal

BY A CORRESPONDENT

ACCORDING to recent reports from Rumania, all work on the Danube-Black Sea Canal has ceased. The canal, which used to be referred to as "one of the finest undertakings of the century" and "this gigantic peace construction," was begun at the end of 1949 and was supposed to be completed in 1955. But since early last summer there has been no mention of it in the Rumanian press. It has been ignored in the last two issues of the official quarterly statistical report. And in Premier Gheorghiu-Dej's Liberation Day speech, in which in other years the canal held pride of place, it was not even mentioned; there was merely a vague reference to "other works" where the "curtailing of budgetary allocations" would be necessary. Only the Deputy Foreign Minister, Grigore Preoteasa, broke this conspiracy of silence when he declared to foreign correspondents assembled in Bucharest last August for the Festival of Youth that "whether or not work on the canal is continued is not the essential problem. It is the government's policy to concentrate on raising the standard of living." Without much doubt this cryptic statement represented the canal's funeral oration.

Originally it was intended that the canal project should not only shorten to one-fifth the distance between the Danube town of Cernavoda and the Black Sea; among other things, it was also planned to "return immense surfaces of land to agriculture" by draining large tracts of moorland; "to bring into full cultivation some hundred thousand hectares of land" through an irrigation system depending on the canal; and to make "possible the industrialisation of the Dobrudja," in order to bring about a rapid rise in the standard of living of the working population. How could such an ambitious project, involving so much capital investment, material, machinery and manpower (thousands paid with their lives and tens of thousands with their health) be undertaken in order to bring about the "industrialisation" of one of Rumania's poorest provinces so as to achieve a rapid rise in the people's

standard of living, and then be abandoned half-way through in order to achieve the very same object? The real reasons behind the commencement and subsequent stoppage of work on the canal are quite different.

Right from the beginning, the official reasons for the construction of the Danube-Black Sea canal were not the real ones. It was Gheorghiu-Dej's sincere belief that the building of Socialism consists in the implementation of projects such as the Volga-Don canal. To carry out such projects is for Gheorghiu-Dej (following in the steps of Stalin) to lay the cornerstone of Communism; it also provided a convenient occupation for the ever increasing number of "clients" of the security services. So he determined, after securing the at first reluctant approval of the Kremlin, to take this—as he thought—short cut to establishing a Communist state; and in August, 1949, work on the canal began in the most primitive conditions.

It was only later that Moscow realised the possible strategic value of the canal and started both to encourage Gheorghiu-Dej and to send machinery. But the near-starving forced labour employed on the canal and the poor quality of the Soviet machinery—not to mention the resistance of the former—did not lead to the great strides forward claimed in the frequent "battle communiques" issued

in Bucharest. Two big trials were therefore staged, one in 1951 and the other in 1952, to provide the necessary scapegoats. At the beginning of this year, however, Bucharest was obliged to face the facts, and to admit that only three of the seventy kilometres planned to be ready by the end of 1955 had been completed. It was moreover at long last decided that a serious study of the scheme was essential. The Swiss engineers who were brought in soon discovered that the subsoil was quite unsuitable, and that since the site of the canal was 0.60 metres lower than the level of the Black Sea, and since the shores of the latter were provided with insufficient dykes, in a very short time, had the original plan been adhered to, the whole project would have been flooded.

There was no other choice but to begin again from the very beginning or to abandon the project altogether. It appears that the latter course has been adopted, at any rate for the time being. At the end of last spring, according to reports from Rumania, all work on the project was stopped at about the same time as the "amnesty" was put into effect. All men over sixty years of age in the forced labour camps on the canal were released at the rate of twenty per day; so were all cripples unlikely ever to be fit for manual work again. But a great number of those who were still capable of working were sent to Ajud in Transylvania, the principal prison city of Rumania, where three factories have since been opened. Thus it appears that when the Deputy Foreign Minister made his ambiguous statement last August the canal sites had already been deserted for some months.

For smoking,
pure and simple...

This Dunhill Holder contains a Crystal Filter which cools the smoke, keeps tobacco particles from your mouth and absorbs nicotine and tar. It enables you to keep on smoking your favourite brand of cigarette with the added enjoyment of filtered smoking too. Each filter lasts for 20 cigarettes and is changed in a moment. Ask your tobacconist to show you the Dunhill De-Nicotea today. Price 17/6 (in box with 10 filters).

THE DRAMBUIE LIQUEUR CO. LTD., EDINBURGH

"A very smoothly run business,"

beamed the Chairman to the Secretary. 'Helped by the correct office equipment,' said the Secretary, wearing his pride well. 'Powers-Samas have supplied trays, racks, cupboards and the like for their punched-card accounting system...' 'Tantamount to tidiness,' said the Chairman, 'and the complete range of desks, chairs, filing cabinets - everything for comfort and neatness.' 'Excellent for efficiency,' said the Chairman, 'Powers-Samas are a long way from great-grandfather's ledgers and trestle tables. Wonderful firm.'

There is a range of Powers-Samas accounting machines and equipment for every business

POWERS-SAMAS

Powers-Samas Accounting Machines (Sales) Limited,
Powers-Samas House, Holborn Bars, London, E.C.1

How would you start to pack a shipment of chains?

Long chains, short chains. Heavy chains, light chains. Chains for delicate instruments and chains for ponderous earth-moving machines.

Every kind of chain is entrusted to Remploy's P.I.P. organisation for Preservation, Identification, Packaging. Not a job for rough and ready methods, this! For instance, even a finger stain can set up rapid deterioration on the ground surface of a chain. So the chains are first greased without being touched by hand. Then follows treatment with suitable preservatives (according to the kind of chain); wrapping in greaseproof paper; over-wrappings and perhaps wax-dipping; cartoning,

and packing into wood cases. Complete identification, by the manufacturers' detailed and coded labels, is applied at every stage.

That sums up the chain of events in this instance. But other packing problems, other solutions. Remploy's advice is yours for the asking.

Remploy's packing is on all M.O.S. Inspectorate approved lists. The P.I.P. organisation, largest of its kind in the U.K., has 13 factories throughout the country. These provide everything for a complete packaging service—from bag liners and cartons to giant packing cases.

THE BUSINESS WORLD

Battle for the Savoy

A WEEK'S truce in the battle of the bids would enable company directors, shareholders and mere economists to devote some much-needed fundamental thought to the issues that have recently been raised by the Savoy Hotel and other cases. But a rough fight is a time for sharp reflexes rather than high thinking; and as the Savoy affair reaches its climacteric none of the contestants is bothering overmuch about the rules that normally govern—or ought to govern—the conduct of companies. In particular, the shareholder stands helplessly on the sidelines of the battle, conscious that much is wrong whoever may win. And a little higher up the river, the perennial critics of companies, shareholders and the City are relishing the spectacle, conscious that they are bound to snatch political capital from the affair, whoever loses.

At the end of last week, Mr Clore announced that he had felt it right "to eliminate competition . . . which can serve no ultimate useful purpose" between himself and Mr Harold Samuel and had agreed to sell his group's holding (£97,500 of ordinary stock on November 27th) to Mr Samuel "and to support him in every way possible." Mr Clore, having thus retired, presumably with a satisfactory profit, from a contest in which he was a late starter and never the principal buyer of Savoy Hotel stock, thus raised Mr Samuel's interest to £298,000, assuming that the latter had bought no further stock since November 26th. That holding would have conferred upon him control of 30 per cent of the voting power and there are strong indications that Mr Samuel may now control 40 per cent of the votes; if, to quote the words of Mr J. B. Lindon, Q.C., Mr Samuel's group might be able materially to influence the policy of the Savoy Hotel company, if not to control it, with 20 per cent of the votes, it ought to be able to do both with 40 per cent.

But if Mr Harold Samuel had supposed that the way was now clear to obtain effective control and put in hand his plan for rebuilding the Berkeley Hotel as an office block, he reckoned without the ingenuity of the Savoy Hotel board under Mr Hugh Wontner, who with the officials and staff of the company hold about 7 per cent of the votes. The board's plan (which found no mention in its emotional circular a fortnight ago, when Mr Clore was named but not Mr Samuel) is to rebuild the Berkeley as an hotel. The strategy of the fight has therefore turned upon one major issue: whether it is possible to put the Berkeley Hotel beyond the reach of Mr Samuel, despite the fact that he is the major shareholder.

The technical means that the Savoy directors propose to secure this end have the merit of ingenuity if no other. Worcester Buildings Company has been formed to acquire the Berkeley and certain other properties, issuing in exchange preference shares to the Savoy group. The Berkeley property has been valued at £490,200. Worcester Buildings has 540,000 3½ per cent first preference shares of £1, without votes unless their rights are affected; 100,000 6 per cent second preference shares of £1 carrying one vote per share; and 200,000 1s. ordinary shares carrying one vote each, a limited non-cumulative dividend of 6 per cent, and the right to a return of capital only. The first preference shares carry the right to all distributed profits after the fixed dividends have been paid on the three classes, and the right to all surplus assets. They are, in effect, the ultimate equity, but they have no say in their own destiny, for the control of Worcester Buildings will vest in the ordinary shares, which have been taken up by the trustees of the Savoy group staff benevolent fund. The three trustees are the medical adviser to the Savoy, a partner in the firm of accountants who

have been auditors of the Savoy since its foundation, and Mr Hugh Wontner, the chairman and managing director of the Savoy. The object of this device is to put the Berkeley property beyond the control of the votes of Savoy Hotel shareholders, but to retain for them the ultimate benefit of the right to its profits and to its assets, should the ordinary shareholders of Worcester Buildings Company decide to distribute them—which might be doubted so long as Mr Wontner remembered that Mr Samuel held 40 per cent of the Savoy shares.

Several objections can be made to this scheme, leaving aside for the moment all consideration of principle. In the first place, it has been less than adequately explained in the directors' latest circular. The trustees, it appears, are a self-perpetuating body, not responsible to Savoy shareholders, and able to decide without any reference to them the disposal of the Berkeley property and of its surplus earnings. Secondly, although the Savoy shareholders have been given much interesting material about the history of the Berkeley (including due reference to its "unique connection with the principal families in the United States"), they were not invited to give their views on the directors' plans to alienate part of the property belonging to their own company. There are no comparisons of possible earnings from the Berkeley site as a new hotel or as offices, so that it is impossible to decide (though perhaps permissible to make guesses) which use of the property is economically the more advantageous.

★

On grounds of principle, it is difficult to find condemnation too severe for what the Savoy Hotel board have done. They have taken, without the consent of their shareholders, a valuable property in which the shareholders have an equity and of which the best use is open to dispute. They have made it impossible for the shareholders—unless Mr Samuel, the principal shareholder, discovers some loophole hitherto invisible—to exert any control in future over the disposition of that property. They have set a precedent which, if extended, could divest shareholders in any company of their legal interests, leaving them wholly at the mercy of directors over whom they would be powerless to exercise any control. They have carried to the limit the modern doctrines that "the company" is something apart from the shareholders, that directors owe a primary duty to "the company" rather than to the shareholders, and are justified in taking any steps, even to the disadvantage of the shareholders, that they conceive to be in the interests of "the company." The point has been aptly put by Professor Keirstead:★

The entrepreneur may say, and believe, when he speaks at the company meeting, that the interests of the company are the interests of the shareholders, but his ordinary thoughts do not run along these lines. Most of the time the company which he serves has its own interests to which he dedicates himself.

★ An Essay on the Theory of Profits and Income Distribution.

Here, in the last resort, is a head-on collision between the idea of a property-owning democracy and a corporative system run by business executives. There are considerable differences in the approach to company problems of Mr Wontner and Mr Austen Albu, MP. Yet each of them is reaching out, from quite different directions, for the same solution—the situation in which the shareholder is to be disfranchised of his rights and denied access to his own property, leaving a board of directors immune from any effective control by shareholders.

★

Each day brings a new turn in the dispute. Mr Samuel made application last Monday to the Board of Trade for the appointment of an inspector to investigate the action of the Savoy Hotel board; this is now under consideration. On Tuesday he offered to sell his holding (apparently of 375,000 ordinary shares) in the Savoy Hotel at 62s. 6d. a share, giving the directors a day to consider the offer. This has been refused by the directors on the ground that the price is excessive, and Mr Samuel has since stated that he had "no desire" to sell this stock but sought to do so "in an endeavour to find some amicable settlement to the present dispute"—which can be interpreted as a willingness to obtain a substantial quick profit even if that would have meant abandoning his plans for making "the most appropriate and economic use of the Berkeley."

This offer must be regarded as a tactical interlude in the basic strategic struggle for control. It is time that the non-controlling shareholders who, be it remembered, still hold more than 50 per cent of the votes, were treated to a little more hard fact than is to be found in the appeals to tradition issued by the Savoy Hotel board and in the assertion by Mr Samuel that he would have "full regard to the wishes of the planning authorities and other interested Government departments" in developing the Berkeley site. The fundamental argument in this case is about a change of use, which the Savoy directors have sought to frustrate by taking the property out of the control of their shareholders, but not beyond their own effective control. Not a single estimate of future capital expenditure and earnings has been put before the general body of shareholders by the two contestants.

Shareholders have become enured in recent years to being treated on the basis of least eligibility. But when directors find themselves under pressure they sometimes put shareholders higher in their thoughts. There has been the interesting case this week of the revision of policy of English Sewing Cotton Company, the directors of which have been perturbed about rumours of a bid for the ordinary stock. "Existing reserves" the directors now declare "are sufficient to support an appreciably higher dividend"—20 per cent against 12½ per cent is forecast, even though the 1953 results will not be accurately known for some time. Even more striking, "the policy of preserving the company's

assets and maintaining a steady dividend will be followed as far as is consistent with ensuring that the market value of the stock bears some relation to the worth of the company's undertakings"; and as a corollary to this new attitude, the issued ordinary stock is to be doubled.

There are some kinds of disturbance that are good, just as others are socially harmful and economically wasteful. Some of the consequences of the battle of the bids can be harmful, particularly if they involve the wanton alteration or destruction of undertakings that are guilty of no crime but careful husbandry and put a modest figure on their own value; to "gut" such undertakings for the benefit of a bidder is often to rob patient shareholders of what was due to them. It is to bids of this class that the Bank of England is presumably looking with a critical eye, for it has made a request to the insurance companies not to buy properties if their purchase would assist the negotiation of a speculative transaction. That request involves awkward questions of definition, though there is a clear difference in practice and in negotiation between a property deal involving the actual owner and one in which a potential owner is

seeking financial support for a bid for control of properties that he has yet to secure and for which he could not otherwise find the purchase price. The request from the authorities will make the "heads I win, tails you lose" type of bid harder to contrive, but it will not prevent the appearance of "speculation" in any property deal that involves a change in the status of a property from one with an unrealistic book value to one with a current market price.

The events of this past fortnight are by no means reassuring for ordinary shareholders. They have been treated to a demonstration that their only equity may be in distributed profits, and that the assets and reserves of a company of which they are owners can be put beyond their reach. That lesson will not be lost on the political critics of company finance who talk of "absentee shareholders" and seek to divide their equity between "the workers" and the Exchequer. These fundamental issues involve something wider than the fate of shareholders; they involve in the last resort important elements of the economic freedom of the individual. To this issue the discussion must turn in a further article.

Competition for Steel Exports

ESTIMATES of world trade in steel are inherently difficult to make and more difficult to interpret. The raw national data are hard to come by and compare; annual totals require the lumping together, in proportions that vary from year to year, of ingots, semi-finished, and finished steel, where tonnage means different things; and some double counting seems inevitable. Ingots brought from Italy to be hot-rolled at Margam and returned as strip, for example, may figure twice in export returns before being consumed in the land where the steel was smelted; and during recent years, when demand has pressed hard upon steel industries with capacity not completely in balance, such special cross-hauls have involved considerable tonnages.

These formidable provisos accepted, however, there are indications that international trade in steel this year may fall below the volume of 1952, which itself seemed slightly smaller than in 1951. Total exports from eight of the major steel-exporting countries, which together account for three-quarters of world production, were running in the first half of this year at a rather lower annual rate than last year. Such statistical indications of a shrinkage in export business would certainly accord with the common experience of steel exporters in recent months, when orders have been hard to find and competition more severe, even at reduced prices. In part this apparent decline in steel exports may be natural in a year during which production has once again caught up with demand—as it might have done in 1952 but for the 17 million tons lost in the American steel strike. World steel output in 1953

will probably be quite 10 per cent higher than last—perhaps 230 million long tons against 207 million tons in 1952. Consumption of steel, too, must have risen; but now that supplies are easier, consumers are using up the stocks that they managed to build to very high levels during the 1951-52 scramble for steel. This has certainly happened in Britain and in the United States, where consumers' stocks have been tending to aggravate rather than to cushion the fluctuations of demand; and world demand has been characterised by similar buying behaviour in many countries.

This year's softening of the export market for steel has been fairly general, affecting most markets and most products. Exceptions include plates, where demand (though not necessarily consumption) probably still exceeds supply; sheet; and rails, the demand for which is as usual fairly steady, with contracts still being fixed for long periods. Demand for tinplate, too, is recovering. But for a wide range of products, demand is still very slack and delivery is being offered over very short periods indeed. This sales resistance is serious enough for a country such as Britain, where only about 15 per cent of output is exported and where the volume of exports is still formally subject to some degree of Government control. It is very much more serious for steel producers in Belgium and Luxemburg, where exports normally account for some 75 per cent of steel output. Hence the competitive cutting of prices during the last twelve months, and the attempt by the revived steel export cartel to co-ordinate Continental export prices for steel.

Last month's cuts in British export prices for steel were generally stated to have brought these prices down to roughly the level of the published prices of the European steel export cartel. Comparisons are difficult to make, but it appears that the basic prices for a number of British steel products are now in fact somewhat lower than the Continental export prices, if the extra amount charged on the Continent for steel of open-hearth qualities is counted in. If the prices for the British steel (mainly open-hearth) are compared with the basic Continental export prices for Bessemer steel, the British prices are somewhat higher. The extra value traditionally placed on open-hearth steel by comparison with Bessemer in Britain reflects the views of an industry that makes 90 per cent of its steel in the open hearth; while the extras charged for open-hearth qualities in Western Europe, on the other hand, reflect to some extent the inconvenience to producers there of supplying large quantities of such steels. Foreign customers have neither reason to exaggerate the difference in quality, and in a large number of applications, it may not matter much. So the British steel offered for export should perhaps broadly be compared with the Continental steel, quality aside—by which criterion British prices are probably still slightly above the cartel's.

★

Moreover, such standard prices as are fixed by the cartel seem in practice to be freely shaded by individual steel producers in Western Europe. The price with which a British figure is being compared may be no guide to the price at which orders for such steel are being quoted. It would be pharisaical to suggest that this does not happen in Britain, too. Heavy steel exports are handled co-operatively through one of the British Iron and Steel Federation's agencies, and in this range quotations are obviously at the agreed prices, though special dispensations may be obtained in to meet competition in particular cases. There is no formal co-ordination of prices for lighter steel products, and in this field the shading of prices may be more frequent, if perhaps not quite so general as in Western Europe. It is still true, therefore, to say that Britain is managing to obtain slightly higher prices than other European

exporters for the steel it is exporting; its f.o.b. prices in October had come down by an average of 8-10 per cent by comparison with last autumn.

Whether Britain can continue to obtain these slightly higher prices is more doubtful. Nearly two-thirds of British exports at present are going to countries in the Commonwealth, where they obtain varying degrees of Imperial Preference; these may give an advantage of 20 per cent in certain countries, but as little as 5 per cent in others, while a number of the colonies accord no preference at all. A fairly considerable proportion of exports, also, goes to countries with which Britain has bilateral agreements; these markets, too, may be rather more stable than others, though the bargaining importance of British steel—or British coal—is at present much devalued. Part of the remaining exports go to the oil-producing countries, where the buyers may be British-controlled oil companies. It is in what the Board of Trade used to designate "outer countries"—those markets where Britain enjoys no special relationship with the customer—that competition has been fiercest this year, but it is no longer wise to exaggerate the protection of special links with steel customers. Even the Commonwealth, as the table shows, has since the war been buying from Britain only about a quarter of its steel imports, though this has been partly due to British restrictions on steel exports. The policy followed in postwar years of holding British export prices for steel moderately steady, in comparison with the very high figures charged by exporters who took full advantage of the shortage, may have enhanced Britain's reputation for fair dealing. But it is unlikely to have made Britain's hold on the customers any stronger today if a competitor quotes lower prices.

Britain's busiest competitors are the members of the European steel export cartel, who in different hats are the members of the Coal-Steel Community that is at present seeking to outlaw that cartel. The High Authority has as yet shown no great success in controlling the internal level of steel prices within the Schuman Community, and it is perhaps under pressure from its American mentors to demonstrate that it can be effective in exerting its authority over the export arrangements between its members. The British steel

industry is at present an interested spectator of this encounter, despite its feeling that the dispute is less concerned with whether minimum export prices should be fixed than with who shall fix them. But the British appraisal of the competitive strength of the Continental steel industries and its own, when it comes to export competition, is still confident. It believes that the prices being quoted by European steel exporters for some products are already below home prices, if not quite down to cost. British steel prices, which do not greatly differ from those charged by the Continental exporters, still afford substantial export premiums on a number of products and some premium on nearly all exports; British costs, broadly, are below those of most of its European competitors.

The largest question mark for steel exports concerns the likely course of world trade, and essentially American trade. In the United States, as in England, there have been some signs that the stocks in consumers' hands are coming down to a level where a normal flow of orders will be resumed. Steel producers everywhere would like to believe that this year's slackening has been simply an inventory recession, generated entirely

by the desire to liquidate stocks built up too high during the period of shortage. In the United States, this is at any rate a good deal of the story; but the steel industry there is also expecting some minor decline next year in demand for current consumption in engineering, particularly in the motor industry. Such forecasts may arouse fears among other exporting countries that large amounts of American steel may be released on to the world market, possibly at low prices (though the American industry has seldom in the past brought export prices far down in order to keep capacity active). But even if the present slackness in demand should develop into more than an inventory recession, Britain has one further layer of insulation to discard. This year, though exporting about 2.6 million ingot tons of steel, it is still importing more than a million tons of semi-finished steel. Demand overseas, and indeed at home, could sink by this substantial margin before Britain's present level of output, or even its planned expansion, need be materially affected. But no steel exporter would welcome the idea that any very bitter or prolonged struggle on the steel export market is imminent.

Business Notes

Turn in the Road

As a first instalment of the modernisation that Britain's road system sorely needs, the three-year programme announced by the Minister of Transport is welcome—but only as a first instalment. The commitment is not a large one, nor entirely definite. Schemes for road improvement and construction that will eventually cost the Exchequer £19 million are to be authorised during the financial year 1954-55, and further projects that will cost it £31 million will be authorised in the two following financial years. It is not easy to translate these figures of authorisation into forecasts of actual spending on road work. The Minister said that in the first two years "actual expenditure will be relatively small"; by the third year it will have risen to some £14-15 million a year. The present level of central Government expenditure on major improvements and construction is about £5 million a year, so the increase described might indicate an actual expenditure over the three years of perhaps £30-35 million, compared with the £15 million that would be spent if work continued at its present rate. The annual expenditure after 1957-58, however, is expected to continue at about the £14-15 million level "for a period of years."

These figures of expenditure, of course, understate the

actual amount to be spent on the programme, because local authorities will be called upon to make a contribution. Local rates bear varying proportions of expenditure on all but trunk roads, for which the Ministry of Transport pays the full cost; and across the whole field of maintenance, minor improvement, and major work on the roads, the local authorities have recently been paying some £46 million a year to the central Government's £34 million. Their share of a programme concerned largely with major roads would obviously be much smaller; it is somewhat surprising that the Ministry, which was ready to describe in considerable detail a number of the specific road schemes that it plans to authorise under its three-year scheme, has not yet been able to give any estimate of the concomitant expenditure by local authorities that this will involve. The Minister, moreover, was not ready to say how much the Exchequer contribution will be next year to the cost of normal maintenance and minor repairs; the contribution from local authorities to both these blocks of expenditure is presumably being counted together.

According to an index of real expenditure on British roads produced recently by the Ministry of Transport, this year's expenditure of £5 million on major road improvements and new construction represents about 24 per cent of the average expenditure between 1936 and 1939. So the level of planned expenditure in three years' time, assuming no increase in prices, would still appear to repre-

STEEL TRADE OF MAJOR EXPORTERS, 1950-53 (Ingots, semi-finished and finished steel)
(000 tons)

† Includes 462.8 thousand tons to French overseas territories.

sent no more than three-quarters of the work being done before the war. In terms of physical resources, this planned increase in road work may represent the most that can be squeezed from the civil engineering industry and its suppliers, if the present deployment of these resources and those of the building industry is taken as essentially sacrosanct. The programme, indeed, may be the most that can be expected while those responsible for other sectors of national investment are not prepared to give an inch. Whether some of those other investments are providing as substantial a return as could confidently be expected from investment in better roads—this programme and much more—is inherently doubtful.

£10 Million for New Zealand

NEW ZEALAND this week has earned the distinction of being the first Commonwealth borrower to come publicly to the London market with a Government issue to finance a major development project that is precisely what the doctors of the sterling family conference ordered. The project is the now well-known Murupara scheme for the establishment by the Tasman Pulp and Paper Co. Ltd.—a company in which the New Zealand Government has a substantial interest—of a large integrated plant for production of timber, pulp and paper. The scheme promises substantial dollar savings for the sterling area when production begins, as is hoped, in about two years' time. As part of its contribution to the estimated total capital costs of about £NZ 27 million, the New Zealand Government has this week raised £10 million in London, to finance the relevant outlays now being incurred in Britain.

The loan took the form of a 4 per cent stock, 1976-78, offered at 98½, at which price the redemption yield to final date was just under £4 2s. per cent. At the time of the announcement these terms offered roughly 3s. more on the redemption yield and nearly 2s. more on the running yield than could be got from the most nearly comparable British Government stock—the Transport 4 per cent stock, 1972-77. Despite the easing of the gilt edged market during the week, the lists closed within ten minutes of the opening on Thursday. Applicants for £5,000 or less secured a full allotment, but larger applications were scaled down to 81 per cent.

Mining in a Warm Winter

THE miners have at length managed to produce the 100,000 tons a week extra that the National Coal Board has been hoping for ever since their second week's holiday. Last week, with 10,000 fewer men on colliery books than a year before, but a thousand more men working at the coal face, they produced 4,559,000 tons, the highest week's output for two years. The cumulative total of coal production, however, is still 2 million tons behind last year's total—essentially because with their extra week and the Coronation the miners took the equivalent of 5½ million

tons of coal in leisure. Distributed stocks of coal at the beginning of December, however, were still about 19 million tons, as high as last year's and offering reasonable insurance against anything but an exceptionally cold winter. This was due in some small measure to the transfer of coal from open-cast stocks during the autumn into consumers' yards and coal dumps, but mainly to the happy coincidence of two errors in forecasting—an estimate of autumn coal consumption that was falsified by the weather, and an estimate of autumn coal production that was falsified by the miners.

Inland consumption of coal this year seems likely to turn out roughly 3 million tons higher than in 1952, which would be higher than in 1951, though not back on the sharply increasing trend of 1949-51. So far this year industry has consumed about 600,000 tons more than last year, and domestic consumers seem to have bought about the same amount; but the coke ovens have taken three-quarters of a million tons more, with the growth in blast furnace output, and the electricity supply industry has increased its consumption by well over a million tons. The railways and the gas industry have been taking less coal, and direct purchases by the iron and steel industry have continued to fall. The major upturn in industrial activity did not come until the second half of this year, and capacity is probably not fully employed even today, so that demand for coal given average weather and a really high level of industrial output cannot yet be gauged. There have been some indications that industry is taking fuel efficiency rather more seriously, and some millions of "improved grates" have been installed with no appreciable effect upon coal consumption in the home. But with exports once again cut back to a level of about 13 million tons for this year, it seems certain that the coal industry, at least, need have no misgivings for the moment about demand.

Steel Prices Switched

GOVERNMENT control of the maximum prices of iron and steel products was this week formally brought to an end; and "determination" by the Iron and Steel Board of the maximum prices to be charged by iron and steel producers was formally brought into being. The products concerned, and the prices (in 22 "related schedules" instead of about 60) remained almost without exception the same. These are maximum home prices; there is no control of export prices, though heavy steel exports are co-ordinated by one of the British Iron and Steel Federation's central agencies, while exports of rails and tinplate are co-ordinated by conferences within the federation. The board, incidentally, has no power over the price of iron and steel scrap, since the industries over which it exercises supervision are mainly concerned with buying scrap, not selling it; so the Government has kept in being its existing order fixing the price of home-bought scrap. The change for the moment, therefore, is largely one of names; a number of the people who were concerned with the control of steel prices in the Ministry of Supply's Iron and Steel Division have similar responsibilities in the new organisation. It may be noted that the board is publishing its price schedules, whereas the Government used merely to "deposit" them for inspection.

The first edition is weighty rather than exciting.

Prices for the moment seem likely to constitute the board's main practical responsibility, though its final scrutiny of development projects will presumably also require regular attention from the members and some continuing staff work. Certain other responsibilities, such as statistics, are for the present being left mainly with the Steel Federation, which has an elaborate and highly effective department doing the job; and in general the board is working through the existing channels of the trade associations.

A fresh approach to the whole price structure of iron and steel products in Britain is certainly overdue, though in the last 18 months some of the main anomalies in these prices have been ironed out. As to personnel, the board is perhaps uniquely qualified to undertake this. It has as yet still to establish itself—and its real position—within the industry, and its eventual sphere of influence remains a matter for delicate conjecture. But a thorough investigation of steel pricing—and some re-thinking of the principles that for years have governed the industry's pricing—would do more to establish it as a going concern in British steel than any careful manoeuvre for position.

Textiles—Tax and Tactics

LANCASHIRE'S well-known views on the "D" scheme and the incidence of purchase tax provide the back-cloth for a forceful exhibition that the cotton and rayon industries put on in London this week. The Christmas message that the exhibition is designed to convey is that the "D" scheme of taxation distorts the normal pattern of trade, to the detriment of the export business. With the exception of certain linen and heavy furnishing fabrics, cloths containing less than 15 per cent of wool, regardless of their other fibre content, are not subject to purchase tax so long as their wholesale price is below 4s. a yard. Any excess over 4s. attracts purchase tax at the standard rate of 25 per cent for made-up garments and 50 per cent for piece goods. Since the home trade is generally reluctant to buy goods carrying any tax at all, Lancashire's argument goes, manufacturers are obliged to contrive their quality in order to sell below the "D" figure of 4s., and such cloths will not sell abroad. Similarly, if it becomes necessary to sell on the home market the balance of cloth specially designed for export, the impact of purchase tax affects the home demand; for this reason certain export lines are being taken out of production. The exhibition provides material evidence in support of these arguments.

Many people in Lancashire, however, would be prepared to admit what the retail trade has maintained all along—that the retail customer is no longer aware of the incidence or the absence of purchase tax since the "D" scheme was introduced. But they argue that traders in the distribution chain between the mills and the final consumer show an incurable prejudice against carrying stocks of taxed goods; they are, it is said, mortally afraid of being caught for a second time with taxed stocks on their hands at budget time. This fear is becoming an obsession; orders are cancelled and consignments returned whenever the trader sees his stocks rising. The recent mild weather is causing them to rise considerably and it would not be surprising

if the consumer trades went through a distinct recession during the first quarter of 1954.

Lancashire's policy has been to ask for the removal of purchase tax on all textiles; but there are signs that the industry has now come so to dislike the present purchase tax arrangements which it had eagerly approved two years ago that some of its members would be prepared to see purchase tax extended to all textiles, including those now tax free, if the "D" scheme could be dropped. If all traders' stock was taxed, it is said, there might not be the same incentive to concentrate on low-priced cloth. Whether the Government would find such a solution politically acceptable is very doubtful, for the "D" scheme, and the standards that were supposed to go with it, were a substitute for the outworn but still popular utility schemes. And it is difficult to believe that the wholesalers would warm to the idea of carrying stocks containing a larger burden of purchase tax than is now the case.

Stabilising the Tin Market

AFTER four weeks of discussions and bargaining in Geneva, the United Nations conference on tin has produced a draft agreement to stabilise the world tin market. The agreement follows the expected pattern. It would seek to regulate prices by taking any surplus of tin off the market through the operation of a buffer stock and controls over exports. The proposed floor price is £640 a ton and the ceiling price £880 a ton. If the price on the London metal exchange was within or above the upper third of this range, that is £800 to £880 a ton, the manager of the buffer stock would sell tin; he would buy when the price was within or below the lower third of £640 to £720 a ton. The implication of these prices is that the producing countries have given up hope of expanding the market for tin; for if the procedure succeeds in maintaining the long-term price within the "free" range of £720 to £800 a ton, the consumption of tin is more likely to decline than to grow.

The cost of financing of the buffer stock would quite rightly be borne by the producing countries. The maximum size of the stock would be 25,000 tons of metal and cash equivalent, and controls over exports would operate when the stock reached 10,000 tons of metal. Producers would be allocated export quotas in proportion to their output, but the agreement provides for 20 per cent of the quotas to be distributed annually to producers according to their efficiency; the distribution would be decided by a majority vote of producers and consumers. Though such an incentive is wholly admirable, it is not easy to see how relative efficiency can be measured when the ordinary standards of the market place are absent. The agreement is for five years, and will come into force after June 30, if ratified by countries with 90 per cent of the consumers' vote producers' vote and 33 per cent of the consumers' vote. In theory, this would enable the agreement to be introduced without ratification by the largest consuming country, the United States. But the agreement could not be effective without American participation, and the proposed range of prices may strain to breaking point such solicitude as the American Congress has for the welfare of tin producing countries.

Japan's Sterling Needs

THE Anglo-Japanese payments discussions noted in these columns last week are making slow progress. The Japanese still insist on treating their shortage of sterling as an essentially short-term problem. The latest evidence of this attitude is the news that Japan has bought a further £4,300,000 of sterling from the International Monetary Fund. This purchase brings the total amount of sterling secured by Japan from the IMF since last September to £22.3 million, a level at which Japan is getting very near to exhausting the whole of the facilities available to it at the Fund for the twelve months period ending next September. The Japanese conviction that the exhaustion of its sterling balances is a purely temporary phenomena is no doubt due to firm hopes that an expansion of Japanese exports to Commonwealth markets only awaits the touch of a magic wand from London. In the talks that are now in progress the Japanese delegates have in fact consistently pressed for more liberal treatment of Japanese goods by the sterling area, and especially by the colonial territories, where open discrimination is still being applied against them. On the other hand, the British delegates at these talks have pressed for more permanent measures to ease the Japanese shortage of sterling than a continuation of the recent expedients of sterling-dollar swaps and purchases of sterling from the IMF. It has been suggested that the time has come for some outright sales of dollars by Japan to this country, so as to liquidate the swap contracts as they mature. So far, however, these pleas have evoked little response from the Japanese. They contend that their present dollar surplus is no less ephemeral than their sterling shortage—and complain that in any case their accumulated dollar reserves are inadequate for their long-term needs.

Viscounts on the Counter

THE first Viscount airliner to be completed on Vickers-Armstrongs' new production line at Hurn was delivered to British European Airways this week. This marks a bold bid by Vickers to capitalise on the company's long lead in turbo-prop medium range airliners. The line at Hurn is capable of turning out 100 airliners a year, roughly £25 million worth, a rate of production that has rarely been equalled even in the United States. In a year's time, the Hurn factory should be turning out six Viscounts a month, and this will be stepped up to the full rate of eight a month if the orders justify doing so. The risk involved in this ambitious scheme lies in the fact that it is by no means certain that this volume of orders can be obtained. The company holds contracts for 86 Viscounts, and the purchase of 50 more is under discussion with various customers, though not all these talks will necessarily end in a contract. By building up the annual rate of production to at least 70 (six a month) and probably to 100 airliners a year, Vickers expects to guarantee any customer delivery of an individually modified aircraft within 18 months, and could probably sell a "standard" version almost off the counter were airliners bought in this way.

The potential world market for a medium-range airliner is probably in the region of 200 or more a year. But the attempt to capture so large a share of this market will involve Vickers in heavy capital expenditure. Tooling costs amount to a round £1 million. The working capital commitment which might run as high as £2 million in any month, will be financed partly by Vickers, partly by progress payments from customers who are usually expected to have put up on average at least 60 per cent of the purchase price by the time the aircraft is delivered.

The burden of tooling and of finding finance for work in progress is one that faces all British civil aircraft manufacturers who, like Vickers, are out to prove that British factories can turn out aircraft as fast, or indeed faster, than their competitors. First de Havilland, and now the Bristol Aeroplane Company, have arranged for additional capacity to be brought in to supplement output from the companies' parent factories; Bristol are obtaining this assistance from the Canadian company Canadair Ltd. Both Vickers and de Havilland are taking steps to build aircraft at a faster rate than the orders are coming in. One reason for such confidence in an industry that is not a particularly favourable one for risk-taking on this scale was contained in a speech made this week by Mr Masefield, chief executive of British European Airways, to the Manchester Statistical Society, when he listed new and more efficient aircraft as the main factor in what he considered to be the certainty that air fares would be further reduced. British European Airways, which is still far from breaking even, made a profit of nearly £400,000 on six months' operation of seven Viscounts, which have proved substantially cheaper to run than the rest of the Corporation's fleet.

A Cut in Gas Prices

THE East Midlands Gas Board may be a little optimistic in assuming that "a 5-10 per cent reduction in the fuel costs of goods and services generally might well go a long way towards . . . solving the country's economic problems," but it is nevertheless to be congratulated upon its own reductions in gas prices this week. The Board showed an operating surplus of £279,000 last year; its present reductions in prices for domestic consumers, plus concessions to industry made earlier this year, will cost some £160,000 annually, and it hopes to contain any rises in costs that may arise in the near future. Last year this Area Board was among the most prosperous in the industry. The average price of its gas and its total costs per therm of gas sold, were both lower than those of any other Area Board in the country except the Northern Gas Board. It did increase its prices by about 5 per cent in March this year following the 10 per cent increase in the price of coal; this week's and earlier reductions may broadly have restored prices to the level at the beginning of the year.

The reduction in this board's price is a reminder of the greater degree of local financial independence and decentralisation in the gas industry, in comparison with the other nationalised fuel industries. The area electricity boards have considerable financial independence, but, of course, buy the power they sell from the British Electricity Authority; the divisional boards in coal are essentially units

PLASTICS inspire new ideas

The trays used for food display in Lyons' tearooms, like all their equipment, are carefully selected and thoroughly tested. They must combine strength and durability with dainty and tasteful appearance. Economical to make, they must be easily cleaned and above

suspicion of affecting the food placed in contact with them.

Again the great virtue of plastics in providing wide combinations of properties is brought into play. Moulded from Cobex (rigid vinyl sheet), these trays fulfil all the demands made upon them and enhance the

appearance of window and self-service counter

So a BX Plastics material solves another problem, and our technical service is ready to go into action on your behalf if you will only give the opportunity.

MARKET INFORMATION SERVICES LIMITED

MARKET RESEARCH & PLANNING

Market Information Services Limited undertakes market research by means of sample surveys of every sort on any required scale. Its field of operation covers habits and characteristics, and public opinion. It has a fully qualified technical staff, its own force of field investigators, and the punched-card tabulating equipment and calculating machinery necessary for this type of work. It specialises in devising and applying new techniques for the solution of difficult problems.

Copywriter Wanted

Owing to expansion an exceptional opportunity now occurs for a man of outstanding ability to join our campaign-planning and copy department. Essential qualifications are some years of advertising copywriting experience, a good Honours Degree and much energy and versatility. Age about 38.

Salary will be matched to the talents of the applicant accepted and opportunities for further advancement will be excellent.

Candidates should write, stating their experience and qualifications, to:

General Manager
McCANN-ERICKSON ADVERTISING LTD.,
Brettenham House,
Lancaster Place, London, W.C.2.

of management and administration. The area gas boards on the other hand, are the responsible enterprises of nationalised gas, running their own businesses completely and merely making contributions to the central reserve and the current costs of the central Gas Council. High profits in particular mining areas, as in individual mines, have to be applied to assist unprofitable districts and mines, and prices are determined at the centre. In the gas industry, the principle of broadly covering costs, taking one year with another, implies price averaging across a region, not the whole country; and local consumers can get the benefit of local efficiency.

Extra Cement

TWO medium-sized cement plants, costing together about £5 million, are to be built by the Associated Portland Cement Manufacturers in Staffordshire and Wiltshire. The combined output of the two plants, each producing 175,000 tons a year, should make future imports of cement unnecessary. The industry has been supplementing home production by importing nearly 500,000 tons of high-cost cement from Europe, and selling it at the lower home market prices. This is, presumably, the justification for this new and costly venture, which will be about five times as expensive as the prewar plants, not to mention the still older installations that form the backbone of the industry. There is, however, little likelihood of any contraction in the industry's market, which is not entirely dependent on the rate of building in this country, and which could probably expand its export sales substantially.

Ghost Bankers at Westminster

SHADES of ancient controversies stalked through Parliament last week, during the debate on the Currency and Bank Notes Bill; and many of these eavesdropping wraiths must now be squirming in their graves. For the sins against the light of the old-style purists came last week not only from the currency cranks—Labour's well-known jokers on such issues—but from a Government that is itself the reviver of monetary orthodoxy, new style. Mr Boyd-Carpenter and his friends, having striven for a decade to destroy the wartime heresy that "money doesn't matter," are now saying in effect that currency still doesn't matter.

The old-style purist, the Financial Secretary pointed out, attached very great importance to the size of the fiduciary issue; but now "it is fairly generally realised that it has very little to do with the general broad questions of inflation or deflation. . . . The main function of the fiduciary issue today is . . . to ensure that sufficient notes are available for the practical convenience of the public." In one sense that is clearly true. Cases in the note issue are rather a consequence of inflation; and nobody would seriously suggest that a prudent or practicable way of arresting inflation would be for Parliament to reverse an increase in the fiduciary issue that had been outstanding for two

years—which is the power, and the only power, that Parliament will have restored to it by the new Bill (as a Note in these columns last week explained).

But the ghosts are still entitled to their squirmings, or some of them. Despite all the sophistication of modern lore on inflation, it still remains true that there is a fundamental link between the degree of inflation and the volume of money; and since the nation's currency habits are relatively stable, there is an even closer link between the total volume of money and the volume of currency, small change though it is. The existence of the Parliamentary sanction could be valuable and salutary, even though everyone might feel confident that Parliament would never dare to use it violently. The conditions of the early nineteen-thirties were very different from those of today, but it is still relevant to recall that the Government of the day took very good care to cancel the 1931 emergency increase in the fiduciary issue (it was a paltry £15 million increase) just before the two-year limit was reached. Parliament's performance in monetary debates is always poor, and invariably lets loose a spate of fallacies from the currency cranks; but perhaps that very fact makes governments shrink the more from submitting their monetary policies to the democratic test. The sanction is stronger in practice than it looks in theory.

Yet in last week's debate one might have thought at times that the sponsors of the Bill were the principal spokesmen of the Labour and Liberal parties; Mr Jay and Mr Grimond both put the practical issue forcibly and well, while Mr Boyd-Carpenter was quite needlessly apologetic. The Labour hobby-horses were, of course, duly taken for a ride, both by Mr Jay and the incorrigible Mr Norman Smith; but the Opposition's only point of substance was its objection that the annulment of a Treasury Order extending a fiduciary increase beyond two years could be moved in either House. This alleged attempt to give the Upper Chamber powers that might be used to frustrate the policies of a Government having a majority only in the Commons betrayed eager Mr Jay into a lapse from the convention about the "other place"—which must have given even graver pain to the writhing grey shapes.

Australia's Oil Strike

THE rate of flow reported from the well where oil was struck on the shores of Exmouth Gulf, West Australia, last week seems to have satisfied the Standard Oil Company of California that the deposits in the area will justify commercial exploitation. One well, of course, does not make an oil boom, but national excitement in Australia, where Canadian development has been watched enviously in recent years, can easily be appreciated. The West Australian Petroleum Company, which made the oil find, is controlled by Standard of California and Caltex (itself partly owned by the Standard company), which jointly own 80 per cent of its capital. The remaining 20 per cent is held by Ampol Exploration, a company formed early this year by the Australian company Ampol Petroleum to take over this holding. Hectic dealings in the shares of Ampol Exploration took place on Australian stock exchanges on Friday and Saturday last week, with the shares, which had stood

at 18s., jumping to well over £6. Early this week the shares soared even higher, but have since eased.

The sands in which this oil has been struck extend over a fairly large area, according to geological surveys, and both the company and the regional authorities are confident that there will be rich deposits to be tapped in the area. No storage or transport facilities exist at Learmouth, the point on the Gulf where the first well has been brought in. Eventually, it is suggested in West Australia, a floating pipeline system might be devised to take the oil out to tankers in the deepwater anchorage.

Expansion of Barclays (D.C. & O.)

THIS year's report of Barclays Bank (Dominion, Colonial and Overseas) is pleasing in more than its attractive production, which is colourfully unique among British banks. The bank's far-flung business through the Dominions and colonies might have been expected to have been adversely affected by the considerable decline in the prices of primary commodities; but in fact, in the year to September 30th last, its deposits rose from £440.9 million to a new record total of £455.5 million. Net profits were only slightly lower at £869,431 (compared with £879,888 in 1951-52), but the fall would have been a little larger but for the small decrease in the rate of taxation. The chairman, Mr Julian Crossley, indicates in his report that the depreciation sustained in the value of the bank's investments in the previous year had been "almost completely wiped out."

During the year, as Mr Crossley's survey showed, the bank has become still more widely diffused geographically. A further 75 new offices were opened, so that over 200 new branches have been established within two years—a truly remarkable expansion that has increased the number of offices of the bank by one-third. This new development has taken place mainly in Africa and the Caribbean; it includes the first banking business ever to be established in the island of Grand Cayman, in which the main industry appears to be the rearing of turtles. Several new offices were opened in the Sudan; the bank is understandably anxious lest political developments subject its business in that country to the same fate as that experienced in Eritrea—where the transfer from British to Ethiopian control forced the bank to close down its branches during the year. Inevitably, banking business in the areas served by Barclays (D.C. & O.) must carry a certain political risk; but if the politicians would seriously reflect upon the important role played by efficient banking services in these under-developed countries, they ought surely to strive to keep that particular risk to the minimum.

The bank's subsidiary, Barclays Overseas Development Corporation, has had a satisfactory year. Its business has expanded only moderately, but, thanks mainly to a strict check upon overhead costs, its net profit has risen sharply, from £40,531 in 1951-52 to £54,657. Last year's maiden dividend of 3 per cent has accordingly given place to a payment of 4 per cent for this year. This corporation is a good example of unspectacular but solid economic development; few economists will dispute Mr Crossley's claim that its work is "none the less valuable for being based upon a

spontaneous and local demand for finance rather than on external considerations." One pound lent to an African peasant for his own scheme may yield more than ten spent on Whitehall's groundnuts.

New Light on Savings

ANY scrap of information that adds to the existing scanty knowledge of the nation's savings habits should be welcomed, and the results of two useful surveys that have just been published deserve rather more attention than they have yet received. The first was undertaken by the Post Office to ascertain how long most people held their National Savings Certificates. It was found, on a sample of 10,000 applications for encashment, that whilst nearly 12 per cent of certificates were cashed within twelve months, no fewer than 53 per cent were held for their full ten-year life. Moreover, only slightly more than one-half of the certificates held to maturity were then cashed, and some of these encashments were presumably made in order to switch to the more attractive certificates that have been on offer for the last three years. These figures suggest that national savings constitute a surprisingly stable form of thrift.

A far more ambitious—if less authoritative—survey was undertaken by Mr Lydall of the Oxford Institute of Statistics* on the measurement of personal savings as a whole, the form that those savings take and their distribution among different sections of the population. Mr Lydall is dissatisfied with the official estimates of the volume of personal savings, and for two good reasons. First, they are a residual figure (arrived at by subtracting estimates of corporate and government finance from an estimate of total capital formation); secondly, they include certain items such as employers' contributions to pension funds and surpluses of insurance companies that are not personal saving in the generally accepted sense. He therefore attempted a direct estimate of personal savings by investigation of a sample of 2,600 cases, and has now classified his results into three types of personal savings—contractual savings (through life assurance, superannuation schemes or mortgage repayments), cash and other liquid assets, and "miscellaneous" saving (including stock exchange securities and the ploughing back of profits into personal businesses). His conclusion is that over 74 per cent of all "income units" participated in some form of contractual saving. He estimates contractual savings as a whole at nearly £400 million in 1951-52, or some 3 per cent of personal gross income; but this proportion measures the nation's savings habits rather than its thrift, for it was made possible only by large inroads into personal cash balances. Despite miscellaneous saving of £80 million, total saving amounted, on Mr Lydall's definitions, to a mere £90 million in 1951-52.

It is of course difficult to know just how much weight can be given to a survey of this type. Mr Lydall's definition differs from that of the Government's national income

* National Survey of Personal Incomes and Savings: Part IV, Personal Saving and Consumption Expenditure. By H. F. Lydall. Bulletin of the Oxford Institute of Statistics. October/November, 1953.

Two answers for the price of one

1 The result of each individual calculation is shown here. To add it to, or subtract it from, the amount in the top answer dial involves only one key depression. Either dial can be cleared independently, or both dials cleared together.

2 The final answer—grand total or net result—appears automatically here when all calculations are complete. No "recapping" needed.

The calculator that cuts out "recapping" can save up to 40% of an operator's time!

On routine figure-work, it is the calculating machine that gets to the final answer with the lowest number of intervening steps that reduces operating costs. That is why this Burroughs is equipped with two answer dials—one for results of individual calculations, and one for grand totals or net results. One key depression clears a result from the front dial, and accumulates it automatically in the rear dial. The operator can take a total or net result at any time without re-entering any figures, without any "recapping."

The savings in time (and cost!) are obvious. Whatever your problem—payroll, invoicing, stock records, analysis—you owe it to your business to let Burroughs show you how this speedy, all-electric machine (or any one of the wide range of Burroughs calculators) could be applied in your office. Call Burroughs today.

Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1. Sales and Service Offices in principal cities.

TWO FIRSTS!

Burroughs, always ahead in providing answers to figuring problems, were the first to introduce an all-electric calculator, and the first also to make a Duplex calculator, giving direct subtraction.

Count on **Burroughs**

for straight answers

The COST of ELECTRICITY

BRITAIN HAS MORE electrical generating plant than it has ever had before; there is more electricity for everyone.

Britain's demand for electricity is also greater than it has ever been before; the factories, the farms, the homes and the offices are using more electricity—and asking for still more.

To meet these needs, British Electricity has achieved new records of construction each year. But the plant is giving full output only for short periods once or twice a day. Continuous full operation would reduce the cost of electricity production.

The most effective way to obtain more economical electricity generation is to expand the use of electricity for all purposes—in the home as well as in the factories, in office buildings and on the farms, and for street lighting.

ELECTRICITY

PROSPERITY

SHIP'S PLATE

"It'll sink," they said, when the first iron ship was launched. But it didn't.

Iron was eventually superseded by steel for ship construction and today in shipbuilding more steel plates are used than in any other industry. Usage of steel plate in other directions is, however, developing fast. Since the war, nearly all railway wagons have been largely built of steel plate. The movement and storage of oil calls for immense quantities for storage tanks, pipe lines, road and rail tankers and tanker ships. Tanker ships, which require proportionately more plates than other ships, now form about 50 per cent of our shipbuilding output.

These are some of the reasons for the great rise in the demand for plates and why production has been increased from 1,633,000 tons in 1946 to at least 2,400,000 tons in 1953.

STEEL is at your service

THE BRITISH IRON AND STEEL FEDERATION 563

statisticians; but, if adjusted to the official definition, his estimate of total savings exceeds the estimate in this year's Blue Book by about a third—but that is not a very large difference by the standards of the official statisticians' own perennial revisions. In any case, Mr Lydall's survey should help to give perspective to analyses of savings habits. The role of the lower and middle income groups in the nation's savings must be measured, for example, not by the sum of their insurance contributions, mortgage repayments and the like, but by their net saving—and this Mr Lydall found to be actually negative for gross incomes below £600 a year. Mr Lydall points out that these estimates, like the official ones, rely upon an arbitrary classification of expenditure; for example, outlays on new houses are "saving" but those on new motor cars or furniture are "consumption." Mr Lydall in fact found what common sense already suggested—that there is a strong inverse correlation between "saving" in this sense and expenditure on durable goods.

Wood Pulp Higher Again

PRICES of most grades of Scandinavian wood pulp will be increased by £3 a ton or more for shipments in the first quarter of next year. Such an increase, following one of the same amount in the quarter now ending, is as much a reflection of the continued strength of demand from the paper-making industries in Britain and on the Continent as of the higher prices for logs this season. The Swedish producers have announced an average increase of £3 a ton, some Norwegians are expected to ask about £1 a ton more, and Finnish prices also appear to be above the Swedish level. For bleached sulphite pulp, which is used in the manufacture of fine grades of paper, the Swedes are quoting about £56 a ton, c.i.f. East Coast ports, and for kraft pulp, which is used for making bags and light board, about £42 a ton. The price of bleached rayon pulp, which was not raised in the fourth quarter, is £2 10s. higher at £67 10s. a ton. Mechanical pulp, the basis of newsprint, will remain unchanged in the first six months of 1954 at £27 10s. a dry ton from all Scandinavian producers. Strong sulphite pulp of newsprint quality is £3 higher at about £45 a ton, and this was presumably taken into account when the price of home-produced newsprint in the first half of next year was recently raised by £1 to £51 10s.

Although the new prices of pulp are not popular with British buyers, a good deal of business has already been done. Their effect will be lessened by the fact that only limited quantities of pulp can be shipped from the Baltic when the ports are mostly frozen up. The increase in Scandinavian prices as a whole may nevertheless lead to higher prices for paper, but the small increase in rayon pulp is unlikely to affect the price of yarn. The new levels may also encourage competition in European markets from American producers, who are already finding it difficult to dispose of all their output of rayon pulp on the home market. If these prices are maintained in the second quarter, the Scandinavians will sell a smaller volume of pulp to Britain, their largest market, in the first half of next year. Imports from Scandinavian and North American sources are still limited by licence, and the total value of these licences in the next six months has been slightly reduced by £500,000 to £28,173,000 c.i.f.

Breaking Plywood's Bonds

THE plywood trade is becoming increasingly concerned at the delay in restoring its freedom to import. The reason for the delay is familiar; the Ministry of Materials holds a stock of plywood of some 80 million square feet, worth about £1½ million. This stock has been run down from nearly 400 million at the beginning of this year by a technique analogous to the rightly criticised "condition of sale." Import licences have been issued only on condition that the importer bought a proportionate amount from the Ministry's stocks. For the more desirable specifications of plywood held by the Ministry the present ratio is one to every two of private imports, in terms of value, and for the less desirable it is one to four. The balance of the stock, however, is largely composed of qualities for which there is very little demand at present prices. Meanwhile there is a shortage of certain types of plywood in Britain, and though this is now easing because supplies from Finland and other countries are coming through more quickly, it may reappear in the New Year.

The Minister of Materials, Lord Woolton, has said that he might look more favourably on the trade's plea for freedom if it would take the remaining stock off his hands, and the trade is trying to frame a suitable scheme. It may suggest that the leading importers arrange to take the bulk of the stock, say, 50 million square feet, within three months, if they are offered an inducement in the form of lower prices and a higher ratio of import licences. These importers would no doubt insist that they should be given a few months to dispose of their purchases from the Ministry before imports from all sources other than the dollar area were returned to open general licence. Though this would still leave the Ministry with about 30 million feet of low-grade stock on its hands for a year or more, there is a rough justice in the suggestion that may appeal to Lord Woolton. The present system can hardly be more palatable to him than it is to the trade.

Too Costly a Hedge?

THE low level of futures prices in London relative to the actual prices of wool tops in Bradford, and the large discount on the distant delivery months has led to some criticism of the market. The December position recovered to about 147d. a lb this week, following the steadier trend of raw wool prices; the July position rose to 135d. and December, 1954, to 129½d. A sale of futures in these months would therefore cost a seller 12d. or 17½d. respectively, assuming that the price of the current month had not changed when he came to buy back these hedges just before maturity. In the opinion of some top-makers and woollen manufacturers the discount is greater than is justified by the outlook for raw wool prices and represents too heavy a price to pay for covering against the risk of a fall.

Some topmakers also complain that the low level of futures prices tends to influence the price that buyers of actual tops are willing to pay for forward deliveries, and

that their system of covering purchases of raw wool by forward sales of tops may be impaired. The future course of raw wool prices alone will determine whether the discount on futures in the London market is too great. It has recently narrowed slightly and now compares more closely with that in the other markets. Nevertheless the present position remains very favourable to a buying hedge, and if this encourages more speculative or hedge buying the discount may narrow further.

SHORTER NOTES

The General Services Administration is to reduce its sales of low-grade natural rubber from the American stockpile from about 10,000 tons a month to 5,000 tons. Existing contracts for sales in excess of 5,000 tons will be honoured up to the end of March. American manufacturers will then have to obtain about half of their requirements of these grades from the market, and this should strengthen prices.

Of the \$35 million recently given to Britain for purchases of American commodities under the ordinary provisions of the Mutual Security Act, \$20 million is for raw cotton. Previous allotments have been taken up by the Raw Cotton Commission, but arrangements are now being made for this cotton to be imported privately. Britain has also been allotted another \$20 million for purchases of surplus commodities under section 550 of the Act; \$5 million of this is for prunes. Allotments under this section

now total \$40 million. Negotiations are continuing for the sale of other commodities up to the initial "target" figure of some \$65 million.

Shareholders of Telephone Properties were shocked to learn this week that the \$7.1 million due to be received from the Venezuela Government over the next few years in payment for its purchase of the company's properties in that country will not be disbursed in the form of a partial return of capital. The board, headed by Sir Alexander Roger, proposes to "continue the business in its present form." Since this announcement the £1 ordinary units have slumped from 5½ to 4½—which sufficiently demonstrates that shareholders would rather re-invest these proceeds elsewhere themselves than leave them to swell the responsibilities of the board.

The very considerable flow of labour back into the engineering industries in the early autumn appears to have continued at an undiminished rate in October. During the month the labour force in the "engineering, metal goods and precision instruments" group of industries rose by 16,000, and the vehicles group added another 6,000. Since July employment in these groups has risen by 72,000; this has wiped out the fall since October last year in the engineering group, while employment in the vehicle industries is now 33,000 higher than twelve months ago.

whereby five subsidiaries now carry on entirely the various sections of the group's manufacturing and trading activities. As a consequence of these measures a substantial reduction in taxation liability was expected, and the latest report, for the year

units down 4½d. to 32s. 9d., so that on the new dividend they offer the blue chip yield of £5 9s. 11d. per cent—as much as 2 per cent lower than the return obtainable on many "county" brewery shares.

JOSHUA HOYLE. During the past year, a considerable decentralisation of the Joshua Hoyle group has taken place,

Company Notes

ARTHUR GUINNESS. The recent dividend increases from the brewery companies had encouraged investors in their confident expectation that Guinness would in turn raise its ordinary distribution; the 10s. ordinary stock units had been steadily rising in anticipation of such an increase until in the last fortnight they had been bumping along near their highest level for the year. Hopes have not been dashed; last weekend the directors announced that, following an advance in trading profits from £5,424,049 to £5,681,948, the total equity dividend for the year to September 30th last would be 18 per cent, compared with 17 per cent for 1951-52. This dividend together with payments on the preference stock absorbs £1,303,500 and is paid out of net profits of £1,860,200; despite the further increase in taxation (from £2,908,248 to £3,045,547) these net profits are £176,771 more than those earned in 1951-52.

It seems clear from these figures that Guinness—one of the pioneers of national advertising, which is now a common policy among the leading brewers of bottled beers—has benefited not only from the preference that consumers are now showing for bottled beers over draught, but also

there are credits of £189,104 from EPT repaid, and of £53,970 for EPT Post War Refund. Consequently, although the group's trading profit shows a sharp drop from £1,031,245 to £704,407, its net profit, after providing £485,000 (against £524,400) for current taxation is approximately trebled at £1,254,465 compared with £417,852 in 1951-52. The ordinary dividend is maintained at 15 per cent, and the allocation to General Reserve increased from £350,000 to £400,000. This total impression is rather rosier than the trading figures above would suggest; on the fall in trading profits, the report contains no supplementary information, and in the absence of a chairman's statement, a reasoned appreciation of the trading is not easy; some shareholders might have expected something better than a 30 per cent fall in profits in view of the marked recovery of activity in the textile industries this year. Improvements may be noted in net current assets and cash, also some easing of the stock burden which last year was heavy enough to cause some concern. At their present price of around 3s. 9d., the 2s. ordinary shares yield £8 per cent.

MORE BREWERY PROFITS. A further batch of brewery profits and dividends is summarised in the table below. In most cases, net profits after

tax are fairly comfortably up on last year, and shareholders have enjoyed some share of the recovery. Wolverhampton and Dudley provides a particular exception, for it reports a drop from £244,741 to £239,103 in net profit, but raises the ordinary dividend comparatively generously from 17 per cent to 20 per cent; no doubt the reasons for this generosity will be clarified in the forthcoming report. Among other companies that have followed a more liberal dividend policy is the Blackburn firm of Matthew Brown, who are paying 14 per cent on their new capital as against an equivalent rate of 11 3/7 per cent for the previous year. Dividend increases are also announced by Bristol Brewery Georges and by Leeds and Wakefield. In the case of Mann and Crossman, however, a cautious policy has been pursued: net profits rose from £148,376 to £167,550, but the dividend (£110,000 net) was maintained at 20 per cent, and £60,000 (against £44,000) was placed to reserves at some slight expense to the carry-forward. The dividends of Hammonds United and H. and G. Simonds were also unchanged, causing a substantial drop in the market price of the shares. The wide divergences between the yields shown by this selection of shares are of interest, but market opinion rightly has regard to local factors in the valuation of brewery shares.

LONDON STOCK EXCHANGE

Next Account begins: December 30th.
Next Contango Day: December 30th.
Next Settlement Day: December 15th.

THE subdued tone prevailing at the end of last week has on the whole continued, apart from some scattered activity, mainly in shares affected by "take-over" news or on which increased dividends have been announced. Gilt-edged started the present week in a dull mood following the announcement of the £10 million New Zealand Government issue, and prices drifted gradually downwards, particularly on Tuesday, when falls of ¼ per cent were fairly general throughout the list. A steadier tendency appeared by mid-week, but not to an extent that could be described as a rally.

In the industrial market all else has been overshadowed by Monday's frenzied dealings in Savoy Hotel shares, which fluctuated between 44s. and 62s., to close at 58s. 6d. By Wednesday's close the price had fallen to 52s. 6d., but fresh activity developed on Thursday morning, pushing the price back to 58s. 6d., though there was a reaction to 55s. 9d. Elsewhere in the industrial market, price changes in the main sections have been generally downwards, though English Sewing Cotton were a bright spot, spurring 6s. 6d. to 59s. 6d. following the forecast of a 20 per cent dividend for the current year and the announcement of a one-for-one scrip issue. On the other hand, the market received an unpleasant shock from the announcement on Tuesday that shareholders in Telephone Properties would receive no cash distribution. The shares promptly slumped 36s. 3d. to 77s. 6d. before recovering to 83s. 9d.

The opening of the three-week account on Wednesday for the first settlement day of 1954 witnessed a general relapse in industrial equities; the *Financial Times* industrial ordinary share index fell to 127.1; its lowest since October 14th, and comparing with 128.0 a week previously.

In other sections of the market, oils have attracted some interest, particularly Apex, following the increased dividend. Kaffirs have been mainly quiet, apart from some mild demand for uranium issues. Rhodesian Coppers have been featureless, though the undertone has been firm.

⁽¹⁾ Petroleum production in Canada in 1938 and 1951 includes natural gasoline. Annual figures of electricity production in Australia are for 12 months ended June 30th of year stated and for New Zealand 12 months beginning April 1st; monthly figures for New Zealand represent about 87 per cent of total generation. ⁽²⁾ Copper production is smelter; tin is primary metal. ⁽³⁾ General trade (including re-exports) except for Canada, which is special trade only. Imports are c.i.f. except for Australia, Canada and S. Africa which are f.o.b.; exports are f.o.b. Trade for India and Pakistan includes that going by land; annual figures for India are for 12 months beginning April 1st of year stated and for Australia and Pakistan 12 months ended June 30th. ⁽⁴⁾ Gold and foreign exchange holdings are those of the government and central bank; only figures for Australia include holdings of commercial banks. Cost of living for Pakistan is based on 12 months ended March, 1949, as 100 for S. Africa relates to Europeans only. ⁽⁵⁾ Average of second quarter.

EXCHEQUER RETURNS

For the week ended December 5th there was an "above-line" deficit (after allowing for Sinking Funds) of £44,569,000 compared with a deficit of £7,422,000 in the previous week and a deficit of £24,243,000 in the corresponding period last year, bringing the cumulative deficit to £408,591,000 (£423,709,000 in 1952-53). Net expenditure "below-line" absorbed £3,128,000, bringing the total cumulative deficit to £690,840,000 (£797,304,000 in 1952-53).

* In consequence of official purchases of tender bills in connection with cash subscriptions to the new Exchequer stock, it is impossible to calculate the division between tap and tender bills until all the bills purchased have passed their original maturity date.

Financial Statistics

THE MONEY MARKET

LOMBARD STREET has had yet another comfortable week; it is, indeed, some time since it had to face any general stringency. On every day of the week covered by Wednesday's Bank return, credit supplies were adequate for the market's needs, without the aid of official purchases; and, except on Saturday and Wednesday, the authorities actually found it necessary to mop up surplus credit by selling bills. Outside loans against bonds were at times available down to 1½ per cent. Throughout the week, late January maturities changed hands at 2½ per cent and February maturities at 2½ per cent.

Despite the easy credit conditions, the market at last week's Treasury bill tender again refrained from raising its bid. However, as the offer was up by £10 million to £250 million, whilst applications rose by only £5½ million to £374 million, the market's allotment rose from 50 to 55 per cent. At yesterday's tender, the bill offer remained at £250 million.

The Bank return shows the heavy seasonal outflow of notes of £31.4 million, but this was only fractionally more than that for the equivalent week of last year; the rise in the active circulation since the seasonal low point in mid-October is, at £67 million, still slightly lower than the outflow of £69 million in the corresponding period of 1952. Government securities in the banking department rose by £18.2 million despite the fall of £11.7 million in the Treasury special account, so that the effective release of credit under this head was almost £30 million, but public accounts rose by £4.9 million, so that bankers' deposits fell by only £3.1 million.

BARCLAYS BANK (DOMINION, COLONIAL AND OVERSEAS)

EFFECT OF LOWER PRICES

The twenty-eighth ordinary general meeting of Barclays Bank (Dominion, Colonial and Overseas) will be held on December 29th in London. The following are extracts from the circulated statement of the chairman, Mr J. S. Crossley:

During our last financial year, which ended on September 30th, we opened 75 new offices in different parts of the world. Your business is still a "live" one and the range and scope of its activities are not diminishing.

Turning to the balance sheet, the variations which are reflected here do not give the impression that any marked change has taken place in the Bank's position, in spite of the fluctuations in commodity prices and interest rates which we have witnessed in the past twelve months. Although deposits have increased and stand at the highest figure we have so far recorded, the items represented by cash and money at call still exceed 20 per cent of the Bank's total liabilities to the public.

ALLOCATIONS FROM PROFITS

Turning now to the profit and loss account, I suggested last year that the lower prices then ruling for the staple export products of so many of the territories served by the Bank must adversely affect our results. The actual decline in the net profit shown would, however, have been more marked had it not been for a slight, but welcome, decrease in the rate of tax payable. We have transferred £150,000 to premises reserve account and £300,000 to the reserve fund. The latter amount has been supplemented by £200,000 which we have been able to release from contingency account, being provision no longer required. After effecting these transfers our reserve fund stands at £8 million.

You will notice the reduction in the figure for acceptances, etc., which is to some extent a reflection of the lower prices. The financing of the exports of these commodities during the year just past has brought us less profit.

THE OUTLOOK

If it was difficult last year to predict the course of events with any confidence, the task today is still more formidable. I suggested that we might look back on 1952 as a turning point marking approximately the end of the sellers' market, which had dominated postwar conditions. It is true that many prices have fallen, and some appear to have reached stability at the lower levels now ruling; some again seem to be recovering, while others still are falling. There is no longer any pronounced general trend in a particular direction. Superimposed upon this striking change in the economic climate, however, there has recently been some change in the political climate also, and the one reacts upon the other. Strange and wrong though it may seem, there is no doubt that the lessening of international tension, however slight and whether justified or not, has recently been the cause of market uncertainty, which in its turn has created some anxiety. It is against this background of uncertainty that our policies now have to be considered.

During the past twelve months, the change in our course has become clearer to see.

Little by little, those physical controls which were the inheritance from the war period are being abolished. More flexibility has been introduced, and the breath of freedom has begun to fill our sails. Let there be no mistake about it, this is an immeasurable gain. We may hope, too, that it is an earnest of more to come.

There may be a tendency to forget that we now have, increasingly, to think and act for ourselves, and to use any talents that we may possess to the best advantage. It is an ironical thought that some of those who were crying the loudest for the abolition of controls may feel somewhat lost without them. If this is a consequence of having been controlled for so long, then it is high time we learned to use our freedom again and to remember that governmental action cannot be expected to do more than create conditions favourable to the development of human industry and enterprise.

NEED FOR ECONOMIES

A beginning has been made in the great task of re-creating these conditions, but it is only a beginning. We still hear far too little about the real economies which are essential in order that taxation may be reduced to a reasonable level. The present level is not reasonable and cannot be sustained indefinitely without disaster. Under our present system it is having the effect of eroding our assets at home and also overseas where companies subject to United Kingdom tax suffer a damaging handicap; and so our vitality is being sapped.

Unless we economise, so as to make room for real saving, we shall not have capital for investment, which means in its turn that we shall be unable to find the resources which are needed for Empire development overseas. This shortage of capital is a crucial matter arising from the fact that we are spending more than we can afford, or, in other words, consuming too much of our production as we go along.

CONVERTIBILITY

Finally, I would say one brief word on a subject which is, perhaps, the most important, and certainly one of the most discussed topics of the day. We have to find a means of achieving a state of affairs in which the great trading area, based on the pound, can work freely with the other great trading area, based on the dollar. Much has been said and written on the subject of convertibility. Although the extent of the reserves that would be needed to bring this about is an important consideration, it is by no means the only one. It seems to me that the arguments have centred too exclusively on this point. We must not forget that whatever figure our reserves might reach, or however large the credits that might be arranged, they will certainly prove inadequate unless the underlying policies are sound. If the two areas follow mutually incompatible policies, based on faulty economics, no truly effective "arrangement" will ever be possible between them. On the other hand, if they were to be founded on mutual trust and a real understanding of the basic principles of trade, then I believe "convertibility" could not only be achieved, but achieved soon.

BANK OF MONTREAL

RECORD FIGURES

The one hundred and thirty-sixth annual general meeting of the Bank of Montreal was held on December 7th in Montreal.

Mr Gordon R. Ball, the president, in the course of his speech, said:

Broadly, it has been another year of expanding activity. But it must also be said that the business landscape has begun to show a more varied pattern of light and shade. Some industries, particularly those dependent on export markets, have been encountering difficulties. Competition has been keener, both in domestic and international trade. In brief, we seem to have passed from a situation in which nearly all business influences were buoyant to one in which the normal hazards of enterprise are once more apparent.

Looking abroad, the year has been featured by a number of welcome developments. There has been some easing of international tension, although whether that betokens a break in the weather or the deceptive calm before another squall remains to be seen.

A particularly welcome move in Anglo-Canadian financial relationships has been the revision of arrangements for repayment of the balance of the interest-free loan made by Canada to the United Kingdom in 1942.

The real measure of improvement that has taken place in the sphere of international trade and finance during the past year presents for the countries of the free world a great opportunity for further bold advances towards closer and freer trading relationships and thus towards more intensive and economic use of resources. It would be tragic if, just at the time when the military and political defences of nations of goodwill were being strengthened, the economic gains of the recent past were to be lost.

It is up to all of us, in all countries, who stand with private enterprise, to demonstrate here and now that the system that we rightly believe produces most and contributes most fully to well-being does not inevitably beget periods of slump and mass unemployment. It is a time that places particular demands on the analytical ability and common sense of our branch managers and other officers who are daily confronted with the requests of borrowers large and small. Our definition of "constructive" assistance does not include the financing of projects where the basic fundamentals of credit-worthiness appear to be lacking.

I am confident that the Bank of Montreal, 136 years young, will continue in the forefront of constructive endeavour.

GENERAL MANAGER'S REMARKS

Mr Arthur C. Jensen, general manager, in the course of his remarks, said: The past year has been one of continued growth and total year-end assets, loans, and deposits are at a new high level. Our profits also are greater than in any previous year. Our net profits amounted to \$7,042,676. Out of this \$5,040,000 has been allocated to dividends; equivalent to \$1.40 per share, which compares with \$1.25 declared last year. Our total assets have reached the figure of \$2,364 million, \$78 million higher than a year ago.

At the end of the fiscal year our total deposits amounted to \$2,227 million, an increase of \$79 million. Our total current loans at the end of the year stood at \$737 million, compared with \$663 million. Whatever the coming year may have in store, it is worth emphasising that there is as yet scant evidence of any general or sharp downturn in the pace of business.

The report and accounts were adopted.

CROMPTON PARKINSON LIMITED

CHAIRMAN'S SPEECH

IMPROVED PRODUCTIVITY AND EFFICIENCY

INCREASED DISTRIBUTIONS

The fortieth annual general meeting of Crompton Parkinson Limited was held in London on December 11th. The following is an extract from the speech of Mr Albert Parkinson, MBE (the chairman), which had been circulated with the accounts:

The decline in demand to which I referred a year ago continued, intensified and extended in scope to almost all our products and, in parallel with this recession, the productivity and efficiency of our operations increased, with the result that the pool of orders in hand has been considerably reduced during the year. In most sections of the business the recession of demand had ceased by the end of the year and in some sections there has been a modest recovery.

The reduction in demand which affected us also affected our suppliers, with the beneficial result that materials and parts became more readily available, thus enabling us to effect both a reduction and a better balance in our stocks which, in turn, largely contributed to our improved productivity and efficiency and at the same time reacted favourably on our liquid position.

The further increase of over £220,000 in the surplus from trading achieved during the past year is highly gratifying, particularly when it is realised that the latest year's figure is arrived at after deducting £135,695 distributed as a special bonus to the employees.

It is proposed to repeat the annual allocation of £10,000 to the Central Benevolent Fund, and this amount, together with the net dividends paid and recommended by your directors, absorbs £374,086, leaving £224,324 to be added to the unallocated revenue reserves of the parent company which gain a further addition of £136,501 from provisions no longer required and profits relating to previous periods now realised and brought into account.

Our cash position has improved by well over two-and-a-quarter million pounds; a result made possible by reduction of stock-in-trade and work-in-progress of just over £1,250,000 combined with a continuance of that conservative policy of accounting and finance we have adopted and retained for so many years.

DISTRIBUTION POLICY

Your directors consider the much improved results of the past year's operations justify a substantial increase in the amount to be distributed to the stockholders and they recommend that the total distribution on the ordinary stock out of the profits of the year shall be 20 per cent.

For the past ten years our total annual equity distribution has been at the rate of 11½ per cent (or its equivalent) divided as to 3½ per cent interim dividend, 3½ per cent final dividend and 3½ per cent special cash bonus. At the time this method of dividing the total cash distribution was adopted many years ago, its purpose was to permit a variation from year to year of the total distribution by a variation of the special cash bonus, thus leaving the interim and final dividends unaffected in any but very special circumstances.

Your directors still find merit in this method, and, having already declared an interim dividend of 5 per cent, now recommend that the remaining 15 per cent be

divided as to 7½ per cent in the form of a final dividend and 7½ per cent as a special cash bonus.

While, as stated above, your directors still think a conservative policy is the right one to follow in your company, they intend that the special cash bonus shall, in the future, fulfil the purpose originally intended.

OVERSEAS

We have continued our policy of close personal contact by visits to many parts of the world, from China and Japan in the Far East to the USA and Canada in the west and from Scandinavia and USSR in the north, to Australia and New Zealand in the south.

The manufacturing operations of our overseas factories have been further developed during the year.

We have constantly in mind the great importance of overseas trade to our country, not only in the form of exports of the technical engineering products that form such a large part of our home manufactures, but in helping to develop the resources of other countries so that they may improve the standards of their peoples and thus create expanding markets for manufactured goods of all kinds.

EMPLOYEES

The results could not have been achieved without the skill, initiative and devotion of a large number of our executive and administrative employees who have worked together under their respective leaders with such gratifying results.

Although we do not operate a formal profit-sharing scheme, it has long been your board's policy to recognise the all-important part played by employees of every grade in the fortunes of the company by adjusting the bonus rates of hourly-rated employees and the payment of an annual bonus to the staff.

In past years these adjustments have not merited special mention, but this year their total is substantial and I thought it desirable to call your attention to this special feature of your company's policy and to add that, in similar circumstances, your board would welcome the opportunity to make corresponding adjustments in the future.

THE FUTURE

I have been chairman of your board throughout most of the postwar years—years that have brought new problems and ever-changing conditions. Yet never before have I found the short-term outlook so difficult to assess, but the long-term view is very encouraging.

We started the current financial year with a total order book less than at the beginning of the previous year and in some sections of our business it was deplorably small. I believe similar difficulties are being experienced throughout the electrical industry and in consequence order-getting has become a more formidable task. On the other hand, the flow of orders has recently improved and the average efficiency of our manufacturing and marketing operations is greater than ever. I can only describe your board's view of the immediate future as one of restrained optimism.

THE ENGLISH, SCOTTISH & AUSTRALIAN BANK LIMITED

A SATISFACTORY RESULT

The sixty-first annual general meeting of The English, Scottish and Australian Bank, Ltd., was held on December 9th, in London. The Hon David F. Brand, chairman, presiding.

The following is an extract from his statement circulated with the report and accounts for the year to June 30, 1953:

At the time my report was issued last year, Australia had started to recover from the temporary financial and economic difficulties which she had met mainly on account of her spending having risen to a level higher than her income and resources justified. The Commonwealth's international trading results, having deteriorated from a handsome export surplus to a substantial deficiency, were improving as the value and volume of imports fell, partly because of Government-imposed import restrictions, and partly as a natural reaction of satiated markets. This process of recovery continued through the year, thanks to good prices for exports and to favourable weather conditions for agricultural and pastoral products.

GENERAL RESERVE

The share capital and reserves have increased over the year by £1 million as the result of your board's decision to transfer that sum to general reserve from contingencies reserve. This operation brings the general reserve to a figure equivalent to the paid-up capital and restores the position which existed prior to 1931, when it became necessary to deplete the reserve in order to meet the loss incurred when the Australian £ was devalued by 20 per cent.

Deposits, current accounts, etc., increased over the year by nearly £4,600,000 to a total of £104,810,000, reversing the evidence of contraction shown in last year's figures. Advances have fallen by nearly £14 million, demonstrating the return to conditions of normal demand for credit.

ALLOCATION OF PROFIT

The gross profit for the year was £253,000 higher than last year and expenses of management required an additional £247,000. After charging directors' and audit fees and taxation, the net profit was £253,873 or £16,353 better than the previous year. A similar appropriation as last year, £45,000, has been made to the Officers' Provident Fund. If the directors' recommendation is approved, the cost of dividends for the year will be £204,375, which includes the special centenary interim dividend of £39,375. After these appropriations there will be a balance of profit of £4,498, which with the amount brought forward will make the total of the profit and loss account £372,449.

During the past several months your board has had under consideration the development of a department of the bank to supply hire-purchase finance to assist the people of Australia in acquiring the necessities of the home and of their everyday life. There has been more demand for this type of finance than existing sources have been able to provide. It was felt that under current conditions in Australia, with its rapidly expanding economy, development in this sphere was a proper function for your bank. All customers of the bank can rest assured that this development will in no wise affect the bank's readiness and ability to provide normal banking facilities for them.

The report was adopted.

THE CRITTALL MANUFACTURING COMPANY

POLICY OF SUPPORTING PRICE REDUCTIONS
HIGHER COSTS OFFSET BY GREATER EFFICIENCY

LORD BRAINTREE'S REVIEW

The twenty-ninth annual general meeting of The Crittall Manufacturing Company Limited was held on December 9th at Manor Works, Braintree, Essex.

Lord Braintree (the chairman) presided and, in the course of his speech, said: The trading profits of the Group for the year, after all charges but subject to taxation, amounted to £729,257, a reduction of £89,522 compared with last year's record figure. Whilst during the earlier months of the year the parent company was trading at an even higher rate than the average for the previous year, there was subsequently a falling off in business, with the result that the previous year's total volume was just about maintained. Whilst the National Building Programme progressed during that period, the recession in business was the result of a long period of extended delivery dates, due to the drastic cut in the amount of steel made available to the metal window industry. Fortunately, the hope that I expressed when we met last year has been fulfilled—the steel shortage no longer exists and we have for some little time been able to offer greatly improved delivery; nevertheless, it will take some time to regain the ground that was lost.

That the results before you are only slightly less favourable than last year is accounted for by our policy of counteracting increases in cost which are outside our control by a constant effort to increase our efficiency. During the year there was a wage award, and in addition we have borne for the first time the full cost of the two weeks holiday with pay which, when the effect on production per man-year is taken into account, is a not inconsiderable addition. On the other hand, in January, 1953, a free market in zinc, of which your company is a substantial user in its galvanising process, brought about a substantial reduction in price. Unfortunately this saving has been more than offset by an increase in the price of brass, which has not been helped by allowing the export of brass ingot during a period of acute shortage of brass scrap. Towards the end of October, 1952, the selling price of rustproofed standard metal windows, which represent nearly ninety per cent of the standard windows sold in the home market, was reduced by approximately four per cent; there have also been material reductions in the selling price of rustproofed purpose-made windows. It is our policy to support price reduction, even in face of difficulty, as a contribution to lower building cost, as we believe this is necessary for the continued prosperity of the building trade.

Lord Braintree then reviewed the Group's progress in overseas markets, and continued:

FUTURE PROSPECTS

I have referred to the difficulties which attended the latter part of last year's trading as the outcome of the rationing of steel which had been imposed earlier on. Taking that part of our business which relates to house building we are helped by the fact that the low upkeep costs of galvanised steel windows is well known and appreciated by local authorities and others associated with house build-

ing. The indications are quite definite that this business is coming back to us and, although our standard window capacity is a long way from being filled, we are now able to avoid short-time working, and look forward with confidence to the commencement of next year's building programme for which we shall be adequately stocked and able to give unprecedented good deliveries.

The purpose-made side of our business has been for some time past restricted owing to the limitation of building permits. The easement of building restrictions should alter this position and we look forward to a much increased volume of purpose-made work.

A difficulty at this time is the unnaturally high cost of brass. The prohibition of the use of brass for the manufacture of window fittings was lifted in December, 1952, and we have now reverted to the supply of high-quality brass fittings. At the outset the change from substitute steel fittings to brass in itself involved a substantial increase in cost, which is now aggravated by the high price of brass to which I have referred. We are convinced, however, that we should not pass on this extra cost unless we are satisfied that it is not a passing phase or could not be recovered in other ways in a reasonable time. I hope it will be noted that the high cost of brass fittings constitutes a handicap to our export trade and that the export of brass ingot will be drastically restricted.

We have embarked on the regular production of several other products. Although windows have always been our first consideration, we are well equipped to make a wide range of structural or sheet metal articles. We are particularly attracted to any product for which the demand is sufficiently continuous to justify special equipment, and we are hopeful that some of the articles we have now introduced will eventually achieve considerable volume.

EXPORT

The total export turnover represents a very substantial proportion of the parent company's business and the total business done can be regarded as satisfactory. Exports to hard currency countries show an increase of nearly 22 per cent.

The total group taxation, at £470,690, which includes foreign taxes, represents 12s. in the pound as compared with £570,050 and 13s. 3d. in the pound for the previous year. The small alleviation in the taxation burden is welcome, but it is still extremely difficult to finance the maintenance and expansion of efficient production and, at the same time, recommend a reasonable return to the stockholders.

The net taxed profits attributable to your company amount to £285,852.

The excess of current assets over current liabilities of the group amounts to £2,208,030. Revenue reserves, including future taxation, at £1,692,173, show an increase of £153,696.

The report was adopted and the ordinary dividend of 10 per cent and bonus of 5 per cent was approved.

THE CANADIAN BANK OF COMMERCE

DEVELOPING COMPETITIVE CONDITIONS

MR JAMES STEWART'S NOTE OF CAUTION

The annual meeting of The Canadian Bank of Commerce was held on December 8th in Toronto.

Mr James Stewart, CBE, president, said that there were many evidences of a developing competitive market in Canada. Signs were not wanting that that competition would continue and possibly increase in the immediate future with all that implied in the matter of profits. Inflation had served to hide or distort cost factors, and pricing in many instances had been unduly influenced by the anticipation of a continuing upward inflationary spiral. For the time being, and for the foreseeable future, the inflationary pressures had been contained, and costs, and prices, would play their proper role in the market-place.

While substantial gains had been recorded in many of the diverse activities that now made up the Canadian business scene, the pattern was more uneven than a year ago, reflecting rising competition. In the trade section they had become a net importer, reversing their position of a year ago. Inventories were accumulating in some lines, suggesting perhaps a stickiness in prices or possibly an overly optimistic appraisal of the market. To his mind those were signs not necessarily of weakness but of vigour in the business community.

The domestic scene revealed many signs of strength. The number of persons gainfully employed was high. Consumer demand remained high. The rate of capital investment had been high for some years now. While there might be some reduction in capital formation in 1954, the amount invested was likely to be large.

The postwar expansion of plant capacity and the creation of new industrial and commercial enterprise had been accompanied by some change in capital structures. In 1939 equity to debt, generally speaking, was about 2 to 1. In 1952, equity had declined to about 56 per cent and debt had increased to about 44 per cent.

The continued strength of the Canadian dollar was the most notable factor in the international aspects of the economy. The level of imports in relation to exports and the continued attractiveness of investment opportunities in industry and resource development would influence the course of their dollar in the months ahead.

Mr Stewart repeatedly referred to increasing competition—not as a counsel of pessimism but as a caution. He stressed that Canada must become increasingly aware of the implications of generally high costs of production and the difficulties emanating from them in competitive markets both at home and abroad.

GENERAL MANAGER'S REMARKS

Mr Neil J. McKinnon, general manager, said that business activity, with the exception of certain areas, had been at record levels. He pointed out, however, that turnover in inventories and payments of trade accounts were slowing down, and while those developments did not give reason for concern, good management must be alert.

Referring to consumer credit, he said that the aggregate volume had continued to show an increase, but the rapid rise observed a

year ago had lessened in recent months and might be levelling off.

On the subject of the first of two important measures of legislation which would be brought before Parliament during the current session, namely, provision for long-term mortgage loans for residential construction, Mr McKinnon said that the terms of that legislation when available would be studied with care and consideration for the interests of the country as well as for good banking principles, both of which in the final analysis were inseparable.

Reviewing the bank's annual statement, Mr McKinnon pointed out that assets had grown during the year by approximately \$91 million and now stood at \$1,911,815,744.

The report was adopted.

LILLYWHITES LIMITED

GRATIFYING IMPROVEMENT

The twentieth annual general meeting of Lillywhites Limited was held on December 9th in London, Mr H. J. Benedictus, ACA (the chairman), presiding. The following is an extract from his circulated statement:

After last year's reduction in profits it is gratifying to be able to report a modest improvement for the year to August 31, 1953. up till the end of 1952, sales continued to be disappointing, but with the turn of the year there was an improvement which continued throughout the remainder of the Company's financial year, and which, I am happy to say, is still in evidence. In fact, sales since the beginning of September show quite a substantial increase on the corresponding figures for last year and, without entering into the realms of prophecy, I am hopeful that it may continue.

The profits for the past year would have been appreciably greater, had it not been that your Company, in common with most others in the retail distributive trades, was put to substantial stock losses, in consequence of the reductions in Purchase Tax in the last Budget.

Our branch at Bournemouth continues to attract attention and may now be regarded as well-established. Once again, we have opened a department at M. Cleghorn & Company, Limited, of 129, Princes Street, Edinburgh, for the sale of ski-ing equipment, clothing and boots. This was a very successful innovation last year, in spite of extremely poor snow conditions in Scotland.

Your company has achieved a world-wide reputation, and every day we receive orders and inquiries from all parts of the world, both from individuals and from internationally famous organisations.

TRADING RESULTS

The combined trading profit is higher by £9,073 than last year, but depreciation takes an additional sum of £1,750. After other smaller variations, the net profit for the year works out at £48,599, an increase over last year of £6,598.

Your directors recommend a final dividend of 20 per cent on the ordinary shares of the company, making a total for the year of 30 per cent, as against 27½ per cent last year. In addition, they propose that the 5 per cent capital distribution which was paid last year for the first time, should be repeated this year. This brings the total dividend up to 35 per cent; in addition, 5 per cent of this dividend is free of Income Tax as a capital distribution. After paying these dividends, the carry forward is increased from £21,020 to £23,627. The report was adopted.

LEETHEMS (TWILFIT)

The twenty-fifth annual general meeting of Leethems (Twilfit) Limited was held on December 3rd at Portsmouth, Mr C. H. Reynolds, MA, AMICE, JP (chairman and joint managing director), presiding.

The following is an extract from his circulated statement:

Throughout the year now under consideration and to date, demand has been consistently heavy and considerably in excess of our production capacity. The limiting factor has been the difficulty in recruiting sufficient numbers of employees of the type and quality we require to keep up our high standard of workmanship the position at the moment is improving and output is steadily increasing.

Sales have been at a record high level and profits consequently good; prospects are encouraging and we anticipate that next year's results will be at least equal to normal. Exports continued at a high level.

The continuing improved trading conditions have encouraged your directors to recommend that 75,000 ordinary shares of £1 each shall be issued and credited as fully paid to members in the proportion of one new ordinary share for every three ordinary shares held at the close of business on the date of the annual general meeting. The amount required to pay up the new ordinary shares will be provided by capitalising £75,000 of the capital reserve, thus reducing that reserve from £125,000 to £50,000.

The directors have decided to recommend that, in addition to the proposed dividend of 6 per cent, a bonus of fivepence per ordinary share shall be declared in respect of 225,000 ordinary shares now in issue. The report was adopted and the increase of capital and bonus issue were approved.

MALAYALAM PLANTATIONS

The thirty-second annual general meeting of Malayalam Plantations, Limited, was held on December 10th in London, Mr H. W. Horner, chairman, presiding. The following are extracts from his circulated address:

The year 1952 was critical for tea producers in India. The present statistical position promises a continuance of satisfactory prices. The company's net profit is £278,851, against £411,832, and the directors recommend a final dividend of 7 per cent, making 10 per cent. They regret that the profits remaining after the heavy taxation do not permit a higher dividend.

Mainly owing to Government exactions and various enactments chiefly relating to labour, costs of production have risen constantly in recent years. The investor is robbed of a fair reward for enterprise and risks taken, not by any over-cautious financial policy but by excessive Government expenditure, often conceived on idealistic, rather than practical, lines necessitating penal taxation, and by premature legislative interference with labour conditions. Our greatest problems are those relating to labour.

The Government of India is set upon a policy of economic development virtually inescapable with the population increasing at the rate of 4½ million a year. India has not the resources and capital necessary and will need enormous sums from outside, which will not be forthcoming unless assured of fair treatment and the probability of being allowed to retain, and to take out of India, a fair return. Creation of an atmosphere favourable to external capital generally is necessary.

The report and accounts were adopted.

HARRIS LEBUS, LIMITED

INCREASED SALES

The sixth annual general meeting of this company was held on December 8th in London, Sir Herman Lebus, CBE, JP, chairman and managing director, presiding.

The following is an extract from his circulated review:

The trading profit for the year to July 10, 1953, after providing for all charges, including depreciation, amounts to £561,879 as compared with £416,885 in the preceding year, an increase of £144,994. After providing for income tax and profits tax computed on the profit for the year, the net profit amounts to £228,883. The 4 per cent preference dividend, less tax, of £21,500 and the proposed ordinary dividend of 8 per cent, which, less tax, amounts to £88,000, together absorb £109,500.

The last half of the financial year to July, 1953, was an important period for the furniture industry. The Utility Furniture Scheme was abandoned, price controls were finally dispensed with and it became possible for the industry to manufacture and sell its products unhampered by these regulations and controls.

Last winter the industry was in the midst of a serious depression in upholstered furniture which continued up to the spring of the present year, but I am glad to say that later there was a general improvement which is still continuing. Your company has shared in the results of the improved demand and the sales achieved during the year show a considerable increase. You will, I think, agree that the year's results are gratifying. Your directors are of the opinion that your company can face the long-term future with sober confidence. The report was adopted.

HERRBURGER BROOKS LIMITED

IMPROVING CONDITIONS

The thirty-third annual general meeting of this company was held on December 9th in London, Sir Louis Sterling, chairman, presiding.

The following is an extract from his circulated statement for the year to June 30, 1953:

The general recession in trade coupled with the closure or severe restriction of many of the regular overseas markets had a serious effect on the piano trade. The result of these adverse conditions in the first six months of our financial year was an extensive fall in sales with curtailed output leading to short time working in the London factory and consequent higher production costs.

This depressed state of trade continued until early in 1953. In February of this year there were definite indications of improvement which have continued through the ensuing months and this improvement shows every sign of continuing throughout the present financial year. The net profit although considerably reduced may be regarded as satisfactory in such a difficult trading year. Your directors recommend to you that the dividend be maintained at 1s. 6d. per share as in the last five years.

It was in April of this year that the Chancellor of the Exchequer decided to remove all purchase tax chargeable on pianos and the relaxation of some restrictions in markets abroad already apparent will improve the export trade which must receive priority as regards sales, but this coupled with the expected increase in home trade justifies optimism for the future.

The report was adopted.

A. MONK AND COMPANY GRATIFYING RESULTS

The annual general meeting of A. Monk and Company, Limited, was held on December 9th at Warrington. Mr Arthur Monk, the chairman, presided.

The accounts show a profit, subject to taxation, of £201,573 for the year ended February 28, 1953, as against £189,153 last year. The charge to taxation in the year—£104,687—is lower than last year by £8,500.

The following is extracted from the chairman's statement:

I think that we have every reason to be gratified with the results of the year's trading to February 28th last. The figures show that the exceedingly good returns of past years have been more than maintained, and, I might add, the usual prudent method of valuing work in progress has once more been followed. A very satisfactory volume of new work came our way during the year, and at the present time we have sufficient orders in hand to keep us fully occupied for a long time ahead.

EXPORT SALES

This appointment is with a large company whose product and reputation is firmly established in the United Kingdom. The already growing export trade has reached proportions requiring the full-time attention of a man experienced in overseas markets. Some years' actual experience of conducting export business and in co-operating with overseas agents is essential. The product is of a technical nature and evidence of aptitude to master technicalities in the plastics and/or textile field is desirable.

The successful candidate must be capable of launching and controlling selling campaigns in a number of countries, with particular reference to Australia, USA and Northern Europe. A knowledge of French and/or German is desirable.

A good University Degree is preferred and ideally the position is suitable for men under 42 years of age, for the initial work will require exceptional stamina and energy. The timing of this appointment is such that there will be every opportunity to show results, which in turn will present attractive possibilities for a stimulating and progressive career. The starting salary will be at least £1,500 per annum and there is a contributory pension scheme. Box 2FA, 9781, A.K. Advg., 212a Shaftesbury Ave., London, W.C.2.

JOURNALISTS

Wanted by Northern publisher of trade journals, capable young journalist with good news sense. Excellent opening for the right man.—Box 400.

THE Church Commissioners invite applications for the early full-time appointment of Investment Manager of their Stock Exchange investments which amount to over £100 million in value and include a large and growing portfolio of equities. Terms commensurate with responsibilities and according to applicant's experience are offered both as to salary and superannuation at levels usually paid by large institutions, and other investing bodies in the City. Apply in confidence by letter marked "Personal" to Sir James Brown (the Secretary to the Commissioners) at No. 1 Millbank, Westminster, S.W.1, stating experience.

If any genuinely interested applicant desires further information, he may obtain it from Sir James Brown or from any member of the Commissioners' Advisory Panel, Sir Richard Hopkins, Mr. G. G. Beamish, Sir Eric Gore Browne and Mr. G. Tysr.

PERSONNEL Management Scholarships. Under the Counterpart Conditional Aid Funds scholarships, value £300 (plus children's allowance), will be available for one-year full-time courses in personnel management at certain universities. Closing date for applications January 31, 1954. Further information and application forms obtainable from the Secretary, Institute of Personnel Management, Management House, 8, Hill Street, London, W.1.

ASSISTANT (male) aged 20-26 required for the actuarial department of an old-established Life Assurance Office in London. Applicants should be students of the Institute of Actuaries or should have obtained an Honours degree in Mathematics. Exceptional prospects.—Apply Box 402.

THE Economists' Bookshop, 11-12 Clement's Inn Passage, London, W.C.2, invites you to submit lists of books on Economics, History and Social Sciences, you may wish to sell (*periodicals excluded*).

SPANISH Evening Classes from January 11th. All grades.—The Hispanic Council, 2 Belgrave Square, S.W.1. SLOane 7180.

QUALIFIED CHEMIST or Chemical Engineer with flair for economics and selling required to represent firm undertaking industrial research and development, and assist with technical market surveys and literature searches.—Write for application form to Box 395.

ARE you interested in the Government's plans for introducing a competitive television? The Popular Television Association of 78, Buckingham Gate, London, S.W.1, will gladly send Speakers to address your Society on this vital subject.

FOREIGN EXCHANGE organisation in USA has openings for men and women with suitable background or experience.—Apply to: DEAK & CO., INC., Foreign Exchange, 75 West Street, New York 6.

A MARKETING EXECUTIVE responsible to Sales Manager is required by a well-established London Company. Good education, preferably University Degree, experience of sales promotion, advertising and marketing methods in substantial firm(s) are essential. Age limits 30 to 45. Salary £1,000 to £1,250 according to experience. Write full personal particulars and details of experience and salaries earned to Box 403.

We have continued to maintain a reasonable proportion of work under the Defence Programme. Excellent progress has been made with the new test track for military vehicles of all types in Surrey. The Ministry of Supply factory at Leyland, Lancs, recently opened, made record speed. Various other Defence contracts for both the Admiralty and the Air Ministry continue satisfactorily. Good progress has been made on many other contracts, and amongst them I should mention the important chlorine, polythene, terylene and paraxylene plants for the Imperial Chemical Industries, Ltd., at Wilton, in North Yorkshire. Creditable performances are shown in Open cast Coal and appreciable work has been carried out for the Nationalised industries.

As I have said formerly, the company is excellently served by a loyal and efficient staff. To them bonuses have already been paid. Further recognition is undoubtedly due, and in addition to having extended the company's pension scheme in the year by providing life insurance cover, we have now set aside a further sum of £20,000 for their welfare.

As to taxation, the charge this year is lower than last largely by reason of the fact that £20,000 has been brought into credit as not now required to equate tax on capital allowances. It would not appear that there can be any liability for EPL. Although there has been a slight easing of the tax burden this year, I feel that industry still has to draw far too deeply on its resources.

The balance-sheet shows a generally stronger all round position than last year and the liquid position is better. General reserve has been brought up to £320,000 by the addition of a further £15,000, and dividend equalisation account has been brought up to £50,000 by a further transfer of £10,000. The carry forward is £98,587.

I am very sorry to say that Sir Thomas Brocklebank, who had been a director for the last five years, and whose advice on many matters gave material help to the company, passed away suddenly only a few weeks ago.

The report and accounts were adopted, and the final dividend of 20 per cent on £150,000 ordinary stock (making 40 per cent for the year) was approved.

PERSONNEL ADMINISTRATION LIMITED MANAGEMENT CONSULTANTS

55 SOUTH AUDLEY STREET, LONDON, W.1. require qualified accountants with industrial experience and a real interest in Management Accounting. A period of training will be given to qualify successful applicants to carry out the company's work. Applicants are invited preferably from Chartered Accountants between 30 to 35 years of age. A University Degree would be an additional advantage but not essential. The prospects are outstanding and the appointments are pensionable.—Please send particulars of qualifications and experience, quoting reference C.A.2.

SOLICITOR OR BARRISTER required for a senior position in the Legal Department of the National Coal Board at London Headquarters. Applicants should be practising lawyers of wide experience, able to conduct major litigation without supervision and to supervise junior staff. The duties of the post will include advising on questions of law relating to coal mines arising in common law litigation. Experience with regard to the coal industry is not essential, but the successful applicant must be an able and energetic lawyer.

The starting salary will be not less than £1,600 per annum, inclusive. There is a Superannuation Scheme.

Write giving full particulars (in chronological order) of age, education, qualifications and experience (with dates) to National Coal Board, Establishments (Personnel), Hobart House, Grosvenor Place, London, S.W.1, marking envelope TT/714. Closing date January 2, 1954. Original testimonials should not be forwarded.

MARKETING and advertising man.—A large reputable manufacturer in the North of England, marketing nationally advertised lines requires a first-class experienced man around 35 years of age. He must be well educated, preferably University graduate, and experienced in similar activities either with another company and/or large advertising agency. He should be capable of assuming a large measure of responsibility enabling him to demonstrate his readiness to take a place in top management within a year. Commencing salary according to qualifications will be of the order of £1,500/£2,000.—Write giving full particulars which will be treated in confidence, own staff having been advised of this appointment, to Box 392.

AN EXPANDING COMPANY requires the services of a man or woman graduate to undertake field and office control of a National Retailer Panel. An Economics or Sociology degree or knowledge of statistics would be an advantage. The work entails maintaining a panel at full strength, checking field work, organising office routine and appreciation of findings in collaboration with the Statistician. Salary will be in the range of £630 to £800 and the post also carries Pension, Life Assurance and Sickness Benefits under a non-contributory social security plan. This post offers an excellent opportunity for a man or woman seeking first-class market research experience. Half the time (office) will be spent in Melton Mowbray, and the remainder in the field.—Box 389.

APPLICATIONS are invited for the position of Assistant Secretary to the Woolen and Worsted Trades Federation. Age limit 30 years. Position is pensionable. Salary according to age and qualifications. Candidates should send full particulars marking the envelope "Applications" to the President, Woolen and Worsted Trades' Federation, Manor Buildings, Manor Row, Bradford.

SCOTTISH COMPANY, with 12 acres storage ground at Firth of Forth port (south side) and having administrative organisation and some idle capital, invites proposals for profitable employment.—Box 393.

CHARTERED ACCOUNTANT with wide experience of finances of big companies, taxation, management accounting and budgetary control, seeks position of responsibility in industry.—Box 399.

THE CHARTERED INSTITUTE OF SECRETARIES.—Directors requiring the services of Chartered Secretaries to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute, 11, New Bridge Street, E.C.4.

Factory walls should be made of daylight. All the evidence goes to show that natural light—and the more the better—has a beneficial effect on workers, and their work. Big windows sensibly placed to transmit the maximum amount of daylight; translucent panels of "INSULIGHT" Hollow Glass Blocks to give light, privacy, and thermal insulation; "INSULIGHT" Double-Glazing Units to let in the light without letting out the warmth—with the help of these you can make daylight pay a dividend. For advice on the best way to use glass in your factory, consult our Technical Sales and Service Department. Supplies are available through the usual trade channels.

The "Build-your-own-Equipment" method 20,000 firms are using

Dexion is now firmly established as the obvious, practical and cheap answer to equipment problems.

Firms needing storage racks, machine stands, maintenance platforms, etc., have realized how much money and time this supremely simple method of construction can save them.

Dexion slotted angle needs only cutting and bolting up. No detailed drawings are necessary. Most structures can be built by unskilled labour in a matter of hours—and when changes are necessary, the Dexion can be used over and over again. Kept in stock, Dexion provides an immediate, on-the-spot answer to any equipment problem.

More than 20,000 firms all over the world are finding that, with Dexion, they can build the structures they need, to their own specifications, on their own premises.

Storage space for 1,000 ft. of Dexion compared with that for 1,000 ft. of 2" x 4" timber. Dexion comes in packages of ten 10 ft. lengths, 3" x 1 1/2". Stove-enamelled steel, or non-corroding light alloy. Bolts included, no extras needed.

Special Dexion racking for a textile mill, built in 1 day (8 hours) by 2 men. Safe load for a single unbraced Dexion strut in steel (6' long) is as high as 1,000 lb.

DEXION SLOTTED ANGLE

For detailed illustrations of Dexion in industrial use, write for booklet S.8 to Dexion Ltd., 189 Regent St., London W.1.

P E R S P E C T I V E

On this fiftieth anniversary of powered controlled flight the memory of Orville and Wilbur Wright is honoured. In twelve seconds at Kitty Hawk they gave civilisation a new domain, and The Bristol Aeroplane Company, whose history extends back to within seven years of their triumph, adds its tribute to their memory.

Aviation has absorbed a greater proportion of man's technological effort during these fifty years than has any other one activity. Today the world is skinned with air routes, and the ordinary traveller can span spaces and continents in hours instead of days. The air has given us a transport dimension to match the communication of our ideas.

In fifty years we have progressed to passenger-miles which are reckoned in millions, and have achieved flight speeds greater than that of sound. Yet we stand on the threshold of even greater things; nuclear power will eventually be used to drive aircraft, and supersonic airliners will serve the travelling public. It may even be that before the centenary of the Wright Brothers' first flight, man will have journeyed into outer space.

Motor packed up again, Mr. Watling?

When overloaded or working under adverse conditions, electric motors, transformers and coils become overheated, causing the insulation — and ultimately the equipment itself — to break down. Because overloading and bad working conditions cannot always be avoided, electrical engineers have been quick to take advantage of Silicones. In extremes of temperature which would cause ordinary insulating materials to fail, Silicone resins and rubbers still retain their outstanding insulating properties to the full. The complete range of Silicone products can be obtained from Midland Silicones Ltd., an associated company of Albright & Wilson Ltd.

Our ideas — your patent

One of the chief advantages in entrusting industrial research and development to an independent research organization is that the client is always fully protected in the important matter of patents. Sondes Place offers as a standing condition in its contracts with clients that any patents which may be granted as the result of work done automatically become assignable to the client. Equally important, the Institute works for only one retainer-client in each field at one time. The client is thus assured of exclusive access to research results.

Industrial research and development and the work of Sondes Place is fully discussed in 'Report', the Institute's occasional bulletin. May we put your name on our mailing list?

Stand—or Deliver?

AFTER four days of conciliation by the Minister of Labour, the Transport Commission has agreed to increase the railwaymen's wages by considerably more than the four shillings a week recommended by an independent tribunal; and there will not after all be the railway strike that would have spoiled so many people's Christmas. The first reaction has been one of nation-wide relief; but the second must be to weigh very carefully what this settlement means. It means that the Government and the Commission have decided—probably rightly—that it is not on the railway lines that the country should stand to meet the first major national strike since before the war. Instead that shock will have to be absorbed somewhere else, perhaps in the engineering industry and possibly early in the new year.

At best the tinder will continue to smoulder, waiting for an unfavourable trade wind to set it ablaze. For the country must now be very near the turning point in postwar industrial relations. The really significant feature of this week's tussle was not that a railway stoppage was averted, but that it was so nearly allowed to occur. Until this year the question of when it is worthwhile to risk a labour stoppage has not been seriously considered. Throughout the years of inflation the automatic reaction of employers in the face of trade union demands has been to grant increases as great as—although if possible no greater than—are needed to prevent the unions from striking. The conciliation, arbitration and investigation machinery kept in constant readiness by the Ministry of Labour has operated on the same basic premise: that strikes must be avoided, in the last resort at any cost (although with the rider that, before the last resort is reached, the cost can be delayed, trimmed down and tidied up by the exercise of a little diplomacy). The object of policy since the war has been to allow wages and prices to trudge drearily up the spiral staircase, while preventing them from soaring giddily in an automatic lift.

The result has been that at each successive industrial award wages have tended to leapfrog slightly—although only slightly—ahead of the increase in prices during the preceding year. Some time before the next annual (it now usually is annual) award, of course, prices have tended to catch up again; and that is why it is always possible for an able union to show that its members' wages have risen less than prices since some specially chosen base date, or than profits or productivity or dividends (conveniently defined) since some other base date, or than the wages of some other union's members since some time else. But the general, as distinct from the particular, pattern has been clear. Between 1938 and 1946, according to the best available estimates, real national product rose by only 9 or 10 per cent, the total of money wages and salaries rose by 72 per cent and the prices of all goods and services entering into personal consumption rose by 57 per cent; between 1946 and 1952, real national product rose by 12 to 15 per cent, money wages and salaries by 69 per cent

and prices by 41 per cent. This has not been runaway inflation, but it has been something more than inflation at a tolerable jogtrot.

Throughout this period two warnings have been clearly written on the wall. The first has been that the process of inflation could not go on for ever, if only because Britain's overseas competitors could not always be relied upon to go on conveniently inflating too. The second has been that as soon as wages were stopped from rising faster than productivity—in other words, as soon as the process of inflation ended—the annual wage increases that could be granted would look derisory, and would almost certainly provoke strikes. Since 1946 the average annual increase in total productivity has been around 2 per cent, or on current wage levels rather less than the four shillings a week that the railwaymen regarded as an insult.

In the past fifteen months, the time for this reaction has drawn steadily and obviously nearer. The awards handed out after organised bargaining bouts have dropped steadily below the 7 or 8 shillings a week that was customary last winter; since October there have been at least seven awards (in relatively minor trades) of 4 shillings a week or less. It could only be a matter of time until one of these awards struck bone on one of the big unions with opportunities for creating chaos on a national scale. It is unfortunate that, thanks to the accidents of the calendar and to the National Union of Railwaymen's eagerness to threaten a strike at the season that would inconvenience the public most, the test case that arose first was a bad one on which to make a stand.

There are two reasons why the destined battleground has been unfortunate. The first is, quite frankly, that if there had been a strike the railwaymen would probably have won it—on approximately the terms that have now been granted without a fight. They would have won because—on the substance of their claim, as distinct from the time chosen to press it—they had public sympathy behind them, on the simple ground that their wages have risen less than most other wages since the war, and that they are still unduly low. There is an element of truth in these contentions. According to Sir Arthur Bowley's index, published in the *Bulletin* of the London and Cambridge Economic service, weekly wage rates on the railways rose by 115 per cent between 1938 and August, 1953, compared with an average rise of 144 per cent in industry as a whole; average earnings of the railwaymen who would have been concerned in the strike were £8 11s. 11d. a week, and of unskilled provincial porters alone £7 2s. 8d. a week, compared with an average of £9 8s. 8d. a week in industry as a whole. Although it is fair to deduce from these figures that for many members of the NUR this would have been a strike for a decent amount of cigarette money, the uncomfortable fact remains that for a minority of them it would have been something more bitter than that.

The second reason why the choice of battleground was unfortunate, however, is that there is a genuine economic—as distinct from emotional—case for over-

haul of the railways' present wage structure. The engine driver with six years' experience got 90 per cent more than the unskilled lengthman in 1939, but he gets only 40 per cent more now—and this is before the deduction of income tax. One result of this vicious narrowing of differentials is that the disgruntled skilled workers have concentrated on securing an easy life in recompense for an unremunerative one, and it is here that the familiar fuss about lodging turns and other restrictive practices has its roots. Another result is that the railways have an inflated labour force in some grades, and a genuine difficulty in attracting men of the right calibre into others. The railways have too few fare-paying passengers in their trains and too many wage-drawing passengers along the line.

★

The settlement to which the Transport Commission has now agreed accords some recognition to these problems; but the statement of agreement makes no attempt to emphasise the basic problem that the railways will never be able to pay anybody properly unless the surplus of labour in certain grades is absorbed and unless those who remain are induced to work harder and more efficiently. The supplementary payments above the basic four-shilling award will be on a percentage, not a flat rate, system; differentials for skilled men will therefore be at least maintained, and in many cases they are to be increased. In addition, the commission and the unions have agreed to "confer, in order to evolve ways of increasing the efficiency of the railway organisation, not only by such adjustments of wages and salaries as may result . . . but by all other appropriate means."

In all essentials, however, the settlement has settled nothing except the convenience of the public this Christmas. The moral that the other unions will draw from this week's negotiations is not that wage increases are now contingent upon a relaxation of restrictive practices and upon working economies. One more opportunity has been missed of driving home the truth that the standard of living must depend on the standard of working. Once more inflation has been thought preferable to a stoppage—although everybody knows that in the end inflation will do far more damage than a year of strikes. The only memory that will remain with the public is that the railway rumpus was handled with sympathy, patience and funk. In the particular circumstances of this particular case these may have been the right qualities to show. But as Sir Walter Monckton surveys the wreckage this weekend—the award of a duly authorised tribunal thrown over, the accounts of a public corporation unbalanced, and a fluttering standard of inflation run up before militant trade unionists elsewhere—he should not forget the truth behind the applause that his skill in negotiation has earned. His triumph is really one more retreat from reality.

A New Look for Nato

THE greater the difficulties that the Atlantic Council has to face, the more it becomes like the Atlantic Cabinet of Lord Ismay's aspiration. During these last few days it has addressed itself, more or less thoroughly, to almost every international problem of importance that should occupy the ministers of the United States, Britain, France and their eleven allies in company. The fact that this Paris meeting has been the occasion for brusqueness as well as politeness, for difference as well as compromise, is something to be welcomed. Ministers of foreign affairs, defence and finance have discussed arms and diplomacy, finance and production, strategy and intelligence, and have agreed without hesitating also to disagree. This in spite of the fact that something like a crisis in Nato's affairs is approaching, and that certain crucial decisions which might cut right across the prevailing comradeship cannot be much longer postponed. It is a healthy state of affairs provided that ministers see the future clearly.

But whatever hopes are staked on Nato as the first frail scaffolding of an Atlantic political community, the fact remains that it must still be judged primarily by its success in providing free Europe—which is something more than Western Europe—with defences more effective and cheaper than the fourteen members could produce separately. So much trouble has been taken to explain how much safer Europe is now than it was in 1949, that too many people believe that real safety has been attained, and can now be maintained by staying at the present level, by marking time, and by talking about the strategy of "the new look" and the logistics of the "long haul." Such slogans are to be treated with caution in view of the fate that overcame such predecessors as "burden sharing" and "integrated forces." For what are the blunt facts? The effective divisions available for the front-line defence of Western Europe are still outnumbered by the Soviet army in being in Eastern Europe. Their strategy in case of attack would be that of the fighting retreat, and it is doubtful whether sufficient trained reserve divisions would reach them in time to make possible a firm stand on natural obstacles to a Soviet advance. Ammunition and petrol stocks are

still unsatisfactory; Soviet superiority in numbers and quality of aircraft is still substantial; trained pilots are in short supply for the Supreme Commander's air forces; civil defence and security arrangements on his lines of communication are still inadequate; there is a shortage of escort vessels for allied convoys; and the eventual benefits to be gained from the gradual introduction of new weapons and scientific aids are still uncertain. Not, however, uncertain enough to have dissuaded the Atlantic Council from reducing the force plans set in General Eisenhower's day. Indeed, it is not too much to say that the probable benefits of these weapons have already been discounted in present military planning.

The state of affairs cannot be called critical, because the official appreciation is now that the Russians intend

to avoid war, whereas in 1950 there was ample room for doubt about their intentions. General Gruenther's forces certainly furnish a deterrent to aggression, even if they do not promise successful resistance to it; and there would be a case for saying that his present strength plus allied superiority in strategic bombing would keep the West safe, if it were not for the fact that the Russians are clearly catching up in their own atomic weapons and must be expected to find scientific aids to intercepting and bringing down atomic bombers. In short, the West probably still has the edge on the Russians and their allies, but is likely

to lose it in the years ahead if it just marks time. And the loss of this clear superiority in new weapons, whether on the ground or in the air, will enhance the importance of having something like parity in Europe in conventional weapons and infantry divisions. It is these facts that make such phrases as "new look" and "long haul" dangerous for public consumption, and make so perplexing the decisions that face the alliance.

Clearly the curve of defence expenditure cannot go indefinitely upwards, unless there is serious reason to believe that "a critical date" of maximum danger from the Soviet Union lies ahead. The idea is that it should now flatten into something like a straight line; but what this line would signify in financial terms may be judged from the table that accompanies this article.

* The amounts for individual countries have been converted from national currencies to US dollars at the official rate of exchange; the totals are provided by Nato. † Includes expenditures financed from US special military support of \$60 million in 1952 and \$177 million in 1953. The total for all Nato countries combined has been adjusted to eliminate double-counting. § Estimate.

Total Nato defence expenditure for 1953 amounts to some \$66 billion, $3\frac{1}{2}$ times the figure for 1949 and 10 per cent above the figure for 1952. There are many things that might be said about this expenditure—in particular about the high proportion of the burden borne by the United States—but there is one outstanding point that is causing anxiety, especially to the poorer countries. Between 1954-5 almost all the equipment that is coming from American and other Nato sources under present aid programmes will have been delivered; then will begin the problem of paying for its maintenance, repair and use in training. The provisional view appears to be that the cost of maintaining present strength will rise considerably, quite apart from the increased expenditure made necessary by improving the quality and readiness of the forces that already exist. Mr Dulles is reported to have given some general assurance that the United States would help to deal with the cost of maintenance; but that does not alter the fact that from 1955 onwards it may cost members of Nato more than it does now merely to maintain a level of forces that is not yet adequate.

The Atlantic Council's military advisers are by now only too well aware of the economic limits that must be observed in their planning; and its economic advisers are only too well aware of all the special difficulties and arguments with which governments can defend their hesitations and shortcomings. Indeed, the present trend in the Palais Chaillot seems to be towards accepting some decline in defence effort before a level can be attained at which governments will be prepared to keep their expenditure steady. In any case, the main decisions about the effort to be made in the first half

of 1954 had been taken before the Ministers met this week. The problem of the long haul from 1954 onwards is a matter for debate and investigation during the next nine months; but the trend of the experts' findings will depend largely on the trend of public opinion during that time. If the governments of Nato encourage complacency about Europe's safety then real crisis could quickly come. America's allies might be seen faltering in their stride at the very moment when Congress might be called on to consider new ways of keeping them.

The layman can hardly escape the conclusion that new ways will have to be found of sharing the heavy minimum burdens that lie ahead. It is foolish to imagine that between 1955 and 1956 the individual members of the Atlantic alliance will be in a position to cope from their own resources with the situation created by the termination of American military aid. The military and economic strategy that has prevailed in Nato since 1949 cannot be maintained intact unless the resources for it can be assured at least a year—preferably two years—in advance. And the signs are that this assurance has not been given. The Atlantic Council's insistence on quality rather than quantity, the emphasis on scientific rather than conventional weapons, the preparation for the long haul rather than the short dash—these are all intelligent and admirable principles; but they could turn out to be nothing more than the first taps on the politicians' drums before they beat a retreat. Before that is allowed to happen it is most desirable that the Nato Military Committee of Chiefs of Staff should urgently review present strategy and produce—not a new look but a new model.

The Eisenhower Plan

NOW that the first blast effects of Mr Eisenhower's atomic address at Uno are over, and the mushroom cloud of immediate reactions has dispersed, one can see more clearly where the President's proposal has left things. The first thing that is clear is that this was no isolated explosion. On the contrary, it has set up a chain reaction that seems likely to go on for a considerable time.

Mr Eisenhower has broken the deathly stillness that has hung for five years over the whole subject of international exploitation of atomic energy. This hush has embraced both the question of bringing atomic weapons under international control, and that of making nuclear energy available for peaceful purposes on an international scale. Action on the second problem has been paralysed by the apparently insoluble nature of the first; and during these years the world has heard nothing new on either subject, while the sinister thunderings from the rival camps, where each national group of scientists

works away behind its own graphite curtain, have grown louder and louder.

The new American proposal is not, and does not purport to be, a solution to the problem of international control. Indeed, informed opinion is now generally agreed that no final solution to that problem is possible this side of world government; and although a clear majority of the nations approved the Baruch plan of 1946, which implicitly pointed to a world government, it may be doubted whether they understood its implications, and it is certain that no such majority would today accept the full surrender of sovereignty involved. The Eisenhower plan makes no frontal assault on this resistance, or on the problem behind it. Instead, it proposes a course of action that involves no loss of sovereignty, either in the form of invasion of privacy, or in that of subjection to a supranational power. It is precisely for this reason that the plan makes possible a wholly new examination of the subject.

The President has impressed on the world's retina a shining vision—a vision of scientists coming out from their enforced seclusion to work together on the production of energy for joint and peaceful use; a vision of transformation for the power-poor countries of Asia and other regions; a vision of international tension being relaxed, and a murky atmosphere purified, by the therapeutic experience of teamwork in a noble cause, while at the same time the looming stockpiles are rhythmically reduced and the weight of atomic weapons is eased off the world's shoulders. This is not a dream to be cynically dismissed. It is a concept that must appeal profoundly, not only to the poorer countries that would be the most obvious beneficiaries, but also to the idealism that is a potent force in the United States and other western countries. Yet the brilliance of the vision must not prevent the most careful scrutiny of the plan itself. There are many questions that must be asked, all of them pertinent and some of them disconcerting.

First there are the questions that would at once arise if the Soviet government should accept the President's invitation. Experience has shown that no watertight division can be made that will completely separate military and civilian development in the atomic field. The valuable secrets today are not the basic formulae in which the early atom spies traded, but the engineering know-how required for atomic plants; some at least of these details would have to be given to the proposed United Nations agency if it is to do any important work. Even if joint activity were limited to research, any worthwhile progress would involve the possibility of stumbling on new concepts of military value. Could not Russian scientists working as members of a United Nations team therefore obtain vital information that would serve military ends? How could even the utmost care in choosing sites for the joint operations and in surrounding the sites with precautions prevent this? Can it be that the Americans feel that their lead in secret development is now so small that it is worth trading some of it in exchange for the political advantages offered by the Eisenhower plan? If so, are they right, and how far do the British and the Canadians agree with them? And what of the Russians' own security requirements?

Secondly, although Mr Eisenhower seemed to make it a condition of his proposal that the Russians must participate, there are many questions that would arise even if Moscow finally rejected the offer. The cynical may even see in the American initiative an attempt to acquire technical know-how already possessed by the Commonwealth countries. And what of the countries that already provide, and those that may later provide, uranium and thorium ores for the atomic plants of the major powers? These countries are already anxious to assure themselves of at least a fair share of the benefits derived from their own minerals. Will they not claim

priority in the distribution of any United Nations agency's favours? Even if they can be satisfied on this score, how would any such agency decide where first to pour out its cornucopia? Atomic energy cannot be handed out in penny packets. Again, the capital investment involved will be very large; and it may be assumed that the United States would (as on so many other occasions) be expected to make the largest contributions, both in fissile materials and in other forms, to the joint enterprise. Would it then be content to see a United Nations agency which it did not control disposing of the resultant largesse? Or would there be congressional cries that this was merely another giveaway programme, and one in which Washington could not even direct its own generosity?

If these questions show how necessary it is to avoid over-hasty optimism about the Eisenhower plan, they also point to two of its most striking characteristics. First, it is an astonishingly bold gesture to be made against the background of domestic politics with which the President has to contend. Even if stunned into momentary silence, the McCarthyites and go-it-aloners can hardly be expected to swallow without complaint a project that looks like a joining of hands with the Russians and the faithless British, under the ægis of suspect Uno. Mr Eisenhower has hoisted the flag of internationalism to its full height again; and America's allies should take note that this was no easy thing to do.

Second, the plan, for all its superficial simplicity, proves, on close examination, to present some fiendish conundrums. It is therefore perfectly reasonable that the Russians should take their time over considering it. Indeed, all those concerned are going to need a lot of time to review its implications; is it yet clear, for example, that Britain and other Commonwealth countries can even accept in principle? But the mental exercise will itself be beneficial. The whole atomic problem has been shelved for far too long, and Mr Eisenhower will have achieved much if he merely sets minds in motion on the subject again, and restored an element of sanity to a dangerously emotional atmosphere.

Outlook for Exports

The quarterly reports issued by The Economist Intelligence Unit may or may not confirm your hunch about sales prospects abroad. But these reports are the result of careful analysis of sound opinion and reliable information on matters of concern to those doing business with other countries. Also they are concise and up to date, and each one contains a statistical summary and charts to show business conditions and trends at a glance.

Separate reports are published every quarter on fifty territories. Particulars and specimen reports may be obtained from:

Brass Helmets and Bureaucrats

PEOPLE learned the hard way during the war to take fires seriously. Before it, fire-engines were rarely much more than a bright flash of colour in a drab world—something for small boys to stare at on their outings to collect train numbers, or for town councillors to show off to visiting magnates. Until 1938 there were no standards of fire protection imposed on local councils. They could do as little or as much as they wished, and some tended to treat their brigades less as a social service than as a local pageant.

The Fire Service Act of 1947, which created the modern brigades, was a measure of decentralisation, since it split up the wartime National Fire Service. Yet by comparison with the prewar arrangements a new, centralised service was created and another trojan horse was planted within the walls of local government. The little dust raised by the Bill has long since settled and, indeed, the complaints now are not so much of interference from Whitehall as that Whitehall provides too little money. Nobody, certainly, wants to go back to the prewar disorder, when the service still showed all the marks of its ancestry. The first brigades were formed by the insurance companies, and it was with reluctance that the local authorities gradually took them over. As late, for example, as 1936, the city of Oxford, with 80,000 inhabitants and a university of semi-professional incendiaries, was protected by 40 volunteers with little full-time help. Only in 1938, with war imminent, was a system of compulsory fire protection introduced. It was never given time to prove itself, and the blitz required more drastic remedies. In 1941, the brigades were nationalised and a fully unified service formed—with the promise that, after the war, control would be handed back to the local authorities.

This was the promise that Mr Ede had to honour in 1947. In doing so, he made four main changes from the position in 1938. A different type of local authority took responsibility for fire protection; the diversity of status among the men serving in the fire service was reduced; the Home Office's powers of administration, inspection and control were strengthened; and, finally, the Treasury was persuaded to give the local authorities a 25 per cent grant to help them satisfy the new standards of fire protection.

★

Most of the opposition to the Act of 1947 was provoked by the first of these changes, since it meant that the wartime pledge was only partially honoured. Instead of returning the brigades to the 1,600 local authorities who had been responsible before, it gave them to two types of authorities only—the county boroughs and the counties. Of the 135 brigades in England and Wales, 75 belong to the county boroughs,

51 belong to the counties and 9 are organised jointly. The 11 brigades in Scotland are organised regionally and come under the separate jurisdiction of the Scottish Home Department.

The county councils replaced the municipal boroughs and district councils who had organised their own brigades before the war and expected to get them back. The Act of 1947 tried to smooth ruffled feelings by providing that each county should have a special fire brigade committee on which county members would be joined by representatives of the smaller authorities. These committees now exist in all counties and apparently work without undue friction in spite of an unpromising start. But they have no financial authority and in anything requiring money can only make recommendations to the county councils.

The great advantage claimed for the postwar system over the era of the parish pump is that the larger brigades are much more flexible. In the old days a smoking chimney or a blazing factory often got, initially at least, the same treatment from the same antique machine. Now each brigade has an elaborate system of priorities. Its area of command is charted and labelled under six different categories of fire risk, for each of which there is a standard of "first attendance" determining the number of pumps to be sent when an alarm first comes through; reinforcements can be rushed up as and when the officer on the spot needs them. Each brigade has its control officer who can move his pumps about like pieces on a chess board. Help can be called from brigades over the border. Before the war this had to be paid for, and many a mansion or rich wharf was burnt to the ground because pride or penury made the local brigade slow to call for help. Now the neighbouring force is compelled to come when asked and is paid for its pains only if it regularly provides the first attendance outside its area.

This system has many of the wartime advantages of a single command; it also avoids the worst evils, at any rate, of over-centralisation. Most of the units are not too big. They vary from the London brigade, which last year had 2,000 full-time men, to Huntingdonshire, with 11 men. The regular fireman does not appear to have much to grumble about. His working week may be long by modern standards, but of the 60 to 80 hours spent on the station not all are hard labour; the problem is how to make the routine reasonably interesting. The firemen's union has built up something of a reputation for "militancy," but on the whole the service is relatively contented. The turnover of workers—a good barometer of contentment—is relatively low. Wage-rates were raised last year and again this year, so that a recruit to the service now gets £8 2s. 6d. a week; in London, there is an extra 10s. The union's main complaint, like that of the local

authorities, is that the fire service is not treated on terms of parity with the police. Before the war a fair proportion of the regular firemen actually were policemen, and until 1951, when special incentives were offered to the police to stimulate recruitment, the terms of service were identical. But the difference in status has now probably become a permanency. The fire service, unlike the police, is near to being fully staffed, and its union's bargaining position is correspondingly weaker. In tussles over wages it is the "retained" men of the service who come off worst. There are still nearly as many part-time firemen as professionals; they work at other jobs but undertake, for a fee, to turn out when the fire-alarm rings. They are employed mostly in country areas, and since they lack organisation and win their bread and butter elsewhere any rise in their retaining fees tends to follow rather grudgingly in the wake of the professionals' advances.

★

There used to be another class of firemen, the "volunteers," who served free of charge because they liked it. The Act of 1947 had no place for them; but they returned in a new guise two years later, when the auxiliary fire service was started as part of civil defence. The initial aim was to recruit 60,000 volunteers, but only some 18,500 have so far come forward. The present state of the preparations for the fire service in war could not possibly be described as happy. Not only are there too few men. Though equipment is sufficient for any foreseeable training programme, there are few stocks of the things—pumps, hoses, collapsible tanks—that would be desperately needed under bombing. The reason for this is not lack of foresight but lack of funds; the fire service has inevitably to take its place in the queue for civil defence expenditure. The authorities are, as a result, concentrating on quality and there has lately been an impressive display of new equipment. There are new theories about fighting fires with self-contained mobile columns and interesting experiments are being made with plastic piping, which could be manufactured quickly in a war and might not compete so fiercely as rubber hose for scarce raw materials.

The need to provide for an efficient wartime force is one reason—or excuse—for the host of Home Office specifications with which the local brigades have to comply. The other is the economic planner's wish to control the rate of capital investment. Programmes for re-equipment or for building new fire stations (badly needed) have to be approved by the Home Office in great detail. Any reduction or increase in the size of a brigade needs sanction. Each authority's standard of fire protection has to receive the Home Office's ukase. These powers are none the less real for being wielded with great tact and circumspection. The minimum standards demanded are much higher than before the war, and costs have risen enormously. Total expenditure now runs at over £15 million and the trend is

still upward. Before the war 5d. on the rates was considered a high figure, now the cost rises to as much as 1s. 6d. Little wonder, then, that the councils are asking for the same help with fire services as they already receive with the police—a Treasury grant of 50 per cent.

But the argument could equally well be inverted. Treasury subsidies are the grave of local initiative, and fire-fighting is a service for which the county and county borough areas provide a reasonable meeting-point between the economies of large-scale organisation, on the one hand, and the advantages of local initiative and responsibility on the other. If the counties cannot at present afford the cost of the service, the change to seek is surely an expansion of their revenue rather than a contraction of their responsibilities. Rates are in principle an appropriate form of taxation from which to finance protection against fire, and the properties most exposed to fire-risks are largely those that enjoy the benefits of prewar de-rating. To restore the rating of industrial and agricultural property would enable the local authorities to pay for their own fire brigades, save them from further whittling down of their powers, and bring benefits far wider than in the fire service.

Lord Palmerston Resigns

The anxiety of the public as to the real cause of the retirement of Lord Palmerston from the Cabinet at the present moment is not a matter of mere idle curiosity. Any uncertainty upon the subject might excite a most prejudicial influence upon interests far beyond our own shores, but in which England is deeply implicated. The eminent position which Lord Palmerston has occupied in the politics of Europe during the last twenty years, and the great ability with which he so long conducted the foreign affairs of this country, have given a weight and importance to his acts in the eyes of Continental Cabinets, which would attach in the same degree to those of no other man of the present day. At any time, therefore, the course which Lord Palmerston might pursue in relation to the actual Government of the day would be matter of deep interest and importance in the eyes of Europe. But at a moment like the present, when the most critical questions remain for settlement that have occupied European diplomacy since the peace of 1815, it is impossible to overestimate the interest that will be excited by his secession from the Cabinet; and we will add, the mischief that would result from such an event, if it were believed to proceed from differences of opinion in relation to the policy pursued upon the Eastern question. Upon this point however there is, fortunately, no room for doubt. It is upon a domestic, and not upon a foreign question, that Lord Palmerston retires—upon the question of Parliamentary Reform, not upon that of Russia and Turkey. . . . The Eastern question is one upon which it is necessary to unite not only a Cabinet at home, but also the Governments of the two greatest European nations. Up to the present moment England and France have been most happily agreed. . . . It is, then, on every consideration the more necessary that it should be clearly known, that it is not upon this question that Lord Palmerston leaves the Government.

Notes of the Week

The Tory Rebels

CONSERVATIVE MPs like to settle their differences in the obscurity of smoking rooms, and it is a symptom of deep feeling when 39 Government supporters feel driven to table a motion embarrassing to Ministers. It calls for the suspension of the talks in Cairo about the canal zone. The 39 include some of the less responsible members of the Conservative Party but also one or two of the most progressive, besides several of the more senior and respected back-benchers. This is not a group to challenge the Government to the extent of risking a General Election, but it may exercise sustained pressure, more subdued than the "Keep Left" movement of Labour days but no less insistent.

Disquiet about the Government's attitude towards Egyptian affairs has been rife on the Conservative benches for some months. Only Sir Winston Churchill's personal intervention in the 1922 Committee averted an open demonstration in October. The delay has, however, worked against the Government. Evidence of Egyptian untrustworthiness has raised the number of the Government's critics to a respectable figure; it even emboldened them to table their motion on the very eve of the Prime Minister's annual luncheon with the 1922 Committee, and just before Lord Alexander appeared before the party's foreign affairs committee in order to talk about the Suez base.

The immediate aim of the motion's sponsors is to deflect the Government from taking any decisive action during the recess. On this point they have wider support on the back benches, and in his speech to the 1922 Committee Sir Winston seems to have conceded that there is no need for hurry. But the main issue is the critics' insistence on the need for an armed garrison in the base. The Government is still willing to withdraw all but a few thousand technicians, provided there is adequate provision for "re-activation"; both Sir Winston and Lord Alexander are said to have argued that this scheme would safeguard British interests. The critics do not agree, for all Sir Winston's reported assurance that "this is not a Government of scuttle." The Government may be willing to hold its hand during the recess, but what those who have signed the motion really want is to see the cards reshuffled.

Facts About the Canal

RECENTLY things have been said in Cairo and done in the Sudan that account for the fears that the Tory back-benchers are now openly expressing. For no one can feel

entirely confident of General Nguib's ability in future to restrain political passions that can demolish treaties and their provisions overnight. But there appears also to lie behind the thinking of the Tory group a calculation that is unsound. It is argued that the alliance embodied in the existing treaty with Egypt is permanent, and Mr Enoch Powell, MP, set out in a letter to *The Economist* last week the legally impeccable case for taking this view. But to jump from this position to the deduction that British troops can and will sit permanently on the Canal is to ignore some of the political realities that even expert military opinion has come to appreciate.

Of these the most important is the validity that law-abiding Egyptians attach to the article of the Treaty that entitles them, at any time from 1956, to refer to an agreed third party the question whether the Egyptian army is or is not competent to maintain the Canal's security. If negotiations are broken off—as the Tory rebels ask—and nothing is agreed by 1956 what is likely to happen? Egypt might well propose, say, that the Security Council of the United Nations or India should arbitrate. If so, how could Britain reasonably object with any prospect of international support? Moreover, if President Nguib is still Egypt's ruler at that date, which of these third parties—or indeed any arbitrator—would be ready to declare his forces second-rate? In short, it is being overlooked that in 1956 Egypt will be in a position to take the whole question out of the sphere of law and diplomacy where it now lies into that of international and inter-racial politics. Very well, the Tories may say; we can take it. But recent experience suggests that in such tussles the former "imperialists" get little sympathy. To break off negotiations now would be to put off an unavoidable issue.

Censure on Labour

HAVING at last, after so many vacillations, decided to move a motion of censure on the Government's handling of African affairs, the Labour party's leaders are now probably wishing heartily that they had had nothing to do with it. For the debate on Wednesday can have done little to satisfy the left wing of their own party, which is clamouring for a forthright attack on the Government's colonial policy, and it has undoubtedly strengthened the personal position of the Minister they set out to discredit.

Mr Griffiths's speech amounted to little more than a summary of all the criticisms the Opposition had already made in detail before. He tried to show that the lack of confidence felt by the colonial peoples in the British Government was the cumulative result of all the crises in

ous parts of Africa. To this Mr Lyttelton and Mr Millan made the obvious reply that if anyone in this country was sapping confidence, it was the Opposition. By generating the differences between the parties and mining the extent of the agreement between them, Labour destroyed the bipartisan approach to colonial policy that hitherto been accepted. Particularly irresponsible was our action in dividing the House of Commons on issues as the constitution of British Guiana and Central African Federation, for which former Ministers share responsibility with the Government and on which it is highly unlikely that they would have acted differently if they had remained in office.

In colonial affairs, the Labour party puts on blinkers to the present and rose-coloured spectacles to look at the past. It tends, that is, to ignore places where things are going well, and to think that the last Government left us a happy, peaceful continent. Its supporters now conveniently forget that it was the present Government that allowed Tshekedi Khama to return to his native South Africa, whence he had been arbitrarily banished by Labour Ministers. The motion of censure could in effect be regarded as being a censure on Labour's attitude in opposition as much as on Mr Lyttelton's in office, and the debate has served a useful purpose only if it encourages our return to the constructive all-party approach on colonial affairs for which Mr Lyttelton appealed.

TV and Talking Out

ALTHOUGH it occupied two days—and a bit—the television debate in the House of Commons this week ended to be sterile and, in the end, farcical. Most of the constructive approaches to the controversy had already been thoroughly worked over by the peers, and MPs were able to add little of value to the argument on either side. This meant that the opposing cases were often grossly overstated, by no one more than the opening Government spokesman, Mr Gammans. Had he been more persuasive, it would have been less of an upset for the Government when Sir David Maxwell Fyfe's well-reasoned closing speech dissolved into the fiasco of the Government motion being rejected out.

For practical purposes, this incident had no lasting effect, merely postponing the vote for 24 hours. But there is something rather ridiculous about a Government failing to carry a vote on its own motion, and the seconds by which Sir David was judged to have talked past ten o'clock, the hour of the ending of debate, must therefore tend to impair the Government's control of the House of Commons. In any case it should be said that the Government and its supporters hotly contended that Sir David had in fact sat in time. Even if someone is still speaking at ten o'clock, the day can still be saved by moving the closure. This has been done by the Chief Whip with great promptness in the past and he was sitting ready on this occasion. That he remained silent suggested that he thought Sir David had just scraped home. However, experienced Parliamentarians should know the dangers of running things so

that the final scenes of uproar obscured what happened in the

debate itself but Sir David's closing words, while conciliatory in tone, in fact left the position virtually unchanged. Mr Morrison had suggested round-table talks, aimed at a compromise scheme acceptable to both sides; but since Mr Morrison was himself prepared to yield little ground in the rest of his speech, the Government could scarcely be blamed for regarding his proposal as a delaying move and little else. Certainly there is tactical sense in an Opposition attempt to delay commercial television; there are grounds for believing that it will be more popular in operation than in prospect. But for the same reason the Government, once committed, is anxious to press forward. Sir David made it clear that while Ministers will consider all practical suggestions, they will go ahead with drafting the necessary legislation and this will embody two essential principles on which the Government will not yield—breaking of the BBC's monopoly and the raising of some revenue by advertising. This was, however, the point reached at the end of the House of Lords debate when Lord Salisbury promised to consider the Archbishop of Canterbury's proposals. The Government may yet agree to the obvious compromise of allowing the new corporation some licence revenue. It need be in no hurry to make its concessions, since there will be plenty of opportunity not merely while the Bill is being drafted, but even more while it is passing through Parliament.

Threats Between Friends

MR DULLES and M. Bidault came dangerously near to rhetoric in some of the thrusts that they exchanged during the Paris meeting of the Atlantic Council. The one spoke of the "agonising reappraisal of the situation" that would be forced on his government if France did not accept the European Defence Community; the other spoke of the danger of nations reverting to old-fashioned national defence and bilateral alliance if the North Atlantic Treaty Organisation were not strengthened as a further guarantee of France against Germany. Do they really believe that either government can disentangle itself from the costly, interlocking system of airfields, bases, pipe-lines, communications and integrated staffs that have been built up at such vast expense during the last five years? That is the argument of interest. And do they really contemplate, as their hints seem to

BRITISH WHOLESALE PRICES
INDEX NUMBERS 1938=100

suggest, abandoning treaties solemnly signed and ratified? That is the argument of honour. Such cavalier treatment of mutual obligations, if that is what is implied, is deplorable.

It was always to be expected that the integration of Europe would not take place without a threat from outside. For a time Moscow provided the stimulus; now the United States seems to be competing for the role. It is difficult to avoid expressing impatience with the hesitant and dilatory way that the French have treated their own European policy; but it is most unwise to express it in the form of threats. It exposes the threatened government to the taunts of pseudo-patriots, jealous rivals, and those whose minds are charged from the currents of anti-American feeling.

For the first time the French public is seriously debating the detailed case for and against the defence community, an experiment momentous for their nation in every respect. They need assistance in the argument rather than whips to their emotions. What Mr Dulles could and should say publicly is that it is no more the desire of the United States than of France that Germany should become dangerously dominant in Europe, either through uncontrolled military revival or through attempts to change its eastern frontier by force. Dr Adenauer could hardly be mortally offended, for he has himself publicly and frequently insisted on both points.

The French Presidency

AT the time of going to press it is not known yet who will succeed M. Auriol as the sixteenth president of the French Republic. Never before on the eve of the polls has the race been so open and such a number of candidates still left in the field. A cynic might observe that all the stir created in France by the election is much ado about little. Indeed, the vote will provide few indications of the balance of parliamentary forces on the basic issues of home and foreign policy. So many side issues must affect the electors' choice, and the frontier separating many of the candidates is so thin, that it becomes impossible to disentangle a coherent policy from the temporary alignments of close to a thousand deputies and senators. With the withdrawal of M. Herriot the attitude of the various parties and groups towards EDC is unlikely to have had a decisive influence on the vote.

And yet this week's decision in Versailles is an important event in the history of the Fourth Republic. The event will be decisive if only for the fact that the period of calculation, lobbying, pulling of punches and purposeful evasiveness with the presidential election in mind will be over. Public figures will no longer have to watch every move for fear of losing presidential votes. This should be at least one step toward the clarification of the French political scene. No spectacular surprise, however, is to be expected in the selection of a new government, which must take place within a month.

What is more, the French president need not be a mere puppet and his powers may well go beyond the constitutional provisions. Clemenceau's resentful advice to

"choose the stupidest" alluded to the permanent fear of the parliamentarians that a seat at the Elysée may evoke Napoleonic dreams. Hence the prerogatives of the president have always been limited and have been curtailed still further by the constitution of the Fourth Republic. Yet, apart from his ceremonial functions, the president chooses candidates for the premiership, presides at meetings of the Council of Ministers and alone keeps the minutes of the proceedings. At these meetings he is the permanent host to usually ephemeral premiers, and this is not without psychological importance. When French deputies vote for a government they can change their mind on the morrow, but by this week's choice they will be bound for the next seven years.

Beria Into the Dock

THE nightmarish Moscow trick has worked again. Six months after his downfall, the once all-powerful security chief and triumvir of the post-Stalinist regime, Lavrenti Beria, is broken and can now be put into the dock. The statement of the State Prosecutor's office announcing this—an act of accusation in miniature—repeats the charges made in July. Beria and his "fellow plotters" were trying to put the ministry of the interior (MVD) above party and state; as agents of foreign imperialism they were aiming at restoring capitalism in the Soviet Union. Some of the charges recall in their absurdity the notorious purges of the thirties. Beria apparently started his treacherous activity in 1919 at the age of twenty as a British agent in Baku. Thus one of the pillars of the Stalinist regime is now said to have been in foreign pay from start to finish.

Malenkov has managed to present the forthcoming exhibition as a "policemen's trial." The six men who will sit with Beria in the dock have all been prominent in the security services, and can therefore hardly count on public sympathy. Beria's role in the hundred days of "liberalisation" after Stalin's death is distorted. It is merely said that he then took his mask off and started replacing trusted servants of the state by his fellow plotters. Was Ryumin, who as head of the investigation branch extracted faked confessions from the Jewish "doctor-prisoners," among these trusted servants? It would seem so, since he was removed by Beria, and L. E. Vlodzimirsky, who is now among the accused, may well have inherited his post. Those who stood behind the vigilance campaign before Stalin's death are now hitting back. The trial, which should start in a few days' time, may reveal how complete is their victory.

Will it be merely a curtain raiser, the first act in a ghastly tragedy? Will Stalin be presented as a dupe or a victim? How will Malenkov's collaboration with Beria be camouflaged? It may be easy to murder Beria amid general applause, but it will be more difficult to reverse the "liberalising" trend begun after Stalin's death, when Beria was still in power. Those who conduct the trial may well ponder over Macbeth's words:

... the times have been
That, when the brains were out, the man would die,
And there an end; but now, they rise again. ...

House Maintenance

Victory for Partnership

THE first results of the elections to the Federal Assembly of Rhodesia and Nyasaland came at an opportune moment for the British Government. A victory for the Confederates, with their avowed aims of substituting segregation for partnership in contravention of the federal constitution, would be bound to have raised one more African problem for Mr Lyttelton and Lord Swinton. Instead, Mr Lyttelton was able to reply to Labour's motion of censure on Wednesday in the comfortable knowledge that the party favouring partnership between the races had won a decisive victory.

The full results were not known at the time of going to press. But members of Sir Godfrey Huggins's Federal party had won most of the 26 seats filled by direct election on a common roll franchise (the electoral procedure was described in an article on page 824 of *The Economist* last week). The Confederate party's main strength was supposed to be in the Northern Rhodesian copperbelt, where there has been a considerable influx of Afrikaners in the last few years. But in fact the Federal candidates, including Sir Roy Welensky, deputy Prime Minister of the Federation, won easy victories. The most interesting result, however, was at Lusaka, the capital of Northern Rhodesia. In a three-cornered contest, Dr Alexander Scott, a Progressive Liberal Independent, was returned. He is founder and leader of the Progressive party, whose racial policy is uncompromisingly liberal. Although the party did not put up any other candidates, in order not to split the vote against the Confederates, Dr Scott's own victory is as heartening as it may be significant.

Of the African candidates, elected indirectly by the African representative councils, the two returned for Nyasaland are members of the Nyasaland African Congress, a nationalist political organisation. One of the two seats for Africans from Northern Rhodesia, where the same procedure applies, will be filled by Mr Yamba, who has been in the territorial legislature for three years. One of the Africans returned for Southern Rhodesia (mainly by a European vote) belongs to the Federal party; but it will be interesting to see whether the Africans from Southern Rhodesia will in fact line up with the Africans from the two northern territories in the Assembly. It will be a great pity if they do, for the principle of partnership will be greatly strengthened if the Federal Assembly can be divided on lines of party, instead of racial, allegiance.

Farmers' Friends

MINISTERS and ex-Ministers have lately been striking familiar attitudes towards British agriculture, though not without some rumbles of dissent back-stage. Mr Tom Williams has used a party political broadcast to commit the Labour party more firmly than ever to a policy that some of its acuter members believe to be politically bankrupt, as well as economically unwise. After some dissension, Labour supported the increase in horticultural tariffs; in his broadcast Mr Williams stated that the first necessity was to

win back the lost "confidence" of producers, which could only be done by giving them a permanent promise of guaranteed fixed prices and by retaining some state control of marketing and distribution.

In other words, Mr Williams wants to make policies he pursued while in office permanent. He thinks that an enormous change in world conditions ought to make no difference, and wishes to insulate British agriculture completely from the impact of falling world prices. Apparently he would support this policy by restricting imports, by increasing food subsidies, and presumably (when the cost of the subsidies became prohibitive) by a return to rationing. This is a permanent prescription for dear food and scarce food. The mystery is how it gets the support of a party consisting almost exclusively of urban consumers.

Conservative Ministers are not quite so simple-minded. Whereas Mr Williams did not even mention the needs of the housewife, Sir Thomas Dugdale in his broadcast could at least assure her that she would soon have plenty of food to choose from in the shops. But he could not promise her that the food would be reasonably cheap, any more than Mr R. A. Butler, when he spoke on agriculture last week, could give any assurance that the taxpayer's large bill for the support of agriculture will be reduced. Both Ministers were emphatic that agriculture must be supported, but once again they did not indicate the conditions or the limits that should be set to this support.

Protectionist Assumption

THE House of Commons last week debated the Order increasing import duties on fruit and vegetables in an atmosphere of sweet reasonableness and inter-party amity. The irrepressible voice of Sir Waldron Smithers spoke up for free trade and cheap food; otherwise, differences of emphasis and approach hardly flawed the surface of a virtual unanimity. In part, this reflects the generally accepted view that Britain must, even at a fairly heavy price, be more self sufficient in food production than comparative international costs would dictate. This is reasonable enough. What is disheartening is the list of unspoken assumptions that serve as justification for any and every piece of international barrier-building.

The debate showed, for example, the assumption that "the" industry—horticultural or other—is a homogenous concern each of whose components is equally efficient, equally vulnerable to price fluctuations, and equally sacrosanct; the notion that a fringe of marginal producers might be "driven out of business" (i.e., induced to turn to some other job) without simultaneous ruin for producers in general is apparently too abstruse and academic to be ever entertained, let alone given weight. There is the assumption that swings, roundabouts, cockshies and dodgems must one and all, as of right, be made paying propositions; there is the parallel assumption that no one should be expected, when calculating the prospects of an enterprise, to take one year with another and allow for ups and downs.

It can be argued, indeed, that market gardeners are relatively ill equipped for switching from swings to roundabouts and particularly vulnerable to ups and downs, and that this peculiarity calls for a tempering of economic winds.

It can be argued, too, that while these winds can be tempered otherwise than by international trade barriers, tariffs are an immediately applicable and familiar device on which it will take time—and a considerable education of public opinion—to improve. No such sophistication, however, appeared in last week's debate. "The" industry must have a fair price; "the" industry must be safeguarded against the unfair climatic advantages of France and Italy; the price which would keep "the" industry in the style to which it is accustomed is the price which the consumer must pay. Such was the all-party premise, and it leaves the prospects for economic rationality distressingly dim.

Palsy at Panmunjom

THE preliminary discussions which, it is still hoped, will make possible a Korean peace conference, have been broken off. At one point during the seven weeks of talk it seemed that progress was being made; the United Nations side showed its readiness to give way on the Communist demand that neutral Asian members, as well as Soviet representatives, should attend the peace conference. But no corresponding concession was made by the Chinese and Korean Communists. Mr Dean's long list of acceptable sites for the conference, ranging from Geneva and Stockholm to Honolulu, Lisbon and Rio de Janeiro, has been met by stubborn reiteration of the proposal that the conference should be in Panmunjom itself. This scarcely suggests that the Communists are eager for the conference to meet at all; nothing could be more unappetising than the prospect of negotiating through the winter months in this bleak no man's land, under the guns of two armies.

Even less promising is the Communists' insistence that the Russians must attend with full neutral status, so that they would not be bound by the conference's agreed decisions. The idea that the Soviet Union was an innocent neutral in the Korean war is one that Mr Dean may be forgiven for refusing to stomach. The North Korean spokesmen who have maintained this fiction throughout the talks ought surely to be asked if they are questioning the veracity of their own master, Marshal Kim Il Sung; for Kim, in a fulsome message of gratitude to Malenkov, has declared that the "tremendous assistance and material aid given by the Soviet people" during the Korean war "were decisive elements in securing victory."

Tourists on the Oder-Neisse

THE recent visit by a group of French parliamentarians, led by M. Daladier, to Poland, shows how far some Frenchmen are prepared to go in their opposition to German rearmament. M. Daladier himself has been for some time a notorious advocate of a revived link with the east in order to hold down a resurgent Germany. M. Soustelle, who is chairman of the Gaullist parliamentary party (URAS), allegedly went, as did his fellow travellers, in a private capacity; but his journey certainly does not run

counter to the trend of thinking displayed by General de Gaulle at his last press conference. The remainder of the group came from a variety of opposition parties; it was united only by its strong opposition to the European Defence Community.

It is not clear whether the original initiative for the visit came from the French or the Polish side. Nor is it plain what precisely the French party hoped to get out of its jaunt. What is clear, however, is that the visit fits in extraordinarily well with the present Soviet attempt to persuade Western Europe to get rid of the "American imperialists" and to draw together in a European security system directed against Germany and under Soviet patronage. It allows the Polish press to draw the satisfactory conclusion that more and more people in the West are coming to realise that the only certain guarantee of their independence and security lies "in the traditional great alliance of nations which defeated the German imperialists in the last war."

Ostensibly the visitors were to examine the Oder-Neisse frontier. This is certainly a subject the close study of which cannot be left on one side indefinitely. But M. Daladier and his friends have chosen the worst possible means of bringing it into the limelight. They have inflamed German fears that France intends to do a deal with Soviet Russia at Germany's expense; and they have aggravated French fears that if France were joined with Germany in the EDC it would eventually be dragged after its stronger partner in a new *Drang nach Osten*. This egregious piece of mischief-making would have appeared slightly less objectionable had the party brought back information about East German rearmament, which began over four years ago.

The Economist Diary

A reference book for the desk

For the man who seems to have everything he could want, *The Economist Diary* is the ideal present. The appointments and memoranda section is designed to meet the needs of the busy man and in addition there are 72 pages of facts and figures, which together form a complete reference book.

The reference material covers a wide range of subjects, including elections, national income, banking, taxation, crime, manpower, commodities, and a special section giving the basic facts on 47 principal countries in the world.

The volume is bound in red leather and measures 10 in. by 8 in. Price (U.K. only): 41/- including postage and purchase tax. Overseas prices vary widely; a schedule will be sent on request. Full details of *The Economist Diary* are given in an illustrated pamphlet available from:

Diary Department, *The Economist*,
22 Ryder Street, St. James's, London, S.W.1

Landlords and Tenants Again

THE Government's Landlord and Tenant Bill, now read a first time, is designed to be permanent. That of itself is a welcome change from the series of temporary measures that it will replace. The first part of a substantial Bill deals with residential property held on long lease, the second with business tenancies, the third with compensation for improvements made by a tenant and the fourth will make a number of minor but useful changes in the general law affecting landlord and tenant. The first two parts are the more controversial.

Broadly, the first part is intended to give the leaseholder in personal occupation the same protection as other tenants enjoy by virtue of the Rent Acts, but only on condition that he will thereafter pay a fair rent for the property (to be settled by the county court in case of disagreement), based on present-day values. The outcry against dispossession at the end of a long lease began in the days of the Labour Government. The answer was to pass a temporary, standstill Act that in effect gave the tenant in occupation the right to stay on while the Government made up its mind on a policy. The present Government will allow him to stay, but removes the anomaly of requiring the landlord to make a gift of an extended tenancy at the old ground rent. The Bill also deals with repairs and the recovery of their cost from the tenant if he is liable under the covenants in the original lease.

Part II of the Bill extends in two ways the principle of the Landlord and Tenant Act of 1927, that a tenant of business premises should have certain rights to demand an extension of his lease. It will remove some of the formalities that have in the past defeated many claims by tenants, and it puts premises used for professional purposes into the same category as business tenancies. Likewise, it makes an extension of tenancy conditional on the payment of a fair rent. The Bill is likely to be amended in detail in committee, but its outline should win the support of all who do not think the private landlord a social criminal; it nevertheless mangles again the shreds of any belief that the owner of property is entitled to do what he likes with his own.

The LCC Converted

THE London County Council seems to have been converted wholeheartedly to a policy of dispersing population and industry from London. The difficulties and complexities that beset this policy, despite its official endorsement, have long been apparent. They explain if they do not justify the LCC's attempts to go on building more satellite towns in and around the green belt—a programme which has been decisively vetoed by successive planning Ministers. The LCC also offered at one time to build a neighbourhood unit in each of the new towns—an offer that the Government department, perhaps unfortunately, rejected.

Frustrated in these attempts, the LCC is now working hard to bring about a large-scale, long-distance transfer of its surplus population through the machinery provided by

the Town Development Act. Mr Reginald Stamp, the chairman of its housing committee, told a recent meeting of the Town and Country Planning Association that "overspill" schemes are being discussed with no fewer than 60 local authorities, within a radius of 100 miles of London; agreement has been reached in principle with eight of them. The financial basis is that the LCC will pay the statutory rate subsidy for 10 years only on houses provided for Londoners. The receiving local authorities will also qualify for special Exchequer aid toward the provision of ancillary services. In several cases the LCC hopes to carry out the new development itself; three major projects of this kind would between them provide homes for 93,000 people. It would thus be building the equivalent of two or three new towns, as well as minor projects, but the programme is well within the capacity of its housing machine.

None of these proposals has yet been approved, and some are highly tentative, but in total they represent a bold onslaught on the problems of metropolitan congestion. Most of the towns to be expanded are too distant to run the risk of becoming mere "dormitories" for London workers. Indeed Mr Stamp emphasised that the offer of a house in an expanded town would be synchronised with (and conditional on) the offer of a local job. Many of the expanding towns want new industry and have a reasonable chance of getting it. But it is much more doubtful whether employment in London will be correspondingly reduced, and the success of the scheme would depend on that.

The Old Soldiers' Lot

THE three-hundred-and-fifty elderly service officers who were pensioned off under special regulations in 1919, and still survive, can have derived cold comfort from the Paymaster-General's statement in the House of Lords on Tuesday. Lord Selkirk committed the Government no further than to promise to give their case for bigger pensions "high priority" (whatever that means) at some

asbestos cat

Only an inhabitant of the lower regions could possibly have any use for an Asbestos Cat. But if our export department received an order for one, they would scarcely turn a hair. Seriously, the uses of Asbestos in industry are growing at a fantastic rate.

Apart from its first great natural property, the fibrous structure of asbestos renders it easily adaptable to many uses, often in combination with other materials. It can be spun, woven and moulded. We, ourselves, turn it into many products. Amongst these are Caposite and Caposil, both Preformed and Plastic heat insulations, also Capasco Moulded Brake Linings and Asbestolux Incombustible Building Board. It is available as yarn or cloth, as mattresses for locomotive boilers and also has its uses in those transports of delight, the jet liners.

Asbestos may solve some problem that's proving a bit of a headache in your branch of industry. If you think so, consult the people who know best about Asbestos...

Silent Witnesses

IN DAYS GONE BY, the manufacture of nitro-glycerine was controlled by men seated on one-legged stools. It was reckoned that, if the strain of unbroken concentration made them sleepy, they would fall over and wake up. Modern control methods in chemical works present a different picture. The acetone plant at I.C.I.'s Billingham works, for example, contains nearly a hundred controls, yet it is looked after by only two men—constantly on the watch to ensure that everything is working smoothly. The main factor in bringing about this great change is Instrumentation. Close inspection of the acetone plant—typical of I.C.I.'s latest practice—reveals packed rows of fine copper pipes—the “nerves” of the control system—bending in and out of the strange silver shapes of the plant itself, and converging on a control room.

Here, in the “brain” of the plant, details of levels, flows, temperatures and pressures are received by the dials and controllers that line the walls from floor to ceiling. In the centre are two great desks, and here sit the operators, who from time to time press switches and enter readings in a book. It is a far cry from the men on the one-legged stools to these gleaming panels of silent witnesses. The instrument experts who are keeping I.C.I. in the forefront of automatic control in chemical plant have their eyes on the future. Already they have ushered in the change from recording to controlling instruments. But these controllers merely hold the process conditions to levels predetermined by the operator. The next step is to provide a master control which will itself determine how the equipment should operate to give maximum output of a product of the desired quality. It is this type of control that I.C.I. chemists and instrument experts are now developing, with the full resources of a great company behind them.

“This South African Sherry is better than ever!”

Yes, it's remarkable how they manage to keep on shipping finer and finer wine year after year.

How do they do it?

Simply by taking infinite care and not trying to hurry the job. These lovely South African sherrys we are enjoying in this country now are the reward of the infinite patience displayed back through the years by those Wine Farmers at the Cape.

You seem to know a great deal about it!

You remember I went to South Africa last year. I happened to meet a man who took me round the wonderful Wineries there where millions of gallons were being matured for the British market.

How long do they mature them?

The best wines are kept seven years at least before they are shipped. The South African Wine Farmers are determined—in spite of the demands from all over the world—to hold back and let the good stuff mature properly. You see their climate and soil are simply ideal for wine-growing, but it is necessary not only to produce lovely wine but, if you establish a name and reputation, to provide for keeping up the quality over the years.

These South African people certainly keep on improving their wines—especially their sherry. It's a credit to them.

That's what comes of selecting and maturing and waiting and keeping on doing that, and the longer it goes on the better the quality becomes.

I must say this is one of the finest Sherrys I've ever tasted.

Well, keep on drinking the best South African Sherrys and you will find the quality will astonish you.”

SOUTH AFRICAN WINE FARMERS
ASSOCIATION
(LONDON) LIMITED

indefinite future date when purse strings need not be gripped so tightly. The Government has not yet heard the last of this matter; although the Labour Party did nothing for these old soldiers when in power, critics on both sides of the House of Commons are determined to press for a change of heart on what they consider to be a clear moral issue.

The regulations made in 1919 laid down that these pensions might rise or fall by not more than 20 per cent, according to changes in the cost of living. Prices had fallen considerably by 1935, but the pensions were not allowed to drop all the way down with them; instead they were stabilised in that year at 9½ per cent below their original level. The officers therefore gained slightly on the downward swing, but they lost heavily on the subsequent roundabout of inflation. Since 1935 the cost of living has risen by nearly 150 per cent, but the pensions have remained constant; and since the 1935 decision was taken unilaterally they now feel justified in complaining. They can also claim that the cost of restoring their original rights under the regulations of 1919 (about £210,000) is paltry by the standards of modern budgeting. The Government's answer is that this would let loose a snowball of other claims; but only those civil servants, whose pensions were also stabilised in 1935, have a case that is strictly comparable. It is a fair criticism that the officers would have gained their case long ago if they had had a union or other pressure group behind them.

Wandering Scholars

THERE was a time when students could move about Europe from one seat of learning to another almost unhindered by barriers of language, ideology or regulations. Last week in Paris the Committee of Ministers of the Council of Europe did something to restore the student's freedom. Five conventions were signed, of which the most important will materially help young people from any of the sixteen member states in their search for admission to the universities of any of the others.

In most European countries governments can control the policies of their universities in such matters as the qualifications needed for admission; this new agreement commits them to accepting international standards. A diploma allowing a French student to apply for a place at the Sorbonne will in future be equally useful in his attempts to enter, say, a Dutch or Italian university. The diploma does not, of course, guarantee admission, but at least he or she is saved from taking some troublesome new examination before applying.

It would be impossible for the British Government to lay down the law to universities in this country about what qualifications they are or are not to accept. The most that could be done at Paris (and an escape clause was specially inserted in the convention to meet the case) was to promise to pass on the text of the convention to the universities and try to persuade them to accept its principles. Though the qualifications demanded of British students are now fairly uniform, the universities have shown themselves very unwilling to promise acceptance of equivalent qualifications

from students coming from outside the Commonwealth and the United States. In practice exemptions are often granted, but foreign students and officials are understandably perplexed by this apparent anarchy. In a year's time the treaty powers have to report progress. It is desirable that the British universities should by then give proof that they really want to make things easier for the wandering scholar, who has never shown much skill at finding his way through a tangle of regulations.

German Banks Protest

A SHARP rebuke has been issued jointly by German private banks to the ministries in Bonn which conduct foreign trade negotiations. They warn them not to conclude or discuss without the knowledge of the banks agreements that involve the long-term financing of exports. They point out that in future the banks' resources must not be committed in this way. This protest has been occasioned by the recent government agreement with Greece, which promised the delivery of DM 200 million worth of engineering products from Krupp and other firms on eight years' credit. It confirms the report that appeared at the time in *The Economist*, that no provision seemed to have been made for financing the agreement, which—apart from technical difficulties—would involve longer credit than the Export Credit Company is empowered to grant. After the bankers' démarche, it is not clear whether the pact with Greece can be regarded as finally valid.

Any *Schadenfreude* in London over this hitch would be out of place. If the Germans had been ready to risk money in helping Greek development, it would have been all to the common good. On the other hand, if they find the risk too great, it is reassuring to know that there are important steadying elements in Germany which insist on orthodox trading methods. Nobody but the Communists would benefit if German industry were to land itself one day in an economic Stalingrad, because its leaders were too anxious to export to under-developed countries, and believed that courage and will-power alone were enough for the purpose.

Letters to the Editor

Middle Eastern Alternatives

SIR—Mr J. Enoch Powell, in his letter published in your issue of December 12th, has tried to argue about the competence of the United Nations, with regard to the future request by the Egyptian Government to exercise Egypt's right, under the 1936 Treaty, to appeal in 1956 to the United Nations against the presence of British troops in Egypt.

I am not going to discuss whether the United Nations is a continuation of the League of Nations—such a discussion being beyond the limits of this letter—but may I just remind him of Article XXXIII of the United Nations Charter, which states that the parties to any dispute, the continuation of which is likely to endanger the maintenance of international peace and security, shall, first of all, seek a solution by negotiation, inquiry, mediation, conciliation, arbitration, judicial settlement, resort to regional agencies, or arrangements, or other peaceful means of their own choice.

I would also draw his attention to Article XXXVII, which states that should the parties to a dispute of the nature referred to in Article XXXIII fail to settle it by the means indicated in that article, they should refer it to the Security Council.

May I add that it is highly improbable that Great Britain would seriously dispute the ability of the Egyptian Army to ensure by its forces alone the liberty and security of navigation of the Canal, for several reasons, amongst which suffice it to mention:

1. That Great Britain had already agreed in 1946, during the Sidky-Bevin negotiations, to evacuate all her naval, military and air forces from Egyptian territory by September 1, 1949; which meant that the British Government admitted the ability of the Egyptian Army to ensure the entire security of navigation of the Canal: that is, to discharge the task for which the British forces were allowed, under the terms of Article VIII of the Treaty of 1936, to be stationed in the Canal Zone.

2. That the issue would be fought not only under the terms of the 1936 Treaty, but also under the terms of the Treaty of Constantinople of 1888, whose provisions are not at all favourable to the British having a military base in the vicinity of the Canal.

3. That in 1936 the British Government agreed to retain only 10,400 troops to defend the Canal. This number could

easily be replaced by a far greater Egyptian force.

As regards Mr Powell's assertion that the new Treaty between Britain and Egypt "must" provide for an alliance, I would simply point out to him that if friendship will prevail in Anglo-Egyptian relations, it could never be based on a "must."—Yours faithfully,

A. E. ABDEL MAGID
Egyptian Embassy, W.1

A Bullish Bulletin

SIR—The note in your issue of December 5th fails to examine the facts as carefully as consistency with your own criticisms would require.

1. You state that, in discussing British and West German competition in the Middle East, the latest ECE Economic Bulletin for Europe does not mention political factors. Our first sentence on this subject explicitly refers to "political factors working in favour of West Germany and against the United Kingdom in some countries."

2. You say that (except in Persia and Egypt) West Germany has made "only marginal inroads . . . in Britain's markets in most countries" of the Middle East. We did not suggest anything more, though you reported on September 19th that German exports to these countries showed a "substantial increase." At the same time, British exports fell, especially to Egypt but also to other countries of the area except Iraq. Regarding that country, you state that "West Germany has actually lost ground since 1952." You must have looked at the wrong figures in our table: while West German imports fell slightly, its exports to Iraq rose from the first half of 1952 to the first half of 1953 and, in the third quarter, were 2.7 times as great as a year ago.

3. You accuse our Bulletin of "irrelevantly coupling" the foregoing developments and East-West trade. These topics were discussed quite separately, and no attempt was made to establish any connection between them.

4. You state that we no longer emphasise the price factor as an obstacle to East-West trade. Let me refer you to the long special article on East-West trade in our penultimate issue.

5. You question the suggestion that, following the trade agreements recently concluded with the USSR by several western European countries, they may be able to make "substantial savings in dollar imports." While our analyses have never led us to think that increased East-West trade could solve the dollar problem, I am surprised by your doubt

that it could make a significant contribution.

6. You allege that one of our tables conveys the impression that Rumania had fulfilled its housing plan to the extent of 97 per cent, whereas it has so far averaged only 62 per cent during the first three years of its five-year plan ending in 1955. The latter statement is correct (except that it should have referred to the first two years, since 1953 results are not yet known) and emerges unequivocally from the very table you criticise. That table, covering three eastern European countries, clearly distinguishes between their original five-year plan targets, the much lower results so far achieved, and the far higher goals now set in the annual plans for 1953 and later years. It is not a "heinous sin" but surely a matter of general interest to sum up past and planned figures (clearly identified as such) and to see that, even if the new targets are hit, the volume of housing construction achieved in all three countries will still be below that envisaged when the long-term plans were drawn up—as much as one-third less in Czechoslovakia and two-fifths less in Hungary, the two countries which you did not mention. I cannot share your fear that our table would confuse the "ordinary reader," though he would be misled by your comments on it.

7. You say we have no basis for stating that "considerable numbers of farmers who had left for western Germany have now returned to their farms" in the Soviet zone. It was, I should think, clear enough from the context that the statement (preceded by "it was reported") was based on East German sources. You are, of course, free to think that our wording, vague though it was, may imply an overstatement of the actual movement or to doubt that it has occurred at all. In that event, my own judgment, based on evidence available to us, would have to differ from yours.—Yours faithfully,

HAL B. LARY
Economic Commission for Europe,
Geneva

[On Mr Lary's first point, we acknowledge that the phrase he quotes does invalidate our word "mentioned." We should have said that the political factors which dominate British trade with Egypt and Persia received no more than a passing mention in the Bulletin.

As for the other points, it would take a great deal of space to deal with Mr Lary's contentions in full, but the general point is that in our view the ECE Bulletin is more optimistic about the prospects of East-West trade than the facts warrant or than the caution proper to an official organ when dealing with controversial matters should have permitted. But (since the question has been raised elsewhere) we would add that we do not in any way impugn the honesty of the secretariat of the ECE or doubt their good faith; nor do we think they can properly be accused of a pro-Soviet bias. ECE has a natural interest in East-West trade, for this is now almost the only field of endeavour where it has no competitors. We intended to suggest that, in their latest bulletin, the authors had allowed their enthusiasm to run away with them—but no more than that.—EDITOR.]

Scandinavian Neutrality

SIR—The tendency towards a united Scandinavia has made itself felt since the Middle Ages. Since about 1850 this tendency has again come to the front in potent movements, chiefly with cultural but sometimes also with political objects. An important political object was reached by the creation about a year ago of the Northern Council. The attempt at creating in 1948 a Scandinavian league of neutrality was wrecked mainly on Norwegian scepticism, and this was a great disappointment to many people in these countries. As things have developed in Europe in the last year, I am convinced that the time has now come for a change. In order to reach a peace scheme in Europe, I think the western powers, in return for the neutralising of Eastern Germany, should offer the Russians a neutralising of Denmark and Norway, as these two countries might enter a Scandinavian alliance.

As emphasised by Sir Winston Churchill on November 3rd, there are many signs of the Russians wishing to devote their energies to the economic building up of Russia itself, and consequently they must be interested in a peace plan and in a relief of the present tension. For the western powers it would not be an essential military regression if Denmark and Norway left Nato and entered a properly armed Scandinavian league of neutrality. To Denmark and Norway it would not mean any decrease of their security, but it would mean that the Scandinavian peoples would at long last be able, without hindrances, to develop their community and use their chance of obtaining real independent, political, and cultural importance in the world. I believe that it is an intuitive feeling of these possibilities that makes the Danish population hesitate before further integration into the Atlantic Pact.—Yours faithfully,

PER CHRISTENSEN
Uppsala, Sweden

Scientists and Mathematicians

SIR—I write to point out certain erroneous implications in your article last week. A little reflection will, I am sure, convince you that it would be quite impossible for the universities to swallow, permanently, 45 per cent of their own honours graduates in the faculty of science; such an intake would more than double the science faculty staff in two years. The majority of this group of 45 per cent re-emerge two or three years later, usually complete with a PhD, and proceed to industry. The main recruitment to industry, in chemistry at least, is now certainly at the PhD level.

Even in recent years of university expansion, I doubt whether as many as 5 per cent of the honours graduates in science have remained permanently within the universities; and in more stable conditions the percentage will be even smaller. Those who proceed to

research are certainly lost to school teaching; but their normal destination is industry and non-university research, which thus appear to secure, within a few years of graduation, some 70 out of every 100 honours science graduates. The schools could secure only a small increase of highly qualified science teachers at the expense of the universities: in this respect I find your article somewhat misleading, and the problem even more serious than you suppose.—Yours faithfully,

ALEX. H. LAMBERTON
The University, Sheffield

[Mr Lambertson's complaint is against the Advisory Council's statistics, not against our article, in which the universities and industry were throughout treated as the joint, not the several, competitors of the schools.—EDITOR.]

Colonial Bogeyman

SIR—The American Negroes, appropriately enough, have a song which runs, "It ain't what you do it's the way that you do it. . . . That's what gets results." No one would deny the importance of decisiveness in any Minister of the Crown, but obviously in Britain's relations with non-British peoples, whether inside or outside the Commonwealth, the personal element and the way that we do it will count far more than in the domestic affairs of our own comparatively homogeneous society. If affairs in Trieste, for example, go wrong, we can be sure that at least our Foreign Secretary's personal qualities have not helped to aggravate the situation. Are we not entitled to feel the same confidence in our Colonial Secretaries, of whatever party?—Yours faithfully,

London, N.W.8 FRANCES BOYD

Battle for the Savoy

SIR—The attempt made by an outside party to corner the shares of the Savoy Hotel has attracted widespread and diverse comment. Similar attempts became frequent enough in India in recent years to lead to legislation which now lays down that no change in the direction of a company can be made without the consent of the appropriate government authority, who will not allow the old directors to be thrown out unless the person demanding the change is able to demonstrate gross mismanagement or neglect of shareholders' interests.

I venture no opinion as to the merits of the Indian law but merely draw attention to its existence for information.—Yours faithfully,

JOSSLEYN HENNESSY
Hopeman, Moray

★

SIR—I would question Mr Kinnear's diagnosis of the cause of recent takeover bids in your issue of December 5th.

Is not the reason for these bids that present low distributions to shareholders have, in many cases, had an adverse effect on Stock Exchange values? Specula-

tors are thus able to make seemingly fair offers for shares which have been artificially depressed as a result of past inadequate dividends. Surely another case of "too little and too late"! The answer to these bids lies in a more courageous dividend policy on the part of directors.

It is still a recognised accounting principle that a balance sheet is an historical document and does not purport to show the present value of fixed assets, but if revaluation is attempted it must be repeated each year if it is to be consistent. Already the I.C.I. valuation is out of date (being, in fact, carried out in 1950 and not 1952 as stated by your correspondent) and fails to show either the current value or historical cost.

If a company (very commendably) wishes to give shareholders details of the approximate current value of fixed assets the value adopted for insurance purposes could be stated as a note to the accounts.—Yours faithfully,

D. F. GOSCH
London, N.W.3

More Smoking

SIR—It is not so hard as your Note suggests to show that higher food prices have brought hardship to many people. Malnutrition is not made into a myth by a chart showing that total consumption of food has declined by less than 1 per cent while prices have risen 3 per cent.

It is quite obvious that the poorer families both spend a higher proportion of their incomes on food and that the range of food they buy is narrower than for other sections of the community. Secondly, it is a demonstrable fact that the prices of staple foodstuffs have risen by a far greater amount than those of other types: indeed a fall in prices of what are widely regarded as luxury foods has been reflected in the comparatively small movement of the food index as a whole.

Thus, since the population is not a homogeneous whole, it follows that the poorest sections have felt the rise in food prices to a much greater extent than others: railwaymen's wives will not be convinced by your "proof" to the contrary. The fallacious nature of your reasoning is further shown by the statement that "while a little less beer was drunk . . . the money saved there went on more wines and spirits." This clearly suggests that you regard beer- and wine-drinkers as being the same people. What evidence is there for this assumption?—Yours faithfully,

PEGGY COLE
London, W.11

[Food prices in October were only 1 per cent higher than at the beginning of the year, according to the official index—which relates to working class expenditure and includes few luxury foods. Without statistical evidence it may perhaps be assumed that beer drinkers sometimes like a drop of gin. And what answer is there to the argument that if people can spend so much on tobacco they can afford to buy enough food?—EDITOR.]

Books & Publications

Born to be Scarce

THE DOLLAR.

By Roy Harrod.
Macmillan. 156 pages. 9s. 6d.

THE Sir George Watson lectures on "American History, Literature and Institutions" are delivered in alternate years by distinguished American and English scholars. This year, the lecturer's mantle has fallen on Mr Roy Harrod, who chose as his subject the story of the dollar from its evolution out of the old Spanish pieces of eight in the eighteenth century down to the present day, and a little beyond it. In the first two lectures, Mr Harrod sticks fairly closely to his historian's last; in the last two he strays, with apparent relief, into wider comments on general international financial problems.

The main task of the internal monetary system in the United States in the past one hundred and fifty years has been to keep out of the way of the country's ebullient industrial expansion. It has always been a matter for wonder that that system, which has been built up by odd officials and bankers who have been extraordinarily expert but has been distorted at almost every turn by elected politicians who have been extraordinarily ignorant, has been in any fit state to take this necessary avoiding action. Mr Harrod's scholarly comments on the principal characters involved in the dollar's history intensify this wonder, rather than explain it away; it is not clear whether this is a reflection on his researches, or a reflection on the unimportance of monetary theory in an expansionary and competitive economy. Perhaps the most valuable feature of the purely historical sections of his book is his emphasis that the dollar gap is a long-standing phenomenon: that

the big change occurred three quarters of a century ago, and that ever since the United States has had a surplus on visible trade account. What is new in the present situation is not this surplus, but the disappearance of ways in which it has heretofore been met.

Perhaps the most striking sentence in the book, however, occurs fifty years later down the chain of history, when the analysis has reached the eve of the world slump of 1930:

Expert forecasters continued to minimise the scale of readjustment that would be needed, and to pin hopes on the powers of the Federal Reserve, by making credit very easy, to tide the economy over its troubles when the readjustment came.

One of the functions of a good historian

is to make present-day readers shudder; Mr Harrod here makes a palpable—though probably unintentional—hit.

The history of the dollar in the nineteen forties in this book suffers from the fact that Mr Harrod has taken an active part in the controversies discussed; and, like all controversial economists, has sometimes been very wrong. The sad switch from Keynes's clearing union to Harry Dexter White's stabilisation fund is described with admirable fairness; some day somebody is going to say that White's opposition to Keynes's clearing union set the basis for continuing American policy (including Republican policy) and a continuing Russian interest, but the innuendo of deliberate intent will be quite unfair. While being scrupulously fair to White as an economist, however, Mr Harrod is also a little too fair to himself. In this book the scarce currency clause in the IMF's charter still has to be classed as a signally bright idea, in spite of the fact that it has failed; and the devaluation of sterling to \$2.80 in 1949 still has to be classed as a signally stupid action, in spite of the fact that it has succeeded. The consequences of that devaluation are discussed without any reference to its effect on the overseas sterling area's purchases of dollar imports; this is Hamlet without the Prince.

In the last section of the book Mr Harrod again brings out his current King Charles's head: that the dollar price of gold should be doubled. The argument here is marshalled with the brilliance that Mr Harrod has shown in waging all his other controversial campaigns in the past fifteen years, both those that can be seen in retrospect to have been obviously right and those that have proved equally obviously wrong. At one stage, in discussing the role of a gold reserve in war, Mr Harrod excels himself:

Britain, a comparatively small power, and waging war on a much smaller scale than would the United States in the circumstances envisaged, overspent externally some \$50 billion in the Second World War. Revaluing approximately for the change in the purchasing power of the dollar since the time when the money was spent, this may mean about \$90 billion now. There is only about \$22 billion worth of gold in Fort Knox.

An Englishman can be excused if he does not unreservedly recommend this passage to students, but expresses the hope that it will be widely read in the United States.

Chamberlain's Heir

MY POLITICAL LIFE. Vol. II. War and Peace 1914-1929.

L. S. Amery.
Hutchinson. 536 pages. 25s.

MR AMERY'S second volume maintains the high level of its predecessor, and the reader finds himself embarked at once on the swift-flowing narrative of a vigorous career. The diversity of the author's wartime activities is quite astonishing. Others may have played more important parts but none, one might hazard, so many and so various. He galvanises the Unionist leaders into sending to Asquith their famous promise of support; drafts a scheme for building up the new armies on a "Territorial" basis; becomes Director of Civil Recruiting for the Southern Command; crosses to France and secures information from German prisoners which may have saved Ypres; writes a handbook for the use of British troops in the Balkans; dines with too convivial Russians on the Danube and visits Gallipoli; back to England where he works for conscription and the overthrow of Asquith; is torpedoed in the Mediterranean, but gets back in time to persuade Lloyd George, through Milner, to convert the Imperial Conference into an Imperial War Cabinet; suggests the Irish Convention; drafts the Balfour Declaration on Palestine; helps Sir Henry Wilson to organise the Versailles Inter-Allied Council of 1917. After all this, and with the war over, he is rewarded with the Under-Secretaryship for the Colonies, not on his merits but because Milner refused to take the Colonial Office without him.

The later and larger part of the volume is more or less equally divided between the general politics of 1919-29 and the author's departmental activities, at the Colonial Office, the Admiralty, and again the Colonial Office during the same period. The departmental chapters have their own specialised interest. At the Colonial Office Mr Amery was an ambassador in bonds; he could not do the things he most wanted to do. On general politics Mr Amery is interesting on the downfall of the Lloyd George Coalition because he approaches the familiar theme from an unfamiliar angle. He was one of the rebel Under-Secretaries who found a leader in Baldwin, but for him the prime object was the elimination not of Lloyd George but of Churchill, the most formidable of the champions of free trade; for Mr Amery, far more than Austen, more even than Neville, was the political heir of Joseph Chamberlain. Austen had inherited his monocle, Neville his business acumen, but Mr Amery had shouldered, "whole hog," the mantle of Tariff Reform and Salvation by Zollverein. From his standpoint the crucial blunder of the 1920s was Baldwin's appointment of Churchill in 1924 to the Chancellorship from which he could dominate the Baldwin Cabinet and frustrate the professed policy of the Conservative party.

Diplomacy Dissected

THE DIPLOMATS, 1919-1939.

Edited by Gordon A. Craig and Felix Gilbert.
Princeton University Press (London: Geoffrey Cumberlege). 723 pages. 58s. 6d.

THESE twenty-one essays, by seventeen American historians, aim at explaining how international relations were conducted by diplomats during the twenty years of mismanagement and crisis between the last two great wars. The period is not an ideal one for the study of diplomats at work—not because it is so recent, for that carries the advantage (of which the authors have made some use) of providing evidence for the historian from talks with principal participants; nor because the unpublished archives are so very rarely accessible; but because the professionals in the great game of diplomacy, who took their profession seriously, were so often at this time outplayed by the amateurs. More might have been made of this, had there been room among so many specific studies for a general survey of the channels through which powers can best deal with each other. Of the conspicuous international figures, only Chicherin, Curzon and D'Abernon in the twenties, and only Benes, Henderson, Litvinov, and Perth in the thirties, had had any practical diplomatic experience in earlier life; of these seven, only Benes was master in his own house, and the power for which he was responsible had neither the strength nor the geographical situation to pursue an independent policy. The permanent heads of great foreign offices, holding posts from which world-embracing decisions had been made in the days of Holstein or Sir Arthur Nicolson, were now reduced to waiting on the word of the dominant party in the state. The dominant party, in turn, waited either on the word of a "public opinion" that was headstrong and timid by turns, and always ill-informed; or on the word of a self-made autocrat whose passing whim was law.

"The Diplomats" is an eminently scholarly and cautious book, conscientiously tentative in doling out praise and blame and necessarily limited in outlook. Some of the most outspoken comments are to be found among the thirty-one excellent photographs (to which some maps might usefully have been added). Good writing conceals, on the whole, the stodginess of much of the subject matter (though such phrases as "Henderson hewed to his main course" can grate); and while some of the commentary is not without platitude, there were shrewd judgments and apt comparisons. For example, the experience of one German ambassador in 1939 is aptly likened to

that of the protagonist of Kafka's *The Castle*: the same hopeless attempt to reach the masters who neither wanted nor released him, the same incapacity to grasp the nonrational rules by which the Castle operated, the same ambiguous treatment by the lower officials, and the same blind effort to serve rather than merely to obey.

The student who masters this long text, and pursues the references in a myriad footnotes, will acquire a close acquaintance with the events of a score of dismal years. But the causes of international malaise and their cures, the mainsprings of policy, the nature of that loathsome magnetism by which the great dictators enslaved a continent will remain hidden.

Wool Through the Centuries

A SHORT HISTORY OF WOOL AND ITS MANUFACTURE.

By E. Lipson.
Heinemann. 205 pages. 12s. 6d.

FROM the twelfth to the nineteenth century the manufacture of wool and worsted was England's premier industry, and it still employs more than 200,000 people. Mr Lipson gives, principally for England, an authoritative and lucid account of the evolution of the industry; he has included, with revisions, parts of his earlier publication, "The History of the English Woollen and Worsted Industries," and the results of new researches. The book will be useful as an introduction for students and others interested in the woollen industry.

Part I deals with the production of wool, and an interesting review is given of the agrarian revolution in England from the fifteenth to the eighteenth century with the expansion of wool output resulting in depopulation of the countryside and social unrest. The world's production of wool has increased by only one-third in the past half century notwithstanding the growth of the population and higher standards of living. Wool is being increasingly produced in mixed farms instead of on big stations, and this, together with the trend towards breeding sheep for mutton, is tending to put up the price. South Africa is an exception to the general trend. Mr Lipson asserts that the potentialities of the sheep industry there have not yet reached their limit. He notes that the wool produced by Australia, New Zealand, South Africa and England is mainly sold in open competitive auctions, whereas that produced in the United States, Argentina, and Uruguay is sold by private treaty. The many varieties of wool have made the organisation of futures markets difficult. Although the United States, like Britain, is an importer of wool, it imposes a tariff for the benefit of home farmers, with the result that the cost of the raw material is high and exports of cloth from the United States negligible.

In the second part Mr Lipson describes the gild system, the domestic system, and early forms of the factory system in England. People who sing the praises of the domestic system are reminded that it imposed long hours, low wages, child labour and monotonous toil. Mr Lipson contrasts the organisation of cloth manufacture in the west of England, where the clothier was an entrepreneur or trading capitalist, with that in West Yorkshire, where the

master was also a craftsman and where it was easier for a wage earner to become a master. He gives reasons for the decline of East Anglia and the west of England and for the supremacy of West Yorkshire, emphasising that Yorkshire workers were less opposed to new inventions. He reviews the main manufacturing processes and gives special attention to the economic and social effects of inventions. The distress of hand-loom weavers and hand combers during their long and unavailing struggle with the power loom is used as an illustration of the short-term clash between economic progress and social welfare.

The durability of English textile machines, many of which are fifty to eighty years old, has resulted in recent years in a slow rate of replacement and in a lack of stimulus to new inventions. Mr Lipson says that "a large extension in the use of automatic machinery, particularly in winding, warping and weaving," would have advantages; but he points out that British exports depend on quality and that any changes in methods which sacrificed quality to quantity would be detrimental to the industry. Export difficulties are shown by the rise of 139 per cent between 1914 and 1939 in the average *ad valorem* duty payable abroad on a 16-oz British cloth.

Brief mention is made of manufacturing methods and organisation in the United States and France; only incidental references are made to Germany, but Mr Lipson notes the emergence in the interwar years of Japan as a wool manufacturing country specialising in worsteds for tropical wear.

The Evolution of Sea Power

THE NAVY AS AN INSTRUMENT OF POLICY, 1558-1727.

By the late Admiral Sir Herbert Richmond.
Edited by E. A. Hughes.
Cambridge University Press. 404 pages. 60s.

"HE that commands the sea," wrote Bacon, "is at great liberty, and may take as much and as little of the war as he will." A history of naval policy is necessarily a commentary on that text. With each new war the argument develops between those who favour a "continental" strategy and those who prefer to make the main effort by sea. It is one of the virtues of the late Admiral Richmond's detailed narrative of the evolution of sea power up to the reign of George I that he shows how the two schools were often more in harmony than would appear at first sight: troops may have to be sent to the Low Countries, for example, in order to give effect to a policy of blockade or to maintain a continental alliance.

During the period covered by this book one can watch the evolution of a true doctrine of sea power. It is not merely a question of the size of battle fleets: it involves the volume of trade to be protected; the value of the merchant marine in providing a pool of

seamen that can be drawn upon in a crisis (thus freeing the state from the modern burden of maintaining a standing Navy); and the number and quality of overseas bases. On such subjects this book provides a wealth of illustration. But on the whole it is disappointing. The lay reader may well find the operational details tedious (though tactics are excluded), and the specialist will be disappointed by the absence of new material. Since the manuscript was completed in 1942 (Sir Herbert Richmond died before completing a second volume), no use has been made of work done since that date.

Nor are we told that in 1943 he drew upon this draft for his *Ford Lectures*, later published in an extended form under the title of "Statesmen and Sea Power." As the latter book takes the subject up to the present day, and yet includes more of the author's weighty comments on the events which he describes, it can be considered a work of more mature historical writing. The present volume suffers from an inadequate index and is published (by a university press) at an unreasonable price.

The American Rich

SHARES OF UPPER INCOME GROUPS IN INCOME AND SAVINGS.

By Simon Kuznets. Assisted by Elizabeth Jenks.

National Bureau of Economic Research. 725 pages. \$9.00.

THE size of this book is a reflection both of the complexity of income statistics and the care which has gone into this particular research. It puts on record the extent of the social upheaval that has been going on in America since the 1930s. Unfortunately it has had to be confined only to the top 7 per cent of income receivers because the basic material is just not there to allow a complete analysis of income distribution over any length of time. This study has involved a very patient assembly of facts from tax returns and, until recently, these covered only a small fraction of the total population at the highest income levels. But although the rich are only a small group their savings make a large contribution to the total which makes this analysis important on that score alone.

Dr Kuznets finds that the slice of total income going to the top one per cent of the American population, before taxes, dropped from 12 per cent in 1939-40 to 8½ per cent in 1947-48; after taxes the fall was from 11 to 6 per cent. The dependence is traced of the upper group on property incomes and the way in which their share has declined with the improving incomes of the wage-earners. These are statistics which answer the question—who are the rich? They show how they have been educated, where they live and the size of their families. There is a wealth of information here both for the economist and the sociologist.

An Indian Critic of Nehru

NEHRU: THE LOTUS EATER FROM KASHMIR.

By D. F. Karaka.

Derek Verschoyle. 114 pages. 10s.

THIS book is the work of an Indian journalist who describes himself as one of "a whole generation in India whom Jawaharlal Nehru has let down." Being let down is always relative to promise or expectation, and a violent revulsion from an extravagant hero-worship is unlikely to produce temperate or fair-minded criticism. The bitter tone of Mr Karaka's book is too obvious for it to be regarded as a dispassionate estimate of the Indian Prime Minister and his work. It is, nevertheless, an extremely formidable indictment of a man who for better or worse is one of the leading figures of the contemporary world.

The author's main complaint is that Mr Nehru has established a kind of personal rule which is capricious, inefficient and harmful to India both at home and abroad. He claims that Mr Nehru "is not at home with matters of a concrete character, which unfortunately comprise seventy-five per cent of the whole range of governmental activity" and that "he cannot come to grips with any issue which involves a proper study of data"; in spite of this, he constantly overrides cabinet colleagues on matters in which they are specially competent and is subject to continual changes of mind under various personal influences, often reversing cabinet decisions on his own arbitrary authority. He is, according to Mr Karaka, excessively irritated by any adverse opinion and his intolerance of criticism is tending to grow. This attitude places difficulties in the way of efforts to ensure honest administration; thus a recent report of the Auditor-General disclosed financial irregularities in the diplomatic service, but avoided mentioning any names, because persons appointed by Mr Nehru were involved. It is even more serious when the Prime Minister commits the government to policies in flights of rhetoric without regard for the consequences, as when he said: "Let us make up our minds to live on the food we produce or die in the attempt." Quite a number of people have indeed died of starvation in India.

Mr Karaka admits, however, that Mr Nehru still has a very strong hold over the masses of the Indian people, or, as he puts it, "his record as a capable administrator is nil, but his personality as an individual is irresistible." He has become a legendary figure, and many in India hold that it would be far better both for the country and for his own reputation if he were now to hold aloof from day-to-day politics and function as a national, unifying force above parties and factions. But it seems to be contrary to his character to assume such a role. "In his cricket eleven," says Mr Karaka, "he wants to bat, bowl and field, all at the same time, and if he could, be umpire as well."

Sister to Phœbus

GUIDE TO THE MOON.

By Patrick Moore.

Eyre and Spottiswoode. 224 pages. 16s.

WHETHER the moon was earth's child, torn from her by centrifugal imbalance, or one of our planets clawed by gravity into earth's orbit, it has never ceased to preoccupy men's minds much more than the sun that warms them. Until early last century men thought life, as we know it, existed on the moon. Its comings and goings, waxings and wanings, and regular eclipses led to the earliest of human calendars and astronomical or temporal calculations. At least one Greek of the fifth century BC knew that the earth must be round to cast a black shadow across the moon; and the tides—of earth as well as of water, of men and women in their everyday business of life, and of birds and fish as well as of certain animals—were early and causally linked to lunar periodicity. Then with improved telescopes came disillusion, and Browning could write of "the cold o' the moon." Verne and Wells made the moon well-nigh a dead world, mortally cold, "shining, like women, with reflected light."

The author of this commendably simple book corrects popular misconceptions at the rate of at least one to a page. Selene does shine with reflected light, but her sunlit daytime sends the surface temperature up beyond our water's boiling-point, while her night temperature plunges (within minutes) to -250°F. or that of liquid air. No life, as we know it, can exist there; but low lichenous life can. There is a poor, thin atmosphere, sufficient high up to shield the moon from meteoric bombardment; but there are mists on the moon, shifting patches (fogs, vegetation or insects?), and even considerable structural alterations of a sudden kind. There are persistent puzzles, which amateurs can help to solve. Much of the best work on moon maps was done by men with no better telescopes than a 4-in. refractor, which can be bought today for the price of a TV set.

Mr Moore, who has given years to his lunar specialty and collaborated with Dr Wilkins, who writes a foreword, in much modern work, writes easily and well; his explanations, accompanied by clear sketches, can be easily understood. If he sometimes makes what seem airy assumptions about the forthcoming ease of rocket-travel to the moon—all change, by the way, on an artificial satellite or two *en route*, in order to profit from the lower "velocity of escape" beyond earth's pull—he fairly and fully describes all the hazards of spatial travel, even down to the inadequacy of those "space-suits" which the comic strips and TV have already made falsely familiar. While lunar observers await Dr Wilkins's forthcoming book with eagerness, Mr Moore's attractive and authoritative volume is not likely to be bettered for the masses not yet moonstruck; and all potential lunatic voyagers should read it right away.

But where's the alloy
THAT WILL DO THIS JOB?

New designs with higher standards of performance often require improved materials.

It is the job of the metallurgist to see that these materials are available when required.

He and the designer both have the same objective — the project which in a few years' time may be depending on materials not yet commercially developed.

Mond Nickel is working now on such problems in the field of nickel alloys. Now is the time for designers to . . .

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

End of the Beginning

Washington, D.C.

THE world of the Republican Administration will probably never again be what it was before the hour of 12.30 p.m. (Central Standard Time) on November 6th when, as Mr Douglass Cater said in *The Reporter*, Mr Brownell, like the Sorcerer's Apprentice, set forces to work which he could not control and the waters began mounting "around him and his boss." An attorney-general can always retire to his office and bury himself in departmental work without even plucking up the courage to hold a press conference and this Mr Brownell did, disappearing from the headlines after his dramatically effective but essentially irrelevant appearance before the Jenner committee.

The President, on the other hand, had to stay in the limelight and face the music, music which was not particularly pleasant to begin with and became progressively more unpleasant as Senator McCarthy began to call the tune. When the ubiquitous Senator took a few hours off from his investigation of the General Electric Company to go to Liederkranz Hall in New York and, through the courtesy of four craven networks, make, without cost to anyone but the broadcasting companies, a \$300,000 attack on the Administration's foreign policy, the period of uneasy truce between him and the White House had to end. The only question was whether there would be a counter-attack or whether the leadership of the party would go by default.

For nearly a week the President stayed silent in Georgia and there was no sign of life from the Administration. The memory of Mr Harold Stassen's fate, when he tried to fight the Senator last March, was no doubt an inhibiting factor to those who remained in Washington, but it was certainly not far short of the eleventh hour when at last the Secretary of State began to hit back. Few people would have cast Mr Dulles to lead the charge of this light brigade and, when he finished reading his statement, there was a long silence while the reporters present suppressed their inclination to break into most unobjective applause. The Secretary, as it later appeared, had taken the precaution of ensuring support from the heavy brigade, and next morning the President took up his position beside the Secretary of State, but with a statement that was fundamentally defensive in tone. The Senator from Wisconsin knows how to treat opponents who merely defend themselves and he immediately issued his outrageous appeal to the public to demand a change in what Mr Dulles had called "the very heart of American foreign policy."

The President left for Bermuda in the knowledge that, by the time he returned, Mr McCarthy might have won a considerable propaganda victory as the telegrams poured

into the White House. Fortunately the flood never became dangerously large nor did it ever show the majority in favour of his rampant nationalism that the Senator must have expected. But it is in the light of this situation that the President's decision to address the United Nations must be judged. Important as his speech may become internationally as solid proof that the Administration has not given up hope of the possibility of peaceful co-existence, its greatest work may be accomplished at home.

The fact that President Eisenhower chose to make his proposals to the General Assembly has, in itself, considerable domestic significance. In McCarthitania the United Nations, an organisation infiltrated with Communists, is held to be un-American and those who approve of it are subversives or, at best, suspect. It is Texas incidentally, not Mr McCarthy's home state, that is the real heart of McCarthitania. The new Democratic Congressman from Wisconsin recently pointed out that Wisconsin gave Senator McCarthy a majority of only 139,000 last year while it gave the President one of 357,000. He also noted that "there was no move on the part of anyone in Wisconsin to buy the Senator a \$6,000 Cadillac for a wedding present, as there was in Texas."

★

By going to the United Nations and by suggesting there that some of the secrecy—and therefore many of the melodramatic potentialities—should be removed from the subject of atomic energy the President was challenging McCarthyism subtly but directly. So on Tuesday of last week he really abandoned the defensive and began the counter-attack. It will take time for that counter-attack to develop because so much ground has been ceded—unnecessarily, in the view of most people—to the enemy already. Some of it will be hard to recover unless the Administration succeeds in developing a series of policies which restore its confidence that it can fight next year's elections on a record of positive achievement rather than on the issue of Communism in past governments.

At the moment nobody but the President seems to have such confidence. Only a few hours before he spoke Senator Knowland who, as majority leader in the Senate, should be the prophet of his programmes, joined Mr McCarthy in asserting that subversion would be an issue "not just in the 1954 elections but in 1956 as well" and in demanding a tougher policy on allied trade with China. And the Chairman of the Republican National Committee, like Mr Knowland, has shown little respect for General Eisenhower's

idea that Communism will not be an issue next year and, also like Mr Knowland, neglected to utter a word on behalf of the Administration when it was attacked by Mr McCarthy.

It is not only in the way that party officials have been allowed to deny most of what the President stands for that ground has been lost, however. Appointments have been made during the last eleven months which cannot be unmade and which cannot help but prove embarrassing. Mr Dulles seemed, as well he might, rather uncomfortable when he was reminded, during the discussion after he had made his fighting statement, that, when the case of Mr John Paton Davies, whose dismissal Senator McCarthy is demanding, comes to him for decision, it will come with the recommendation of Mr Scott McLeod. Mr McLeod was appointed Grand Inquisitor of the State Department as a gesture of appeasement to Senator McCarthy and it has now become politically almost impossible to dismiss him because of his knowledge of the personnel files.

It is unlikely, also, that the broadcasting networks will regain their courage, except when it comes to refusing time on the air to the *Daily Worker*, as long as two of the four Republicans on the seven-man Federal Communications Commission—and the only two Eisenhower appointees—are what is euphemistically called “friends of McCarthy.”

The counter-attack upon Senator McCarthy, therefore, will not be easy. However, by proposing what is now beginning to be called “Point Four A” (the A standing for atomic) the President has managed to shift attention away from the question of subversion by giving the public and Congress a positive policy to discuss. It may well be that the public, if not Congress, is growing tired of hunting for Communists under every desk. A recent Gallup poll showed that only 5 per cent of those questioned thought that “weeding out Communists” was the President’s most important achievement and the Republicans have just lost control of the City Council in Cincinnati after a campaign which they based entirely on the supposed connections of an official with a Marxist study group many years ago. It is worth remembering at this time that Mr Truman won his astonishing victory in 1948 despite the fact that Mr Alger Hiss’s name had been in the headlines for three months before. But that was during the early days of the Marshall plan and the people were in an affirmative mood. They can be led back to such a mood if last week’s speech is developed with imagination.

Threadbare Flag

FROM A CORRESPONDENT IN NEW YORK

SO much attention has recently been focused on labour troubles in the port of New York that some people think the way to cure shipping woes is to control waterfront crime. But even if success rewards the much-needed effort to clean up the New York docks, now being made by a bi-state commission, with the co-operation of the American Federation of Labour, the basic problems of the American shipping companies whose vessels use the harbour will not be solved.

It is one of the anomalies of the American economy that shipping and shipbuilding are stunted industries, which cannot be compared, either by volume, size or profitability,

with the great business enterprises of which the country is proud. These industries flourish in wartime, when patriotism sends them young recruits, when government subsidies are lavish and costs are minor problems. The rest of the time the shipping and shipbuilding companies limp along, quarrelling among themselves, complaining of foreign competition yet unable to meet it without help, yearning for government aid yet growling at the accompanying government control.

Shipping is the Cinderella even of the transportation industries; only \$100 million was spent for capital purposes on ships and boats in 1950, compared with \$2,100 million for business motor vehicles and \$200 million for aircraft. At the end of 1946 American vessels were carrying 60 per cent of the country’s foreign waterborne commerce. In 1951

they were carrying 40 per cent; such commerce was, for the United States, at a record height, but by 1952 only 34 per cent of it travelled in ships sailing under the American flag. This decline is the more significant because it comes at a period of active trade and generous shipping subsidies.

The present American merchant marine dates in large part from the last war, when some 5,500 vessels were built at top speed (and cost) for war needs. Of those emergency ships, 2,000 have been laid up in “mothballs.” (They are called the National Reserve Fleet, and 200 of them were actually put to work when the Korean war broke out.) Foreign buyers bought 1,200 of them. A count in October, 1953, published by the American Merchant Marine Institute, a private organisation, shows an ocean-going fleet of 1,255 active vessels (of 1,000 gross tons or more) in private hands, of which 812 were dry cargo and passenger-carrying ships and 443 were tankers. In addition, the government has leased 147 privately owned ships to the Navy’s Military Sea Transport Service, while 36 government-owned ships were chartered to private operators.

A deep sea fleet of 1,438 vessels seems small for a country facing two oceans and with almost 5,000 miles of coastline. In terms of dead weight tonnage the United States ranks next to Great Britain; the proportion is now 15 to 22, but Britain has building or on order so much tonnage that, when it is finished, the proportion will be 16 to 28.

For Americans who equate patriotism with national

supremacy in every field, this is a sorry situation, and it is found not only in trans-ocean trade but also in the coastwise trade which was dealt a heavy blow by the war. The pleasant, leisurely voyages that used to be popular between New York and Boston, New York and Charleston or New Orleans, or Seattle and Los Angeles, can no longer be made except by private yachts. No American passenger ships now move in regular service between American ports, and even the harbour tugs and towboats have been hit by current ills.

★

The only things that are new about this situation are certain of its symptoms; “block obsolescence,” for example, which reflects the fact that the present cargo fleet was mostly built in one short five-year period of feverish construction and will therefore become obsolete all at once. Historians claim that the great tradition of American merchant shipping—the tradition that includes the famous clipper ships on the China run—was fractured by the Civil War of 1861-65 when high insurance rates, caused by heavy losses, sent two-thirds of the North’s merchant marine to shelter under foreign flags. When the war was over, Congress ruled that these “deserting” ships could not return to American registry.

Whether this was, in fact, the blow from which the merchant marine never recovered, or whether it merely represented a violent shock to an era and an industry which were already dying, is a detail for argument. But it is certain that, under present economic conditions, shipping in the United States is an essential industry which cannot make ends meet without government help, and is economically and psychologically out of step with the times. Except during a war period ships are built one by one, and are not suited to the economies of mass production. Building costs are consequently too high and so far they do not yield to customary American methods; American shipyards cannot compete with those in Britain unless they are subsidised. Ship operation runs afoul of high wages and trade union attitudes developed in factory work, where men do their day’s stint and then are free. Not only are crews excessively expensive, but discipline, especially in passenger ships, suffers from the absence of the ingrained sea habits praised by those who prefer British, French, or Dutch ships.

Were it not for defence needs most salt water shipping, at least, would on economic grounds better be left to other nations which can do these things more cheaply. The Democrats had that conclusion pounded into them; the Republicans, having put a man at the head of the Maritime Board who got his training in a midwest clothing business, are thus far paying lip service to the defence argument and cutting down subsidies by hard bargaining wherever they can.

Postwar operations have been governed by the terms of the Merchant Marine Act of 1936, which provided for ship building and ship subsidies, and the Merchant Ship Sale Act of 1946, which set forth how and to whom the surplus of war-built vessels could be sold. Between 1946 and January, 1951, when the latter Act expired, some 1,956 surplus ships had been sold (843 to American operators) at an aggregate price of \$1,725 million. In the three years which have since passed the ship owners have spent a good part of their time in controversy and committee, trying to frame new recommendations to Congress for changes in the 1936 Act.

Meanwhile the American taxpayer is like that classic southern character, B’rer Rabbit: “he sit tight and say nothin’.” That he likes on occasion to travel on American ships is indicated by the fact that the President Lines, which make a specialty of sending cruise ships round the world, are said to be booked for a year and a half in advance. Perhaps one of the advantages of an ageing population will be that the numbers who enjoy such trips will increase until American cruise ships become a large and profitable factor in the shipping world. Already the costs of freight handling have risen to the point where passengers who can walk aboard under their own power are more profitable than certain types of cargo which must be loaded and unloaded by men and machines. But in general Americans seem ready to travel in anything that flies or floats, regardless of what flag flies above it; this should comfort those who are trying to fill the dollar gap, however unsatisfactory it is for American shipowners.

American Notes

Week of Decision

THE President’s three-day conference this week with his Congressional leaders was expected to be of critical importance. His view is that unless the party has a record of positive and progressive achievement to lay before the voters next autumn, it will deserve to lose the mid-term elections. In the hope that the Republicans, who have the barest of majorities in Congress, and some of the deepest differences, can be persuaded to work together toward agreed goals, every chairman of committee has been invited to a preview of the Administration’s programmes, which have been drawn up at recent meetings of the Cabinet and the National Security Council. Even Senator McCarthy will be there. Mr Nixon, the Vice-President, who returned this week from his round-the-world good will and fact-finding mission, will be on hand to exercise his gifts of conciliation if necessary. But it is thought that the President, having squared off at Senator McCarthy, may be prepared to act as party leader himself, now that Senator Taft is gone.

The decision taken this week by the National Security Council on the size of the military budget was the basic one, for it is only in military spending that substantial cuts can be made. According to reports, Mr Wilson, the Secretary of Defence, has gone half-way to meet the Secretary of the Treasury: an effort will be made to reduce military spending by from \$3 billion to \$3.5 billion in the year which begins next July, partly by imposing further manpower cuts on the Army, Navy, and Marines (but not the Air Force) and partly by lower purchases of equipment. But, even so, if the Administration is to have any chance of presenting the voters with a balanced cash budget (in which social security receipts are treated as ordinary revenues) as a first instalment on its promise to end deficit

spending, Congress will have to agree to continue the excise and corporate taxes which expire in April.

Tax policy is only the first of a host of controversial issues on which agreement will be hard to secure. The headaches which were postponed in the last session—a new farm policy and revision of the Taft-Hartley Act—are coming home to roost. The Administration would like to be able to share information on atomic weapons with its allies; to broaden social security coverage and increase benefits; and to continue to block the Bricker Resolution, which would curtail the President's authority in foreign affairs. Tariff policy will take its place in the list when the Randall Commission reports in March. To find a Congressional majority for a programme containing so many contentious items would be difficult enough in any pre-election session, when most Congressmen are concerned to save their own seats. It will be more difficult than ever with the majority party divided and with the Democrats, after the attack on Mr Truman, tempted to limit their co-operation to matters of national security.

Less Power for More Money?

CONGRESS has been taking its first close look at the Administration's policy for hydro-electric power, through the eyes of a Senate subcommittee headed by Mr Langer, an unconventional Republican from North Dakota. The immediate controversy has arisen not over the particular aspect of the policy which has attracted most attention—whether or not the federal government is in future to develop dam sites—but over the sale of the electricity to be generated from dams already under construction in the Missouri Basin. This new supply of hydro-electric power will begin to be available in about a year for consumers in ten midwest and mountain states, and Senator Langer has been hearing the

complaints of 350 rural electricity co-operatives, serving 750,000 members, about the terms on which the power is being offered to them.

The law requires that when power generated from government-owned facilities is being sold, preference must be given to supplying public bodies and co-operatives, before private utility companies may buy. The contracts for the new power force the co-operatives to estimate their needs for the next twenty years by January 1st and to undertake to buy that amount of electricity. The purpose of this is to

enable private companies to plan ahead; under the previous arrangement they could not count on a firm supply of federal power. Quite apart from finding it difficult to prepare such long-term estimates in the 90 days that were allowed, the co-operatives object that under these new "marketing criteria" they will almost certainly find themselves short of cheap federal power, and unable to expand unless they supplement their supply by buying from private companies, or else committed to paying for more federal power than they need. They will thus have either to ration their members, or charge them more for the electricity on which farming operations are increasingly dependent; in addition the basic price of federally-generated electricity is also to go up before long.

The spokesmen for the Department of the Interior reply that the marketing criteria are not so inflexible as the contracts make them seem and that a pattern is not necessarily being set for similar contracts in all federal marketing areas. The new contracts will probably be challenged in the courts, as contravening the preference provision in the law, if the department continues in its refusal to modify them. Meanwhile Democrats are arguing that the contracts prove that the Republican power policy, which is supposed to foster co-operation between federal, local and private agencies, will in fact lead to a private power monopoly. Even such faithful admirers of President Eisenhower as the *Denver Post* are suspicious of the new contracts. The Republicans may still lose vital farm votes in the midwest next November even if Congress manages to work out an agricultural price policy that satisfies the farmers.

Striking Tests

THREATS of another dock strike on Christmas Eve and of a strike on the public transport system on New Year's day are still hanging over the New Yorkers who have only just got their newspapers back. They have had more than their fair share of work stoppages lately, for there was both a dock strike and a hold-up in milk supplies in October. But at least the city does not seem to be suffering from lack of milk again, even though the paper containers in which most of its milk is packaged come from tin can manufacturers, and about half the country's can-making capacity has been shut by a strike since the beginning of this month. Luckily neither bottles nor bottling machines are yet entirely obsolete, and they have been used to fill the gap in New York. But some producers of concentrated orange juice have already been forced, by scarcity of tins, to close down at the height of the Florida citrus season. The strike, if it continues, will have serious consequences for growers of some other perishable crops, although stocks of tinned food are so high that it will be a long time before consumers are affected.

The 33,000 strikers, who are demanding higher wages and other changes in their contracts, are members of the steelworkers' union. Their hopes of success will not be encouraged by the settlement which another group, also belonging to the Congress of Industrial Organisations, the automobile and aircraft workers, has just reached with the North American Aviation company. Production of jet and other military aircraft had been held up for seven weeks

خوش آمدید
P.A.L.

"Welcome" is the word at Karachi—and everywhere out East—for PAL. With headquarters at Manila, Philippine Air Lines bring to travel service unequalled familiarity with the East and its ways. One reason why it pays to fly with PAL.

It pays, too, to fly by PAL's long stages, landing only at focal points of the international networks. And to fly in real comfort, in one of PAL's Douglas DC-6 and DC-6B pressurized planes fitted with luxurious sleeping-berths.

PAL fly from London twice weekly. On Saturdays, first stop MADRID. Then on to ROME BEIRUT • KARACHI • CALCUTTA BANGKOK • MANILA. On Tues-

days, we make ROME via HAMBURG and ZURICH, and the stop at CALCUTTA is omitted. From MANILA, frequent flights to HONG KONG, to TAIPEI, and via OKINAWA to TOKYO. And twice weekly via HONOLULU to SAN FRANCISCO.

Fly East with PAL who know the East so well.

20 PALL MALL, LONDON, S.W.1

IF YOU BUY POWER

you should know about **THE BRUSH GROUP**

IF YOU BUY POWER. If you are a commercial attaché, in charge of an irrigation project, a mining engineer, a shipowner . . . if you buy engines for power stations, trains; if you buy power to light a city or pump oil, excavate a building site, or do the hard work on a farm . . . you will be interested in THE BRUSH GROUP.

Here we have gathered in one group the leading British diesel and electrical equipment manufact-

Power from the firms that make up THE BRUSH GROUP

Turbo-alternators, transformers, generators, switchgear, and electric motors

from **BRUSH** Diesel and petrol engines

from 1½ to 100 b.h.p. for agricultural, industrial and marine use

from **Aslow** Diesel engines, power units,

alternator sets, marine propulsion and auxiliary units from 37 to

200 b.h.p. from **McLAREN** Diesel, gas and dual-fuel

engines from 5 to 2,000 b.h.p. for marine, industrial and heavy-duty

applications from **National**

Industrial diesel engines and marine propulsion and auxiliary engines,

ranging from 135 to 3,000 b.h.p. from **Mirrlees**

Power from the most closely-knit organisation

of its kind in Britain, THE BRUSH GROUP

urers. Within this Group are a shared knowledge, an extensive range of manufacturing experience, world-wide servicing facilities, and a company of designers, engineers and craftsmen with a unique variety of technical skills. With this Group organisation and experience, it is certain that we can help considerably in any problems you may have connected with the supply and maintenance of power for your special needs.

THE BRUSH GROUP, DUKE'S COURT, DUKE STREET, ST JAMES'S, LONDON, S.W.1; AND THROUGHOUT THE WORLD

at the company's plants in California and Ohio, but in the end the union accepted the company's offer, a wage increase of only five cents an hour. The strike was part of an organised drive to set a pattern for the industry, in conjunction with the American Federation of Labour's machinists union. But the AFL members came to terms with the managements of the plants where they work without striking; this breakdown of local co-operation has not set a good example of the labour unity for which both organisations are striving at the national level.

To the disappointment of the aircraft workers, the Administration did not intervene in this strike, even though the defence programme was suffering from it. But if, as is possible, there is a railway stoppage before long, President Eisenhower, faced with a nationwide strike for the first time, can hardly refrain from intervening. It looks, however, at the moment as if strikes might be avoided in the contract negotiations with other big unions which are due next year. For if, as has been suggested, the recent series of comparatively small strikes have been designed by union leaders to test the prospects for successful strikes on larger scales next year, then it is the employers who have been encouraged. They have had to concede little or nothing and, at a time when the business outlook is uncertain, the loss of production resulting from a strike can be faced fairly calmly.

Mr Reuther's Remedy

THE trade unions are, however, in a less strong position and are far from calm about the jobs their members are losing. Unemployment rose unseasonably in November, although it is still extraordinarily low; factory employment continued its four-month decline and there are more reports of lay-offs and of less overtime working. Against this back-

ground the automobile workers called a special conference in Washington on full employment and gave their president, Mr Reuther, who is also head of the Congress of Industrial Organisations, a platform on which to present the CIO's cure for economic depression. Mr Reuther's remedy is to keep wage-earners' pockets full: salaries and wages together provide over two-thirds of personal income and, with

government spending falling, personal spending must go up if prosperity is to be maintained. This is an argument for increased wages, to take the place of the rising cost of living, on which wage claims have so long been based, but which is obviously no longer valid. The consumer price index has already levelled off, and is probably now turning down; even if the fall in overtime reduces earnings more than it has so far done, they have a long way to go before they drop below the cost of living.

Mr Reuther's remedy applies not only to wage rates but to minimum wages and unemployment benefits and here it fell, unexpectedly, on sympathetic ears in the Administration. Mr Mitchell, the new Secretary of Labour, told the conference that the President, recognising the importance of enabling workers, even when unemployed, to go on spending, would recommend to Congress that it increase the amount and broaden the coverage of both unemployment compensation and minimum wages. The recommendations are not likely to go as far as Mr Reuther wants, at least where increases are concerned. The Administration will probably ask for a rise of only 15 cents in the present minimum wage of 75 cents an hour, while Mr Reuther would like 50 cents; nor will respect for states' rights allow the President to do more than urge the many states whose systems are unsatisfactory to increase the amount and the duration of the unemployment benefits they pay. Previous experience holds out little hope that mere urging will be effective, or that Congress will be enthusiastic about a higher minimum wage or about bringing more workers either under these regulations or into the unemployment insurance scheme.

Skeleton in the Smokes

THE big tobacco companies are just beginning to admit publicly that there may be a skeleton in their cupboard: the link between cigarette smoking and cancer of the lung which research workers in the field are convinced exists, not simply because deaths from lung cancer and cigarette consumption have both risen sharply, but because of statistical studies of cancer victims and laboratory proof that cigarette tars can produce cancers in mice.

The tobacco spokesmen have broken their silence to insist that the case is not proven and to denounce "loose talk," but falling cigarette sales suggest that more will have to be done to restore the smoker's confidence that he is not shortening his life with every puff. Consumption fell each month from July to September and the year's sales are expected to be 2 per cent lower than those in 1952. This is the first decline in over twenty years; even in the 1949 recession consumption, though it did not rise the usual 4 to 6 per cent, held steady—a fact which makes the manufacturers' contention, that high living costs and the fall in overtime working are responsible for the present drop, look like wishful thinking. The capture of nearly a quarter of the market by the longer "king-size" cigarettes may account for some of the fall in the number smoked. But neither of these factors explains why tobacco shares, which in the past have led a charmed and almost depression-proof life, should have fallen while other shares have been rising.

The tobacco companies, which in the past have found

the health motive in advertising the most profitable and the surest way of increasing consumption, so that now ten cigarettes a day are smoked for every American over fifteen, are in danger of being hoist on their own petard. The sales of filter-tip cigarettes, which can claim to give some protection (though hardly enough to warrant the slogan

“just what the doctor ordered”) have been rising so rapidly that most companies feel they must have a filtered cigarette among their brands; the Philip Morris company, for example, has just arranged a merger with Benson and Hedges, owners of the popular “Parliament” filtered cigarette. But in the long run the tobacco companies may have cause to regret their slowness in responding to the doctors’ challenge that it is their duty to provide the money for research, either to acquit the cigarette or, if it is guilty, to isolate the cancer-producing substance and discover if there is a practical way of removing it.

Tax Collector’s Net

CORRUPTION at the Bureau of Internal Revenue was one of the disgraces of the Truman Administration. In the three years since Senator Williams launched his campaign for honest federal tax collection, more than 300 employees of the bureau have been dismissed or allowed to resign. With the clean-up two big fish have been caught who earlier might have been allowed to get away: Mr Arthur Samish, the liquor lobbyist who was said to have the California Legislature in his pocket and who is going to jail for three years for failing to declare \$110,000 he received from an advertising firm for securing a distillery account, and Mr Vincent Hallinan, former presidential candidate of the Independent Progressive party, who has been sent to jail for eighteen months and fined \$50,000 for evasion.

What remains astonishing is the wide mesh of the net with which tax collectors work. When the new commissioner, Mr Andrews, authorised revenue agents to make door-to-door calls in New England, politely inquiring whether householders had filed returns, he hit a jack-pot;

one in eight had not, and \$24 in additional revenue was received for every dollar spent. Some individuals had not filed returns for years, although they enjoyed large incomes. In Denver tax agents were reduced to checking their returns against local telephone directories. Aside from those whose taxes are withheld under pay-as-you-go, tax payment is largely “voluntary” and Congressional parsimony has made it hard for the tax collector to make sure that everyone who should volunteer does so.

Door-to-door collection is to become a permanent tax tool, although some Congressmen have grumbled at the “snoopers.” Politicians, indeed, have proved rather ungrateful for the reorganisation and reform of the service, perhaps because the elimination of political influence and the decentralisation of many tax functions diminishes their ability to do favours for constituents. Under the Republicans, a sharper eye is being kept on large expense accounts and deductions for yachts and similar business costs; and even the small man’s benefits in kind—his free meals, or lodging, or insurance—may, under a recent ruling, be more often taxable.

The House Ways and Means subcommittee, which has been looking into tax enforcement, considers that there is still room for much improvement. It notes that taxpayers are not required to furnish enough details; thus Mr Henry Grunwald, a lobbyist, listed in his 1950 returns \$1,580 from a named corporation, and \$117,000 from “fees.” Taxpayers ought to have to substantiate their expenses; and should be reminded that they are required by law to report payments of \$600 or over to maids, doctors, lawyers, and so on. But the new regime is not all austerity. Tax collectors are instructed not to haggle or nag; there are fewer court cases and they are settled more rapidly. Plans exist for relieving 35 million taxpayers, out of 55 million, of the obligation of filing a return at all—though not of paying their tax. There may be justification for the Republican renaming of the bureau as the Internal Revenue Service.

SHORTER NOTES

A large scale test of protective injections against infantile paralysis will be made early next year on between 500,000 and 1 million children in the next to lowest class in public and private schools in southern states. The project, which will cost \$7½ million, is financed by the National Foundation for Infantile Paralysis. The children, after written agreement from their parents, will be given three injections of a vaccine developed by Dr Jonas Salk from dead polio virus; subsequent studies will determine the value of this immunity and the length of time it provides protection.

The announcement that the Baltimore Orioles will return next year is news for the baseball fan, not the bird watcher; for the first time since 1903, Baltimore has a major league home team. A syndicate of business men has bought the franchise of the St Louis Browns, who have aroused little enthusiasm in Missouri in recent years. It is hoped that the transfer will invigorate both the team’s standing and its earnings as markedly as the removal to Milwaukee of the Boston Braves has done.

The World Overseas

Retrospect of a Muted Assembly

FROM OUR UNITED NATIONS CORRESPONDENT

A DAY after the dramatic appearance of Mr Eisenhower at the United Nations, its Eighth Assembly adjourned. The final ceremony came only two days behind schedule, and almost in a whisper. Laudatory speeches and gallant compliments to the Assembly’s first chairwoman sounded muffled in a chamber still echoing to the terrible realities and forthright hopes which the President had voiced there. Even the weary fact that the Korean negotiations, hanging over the “glass house” like almost visible smog during the entire session, had come to the verge of collapse, so that what should be a final ending could be nothing but a recess, seemed somehow muted by those echoes.

This Assembly was characterised by lowered tensions, quickened work pace, the end of black-or-white choices and the emergence of shifting greys. Delegates holding post mortems in the lounge have been heard to describe it as a “marking time” session, but while the tragic nonsense of Panmunjom did continually cloud it, many things could be done here meanwhile, and were done. The sense of marking time mirrored Korea, not so much the sessions on New York’s East River.

Nevertheless, it is largely true that the most important things were those that did not happen—the outbreaks which did not occur, the crises which did not boil up into angry and prolonged debate. There was plenty of anger on tap; the Russians are supplied with a native brand which they turn on by automatic control, and America’s Mr Lodge has a hard-edged delivery which in its way is almost as tiresome. But the familiar sore spots—Morocco and Tunisia, the Burmese plaint, the antiphonal Korean charges of American germ warfare and Chinese atrocity techniques—these things stirred excitement only to be checked without igniting it.

The Americans were expected to rise to a high scream in the matter of paying awards allowed by the Administrative Tribunal to discharged staff members. It was assumed that Mr Lodge would himself stalk in to state the American position in terms akin to “millions for defence but not one cent for tribute.” Instead, the matter was resolved with appropriate noises from the regular American representative in the Financial Committee, while a British-Canadian-Colombian resolution referred the matter of the Tribunal’s competence to the International Court. Only the cynics murmured that, had this item not coincided with the New York newspaper strike, matters might have appeared far uglier.

Who should be credited with the relatively quiet atmosphere of this Assembly? The presence on the rostrum of an Indian lady with a modulated voice and the demeanour of a greying schoolmistress; the lessened scale of tensions allowed by the Russians; a growing awareness among experienced delegates that jamming through a resolution may neither win friends nor influence events; the improved position of Britain; and the shifting alignments among smaller nations—all these factors played their part. So did individual changes in the delegations, and the subtle but sure influence of the new Secretary-General, Mr Hammarskjöld.

There are reasons to believe that the Americans, who were in part instrumental in naming Mrs Pandit as president of the Assembly, expected India to be grateful and co-operative. If so, they forgot that the Indians have become too skilful tacticians to show whatever gratitude they may have felt over the elevation of their Prime Minister’s sister. Mrs Pandit herself made it plain from the start that she would have no favourites. The day she called down her former colleague, Mr Krishna Menon, is starred in delegates’ memories along with the moment when she ruled Mr Vyshinsky out of order and cut him off from translation with no more effort than the pressure of a finger on a button.

Indians and Intricacies

But if the chairwoman’s influence was cast on the side of peace and fair rulings in plenary session, other Indian delegates did not hesitate to assert themselves, and not only in the committee assigned to deal with the two charges against South Africa (the treatment of Indians, and *apartheid*) which were India’s immediate concern. In the Fourth (trusteeship) Committee, too, the Indian delegate was both crafty and persistent in championing African complaints against the colonial powers. Over strong British protest Mrs Lakshmi Menon tried very hard to persuade the committee that it should review the affairs of the new Central African Federation. Rumours persist that, if London had not convinced Delhi that this was a matter to be settled within the Commonwealth rather than to be aired in the United Nations, she might have carried her attempt through.

Mrs Menon’s former experience as a member of the Uno secretariat has given her skill in the intricacies of procedure

and a delight in scoring by the book. In the beginning these worked well, and not only because she was blessed with a weak chairman, but toward the end her insistence on scoring technical victories turned against her. Even a wrathful speech from a British delegate did her less good than might be expected in a committee so given to baiting colonial powers.

Perhaps in part because Indian leadership was so assertive, the Asian-Latin combinations which seemed to be approaching solidity in earlier Assemblies were weakened in this one. The Latin Americans prefer to develop their own leaders. At various times the Mexicans, the Argentines and the Guatemalans made a bid for the title, but only with momentary success. The hint of Communist influence which hangs over Guatemala and the disturbing effect of the Puerto Rican affair both impaired Latin solidarity. That Puerto Rico and the United States should appear arm in arm to claim that the island was now self-governing and therefore that information about it need no longer be sent to the Fourth Committee was too much for the anti-colonial enthusiasts.

From a long-term point of view, the housekeeping items proposed by the Secretary-General and accepted with minor changes form one of the solid achievements of this session. Mr Hammarskjöld's troubles with personnel are not yet over, but at least he now has in hand the means he asked for dealing with them. Some necessary groundwork has also been laid for the review of the Charter two years hence, and points of view have begun to emerge. Even the financial balkiness of the United States has proved less obdurate than many people feared. Congress may revive those fears, just as Chinese hysteria may tear jagged holes in whatever hopes of peace have been wrought in these twelve weeks. But for the moment, one has the sense, illusion though it may be, that the United Nations has passed through a critical stage and may live to grow up.

Mr Jagan in India

MR CHEDDI JAGAN has found India tougher going than he expected. His extremism has been masked by assumed moderation and genuine natural charm, but most Indians whom he has met have suspected so strongly that he is a Communist that they have instinctively taken what he says with a pinch of salt. His recent arrival in India caused no more than a faint ripple of excitement; no one immediately sought to make political capital out of his being an Indian; and the press, the political pundits and even Mr Nehru sat stolidly on the fence when he first approached them. He has now converted a number of the leading newspapers; the *Hindu* started the ball rolling with a favourable editorial at the end of last month. It speaks much, however, for the distance Mr Nehru has travelled since he first came to power, that he has declined to raise the question of British Guiana at the United Nations; all he says is that if someone else lodges a protest he will have to back it.

Most Indians have felt that the situation in British Guiana arises from an internal political row rather than a dispute based on the colour of men's skins; it is not therefore a case of colonialism versus nationalism and only concerns

Indians indirectly. Those who regard Mr Jagan as a Communist are anxious to have India keep out, but they deplore the Colonial Office's handling of the situation and resent being put in an awkward position themselves. Those Indians who do not regard Mr Jagan as a Communist are equally indignant about their own embarrassment with regard to Britain. All, particularly those whose friendship with the British is strongest, are very worried at what is considered a "retrograde step" in terms of India's own former struggle for independence—namely the suspension of the Guiana constitution. Even the most anti-Jagan of Indians insists that the British ought either to have arrested Mr Jagan and his associates, made specific charges against them before the courts, and held another election, or suspended the cabinet and then held another election; but they should not have suspended the constitution.

While Indian opinion is still broadly unsympathetic to Mr Jagan, there is a growing feeling that if the stalemate in Guiana persists Mr Nehru will feel bound to take the matter up informally within the Commonwealth. At present, Indians slightly despise Mr Jagan for not staying to fight his battle in Guiana itself, particularly as he has left his wife there to face the music; Gandhi, they say, fought his civil disobedience campaign in India, not in America or other ostensibly sympathetic countries. But Indian feeling may well change if—as seems probable, in view of what Mr Lyttelton has already said—no one is brought to trial, and if no new cabinet is formed representing local opinion in Guiana.

Canadian Tories—II

FROM OUR OTTAWA CORRESPONDENT

THE Canadian Conservative party—renamed by its last leader but one "Progressive Conservative"—has had an unbroken succession of electoral failures since 1930. Its most recent failure in last August's elections has left it with only 50 members in a Parliament of 265 members; yet it is still the official opposition and the only apparent alternative government. It is paradoxical that Canadians, having watched the Republicans in the United States emerge from the wilderness, are inclined to be appalled at the results there; all the same many of them still deplore the fact that Canada's equivalent, the Conservative party, cannot get itself out of the wilderness.

In a previous article it was suggested that personalities play a large part in Canadian federal politics. An equally important fact of Canadian politics—and this has some parallel in the United States—is that the reconciliation of regional differences is so difficult that, in any given set of circumstances, almost any party in power would be inclined to find a similar answer. Another way of putting this is to say that governing Canada is like doing a tightrope act. In a famous example from recent years, the Western politicians demanded that prairie wheat farmers should be compensated because the Anglo-Canadian wheat agreement gave them less return than they expected. The Liberal Cabinet had to calculate whether taxpayers—and particularly the major taxpayers in the major centres of population in the east—would be more annoyed at having to pay \$65 million in extra taxes to compensate the farmers, or whether

Western farmers would be more annoyed if they did not get the bonus.

This was typical of the sort of calculation which any Canadian government has to make about divergent regional interests. If the government is to be pitied for having to reconcile so many differences, what of the Opposition? It is not often realised in this country that any opposition party which seeks to be national in scope—and if it does not, it does not offer an alternative government—faces exactly the same stresses between regional interests as the government of the day. The one great advantage of the opposition is that it does not have the responsibility for reconciling them. But it does have the equally complicated task of attacking the government's reconciliation without offending any interest more than the government has done.

To put it more simply, if the Government is on the tightrope the business of the opposition is to tip it off. But shall it be pushed to the right or the left? To take a current example: the government has refused to subsidise a Canadian merchant marine. The opposition could win some easy support in Vancouver and Halifax and, maybe, Montreal, by clamouring for a subsidy. That would be pushing the government off the rope on one side. But the government has given vague hints that it might sometime, on certain conditions, consider assistance to certain shipping routes. The opposition could no doubt win some kudos with certain consumer groups and among liberals opposed to subsidies of all kinds by saying that it would never in any circumstances consider a subsidised merchant fleet. That would be tipping the other way. Obviously its wise course is to do neither of these things, but to take advantage of its freedom from responsibility and merely point out the disadvantages of the middle road which the government has attempted. But then it can always be asked "What would you do, chum?" And nine times out of ten the answer is that the Government has chosen the only possible compromise.

A Better Tightrope Walker?

This is the essential background to the dilemma of the Canadian Conservative party. Its main error has, perhaps, been to think that by its action and its speeches it could convert the people from Liberalism to Conservatism. It has thought in terms of offering them something positive, of offering them almost anything—except an alternative government. It has consequently involved itself in contradictions too numerous to count, but not too numerous to be remembered. But it has not established in anybody's mind the idea that it commands a wealth of political genius, that it is a band of sincere and experienced men even more skilful than the Liberals at finding acceptable compromises. Can the Conservative party cease to present the appearance of beating around wildly for means to attack the government? Can it, instead, convey the impression that it is the government that is beating around wildly to find acceptable compromises—as it very often is—and that the Conservatives would bring a new spirit which would reconcile differences that baffle the Liberals? To get the tightrope walker off his tightrope and calmly take his place is a feat which requires either a clumsy tightrope walker or an element of the magical in his substitute. It is here that the element of personality plays so large a part in Canadian politics.

Since the war, it must be confessed, the personality of the

political leaders has operated in favour of the Liberals. They have had the great advantage of Mr St. Laurent's leadership, and such highly attractive figures as Mr Pearson (Minister of External Affairs) and Mr Abbott (Minister of Finance). But they have also had some very weak brethren in their team. The Conservatives have had the disadvantage of changing leaders too often. And when they elected their present leader, Mr Drew, they were at least as responsible as he was for presenting him to the public as an aggressive fighter rather than as a conciliator. This was a mistake, since most Canadian voters both in Quebec and outside know that a Prime Minister must be a conciliator.

The Long-Term Goal

The Conservatives have a chance of taking the Liberals' place on the tightrope if the present government makes a serious slip. It has made several quite blatant ones even in the near past, but has always managed to recover. It is bound to make more. Moreover, it must also in the course of nature lose its great vote-getter within a few more years. Mr St. Laurent is now nearing 72. The two most obvious successors are Mr Pearson and Mr Abbott; and at the present it looks as though neither may stay the course. If both have given up politics before Mr St. Laurent retires, the Liberals' choice will not be so easy.

The Conservatives' future, in this case, depends on their ability to persuade the voters that they are reliable and conciliatory and that they have a better leader than the Liberals' successor to Mr St. Laurent. On the face of it there seems no reason why they should not succeed. But they will not succeed if they persist in the ludicrous attempt to score short-term and insignificant points instead of setting their eyes on the long-term goal. It is for the C.C.F. and the other fringe parties to offer baits to particular groups of voters. The Conservatives, as a party with a claim to nationwide support, can only win by showing themselves as broad in their sympathies and their comprehension as their opponents. They are in the wilderness because they have not convinced enough people that they would make a good government. And this is largely because they have been looking only for transitory and trivial successes. They will be unwise to change their leader unless they can discover an unchallengeable vote-getter; and they must remember that the Canadian voters are looking for a statesman, able to reconcile all parts of the nation, not for a politician who can score quick debating points or make large promises.

(Concluded)

Dilemmas in Uganda

BY A CORRESPONDENT RECENTLY IN UGANDA

RECENT events in Uganda must be seen against the double dilemma of British policy in the Protectorate: can economic and political development proceed together, and can a Uganda national spirit be built by kindness? The last Governor, Sir John Hall, was noted for what he did for economic development and the present one, Sir Andrew Cohen, is generally believed to have been sent out by the Labour Government to build the political structure of the country. Yet economic development must not be lost sight of; Sir Andrew has tried to give Africans a share

his predecessor's development plans. There are Africans in the directorate of the Uganda Development Corporation, and African local governments hold shares in its subsidiary projects and in the large agricultural developments of Busoga and Bunyoro. Land, it was announced in 1950, could not be taken for any development without consultation with the African local governments.

These bodies are at the centre of Uganda's problem of political development. They range from Buganda's ancient *lukiko* and three traditional ministers under the Kabaka, to the artificial local governments which are being developed on English local government lines. The districts of Uganda are based for administrative convenience on tribal divisions, and this has had the effect of strengthening tribal consciousness. Mr C. A. G. Wallis in his report, published last February, on "African Local Government in the Protectorate of Uganda" commented on the general desire of the peoples of Uganda to drop the word "local" from the titles of their administrative bodies. He found that their aim was "Home Rule" for each tribe. The most they could consider was "a federation of native states, each with its own ruler and ministers." It is into this pattern

at the Kabaka's demand for separation and self-government for Buganda must be fitted.

There is also the young and growing Uganda National Congress which aims at a self-governing, united Uganda. While it is difficult to assess the immediate strength of this body, it cannot be dismissed, as many in the administration do, as "only a Buganda organisation." Certainly the abaka's people were the first to become politically conscious, as the troubles of 1945 and 1949 showed. As yet, all the non-official and non-mission vernacular newspapers appear in their language, although there is one printed in Busoga which circulates in that district. The importance of the Congress lies in the fact that it has begun to spread beyond the confines of Buganda. Since the disturbances of 1949 it has had agents working in the easternmost district, Toro, where they have been able to lay on suspicions about the Kilembe copper mines and on the setting aside of the Queen Elizabeth National Park as a

game reserve; many Toro tribesmen say that this is part of the tribe's ancient grazing land. This year agents of the Congress have influenced the non-Bantu peoples to the north of Lake Kyoga. There has been trouble in Gulu, the capital of the Northern Province, and political agitation has developed among the Lango. But although the administration regards the Uganda National Congress with suspicion, the fact remains that it is the only body at present in the field that can build up an all-Uganda national spirit.

The Government may proclaim, as Sir John Hall did in 1947, that

It is a matter of prime importance to devise some unifying process which over a period of years will tend to produce a sense of common interest, common purpose—and later, it is hoped, of common nationality—and at the same time to encourage and not impede the growth and development of indigenous political institutions.

Here lies the Government's present dilemma. The refusal of the Buganda *Lukiko* and of the Busoga local government to nominate members to the Legislative Council illustrates the essentially conservative character of the various African local governments. But the men running these bodies are for the most part old in government service and are likely to be undermined by the growth of the political movement.

Worried Business Men

This, as usual in Africa, is feeding on the land grievance, which at present takes the form of a fear of land being lost to new industries. Apart from Kilembe, the industrial and mineral area is in the eastern province. Its power is to come from the Jinja dam—to be opened by the Queen next April—at the exit of the Nile from Lake Victoria. Light industries are to be started nearby, and current is to be taken to the cement factory and mineral complex of Tororo, if it is decided that the latter is a paying proposition; (one foreign firm however, has already withdrawn). European business in Uganda seems to be worried by Sir Andrew Cohen's political developments; it reacted unfavourably last August to the Government's proposals for cotton ginning and to the increased membership of the Legislative Council which is due to take effect from January 1, 1954. These views were summed up in the *East African Standard* in September, at the time of Sir Andrew Cohen's visit to London for consultations; the paper suggested that he was being recalled to be told to slow up political development lest foreign capital be scared from Uganda. Such an allegation had an added political twist in that Sir Andrew is regarded by Africans as "their Governor."

Economic development has been pushed because the Government is afraid that the economy is too dependent on coffee and cotton. The strength of Uganda's development hitherto has been in its encouragement of peasant agriculture; it has been a peaceful country because it has not been faced with revolutionary social change. Now industrial development is planned where there is already a labour shortage; many agricultural employers, the mines in Ankole and Kigezi and some African local governments have been unable to obtain the labour they need. Some observers believe that the Government has not made sufficient preparations for the social change that will result from industrial development. Despite the activities of Sir Andrew Cohen, there is still much of the sleepy complacency that is almost traditional in the Uganda civil service.

Economic Sermon for France

THE approach of Christmas is a busy time for French finance ministers, who must try to steer their budget through parliament before the end of the year. It has also become the period when they are lectured by international bodies about the sorry state of the French economy. These annual sermons do not spring from any Francophobia among West European analysts. It is just that when the reports are drawn up at the end of the year it is found with monotonous regularity that France has forgotten to do its home work. Indeed the survey of the French economy now published by the Organisation for European Economic Co-operation (OEEC), begins by recalling last year's diagnosis and concludes that in broad lines it still applies to the present situation. Despite a greater internal price stability and an improvement in the terms of trade, the present system must still be propped up by substantial American aid. France still has a big trade gap and an important budgetary deficit. Above all, its prices are out of line with those prevailing on the world markets.

As this report was drawn up by France's fellow members of OEEC, though with French participation, it is only natural that stress has been laid on the disparity between French and foreign prices which is preserved by a complicated system of tariffs, quotas and export subsidies. France is the chief laggard in the EPU drive for the liberalisation of European trade. True, up to the middle of this year the quantitative restrictions imposed by France had an appreciable effect only on the volume of imports from Italy. The cut in the trade deficit from \$858 million in the first half of 1952 to \$361 million in the corresponding period of the current year has been largely due to an improvement in the terms of trade, and even so France has been unable to cover its growing deficit with the sterling area through a surplus with other OEEC countries. Experts fear, however, that French persistence with the restrictionist policy may bring retaliation and lead to the collapse of the whole liberalisation drive.

Deadweight of Past Errors

In the months since January, 1952, the price position has slightly improved. The French index of wholesale prices fell by 9 per cent, slightly more than in other member countries, though this reduction was largely the result of the fall in world prices of raw materials. The disparity of prices varies from commodity to commodity. Thus it turned out that the French steel prices, though much higher than the British, were competitive with those prevailing in the other markets of the coal and steel community. The prices of chemicals, on the other hand, and even more of textiles and engineering goods are out of touch with world markets. But the report goes further and sees in the protective wall an important cause of the internal distortions of the French economy.

These distortions are to a great extent the result of the deadweight of past errors. It is recalled that since the first world war long periods of economic stagnation have alternated with shorter spells of inflationary expansion. With the exception of four years—1926 to 1930—inflation has been the automatic companion of economic growth. The Korean boom led to a bigger rise in prices in France

than in the other member countries, and this year's price stability has been accompanied by a 2 per cent fall in the gross national product despite a good harvest.

*FRENCH ECONOMIC DEVELOPMENT
(1923=100)

	Gross National Product	Industrial Production	Construction
1923	100	88	58
1930	125	140	137
1938	106	104	52
1952	134	143	71

* In view of the difficulty of statistical comparisons over long periods, figures should be taken as approximate.

The list of the vagaries of the French economy is not elaborated at length once again. The backwardness of agriculture; the disproportionate cost of distribution; the deplorable state of housing; the iniquity and inefficiency of the fiscal system; the unwillingness of French savers to invest; the existence of sanctioned as well as fraudulent privileges; all these have become commonplaces to the observer of the French scene. The long-term remedies proposed do not differ greatly from the policy followed by the present government. The survey approves fiscal measures for the encouragement of investment and advocates the provision of more medium-term credit. Since the rate of investment should not slacken, it favours credit selection and the pruning of some State expenditure. It sees a chance of cutting building costs by a housing programme based on large-scale production.

A Drastic Cure

In one respect the OEEC doctors have their own view on the cure which should be prescribed for Europe's patient. They seem to see no chance of salvation unless the cure is accompanied by a strong breath of fresh air through the lifting of the protective curtain. Only a strong draught from outside could, in their opinion, get rid of the parasites on the French body economic and the patient is not too delicate to be submitted to such treatment. France has been granted great and growing dollar aid, but this is being used to patch up its balance of payments rather than to support economic expansion. Yet "little is needed to shift France from dangerous economic stagnation to the path of economic recovery."

Implicit in the whole report is the argument that France should devalue or otherwise accept a forced adjustment of its prices through a freer entrance of foreign goods. But the plea for devaluation is nowhere specific. The elimination of the disparity between French and foreign prices is the ever-recurring refrain, but "it is up to the French Government to determine the proper methods to get that result." This caution should finally dispel rumours that an international mission is contemplated to prescribe cures for the French economy. The Germans recall half-proudly, half-bitterly, that when they faced a crisis in 1951 they were not let off with an informal lecture. The EPU management board then appointed a special commission to make recommendations which the Germans put into practice. The Germans in private accuse OEEC of leniency towards the French. Yet they must know that, while France is now taking the end-of-term sermon well in its stride, nothing could be calculated to get worse results than to send to France a supervisory commission including German tutors.

Migration from Israel

FROM A CORRESPONDENT IN TEL-AVIV

BETWEEN May 15, 1948, the day of the establishment of the Jewish state, and July, 1953, a total of 717,923 people immigrated into Israel. This doubling of the population, one of the main goals in Israeli policy, was achieved in five years and mass immigration has now come to a standstill. But Israel, while struggling hard to solve the problems created by so many newcomers now finds itself faced with a new phenomenon, emigration from the country. This topic has been taboo for a long time. It was taken for granted that for the Jewish wanderer to set foot on Israeli soil meant journey's end once and for all. The immigration during the first four years of the new state has been of so dramatic a quality—bearded Yemenites kissing the earth of the Holy Land when stepping from the aircraft which brought them out of the desert—the exhilaration over the unbroken stream of immigrants has been so great, that nobody gave a thought to the possibility that some would not want to stay.

Conspiracy of Silence Broken

These thoughts were probably responsible for the reluctance with which the whole problem of emigration was approached. The conspiracy of silence has however lately been broken. The stream of emigrants became too big to be ignored and groups of emigrants who could not find a livelihood in the countries to which they had returned became a responsibility of the Israeli authorities abroad. Eventually people in Israel came to realise that emigration on a certain scale was only to be expected after the immigration-rush of the last five years. Every country of immigration, including the United States, has had also a certain percentage of emigrés. In Israel too periods of large-scale immigration have always been followed by a period when the tide turned and people went back whence they had come or tried their luck in another country. This happened before world-war I and again in the twenties. That it should happen again in 1952/53 was only to be expected.

The volume of emigrants from Israel is not alarming. As against the 710,000 who came into the country over the last five years 50,000 (roughly 7 per cent) left during the same period. And these were by no means all new immigrants; it is estimated that among those who departed there were some 15,000 old-timers. It is, of course, not easy to find out what made these people move again, although questionnaires are filled in at the request of the authorities and inquiries are made by reporters and statisticians. Migration among Jews is influenced more than among most people by their world-wide connections, by the fate and advice of relations and by the fact that families were scattered all over the world during the war years.

Economic difficulties, however, undoubtedly played a large part in encouraging people to set out on their travels again. Among so many there were bound to be some who did not succeed or who came with illusions about Israel's economic possibilities; more often than not, conditions in the country were painted in much too rosy colours by the emissaries who urged people to go to Israel. From the economic point of view Israel will not lose much if people who were not prepared for hard work leave again in order to try their luck elsewhere. But it can ill-afford to lose

skilled workers or members of professions or scientists. Palestinian Jewry under the Mandate had more intellectuals and more skill than it could use; but Israel today is crying out for skill because the mass-immigration contained only a small fraction of highly-trained people. It has been repeatedly pointed out that the emigration of skilled workers and professional people would cease once the egalitarian system of remuneration—under which a bus driver gets more than a cabinet minister—was modified. But as things stand at present there is not much hope that reforms in this field will be made soon.

Another important point is psychological and intricately bound up with the relations between the various groups of immigrants. More than 50 per cent of the Jewish population in Israel today comes from a wide range of Oriental or North-African countries. Many of the old-timers lump all of these together as "Orientals" but in fact there are wide differences—of social and cultural standards and of intellectual ability—between them. An Iraqi or Egyptian engineer or doctor may be as "westernised" and as able professionally and intellectually as his colleague in Tel-Aviv who came from Germany or Poland. On the other hand there are tens of thousands who may possess some of the treasures of Eastern culture but are totally ignorant of western ways of life and of western methods of production and are therefore unfit for skilled jobs. It is this diversity in the human material which makes life in Israel today so complicated but also of so much interest to the sociologist.

Disappointed Newcomers

It is not surprising that many "Orientals" should have developed an inferiority-complex with all the touchiness and superficial toughness that goes with it; or that some of the Jews from North Africa should prefer to return to their country of origin rather than put up with what they imagine to be the haughtiness of the old-timers. A number of Indian Jews asked to be sent back not only because they could not adjust themselves to hard work and primitive living conditions but also because they complained of "discrimination." When, however, they were sent back by the Jewish Agency they discovered to their dismay that they could not continue in India where they had left off and wanted to return to Israel again.

There are more instances of disappointed emigrés and they cause much trouble to the Israeli authorities abroad. The "Law of the Return" passed by Parliament during the period when exhilaration over mass-immigration was at its height bestows Israeli citizenship on every Jew who enters the country after only a few months' residence. The state thus became responsible for many who decided to emigrate again and who, when stranded abroad without means, claimed the assistance of Israeli authorities. Israel may even see a second return of those who have been sobered by the difficulties of life in other countries.

In the field of emigration as in the field of economics Israeli public opinion is coming down to earth. The very fact that a number—and not all of them newcomers—wish to leave has led to a renewed discussion of the attitude of the old-timers to immigrants, of the relations between the different groups which have to be integrated into a joint community and of the problem of education which cropped up after mass-immigration came to an end. This discussion, if undertaken without cant, might lead to a number of necessary reforms in education and in public life in general.

'Fly fighting' to greater effect

The constant destruction of disease-bearing flies is a measure vital to public health—and one for which any new insecticide offering greater power and effect is sure to be welcomed.

Shell's newest insecticide, called dieldrin, is particularly effective, not only against flies, but also against many other pests, including Cockroaches and Ants, both of which are notoriously difficult to control.

Dieldrin is many times more powerful than DDT and has a more lasting effect. When used in residual spray formulations it will give a greater degree of control at less cost.

Eighteen entomological teams have been carrying out world-wide trials with dieldrin during the past two years and their findings have been followed by large-scale use of dieldrin products in many countries. They are used against the mosquitoes which carry malaria and against those which carry filariasis (*elephantiasis*). In Venezuela they fight the Triatomid Bug which spreads chagas disease. In California they have saved the rice crop from Leaf Miner. In Switzerland they are being used increasingly against Colorado Beetle.

Test sprayings of the South Coast beaches show that dieldrin offers very great promise of being the most effective answer to the current fly infestation (*Coelopa frigida*) in both the larval and adult stages.

THE BUSINESS WORLD

The Shareholder Today

SIXTY-TWO shillings and sixpence was Mr Samuel's price for Savoy Hotel ordinary shares, and in the end he got it from the very directors who had earlier denounced it as "excessive." It is part of the bargain that Worcester Buildings Company (which the directors of the Savoy Hotel had formed to put the Berkeley Hotel properties beyond the reach of Mr Samuel and all the other ordinary shareholders) will be put into liquidation. Mr Samuel has told the Board of Trade that he has ceased to be concerned with an enquiry into the company's affairs. For their part, the directors have not disclosed the source of the support—involving more than £1½ million—which enabled them to take over Mr Samuel's holding. A purchase price of 62s. 6d. is something very different from 45s. 6d. to which the shares dropped at one time this week. Evidently the directors will have a lot of work to do—and a lot of words to eat—before Savoy Hotel shares can earn and maintain a price of 62s. 6d.

When last week's article on the battle for the Savoy was passing through the press, all these events had still to come. Mr Samuel proved—as his earlier offer to sell had already suggested—that he was not so set on the idea of using the Berkeley Hotel property to better advantage that he would throw aside the opportunity for making a handsome capital profit for one of his companies. The danger now is twofold: first, the whole episode may be written off as another speculative coup, in which the forces of good had to pay dearly to defend themselves; secondly, the issues of principle involved in takeover bids and in the technical means that the directors of the Savoy contrived to frustrate Mr Samuel may be quickly forgotten. But before the dust has died down, let it again be recorded that the directors of the Savoy Hotel, by their contrivance of alienating properties that belonged in equity to their shareholders,

have done permanent damage to the basic assumptions of joint stock enterprise. At Question Time on Tuesday, this point passed unmentioned. But there was a battery of questions from Mr Gaitskell and his colleagues which associated "recent violent fluctuations in the prices of the shares of certain companies" with takeover bids, and with the encouragement that they gave to "the increase of dividends, the dissipation of reserves and the abandonment of conservative financial policies." The Chancellor's moderate reply neatly avoided these contentions and suggested that some bids might be good ("in the normal course of business") and others might be open to criticism on several grounds ("I deplore those cases where there is a speculative element").

By this time, all the real issues have become thoroughly confused. That the general public disapprove of typical takeover bids cannot be denied. But that does not make their objections rational. It may be felt that a bid by A from a West End address may be different in essence from one made by B from E.C.2 or by C from Birmingham. Control by "financiers," particularly new financiers may be thought undesirable—bad for the social and economic fabric of the country, bad for "the workers" whose ways may be disturbed, bad for undertakings and their directors long known and respected, and bad for shareholders. All such objection has a sufficient element of truth to make it sound plausible. The set ways of harmless sloth may well be better than the predatory dismembering of a business by a sharp-eyed newcomer whose only interest is in taking out as much cash as possible in the shortest time.

It is a dangerously short step from this position to denounce all bidders as vultures and to demand that their activities are put beyond the pale, if not made

illegal. Official requests go out to the institutions for "special care" in their handling of requests for finance in cases where there appears to be "a speculative element"—without benefit of further definition. Yet in every property transaction that involves a change of ownership, or a change of use, or a change of status from an unrealistic book value to a current market price there must be some element of speculation. The addiction of directors and accountants to the fallacies of historical cost has led to a grotesque undervaluation of properties in many conventional balance sheets and to a corresponding undervaluation in the shares of the companies concerned. One might suppose from the commination of bidders that inflation had never occurred. When they bid, they have an eye to profit, which is no sin or crime. But there may be valuable economic consequences of their action. They may cause the services provided by a given piece of property to be costed at realistic current values, and if this realistic assessment of cost shows that the existing use of the property is uneconomic the comparison may encourage a change in its use to some more economic purpose.

Bidders, in short, are people whose actions make for economic change—it may be disagreeable change even on those occasions when it promises higher economic efficiency, and it may, at the worst, be change coldly intended to produce a quick profit without overmuch regard to the consequences in the longer run. The fact that, even with the best intentions, such bids and the changes that they contemplate produce a bad impression among some sections of the public is not a decisive black mark against them. They may affront modern *mores* that "profits" are a bad thing. They may present an unwelcome challenge to the contemporary spirit that pervades the whole of the British economy—shared by industrial companies and their directors, by the trades unions, by retailers and distributors, and sometimes even by the consumer himself—that adaptation and flexibility must proceed so gingerly that no trouble ensues for anyone.

★

In no sector of the economy has this static philosophy been more apparent than in the relations of directors of public companies to their shareholders and in the rewards that the latter have been conceded in the last decade. The Excess Profits Tax and the Excess Profits Levy have creamed off part of the real substance of industry and the Profits Tax has imposed a penal tax on the distribution of profits (and capital) to shareholders. Successive Governments have exhorted and implored industry to exercise "restraint" in dividend policy, and the last Labour Government was intending to enact a permanent freezing of dividends. Because the Exchequer and accountants have formed an unholy alliance to deny the principles of replacement cost, depreciation allowances have been too small and

"profits" too large; because governments merrily inflated for several years after the war, handsome "profits" emerged from the simple magic of rising prices. The boards of the majority of companies were wise enough to recognise that such easy money (after tax had been paid on it) would not last for ever; they ploughed back the surpluses, extended the undertakings for which they were responsible to shareholders, enjoyed an automatic supply of new capital without having to satisfy the tests of the market and, without realising what they were doing, relegated their ordinary shareholders to the status of holders of non-cumulative second preference shares. At the height of inflation and during the period of the strongest exhortation and heaviest taxation, the equity element in ordinary shares was put into a moral and fiscal deep freeze.

The indignation that has greeted many recent bids and the growing tide of dividend increases is in large part an irrational reaction to the opening of the refrigerator door. It is said that bids and higher dividends are "politically embarrassing." They are bound to be so to any Government that is not prepared to defend the freedom of people, within the law, to buy and sell in the open market or to one that is tempted to compromise on the fundamental principles of a property-owning democracy that form the essential fabric of British company law. In practice, admittedly, a share-owning democracy may be no more enlightened and rational than democracies of other kinds. It can be apathetic to the point of neglecting its own interests. It often provides the perfect field of operation for any board of directors whose motto is "Divide and rule." In theory and in legal form the shareholder is master, exalted by the Companies Act of 1948 far beyond the status of the directors. But in practice he makes no pretence to exert effective control, and is content to leave everything to the directors until he discovers that things are going wrong. There has grown up, too, the doctrine that "the company" is something apart from the totality of the shareholders—that they own no part of its assets, but have a right only to participate in its results to the extent that the directors recommend. It takes an extraordinary crisis to stir shareholders into action; they are incapable of organising themselves to demand changes in policy or increases in dividends; they rank well after the employees, the progress of "the company," and the wellbeing of the customer in the thoughts of the directors whom—in legal form—they appoint.

Is it surprising that in the last decade a wide gulf has opened between the market price and the real value of many ordinary shares? Are not the opportunities for the bidders self-evident? When dividends and share values have lagged so far behind the general rise in the structure of prices, is there anything basically wrong or immoral in activities that spur company directors into distributing a fairer share of "the company's" earnings to the people who own it or to unlock capital values that are not being used by "the company" to the best advantage? Before directors answer that these

things are harmful, they might first compare the rewards to their shareholders with the growth of their own emoluments; if the two sets of figures move in step, their protestations will be heard with the greater respect.

It may not be very realistic to suppose that the general body of investors will be spurred into action by recent events—even by the decision of the Savoy Hotel board to put the Berkeley Hotel properties beyond their shareholders. No new Marx is likely to rally investors with the cry: "Shareholders, you have nothing to lose but your claims." It has been left to the Samuels and the Clores to let loose the suppressed revolution in

Titanium—The Tough Baby

SOON after it was announced this summer that Imperial Chemical Industries would set up a plant to produce titanium in Britain, the requirements of this new structural metal in the United States, the only country where it is known to be in commercial production, increased sharply. These requirements now threaten to outpace existing plans for titanium production there—which in 1953 will probably be no more than 2,500 tons. By the middle of next year the United States may no longer have any surplus of titanium metal for export, because the American aircraft industry, now putting new military machines into production, expects to need more titanium than it can get. Recently the Ministry of Supply has been importing some titanium, and some has come from an ICI pilot plant that may be producing at the rate of 150 tons a year in some months' time. The ICI plant, which will not come into production before the end of 1955, is intended to produce 1,500 tons of raw titanium a year, about a sixth of the output expected in the United States in two years' time. This raises the question whether the Government should review its present plans for production of the metal in Britain, to decide whether these will offer sufficient titanium, in time.

Such a decision, here as in the United States, is for the Government, because titanium, at about £7 a lb, is beyond the purse of anyone but the taxpayer. The ICI plant, like the existing du Pont and Titanium Metals Corporation plants in the United States, could not be justified commercially without a Government contract to purchase at least 75 per cent of its output. What does titanium offer for such a price—about 50 times the American price of aluminium or stainless steel—as a metal for aircraft? Essentially, its unique combination of the two properties that aircraft require from a metal above all else—lightness and great strength.

Titanium is 60 per cent heavier than aluminium, but about half as heavy as stainless steel. Alloys based upon 90 per cent or more of titanium are far stronger than aluminium alloys and stronger than most alloy steels; their strength-weight ratio thus excels all

company finance and whatever may be said in criticism of some aspects of their activities, they have provided a most salutary challenge to conventional ideas in the boardroom. It may well be worth one or two disagreeable episodes to provide object lessons to directors at large. It can certainly be said that neither side emerges with any great credit from the battle for the Savoy. Yet the lessons are clear. It is more sensible to give benefits to existing shareholders than to leave the front door open to a determined bidder; once on the defensive, directors may be led into courses that are themselves indefensible.

common engineering metals and alloys. Because of its high melting-point, great hopes were initially placed upon the potentialities of titanium as a high-temperature metal, but unfortunately its exceptional tensile, fatigue and creep strengths deteriorate if it is continually exposed to temperatures above 450 degrees centigrade, and above 700 degrees titanium absorbs oxygen and nitrogen and becomes brittle. Metallurgists still cherish some hopes of new titanium alloys that may offer high performance up to 800 degrees. But on present signs this medium-weight metal performs best in the medium-temperature range from 250-450 degrees, where its qualities far outclass aluminium or magnesium alloys—leaving work at really high temperatures to special steels, Nimonics and Refractalloys.

But even within these limits the demand for this light, strong metal is likely to grow as the performance of aircraft and guided weapons improves. At speeds up to the speed of sound, there may be little advantage in using titanium in airframes; but when speeds push through the barrier beyond Mach 1.5, the skin temperatures of aircraft may reach 250 degrees; and when that happens titanium may have to replace other light alloys in many parts. As it is, certain new American fighters will incorporate large structural sections of titanium, while the Douglas DC7 civil aircraft, which operates at far lower speeds, is now using titanium in the nacelles of its piston engines. But the immediate and vastly expanding demand for titanium in the United States is for gas turbine engines—a demand that is held to threaten a critical shortage of titanium there in the next few years. The alloys may be suitable for extensive use in engine compressors, particularly in the later stages where temperatures reach a level at which other light alloys perform less efficiently, while stainless steel would be far heavier; and the higher-performance titanium alloys may be used in the turbine discs, where temperatures are much greater. Two key engines for the current American air programme, the Pratt and Whitney J-57 and the General Electric J-75, may incorporate much larger quantities

of titanium than were used in any of the hundred or so prototype and experimental engines that employed titanium parts.

At present prices—roughly \$18 a lb for sheet and \$12 a lb for bar—there is little use for titanium outside military aircraft. There is a small but possibly growing use in vulnerable parts of chemical plant, because it adds exceptional resistance to corrosion to its other costly virtues. Titanium production on the scale now contemplated would be quite uneconomic for anything but a large programme of military aircraft; civil aircraft do not enter the range of performance where the use of titanium for any but a few special purposes becomes

imperative. On the other hand, no producer would be in this adolescent industry, defence contracts or not, if he did not believe that the price can eventually be radically reduced to tap a potentially large commercial demand.

★

The present high price of titanium reflects the exasperating cluster of technical problems that have to be solved in its production. When molten, titanium is a "universal solvent" that dissolves or is contaminated by every known refractory; moreover, it reacts with the oxygen and nitrogen of the air, so that all extractive and smelting operations have to be carried out under vacuum or in an inert gas. The metal must be extracted with high purity—if not, its qualities will be greatly impaired; and there is no known way of removing any contaminants that it may pick up during extraction. The rutile and ilmenite ores in which it appears as titanium dioxide—more familiar, and in far

greater demand, as a most effective white pigment rather than as a source of metal—are abundant and cheap; they cost only a few cents a lb. But the Kroll process, still the only commercial method of extraction in use, requires the chlorination of the dioxide and then its reaction at red heat with magnesium—itsself an expensive metal, the commercial production of which in Britain is at present only questionably economic.

The "commercially-pure" titanium sponge produced by the Kroll process presents further technical problems in its melting and consolidation into an ingot. Large ingots, weighing up to 4,000 lb, are now being produced; but such a size, necessary if the metal is to be handled efficiently in conventional forging and rolling equipment, is in itself a financial risk—nearly two tons of metal, worth say \$70,000, the quality of which may worry even the experienced producer. Titanium can readily be forged, rolled and wire-drawn; and one American producer is extruding it with the French Sejournet process used also for alloy steels. Owing to the highly reactive properties of molten titanium, casting into complex shapes is not yet practicable, but powder metallurgy offers promise in this field.

Both du Pont and Titanium Metals Corporation, the only two American producers today, use the Kroll process—which was incidentally disdained by industry before the war, and established as the basis of the growing industry only through the persistence of the United States Bureau of Mines and some enthusiasts in the American defence services. Each is at present turning out 4 to 5 tons of the metal a day; by mid-1954 both should be producing 10 tons a day. The Crane Company of Chicago has been awarded a contract to produce 15 tons of titanium sponge a day in another plant using the Kroll process (for which the Government will provide the capital as well as the purchase contract), but this can hardly be in production before 1955; other contracts may be signed following the recent Senate hearings, when the shortage of titanium was surrounded with so much propaganda. Demand for the new aero-engines seems likely to grow faster than the yield of finished titanium products (about 60 per cent of the output of the raw metal "sponge"), but scrap recovery should help to fill the gap. Recovery processes are still in the experimental or pilot stages, but at last they do seem practicable. By 1957, according to present estimates, demand may be in the region of 25,000 tons a year, compared with outputs of 18,000 tons of titanium "sponge" and of 20,000 tons of finished titanium, including recovered scrap.

Every titanium producer sighs for a cheaper extraction process, and for years hopes have centred on an electrolytic method, as is used for aluminium and magnesium. Electrolytic processes on a commercial scale are still out of reach, though perhaps only just; but while American producers are still sure that electrolysis will offer better quality titanium, they are now less sure that this process will be far cheaper.

The visions of "20 cent titanium" have faded; and they believe the introduction of dependable electrolytic methods will be gradual, not an overnight revolution.

The British production plant now being built by ICI follows four years of research into titanium by the company. It does not appear likely that ICI will use an electrolytic process; it seems possible, though this is unconfirmed, that it may use a thermal reaction method differing from the Kroll process, in that the titanium tetrachloride will be reduced with purified sodium and not with magnesium. Experimentally, this process is well established—indeed, some of the first titanium metal ever made was produced by it—but no existing or projected plant in America employs it. The use of purified sodium might call for large amounts of power in electro-metallurgy, but large amounts of power are equally required for the present Kroll process, and would be required for an electrolytic process. Though ICI has experience of producing titanium in a Kroll reactor pilot plant, the inherent difficulties of producing titanium, together with the special problems of starting a new process, introduce more financial risk into this venture than almost any other manufacturer except du Pont (which originally began production at its own risk) has yet faced. The plant itself is being financed by ICI, and though it has if necessary a guaranteed Government market for three-quarters of its output, this will be governed by the prices reigning by 1955 for American titanium. Even using Kroll reactors, the American producers have assured their Government that they hope by 1956 to bring down their prices for titanium

sheet to about \$4 a lb, and for bar down to \$2 a lb. If they should achieve such prices, ICI would need all its vast technical ingenuity and commercial experience to make its new plant pay.

Britain has thus become the second country in the world to announce plans for titanium output beyond an experimental scale, though Americans who have been judging the excellence of Russian technical literature think that there may be some production behind the iron curtain. So far, the small quantities imported here and those produced from ICI's pilot plant have been used for experiment; Rolls Royce, indeed, produced some of the first compressor blades ever made from titanium. The exchange of engineering data has not been in one direction only; a director of Titanium Metals Corporation said last month: "Sending any new engineering material to Rolls Royce can do that material nothing but good." The American producers, indeed, hope to squeeze out some titanium for export here throughout next year. But, whatever may be their judgment of this new metal, British engine designers obviously cannot plan to use titanium in production quantities until it begins to come from ICI in 1955. If that is a handicap, it is one about which little can be done now—Congress, indeed, may be in a temper to clap an embargo even upon the current trickle of exports. Whether Britain's military aircraft and guided missiles are entering the range where sizeable and growing quantities of titanium will become essential, and whether the output at present planned by ICI needs to be accelerated, or supplemented by further British production, are questions that the Government has now to decide.

Business Notes

What Next in Steel?

REMARKABLE examples of muddled thought and a complete lack of constructive policy were the almost exclusive features of last week's House of Commons debate on the sale of the United Steel ordinary shares. Mr Hynd, who moved the Labour resolution, took as his main point that in order to resell the company's capital at a profit the Iron and Steel Holding and Realisation Agency has reorganised the capital so that both the ranking capital and the prospective annual dividend and interest payments to outside interests will be larger than under nationalisation.

That is true even though Mr Hynd apparently did not appreciate that the £10 million of debenture stock does not

enter into the calculation since it represents freshly subscribed cash. On the dividend forecast of 9 per cent the total annual dividend charge will be around £1,700,000 gross against about £740,000 gross interest at 3½ per cent on the compensation stock; but the argument falls because £1¼ million of that prospective charge is equity dividend, the payment of which is dependent upon the availability of earnings.

On one small point only did the debate make a material contribution. Mr George Strauss has modified to a minute extent the wording of Labour's re-nationalisation "threat." In claiming that when Labour is able to nationalise steel again compensation will be limited to the amount already paid and that dividends in excess of 3½ per cent will be taken into account Mr Strauss now explains that he is not referring to new capital which may be raised

meanwhile. For such small mercies small thanks are due. But what of new capital which may be created out of undistributed earnings? And what of the incentive to managements to plough back as Mr Strauss desires if that, too, is not allowed for?

On Labour criticism of the terms of sale of United Steel shares Mr Strauss gave only diffident support to Mr Hynd. He found himself either unwilling or unable to say whether he considered the selling price was too high or too low and was reduced to stigmatising Sir John Morison, head of the realisation agency as the victim of a powerful monopoly—the consortium of City issuing houses which advises on these offers. Surely it is desirable that the agency should have the best financial advice on its financial operations. Surely, too, the outcome shows that the advisers, who would never have dared to dictate to Sir John Morison, at least judged the market closely. Certainly there has been no support for the suggestion that the big interests received excessive allotments.

With United Steel now standing at a discount of 4½d., there is no support from the consortium, no selling and a little buying from large investors. It is some of the smaller applicants who hoped for quick profits who are now selling and finding a shortage of monopolists willing to take their stock. Doubtless the agency would like to make another offer fairly quickly. It had hoped to sell the relatively small Lancashire Steel in mid-December. Now it is not to be expected that anything can be done until February. Whether it will then be the relatively large Stewarts and Lloyds or Lancashire Steel may depend in part upon the size of the investor's appetite.

Exports—1953 and After

THE provisional returns of Britain's overseas trade in November could hardly be better. The value of exports was the highest for twenty months, imports were rather lower than in October and the gross visible trade deficit was the lowest for three years. Although November had only 25 working days, two fewer than the previous month, exports rose to £239.9 million (f.o.b.) from £227.6 million in October and a monthly average of £211.6 million in the third quarter. Re-exports fell by £400,000 to £8.9 million, but were still £400,000 above the third quarter average. On a working day basis the improvement in exports was striking. The average for November was nearly £10 million a day, compared with £8.8 million in October and a third quarter average of £8.5 million.

Exports to North America, however, fell to £25.1 million from £27 million the previous month and a third quarter average of £26.7 million, a rise of £500,000 to £13.8 million in shipments to Canada being more than offset by a rather sharp fall of £2.3 million to £11.3 million in shipments to the United States. The value of imports fell to £272.4 million (c.i.f.) in November from £279.8 million in October and a third quarter average of £274.8 million. The gross visible trade deficit was reduced to £23.5 million, less than half the third quarter average.

The sharp rise in exports in November has given a veneer—but no more—to the figures for the first eleven months of the year. An increase of some 3 per cent in the

volume of exports in this period has been offset by a slight fall in export prices, so that the total of £214.4 million is no better, in fact £1.4 million worse, than that of the same period of 1952. This comparison does, however, conceal an improvement in the last five months, when exports rose to a monthly average of £220.5 million from £202.6 million in the same period last year. Exports always tend to rise during the autumn, and what is now worrying Ministers, and sending them to stomp the country in the call for greater efforts, is whether the recent improvement can be maintained, if not bettered, in 1954. Shortages of sterling in

UNITED KINGDOM TRADE

* Provisional figures.

the so-called "third markets" may partly account for the decline of £77 million in exports to such countries in the first ten months of the year, but these shortages are not likely to be appreciably eased next year. At the same time competition from Germany is increasing, and the flow of orders, particularly for engineering goods, is not reassuring. It seems that the main effort must continue to be made to the dollar and OEEC markets, where prospects are more promising. Exports to the dollar area rose by £42 million in the first ten months of this year and to the OEEC area by £41 million.

Equity Rights

AFTER representations by about thirty shareholders, Joseph Lucas has reversed its regrettable plan to cease paying interim ordinary dividends. This decision, when announced by the chairman in his annual statement last month, was criticised in these columns and elsewhere, since it would have pressed unnecessarily hard on shareholders. The quick change of mind by the directors must be unreservedly welcomed; it represents a minor victory for shareholders who are prepared to defend their interests.

In another company—Telephone Properties—shareholders holding a minority of the equity capital have also been quick to assert their views. The directors (who control the majority of the votes) set the cat among the pigeons when they announced that the sum of about £2½ million arising from the sale of the company's principal asset, the 83 per cent holding in the equity of National Telephone Company of Venezuela, would not be distributed to shareholders as it became payable in instalments over the next four years. Instead, the directors propose to invest this money, turning the business into an investment trust. In

support of this decision, the directors pointed to the company's articles of association which state that profits realised from the sale of capital assets shall not be available for dividends but shall either be transferred to a capital reserve or used in writing down assets. They add that the articles make it impossible to distribute capital profits to members without incurring the risk that such profits might attract tax.

Some shareholders have already pointed a way round by proposing a reduction in the capital to a purely nominal figure. Their opposition to the board's plan is mainly based on the contention that the sale of the Venezuelan assets knocks away the principal prop of the business and therefore that it is not in shareholders' interest to keep the company alive. If the directors remain adamant these shareholders may take the drastic step of petitioning the Court for a compulsory winding-up order. In this instance the minority shareholders seem to have a good case at least for demanding an option either to continue with the company in its proposed new form or to take out their equity.

Optimism About Nuclear Energy

THE résumé of the development of nuclear power that Lord Salisbury, the Minister now responsible for atomic energy, gave to the House of Lords this week suggests that there is still a great deal of loose thinking in official circles on the contribution that it is likely to make towards the country's power supplies. He repeated the argument that is already popular among nuclear physicists, namely that world resources of conventional fuels are being burnt up so rapidly that atomic fission will be harnessed to the power turbines only just in time to save mankind from a return to candles and a new Dark Age. He also added that the sooner nuclear power plants release 30 to 40 million tons of coal a year for exports, the better for the country.

This seems a distinctly big assumption to make about a method of power generation on which so little is known. The economics of atomic power plants, so far as any estimates can be made at this early stage, are far from competitive with conventional power plants. Lord Salisbury himself admitted that atomic electricity would cost about 1d. a unit to produce compared with ½d. a unit at the thermal power stations. To suggest, as official speakers have suggested more than once, that atomic power already offers a solution to the problem of the country's marginal electricity supplies is nothing short of wishful thinking. It would be much fairer to the scientists concerned with the difficult task of designing and building the first nuclear power plants, if Government statements were in future to make it quite clear that such plants are wholly experimental, and that the time to assess their role in the fuel and power industry of the country will come when something positive is known about their method of operation and their probable cost.

Payout for Colliery Houses

THE December issue of Treasury 3½ per cent stock 1977-80 in part compensation for the nationalised coal mines and their ancillaries is the largest of these half-yearly

stock issues since the process of compensation in instalments began in 1950. On this occasion compensation amounting to £33 million has been satisfied by the issue of £35½ million nominal of stock at 92 11/16. The amount is large because it is the first issue since the basis for valuing the colliery houses was decided by an independent tribunal set up by the Coal Board and the Mining Association. Many companies have been able to agree the values of their houses, and several liquidators have been able to give shareholders estimates of the break-up values of their shares.

Future instalments of colliery compensation must be smaller—how much smaller it is impossible to guess, for there is no breakdown of the compensation already paid for the various classes of mining properties. Altogether £189 million of colliery compensation money has now been paid and the nominal amount of Treasury 3½ per cent 1977-80 stock (which has been consistently used for the purpose) has risen to about £206 million; the "coal industry value" assets have been fixed at £164,660,000 and ancillaries are believed to rank for about £100 million. Evidently the bulk of the global figure has been paid and a useful start made on the more important ancillaries. It follows that colliery shares have become a much more restricted field for investors seeking capital gains.

This week's issue has contributed to the rally in the gilt-edged market, which was dragging downwards. It represents a disbursement of cash rather than a new stock issue. No money is taken from the pockets of the investing public and the new stock finds its way back to the Government broker in exchange for cash. The recipients are largely companies in the process of liquidating. They sell the stock at once and the Government broker plays longstop to the market, accepting at the start of dealings all the stock offered to him at ¼ below the issue price. If market estimates are to be relied upon, the operation may have injected about £25 million of cash into the system, which is only £2 million less than the United Steel share offer and the New Zealand loan together are withdrawing from it.

EMI out of the Groove?

MANY shareholders must have attended last week's meeting of Electric and Musical Industries in a critical mood, for their dividend had been cut from 12 to 8 per cent (following a fall in trading profits from £1,500,000 to £660,000) while many of EMI's competitors had continued to report higher profits and dividends. After listening to Sir Alexander Aikman's lengthy speech they must have left the meeting with the uneasy feeling that their misgivings (admittedly largely unspoken ones) had not been completely answered.

Sir Alexander isolated a number of factors to explain why the group's profit margins were so sharply reduced in the year to June last, when there was a slight increase in total sales. The least contentious point he made was that the group's sales—over half of which are made abroad—were badly hit by the recession in the primary producing countries. His other point that the group had difficulty in surmounting the obstacle of switching to the production of long-playing records (involving "substantial additional outlay") prompts the observation that other gramophone companies seem to have overcome these difficulties with much

less pain. Similarly, his remark that although the market for the lower-priced television sets was good, it "was not so good for the very high-grade types which constitute the bulk of EMI's programme" could be critically interpreted as meaning that the group had misread the market and had priced some of their sets out of it.

Looking forward, Sir Alexander suggested that the sales of the group's gramophone records and radio and television sets should be at least maintained in the current year of trading. But shareholders were left to find what comfort they could in his conclusion:

The prospects for the immediate future in some directions are much brighter, but in others somewhat unfavourable; some of these are applicable to industry as a whole and some peculiar to our business and to certain territories in which we operate.

Critics of EMI will hardly find in this the answer to their arguments that the group might have extended much further the goodwill associated with the HMV trade mark. And they may still wonder how far EMI's business will be affected by the ending of the reciprocal arrangements for the sale of gramophone records between itself and the Radio Corporation of America.

Finance in Search of Inventions

A BILL to prolong the life of the National Research Development Corporation for another five years, which was published last week-end, did not explain how the Corporation was to be financed during that period. The answer came when the NRDC's accounts for the year ending June 30th were published a few days later. These show that since the Corporation came into being in 1949 it has invested only £500,000 in new inventions out of the £5 million voted for its first five years. The plain truth is that the NRDC has been hard put to find projects into which to put its money. When its first five years end, next June, its unused borrowing powers will amount to at least £4 million, and past experience suggests that this should be ample for the next quinquennial.

The NRDC was set up to provide finance for inventions the development of which might not attract private industry. From the liberal way in which the Corporation's terms of reference have had to be applied, there appear to be far fewer such cases than was at one time believed. The fourteen projects that are now in hand make a decidedly mixed bag, ranging from electronic computers, one of the NRDC's outstanding successes, to potato harvesters, chick sexers, light steam engines, diffraction gratings, several chemical projects, including the production of hecogenin from sisal as a starting-point for cortisone synthesis, and some aspects of the highly important work done by the Royal Aircraft Establishment on plastic structures. A feature of several of these projects is that they originated in laboratories associated with the Department of Scientific and Industrial Research, so that in addition to holding non-military patents owned by the Government (of which the total so far comes to 2,224), the NRDC is becoming partly responsible for developing and exploiting the commercial aspects of government research.

Little Change in Sulphur

THE effect of the return of sulphur and sulphur-bearing pyrites to private trade on January 1st will be more apparent than real. Control of sulphur for its principal use—in the production of acid—will end, but imports of sulphur for this purpose will continue to be restricted to that portion of Britain's requirements that cannot be met from other materials. The Ministry of Materials, which takes a cautious view of the outlook for supplies of sulphur, considers that it is necessary to lessen industry's dependence on this material and to conserve supplies.

Restriction of sulphur imports is designed to keep in full operation the new plants using imported pyrites or domestic anhydrite, which have higher costs than the sulphur-burning plants. The supply of sulphur is admittedly only just in balance with demand, but this itself seems to offer sufficient protection for the new plants. And it is doubtful whether the quantitative restriction of imports, which will be exercised by the granting of specific licences, could be justified before GATT on balance of payments grounds. The United States, however, can find a ready market for the sulphur that it is prepared to export, and is unlikely to raise any objections. Imports of pyrites will be returned to open general licence.

The National Sulphuric Acid Association, which has acted as the Ministry's trading agent during the years of control, will now act for the industry as a principal, as it did before the war. The association will handle all imports of sulphur and allocate supplies to consumers. It will also arrange for the import and distribution of a considerable part of the industry's requirements of pyrites.

Freedom for Silver

THE London silver market has this week moved into line with many other commodity markets in regaining its freedom to obtain supplies where it wishes and irrespective of the currency in which payment has to be made—provided, however, that the silver in question is destined for domestic consumption. Up to the end of last week the market could import silver for this purpose only from non-dollar sources. If the imports from those sources did not suffice for the essential needs of domestic industry the market had access to silver from the Government's stock; this was supplied by the Bank of England at "official" prices based on the current New York parity. It has now been decided that official stocks should no longer be available to supply these needs. The stock is to be husbanded to repay the 80 million ounces of lend-lease silver due to the United States. In consequence, the market is now allowed to buy its "essential" silver in the cheapest market, including the dollar area. This freedom to import dollar silver does not, however, imply freedom to arbitrage and re-export such silver. Multilateral dealings in silver will, as in the past, be subject to official permission, and that will depend upon the relative hardness or softness of the currencies in question. It will still be forbidden to import silver from a hard

*"Don't argue.
Get cracking!"*

The air was electric with tension.

Someone had contradicted the boss. Someone had flouted the great Panjandrum. He had asked to see one of the new Sumlock electric calculating machines, and someone had said that Sumlock didn't make electric machines. Oh, the folly of it—even the air was electric.

WORKERS IN THE TEAM Number 5 in a series

KEEN BLUE EYES accustomed to long hours on the look-out; the clear complexion of one who works out of doors; unobtrusive competence and a sparkle of quiet humour. This is Vic Pitcher, a contented man.

It was in 1927 that he began to drive a lorry for the Company as his father did before him. Now he has two sons in the firm. He has covered well over three-quarters of a million miles, is still driving, and still likes it. There is responsibility in delivering big loads of equipment and materials to distant sites where everything depends on punctuality.

He is justly proud of the condi-

tion of the lorry which has been in his charge for 3½ years. On Saturday mornings he works on its maintenance; and behind him are all the resources of the great central transport and equipment depot on which he is based. The depot relies on Vic and Vic relies on the depot, which is part of a very much larger organisation, the Company; and that is made up of many thousands of people who, like Vic, take a pride in their jobs.

LAING

JOHN LAING AND SON LIMITED
BUILDING AND CIVIL ENGINEERING CONTRACTORS

Great Britain, Canada, Union of South Africa, Rhodesia

TI is movement

TI, through its range of manufactures, is concerned with the details of mechanical movement . . . from the speed of a plane flying faster than sound to the power of a truck shifting ten times its weight . . . from the flash of a bicycle downhill to the ceaseless activity of some very small component, so balanced that it does not appear to be moving at all.

TI is a group of inter-related companies whose manufacturing activities are wide, including precision tubes, components and assemblies for engineering, transport and building; bicycles and components; wrought aluminium; steel making and rolling; electrical equipment and appliances; machine tools; mechanical handling; pressure vessels; metal sections; gland packings; paints; bus body framing and seating; road signs; tubular furniture; shop fittings; metal sports goods.

TUBE INVESTMENTS LIMITED, THE ADELPHI, LONDON, W.C.2. Trafalgar 5633

currency area in order to resell it for softer currency. It is not expected that the satisfaction of essential domestic requirements will involve substantial purchases of dollar silver. Indeed, the market has been given to understand that if its freedom to buy dollar silver is used too extensively, the new concessions will be withdrawn.

The relaxation has been made in the confident belief that supplies of non-dollar silver will be more than adequate to satisfy domestic requirements in the months ahead. This confidence is based on recent arrivals in this country of substantial consignments of Russian silver. A large cargo valued at about £4,500,000 made its appearance in October, and most of it was bought by the Bank of England on Government account. Smaller sales have since been made in the London market and have had the effect of wiping out the premium for free or sterling silver over the quotation for official silver based on the New York parity. Thus the arrival of Russian silver has had an effect on the silver market comparable with the impact of consignments of Russian gold on the free market for that metal. During the past week there have been no further sales of gold from Russia, and as a result the free market price has hardened to a few cents premium over the official parity of \$35. Large arrivals of silver from Russia are out of the question for some time to come, since the Baltic ports are freezing over and silver is too weighty a commodity to be economically transported by air. But the supplies have been sufficiently expanded by recent Russian offers to justify the freeing of the market without conjuring up fears of substantial purchases of dollar silver.

Changing Views on Rubber

LIFE has gone out of the rubber share market; the small burst of activity of a fortnight ago died down when the American concession on the rotation of the stockpile fell short of the best hopes. Yet oddly enough some of the leaders of the plantation industry seem at this very moment to be changing their view on the prospects for rubber.

Their change is based mainly on a more favourable interpretation of the statistics. Sir Eric Miller gave shareholders of Harrisons and Crosfield a hint last Monday when he reminded them that the percentage of natural rubber used in the United States had moved from 39.6 in the first half of this year to 44 in October, and he expressed the view that the ratio should reach 50:50 before long. Sir Eric pointed out that this improvement is occurring despite the fact that oil-extended synthetic rubber is several cents per lb cheaper than GR-S. Though he did not explore it, this contrast seems to lend support to the suggestions that oil-extended rubber involves the user in much greater operating costs.

The figures at least make it arguable that the true surplus of natural rubber this year may turn out to be much less than was previously foreseen and that it may shrink away still further next year—provided that there is no more than a moderate fall in the activity of the American consuming industry. Against the Rubber Study Group's prospective nominal surplus of 169,000 tons must be set the increase in the American and British stockpiles which should account for about 80,000 tons by the end of this year and an

increase in manufacturers' stocks throughout the world of around 45,000 tons. This leaves a prospective surplus of no more than 44,000 tons and in view of the questionable nature of the Far Eastern figures, especially when it comes to calculating the dry content of wet rubber, some authorities are inclined to doubt whether the true surplus is so high.

The best estimate for the end of this year is that the United States stockpile may amount to about 1,200,000 tons. That would leave about 50,000 tons still to be bought, presumably in 1954. There is no present confirmation that America intends to use some counterpart sterling for that purpose. But by whatever means rubber is bought in 1954 the gap to be bridged should not be wide, provided that natural rubber does not rise substantially in price.

Seasonable Cheer in Kaffirs

THE recent recovery in the Kaffir market was assisted by the optimistic tone of Mr Robert Annam's speech at the general meeting of Consolidated Gold Fields; it has been kept alive by the unexpectedly good crop of Christmas dividends from the Cape. The distributions recently announced by three mining groups—Anglo-American, Central Mining and Union Corporation—are listed in the accompanying table; only one of these payments is smaller

than that announced last June. Even more surprisingly, in view of the further squeezing of gold profits between the rise in working costs and the running off of the premium on "free" gold sales, five of the producing mines have announced higher dividends than they paid in the summer. Among these increases the stock markets were particularly surprised and pleased by those announced by East Daggafontein, South African Land and Crown Mines.

Building Societies "No Change"

As a whole the building societies have managed well to accommodate themselves to changing interest rates and to play their necessary part in financing the growing amount of private housebuilding. Doubtless many of the smaller societies wish that new shareholders and depositors were easier to find; doubtless some of the borrowers wish that house loans could be arranged to cover higher percentages of the purchase price. But the big societies show formidable growth compared with the days when the standard charge for mortgages was 4 per cent and the standard rate paid on shares only 2½ per cent net.

Leeds Permanent is one of the strongest. Its total assets on September 30th showed a rise of £7,908,672 to £74,649,817. A handsome flow of new money has come in. Shareholders' balances have risen from £55,018,387 to £62,689,997. Reserves at £4,384,179 compare with £4,034,332, but they are now a little below 6 per cent of total assets. The society is fortunate in that the market value of its investments exceeds the book value.

The Woolwich Equitable Building Society's total assets now amount to £85,954,000, the share account having risen by £8,850,741 to £72,040,188. In spite of this flow of investment money, the chairman, Mr G. Leslie Wates, argued at Tuesday's meeting that conditions did not justify any change either in the 2½ per cent net rate paid to shareholders or in the 4½ per cent paid by borrowers. Any general reduction in mortgage rates would, he felt, eat into the society's essential operating margin and it was necessary to maintain a rate on share capital which would enable the society to meet the increased demand for mortgages on new houses. Other responsible leaders of the building society movement will no doubt share Mr Wates's view. It has never been the practice of building societies to make frequent changes in interest rates or to adhere closely to small changes in Bank rate.

Minor Setback in Sales

THE official figures suggest that retail trade was beginning to pick up in October after a very quiet September, but most retailers are far from pleased at their October results. Sales were 6 per cent in value higher than for October, 1952, and the index (1950 = 100) moved from 120 in September to 125, showing the normal seasonal improvement. But these averages hide some sharp fluctuations in the sales of different types of goods and by different classes of shop. Sales of hardware, for example, showed a big rise; but whereas department stores sold 20 per cent more than they did a year earlier, the multiple stores sold only 10 per cent more, and their sales of pots and pans, as distinct from radio and electrical fittings, were up by as little as 4 per cent. Among the small specialist shops the radio and electrical dealers reported an improvement of 18 per cent, whereas ironmongers sold only 5 per cent more.

In clothing sales, improvement was confined to women's and children's clothes; men seem to have bought little more than they did in October, 1952. The multiple stores

(whose figures include the sales of the large chains of variety stores) captured most of the extra trade, for their sales were 10 per cent higher, compared with a bare 5 per cent improvement for the department stores, 2 per cent for the co-operatives, and 1 per cent for the independent retailers, who are the specialised clothing shops. But this winter the overriding preoccupation for all retailers has not been competition between different types of shops, but the weather.

If the widely differing experience of different classes of retailers is disregarded, the figures suggest a moderately satisfactory improvement in clothing sales. But it appears from trade reports that while winter coats sold reasonably well, sales of other winter garments, such as woollen dresses, have been well below expectations. Clothing stocks were not uncomfortably high at the end of October, but they showed

increases ranging from 7 to 25 per cent on the previous year; stocks of certain types of clothing were already beginning to accumulate, have continued to accumulate in the following weeks, and are not likely to revert to normal levels until after the January sales.

Wholesale sales were 3 per cent higher in October than they were twelve months earlier, and deliveries to retailers continued at the very high rates reached in September. There is some concern among wholesalers, however, about the prospect for the spring trade; retailers with winter stocks still on their hands and with the Budget coming into view, are showing no anxiety to take on commitments for new stock.

Chile Sells Copper

COPPER prices sagged on the London market this week on the news that the Chilean Government has at last authorised the immediate resumption of sales from current production at the market price. Cash copper closed on Thursday at £229 a ton, a fall of £3 on the week, and three months' was £2 lower at £219 10s. a ton. In the United States, however, producers maintained the domestic price at about 30 cents a lb (£240 a ton) for electrolytic copper, delivered Connecticut Valley, which is about £8 a ton above

Basic chemical ingredients are as vital to the world's textile industries as flour and salt are to the cook in the making of ravioli. One of these basic chemicals is the range of Hydrosulphites, essential for the dyeing of super-fast colours. The large independent company of Brotherton, established in 1878, is now one of the world's chief manufacturers of these basic chemicals.

A BIG NAME IN THE CHEMICAL WORLD

Brotherton

One of the world's largest manufacturers of hydrosulphites, liquid sulphur dioxide and hexamine. Makers of an extensive range of Metachrome dyes for dyeing wool in all its forms.

Brotherton & Co. Ltd., City Chambers, Leeds. 2.
Also at Manchester, Glasgow, and London.
Works at Birmingham, Wakefield and Birkenhead.

4 ABBEY ORCHARD STREET, WESTMINSTER, LONDON, S.W.1

Have you got
their custom
for Christmas?

They've been out on a buying spree and have come home a lot lighter in pocket. When presents are revealed on Christmas morning, will your product be among them?

It's possible, of course (but by no means certain) that your product is out of their price range at the moment. But it won't always be and you can make yourself a present of their future custom by telling them about it now, so that they put it on the list of things they are looking forward to.

With the biggest daily net sale on earth and the lowest square inch per thousand rate of all national dailies, the Daily Mirror offers you the most powerful mass market coverage in the history of daily newspapers. But even more significant is the fact that the majority of its readers belong to the vital younger generation. Your customers today—next month—next year.

the Government broker's price for electrolytic in London. Sales of Chilean copper to the big American producers with mines in Chile have just been confirmed at 30 cents a lb. for electrolytic, delivered Connecticut Valley; such sales are in fact being made from stocks lying in the United States, and the equivalent amount of metal from current production will be transferred to stocks held in Chile. But it is unlikely that the Americans can hold the domestic price at that level for very long, and the first break may come, as usual, from the custom smelters.

In Britain there is still a real shortage of electrolytic copper, largely because consumers ran down their stocks in anticipation of low prices. This may cushion the market's fall for some time. But in a few months world prices may be appreciably lower. America can hardly absorb Chile's current output of some 30,000 tons a month, and the balance will come on offer to European markets, which may by then be affected by a diversion of Rhodesian and Belgian Congo copper from the United States. By withholding its supplies from the market for the last six months Chile has proved to be the best friend of other copper producers, and the latter can hardly complain now that Chile has re-entered the copper business. They can at least take comfort from the fact that the surplus of about 125,000 tons of Chilean copper is still likely to find its way to the American stockpile.

Boom in Cocoa

FOR most of this season raw cocoa has been rising under the pressure of a persistently strong demand and a prospective shortage of supplies. Fears of a shortage have recently increased, and prices are now poised rather precariously at a high level. Good fermented Gold Coast cocoa is about 330s. per cwt for December-February shipment, c.i.f. UK. Though the Brazilian crops promise to be rather higher than last season's, the West African crops have been disappointing; the rates of purchase by the marketing boards in the Gold Coast and Nigeria have been slow, especially in Nigeria. The revised estimate of the main crop in the Gold Coast, which produces nearly one-third of the world's supply, is expected to be about 225,000 tons or even less, compared with the earlier estimate of 236,000 tons and a crop of 244,000 tons in 1952-53. The outlook for the Nigerian crop is uncertain. It is generally expected to be about 95,000 tons, some 8,000 tons lower than in 1952-53. It might turn out to be a late crop of roughly normal size, but the poor weather which has been partly responsible for the delayed growth increases the risk of black pod disease, which could sharply reduce production.

The market is proving sensitive to the weekly reports of purchases by the marketing boards, and is liable to swing violently in either direction. Manufacturers are buying only their minimum needs in the hope of a fall, but stocks generally are very low and leave little room for manoeuvre. The big British manufacturers paid 250s. per cwt for 14,000 tons from the marketing boards early in the season, 290s. for 10,000 tons later on, and are believed to have paid (with considerable reluctance) over 300s. for small quantities recently. The boards are now asking about 340s.

Consumption of cocoa products in Britain has climbed steadily since rationing ended last February, and net imports of cocoa beans have risen by 17,000 tons to over 96,000 tons in the first ten months of this year. Buying on the part of eastern European countries has recently increased, and though the purchases are not considerable, they have intensified the tightness of supplies. The only substantial prospect of relief to the market lies in a good intermediate crop in Brazil next summer.

SHORTER NOTES

The interim ordinary dividend of 15 per cent from Great Universal Stores surprised the stock market on Thursday. It is even bigger than the dividend the directors forecast in October when a 50 per cent bonus issue was announced. They then expected to declare an interim dividend of 12½ per cent on the new capital of £4,069,039—the same rate as was paid on a capital of £2,696,026 the year before. In their latest statement the directors add that sales and profits before tax in the first eight months of the current financial year (ending on March 31st next) are "substantially in excess" of those recorded in the same period a year ago. This interim payment throws estimates of the final dividend on "Gussies" into the melting pot, but the market, already talking about a total distribution of 60 per cent, marked the 5s. ordinary stock units up by 1s. 4½d. to 45s. 9d.

★

For the second successive Christmas season the Bank of England has been obliged to ask for a second increase in the fiduciary issue. The issue was raised on Wednesday by a further £50 million, to the record level of £1,675 million. This seasonal increase of £100 million compares with one of £75 million last year. The outflow of notes for Christmas spending has so far been only slightly greater this year than last; but the authorities were undoubtedly concerned to guard against the contingency of a transport strike.

★

The third quarter's financial statement from the National Coal Board presents the bill—in money—for the second week's holiday the miners enjoyed this summer; the bill in coal has already been met. The total operating costs of the mines were £9 million lower than in the second quarter—and indeed lower than a year before, in spite of this year's wage increase—but these had to be spread across an output 4½ million tons lower than in the second quarter (and 2 million tons less than in the third quarter of 1952). The Board realised almost exactly the same price for the coal it sold in the third quarter as it did in the second. Inevitably, therefore, its colliery profits fell—to £156,891, or less than a penny a ton, for the quarter. Its total profits, adding in those on opencast and ancillaries but deducting £600,000 for the loss on imported coal during the quarter, came to only £226,891, before meeting interest charges of £4,150,000. By drawing back £1½ million from the £3½

million it has provided for taxation in the first half of the year, the Board finally showed a deficit in the quarter of £2,423,109.

★

In the Business Note "Judgment on the 'Princess Victoria,'" in *The Economist* of December 5th, the name of the registered manager of the Irish ferryboat that sank in January was given in error as "Captain Perry." This should have been Captain J. D. Reed, whose appeal against a finding of default made by the original inquiry into the sinking was upheld by the Northern Ireland High Court.

Company Notes

COURTAULDS. Investors in blue-chip equities have received this week rather better Christmas boxes than they could have expected. Most significant of these was the announcement of a bonus of shares (accompanied by the promise of a higher dividend) by Courtaulds. The group is the producer of the textile industry's cheapest raw material—viscose rayon. Monthly figures have shown that production has rallied strongly from the low point of mid-1952 and now runs near maximum capacity. Prices were cut this summer but evidently still provide an adequate margin of profit. The particular significance of the dividend increase was that it marked this strong revival in the rayon trade and in the group's profits; this is why the company's £1 ordinary stock units were marked up by 5s. to 50s. 1½d., taking the 10s. ordinary stock units of British Celanese—manufacturers of acetate rayon—up with them. Its general significance was that such a conservative company should decide to join the movement towards higher equity payments; this is why after the announcement blue-chip equities outside the rayon group were also marked up.

The directors intend to correct the glaring disparity between the company's issued ordinary capital of £24 million and the real capital employed in the business by capitalising £24 million from reserves and issuing shareholders with one new £1 stock unit for every unit they now hold, bringing the company's issued equity capital up to £48 million. The company's financial year does not end until March 31st but the directors intend "unless adverse trading conditions or other unfavourable circumstances arise in the interval" to recommend a final dividend of 3½ per cent for this year on the new capital of £48 million. Together with the two interim dividends (paid on the existing capital) of 5 per cent and 1½ per cent this final payment will bring the total dividend for the year on the new capital up to 7 per cent, equivalent to 14 per cent on the old capital. This represents a sizeable increase on the 11½ per cent dividend paid in each of the last three

financial years. On the basis of this new dividend the company's £1 ordinary stock units, at the current price of 50s. 6d., yield about £5 11s. per cent—about the average yield on leading blue-chip equities.

TURNER AND NEWALL.

Another industrial giant to make a sharp break with an ultra-conservative past is Turner and Newall. A year ago this group pushed its dividend up by 5 per cent (to 25 per cent) and now by recommending a total payment for the year to September 30th last of 17½ per cent it has increased it by another 5 per cent. This dividend is to be paid on the ordinary capital of £10,944,718 (as doubled by the 100 per cent share bonus at the beginning of this

year). These successive increases should soothe critics of the group's dividend policy. Even now this firmly entrenched company can well afford the distribution.

The latest increase in dividends is supported by an advance in the group's net profits from £3,743,994 to £4,487,413—a profit which provides a massive cover on the net equity payments of £1,027,682. This increase in net profits is in line with the advance in the group's trading profits from £13,893,719 to £14,356,631, for expenditure on the development of mining properties of over £500,000 has been balanced by a fall in the tax bill from £8,001,072 to £7,495,680. Vertical integration in the asbestos industry obviously pays just as well as it does elsewhere.

Mr G. H. Latham of Whiteheads will succeed Sir Ellis Hunter of Dorman Long as president of the British Iron and Steel Federation at the beginning of the New Year. The president of the federation is a steelmaker appointed to share the chief responsibilities with its independent chairman, the post to which Mr Hugh Grant, Q.C., was this year appointed to follow the late Sir Andrew Duncan. Sir Ellis has held the office since 1945, and has taken a major share of those responsibilities during years of tremendous significance for the federation—in which the industry was first nationalised and then set firmly upon its way back into private ownership.

Almost invariably it argues the need for heavy appropriations to reserves. Turner and Newall have always followed this policy—some critics might say slavishly. This year the company has been able to reserve even more, thanks to the release of more than £1 million from tax provisions and contingencies.

The £1 ordinary stock units of Turner and Newall have for long ranked among the bluest of blue-chips but in the last few months the yield looked slender even for a share of such standing. The yield reflected buying by institutions as well as private investors. The dividend surprised even the most sanguine buyers and the stock units were marked up 5s. 3d. to 69s. 3d. immediately after the dividend announcement. Now the stock units offer a yield of just over 5 per cent, which suggests that investors believe that the board, having taken its head out of the sand, will have more to offer.

★

HAWKER SIDDELEY. Yet another fillip was given elsewhere in the stock markets by the announcement from Hawker Siddeley that its total dividend for the year to July 31st last was to be 15 per cent, compared with 10 per cent in 1951-52. So generous an increase suggests that the company has shaken off any slight misgivings it may have had about the political (rather than economic) expediency of raising dividends during rearmament. The increase was overdue but this did not prevent the stock market from welcoming it by marking up the company's £1 ordinary shares by 2s. to 50s.; the shares have since fallen back to 49s. 3d., to yield 6.1 per cent. This increase is not, however, the sequel to a spectacular advance in trading profits, which show little change at just over £7,900,000. Presumably the directors are satisfied that the group's output of military aircraft—the only type of aircraft which Hawker Siddeley produces—will provide at least steady earnings over the next few years.

In the latest financial year the task of ploughing back profits into reserves has been made easy by the writing back of over £2,300,000 from tax and other provisions. And, at the same time, the balance sheet shows clearly how far the group has already extended its overseas interests—a policy that springs in part from the need for the strategic dispersal

of the aircraft industry. During the year the group, through its Canadian subsidiary, purchased land and buildings, "comprising the gas turbine plant and other Crown assets," at Malton, Ontario. The initial payment amounted to £2,180,827 and the outstanding balance (which can be paid off in instalments) amounts to £4,017,440. This acquisition is also presumably reflected in the increase in the net book value of the group's fixed assets from £8,278,592 to £16,654,477; these changes in the group's assets and liabilities are so remarkable that it seems

a pity that the directors have not explained them in more detail.

Since the end of the financial year the group (though its subsidiary, Armstrong Siddeley Development Company) has subscribed a further sum of \$6 million as additional share capital in A. V. Roe Canada Limited. It may have been with this subscription in mind that the directors have been so assiduously building up the group's cash balances; in the latest financial year these balances jumped from £670,339 to £7,366,203. This substantial

reinforcement must add to the status of the company's equity shares, which in the rearmament period, at least, should be numbered among the aircraft leaders.

★

BASS, RADCLIFF AND GRETTON. The stock market showed its disappointment with the news that the Bass ordinary dividend for the year to September 30th was to remain unchanged at 43 per cent by marking down the company's £1 ordinary stock units by 1s. to 125s. But the group's preliminary report, though it is disappointingly cursory, provides no evidence that will damage the high standing of these stock units in the brewery market. The latest monthly beer production figures, showing that in October production at 1,983,000 bulk barrels was 4,000 bulk barrels fewer than in October last year, still show a disappointing trend. Nevertheless, as was to be expected from one of the leading companies in the bottled beer trade, Bass has reported (in company with many other local and national brewers) an increase in its net profits; after all charges, including taxation, these profits are returned at £887,133, compared with £639,642 in 1951-52.

This increase in net earnings seems to stem from a rather less marked increase in gross profits, for the group's provision for taxation has fallen from £1,223,617 to £1,099,682, so that its profits before tax (excluding certain exceptional credits) appear to have risen from £1,860,422 to £1,916,518. Of all the breweries, those brewing—and distributing on a national scale—bottled beers have the most certain prospect of reasonably stable profits. It is for this reason that the £1 ordinary stock units in Bass (yielding at the current price of 125s. 7½d. £6 17s. per cent) offer a rather finer yield than those offered on the shares of the "county" brewers. Hence, the appeal of these stock units is to the long-term investor.

LONDON STOCK EXCHANGE

Next Account begins: December 30th.
Next Contango Day: December 30th.
Next Settlement Day: January 5th.

THE threat of a railway strike gave the stock market (which had been uneasy before the week-end in anticipation of this dispute) a sharp knock immediately after the week-end. Then, a crop of good dividend announcements helped to steady the market; finally when the threat of a strike was removed prices advanced quite steadily. On Monday some of the longer dated Government securities lost as much as ½ of a point (bringing War Loan down to 84½). Later, however, as hopes that the strike would be averted became brighter gilt-edged prices began to creep up again; in early dealings on Thursday this advance became stronger.

Similar influences were at work in the industrial market, but prices regained their earlier losses rather more quickly than in the gilt-edged market, thanks to the better dividends announced by Courtaulds and Hawker Siddeley. On Monday the *Financial Times* ordinary share index fell half a point to 126.7, but by the close on Wednesday it had more than recovered from this setback to stand at 128.0. The sections most badly hit by the threat of a strike were brewery, electrical equipment and textile shares. But these last two groups, together with engineering shares, led the recovery later in the week. Another feature of the market was a further violent flurry in Savoy Hotel shares. Throughout this period oil shares remained firm.

Kaffirs continued their advance, which had been stimulated before the week-end by the surprisingly good batch of half-yearly dividends, until Wednesday when the "developers" became a little unsteady. Rubber shares were idle but tea shares in a quiet market remained firm. Interest in the foreign market was concentrated at first on the Peruvian issues, which were marked up in anticipation of the debt settlement. On Wednesday interest switched to Japanese issues which were marked up throughout the list in response to renewed suggestions that Japanese sterling loans would be quoted on Wall Street.

(1) Relates only to prices in capital cities for Austria, France, Greece and Turkey. Cost of living in Paris based on 1949=100, and in Western Germany on July-December, 1948=100. (2) Index numbers of unit value which compare the current value of trade with its value in 1948; they are influenced by changes in the composition of trade as well as price movements. Index numbers for Germany based on 1950. (3) Notes only for France and Austria. (4) Holdings of the government and central bank at end of period; figures for Greece are gold reserves only. (5) Average of second quarter.

EXCHEQUER RETURNS

For the week ended December 12th there was an "above-line" deficit (after allowing for Sinking Funds) of £24,119,000 compared with a deficit of £44,569,000 in the previous week and a deficit of £21,976,000 in the corresponding period last year, bringing the cumulative deficit to £432,710,000 (£445,685,000 in 1952-53). Net expenditure "below-line" absorbed £6,758,000, bringing the total cumulative deficit to £721,717,000 (£827,938,000 in 1952-53).

* In consequence of official purchases of tender bills in connection with cash subscriptions to the new Exchequer stock, it is impossible to calculate the division between tap and tender bills until all the bills purchased have passed their original maturity date.

Financial Statistics

THE MONEY MARKET

LOMBARD STREET has enjoyed yet another comfortable week. The authorities again found it necessary to mop up surplus funds in the market by "reverse selling" of bills nearly every day of the week covered by Wednesday's Bank return; the sole exception was Saturday, when credit supplies were only just adequate. On Wednesday, large Government disbursements made funds so plentiful that the authorities' sales of bills (to both the market and the banks) assumed considerable proportions.

The market again maintained its bid at £99 9s. 6d. for the unchanged total of £250 million of bills on offer at last week's Treasury bill tender. But as total applications fell by £5.5 million, to £368.5 million, the market's allotment again rose—from 55 to 58 per cent. The average rate of discount also rose fractionally, to just under £2 2s.—its highest level since the beginning of October.

The fiduciary issue was raised by a second £50 million, to the record level of £1,675 million, on Wednesday; and the Bank return showed how necessary that increase was. The week's outflow of notes was £34.1 million—apparently the largest for any single week. This brought the active note circulation to the record level of £1,632.1 million. Total withdrawals for Christmas spending have now reached £101 million, compared with less than £96 million in the corresponding weeks of last year. Government securities in the banking department fell by £26.9 million; allowing for the effects of the increase in the fiduciary issue, there was thus an insufficient neutralisation of the currency efflux, so that bankers' deposits dropped by £11.1 million.

AUDITORS' REPORT

EDINBURGH, 19th November, 1935.—We have examined the Books of THE COMMERCIAL BANK OF SCOTLAND LIMITED, kept at the Head Office and the returns from the Branches for the year ended **31st October, 1935**, and have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purpose of our Audit. In our opinion proper books of Account have been kept and returns made for the purpose as above stated.

We have checked the Cash at the Head Office, the London Chief Office and the Glasgow Chief Office. We have verified the Money at Call and Short Notice in London and the balancers with other banks.

We have seen the Treasury Bills and Certificates for Government and other Investments.

The above Balance Sheet and Profit and Loss Account are in agreement with the books and Branch Returns. To the best of our information and according to the explanations given to us, the said Balance Sheet and Profit and Loss Account give a true and fair view of the state of the Bank's affairs as at 31st October, 1935. We are accordingly of opinion that on the basis authorised by the Act (1) the Balance Sheet gives a true and fair view of the state of the Bank's affairs as at 31st October, 1935, and (2) the Profit and Loss Account gives a true and fair view of the profit for its financial year ended on that date.

MAURICE CRICHTON, C.A., Auditor.
R. J. HENDERSON, C.A., Auditor.

COMPANY MEETINGS

LORD ROTHERWICK OF TYLNEY'S VIEWS ON SCOTTISH INDUSTRY

Out of the net profits the directors have again allocated £75,000 to contingency fund and £100,000 to the officers' pension fund. The latter fund is separately administered by trustees, and while now substantial, is not from an actuarial viewpoint, sufficient to

meet the bank's obligations under the scheme. The fund has been built up over the years entirely by contributions from the bank, and we know that the staff appreciate the benefits and security which it offers.

DIVIDENDS

For some years the directors hoped that it would be possible to recommend a small increase in the dividend to "A" shareholders, but for various reasons it has not been appropriate to do so until now. I am therefore glad to submit the proposal that a further distribution of 8½ per cent on the "A" shares (making 16 per cent for the year) and 5 per cent on the "B" shares (making 10 per cent for the year), both subject to income tax, be approved.

ACKNOWLEDGMENTS

It would not be appropriate were I to conclude my remarks without referring to the valuable services rendered by all members of the staff, the result of whose efforts are reflected in the report which I have presented to you today, and, on behalf of shareholders and customers alike, I offer them our sincere thanks. There is another matter, however, of which I would like to make special mention. Since 1932, Sir John Erskine has guided the affairs of the Bank with sure and expert knowledge and, in addition to that important task, he has made his knowledge and experience freely available in many directions for the benefit of the community. As you heard a year ago, Sir John has decided to retire from the management at the end of this month, and while I am glad to say that he will continue with us as a member of the board, I am sure you would wish me to give him a special word of thanks for all he has done for the Bank during his long term of office. We shall miss him from his accustomed place from day to day; but we wish him every happiness in the leisure which he is about to enjoy.

It is proposed that the Earl of Mar and Kellie be re-elected Governor; that I be re-elected Deputy Governor, and that the extraordinary directors, whose names appear on the list, be re-elected.

Mr Douglas Mure Wood, the ordinary director, who, by rotation, retires at this time, was 71 years of age in January of this year. Special notice of the intention to propose his re-election has been received by the Bank, and a resolution to that effect will be put to you.

Mr Maurice Crichton, CA, Glasgow, and Mr Ronald J. Henderson, CA, Edinburgh, will, under the provisions of the Companies Act, 1948, continue in office, and a resolution fixing their remuneration will be proposed.

I now move that the report and accounts be adopted, and I shall call upon Mr Robert Y. Weir to second the motion. After that has been done, and before I put the motion to the meeting, any shareholder who desires to make any observations will have an opportunity of doing so.

The report and accounts were adopted and the dividends as recommended were approved.

The retiring directors, as mentioned, were re-elected and the remuneration of the auditors was fixed.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:

*The Company Meetings Department,
The Economist,
22 Ryder Street, S.W.1.*

GLAXO LABORATORIES

INCREASED SALES OFFSET PRICE REDUCTIONS

EXPORT MARKETS AND N.H.S. ECONOMIES

The nineteenth annual general meeting of Glaxo Laboratories Limited was held on Monday, December 14th, in London, Sir Harry Jephcott, MSc, FRIC, PhC (chairman and managing director), presiding. The following are extracts from his circulated review:

At home revenue from sales showed a small increase, price reductions made during the year being more than offset by the greater volume of business.

In export markets progress was seriously affected by import restrictions, more widespread than at any time since the war, and in Brazil our inability to secure payment finally forced us to discontinue shipments. It is clear that at best we shall receive only over a period of years payment for the goods we have supplied to that country. The net decrease in total export business was due not so much to any fall in demand as to the imposition of these restrictions, notably in Australia, Pakistan, Brazil, Argentina and Italy. The effect was mitigated by a reduction of stocks and, over all, sales by our subsidiaries only fell by about 4 per cent.

Competition was thereby intensified in those markets to which restrictions did not apply and, in consequence, not only was the volume of trade affected but prices in general were less favourable. Competition was accentuated by surplus production capacity for antibiotics in North America, and the opening of new plants elsewhere. In some markets substantial quantities of penicillin have been offered on occasion at prices little, if anything, above the bare factory production costs. The combined effect of all these influences was to reduce our trading profit by some £350,000, which was more than offset by changes in provisions for tax.

CHANGING PATTERN OF EXPORT BUSINESS

So long as the prices of primary produce remained high, many countries imported products packed ready for sale. That phase has passed. There is now a widespread resurgence of the desire for local production, which in some countries extends to the encouragement of manufactures that cannot be economically conducted. In short, the pattern of export business is changing and in many instances our future exports will need to be in the form of bulk products for local processing and packing.

We recognise the inevitability of this tendency; consequently, if our goodwill and the demand for our products—built up over a long period at great effort and expense—are to be preserved, we must undertake overseas as much manufacturing as can be conducted with efficiency and practicability. Already we have manufacturing facilities in Argentina, Australia, India, Italy and New Zealand. Similar facilities are now being provided in Brazil, Pakistan and South Africa, with a considerable extension of our factory in Australia.

N.H.S. PROBLEMS

In the overall cost of the National Health Service the payment to drug manufacturers is one of the smallest items, representing no more than 8 per cent of the total. Nevertheless, the Ministry has been subjected to some criticism by the Comptroller and Auditor-General for a suggested failure to secure drugs at the lowest possible price.

It is important that this quest for economy shall not impair the ability of the British pharmaceutical industry to stay in the forefront of research and increase its exports.

Unfortunately, the Ministry of Health has published a list of products classified as ones which "have not been proved of therapeutic value." The Ministry has suggested to doctors that they do not prescribe these preparations; the individual doctor who does may be called upon to justify his action. This has had an effect which was neither foreseen nor intended. Whatever the merits of these drugs, the fact is that medical practice is not uniform throughout the world and in many markets products so listed are in considerable use. In some countries overseas it is a condition precedent to the sale of a preparation that it shall be on sale in the country of origin. The implied criticism inherent in the Ministry's classification can thus prevent the supply of preparations that the doctor abroad requires.

The Ministry is undoubtedly well aware of its responsibility, not merely to supply the drugs that may be ordered by the doctor today, but also to secure that what medical science may call for in the future will be available when needed. This means that the manufacturer must be prepared continuously to undertake research and development expenditure, the outcome of which is uncertain, and the cost of which must be recovered in the price received for his goods.

RESEARCH OBJECTIVES

We continue to expend a large sum each year upon development and research. In part our immediate aim is to improve our existing manufacturing operations, the effect of which is seen relatively quickly. We have once again been able to reduce the price of our antibiotics at home, and to trade not too unfavourably even in the most acutely competitive export markets. The major effort has, however, been directed to long-term objectives—the devising of new and more economic processes for manufacture of known products and the research for entirely new medicinal substances.

During the past two years and more we have expended much effort upon the synthesis of cortisone, at first from ergosterol, then in collaboration with the Medical Research Council from hecogenin. Though both syntheses have been successfully accomplished, in an academic sense, the former was judged unlikely to be of commercial value, while much work remains to be done on the latter before it can be commercially evaluated.

The company's superannuation scheme is a source of general satisfaction, but it affords little protection for dependants if an employee dies prior to retirement. Although it has been customary to assist widows and dependants, the directors now propose a formal scheme to provide them with pensions and assistance related to salary or wages and length of service, and that, as a first step, £50,000 be allocated to this scheme.

It is a pleasure once more to acknowledge the enthusiastic work and the loyalty to the company's ideals and interests of all my colleagues at home and abroad.

CURRENT PROSPECTS

There is no reason to expect that the current financial year will prove any easier

than the last, although recently the relaxation of import restrictions in certain sterling-area countries has given a measure of relief. We are determined to hold our own in every market in which we have a substantial interest, and to increase our efforts in other markets.

Since the beginning of the present financial year there has been some increase in

the volume of export sales, which has approximately compensated for reductions in prices, and I should estimate that, to date, our trading profits, while unlikely to have improved on the past year, have not seriously declined. This relates, however, but to the first three months and, as to what lies ahead of us, I cannot make any predictions.

The report was adopted.

JOSEPH LUCAS (INDUSTRIES) LIMITED

A YEAR OF ACHIEVEMENT

MR A. B. WARING ON WIDENING SCOPE OF ACTIVITIES

The fifty-sixth annual general meeting of Joseph Lucas (Industries), Limited, was held on Monday, December 14th, in Birmingham, the chairman, Mr A. B. Waring, presiding. In his statement to the shareholders he said:

The comparison of the results for 1953 with those for 1952 shows that the consolidated surplus from operations is greater by £58,322, income from other sources has declined by £75,459, the profit retained by subsidiaries is less by £117,773, and the net profit for the year has increased by £100,636.

The additions of profit brought forward from the previous year and also the over-provision for taxation additions make the profit available for appropriation £1,202,850, the comparative figure for the previous year being £1,172,603.

In view of this achievement and after taking into account all other circumstances, the directors recommend a final dividend of 1s. 10d. per share, which with the interim dividend of 4d. per share already paid makes a total distribution of 2s. 2d., or 105/6 per cent on the equity shares.

TAXATION

Taxation continues to be the overriding factor in industrial affairs. Everything has been said that can be said of its many evils and the bad influence it has on the thinking of those responsible for the conduct of manufacturing enterprises. The elimination of Excess Profits Levy will help to lighten the burden, and the company's accounts for next year will carry only five months' liability, which should reduce the charge to less than half of the current year's provision of £585,900 if the profits are maintained.

In spite of the reduction in the rate from 9s. 6d. to 9s. provided in the last Budget the charge for income tax is £430,452 higher than last year. This increase is due mainly to two factors. As from January 1, 1952, profits tax was no longer allowed as a deduction in arriving at the income tax liability, and as from April 1, 1952, Initial Capital Allowances on new buildings, plant and equipment were withdrawn; they were reintroduced on April 15, 1953, and applied to new plant and equipment at half the rate that had prevailed at the earlier date.

BALANCE SHEET FEATURES

The consolidated balance sheet demonstrates a further strengthening of the financial structure of the company. Of particular interest is the increase which has taken place in current assets, which now stand at £30,157,772, an increase of £2,636,011. Current liabilities stand at £11,048,085, an

increase of £941,383. It will be seen that the stock has been reduced by £2½ million. This is the result of a major operation carried out with determination in the factories and warehouses both at home and overseas; in addition to releasing cash unnecessarily tied up, it has eliminated the bad practice of hoarding and the lack of control that had grown up during the many years in which materials were in short supply.

The revenue reserves show a substantial increase. In addition to the provision made in this year's accounts, they have been affected by a credit to the general reserve of £447,714, being an amount arising out of the final settlement with the Inland Revenue for wartime Excess Profits Tax; reference to this settlement, which was then pending, was made in last year's statement. As a result of this settlement the provision of £537,452 for deferred repairs has been transferred to the reserve for buildings, plant and equipment replacements.

MOTOR INDUSTRY

The company's fortunes are tied to those of the motor-vehicle and aircraft industries and fluctuations in either of them have an immediate influence on its affairs. During the financial year the output of cars, commercial vehicles of all types and tractors, increased to 870,715 from 828,909 in the previous year. Cars increased by 16 per cent, whereas commercial vehicles decreased by 4 per cent and tractors by 16 per cent. The output of motor-cycles decreased by 16 per cent and pedal cycles by 24 per cent.

The continuance of the success of the motor industry depends on its ability to export. Its record of achievement as an exporter is quite outstanding, despite a fall of 12½ per cent in the export of cars and over 25 per cent in commercial vehicles and tractors. With overseas sales of £300 million, it is still the largest earner of foreign currency, in spite of the fact that practically every market in the world, with the exception of North America, is affected by some form of import or currency restriction; fortunately for the industry the severe restrictions imposed by Australia in the spring of 1952 have now been substantially relaxed.

During the year foreign competition increased and Germany, France and Italy were all active in the small car field. German exports are expected to increase still further in the forthcoming year. Much encouragement is given to them by their Government by sponsorship of trade organisation abroad, and, where necessary, by the provision of special credit facilities. It is not possible for the individual vehicle manufacturer to break down the trade barriers set up by

foreign Governments and the more difficult markets will be developed by those manufacturers whose Government is most adroit and effective in overseas trade negotiations.

INCREASED ACTIVITY

At the present time the home market in particular is providing much increased activity for the motor trade. The attendance of 613,000 at the recent Motor Show is an indication of the continued intensity of public interest in motor-cars. During the year 232,000 cars were supplied to the home market, which was twice as many as in the previous year and compares with 318,000 in 1937. It would appear that the current rate of increased supplies is meeting current demands, but the advent of a new category of less expensive cars will tap a wider income group. An infinitely wider group would be tapped by a reduction in the annual burden of £375 million of taxation which the users of vehicles are now paying on petrol, licences and purchase tax.

The motor industry is and must continue to be dynamic; the individual manufacturer is always on his toes, otherwise he quickly loses his place to his competitors. He is forever developing new or improved designs to stimulate existing or potential markets. He is cost-conscious to a degree and requires no invoking to improve the methods and economics of production. Since the materials and accessories he buys constitute the major part of the cost of the vehicles he makes, it is inevitable and proper that his suppliers are kept under constant pressure to give better value, and this they must do, otherwise they quickly lose their business. The pressure of events in the motor industry provides at all times a stimulus for all engaged in it.

AIRCRAFT INDUSTRY

The company's sales to the aircraft industry were greater by about 45 per cent, being accelerated by the rearmament programme. They contributed practically the whole of the increased turnover which the Group achieved during the year. Three new aircraft equipment factories at Liverpool, Hemel Hempstead and Toronto became productive and profitable. New service stations are under construction at Montreal and Sydney. Despite the considerable anticipated growth in demands for equipment for civil aircraft, a substantial reduction in activities will be inevitable when the rearmament programme slows down. In anticipation of this event, steps are being taken to fill part of the gap by widening the scope of activities and by adapting to industrial uses some of the products that have been developed for aircraft.

On the aircraft side of the organisation continued success in the future depends entirely on our ability to originate new devices and to develop further those that are in use. The problems to be solved demand the highest possible degree of scientific and technical training on the part of our staff and the full co-operation with the engineering staffs of our customers, with whom we retain the closest relations. On the road vehicle equipment side the urgency is to improve the design of existing devices so that they give better performance, require less service and can be made for a lower production cost. To meet these vital needs the development and research departments continue to be strengthened and additional facilities are being constantly added to those that exist.

Outstanding improvements continue to be made in the methods of production particularly as applied to motor car equipment. All factories are equipped with the most modern machines and a ruthless policy is pursued of replacing plant immediately it is known to have become obsolete.

AIRE WOOL COMPANY

(Woolcombers and Topmakers)

A SATISFACTORY YEAR

The eighteenth annual general meeting of Aire Wool Company, Limited, was held on December 16th at Shipley, Colonel Lord Barnby, CMG, CBE, MVO (the chairman), presiding.

The following is an extract from his circulated statement:

There are submitted herewith for your approval and adoption the report of your directors and the statement of accounts, for your company's financial year ended July 31, 1953:

WOOL POSITION

There are grounds to assume that wool usage is steadily expanding not only in older countries but also in new areas where a rising standard of living creates more buying power. This is not only based on apparel, but also for blankets, felts for paper-making machinery and other machine felts, pile and flat fabrics for furniture, vehicle seatings and entertainment establishments.

The USA still probably remains the determining world factor which can affect wool prices either by its own consumption or its dispersed "Grants in Aid" to many countries. It should be remembered that the population in the USA at 160 million has the highest *per capita* purchasing power in the world. Wool consumption there for the last 18 months has been less *per capita* than immediately postwar. The uncertainty of periodical sale price revisions by the USA Government for the wool of which they become possessed under the "Farm Price Parity" Support programme is most disturbing. It is an impressive illustration of the disadvantage of governments being in business.

WOOL TERMINAL MARKET

The spring of 1953 witnessed the coming into operation of the London Wool Terminal Market. It is too soon to assess what will be its full effect on business here. It must be admitted that the volume of transactions to date exceeds what was generally thought

might be reached. There seems little doubt increasing numbers in the industry and outside are taking interest in its operations. It certainly would seem logical that if wool Futures Markets are to exist and Australian Merino wool is to remain the natural basis for measurement, that on a commodity so largely produced in the sterling area the dominant Futures Market should be in sterling and located in London.

SYNTHETIC FIBRES

Synthetic fibres are becoming more and more of concern to the wool textile industry of the world. Tremendous sums in publicity have already been expended by the large USA chemical companies producing their varied brands of synthetic fibres and are supported by vast turnovers on chemicals, plastics, fertilisers and other products. The general effect is bewilderment in the mind of the retailer who seeks to forecast what his customers may ask for under influence of such advertisements.

FUTURE OUTLOOK

The first quarter of our new trading year promises to be satisfactory. The activity of the worsted spinning industry—our customers—is at full stretch to available labour supply and prospects of continuity appear good. Present wool levels (currently on about pre-Korean levels) may seem high by past comparisons, but it would appear that "world economic climate" is able to make them fit. There are no accumulations, so consumption and production are about in balance. But a somewhat lower price level would help sales at retail and be probably healthier for growers.

Forecasting the possible course of wool values becomes more unpredictable because of Government actions, such as controlling imports by quotas of "exchange" or contingents of import volume or barter arrangements at preferential exchange rates. To this are added the unmeasurable movements of merchandise to behind the Iron Curtain areas, to which China must now be added.

I referred last year to the mischief of "variable" exchange rates. Recently there was significant specific action by the USA against import of Uruguayan tops, which has been effective. These Uruguayan exports are now being deflected to countries which have not yet seen fit to take similar action. There is need for the UK Government to act energetically, as has been most strongly recommended by the British Wool Federation.

TRADE FEDERATIONS

The value of trade federations each year becomes more obvious. The strength of these trade bodies must lie in numerical membership and vigilant support to the officers and committees who so generously give their time in the general interest.

DIRECTORS AND PERSONNEL

During the year we have welcomed to our board Mr F. D. Nickell-Lean. He is intimately acquainted with the wool textile industry and brings with him a wide experience and knowledge of its various branches.

I cannot close without referring to those whose efforts have contributed to these satisfactory results, and I am certain it would be your wish, as it is that of myself and your board, that I take this opportunity of extending to the managing director, Mr R. P. Pitcher, to the directors of our various subsidiary companies and to all other personnel, thanks and appreciation for their loyal service throughout the year.

The report and accounts were adopted.

LAKE VIEW AND STAR

RECORD TONNAGE MILLED

The forty-third annual general meeting of Lake View and Star Limited was held on December 15th in London.

Sir Joseph Ball, KBE, chairman, in the course of his speech said:

The increase in revenue from mining and retreatment operations amounted to £179,978 over the figures for the previous year, and is primarily accounted for by the rise in gold production during the year. Mine working expenditure, including retreatment and development, rose by £196,365, due to further increases in the basic wage and the cost of stores, and to the higher tonnage treated. Your directors recommend the payment of a final dividend of 1s. 6d. per share, less tax, making a total distribution for the year of 2s. 3d. per share, as against 2s. 6d. per share for the previous year.

Development footage for the year at 27,949 feet, shows an increase over the previous year's figures of 4,717 feet. Ore reserves at 3,735,000 tons averaging 4.81 dwt per ton, show an increase of 11,600 tons, and positive and broken ore now accounts for 91.7 per cent of the total reserves.

Tonnage of ore milled during the year increased by 69,598 tons to a record figure of 721,845, averaging 4.9 dwt per ton, a rise of 0.14 dwt on the previous year. Turning to the question of costs, you will see that these were 42s. 4d. per ton milled, a rise of 1s. 5d. on the previous year. The fact that the increase was limited to this relatively small amount, despite further rises during the year in the basic wage and in the cost of stores, was due partly to the higher tonnage milled, and partly to continuous and successful efforts to reduce costs and to increase efficiency. At the Chaffers retreatment plant 522,877 tons of old residues were treated averaging 1.12 dwt per ton at a cost of 3s. 4d. per ton and a profit of £25,464, which includes premium gold sales and copper bullion realisation.

The report and accounts were adopted.

THE LIVERPOOL WAREHOUSING COMPANY

58TH ANNUAL MEETING

CHAIRMAN'S STATEMENT

The fifty-eighth annual general meeting of The Liverpool Warehousing Company, Limited, was held in Liverpool on December 16th.

The following statement by the chairman, Mr W. Milligan, had been circulated to the stockholders with the annual report and accounts:

The trading profit, which is within near reach of last year's figure, will indicate to you that the conditions actually experienced proved rather better than we anticipated. The first half of the year left us with a lot of leeway to make up, but fortunately conditions improved materially during the second half, and incidentally, this demonstrates how cautious one should be in making any forecast regarding future trading prospects.

We are bound to recognise that the business in which we are engaged is extremely sensitive to factors which are unpredictable. There is one prediction, however, I think it is safe to make. If your company keeps abreast of modern requirements by providing first-class warehouse accommodation and attendant services at moderate charges, I firmly believe that its future prospects are entirely favourable. To meet these needs, we have in the course of construction six new warehouses on an island site on the Dock Road in the North end of Liverpool, the loading capacity of the floor area of which will be more than double that of the warehouses they will be superseding. If this development fulfils our expectations, it may be the forerunner of others, but much will obviously depend upon the demand for storage and the availability of the requisite finance.

Mention of finance prompts me to say how difficult it is these days to set aside sums which can be considered adequate to replace warehouses which have outlived their profitable life. While we spend a large sum each year on maintenance in order to keep all our premises in the highest possible state of repair, we should be less than prudent if we failed to recognise that there is a limit to the length of life of even the best of warehouses. The problem is how to provide the cost of replacements.

First and foremost there is the crippling burden of taxation. This year the sum set aside in the profit and loss account for taxation again represents approximately 60 per cent of our profits.

Secondly, there is local rating, which looms up as a close competitor to direct taxation: This year the sum we have been called upon to pay runs into six figures. Increased assessments and poundage together have caused the amount to be more than double what it was in 1945.

Thirdly, we have to bear in mind that the extent to which importers and exporters utilise the facilities offered by the company is dependent upon the maintenance of moderate charges. If warehouse charges are raised beyond a certain level, the business interests concerned will doubtless endeavour to avoid the expense by moving goods direct from the quays and from factory to ship. This is a point the local rating authorities would do well to bear in mind, for we are getting very near to a position where the law of diminishing returns might assert itself.

The profit provided by our subsidiary,

The Sandon Motor & Engineering Company, Limited, this year is substantially reduced owing to a contraction in the business with which it is concerned, and this applies especially to the Tyre Retreading Factory and the Light Engineering Works at Grundy Street. We are hopeful, however, that this will prove to be nothing more than a periodical fluctuation to which businesses of this description are subject. Our plans for the development of this subsidiary by the provision of up-to-date premises and equipment are being speedily fulfilled, and we believe that our new garage and service station opposite the Cotton Exchange will be well supported by the numerous businessmen who bring their cars into the heart of the city.

COTTON STORAGE PLACE

The chairman made the following additional comments on a topical matter:

"Some of you may have noticed in yesterday's papers a report on a meeting at the House of Commons of the standing committee on the Cotton Bill, and that one of the members made a reference to the enormous loss of storage capacity in Liverpool and expressed doubts as to what the merchants would do in future to store their cotton. Having regard to this statement I should like to take this opportunity to say that I see no reason why any fear should be entertained regarding the provision of adequate storage space for cotton in the Liverpool and Manchester warehouses. Our company has over 400 first-class warehouses in commission with a capacity of 2 million bales and we have other premises in the course of construction. I firmly believe that there will be ample space available to meet the immediate and future needs of the industry. I think you will agree with that, gentlemen."

The report was adopted.

SOBRANIE LIMITED

FACTORS AFFECTING RESULTS

The fifteenth annual general meeting of Sobranie, Limited, was held on December 16th, in London, Mr I. Redstone (chairman and managing director) presiding.

The following is an extract from his circulated statement: The figures which I must now present constitute disappointment, since the absence of more favourable results is certainly not for want of trying.

It is my belief that pursuing, as we assiduously do, a policy of market cultivation coupled with maintaining the highest possible quality of cigarette to offer to people able to afford the small difference in price, we shall day by day add to our increasing number of firm customers, and I feel confident that the passage of time will enable us to present more satisfactory figures to our shareholders.

A very substantial cause of our trading decline is to be found in the export markets, but here I think the factors which are at the moment operating to our disadvantage may before long cease to be operative.

The "Cocktail" cigarette, the introduction of which I foreshadowed in my last speech, has been a very real success, and there is no doubt that it has settled down as a very steady selling line.

The fact that we have met with reverses in the present year is not in the view of your directors any reason for deep-seated pessimism, but is, so far as we are concerned, an inducement and a spur to greater efforts in the future.

The report was adopted.

THE PERUVIAN CORPORATION

INCREASED NET SURPLUS

The sixty-third annual general meeting of The Peruvian Corporation, Limited, was held on December 15th, in London, Mr W. H. White (the chairman) presiding.

The following is an extract from his circulated statement:

The gross revenue from railways, steamers and other assets for the year amounted to £3,853,129, as compared with £3,858,927 in the immediately preceding year. At the same time, expenditure advanced from £3,483,527 to £3,579,510, due to increases in salaries, wages, social legislation obligations, and higher costs of some materials. After adding back the fuel oil reserve of £119,264 made last year (no longer required), the net surplus was £392,883 before charging debenture service, which compares with £375,400 in the previous year, ascertained after making the fuel oil reserve.

Two coupons on the corporation's debentures (due October 1, 1947, and April 1, 1948) were paid on April 1, 1953, and October 1, 1953, respectively, which leaves a balance of £555,587 of net revenue to be carried forward under the scheme of arrangement to meet future payments of debenture interest.

During the year under review, Peru has continued its progressive development. The country has enjoyed the advantage of political stability and social order and both State and private activities have continued to advance.

The value of the sol in relation to the £ sterling and the USA dollar remained relatively steady during the year. Our monthly remittance rates have averaged S/43.00 to the £ sterling during the year, as compared with S/39.10 during the previous year. The rate has since fallen, however, to about S/51.00 to the £ sterling.

BOLIVIA

The difficulties in Bolivia, particularly in regard to the provision of foreign exchange, have continued throughout the year. I pointed out last year the vital importance of the production of tin in the economy of Bolivia, and as the price has fallen steadily from \$US1.21½ per pound (which ruled from May, 1952, to March, 1953) to \$US0.85 per pound at the present time, the outlook is not good, especially in view of high production costs.

On May 15, 1953, a Decree changing the official rate of exchange from Bs.169.61 to Bs.537.08 per £ sterling was promulgated, and to meet this devaluation our tariff was increased from June 15, 1953, by 213 per cent in respect of the Peruvian part of the International through traffic, and by 115 per cent on the Bolivian section.

In my speech last year I stated that the Board of Inland Revenue had expressed dissatisfaction with the decision of the Special Commissioners on our successful appeal regarding the method of computing our liability under the social laws of Peru, and had requested the Special Commissioners to state a case for the opinion of the High Court. The case was duly stated and lodged, but I am unable to say when the hearing will take place. In the circumstances, I can say no more.

At the request of the corporation, the committee have extended the duration of the Scheme of Arrangement between the corporation and its debenture holders for a further period of one year expiring December 31, 1954.

The report was adopted.

STREAM-LINE FILTERS, LIMITED

RECORD TURNOVER

The seventeenth annual general meeting of Stream-Line Filters, Limited, was held on December 14th in London. Mr C. S. Garland, ARCS, BSc, FRIC, MICHEM (chairman and managing director), presided, and in the course of his speech said the accounts for the year to December 31, 1952, record further increases both in turnover and in profits, but your directors would again emphasise that these record results must be regarded as abnormal and it is for this reason that they have described the increased distribution from 20 to 25 per cent as a bonus. They do not consider that the best long-term interests of their shareholders would be served by wide fluctuations in the rate of dividend. Their present policy should admit of regular interim and final dividends.

The year was notable for considerable disturbances in most export markets—restrictions of quotas and of import licences. Your company, which normally exports some 60 per cent of its output, is particularly susceptible to the difficulties arising from foreign countries' shortage of sterling which has greatly reduced the volume of orders coming, for instance, from South American countries, France and Turkey. It also feels the reflected competition which its valued customers—shipbuilders and engine-makers—have experienced resulting in some instances in cancellation and in a general reluctance of foreign buyers to place further orders for long forward deliveries.

The record turnover has to some extent been at the expense of shortening the balance of orders in hand which, however, permits of the quotation of closer delivery dates. The company, as a matter of basic policy, attaches great importance to keeping its delivery promises and to quoting fixed prices abroad. This policy has built up a goodwill which should be of the greatest value in times of difficulty.

HEAVY TAXATION

As regards the results for the year, after making provision for contingencies in regard to the proceeds of certain long-term contracts, the profit on trading of the parent company was £179,571. After adding other income and providing for depreciation and other charges there remained £165,628, of which taxation takes £111,814—over 67 per cent. The profits of the whole group after all charges was £271,474, of which £193,485, or 71 per cent, goes in taxation including £45,150 (23 per cent) for Excess Profits Levy. As pointed out previously, this penalty on enterprise bears with particular hardship on your companies which in the standard years were building up their export trade. It is a relief to know that this impost will affect only one more balance sheet.

As the book figure of the parent company's plant had been reduced to a nominal value, only £2,634 could be written off for depreciation. The estimated present cost of replacement of the group's plant and machinery is more than £100,000 and a further £6,000 has, therefore, been added to the fixed assets replacement reserve, bringing this to £20,000. The addition to contingencies reserve of £4,625, making £24,000, is in respect of our investment in an associated company in France manufacturing our special products, which company also accounts for the increase of £2,572 in trade investments.

For 1953 the turnover has been substantially maintained but with some further reduction of the volume of forward orders. It is impossible at this stage to make any estimate of profits earned except to say that your directors are confident of the ability of

the company to continue to pay reasonable dividends.

Your company enjoys most loyal service from all its staff and employees and the several works of the group can be justly described as "happy ships." Our thanks are due to be recorded to the managers, staffs and workers who have all made their valued contribution to this end.

The report was adopted.

HECTOR WHALING

IMPROVED FINANCIAL POSITION

The twenty-fifth ordinary general meeting of Hector Whaling Limited was held on December 16th in London, Mr R. de B. Trouton (the chairman) presiding.

The chairman, in his circulated review, said that three outstanding changes had taken place during the past year in the affairs of the company and its UK subsidiaries. The first was the repayment by United Whalers Limited of the remaining balance of its preference stock. He was glad that they had been able to exercise that option and thus remove a heavy annual burden at the earliest possible date.

The figure of £6,337,355, representing the cost of their fleet, was some £81,000 below that of the previous year and the commitments for additions to fleet were down by the substantial sum of £675,000 to £225,000. That total reduction of £756,000 was the resultant of several transactions during the year, the most important being the cancellation of their contract to build a 20,000 ton tanker for delivery in 1954. They had acquired three whalecatchers which should bring their catching fleet to a high state of efficiency and should meet most of their replacement requirements.

The last of the changes was the purchase by the company of the entire business and assets of its principal subsidiary United Whalers Limited.

The statement continued: I should like to draw attention to the greatly improved liquid position of the company and its UK subsidiaries which now exists. Our net liquid assets of £1,214,000 exceed capital commitments of £225,000 by approximately £990,000, compared with a corresponding deficit at July 31, 1948, of over £2,500,000, a net improvement of some £3,500,000, of which about £900,000 represents the excess of capital issued by us over capital redemption.

Trading profits of the UK companies fell by some £680,000, as compared with the previous year. The reduction in our whale oil takings was £710,000—a 6 per cent increase in tonnage produced having been heavily outweighed by a drop of £34 per ton in price. We also suffered a decline of £60,000 in sperm oil takings, and tanker freight earnings were more than £400,000 below those of the previous year.

The brighter side of the picture, which we hope may be significant for the future, is that these declines were offset to an extent of approximately £500,000 by increased by-product takings and by savings in operating costs.

Last season "Balaena" made almost 166,000 barrels (about 27,600 tons) of whale and sperm oil. We produced about 4,700 tons of frozen meat, 4,150 tons of meat and liver meals and 130 tons of meat extract. Our income from by-products was almost equal to the record of 1947-48, when a much longer period of operation was permitted.

This year we have sold our entire production of whale oil to the Ministry of Food at £67 10s. per ton. I am glad to say that we have contracted for the sale of practically all our by-products at satisfactory prices.

The report was adopted.

THE STAVELEY COAL AND IRON COMPANY, LIMITED

FUTURE POLICY

MR THOMAS A. MCKENNA'S STATEMENT

The ninetieth annual general meeting of The Staveley Coal and Iron Company, Limited, was held on December 15th, at Sheffield, Mr Thomas A. McKenna, chairman and managing director, presiding.

The following is an extract from his circulated statement:

The gross income of the group amounts to £1,521,113, as compared with £1,141,077 in the previous year. The crippling effect of taxation absorbs no less than £1,010,536 out of a total earnings of £1,521,113.

The current year's profit attributable to the group is £1,521,113, taxation absorbs approximately 66½ per cent, dividends 27 per cent, and the amount reinvested in the business 6½ per cent. Of our net profit, after taxation, £587,313, dividends absorb 70 per cent, leaving 30 per cent retained in the business. Your directors are again recommending a final dividend of 14 per cent, making a total gross dividend for the year of 22½ per cent, less tax.

DENATIONALISATION OF IRON AND STEEL

Stockholders should be aware that for the past seven years your company has been engaged in the toils of nationalisation, since 1946, in connection with its coal interests, which have already been reviewed, and since 1948 in connection with its iron and chemical interests.

Following the passing of the Iron and Steel Act, 1953, the shares in The Staveley Iron and Chemical Company, Limited, passed from the Iron and Steel Corporation of Great Britain to the Iron and Steel Holding and Realisation Agency on July 13, 1953.

Your directors were then faced with the necessity of making a decision fraught with vivid political, commercial and sentimental aspects: a decision as to whether or not to try to buy The Staveley Iron and Chemical Company from the Holding and Realisation Agency. They have decided not to do so, because, after seven years' experience of the frustration and totally uncreative effort necessarily involved in negotiating compensation for your nationalised interests, they doubt whether it would be in the stockholders' interests to reinvest a very large sum of money in an industry which is specifically threatened with renationalisation.

BONUS ISSUE

Your directors, having considered the future capital requirements and capital structure of the parent company, now recommend a capital dividend to stockholders of £1 in cash, tax free, for each of £1 stock held. At the same time, your directors also recommend the issue to stockholders of one new £1 Ordinary share, credited as fully paid, for each £1 stock held.

It is the intention of your directors to use surplus funds for the development and expansion of your subsidiary companies, and in the acquisition of other companies, both at home and abroad, where prudently and profitably possible, and where the experience and knowledge of the Staveley organisation can be constructively used.

The report and accounts were adopted.

At a subsequent extraordinary general meeting, resolutions for the bonus share issue, as mentioned, were approved.

JOHN HOLROYD & COMPANY

RETURN TO MORE NORMAL TRADING CONDITIONS

The fifty-first annual general meeting of John Holroyd & Company Limited was held on December 17th at Milnrow, Lancashire, Mr E. O. Liebert (the chairman) presiding.

The following is an extract from his circulated address:

I do not doubt that shareholders will be pleased at the results that we have been able to show for the past year, for in my speech last year I gave you warning that the outlook was uncertain, due to the falling off in demand for engineering products. It is safe to say that the fine results we have been able to achieve have been largely due to a very full order book at the beginning of the year, for during the year our output was a good deal higher than our intake of orders, and unless there is an immediate change there is no doubt that our production will decline, with a resultant adverse effect on our results for the current year. I have always tried to give you a fair and unbiased opinion on the outlook, and my remarks above are not intended to cast gloom and despondency amongst you, but rather to let you know that we appreciate the position as it now is.

You may be confident that we shall do all we can to safeguard our position should we indeed be running into a period of more difficult trade.

It has been quite extraordinary in the past year how conditions have changed, for this time last year our production was still being held up by shortages in one direction or another, either of raw materials or of bought-out components. All this has changed and the only shortages now are of orders, which may or may not be due in some degree to many of our customers having overbought, thereby being in a position to work off accumulated stocks, as up to a point we ourselves have been doing for some time. I feel, however, that buyers will again have to come into the market, and indeed during the last month or so there has been some improvement in the order position.

EXPORT TRADE

Last year I mentioned our export trade and I am pleased to say that we have been able to make further progress for several new overseas agents have been appointed, and further visits have been made abroad by your directors. As a consequence, I am confident that our export business should steadily expand.

We have also concluded the purchase of yet another subsidiary company, and this, too, we hope will add some revenue during the current year.

I know that you will wish me to say how much you appreciate the efforts that have been made by all the employees of the parent company as well as the subsidiaries, and you will be pleased to know that everyone will benefit to a greater extent than previously by an increase in the distribution of our Profit Sharing Scheme.

We have again placed £50,000 to plant replacement reserve, making that reserve £300,000. It is your directors' view that whilst this might not now be absolutely necessary (prices are more stable than they were) it is a cautious move, for the cost of new plant is extremely heavy and any success that we may have had has in my view been largely due to the fact that we have always tried to buy the very best and latest equipment available.

THE OUTLOOK

Finally, and to sum up, I feel that we in engineering have, in common with most other British industries, concluded a long period of intense activity and expansion, and that we are now entering upon what might be termed a more normal phase of business activity with keener prices and more competitive and shorter deliveries. I have not the least anxiety in my own mind that, as in the past, we shall be able to hold our own in whatever the future might hold, equipped as we are with the finest plant and manned by the skilled and loyal staff that we have.

During the year, as you know, we doubled our capital by issuing a one-for-one scrip bonus, which, quite naturally, was well received by our shareholders. The doubled capital of £500,000 is considerably less than our reserves and represents less than one-third of the capital and reserves employed in the business of the parent company and its subsidiaries, as shown by the balance sheet. I am mentioning this as the dividend I am about to propose is a modest one expressed as a percentage of such capital, being less than 5 per cent. It is considerably less than the amount left in the business for development and is about one-fifth of the taxation we pay, which, as you may have observed, amounts to over 62 per cent of the group's net profit—and this before charging the £50,000 plant replacement reserve.

The report was adopted.

SECOND INDUSTRIAL TRUST, LIMITED

RECORD REVENUE

MR L. A. STRIDE ON COUNTRY'S SLOW ECONOMIC RECOVERY

The forty-second annual general meeting of Second Industrial Trust, Limited, was held on December 10th in London.

Mr L. A. Stride (the chairman), presided, and in the course of his speech said: Our total gross revenue for the year to September 30, 1953, is £164,082. This is a record figure, but our natural satisfaction at this achievement must be tempered by the knowledge that of the increase of some £14,500 only about £4,000 arises from normal revenue increase the balance being made up of double taxation refunds and arrears of income received during the year. Inevitably our tax liability has increased and after deducting £65,000 on this account the net revenue figure is £8,000 more than last year at £70,306. We recommend on the ordinary stock, a final dividend of 11 per cent, making 16 per cent for the year, as against 14 per cent paid last year. The balance sheet illustrates clearly the continued growth and development of the trust.

The financial year under review has been one of stability, as compared with the crises of recent years. Considerable progress has been made in strengthening the finances of the country, as our slowly increasing gold and dollar reserves indicate.

Much has been done to free industry from the shackles which have hampered it since the war and to enable free enterprise, upon which the prosperity of this country must ultimately depend, to play its proper part in our economic life. Nevertheless, we must be realistic and appreciate the fact that the improvement in our affairs has gone neither fast enough nor far enough to put the country financially out of danger.

We cannot, of course, improve our finan-

cial position unless our exports expand further.

To a great extent we seemed to have overcome our old difficulty of delivery dates only to find we were now being priced out of overseas markets, even out of those which are traditionally buyers of our products.

It is not difficult to understand how this can be when we learn from the President of the Board of Trade that although import prices have fallen by 17 per cent in the last two years, this potentially competitive advantage has been more than absorbed by wage increases during the same period. The strength of the Trust, and consequently its ability to meet successfully whatever the future holds in store for it, has never been greater.

The report was adopted.

THE ROVER COMPANY LIMITED

PRICE REDUCTIONS—BUT QUALITY FIRST

The fifty-eighth annual general meeting of The Rover Company Limited was held on December 11th in Birmingham. Mr H. Howe Graham, FCA (Deputy Chairman), presided in the absence through indisposition of the chairman, Mr E. Ransom Harrison, FSAA.

The following is an extract from the chairman's statement, which had been circulated with the report and accounts:

I am pleased to report another successful year's trading. Our turnover, both in value and in the number of vehicles sold, shows an increase over last year's record figures. Export business has been maintained and constitutes well over half of our total turnover.

We are continuing our work on the development of gas turbine engines for motor-cars and for industrial purposes, and expect to commence production of a small engine of this type for industrial uses shortly. The development of the gas turbine car has not yet reached a stage at which production on a commercial scale is practicable.

On September 23rd last we announced our new season's programme for the home market, together with an all-round reduction in prices. The 1954 range of Rover cars includes two new models, the "90" and the "60," besides the existing "75." All three models are cheaper than last season's "75"—the retail price of the "75" itself, including purchase tax, has been reduced by £85. The new standard Land-Rover incorporates many improvements, and its price in the home market has also been reduced; in addition we have introduced a larger version of this vehicle, the Land-Rover Pick-Up Truck. In making these price reductions we have not in any way lowered our standards of materials or workmanship; we shall continue our policy of putting quality first.

The surplus on trading and management fees for the year of £1,416,407 is slightly higher than last year's figure. The amount required for taxation is £875,003. There is a net profit for the period of £369,626, as compared with £313,300 last year, and there is a total amount of £470,812 available for disposal, out of which the directors recommend the payment of a dividend of 2s. per share, less tax, and the transfer of £200,000 to general reserve and £10,000 to pensions reserve, leaving a balance to carry forward to next year's account of £100,327.

The report was adopted.

S. SMITH & SONS (ENGLAND)

RECORD SALES

The annual general meeting of S. Smith & Sons (England) Limited was held on December 15th at Cricklewood Works, London, N.W., Mr Ralph Gordon-Smith, chairman and managing director, presiding.

The chairman reported that the group profit before tax amounted to £1,678,000 as against £1,248,000 last year and, after deducting the very substantial provision necessary for taxation, the net profit was £566,000 for taxation, the net profit was £566,000 compared with £434,000. To this must be added £254,000 for items relating to previous years, which compares with £182,000 last year. With the settlement of wartime taxation problems, credits of this magnitude in respect of previous years would be unlikely in the future. The improvement in profit for the year resulted, in the main, from increased sales in all major sections of the business and also from the more efficient employment of factories. The total sales for the group were easily a record.

KELVIN & HUGHES GROUP

The separate accounts of the Kelvin & Hughes group showed a consolidated net profit after taxation of £160,000. Since the end of the financial year the company had arranged to acquire from the outside shareholders in Kelvin & Hughes, Limited, the outstanding 47 per cent of its ordinary share capital in exchange for an issue of ordinary shares in the company.

The board recommended a final dividend of 12½ per cent on the ordinary shares, making, with the interim dividend paid, 15 per cent for the year, against a total of 12½ per cent last year. Application had been made to the CIC for consent to capitalise part of the reserves in paying up new ordinary shares to be issued to the ordinary shareholders in the proportion of 3 new shares for every 5 held.

The chairman said that after the first few months of the year the demand from the vehicle producer customers of the company increased, and was still being maintained at a high level. Great credit was due to the motor accessory division in meeting the demands made on it. The year had shown continued improvements in the division's efficiency both in production and organisation, but the directors still considered that it was necessary to invest large sums, both at Cricklewood and Witney, in order to achieve production layouts and methods necessary to assist the British motor industry in its world struggle for markets, by producing at the very lowest cost.

The clock and watch division's products had been progressively improved and were, today, widely recognised as ranking with the leading lines in their particular fields in the world. The de luxe jewelled lever watches produced at Cheltenham were gaining a high reputation and had been associated with many successes during the year.

AVIATION AND INDUSTRIAL INSTRUMENTS

Smiths aviation division was now benefiting by the company's expansion programme completed a year ago and the progress achieved during the year was more substantial than in any previous year in its history. The division was well served and well equipped to meet the exacting demands of the aeroplane and engine designers in the fields of both civil and military aeronautics.

Smiths industrial instruments had again had a successful year. One outstanding success was the award of a very large con-

tract for Smiths-Stones electric railway speedometers. New outlets for this division's products were being explored continuously.

The output of Kelvin & Hughes Limited, showed a substantial increase over the previous year's record making a total increase of 70 per cent during the last two years. Bearing in mind the complicated nature and high quality of the equipment manufactured, this was a remarkable effort.

The chairman reported that the group's total sales for the present financial year showed a satisfactory increase over the corresponding period in the previous year.

The report and accounts were adopted.

HEENAN & FROUDE, LIMITED

INCREASED OUTPUT

MR CHARLES L. HILL'S STATEMENT

The fifty-first annual general meeting of Heenan and Froude, Limited, was held on December 17th, at Worcester, Mr Charles L. Hill, chairman, presiding.

The following are extracts from his statement circulated with the report and accounts for the year to August 29, 1953:

The group net profit, before taxation, amounting to £367,113 shows a fall from the comparative figure of £394,003 last year. After providing £213,788 for taxation against £249,449 last year and allowing for minor adjustments the net profit of the group is £154,628 compared with £144,515. The cash position of the group shows a welcome improvement, the bank overdrafts having been reduced from last year's £268,159 to £90,086 and bank balances and cash increased from £29,009 to £86,038.

The output of the group during the financial year was in excess of the previous year, but rising costs of manufacture have reduced profit margins. The days when standard prices could be amended to take account of wage and material increases, without affecting the flow of orders, are now well in the past and it is the view of your board that a long period of stabilised costs of manufacture is needed if we are to hold our own in world markets.

COMPETITION

Although the orders on the books of the group at the year-end were some £900,000 less than at the same time last year the balance stood at about £4,400,000: in the four years to 1952 demand for the group's main products was exceptional and the fall from the peak figures emphasises the definite trend towards more difficult trading conditions in competitive world markets, where price and delivery dates must not be less favourable than those of foreign manufacturers if the orders are to be secured. Delivery dates have improved during the past year and no orders are being lost on this account, but on the price question it is only too clear that it will be difficult to maintain the volume of sales even at the existing price level; if manufacturing costs continue to rise and force prices yet higher we shall be priced right out of the world markets and that would help no one except foreign manufacturers.

The group's net earnings before taxation are at a modest rate of well under 10 per cent and this is a slender margin, particularly after the essential needs of the future are provided for by way of reserves, out of which to pay higher wages which sooner or later also means paying more for materials, more

to subcontractors and more for establishment charges.

PAST YEAR'S ACTIVITIES

Reviewing the year's activities, the Engine Test Plant section has successfully overcome the problems of designing test plant to match the ever-increasing power and speed of jet engines and gas turbines. The most notable achievement was the installation of a number of plants for testing the Avon and other leading jet engines, and the design and accuracy of these plants has further enhanced the company's reputation. Two wind tunnel plants for testing piston engines were also completed by the end of the year and have since been put into service. In the standard ranges, a large number of dynamometers—hydraulic, dynamatic and electric—were delivered to many parts of the world for the testing of a great variety of engines of powers ranging from 5 h.p. to 15,000 h.p.

Orders for the Heenan Eddy-Current Couplings were not so numerous as in the previous year, although many new applications were developed. These couplings, which provide variable and controllable speeds from a constant-speed motor, have been applied to a wide range of industries as, for example, to the textile industry in this country and to the cane sugar industry in Mauritius, in both cases effecting a 10 per cent increase in production.

As foreshadowed in last year's report, orders in the Industrial Cooler section have not been maintained at the exceptional level, although they are still being received at a rate which is not unsatisfactory.

The effect of overseas competition has been more apparent in the Automatic Machine section than in any other part of the company's business.

In the Municipal Engineering Division new contracts for refuse disposal and utilisation plants, incinerators and baling presses have maintained the balance of orders. Many new schemes prepared for local authorities are of a magnitude which augurs well for the future.

Taken together, the subsidiary companies have had a good year and contributed about two-thirds of the group net profits.

In addition to the production of a continually increasing range of all kinds of hydraulic presses and equipment for various purposes, both large and small, *Fielding & Platt, Limited*, has, during the year, delivered the first few presses incorporating the latest developments for the extrusion of metals.

Court Works, Limited, specialists in malleable and grey iron castings, avoided the recession in the foundry industry and had a record year.

The company's subsidiary in the locomotive industry, *W. G. Bagnall, Limited*, also had a record year of output.

Industrial Waste Eliminators, Limited, has improved upon last year's record profit and maintained a high rate of deliveries of its abattoir and ancillary equipment.

The trading of *Morton Machine Company, Limited*, has followed the previous year's pattern, with its main production lines, bakery machinery, representing about one-half of total sales.

The profits of *Associated Locomotive Equipment, Limited*, were less than last year due mainly to the complete cessation of business with Argentina.

Two years ago your company acquired 49 per cent of the issued share capital of *British Organic Products, Limited*, and before the end of the year under review this was increased to 51 per cent, thus giving the company a controlling interest.

The report and accounts were adopted.

BIRMID INDUSTRIES

SATISFACTORY RESULTS

The annual general meeting of Birmid Industries, Limited, was held on December 16th at Birmingham, The Rt Hon Lord Burghley, KCMG, chairman, presiding.

The following is an extract from his statement circulated with the report and accounts for the year to July 31, 1953:

In my address last year I stated that the position had changed since July of that year, and incoming orders, together with cancellations, rather pointed to the fact that the results for the year ending July 31, 1953, might not be so favourable as for the year then under review.

Fortunately, the position changed for the better and, consequently, the fall in the profit is not quite so large as was, for a time, anticipated. Having regard to all the difficulties encountered during the year, your directors consider the results to be very satisfactory.

DIVIDEND AND BONUS

The total capital employed now amounts to £6,185,638. The proposed dividend and bonus of 12½ per cent, less tax, as against 11½ per cent, less tax, paid for the previous year, is only equal to 4.84 per cent (gross) on the capital employed. Capital and revenue reserves exceed the capital issued by £3,788,138.

The total capital expenditure envisaged during the next few years is in the region of at least £1,500,000. In a group such as yours it is necessary when considering matters of this kind to take long views and, as far as possible, be sure that there are sufficient financial resources to take advantage of the opportunities for expansion of business and also for the installation of the most up-to-date plant.

The charge for taxation at £1,055,055 is in excess of the net profit, £550,987, by over £500,000. After allowing for the credit in respect of surplus taxation of previous periods, the total payable to HM Government amounts to £982,784, as against the proposed dividend of £164,828, or a ratio of six to one.

PRODUCTION AND SALES

Last year I foreshadowed a falling off in the rate of order intake. This feature in fact continued during much of the financial year, and was reflected in a fall of nearly 10 per cent in the aggregate value of sales for the group companies.

From about December, 1952, to April, 1953, the automobile industry suffered some setback, due partly to import restrictions in some overseas markets, and partly to doubts as to the forthcoming Budget proposals affecting purchase tax. Also the reduction in the rate of some parts of the rearmament programme, together with the extension of the completion periods, lessened the demand made upon your companies. Thus it became necessary throughout the group to reduce staffs and working hours appreciably.

At the present time the demand for your companies' products is more encouraging and I hope may continue steady.

Every general wage increase unrelated to production inevitably increases living costs. Thus we have the paradox of the present 15 per cent wage increase claim "to meet increased living costs," which in fact must inevitably entail an increase in living costs. It is to be regretted that apparently certain of the trade unions still do not accept that such stable conditions are as much in their interests as anyone else's.

The report was adopted.

ATKINSON-OATES MOTORS LIMITED

(Incorporated in the Union of South Africa)

OUTSTANDINGLY SOUND POSITION

MR A. R. CALLOW ON A VERY SATISFACTORY YEAR

The twenty-fifth ordinary general meeting of Atkinson-Oates Motors Limited was held on December 4th at 701 Atkinson House, 47 Strand Street, Cape Town, Mr A. R. Callow (chairman of the board) presiding.

The following is an extract from his circulated review: The company enjoyed a very satisfactory year and the results are fully up to expectations. The net profit before taxation amounted to £838,657 which is slightly lower than the previous year.

The dividend has been maintained at 80 per cent, which must be a source of satisfaction to shareholders in view of the very difficult times through which we are passing. It is the intention of your directors to stabilise dividends as far as reasonably possible and at the same time to strengthen the company against any contingencies which may arise in the future.

In accordance with this policy, your directors considered it prudent to transfer £300,000 from the accumulated profits to reserve fund which account now stands in the books of the company at £1 million.

I have to report that since the end of the financial year a tender has been accepted for the erection of a building on the site we acquired in Pretoria. It is anticipated that the building will take twelve months to construct at an approximate cost of £125,000. The requirements of a modern motor business have been incorporated in this building which will be occupied by Sydney Clow and Company, Limited.

It had been planned to start the building of our proposed assembly plant at Elsie's River, Cape, early next year. Owing, however, to the fact that the present exchange position does not permit of the importation of capital equipment we have reluctantly been compelled to defer our plans until such time as the necessary exchange is available.

Our cash resources of £1,564,581 may seem unduly high to shareholders but with our commitments for taxation, dividends and the building project mentioned, considerable inroads will be made in this figure. Surplus funds are invested whenever practicable and help to augment our income.

The company is in an outstandingly sound position as all stocks and other assets are fully paid for and the landed property is unencumbered. Our current liabilities, apart from taxation and dividends, are relatively small and we can look forward to the future with justifiable confidence.

Referring to the prospects for the current financial year, I might mention that there does not appear to be any likelihood of the control of exchange being relaxed. In view of this, we cannot increase our imports of stock as our currency allocation will not exceed that of the year under review. With limited supplies no difficulty will be experienced in disposing profitably of all new vehicles imported as a strong demand still exists for the lines we represent. In addition, our parts departments and workshops continue to show good progress and used cars find a steady market. Summing up our position I have every confidence that it will be possible to maintain a satisfactory level of turnover and profits during the current financial year. The report and accounts were adopted.

LINES BROS., LIMITED

EXTENSION OF ACTIVITIES

The thirty-fifth annual general meeting of Lines Bros., Limited, was held on December 15th in London, Mr Walter Lines, chairman and joint managing director, presiding.

The following is an extract from his circulated statement:

At the end of 1952 the cost of our main raw materials showed a welcome downward trend, which, together with some economies in methods of manufacture, was passed on to our customers, as is our normal policy. Unfortunately, in a few months this trend was reversed and labour charges also increased. A tendency for the costs of packing materials—so vital to export business—to fall was reversed later in the year. Apart from these factors, we suffered what seems to be the normal annual increase in the cost per cent to our products of electricity, coal, gas, water, freight, and local rates, about which we can do nothing. To add to the effect of these items, the buyers made up their minds that there would be a reduction in purchase tax when the Chancellor opened his Budget, and decided they would not be caught this time with stocks on which they had paid a higher rate of tax. On Budget Day, April 14th, the Chancellor duly made the reduction—from 33½ to 25 per cent—instead of on January 1st, in spite of representations made to him by almost every section of industry. The result of this delay was deplorable, for manufacturers, who must endeavour to keep their staffs fully and, therefore, economically employed, soon filled up all available storage space, and were compelled to reduce instead of increase production on which so much depends. We decided, and I am sure rightly, to stick to our reduced selling prices. These factors affected the first half of the year under review, and although by the end of June we had succeeded in maintaining the money value of our sales, and actually considerably increased our bulk sales, the final trading profits were somewhat lower. We had, and have in hand a large programme of improved layouts and installations of new plant which we feel sure will help us to take care of increased costs. The effect of these improvements was not felt in the year under review. Since the beginning of our new financial year there has been a large increase in sales as compared with the corresponding period last year.

NEW ACQUISITION

In the early part of 1953 I visited South Africa, which before 1940 had been our best export market but which has, since 1951, for currency reasons, imposed an embargo on the import of toys. On my return I recommended the purchase outright of an operating company, with factory, plant, and land at Johannesburg, with the name of Jabula (Zulu for "happy"), which has for some years been making a limited range of metal toys, helped no doubt by the embargo on imports. This is the largest toy factory in South Africa.

Export trade has recently shown considerable improvement following the setback due to embargoes and other trade barriers, and we have been hard put to it to execute all the trade offered for immediate delivery. Our design and development building has been very fully occupied with many new and attractive articles which we are sure will be in great demand.

With the coming into production of new lines and the improvements we have been making in our manufacturing methods, we look forward with confidence to a steady growth of profitable trade.

The report and accounts were adopted and the dividend on the ordinary shares of 8d. per share, less income tax, was approved.

GOODE DURRANT & MURRAY LIMITED

SATISFACTORY YEAR'S TRADING

GROWING CLIENTÈLE IN WORLD MARKETS

The fifty-fifth annual general meeting of Goode Durrant & Murray Limited was held on December 17th at 197 Great Portland Street, London, W.1, Mr Lewis A. Kemp (the chairman) presiding.

The following is the statement by the chairman which had been circulated with the report and accounts:

It is with much pleasure that I place before you your company's results for the year ended July 20, 1953.

These are not quite up to last year, due to the prudent necessity of adequate provision against loss in respect of frozen currency in Brazil, which has prevented us from showing a very satisfactory result. Even so, the final figures, arrived at after a difficult year in overseas trading, can be regarded as by no means unsatisfactory. Your directors are satisfied that the position has been consolidated. Market conditions are more stable, dated. Surplus stocks have been absorbed, and losses have been ascertained and met. In general, restrictions on imports are being relaxed, and turnover, by volume as distinct from value, is improving.

RÉSUMÉ OF MARKETS

AUSTRALIA: I am not attempting to quote statistics regarding the wool clip, wheat, and other primary products, but confine myself to pronouncing the simple fact that the income from these sources is the life-blood of Australian economy, and I am glad to report that the primary industries throughout the Commonwealth are in a healthy condition, and finding ready markets for their products at profitable prices. Secondary industry is striving to meet the demand for goods. Our trading stocks have been reduced, as a result of which our liabilities to bankers in Australia have been brought back to normal. Reduction in stocks, through import restrictions, was responsible for some shortages and lack of balance, which has now been rectified. The margin of profit we are allowed to make is limited and working expenses continue to rise. Our woollen mill has recovered and has aggregate orders in hand to ensure full activity. The erection of the oil refinery at Kwinana in Western Australia is attracting other industrial development as well as population. Although the rise in wages has been stemmed, costs of manufacture are high and must cause some anxiety to manufacturers. The inflationary tendency is worrying to the business community generally.

NEW ZEALAND: Difficulties of payment have been overcome, and increased exchange is now available. Stocks have been reduced, and demand for new goods is very keen. Primary products are in world demand, and are being disposed of at satisfactory prices.

WEST INDIES: Our trade in this area has been very satisfactory, and there is an increasing demand for goods by our customers.

AFRICA: In the Union of South Africa trade is buoyant, but there is difficulty in balancing imports with exports and, as a result, there is to be a continuation of quotas for imports, which may have some effect upon our business. Industry is expanding, and the demand for capital continues unabated. In East Africa the Mau-Mau troubles have caused disruption in some areas, but have not affected trade to any marked degree.

The Rhodesias are enjoying prosperity and new industries are springing up. Nyasaland has had a good season, and merchants are active in ordering supplies. Our trade with West Africa is expanding with the progressive development of the territory.

LATIN AMERICA: Our business with this area is completely over-shadowed by Brazil, from which territory no payments have been received for over a year. However, since the date of the balance sheet we have encashed over 25 per cent of our debt and are exploring avenues to secure early remittance of all or part of the remainder held in abeyance by the Brazilian Bank, with a view to avoiding the delay entailed by the Government scheme of payment by instalment spread over several years. The other markets in South America are not very active at this time, but we are still conducting moderate business in certain of the Republics.

MIDDLE EAST AND ASIA: Generally speaking, trading in these countries is adversely affected by political influences, but contacts have been maintained, and business continues active with some of our old customers.

BALANCE SHEET

You will see that our current assets exceed liabilities by £864,936. Your directors are of the opinion that the provisions for doubtful debts are sufficient for any eventuality, and that stocks are soundly valued.

The profit available, amounting to £64,263 after provision for taxation, is sufficient to repeat last year's dividend of 10 per cent and add £19,027 to the carry-forward, which now amounts to £96,160, in addition to £23,451 left in the accounts of subsidiary companies.

During the year we acquired an old-established business of confirming agents and shippers, which will be carried on as a subsidiary company, and expanded as opportunities occur.

Both our United States and South African subsidiaries have contributed to the profit of the group, and we trust that conditions will allow us to extend our business in these spheres.

Trading for the opening months of the current year is encouraging and justifies an opinion of restrained optimism. We are working upon a more solid base, with normal conditions of competitive trading and greater freedom, which should provide opportunities for expanding the company's business on favourable terms. Exports are essential to the United Kingdom, and we have a vital part to play in our capacity as shippers and financiers for our growing clientele in all parts of the world.

The report and accounts were adopted.

HILLS (WEST BROMWICH) LIMITED

The twentieth annual general meeting of Hills (West Bromwich) Limited was held on December 11th at West Bromwich, Mr E. D. Hinchliffe, AMI, Struct. E (deputy chairman and managing director) presided and paid a tribute to the late chairman, Mr R. S. Dyball.

Tribute was paid in the late chairman's circulated statement to the services rendered by the late Mr Manley Cooper, who was for so long connected with the company.

The statement continued: The balance on trading accounts at £190,699 shows an improvement of £48,834. The profit before taxation is £102,677, compared with £73,257 in the previous year. The charge for taxation has increased from £43,268 to £63,882 for the year 1952-53.

Our existing order book is of such magnitude that your company can operate in its field of school construction for at least two years at not less than its present rate of production.

The advantages of Hills system of dry-built construction for single- and multi-storey building is becoming increasingly appreciated: many types of development structures have already been completed, including factories, canteens, office blocks and various forms of social amenity buildings. It is anticipated that the volume of work from these sources will make a substantial contribution to output.

In addition to Pakistan and Canada, a very marked interest is being shown in your company's products by overseas countries. I think it is not unreasonable to hope that the results for the current year at least will equal those now under review.

The report was adopted.

KEYSTONE KNITTING MILLS (1928)

VERY SATISFACTORY PROGRESS

The twenty-fifth ordinary general meeting of Keystone Knitting Mills (1928), Limited, was held on December 14th at Elstree.

Mr H. N. Lewis (chairman and managing director) presided and in the course of his speech said:

The profits of your company and its subsidiary are £25,547, as compared with a loss of £30,653, representing an improvement of £56,200. These figures are after taxation provisions. Omitting taxation, the improvement is no less than £88,990. I think all will agree that these figures indicate very satisfactory progress.

I will now refer you to the consolidated profit and loss account. For your convenience my figures will be kept to the nearest hundred pounds. The profit on trading for the current year at £198,000 is an increase of £108,800 on the preceding year. In order to achieve this result and be prepared for the competition which is expected to become more severe, it has been necessary to incur additional expenditure. General advertising and other selling schemes have been adopted for the purpose of bringing your company's products before the general public to a greater extent than in past years.

It was decided to recommend that the dividend on the deferred ordinary shares be retained at 5 per cent (less income tax) as last year.

While the company's sales during the year to June 30th last showed reasonable improvement on the total for the preceding year, I am glad to be able to inform you that the total for the five months which have elapsed since that date shows a further gratifying increase.

Sales to the export markets are slightly less than in the corresponding period of the preceding year.

Nylon yarn, which is now the major raw material used in the manufacture of hosiery, is still in extremely short supply and the quantity of nylon hosiery we can produce is restricted only by the raw material available to us.

We are constantly experimenting with new yarns and new fabrics in order to maintain the high reputation which "Keystone" hosiery and lingerie have always enjoyed, and to keep the factory fully employed.

Bearing in mind all relevant circumstances, I can see no reason why the improvement in business which we are experiencing should not continue throughout the current year.

The report was adopted.

THE SCOTTISH AUSTRALIAN COMPANY

PROPOSED NEW ACQUISITION

The annual general meeting of The Scottish Australian Company, Limited, was held on December 10th in London.

Mr J. Norman Eggar (chairman and managing director) presided, and in the course of his speech said: Dealing first of all with the profit and loss account, you will notice that the proceeds from wool and livestock are down by £45,000. Actually, proceeds from wool were down by £62,000 and proceeds from livestock up £17,500. Our wool clip was down by 1,033 bales, three stations—Bowen Downs, Corrella-Warraweenah and Fernlee—having substantially smaller clips. This is the main reason for the reduction in revenue, though the average price per bale realised £3 18s. 5d. more.

Our income from the joint organisation was £44,907; we expect to receive similar sums during the current year and next year. You will notice that taxation absorbs £216,383. We have available for disposal the sum of £179,132 after crediting a taxation adjustment in respect of past years and providing £13,330 for a staff bonus which has been extremely well earned. We are appropriating £100,000 to general revenue reserve, bringing that reserve to £1,300,000. After charging £17,600 for the dividends, less income tax, on the guaranteed preference stocks and £55,000 (net) for the interim and the final dividend of 10 per cent and bonus of 5 per cent, if approved, on the consolidated ordinary stock, we carry forward £157,942, against £151,410 brought in.

As regards the parent company's balance sheet, you will notice an item, "wool realisations in excess of one year's clip carried forward, £247,608." Last year, contrary to our usual custom, we sold most of our Queensland clip in Brisbane instead of bringing it to London. The proceeds for this wool were actually received before the end of the financial year, but it has always been our practice to deal with only one clip from each station yearly, so that the amount referred to had to be carried forward.

You will, I am sure, agree that our balance sheet is a strong one. The pastoral industry must have its setbacks from drought, bush fires and floods, but our interests are widely spread and I feel that our resources will enable us to face the future with confidence.

PROPOSED ACQUISITION

You will expect me to refer to the announcement which appeared in the press on November 11 that this company had offered to acquire the share capital of The New South Wales Land and Agency Company, Limited. That company is engaged in similar pastoral activities to our own. It owns two freehold properties in the north of New South Wales some 75 miles south-west of Texas, and a freehold and two leasehold properties in Queensland. Assuming that the offer is accepted, it will mean that we shall get an addition of some 50,000 to our stock of merino sheep and some 10,000 head of cattle. The transaction will involve an issue of an additional £130,725 consolidated ordinary stock, to which the Treasury has given its consent. Full details are being issued to all stockholders, who will be asked to attend an extraordinary general meeting on January 15, 1954, for the purpose of passing the necessary resolutions. If these are carried, Mr D. R. Jardine, Chairman of the New South Wales Land and Agency Company, Limited, will join the Board of this company.

The report and accounts were adopted.

TOWN TAILORS

STEADY PROGRESS IN ALL SECTIONS

The twenty-third annual general meeting of Town Tailors, Limited, was held on December 14th at Leeds, Mr Hector M. Frazer, chairman and managing director, presiding.

The following is an extract from the chairman's circulated statement for the year to August 1, 1953:

We have made steady progress in all sections during the year. After charging depreciation and all expenses (excluding taxation), our group net profit is £311,777 compared with £264,382 for the previous year, when we had the benefit of £75,000 credited from a special stock contingency reserve.

In 1950 I said that I looked forward to the day when our ordinary shareholders would receive a more adequate reward. During the following year, we were able to increase the dividend by one-sixth and in spite of the severe recession in the tailoring trade, we maintained this increased dividend during last year. Now, I am happy to say that another increase is proposed. Your directors recommend the payment of a final dividend of 16 per cent to the ordinary stockholders which, together with the interim dividend of 12 per cent, makes a total dividend of 28 per cent for the year, against 28 per cent for the previous year on a smaller capital.

For the fifth consecutive year we have decided to recommend a bonus issue to our ordinary stockholders. This will consist of one ordinary stock unit for every six ordinary stock units held. The cost will be £50,000, which we shall take from the reserve accounts. It is proposed to carry forward a balance of £401,111 on the profit and loss account.

FACTORIES AND SHOPS

Our factories are all working to full capacity and no labour hours have been lost by any dispute during the last twelve months. The new factory at Barrow is making steady progress, and we are now building an extension to the Blyth factory.

All Weaver to Wearer shops are profitable, and new branches have been most successful. Additional new premises were opened at Romford, Bournemouth, Boscombe, Glasgow, Hammersmith, Greenock and Whitehaven.

Subsidiary companies have again been of great help. Our mail order department is making good progress and export shows improvement. A new innovation is the export of ready-made clothing; previously we shipped piece goods only.

Always, we try to be in the forefront of new fashions which we feel will be in great demand. By specialising on lines in which we excel, we continue to concentrate on the needs of the majority.

We still lead the field of multiple clothiers in giving better value at considerably lower prices. We propose to continue this policy of a quick turnover of stocks at a lower margin of profit. This assists our customers, reduces our risks and should benefit our stockholders.

In the future, I would recommend that we spend even more money on improvements to try to ensure continued progress and thus safeguard our stockholders' interests in the days of more intense competition, with which we are sure to be faced. For the current financial year, I cannot at the moment visualise many unfavourable factors which will prevent normal progress being made.

The report and accounts were adopted.

At a subsequent extraordinary general meeting the proposed bonus share issue was sanctioned.

CONSOLIDATED GOLD FIELDS OF SOUTH AFRICA, LIMITED

RECORD FIGURES

The annual general meeting of this company was held on December 10th in London.

Mr Robert Annan, chairman, in the course of his speech, said:

Dividends and interest on our investments at £1,226,000 constitute a further record, and continue to reflect the satisfactory development of our important interests in the mines on the Far West Rand and in the production of platinum.

After charging £635,000 for overseas and United Kingdom taxation the net profit for the year is £876,000. With the single exception of last year, this constitutes our highest net profit since 1939.

The mines achieved record figures for tonnage milled and gold produced with a substantial increase in profits. This is principally due to the expansion of operations at West Driefontein. Four of the mines have been included in the scheme for the production of uranium.

The results have been, on the whole, most satisfactory, particularly in the opening of new mines on the property of West Wits and in the Free State.

We have sound reasons for confidence. Our main interest continues to be in the South African gold mining industry, where the expansion which began with the launching of West Witwatersrand Areas twenty-one years ago is bringing into production mines of considerably higher grade than most of those now being worked.

The report was adopted.

LONDON & RHODESIAN MINING & LAND

The annual general meeting of this company was held on December 8th, in London.

Sir Joseph Ball, KBE (chairman and managing director), presided and, in the course of his speech, said: The profit for the year amounted to £98,424. The carry forward at £36,814 is slightly over £2,000 in excess of the corresponding figure last year.

Mining: An important source of income to the company arises from the fees and commissions which we receive as consulting engineers and managers of mines owned by associated companies, such, for example, as the well-known Cam and Motor Mine, and the three mines owned by Coronation Syndicate, Limited, viz.: The Muriel mine, Tebekwe mine and the Arcturus mine. During the last year or two they have all made very substantial progress.

Shortly after the close of the financial year, we received information as to the possibilities of a gold mining property conveniently situated in the Jumbo district. An offer of £80,000 was found to be acceptable, and steps were accordingly taken to form a Southern Rhodesian subsidiary company, with an issued capital of £90,000, to purchase and operate the mine, and the transaction has now been completed.

Ranching: The total profit on our ranching operations during the year under review amounted to £34,596—an increase of approximately £2,100 over the previous year.

Real Estate: The company still held 973,925 acres of land at June 30, 1953, despite the fact that sales during the year totalled 41,643 acres and resulted in a profit of £22,538. The report was adopted.

JOSHUA TETLEY & SON LIMITED

(Brewers and Bottlers)

A YEAR OF PROGRESS

MR F. E. TETLEY ON AN IMPORTANT DEVELOPMENT

The fifty-seventh annual general meeting of Joshua Tetley & Son Limited was held on December 11, 1953, at the Registered Office of the company, The Brewery, Leeds 10, Mr F. E. Tetley, chairman of the company, presiding.

The secretary of the company, Mr R. F. Tetley, read the notice convening the meeting, and Mr W. N. Herald (Messrs Peat, Marwick, Mitchell & Company) read the report of the auditors.

Mr F. E. Tetley referred to the resignation as chairman of Mr C. H. Tetley and to his services to the company over a period of fifty-one years, for nineteen years of which he was chairman.

The chairman then said: Ladies and gentlemen,—The directors' report and statement of accounts having been in your hands for the required time I presume you will agree that we should take them as read. (This was agreed.)

TRADING RESULTS

It falls upon me now to submit for your approval and adoption the accounts and directors' report for the financial year ended September 30, 1953. The company has again made progress with regard to sales and our total income of £6,724,623 shows an increase of £274,000 over the figure for last year. Our income for 1953 has been absorbed in the following manner:

Beer duty	61.4
Taxation	5.4
Materials and production costs (excluding wages)	11.1
Wages, salaries and pension schemes	6.0
General trade expenses	9.6
Depreciation and reserves	3.9
Interest	.9
Dividends (net)	1.7
	100.0

There has again been a certain increase in our expenses and charges and the final result shows that we have a net profit before taxation of £619,000, as against £540,000 last year. Taxation this year has been on a lower scale than last, the rate per £1 being reduced from 12s. 10d. to 11s. 8d., so that we have available for appropriations and dividends a net profit of some £64,000 more than a year ago. We have thought it wise to recommend the payment of the same ordinary dividend as last year—namely 3s. 3d. per £1 of stock, to place £50,000 to the credit of general reserve, bringing its total up to £1,050,000, and to increase the profits carried forward by an amount of £89,543. We have not thought it right to recommend any increase in the dividend in view of the fact that our net current assets have again declined, this time by some £106,000, while our bank overdraft has increased from £87,000 to £171,000. As a matter of interest I can state that over the last seven years the amount we have invested in the business has only exceeded the net dividends paid by the sum of £28,500.

OFFER TO DUNCAN GILMOUR & COMPANY

I am glad to inform you that the discussions between the board of your company

and that of Duncan Gilmour & Company, Limited, have now been satisfactorily completed, with the result that a formal offer is being dispatched tonight to the stockholders of Duncan Gilmour & Company, Limited, of an exchange of stocks of this company for their stocks. The effect of an acceptance of the offer will be that Duncan Gilmour & Company, Limited, will become a wholly owned subsidiary of Tetleys and the present board of Duncan Gilmour will resign. Your directors are confident that if the offer is accepted it will constitute an important development in the history of this company.

I should add that no change in the board of this company is contemplated as a result of this amalgamation, but we shall welcome the co-operation of the executives and administrative staff of the Duncan Gilmour group.

I am advised that it would be improper for me to disclose further details of the proposals at this meeting, but a circular will be dispatched to you tonight setting out details, together with the report of the proceedings at this meeting. You will receive the details at precisely the same time as they are received by the stockholders of Duncan Gilmour.

This circular will also refer to our proposals for raising additional finance and maintaining the balance of the company's capitalisation.

SATISFACTORY SALES IN CURRENT YEAR

Since September 30th sales have been satisfactory and it is anticipated that our malting costs will again be lower in the coming year. Our new drum maltings are expected to be in partial production for some months of next year, though they will not be fully employed until the spring of 1955.

In conclusion, I should like, on behalf of the directors, to thank all the men and women in our employ for the splendid work which they have done for the company during the past year, and I have no doubt that all stockholders would wish to join the directors in this expression of thanks.

I now beg to move that the statement of accounts of the company for the year ended September 30, 1953, as audited, together with the directors' report, be and are hereby approved and adopted, and I will ask Mr M. H. Tetley to second this motion.

The report and accounts were then unanimously adopted, the dividends approved as proposed by the directors and the formal business duly transacted, the proceedings terminating with a vote of thanks to the chairman.

IND COOPE & ALLSOPP, LIMITED

The forty-first annual general meeting of Ind Coope & Allsopp, Limited, was held on December 17th, in London, Col. The Rt Hon Lord Courthope, MC (the chairman), presiding.

The following is an extract from the chairman's circulated statement for the year ended August 31, 1953:

Notwithstanding a small decline in overall output, turnover again increased. This was largely due to a growing demand for Double Diamond and for the better quality Burton beers both on draught and in bottle. There was also increased demand for wines and spirits. As the year has progressed output has tended to improve, and it has during the new financial year been in excess of that of last year.

Last year I told you that the outlook was promising and we have had a record export year, our brewery at Alloa having been continually at full production. This is due not only to the enterprise of those concerned, but to the very great strides made in pro-

ducing a lager beer which the public have adjudged the equal of any continental competitor. Though this is a relatively small side of our business, it is an important contributor to our profit and loss account.

The group trading profit is reduced from £2,703,217 to £2,599,641, notwithstanding an increase of over 2 per cent in overall group turnover. This fall in trading profit results from generally increased costs of distribution and selling and in particular a substantial fall in managed house profits.

The report was adopted and a final dividend of 8 per cent, making 12 per cent for the year, was approved.

WALMSLEYS (BURY) LIMITED

(Manufacturers of Pulp and Paper
Making Machinery and Equipment)

LARGE VOLUME OF WORK IN HAND

The twenty-first annual general meeting of Walmsleys (Bury) Limited was held on December 11th at the Chamber of Commerce Rooms, Silver Street, Bury.

Mr John Wolstenholme (the chairman), who presided, in the course of his speech said: The group profit for the year ended June 30, 1953, before charging taxation, is £376,587, compared with £459,445 for the previous year. This fall in profits before tax is an experience shared by quite a large section of industry, especially the paper and board trade, in the same period of time. I am not alarmed about it. Indeed, if the surge of inflation which had been carrying profits to ever higher levels can continue to be kept under control, all of us, shareholders, employees, customers and management alike, will have cause to be grateful.

After charging all taxation and deducting the proportion of subsidiary companies' profits which are attributable to outside shareholders' interests, the group profit becomes £200,644, compared with last year's figure of £213,826.

Out of the profits £12,000 has been set aside for pensions reserves.

This year a final dividend of 12½ per cent on the ordinary share capital has been proposed for your approval. The net dividends thus require £39,988, leaving £148,656 to be added to the amount brought forward from last year. After these provisions the sum carried forward in the profit and loss account becomes £969,966.

MANUFACTURING PROGRAMME

Several very large contracts are in progress, the completion of which to the customer's requirements call for a strong and sustained effort at every level of the organisation. We have a reasonable confidence in our capacity to meet these calls, at the high level of quality which sustains our reputation.

Very recently we have received complimentary reports of the start up of new machines from the Walmsley Group from countries as distant as New Zealand and Pakistan. We have executed a host of orders for equipment of smaller character. In the year under review there has been a drop in the volume of smaller orders, a reflection of the trading recession to which the paper trade has been so widely subject. The volume of these smaller orders and inquiries has recently shown some signs of revival.

Paper-making machinery has again constituted some 80 per cent of our total work, but our other activities—namely, high-speed engines, mining machinery, rail-cars and mobile cranes have maintained their contribution to our output.

Future prospects depend upon the general

The Morality of Money

CHRISTMAS is a time for counting blessings. And certainly, in the material sense, the British people have plenty to be thankful for. The country is not only richer than ever before, but quite a lot richer. The annual production of wealth, in real terms, is at least one-fifth larger than it was before the war. Contrary to the almost universal belief, this is not a poor country but a very rich one, and the fact will be attested this week by millions of groaning boards and sagging Christmas trees. Why, then, do we still have economic problems, hibernating perhaps at the moment but certain to re-emerge in the spring? Why, particularly, do we suffer from problems that arise from an inadequacy of production, either of output in general or of particular sorts of output? It can only be because something is wrong with the motive force, the regulator, of the economy. That is money.

Money is sometimes said to have been dethroned. Never was anything less true. People still work for money—not simply and solely for money, but for money infinitely more than anything else (if you doubt it, try to take their money away). And it is money—again not alone, but much more than anything else—that induces them to work at this and not at that. Like petroleum for the internal combustion engine, money provides both the prime mover and the lubricant. Indeed, it is doubtful whether a complex economy, one depending on anything more than the simplest degree of division of labour, could ever be made to function at all except as a money economy. Certainly in this country, such inroads as planners and controllers have made into the money system—monstrous though some of them seem when the attention is concentrated on them—are in the aggregate no more than marginal. Indeed, the socialist experiments in this country have proved how very weak are all the other incentives to economic action in comparison with money. Prohibitions are perhaps a somewhat different matter. You can inhibit a man from some form of economic action by passing a law; you can stop him working or producing by statute. But if any means of inducing him to work, other than paying him money to do so, has yet been discovered, the British Transport Commission urgently desires to hear of it. Not that the offer of money always produces the result; but (save here and there, and for special reasons) nothing else ever does.

But if money has lost very little of its economic power, it has, in this country, lost some of its moral force. For though money in fact still dictates the great mass of economic decisions, large and small, that are taken every day, people are no longer sure that it ought to. And that at once puts sand in the wheels of the economic system. For a free-running and swift-running money economy must be based on the presumption that the possession of money carries with it a moral right of the possessor to spend it—not perhaps in all circumstances, but much more often than not. But that is precisely what so many people nowadays affect to doubt. A very large slice of the national

income is today directly transferred, in cash, from the rich and comfortable, the healthy and the employed to the poor, the infirm, the unemployed and the old. Net incomes are held down to a maximum level which in any other age would have seemed inconceivably low. Socialist politicians admit in public that redistribution can hardly go any further. And yet, after all that, it is still thought that people do not have an unqualified right to spend their net, post-tax, incomes as they choose. Fathers who have paid their share of rates and taxes and have thus helped to pay for schools for everybody else's children are criticised if they choose to spend part of what remains to them in buying for their own children a form of education that they think the best. Although it would cost very little in scarce foreign exchange, any increase in the travel allowance above £50 a year is resisted on the grounds that few people want to spend more than that on foreign travel and therefore those who do so wish can justly be frustrated. Nor is it only the rich whose right to spend their net incomes as they choose is denied. It is true that "no mucking about with the worker's pennies" has become a sacred text. It is true also that nobody attaches the same moral disapprobation to the smoking away of vast sums of dollars that they do to even moderately comfortable holidays on the Riviera (which are an infinitely smaller burden on the economy). But in many other ways even the trade unionist is obviously not trusted with his own money by the gentlemen in Whitehall. A whole apparatus of taxes and subsidies is designed to make him think that he wants a parcel of goods and services significantly different from what he would choose if he were left to himself.

★

These restraints upon the power of money have been imposed for all manner of non-moral reasons. But they could not be sustained for a moment if the morality had not gone out of money, at least in part. And, indeed, that it is so is a matter of everyday observation. Even those who have the money, honestly come by, and all taxes paid—are diffident about their right to command anything with it. Wealth no longer preens itself. If it is a matter for pride at all, then the pride must be a very private pride indeed, for in public the prevailing *mores* dictates an attitude of apology for any wealth possessed in excess of the dead average.

Here then is a paradox. The British people desire a quickening of the tempo of their economy. At least, if they do not want it they need it, both to be able to pay their way in the world and also to be able to redeem the pledges they have made to themselves under the ensign of the welfare state. Nothing would more certainly achieve this result than to liberate the main driving force of the economy from some of its shackles and let money do its stuff. Yet to do that would be thought to offend against the moralities—even, in a dim, muddled, public-spirited sort of way, by

many of those who would be the most immediate and obvious gainers. (Everybody, of course, would gain in the long run.) So we are caught in a dilemma between ethics and economics, a split personality on a national scale, pulled one way by all manner of desires for greater material prosperity, and the other way by an undefined feeling that the means of getting it are not quite nice. Such a situation is not even very moral, for we have all the incidental moral disadvantages that flow from a still considerable degree of inequality without reaping more than a fraction of its benefits. A community that was very unequal might excuse itself if it were very rich and growing richer, or one that was stagnant and poor if it were utterly just. But for the halfway course there is little to be said. And if it persists, the results can hardly help but be disastrous—not perhaps tomorrow or the next day, but in the end—for a nation, like a man, cannot prosper for long if it is ashamed of the means by which in fact it makes its living.

One of the matters to which those who understand mass psychology might therefore well direct their thoughts is the means by which (since there is no prospect of getting rid of money as the mainspring of the economy) some of the morality it once possessed can be put back into money. Since incomes have been redistributed about as far as they can be, could not net incomes regain some of their former character as titles, moral as well as economic, to a proportionate share of the flow of wealth? To ask the question is to come up against the difficulty. For incomes are not the only source of expenditure, and not all incomes are earned. This is the poison that has weakened the morality. Even today there is little grudge against wealth, even great wealth, that has manifestly come to its present possessor in consideration of services rendered by him to the community—as witness the well-advertised conspicuous spending of film stars or comedians. The grudge is against wealth that is inherited, or that is earned by reason of a position inherited.

If this poison could be removed. . . . But an argument that starts with the need for sharper incentives and ends up by toying with the idea of still further limiting inheritance has clearly outrun its own wind. It has certainly gone quite far enough for Christmas week. Yet there is food for some very serious thought. Beyond recall, society is now in the hands of the Have Nots. They can perhaps be brought to see that, unless present effort and present enterprise and present success are allowed to have some reward, there will soon be no effort, no enterprise and no success. But will they be brought to see it if the argument is cumbered with the need to reward those whose wealth comes from no effort or success of their own? And if not, which is better, to try to go on running with a motive force that is distrusted—which can lead only to stagnation or to the police state, or to both together—or by some sacrifice of the capitalist gospel to try to dissipate the cloud and make money again effective because it is accepted as a just appraisal as well as an economic force?

Atlantic Assembly

MANY hard things have been said about the Council of Europe's ineffectiveness and about the spirit of frustration that sometimes prevails in Strasbourg. But one thing at least—and there are others—can be said in its defence: it has greatly expanded and deepened the knowledge of Europe's problems and aspirations among the delegates of national parliaments who have gathered there for the last four years. Certainly, the House of Commons talks of Britain's neighbours with greater understanding than it used to; and there have been occasions recently when a good debate in the Consultative Assembly has clarified and steadied opinion about the direction in which member nations should move. The role of Europe has become a commonplace of political discussion, and the democratic statesman who recommends a return to former rivalries and traditional attitudes has now to accompany his remarks with an apology for being old-fashioned. This is all pure gain, but it is not enough. Western Europe, if it is to organise its future in safety and prosperity, needs the harness and the shield of the Atlantic alliance; and the next question for politicians should be how the members of fourteen parliaments and their voters are to become as familiar with the Atlantic idea as they are with the European.

It is a matter in which Britain, with its vital interest in linking North America to the Continent from which its islands must be defended, has a special responsibility for leadership, which has been only slowly and timidly recognised. It was, therefore, a very welcome novelty in the rambling and inconclusive debate on foreign affairs in the House of Commons last week when a Labour member, Mr Denis Healey, put forward his proposal of "some sort of parliamentary assembly for the principal countries of Nato." He declared that public apathy and parliamentary ignorance are the most formidable obstacles to the development of a united and persistent western policy; that United States senators and congressmen are dangerously isolated from their colleagues in other parliaments; and that the motives of American opinion of many major issues are totally misunderstood on this side of the Atlantic. These are all true and important points, to which might be added the view that many members of the House of Commons—sometimes even Ministers—show a lamentable ignorance of what is done at the headquarters of the Atlantic alliance.

The idea that politicians should debate and probe into the affairs of the Atlantic Council and the Supreme Headquarters is far from popular at the Palais Chailot. Indeed, a Norwegian proposal to this end recently received from the Council the kind of welcome that sends an idea scurrying into a pigeon-hole. The military want to maintain the secrecy in which they have worked fast, confidently and well. Officials associate the

presence of politicians with extra work in answering awkward questions. The permanent delegates plead that they are responsible to governments and not to parliaments. The sceptics everywhere point warningly to Strasbourg, where so little is done while so much is said, and proudly to Nato, where so much is done without anything being said. These arguments deserve respect; indeed, they might be conclusive if it could be said that Nato was already supported by a public opinion enlightened and powerful enough to get things done quickly and well. In fact, however, it is being and will be increasingly frustrated by the kind of ignorance that sets allies at odds and makes it difficult for governments to honour commitments.

★

Clearly, any attempt to create a legislative assembly, or the semblance of one, would be doomed to failure. Nothing could be more exasperating, both to Nato and to the politicians of member countries, than a struggle by such an assembly to win powers it was never intended to have. Europe has quite enough trouble of this kind on its hands for the moment. Likewise, any discussion in public—and the proceedings must be public to have any value—of Nato's detailed defence and financial plans would be undesirable; security objections apart, it might easily check the present readiness of national governments to communicate to Nato secrets and problems of which parliaments never officially hear. It would be dangerous to debate too often, to summon too many members of parliament from the fourteen nations, to give the assembly power to delay and complicate action. But within these limits it should be possible to bring together, say once a year for two weeks, a group of members of parliament from each country (chosen by parliaments) for debate and informal contact. It would be a new kind of body that would have to develop novel methods of work—like Nato itself.

What other conditions should an Atlantic Assembly fulfil and on what work could it usefully start? First and foremost it should be a body in which Americans and Canadians would be willing to sit; without them its most useful purpose would not be served. There would be resistance to the idea, notably in Canada; but it would be most regrettable if it were thought by Europe that the North Americans were obstructing integration. Again, there must be real equality between members; as Mr Healey pointed out, American representatives must not appear as cross-examiners of Europe. As for the work to be done, it would suffice at first if the politicians were presented by the Atlantic Council with a special report for debate, rather as the OEEC presents

the Strasbourg Assembly with a special report. They could be addressed by the commanders and the experts: much that now goes into unreported press conferences would have much more impact on a meeting of politicians. Such burning questions as Germany's relationship to Nato, America's obligations in Europe, and the economic limits to be imposed on rearmament could be made to lose half their bitterness if they had been debated in a serious and orderly manner at the headquarters of the Atlantic community.

There is a clear danger lest Nato, as at present constituted, become a technocracy of military men and diplomats, remote from public opinion and living in the illusion of achievement that prevails wherever a lot

of intelligent and high-ranking people are gathered together. Britain and, perhaps, the United States and Canada may be quite satisfied with the organisation as yet another expression of their special relationship; it does not disturb them that Nato should be pushed and puffed into a gigantic figure two or three times a year and then left to sag like a breathless Guy Fawkes for the rest. But it does disturb the smaller Governments and it does irritate all those Europeans who feel that their relationship to America, if not that of satellite to sun, lacks intimacy and equality. An Atlantic Assembly, starting life modestly and shrewdly, could contribute greatly to a real understanding of Europe's destiny on both sides of the Atlantic.

The Business of Christmas

CHRISTMAS is bigger business than ever, and some sour people maintain that that is why it continues to exist. As long ago as the 1890s Bernard Shaw was arguing that but for the shopkeepers Christmas would already have died a natural death. Between the wars Mr Aldous Huxley proclaimed that, once consumption had failed to keep pace with the increase in productive capacity, traders successfully promoted the idea that gifts were an essential expression of the Christmas spirit. Today, when the shops are again trying hard to sell goods to customers instead of explaining to them cursorily that they have not enough in stock, there is again a temptation to regard the secular side of Christmas as a commercial creation, a better line of sales talk than Mother's Day or National Dog Week. Fortunately, however, the evidence of history is against those who call humbug on the feast.

In ancient and medieval times the seasonal bulge in consumption at Christmas seems to have been proportionately greater than it is today. Christmas originated in the pagan festivities that took place when the harvest was in and the cattle were slaughtered for the winter; it was a flush season for supplies of meat and other produce, and a flush season for eating them too. Even by the Middle Ages, the only artificial stimulus to Christmas consumption was that the Church prescribed a period of preparatory fasting during Advent. Work ceased during the Twelve Days, the season combined the role of an annual vacation and a winter break, and moralists were given plenty of scope to condemn the drunkenness and gluttony of all classes.

In those days gluttony had little impact on trade. The typical medieval community supplied itself with the food and drink, the decorations, the New Year gifts, and the entertainment that were needed for its full enjoyment. It was only gradually that imported materials used for the plum pudding, the Twelfth cake, the mincepies, and other traditional delicacies began to command a wider market; and that country areas

began to enjoy a seasonal boom in sending food supplies to London and other large towns. By the eighteenth century, for example, there was a highly organised trade in Norfolk geese and turkeys for the London market. It was the custom to walk the birds to town, and one year it is recorded that the turkeys were set to race against the geese for a wager; the turkeys lost by nearly a day—because, it was said, they stopped for sleep at night while the geese snatched sleep on the march.

The geese were not alone in stealing marches at Christmas time while their rivals slept. In 1728 there appeared one of the first recorded newspaper advertisements for a Christmas gift: the "Famous Anodyne Necklaces . . . approved of by the great Dr Chamberlen for Children's teething fits, fevers, convulsions, etc. Note: Her Majesty has always had these Necklaces for her Children." They cost only 48s. a dozen, and were recommended as "Very Proper for a Present at Christmas, or for a New-Year's Gift, For All God-Fathers, God-Mothers, Relations, Friends, and Acquaintances to Give to Children." About this time, too, publishers began to bring out books specially for the Christmas season; among them were "The merry medley, or Christmas-box for gay gallants, etc." (price 3d.) and "A Christmas-box for masters and misses; consisting of stories proper to improve the minds of children" (price 6d.), which were published in 1744. Out of such small beginnings there grew a distinctively English children's literature, the Christmas Books of Dickens and Thackeray, and the Christmas book season of today.

But these first manifestations of Christmas as a children's festival and a time for gifts were straws in a wind that had not really begun to blow. Indeed, in the first half of the nineteenth century Christmas as an institution seems to have been in recession, except as an occasion for eating and drinking. Even for Dickens in the "Christmas Carol" the most important shops at Christmas were the grocers, poulterers and fruiterers, with "everything that was good to eat and in its Christ-

mas dress." Dickens hardly mentions Christmas presents in either the "Carol" or "Pickwick," although the Ghost of Christmas Past shows Scrooge a father laden with toys and gifts, including a fictitious turkey, glued on a wooden platter, which the baby was suspected of swallowing. Other contemporary references suggest that the custom of giving presents, if not in decline, was barely holding its own; and it appears from Home (1827) that the Christmas box system sometimes worked in reverse. Shopkeepers gave presents to their customers; grocers would give packs of cards or raisins to put in the plum pudding; chandlers would give large mould candles. The sluggishness of Christmas trade a hundred years ago appears from Nathaniel Hawthorne's report that on December 20, 1857, the London shops were only beginning to show "some tokens of approaching Christmas; especially the toyshops and the confectioners . . . the former exhibiting Christmas trees, hung with rich and gaudy fruit."

A few years after Hawthorne wrote, Christmas had been transformed. The great Victorian boom was now in full swing; and the children, Santa Claus and those who produced goods for them were among the beneficiaries. But even at this period the spectacular expansion of Christmas trade was due to impersonal forces rather than to commercial acumen or to the infant arts of publicity. The Christmas card, for example, was an oddly belated response to the penny post. It represented the adaptation to modern conditions of the ancient custom of exchanging the season's greetings. After a false start in the forties, when the publishers and stationers missed a wonderful opportunity, it became a sensational vogue in the sixties and seventies; and by the nineties it was estimated that at least 200,000 Christmas card designs had been produced in England alone. The rapidly growing popularity of the Christmas tree from the forties onwards also owed little or nothing to advertisement; but once it was established it created an additional demand for toys, decorations and other articles to hang on the tree. The factories poured out more and more consumer goods suitable for Christmas presents, and a cheap and expeditious parcel post encouraged the development of the custom. Among the pioneers Mr Tom Smith, who began his working life in a confectioner's shop, built a flourishing business upon the crackers which he evolved from the Continental bon-bon. The speciality trade had begun.

By the eighties the boom in a commercial Christmas had reached full spate. London shops were wooing their customers with invitations to choose from "One hundred thousand Christmas presents and New Year's gifts" or "10,000 presents from 5s. to £10"; and business from every part of the globe flowed into the world's greatest market. A report in the nineties spoke of the tons of nuts arriving daily from Asiatic Turkey, of grapes from Belgium, Spain, France, and the

Channel Islands, 100,000 bushels of Canadian apples specially bought for the season, "enormous" supplies of bananas from the Canaries and Madeira ("Few fruits have made more rapid advance than the banana"), and as many as ten million oranges being sold by auction on one day. In 1898, native oysters, a traditional Christmas gift, were being offered as presents in double barrels of 16 dozen for 48s.; and in the same year the housewife could choose between English turkeys from 5s. to 25s. each and turkeys from Ireland, Canada, Austria, Italy, and France at prices from 2s. 3d. upwards. At these prices, and at long last, the Bob Cratchits could join in.

★

It would be wrong to suggest that commercial skill did not count in this revival. Competition was keen, and the shopkeepers vied with one another in the splendour of their Christmas bazaars and the number of square inches they took in the advertisement columns. During the twentieth century, of course, the apparatus of publicity has become even more high-powered, but this is a general trend not related specifically to Christmas. It is doubtful if those who assert that Christmas has been over-commercialised have really thought their criticism through. If they mean that less and less attention is being given to the religious aspects of the season, they may or may not be right, but the secular is not synonymous with the commercial. If they mean that the housewife buys things that she used to make at home and that her daughters no longer spend their evenings producing samplers for Christmas presents, they are only saying that Christmas has changed along with the changing times. If they imply that it is only the wiles of advertisers that have transformed the happiest festival of the Christian year into the hugest orgy of family consumption, they have the evidence of two thousand years against them. Last December the larger shops of Britain sold 11 per cent more groceries, 50 per cent more clothing and footwear, 50 per cent more hardware, and 75 per cent more chemists' goods than in the normal month; this December they have no doubt done much the same again. It is in the line of historical tradition, and not in response to some new commercial ramp, that throughout this long week-end the country lies replete.

Next week's issue of *The Economist*
will contain a Special Section devoted to

A Review of 1953

and

**The Economic Outlook
for the New Year**

Our Patience Was Exhausted

December 25, 1954.

LOOKING back, from the vantage point of the last weeks of 1954, at the most memorable events of the year, it is not easy to trace the origins of the extraordinary change that has come over British behaviour in international affairs. Most commentators have fastened upon the notorious episode that took place in Oxbridge at the end of January as the obvious starting-point for their analysis. Yet this was only a flickering match set to tinder that was all too ready to burn. The distinguished Anonymian statesman who spoke in the now famous debate of the Oxbridge university union was undoubtedly seeking to pay a compliment—and a compliment that used to fall repeatedly from the lips of visitors to this country—when he dwelt at length on the British characteristic of restraint in the face of insult. It was unfortunate that his manner of delivery unintentionally gave these observations a patronising, indeed a sneering, sound. It was doubly unfortunate that he had not seen the evening papers, and did not know, as his audience did, that the British legation in Anonymopolis had been stoned and partially burnt by demonstrators that afternoon. But the unprecedented events that followed—the carrying by acclamation of a spontaneously framed resolution to the effect that “this House will fight not only for Queen and Country, but also for the hell of it,” and the forcible immersion of the distinguished visitor in the ornamental pond of one of the oldest Oxbridge colleges—provided convincing evidence of the latent restiveness of the public.

Two points should here be noted. First, in those early days there was no question of any official condonation of, much less support for, such actions. On the contrary, the Government presented the most profuse apologies to Anonymia, and the prosecution of the arrested undergraduates was initiated in a decidedly harsh manner. Foreign observers found something sinister in the promptness with which special excursion trains to Oxbridge were provided when the accused appeared in court there; but there is no reason to suspect British Railways of anything but a praiseworthy attempt to salvage its finances by meeting an undisputably genuine public demand. Indeed, the widespread nature of that demand is the second point to be noted. This cannot be wholly explained by the fact that the historic debate happened to be the first to be televised from a university union. People came from areas still beyond the range of TV to demonstrate in the streets of Oxbridge on an issue that had evidently moved them profoundly; and it was undoubtedly the strength and persistence of the feeling that had been aroused that forced the authorities first to whittle down the charges against the students and finally to abandon the prosecutions altogether.

That, however, was only the first phase. During the confused months that followed, official policy was to evolve in a most striking manner. When the London mob came out in March, with a bellicosity that it had not shown since the Gordon Riots, to sack the Italian and Yugoslav embassies and tourist offices in reaction to the wounding of a number of British soldiers in Trieste, all available police reserves were flung into the struggle to restore order. In the final hours of the rioting even the Horse Guards sentries were ordered from their traditional posts to reinforce the flagging cordons. Admittedly much damage had already been done to the embassies before these extraordinary measures were taken. But to any dispassionate witness it was clear that the authorities, despite the student riots of the previous November 5 in London, had simply been taken altogether by surprise. They were, fortunately, somewhat better prepared when crowds demonstrated outside the French Embassy against the demand of M. Bidault that British divisions should be pledged to remain on the Continent for fifty years.

★

However, while one may dismiss summarily the charges of official connivance levelled in respect of the March riots, the same cannot be said of all the events that followed. In May, for example, when two shiploads of Argentine ewe mutton were hurled into the waters of the Pool of London by persons apparently incensed not only by the poor quality of the meat, but also by President Perón's latest assertion of sovereignty over the Falkland Islands, there is ample evidence that the police adopted a benevolent and inactive attitude. The “Wapping Ewe Party,” as the affair is apparently to be named in future history books, may be seen as the turning point. Thereafter, the Government made no real effort to stem the tide of popular indignation, or to penalise individuals who personified it. Neither the Ministry of Health nor the GMC took any action against the dentists who, when a visiting Egyptian politician was stricken by an agonising toothache in London, refused to ease his pain on the specious ground that to do so might be interpreted as an act of political propaganda carried out in the guise of humanitarianism. Authority turned an equally blind eye on the group of retired colonial officials who, ostensibly in protest against alleged Indian intervention in East African affairs, paralysed the work of India House for five weeks by squatting immovably in front of its doorways, day and night, while their ringleaders carried *satyagraha* to the extent of hunger strikes which brought four of them very near (but not quite) to death.

From this position, it was only a short step that brought the Government to adopt, in September, the

so-called Reciprocity Policy. It is difficult to defend all the official actions that have been taken since this new policy was formally proclaimed by the Foreign Secretary. It was, no doubt, perfectly logical to expropriate and nationalise the stocks of carpets held by certain Persian dealers in London and Manchester, and the Government acted very properly in guaranteeing compensation, though there may still be some argument as to the adequacy of the terms offered. Nor can serious objection be made to the new regulations governing entry to this country that were introduced in October—though some degree of malice may be read into the way these regulations were rushed through and applied on the very day that Senator McCarran crossed the Atlantic. (It seems, moreover, that the Senator has little reason to complain of the fact that he is still being detained, in quite comfortable circumstances, on Foulness Island; for he has steadfastly refused to renounce his republican principles, and the logic that forbids the free movement of persons holding such views in a monarchical realm is obvious.) But certain other actions that have been taken during these last three months must excite grave doubts. The summary incarceration in the Tower of two correspondents of East

European news agencies, who have not been accorded the normal facilities to engage defending counsel—who, indeed, have not been seen by any visitor since their arrest—cannot by any form of sophistry be reconciled with the basic principles of British justice. The left-wing press may well be right when it suggests that the two Slav journalists are being “prepared” for an eventual trial, at which they will be induced to make “confessions” of espionage that will brand more than one Opposition leader as having been a secret agent of Moscow since 1919.

This is a most repugnant development. It will be recalled that, in the early months of the year, this journal was among the first to welcome the fact that the British people were at last beginning to do unto others what had been done to them; but it is a very different matter if xenophobia is to be exploited as a weapon of domestic politics. The time has come to call a halt. The events of the year have left their mark abroad; enough has happened to show that the lion's tail can no longer be twisted with impunity. As Sir Winston Churchill remarked, during the debate on the increased Home Office estimates for the police, “what kind of people did they think we were?”

Notes of the Week

Reply to Eisenhower

MR MOLOTOV'S statements are like old artichokes. They have to be stripped down to the innermost leaves before anything tasty is found; and when the patient seeker at last comes to a little succulence amid the oil and vinegar, his joy is sometimes disproportionately great. The statement handed to the American Ambassador in Moscow on Monday is undoubtedly of this character. It is pleasing to have so early a response to President Eisenhower's proposal of December 8th. It is even more pleasing that the Kremlin should now agree to discuss that proposal, which the Communist press at first branded as “the most inane” ever made in regard to atomic energy. But this good news is wrapped up in a mass of verbiage of a much less encouraging nature.

Some of the outer wrappings can be quickly thrown aside; in particular, the long protestations of Soviet goodwill seem to have been written in so hastily that they are not even plausible (how, for example, do Porkkala and Port Arthur square with the claim that Soviet interests do not necessitate military bases in other countries?). But Molotov's message carries a heavier load than this. As in

the case of the Berlin conference, it seems that the Russians, while accepting in principle the invitation to talk privately—which is a step forward—mean to transform what was intended as a limited and practical discussion into a much broader affair. Molotov serves notice that any talks on the Eisenhower plan must be expanded to cover the question of an unconditional pledge by the Great Powers not to use atomic weapons. Yet this Soviet idea of a pledge on paper has been already exhaustively debated publicly and privately at Uno over several years and rejected by the great majority of nations as dangerously ineffective.

That it is now exhumed suggests that the Kremlin has little intention of taking the Eisenhower plan seriously until more is known about it. Compelled to pay lip service to it by the sharp reaction, in countries ranging from France to India, against the first Communist sneers at the plan, Moscow still hopes to divert attention from the President's proposal. It would be premature to take Molotov's statement as meaning that the Russians are likely to permit progress with the Eisenhower plan. On the contrary, they have found again an opportunity to launch the type of negotiation in which they excel—an endless debate on broad issues, starting from extreme positions and untrammelled by any wish to reach a concrete agreement. Once again they have missed the opportunity for a conciliatory gesture.

Suing for Peace

SOME misunderstanding of this technique of negotiation seemed also to underlie the speech made in the House of Commons on Thursday by Mr Kenneth Younger. He suggested that some "very influential people" who distrust the Prime Minister's sallies into diplomacy want to give up the search for four-power agreement and look forward with complete scepticism to a meeting with the Russians. This is a misstatement of a realistic and carefully documented point to which the Labour Party, with a few notable exceptions, appears unable to oppose anything but benevolent sentiment.

Briefly the point of view is this. The Russians have made perfectly clear in their last Note about a four-power meeting how they want Europe to be organised. It is a plan diametrically opposed to that of the West, and is in substance the policy of 1945. That does not necessarily mean that they do not wish to negotiate; but it does mean that they expect the hardest and most fundamental haggling—one day. To this perfectly proper, if rather cold-blooded attitude, Mr Younger and his friends wish—it seems—to oppose the posture of suppliants for peace. They urge that the West, in advance of a conference, should show readiness to make important concessions to the Russians on the main points of difference—for example, the European Defence Community. It does not occur to them that this may make negotiation more, rather than less, difficult. Surely it is clear by now that Soviet statesmen prefer to argue about vital interests from extreme positions.

Because people disagree about tactics it does not follow that they disagree about objectives. Indeed, if the Russians should come to Berlin and reveal a clear desire for real negotiation no one will question the wisdom of taking them seriously. But every attempt to reconsider beforehand the accepted policy of the West offers them the temptation to play for time in the hope of getting better terms. This seems to be understood much more clearly in the United States than in Britain or France.

Molotov Stalls

JANUARY 4TH is less than a fortnight off, and it will be surprising if Molotov now agrees to meet the western foreign ministers in Berlin on that date. There are several good reasons for his wanting a postponement. The first is that Soviet leaders do not like the world to think that they are put into the position of accepting peaceful proposals from the West; it must always appear that the West is forced by its own "peace-loving" public opinion into accepting a suggestion from Moscow. Molotov, of course, may also be hoping that a new French government, led by an opponent of German rearmament, may be in office, if not in real power, later in the year.

There is another reason for stalling that must appeal strongly to the Kremlin. This is the need to appease anti-Communist sentiment in Germany and to organise a pressure group that would demonstrate "the people's will"

as being on the Soviet side, while the ministers argue around the table. In Eastern Germany feverish efforts are being made to this end. The German "Peace Congress" and the "National Front" have been hastily rallied, and a committee is to be set up in East Berlin that will compete with the body of observers set by the Federal Government in Bonn. The chairman of the "National Front" has confessed bitterly that there has been no outburst of rage against Dr Adenauer's policy and, in particular, against the arrival of atomic artillery in Western Germany.

However, no immediate results seem to be expected from these efforts. Indeed, the "National Congress" is being held no earlier than May and will, it is said, "become a milestone on the victorious march towards a united, peace-loving, independent and democratic Germany." January 4, 1954, is clearly too close to June 17, 1953, to suit the Communist book. In the circumstances the western foreign ministers should plan to end the conference with Molotov quickly and in a way that will command the support of the majority of Germans—provided, of course, that the Soviet intention to postpone the meeting or to drag it out is clear beyond dispute.

Parliament Goes Home

PARLIAMENT dispersed for the four weeks' Christmas recess in a somewhat carping mood, but the parties had at least managed to achieve a tepid unity on foreign policy. Much though Labour might have liked to take up an aggressive party position, the eve of a major Foreign Ministers' conference was clearly not an appropriate moment. President Eisenhower's atomic plan, coupled with the paucity of information from Bermuda, further served to dampen down controversy, since the only important diplomatic initiative known to Parliament was one with which all parties obviously agreed. Labour might have liked to make a fuss about the secrecy of the Bermuda talks, but in the Commons debate Sir Winston Churchill managed to divert their fire by an artfully artless disquisition on the merits of secret diplomacy—a singularly audacious move in a debate which was supposed to be solely concerned with the Bermuda conference and its results.

With little new to distract them, MPs were able to devote much of the debate to the irrelevant issue of whether or not Mr Bevan should write for a Cairo newspaper articles described by Lord Reading, with some restraint, as "unhelpful." Defending himself, Mr Bevan built up a mountainous case on a point not seriously in dispute. Lord Vansittart gained little support for the contention that Mr Bevan's action might have been unconstitutional in a Privy Councillor, and Mr Bevan had no difficulty in demolishing that particular theory. What he quite failed to dispel was the widespread feeling that the articles were irresponsible and very different in aim from Sir Winston Churchill's prewar anti-Munich articles, behind which Mr Bevan sought to hide.

But Mr Bevan did not devote all his time to defending his contributions to Egyptian journalism. For many months past he has been credited with a desire to make a front-bench Opposition speech on foreign policy and he was not

going to let slip this fortuitous opportunity. He used it to arouse left-wing emotions by playing on the familiar theme of the "rising nationalism" of Africa and the East. How superficial is this approach Mr Eden later demonstrated in one of his more thoughtful speeches. Needled, no doubt, by the Conservative backbench motion on the Suez base, Mr Eden strove with some success to sketch the middle course that provides some hope of reconciling the legitimate demands of nationalism with the protection of wider international interests.

Reprieve for Juries?

THE first debate on the proposals of the Royal Commission on Capital Punishment took place in the House of Lords last week. One might have expected serious consideration, free from the political emotions of the Commons, of the commission's main recommendation—that juries should have the duty of deciding whether, after a conviction for murder, there are extenuating circumstances to justify the penalty of imprisonment instead of death. Instead, most of the speakers in the debate questioned the very assumption that led to the setting up of the Royal Commission, the assumption that the death penalty ought not to be imposed in cases where it clearly would not be carried out.

Lord Simon, who initiated the motion, and almost all the judges contested the proposition that the law needs altering at all. They applaud its rigidity; they think it proper that the death sentence should automatically be passed in every case of murder—even although some 45 per cent of such sentences are eventually commuted by the Home Secretary—because, for one thing, they consider that the black cap marks the community's disapproval of the crime. The debate therefore hardly turned on the merits of the commission's recommendation at all. The implicit contest, which could not by the terms of the motion be overtly stated, was between the abolitionists—in the persons of Lord Templewood and Lord Chorley—and their opponents, who want to retain the death penalty and even perhaps reduce the number of reprieves. Between them came Lord Jowitt, leader of the Opposition in the Lords, who confessed to being more undecided on the general issue than when he opposed abolition in 1948, but is quite decided that jury discretion is unworkable; and the Lord Chancellor, who was unable to say anything because the Government has not yet made up its mind on any of the commission's recommendations.

It is indeed highly unlikely that the proposal to give juries discretion over the penalty for murder will be accepted by this or any other Government. But since the Royal Commission unanimously decided that it was the only practical way of modifying the death penalty—short of abolishing it—the proposal deserved less cavalier treatment than most of their lordships were disposed to give it last week.

Kenya's Constitutional Dilemma

THE economy of Kenya has received a shot in the arm, and the current discussions on constitutional reform can at least go forward in the knowledge that the Govern-

ment is solvent. Of the £11 million offered to the colony by Mr Lyttelton a fortnight ago, £6 million (£4 million as an outright gift, £2 million as an interest-free loan) will go to restore the revenue balances to the level needed for the Government's normal cash transactions; the other £5 million will be spent in the next five years on constructive schemes for African agriculture, and thus help to provide work for the many Africans who have been crowded back into the reserves.

This gesture of goodwill has come at a time when the discussions on the constitution have shown widespread agreement on the need for a change, but on not much else. The Africans, the two groups of Indians and the Arabs have now given their views on the policy statement issued by the European elected members. The Africans and non-Muslim Indians have not helped by throwing intransigent utterances at each other on the thorny problems of immigration and land-alienation; and the Africans have demanded that they should fill half the places on the Legislative Council, while the others have asserted that the races should be equally represented until a common roll is introduced. On one point only there seems to be wide agreement in principle: that all races should be offered portfolios in the government. Even this, however, leaves a watershed to be crossed. At present all "Members"—or Ministers—in the Government sit on the official side of the Legislative Council. It is normal Colonial Office policy gradually to give responsibility to the unofficial elected members. It is hard to see how changes can be made in Kenya without taking this step; yet once it is taken there is no turning back on the road to eventual self-government. Many settlers are now realising that progress along this road cannot possibly take the form that they would like; and some are wondering whether they would not, after all, be better off if they stayed permanently under the paternalistic guidance of the Colonial Office.

Wining and Winning

HE who pays the piper calls the tune. This is an axiom to be borne in mind whenever a government offers to pay the bills of visitors from other countries, whether

they be journalists, politicians, or other persons of influence. Admittedly, circumstances alter cases—that is another useful old saw—and a good case can be made for comprehensive official hospitality for certain categories of visitors, such as scientific and other technical experts engaged on serious research, or artists and artistes who can make a really valuable contribution to a country's cultural life. But visitors of these types are not generally expected to go home and make political propaganda in favour of the country that has wined and dined them. Travellers whose interests are primarily political cannot claim the same automatic presumption of innocence.

These reflections are prompted by the Egyptian government's recent invitation—since refused—to some British Members of Parliament. But this was no isolated incident. Offers of "all-in" hospitality from governments (or their thinly veiled agents) to foreign visitors regarded as likely proselytes seem to be increasingly common. Most of the birds of passage who flock to Communist countries, whether to attend congresses or to be lionised on heavily conducted tours, do so at the expense of the East European taxpayer; admittedly, few of them could pay their bills out of their own pockets, owing to the absurd rates of exchange imposed by their hosts, but that scarcely makes their position less venal. A clear distinction should be drawn between this kind of thing and the reasonable amount of modest hospitality that a stranger in a foreign land can accept; but wherever there is a danger of that distinction becoming blurred, the golden rule should be a graceful but firm refusal.

Versailles or Weimar?

WHEN France was ruled by kings, comedians were brought to Versailles to entertain them. The Fourth Republic, ruled by politicians, has transformed Versailles into a stage for a farce—the farce of the presidential election—with the whole of France and the world outside looking on. The French public has shown that it is in no mood for such a spectacle. It knows its politicians too well to have expected an orderly dialogue between two performers and a speedy dénouement that would leave only one of them on the stage. But even the most pessimistic did not expect that, after five days and ten acts, the actors would still be performing on a crowded and confused stage. It is no wonder that the proceedings at Versailles have provoked a mixture of derisive laughter, indignation and humiliation.

Frenchmen are offered by their politicians the sad spectacle of democratic forms run mad. It is, of course, perfectly constitutional to continue the ballot *ad nauseam*, but the members of parliament were charged to choose the man who should be the symbol of the Republic's unity. By their behaviour they demonstrated that there is no such unity, at least in parliament. It is difficult to apportion the blame for this tragi-comedy, but there is something wrong with a system which cannot work within the framework of its own institutions. The present regime is based on the assumption that parliamentary parties have a unity of purpose which in practice does not exist. The parliamentary parties were capable of a tacit agreement at the time that they felt threatened by the Gaullists on one side and the Communists on the other. But once the immediate danger

had gone, the magic of democratic unity wore off. The readmission of Gaullists into the governmental coalition has shifted the balance to the right; the untouchability of the French Communists precludes the traditional alternative—a government of the left. When it comes to the presidential election, however, the search for a coherent majority is further complicated by the votes of the senators, by personal and local quarrels, by sentimental attachments to outmoded labels.

The resulting deadlock has done untold damage to the already tarnished prestige of French democracy. Will democratic politicians never learn from history and always move fecklessly towards their doom? Will none among them warn his fellows of the fate that overcame the Weimar Republic in Germany?

Mossadegh's Secret

DR MOSSADEGH, until so lately a star performer on the world stage, is now condemned to oblivion. The Shah and General Zahedi have done well not to make a martyr of him. They have sentenced him to three years' solitary confinement—a terrible ordeal for an old man who thrives on limelight, but a fitting punishment for the obstinacy that set Persia's development and welfare schemes back by several years. Why was he so successful? What is the quality in elderly Asian leaders like Dr. Mossadegh and Syngman Rhee that enables them to keep reasonable statesmen at bay, to keep the West guessing and to baulk—even to rout—the representatives of great powers offering policies which, though admittedly self-interested, are also of advantage to Asia?

Dr Mossadegh held Persia in thrall partly because he was honest in a country where honesty has not been the rule in politics and partly because he had the driving power of a one-track mind. His tragedy, and Persia's, was that he used these assets only for negative and destructive ends. Had the same amount of energy been put to a constructive purpose, the result for Persia could have been beyond imagining. But his real strength lay in the fact that his one idea harnessed a nationwide dislike of the foreigner—first against the Russians and their oil ambitions in the north, and then, as a counterpart, against the British oil interest in the south. Does the immense motive force of this xenophobia spring from Asian weaknesses or from the failure of the great powers to replace a bossy relationship with something closer to tolerance, or from both? There is room for inquiry on this subject both inside and outside Persia.

Birmingham's Slum Scheme

BIRMINGHAM CORPORATION is promoting in Parliament a private Bill which aims, among other things, at carrying further its bold programme of urban redevelopment. The city took advantage of a provision in the 1944 Town and Country Planning Act, since repealed, that gave broad

powers for dealing promptly with congested areas of obsolete houses. Birmingham has created five redevelopment areas, encircling the centre of the city, in which the corporation has acquired 28,000 houses (nearly all unfit) as well as 5,000 shops, factories, and other premises. This large-scale acquisition of old properties, coupled with a broad discretion in their management and disposal, is proving to be the key to a satisfactory programme of redevelopment spread over a long period.

Birmingham is now seeking a renewal of these powers in order to tackle its remaining "blighted" areas in the same way. If the Bill passes, the corporation will in time assume responsibility for almost all the slum property in the city. As the slums are demolished, only a half of their inhabitants will be rehoused by public schemes within the same areas. The corporation intends that the remainder should be offered accommodation in other towns in the region, under housing schemes that Birmingham will help to pay for. But the City Council is afraid that this plan will be set at naught by an influx of new residents who will establish a claim to public housing.

To meet this contingency the Bill includes a novel clause, enabling the city to exercise some control over the future letting of houses whose occupants depart under an assisted "overspill" scheme. The LCC, which faces a similar problem, may seek similar powers. A town meeting, which last week approved the rest of the Birmingham Bill, understandably criticised this one clause. It is a bad principle to allow local authorities to regulate private lettings. Moreover, the request for this power, however financially intelligible, is based on faulty diagnosis. People do not seek to live in Birmingham or anywhere else out of caprice but because a job pulls them. Birmingham, however, is far more anxious to squeeze out population than it is to squeeze out industry. It is no answer to this dilemma to place trivial restrictions on the mobility of labour.

More National Parks?

THE National Parks Commission recently designated the area of a new national park in the Yorkshire Dales. If confirmed by Mr Macmillan, this decision will bring the number of national parks in England and Wales to seven; the others are the Peak District, the Lake District, the Yorkshire Moors, Snowdonia, the Pembrokeshire Coast, and Dartmoor. This is an impressive list, and it is clear that the North of England—at any rate—is now well served. But the commission, in its latest report*, expresses disappointment that the list is not still longer, and in particular that its attempts to turn Exmoor and the Cornish coast into national parks have so far been frustrated by opposition from the local authorities.

National parks, despite their name, are primarily under local control. The creation of a park does not add to a county council's powers (already ample, if it chooses to use them) to stop undesirable development; its purpose is to secure that extra care is given to the planning and control of the area designated, and to assist the provision of recreational facilities to serve the nation at large. Some

* Fourth Report of the National Parks Commission, for the year ending September 30, 1953. HMSO. 2s. 6d.

counties are reluctant to go to the trouble and expense of creating special administrative machinery to further these ends.

Their attitude is understandable, and the Commission itself regards it as an "anomaly" that local authorities should carry the burden of responsibility for a national park. The position, however, is not really as anomalous as it seems. If there were only two or three national parks, it might be reasonable to finance and control them on a national basis; since there are many parks (and the commission wants more), it would be wrong and wasteful to separate them from local government. In these circumstances the machinery and the budget of each park is best kept on a modest local scale, aided as it is by an Exchequer grant. The National Parks Commission also has a general duty of advising on the protection of natural beauty in all parts of the country, and it is within this broad context that its work should go forward; any tendency towards a proliferation of designated parks—and thus towards a division of Britain into "spoilable" and "unspoilable" areas—should be resisted.

Framework for Japanese Forces

IT is dangerous to overlook the fact that the rearmament of Japan is now proceeding without any of the collective safeguards provided in the case of Germany both by Nato

The Economist Diary

A reference book for the desk

For the man who seems to have everything he could want, The Economist Diary is the ideal present. The appointments and memoranda section is designed to meet the needs of the busy man and in addition there are 72 pages of facts and figures, which together form a complete reference book.

The reference material covers a wide range of subjects, including elections, national income, banking, taxation, crime, manpower, commodities, and a special section giving the basic facts on 47 principal countries in the world.

The volume is bound in red leather and measures 10 in. by 8 in. Price (U.K. only): 41/- including postage and purchase tax. Overseas prices vary widely; a schedule will be sent on request. Full details of The Economist Diary are given in an illustrated pamphlet available from:

Diary Department, The Economist,
22 Ryder Street, St. James's, London, S.W.1

and the EDC. It is being carried forward on the basis of a security pact with the United States, but this alliance is purely bilateral and does not involve any of the other signatories of the San Francisco peace treaty; nor does it integrate Japan's new armed forces in any kind of regional defence association. The separateness of the American-Japanese connection from other defensive arrangements now existing in the Pacific is characteristic of the general lack of any kind of collective security system in that area.

The problems raised by this situation are considered in an article on page 970 of this issue with particular reference to South East Asia. With regard to Japan, the absence of "framework" increases the disquiet felt among Japan's victims of the Pacific war at the prospect of a revival of its power. The Americans' task of guiding this new development and keeping it inoffensive to weaker nations is not without difficulty even at this early stage, because Japanese industrialists have been showing signs of restiveness.

The five-year scheme adopted by the Japanese National Security Board has been criticised by the defence production committee of the Keidanren (Federation of Economic Organisations) on the ground that it does not pay sufficient attention to sea and air power, and involves too much dependence on the leasing of American weapons. But it is just the concentration of Japanese rearmament on a land force (with the United States providing naval and air support in an emergency) and its dependence on American supplies that would provide the best guarantee against a possible future renewal of truculence and violent expansion. It is reported that a navy of 150,000 tons and an airforce of 1,200 front-line aircraft by 1958 are envisaged in the armaments programme to be presented by the Yoshida Government at the forthcoming defence conference in Tokyo. Naval and air strength and a large independent arms industry would tend to make Japan dangerous again.

American Arms for Pakistan

BOTH Mr Mohammed Ali, the Pakistani Prime Minister, and Sir Zafrullah Khan, the Foreign Minister, have recently denied that there is any question of Pakistan either granting bases to the United States or joining an American alliance. The foundation of the recent rumours appears to be no more than the admitted fact that Pakistan is to buy a certain amount of military equipment from the United States and perhaps to receive some of it as a gift. No precise details are yet available. But, as Sir Zafrullah has pointed out, there was nothing unusual or remarkable in the recent visit to America of the Pakistani Commander-in-Chief, General Ayub Khan, who "in discharge of his responsibility" went, as many others have done, "looking at things that interested him." If any American arms were to be supplied as military aid, it is understood that Pakistan would probably be required to furnish guarantees that they would not be used for aggression—for instance, in Kashmir. Some dollars might be made available for off-shore purchases in Britain.

The rumours about bases have caused reactions in both Delhi and Moscow. Both have protested to Karachi, and

Pakistan has assured Russia that, while it proposes to take every step to safeguard the national interest, it contemplates no step hostile to friendly countries. In Delhi the Congress Party's working committee has passed a resolution deploring what it considers to be a recent hardening in the attitude of the colonial powers towards nationalist movements, and it couples this with its report on the negotiations between Pakistan and the United States. It also staged a mass demonstration over the week-end. Backed by public opinion in such a frame of mind, Mr Nehru has strongly protested in public about the possibility of any American-Pakistani military link. Understandable as Indian emotions may be, however, the implication is that Pakistan is not free to pursue a fully independent foreign policy. That is something which runs counter to the whole concept under which power was transferred in 1947 to two states rather than one, and it will be vigorously rejected by Pakistan. The Indian sub-continent is admittedly a strategic unity. But its division is now as politically complete in practice as in theory.

For the United States, Indian reactions to the rumours of bases in Pakistan raise important issues of general policy. In the present state of international affairs, no such base would be worth the alienation of India. During the past few months Delhi's attitude to China and its policy towards

Rumours of Peace

If we are parties to re-establishing peace by the restoration of previously existing treaties, we shall be guilty and blind to an almost incredible degree. Why! it is these very treaties which have given to Russia perpetual pretexts for interference in Turkish internal affairs—which have made the connection between the two countries one chronic irritation—which have enabled Russia to undermine, to weaken, to disorganise, to madden Turkey—which she looks to and relies on for enabling her gradually to destroy and absorb that unhappy power. It is under these very treaties that she has been enabled to ruin and control the navigation of the Danube . . . to rob English merchants, and to sap the sources of Bulgarian and Wallachian prosperity. It is under these very treaties that she is now crushing the liberties and destroying the peace and property of those wretched Principalities. It is under these very treaties that she is empowered to exclude all other ships of war from the Black Sea, and thus to operate there uncontrolled. . . . If it be true, as asserted, that under Russian instigation Persia has declared war against the ally of England, this should remind us of a consideration which, in general, we are said not to be too apt to lose sight of—namely, that in dealing with Eastern nations, forbearance and moderation are always interpreted as signs of weakness, and insolence and audacity as indications of strength. Orientals . . . always submit to those who are powerful, and they always consider assumption and aggression to be proofs of power. If, therefore, the present war ends in even the apparent triumph or immunity of Russia (*who is known throughout Asia as our great rival*), and in the even apparent discomfiture or injury of Turkey (*who is known to be our ally and protégé*), we may find that the settlement of the quarrel on such terms as are said to be designed, will be no less dangerous and troublesome to the Indian than to the Ottoman Empire. If we have any consideration for the future peace either of Europe or of Asia, we must make the discomfiture of Russia as obvious to others as to herself.

Assembling the automatic Wind Computer of the Mullard Radar Sonde.

PROGRESS IN ELECTRONICS

THE rapid growth of air traffic throughout the world and the introduction of high speed aircraft flying at great heights have multiplied the problems of the meteorologist. The methods of forecasting weather conditions which were adequate ten years ago cannot provide the detailed and accurate data which are required to-day.

A new technique for weather forecasting has, however, now been developed. By employing an equipment known as the Radar Sonde, the complex conditions in the upper atmosphere can be accurately measured and recorded.

A small balloon carries a miniature radio and meteorological station up to a height of 100,000 ft. and is borne by the wind to distances exceeding 100 miles. Throughout its flight the balloon is continuously interrogated by a powerful radar transmitter, and the answers are transmitted back by return.

As the information is received at the ground station it is decoded, computed and recorded to give a detailed picture of wind speed and direction, and of temperature, pressure and humidity.

The Radar Sonde has been designed and built by the Mullard Research Laboratories in co-operation with the Ministry of Supply and the Meteorological Office.

"FIRST APPEARANCE OF MR. SAMUEL WELLER", says the title of this illustration in *Pickwick Papers*. And such is the artistry of 'Phiz' that we know Sam would be the kind of man Mr. Pickwick found him to be—cheerful, cheeky, a willing servant and a true friend.

'Phiz', born Hablôt Knight Browne, illustrated ten novels by Dickens between 1836 and 1859. He modelled his pseudonym on 'Boz', the nom-de-plume under which Dickens published

his first major work at the age of twenty-five.

It can be said of all the classic figures in literature, whose names are as familiar as our own, that without paper they could never have lived. Nor, indeed, would these famous characters have given delight to so many people all over the world had not the paper-maker made it possible to produce inexpensive editions in vast quantities.

Wherever words are read, they are read by the hundred million on paper made by Bowaters.

the Communist bloc have hardened. This is one of the most favourable recent developments in Asia, which it would be folly to push into reverse.

Eliminating the County Scholar

How should students be selected for the universities and what authority should be responsible for providing scholarships or awards to keep them there? These are twin problems that have exercised both the universities and the local authorities a great deal since 1945. The universities have insisted that they alone are responsible for deciding who shall be admitted to universities, while the local education authorities are solely responsible for making their awards. In practice the dividing line cannot be so sharply drawn. Unless the local education authority is prepared to undertake an entirely passive role, giving awards to all needy students who find a place in a university, it is bound to exercise, by granting or withholding financial assistance, a secondary control over who goes to a university.

This double hurdle produces many anomalies between one area and another, since most authorities have their own criteria for selection and set a limit to the numbers of students they are prepared to assist. The variation in opportunity, according to where a student lives, may be as great as that imposed on school children at eleven when they are competing for grammar school places. To overcome these inequalities PEP in a recent broadsheet* proposes that any student accepted by a university should automatically be entitled to an award (on a means test), paid wholly by the Exchequer, and that local authority awards should cease.

This proposal has an attractive simplicity; the Ministry of Education would presumably administer the scheme much as it now administers the 2,000 state scholarships each year. But in the process something significant would be lost. Most authorities give much time and attention to the selection of their county scholars: many are interviewed, and there is a network of personal relationships between headmaster, selectors, candidate and university which would be lost under the PEP scheme. The local authorities would almost certainly become less interested in the universities as a result. This is a considerable price to pay, even for equality of opportunity. It cannot be commended unless there really is no way at all of ensuring fairness without driving another nail into the coffin of local autonomy.

A Vinous Christmas

THE wine trade appears to be having—and distributing—a happy Christmas this year. Sales seem to have been better than they were last Christmas. They have, indeed, been satisfactory for the year as a whole, and for nearly all sections of the trade.

* *Choosing University Students.* Political and Economic Planning. No. 357.

All the main exporting countries have succeeded in selling more wine to Britain than they did in 1952. In quantity the largest supplier in the first eleven months of this year was Spain; it is probably the largest in value too, although France, with a larger export of expensive wines in bottle, runs it close. But these imports will not be sold over the counter for six months at the least. The course of consumption is less clear. The nearest thing to statistics of consumption is given by withdrawals from bond, and in the most recent fiscal year (ended last April) these are believed to have fallen by about 500,000 gallons from the 9,800,000 gallons of 1951-1952. All types of wine—table wines and heavy wines, still and sparkling—shared in the decline. But since April, according to reports, trade has improved—except for champagne; this, apart from a brief heyday in hotels at Coronation time, has slumped very badly. The heavy wines, on the other hand, in spite of a duty that is over six times what it was before the war, seem to be holding their own. The port advertising campaign has borne some fruit, and sherry is said to be gaining ground in provincial and suburban off-licence trade, but losing a little in the West End of London.

The fact that less champagne is being drunk and that sherry's gain appears to have been with the middle classes might suggest that money is not so plentiful in the West End. But for the drop in champagne drinking there is another explanation. After the disastrous vintage of 1951 the French growers raised their prices so high that champagne became almost too dear even for an expense account. There are signs that the British public is becoming steadily more appreciative of table wines in general, yet because of the decline of port, it still drinks only about two-thirds of the wine it drank before the war.

COAL PRODUCTION in GREAT BRITAIN WEEKLY AVERAGES

Letters to the Editor

Dividends and Taxes

SIR—There have been two recent developments bearing upon the dividend practices of public companies. The one has attracted little attention, and the other a great deal; but they are both developments in the same direction, and of sufficient importance that they cannot, together, fail to have significant political consequences.

The first has been an increase of 9 per cent in the first ten months of this year, over a comparable period of 1952, in the net amount going to the ordinary shareholders of a representative cross section of companies reporting. This increase has apparently been regarded by the Government as justified by the increase in capital employed in the same period; defining "capital employed" as the sum of share capital and reserves, this absolute increase of 9 per cent can be shown to have been accompanied by no change of yield.

The distributive consequences of such a justification are, however, far reaching. The 1952-53 increase in the amount of capital employed has been in no way exceptional. Given present patterns of saving, it is certain to be substantially exceeded in the near future if an investment programme at all compatible with our needs is to be carried through. Such a programme, it is to be hoped, will produce a buoyant national income. But it is certainly most unlikely to produce a national income increasing at a rate of more than 9 per cent per annum. Four per cent might be a more realistic figure, and if an adequate balance of payments surplus is to be built up and other commitments are to be met, there will be many claims upon this 4 per cent other than those for increases in personal incomes. The argument that increases in the amount of capital employed automatically justify *pro rata* increases in the amount of dividends distributed would therefore involve in the future, as it has certainly involved in the past year, a tilting of the balance in favour of the dividend drawers.

The second development has been the much publicised take-over bids of recent months. These are obviously designed to force a distributive policy still less (indeed a great deal less) conservative than that justified by the preceding argument; and, as you suggested last week, their effect may be widened. Mr Clore and Mr Samuel, not without some argument on their side, have effectively re-proclaimed the doctrine that the primary duty of the company is to give to its shareholders the maximum return in the shortest possible time.

But these changes can hardly fail to

affect the financial policy of a future Labour Government. So long as effective dividend restraint persisted, a high level of company profits, even after tax, was an effective aid to savings and had little regressive effect. The shareholder's income obviously rose little and the market value of his holding was also kept down, for the Stock Exchange showed itself primarily interested in yield. High company savings were thus compatible with a semi-egalitarian policy.

The basis of this marriage has now been destroyed. To save in such a way is to give to the ordinary shareholder claims which, even when he wishes to be restrained, it will in future be increasingly difficult for him not to press. In these circumstances any Government concerned to maintain at least the present degree of equality in the distribution of the national income will fight shy of high company profits. It will be forced towards a higher level of corporate taxation and the replacement of company savings by public saving through a larger Budget surplus.—Yours faithfully,

ROY JENKINS

House of Commons

Extended Credits for Exports

SIR—There is a very real problem for exporters. It is one of means, not of ways. Britain cannot now afford any great volume of exports unrequited for several years. Most European countries face the same difficulty, so the problem is one which calls for an international solution.

Bills of exchange provide the answer. The World Bank should be asked to offer to member nations discount (or re-discount) facilities, such as the Bank of England offers to London discount houses.

For example, a British exporter, under the terms of his sales contract, might draw bills at say, one, two and three years on his overseas buyer or on his buyer's bank abroad. He has obtained export credit guarantee and he negotiates his bills with his own British bank. The British bank whether on its own or acting in a consortium, requiring foreign exchange, endorses the bills and discounts them at the discount office of the World Bank, receiving the desired currency in exchange. The World Bank may hold the bills as investments, or could presumably at need endorse them and itself re-discount them with the banks of member nations.

If the World Bank prefers to deal only with central banks, the procedure can be adjusted. The principle is that the

World Bank should provide the backing for an international discount market. If the principle were agreed the practice would present little difficulty. Credit would make possible the growth of world trade. As at the discount office of any central bank, so at the discount office of the World Bank, the credit standing of some acceptors would be good, of others not so good. The World Bank would be, as the Bank of England is in London, the lender of last resort, and woe betide those who blotted their copybook in dealing with it.

Would the World Bank be willing to act in this way? It would be proper banking business, and, though the credit given would be of shorter term than is usual for a bank organised to deal with capital financing, this again is a matter of detail or of degree. The principle is faithfully in line with the Bank's policy of flexibility and the willingness to consider constructive suggestions for the employment of the Bank's resources.—Yours faithfully,

LONDON, E.C.3 HUGH M. O'CONNOR

Conflicts at Luxemburg

SIR—In connection with the article in your issue of December 12th, I think it is worth pointing out that the question of export cartels was raised during the recent eighth session of GATT. When the contracting parties discussed the first annual report of the six member states (following the granting of waivers from GATT obligations in 1952, such reports are to be submitted annually until the end of the transitional period) several countries outside the pool raised the question of export cartels, and the High Authority gave the contracting parties an assurance in the following terms: "that it will take every measure in its power to ensure that equitable prices are charged in markets outside the community and no arrangement or combination between producers shall impair the value of that undertaking." The contracting parties also expressed the hope that the High Authority would see its way to make public the results of the examination it is conducting of producers' agreements, as well as the remedial measures it may decide in so far as those results or measures relate to the undertakings that formed part of the GATT waiver.—Yours faithfully,

RICHARD R. FORD

General Agreement on Tariffs and Trade, Geneva

German Assets Abroad

SIR—How is it possible to sit down, with any prospect of success, for discussions with the Russians unless clear and unmistakable rules of conduct are first enacted within the ranks of the West?

In this sense, the German people's demand for the return of confiscated assets abroad would be a demand in the interest of the entire civilised world. I have never understood how the Western powers could consider it possible to include Germany in their system if they were not to grant her again, first

of all, those rights which are the prerequisite for co-existence between civilised peoples, the most important of which is the inviolability of private property.

I cannot understand either why the German Government should have declared its readiness to enter into international covenants when no ground had been created on which to base such action, and why it requested silence about the return of German property, which means tacit acceptance of illegal robbery. A demand for its return would not be, as you have suggested, an assertion of increased self-confidence. It would be prompted by a desire to see the principles of law re-established between civilised peoples.—Yours faithfully,

M. VON DZIEMBOWSKI

Söcking über Starnberg

[The technical answer to this typical German point of view is simple. The Federal Republic's liability for repayment of its debts was reduced by the London debt agreement. It should also be recalled that German-occupied Europe was left with large credit balances in Berlin, representing the extent to which it had been exploited, which no one expects to see repaid.]

The political answer is that victims of German destruction and cruelty do not accept the right of Germans to complain on moral or legal grounds about the confiscation of assets abroad. We are all suffering from the effects of the war that the Germans started.—EDITOR.]

Poisoned Air

SIR—In your recent note on "Poisoned Air" you say that "moral persuasion" is the only method that can be used against the worst producers of "smog." With all respect, "it ain't necessarily so."

Consider Pittsburgh. This was once the dirtiest city in the USA; it is now, by the direct test of the condition of one's shirt collar at the end of the day, one of the cleanest and far cleaner than any English city, even outside the industrial belt. This result has not been obtained by moral suasion but, so I am informed, by the passing of two ordinances, one forbidding the emission of smoke by industrial premises and one, a year later, imposing a similar prohibition on non-industrial premises. The result is magnificent, and the new and shining buildings that are now going up are a splendid contrast to the blackened and eroded structures of the earlier period.

Now, I know that there are many differences between England and the USA; in natural resources, in the nature of the "domestic hearth"; "we don't do things that way." But we might try, for once. An ordinance of the Pittsburgh type, to take effect, say, in three years, would be a powerful inducement to landlords to instal appropriate grates and householders to burn appropriate fuel, and for the producers of such fuel to put it on the market, for the demand for other types would fall off.—Yours faithfully,

E. M. HUGH-JONES

Early Bureaucrat

THE TUDOR REVOLUTION IN GOVERNMENT.

By G. R. Elton.

Cambridge University Press. 466 pages. 42s.

A CENTURY ago Mr Gladstone, writing of the Trevelyan Report on the civil service, mentioned approvingly "its tendency to strengthen and multiply the ties between the higher classes and the possession of administrative power." "As a member for Oxford," he added, "I look forward eagerly to its operation." Partly because of the multiplication of these ties academic historians have come to pay more and more sympathetic attention to the organisation and role of the civil service in the past. Thanks to the work of Tout and his disciples the gains have been greatest for the earlier centuries; but the later periods are beginning to show equally rich rewards. And with this new approach has come a reappraisal of individual figures: Renulf Flambard, Thomas Cromwell and Charles Jenkinson are among those gaining respect and even admiration.

Mr Elton is an extremely able and rigorous exponent of this relatively new discipline, and is fully aware of its implications. "Our history," he writes in his introduction, "is still much written by whigs, the champions of political freedom; to stress the need for controlling that freedom may even today seem not only not Liberal but even illiberal." Moreover, he presents his very detailed study of administrative changes in the 1530s not as just a single chapter in a long and slowly moving story but as the second act in a three act drama. For this is a study of an administrative revolution; and, he argues, there have been only three such revolutions in English history. The first was the Anglo-Norman creation of medieval household government, in which efficiency depended on the personal qualities of the king. The second, here traced in detail, was the deliberate organisation of national bureaucratic departments, which substituted government under the king for government by the king. The third came in the nineteenth century and created an administration by departments responsible to the reformed House of Commons.

Behind the great changes of the 1530s—the organisation of the new revenue courts, the reform of the government secretariat, the transformation of the privy council into a permanent ministerial board both making and executing policy, and the remodelling of the household to fit it for its attenuated task—Mr Elton sees the hand of one

man, the "bureaucrat of genius," Thomas Cromwell. In working out this thesis Mr Elton gives us what is by far the best account of the agencies of central government as they were recast and enlarged during the Reformation. His researches have made a solid and substantial addition to knowledge of an important and difficult subject.

But the inferences he draws from his discoveries are sometimes strained and occasionally contradictory. The anti-thesis of those dangerous terms "medieval" and "modern" is artificially sharpened to throw the reforms of the 1530s into prominence. It seems difficult to maintain both that the 1530s are essentially modern because "individuals assert themselves where anonymity had been the rule" and that medieval government had been less efficient because "individual qualities and behaviour counted for more than the traditions of a department." Mr Elton does indeed face the paradox that Cromwell was both autocrat and bureaucrat, devising institutions and procedures only to cut across them by the unorthodox methods of highly personal government. But it is not easy to reconcile his comment that "Cromwell rarely worked in the manner of a revolutionary reformer but rather changed things along lines of development already dimly discernible" with his main thesis that Cromwell was the architect of a deliberate and conscious administrative revolution. There is much to be said for the less dramatic conclusions of an American scholar, Professor Richardson, set out in his recent study of chamber administration under the first two Tudors.

Mr Elton has elsewhere shown his familiarity with the policies and personalities which he has almost entirely excluded from this study of institutions. Now that he has proved his quality as a scholar it is to be hoped that he will go on to show us the institutions in action, in relation to the men who used them and the problems they tried to solve.

Love and War

AUGUSTUS HERVEY'S JOURNAL.

Edited by David Erskine.

Kimber. 349 pages. 25s.

AUGUSTUS HERVEY lounges out of his portrait by Gainsborough with the assured arrogance of a Whig aristocrat. His father—Pope's *Sporus* or Lord Fanny—was the author of those superlative memoirs of the court of George II of which a new edition has recently been published. His brother, the Earl-Bishop, was that paragon of

grand tourists who is commemorated by a thousand Hotels Bristol on the Continent. Although we meet Augustus as an impecunious lieutenant in 1746, we leave him in 1759 possessed of a modest fortune earned by prize-money and other well-merited rewards. The impression left by his journal (which is efficiently and unobtrusively edited by a descendant) is that of a courageous, competent officer whose services as well as his social status justify his criticisms of renowned figures such as Hawke and Saunders. He can even call the great Lord Anson a "wretch."

If ever there was a sailor with a wife in every port it was Captain Hervey. His uninhibited descriptions of how he spent his leave remind the reader that this is Boswell's world—"twas one continued scene of pleasure." If his amours are not so squalid as Boswell's, they are just as numerous and described with equal frankness. Mr Erskine calls him "the English Casanova," but if the latter was a liar he could certainly write better than Hervey, who cannot prevent the reader from becoming somewhat satiated with his "little flighty suppers," his luscious women and their sour, surly husbands. When duty calls he is another man:

I cared little about anything but my pleasures in these days, till I got to sea, and then my profession was all my pleasure.

From a historical point of view the chief value of the book is Hervey's defence of his friend Admiral Byng. His journal tells us little about life on board, and it is a pity for his own reputation that it breaks off on the threshold of a notable career. Nevertheless it is certainly the best naval autobiography of the period because it introduces a lively, intelligent young man who must have been extraordinarily good company.

Men of Goodwill

"THIS I BELIEVE." *The Personal Philosophies of One Hundred Thoughtful Men and Women.*

Foreword by Edward R. Morrow.
Hamish Hamilton. 205 pages. 12s. 6d.

THERE is something rather appalling about the idea of a hundred potted credos, first delivered at five-minute lengths through a microphone and then assembled in book form. That such a radio broadcast, or such a publication, is symptomatic of a pathological rootlessness and need for reassurance in society at large is, of course, no criticism; to confront and counter these evils is precisely the object of the exercise. The question is whether such an exercise can possibly be a success—otherwise, that is, than as a kind of spiritual gossip column or Who's Who in which to look up the souls of an assortment of newsworthy individuals.

At the Who's Who level "This I Believe" is fascinating. One knows already, from explicit statements made under less crippling conditions, the world-views or universe-views of A, B and C—say Mr Aldous Huxley, Lady

Astor, Mrs Eleanor Roosevelt. One may have guessed—but how mistakenly! at those of D and E; say Mr Aneurin Bevan or Mr Cecil Day Lewis. One may have speculated about those of such colourful characters as Mr Peter Ustinov. Here are the answers.

International comparisons are interesting, too. Fifty contributors are British, fifty American. A round half-dozen British contributors explicitly profess rationalist or agnostic views. Not one American does so, and only three omit prominent reference to religious belief. Among the British there are a sprinkling of confessed pessimists; among the Americans there are none. It would have been enlightening, perhaps, to have the creed of Mr James Thurber, or of that latter-day Yahoo fancier Mr Philip Wyke. But no one was found—or invited—to strike such an un-American note; nor, on either side of the Atlantic, to stand up for any fundamentalist dogma, religious or secular. One Episcopalian and one Anglican announce their personal adherence to a definite theology; but no voice proclaims *Paiens ont tort, et Chrétiens ont droit*.

Tolerance, indeed, is the keynote; and, with tolerance, "reverence for life," integrity in the search for truth about man and nature, human brotherhood, an undenominational Deity, the essential goodness of life. This general consensus is expressed with varying emphases, in styles ranging from the highly civilised to the excruciatingly folksy. (Folksiness is, of course, an occupational disease of American inspirational writing. It should be added that the most moving and memorable item of all comes from America; it is that of Miss Helen Keller.) Very possibly many readers will find this book "helpful," and thus justify its existence. But a wicked wish somehow remains that Mr Aldous Huxley—not the contributor of today, but the unregenerate of long ago—could have had the reviewing of it.

Lessons in Libels

HATRED, RIDICULE OR CONTEMPT.

By Joseph Dean.
Constable. 259 pages. 15s.

ACTIONS for defamation are second only to trials for murder in general interest, and presumably for very much the same reason; a reputation may sometimes have a value not far short of life itself. Mr Dean has accordingly collected accounts of some of the famous libel and slander actions of the century and made a very readable book out of them. His object has been more entertainment than instruction, and the result is a book which appears appropriately enough in time for the Christmas shopping lists.

Not that the book is devoid of its more serious lessons (what books are?). On the whole, the press comes out of it reasonably well. It certainly has been as much sinned against as sinning. And did not Professor Laski in the end

complain more of the courts—at least of such things as special juries—than of the newspapers that repeated what he did (or did not) say? It is some of the judges who do not show up too well in Mr Dean's narratives; Mr Justice Darling, who proved no match for Mr Pemberton Billing in 1918, and Lord Hewart, the Lord Chief Justice, in the Hobbs libel case, of whose conduct Lord Justice Sankey in the Court of Appeal said: "It is not admissible to do a great right by doing a little wrong." Counsel for the litigant with a good case may well pray that the judge will not be too obviously on his side.

Nor can Mr Tolley, the amateur golfer, or Messrs J. S. Fry and Sons have felt any profound veneration for the courts when at last there was an end to their litigation over an advertisement in which Messrs Fry showed Mr Tolley as praising their chocolate. On the trial of the libel action the jury awarded Mr Tolley £1,000 damages and Mr Justice Acton gave him judgment for that amount. Three judges in the Court of Appeal said that he had no right to the judgment and that the damages were excessive. One law lord in the House of Lords agreed with them; the other four restored the original judgment but ordered a new trial on the amount of the damages. The difference between the sum Mr Tolley finally received and that paid to the lawyers must have been remarkable. That, of course, is the final moral in the book; do not go to law at all, unless, of course, you are an "assisted person."

Laborious Survey

SURVEY OF INTERNATIONAL AFFAIRS, 1938. Volume III. R. G. D. Laffan and others.

Edited by Veronica M. Toynbee.
Oxford University Press. 622 pages. 55s.

THIS volume presumably concludes the prewar series of Chatham House annual surveys. The desire to finish the task is understandable; but this volume must have been as laborious to write as it is to read. Professor and Mrs. Toynbee cannot be blamed for the fact that the war made the completion of the series in its original form impossible; but the delay of fifteen years makes the volumes that have appeared since 1945 necessarily different in kind from the prewar ones. The original volumes were written very soon after the events they recounted; they provided basic factual material in a convenient form and they often conveyed eloquently a particular view of the events described (Professor Toynbee's comments on the Ethiopian crisis in the Survey for 1935 are a good example).

The authors of the volumes for 1938—and to a certain extent those of "The World in 1939"—have a more difficult task. For they have to deal with the whole mass of material that has appeared since the war (and 1938 must be one of the best documented years in the history of the world), and thus compete with a number of works by

eminent contemporary historians, such as Sir Lewis Namier, Mr Bullock and Mr Wheeler-Bennett, as well as with the original material that is readily available in published form.

The present volume deals with a number of unconnected topics omitted from the earlier volumes of the Survey for 1938: Czechoslovakia up to the march into Prague; the relations between Germany, Poland and Lithuania up to March, 1939; Russia and the Balkans during 1938; and the rearmament of the major powers down to the Munich agreement. These chapters are by different authors; they have little connection with each other and they vary in quality. Mr Laffan has contributed a scholarly and impassive account of the end of Czechoslovakia. Mr Ashton Gwatkin's section on Russia adds nothing to our knowledge. Lord Chilton's account of rearmament contains some useful material embedded in prose of the flattest kind ("By the same token their adversaries found themselves on the horns of a dilemma" is a fair specimen of the sort of sentence to be found).

The editor and authors have clearly taken a great deal of trouble over a volume that will have a certain value in providing factual material and bibliographical indications for future researches in the field of recent history. Now that the prewar series is complete on our shelves—even if we take down the later volumes less often than we do the earlier ones—Chatham House will, it is hoped, concentrate all its efforts on continuing to produce rapidly annual surveys that will provide an invaluable guide to the most immediate past which historians have not yet had a chance to evaluate.

Aesthetic History

ILLUSTRATED HISTORY OF ENGLISH LITERATURE. Volume I. By A. C. Ward.

Longmans. 244 pages. 25s.

THE creation of a book is an affair of threefold co-operation between publisher, author and reader. Messrs Longman's production of A. C. Ward's "Illustrated History of English Literature" is so pleasant that the volume is an invitation in itself, and the presentation of its argument is so genial that the reader is charmed into an early and lively anticipation. But being so well served, the reader is also invited to make a reciprocal contribution. Mr Ward lays down his requirements in a forthright note in the introduction. "It will be assumed," he declares, "that the reader hears mentally all printed words, not only sees them with his eyes." It is an intriguing proviso, and the author has the happy faculty of enabling those whose ears can accept it to identify themselves with the gradual development of English Literature so that it becomes something essential to their own make-up. This effect is not gained by any sensational attack, but by the more subtle persuasion of straightforward,

lucid prose, by a breadth of knowledge modestly displayed, and an abiding commonsense.

The major masters of verse and prose are linked by a selection from various imitative followers who are considered as "ducts of poetry"—writers who may have little appeal outside the generation for which they wrote, but whose words "fertilize other men's minds and through them live again more potently." Thus, continuity is achieved without loss of pace.

Since most works of art reflect contemporary manners, and most writers are concerned with human reactions to difficulties, this is a social as well as an aesthetic history, which presents the evolution of English letters against the background of their times and of their literary and artistic inheritance. It is not a book to be read once and shelved; it is for those who want a guide to literature that is more than an annotated bibliography and yet does not try to distort richly diverse material to fit a preconceived scheme. It is for those who have an insatiable appetite for talk about books and their possibilities, and about writers and their peculiarities; who cannot be reminded too often of an inspired phrase, and who like to finish their reading with a sense of having shared in a fruitful discussion.

The present volume, which carries the reader from Chaucer to Shakespeare, is to be followed by a second volume, from Ben Jonson to Samuel Johnson, and a third, from William Blake to Bernard Shaw.

God and Marxism

CHRISTIAN FAITH AND COMMUNIST FAITH. *A series of studies by members of the Anglican Communion.* Edited by D. M. Mackinnon.
Macmillan. 260 pages. 21s.

IN commending this volume of essays as "a worthy example of a co-operative effort in the true Anglican spirit," the Bishop of Chichester poses the question whether there is something in Communism which is fundamentally incompatible with Christianity. This is, indeed, the main issue in the several essays, which are based on the belief that Communism cannot be understood unless it is apprehended as a religion. In this sense Communism must, of course, be understood as Marxist Communism. The Apostles practised Communism for a short time, and they abandoned it, not because they had discovered theoretical objections, but because it did not work and threw the Christian community at Jerusalem upon the relief of the rest of the Christian world. Every Christian monastery practises Communism—but practises it by the free choice of its adherents. Marxist Communism is, however, clearly incompatible with Christianity, for it is based on a materialist philosophy and a materialist interpretation of history that allow no place for God. But the practical question now arises, whether the policy pursued by the Soviet Union is Marxist

Communism or not. Even the theoreticians of the Soviet Union have some reservations on this point, and the question whether the policy pursued by Russia at any given moment is incompatible with Christianity is an empirical one that cannot be decided in advance. The Soviet Union, which made the Molotov-Ribbentrop pact, is quite capable of deciding that Moscow is worth a Mass.

There is, of course, open war between the Vatican and the Kremlin, and the writers of these essays seem anxious that Roman Catholics should not have any monopoly of the hostility to Communism. But there are many political as well as religious factors in this struggle; for instance, the snatching of Poland from the Western world in which it had been for some centuries an outpost of Latin civilisation. It is the position of the Orthodox Church in Russia that is really more worthy of study. After a persecution equalling any in the records of Christianity, and after a generation of attempts to prevent the young from becoming contaminated, a *modus vivendi* was found when the leaders of the Kremlin in 1941 found themselves compelled to rally all patriotic support. Probably neither side has any illusions, but a co-existence of the two has somehow been established.

This does not, however, invalidate the thesis of these essays, which are on a more theoretical plane. A first section, contributed by Professor H. A. Hodges, Mr Denys L. Munby and Professor D. M. Mackinnon, analyses Marxism, Leninism and Stalinism. A second, in which the Rev. R. V. Larmour, Mr M. B. Foster and Mr I. M. Crombie are the writers, probes rather more deeply and subtly into some of the philosophical issues raised by Marxism. The Rev. Christopher Evans then introduces the other side with a statement of the faith of the New Testament.

A final section consists of studies in the Christian understanding of human life and destiny. The contributors are Father Martin Jarrett-Kerr, Professor G. E. Hughes of New Zealand, Dr. Arnold Toynbee, and Dr. John A. T. Robinson. The work as a whole is thoughtful and balanced; if one regret may be permitted, it is that much study of Marxism has often made the writers as obscure as Marx himself.

Purple Guide

ASSISI AND UMBRIA REVISITED.

By Edward Hutton.
Hollis and Carter. 21s. 247 pages.

THIS book is a curious compound of guide book, travelogue and lives of the saints. As a guide to Italy Mr Hutton is certainly very knowledgeable, and he seems minutely acquainted with every corner of Umbria. He takes the reader by the hand, points out everything of interest, throws in any history that may be relevant; he leads one round the galleries with appreciation and discernment, and describes the most important paintings. But it is here that it

matters most whether one is a reader at home or a sightseer. The chapters on pictures are more than a catalogue; yet if their purpose is to remind the reader of what he once saw their success is not likely to be great. The man who has once visited, say, the Pinacoteca at Perugia may recall, from Mr Hutton's descriptions, a few of the pictures. But in print, if not in paint, one Madonna and Child is very like another. The best aid to memory would be photographic reproductions, of which, for a work of this kind, this book contains too few. (Incidentally it needs a map as well.)

The descriptive style, moreover, is prone to erupt in purple passages. The visitor on the spot wants to absorb the beauty that he sees without the help of pretentious prose; while the armchair reader, who wants to create the Umbrian scene in memory or imagination, may often be repelled rather than stimulated by Mr Hutton's words. Take, for example, his description of the two crucifixes by Cimabue in the upper church of San Francesco at Assisi. All who have seen them will agree with Mr Hutton that they are both great and dramatic—and yet the effect of his description is embarrassing. The peace of an Assisi garden is lost in another blush:

Many pleasant hours of a spring evening slip by almost unheeded—so quietly, so sweetly do they pass among the flowers and the thoughts that come to you from long ago, fragrant with the innocence of St. Clare and her company.

Even those to whom the stories of the Umbrian saints are as vividly real as they are to Mr Hutton may find these words laboured, their sentiment contrived. It is a pity that Mr Hutton writes like this, for there can be no doubt that his affection for Umbria is sincere and his knowledge of it profound.

Neo-Nazi Propaganda

NAU-NAU GEFAHRDET DAS EMPIRE.

By Dr Werner Naumann.
Presse Verlag K. W. Schütz, Göttingen.
153 pages and appendices.

STUDENTS of German affairs should devote careful attention to this able and malicious piece of neo-Nazi propaganda. Dr Naumann is a mass of injured democratic innocence—"Do Might and Tyranny prevail or Right?" he asks theatrically, just as the Nazis did in Weimar days before the might and tyranny were exercised so terribly by them.

The book is presented in the moving form of prison notes, smuggled out—probably by a British officer, it is emphasised—to Naumann's friends, and preserved and published by them. Naumann displays himself in these notes as the martyr of endless examination by British Intelligence officers who succeeded, he declares, without any physical maltreatment in applying the technique of Soviet inquisitors. One might sup-

pose from this account that only the Russians and their more raffiné pupils, the British, had evolved methods of spiritual torture. It is difficult not to feel that these implications about British inquisitors should be answered in some effective way.

The parallel between Communist and British behaviour is deliberately and systematically drawn; it links up in this book with the thesis that the arrest of Naumann was engineered by Moscow through that puppet of the Kremlin, Sir Ivone Kirkpatrick. It is even suggested that the whole business was organised by the *Rote Kapelle*, a Communist group which was mercilessly suppressed by the Gestapo during the war. The old Nazi game of treating Social Democrats and the British Labour Party as no better than Communists is, of course, played by Naumann who vies with Senator McCarthy in discovering agents of Moscow among British, American and United Nations officials. National Socialism, Naumann insists, far from being a shameful thing, meant dedication to the fight against Bolshevism; but alas! the British failed to understand that menace first in 1917, then in 1941 when they refused to take Hess seriously (torturing him in the Tower instead), and for the third time in 1953 in attacking Naumann. In Naumann's case, as he has constantly proclaimed, the British were further actuated by jealousy of his commercial success and by the desire to steal his trade secrets; this is the continuation of one of the constant refrains of Nazi propaganda during the war.

It is interesting to observe that, while Naumann denies with a suggestion of indignation that there is a neo-fascist movement in existence, he declares quite openly that he is an unashamed Nazi and makes a point of publishing a photograph of himself with Goebbels early in this book. Its final sentence innocently inquires why, if a former Nazi now expresses his respect for human rights, he is received with more suspicion than a former Communist like Reuter or Koestler. It would seem rash to presume from the election results of September 6th that Naumann's following is insignificant, for he implies that he and his friends will support those most capable of rebuilding Germany's strength immediately. This means voting for Dr Adenauer while disliking the CDU; later the time will be ripe for them to throw it aside and to take its place.

Russian Inertness

SOVIET OPPOSITION TO STALIN.

By George Fischer.

Harvard University Press (London: Geoffrey Cumberlege). 230 pages. 25s.

NO country invaded by Hitler produced so large a proportion of willing quislings as the Soviet Union. Hundreds of thousands performed some sort of service for the conquerors, and many times more would have done so if Hitler had not insisted on a policy of

oppression and exploitation that made any "collaboration" impossible. Some thousands of Soviet "collaborators" escaped forcible repatriation at the end of the war, and most of the Germans who had organised them survived. These Russians and Germans are a valuable source of non-Stalinist information on the Soviet Union. Mr George Fischer, son of the well-known writer Louis Fischer, spent a large part of his youth in Russia, and after the war conducted an inquiry into the wartime Russian "collaboration," with a view to examining the prospects of opposition to Stalinism within the Soviet Union.

The Vlasov movement already has a considerable literature, among which should be mentioned the long and enthralling study of the German angle by Jürgen Thorwald, *Wen sie verderben wollen*, published in Stuttgart in 1952. Mr Fischer's book is the best thing yet written on the subject. It is short, clear and restrained, and it is well worth the attention of British students of Soviet affairs.

Mr Fischer analyses the different German policies towards occupied Russia. There was Hitler's policy of massacre, starvation, conquest and settlement of Germans on Russian land. There was Rosenberg's policy of starvation for the Russians but autonomy, under German rule, for Ukrainians, Caucasians and Moslems. There was the "Utilitarian" school in the army, which wished to make use of anti-Stalinist Russian manpower without committing itself to the future. Lastly, there were those whom Mr Fischer calls "The Other Germany," men who believed in a future friendship between the German and Russian peoples, conceived in Prussian and Bismarckian terms, without Hitlerism or Stalinism. Among these was von Stauffenberg, the hero of the July, 1944, plot. General Vlasov and his men were tossed about on a stormy sea, blown by gales from all directions, unable to control their fate. The Russian Liberation Army was, as Mr Fischer shows, no more than a phantom, and when Himmler decided in the autumn of 1944 to make use of Vlasov it was too late.

Mr Fischer does not feel that this complex and tragic story justifies any firm conclusions on Russian opposition to Stalin. His own tentative view is that the main characteristic of the Russian people is "inertness," not opposition. By this he means that the totalitarian system has accustomed them to complete dependence on the authorities. They will avoid any initiative, but show great skill in adapting themselves to the demands of their bosses. When the hand of the bosses is removed, they are helpless and fall a prey to any other force. This is what happened in 1941. In fact, in time of foreign invasion, the "inertness" of the Russian people operates in favour of the invader, but in time of peace and order it operates in favour of the regime. Mr Fischer's analysis is at least plausible, and one may hope that his countrymen will give it serious consideration.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

New Look at Defence

Washington, D.C.

MR JOHN FOSTER DULLES captured the headlines of the world by his warning to France last week that an "agonising reappraisal" of American policy towards Europe would have to take place if France failed to ratify the European Defence Treaty. Some of the sting might have been removed from this graphic phrase if it had been pointed out that agonising reappraisal is a condition to which the American government is fully accustomed, especially in the last two months of every year, when the process of framing the budget for the fiscal year which begins in the following July reaches its climax. From October onwards the head of almost every agency and department, with his eye not yet upon Congress but upon the stern unbending officials of the Bureau of the Budget, begins to find one occasion or another to deliver an impassioned harangue or to inspire a leak on the importance of conservation, the navy, welfare or whatever his department may be, until the budget is finally completed at the end of December.

In no section of the Administration is the infighting keener than among the three armed forces. This year it has been particularly sharp. In the first place, the Department of Defence has been operating within a much more restricted framework than in any year since the outbreak of the Korean war, owing to the determination of Mr Humphrey, the Secretary of the Treasury, to balance next year's cash budget even if the conventional budget, which excludes the surplus of the social insurance system from ordinary revenue, still defies the efforts of Republican financial orthodoxy. This means a reduction in expenditure of some \$6 billion for the year 1954-55 below that of the current year.

In the second place, entirely new Joint Chiefs of Staff have been reviewing, since August, the whole basis of the strategic commitments of the United States, taking a so-

called "new look." Finally, there is the still unsolved question of the effect of the new atomic weapons (which, as Admiral Radford, the chairman of the Joint Chiefs of Staff, declared before the National Press Club recently, "have virtually achieved conventional status within our armed forces") upon the whole structure and cost of those forces.

It was natural that Mr Humphrey should look to the defence budget, which this year accounted for well over half of federal expenditure (with foreign aid, atomic energy and related security expenditures the figure was nearer two-thirds) for the lion's share of the reduction in spending.

On present predictions, which are summarised in the accompanying chart, it is clear that his fellow industrialist, Mr Charles Wilson, has not failed him. The important points about the new figures are the methods by which they have been reached, and the revised conception of American strategy on which they rest. The cuts are to be achieved principally by a reduction of manpower and money for the Army, Navy and Marines. The Air Force, on the other hand, will expand both in strength and probably in the amount of funds devoted to it.

It is obvious that this represents an amalgam of conclusions reached on two

different levels in the Department of Defence. The decision to effect a ten per cent reduction in the manpower of three of the services is that of Mr Wilson and the civilians in the Pentagon, and has been taken primarily for reasons of economy. But it also has been taken because the United States is facing a growing shortage of young men, now that it is beginning to be dependent on the children of the lean depression years, when the birth rate was low.

This fact was heavily underlined by the report last week of the President's Commission on Universal Military Training, which recommended a six months' period of military training for all eighteen-year-olds followed by service in

DEFENCE PLANS

MONEY (\$ billion)

ACTUAL SPENDING

1953/54 34.5
1954/55 32

MANPOWER (number of men)

ARMY

Now 1,500,000
Mid-1955 1,250,000

NAVY AND MARINES

Now 1,005,000
Mid-1955 870,000

AIR FORCE

Now 945,000
Mid-1955 970,000

the reserve, in addition to the present selective conscription system. By the same reasoning, it is calculated that the Army will have to decline by another quarter of a million men by the middle of 1957. Although Mr Wilson has been accused by certain newspapers of making the same erroneous calculations about economy and security that one of his predecessors, Mr Louis Johnson, did in 1949, he has received the public backing of the President.

On the other hand, the decision to expand the Air Force while letting the other arms shrink is primarily that of the Joint Chiefs of Staff. (Last spring the Air Force was fighting a noisy rearguard action against the economising zeal of Mr Wilson and his able deputy, Mr Roger Kyes.) It represents once again, and in response to a new set of strategic conditions, the abandonment of what, with commendable knowledge of a great English children's classic, is known in the Pentagon as the policy of "Pistol for the Rat: pistol for the Badger: pistol for the Mole"—that is of the three services receiving year after year constant shares of the available manpower, equipment and funds. The Army and the Navy have made no secret of their unhappiness at this decision. It is the more remarkable that it has been taken by a Joint Chiefs of Staff, whose chairman is not only an Admiral, but also one who was a leading opponent of the Air Force in the great debate several years ago between the carrier and the heavy bomber.

★

Admiral Radford has insisted that the Joint Chiefs have not yet completed the "new look" which would carry their planning through the middle of 1957 and cannot commit themselves to more than an "interim look," which embraces only the next fiscal year. But it is fairly clear that some very far-ranging decisions have been reached. The first is that the American military establishment must be put on a basis which will render it reasonably immune to shifts in the international scene or in Congressional sentiment over the next five to fifteen years. Consequently, its financial budget must be stabilised within the next two to three years, somewhere below the \$30 billion mark and its manpower below three million men. Secondly, and as a consequence, the development of all types of atomic weapons must be exploited to the full to replace manpower by firepower wherever possible. This would be done principally by expanded airpower, but Admiral Radford was careful to emphasise in his Press Club speech that airpower comes under the control of the Navy, Army and Marines as well as of the Air Force itself.

Thirdly, it has been concluded that the Russian possession of the hydrogen bomb process places a new emphasis upon retaliatory power as the most effective deterrent to attack on the United States, and therefore upon the importance of the Strategic Air Command. And finally, the strategic imbalance of the United States, by which out of a total of twenty-three divisions it has six in Germany and another nine at the opposite end of the world in Korea, must be corrected, even if this means the withdrawal of some forces from both those theatres and their replacement either by local forces or by tactical atomic weapons.

What Congress will make of the new or the interim look is difficult to say. It will come before the legislators with all the military authority of the President himself. But Mr Wilson, who is acquiring a grudging respect in official circles for the efforts he is making to impose his

will upon the sprawling Defence Department, is not an adept salesman of policy. The Air Force is popular, but General Ridgway, who has a protest from the Army to make, is a more renowned figure than General Twining of the Air Force, and the Marines have the best organised lobby in Congress. For the moment, however, there is calm; the fight within the Pentagon has been resolved into figures and the budget rests securely in the President's brief case. It will not be long before it breaks out again.

Shifting Colonial Winds

FROM A SPECIAL CORRESPONDENT

IN the United Nations Assembly the United States has long tended to stand apart from the colonial powers; but political realities are bringing about a subtle change in this attitude. Not only does the United States now find itself needing the colonial powers as allies; it also sees its favourite self-portrait rejected by the newer nations. As an old graduate from colonialism it expected to be welcomed by them, but in the last year or two it has been finding itself pushed aside as one of the grasping and tiresome elders, and even criticised for its own colonial operations.

The experience is sobering, and United States delegates show its effect. Americans are now beginning to speak of their country's attitude toward colonial affairs as "ambivalent," which at least represents a fifty per cent shift. If American delegates do not often defend the colonial powers, they have at least become more reticent in supporting attacks on them.

Within the State Department the change has come about so gradually that the October speech of Mr Henry Byroade, Assistant Secretary of State in charge of Near Eastern, South Asian and African Affairs, which seemed to many people the announcement of an important new policy, is there said to have been merely the restating of an already accepted one. But recent experience in the United Nations was one of the factors which made its restating in emphatic form seem politic. Within the American delegation itself there is more than a hint that the ambivalence has not been resolved. Mrs Frances Bolton, a Congresswoman from Ohio, said quite flatly in the debate on Puerto Rican independence that

the Constitution of the United States gives to the Congress of the United States the sovereign and exclusive power to decide upon changes in the constitutional status of United States territories

—a statement as definite in its context as Sir Winston Churchill's remark about not having become Prime Minister in order to preside over the dissolution of the British Empire. Mr Mason Sears, on the other hand, heir of Boston's anti-colonial traditions, finds it much more difficult to square support of the colonial powers with the demands of his New England conscience. He accepts ambivalence in theory, he even explains it to the press, but his heart is in the old days when any rebel (except a Southerner) could be sure of shelter within the folds of the American flag.

Four factors are important in this shift of attitude: the educational effect of the everyday work of international affairs; the belief that the immediate danger is Soviet Russia while the vital allies include colonial powers; the general

shock of finding the United States classed among the colonial powers by newer nations; the specific shock of being attacked on the subject of Puerto Rican independence.

The Puerto Rican affair has been one of those fertile incidents with less news value than its effects warranted. Americans have felt so warmly virtuous on the subject of that island that even the attempted assassination of President Truman by a Puerto Rican nationalist was brushed aside as the inept effort of a deranged mind. Having given the country its technical freedom, and notified the United Nations that information on its affairs would no longer be supplied, America felt its hands were clean. To come thus complacent to the Assembly, and find its word about Puerto Rican independence doubted, its good faith challenged, was the kind of shock that educates fast.

At least four recent Assembly votes, two in plenary sessions and two in the Fourth (dependencies) Committee, have shown the effect of these experiences. Last year the United States abstained from voting on Arab-Asian efforts to bring the Tunisian and Moroccan complaints before the Assembly; this year it voted "no" on both. When India tried to bring consideration of Central African Federation within the purview of the Fourth Committee, the United States joined Britain in opposing the demand. When Lord Hudson tried to have debate on the subject closed, the American delegate voted for closure.

These are straws in a wind which may not yet be steady. A further indication lies in Mr Byroade's assertion that many of the Asian nations he visited last spring with Mr Dulles and Mr Stassen suffer from "a severe colonial hangover" which often takes the form of an "unreasonable suspicion of the policies and actions of western nations." The phrase had, until recently, a vestigial application to the United States. It still describes the state of mind of one big mid-western newspaper. But the important point is that this is the jocular description of a green-apple sickness from which the speaker knows he has recovered. In coining so brisk a bit of American slang to describe the state of mind of newly independent nations, Mr Byroade showed that he felt his own country had outgrown such adolescent ills.

★

It is too early to tell what effect this new maturity may have on American policy in specific trouble spots. Reports suggest that certain State Department officials are fearful lest the British go too fast in granting the right of self-government to their African wards, but for obvious reasons no public statement of this fear is probable. In the immediate American orbit the Monroe doctrine still rules, but nowadays it is directed against attempts to turn weak countries into holding grounds for Communism. British and French interests in the Caribbean are taken for granted. But there still burns beneath the surface that generous, sometimes unthinking sympathy for the underdog which has been one of young America's most beguiling and cherished characteristics. The degree of youthful sympathy which has been privately expressed for Dr Jagan, like the careful hearing given to the Reverend Michael Scott on African matters, suggests how easy it might be to exploit a mis-step on the part of the colonial powers.

Official American policy walks a very narrow tightrope in these matters, wary of the future, not yet sure of public support for any change. The degree of shift which is taking

place can be measured by a closing sentence in the Byroade speech:

It will be one of the great tragedies of our time if the peoples of Asia and Africa, just as they are emerging from generations of dependence, should be deluded by the fatal lure of the new [Soviet] imperialism and return thereby to an age of slavery infinitely more miserable than they have ever known before.

The clue lies in the comparative. Americans may not publicly admit that the old colonialism had anything good about it, but at least they think it is not so bad as the alternative offered by Communism. In that lies packed a generation of learning.

American Notes

Eisenhower in the Driver's Seat

THE President is spending Christmas in Georgia, packing up the heavy programme for 1954 which he must load into his three statutory messages to Congress early in January. Last week he spent three full days, starting at 8.30 each morning, conferring with the party leaders who will have to pull the programme through Congress. Senator Knowland, who is trying to fill some of Mr Taft's shoes, Mr Martin, the Speaker of the House, the Vice-President, Mr Nixon, his deputy as president of the Senate, Mr Bridges, and others, with Cabinet Ministers and committee chairmen as required, were consulted about the details of the programme. But the President announced firmly, before the meetings began, that its principles were already unalterably established.

Mr Eisenhower thus strengthened the recent impression that in future he intends to occupy the driver's seat of the Republican party himself and that, if his Congressional supporters balk at any of his proposals, he will call on the American people for help. He actually prepared to do this last week; for the first time a presidential press conference was reported fully and directly, instead of indirectly as has been customary, and a recording was broadcast. The precedent thus set may later be extended to include the televising of these conferences, which would give the average American an even sharper impression of the sincerity of the President. Mr Eisenhower went on to make it clear that the programme being considered at the Congressional consultations was his personal responsibility. Strict secrecy was imposed on those attending, apparently with more success than usual, and the official statements on the proceedings were made by the President himself.

These statements showed, as might have been expected, that the programme is to follow the middle of the road, but little was revealed about its contents. Indeed, it has not yet been decided exactly what is to go into some of the more difficult packages—farm and foreign trade policy, for example.

The only definite announcement was that the Senate is to be pressed to raise the limit on the national debt at once. New laws to facilitate the prosecution of subversives and criminals are also high on the list, as is a limited relaxation of the restrictions on the exchange of atomic information, something which Senator Hickenlooper for one seems sure to oppose. Representative Taber is another who has no objection to opposing the President, at least when it is

"Now Knowland, Now Martin, Now Bridges And Nixon"

Herblock in the Washington Post

for the sake of balancing the budget, which he is sure can be done.

In an election year Democrats will feel less like coming to the President's rescue than they did at the last session and he hardly added to their willingness when he opened his party consultation with a list of Republican accomplishments in the past year. This included taking credit for next January's tax reductions, which were originally planned by the Democrats, and for a number of other successes which might more suitably be treated as non-partisan matters, such as stopping the shooting in Korea, strengthening the free world against Communism and helping farmers afflicted by drought.

All Quiet at Fort Monmouth

BEFORE the Harry White case swept all other spy stories off the front pages, there was an impression, based on Senator McCarthy's breathless daily bulletins and fostered by the Army's haste in taking cover, that a flourishing spy network had been uncovered at the Army's

radar research centre at Fort Monmouth, New Jersey. The return to duty of twelve of the thirty-three employees who had been suspended and the fact that Mr Stevens, the Secretary of the Army, plucked up courage last month to announce that whatever might have happened during and after the war, no cases of current espionage had been found, suggest that the reports were grossly exaggerated. Unfortunately, Mr Stevens, after lunch with the displeased Senator, qualified his statement to read that the Army had not found any spies, leaving the tactful implication that Senator McCarthy might have been more successful. The persecution of Brigadier General Telford Taylor, who dared to denounce the McCarthy hearings, has shown what can happen to those who defy a Senator who has his agents in key government departments. But it is significant that the Senator's own enthusiasm for the Fort Monmouth case has moderated and that he is shifting to fresh pastures in private industry.

True, three weeks of open hearings produced a parade of witnesses who invoked the protection of the First and the Fifth Amendments and refused to say whether they had been or still were members of the Communist party. But few of them are still employed at the centre and no charges of espionage have been filed. The Senator himself—though at the hearings he assumed that a refusal to answer questions was tantamount to a confession of treason—now says modestly that it is not his job to do the work of the Department of Justice, but simply to indicate "potential espionage" and to alert security officers. As most of his material seems to come from the files of the Army and those of the Federal Bureau of Investigation on the Rosenberg case, to which it is suspected he had access, it will hardly set the alarm bells ringing. But the American Federation of Scientists fears that the hearings have dealt a damaging blow to research essential to the defence of the United States.

In examining the records of private companies who do work for the government, Senator McCarthy will have competition from the two other Congressional investigating committees. The General Electric Company, which is Mr McCarthy's present target, has announced that it will employ no Communists or proved spies, and has suspended employees who refuse to answer his questions; it suggests that the government might investigate their loyalty, as it already does that of workers on secret defence projects. The Defence Department's top security officer would like authority to ban "security risks" from all plants vital in war-time. Few Americans, at this rate, will escape a security dossier by 1984.

Truce on Social Security

OF all the programmes outlined to his party by the President, none seems more certain to be carried out at this session of Congress than the plan to raise the benefits paid under the federal old age insurance scheme and extend it to 10.6 million workers who are now excluded. At present just over 47 million are covered, out of a labour force of 63 million. Old people also would be allowed to earn more before their benefits were affected. Politicians of both parties are anxious to win the goodwill of the voters on this non-controversial score. Only the doctors, of the 6.4 million

workers who would be required to join, seem to object; the rest include farmers and farm labourers, some domestic servants and the professional self-employed. Ministers of religion and employees of states and cities would be allowed to join if they wished.

This does not mean that there is not a fierce dispute about the enthusiasm of some Republicans for the proposal of the Chamber of Commerce that the present "insurance" features of social security should be scrapped and a complete pay-as-you-go plan adopted, with minimum pensions for everyone over 65. The President has shown some interest in this new approach, and Mr Curtis, the chairman of the House Social Security Sub-Committee, used to be a convinced advocate of it. After holding hearings, however, Mr Curtis has been converted to the view that any changes next year must take place within the existing framework. Insured workers are indignant at the thought that their savings in the trust fund might be raided for the benefit of old people who have paid no contributions and hence are dependent, today, on state old-age assistance; and they are afraid that under a system which depended entirely on current tax-receipts, their benefits might suffer.

What will cause some trouble is the question of whether the rise to 2 per cent in the pay-roll tax paid by workers and their employers, which takes place in January, should be rescinded. It will bring in another \$1.7 billion a year and improve the government's cash position in a deficit period and, in the view of such austere Congressional financiers as Mr Reed, the chairman of the House Ways and Means Committee, is essential to the long-term stability of the social security trust fund. But the fund has a substantial surplus at present, and the Administration fears that, if social security contributions rise just as taxes are reduced, the lower paid workers, whose pay packets will be smaller instead of larger, will not show their gratitude for the tax cut when they go to the polls in November.

Colour for Christmas

THE Federal Communications Commission has given the television industry a handsome Christmas present—permission to go ahead at once, after nearly three years of controversy, with commercial transmissions in colour by a system which has been worked out co-operatively by the industry; the outstanding advantage of this system is its compatibility, which means that programmes can be received in black and white on the 27 million television sets now in use in the United States. But it will be next Christmas at least before many viewers will be able to enjoy the FCC's present: that colour television is enjoyable is almost universally agreed. It will take several months to put colour receivers on the market and if total output in 1954 reaches 100,000—only two sets to a dealer—many observers will be surprised.

These sets will cost from \$700 to \$1,000 each and will have only 14-inch screens; black and white sets can be obtained today for as little as \$200 with the desirable 21-inch screens. It will be a long time before colour sets, even when mass-produced, are as cheap as this, for the special colour tubes are very costly. This is the main reason why manufacturers feel that converters, to enable existing sets

to receive in colour, would be too expensive to appeal to the public. Many consumers have been postponing their television purchases until colour sets are available and to dealers the FCC's announcement brought not cheer but the collapse of their hopes of getting rid of burdensome stocks by last minute Christmas sales. Nevertheless it is thought that when consumers realise how long they will have to wait and how much they will have to pay for colour sets they may decide that black and white is acceptable after all.

How much colour there will actually be on the television waves in the near future is another question. Experimental transmissions by the National Broadcasting Company have already brought opera into the home and New York programmes on to Californian screens very satisfactorily. This network and its deadly rival, the Columbia Broadcasting System, were both on the air with colour programmes before the FCC's ink was dry. But a few colourful hours a week is all either of them can promise, for colour cameras and equipment are not yet available in any quantity. Even when they are, it will cost at least \$400,000 to fit out a studio for colour; this is something that few local stations can afford. Luckily the equipment needed to rebroadcast a network programme in colour can be had for as little as \$25,000 or so. Another difficulty is that advertisers, already finding the costs of television excessive, will hardly be willing to pay even more for colour until they can be sure of a substantial audience with colour receivers. However, similar problems in the early days of monochrome television have largely been overcome and already substantial technical progress has been made with possible, even if partial, answers, among them NBC's tape recording of colour transmissions, CBS's cheaper tube, and reception by subscription.

SHORTER NOTES

As expected, farmers in the twenty cotton-growing states have agreed, by an overwhelming majority, to the imposition of acreage and marketing quotas on their 1954 crop which, it is hoped, will reduce their harvest from 16.3 million bales this year to 10 million next. But more intensive cultivation may well upset this programme; when controls were last imposed, in 1950, the yield an acre went up from 634 pounds to 805. In any case, the full reduction, of about 30 per cent, in acreage is considered to be too severe to impose in a single year and Congress is likely to increase the quotas when it meets in January.

★

The "marketing criteria" in the Department of the Interior's new contracts for sales of electric power to rural co-operatives in the Missouri Basin area (discussed in the last issue of *The Economist*) have been revised to such an extent that they may after all not be challenged in the courts. The revisions, which the Department calls "clarifications," but others regard as capitulations to the protests of local consumers, extend the deadline for estimating future requirements of electricity, and guarantee that power not needed immediately by public consumers will be sold to private companies on short-term contracts only.

The World Overseas

Report on Southern Asia

ATE has forged a strange link between the Korean war and the Colombo Plan. As readers are now reminded by the second annual report of the Consultative Committee on Economic Development in South and South-East Asia, published after the Delhi meeting in October, the first session of the Committee was held in Sydney in May, 1950. One of that year the North Koreans sprang at the throats of the South and for the next few months a worldwide scramble for raw materials sent prices giddily upward. At the time the starting date for the six-year Colombo Plan arrived, on July 1, 1951, no one in South-East Asia knew where they were. Was six shillings a pound worth value for rubber than two? Should tin be counted at £1,400 a ton or less than half as much? Was the market price of raw jute to be nearer Rs200 a bale or 100? Never had the background for long-term economic planning been more awkward or uncertain.

Now the boom has been followed by a slump. Two full years, or one-third of the Colombo Plan period, have gone and during this time the world's view of the Korean war and its probable consequences has turned full circle. The struggle no longer looks like the start of a world war; it has even been brought to an uneasy truce. The prices of some—though not all—raw materials are back near the levels from which they took off in 1950. And the countries of South-East Asia, compelled to plan—if they were to plan at all—not only at the mercy of surging and uncontrollable economic forces but with brand new governments, have been left with a challenging and difficult situation to clear.

Burma alone in South and South-East Asia has enjoyed marked improvement in its terms of trade during the past 10 years; indeed, there was an improvement even in the twelve months ending June 30, 1953, with which the present Colombo Plan report is mainly concerned. In this period all the other countries of the area have suffered from a sharp fall in the value of their exports, a consequent contraction in their imports and—since most of their government revenues lean heavily on export and import duties—an important reduction in their own ability to finance the development projects drawn up under the plan. The reverse trend in the terms of trade has hit India and Indonesia hardest, making them some 9 per cent worse off than they were in 1948. Ceylon and Malaya are still above the level of that year, when rubber, the most depressed of all raw materials since the war, stood at only one shilling a pound, a price even lower than that ruling today.

The fall in commodity prices has meant a fall in national incomes. This, in the words of the report, has "caused rather widespread economic distress and the contrast with the previous high expectations [has] produced a general feeling of frustration and bewilderment." Particularly affected have been the smallholders and all whose livelihoods depend on agriculture; there has also "been some increased unemployment, for example, in urban areas in India." At the same time, the boom had led, in the world as a whole, to a general rise in the prices of capital goods and, in the area itself, to a rise in the average level of wages.

These increases have by no means been cancelled out in the commodity slump that has followed. Nor are they likely to be. Consequently, while the costs of carrying out the original development plans have risen, the resources from which they must be met have relatively declined. The whole concept of the Colombo Plan in fact has run into greater difficulties than might reasonably have been expected. It is, therefore, no small tribute to the governments concerned that nearly all of them managed to keep up the impetus of development and to spend rather more on their programmes in 1952-53 than they spent in 1951-52. The price, however, has been a severe reduction in external assets and internal reserves, and the appearance of a bigger question mark than ever over the future. If the improvements in the standard of living originally planned are to be achieved, one of two things must happen. There must either be greater temporary sacrifice on the part of the peoples themselves, or there must be an increase in the amount of external aid which in any case has never been guaranteed as adequate to close the gap between intention and availability.

The primary reason for Burma's relative economic success has been that it alone is endowed with a large food surplus, and that the price of rice is only now beginning to weaken; decreases in the value of other Burmese exports have been much more than offset by the buoyant rice position. This could not have been sustained, however, if the country had not made substantial progress in other ways, particularly in the political sphere. In the past eighteen months, the government has extended its writ over most of the country for the first time since independence. This has raised general economic output by a quarter; in 1952, for instance, as much as 633,000 more acres were sown to paddy than in 1951. And the government, in spite of some over-optimistic planning, has undoubtedly been adroit in diverting much of the extra economic potential into

its development programme. Approximately a quarter of all imports have been capital goods.

The two largest members of the Colombo Plan, India and Pakistan, have not been so fortunate. In each, however, the government has taken determined, if sometimes tardy, steps to meet its difficulties. In 1952-53 India converted the previous year's payments deficit of Rs1,536 million into a surplus of Rs551 million; but the total volume of trade was considerably less, and the previous year's losses had been financed only by drawing down the sterling balances and through the American wheat loan. In Pakistan a calamitous situation arose over the balance of payments as a result of the combined shrinkage of export earnings and the failure of the monsoon; the budget, on the other hand, has remained in balance on current account. In spite of their difficulties, however, both countries have pushed ahead with the expansion of their development expenditure. Indeed, in so far as India and Pakistan contain considerably more than half the population, wealth and economic capacity covered by the Colombo Plan, the general picture of progress presented in the current report owes much to their efforts.

Communist Competition

After discussing with commendable frankness the difficulties and setbacks of each country in turn, the report summarises their main achievements in the three key fields of agriculture, power and communications. "At the present time," it says, "the programmes . . . may be considered as having generally passed out of the stage of preparation and into that of execution." Economic returns, that is, may begin to be looked for in such developments as Ceylon's Gal Oya scheme, Indonesia's approach to self-sufficiency in food, the Connaught Bridge Power Station in Malaya, the new motor road into Nepal, Burma's reclaimed land, the many multi-purpose water projects and new factories going up in Pakistan and India.

There can be no question that the existence of the Colombo Plan and the organisation which has now been created in each country to further its designs have given a fresh impetus and a useful cohesion to the economic growth of the area as a whole; the unprecedented collation of economic information and the work of the Technical Co-operation Committee are alone worth a great deal. But whether the growth is fast enough and whether the present rate can be effectively maintained are two quite different questions. It is one thing to set a chain of economic development in motion, another to ensure that its purpose and its extent can be neither twisted nor denigrated by Communist propaganda. The Colombo Plan was conceived as a genuine attempt to further the well-being of South and South-East Asia, and it is a matter of great pride to its Commonwealth sponsors that, in one form or another, all the countries of the area now participate. With the end of the Korean war, however, the Communist powers are in a position not only to press on with shop-window development in China and Manchuria, but to make temptingly deceptive offers of Russian capital goods in trade agreements with South-East Asian countries. In spite of all that has been achieved, therefore, the lesson of the present report is that, if the Colombo Plan area is to hold its own against Communist economic propaganda in the next few years, it will almost certainly need more assistance from outside than any yet offered.

American Aid for Europe

IN the tumult that arose last week over what Mr Dulles had to say about the consequences of failure to accept the European Defence Community (EDC), one crucial point received insufficient notice. What is the American Congress likely to say if the EDC does not materialise? How much will it be prepared to grant Europe in the way of future military aid, and on what terms?

Earlier this year US legislators had already grown so impatient that they attached an amendment—the so-called Richards amendment—to the 1953 foreign aid appropriations, stipulating that 50 per cent of the arms manufactured for the six EDC countries must go to the Community Army and to it alone. If, however, EDC came to nothing, then Congress would decide how to dispose of the arms on the President's recommendation. Had the House of Representatives been left to itself, the appropriations would have been even more circumscribed; but the Senate intervened and this relatively mild version was the outcome.

Many of those who are aware of the Richards amendment have been inclined to treat it lightly. They argue that the arms provided by the 1953 appropriations will not exist until 1955 or even 1956, and it will be time enough then to settle their destination. Their complacency ignores two important clouds on the near horizon. Some of these arms—for example, ammunition—may be ready for shipment well before 1955 and, what is more important, Congress will start in the New Year to consider the appropriations for 1954.

Headaches for Nato

Last year Representative Richards found widespread support when he urged:

If the EDC is dead, then it is folly to continue to appropriate billions here to furnish arms for the individual countries where there is no will to bury past differences and to unify. We could better use the money in other countries of Europe such as Turkey, Spain and Germany . . . or use it to strengthen our own defences here and abroad. Mr Dulles's warning that failure to ratify EDC would compel the United States to face an "agonising reappraisal" of its policy seems pallid beside the forthright declaration of Representative Richards.

This would be an unfortunate moment for Congress to balk at extending further military help to Western Europe and in particular to the EDC countries. For many European nations, having built up their forces only with very substantial assistance from the United States, now discover that they may soon be faced with a problem that will require further American help and good will. The most pressing question ahead is how these countries are to finance the maintenance of the forces and equipment already in being, how they are to pay for such items as spare parts and replacements. No one has yet estimated the exact dimensions of this burden, but it is already quite clear that the required outlay will soon become one of the major items in European military budgets.

Because so little is known about the dimensions of this potential problem, the North Atlantic Treaty Organisation (Nato) plans to make it the subject of very thorough

investigation and analysis during the coming year. Indeed, this question will provide Nato with one of its primary exercises in the realm of economics, although it will involve some careful calculations of a political and military nature as well. Nato officials will have to ask themselves—and find answers for—such questions as: what is the peace-time rate of attrition of the weapons now in use? How quickly should certain military equipment be written off as obsolete? Suppose, for example, that in 1957-58 it is decided to replace current weapons very largely by less conventional atomic types—who will pay for them and where shall they be manufactured? How large a war reserve should the Nato forces maintain?

The US Administration is well aware of what these investigations may yield, and it has no desire to lower the guillotine on American aid in 1956 or in any future year, if further help proves necessary. But what Congress says and does is another matter.

Beria's Path to the Dock

THE days of Lavrenti Pavlovich Beria are clearly numbered. Whether it be preceded by a hideous public show or by a "trial" behind closed doors the final act of his drama is drawing to an end. The statement last week from the State Prosecutor's office gave a foretaste of the official obituary notices. Even in the chequered history of the Soviet regime never has a man fallen so quickly from such a high pedestal. What an extraordinary contrast between the paeans to "Georgia's beloved son" and "Stalin's close collaborator" fashionable not so long ago, and the epithets of "traitor" or "agent of foreign imperialism" now coupled with Beria's name. On the palimpsest a new version is written in black, distorting letters. What, in fact, has been Beria's career?

Beria's adult life was entirely bound up with the Soviet regime. He was born in 1899 in the village of Merksuli, in the Sukhum district of Georgia. The official history has it that he came from poor peasant stock, but his parents could not be so very poor, since after finishing at the local school in Sukhum he proceeded with architectural studies at the technical high school in Baku. Again according to the official story, he joined the Communist Party as early as 1917 and he clearly must have been prominent in local politics, since four years later he was appointed deputy chief of *Cheka* (the original name of the Soviet security services) in the Azerbaijan republic.

Thus Beria became a security specialist and entered on a path he was to follow for over thirty years. At first his career, if rapid, was not startling. He climbed the ladder of the Soviet hierarchy. He became successively head of the security services in his native Georgia and then for the whole of the Caucasus. By 1931 he was also Georgia's first secretary, that is to say, the political boss of the country. Throughout, he combined the tasks of the policeman with those of the economic overseer. He directed the struggle against the local *mensheviks* and then against the opponents of the Stalinist regime. At the same time he watched over agricultural development and the oil production of Baku.

At the age of 35 Beria was a power in his region, but

almost unknown outside. But Stalin was watching over his native Georgia, and Beria received his first reward for his struggle against the opposition. In 1934 he was elected to the Central Committee of the All-Union Party and thus emerged on to the broader stage. The next year he produced a book which did much to foster his career. It was a history of the working class movement in the Caucasus, which ascribed to Stalin a role in the revolutionary movement well beyond his actual achievements. Stalin saw that his fellow-Georgian was not only efficient, but also faithful and reliable. Two years later he was given the real prize. When in 1938 the regime of bloody and blind terror was beginning to defeat its own ends, Beria was called to replace Yezhov as head of the NKVD and to prevent the executioners from running amok.

In this way Beria's name was associated for the first time with the liberalisation of the police regime. Not that the NKVD suddenly became a philanthropic institution, but the arrest of the mad purges of the Yezhov era was a great relief for the whole country. Many people were released from jails and camps. The reign of uncontrolled terror was over, and at the same time Beria climbed to the top of his profession and to one of the most powerful posts in the country. During the war he was a member of the inner defence committee and was responsible for security in the rear and later for security in the armed services as well.

A year after the end of the hostilities Beria had climbed as high as anyone could during Stalin's lifetime. A bemedalled marshal, he was appointed vice-premier and a full member of the Politburo. He had relinquished the ministry of internal affairs (MVD) which was subdivided into two separate branches: internal affairs (MVD) and State security (MGB). Sergey Kruglov who inherited the former is now Beria's successor; Vsevolod Merkulov who became head of the latter—is now Beria's fellow prisoner. But at the time it was assumed, probably rightly, that Beria was supervising internal affairs from his posts in the cabinet and the Politburo. It later turned out, however, that in the last days of Stalin's life Beria's control was slipping. Though his face with the characteristic *pince-nez* could still be seen in all official photographs next to Stalin and Malenkov, some moves started by the security police were not of his making and were probably aimed at him and other prominent figures. New and tough policemen were getting the upper hand and carrying out a nationalist "vigilance" campaign. The arrest of Jewish doctors accused of poisoning Zhdanov and of similar attempts on army leaders looked like the prelude to a new wave of bloody purges. Then came Stalin's death and the group connected with Beria struck back.

Struggle Behind Closed Doors

After March 5th the speed of events rapidly increased and for a hundred days Beria occupied the centre of the stage. It was he who proposed Malenkov for the premiership, and Beria's name was always second in all official announcements. He took over the reunited ministry of internal affairs and once again his advent spelt the beginning of a milder course. The vigilance campaign was stopped, the doctors released. The security men in charge of the "plot" were in turn accused of having extracted false confessions by unconstitutional means. Soviet citizens were suddenly reminded that they had constitutional rights, and this was a big jolt to the self-confidence of the policemen.

Beria was thus undermining the powers of his own organisation. The process spread from Moscow to the outlying provinces and there the tough security men were in addition accused of forcible Russification. Born in the Caucasian melting pot, Beria has always been fascinated by the national problem and he must have come to the conclusion that a Russian fist was not the best method of knocking together the Soviet nationalities.

Beria alone cannot get the credit for all the moves sketched out after Stalin's death. Alone he would not have had sufficient power. In theory the Kremlin was acting as one, but a deadly struggle was being waged behind closed doors. The outside world could get only glimpses of it, such as the sudden resignation of Malenkov from the secretaryship of the Party in favour of Nikita Khrushchev. Then came the June rising in Berlin which must have strengthened the hand of the Soviet opponents of a policy of concessions and reform. A few days later Beria was absent at a theatrical performance attended by all important personalities.

On July 5th came the biggest political bombshell since Stalin's death: Beria was arrested as foreign agent who had attempted to foster bourgeois nationalism and to restore capitalism. After the liberal interlude the spectre of the Moscow trials was resurrected. Then for six months little was heard of Beria and only the purging of his men revealed that the "Beria clique" was being crushed. A policeman linking his fate with the forces of reform always takes a great risk since it is easy to present his fall to the public as a victory for freedom. Beria now faces the supreme penalty for his audacity. The tougher security men and their allies, who have succeeded in crushing the ambitious Georgian, must hope that this marks the end of a chapter. It is more likely to be but a prelude to new upheavals which may shake the foundations of the post-Stalinist regime.

Crisis Over Port

BY A CORRESPONDENT RECENTLY IN PORTUGAL

IT is a long way from the terraces of the Douro to the English suburban home or dockside pub, but there is a close economic tie. Fifty years ago, port wine was drunk after dinner in Southend, Sydenham and Stoke-on-Trent, and by the "dock glass" in Limehouse and Liverpool. Twenty years ago, Britain was still drinking 40 per cent of the wine produced in Portugal, and port accounted for a fifth of Portugal's exports. Since then fashions and excise duties have changed. The volume exported is down by half, and its value to 6 per cent of exports from Portugal, while Britain now takes less than a third of this smaller quantity.

The name *Vinho do Porto* is strictly defined and protected by Portuguese law. The wine must be made from grapes of recognised types grown in the demarcated wine region of the upper Douro; it must be treated with approved grape brandy (now supplied through a state monopoly); and it must be stored in one of the lodges at Vila Nova de Gaia across the river from Oporto. The shippers—there are about 80 of them, with one British firm handling some 14 per cent of the trade—must belong to the official guild, through which is fixed, in August of each year, the

amount of wine to be treated in the coming vintage. Each shipper must treat a certain minimum quantity to preserve his export rights; and he must also submit his wine to testing.

Some shippers have their own vineyards, but most of the grapes are bought from small farmers, of whom there are many thousands in the wine region owning tiny terraced holdings where they grow practically nothing but vines. The total wine-making capacity of the demarcated region is between 100,000 and 150,000 pipes a year. In 1953—and this indicates the severity of the crisis in the trade—the quota fixed for treating was 25,000 pipes, equivalent to rather over 30,000 pipes of port wine when the brandy has been added. (A pipe for wine-making may hold up to 140 gallons; an export pipe is 118 gallons, or about 5.4 hectolitres.) The purpose of the quota is to keep up the prices paid to the growers; wine not sold for treating is bought by the Government at a lower price, either for sale as such or for making into brandy, but this does not compensate for the shrinkage in demand for port-making.

Very little port is drunk in Portugal, except by foreigners. It is, and always has been, chiefly an export commodity. Before the war Britain and France were the biggest customers, with Germany a bad third, but all three are now taking considerably less. In Britain and Germany dry

wines are more favoured without great regard for price (thus in Britain dry sherries, though carrying the same rate of duty as dark sherries or port, have held their sales much better) and people have not grasped that port can be a dry wine. In France, where port is drunk as an *apéritif*, imports are limited under the "contingent quota" system, but each year's quota is taken in full and the shippers believe that much more could be sold. Belgium, on the other hand, has risen since 1946 to second place as a customer, and the Scandinavian countries (where they offend the purists by mixing port with beer) are also buying considerably more. Sales to the United States were negligible before the war, and in 1952 were still under 2 per cent of the total exported; the discriminating market in the United States is very small, and true port cannot compete among the wider public with the Californian "port," which is said to offer the cheapest way of getting drunk. The Government and the Port Wine Institute have not lost hope of increasing exports to the United States, but the shippers are sceptical and unwilling to finance the costly advertising campaign that would be needed.

But it is the fall in the British trade that most shippers regard as the real cause of the crisis. The Portuguese Government and the Institute have financed an advertising

campaign to popularise dry port before dinner, port when the washing-up is done and the television switched on, even white port iced in the summer—a two-edged sword, since several of the shippers are in the sherry business too. Everyone, Institute and shippers alike, hopes for a reduction in the duty on heavy wines from the present 50s. a gallon to something nearer the 8s. 6d. of prewar days. There is a touching faith that even a partial cut would make a dramatic difference to sales, and would compensate the Chancellor for any loss of revenue by raising incomes in Portugal and so helping British exports. But it would take more than any reduction he would find feasible to restore port-drinking to its former position in a Britain that has lost the habit.

Security in the Pacific

ANZUS has held another conference in Washington, and in speaking about it in the House of Representatives in Canberra, Mr Casey went out of his way to emphasise that there was no prospect of a wider security alliance in the Pacific which would correspond to Nato on the other side of the Soviet bloc. The necessary political conditions for it, he said, did not exist, because states that might be brought in were not willing to undertake the precise obligations which would be required for such a partnership. At the same time he maintained that the Anzus agreement had proved of great value to Australia and did not exclude Australian co-operation with the United States in the latter's other commitments.

Great as are the difficulties in the way of any organisation in the Pacific comparable to Nato, Mr Casey's attitude seems somewhat unduly complacent, for Anzus, useful though it may be in itself, belongs essentially to what may be called the third line of defence in the Pacific, and would hardly become operative as an alliance in war unless the first two lines had been lost. In the last war Australia was not itself directly threatened until the Japanese had landed in New Guinea and sent a squadron into the Coral Sea; New Zealand did not see the enemy nearer than Guadalcanal. Australia and New Zealand were only uncovered to direct hostile action because the Japanese, starting the war with a powerful navy and in possession of the Mariana and Caroline Islands, succeeded in taking Indonesia, the Solomons and part of New Guinea by overseas expeditions before they could be checked.

Today, the situation is rather different. The Russo-Chinese alliance does not dispose of naval strength in the Pacific comparable to that of Japan in 1941, and its capacity for long-distance overseas invasion may be assumed to be much less; further, the United States now holds the former Japanese island chains to the north of New Guinea and the Solomons, thus forming a barrier across the north-eastern approaches to Australia which would have to be pierced before an enemy from Asia could again arrive in the

Coral Sea. On the other hand, the possibility of hostile approach from the north-west is no less than it was at the time of the Japanese conquests, and potentially perhaps even more dangerous. The main threat of expansion of the Russo-Chinese bloc is on the mainland of south-east Asia, where China can directly support Communist-led local forces, and, in the event of war, move armies overland; the countries concerned, which have no sea protection—except for a certain possible use of sea-power for interception at the Isthmus of Kra—are Indo-China, Siam and Malaya, and these countries may be counted as being in the first line. Further north, Korea is also part of the Asian mainland, as the world has good reason to remember, and the Hokkaido, the most northerly of the larger islands of Japan, could be invaded from the north across narrow straits from Russian-held Sakhalin and the Kuriles.

But Japan as a whole, Okinawa, Formosa, the Philippines and Indonesia all have protective sea-moats more or less wide, so that if they were held by well-equipped and politically reliable military forces with adequate air and naval cover, it would be difficult to attack them from the mainland. They form the second line of defence. The doubts which arise with regard to this zone are more political than strategic; important Communist or fellow-travelling elements exist in these countries and could in time of war be co-ordinated with airborne landings from the mainland—a form of warfare which under modern conditions can be used against offshore islands even without command of the sea. Of these second-line insular territories, Indonesia would probably be the most vulnerable to such a combination of internal and external violence if the south-east Asian mainland had fallen. If the nearer islands were to be taken in whole or part from the mainland, Pacific defence would then be back on the third line consisting of Australia and the oceanic island groups from Hawaii westwards—a situation very similar to that of 1942 except that Saipan and Truk would be from the start in American hands.

From the foregoing survey it emerges that the strategic situation in the Pacific and the Far East is very different

from that in the North Atlantic and Europe; in the latter case all the countries on the eastern side of the Atlantic except Britain are continental, whereas on the western side of the Pacific most of the countries concerned are insular—Japan, the Philippines, Indonesia and Australia. On the other hand, it is precisely the mainland countries forming the first line which are at once most endangered and least protected by any wide system of collective security. The United States now has an alliance with South Korea which commits it to go to war again on the Asian mainland if this ally is again attacked, but there is no American commitment with regard to South East Asia; supplies are being sent to Vietnam and to the French forces there, but nobody knows what America would do if there were a French collapse in Indo-China—or a crisis in France forcing a withdrawal from Indo-China on terms amounting to the line of fire, with Malaya hardly tenable if a “people’s republic” were to be established in Bangkok.

At present the United States has formal defensive pacts with Japan, South Korea, the Philippines and Australia, but none of the latter have obligations towards one another. The United States has no formal obligations (apart from general liabilities under the United Nations Charter) in the event of an attack on Malaya or Hongkong, and any assistance that Australia might render would be given as a member of the Commonwealth, not of Anzus. No country has any formal commitment of military aid to Siam. But it must be asked whether this obscure and indeterminate situation means that each country would be left to its own devices in an emergency or whether some kind of joint action would in the last resort be taken, at least by the United States, Australia and Britain together, to prevent “creeping conquest” in South East Asia.

Boost for New Zealand Wages

FROM OUR WELLINGTON CORRESPONDENT

THE average New Zealand wage earner is beginning to realise that more money in the pay packet is not the only answer to cost of living problems and that an arbitration court that controls minimum (but not maximum) wages without controlling prices, creates its own problems. Until this year the New Zealand Arbitration Court was obliged, when making its periodic revisions of wages, to consider the general economic effect on the country of general wage variations. Under trades union pressure, however, this obligation was removed earlier this year. Thus the court was strictly within its rights when, last month, it decided its latest general wage order on the demonstrable discrepancy between increases in wages over the last twelve months and increases in the cost of living.

The court's order authorised the equivalent of a 10 per cent increase in minimum award wages, with a limit of 24s. a week. It was made retroactive to September 15th when the wage negotiations were officially begun, and employers were told that they are under no compulsion to pay the increase on anything but minimum wages. This provision, of course, means very little; for if margins are to be maintained, most employers concede that the increase will have to be extended, at least partly, to workers already receiving more than minimum rates. The retroactive effect of the

order will also create considerable burdens and problems for it means that all employers will have to find at least nine weeks' back pay in a lump sum and if possible, distribute it before Christmas. As a result holiday and Royal Tour spending will be considerably stimulated, but the subsequent hangover is likely to be correspondingly severe.

The Government, as the largest employer in the country (it now employs something over 100,000 people) will have at least another £8 million added to its annual wages bill and it will undoubtedly be faced with an immediate demand for commensurate increases in pensions and some social security benefits. The farmers, who are undoubtedly in the best position to absorb the increase, have already had their guaranteed butterfat price raised by 2.15d. a lb which means, among other things, that each pound of butter eaten in New Zealand will be subsidised by nearly 1s. 4½d. to keep it at the present retail price of 1s. 8d. a lb. Unless the butter subsidy is decreased, which might be bad political medicine, it will in future cost New Zealanders over £5,750,000 a year to convince themselves that they can still eat their own butter cheaply.

The Federation of Labour had asked—obviously with its tongue in its cheek—for an average increase of £2 4s. 5d. a week in wages. The 10 per cent increase it received was obviously more than any but the most sanguine of its advocates had expected and correspondingly more than the most pessimistic of its opponents had feared. The employers had argued that an increase of 3½ per cent, or possibly of 5 per cent, would have been adequate and that if it had been kept to that modest level, a good deal of it would have been absorbed instead of being passed on. Faced with a 10 per cent increase however, there is no doubt about the employers' decision to pass it on. Immediately the wage increase was announced, retail and wholesale prices began to rise, and they are still rising. The Government, which has been steadily reducing price controls, is now anxiously considering what remedial checks it can impose.

It is much too early yet to predict how much, if any, of the 10 per cent increase its recipients will retain; but on present indications it is unlikely to be very much. Some dim realisation of this possibility is obviously dawning, for there is a noticeable lack of jubilation about the wage rise in quarters where it might be expected. Though the court expressed a pious hope that the increase in wages would result in an increase in production, there is little to suggest that the hope is likely to be realised.

The increase will undoubtedly provide one more set-back to New Zealand's house-building programme. The Government recently made some efforts to stimulate this, but the major factor is still cost and builders estimate that the new wage scale will add at least £100 to the cost of a £3,000 house. The Government could diminish the inflationary effect of the wage increase by tightening bank credit but this would again affect house-building prospects and is likely to be judged politically inexpedient with an election less than a year away.

It is difficult to see how the order can have anything but an inflationary effect and offset some of the efforts that have been made to restore more value to the New Zealand pound. Already suggestions are being made that the present system of wage fixing should be overhauled, but it seems unlikely that they will be considered seriously. The trade unions appear to be firmly, though not necessarily happily, wedded to the court, and if the Government has any alternative suggestions, it is keeping them to itself.

CLEAN COAL

The growing use of mechanical coal cutters and the working of thinner and poorer seams inevitably increase the amount of dirt in the coal that reaches the pithead. Efficient coal cleaning is more than ever essential to prevent trouble at power stations, coke ovens, gasworks and other coal-consuming plants, and to avoid burdening transport systems with millions of tons of rubbish. Simon-Carves have been building coal washeries for half a century. Plants by Simon-Carves are today responsible for nearly half the coal mechanically cleaned in Britain, and post-war plants built abroad have earned handsome amounts of foreign currency.

THE BUSINESS WORLD

Scotch Galore ?

THE free market for Scotch whisky, which has been in abeyance for almost 14 years, will, on paper at any rate, be restored on January 1, 1954. At least, the practice of allocating Scotch whisky between the home and export trades by annual agreement between the Scotch Whisky Association and the Government, and the rationing of home supplies resulting from these agreements or from the imposition of quotas by the association on its members, will cease. The industry has undertaken to continue its export efforts, but it is once again free to develop the home trade. The situation that faces it is very different from that of 1940.

Whisky's home market has almost halved. In 1938-9 it took 6.9 million gallons; in 1951-2 only 3.5 million. In 1938-9, whisky supplied nearly 70 per cent of the home consumption of potable spirits—10 million gallons—while gin, rum and brandy were far behind. The diversion of Scotch to earn foreign currencies, especially dollars, during and since the war, gave its rivals their opportunity. Indeed, in 1949-50, gin overtook whisky. In 1951-2 whisky recovered its lead, but it supplied only 40 per cent of Britain's total spirit consumption of 8.9 million gallons, and gin remained a close runner-up.

Secondly, the industry is now much more dependent on exports. In 1938-9, 6.9 million gallons, out of a total of 14.6 million gallons of Scotch consumed in the world, were sold at home; in 1951-52, only 3.5 million out of a similar total. The home base has shrunk from almost 50 per cent of trade to barely 25 per cent.

Thirdly, whisky stocks have at last been rebuilt to prewar levels, but their age-composition is very different. At law, Scotch may not be sold at home (and in some other countries) until three years after distillation. In practice it is normally matured for six or eight years, and sometimes for 12 or 15 years. Restricted supplies of cereals reduced distilling from

30 million gallons in 1938-39 to nothing in 1942-43 and 1943-44. It then increased until 1949, and has since resumed prewar levels. In the meantime, stocks had fallen from 144 million gallons to 85 million in 1945. As less matured whisky was available for sale, and more was exported, a strong sellers' market developed at home, with all its usual symptoms, not least a free ("black") market and price. By March this year, stocks had recovered to 150 million gallons. But perhaps 125 million gallons of this had been distilled in the last five years and are not yet ready for sale.

The end of allocation will not by itself produce a large increase in supply immediately or even in the next few months. At current prices, whisky demand and supply in the country as a whole have been approaching each other, and the sellers' market has been coming to an end. Even if there had been a risk of continuing general shortage, rationing was overdue for abolition. But the physical process of maturing malt whisky cannot be hurried to suit the freeing of the market. Assuming an average maturing period of seven years, whisky for sale in 1954 will on the average have been distilled in and around 1947 (in practice, of course, most blends contain whiskies of several different types and ages). Only 14 million gallons were distilled in 1946, 9 million in 1947 and 21 million in 1948, compared with the 29 million of 1939. Distillation at prewar levels did not restart until 1949. So whisky will not be plentiful in 1954; it could become so in 1956, but, since it can be held in stock, it need not be, even then. For the time being, therefore, private rationing may replace the official system.

When plenty will come depends not only on the technical conditions of supply but also on the fiscal, social and economic conditions of demand. Opinion

in the industry seems to be that home consumption will not rise very much so long as the duty remains at its present height. Consumption in 1953 so far has in fact been running at the rate of about 4.2 million gallons—a long way short of the prewar 6.9 millions.

The price of Scotch has risen from 12s. 6d. (including 8s. 6d. duty) a bottle in 1939 to 35s. The duty on whisky (and on other spirits) has trebled since 1938, and is now roughly 70 per cent of the retail price. Are there any chances of a lower price through a cut in the duty, now nearly £1 5s. per bottle? The industry will duly make its annual pilgrimage to the Chancellor in turn with many other deserving supplicants. Like these others it may dangle before the Chancellor the prospect of higher revenue if the duty is reduced. When the duty on light French table wines was reduced in 1949, demand rose so much that the lower duty yielded a larger revenue. But is the demand for whisky equally elastic? A reduction in the duty of, say, one-fifth, or 5s. per bottle, would need an increase in demand of more than one-fifth to increase the yield. This would need an increase in supplies of about 800,000 gallons, which is not likely in 1954. And a cut in duty might not help whisky much if it were shared by all spirits.

The distillers have another argument—that the industry can exert its strongest efforts abroad only if its home base is secure. Chancellors and Financial Secretaries have been eloquent in their tributes to these efforts: in 1952, Scotch earned roughly \$50 million, or about 10 per cent of the dollars earned by all visible and invisible exports. The argument that a large home market is essential for a maximum export effort is not self-evident; indeed, the contrary might be true. Yet the industry's appeal to exceptional circumstances evokes sympathy: its export markets are susceptible to sporadic disturbances—tariffs, quotas or currency restrictions in Australia, New Zealand and Brazil, embargoes in Mexico and South America, prohibition in Egypt and Pakistan, and, not least, the danger of "readjustment" in the USA, which takes over 50 per cent of the exports.

But virtue brings no reward. The industry's very success in exporting has weakened its home base—perhaps permanently. With exports at more than 11 million gallons, it would need a very large increase in home demand to raise the proportion of world Scotch

consumption to 50 per cent. If a 10s. cut in the duty per bottle were to raise home sales to 6 million gallons—neither of which assumptions is likely—the home base would still be only 35 per cent. Exports seem destined to play a dominant part in the industry's marketing; the prewar balance between home and export trade is hardly likely to be restored except by a slump in the USA of 1929-31 proportions.

But even if it cannot yet reduce the price, the industry plans to bring the merits of whisky home to those who drink other spirits or other beverages. The end of the sellers' market was foreseen two years ago, when training schemes for salesmen were re-started after a 12-year gap. Increased advertising of the proprietary brands is a certainty, and the Scotch Whisky Association is also stepping up its publicity.

Even more radical measures may be called for. Soft

drink consumption has grown $5\frac{1}{2}$ times in 28 years, and may double in the next five or ten; lighter beers have been replacing the heavier; even Lemon Hart has its Light Hart. It might be possible to develop lighter-bodied whiskies for women and younger people; and blasphemous as this may sound on Speyside, these might well comprise a higher proportion of grain whiskies. On the average the present ratio of grain to malt in blended whiskies is about 50-50. An increase in the proportion of grain would reduce the average period of maturing, since grain whiskies mature in four or five years while malt whiskies

take seven or more and thus ease the industry's budgeting problems.

Other ways of adapting whisky to changing social habits and drinking tastes may be possible. Price is not the only explanation of class differences in drinking; social and drinking habits play their part. Novel measures may be necessary to spread whisky drinking at a time when working-class real incomes have risen by a third in 14 short years and many in the traditional whisky-drinking classes have been relatively impoverished, when women are increasingly patronising the improved modern public houses, and when home drinking is increasing.

How far advertising by itself will increase whisky consumption as a whole, and how far merely redistribute it in favour of the largest advertisers and the better-known brands, remains to be seen. The

Distillers Company is by far the largest blender of whisky. It owns six out of the nine grain distilleries, but most of the 90 malt distilleries are owned independently. It also markets several "national" brands including Johnny Walker, Black and White, White Horse, Haig and Dewar; but other distillers and blenders have built up national or regional markets for their brands, and brewers blend whiskies for their own houses. There are about 100 main brands and many other local or private ones. The smaller firm often has small overhead costs; and its blends may be as good as the famous. But the national names have a firm hold, and increased publicity for them may withdraw custom from the lesser-known. Moreover, some of the largest firms concerned are also major producers of gin, to

Rockets for Reindeer

SPACE travel is technically possible. Its eventual development appears to be inevitable. But its impact on the human race and the scale upon which an inter-planetary transport industry might operate are still matters for conjecture. Whether journeys into outer space can become more than exploratory depends on technical developments yet undreamed of, but it is no longer in dispute that modern rocket technology can, if required, provide the means of making such journeys.

The science of rocketry on which practical space travel depends is precise and predictable, based firmly on the established theory of ballistics. The salient facts are roughly as follows; there is a belt of comparatively "solid" atmosphere around the earth which grows progressively less dense, until at altitudes of about 20 miles it can no longer hold up an aeroplane or feed its engines with oxygen; but there is no theoretical limit to the heights that a rocket could reach. It does not need the atmosphere to hold it up, and its fuels carry their own oxygen. A rocket rises like a shell, in a smooth parabola, and gravity draws it back to earth when it begins to lose speed.

If a rocket were to start its flight from a point on the earth's surface, and climb to a height well clear of the earth's atmosphere, 500 miles or more up; then, provided it were moving fast enough, it would not meet the earth again on the downward leg of its flight, but would shoot past the curving surface into space. But as it went past, the forces of gravity would come to bear on it and swing the rocket round like a horse on the long-rein. Acceleration in the order of 25,000 miles an hour is needed to launch a rocket into space, but cruising speeds of around 11,000 miles an hour are sufficient to keep it there (although naturally these speeds alter with altitude and the figures given relate to an orbit set up 10,000 miles from the earth's centre). Such a rocket would be too far and too fast for gravity

whom total spirit consumption at home may matter more than the division of the dram.

If, then, home demand for whisky cannot be expanded beyond 4.5 or 5 million gallons, the increasing supplies available in 1955 and beyond may bring a buyers' market. There may be hopes of an increasing demand in the USA, based on expanding population and rising income per head; other export markets are too uncertain to permit anything more than guesses. At home it would be possible to mature for longer periods and so hold supplies off the market. But not indefinitely: larger stocks lock up more working capital, and the pipeline of maturing stocks is already expensively long. In the middle run, supply is basically inelastic and, short of war, more plentiful supplies of whisky might restore price competition.

to bring it back to earth, but not fast enough to break free. A rocket in space will never lose velocity because it meets no air resistance, and having no further need for power it would become an artificial satellite orbiting endlessly round the world. Temporary orbits for rockets, indeed, could be set up closer to the earth, at roughly any altitude above 100 to 200 miles. The force of gravity would quite soon overcome the velocity of such a rocket and pull it down to earth; but for research purposes a perpetually-orbiting rocket would not be essential.

To build and launch an—unmanned—artificial planet on these lines would be well within the reach of present rocket technology, if a sufficiently strong case could be made to justify the experiment. The subsequent stages of space travel are less clearcut. One school of thought believes that the launching of orbiting rockets will be followed by the construction of "space stations," big enough to accommodate sizeable crews and workshops. The work of assembling space ships for inter-planetary journeying would be undertaken on these stations, from components ferried up from the earth in rockets. This, for a number of reasons, seems improbable. At this stage, it is difficult to see how men will be able to work in space; while the concept of a rocket ferry service carrying up materials for the space station does not stand examination.

It seems more likely that the launching of instrument-carrying rockets will be followed by cautious experiments with manned rockets, still operating as artificial planets round the earth. Once a rocket is moving in its orbit, it should not need a great deal of power to break free of the restraining pull of gravity and head for the planets. The nearest heavenly body is the moon, 250,000 miles away, and this stage of space travel is generally visualised as a series of exploratory voyages round the moon and in the space surrounding the earth.

Whether landings would actually be made on the moon and whether the crews would be able to leave their vehicles remain unpredictable. Conditions on the moon, where there is no atmosphere, are hardly attractive. Planets like Mars (never nearer than 34.5 million miles) and perhaps also Venus (26 million miles) appear to have the kind of atmosphere that might make life slightly easier, although there is no evidence that they have any oxygen, but the journey to either would follow a route roughly 100 million miles long and take approximately 5 months. The size of rocket required to carry provisions for a voyage of this duration suggests that it will be outside the scope of space travel for a long time.

When such a programme of development will be put in hand depends on how valuable the project appears.

Much that is valuable could certainly be learned about high-altitude conditions. American high-altitude research rockets have reached heights of only 250 miles; and the amount of data that they can collect during the minute, or so that they travel in space is limited. An orbiting rocket, even an unmanned one, could be a valuable research tool and its cost might not be so very high compared with that of the present research rockets. Scientists visualise at this stage the construction of small orbiting rockets carrying about 100

pounds weight of instruments, travelling somewhere between 200 and 300 miles above the earth and staying in their orbit for only a short period. Manned rockets, built on a more ambitious scale to cruise farther into space, would be more useful still. But any idea of going beyond the collection of data and developing, say, the moon's suspected mineral deposits, is ruled out from the start by the difficulty of transporting them back to earth.

The military value of these experiments in space is frequently over-rated. Over a period of time, all sections of the earth would come under the review of an orbiting rocket, so that it could be a valuable observation post and an effective radio transmitter; but the skill that could launch such a rocket could also shoot it down. Yet the military have a vested interest in the development of inter-continental rockets—missiles that will cover great distances but will stop short of true space

flight itself. The importance that has suddenly become attached to the giant Australian range at Woomera suggest that many of the engineering problems associated with the design of big rockets for interplanetary flight may be solved in the course of designing long-range guided weapons.

The size and weight of rocket can be worked out quite accurately for any given range and payload. The V2 carried one ton of explosives 200 miles (300 miles were reached experimentally towards the end of the war) and used $8\frac{1}{2}$ tons of fuel to do so, while the entire rocket itself only weighed $12\frac{1}{2}$ tons. A manned rocket carrying a payload of about 2 tons and designed to orbit at, say, 6,000 miles, would probably weigh in the region of 240 tons, most of this consisting of fuel. But the landing of

manned rockets raises special problems of size. To pull free of the earth, a rocket would have to reach speeds in the order of 25,000 miles an hour. The highest speeds, however, would be reached only after the rocket had passed through the earth's atmosphere, and heat friction—already a problem in high-speed aircraft—would not then build up to any significant degree. But when a rocket comes back to earth, it comes at great speed from space down into the dense atmosphere. Long-range military missiles will reach their targets intact because

they are likely to pass through the danger zone at such high speeds that only the outer skin of the rocket would be affected. A manned rocket that has to land gently would have to lose speed before it enters the atmosphere.

One suggested method of "braking" is that the rocket should reduce speed by skimming round the surface of the atmosphere, using the resistance of the air as a brake and gliding in to land like a rocket fighter. This would involve circling the world several times, making the glide home a considerable feat of navigation. But the only alternative is to give a manned rocket the means to reverse the launching process, that is, sufficient rocket power to fire into the line of flight, the only effective way of applying brakes in space. If this means that the initial payload of the rocket would become not 2 tons but nearer 240 tons (the equivalent of the total weight originally planned at take-off), then the

initial take-off weight might become something in region of 29,000 tons, equivalent to a medium-sized ship.

Such estimates as have been made of the cost of experimental space travel are not too discouraging. The most recent figures are those in a paper read to the British Interplanetary Society by Mr A. V. Cleaver, rocket expert of the de Havilland Aircraft Company. He estimated that the first stage, covering the research necessary to design, build and launch unmanned orbital rockets at heights of 200 miles would cost about £50 million, almost all of which could be written off against military research. He calculated upon a further £250 million for the development and building of 10 manned orbiting rockets with small crews. Assuming that the unmanned rockets have been completed by 1956, this second stage should take a further 10 years. What develops after that, he admits, is sheer guesswork.

Business Notes

Recovery in Engineering Exports

THE most heartening aspect of the detailed returns of Britain's overseas trade in November is that the jump of £12.3 million in exports from the previous month's figure of £227.6 million was almost wholly attributable to increased shipments of engineering goods. These goods, which make up over one-third of Britain's total exports, had shown only a small rise of £3 million in October from the low average of £81 million in the third quarter of this year. In November however, they rose by £10 million to £94 million, bringing the average for these two months to £89 million. But there is still some leeway to be made up. For the five months July to November the monthly average of engineering exports was slightly less than the average of £84.5 million in the first half of the year, and was still 3 per cent below the average of £87 million in 1952. Shipments of electrical goods and machinery in those five months were lower than in the first half of the year, but "vehicles" were a little higher owing mainly to the record shipments of aircraft.

Exports of the other groups of manufactures were all somewhat higher in October-November than in the third quarter. Shipments of textiles rose by a further £2.5 million a month to £35.5 million. Shipments of metals increased by nearly 10 per cent to £25 million, and exports of "other manufactures" were nearly £5 million higher at £49.6 million.

Imports in November and October showed little change compared with the third quarter. For the first eleven

His guess is that from £500 million to £1,000 million might be required to cover the development of manned interplanetary travel by the end of the century.

The major controversy among rocket scientists is not so much about the feasibility of manned rockets, or how to fuel and land them, but about the desirability of starting to build small, unmanned instrumented rockets immediately, as an advance on existing high-altitude research techniques, as well as a prelude to research in space. The split is between those who want this work to be started now, and those who do not believe that the data such a rocket would be likely to bring down are so valuable that it cannot wait until improvements in the design of rocket motors make it possible to build orbiting rockets of more modest dimensions. Pending a revolution in rocket fuels and rocket motors, space travel in the popular sense seems remote.

months of the year the volume of imports is estimated to have been 10 per cent larger than in the same period of 1952. In spite of that increase the fall in prices has been so steep that the average monthly value of £278.7 million is 5 per cent below that of 1952. Import prices fell by an average of 12 per cent while export prices fell by only about 3 per cent. This substantial improvement in the terms of trade, without which Britain's balance of payments would now certainly be looking extremely sick, came to a halt last August. In November a fall of one point to 86 (1952 equals 100) in the index of import prices was matched by a fall of one point to 96 in the index of export prices, and the terms of trade remained at 90 for the fourth successive month.

CIC and Bank Lending

THE Chancellor's investigation of recent complaints from the shipbuilding industry about the difficulty of securing overseas orders in the absence of facilities for medium-term credits to buyers has had a useful result—a general relaxation of the system of controlling bank advances. Mr Butler's first directive to the Capital Issues Committee in December, 1951, and his associated "request" to the banks, had contained several new and rather objectionable principles. The banks were informed that advances for capital expenditure "should not in general be made." This meant that any contemplated projects for such purposes,

and for any other purposes not within the ordinary course of business, had to be referred to the CIC if the amount was over £50,000. The CIC, when scrutinising applications for bank finance, was also required to look not only to the "priority" of the project but also to the arrangements for repaying or funding the advance. The committee's practice has generally been to insist that no advance shall be granted for capital purposes unless there are firm arrangements for funding it within six months. The Chancellor has now agreed that there is no longer any need for this particular intervention. The arrangements for banks to refer to the CIC still continue, but the Chancellor has instructed the committee that it need not look into the repayment terms and period of the loan, which are properly left to the discretion of the banks.

The restraint that has now been withdrawn was obviously the particular one that was troubling Sir Frederick Rebbek when he recently expressed the grievance of some ship-builders; but the likely effect upon export business in capital goods of the welcome change should not be exaggerated. The rule did not obstruct medium-term credits for exports if the banks were themselves prepared to put up the finance and if it was provided to or through the British exporter. In that event the finance was not technically for capital purposes but was in the ordinary course of the borrower's business. Hence the relaxation will affect only those cases where the credit is sought directly by the prospective purchaser himself. Not all banks, as a recent article in these columns explained, are prepared to venture far into medium term export finance even when the domestic customer is the borrower. And it remains to be seen whether those banks that take a more liberal view are prepared to extend it to direct credits to overseas buyers. But the relaxation applies equally to purely domestic business; in that sphere it may have a greater effect.

Bank Advances Still Falling?

DESPITE the evidence of the clearing bank's figures for November, which showed an increase in advances by £22 million, it still seems questionable whether the trend of bank lending to the private sector of the economy has yet turned upwards again. The quarterly classified statistics of bank advances, which are free from the distortions that beset the monthly totals (and also differ from them in that they embrace all members of the British Bankers' Association but exclude advances made outside Great Britain), show that total advances dropped by nearly £48 million in the three months to last November to only £1,741 million. This made a fall of no less than £275 million since the change in monetary policy in November, 1951. Only £23 million of the quarter's fall was attributable to net repayments of advances by the nationalised public utility industries, despite the fact that calls on the Gas loan during this period apparently provided some £70 million. This shows that the rate of re-borrowing by these industries is still heavy. The volume of credit absorbed by all other borrowers—broadly speaking, by the private sector—thus declined by nearly £25 million. This compares with a decline of £42 million in the previous quarter, but with increases in each of the two quarters before; in the corre-

sponding quarter of 1952 there was, however, a very much steeper fall, by almost £81 million.

But if the downward movement has not yet ceased, it has lost most of its momentum. Over the twelve months to last November, this "private sector" total dropped by less than £20 million, whereas in the first year of the new monetary policy it fell by over £200 million. Of this year's fall, £16 million was attributable to the big personal and professional group, whose credits were reduced by nearly £6 million in the latest three months. Other substantial falls over the quarter occurred in the "other financial" group, down by £16 million, which includes advances to the finance corporations as well as hire-purchase finance and the like; in engineering, down by £10 million and making a £20 million fall over the year; and in iron and steel, down by £4 million, but still leaving the total £22 million up on the year. The only substantial increases over the quarter occurred in food, drink and tobacco (up by £15 million) and in local authorities (up by £7 million).

Another Steel Sale

THERE is an impish quality about Sir John Morison's steel share sales. The share market does not justify another big public offer; the Iron and Steel Holding and Realisation Agency has been publicly, though foolishly, criticised for the capital inflation involved in unscrambling steel at a profit. Sir John's reaction is to sell another steel company at a proportionately higher profit.

Sheffield Forge and Rolling Mills Company has been sold to Darwins for £420,000. It was nationalised for £275,928—22s. 6d. each for 245,269 ordinary shares of 6s. 8d. The purchase will involve rights issues by Darwins of 431,700 10s. ordinary shares to ordinary shareholders, and 256,647 £1 6 per cent. cumulative preference shares to existing 5½ per cent preference shareholders. The dividend on the existing preference capital will also be raised from 5½ per cent to 6 per cent.

Since Sheffield Forge are makers of common steel sections the price is good. Doubtless Darwins who are makers of high grade and often costly alloy steels desire to add to their making capacity. But no historical connection exists between the two companies. Before nationalisation the Senior family was the largest among a number of shareholders but had no control. They decided not to re-purchase and Sir John Morison was lucky to get so high a price elsewhere.

The Agency's score of steel sales is now three private sales—Templeborough Rolling Mills, Round Oak Steel Works, and Sheffield Forge, with only one public offer—United Steel. It will try to conclude a few more of the small private sales in the interval before the market is again buoyant enough for a substantial public offer.

The Coal Board's Self-Inquiry

THE inquiry into the organisation of the National Coal Board in which the board has obtained the assistance of five distinguished independent members is—at least in

form—a purely internal affair. The board itself will presumably supply other members of the committee; the report will be made to the board, not to the Minister of Fuel and Power; and Parliament's opinions on the matter will not necessarily be sought unless any changes the board might decide on as a consequence of the report require changes in its constitution. Whether the report will ever be published remains to be seen; some of the recommendations of the Burrows committee, which studied NCB structure in 1948, were published by the board along with detailed replies, but never the whole report.

Formally, therefore, this inquiry is much less than the board's critics in Parliament were after a year ago and again this autumn; weather came to the rescue of Mr Lloyd and the board. In fact, however, the effect may not be so different. This is not an examination of the coal industry to find out the most effective form of organisation for it, but a study of the organisation to see how far it suits principles about which the board has already made up its mind—that the area is the vital unit of higher management, and that the area general manager is in effective charge of his area "subject of course to necessary co-ordination and full accountability to the divisional board." These principles of decentralisation would probably be accepted by most of the board's Tory critics, though there is very wide room for difference about their interpretation and implementation; as principles, they are unexceptionable as well as fashionable. Nevertheless, it is worth emphasising that this is not the wide-ranging public investigation of its structure and efficiency, with no holds barred, that the board along with other nationalised industries will eventually require.

Those Colonial Balances

IT is well-known that the Colonies have been piling up their London funds for years, but the extent of the increase is seldom mentioned. A memorandum published by the Colonial Office last week shows that the sterling assets of the Crown Colonies rose from £670 million at the end of 1949 to £1,222 million at the end of 1952. Though the Colonies need to maintain adequate reserves, it is difficult to believe that it is really in the interests of these poorest members of the sterling area to use their export earnings to build up idle balances equal to more than a year's imports. It would be grossly unfair to represent the increase in these balances as showing a deliberate policy by the British Government to hold in check colonial consumption; but it is equally misleading to attempt to show, as the Colonial Office does, that the level of colonial balances is unaffected by high policy decisions from London.

Fortunately, the official statement also includes new and useful detail on the composition of those assets, making Whitehall's responsibility for their level easier to assess. Colonial Government funds were 36 per cent of the total at the end of 1952. Another 30 per cent was taken up by the London funds of colonial currency authorities, and 12 per cent by the reserves of the West African and other marketing boards. Most of the remainder was accounted for by the London assets of the colonial banks. All these balances showed sizable increases in the three years under consideration. The increase in the sterling

assets of the banks and currency authorities was primarily technical; the large increase in the balances of the marketing boards, which took place mainly in 1950 and 1951, reflects the high commodity prices that followed the outbreak of the Korean war. The increase in Colonial Government funds is easily explained too; development projects take time to prepare and available money cannot be immediately spent. But the pertinent question is why such projects were not ready; why the outflow of long-term capital from London for development was so much smaller than the accumulation of colonial savings in London.

The future course of the colonies' sterling reserves, as the Colonial Office recognises, is almost certainly downward. Any serious fall in commodity prices must reduce the reserves of the marketing boards, and assets of the banks and currency boards are bound to be absorbed as industry is developed and money and capital markets established.

Protection for "Free" Sugar

THE International Sugar Agreement that comes into force on January 1st is a brave attempt to give some protection to the Cinderella section of the world sugar trade, the "free" market. So much of the world's sugar is sold under preferential arrangements of one kind or another that exports through the free market now amount to only about 5 million tons, out of annual world exports of some 12 million tons and a world production of over 35 million. The free market is thus the residual source of supply and suffers from a persistent tendency towards price deflation. The new agreement has been ratified by nearly all the important countries, and is therefore much more broadly based than the two previous agreements of the pre-war period. Its exporting members have agreed to cut their export quotas by 15 per cent, reducing the total from the basic figure of 4,615,000 tons to an effective figure of 3,390,000 tons. The council has not published its own estimate of the requirements of the free market in 1954, but when allowance is made for the probable exports of the countries that export to the free market but have not signed the agreement, the revised total still appears too high.

For some time the mere existence of the agreement may affect market sentiment sufficiently to maintain the price within the stabilisation range of 3.25 to 4.35 US cents lb, f.a.s. Cuban port. Expectations that the agreement would be ratified were largely responsible for the recent advance in the spot price from about 3.15 cents to 3.30 cents lb. The council has the power to raise or lower the export quotas while the price is within the stabilisation range. It is obliged to do so if the average price is more or less than the maximum and minimum for fifteen consecutive days. If it cannot agree on the amount by which the quotas should be adjusted they will be automatically reduced each time by 5 per cent of the basic figure when the price falls below the minimum, or raised by 7½ per cent when it goes above the maximum. The maximum permissible reduction in the basic quotas, however, is 20 per cent, so that any lapse in market confidence would now leave the council with the power to make a reduction of only 5 per cent, or about 230,000 tons.

Britannias in the Window

THE Bristol Aeroplane Company is the third British aircraft manufacturer to tool up for the production of a civil airliner well in advance of actual orders. Last week, Bristol announced an arrangement with Short Brothers and Harland whereby Shorts were to start tooling immediately to produce 25 long-range Britannia airliners a year. This is the same rate at which the aircraft is being built at Bristol, bringing the probable rate of production when both lines are fully working to 50 aircraft a year. Firm orders so far amount to 43 aircraft and negotiations for a further 50 are fairly far advanced, but Bristol will need considerably more than these to justify its investment.

The size of the venture is very considerable. Tooling for each production line amounts to about £1.5 million, and the amount of capital represented by work in progress at any one time will probably average an additional £4 million. Bristol's commitments are heavier than either those of Vickers (with a target of 100 Viscounts a year) or de Havilland, because the company will also build the Britannia's engines, at the rate of about 300 a year. But if the company does not take this risk now it may lose a valuable portion of the market through inability to deliver on time. The turbo-prop Britannia promises to become one of the cheapest aircraft to operate, but because it represents a radical departure from existing long-range designs, and is indeed Bristol's first major venture since the war, foreign airlines are preferring to hold their hand until the first of the aircraft go into service with BOAC in 1955 (the first production machine being due to fly next summer). At an initial price of £750,000, this caution is understandable, and it is a sign of the British industry's confidence in its market that quite small companies (financially speaking) will take the risk of building such expensive commodities as airliners—the Viscount costs around £300,000, the Comet II £500,000 and the Comet III the same as the Britannia—for sale on the counter. None of these airliners, however, are such standard articles that manufacturers do not modify them to airlines' requirements, although recent statements made under influence of the seaside air may have tended to convey that impression.

Puzzle from Lancashire Cotton

WHICH was the normal year for Lancashire Cotton Corporation, that ending October 31 in 1952 or in 1953? This is the puzzle set by the further drop in the company's trading profits, from £4,225,974 to £3,212,254. The company itself doubtless feels that 1951-52 was the exceptional year when profits benefited (though only in the first few months) from the completion of orders carried over from 1950-51. Margins on these were exceptionally high. But investors will still wonder when the company's exports of yarn (which were severely curtailed in the summer of 1952) began to pick up again and when the company's profits began to reflect the revival in trade at home.

Until the company resolves these doubts a question mark

THE ECONOMIST, DECEMBER 26, 1953

must hang over its dividend policy. By declaring a final equity dividend of 10 per cent, the full year's distribution has been raised to 20 per cent, compared with 15 per cent in 1951-52. But this new distribution includes a Coronation bonus of 5 per cent and there is naturally doubt whether that will be repeated. Basing its estimate on the further decline in the company's net profits (from £1,924,403 to £1,756,474), the market has assumed that this bonus is indeed a once and for all payment. The company's £1

	Years to Oct. 31, 1952	1953
<i>Earnings:—</i>		
Trading profit, before tax	4,225,974	3,212,254
Total income	4,358,690	3,400,885
Taxation	2,340,000	1,550,000
Net profit	1,924,403	*1,756,474
Ordinary dividends	318,665	445,117
Ordinary dividends (per cent)	15	†20
Replacement reserve	500,000	500,000
General reserve	1,000,000	1,000,000
Added to carry forward	80,750	Dr. 34,627

* Excluding £180,000 released from tax provisions. † Including a 5 per cent Coronation bonus dividend.

ordinary stock units were therefore marked down by 4s. to 49s. They have since recovered to 49s. 9d. and at this price on the basis of a 15 per cent total payment they yield 6½ per cent. The optimists, who will note that the dividend is generously covered by net earnings, will still base their yield calculations on a 20 per cent dividend. On this assumption the yield is 8½ per cent. But, before counting their chickens, they should wait for the full report. Now that trade has revived, the company may be more willing to use its liquid resources in re-equipping its mills. Capital commitments may be heavy.

Brazil Debt Payments

AGREEMENT was reached in London this week about the methods of carrying out the arrangements made last October for the settlement of Brazil's £54 million commercial debts due to firms in the United Kingdom and the colonies. The main point was the order in which the creditors would rank for payment out of the proceeds of Brazil's immediate payment of £10 million and subsequent minimum annuities of £6 million (to be stepped up in accordance with the course of Brazil's sterling balance of payments). This question has been settled by deciding that the full amount of each debt shall be paid in chronological order of the date of approval by the Bank of Brazil of the application for the remittance of sterling. Interest will be paid on the outstanding debts at 3½ per cent simple interest from October 1, 1953. The arrangements have naturally given much satisfaction to the creditors of longer standing. The risk and inconvenience on smaller firms holding younger claims might with advantage be met by creating a market in which these claims could be discounted. Brazil has completed its arrangements for securing the initial down payment of £10 million from the International Monetary Fund. The first payments to creditors should be made through normal banking channels in the course of January.

First Again!
AIRCRAFT NOSE-DOCKS
in ALUMINIUM

S.M.D. Engineers now build Aluminium Nose Docks to provide cover and facilities for servicing aeroplane engines—eliminating the expense of complete hangars. These "Wing Hangars" are easily transported, and erected; delivery is rapid and, of course, no painting is required. Let us send you details.

ALMIN LTD · FARNHAM ROYAL · BUCKS

FARNHAM COMMON 595

Aluminium Hangars and Nose Docks are built by S.M.D. Engineers Ltd., of Slough, the construction company of the Almin Group.

"If it's Aluminium - ask Almin!"

Fleet users...

Why it pays to send your
vehicles to MEASHAM

Every new vehicle delivered means a used one to dispose of . . . travellers' cars . . . delivery vans . . . lorries . . . Measham deals with the situation twice a week! That's why the big concerns buy and sell at Measham: Government Departments, Local and Police Authorities, firms with vast fleets of private cars and commercial vehicles. Big organisations have to think big; and they have found over the years that Measham's immediate market offers the most buyers, the widest selection of vehicles, and the best and fairest terms. One or a fleet—it's Measham every time!

future imperfect

Wild animals depend for their food on what they can find.

It is a hand-to-mouth existence. Man, having evolved the idea of agriculture, sows to reap. He cozens nature, making her amenable, to produce his food *when and where he wants it*.

He asks only health and strength to work his fields, peace to enjoy the fruits of his labour and a stable economy to ensure that he can sell and buy and exchange.

The main product of the Fisons business has for a hundred years been chemical fertilizers, to enrich the soils of farms and gardens.

But they make chemicals for medicine and industry too.

Fisons contribute to Britain's harvests, health and wealth.

FISONS LIMITED • HARVEST HOUSE,
FELIXSTOWE • SUFFOLK

..... Fertilizers • Heavy Chemicals

.....
Fisons are also among the largest manufacturers in Great Britain
of pharmaceuticals, medicinal food preparations and fine chemicals
for industry. Many of Fisons products in these fields are household names.

it's all in **FISONS** field

Too Little for Shirley?

THE Shirley Institute has recently undertaken a comprehensive programme of research into the spinning, weaving and finishing of yarns and fabrics made of various proportions of cottons and nylon staple. Nylon has evidently been chosen because this synthetic fibre is in quantity production, and the results of this research into blending will thus be of immediate interest to the mills. The blending of cotton with terylene and orlon will no doubt be studied in due course. Ideally, however, such research should precede, rather than follow, the commercial production of the new synthetics, and the timing of the institute's new programme suggests that Lancashire is not providing it with the resources necessary to tackle this work as early or as comprehensively as it would wish. As Dr F. C. Toy, its director of research, has stated, every year shows the growing importance of mixed fibres in the textile industry. Nor does this apply solely to mixtures of the new synthetics and the natural fibres; the blending of cotton with viscose and acetate rayons are older but still fruitful studies.

The Institute's funds, which come primarily from a levy on the industry, supplemented by a *pro rata* grant from the government, will amount to not less than £305,000 this year and should increase to some £350,000 in 1954. But the claims on these funds are many, and Lancashire might well consider whether a still larger income would not pay increased dividends and help to overhaul the lead that the Americans are attempting to establish in blending techniques.

Dr Toy's reference to the growing importance of mixed fibres is developed by his colleague, Dr D. W. Hill, in an article in the "Three Banks Review." Dr Hill points out that the demands on fibres are so many, and sometimes so conflicting, that it is unlikely that the ideal fibre, possessing all the virtues, will ever be found. But in the man-made and natural fibres together manufacturers now had at their disposal a range from which it was possible to create products surpassing all past conceptions of textile utility. With time the range would grow wider still. It presents at once a challenge to and an opportunity for Lancashire, for the cotton textile industry's future as an exporting industry will depend more and more on its ability to harness its traditional reputation for quality and design to the production of high-class goods that exploit the new fibres to the best advantage. That, as Dr Hill remarks, will require new skills and a considerable increase in the scientific and technical personnel of the industry, for the properties of the new fibres sometimes offer baffling problems that cannot be solved on the basis of experience.

Freeing the D-Mark

THE German central bank has taken three more short steps towards freeing the D-mark from exchange restrictions. The most important of these is that it will now permit the transfer of earnings from all investments that were made in Germany before August 7, 1950; it will

also permit transfers of earnings on investments made with foreign exchange after that date, though not on those made with blocked marks. The significance of the deadline is that it was in August, 1950, that the *Bank deutscher Laender* first allowed blocked marks to be sold by one non-German to another, and so created two categories of blocked D-marks—the "original" and "acquired" varieties. The bank is also to raise the ceiling of small debts that can be transferred at once under the terms of the London Debt Agreement above the present DM 10,000 (although it has not yet announced by how much); and it will allow DM 500 a month to be transferred to the victims of Nazi persecution whose claims for restitution have been accepted.

These moves were all expected, in view of Germany's large and growing surplus of foreign exchange; the central bank's reserves of gold and foreign exchange are approaching DM 8,000 million and are already equal to more than five months' imports. In these circumstances, the bank's earlier permission to transfer earnings only on the foreign-owned investments that were made before 1931 seemed over-cautious. But the German authorities have been hampered by not knowing the full amount of blocked marks that will have come into existence by the time all restitution claims have been met. Nor is it easy to estimate how much has already left the country. It is already legally possible for holders of "acquired" blocked marks to transfer their earnings by various means, if they are willing to sell at a discount, and many have done so in the past few years; moreover, it is an open secret that an unknown amount of capital has been transferred illegally. All these factors—together with uncertainty about the future of Germany's foreign trade surplus—make it hard for the *Bank deutscher Laender* to take a plunge into freedom. If it continues its present little-by-little approach, the next step will presumably be to allow the transfer of earnings on investments made with blocked marks after 1950; after that the aim should be to allow some transfers of the capital itself.

Bigness and Morale

THE Acton Trust, which recently began a broad study of certain effects of size in industrial units, has published its first interim findings on the subject*—dealing primarily with industrial morale, as expressed in regularity of attendance at work. It concludes that, "as a general rule, workers go absent for one reason or another proportionally more frequently in large concerns than they do in small concerns." The conclusion was based upon comparison of absenteeism and size for 18 individual coal mines, plus correlations between average absenteeism and the average size of pits in coal wages districts and National Coal Board areas; and upon absenteeism and employment records for 91 industrial units in a large (and easily identifiable) industrial combine and for 230 stores in a large retail organisation. The connection between larger units and higher rates of absenteeism, the Trust found, was very marked in coal, fairly marked in the multi-plant manufacturing concern, and "just discernible" in the retail chain.

It compares its correlation of absenteeism and size of

* "Size and Morale." The Acton Society Trust, 3s. 6d.

pit with Sir Andrew Bryan's conclusion in 1951 that the accident rate rises with the size of coal mines. That conclusion may be rather more strongly established statistically, since it classified individual mines into size groups, and did not rely partly upon averages of mines in a district or area. In some studies of coal industry statistics, these averages can be misleading; for example, wages for the same job in a district may differ more widely than the district averages for that job, upon which the calculation of "district wages differentials" is based. The fragmentary statistics that the Trust incidentally quotes to link productivity and size of pit, once again averages, may be more open to this criticism than its broad conclusions about absenteeism and morale. The Trust's suggestion that "it is

... the larger pits which have the lower efficient output" does not seem to be borne out by the statistical breakdown of British pits by size and productivity published annually by the Ministry of Fuel and Power. The implications of that table are not clear cut. It suggests, as the table shows, that mines with small output-per-man-shift are generally smaller than those with medium OMS, but that the highest levels of productivity tend to be associated not only with the larger sizes of pit, but with pits employing fewer than 100 men. Only 72 of these 490 small mines are owned by the National Coal Board, the remainder being licensed to private operators, mainly concerned in working small pockets of coal without elaborate equipment. A fair proportion of these small pits have a high OMS; but in all they employ fewer than 10,000 men and produce about 3 million tons, something less than 1½ per cent of the country's output.

More Kaffir Dividends

THE last batches of this December's Kaffir dividends were announced by the Consolidated Gold Fields and Johannesburg Consolidated mining groups over the weekend. These dividends, which are listed in the accom-

panying table, contained the usual surprises; the stock markets were particularly pleased with the repetition of last June's payments by Randfontein and Simmer and Jack. On the other hand, this latest list contained rather more disappointments than the first dividend announcements

KAFFIR DIVIDENDS (June, 1952—December, 1953)

Ordinary Shares	June, 1952	Dec., 1952	June, 1953	Dec., 1953
<i>Consolidated Gold Fields</i>	s. d.	s. d.	s. d.	s. d.
Libanon, 10s.	0 3	0 3	0 3	0 3
Luipaard's Vlei, 2s.	0 7	0 7½	0 7½	0 7½
Rietfontein Cons., 5s.	1 3	1 4½	1 3	1 4½
Robinson Dp. "B," 7s. 6d.	0 6	0 9	0 9	0 9
Simmer & Jack, 2s. 6d.	0 3	0 4	0 4	0 4
Sub Nigel, 10s.	4 0	4 0	4 0	3 9
Venterspost Gold, 10s.	0 6	0 5	0 5	0 5
Vlakfontein Gold, 10s.	0 8	0 8	0 6½	0 6½
Vogelstruisbult, 10s.	1 0	1 0	1 1½	1 1½
West Dreifontein, 10s.	...	...	0 6	0 9
<i>Johannesburg Consolidated</i>				
East Champ d'Or, 2s. 6d.	0 3½	0 3½	0 2	...
Government Areas, 5s.	1 0	1 0	1 0	0 9
New States Areas, £1.	0 4½	0 3	0 3	0 3
Randfontein Estates, £1.	0 9	1 0	1 0	1 0

(discussed in these columns last week); the dividends announced by West Dreifontein, Luipaard's Vlei and Vogelstruisbult were all below recent market forecasts. The Kaffir market had perhaps taken too sanguine a view after the first dividend announcements.

SHORTER NOTES

Both the Kenya and Aden governments have played for safety by placing their new loans with institutional investors. The whole of the £6,510,000 tranche of Kenya Government 4½ per cent stock (1971-78) has been placed privately, 10 per cent of it in Kenya and the balance with Colonial Government funds. It is not expected that the new stock will be sold on the market. Existing stock of the same issue stands at £100½. In issuing £1,330,000 of a new 4½ per cent stock (1972-74) at 98 the Aden Government has also looked to the support of the institutions; £480,000 of this loan has gone to Colonial Government funds, another £750,000 has been placed with financial institutions in London; only the remaining £100,000 is being offered for public subscription and that only to residents in Aden. Dealings started on Tuesday at around £98½.

★

The revised estimate of the main cocoa crop in the Gold Coast, at 205,000 tons, was well below the market's most cautious forecasts and prices have risen to new peaks for the season. The West African marketing boards are now asking 360s. a cwt for January-March shipment, an advance of 20s., and good fermented Gold Coast cocoa on the London market is about 25s. higher at 355s. a cwt for shipment through to May.

COMPANY MEETINGS

THE NATIONAL BANK OF SCOTLAND LIMITED

RECORD ADVANCES AND PROFITS

LORD ROWALLAN'S REVIEW

The one hundred and twenty-eighth annual general meeting of the proprietors of The National Bank of Scotland Limited was held in the bank's head office, Edinburgh, on December 17th.

The Right Honourable Lord Rowallan, KBE, MC, TD, DL, the Governor of the bank, in the course of his speech, said: In its main essentials the balance sheet shows no great change from the figures of twelve months before. It is true deposits at £96 million are £1 million less, but that represents no more than a day-to-day fluctuation. Note circulation, in common with all note circulations, continues to increase, and the amount outstanding is now over £11 million and nearly £700,000 higher than in 1952. Our cash resources remain substantial, amounting to nearly £36 million, giving a ratio of 33 per cent against liabilities to the public in the form of deposits and note circulation. Advances and bills discounted together amount to £30,500,000, the highest figure yet recorded.

INVESTMENTS

Investments in British Government securities stand at £44,500,000, and I invite your attention to the statement in the report that the value of these investments at prices ruling at October 31, 1953, exceeds the figures stated in the balance sheet. I might add that all these investments have fixed maturity dates and that more than half mature within a period of ten years.

One item upon which there is a considerable reduction is that of acceptances, endorsements, guarantees and other obligations undertaken on behalf of customers, which can in part be explained by the fact that certain commodities in international markets are no longer being financed through London but are now subject to direct barter arrangements as between the overseas countries concerned and the Continent. The remuneration obtained for the services previously provided was part of our invisible exports. Even so, with obligations of nearly £5,500,000 current, it is evident enough that the bank continues to play a substantial part in the finance of international trade.

REASONS FOR IMPROVEMENT

It will not have escaped your notice that the profits at £306,000, which is a record, while £19,000 higher than those of 1952, are only £5,000 higher than the profits of 1950. The improvement over the past twelve months can in great measure be attributed to lower taxation, because, apart from the reduction in the rate of income tax, material benefit has been received through the relief on the substantial part of the profits that has not been distributed.

On the other hand, because of the lower rate of tax, the provision for dividends requires nearly £5,000 more, and to that extent offsets the apparent increase in profits. Let any hasty conclusion should be drawn that the improved earnings are to be accounted for by the new service charges

introduced, let me say that these new service charges have done little more than help us to keep abreast of increased working costs.

The allocations out of profits are: £100,000 to revenue reserve fund, £40,000 to heritable property account, and £75,000 to the trustees for the officers' pension fund, leaving £122,300 to be carried forward to the next accounts, as against £138,700 brought in.

CAPITALISATION OF RESERVES

You will see that it is intended to capitalise £150,000 of the revenue reserve fund to increase the amount paid up on the £5 million consolidated capital stock from £1,100,000 to £1,250,000. One of the reasons for making that change is that the consolidated capital stock is presently transferable in units of £500, of which £110 is paid up, a somewhat cumbersome and awkward fraction, and the change proposed will admit of future dealings taking place in units of £1, with 5s. paid up.

The change, when it does take place, will not have effect until after payment of the second instalment of the dividend which will be distributed on July 15th next. It is proposed at the same time to take the opportunity of bringing the Bank's Regulations up to date.

TRADE AND INDUSTRY

In the main, the pattern of Scottish industry has followed very much that of recent years. Agriculture and fishing have had reasonable rewards from the harvests from land and sea, but while agriculture has so far obtained a return on a sufficient scale to provide for adequate mechanisation, it cannot be said that the return from the trawling side of the fishing industry gives much encouragement to embark upon the substantial capital outlays that would be involved in the building of new vessels and, unfortunately, much too large a proportion of the trawling fleet is quite out of date. Our main textile industries, both wool and jute, after somewhat unsettled conditions earlier in the year, have staged a satisfactory recovery and are well placed with production and orders, but the linen industry remains somewhat in the doldrums.

One exceedingly bright feature has been the Hawick knitwear trade, which continues to make a handsome contribution to our exports. In iron and steel there is full activity, but in shipbuilding and engineering there has been creeping in a note of hesitation, partly through the cancellation of some contracts and partly through a reduction in the flow of new orders. One may take leave to doubt whether we have made as much of our shipbuilding and engineering opportunities as we should, because there are reports from both industries of production having been hampered through lack of adequate supplies of steel, and it could be suggested that steel might have been more advantageously used by them for our general

export position than by others to whom steel was diverted.

NATIONAL FINANCE

In the general financial sphere, we as bankers have more than a passing interest, but more than bankers should be pleased at the improvement that has taken place in the national finances and in the greater feeling of confidence engendered. No longer are we living under the strain of attempting to make insufficient exports meet the cost of excessive imports, for our national finances have been brought into a better state of balance, visible evidence of which is provided by the steady if somewhat unspectacular increase in our own and in the sterling area's reserves of foreign exchange.

These reserves have increased by as much as £300 million between the low point of 1952 and the end of October this year, but it would be a mistake to adopt any attitude of complacency because our position in general is still too delicately poised. We must still continue to make the utmost effort to expand our exports, and the words used by the Chancellor of the Exchequer at a recent meeting of the National Production Advisory Council of Industry can well be repeated: "To get the increase in exports we must more than match the growing efficiency, productivity, and competitive power of other industrial nations."

The report and accounts were adopted.

THE BIRMINGHAM SMALL ARMS COMPANY

PRESCRIPTION FOR MEETING COMPETITIVE CONDITIONS

The ninety-second annual general meeting of The Birmingham Small Arms Company, Limited, was held on December 18th at Small Heath, Birmingham.

Sir Bernard D. F. Docker, KBE (chairman and managing director), after reviewing the satisfactory trading results, said:

I believe that in this country we need not worry about our ability to compete in the markets of the world. What we do need to worry about, so far as we manufacturers are able, is that there exists conditions under which we can in fact compete. Let me give you my prescription:

So far as government is concerned—removal at the earliest possible moment of all restrictive controls, including currency restrictions. Economy in the administration of the functions of government—about which I would welcome real evidence. Reduction in taxation to provide an incentive both to industry and the individual. Abolition of purchase tax, which still in so many cases directly keeps up the cost of living, and seems in danger of quietly turning the country into seasonal trading.

So far as we in industry are concerned—continued attention to quality of goods produced—we need to sell our brains and our skill; all-out effort to increase the scope of our sales by every method, and here we need the practical sympathy of government.

So far as the workers are concerned, if we succeed full employment is possible, and for value of work given a good living is assured. To my mind, too much attention is paid by too many to basic rates of pay. The criterion must be what a man takes home on a Friday night, and can the work be obtained to keep him employed? Restraint in application for advances must keep down the cost of living and make pay packets buy more goods.

The report was adopted.

DENNIS BROTHERS LIMITED

(Motor and Mechanical Engineers)

SATISFACTORY RESULTS DESPITE DIFFICULTIES

HAMPERING EFFECT OF EXPORT RESTRICTIONS

SIR GEOFFREY BURTON ON PURCHASE TAX BURDEN

The annual general meeting of Dennis Brothers Limited was held on December 18th at the Café Royal, Regent Street, London, W1, Sir Geoffrey Burton (the chairman) presiding.

Mr H. E. Johnson, FCIS (director and secretary), read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts:

In presenting to you our accounts for the year ended September 30, 1953, I consider the results are satisfactory, having in mind the difficult trading conditions and export restrictions. You will notice that the profit, after charging all expenses, including taxation and depreciation, is £160,577 as compared with £172,521 for the previous year.

We have again had to meet increases in wages due to awards beyond our control, and so far we have carried this increased cost, and not passed it on to the consumer. We believe this policy has been in the best interests of the company, but it cannot be extended further. As you probably know, there is an application now in course of negotiation between the engineering unions and the employers' federation which, if granted, will certainly involve an increase in prices and add further to the difficulties of our home trade, and even more so in relation to export trade, where competition from other European countries is daily becoming more severe.

LABOUR PROBLEMS

Our relations with labour have, as in the past, been good, but one of our anxieties has been due to our inability to obtain sufficient productive employees to meet the requirements of our various works departments. The demand for labour in and around the Guildford area since the war has grown to such an extent that it exceeds the supply. There is also the added difficulty of housing, although your company is fortunate in owning 250 houses which are let to our own employees at lower rents than any in the district. Had it not been for the foresight of your directors in the past in this connection, we should be suffering today considerably more than we are.

Dealing with the accounts, our stock shows an increase of £147,000, which in general is due to new models and customers' special requirements. The total of sundry debtors, tax reserve certificates, and cash in hand is down about £90,000, which is more than covered by increased stock. Creditors and provision for taxation are approximately the same as last year.

INCREASE OF CAPITAL

On September 29th last an extra-ordinary general meeting was held for the purpose of bringing the issued capital into better relation with the real resources employed. At this meeting you approved proposals to capitalise £676,113 of the reserves. This was done by transferring £108,987 standing to the credit of capital reserve, £150,000 from general reserve, £300,000 from renewal and re-equipment account, and £117,126 from

profit and loss account, to issued capital, bringing this up to £751,237. After issuing nine shares for one, we consolidated ten shares of 1s. each into one share of 10s., thus making the issued capital of the company 1,502,475 shares of 10s. each. At the same time we also increased the authorised capital from £600,000 to £1 million. This is reflected in the balance sheet now before you.

Sales during the year have been hampered by export restrictions and by lessened demand at home, but we have started the new year with a good volume of orders.

There has been no Commercial Vehicle Show at Earls Court this year, but one at Kelvin Hall, Glasgow. We have exhibited a Centaur chassis with 5½-litre engine and special platform body; a Pax chassis with tipping gear and distinctive lightweight body, and a novel integral box-van vehicle for a well-known Scottish sweet manufacturer. The latter is mounted on our latest Stork chassis which was so well received at the last show, and has already justified its introduction. One of the first we supplied was for the London Evening News as a mobile printing unit used for printing stop press news on site.

Our fire engine department has had a satisfactory year, and in our opinion there should still be a steady demand, especially for export. Our fire engines are second to none and we can justifiably claim to be leaders in the manufacture of fire-fighting equipment.

MUNICIPAL VEHICLE DEPARTMENT

The municipal vehicle department has also given a satisfactory account of itself, though as I pointed out last year, competition is increasing in all directions. We intend to keep in the forefront in this field, and several models, some already offered to the public and others projected, should result in the company's business being maintained in this department during the forthcoming year. In particular, our overseas customers have now had the opportunity of assessing the quality of our postwar products, and an increasing demand can be expected in this direction.

Special attention has been paid during the last year to improvement in our servicing arrangements. Quick and efficient service is essential to retain a satisfied customer, and we have plans to still further improve our service by ensuring that the personnel of your company and their agents are in closest touch with our customers both at home and abroad, so that there shall not be a moment's delay in supplying spare parts and giving help in any direction when required.

I have already referred to the difficulties in regard to the home trade. This is to a large extent due to the regulations controlling hire purchase and to purchase tax. In particular, there has been a falling off in orders from coach proprietors due to the fact that one-third of the price has to be paid on delivery and the balance within eighteen months. As the trade is mainly seasonal, this does not allow the operator time to recoup himself.

NEED FOR TAX REBATE SCHEME

With regard to purchase tax, I feel that a tax rebate scheme on vehicles held in stock should be introduced. We have through the Society of Motor Manufacturers and Traders been urging the Ministry to adopt such a scheme. Meanwhile our agents are reluctant to take vehicles into stock on which they have to pay purchase tax, because at a later date tax may be reduced and they cannot obtain any relief. In addition to this, of course, the high rate of purchase tax, which is 33½ per cent of the price of the chassis, continues to be a severe burden, and restrains operators from purchasing the latest types of vehicle even though they would be considerably more economical to run.

At the extra-ordinary general meeting held at the end of September I mentioned that our reconstruction of capital did not imply increased earnings or dividend. Although our net earnings have shown a slight drop as forecast, I am glad to say that the board recommend the same final dividend as last year, which on the new basis means 20 per cent, making a total of 25 per cent for the year.

I wish once again to conclude by thanking your behalf all those engaged in the management of the company and also our employees, both in the offices and the factory, for the good work done during the year and for their unswerving loyalty to your company.

The report and accounts were adopted and the final dividend of 20 per cent, less tax, making 25 per cent, less tax, for the year, was approved.

The retiring directors, Mr H. W. Dawes and Mr H. E. Johnson, FCIS, were re-elected and the remuneration of the auditors, Messrs Gane Jackson Jeffreys and Freeman, having been fixed, the proceedings terminated.

THE STRAND HOTEL LIMITED

The forty-sixth annual general meeting of The Strand Hotel Limited was held on December 17th, in London, Mr S. I. Salmon (the chairman) presiding.

The following are extracts from his circulated statement:

The accounts show that the increase in our profit last year has not been maintained. Although the turnover is slightly above that of last year, the balance on trading account, which amounts to £157,643, shows a decrease of £19,611. After adding interest received and deducting debenture interest, directors' remuneration, depreciation and taxation, the last item amounting to £100,404, there is a profit for the year of £60,396, compared with £66,712 for the previous year.

This result may seem rather disappointing, but the general position is not without cause for some satisfaction. Our greatest concern, for several years now, has been the necessity from time to time to raise our charges to keep pace with the rising costs of operating the business. These costs, under a number of headings, have risen again this year, but in total the increase is not as great as it has been in recent years. Despite these additional costs, since last year we have raised our menu prices to a small extent only and have refrained from making any increase in our bedroom charges. This has meant foregoing some profit this year, but, looking ahead, we feel sure that the best way to encourage more custom to our restaurants and a greater demand for accommodation is to keep our prices down to a minimum.

The Government policy of derationing and of easing restrictions is a relief and encouragement to the hotel industry.

The report and accounts were adopted.

COMBINED ENGLISH MILLS (SPINNERS)

GRADUAL RECOVERY FROM RECESSION

SIR JOHN REYNOLDS ON FUTURE TREND OF TRADE

The twenty-fourth ordinary annual general meeting of Combined English Mills (Spinners), Limited, was held on December 21st in Manchester, Lt. Col. Sir John Reynolds, Bt., MBE, JP (the chairman), presiding.

The following is an extract from his speech which had been circulated with the report and accounts:

I have to report a gross trading profit of £875,310, compared with £1,703,384 for 1952, and a net profit of £286,666, as against £555,872.

The depression of 1951-52 descended on the trade with alarming rapidity and lasted, in all, approximately twelve months. Recovery, fortunately, came with more buoyancy than has always been the case in Lancashire's past history, and by March business was, although not good, at least fair.

The closing date of any firm's accounts makes an extraordinary difference on the effect of the depression in its figures; in some instances spreading the decline in profits relatively evenly and in others leading to very sharp fluctuations indeed.

Last year I warned our shareholders that the recovery, although on the way, would have to proceed at exceptional speed if the bad start of the coming year was to be made good.

The recovery which I then anticipated has in fact continued to develop slowly, but gradually, and this with the present appearance of stability has led your board, despite the decline in our profits, to recommend the maintenance of the preference and ordinary dividends at the same rates as last year.

We are placing to general reserve £150,000. This is provided by allocating £100,000 of our tax provision which is no longer required, together with an amount of £50,000 provided from this year's earnings, making the general reserve £1,150,000. The carry-over is increased by £17,601, making the credit balance to carry forward £428,923.

During the year, £337,412 has been spent on capital additions, as against £108,421 last year, and £259,000 on repairs and maintenance, against £443,000. The change in the ratio between these two items denotes that the wartime back-log of repairs is to some measure made good and that the emphasis is now on renewal of and additions to plant. The burden of taxation is correspondingly heavier.

Future commitments on capital account as at September 30, 1953, are £326,000, against £219,000, as shown in our last balance sheet.

STOCK POSITION

The level of stocks of yarn, cotton, rayon, etc., at £2,619,049, is a reflection of two developments, increased trade and our decision to contract out of the Raw Cotton Commission for cotton supplies, thus assuming responsibility for purchasing our raw cotton in the "free" market.

There is, in consequence, a sharp reduction in cash, but, as our stock increase lies almost entirely in raw cotton, which, of course, is readily negotiable, the loss in liquidity is more apparent than real. While financing out of our own resources all these heavy cotton commitments, we have retained tax reserve certificates against the full amount

of our January and April, 1954, tax liabilities.

Stocks of both cotton and yarn are covered by sales or by "hedges" in the Raw Cotton Commission's cover scheme and are not, therefore, subject to the risk of heavy stock depreciation.

VITAL NEED FOR VIRILE SPINNING SECTION

There can be no doubt that the early recovery of the spinning trade, after so sharp a recession, was in a large measure due to the steadying effect of the Yarn Spinners' Association. Other sections of the trade were at one time critical of the firm stand the spinning section took against selling below economic bare costs. It is now generally recognised that the "floor" which our section of the trade provided shortened by many months a movement which had the makings of a serious slump. A strong and virile spinning section is vital for the well-being of the whole industry.

LABOUR PROBLEMS

During the year labour costs have again risen with an increase in spinning wages of 5 per cent as from August 3, 1953.

Despite this increase the supply of labour is far from satisfactory. In 1951, 321,000 people were employed in the trade, dropping to 262,800 in the worst of the 1952 slump. Recovery in the labour force has been made to 277,970, but even so, labour shortage is a very definite problem.

THE CURRENT YEAR

We have continued to maintain and increase yarn sales and to build up our order book still further.

With a hundred per cent employment in British industry in general any serious or long-drawn-out decline in "off-take" seems unlikely. Minor fluctuations are inevitable in any market, but the tremendous reduction over the years in the number of Lancashire's spindles leaves those of us who remain far less at the mercy of these fluctuations than in prewar days. The following figures comparing approximately the end of the first world war with today are illuminating: 1918—61 million spindles working 55 hours per week; in comparison with the peak period of 1951—28,750,000 spindles working 45 hours per week. The spindleage working today is less than that of 1951.

Export markets are obviously fraught with difficulties and we appreciate the vital importance of this section of the trade, but with the change of ratio between home and export trade, Lancashire can no longer be subjected to the perils and vicissitudes of former years by export difficulties alone.

All recent published trade figures point to a buoyant demand and no unwieldy stocks in any part of the proverbial pipeline. We are not disturbed therefore by fears of a serious decline in this year's volume of trade. Competition, however, is extremely keen and margins remain unduly low, so, while looking and hoping for a satisfactory year, it would be quite unrealistic to anticipate any return to the profits of 1951.

The report and accounts were adopted.

BRITISH MOTOR CORPORATION LIMITED

RATIONALISATION OF PRODUCTION

The second annual general meeting of the British Motor Corporation Limited was held at Oxford on December 18th.

Mr L. P. Lord, chairman and managing director, in his circulated statement, says: The old problem of financing the replacement of plant and equipment after the payment of excessively high taxation still remains. A solution is not yet in sight and the question continues to give great concern.

Rationalisation of Production.—The plans for design, development and manufacture mentioned last year are taking shape. Our staffs have been busily engaged on the rearrangement of plant and the installation of new machinery as quickly as it can be obtained.

PRODUCTION

During the course of the year the production of the Austin Motor Company was interrupted by a three-months' strike. Exports were seriously affected; sales were lost and could not be regained. In spite of this the vehicle production from the Austin factory was 139,694 against 147,833 for the previous year. The corresponding figures for Morris Motors were 139,146 and 128,925 and the total production of the Austin and Morris companies was thus 278,840 against 276,758 for the previous year. At the present time production in all factories is running at a new high level.

The extension to the assembly plant in Sydney, Australia, is proceeding apace. The buildings of the assembly plant in Cape Town, South Africa, are completed and now await the installation of equipment. New companies have been formed in East Africa, Rhodesia and Canada.

Turning now to the home market, it is well known that a large number of vehicles are being sold here in spite of the handicaps of purchase tax and petrol tax, but one wonders how long the home market will continue to absorb vehicles at the present rate under these conditions.

I would like to associate myself with everything HRH the Duke of Edinburgh said concerning roads in his opening speech at the London Motor Show. As far as road building is concerned, the United Kingdom is one of the most backward countries in the world. Trade is being hampered and costs increased by the restricted movements of goods, and many accidents which occur every day arise from present archaic road conditions.

ACQUISITION OF FISHER AND LUDLOW LIMITED

Since the end of our financial year the Corporation made an offer for the ordinary stock of Fisher and Ludlow Ltd., and following acceptance, the issue of shares and payment of cash has been substantially completed. I feel sure that the acquisition of Fisher and Ludlow will be of mutual benefit.

I have already said that production in our factories is running at a new high level, and although marketing conditions all over the world are not becoming less difficult I think that in the absence of any major adverse unforeseen happenings we shall have a successful year. In approaching our problems we can always draw on the many varied experiences of the past and rely on the goodwill and energy of our staffs, suppliers, distributors and dealers.

The report and accounts were adopted.

TRONOH MINES, LIMITED

MR J. H. RICH ON TIN CONTROL

The fifty-first annual general meeting of Tronoh Mines, Limited, was held on December 18th in London.

Mr J. H. Rich, chairman of the company, presided, and the following is an extract from his circulated statement.

As regards the future outlook for tin, the market at the time of writing is suffering from a lack of confidence resulting in a depressed price. Contributory causes for this are the Korean truce, the persistent references to a surplus of 40,000 tons, and the possibility of a trade recession in the USA. It is not surprising that in these unfavourable circumstances consumers should confine their purchases to their bare requirements. Providing there is no serious falling off in American productivity the existing period of low prices may, I think, be regarded as a passing phase. One favourable feature is that the production of tin has reached its peak, and in fact unless new fields are found production will tend to fall while statistics show that the general trend of consumption is upwards.

The recent heavy drop in the metal price has revived interest in the controversial subject of an International Tin Control Agreement, and an International Conference is meeting in Geneva to consider the possibility of achieving this. It is claimed that under such an agreement stable conditions would result, enabling companies to plan ahead and that unemployment would be eliminated. It is interesting to see how far these claims can be substantiated in the light of the experience gained during the ten years prior to the War when a control scheme was in operation. First let us see how far stable conditions resulted under the previous scheme. Under that scheme, and presumably the same conditions would apply under any other control scheme, each participating country was allotted a tonnage assessment, and in the case of Malaya that tonnage was distributed in the form of domestic assessments to the several hundred producers in the country. An integral part of any control scheme is the quota release, which is the percentage of the tonnage assessment permitted to be produced during a given period, the claim being that by this means the price can be stabilised.

QUOTA FAILS TO PRODUCE STABILITY

During the ten years in which the previous control scheme operated the average annual quota release in Malaya varied from 24.33 per cent to 88.75 per cent, and during the same period the price of tin varied from £118.5 to £242.3 per ton, as shown in the Statistical Year Book for 1952. These figures clearly show that the last control scheme failed to produce any stability of either production or price.

Further, owing to the tonnage assessment previously referred to and the permissible sale of quota, any new mine could only be operated at the expense of existing producers, and it was on this account that the Malayan Government refused to issue any prospecting licences.

This prolonged lack of prospecting is now the grave concern both of the Government and the industry, and it is pertinent to enquire what would be the attitude of the Government to prospecting in the event of a new restriction scheme coming into operation. In view of these facts it is difficult to understand how it can be claimed that a control scheme would enable mining companies to plan ahead and enter into capital commitments.

What mining concern would be prepared to put up from three-quarters of a million

to a million pounds to develop and equip new property, knowing that its production would be compulsorily controlled and that the plant might only be in operation for three months in the year, as was the case of one of the associated companies of this group under the former control scheme? The threat inherent in any such scheme is bound to act as a deterrent to the development of new areas, to the detriment not only of the industry but to the economy of the country as a whole.

As to the claim that unemployment would be eliminated, it is only necessary to refer to the annual report of the Chief Inspector of Mines for the year 1938, in which he says that many of the mines were closed down owing to the low quota release, resulting in some 30,000 workers being discharged and calling for an expenditure of some \$600,000 by Government in unemployment relief work.

Despite claims to the contrary, the results of the previous control scheme clearly show that it did not produce the stability claimed, and there is nothing to indicate that conditions have so changed as to produce any other result from a new control agreement.

NEW ZEALAND LOAN AND MERCANTILE AGENCY COMPANY LIMITED

MR MICHAEL G. H. BROWN'S SPEECH

The fifty-ninth annual general meeting of New Zealand Loan and Mercantile Agency Company, Limited, was held on December 18th in London.

Mr Michael G. H. Brown, the chairman, presided, and in the course of his speech said:

Since the issue of our accounts, there have been further statutory increases in certain award rates of pay in New Zealand. It is to be hoped that that country will not allow a rise in remuneration to overtake any rise in production to the extent of involving itself in a runaway form of inflation.

As concerns our company, we hope that some part of the increased cost to us will be met by increased turnover. Regrettably our industry may have to meet a part of this extra cost by an increase in our service charges to clients.

As is frequently pointed out, our trade is more dependent upon wool and meat prices and weather conditions than any other single factor. Lately there has been a little hesitancy in the strength of the bidding at the Wool Auctions for certain grades, but prices have still held at very satisfactory figures. The price of meat is, as yet, fixed by agreement between Governments and this trade will not be freed until about the end of the current year.

Seasonal conditions and the stock feed situation in Australia are generally satisfactory, except in the central areas of Queensland, where conditions are very dry and an early break in the approaching wet season is urgently needed. In New Zealand the season's prospects are really very good.

Domestic trade in these two countries is still running on a good level and, with increasing populations, we have every reason to hope that during the current year we shall handle a satisfactory quantity of business, which will leave us with a reasonable profit margin for all the work we do.

The report and accounts were adopted.

BROWN BAYLEY'S STEEL WORKS

RECONSTRUCTION SCHEME EFFECTED

The thirty-fifth ordinary general meeting of Brown Bayley's Steel Works, Limited, was held on December 18th, at Sheffield, Mr J. W. Garton, the chairman, presiding.

The following is an extract from his circulated statement: Since the last annual meeting your board submitted its proposals to the members for the repayment of the preference share capital. These proposals, I am pleased to say, were accepted without modification by an overwhelming majority of both classes of shareholders. The repayment moneys and the necessary expenses were wholly found out of the resources of the group, of which £600,000 is on loan at call on reasonable terms from The Hoffmann Manufacturing Company, Limited.

The consolidated profit and loss account generally reflects the loss of income, caused by the disposal of the assets of the Farnley group. However, with an increased dividend from the Hoffmann group and the maintenance of the dividend from the South African subsidiary, the net amount available to members has increased from £67,312 to £76,698.

Your directors recommend a final dividend of 2s. 3d. per share, which, together with dividends already paid, will absorb slightly more than the year's available income. Future dividends will depend largely on the trading results of the Hoffmann group and to a lesser extent on the earnings of the South African selling agency.

LIQUIDATION OF FARNLEY GROUP

The Farnley Iron Company, Limited, has for many years been an investment holding company, in which your company has had a controlling interest. In recent years this interest has gradually been increased, and in December, 1952, your company acquired the remaining outside shareholdings. The Farnley Company's principal assets were two wholly owned subsidiary companies—namely, The Taylor Rustless Fittings Company, Limited, and The Farnley Housing Association, Limited—investments in Government securities and a loan to the parent company. In connection with the recent scheme of arrangement, your directors considered that since The Farnley Iron Company, Limited, was serving no useful purpose, it should be liquidated to provide the necessary money and capital profit, out of which to pay certain sums to the preference shareholders. To this end it was necessary to sell The Taylor Rustless Fittings Company, Limited, a stainless steel fabrication works in Leeds, to outside interests. The sale was completed in May of this year at a figure in excess of the book value of its net assets, which your directors consider to be satisfactory. The Government securities, however, had to be realised at a price below their original cost. Your directors have been advised that in order to complete this liquidation, your company has no alternative but to take over the other subsidiary, The Farnley Housing Association, Limited.

Your company is giving very careful consideration to the future of Brown Bayley Steels, Limited, and this important matter is the subject of discussion between the Iron and Steel Holding and Realisation Agency and the board.

With regard to the year 1953, the accounts are not yet completed, but permission will be asked from the agency to publish them as heretofore.

The report and accounts were adopted.

J. GLIKSTEN & SON

DEVELOPMENT OF OVERSEAS RESOURCES

The forty-eighth annual general meeting of J. Gliksten & Son, Limited, was held on December 18th in London, Mr S. G. Gliksten (chairman and managing director) presiding.

The following is an extract from his circulated address:

The revenue from trading of the group amounts to £736,979 as compared with £718,370 a year ago. Adding income from investments, etc., of £13,706 and deducting directors' fees, interest and depreciation, etc., of £190,154, a figure of net profit, before taxation, results of £560,531 as against £542,199. The provision for taxation requires £188,647 as against £350,183 a year ago. The net profit remaining after taxation £370,826 against £189,965 a year ago, is adequate after meeting the preference dividend to provide substantial transfers to reserves and to maintain the dividend on ordinary stock at 32½ per cent, less tax, as last year.

The total capital employed, including reserves and undistributed profits, amounts to £2,925,586 as against £2,626,866 a year ago, an increase during the year of £298,720 which I feel sure you will regard as highly satisfactory. Current assets exceeded current liabilities by £1,793,788, a ratio of 2.36 to 1. Stocks and work in progress have been reduced by £504,608 and it is satisfactory to record that we are more than maintaining our turnover on these reduced stock holdings.

As I forecast a year ago, the past year has shown a substantial reduction in the amount of our call indebtedness and our financial forecast and budget for the current year promises a further considerable reduction. As far as can be foreseen all our developments and extensions can be adequately financed from our own resources.

GENERAL SURVEY

One feature of modern business development which does not appear to be properly appreciated by our legislative friends is the lack of adequate reward obtainable by those who are prepared to undertake the hazards of operating overseas in undeveloped territories, most of which are subject to extremes of heat or cold. Enterprises embarking on such operations which remain domiciled in this country are treated in exactly the same manner as those concerns which operate under the more sheltered and favoured conditions of a highly developed community such as obtain in this country. In other words they are charged exactly the same rate of tax on profits, if any, earned overseas and are granted practically the same capital allowances despite all the dangers, both climatic and political, which are inherent in these overseas operations.

In my considered opinion special consideration should be extended to trading enterprises such as our own who have the will, determination and capacity to develop our colonial and overseas resources.

As regards our home operations, I view the future with confidence. Prices of the commodities in which we deal have been relatively stable during the past year and as far as can be foreseen these conditions are likely to continue.

We welcome the announcement that softwoods have now been freed from all control, and look forward to further relaxation in the control on importation of plywood.

During the period since the close of the accounts, turnover has increased and trading results continue to be satisfactory.

The report was adopted.

HECHT, LEVIS & KAHN

(Merchants in Raw Rubber and Other Commodities)

DIFFICULT TRADING CONDITIONS

The twenty-eighth annual general meeting of Hecht, Levis & Kahn, Limited, was held on December 18th in London, Sir Walter Fletcher, CBE, MP (the chairman), presiding.

The following is an extract from his circulated statement:

The group trading profit is £328,985 as compared with £727,072 last year. There was a considerable reduction in turnover on the London market, and the great difficulties encountered in New York were relative stagnation and certain abuses in the handling of the strategic stockpile made market conditions exceptionally difficult, meant that in that area, normally a source of reasonable profits, losses occurred. The practice under which the majority output of whole countries such as Ceylon were dealt with outside the established market, and on the other side the practice by which the requirements of the countries were equally grouped through government buying agencies have combined not only to reduce turnover but to make markets over-sensitive to relatively small operations and militated heavily against the normal trading practices in which your company has specialised for so long. The impossibility of carrying stocks due largely to the same causes was another adverse feature. Of the net trading profit available to shareholders, that is after the deduction of that amount applicable to outside shareholders of £87,446, no less a figure than £162,878 goes in taxation. The final outcome of the net trading results is therefore a profit in the parent company of £26,953.

BROADENING OF INTERESTS

It will be observed that we carry under the heading of Reserves available for the shareholders in London £787,280, a very considerable umbrella for the rainy day in which we are now working. During the year we continued the policy outlined last year of broadening our interests, which up to then had been very largely in raw rubber only, to other commodities and other forms of trade. This naturally entailed then and has during the current year incurred a considerable increase in overheads in certain directions, but a company like ourselves cannot stand still nor can the board take a chance on behalf of its shareholders that the rubber business will return to that form most acceptable to us and for which we are specially organised. The increased impact of synthetic rubber and of Government trading and the cutting out on political grounds of quite large consuming markets are warning signals that we dare not ignore.

The shareholders will no doubt want me to say something about the prospects for the current year. The rainy day and the lean time are still with us and on top of it there are the increased overheads, for the reasons that I have given, but the provisions that we have made in good times for exactly such an eventuality, and the fact that we are, if anything, more dynamic and less static than we have been for a long time drive away any over-pessimism that might lead to a paralysing of our activities. Because we look back on a long and very honourable history of a century as a trading organisation, we are enabled to look forward even though the moment is a very difficult one, in the same spirit which overcame equally great difficulties in the past.

The report was adopted and a final dividend of 10 per cent was approved.

REGIS PROPERTY COMPANY, LIMITED

LARGER INCOME

The fifteenth annual general meeting of the Regis Property Company, Limited, was held on December 21st in London, the Right Hon Lord Kennet of the Dene, PC, GBE, DSO, chairman, presiding.

The following is an extract from his circulated statement for the year to June 30, 1953:

Last year I told you of the completion of the new section of Plantation House; since the end of the year under review we have been fortunate in acquiring the freehold of this section, so that our office property is now entirely freehold.

There has once again been an expansion of income. This is accounted for by a further increase of revenue from our office property which has offset the ever-rising outgoings in respect of our flat properties. Once again there has been a slight increase in the charge for mortgage interest, but the final result shows that profits, subject to taxation, have risen by £4,520 to £171,632.

Provision for taxation has absorbed an additional £6,432 so that the net profit of the group for the year is £74,449, as against £76,361 for 1952.

In previous years, in order to balance expenditure on deferred repairs, it has been necessary to allocate large sums from the net profit of the company to provision for repairs and contingencies. The programme for repairs of this nature has now been completed. Consequently nothing has to be allocated to provision for repairs and contingencies this year, so that the surplus for the year's net profit available for distribution is, in effect, £73,981, as compared with last year's figure of £66,476 which, I feel sure you will agree, shows satisfactory progress in the company's earning powers. We can, I hope, look forward to a betterment of this position in coming years, when office leases entered into before 1939 become due for renewal.

INCREASED DIVIDEND

The shareholders are entitled at this stage to some further consideration and we have therefore recommended payment of a final dividend on the ordinary shares of 6 per cent, making a total distribution on these shares of 9 per cent for the year, as compared with 16 per cent on half the number of shares, for the previous year.

Although the balance sheet shows a substantial excess of current assets over current liabilities, £560,000 has been expended since the date of these accounts in the purchase of the freehold of the new wing of Plantation House, to which I have already referred.

During the year we have been negotiating for the purchase of the share capital of the Liverpool Exchange Company Limited. Our object in these negotiations has been to spread our risks and to enlarge our investments in office properties.

Property owners generally are still waiting for a long-delayed revision of the Rent Restrictions Acts, which are causing much injustice. As I have already pointed out, our office property and non-controlled flats are having, in effect, to subsidise our rent restricted properties, which, in spite of all difficulties caused by the Act in its present form, are being fully maintained in accordance with the high standards on which we pride ourselves. Let us again hope that this current year may see some necessary legislation which will have the effect of putting our flat properties on to a proper revenue-earning basis.

The report was adopted.

RALEIGH INDUSTRIES LIMITED

A RECORD YEAR

SIR HAROLD BOWDEN'S STATEMENT

In his statement to the shareholders, reporting the company's record production, export sales and profits, the chairman, Sir Harold Bowden says:

It is with pride and considerable satisfaction that the directors of your company present the accounts for the year ending July 31, 1953, for we have achieved yet another record in production, in export sales, and in profits. After a long sequence of records it is not easy to go on improving.

IMPROVED HOME SUPPLIES

Our output, or productivity to use Government phraseology, has again increased in a year in which the total production of bicycles in this country has shown an overall decrease. Such a result, I am sure, is a very heartening one. Over a year ago we announced the production of a million bicycles a year, and since then we have made further considerable strides.

The position of our dealers in the home market has been an unhappy one because of the high priority which we have given to export markets in conformity with Government policy and the national interest. However, I am glad to say that this position is being remedied, thanks to our greatly increased output.

STURMEY-ARCHER

I am also happy to tell you that our Sturmeley-Archer production has reached record figures and is still rapidly expanding. The world wide demand for our gears and lighting sets is greater than ever in the history of the company, and despite our vastly increased production, we are still quite unable to meet it.

As in the past, it is the sterling quality of Raleigh products and our unmatched goodwill throughout the world which has enabled the company to achieve these excellent results.

Further, you will, I am sure, be pleased to learn that our sales figures since the date of the balance sheet again show a healthy increase over those for the corresponding period last year.

LABOUR COSTS

We are glad to see certain signs of a stabilisation in the cost of materials, which today is by far the largest single factor in the price structure of the bicycle, and we hope that we will show a downward trend in these costs.

Labour costs have shown a continued rise since the end of the war, and if our industry is to maintain its present hold upon the world's markets and to continue to provide full employment a halt must also be called to further wage increases that do not bring increased production in their train. With foreign manufacturers knocking at the doors of our export markets, it is essential that our prices should be truly competitive and our costs kept to a minimum, and I am sure that it is in the interests of all those who obtain their livelihood within our industry that a long-term viewpoint should be taken of this problem.

CORONATION BONUS

In view of the record results achieved and of our desire to reward the fine effort of our

workpeople this Coronation year, your directors decided to pay out of the year's profits a special Coronation bonus which together with a bonus equivalent to that which we have distributed in the past when times were good, brings the total distribution for the year to a sum more than double that ever previously paid. In addition to these special distributions we have donated a sum of £20,000 to our Athletic Club for its further development.

BRITISH OVERSEAS MINING ASSOCIATION

TAXATION OF INCOME FROM OVERSEAS

The eighth ordinary general meeting of British Overseas Mining Association was held on December 18th at 1, London Wall Buildings, London, E.C.

Mr Robert Walker, MBE, the President, was in the chair and the following is an extract from his speech:

The Association has repeatedly urged upon HM government the need to mitigate the burden of United Kingdom taxation on the overseas mining industry. Since the Income Tax Act of 1945, a number of reliefs have been given, and of those we are duly appreciative. They have, however, done no more than touch the fringe of the industry problem and have clearly failed to provide the stimulus required if the industry is to survive.

While overseas governments have encouraged their mining industries by incentive legislation, as, for example, in Canada, the industry directed from the United Kingdom has declined in size. Since 1939, a single new overseas mining company has been registered in this country, and it is estimated that, out of an amount of £260 million raised in the market for overseas mines in the period 1946 to 1952, inclusive, only £15 million was invested as additional capital in overseas mines directed from the United Kingdom. Moreover, this latter amount includes over £4 million raised by companies which have since migrated to the countries where their mines are situated.

The excessive burden of United Kingdom taxation and the growing aspirations of nascent nationalism in overseas territories have resulted, in an increasing measure, in the practice of registering new mining companies in the territories where the mines are situated, with boards of directors resident in those territories. Many of these mining companies, though registered overseas, are affiliated to mining finance houses or holding companies resident and controlled in the United Kingdom. Dividends flowing from them are still taxed here, and the funds left available in the hands of the mining finance houses and holding companies for exploration and development work overseas are thus substantially diminished.

It is our hope that the Royal Commission on Taxation in its final report will see fit to recommend that income from overseas mining is spared the onerous taxation rates prevailing in the United Kingdom.

It is interesting to note in this connection that the Fiscal Commission of the United Nations, which has been studying the problem of taxation on overseas income, has expressed the view that the opening up of under-developed territories must inevitably be hampered if income arising in those territories is taxed again in the capital-exporting countries; it is not surprising that the United

Kingdom practice of taxing all income regardless of its source is provoking growing irritation abroad, particularly within the Commonwealth.

DISCRIMINATION AGAINST UNITED KINGDOM COMPANIES

I will mention one practical aspect of this matter. Overseas governments frequently give incentives to new mining concerns in their own territories in order to encourage them, but are, not unnaturally, averse to doing this if the gainer is to be the United Kingdom Treasury. If the present United Kingdom practice of taxing all income arising overseas at the full rate continues, there will be increasing discrimination in overseas territories against companies which are controlled from or owned by companies resident in the United Kingdom. A recent example of this is that the exemption of uranium profits in Australia is limited to companies controlled as to 75 per cent by individual shareholders resident in Australia. Another example is that the percentage depletion allowance in Southern Rhodesia, though available to United States and Canadian companies, is not given to United Kingdom mining companies operating there.

It is our hope that, as an immediate step, the United Kingdom government will at least implement the third recommendation of the interim report of the Royal Commission on Taxation and allow relief in the United Kingdom to match any reliefs given by overseas governments.

ELIMINATION OF DOUBLE TAXATION RELIEF

Another matter which I would like to mention is the discouraging ruling that double taxation relief is not given in the United Kingdom if an overseas territory happens to impose its taxation on mining companies in some form other than a forward income tax or profits tax. The fact that an overseas government finds it convenient to levy part or all of the total taxes on its mining industry in the form of royalty, export duty or tax on turnover, does not make the resultant levy any less of a tax burden. In equity, such overseas taxes should be brought within the application of the double taxation relief, as recommended by the Association in its submissions to the Royal Commission.

The report for the year ended September 30, 1953, was unanimously adopted.

WRIGHT SADDLE COMPANY, LIMITED

A SUCCESSFUL RECOVERY

The seventeenth annual general meeting of the Wright Saddle Company, Limited, was held on December 18th at Birmingham, Mr J. H. Gold presiding in the unavoidable absence of the chairman, Mr Arthur Colegate, MP.

After he had dealt in detail with the accounts, Mr Gold read the chairman's speech, as follows: In my speech last year I drew attention to the obscurity of the outlook in the bicycle industry and to the difficulty of prophesying what the year held in store for us. While our financial year started well enough, we ran into difficulties at the beginning of the calendar year caused by the cancellation of the import licences required in some of the most important export markets for bicycles and bicycle components. It was some months before conditions improved, during which we were working at a lower level than for some years past. Fortunately,
